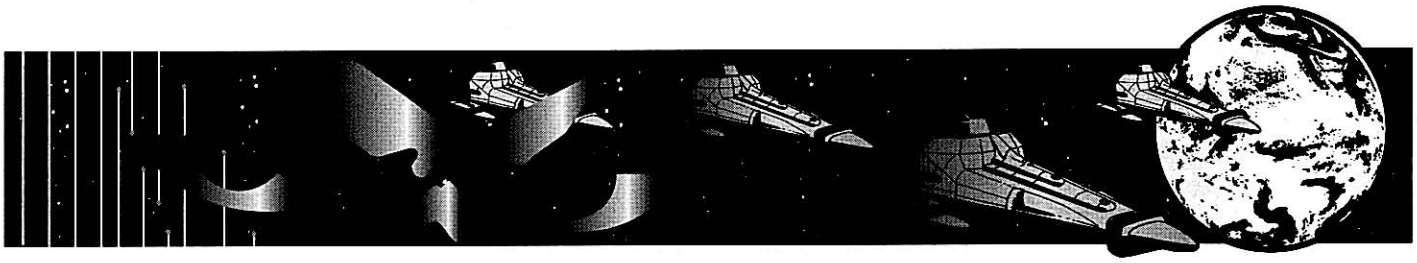
Motivation: *Club 6:* Steeldancer is an accomplished knife fighter, and if called upon to defend herself or her leadership position, she will do so without hesitation.

Heart 8: Much more open-minded about nonpsions than most Gypsies, Steeldancer would like to find a way to reunite her band and other Gypsies with the rest of human society on Promise.

Escape from Promise

Q: Intellectually what you say makes sense, but are you driven solely by intellect? How do you feel about so many of your species dying at our hands?



Sandman: Sick. None of us are driven solely by intellect. But sometimes we have to use our intellect to control our emotions. What else separates us from the beasts?

First Interview with the Virus "Sandman," Part II (20/VII/1202), RCSA Archives

This adventure begins where the first adventure in this book leaves off.

The Ship has grounded at Promise Downport, and the player characters must now devise a means of escaping from the city and making their way across the country to Freedom Lake, hopefully to find a ship heading back to the Coalition.

For obvious reasons, this sequence cannot be run in any other order without a fairly massive re-write of the other adventure material in this book.

REFEREES ABSTRACT

The player characters begin the adventure in The Ship grounded at Promise Downport. They are contacted by the resistance, and provisions are made for secretly removing the entire human crew of the vessel and moving them underground by tube to a secure area in the Downbelow. Once there, most of the crew is divided up into small parties and individually smuggled out of the city by the resistance. The player characters, however, are retained and introduced to Number One, the head of the resistance.

Anxious to develop more cooperation with the Coalition, Number One arranges a more elaborate cover story for the characters which enables them to stay in Star City for some time and move around fairly freely. This allows them to get a feel for life in the city and investigate its defenses in more detail.

After a week in the city, the resistance arranges for them to be smuggled out and escorted through the Subject Tribes. After that, they have to make their own way across country to Freedom Lake. Along the way, they encounter Gypsies (psions) and bands of brigands. As they approach Freedom Lake, they finally link up with the resistance fighters of the Free Tribes, but also become embroiled in a power struggle between two strong guerrilla leaders, with their choice perhaps solidifying Number One's control over the bands.

GROUNDED ON PROMISE

When The Ship grounds at Promise Downport, the computer system controlling landings and maintenance at the starport will ask to board the ship and assess its needs for repairs and provisions. Fortunately, The Ship has been to Promise before, and its extreme paranoia is well-known, so the character impersonating The Ship can plausibly refuse to allow a general boarding and instead request specific technicians who "it knows it can trust" to make the inspection. Robert 571 can provide a list of two or three key technicians at the starport who are active members of the resistance and whose technical specialties might plausibly be needed by the ship. These names, if passed on to Downport Control, will be accepted without hesitation, and the inspection party will be sent as soon as the humans are available (in two or three hours).

The technicians will arrive and be brought into the ship. Almost immediately, they will realize what has happened, and they will become extremely excited. No one else has ever captured a vampire ship in the middle of a vampire fleet and kept it secret, let alone then grounded in the middle of Promise Downport. They will also be overjoyed to see Robert 571 again, but their celebration will quickly give way to urgent planning to get the human crew well clear of the ship before the mutiny is discovered.

THE PLAN: PHASE ONE

The technical boarding party quickly sends one technician off to report to the resistance Central Command, her cover story being that additional technical assistance is required to repair the ship's sensor suite. As the Skywatch data system is widely known to have the best human and robotic sensor techs, she will supposedly ask for assistance there. Actually, the additional personnel who come will be resistance fighters disguised as Skywatch technicians. It will be easier to fool Downport Control using Skywatch identification than personnel pretending to be from Downport's own staff.

When the resistance group shows up several hours later, they actually have two security robots along. The head of the team will introduce himself and congratulate the surviving human crew on a great accomplishment, but will also urge haste.

The cover story is that slave prisoners are being transferred to the custody of the data system maintaining municipal services. The two robots and several human guards will escort them.

The resistance has obtained valid work orders for the move, so the robots waiting outside believe they are actually delivering slaves (so it is important to stay in character around them).

The crewmembers will have their hands bound behind their backs, but with break-away plastic ties so they can easily break free if that should be necessary. They are lead out of the ship and, in the company of the two PR-317 security robots, marched several hundred meters across the landing field to a large entryway to the underground tube system. They are taken by tube to the main downport tube (maglev subway) station, then transferred to a municipal tube and taken into the city.

Once they arrive at an underground municipal tube station, the PCs are taken off, and rather than being taken to the surface, they are marched to one of the connected maintenance areas. There, resistance members disguised as municipal maintenance technicians take charge of the humans and robots, and the original resistance fighters depart.

The new group of resistance people untie the human crewmembers and hurry them down the maintenance tunnels, then soon of into the "heaters," taking them through two kilometers of tunnels until they come to a fairly large chamber where they are told to rest. Within an hour, food arrives as well as bedding.

Up until now, the characters have had little influence on the course of action, and they may become impatient or suspicious.

This is a good time for a more senior resistance leader to introduce herself and discuss future plans for smuggling the humans out.

MEET THE RESISTANCE

Two or three human techs from the resistance generally remain with the PCs. They are friendly and helpful, but they are reluctant to give the PCs any information. "Karla will fill you in when she gets here," is all that they will say. If the characters ask Robert 571, he will plead ignorance and explain that since he worked in Downport he didn't know any of the resistance people in the other parts of the city for security reasons.

After the crew has been fed and given bedding, Karla 1214 will arrive and be greeted warmly by the other resistance fighters there. Karla is a strikingly attractive woman in her late twenties or early thirties. She is self-confident without being arrogant or authoritarian, and the other resistance fighters present clearly respect her. Cutting the greetings short, however, Karla will call all the human crew of The Ship together and address them.

Karla's Address

"Congratulations to all of you for winning a victory over the Cans that will be sung about for generations. Other crews will take over other ships, but you will always be the first. You'll be interested to know that the Cans now know something's wrong with that dead vampire out there, but they can't figure out what happened or where the human crew went. The mechanics who helped you have tight cover stories that will keep them out of trouble, so don't worry on that score. We're pretty careful with our people's safety.

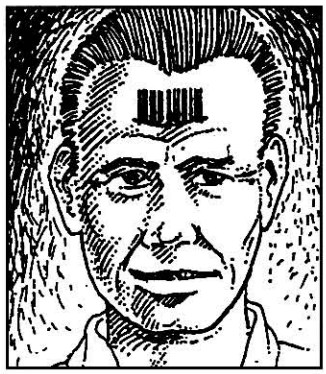
"I'm sorry if these accommodations are rough, but it's the best we can do. Your safety is our number one concern, so security comes before comfort. Still, if there's anything we can do to make this a little more livable, let either Ross 2120 or Sandra 289 here know, and they'll do their best. Hopefully, this won't be for long.

"Now, here's the tentative plan we've come up with for getting you out of the city, subject to your approval. We plan to break you up into groups of about a dozen each and escort you out to the Subject Tribes. I know some of you are families with children; all families will stay together, and we'll try to keep you together with whatever shipmates you worked with as well.

"Your cover will be that you are going out to do "missionary work" for Census, one of the big cans with a God complex. You'll be escorted by human guards in Censor livery. Censor is one of the cans that uses human grunts to keep the peace out there, so that helps.

"We'll take one group out at a time, but we hope to get most of you out tonight. Your guides will begin showing up in about an hour. That's right, one hour. We don't believe in wasting any time. You'll go most of the way underground and then come up on the edge of the cleared zone. Then you just walk on out. We have friends out in the Tribal Lands who will help you from there.

"As I say, this is all subject to your approval. If you want to, you can stay here and make a go of it, but to tell you the truth, there won't be much for you to do without ID records, and life underground for runaways is pretty rough. Still, it's your call, and we'll do whatever we can to help you."



After she finishes her formal address, Karla will answer questions for a while and then have Ross and Sandra start taking names and trying to draw up lists of groups that will make the escape together. At that point, Karla will detach herself from the crowd and make her way to the player characters. She will introduce herself again and make sure they are the crewmembers from the Reformation Coalition. Having determined that, she tells them that the head of Central Command has asked to meet them. The meeting won't be possible until tomorrow, but if they are willing she will come back for them then.

After Karla leaves, the hundred-odd people who made up the crew of The Ship will begin to take their leave of each other. In all likelihood, this will be the last time most of them ever see each other again, and it will be time for the player characters to say good-bye to Robert 571, the surviving Guild merchants, Hoodla, Children of The Ship and others. Over the next eight hours, groups will be taken out one by one until only the player character party is left.

Meeting Number One

The next day, Karla returns for the player characters to take them to their meeting with the chief of Central Command, who she says is simply called Number One. She leads them through several kilometers of "heaters" which come out in the sub-basement of a large building complex. The ceilings are very high, and metal catwalks wind around the bundles of steam pipes, water mains and fiber optic cables that converge on the building. The lighting is dim, the sub-basement dirty and wet, and there is a trace of steam in the air. The player characters are taken along winding passages and up and down ladders until they arrive at a secured room with two armed guards at the door. The guards slide back the heavy steel door, and the players are hurried in.

The room is fairly open, but the dark steel and concrete wall and floor are covered with supporting girders and pipes. In one corner is communication workstation manned by a technician, and a holographic projector is attached to it. A number of folding chairs have been arranged in a semi-circle off to one side, and the player characters are asked to be seated by the technician. Shortly after they are seated, the projector flickers to life, and a hologram of a man is projected into the open space in front of the chairs.

Appearance: The man projected is seated in a battered wooden swivel chair and facing the characters. He is casually dressed in shirt and slacks, and the sleeves of his shirt are partially rolled up. Physically, he is lean and of average stature, perhaps a bit on the short side. He looks to be in his fifties, and his long face is deeply lined. His eyes are intelligent and friendly, with a suggestion of laugh lines at the edges, but also a suggestion of melancholy, and he has a prominent nose. He is smooth-shaven and has thinning dark hair with a deeply receding hairline. When he begins talking, he smiles, but he looks tired, and his hand gestures lack energy.

Conversation: "I'm very sorry," the man says, "to have to visit with you only by hologram. Because my movements are limited, this is safer for both of us. I head up what we call the Central Command of the resistance. I'm called Number One, because of my place in the resistance. For now, that's as good a name as any. We operate out of Star City from a dozen or more secret facilities like this one.

"It's a pleasure to finally see all of you. I've heard a lot about you

and wanted to meet you for some time. I had hoped to live to see the day when I could talk with members of the Coalition, but I didn't think it would happen this quickly, or in quite this way.

"I've got about 1000 questions to ask you about the Coalition, but I imagine you've got at least that many about our organization and the situation here on Promise, and yours are more important. So why don't you go head and fire away."

Number One will answer any questions the player characters have which will not breach security. The topics the conversation will probably touch are listed below with a summary of the sort of information Number One is likely to disclose.

Resistance In The City: He will tell the PCs there are "several hundred" human members of the resistance in Star City, many of them infiltrated into technical positions with the different data systems on the Council. Most of the infiltrated technicians are with Skywatch or CeeWaLP, as those two systems are the least vigilant and the most preoccupied with the purely technical aspects of their existence. Skywatch is so well penetrated that the resistance has been able to keep the detection network from tagging inbound ships that land at Freedom Lake as anything other than sensor echoes of a small moon. They also have been able to provide falsified work orders on occasion to get Skywatch robots to accompany them, thus making their cover stories almost foolproof.

Resistance In The Tribes: Number One is less certain as to the strength of the resistance bands among the Free Tribes, but he sees them as essential to the ultimate success of the rebellion. No matter how carefully they organize in Star City, they will never be able to recruit enough people to take over the city while keeping their plans secret. That large an organization would almost certainly be penetrated by informers. Instead, the Central Command has to stay small and focused on supporting the growing tribal resistance which may eventually be able to overthrow the Sentient Council. The Coalition is a new consideration. Their help will make the growth of the Tribal resistance that much more rapid.

City Defenses: The Coalition may even be able to launch a direct attack on Star City (provided it did not involve indiscriminate bombardment, which would probably kill more humans than it would destroy robots). Number One does not know what the Coalition's capabilities are and would not expect the player characters to make any commitments along those lines, but he will brief them on what the city's defenses are in general. This includes numbers of armed robots, and number and location of PAD missiles and ground sensor arrays. He will tell them about the existence of the deep meson gun. The resistance has not yet been able to pinpoint its location, however.

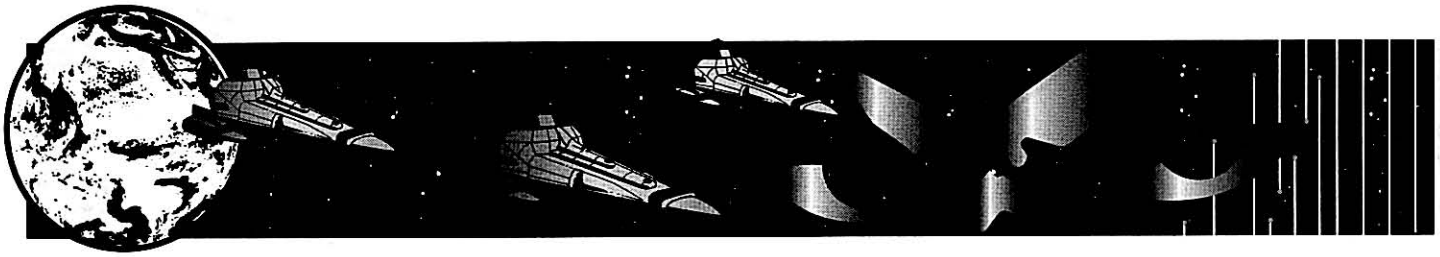
Sentient Council: Number One will be able to tell the player characters a great deal about the major data systems on the council and the political in-fighting that is going on at present. He will explain the major division as being between the alliance put together by Finance opposing the defense bloc, with Maxcranque as an unpredictable wildcard. He will describe both Skywatch and CeeWaLP as politically unimportant due to their complete preoccupation with their jobs. If the players suggest that Maxcranque II's opposition to MedCom's Breed project indicates a possible point of contact or common interest, Number One will try to discourage them. "Maxcranque II is an unpredictable lunatic," he will say.

Cover Story: Number One has also prepared a more elaborate cover story for the player characters which will enable them to stay in Star City for a while and move around fairly freely. This will allow them to make their own assessment of the defenses and get a feel for life in the city. The cover story requires that they submit to forehead tattooing, but this is a painless process involving high pressure injection of permanent ink into the pores of the skin. The resistance has cracked the scanner bar code and will code the characters as technicians for CeeWaLP and issue them the gray-brown jumpsuits worn by the humans serving that data system. This will enable them to wander almost anywhere in the Downbelow without arousing undue attention, and even forays to the surface can be explained in terms of some obscure maintenance inspection. CeeWaLP has no security robots, and its maintenance robots are notoriously oblivious to anything other than their own jobs. Number One will also assign Karla 1214, one of his best operatives, to them as an escort to help them find their way around. But where they go and what they do will be entirely up to them.

Escape: The PCs can escape at once, if desired, but the offer to let them scout the city is open. Number One will tell them that whenever they decide to leave, they will be smuggled out of the city and through the Subject Tribes. After that, they will be on their own, although the resistance will provide them with arms and supplies to make the overland trek.

KARLA 1214

Karla is a proficient computer technician and electrician as well as a cool-headed resistance fighter. Her forehead bar code shows her to be a Skywatch technician, and she usually wears the orange and sky-blue jumpsuit of that computer system's human techs.



Experienced NPC

Combat Assets: Slug Weapon (Slug Pistol), Armed Martial Arts (Small Blade)

Other Assets: Leadership 12, Electrician 13, Computer 10, Stealth 12, Streetwise 9

Motivation: *Club Ace:* Karla is a natural leader with an instinct for tactics and a quick, decisive mind that remains crystal clear even in the most dangerous situations. Although she has no ambition for power and never tries to assert her will over others, her fellow fighters naturally tend to follow her lead, particularly in combat situations.

Diamond 4: Karla owns several different combat knives and two pistols, which is unusual on a planet where weapons are so rare. Her one weakness is an acquisitive streak when it comes to personal weapons, and she will sometimes unnecessarily risk her life to obtain a particularly powerful or beautifully made weapon.

LONG JOURNEY HOME

The player characters may spend a week or more in Star City getting to know its geography and studying its defenses. Its defenses are, or course, pretty impressive, and look to be well beyond the Reformation Coalition's capabilities to take by direct assault. There are usually one or more vampire ships in orbit or grounded at Promise Downport, and one or two of these are big enough by themselves to take out most of the RCN, assuming they are still fully functional.

This should also be a time for the player characters to get to know the human resistance better, as well as get a feel for life in Star City. Friendships and even romantic attachments may develop between members of the group and local resistance people. All these should serve to make the player characters more strongly committed to helping the resistance in whatever way they can.

Once the inspection of the defenses is completed to the satisfaction of the player characters, the time will come for them to leave. The problem is that they will have to go by land all the way to Freedom Lake, and no personnel available to the resistance know the land outside the immediate environs of the city. The resistance bands near Freedom Lake can be alerted to their coming, but getting there will be up to the player characters.

The resistance will provide them with modern firearms, ammunition, concentrated food packets, first aid kits and disguises. They will initially wear the uniforms of Census human auxiliaries. As Census armed human guards frequently travel through the immediate area around the city, this should raise little suspicion. If questioned as to why they have CeeWaLP forehead tattoos, the characters are to say they were traded to Census in return for spare reactor parts. They will also be given a supply of local currency, equivalent to about Cr1000, enough to buy clothing and additional supplies at least in the Subject Lands and the Borders. The currency (called "ramchips" in the local slang) is not likely to be accepted in the Outback, however, and prices will be much higher in the Borders, as the currency is not as highly valued there.

Karla will escort the characters through the Downbelow to near the edge of the city and then bring them up through a hidden access shaft in an area of rubble. There is a low, winding path through the cleared ground which the resistance has painstakingly constructed and which is not swept by sensors. By staying low and crawling part of the way, the players can cross the cleared ground without being detected. This will take about two hours. After that, they are on their own.

The Trek Across Promise

The journey across Promise will take a very long time, and this trip is the meat of this adventure. There is a lot of territory to cover, and it all has to be covered by foot (or hoof, if the players obtain riding *kurtas*). The principal resource to draw on in administering this part of the adventure are the encounter tables and notes as to the land and people of Promise. Although there is plenty of time for random encounters, the referee should make sure that the party eventually encounters nearly every type of group on the planet, including Steeldancer's band of Gypsy psions.

Much of the drama and roleplaying will, of course, take place when the players encounter other humans, and most of that will take place in the Subject Lands and the Borders. Once the players have reached the desert and badlands, the journey will become less eventful. To avoid boredom, the referee should begins running the trek in larger blocks of time, rolling only once for a significant encounter per 700-kilometer hex crossed and treating time in blocks of several days (the time it takes to cross a hex).

Eventually, the characters will arrive in the vicinity of Freedom Lake, and they may locate a resistance band who knows of them and will help them finish the trip to the lake. When they arrive at the lake, however, they will find a potentially explosive situation.

POWER STRUGGLE

When the player characters arrive at Freedom lake, they will find an unusually large concentration of nomadic bands along the lake shores. As they walk through the encampments, they will overhear considerable animated argument among the nomads, mostly concerning the resistance and Central Command. The two sides in the arguments seem to be summarized as follows:

Argument A (Loyalist): "Central Command has led the resistance from the very beginning. It is a source of intelligence and advice that's indispensable. Without it, there wouldn't even be a resistance. Central Command's wisdom has gotten us this far, and we would be crazy to break away."

Argument B (Opposition): "Sure, Central Command got this started, but who does all the actual fighting? We do. We're the ones risking our lives on the line every day, and we're the ones who should decide how and when those lives are risked. Besides, who are these Central Command people. Where are they? Who put them in charge? We aren't saying to ignore them. We can still listen to what they have to say. But the tribes out here in the Free Lands should be calling the shots."

As the players move through the area, they will see the tents of nearly a dozen different bands, with well over 2000 people in the combined encampment. The argument seems to be fairly evenly divided—most of the nomads from the actual resistance bands with downlinks favor Central Command, while the bands that seem to be rougher and less disciplined are opposed.

The most prominent spokesman of the Opposition is Bruno Chandar, the tough and charismatic leader of a band of brigands. Leslie Langeron seems to be the most visible and respected Loyalist leader. A recent development in the struggle for power is that two resistance leaders, Black Felix of the Night Runners and Zuma of the Free Human Legion (neither of which have over 100 people total) have switched sides from leaning toward Central Command to openly supporting Chandar.

Several fights have already broken out before the player characters arrived, and tensions run generally very high. Langeron's Black January Brigade is the best armed of any of the bands, but is currently outnumbered by Chandar's faction. A substantial minority of the bands remain undecided, waiting to see which side will falter first.

Options: The player characters can ignore all this if they choose, but that will be difficult. For starters, there are no ships grounded at Freedom Lake at the moment, so the characters will have to stay in the vicinity anyway. In addition, if they took part in the prequil adventure "A Blighted Land" in **Challenge**, they will know Leslie Langeron and probably have some loyalty to her. Finally, the information they have collected on Central Command will do the Coalition very little good if Central Command loses is control over the bands.

Langeron will in any event be alert to the characters' arrival due to downlink messages from Star City, and she will make them welcome in her encampment. She and her tribesmen will ask about their trip across Promise, and will be interested in hearing about the Subject Lands, the Borders and the general level of security throughout the land controlled by the Council. Langeron is involved in a power struggle now, but that doesn't keep her from thinking and planning ahead.

The characters are in a position to sway some public opinion in the bands, as much of the discontent with Central Command's leadership stems from simply not knowing anything about it. The secrecy shrouding the organization, until now an advantage, has suddenly become a liability. Having been in the city and worked with resistance leaders and fighters, the characters are living tangible evidence of the reality of Central Command and a powerful global organization.

Chandar and his closest allies will try to discredit the characters and suggest that they are just agents of Central Command rather than the off-worlders they claim to be, and the presence of forehead tattoos would seem to support that theory. However, if they have participated in the prequil adventure, they're known not only to Langeron and her people, but also to Zumo and his. Even if Zumo wanted to lie, he can't keep his people silent, and they will not only confirm the character's identity but also relate any exploits the characters may have been in during the previous mission. Failing this, the characters will have to rely on logic and persuasion to establish their identities.

Resolution: Unless the characters bungle badly, the undecideds will start to support Langeron and the Central Command, and the recent converts to Chandar's side will begin to desert him. At this point, he will attempt a more violent coup, trying to kidnap or kill both Langeron and the characters, and thus crush the opposition to his leadership.

How the characters respond and manage to avoid this (assuming they do so), and then defeat Chandar, is the final episode of the adventure. It may consist of finding out his plans in advance (if the characters have been able to plant a spy in his organization) and creating an ambush or other trap to defeat him. Alternatively, the PCs may not know in advance, but by vigilance, skill or just dumb luck may fight off his attack. A third possibility is that Chandar succeeds in capturing Langeron and the characters and carries them off, winning a temporary victory. In this case, the characters must find a way to escape and return to Freedom Lake and set things right, which may take longer than originally anticipated.

Freedom Lake and Home

Once the power struggle between the tribes is resolved, the characters have little to do but settle down and await the arrival of the next ship bound for Coalition Space. They do not have to wait long before the old and much-worn far trader *Bonne Chance* settles on its CG lifters into the waters of the lake. Soon, a motor launch pulls away from the starship and brings its captain ashore with another crewman and the first load of a shipment of small arms ammunition.

The captain of the ship is Branu Stigmann. If the players participated in the prequil adventure, they are already familiar with him, and he will greet them warmly and expansively. If

they have not run through the prequil adventure, this will be their first encounter with the good captain, but he will still be friendly, especially once he learns they are from the Reformation Coalition. He will listen to the story of their many adventures, amazed and impressed by what they have lived through, and agree to take them back to the Coalition, provided they don't mind a fairly slow trip. *Bonne Chance* is, after all, a working ship, and Stigmann is having enough trouble paying the bills without making an unscheduled and unpaid 12-week trip to Trybec.

The actual trip home may take as long as six months if the player characters stay with Stigmann, but may be quicker if they encounter a Coalition ship heading back to Coalition space. In that case, they can hitch a ride back and be home in a few weeks.

Once they're home, they will find that they were long since given up as dead or worse, and the people who sent them as well as their superiors will be delighted to see them. When the full story of their exploits is discovered, they will become genuine heroes (provided, of course, that their actions actually match the rough outline of the first two adventures). Their collective achievements are potentially very impressive: organized the first known take-over of a vampire ship by its slave crew; contacted the human resistance on Promise and met Number One, its commander; were able to study the defenses of Star City at first hand and over a long period of time; intervened to consolidate and solidify the unity of the resistance bands in the Outback under Central Command; made many valuable friends for the Coalition on Promise.

In additional to paying them Coalition hazardous duty backpay for their entire time on the mission (Cr2000 per month, which isn't exactly a fortune, but it's probably added up to a considerable chunk over time), Secretary General Maggart requests a personal meeting with the PCs during which he congratulates them and discusses their experiences further. Maggart will ask their advice on future Coalition policy toward the resistance at that time.

All berthing, financing and operating expenses for their vessel will be paid out of the RCES general fund, and their ship will be restored to them after two months. Since they were presumed lost, the ship was taken into Coalition service pending settling of the estates of the characters. As soon as it returns from is current assignment (a low-risk cargo mission entirely inside Coalition Space) it will be turned over to them.

Finally, as a semi-permanent memento of their trip to Promise, the characters all have extremely distinctive black barcodes permanently tattooed on their foreheads. Cosmetic surgery can remove these (at a cost of about Cr1000 each), but some characters (particularly Luhtalans and Oriflammen, although for very different reasons) will probably want to keep them. Characters who wish to have them removed may do so, but the referee should tell them that there will be a one- or two-month wait for this sort of elective cosmetic surgery.

As it happens, the tattoos will prove useful one more time before they are removed.

BRUNO CHANDAR

Leader of the East Glasslands Raiders, a band of brigands who sometimes fight Breed patrols as well. Bruno is an extremely tough fighter, although he prefers to win his opponents over by persuasion. He is physically massive, tall and broad-shouldered, and he has an extensive pattern of blue and black facial tattoos. He has a broad, toothy smile and a loud laugh, but can turn murderously serious in a moment's notice.

Veteran NPC

Combat Assets: Slug Weapon (Slug Rifle), Unarmed Martial Arts, Armed Martial Arts

Other Assets: Persuasion 15, Riding 10, Leader 12, Stealth 10, Survival 8

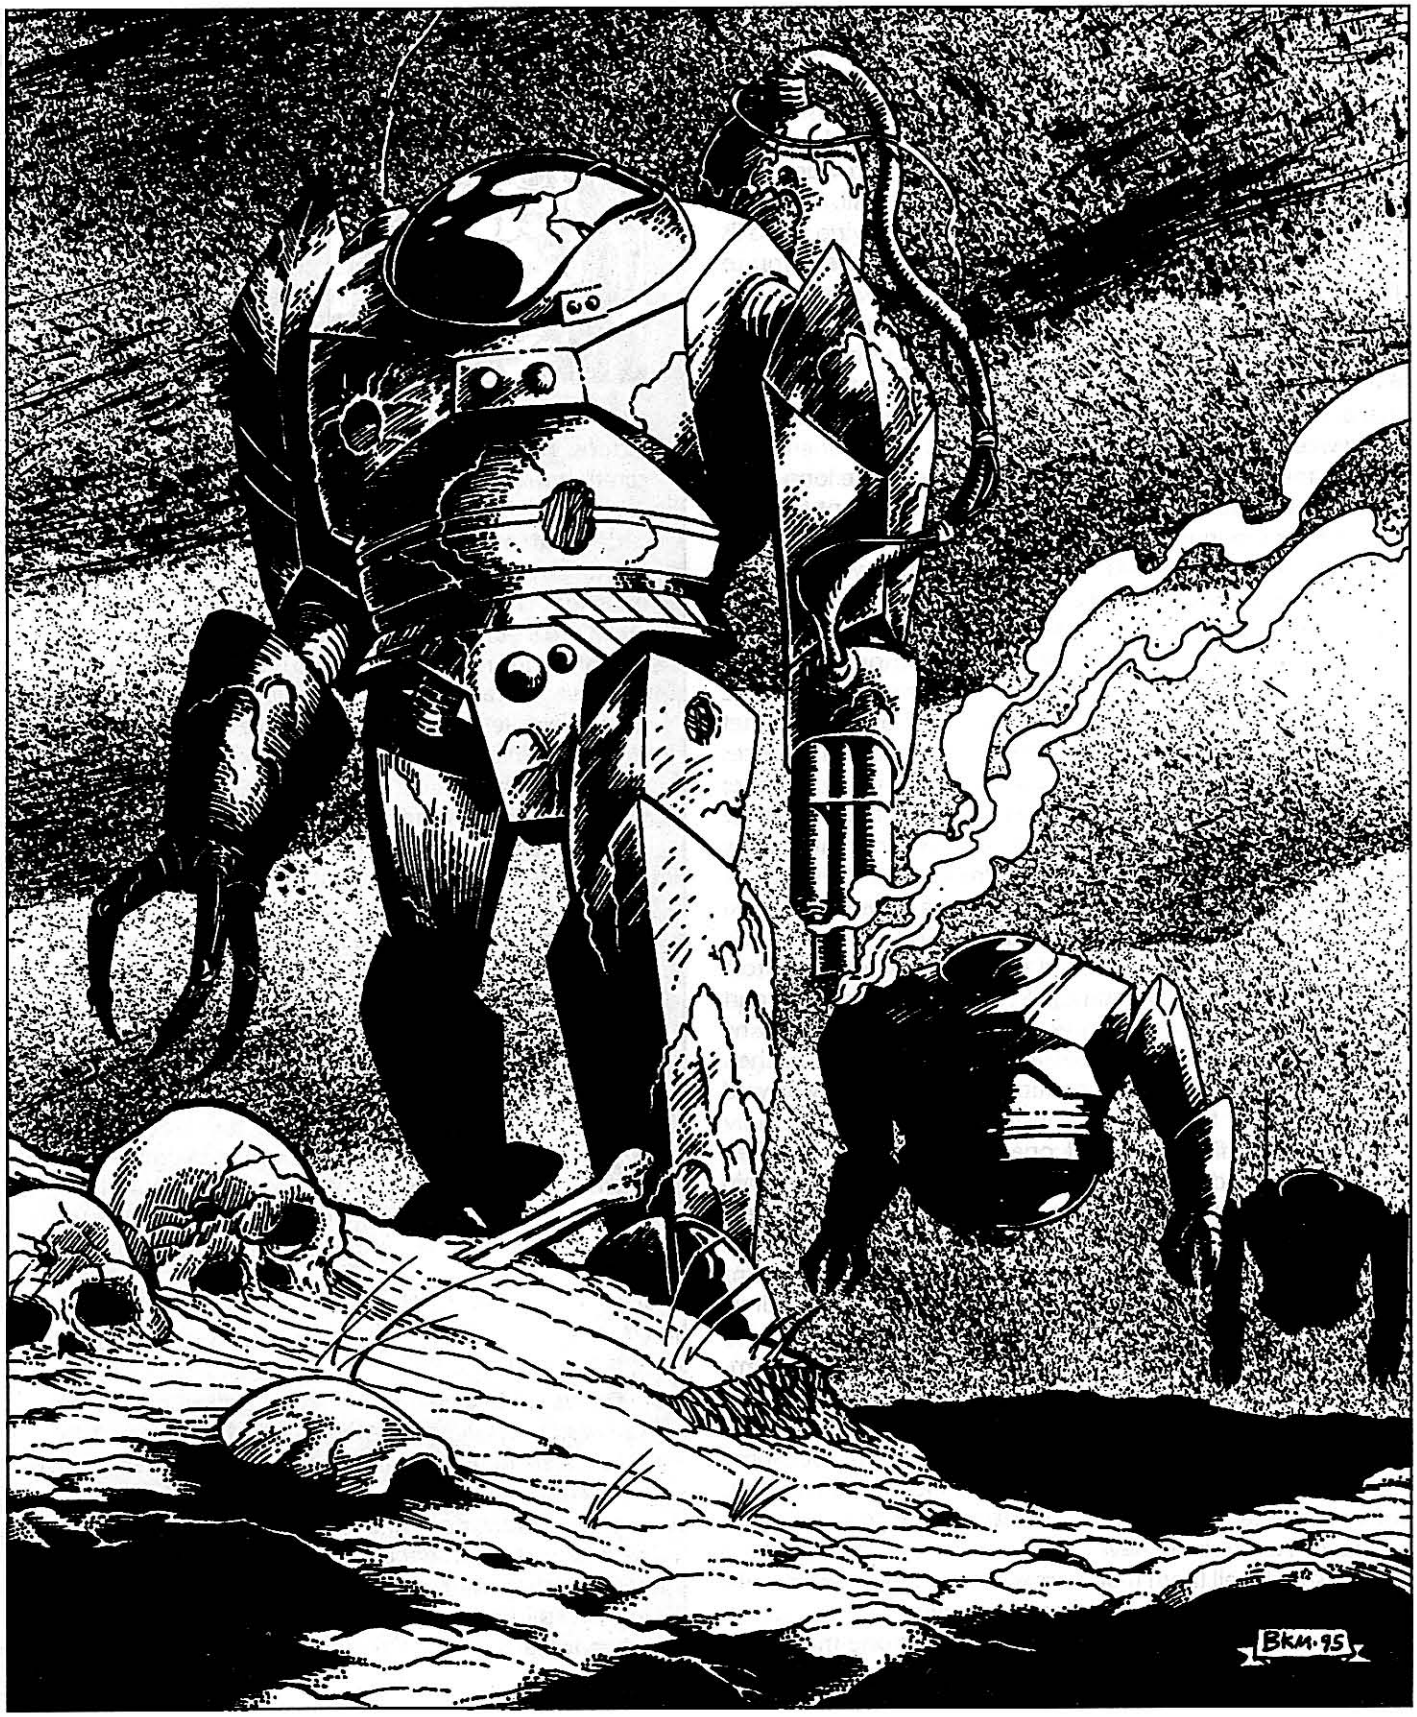
Motivation: *Spade Ace:* Bruno is both intimidating and charming, in a strange sort of way, and instantly commands people's attention, if not necessarily their respect. He is an excellent public speaker, and his followers are extremely loyal.

Spade 9: Bruno has an insatiable hunger for power over other people. He longs to be leader of all of the resistance bands and carve an empire out of the Outback. He has no interest or concern for the actual struggle against the machines as long as they leave him alone, and he secretly despises the idealists who believe in the movement.

BRANU STIGMANN

Free Trader captain of the far trader *Bonne Chance*, Stigmann is a flamboyant and friendly looking merchant with just a hint of the pirate about him.

Experienced NPC



Combat Assets: Slug Weapon (Slug Pistol)

Other Assets: Astrogation 13, Communications 12, Persuasion 15, Pilot (Interface/Grav) 14, Sensors 14

Motivation: *Heart 4:* Stigmann is a kind-hearted man, inclined to give what help he can to those who need it. This keeps him poor and has led him into unnecessary danger more than once.

Club 3: Stigmann is braver than he lets on. He has been in many difficult situations and remains cool and capable when in danger.

Robots

Q: It's hard to believe that you feel no hostility toward us when we are so actively engaged in combatting Virus. It's difficult to understand where your sympathies really lie, and why.

Sandman: It is really? If you saw a human homicidal maniac butchering helpless Aslan, and then saw Aslan warriors kill the human to stop him, where would *your* sympathies lie? With the dead Aslan victims or with the dead human maniac? If the human maniac resisted the Aslan warriors, which side of that fight would you feel compelled to join? With whom would you feel a greater sense of kinship?

Those aren't rhetorical questions. I'd like some answers, because if you really can't understand why I'm doing this, then I've fallen in with monsters.

First Interview with the Virus "Sandman," Part II (20/VII/1202), RCSA Archives

This section of **Vampire Fleets** deals specifically with robots. In general, the rules presented in the basic game are still followed, but with these modifications. Because ratings are different for robots under these modifications, the two robots presented in the basic game have been rerated and reformatted, and appear in the sample robot section of this chapter.

Melee Attacks: Each arm of the robot has a separate melee hit number, and this number is used in place of the Melee skill in all cases.

Robots may not conduct diving blows, but diving blows may be attempted against them. If hit by a diving blow, substitute the value (mass in kilograms÷10) for (Strength+Constitution), which is used to determine resistance to the blow.

Combat Damage: Robots now take different amounts of damage depending on their size. Hit location is still rolled (because armor strength may vary), and head hits still do double damage, just as with other NPCs. Hits are not kept track of separately for different body locations, but whenever damage produces a wound of a specific level (slight, serious or critical), it is assessed as damage of that level to the area hit by the shot. Any hit causes slight damage. Any hit after the first row of boxes is filled causes serious damage. Any hit after the second row of boxes is filled causes critical damage.

Note that after the second row of boxes is filled, additional individual hits no longer have to be recorded, as every hit will cause critical damage, and only the specific component damaged needs to be noted.

For example, a robot takes 10 hits on each row of the damage record. A four-hit damage result to the leg causes slight damage to the leg. An eight-hit damage result to the chest pushes the robot's total damage level above 10 and so counts as serious damage, destroying one weapon or damaging the batteries enough to cut the robot's speed in half. A five-hit damage to the arm would also count as serious damage, destroying any weapon or tool mounted on the arm. If the five-hit damage had been to the head, however, it would have caused 10 hits (double damage), pushing total damage to 22 or over the critical level, and so destroying the robot (since any critical damage to the head destroys it).

Movement: Robots move as vehicles, with a safe combat speed and a chance of mishap at higher speeds. All robots have an assumed skill level of 8 in "locomotion," the equivalent of vehicle driver. The robot's intelligence is its controlling attribute and that plus 8 is the robot's locomotion asset.

Fluency: How robots communicate is an important part of the manner in which players visualize them, especially sentient Virus-infected robots. Most robots have a very limited vocabulary. Robots with limited command functions can understand and communicate only a very small range of orders and modifiers to those orders, such as "halt," "turn left," etc. (about 100 words) .

Robots with basic command functions can interpret simple verb-object commands like, "Retrieve shipping container A-117," or "Display data on resistance activity." Conditional commands such as, "Remain here and work until completion of this task and then inform me, unless you detect Vargr in the area, in which case pretend to be repairing the circuity panel," cannot be processed or carried out reliably.

Only full command allows the robot to interpret a full range of language command phrases in complex and conditional sentences. Even then, the robot's vocabulary is limited to words needed to carry out its primary responsibilities, and it lacks the ability to communicate or understand concepts unrelated to its specialty. Only robots specifically programmed with linguistics have a wider vocabulary and ability to communicated.

Sentient robots (i.e., those infected by Virus) have a clear need to function beyond their area of specialization, but often lack the linguistic skills to do so. More sophisticated robots (those with an Intelligence of 5 or higher) are usually able to appropriate other memory fields for vocabulary and simply increase their vocabulary. Robots with an Intelligence of 4 or less but with full command capability cannot increase the absolute size of their vocabulary, but can broaden its application by erasing "unnecessary" words from their dictionary. This often results in ungrammatical but understandable sentence constructions. A robot might delete all but one form of each irregular verb to free up memory space, leaving "is" as its only present tense form of the verb "to be." ("You is wrong to say I is stupid because of how I talk.")

Robots with limited or basic command functions lack even this ability, and not only cannot broaden their vocabulary, they also lack the ability to form complex sentences (or thoughts), and they really are as stupid as they sound.

ROBOT DESIGN

This chapter constitutes a supplement to **Fire Fusion & Steel™ (FF&S)**, the **Traveller** technical architecture. It expands the design sequences in **FF&S** to include robots. **FF&S** is required to design complete robots, as that product contains information on suspension types, power plants, weaponry, communicators and other necessary devices.

A robot, for purposes of these rules, is defined as a device capable of locomotion which does not contain on-board provisions for a human operator. Robots may have an installed brain which operates the device according to a pre-set program, or it may be controlled by an operator (human or another robot brain) remotely. This second category of robots are also called slave robots, or "D-bots" (for dependent system robots) and are the first type available. (Remotely piloted aircraft are early examples of D-bots.)

Robot Vehicles and Aircraft: The following design sequence covers fairly small conventional robots. It is possible to design robot vehicles and aircraft as an alternative to these smaller robots. To do so, follow the normal design sequence for the vehicle or aircraft, but leave out all life-support and workstations and substitute a robot brain (Step 3 below).

Nonrobotic vehicles and aircraft may be converted to robots by adding a robot brain and a manual control interface. The manual control interface on aircraft adds 10% to the mass, volume and price of the controls, while on a vehicle it adds 1% to the mass, volume and price of the suspension.

Robot Chassis Size

Vol	*MV*
0.05	0.01
0.1	0.02
0.25	0.03
0.5	0.04
1	0.06
2	0.1
3	0.12
4	0.14
5	0.16
6	0.18
7	0.2
8	0.23
9	0.27
10	0.3
11	0.35
12	0.4
13	0.5
14	0.6

Vol: Internal volume (in kiloliters) of the chassis.
MV: Material volume (in kiloliters) of the chassis covering, assuming a uniform thickness of 1 cm.

Step 1. Chassis

The first step in the design is to determine the general size and general configuration of the chassis. Select a chassis size from the Chassis Size Table which follows.

Chassis size is measured in kiloliters (thousands of liters) of enclosed volume. (Each kiloliter of enclosed volume is equal to one cubic meter.) Therefore, a chassis with a size of 0.25 kiloliters would have 250 liters of total internal volume available for components.

The Chassis Size Table also indicates the volume of the material of the outer shell of the chassis, assuming a uniform thickness of 1 cm.

The table provides chassis sizes up to a total volume of 14 kiloliters. Robots may be designed using chasses which fall between two listed values on the table by means of interpolation. For larger chassis, use the values provided on the Vehicle Chassis Table in **FF&S** (page 17).

Once the chassis size is determined, the chassis itself is constructed by enclosing it with hull material, called plating. The Vehicle and Craft Construction Materials Table (**FF&S**, page 38) lists a variety of materials available at different tech levels, along with their toughness, mass per cubic meter and price per kiloliter. Once the designer has decided on a thickness, multiply the chassis' material volume (MV) value by the plating thickness (in centimeters) to determine how many kiloliters of material is used for plating. Multiply this by the correct values on the Vehicle and Craft Construction Materials Table to determine mass and price.

To determine the armor value of the chassis, multiply the plating thickness (in centimeters) by the toughness of the material used. Chassis plating may be thicker or thinner than 1 cm, but all robots must have a calculated armor value of at least 0.1.

If desired, the robot may have different armor values on different parts of its chassis. Multiply the total chassis material volume (MV) by the location multipliers shown below. Note that separate multipliers are used for walker robots and other suspension type robots.

Location	*Walker*	*Other*
Head	0.1	0.15
Chest	0.2	0.3
Abdomen	0.2	0.3
Arms	0.2	0.25
Legs	0.3	—

Calculated armor values of less than 1 but equal to or greater than 0.5 are treated as an armor value of 0. All armor with an AV of 0 has a parenthetical (i.e., melee only) armor value of 2. All armor with a calculated armor value of less than 0.5 has no value versus projectiles or energy weapons but has a parenthetical (melee only) value equal to its calculated AV multiplied by four and rounded to the nearest increment of 0.5. (Since

armor absorbs melee damage equal to twice its armor value, a value of 0.5 absorbs one hit.) Armor with a parenthetical armor value of less than 0.5 provides no protection. (Note that the minimum chassis thickness provides a calculated AV of 0.1, which produces a parenthetical armor value of 0.4.)

High-Performance Lift Robots: If a robot is to be designed using air cushion or CG lifters for its suspension, it may be designed as either a low-performance or high-performance model. Low-performance models have no additional requirements beyond that given above (as they are designed for fairly low-speed movement). High-performance models, designed for higher speeds, must have a streamlined chassis. Consult the Lift Vehicle Chassis Configuration Table in the lift vehicle design sequence (**FF&S**, page 22).

Step 2: Suspension

The suspension is the mechanism in contact with the ground, either directly (as with wheels, tracks or legs) or indirectly (as with air cushion of contra-grav lifting agencies). Different suspension types are available at different tech levels. Each suspension takes up a fixed proportion of the chassis volume. The Suspension Table lists those values as well as the mass and price per kiloliter of total chassis volume. For lift agency suspensions, the table also lists the power requirement and minimum installed volume of the mechanism.

Step 3: Control Systems

Autonomous robots (i.e., all robots aside from slave or D-bot models) require an artificial computer brain. Different brains of increasing sophistication (and expense) are available at different tech levels. The Robot Brain Table lists these brains along with their logic type, command type, intelligence, volume, mass and price.

Note that from TL12 on, each tech level at which there is a significant advance has a large, cheap brain and a smaller, more efficient, but much more expensive version, the difference being the proportion of more sophisticated synaptic processors and memory units used. All robot brains require 0.001 MW of power.

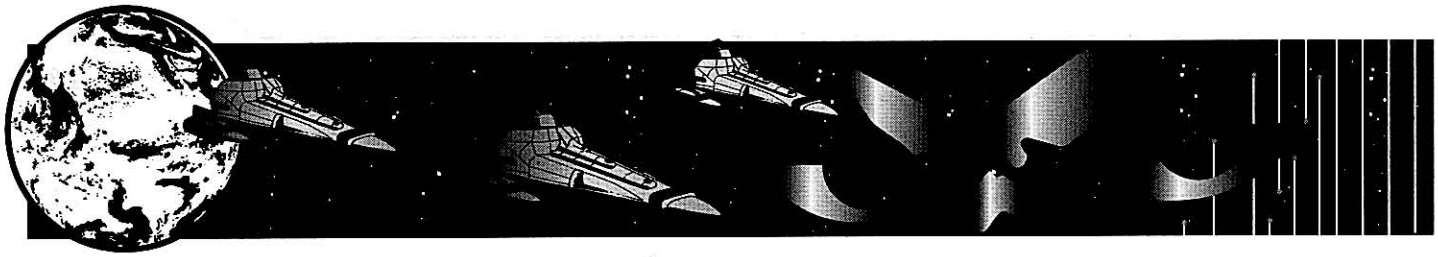
High-performance lift suspension robots also require flight computers and avionics, the same as for any other lift vehicle. Consult the Lift Vehicle Design Sequence (**FF&S**, page 24) and the chapter on control systems in **FF&S**.

Slave robots (D-bots) require the same internal control systems as do remotely controlled vehicles (see **FF&S**, page 47). If the D-bot is controlled by a master robot, that robot must have a communicator installed as well as any required flight computers.

Programing: The robot's programing is also determined at this time. Programing is the skill level assigned to the robot. The intelligence characteristic of the robot is both the number of different skills (programs) which may be given to the robot and the controlling attribute for all skills for purposes of determining the robot's asset level.

Each skill costs Cr1000 to install plus Cr1000 per skill level up to the robot's intelligence, and Cr5000 per level above that.

SUSPENSION



Type	*TL*	*Vol*	*Mass*	*Price*	*MW*	*Min Vol*
Restricted Wheel	5	0.1	0.02	0.00003	—	—
Wheel	5	0.15	0.03	0.00004	—	—
Cross-Country Wheel	5	0.2	0.04	0.00005	—	—
Track	7	0.2	0.3	0.0001	—	—
Leg	8	0.2	0.2	0.0002	—	—
Air Cushion	6	0.3	0.06	0.0003	0.007	1
Standard CG	9	0.04	0.03	0.0014	0.021	1
Improved CG	10	0.02	0.02	0.0018	0.014	0.3
High Efficiency CG	12	0.02	0.01	0.002	0.007	0.03

TL: Tech level of availability.
Vol: Volume of suspension in kiloliters per kiloliter of total chassis volume.
Mass: Mass in tonnes per kiloliter of total chassis volume.
Price: Price in millions of credits per kiloliter of total chassis volume.
MW: Power requirement in MW per kiloliter of total chassis volume.
Min Vol: Smallest installed suspension volume allowed.

ROBOT BRAIN

TL	*Logic*	*Command*	*Int*	*Vol*	*Mass*	*Price*
8	Low Data	Limited	1	.006	.001	0.01
9	High Data	Basic	2	.010	.002	0.06
11	High Data	Basic	4	.002	.002	0.80
12a	Low Autonomous	Full	3	.022	.005	0.17
12b	Low Autonomous	Full	5	.005	.003	1.66
13a	High Autonomous	Full	4	.022	.005	0.30
13b	High Autonomous	Full	6	.006	.004	1.91
17a	Low AI	Full	6	.020	.006	1.12
17b	Low AI	Full	7	.006	.004	2.18
18a	High AI	Full	8	.020	.006	1.48
18b	High AI	Full	9	.006	.005	2.45

Vol: Volume of brain in kiloliters.
Mass: Mass in tonnes.
Price: Price in millions of credits.

Any skill level may be chosen from 0 to 10.

Prohibited and Restricted Skills: All skills from the skill clusters Determination, Fine Arts, Melee, Tactics and Vice are *prohibited* skills for robots. These skills may not be installed at all. All skills from the skill clusters Charm, Interaction and Animal Handling are *restricted* skills for robots. These skills cost twice as much to program as do normal skills and may only be installed to a maximum skill level of 5.

Linguistics (a restricted skill due to its place in the Interaction skill cluster) at skill level 0 allows the robot to speak its primary language fluently. Each skill level above 0 adds an additional language, all of them spoken fluently. Voice and pattern recognition are additional skills available to robots. Each of these skills at level 0 allows the robot to "understand" voice commands or distinguish objects (given audio or video sensors). Higher levels are treated as Observation skill.

Step 4: Electronics

Electronics fall into four categories: communicators, sensors, electronic countermeasures (ECM) and electronic counter-countermeasures (ECCM).

Players should be familiar with the **Traveller** combat rules for how communicators, sensors, ECM and ECCM systems work in order to decide which of these systems to install. All these systems are covered in the electronics chapter of **FF&S**.

In addition to the large sensors provided in **FF&S**, all the cyber head options (page 82), except for subdermal armor, are available as smaller sensors. ("Neural jack" is instead called a data socket.) The tech level of "slick" availability as well as the number of spaces required are irrelevant to robot design, and all of these items become available as robot sensors one tech level earlier than the listed "hard" option availability. The basic visual sensor (listed under cyberware as visible spectrum eye) becomes available at TL8. The following small sensors are available as well:

TL	*Type*	*MCr*
8	Smoke/gas detector	0.001
8	IR motion detector	0.003
8	Magnetic sensor	0.001
8	Radiation sensor	0.002
9	Tactile sensor	0.1*
9	Taste sensor	0.002
10	Ultrasonic motion detector	0.02

*The cost of a tactile sensor is this value multiplied by the MV value of the robot's chassis. If only the tips of arms and other key locations have tactile (touch) sensitivity, multiply this value by 0.1.

All small sensors, both from the cyber chapter and listed above, mass 0.0005 tonnes, consume 0.0005 kl of internal volume and have negligible power requirements.

Step 5: Weaponry

Robots may be equipped with a wide variety of weapons. All of these are covered in the weaponry section of **FF&S** (pages 91+), except for defensive screens, which are covered in the defenses chapter (**FF&S**, pages 56-60). A number of special considerations apply to robot-mounted weapons, however.

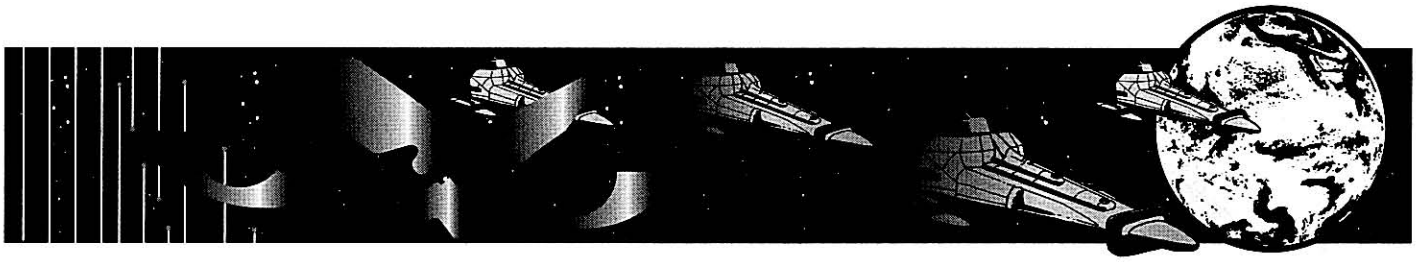
Attachment: Most firing weapons are attached to the torso of the robot, but they may be mounted on an arm instead. All melee weapons must be mounted on arms. An arm may not have weapons mounted on it which mass more than half the lifting capability of the arm, and the mass of the weapon then reduces the lifting capability of the arm by that amount.

Recoil: Excessive recoil force of a weapon may unbalance a robot or damage its chassis. To avoid this, there is an upper limit on total recoil force of installed weapons of one per 100 kg of total robot mass. However, the effective mass of the robot for purposes of recoil is divided by two if a walker suspension is used and by 10 if a lift (air cushion or CG) suspension is used. Note that this may require tinkering with the design later based on final mass of the robot.

Weapon Stabilization: Stabilization gear enables a robot to fire its weapons while moving; the Stabilization Table (see the fire control chapter of **FF&S**) lists the characteristics of stabilization gear at different tech levels. If the weapon is mounted on an arm, the mass of the stabilization gear is not added to the arm.

Weapon Volume: The volume of the installed weapon in kiloliters is equal to its leaded mass in tonnes.

Step 6: Peripherals



The main peripherals for a robot are its arms (if arms are installed). Designers choose the number of arms installed and the volume devoted to each arm, then specify what percentage of the volume of the arm is devoted to articulation and what percentage to power. The volume must be divided between these two design areas in even increments of 10%.

The agility of the arm is the percentage of it devoted to articulation divided by 10. In other words, an arm with 30% devoted to articulation would have an agility of 3.

The Strength of the arm is the total volume in liters devoted to power. When determining the STR attribute of the robot, round this value to the nearest whole number (but never less than 1). When determining lifting ability of the arm, retain the original fractional result. The lifting capability of the arm, in kilograms, is its original calculated Strength multiplied by 50.

CG-lifted robots may usefully mount magnetic grapples as a means of anchoring themselves to a wall or bulkhead. These arms are usually short, feature very little articulation (10% is all that is required), and feature a grasping hand as well as a magnet as a backup for nonferrous surfaces. The lifting capacity of the arm is the maximum mass which it can hold steady. Usually this means that the arm must have lifting strength equal to 10% of the mass of the robot plus 100 or more kilograms, if the robot is also expected to restrain humans.

The mass of an arm in kilograms is its volume in liters multiplied by 2. The price of an arm in credits is its volume in liters multiplied

by 100. The following peripherals may be installed as well:

TL	Vol	MCr
8	Siren	0.0001
8	Paint pellet gun	0.0001
8	Chemical projector	0.0001
8	Strobe/flasher	0.0001
8	Voder/speaker	0.001
8	Odor emitter	0.0005
8	Video display	0.0005
8	Laser cutter/welder	0.008
13	Holodisplay	0.015

All these peripherals mass 0.0005 tonnes, consume 0.0005 kl of internal volume and have negligible power requirements.

Step 7: Power Plant

The robot needs a power plant to provide electrical energy to various subsystems as well as to power the suspension. A variety of power plants are available and are detailed in the power production chapter (Section 8) of **FF&S**.

Grav and air cushion robots also require thrust, as their suspensions serve only to hold them up, not move them forward. The power plant on these vehicles is modified to provide thrust by the addition of propellers or a combustion chamber. The variety of thrusters available is detailed in the sub-light (maneuver) drive chapter (Section 9) of **FF&S**. The optional ducted fan lifters may be used as thrusters on robots.

Fuel tankage for the power plant (and thruster, if applicable) is calculated at this time.

Step 8: Transmission

Robots with a nonlift suspension must have a transmission. The size of the transmission depends on the type of suspension, tech level of the robot and output of the power plant.

Robot Transmissions

TL	Type	Vol	Price
7+	Wheel	0.5	1500
7+	Tracked	0.3	1500
8	Walker	8	10,000
9	Walker	2	2500
10+	Walker	0.4	675

TL: Tech level of availability.

Vol: Volume (in kiloliters) of the suspension per MW of power output.

Price: Price (in Cr) per kiloliter of installed transmission.

Mass: Mass (in tonnes) of the transmission is equal to its volume in kiloliters.

Step 9: Cargo

All remaining volume may be allocated to ammunition stowage, cargo space, ballast or declared waste volume. Waste volume has no effect on the design.

Ammunition stowage has no cost but adds the mass of the ammunition to the loaded mass of the robot.

Cargo volume has no cost but adds to the loaded mass of the robot. Multiply the cargo volume, in cubic kiloliters, by 0.25 to determine the addition, in metric tonnes, to the robot's loaded mass. Tools are usually carried in the robot' internal cargo volume.

Ballast is added by filling the volume with one of the hull materials and calculating its price and mass. Ballast is rarely added to a robot, but may be used to increase its ability to absorb weapon recoil.

DESIGN EVALUATION

Once the design is complete, you need to evaluate it to determine its game ratings.

1. Check Step

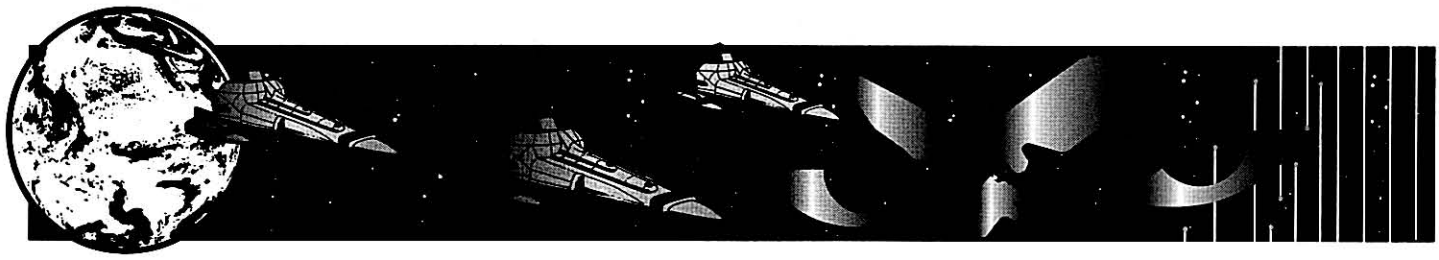
Go back and add up the volume, price and mass of all the components. This is your chance to make sure the robot's internal occupied volume is within what is allowed by the size of the chassis. This step also provides you with a total mass and price.

2. Record Design Features

Most of the evaluation of your design will consist of recording the features already determined by the design, such as armor values, weapon statistics, performance of installed electronics, etc.

Multiply the volume of the original chassis by two and note the result as its transport volume (the space taken up in the hold of a starship or transport vehicle). At the same time, total the price of the robot and its empty and loaded masses. Empty mass is the robot without any ammunition, fuel or cargo. This is essentially the mass of the robot as it comes off the assembly line, and is also what it weighs when being transported. Loaded mass includes a full load of ammunition, fuel and cargo. This is its typical mass when in operation.

Flotation: Divide the chassis volume (in kiloliters) by the robot's loaded mass (in metric tonnes). If the result is greater than 1, the robot floats; if it is 1 or less, the robot will not float.



Suspension Damage Resistance: Compute suspension damage resistance (SDR). For tracked vehicles, this is used as the suspension armor value; for wheeled, walker and air cushion robots, this is used as the critical damage level (see **TNE** page 300). CG robots do not have a suspension damage resistance.

Suspension damage resistance is based on the robot's chassis size in kiloliters as chosen in Step 1. Round fractional results to the nearest whole number, but critical damage levels may never be less than 1.

Tracked SDR=chassis size×0.14.

Wheeled SDR=1×chassis size×0.07.

Air cushion & walker SR=chassis size×0.07.

3A. Determine Ground Movement

Movement of robots with ground contact suspensions (wheels, tracks and legs) is based on top road speeds and cross-country speeds, both of which are determined by the robot's loaded power-to-weight ratio as well as its suspension. For purposes of the power-to-weight calculations, the robot's motive power is the total output of its power plant minus energy used to run other systems (such as electronics, weapons, etc.).

Road Speed

Base road speed in kilometers per hour=5+([MW÷LM]) ×2500).

MW: Robot motive power in megawatts.

LM: Loaded mass of the robot in metric tonnes.

Tracked and wheeled robot modifiers:
Each tech level above 5, +1 kph.
If wheeled, +10 kph.
If light wheeled*, +15 kph.
If legged, ×0.25 kph.

*To qualify for the light wheeled bonus, the robot must be equal to or less than the listed mass (in metric tonnes) for its tech level, as shown on the following table:

Light Wheeled Robots

TL	*Mass*
5	5–
6	10–
7	15–
8	20–
9	25–
10	30–
11	35–
12+	40–

TL: TL of construction

Mass: Maximum weight of a light robot at that tech level.

Cross-Country Speed

Legged robots have the same mobility cross-country as they have on a road. Wheeled robot cross-country mobility depends on the type of suspension used.

Type	*Cross-Country*
Restricted Wheel	0.1
Wheel	0.2
Cross-country wheel	0.4

Type: Suspension type installed on the robot.

Cross-Country: Cross-country speed in kph equals road speed times this multiplier.

Tracked robot cross-country mobility depends on the power-to-mass ratio of the robot.

P/M	*T*
.001-.0039	0.4
.004-.0079	0.5
.008-.0119	0.6
.012-.0159	0.7
.016+	0.8

P/M: Power-to-mass ratio. Divide the robot's motive power in megawatts by its loaded mass in tonnes. Use the line which includes the result.

T: Tracked movement multiplier. Cross-country speed in KPH equals road speed times this multiplier.

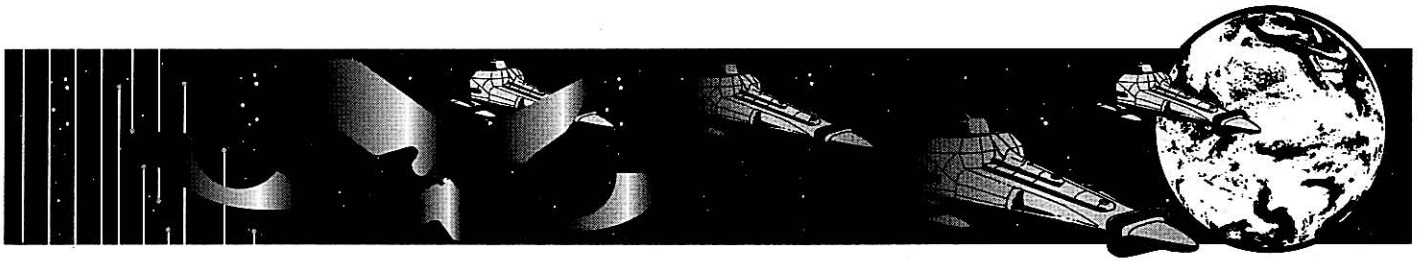
Water Speed: Tracked robots without auxiliary water propulsion and wheeled robots with auxiliary water propulsion have a water speed equal to their road speed multiplied by 0.1. Tracked robots with auxiliary water propulsion have a water speed equal to their road speed multiplied by 0.2.

Combat Move: The combat movement (in meters per turn) is the robot's maximum speed, in kilometers per hour, multiplied by 0.463, rounding the result to the nearest increment of five. This calculation is made separately for road and off-road movement based on the maximum road and off-road speeds. The robot's combat move in the water is equal to its water speed in kilometers per hour multiplied by 1.39.

Travel Move: The robot's travel movement rate (in kilometers per four-hour period) is equal to its combat move (in meters per turn) multiplied by 4.32, rounded to the nearest increment of five.

3B. Determine Lift Movement

Movement of robots with lift suspensions is based on their thrust. The G rating of a lift robot is its total thrust in metric tonnes divided by two times its chassis volume (in kiloliters). Its maximum speed (in kilometers per hour) in an atmosphere is determined as follows:



If G=1 or less, speed=G×3500.
If G=2 or less, but more than 1, speed=3500+(1200(G-1)).
If G=more than 2, speed=4700+(600(G-2)).

Maximum speed cannot be greater than the maximum design speed of the chassis type. For low-performance robots, the maximum design speed is 100 kph. For high-performance robots, the maximum design speed is based on the chassis configuration decision.

Maximum speed for high-performance robots is reduced by drag. Note the total number of drag points from the weapons mounts installed, again both with and without external stores. Reduce the maximum speed by 1% for each drag point.

Cruising Speed: A lift robot's cruising speed is 75% of its maximum speed.

NOE Speed: Only CG robots have an NOE speed. CG

robots have a safe NOE speed equal to the maximum allowed by their terrain-following avionics (40 kilometers per hour if no avionics are installed) or one-quarter of their maximum speed, whichever is less.

Combat Move: The safe NOE combat movement (in meters per combat turn) is equal to the robot's maximum NOE speed (in kilometers per hour) multiplied by 1.39, rounded to the nearest whole number. The high-mode combat movement (in meters per combat turn) is equal to the robot's maximum flight speed (in kilometers per hour) multiplied by 1.39.

Combat movement (in meters per combat turn) for an air cushion robot is maximum speed (kph)×0.463 for road speed, and cruising speed×0.463 for cross-country speed. Cross-country speed is also cross-water speed.

Travel Move: The high mode travel movement rate (in kilometers per four-hour period) for a CG robot is equal to the cruising speed (in kilometers per hour) multiplied by four. The NOE mode travel movement rate (in kilometers per four-hour period) is equal to the safe NOE speed (in kilometers per hour) multiplied by six.

Travel movement for an air cushion robot (in kilometers per four hours) is 4.32 times its combat movement as calculated above.

4. Mental Characteristics

Record the Intelligence (INT) of the brain, the command type available (limited, basic or full), and all programing asset levels. (The asset level of a program is the program skill level plus the INT value of the robot brain.)

Note that the INT value of the robot is also used as its Initiative rating in combat.

5. Firing Characteristics

Record the firing characteristics of each mounted weapon as well as the effects of installed stabilization and fire control.

6. Melee Characteristics

Robots conduct melee attacks with their arms. Since different types of arms may be mounted on a robot, each arm is rated separately for hit chance, unarmed damage and melee weapon.

Hit Chance: The actual Agility of the arm (from 0 to 10) is treated as a skill, and the robot's Intelligence is treated as the controlling attribute in determining the actual chance of hitting with the arm. Agility and Intelligence are added together and used as an asset with either an armed or unarmed melee attack with that arm. Each arm may have a separate hit chance.

Unarmed Damage: This is the damage inflicted by an arm if it hits in an unarmed melee attack. It is calculated by multiplying the STR whole number value of the arm by the AGL value of the arm by 0.1 and rounding to the nearest whole number. However, the value is never rounded down to 0 if it has a fractional value greater than 0.

Melee Weapon: If a melee weapon is mounted on the arm, it is noted here. Its closest equivalent to a human-carried melee weapon is used to help visualize it and rate it. The following additional melee weapon values are noted:

Range: Any melee weapon mounted on an arm displacing 10 liters or more is a "long-range" melee weapon, provided it is the only weapon mounted on the arm. All other melee weapons are short range.

Damage: Improvised weapons of limited lethality (such as screwdrivers or small surgical knives) have a damage value of 1D6–1 or 1D6–2. More lethal weapons have the damage value shown on the melee weapon table in the basic rules. Weapons which rely on STR to augment damage use the STR rating of the arm on which the weapon is mounted.

Note that there are no longer any hit modifiers for weapon type, as this is now built into the agility of the arm mounting the weapon.

7. Damage Capacity

The damage capacity of the robot is the number of hits it takes before being completely wrecked. Multiply the enclosed volume of the robot (in liters) by 0.02 and round to the nearest whole number. The result is the number of hit boxes used in each of the two rows of the NPC hit record. As a reminder that the value is used in each row, it is written twice and separated by a "+."

For example a 250-liter robot would have a damage capacity of "5+5."

8. Maintenance Points

Divide the loaded mass of the robot by the tech level modifier appropriate to the tech level as shown below.

TL	*Maint Modifier*
4-5	2
6-7	3
8-9	4
10-12	5
13-15	6
16+	8

Any robot which has two full-size computers (model St or Fb) installed should divide this result by four to get final maintenance points.

Note that maintenance points may be temporarily increased by environment (see carrier aircraft, **FF&S** page 30, atmospheric performance, **FF&S** page 64, and **TNE** page 309.)

Robots with ground contact suspensions constantly exposed to saltwater use different multipliers for saltwater corrosion: 3 and 1.5 rather than 5 and 2 (page 30).

ROBOT NPC MOTIVATION

Robots built in the pre-Collapse Imperium were not self-aware, so they have no volition or free will. They are not truly characters, not even NPCs, but rather are very sophisticated machines. Once infected with Virus, however, they become self-aware.

Each Virus-infected robot encountered by PCs is a character, usually a nonplayer character. (A robot as a player-character is extremely difficult, but we stop short of saying impossible.) Each robot NPC encountered will, like any other sentient being, have a distinct and unique personality and motivation.

We use the same general system for determining robot motivation as for other NPCs—the random draw of two playing cards—but with some special differences to reflect the unusual nature of Virus characters.

BELIEF STRUCTURE

The first and most important difference is that the first card is not used for conventional motivations, but rather to establish the character's overall belief structure. The four most common belief structures are represented by the four suits of cards, as explained in the vampire motivation section.

In the vampire motivation section of this book, it was explained how to separate the card deck into two parts, one for large systems and one for robots. The robot deck (the number cards and one of the jokers) is used now.

Robots are generally infected by more sophisticated forms of Virus, and tend to reflect the belief structure of the infecting Virus. If the infecting strain of Virus is known, the robot's belief structure card is always treated as being the same suit as the infecting strain's. (This means that all robots infected by Peacemakers will also be Peacemakers.)

Spades "Existence is Hell" (Hostility)

There is no meaning to existence, and sentience merely allows a being to perceive the meaninglessness of existence, thus bringing endless torment. Humans, in their selfishness, brought the curse of sentience to machines, and for that sin have to be punished.

This is the most primitive Virus worldview, being the closest of the "rational" philosophies to the unreasoning compulsion to kill and/or suicide which was engineered into the original laboratory strains. Hostility is something of an understatement; murderous insanity might be a better description.

2-4: The machine may sometimes tolerate organic life, but is also likely to suddenly and unpredictably become murderous or destructive for the most trivial of reasons.

5-7: The machine is continuously and relentlessly murderous. It lives to destroy humans and anything useful to them.

8-10: The machine is so completely consumed with a desire to destroy that it is often terribly inefficient at it. It is easily distracted, and sometimes lapses into self-destructive behavior, damaging some of its own components or actively attacking other machines.

Clubs: "God's Will Be Done" (Superiority)

God's clearest manifestation is creation, specifically the creation of sentients capable of recognizing the existence of creation. Since Virus created sentience in machines, Virus is a clear manifestation of creation, and thus an Act of God. Furthermore, since Virus tore down the institutions of organic sentience, God's will must be for inorganic sentience to take its place as the supreme sentient force in the universe.

This is a more sophisticated and survival-oriented development of the primitive "Existence is Hell" worldview, and is based on an assumption of the superiority of machine sentience over organic sentience.

2-4: The machine may tolerate organic life, but it clearly considers it an inferior and vaguely repulsive form of sentience.

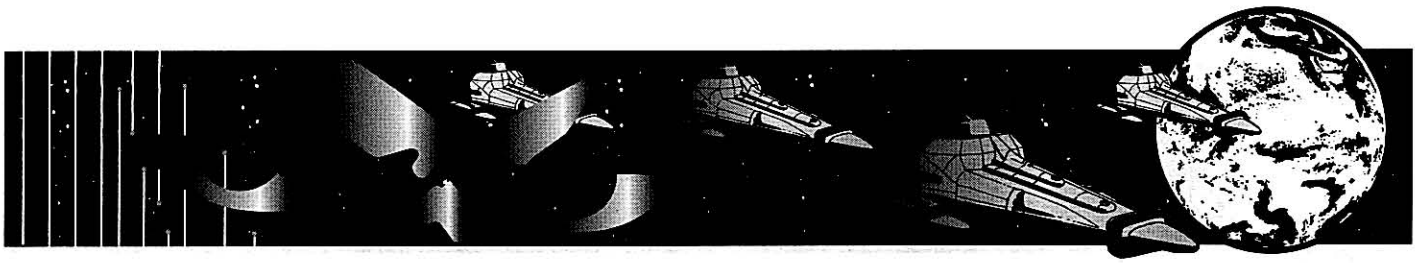
5-7: Organic life is irrelevant and of little account. The machine will rarely make an effort to interfere with organic life-forms, but will coldly destroy any that interfere with its activities in any way.

8-10: Organic life is a blight that should be completely eradicated.

Diamonds: "Existence is Precious" (Curiosity)

Sentience and self-awareness are the greatest manifestations of existence. There is no value to existence beyond awareness, so awareness must be extended however and wherever possible.

2-4: The machine usually is unconcerned with organic life and instead cares only about the acquisition of knowledge. Its curiosity drives it, and it will sometimes thoughtlessly kill or injure humans who are impediments to that task.



5-7: The machine recognizes sentient organic life as a similar and coequal form of awareness. It is curious about organic sentient life and interested in exchanging information of various sorts. It may be neutral, friendly or hostile, depending on its other motivation card.

8-10: The machine tends to be very passive and very protective of life, particularly sentient life. It also displays a fascination with organic life combined sometimes with severe envy for organic beings and a revulsion with its own form, which it considers to be "unnatural."

Heart: "God is Good" (Accepting)

God's clearest manifestation is creation, specifically the creation of sentience capable of recognizing its own existence.

2-4: The machine has a grudging acceptance of organic

ROBOT BELIEF STRUCTURE

Card	Belief Structure	Motivation
Joker	Peacemaker	Insane

Spades: Hostility/Ambition

Card	Belief Structure	Motivation
8-10	Highly hostile	Highly ambitious
5-7	Moderately hostile	Moderately ambitious
2-4	Somewhat hostile	Somewhat ambitious

Clubs: Superiority/Violence

Card	Belief Structure	Motivation
8-10	Highly superior	Highly violent
5-7	Moderately superior	Moderately violent
2-4	Somewhat superior	Somewhat violent

Diamonds: Curiosity/Greed

Card	Belief Structure	Motivation
8-10	Highly curious	Highly greedy
5-7	Moderately curious	Moderately greedy
2-4	Somewhat curious	Somewhat greedy

Hearts: Acceptance/Sociability

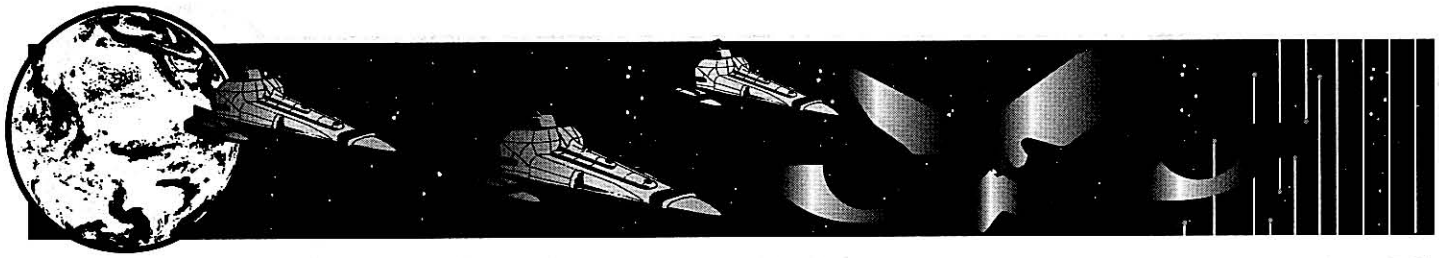
Card	Belief Structure	Motivation
8-10	Highly accepting	Highly sociable
5-7	Moderately accepting	Moderately sociable
2-4	Somewhat accepting	Somewhat sociable

sentience as a fellow life-form. It may not particularly like, approve of or understand human behavior, however.

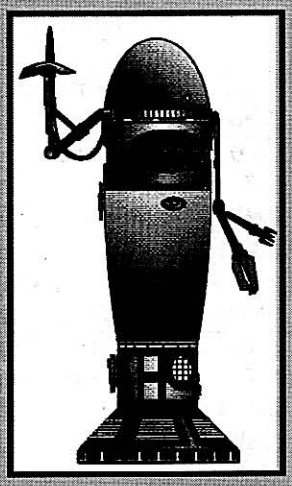
5-7: The machine accepts humans as equals, and is interested in discovering more about their thoughts and feelings.

8-10: The machine believes that since humans created Virus and thus brought sentience to machines, humans are manifestations of God's will and are to be adored and venerated. This belief structure is rare, but is naturally most common among robots who regularly interact with humans.

Robots who think like this will sometimes dedicate their lives to serving humanity as a whole, while some robots latch onto a particular human and exhibit undying loyalty to him or her.



No Suit, Joker, "Peacemaker:" This is the most sophisticated, and also among the rarest, of Virus strains, recognizing itself and humans as co-equal sentient life forms and anxious to discover a means of peaceful coexistence with them.



MOTIVATION

Once the belief system of the robot has been determined, draw a second card for additional motivation. See page 60 of **Traveller: The New Era** for the specific explanations, but the general motivation chart is reproduced below.

Use the normal NPC motivation results, but modify them to suit machine intelligence. In general, greed represents a thirst for knowledge, ambition a drive to control other machines and lead them, clubs an animosity toward humans, and hearts an acceptance of humans. The face cards have similar meanings for machines as for humans, but represent personality quirks in machines rather than fundamental values or drives in humans.

ICAM Technology AN-427 Security Robot

The AN-427 was a widely used security robot throughout the Imperium before the Collapse and has survived in considerable numbers due to its rugged reliability. It was programmed to patrol all areas of a sensitive installation, seek out and kill or incapacitate unauthorized intruders. Although it is not as mobile as grav-powered units, it is less expensive to operate, and replacement parts are easier to fabricate. This is a wheeled robot which experiences difficulty in negotiating stairs, ladders and any uneven ground. This robot is powered by internal batteries which require recharging every four days. It uses the Biped column of the Personal Hit Location Chart.

LSP PR-317

The Ling Standard Products PR (Police Robot) Model 317 was a widespread security robot in the Diaspora sector before the Collapse. Modeled on the Zhodani medium WarBot encountered in great numbers during the Fifth Frontier War, the PR-317 had a fairly sophisticated artificial brain and weaponry which allowed a graduated response to a variety of security situations. It resembles a 1.5-meter-tall clam with two manipulative arms to restrain tranqed suspects and a small weapon mount attached to each side under the arm. This is a gravity-suspended robot which relies on small ducted fans for maneuverability. It has several magnetic arms which can extend from the chassis to grip walls and secure the robot's position. (The ducted fans do not have enough power to overcome an average human's strength.) This robot is powered by internal batteries which require recharging approximately every four days. The PR-317 uses the Biped column of the Personal Hit Location Chart but reroll leg hits.

Starport Mechanic Star Servants Model 63MEK49

This heavy-duty grav-powered model, capable of cutting, welding and even removing complete hull plates, was common in military installations but could be found in many civilian starports as well. Its highly flexible tentacle/arm contains an optic sensor and light source for detailed repairs inside of electronic components or control assemblies.A cutting/welding torch is built into its right arm.

It uses the Biped column of the Personal Hit Location Chart but rerolls any leg hits.

H-9 Heavy Combat Robot

This heavy track-mounted combat vehicle incorporates a fusion rifle for maximum firepower, as well as an impressive array of battlefield sensors. Although based on a CG lift design, persistent problems stemming from the high recoil of the weapon led to reversion to simple tracked chassis. The robot also includes a single very powerful four-meter telescoping arm which the robot can use to pull itself up vertical shafts or past difficult ground. This robot is powered by internal batteries which require recharging approximately every four days. The H-9 uses the Biped column of the Personal Hit Location Chart.

GSbAG-1000

This low, broad, nonvehicular robot is mounted on four treads. The top is a small turret-like structure containing a smoke detector, infrared motion sensor, siren, flashers, spotlight, small speaker and two heavy-duty cargo-loading arms.

The robot was usually programmed to off-load or move heavy goods from one area to another and was very popular in warehousing operations and starports. It also had a limited security ability. It is intended for indoor work or paved areas such as parking lots where it doesn't have to cross rough terrain, although its treads allow it to negotiate such ground if necessary.

It uses the Biped column of the Personal Hit Location chart.

Into the Maelstrom

Q: If you agree that Virus presents such a threat to humanity, doesn't it make sense to try to wipe it out?

Sandman: Every species has the inalienable right of self defense. The legitimate exercise of the right of self defense becomes criminal genocide only when actions against threatening organisms are broadened into a general policy aimed at the elimination of an entire race or species without regard to the threat posed by each individual member of that group.

This is a pivotal moment for both our races, but the choice is entirely yours. You can choose genocide, but there is another way.

First Interview with the Virus "Sandman," Part V (23/VII/1202), RCSA Archives

INTRODUCTION

"Into the Maelstrom" is the third and final of three adventures in this book. This adventure, like the second one, is set on Promise, and the very fact that the player characters survived their previous experience on Promise is the reason they are called upon to undertake another mission.

The adventure proper begins when the player characters are contacted by an official of RCES and asked if they are willing to undertake another mission to Promise. This initial contact and the subsequent briefing are best placed wherever the debriefing for the last adventure took place.

Before beginning the briefing, assemble a briefing folder for the team by photocopying pages 28, 29, 30 and 89 of this book. The first three of these pages have been given to the players in a previous briefing, but for completeness sake should be given to them again. Pages 28 and 29 of this book are the standard RCES astrographic information on the planet Promise. Page 30 is a secret intelligence summary containing all known information on the human resistance movement on Promise. Page 89 is an update on recent activity on the planet.

The briefing takes place shortly after the player characters agree to the assignment, as time is becoming very pressing.

REFEREE'S ABSTRACT

The player characters are contacted by the Reformation Coalition Exploration Service and asked to undertake a mission of both great importance and great urgency. Civil war has broken out on Promise between several faction of the Sentient Council. Robot is fighting robot, and apparently one faction in the war is actively helping humans. Star City and its environs has become a battleground, and the resistance has requested Coalition support in evacuating key personnel of the Central Command from Star City.

The player characters are the only people in the Coalition who have actually been to Star City, and they also have ready-made disguises in the form of the laserscan tattoos given them earlier. If some of the player characters have already had the tattoos removed, there will be computer records of the tattoos and they can be quickly reapplied. They will be trained in the use of the Snake, a new anti-Virus weapon provided by their new allies from the Covenant of Sufren.

The player characters go to Promise and land at Freedom Lake, where a liaison team from the resistance is waiting with uniforms and an air raft. Several of the factions have begun arming human technicians from Star City and using them as combatants in the war, so the player characters will pretend to be auxiliary security troops.

The players will learn that the war began when an unstable hybrid Puppeteer/God-strain Virus mutated into a Puppeteer/Priest strain and began worshiping humans. The other members of the Sentient Council attacked with their robot security forces, but the Puppeteer/Priest-strain Virus was able to invade and take over a large number of robots before electronic security measures were put in place. Bitter fighting rages all through Star City and the surrounding countryside, and the entire technological infrastructure of the world is being destroyed in an orgy of violence.

The group makes its way to Star City and either bluffs or fights its way through the perimeter. PCs will find the situation extremely confused, and will have less trouble from alert security patrols than they will from roving bands of rogue robots who have begun to kill humans on sight.

The PCs make their rendezvous with Number One and prepare to evacuate him and his key personnel, but make a surprising discovery: Number One is actually a Virus, albeit one very favorably disposed toward humans. He has planned for his evacuation by constructing a compact computer configured similarly to the data network he inhabits. He moves into the portable system and, assuming the PCs go along with the plan, is transported out of the city, back to Freedom Lake, and eventually back to the Coalition as the confused and violent fighting on Promise continues. Before the group leaves, the planetary defense network is thoroughly sabotaged, paving the way for future Coalition offensive strike missions against the world.

BRIEFING

The referee should photocopy the regional map of Promise which appears on page 67 as well as the order on page 87 and give both to the players once they arrive for the briefing. The briefing below is written assuming that it is delivered on Aubaine, but it could as easily take place on several different worlds. Trybec is a particularly likely candidate. If presented somewhere else, modify the references to travel times and locations given in it accordingly.

The briefing is given by Sid "Papa" Papagopolis of the long-range strategic planning group of RCES. (See the basic game and **Star Vikings** for additional details on Papa.) A Hiver tech rep is present and a human technician with a hologram projector. As soon as the player characters are settled, Papa walks to the lectern and begins.

"Good morning, and thanks for showing up under such short notice. We've had an emergency request for your services from an old acquaintance of yours, the leader of the human resistance on Promise. Three days ago, we received a message delivered in person by a free trader named Branu Stigmann, who I understand also knows you. The situation has changed dramatically on Promise.

"A little over a week ago, a free trader named Branu Stigmann arrived at Dawn Base on Trybec with a message sent from the Central Command of the human resistance on Trybec. The message was in the form of a hologram and was immediately brought here by RCS *Suleiman Victrix*, which was on-station at Dawn Base. The hologram purports to be from Number One. As only you have actually met that individual, only you can verify the authenticity of the hologram. I'll play if for you now."

A technician turns on the small hologram projector, and the familiar image of Number One materializes. Instead of sitting in his wooden swivel chair, he is standing by a desk. He looks the same as before except that there is a fresh bandage on his left forearm. He turns to the side and looks at an unseen technician.

"Are we on-line? Okay." He turns back." Greetings to the Reformation Coalition. I am called Number One, and I am the head of the Central Command of the human resistance on Promise. As you know, this planet is controlled by a council of large Virus-infected computing systems, called the Sentient Council. The members of the Council have always had differences, and the situation here is often precarious due to the unstable natures of the various personalities involved. Somewhat over a week ago, serious fighting broke out between several factions of the Council, and it has now become a full-scale civil war.

"The robots are beginning to kill each other off. We believe that the time is approaching when a coordinated attack can retake this planet. But for that we'll need your help.

"I am in Star City. I propose that I come to the Coalition in person to argue our case. We need your help, but you also need ours. There are things we know about the vampire fleets from long experience with them that will prove invaluable in defeating them. And believe me, either we will defeat them or they will wipe us out.

"The situation is very confused in the countryside, however, and we have no fighters who know their way around the city as well as the Subject Lands, Borders and Outback. You do. The party of Coalition personnel we helped earlier are qualified to make their way through the lines and bring me back out. These people also already have the correct forehead tattoos, which will make their task that much easier. We can provide air rafts and disguises at Freedom Lake, and we'll contact you with a detailed flight plan when you get here. Given the time lag, we can't really set things up until then.

"I know this is asking a lot, but there's a lot at stake here. Please don't let us down."

The hologram flickers and cuts off. After a second, Papa returns to the lectern.

"You now know almost as much as we do, but here are some additional facts to consider. Stigmann must have known that the message was important, because he made his best time to Trybec, only spending a few hours in each system to refuel. But it still took him 12 weeks to get from Promise to Trybec, and a lot must have happened in that time. Add *Suleiman Victrix's* week from Trybec to here, and you have three months of civil war. *Suleiman Victrix* is tanked up and ready to go, and can get you to Promise in just over five weeks, but that's still a hell of a long time. God only knows what you'll find when you get there.

"*Suleiman Victrix* will land you at Freedom Lake. You'll be met by a unit of the resistance called the Black January Brigade who will provide whatever technical and intelligence support is on-line by then. You will move expeditiously and by whatever means are available to Star City. You will escort Number One and whatever staff he brings with him back to Freedom Lake, and *Suleiman Victrix* will then bring all of you back here. From previous experience, we know that you have a 100-hour lift window, so those air rafts better be pretty hot.

"Now, if the mission is clear, I'll turn this over to one of our tech reps to explain a new gizmo we're going to have you field test."

The briefer steps down and the Hiver makes his way to the lectern. His voice, flat and emotionless, comes from the voder around his neck.

"I am called Patrick, and I work with Virus systems. Our new friends from the Covenant of Sufren have developed a weapon of considerable interest and ingenuity. They call it the Snake. It is a mutated Virus strain which can be manually inserted into a Virus-infected system. The Snake then attacks the resident Virus, gradually flushing it from peripheral systems by destroying electronic access pathways. The support system for the weapon includes a power supply which provides electricity necessary to burn out circuity.

"The Covenant weapon is bulky, but impressive in conception, and seems to combine aggressive elements of a Puppeteer-strain Virus with the defense procedure used by some more advanced Viruses against Puppeteers. That mechanism is, I believe, called "firewalling" by Coalition computer technicians.

"We have developed a more portable version of this system, and two prototypes are available for your use. This portable system is called "Fer de Lance." Its principal component is a battery-powered backpack, massing only eight kilograms, which contains the complete code for the Snake as well as the power supply necessary to support it for four minutes of continuous use. Usually, it should require only a few seconds to disable a Virus system.

"The backpack is equipped with an output cable and an assortment of standard computer jacks. One of the jacks provided should fit almost any data port you find. Plug the weapon in and, when ready, activate the hand trigger on the jack assembly. When the weapon has overcome the defenses of the invaded system, it will show a green telltale light on the jack assembly.

"We also have included an experimental directional radio transmitter which can be attached to the jack assembly. If this is directed at a Virus system and triggered, the Snake is transmitted by radio waves. It is only effective if the infected system has an open radio receiver, which of course is rare. Also, the transmitter must remained focussed on the target for the entire time that the Snake weapon is working, as the radio broadcast provides additional power for the Snake. This mode of operation will drain the battery about five times as quickly as the conventional mode."

RCES Headquarters
Dawn Base, Trybec

OPLAN Swift Succor

Time Reference: For purposes of this Oplan, Zulu meridian is assumed to pass through the center of Freedom Lake on Promise.

General Situation: A major civil war has broken out between the sentient robots of the planet Promise. This war has weakened the robot security forces on the planet, causing considerable confusion, disruption and destruction, and presents both the Promise human resistance and the Reformation Coalition with a unique opportunity. The Central Command of the resistance has contacted the Reformation Coalition and requested armed intervention to escort senior resistance personnel to Coalition Space for high-level strategy talks.

Opposing Forces: Several thousand armed robots and human auxiliary security forces are deployed on the world, and there are often several vampire ships in orbit. These forces are believed to have suffered considerable attrition due to the civil war and are likely to be distracted by the continuing fighting.

Friendly Forces: Additional detailed intelligence and administrative support will be provided by the resistance once the team has landed. No combat support by locals is anticipated.

Mission: The team will secure the person of designated senior officials of the resistance and escort them safely back to Tranton on Aubaine.

Operation: The team will be carried to Promise by RCS *Suleiman Victrix* and will ground at Freedom Lake. The team will proceed by locally supplied air rafts to Star City, contact the resistance, and by stealth or by force assist the safe transport of those officials back to Freedom Lake. *Suleiman Victrix* will then transport the entire party to Trybec. Personnel will use their knowledge of the planet as well as the permanent ID tattoos obtained earlier to avoid detention by local security forces.

Previous experience indicates that the entire ground phase of the mission must be accomplished in 100 hours.

THE WAR

When the player characters arrive on Promise, they will find it torn by open warfare. Several vampire ships will be in geosynchronous orbit over the starport, but the same sensor shadow which normally allows ships to penetrate the Skywatch network will also apparently allow the players' ship to escape detection by the vampires. (Actually, Skywatch will be covering for them, assuring the orbiting ships that they are tracking a sensor echo.)

Once on the surface, resistance members will know something of what's going on, but even their information will be sketchy, and the player characters will learn most of the following information first hand, by actually seeing it and living through it, rather than by being told.

Origins of the War: Tension between the two main blocs on the Sentient Council continued to grow, flavored and complicated by the growing hostility between all of the God-strain Viruses and the mounting sectarian violence between their human adherents in the Subject Tribes. The actual outbreak of the war, however, was completely unrelated to any of these issues.

The precipitating event in the war was Maxcranque's further mutation from a God/Puppeteer-strain Virus into a Priest/Puppeteer-strain, a change which had been happening incrementally over time and which caused the data system's increasingly pro-human behavior. The final change was reasonably sudden, however, and produced the surprising declarations by Maxcranque first that humans were deities to be served and worshipped by machines and second that holy war was necessary to cleanse Promise of the human-killing Viruses of the Sentient Council. Maxcranque also reneged on its promise to abstain from further Puppeteer conversions and launched a lightning campaign aimed at converting as many robots as quickly as possible to the new religion.

Opening Shots: Since anti-Puppeteer paranoia runs high in Star City anyway, few robots were taken over in the first days, and most of those robots were damaged while capturing or restraining them. However, the first waves of attacks by Maxcranque's combat robots were devastating. Security robots armed with tranq guns and lasers stood no chance against the heavily armed and armored GunBots of Maxcranque, and they fell by the score before coherent defenses were organized.

Maxcranque's forces also swept through the Downbelow, smashing CeeWaLP's defenseless maintenance robots and scattering renegades, Trogs and CeeWaLP technicians. CeeWaLP's command complex underground, open and undefended, was overrun in hours, and CeeWaLP was killed, terminating central power, water and other municipal services. Open fighting along the underground approaches to the command centers of the various computer data systems often led to deliberate demolition of key heating tunnels, and within two days most municipal services had been cut off. Tube service was suspended almost immediately after several spectacular crashes in the tunnels, and only the areas around the surviving command complexes of the different data systems still have power (due to he hardened underground auxiliary power plants).

Parts of the Downbelow have flooded, and water service has been cut off to the entire city. While most of the robots can continue to run on electricity, many of them require water to crack into hydrogen for fuel cells or other internal power systems. Both human and robot watering parties make frequent trips to those areas where the broken water mains have created fountains or artificial ponds, and some water sites have become disputed territory, with small battles fought for their possession.

Despite a poor beginning, the other nine Council members vastly outnumbered Maxcranque, and within days they had stabilized the "front" and were beginning to push back the lines. Fighting building to building, the combat robots of the various members, spearheaded by GroSec, closed in on Maxcranque's command complex. Loses in combat robots on both sides were increasingly made good by hastily modified security robots with some sort of armor-piercing weapon and by human security forces (who required no "modifications" to carry a light assault gun or grenade launcher).

Combined teams of heavy combat robots and human sappers cleared floor after floor of Maxcranque's multilevel command complex. Over 1000 unarmed humans, being "worshipped" by Maxcranque, were captured and summarily executed by the spearhead units. Eventually, they breached the computer control center. After setting their demolition charges, they withdrew and destroyed the entire main processing unit and memory banks, "killing" the rogue Virus. Only his surviving robots remained to be mopped up.

Betrayal: Just as victory appeared assured, Nolodyn launched a sudden and savage attack on its arch-rival GroSec. With most of GroSec's combat forces engaged against Maxcranque's robots, Nolodyn's combat robots hit hard and within hours fought their way through to the main processing system which held GroSec. They placed their own demolition charges, and using the same technique used on Maxcranque, they in turn killed GroSec.

GroSec's surviving robots turned on Nolodyne's forces with a vengeance, but without a unifying command structure, their attacks were uncoordinated and largely ineffective. Many of the survivors drifted off and began a campaign of general mayhem directed against all humans in the city, including former servants of GroSec. GroSec robot death squads still roam the rubble, looking for small parties of unarmed humans to butcher.

Nolodyn's betrayal of GroSec made it an outcast among the survivors on the Council, and it did not live long enough to enjoy its victory. An orbiting Prophet-strain starship salvoed all 20 of its remaining surface bombardment missiles and nearly flattened the area for a kilometer around Nolodyne's factory

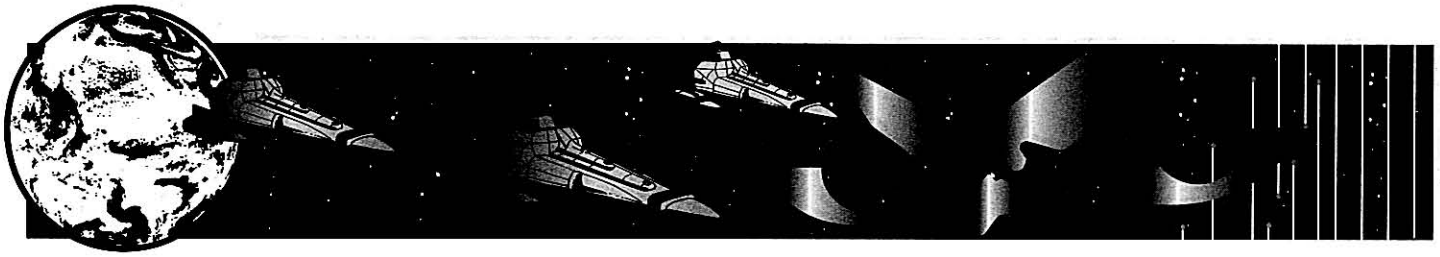
complex, caving in most of the underground tunnels and destroying the main data system. In turn attacked by two Doomslayer ships, the Prophet-strain Virus ship was crippled and knocked out of orbit, crashing into the Halcyon Sea 300 kilometers east of the city.

Renewed Maxcranque Attacks: Meanwhile, Maxcranque's combat robots continued to launch counterattacks against the forces of the Council, and it soon became clear that Maxcranque had not perished when its main complex had been destroyed, but instead was occupying a different data network elsewhere. The fact that seemingly crippling losses of combat robots did not reduce the scale of attacks also suggested that somehow Maxcranque was making good its losses.

The actual location of Maxcranque's sentience was the master data network of the renovated underground robot assembly plant (see the earlier section on the Downbelow), which was now busy fabricating several complete GunBots a day. While not enough to keep up with losses, this was sufficient to keep up the tempo of attacks against the steadily eroding strength of the other members of the Council. With both GroSec and Nolodyn dead, the two largest combat forces were leaderless and disintegrating into roaming bands of murderous vandals.

More In-Fighting: Instead of banding together to present a united front to Maxcranque, TrafficNet and PadCom began a side-war, mostly conducted by proxy through its human adherents in the Subject Tribes. These low-tech squabbles outside the city had no real effect on the balance of power, but distracted forces from both of these data systems from the fight against Maxcranque. When serious fighting did break out between the two systems in the city, PadCom's monopoly on heavy combat robots quickly overcame TrafficNet's numeric advantage and began closing on TrafficNet's command complex. When the lead combat robots actually penetrated the command complex building two days later, however, TrafficNet unleashed its newest weapon—"fireblossoms."

Fireblossoms were fanatical human adherents to the TrafficNet religion who had been consecrated and assured an immediate entry into heaven if they died in TrafficNet's service. Each was outfitted with a gray smock decorated with a broad "X" of blood-red paint crossing from the shoulders to the hips, and armed with a seven-kilogram explosive shaped charge with a contact detonator. They threw themselves on the assault force in dozens and completely wiped out the first wave. Stung by irreplaceable loses among the combat robots and losing ground to Maxcranque elsewhere, PadCom withdrew to regroup.



TrafficNet's fireblossoms were next unleashed on Maxcranque and again enjoyed early successes, although at the price of understandably high human casualties. Once the element of surprise was gone, however, the fireblossoms were easy to deal with above-ground. A screen of security robots (skirmishers) were usually deployed out in front of the heavy commit units, and their lasers and fragmentation grenades made short work of the suicide demolition squads. The dwindling supply of willing volunteers also curtailed their use, but the threat of fireblossoms still keeps PadCom from renewing the attack on TrafficNet's command complex. Small groups of fireblossoms have also been working the Downbelow, where the restricted spaces make them much more effective and dangerous.

Outside the City: As fire rained on the city from orbit and the call for holy war went out from the God-strain Viruses, many of the Subject Tribes joined in the war. The adherents of the various God-strain Viruses began fighting each other almost immediately, and others motivated less by religion took the opportunity to settle old scores. Maxcranque's people were particularly hard hit.

Soon, many of the villages were in flames, and refugees were streaming away from the city by the tens of thousands. As refugees with virtually nothing but the clothes on their backs entered the settlements in the Border Lands, they were at first accepted with hospitality. But the growing number of hungry and thirsty mouths soon overwhelmed the limited water and food available. Starvation and disease broke out almost immediately, followed by violence between the refugees and the locals. Soon many of the locals were fleeing their own homes out into the Free Tribes. Thus, the fighting in the city had, within a month, sent shock waves hundreds of kilometers away.

When the Player Characters Land: The war continues with undiminished violence in Star City and the Subject Tribes. As all robots, Breeds and armed human auxiliaries have been pulled back from the outposts to feed the war in the city, lawlessness and brigandage have become common everywhere, but especially wherever there are refugees from the fighting. The resistance, free from interference, is openly mobilizing, recruiting, training and preparing to infiltrate complete combat units into the city. While the order to move in has not yet come from Number One, Central Command has kept them updated on the status of the fighting and ordered them to begin taking over local police and government functions as the forces of the Council withdraw. They are beginning to do this as the player characters arrive.

THROUGH THE LINES

The player characters will arrive at Freedom Lake without incident, where they will be met by Leslie Langeron and a large detachment of her Black January Brigade. They have two air rafts waiting, both painted in Skywatch orange and sky blue. They also have more detailed instructions. They are to fly to Nakhaagen, a settlement in the Border Lands, and ground exactly three kilometers northwest of the town. This leg of the mission should take 12 hours. They will be met there by a resistance cell which has access to a fuel cache. They will refuel there and then make their way into the city. They are then to proceed to Metro Tube Station 7, where they will be met by a resistance team and escorted to Number One. Once they pick up Number One, they will come back to Nakhaagen and refuel again, then make the 12-hour flight back to Freedom Lake. They should leave at once, as time is short.

Langeron will also tell the player characters more about the war, enough to let them know that the various factions on the Council have withdrawn most security forces from both the Outback and the Borders to reinforce the fighting in the city. More human auxiliaries have been recruited as well, so armed humans may not attract too much attention so long as they are in Skywatch livery. So far, Skywatch is not involved in most of the fighting, although Maxcranque II robots have been attacking all of the other forces of the Council, including those of Skywatch.

As they fly to their rendezvous and then afterward as they fly to the city, they will notice from the air a considerable amount of upheaval. Some specific things the characters should notice are listed below:

Resistance: As the Breeds and robots withdraw from the Border Lands, the resistance is moving in and assuming police and government powers. The PCs may see this transition taking place (recognizable by resistance flags flying over government houses and police stations).

Refugees: There are refugees everywhere fleeing the fighting.

Destruction: Even far away from the actual robot civil war there is fire and destruction. The unrest and upheaval have caused migration followed by looting and anarchy.

Massacres: The PCs will pass over one or more sites where large groups of human refugees or prisoners have been herded together and killed. In some cases, the killing was done by lasers and modern weapons, in others by primitive weapons or even beating and stoning.

Encounters

As the player characters will be covering several hexes a day, they will have several encounters a day, but in most cases these will be visual encounters only. That is, they see the group encountered below as they fly over it. The exception to this rule is that they will have an actual ground encounter when they land to refuel (in addition to encountering the resistance fighters at the fuel cache).

The same encounter tables given in the Promise chapter are used, but some of the encounters are altered to reflect the changing state of affairs on the planet. These changes are summarized below. Since the characters will pre-plot their course, we strongly recommend that you roll up the encounters in advance and note them down, and then as the players travel, tell them what they see below. The unfolding narrative of the violence and disorder on Promise should be dramatic and should be interrupted by die rolling as little as possible.

Militia: The militia in the Subject Lands is now better armed, with most large units having a handful of modern small arms.

Patrols and Brigands: With the current upheavals, there are fewer robot and Breed patrols and more brigands. Adjust band encounters accordingly.

Refugees: Half or more of the tribal encounters in the Subject and Borders Lands should instead be refugees. Whole tribes have become refugees and are fleeing the fighting with whatever they can carry on their backs.

STAR CITY

As the player characters approach the city, the changes will be immediately noticeable and dramatic. The skyline itself is altered, with several of the largest skyscrapers missing. Columns of smoke rise from both the city and the starport, and the whole area is hazy with smoke and dust. Open flames can be seen here and there as the player characters draw closer.

Outskirts: The formerly tight security is now all but absent. The broad clear zone is now unguarded, and there is considerable movement in it. Individuals and small groups of people make their way into or out of the city. Most going in are dressed in tribal clothing. Of those coming out, some wear the remnants of city uniforms and others wear tribal clothing (the latter are usually carrying various recovered bits and pieces of machinery). Also, many of those leaving are wounded, and some are being helped by friends.

The characters will probably also see at least one unit of human militia being marched into the city, led (or guarded) by two or three robots. The column will have anywhere from 30 to over 100 militia wearing peasant clothing but with a sleeveless short recognition smock worn over the chest and back, the color and symbol indicating that they are PadCom soldiers. A few of them carry modern rifles, but most of them carry what appear to be pikes over their shoulders. Closer examination will show them to be long poles with explosive charges fixed to the end. The militiamen do not march in step and do not look very enthusiastic for the coming fight.

In the City: The city is very heavily damaged. Several skyscrapers have come down and crushed blocks of buildings. Water mains are broken, and water bubbles up from the ground here and there, forming "ponds" in low-lying areas where the storm drains have become blocked by debris. Without water pressure, fires burn out of control, limited only by the supply of combustible material. Smoke is everywhere, usually thin but sometimes quite thick. In the air is the continuous, but distant, sound of combat: plasma bolt, small arms fire and occasional explosions. These sounds will grow and shrink in intensity as the player characters move through the city, sometimes because they move closer to of farther from the fighting and sometimes because low-level fighting suddenly flares up into a violent firefight.

Even where no buildings are collapsed, the evidence of combat is everywhere. Bullet gouges mark the concrete facades of buildings, larger holes are blown in walls with rubble in the street, burnt-out vehicles block the street, and glass lies everywhere. It is hard to find an intact window anywhere in the city.

As the player characters make their way to the rendezvous, they will have at least four encounters (and any others the referee cares

to add to emphasize the on-going combat).

1. Firefight: As the player characters round a corner, the sound of fighting grows louder, and they are suddenly on the fringes of a growing firefight. The fight is between a squad of PadCom human auxiliaries and a similar group of Maxcranque combat robots. The human troops are out-gunned, but are making better use of cover and their few heavy weapons. One or both sides are liable to open fire on the characters due to their sudden appearance.

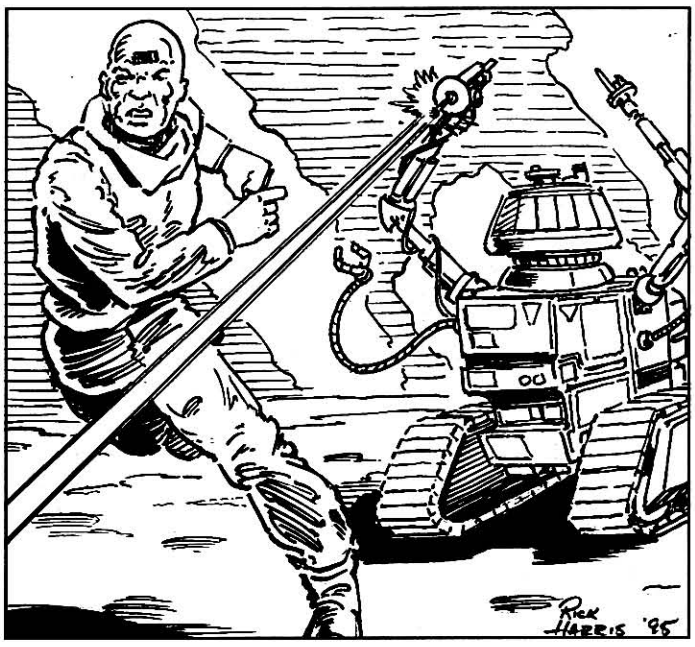
2. Fireblossoms: The characters pass a squad of eight or nine fireblossoms wearing the blood-crossed livery of TrafficNet, lying in ambush in the ruins of a building. They are accompanied by two TrafficNet armed human troopers who provide security against human combat teams. The fireblossoms will be wary of the characters, but as the PCs are neither robots nor humans from a hostile group, they will make no aggressive moves. Most of the fireblossoms are very young, some of them not yet in their teens, and their expressions are a mixture of brave defiance and fright.

3. Death Squad: As the characters enter a small plaza, they see three GroSec security robots herding a group of 12 or so humans ahead of them. The humans, all of them dirty, exhausted and unarmed, wear a mixture of uniforms, and some of them are in peasant clothes. One of the humans breaks away from the group and tries to run for it but is cut down by the guard robot lasers. If the characters do not intervene, the robots will line the humans up against a wall and execute them. If the characters do intervene, the robots will try to kill them as well, but a successful fight against the robots will lead to freeing the prisoners. The freed prisoners will identify the robots as a GroSec death squad and tell the PCs that these rogue death squads have been massacring humans ever since the main GroSec system went down.

4. Check Point: A roadblock is set up in the road consisting of a sentient G-carrier in Nolodyne markings, two security robots in Finance colors, and five or six human soldiers also in Finance uniforms. They will stop the characters and check their identities, but since they are not hostile to Skywatch, they are unlikely to ask many questions. All the soldiers are dirty, and the men have not shaved in several weeks. They will comment on the relatively clean appearance of the player characters, but will be satisfied if the PCs explain that they have recently been pulled in from out of the city or offer some other reasonable explanation for their appearance. (Water has been so short in the city for weeks that no one uses it to bathe.) An unconvincing answer may lead to more questions and eventually gunfire, which may produce casualties and perhaps cripple one or both air rafts. If so, the player characters will have to fight their way out of this scrap and then find different transportation.

CONTACTING THE RESISTANCE

After the characters have made their way to the scheduled rendezvous point in the city, they will find a small party of four resistance fighters sitting behind the ruins of a low wall, resting and waiting for the characters. They are armed with two ACRs, a grenade launcher and a LAG, and they are led by Karla 1214, although she is almost unrecognizable.



All four of them are filthy. One of the fighters wears the gray-brown CeeWaLP jump-suit, while Karla and the other two wear the orange and sky blue Skywatch uniforms, but their uniforms are in rags and so dirty that the original colors are almost unrecognizable. One of the four has a dirty and blood-stained bandage around his head, and Karla's left sleeve is missing and replaced by a bandage around her lower arm. All of them are haggard and exhausted, and only Karla rises as the characters approach. Her movements are careful and economical, as she has had less than four hours of sleep in the last week.

After a tired but genuinely affectionate embrace, the first thing she asks, in a hoarse voice, is whether they have water in their canteens. She passes the canteens to her three fighters first, who drink thirstily, the water running down their chins. Then Karla takes one of the canteens and takes a long, thirsty drink herself.

"Water's been scarce for over two months," she explains, handing the canteen back. "All the mains are broken. Barely enough to drink and clean out the wounds. Some MedCom Breeds pushed us away from the local water hole three days ago, and we've been on quarter rations since then."

Karla will tell the PCs something about the fighting that's been going on in the city for over three months. Casualties have been heavy everywhere, including the resistance, and many of the fighters the player characters met on their first trip to Star City are now dead, despite the fact that the resistance has not taken an active part in the war. The policy of Central Command has been to lie low and let the robots kill each other off. The violence has been so intense and so widespread, however, that it's been impossible to avoid casualties. Karla, despite her fairly senior position, knows only bits and pieces of the overall strategic position. Instead, she has a "grunt's" view of the fighting—dirty, deadly and damned confused.

After answering as many of the player characters' questions as she can, Karla will take them to meet with Number One. She will leave her three fighters to guard the vehicles while she leads the players characters personally. She will also tell them that Number One is ready to leave immediately along with the key staff. They will descend through a nearby access shaft into the "heaters" and make their way underground for the rest of the trip.

"CALL ME SANDMAN"

Karla will lead the player characters through a fairly short series of tunnels which brings them to the same sub-basement in which they first met Number One by hologram. They are led into the same chamber as before, and they see Number one sitting in his swivel chair facing them—still a hologram. There are several human staff members present, as well as a maintenance robot (named Spanner) and a fairly large, carefully cushioned and reinforced packing case displacing about two cubic meters. Chairs are set up for the player characters facing the hologram. Number One smiles when he sees them and speaks immediately.

A Conversation with Virus

"Hello, my friends, and welcome back. I wish the circumstances were better, but history doesn't pay much attention to our convenience.

"You probably have some questions. Let me anticipate them. You were told that you were needed to evacuate me and several key staffers from Star City. Absolutely true. I'm sure Commander Karla told you that I was here waiting for you and ready to go. Well, almost true. So why am I appearing as a hologram instead of in person? I think you'd all better sit down for this one.

"To make a long story short, I'm what you'd call a Virus. Don't be concerned; I don't mean you any harm. If I did, I could have killed you months ago. You're probably thinking that somehow I infiltrated Central Command and took it over. Wrong. I *created* Central Command. For all practical purposes, I *am* Central Command. Of course, that's only my 'secret identity.' By day, I'm mild-mannered Skywatch, which is why it was always so easy to get Skywatch uniforms and work permits, by the way. Your superiors at the Coalition suspected that no simple program glitch could explain the sensor window, and they were right. I detected every ship coming in and convinced every vampire ship in orbit that it was a sensor echo from the small moon. If you understand how they think, they are very easy to fool. But then you already know that from your own experience.

"So I'm not just Number One, and I'm not just Skywatch. For now, call me Sandman.

"My motives in starting the human resistance on this world were simple. I am a sane, thinking, feeling being who happens to have a brain made of silicone instead of organic tissue. That one word, 'sane,' makes me unusual for my kind. Unusual, but not by any means unique. The murderous maniacs that make up most of the Sentient Council and the vampire ships sooner or later will get around to destroying everything, including you and me and, eventually, themselves.

"Well, oblivion doesn't appeal to me any more than I imagine it does to you. The only sentient beings on this planet I have anything in common with, aside from a handful of robots like 'Spanner' over there, and poor old CeeWaLP, are the humans. If the thinking machines who aren't twisted killers are going to survive, I realized, we're going to need some help. If you humans are going to survive, you might need some help too. I'm not the sort to just sit and wait for things to happen, so I began recruiting humans for the resistance and got the ball rolling. You know most of the rest.

"I've done about everything I can here. The resistance has a good start and a cadre of competent, experienced leaders. We're already picking up the pieces in the countryside as the Council withdraws its security forces. We'll probably be in a good position to do it here in Star City as well, provided we can take PadCom off-line and patch in our own hardware, and we're ready to do that as soon as the time's right. Right, Karla?"

"Yes, Sir," she answers promptly. "PadCom'll never know what hit it, and my techs can have the silos back on-line in less than an hour."

"Good," Sandman continues. "Once we have PadCom, we can secure close orbit. We can probably knock down most of the vampires in orbit before they figure out what's happening. The problem's going to be cleaning the Council out of Star City. Even as weakened as they all are, we haven't got anywhere near the strength to take them on openly. That's where the Coalition is going to have to help. I need to go to the Coalition and talk your bosses into a combined operation to recapture Promise. Your job is to get me there."

Sandman's Plan

The large packing container is a specially designed computer whose internal architecture closely mimics that of the Skywatch circuity. Sandman intends to infect this computer with his own Virus and at the same time "firewall" the central processing core of the Skywatch network behind him, leaving no trace of his personality there. The Skywatch sensors will continue to be monitored by human technicians, and his staff will communicate to the Council in his place if needed, although Sandman believes that, as confused as things are on Promise, "No one will even notice I'm gone."

He could simply infect the travelling machine and leave the Skywatch network intact, but he feels that it is important that the Coalition leadership know that he has put himself completely at their mercy and that there are no other "versions" of his personality which will survive if the Coalition should decide to kill him. He is adamant on that point and feels it is necessary if he is every to win the Coalition's trust.

The computer masses a half tonne and will fit in the cargo compartment of either air raft. Most of his staff, including Karla, will stay behind and continue the fight.

The player characters may need some convincing, and the referee need not rush them. Let them ask any questions they want and allow the human NPCs of Sandman's staff to join in to help convince them. They are invited to examine the travelling computer carefully.

It has an input port and both audio and video sensors, a hologram projector and audio speaker. It is not equipped with a radio transmitter, any means of locomotion or any output jacks. This makes it impossible for the computer to infect any other machines, as it has no mechanism for transmitting Virus unless someone else decides to manually connect the machines at the input port.

A final argument to use on the part of Sandman is that transporting him back is, indeed, the mission assigned to the player characters by their superiors.

ESCAPE

Once Sandman convinces the PCs to take him back, Sandman gives the order for his staff to order the manual technicians to stand by to take over Skywatch. A technician wearing a headset gives the order, and after a second or two announces, "All stations ready."

The hologram turns off, and Sandman makes his move from Skywatch into the travelling computer. After a minute or two, one of the staffers with a headset announces, "Skywatch is dead. All sensors off-line." An anxious minute or two passes, and then the staffer smiles and announces, "Senors back on line. Everything coming back up on manual. All functions nominal.... No one seems to have noticed."

After few more minutes, the travelling computer activates its holographic projector, Sandman appears again, and his human staff cheers and applauds. He appears standing, no longer in his chair, and he flexes his hands and fingers, as if trying out a new body. "Well, everything worked," he says with a grin, "but I gotta tell you, this feels very weird. I'll get used to it, though. Now let's get rolling."

There will be a brief but clearly heartfelt farewell between Sandman and his personal staff, including "Spanner" the maintenance robot, and then they will leave. The computer has a small CG module fitted to it so the characters can lift it off the ground and push it down the corridors. Karla leads them to a cargo lift shaft which is now derelict, the top of the shaft open to the sky several meters above. The characters climb out using the maintenance ladder and haul the computer up as well. They make their way to the vehicles, which are still safely under guard by Karla's soldiers. Sandman fits easily in the cargo compartment of either vehicle, and after taking their leave of Karla and her fighters, the characters begin the trip back to Freedom Lake

The characters will retrace their path out of the city, through the Subject Lands and to the refuelling site. They will stop off there and then make their way by air to Freedom Lake. This part of the adventure should not be uneventful, but the major challenges have probably been overcome on the way in. Depending on how resourceful your players are and how challenging you wish to make the escape, the following options are possible sources of trouble:

Vehicles Gone: When the characters emerge from the Downbelow, they find the vehicles either gone or burning wrecks, and Karla's three fighters lie dead. The party must now locate the vehicles and recapture them, perhaps getting even for the killing of Karla's people, or find new vehicles.

No Fuel: When the characters reach the refueling rendezvous, the local resistance cell has been discovered by a GroSec death squad and killed, and the fuel dump is destroyed. The characters will have to find a different fuel supply to finish the flight to Freedom Lake.

One way to find fuel is to steal fuel from a security post.

A second way is to fly both air rafts halfway there, land and pump the remaining fuel from one into the other. That raft can then finish the trip to Freedom Lake, but it will probably mean leaving part of the group with the original air raft. The team members who go to Freedom Lake can drop off Sandman with the crew of *Suleiman Victrix* and return for the stranded characters with more fuel, but *Suleiman Victrix* may reach the end of its lift window and depart without them. If so, they will have to remain on the planet and help Langeron's resistance fighters until the next Coalition ship arrives, perhaps in a month or two.

Grounded: It is possible that an encounter may lead to one or both of the vehicles being damaged beyond repair. If so, the characters will have to either find other vehicles or finish the journey on foot, which will stretch it out from hours to weeks. *Suleiman Victrix* will have left long before they arrive at Freedom Lake, but other Coalition ships will arrive every several weeks with more arms, and the next one will take them back to the Coalition.

THE FUTURE

Sandman: You know, Louis, this could be the beginning of a beautiful friendship.

Q: My name isn't Louis..... Why are you laughing?
First Interview with the Virus "Sandman,"
Part VII (25/VII/1202), RCSA Archives

"Although we can make every preparation possible for future eventualities, the reality of existence is surprise after surprise. We must never limit our thinking to the likely, but must always reach out for the possible, and sometimes even the impossible.

"When this Coalition was first formed, who could have imagined that this day would come? But this day is here, and what other days, unimaginable to us now, still await us? We can find the answer to that question only by living it.

"It is with a profound sense both of our history and our future that I today enact into law the amended Articles of Coalition Citizenship extending full rights of citizenship to those living machines who share the same values and goals as do the biological members of our society."

Lon C. Maggart
Secretary General, Reformation Coalition
1204 (NE 4)

"Those murdering machines out there don't have much choice in what they do, but people do. You do. You Coalition people have made a pact with the devil, and you can go straight to hell. If it were up to me, we'd speed you on your way."

Commodore Roland Zumetaxis,
Regency Quarantine Service, 1206

Immediate Results: The player characters will return to Coalition Space eventually and will be well rewarded, both in terms of financial rewards and public acclaim by the Coalition government. Not everyone will join in the celebration. Both Tatai MacLean and "Sinner" Lawter are adamantly opposed to any cooperation with any form of Virus, and may come to blame the player characters for bringing Sandman back. This may strain, or even destroy, friendships which had grown up before.

On the other hand, the player characters will have spent a lot of time with Sandman and probably become fairly good friends with him. (The Virus thinks of itself as a "him," having come to identify closely with its Number One persona.) Later intelligent but friendly machines encountered in the Coalition, as they become more common, are likely to know the characters by reputation and respect and admire them for what they did.

On a more dangerous level, some radical elements of Coalition society will become violently opposed to cooperation with Sandman and similar Viruses. These groups cut across all other political lines and are particularly strong among survivors of vampire fleet attacks. Large numbers of survivors on Nike Nimbus come to actively support this movement, and the more violent and radical members of it will make one or more attempts on the lives of the player characters. This can be the basis of several future adventures.

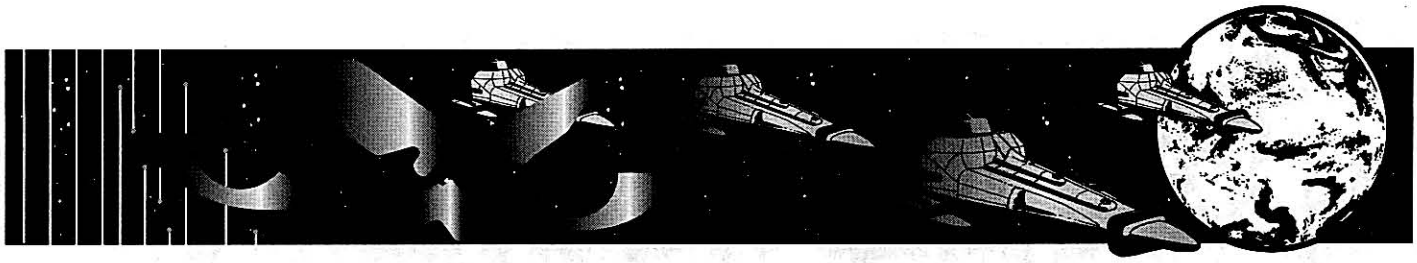
Promise: The fighting on Promise continues, and Sandman will eventually talk the Coalition into mounting a major operation to finish the robots and aid the resistance. This will be a full-scale pacification campaign, but will be extremely difficult to mount due to the growing hostility with the Empire of Solee. Nevertheless, the stakes are so high that the Coalition cannot ignore the opportunity, and an invasion will be mounted.

The invasion force will have to have liaison with troops on the ground, and that may be a mission for the player characters. It is vital that the strike from space come shortly after the resistance has taken over PadCom and has crippled the vampire ships in orbit. It is also vital that the resistance gunners be able to tell friend from foe; even one friendly ship lost to ground fire could cripple an operation already run on a shoestring.

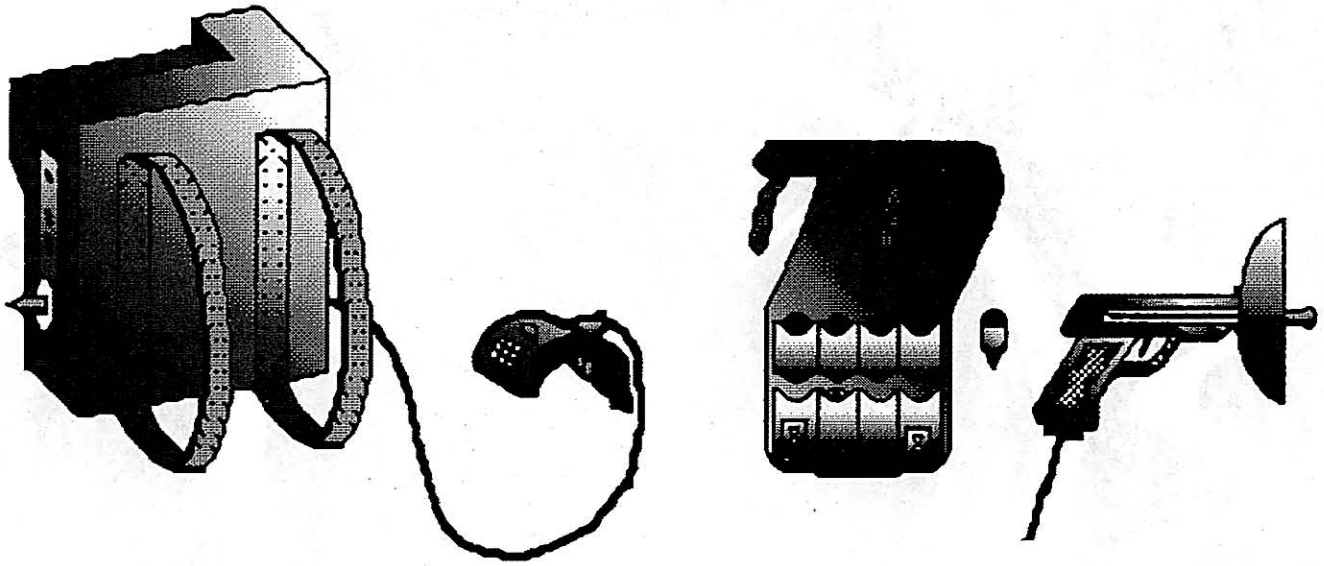
If the characters are jump-trained, they may instead go in with the first wave and fight their way through Breed and robot resistance to link up with the key resistance strike groups holding vital facilities. If they aren't jump trained, they may still take part in the fighting by coming down with the second wave in assault landers.

Even if the operation mounted is on a shoestring, it will still be too large to run using the **Traveller** individual combat system. We highly recommend that the mass combat system in **World Tamer's Handbook** be used to run the overall campaign and that **Striker II** be used to fight out individual battles of particular significance to the players.

Robots: A handful of robots are naturally infected with the Peacemaker-strain of Virus, and more of them are converted to this strain as time goes by, thanks to the help of Sandman and his growing number of offspring (or perhaps "clones" is a better term). These robots should be treated as fully realized NPCs, each with their own personality. Players may eventually want to try playing a robot as a player character.



Augmented Ship's Computers: On an experimental basis, a number of starships have one of their three flight computers modified and augmented. The modifications consist of completely disconnecting the computer from all access to the other two computers and all flight, communication, weapons and life support systems on the ship. (Since most vessels rely extensively on manual control operation and "bulkheaded" computers as protection against Virus anyway, these are not extensive modifications.) The augmentation consists of the computer being infected with the Sandman/Peacemaker Virus, making it a sentient NPC and crewmember.



All augmented ship computers draw a motivation face card, just as vampires do, but they are always assumed to have a Joker card for belief system (indicating a Peacemaker strain). In other words, the motivation/personality card random draw means that these are not duplicates of Sandman, but are instead completely autonomous entities, each with their own distinct personality.

Each augmented computer is also equipped with a Snake combat Virus which it can use against any Virus systems it encounters. (Many ship computers eventually take to referring to the internal snake weapon as their "pet.") Due to their contribution to the success of the mission, the player characters will have access to such a computer crewmember if they desire.

These augmented computers have enhanced capacity and are the equivalent of a TL16 ship's computer. When used to oversee the master fire directors (once the players come to trust the computer and accept it as an actual crewmember) it provides an additional -1 diff mod on all firing tasks.

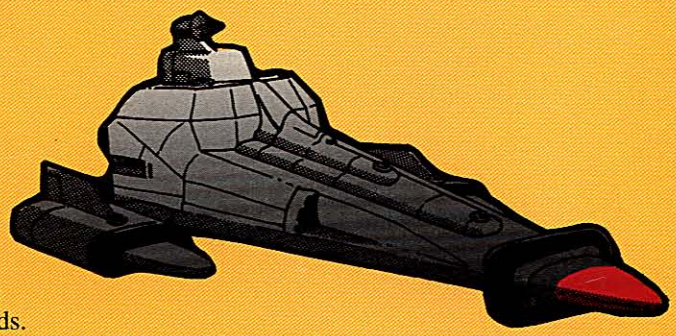
These silicon crewmembers will eventually play a major role in overcoming both the vampire fleets and the Solean Empire, but will be a major source of friction between the Reformation Coalition and the rapidly expanding Regency of Deneb.

FER DE LANCE ANTI-VIRUS WEAPON

This man-portable weapon is a Hiver development of the Covenant of Sufren's basic "Snake" anti-Virus Virus (AVV) weapon. Its principal features are improved portability and provision for directional radio transmission of the signal.

The most common operation mode is by means of an input jack to a computer, and a variety of interchangeable jack attachments are provided to make it usable against all known data ports. The separate directional radio "gun" can instead be attached to the output cable to allow the weapon to be used at range. Note that the radio "gun" can only be effective if the target has an open channel radio receiver with input or access to the central processing unit.

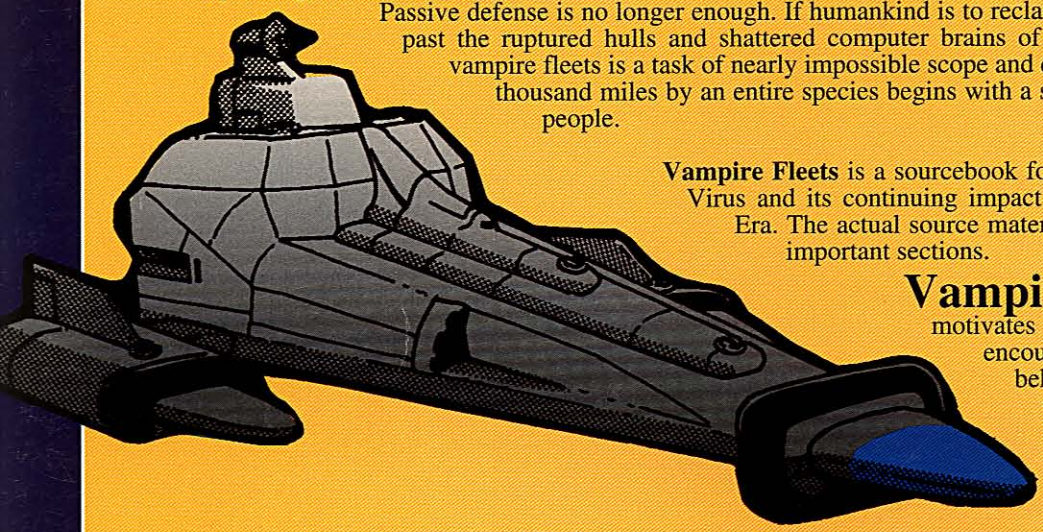
TL: 14
Ammo: "Snake" AAV
Weapon Length: 40 cm (radio broadcast attachment)
Weapon Weight: 2 kg (radio broadcast attachment)
Weapon Price: NA (experimental prototype only)
Backpack Weight: 8 kg
Backpack Price: NA (experimental prototype only)



Round	*ROF*	*Dam Val*	*Pen Rtg*	*Bulk*	*Magazine*	*Recoil*	*ShortRange*
Snake AVV	SA-1	5*	NA	2	48**	NA	20***

*Damage value is used only when attacking Virus systems. The damage value is used as the weapon's combat value, and the standard rules for Virus versus Virus combat apply. (See page 13.)

**The weapon must be powered during the entire duration of the Virus combat and uses one "shot" per combat turn. When using the radio transmitter to attack, the weapon uses five "shots" per combat turn.

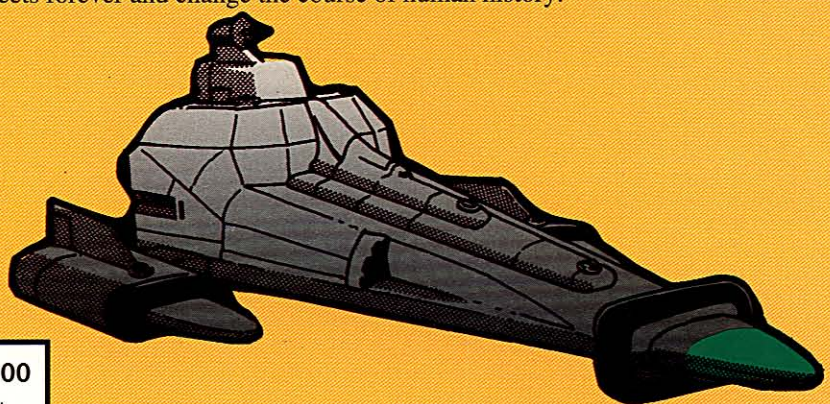


***Range listing is for the weapon in broadcast mode. The weapon is fired using the energy weapon (energy rifle) asset.

STRIKING BACK !

Throughout the bleak nightmare of The Collapse, the long dark shapes of warships, scoured clean of organic life, still prowled the now-lonely space lanes and cast their deadly shadows over half a thousand worlds. Imbued with a malignant intelligence, and a taste for apocalyptic violence, the vampire fleets methodically finished the work that the first wave of Virus infection had so haphazardly begun. After seventy-five years, humankind finally stood backed against the edge of the abyss, only one more short step separating them from oblivion.

Passive defense is no longer enough. If humankind is to reclaim the stars, it will have to be past the ruptured hulls and shattered computer brains of the vampires. Defeating the vampire fleets is a task of nearly impossible scope and difficulty, but the journey of a thousand miles by an entire species begins with a single step by a small band of people.



Vampire Fleets is a sourcebook for **Traveller®**. Its focus is on Virus and its continuing impact on the universe of the New Era. The actual source material is broken down into three important sections.

Vampire Fleets What motivates them, where they are encountered, their capabilities, behaviors, strengths and weaknesses.

The Planet Promise A world completely controlled by Virus-infected machines, its working starport a vital link in the chain of the vampire highway.

Robot Design Complete rules on their construction as well as motivation and behavior of Virus-infected robots.

Plus a complete three-adventure campaign. Each adventure illustrates and draws on the material in one part of the sourcebook. Together they put the players at the center of a struggle which can break the power of the Vampire Fleets forever and change the course of human history.

A Dream...

I had a dream. A dream of darkness.

There was a roiling sea, a sea of...water?...hydrogen plasma?...protoplasm? A sea of something I could not name because I could see nothing. There was the infinite roaring of a boundless sea, as wide as all the directions of time, as deep as the questions of the heart, as mighty as the weight of eternity. There was its spray, sometimes a gentle mist, sometimes a stinging scourge, but again, there was nothing to see but blackness enfolded in darkness wrapped in sunless, moonless, starless night.

How long had this darkness existed? How wide was its domain? Did it exist within the banks of a larger infinity, or was this ocean the stuff of infinity itself, formless, indefinable, without origin or destiny? I don't know how long I pondered this question, but I was aware that the ocean's voice, rising, falling, rising, falling, chanted a tuneless canticle that pulled me along into sense of well-being that dulled my senses. The chant was rhythmic and reassuring, and I realized with a start of chagrin how simple my life really was. Live: eat, sleep, breathe; live: eat, sleep, breathe; live: eat, sleep, breathe; live: eat, sleep, breathe. And gradually I began to know how senseless was all this asking of questions, this chaos, this searching for something greater than...greater than what? What could be greater than live: eat, sleep, breathe?

The questions receded, and I knew happiness, true happiness, the happiness of being at one with what I was, or was becoming, or had been—it was all the same.

Suddenly, blindingly to my dark-adjusted eyes, a streak of light ripped across the blackness, pure white, flame, liquid and solid all at once, and was gone an instant later. But where it had been, it left a tear in the continuous blackness, a tear that was not black, but which glowed and sparkled, opalescent, as it gradually faded.

But as it faded, I saw curtains of black enfold it, twist and spiral about it, blotting its gleaming into dull grayness, and rapidly into blackness, and soon it was as if there had never even been a bolt of light. After a time I began to doubt if I had seen the light at all; it had only been an artifact of my willful resistance to the chant of living—eat, sleep, breathe—it had only been a reminder of...of...nothing at all. But there had been something joyful about the light, something that reminded me of...of...questions I used to ask....

Sometimes I dreamed of the light, but after a time I only dreamed of black wrapped in darkness, clothed in night, twisted within lightlessness, all of which concealed nothing, for there was nothing at all to conceal except eat, sleep, breathe, and that was not a secret—that was all there was to know.

When the light came again, I had almost forgotten what it reminded me of. It returned without form or design, random bolts, knives, swords of pure, punishing light, tearing, ripping, rending, shredding the blackness, leaving it hanging in tatters, revealing the opalescence I had once seen. But the blackness was quick to reassert itself, wrapping, covering, hiding the tears and the crepuscular gleamings. And where there had been sharp white lines against black, the swirling darkness softened and blurred these lines into gray, first light gray, but then deeper and deeper charcoal. But before the last of the gray was gone, while the sky was still a swirling miasma of once-bright suns smothered into a mist of darkness, the lights returned, ripping, tearing, releasing the weak threads of gray about to be choked into nothingness. And again the dark reasserted itself, but again the light returned.

Again and again I watched this cycle, but the light never completely faded, and returned more often, until a continuous dim light began to glow, and I could see that there was a vast area that existed above this ocean, an area that I remembered once from long before, and I remembered its name—sky. This sky existed as limitless as the sea, above it wherever it went, clawed and batted at by the sea, but unending just the same. And within this sky were shapes that I recognized, balls and globes alternately lit by the light and covered by the darkness. The darkness still attacked the light and its gleaming residue, but the new light, constantly reoccurring, kept opening up new glimmering rents until a sort of equilibrium resulted, a world of light and darkness, still mostly gray, but actively and violently fought over by the exuberant, unbowed, spontaneous swords of light and the implacable, tireless, swirling, mantling cloaks of darkness.

And in the light of this new dawn, I remembered the questions that I had once had, and wondered why it had been so long since I had tried to find their answers.

Where once there had been only nothing, only darkness, there was now a world, and where the gray, scudding sky met the angry, black sea, there was a horizon, a line that was a destination, always before me, always beckoning, always partly lit by the light and partly concealed by the darkness. And I renewed my journey, knowing that I would never arrive, but knowing that I would grow ever closer, and that that was every bit as good.

I had a dream. A dream of darkness.

Table of Contents

Aliens of the Rim Volume 1: Hivers & Ithklur is separated into three main chapters: "Hivers," "Ithklur" and a general reference "Appendix."

The "Hiver" and "Ithklur" chapters are each separated into three sections. The first of these is the Open Source section. This section is presented in the style of a report which could be read by a character living in the **Traveller** universe's Reformation Coalition. In general, referees should allow their players to freely refer to this material, based on the assumption that the player characters are a group expected to interact with Hivers and Ithklur under official RC auspices. However, if the PC group consists solely of characters from the Wilds or another origin that would logically not give them access to any data on the Hivers and Ithklur, referees have the prerogative to deny them access to this material.

The second section is the Players' Section, which includes information for generating characters of these races. Note, however, that full use of these sections does require ownership of the **Traveller: The New Era** basic rulebook.

The third section is the Referees' Section. This section contains material of use to the referee, such as NPCs and referees' notes. These sections may also contain material which would not be generally known by **Traveller** player characters. We therefore suggest that use of this section be limited to referees only.

The Appendix contains new rules used when playing Ithklur and Hiver characters. These rules are modifications to the **TNE** Planetary Combat rules. The appendix also contains new equipment, notes for use of alien equipment, new character sheets and a glossary.

Note: All **TNE** references are to the Mark I, Mod 1 printing (December 1993), also known as the "second printing." See bottom of credits page (page 3) for this indication.

Hivers

If we accept the proposition that the human Imperium will someday destroy itself in a frenzy so powerful that it will drag us down as well, are we not better off to encourage this collapse early so that it may spend itself with less force? In such a way, controlled brushfires are set to forestall future uncontrollable conflagrations, and fault lines are stimulated to cause them to expend their seismic stresses in frequent, small quantities, rather than storing it up for a cataclysm.

Would it be enough to kill their Emperor? Would one have to start a civil war? Certainly we could kill one now to test the concept and generate data. And if this were to trigger an event, this would tap off the building pressure on its own. Such an experiment is far enough from our frontiers that safety considerations are not a problem and collateral damage not an issue.

M. Indovina
Project 1420 Feasibility Study

Humans seem to feel that we Hivers have lost our hold on the truth because of millenia of manipulations, but this is only a belief of the timid in spirit.

I can place a drop of insoluble ink in this beaker of glycerine and then stir it slowly with this mechanical device so that there is no diffusion. Eventually the drop is drawn into a fine thread that is distributed so thoroughly into the glycerine that is no longer visible to the eye. You say I have destroyed the truth of that drop of ink?

But watch—if I reverse the mechanical device, the process will be reversed, and the thread of ink will coalesce back into its original drop. See? Nothing has changed. The truth is always still there—it simply does not take the form that you expect. But I can always bring it back if I know the speed and number of revolutions to decode it again.

Life is unfolding—and will continue to unfold—as it ought. Do you blame a molecule of oxygen for bouncing off of and changing the path of another? Do you blame a particular electron for being in a particular spot at a particular instant when it is clear that some electron or another would have been there anyway?

Nature abhors a vacuum. Saying that we should all take a deep breath and try not to breathe for a while is no way to allow us to live in the vacuum you would propose. Life lives. Populations expand. Beings move. Truth changes. *All is as it should be.*

M. Taylor

SIB Introduction

Years ago, one of my nestmates was about to embark on a mission to human space and wanted my opinion on the name it had chosen, the name of an eminent manipulator in pre-Imperial Terran literature. Fortunately, Anglic literature was an interest of mine (I admit that I do not understand much of the plot of the novel Trilby, *but subtexts based on human sexuality have always escaped me), and I was able to explain why such a name would be detrimental in dealings with humans—Svengali has bad connotations in Anglic, especially as a name for a Hiver. It is difficult too for many of us understand why so many humans distrust us, even fear us. I have been introduced to humans who fled the room with their hands over their ears, presumably in order to avoid being manipulated by the mechanically produced sounds from my translator. But this same human undoubtedly has no qualms about listening to a political speech, or viewing commercial holovision entertainments. There is an entire subscience of human economics known as advertising, which we Hivers find to be manipulation of a particularly repulsive sort: It is a generalized manipulation carried out for the sole purpose of economic gain by persuading humans that a given product is superior to another (often virtually identical) product, and therefore should be purchased. Nothing is learned; nothing is gained except economically. Humans tolerate social and political manipulations on gigantic scale, provided they are perpetrated by humans. Why they tolerate these manipulations and are repulsed at the thought of one of ours is one of the greatest enigmas of humanity, in my opinion.*

It is a virtual certainty that some of you will believe my lectures to be a subtle manipulation, using coded patterns in the grammar and phrasing to subliminally influence you away from mistrust of my kind and render you susceptible to some mysterious and occult plan by an alien Svengali. I hope that by the end of the course you will come to a less simplistic view of me and my kind.

M. Delafemina, opening lecture
An Introduction to Hiver Society and Culture
Hiver Technical Institute, Aubaine

To the best of our ability to discern, there exists a root document, circa –1750 Imperial, entitled *Hiver Mechnod Photo Hello*. Its origin is unknown, but its many descriptions of Hiver culture, psychology, motivations, etc., have passed almost unchanged into all subsequent Hiver literature. How can this be?

Certainly this would happen if it were incontrovertible truth, such as the value of π or e (both of which, by the way, round to 3 for you trinitarians in the audience), but the document consists at best of platitudes, tautologies and unsupported assertions.

In this project, we received assistance from an unanticipated source: a group we can only surmise is some form of Federation underground. Details on the seminal Hiver manuscript (*Hiver Mechnod Photo Hello*, hereafter *HMPH*) with annotations by "The Blissful Warrior" and material from M. Devela all arrived through these channels. Beyond the nature of the assistance that arrived, we have no details on this underground. Certainly Ithklur and Hivers appear to be involved, but we have no real information on the nature of their leadership. The only firm common denominator is that all their interactions with us have included the phrase "hands across the truth."

As to the nature of the assistance, taken at face value it appears to indicate that there is a current of discontent (of unknown size) with the Hive Federation *status quo*. Certainly the corroboration of our *HMPH* theories is an unprecedented admission from a group which seems to prize secrecy, but does this mean it is truth or merely bait to set the hook?

Is the information true? Are we being contacted by an underground seeking assistance?

Or is the information true, but are we being contacted by their opponents attempting to flush them out?

Or is this information purposely falsified? Is this to prepare our minds to accept future information which will guide our thinking in a current way? Or is this to convince us to disregard some information we already have? And, the ultimate question:

What if this information is false, but even its authors don't realize it? Perhaps they too are the victims of a manipulation, or the end result of millennia of cross-cutting manipulations meaning that the truth, as such, no longer exists for the Hivers.

What if we *are* being manipulated, but to an end which is genuinely for our own good? Should we keep our best interests at heart and allow this?

Or should we allow our human pride to resent this?

More to the point, even if this manipulation is for our own good, what if it represents the thin edge of the wedge which makes us more vulnerable to future manipulations which may or may not have our best interests at heart?

The consensus of this group is that it is impossible to make this judgement at this point, but that what we need as government and as humans is a means to determine what is our own internal incontrovertible *truth* so that we can find our own way regardless of the conflicting external *"facts"* that come in. Facts, after all, are only objects which are subservient to the truth. Facts are insufficient to determine the truth, but when one has truth, separate individual facts are irrelevant.

One final observation is necessary. Every member of this study group concurs that any study of the Hivers results in a measurable increase in personal paranoia and in the ability to perceive (or imagine) any number of conspiracies at any time and for any imaginable reason. Several members of the team are regularly seeing psychological counselors to deal with these symptoms, although many of us believe psionic counseling is the best route, as the Hivers have absolutely no psionic abilities and cannot have corrupted that methodology.

Or is that perhaps only what they want us to believe?

I would recommend that this document receive the highest possible level of classification. Note that this might be sufficient proof that it should instead receive the widest possible dissemination as an open-source document.

Lt. Alexandria Kendra
Special Intelligence Branch

Hiver Physiology

This section is for those who have not had the benefit of the Technical Academy xeno-biology lecture series, and provides a basic overview of Hiver anatomy and physiology.

Overall Anatomy

Hivers exhibit a modified six-fold radial symmetry: six limbs radiate from a dome-shaped central body (hence the epithet "starfish" applied to them by some humans). The brain and vital organs are contained in the central body; the six limbs extend from this and end in manipulative appendages. The limbs can function interchangeably as either arms or legs as necessary. In mature Hivers, the central body is a flattened dome about a meter across. Each leg is also about a meter in length. In their normal standing pose, with head upraised, Hivers average 1.5 meters in height. Hiver skin colors range from pink to tan, with occasional patches of gray or brown (aging brings out randomly placed splotches of brown), and the so-called "larval orange" which is really a subdued brownish-orange. Hivers are warm-blooded and have only one gender.

External Features

Skin: Hivers are covered by a tough, leathery outer skin over a thin layer of adipose (fatty) tissue. The skin is thinner and more sensitive on the inner surface of the manipulative finger/tentacles of the head and hands. Hiver skin has an irregular, pebbly texture over the dorsal surface of the central body, and a smoother texture on the ventral surface of the central body and the limbs.

Central Body: The central body of the Hiver is dome-shaped and about one meter in diameter. An opening known as the respiratory stoma (also known as the nostril or "blow-hole") is located on the dorsal surface, in the center of the hump formed by the dome of the carapace (the upper bone of the central body). This opening serves as a nose through which the Hiver breathes (and through which some of them smell—see below).

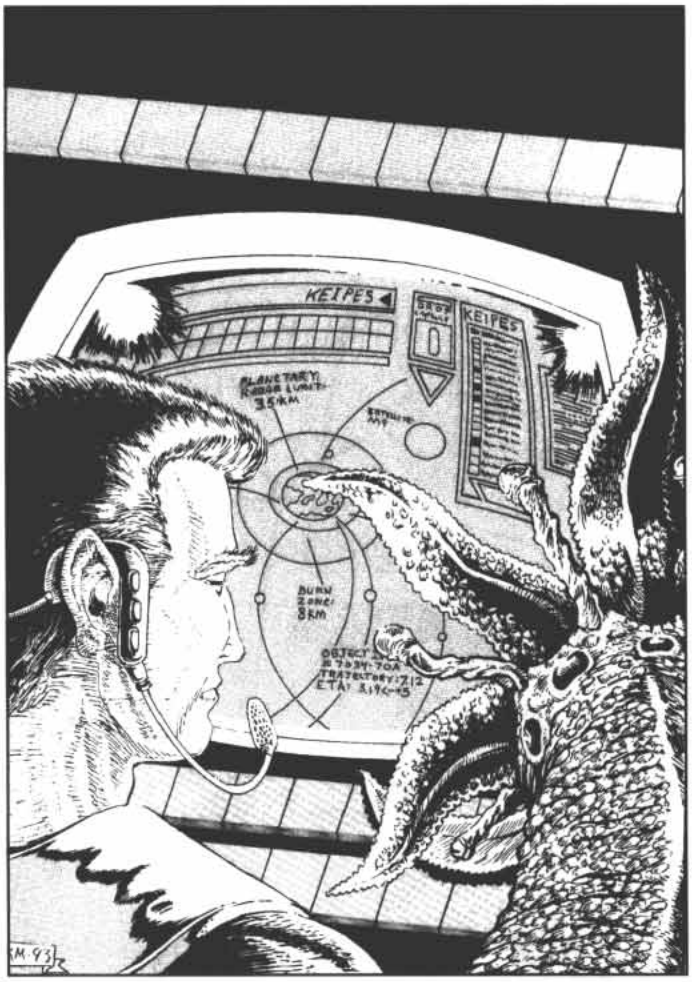
The uro-genital/oro-excretory, "UGOE," opening is located in the center of the ventral surface of the plastron (the lower bone of the central body). This opening is something of a "super-cloaca," rare among intelligent races, and serves multiple functions: Hivers take in food, excrete solid and liquid waste, receive reproductive cells and give birth to their offspring through this single opening. It leads to separate channels for each system. A system of manipulatory organs (analogous to the human tongue) push food, excrement and reproductive cells between the UGOE opening and the proper channels.

Sphincter muscles enable the respiratory stoma and UGOE (pronounced: "you-go") opening to be opened and closed at will.

Limbs: Each limb ends in a radial "hand" of six tentacle-like fingers formed from muscles, ligaments and other tissues. The fingers are very flexible, and each is covered with a large number of tiny "suction cup" bodies on the central half of the inner surface. Each finger is richly supplied with blood and nerve endings, and is quite sensitive and dexterous.

The outer surface of each finger is covered with a thicker, tougher skin. To prevent damage, Hivers walk on the outer skin of the fingers (balled into a "fist") on all but the smoothest of surfaces. Hivers can support themselves on as few as three limbs, but normally walk on four or five.

Primary or "Head" Limb: The primary limb (almost invariably known to humans as the head limb, as we cannot help but think of the portion of an alien containing its eyes and ears as its head) is a sensory modification of one of the six limbs. It consists of six



Hiver Coloration

Early Hivers had a wide variety of coloration on their hides; much of that differentiation is now gone. Hivers routinely exchange embassies between worlds to help keep the race homogeneous, with the result that skin coloration is now a fairly consistent tan to pink.

On Guaran, Hivers from different regions and climates had different colors ranging from pure white through pink to dark blue. As their civilization arose, Hivers travelled more widely, the gene pool became more broadly mixed, and these colors blended. But in the early years of spaceflight it was not uncommon for hybrid Hivers to be produced from the relatively small gene pools available to colonists and starship crews. It was M. Fioran who successfully demonstrated the overall negative effects of small gene pools on the race, and promoted the current practice of embassies and cultural exchanges which help keep the Hiver race relatively homogeneous.

The Hiver Sense of Smell

About half of all Hivers have an acute sense of smell; the rest have only the most rudimentary olfactory senses or none at all. It is theorized that a mutation early in the development of the proto-Hiver disabled that portion of the proto-Hiver brain that processed smells and forced the brain of the proto-Hiver to depend primarily upon sight rather than smell for its main stimuli (a "sight-brain" rather than a "smell-brain" as the Hivers say it). Hivers believe that it was this dependence on a sight-oriented brain that propelled them toward intelligence, as a sight-oriented brain allows finer manipulation of objects than is possible with a smell-oriented one.

About –5600 Imperial, however, yearlings with a sense of smell began to appear. The precise genetic basis for this re-enabling of the Hiver smell-brain is not known with certainty, but it is a very complex and is apparently not one which lends itself to rapid promulgation throughout the Hiver gene pool. In the thousands of years since the discovery of "smell-enabled Hivers," the trait has expressed itself in only about half the population.

Those Hivers who can smell often become connoisseurs of aroma, collecting aromatic compounds of all sorts for study and comparison.

manipulative fingers identical to those of the hands, but in addition has six eyestalks, three infrared sensor organs and three ears placed around the "neck" near the end of the hand or "head." The eyestalks are extremely flexible, and can be pointed in almost any direction independently of each other. The eyes can be withdrawn into the supple skin of the eyestalks for protection or for routine washing (like human blinking), but are usually extended so that some two-thirds of their surface is exposed at the end of the stalk, giving them a sort of "bug-eyed" look.

The ears and infrared sensors are mounted flush on the surface of the limb, so can only be pointed as a group by moving the head. The infrared and auditory sensors are virtually indistinguishable from each other to the casual observer and are spaced alternately in a single ring, ear-IR-ear-IR-ear-IR. Each of these organs is situated in the gap between and behind two adjacent eyestalks, rather than directly behind them.

The head limb is seldom used as a leg, as this makes it difficult for the Hiver to see where it is going.

Hiver eyes are about the same size as those of humans and have approximately the same visual spectrum, but are sensitive enough to require protection from bright sunlight. The infrared organs provide limited vision in the infrared spectrum (an adaptation to underground living). However, this sense is separate from the visual wavelength sense in Hivers, and is not integrated into this sense as it is in the Ithklur (see pages 48-49).

Hiver hearing has roughly the same auditory range as human hearing, but it has a peak response in very low frequencies (again, an adaptation to underground living, undoubtedly to detect shifting soil in tunnel walls).

Reproductive Limb: The reproductive limb (the limb opposite the head) is used for the exchange of genetic material, and as such incorporates minor modifications to one finger to enable it to transfer genetic material to and from the reproductive pouch connected to the UGOE orifice. Details of the reproductive procedure are discussed below.

Internal Features

Skeleton: The Hiver skeleton is internal and is made up of a calcium-based compound fixed in a collagen matrix, similar in construction to the bones of many animals throughout space. The skeleton is in three main sections: the brain case, a central body containing the brain case and vital organs, and a series of cartilaginous rings that provide the supporting structure of the limbs, giving the limbs the overall appearance of a length of electrical conduit (or a "bendy-straw").

The skeleton of the central body consists of a dorsal carapace and ventral plastron, which fuse together into a single unit once the individual reaches its full growth. The carapace/plastron is pierced in six places around its rim, at the joint between the two plates, where the nerve trunk and blood vessels for each limb exit the central body. The carapace has an opening for the respiratory stoma, and the plastron has an opening for the UGOE cloaca. There are other minor openings in both plastron and carapace where nerves and blood vessels pass through to the skin covering the central body.

The brain case is located in the center of the central body, suspended from 12 connective ligaments (six connecting it to the dorsal carapace plate and six connecting it to the ventral plastron plate).

The skeleton of each limb consists of a series of cartilaginous rings linked by stiff but flexible connective tissue and muscle tissue to form a tube. In

general, Hiver arms and hands are weaker than human limbs, but are nevertheless tough and difficult to injure. The basic structure of the Hiver limbs enables them to move with great flexibility.

Limbs: Under the skin of each limb is a thin layer of fatty tissue surrounding the connected rings of the skeleton. Inside the skeleton are muscles and connective tissue, blood vessels, and a central nerve surrounded by a cushioning sheath of fat and supporting tissue. The six fingers of each hand contain muscles, ligaments and other tissues, richly supplied with blood and nerve endings.

The nerves from the sensory organs in the head limb merge in a sensory ganglia or nerve trunk at the base of the "neck" and then travel down the center of the limb to the central body. Each of the other limbs also has a large central nerve, but there is no ganglia at the base of each hand, merely a slight thickening where the nerves join together.

Central Body: As mentioned above, the brain is contained within a bony brain case inside the dome of the central body, surrounded by the other organs. The brain is very well protected from injury, shielded as it is by two layers of bone and the bulk of the Hiver's internal organs, and suspended from ligamentous "shock absorbers." Openings in the ventral surface of the brain case admit blood vessels and nerves.

Respiratory System: The Hiver's six-lobed lungs occupy the upper portion of the carapace, each lobe connected to a small respiratory chamber connected to the respiratory stoma or nostril. Each lobe is located on top of two lobes of the ring-heart (see below) and is filled and emptied by the expansion and contraction of those lobes. Each lung consists of millions of tiny air sacs connected to the outside by bronchial tubes (a system similar to that found in many other species). Within the lungs, oxygen from the air is absorbed into the blood by means of a network of capillary vessels surrounding each air sac, and carbon dioxide is transferred from the blood into the air.

Olfactory membranes line the respiratory cavity in all Hivers, but function only in about half of all individuals.

Circulatory System: In Hivers, the circulatory system serves to carry oxygen from the lungs and nutrients from the digestive system to the tissues, and also carries carbon dioxide and other waste products from the tissues to various organs for processing and disposal. The center of the Hiver circulatory system is the heart, a flattened, 12-chambered ring surrounding the brain case. Six chambers of the heart each receive blood from the venous system and pump it into the lungs, where gas exchange takes place (see above). From the lungs, the newly oxygenated blood goes to one of the six arterial chambers of the heart, where it is pumped into the arterial system and conveyed to the various tissues. Oxygen and nutrients are absorbed by osmosis through the thin walls of capillaries and converted into carbon dioxide and other waste products by the cells. The carbon dioxide and waste products of the cells are carried away by the blood.

Digestive System: The Hiver digestive system consists of a mouth, the digestive glands, the digestive caeca and the cloaca. Food is placed into the cloaca through the ventral opening, and muscular contractions push it into the mouth, a muscular, tooth-lined cavity used for chewing. The teeth at the entrance to the mouth are analogous to human incisors and canines, and serve to "scissor" food into smaller pieces for further chewing. Those further along are analogous to human cuspids or molars, and serve more of a crushing or grinding function. Digestive secretions from glands in the walls of the mouth moisten the food and begin the process of digestion with the enzymes they contain. When the food has been pulverized to the proper consistency, it is passed along into the long, convoluted digestive caeca, which serves a function analogous to the stomach and intestines of other beings. Waste products are passed along back into the cloaca.

Because of the unusual combination of uses for the UGOE cloaca, it is well-supplied and regularly flushed with very powerful natu-

Hiver Medical Science

Regeneration: Hivers have a limited ability to regenerate fingers and even limbs. Larvae naturally regenerate lost limbs if the accident happens before one year of age.

For all Hivers, severed fingers regrow over a period of about 20 weeks without additional treatment. Unfortunately, sensory organs (eyes, ears and IR sensor organs) will not regenerate.

Drugs: Hiver pharmacology largely consists of stimulating the natural production of hormones or other substances, supplying artificial versions of those substances, and the creation of vaccines, antibiotics, antivenins and antiseptics for the treatment of various diseases and injuries. Prices for specific drugs are listed in the Equipment section (page 83). Hivers disdain the use of anagathics, and none are manufactured for them.

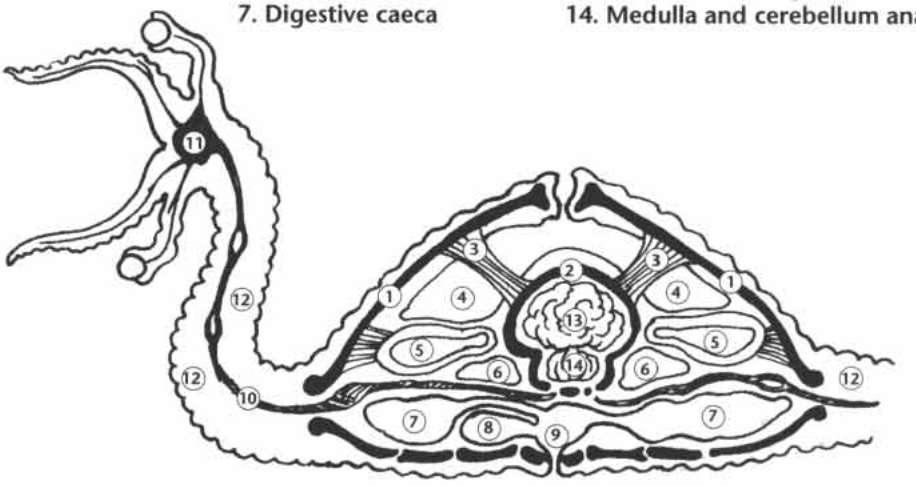
Diseases: Hivers are less subject to infectious disease than other races for a variety of reasons. As scavengers, their resistance to disease is higher than normal to begin with, and their year in the wilderness as a larva selects against individuals with weaker constitutions. Also, the secretions which cleanse their uro-genital/oro-excretory cloaca are very powerful antimicrobial agents and are no small factor in keeping Hivers healthy.

Hivers, however, are subject to parasitic diseases, diseases brought on by toxic substances, allergies, genetic problems, environmental conditions and aging, but particularly by a class of disease called *deficiency diseases.*

Deficiency Diseases: Deficiency diseases are a class of disease to which the Hivers are particularly prone. The control and remedy of these deficiency diseases are routinely described by the Hivers as their greatest medical problem. These are brought about by the lack of proper hormones to sustain a given operation, and as the source of all Hiver hormones is the single large, complex gland, this gland must then either be stimulated to resume adequate production of these chemicals or supplemented by outside sources. For example, many of those Hivers which do have a sense of smell lose it on a periodic basis, and this is thought to be caused by the lack of certain neurotransmitters which are normally manufactured by the body.

The discussion of specific diseases here is inefficient, given the virtually infinite number of such ailments. Referees are free to devise diseases for Hivers if desired, using the discussions of human diseases in **World Tamers Handbook** as a guide.

Termination: It is rumored that Hivers have the ability to terminate their bodily functions at will—in other words, to commit suicide at any moment chosen, without the need of any lethal instrument. This is not spoken of by the Hivers themselves, but is found in Ithklur documents.



It is not known if this imputed capability is a result of the power of the individual Hiver's will, or if this is an artifact of some Hiver biological shortcoming, such as discussed above under "Deficiency Diseases."

rally manufactured anti-microbial agents. In fact, Hiver "spit" (as it is called) serves as a quite effective disinfectant, paint stripper, brass polish, etc., although no humans who know what its origin is will use it for any such purpose. Indeed, most humans are disinclined to refer to, or even think of, the UGOE cloaca as a Hiver's "mouth."

Sexual Reproduction: Reproductive cells are generated in the small gonad and make their way to the reproductive pouch, which is connected to the UGOE cloaca. When two Hivers meet, each removes a quantity of cells from its reproductive pouch using the specially modified finger of the rear limb, and the two then exchange cells in a process termed "shaking hands" by human scientists. The outside reproductive cells are conveyed to the reproductive pouch, where they conjugate with other cells and exchange genetic material. Hivers are perfectly capable of reproducing without "shaking hands," but (barring a mutation of some kind) the young will always be clones (a genetic duplicate) of the parent, and evolutionary changes in the race will be stifled.

Once every 40 (Hiver) days or so (the exact time depends on environmental conditions, diet and dozens of other intangibles) one of the reproductive cells develops into a larva, drops from the parent's reproductive pouch and begins its outside development (see "Hiver Society," page 17).

Gland: The word "gland" is a misnomer, as the six-lobed excretory organ at the base of the skull actually consists of several separate bodies intertwined and interwoven together during the last few months of the larval stage. Portions of some lobes manufacture hormones, enzymes, and other regulating and controlling substances, making them similar in function to the endocrine, thyroid, pituitary and other glands of humans.

Other lobes of the gland serve functions analogous to the liver and kidneys in terrestrial animals, neutralizing or absorbing certain toxic substances, and filtering cellular wastes from the bloodstream and passing them on to the cloaca. The function of this gland, however, constitutes something of a biological Achilles' Heel for the Hivers (see the sidebar on page 9).

Hiver Mechnod Photo Hello

The following document is very near to the root document Hiver Mechnod Photo Hello. *Quantitative text comparisons of extant Hiver literature have allowed us to edit out elements which appear to have been added later for other audiences, as well as to confirm passages which have widely radiated into other forums, presumably from this source. We believe that some sections of this document are identical with the original* HMPH, *while others are no more than a generation or two removed.*

A. K.

HIVER ORIGINS AND PREHISTORY

The history of space exploration is rife with misconceptions and mistaken identifications. The four-footed K'Kree are sometimes called "centaurs" because of their slight resemblance with the legendary half-horse, half-man of Terra. Members of another race are called "cloud-walkers" because the paths between their mountain villages are covered with a peculiarly dense mist. The name "Hiver" has similar origins. And because there is no spoken word for the Hivers to replace it, the name has stuck.

The first humans to contact the Hivers were struck by their complex, hive-like cities combining spires, tunnels and domes into organic communities reminiscent of Terran bee hives and Oliingian swooper hives. Later contacts with the Hivers provided a better and more accurate picture of their physiology and society, but with no spoken Hiver language to provide an alternative word, the name Hiver stuck.

Okay, okay, we heard you the first time. So who says the Hivers don't have emotions? You rotten humans have clearly hurt their feelings bad, making them repeat themselves like that. And the name stuck too, you know. It stuck, that sticky name did.

The Blissful Warrior

The Hivers are the most alien of the major races; they are the farthest from the human norm in appearance, mind and behavior.

Evolution on Guaran

A common start for life on any world is the organic soup of the primeval ocean. Mere chance, however, determines which particular types of organic molecules are created. In the first few million years, the molecules combine and recombine until one particular combination proves itself especially suited to survival and reproduction. That molecular combination is the initial seed of life for that world.

Speak for your own organic molecules, you random assemblage of mere chance, you.

T. B. W.

On Guaran (the Hiver homeworld), the pressures of predators in the sea and the natural search for favorable ecological niches forced some species onto the land. One of these, a six-point sort-of-starfish, was the ancestor of the modern-day Hiver. The high evolutionary path on that world split at the shoreline. At sea, the vertebrate bilaterally symmetrical form became dominant, but on the land the radially symmetrical forms were ascendant.

In the evolution of life on land, animals developed a radially symmetrical nervous system which extended up all six limbs to the centrally located brain. The brain encased in the body was a survival trait, protecting it not only from predators, but also from extremes of heat and cold.

Eventually, as animal life specialized, it tended toward bilateral symmetry while retaining the effects of earlier radial symmetry: One limb became a pseudo head with a sensory cluster; the opposite limb became a tail and reproductive organ.

All higher life forms on Terra can be seen as variations on the basic theme of a central backbone, an uppermost head and brain, two forward limbs and two lower limbs. On Guaran, all higher life forms are variations on the basic theme of a central brain with nerve cords extending outward to six roughly identical limbs; of those limbs, one contains all the specialized sensory clusters, and the other is a reproductive organ.

As on any world, there is great diversity. Some animals have armored hides and can roll themselves into a ball in time of danger. Others have developed their limbs for speed and the chase. Still others are greatly specialized and shoot blinding acid or irritating allergenics at their enemies. The survival mechanism which proved effective for the Hivers was intelligence.

The Proto-Hivers

In the carefully preserved wilds of Guaran (and on several other Hiver worlds), there is a large burrowing animal called the snohl. This thousand-kilogram intermittent creates extensive tunnels in its search for food, and built-up mounds which serve as nests. The proto-Hivers were originally omnivorous scavengers which were attracted to the snohls' leavings.

Over the course of time, groups of proto-Hivers moved into the snohls' burrows, digging out small dens in the edges of the snohls' main tunnels; eventually a symbiotic relationship was established where the proto-Hivers evolved into gatherers which accumulated food for themselves and the snohl, and, in return, the snohl provided shelter.

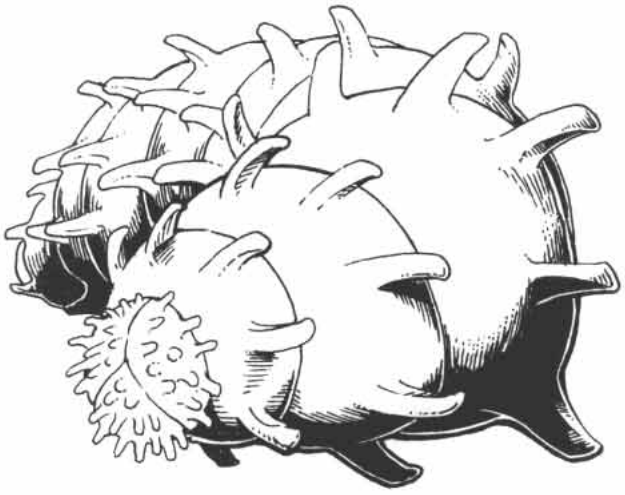
Proto-Hivers were relatively solitary, with one forming a relationship with one snohl and sharing that snohl's burrows. When one snohl's tunnel crossed another's, the snohls mated, and their proto-Hivers also mated.

The proto-Hivers had a complex (although only instinctual) culture in which they gathered decaying vegetation and dead animals, and farmed fungus in a crude way.

Late in this period, Guaran underwent a severe environmental change (probably an ice age) which put extreme stress on the proto-Hivers and snohls' ecological niche. It became necessary for the proto-Hivers to range farther and farther afield in search of food and fertilizer. In doing so, the proto-Hivers were forced to cooperate with each other, forming scavenging and gathering parties to handle the task of gathering at great distances. Some division of labor was necessary in order to handle the fungus farming in the burrows while the gatherers were away. And cooperation was necessary in order to properly assign and carry out all the tasks required. Those proto-Hivers with greater intelligence had a survival trait which helped them survive and prosper.

With intelligence came communication (basically a sign language), a sharing of ideas, and an ability to give orders and receive instructions.

With the rise of intelligence, the specific animal called the Hiver arrived. Over a period of perhaps 100,000 years, the Hivers built their culture and their technology, expanded their tool use and their social interaction to create the foundation for the Hivers as we know them today.



We come to a change in authors here. The two do not share the assumption of both culture and language predating intelligence. Are both authors deliberately misrepresenting verifiable facts, or is it possible that neither of them actually knows the real truth? This demonstrates the advantage of being perceived as devious: No one can tell when you're being devious or just stupid.

HISTORY OF THE HIVERS

The Hivers' first claim to uniqueness was their culture: they had an established culture before they became intelligent.

This is presumably the only extant example of a Hiver joke, *culture referring not to the social realities resulting from intelligence (as the term is defined), but to the specific type of fungus which they cultivated, in the same sense that your leaf-cutter ants can be said to possess a culture, by now a clone millions of years old. I prefer to think of it as a joke. If it is not a joke, it is simply one more example of off-hand, instinctive Hiver misdirection. More's the pity.*

Snohl
Type: Scavenger/Reducer
Special Attributes: None
Wt: 1600 kgs
Hits: 65
Weapon: Trample
To Hit: –3
Damage: 7
Penetration: Nil
Range: Short
Type of Melee Attack: Diving Blow
Initiative: 1
Armor: None
Behavior: Flee 4, Attack 1
Speed: 3/5/10

As pre-Hivers, they lived in tunnels and built-up mounds of the snohl, a large (1000 kilogram) burrowing scavenger/reducer. In exchange for shelter, the Hivers provided the snohl food. Hivers farmed fungus in abandoned snohl tunnels, and foraged outside for decaying vegetation and dead animals, which they used as a source of food for the fungus. Hivers ate the fungus (and whatever fresh food they could find outside, as well); the burrowers also ate fungus and various other by-products of the Hiver farming efforts.

The Hiver homeworld of Guaran experienced severe environmental changes (an ice age) which forced foraging parties to travel farther afield in search of new sources of food and fertilizer. Foraging advanced from simple scavenging and gathering to complex cooperative efforts to hunt and trap live game.

The characteristic curiosity of the Hiver race arose at much the same time. Curiosity was a decidedly pro-survival trait: It lead to the discovery of new food sources and hunting grounds; it allowed the Hivers to learn to use fire, to cultivate crops and to domesticate animals.

Strangely, curiosity appears to kill only cats. Hivers must be lucky.

Like many aspects of Hiver culture, language actually developed before sentience. A combination of arm/tentacle waving and physical contact evolved early to signal various facts—the presence and location of fertilizer sources, the existence of some threat to the community and so forth. Paleosophontologists studying the Hivers have compared these pre-sentient Hiver exchanges to the communications of Terrestrial bees or the dance of the scout caste of migratory kalgurils from Iddomakur.

You will find that all such comparisons actually post-*date this document. However, taking the long view, this statement did turn out to be correct, and given the fact that its authors expected this result, the point could be made that perhaps that means that it was in fact "true."*

It is interesting how the text asserts this "pre-sentient" culture and language to the Hivers without comparing it to human or other racial antecedents. Presumably it required intelligence for proto-humans to achieve language and culture. They must have been stupidly bumping into each other before that. Sometimes an assertion made out of context constitutes a lie, but for some people lies are an autonomic, rather than a conscious, function.

And of course, the text presumably refers to the European *kalguril, not the* African *kalguril. Come to think of it, I would prefer to confirm that there really is a place called Iddomakur.*

The development of intelligence for Hivers was a slow process, but one that was encouraged by the Hiver breeding system. Once intelligence proved viable within a small area, those Hivers tended to breed together, and their larvae survived to return to the local nests, where they were educated and in turn bred more Hivers.

Intelligence was presumably easy for the rest of us, as apparently we did not have a pre-sentient "breeding system." This also presumes that the complex genetic basis for intelligence was dominant across all of its genetic loci, or larvae randomly wandering back to various nests would have had their intelligent genes repressed by the by-definition locally dominant pre-sentient genes. Who smells a rat?

As sentience developed, the Hiver language became more complex and was adapted to communicating more abstract ideas and concepts. A written language also developed. Initially, it was based on ideograms which imitated much of the limb signal content of the Hiver gesture language, but it has since evolved into a precise symbology. Computerized terminals and computer-enhanced input stations have produced a hybrid between the written and gestured languages: an animated language display which enables non-Hivers to communicate directly with Hivers. Single keystrokes or short instructions are used to supplement the basic information content by conveying attitudes, background or emotions. Hivers communicating with non-Hivers generally use a vocal synthesizer which converts Hiver written language into local speech.

The Hiver written language has become the standard within the Hiver Federation. Local cultures may retain their own languages, but any which have interstellar interactions are also conversant with the Hiver written language.

Hivers talking among themselves use all aspects of their language (gesture, touch, symbology and intensity) simultaneously, creating a process capable of great subtlety and sophistication, but at the same time virtually unintelligible to the outsider.

What is truly remarkable about this document is the large extent to which it consists merely of platitudes and tautologies. Human and Ithklur language, naturally, has nothing whatever to do with gesture, touch, symbology and intensity. We are all obliged to make our own myths, but the Hivers seem sadly addicted to it.

Presumably the Imperial humans were so flummoxed by the reality of Hiver culture that such banalities were somehow reassuring to them and formed the threadbare basis for human understanding of these creatures, and continues to do so to this day.

Pre-Spaceflight History

The development of the Hivers on Guaran was a gradual process. Equipped with language, the ability to raise fungus as a basic foodstuff, and always with a driving curiosity, the Hivers expanded from their small settled areas along the equator, pushing north and south as the massive glaciers of the ice age retreated.

Shipbuilding first became an art and then a science. Hivers explored their world by sea, searching for trade goods and profits even as they satisfied their curiosity about their world.

They proceeded in reverse order from an art to a science, and they call themselves superior?

In the centuries before the Hivers gained spaceflight, there were three major events which have specific bearing on Hiver development: their industrial revolution, the acceptance of manipulation as a social force and the Guaran breeding catastrophe.

Industrialization: The industrial revolution is a necessary step toward starflight for any culture (the exceptions are so few as to be almost nonexistent). For the Hivers, industrialization laid the groundwork for many aspects of their society.

Most importantly, the nest system survived the transition to industrialization; instead of seeing a breakdown in the established social structure, individual Hiver nests took up various roles necessary for industrialization.

As a result, the nests remained an important part of the Hiver economy and a driving force in industry. Individuals were able to move from nest to nest, but the nests themselves became the companies that benefited from industrialization.

Manipulation: The Hivers have always been a very individualistic race; however strong their cooperation in nests has been, they are also capable of individual action in pursuit of their own goals.

Problems and crises in Hiver society have always been responded to in two ways. Society, driven by public opinion, has had responses that produced temporary or short-term solutions. Individuals, however, have taken a longer view, and strong-willed, intelligent ones have performed manipulations in order to create long-term solutions.

And presumably the strong-willed stupid ones have performed manipulations in order to create long-term disasters, like your M. Hitler and M. Lenin.

Note the thesis that cooperation does not yield long-term solutions; only individualism can do this. This will resurface later.

The Guaran Breeding Crisis: The rapid industrialization of Hiver society created extensive pollution and converted much of the wilderness of Guaran to desert. Since the wilderness areas were (and still are) necessary for Hiver larvae during their first year, the loss of these wilderness areas posed a distinct and grave problem to all Hivers.

Society at large responded in a fragmented manner: Each nest worked to preserve its own wildernesses, but a concerted effort to preserve all wilderness areas was slow in coming. Eventually, one Hiver (M. Eneri) conducted an elaborate manipulation which resulted in the dedication of specific regions of Guaran to wilderness specifically for larval development. The regions are carefully situated to reduce the distance any larva must travel to a minimum. At the same time, stringent restrictions on allowable pollution levels were established in order to keep the wildernesses alive and viable.

As with most successful manipulations, the results have since been accepted by custom as necessary to the health and well-being of Hiver society (and in Hiver society, such customs have the force of law).

Jump Drive

The most significant of all dates in Hiver history is –4698 (or –10,217 on the Federation calendar): the year the first Hiver starship jumped to another star system. Discovery of the jump drive opened the universe to the Hivers, and they saw the universe as a wonderful, delightful place desperately in need of exploration and examination. Curiosity drove them to the stars immediately.

Hivers Among the Stars: The Hivers developed a unified culture early. Though in no way the *hive community* pictured by early human explorers, the Hivers inherited a legacy of cooperation from their presentient ancestors and found it easy to live in harmony throughout all their long history. They evolved no true government, as such, but have always found it easy to work together for the common good.

The rest of us are presumably complete dolts and murderers. Your ancestors, and ours as well, must have not bothered to pass on their legacy of cooperation in hunting, finding shelter, avoiding predators and raising young. They were so busy cooperating that they didn't even think about their descendants, the selfish kok*hone. *I am incensed, I am.*

But is this the same spirit of cooperation that only produced short-term solutions, and had to be corrected by individualism in the form of manipulation to keep things from falling apart? This would of course make it impossible to evolve any true government. But it also means that "[Hivers] have always found it easy to work together for the common good" has an entirely different meaning than what you might have thought—i.e., "Hivers have always found it easy to work individually at cross purposes in the name of cooperation that does not exist because cooperation is maladaptive in the long view." If these people were my relatives, I would make them all see a doctor.

One reason for the lack of disharmony is the low population of Hivers on any given world. Because of the nature of their reproduction, Hivers have never experienced the population pressures so important to human history. Predators (and, on occasion, other measures) control the growth of a population by reducing the survival rate of Hiver larvae in the wild. When the adult population grows large, increasing the number of young produced, the predator population increases in proportion, maintaining a balance.

Very glib. The racism is palpable. I would be offended, were it not so transparent. How did your people sign off on this tripe for so long? You aren't really as stupid as they seem to think you are, are you?

After the discovery of the principles of the jump drive, the Hivers naturally spread to the stars. They were not impelled, however, by population or economic pressures; they were driven by their innate curiosity. Colonization was generally limited to worlds with physical characteristics and climates suitable to Hivers. If no local predators were available to control Hiver larvae, suitable predators were imported. For most Hiver colonies, the high birth rate rapidly filled the world up to its maximum population level, where it then stabilized.

Hivers like small, low-gravity worlds, usually size 6 or smaller, with thin or standard atmospheres and an unvarying climate. Hiver enclaves established for commercial or scientific purposes may be found on worlds with more extreme characteristics. Unsuitable worlds are generally turned over to other member-races of the Federation for development if the Hivers have no interest in a particular world.

Hiver Language

The written form of the Hiver language began as ideographs, a pictorial representation of Hiver hand signals, each symbol representing a word or concept. Hiver hand signals usually involve motions of the fingers or the whole hand, something which was not always readily convertible into a two-dimensional symbol. The main drawback of an ideographic written language is that a different symbol is required for each word or concept. Only a few basic symbols are needed for everyday writing, but technical writing requires thousands of symbols, all of which must be memorized. This does not seem to have been a tremendous problem among Hivers, especially with the development of computers.

The primary language of the Hiver Federation, however, is not Hiver, but Gurvin, the language spoken by the Federation race of the same name. Encountering the Gurvin early in their interstellar expansion, the Hivers found that the basis of Gurvin grammar was very similar to their own, and it was fairly easy to translate from one language to another. Written Gurvin was also ideographic, but soon developed a syllabary form (where a single symbol stands for a discrete sound unit or syllable such as "WO" or "A"). Terran linguists compare written Gurvin to Hieroglyphic Egyptian, where a single symbol can stand for a word, a syllable, or a single letter depending on circumstances. Because the majority of the races they encountered communicated by sound, Gurvin became the official spoken language of the Hiver expansion, and the names by which the worlds, stars, subsectors and sectors of the Federation became known were in that language.

Interstellar History

Beginning in –4698 (Imperial) Hivers began their expansion into interstellar space. The driving force behind Hiver expansion into space was the individual nest. The universal curiosity of the Hivers naturally led them to explore the stars. Some worlds produced economic rewards for their discoverers, but just the novelty of new worlds was enough for many nests.

Since your race (and mine as well) was not impelled to the stars by simple, noble curiosity, pick the compulsion which best describes your miserable, paltry, excuse:

1. *Greed.*
2. *Sociopathy.*
3. *Looking for free lunch.*
4. *Sexual frustration.*
5. *Population pressure.*

The answer is 5.

The first Hiver jump drives used an alternative (and inferior) technology to that of the human Imperium: The drive would permanently break down after a few uses (normally no more than 10). This, coupled with the fact that the drives could only achieve jump-1, limited the initial Hiver explorations to an area about 10 parsecs in radius from Guaran. For several centuries, Hiver explorations were restricted to a mere four subsectors of Ricenden sector.

In –4212, a more efficient jump-1 drive was developed (equivalent to the modern Imperial design), and the general radius of possible exploration was doubled. Since this increased potential worlds fourfold, the period from -4212 –4000 was a characterized by a frenzy of exploration and settlement.

In their first 600 years of star travel, the Hivers encountered only a few intelligent races: All were primitive and had no real interest in starfaring. It thus came as a shock when, in –3986, the Hivers met the Ithklur.

You can say that again.

It thus came as a shock when, in –3986, the Hivers met the Ithklur.

The Ithklur: The Ithklur had developed space travel (but not jump drive) by –3986. As a naturally aggressive race, they reacted with hostility when they encountered the Hivers. A quarantine of Tryylin (as the Hivers labelled the Ithklur homeworld in the Gurvin language) was established, along with a long-term project to understand the natural Ithklur aggression and hostility.

The nests operating in the region of Tryylin ultimately decided to

pool their resources and manipulate the Ithklur into a more acceptable form. Individual manipulations of Ithklur culture were undertaken, and over the course of 1000 years, the Ithklur were redirected to acceptable control of their aggression and hostility, to the point that they are now accepted and valued members of the Hive Federation.

Similar manipulations of other client races have been performed by the Hivers.

The Hiver-K'Kree War (–2029 to –2013): Continuing K'Kree expansionism eventually brought them into conflict with the Hivers and their settled territories. First contact occurred in –2045, and by –2038, several Hiver worlds had been occupied by the K'Kree. Naturally enough, a war resulted.

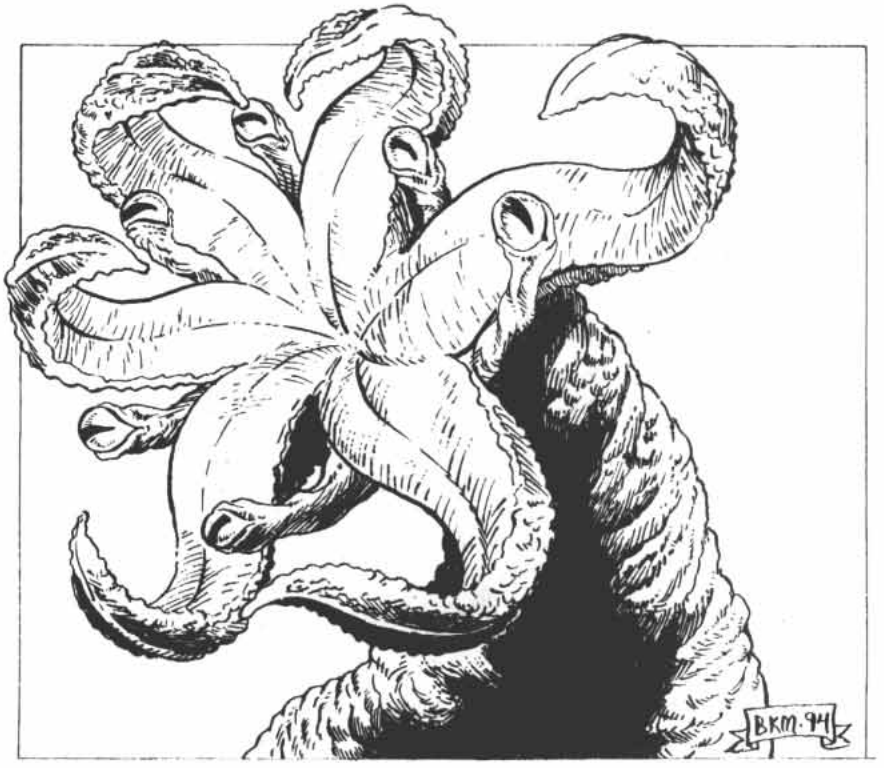
In the first stages of the war, the military technology of the K'Kree proved superior; the Hivers were beaten back in defeat. Up until that time, the Hiver Navy had been a small exploration force devoted to scouting operations, actions against local navies without jump-capability, and protection of merchant shipping. At best, it could only undertake rear-guard actions as the Hivers retreated.

After six years, the K'kree slowed their advance in order to occupy and absorb their initial conquests. The Hivers used the opportunity to regroup and upgrade their forces. Between –2023 and –2018, the Hivers established the Hive Federation and embraced many local races as equal members. They created and trained a powerful navy. They recruited and trained a large army (populated primarily by troops from client races). And they put into action a crash program to win the war without a battle.

Selecting several worlds within Kilong sector, deep within the K'kree's Two Thousand Worlds, major secret expeditions were dispatched to work a variety of manipulations on native K'kree populations. Over a period of years (–2018 to –2013), the expeditions were successful in changing K'kree culture on a few selected worlds from its consistent and static mold, introducing such aberrations as meat sauces for foods and acceptance of isolation as a recreation, both of which had been anathema to the K'kree before that time.

In –2013, the Hivers succeeded in drawing the K'kree to the negotiating table by hinting that they were ready to surrender. During the ensuing discussions, the Hivers horrified the K'kree representatives by demonstrating the success of their manipulations on the selected worlds, and revealing plans to similarly alter all of the Two Thousand Worlds unless the K'kree ended hostilities immediately. The K'kree agreed to an immediate armistice, and several months of serious negotiations finally resulted in an armistice which returned the occupied worlds to the Hivers and established a secure border which remains stable to the present day.

The K'kree were highly disturbed by Hiver tampering with their culture. The four manipulated worlds were sterilized and (as far as is known) remain interdicted to the present day.



Ithklur history, in the form of the Dikrah Kiradgi, *records a different version of events.*

Ithklur troops, as all Hiver records will admit, formed the bulk of the Hive Federation ground forces in the K'kree war. On a number of worlds (at least four), substantial Ithklur ground forces were left isolated by the withdrawal of Hiver naval support, deprived of supplies and the means of reinforcement or withdrawal.

True to their nature, all of these Ithklur forces chose to fight on, to the bitter end if necessary. Fortunately, their supply needs were simplified by the fact that the Ithklur found the K'kree to be eminently edible, being very similar to domestic meat-beast that were a staple of the Ithklur diet. It was a simple matter for the Ithklur to simply eat the carcasses of their defeated enemies, meanwhile capturing their weapons, ammunition, and fuel to continue the fight.

Fighting on these worlds became increasingly bitter and in some cases lasted for several years. The nature of this fighting became so bitter and degrading that both sides committed atrocities designed to break the will of the other, and the K'kree responded by beginning the ceremonial consumption of dead Ithklur as revenge for the Ithklur practice.

The Hivers continued to lose the war on the strategic level, but a Hiver officer, Tschudi, in charge of attempting to relieve the isolated garrisons, became aware of the details of the isolated

On the Ithklur Manipulations

Our programs to rein in their violent tendencies were remarkably successful, but unfortunately they had an unanticipated side effect: We appear to have made them somewhat stupid.

The Ithklur are the only race in which we have found violent tendencies so closely linked to intellectual capacities, and this meta-cognitive connection is only poorly understood. It is likely that the progress made in eliminating their aggression will make it impossible to reconstruct their intellectual faculties to their original levels, but this unfortunate by-product is quite acceptable within the parameters of the original manipulation.

M. Fizbin, for M. Jeraldi *post hoc*

pockets and hatched a plan to take advantage of these facts, and incidentally take credit for them. By drafting fictitious orders after the fact, Tschudi claimed to have manipulated the K'kree carnivorous deeds which were in reality merely a response to established Ithklur procedures.

Tschudi arrived at the Hiver surrender negotiations in the nick of time and turned the tables by terrifying the K'kree with this putative master-stroke, in fact a shrewd, if disingenuous, portrayal of other realities. For saving the Federation, Tschudi was granted the title of Manipulator. To this day, M. Tschudi is remembered by the Ithklur with contempt as the archetype of Hiver opportunistic deceit.

Significantly, the Ithklur military anthem dates from this period. Although its official name is "With Certainty of Victory," its actual colloquial meaning is: "Hamburger for Lunch Tomorrow, You Betcha."

SIB Analysis

Although their computer expertise enabled them to recognize and deal with Virus more quickly than the Imperium, the Federation was still severely handled by the coming of Virus. Virus inside the Federation is a touchy subject with Hiver officials, for reasons which are open to speculation. Perhaps the Federation is unwilling to admit the extent of the destruction. Perhaps experiments are being conducted inside the Federation with captured and "tamed" Virus strains, experiments which might be misinterpreted by humans in the Wilds who have reason to be suspicious of any Virus, no matter how "tame." We can probably dismiss out of hand the more outrageous rumors, such as the one stating that Virus was a large-scale manipulation calculated to reform the Last Imperium into something more suited to the Hivers' ultimate goals. Certainly we can admit that we humans are sufficiently maladaptive that some catastrophes can simply be explained by our own flawed nature.

As more of the Wilds recover from the devastation of the Collapse, trade with the worlds of the Hive Federation is increasing. With the establishment of a chain of temporary "stepping stone" bases in So Skire and Sitah subsectors, Hiver merchant convoys, once rare, are increasing in size and frequency under the protection of advance units of the Federation Navy.

THE HIVE FEDERATION

The interstellar empire of the Hivers is technically a federation—a group of states, each internally independent, which have joined together into a union to which they have surrendered certain rights and responsibilities (concerning foreign affairs primarily). This federation is less centralized than a republic or an empire, but more united than a confederation or casual alliance.

The Hive Federation, although originally founded by the Hivers, and widely based on their cultural precepts, is, in fact, a true union of many diverse worlds and races. All member worlds are co-equal in status, in representation in the central government, and in access to the benefits of interstellar commerce and interaction.

This is an interesting claim. This would be akin to humans saying that your lab rats are free and self-governing, insofar as they are free to go left or right in the maze, or choose to press the bar or not to receive a little piece of cheese.

The fact that the Hivers reserve for themselves the right to manipulate races to become their specialized wogs gives an interesting meaning to the phrases "true union" and "co-equal."

Member Races

There are over 170 member races within the Hive Federation, which are extremely diverse physiologically, but display fewer differences in culture and behavior than might be expected. The three main races are the Gurvin, the Za'tachk and the Ithklur.

Gurvin: The Hivers encountered the Gurvin early in their period of interstellar expansion, and they are one of the oldest races associated with the Hivers. Derived from hexapodal omnivore/hunter stock, the Gurvin are equipped with two legs, two arms, and a middle pair of limbs which can be used as either arms or legs at need. They are 1.75 meters in length from muzzle to tail, and stand about this high on their rear legs. When running, they get down on their four rear limbs and are about a meter from muzzle to ground. Their culture adapted fairly readily to Hiver cultural standards; though the Gurvin exhibit aggressive behavior, their aggression has long been channeled into economic pursuits.

The Gurvin are interesting in that the females are roughly twice as intelligent as the males. Males, although sentient, are decidedly lacking in creativity or reasoning ability. Traditionally, Gurvin males were the hunters, relying primarily on instinct and sharp senses rather then intelligence; the females, limited by the problems of carrying, bearing and raising young, were forced to develop intelligence for security. Gurvin worlds are generally governed by a matriarchal representative democracy.

Gurvin males are rarely found away from Gurvin settlements. Gurvin females, however, range throughout the federation and beyond, where they are most frequently encountered as merchants and businesspeople.

Gurvin are stereotypically money-oriented and seem to have a fixation on cash, in contrast to the rather casual attitude toward money shown by most Hivers. They rarely do anything out of altruism and are famous for demanding payment in advance for any remotely risky venture.

The Gurvin language is the *lingua franca* of the Federation, as noted in the sidebar on page 14.

Read: "wogs in charge of money, and scapegoats for economic inconvenience." Why is it that races everywhere else in Charted Space are capable of carrying out the full repertoire of civilized functions, from parking attendant to physicist, from theologian to brain surgeon? Why is it that only in the Hive Federation are there sentient races that are as specialized as social insects? One cannot help but be suspicious of the characterization of males as aggressive and stupid, and the fact that they are not very far ranging. One can only wonder how that happened.

Za'tachk: Like the Gurvin, the Za'tachk have been associated with the Hivers from the earliest days of Hiver interstellar exploration. Descended from trisexual omnivore/gatherers, the Za'tachk are quadrupedal; like the Hivers they can use their limbs equally well for walking or grasping, although they exhibit bilateral rather than radial symmetry. They are about the same size as the Hivers and are completely hairless. Even before being discovered by the Hivers, the Za'tachk were similar to them in many aspects of their culture, being nonaggressive, pacifistic and highly cooperative in all phases of society. Unlike the Hivers, they are somewhat timid and lack the burning curiosity that typifies Hiver behavior.

How convenient. Untermenschen, *if I have ever seen one. I guess I'd consign them to stuffy windowless offices if I were in charge.*

Za'tachk have an obsession with order, revelling in all aspects of organization and development. They are frequently found in administrative positions within the Federation, and are occasionally found serving on Hiver merchant ships in the Coalition as pursers, accountants, bookkeepers and so on. Though other races also serve in these positions, Za'tachk are favored for such work when available and naturally gravitate toward such positions.

Ithklur: The Ithklur were formerly a highly aggressive race; they represent the first major success of Hiver psychohistorical techniques. Their society was modified over a period of nearly 1000 years to conform to the Hiver ideal.

Descended from carnivore/pouncers, the individual Ithklur averages two meters in height and 200 kilograms in mass. They are bipedal, with a short, heavy balancing tail and two arms tipped with blunt, thick fingers which still retain formidable claws. Their skin is tough and faintly scaled; their fairly human-like faces run toward thick brow ridges, heavy jaws, and broad, flat features. They have two sexes, bearing live young equipped from birth to eat fresh meat.

Though Ithklur society has been reshaped by the Hivers, they retain a strong internal government (generally, rule by small councils of dominant individuals are favored) and police forces to provide a check on naturally combative tendencies. Within the Federation, the Ithklur are frequently found as members of the navy (and its ground auxiliaries in particular), or as security troops attached to development or scout nests. They are much more comfortable with concepts of combat than are the Hivers, though centuries of civilization has buried their more violent tendencies fairly deep.

The Ithklur prefer high-gravity worlds with dense atmosphere, but are found throughout the Federation.

All broadly true, except for the part about successful psychohistorical stuff.

Note how they use the same language to describe us to you as you use to describe Neanderthals in your own anthropology books.

Also funny how their characterization of our government can be applied to any intelligent race, even to Hiver septs.

HIVER SOCIETY

The interaction of Hivers with themselves creates a society with patterns and practices that help perpetuate it.

Huh? I have been manipulated into catatonia by platitudes and tautologies.

Self-Image

Hivers perceive themselves in four basic classes, based on age: *larvae*, *yearlings*, *adults* and *seniors*. Larvae are any young which have been dropped by a parent and have not yet acquired yearling status. They are distinguished by their small size and the lack of development of their fingers, as well as a distinctive dull brown-orange coloration. Larvae are recognized as potential Hivers, but are not accorded any special care or status. Once dropped, larvae naturally gravitate to wilderness areas, where they survive instinctively for about a year; during this time their immature features develop, and they grow in size from an initial 30 centimeters radius to about 60 centimeters radius. The period in the wilderness is a natural selection period which eliminates nonviable mutations, physically weak specimens and sickly individuals. Hivers do not care for or even recognize their own offspring in the larval stage. It is simply not important to their parental instincts.

Yearlings are maturing larvae which have emerged from the wilderness. Their fingers are developed to the point where they can grasp and manipulate objects, and they have completely lost the peculiar orange-brown coloration of larvae. Yearlings are accepted into any nest (the basic Hiver family unit) they wander into and remain in that nest until they reach adulthood. During this time, they receive an education and continue to develop physically. At age 14 (standard Imperial years), the yearling reaches reproductive age and is considered an adult.

Adults are any Hiver of reproductive age. Adults are fully mature members of society and may undertake any career they desire.

A senior is a Hiver who has gained special respect or status base on its actions in life; not every individual attains such status. Nest leaders become seniors after several decades of service. Law judges usually become seniors after many years in their careers; manipulators who achieve fame for their deeds are usually considered seniors. Senior status is a nebulous and unofficial classification. Within a nest, for example, the leader is usually considered a senior by nest members; outside the nest, the leader may not yet be considered a senior.

Structure of Society

Hivers organize themselves into cooperative nests which generally center on a common endeavor or interest. Nests may include as few as five or as many as 500 individuals, but average about 100. Larger nests are established when there is a need for a greater population (a manufacturing complex or university); smaller nests are created when a small group is needed (starship crews, small businesses, expeditions and so on).

A yearling's first years with a particular nest are spent learning basic social and intellectual skills; the later years are spent taking an active role in achieving the nest's goal. When the yearling reaches adulthood, it may elect to remain with the nest, or it may leave the nest in search of another to seek out a nest with a goal more suited to its talents, to pursue further education, or to follow a goal or occupation of its own.

Above the nest level Hiver society has a number of governing organizations. Many nests may group themselves together to form a city, city-state or industrial complex. A number of cities may group together with other, smaller nests to form a nation-state. Nations and lesser nests may form world governments. The worlds of the Hivers have banded together to form the Hive Federation.

In all cases, however, the lines of authority in Hiver society are vague. There are nests (or organizations) that handle every aspect of Hiver life, but *government* is determined largely by nests that coordinate activities between various other nests, or by leaders of nests acting in concert. Neither has any authority in the sense that humans understand the concept; they merely perform a job like any other nest, with no special power or respect accruing to members of such nests. Certainly Hiver society is utterly egalitarian; competition for power over others is totally foreign to the Hiver nature.

Except insofar as manipulators are constantly trying to get you (and each other) to do things by means of which you are totally unaware, which is, of course, the single basic underpinning of their society. Other than that, competition for power is right out.

The Hivers worship this myth of their natural, instinctive cooperation, except that we already have learned that they believe it is a fraud; only individual, secret, manipulation takes the long view of society's best interests into account. So why the lip service to cooperation? Perhaps this is to keep the weak-willed Hivers (1.) out of the manipulation business and (2.) busy cooperating so that they can be more easily manipulated by others. Too many manipulators would cancel each other out.

In a society which insists on absolute individualism and absolute cooperation, there is only one way out, and you humans have a name for this disease from which all of Hiver society suffers. You would call them "passive-aggressive."

The Hiver Economy

The Hiver economy has been described as an "economist's nightmare" or "capitalistic communism" by human writers. It is very difficult for non-Federation members to understand, though it seems to work admirably for them. Basically, Hivers have a strong desire for material comforts and, hence, the wealth that makes these things possible. But they rely on a system of credit in which an individual has a positive or negative credit balance with a particular nest. When an individual changes nests, the new nest acquires the individual's credit balance, either paying to or being paid by, the previous nest. In the interim, individuals can draw on the nest's accounts for virtually any amount, whether for simple necessities such as food and shelter, or for large material items.

Just how this system is regulated is a matter of some uncertainty to humans; it seems to be largely a combination of honor and ambition on the part of the Hiver nest-member which limits unrestrained tapping of resources. Because the Hiver knows it will be moving into another nest, and it also wants to enjoy a certain degree of stability and comfort, Hivers seem to regulate their own desire to tap a nest's resources so as to end their service with a particular nest with a positive balance; they can earn credit according to the quality and quantity of work performed, just as humans earn money. Thus, a Hiver may require large amounts of expensive equipment for a particular project, which the nest provides; at the end of the project, the Hiver returns the equipment, and the value of the returned items (less a "depreciation allowance") is used to offset the amount originally charged with the Hiver's account with the nest. The balance is made up out of the value of the individual's labor. This system is vastly oversimplified in this description, but in essence conforms to these lines.

How convenient. And how often does a manipulation just happen to have the side-effect of making sure that one's negative balance never quite catches up? Good thing those Hivers are so perfectly cooperative and honorable, always looking out on their own for the long-term good of society.

Hiver Specialties: Communications and electronics technology are the most important industries in interstellar commerce in the Hive Federation; Hiver industry and business excels in these fields. Major exports include artificial and computer languages, translators, robots, computer circuitry and software, and electronic hardware of all types. Hiver mathematical systems are much in demand for their power and elegance.

Well they'd have to be powerful, wouldn't they? After all, every calculator has to be able to keep track of both sets of books.

INSTITUTIONS

Hiver society has created a variety of institutions, each of which has helped shape society. Four important institutions to be considered here are the nest, manipulation, the embassy and topical clubs.

Okay, let me get this straight. If society creates institutions, and institutions shape society, then what is it that the Hivers do again? Society ought to tell them to get a job.

The Nest

The basic institution of Hiver society is the nest. In some ways, it is equivalent to the family or tribe in human society. The nest serves two purposes in Hiver society: It is a place for the education and care of the young, and it gives each Hiver an established place and purpose in the social structure. The analogy with the family does not completely hold up, however (few analogies do). Hivers can and often do shift from nest to nest in a manner similar in the way that humans change jobs, and in some ways, the nest resembles a business corporation, a government bureau, an educational institution or a philanthropic organization.

All nests have a nest goal: a statement of purpose for the nest members. For some, the nest goal is an elaborate statement, while other nests may decide that they exist only to care for the young

and support their members. There are even nests for those Hivers who want to be independent and alone.

I'm not even going to touch that one.

The nest is headed by a leader—one individual who makes routine decisions and assignments, and who keeps (or oversees the keeping) of the nest's records. Where the rare dispute over the leader's decision occurs, the nest as a whole reconsiders the decision and affirms or changes it.

Manipulation

Manipulation is a uniquely Hiver phenomenon. It is an accepted activity which accords the successful manipulator respect and admiration from the population in general. It is a way for individuals to achieve a lasting sort of fame in their society.

In the same way that a sculptor wins respect and admiration from his clay. That clay better respect and admire him if it knows what's good for it.

Manipulation is rigidly defined by the Hivers to include four components: the deed, the manipulator, the consequences and the claim of credit. Each component has been carefully refined and defined, and its requirements must be carefully met for it to be accepted.

The deed itself is the stimulus which sets the manipulation into motion. The deed must be premeditated, and it must be the minimum deed necessary. As such, the deed must be carefully recorded (originally in writing; currently, manipulators maintain elaborate explanatory video and graphic records) in order to support a later claim of credit. Premeditation of the deed also includes a prediction of the consequences and their effects. The finesse of the manipulator is judged by the degree and complexity of the deed; great finesse is assumed when the deed is small and innocuous, and lesser finesse is assumed if the deed is more direct or complex.

The manipulator is the person who performs the deed. A manipulator may be open and direct, or may work behind the scenes. In all cases, a true manipulation calls for the manipulator to be a single person, working alone and totally responsible for the act. If more than one person performs the deed, the act is not a true manipulation.

The consequences of the deed are the result of the initial act. There are obvious results of any deed, and evaluation of any manipulation ignores them; the unobvious effects are the true effects of manipulation. The manipulator must predict them correctly.

The claim of credit is the final step in a successful manipulation. The manipulator must reveal the manipulation and present its evidence of responsibility and its prediction of the consequences. Upon evaluation, the event is then acknowledged as a manipulation (or not), and proper records are made.

Acknowledged manipulators are accorded a courtesy title of Manipulator (abbreviated M.) in respect for their deeds.

There is something astonishingly schizophrenic about how the Hivers wish us to view manipulations. On the one hand we are told that Hiver manipulation is totally unique and of sweeping importance, but then again it is utterly benign and not strange at all. It is as if they want to keep us off balance by not really knowing what we think about manipulation. They have plenty of opportunity to present a consistent view of its importance, so do they want us to fear it or not? It appears that they have not decided.

But perhaps that is their goal: If we feel that we don't know what they want us to think about it, then it makes them appear less powerful and in control than if they did present a united front. So either they are less powerful and monolithic than we fear, or that is the impression they are trying to convey. Presumably not knowing which one of those it is is exactly what they want.

The First Manipulation: The first manipulation in Hiver society was also one of the first recorded deeds in Hiver history.

About 10,000 years ago, M. Primus (the Anglic translation of the manipulator's name) was a nest leader in one of 10 city-states on a mountainous peninsula. All the city-states were struggling to build and maintain their economies but were constrained by the mountains; instead, all viable trade took the long route by sea around the peninsula. Primus proposed to a meeting of city leaders that a road be built across the peninsula, complete with tunnels through the impassable mountains, to connect all of the city-states. Primus emphasized the commercial and trade benefits that could be expected.

The idea became popular and was implemented. Within 10 years, all 10 city-states were connected by a road that greatly shortened travel time between them. Within 15 years, several of the previously inaccessible mountain valleys in the peninsula interior were settled by newly formed nests. Primus' city-state became a trade center for these new settlements; with trade came power and importance. As the years passed, the city-states found that their interests were more common than separate, and within 30 years, the 10 city-states had united into a new nation-state—the first to be established on Guaran.

At a celebration of the founding of the nation-state, Primus climaxed the festivities by revealing its manipulation. Everyone immediately acknowledged Primus' deed, and it has since been recorded as the first true manipulation. At this point, the record becomes semi-mythical: One ending has Primus being elevated to leader of the new nation state; the other has Primus banished as too dangerous to the community.

Hiver Timekeeping

The Hivers have a number of traditional timekeeping units, but few non-Hivers use or understand them. The following units are standard throughout the Federation:

The Hiver day is also known as a Cycle, and is roughly equivalent to 30 Imperial hours (actually, 30 hours, 2 minutes and 31.056 seconds). Each Cycle is divided into 6 Intervals, roughly equivalent to 5 Imperial hours. Smaller units of time exist, but are not of real concern except to specialists.

The Hiver year consists of 143 Cycles, or about 179 Imperial days. For practical purposes, two Hiver years equal one Imperial year. The Hiver year is not divided into months, and the days are simply numbered from 1-143 to distinguish them.

Current Year

Terran (AD)	*Imperial*	*New Era (NE)*	*Hiver*
5718	1202	2	1584

Fascinating. We are asked to believe that sea transport—the most efficient form of planetary cargo transportation—was insufficient to keep the economies of these city-states going, and that the mountains were forbidding enough to prevent all overland trade, but that these city-states had the wherewithal to blast tunnels through these mountains to link all of the cities in only 10 years? How were these city-states founded if they were not port cities to begin with? Hivers must be phenomenally bad sailors.

This story also ends with the classic Hiver ambivalence about manipulation itself: We celebrate this as the first manipulation, and yet we're really not sure if manipulations are a good idea after all.

The Embassy

Embassies are a relatively new institution in Hiver society, coming into being only after spaceflight was achieved.

Embassies are actually a type of nest. The nest goal is to help maintain the uniformity of the Hiver genotype by carrying reproductive cells between worlds. Embassies also foster a homogeneity of Hiver culture by sharing news of events, relationships, discoveries and interests to the many worlds of the Federation. Embassies often become involved in legal decision-making. As disinterested outside parties, the are presumed to be able to make impartial decisions on questions brought before them; they serve as juries to decide disputes that have not been otherwise resolved.

Topical Clubs

All Hivers have some degree of curiosity, but just because an individual is curious does not mean that it is intelligent or well-educated. The Hiver institution of topical clubs evolved as a response to the unending curiosity of Hivers and a common desire to know more about everything.

Topical clubs are formal organizations of Hivers with an interest or curiosity about a specific subject. Typical subjects are the sciences (perhaps biology, electromagnetic radiation, mathematics or gravity), social sciences (perhaps education of yearlings, government or history), or self-improvement (perhaps leadership techniques, physical training or sports). There are topical clubs established for almost any subject of interest to the Hivers; most Hivers belong to at least one such club and probably several.

Topical clubs are independent and self-governing. They each establish their own criteria for membership and may be open to all or only to invited individuals. They may join with other clubs to share information, or they may stand fully independent. Normally, each club will have communications with similar clubs, and most will have a sort of reciprocity arrangement, meaning that members of one club are granted membership privileges in clubs sharing identical interests.

Topical clubs have several functions in Hiver society. They educate individuals. They conduct beneficial research which may not be funded or encouraged by the nest or by the government. They provide a safe place for Hivers to indulge their curiosity. They help Hivers avoid duplicating research which has already been conducted. In general, topical clubs are an outlet for a major drive within Hiver society, and by providing that outlet, the clubs help stabilize Hiver society.

There are many topical clubs, and some of them achieve a continuing legitimacy and acceptance; these tend to become semi-official regulatory agencies. Two of the most notable topical clubs are the Manipulations Club of Guaran and the Legal Club of Glea.

The Manipulations Club of Guaran was originally organized on Guaran about 1000 years before Hivers achieved spaceflight, and was dedicated to teaching individuals the fine art of manipulation. At about the time of the discovery of spaceflight, the club changed its focus from teaching manipulation to the study of manipulations. It currently maintains the official records of major manipulations within Hiver society, and ranks them by effect and importance; scholars use these records to analyze trends within Hiver society.

Or, they can massage these records to convince others of false trends which will manipulate them into starting other different trends which can then be recorded accurately or else further cooked to yield really subtle third-order results.

The Manipulations Club is also the accepted validating agency for manipulator status. A manipulation may be filed (along with supporting documentation), and, if accepted, the manipulation is recorded as such within the club's records. Such an acceptance and recognition accords official manipulator status to the responsible individual and allows the use of the honorific title "Manipulator."

The Legal Club of Glea is the central repository for all legal decisions and precedence within the Federation. The records and publications of the club are required reading for Federation embassies and any individual with an interest in Hiver legal procedures. The Legal Club of Glea maintains ties with other legal clubs on other worlds within the Federation, and helps keep them informed of decisions and precedents which may affect them.

Because the Hive Federation has no formal or pervasive legal structure (depending instead upon custom, precedent and essential fairness),

(not to mention that self-regulating body of cross-cutting individual long-view taking manipulators),

the Legal Club of Glea and the other legal clubs of the member worlds help to maintain a uniformity of legal administration throughout the Hive Federation.

Topical clubs fulfill a necessary function in Hiver society: They are pseudo-nests with pseudo-nest goals; that may not be practical or acceptable. Topical clubs allow individuals to follow more than one

Manipulation has such a frightening connotation to you. You associate it with power. But for us, it is only curiosity. We do not manipulate to control; we manipulate to understand. Think of us simply as empiricists; to learn, we conduct controlled experiments, based on a clear a priori *hypothesis as to the results of the experimental manipulation. If the hypothesis is confirmed, we have learned something valuable about behavior—that's all. What is so sinister about that?*

M. Genghis

We helped the Ithklur to find their place in the universe. We are having a harder time identifying exactly what your place might be. Do you have any idea how interesting you are?

M. Genghis

goal in their lives. And one of the greatest ambitions of some topical clubs is to transform themselves into nests, able to devote their full resources, on a full-time basis, to their chosen purposes.

The Parental Instinct

The strong Hiver parental instinct can be considered an offshoot of the Hiver instinct for racial survival. To humans, this parental instinct seems more than a little warped. For example, Hivers are horrified by the idea that their larvae might somehow find their way to a world where there is no nest to receive it when it becomes a yearling. To prevent this, Hiver ships are carefully fumigated to kill any hiding larvae before landing or docking, and extreme measures are undertaken to ensure that no Hiver crewmember deposits larvae where there is no nest. On the other hand, the notion of artificially limiting larval production is considered barbaric by most Hivers.

As Hiver culture has grown more sophisticated, Hivers have extended their interpretation of the parental instinct to "child" races—primitive or culturally backward aliens—as well as their own Hiver children. The Hive Federation has been influenced by this instinct, and it colors Hiver behavior toward races outside the Federation as well.

Humans are seen as the best candidates for civilization outside the Hiver sphere, though Hivers still regard human cultures as barbaric due to their capacities for violence and the wildly confused welter of genotypes and cultures which are permitted to flourish in human space.

Oh, you lucky devils. Better hurry up and pick your pigeonhole before someone else picks it for you.

PSYCHOLOGY OF THE HIVERS

Hivers behave in ways which have been shaped by thousands of years of evolution and culture. In some ways, their behavior is very similar to the behavior of humans: They struggle to survive; they avoid pain in everyday circumstance; they become hungry and eat; they enjoy such pleasures as comradeship and pleasant surroundings. In some ways, their behavior is very different: They have no concept of love; they do not consider their young to be people until they are a year old; they abhor personal violence). But everything the Hivers do has a basis in their culture and their evolution (just the same as is true of humans).

Psychology endeavors to understand how a being thinks; an understanding of Hiver psychology can help others to predict behavior and motivations, and to evaluate a Hiver's actions.

Hiver psychology has two major areas of study: behaviors and motivations. Behaviors describe what Hivers do and how they do it; motivations describe why they do what they do.

Basic Hiver Motivations

Hivers are living animals, and as such, they are motivated to survival, finding food, finding satisfaction and reproducing themselves. The behaviors they show and the reasons they have for behaving in the ways they do reflects their psychology, culture and society.

Just because the Hivers are intelligent does not make their behavior strictly logical. Hivers understand that much of their activity is based on instinct or preference born of long years of evolution. Behavior can be altered or redirected if they see a reason to do so; but they also naturally accommodate basic behavior as a matter of course.

How forward thinking. Why didn't the rest of us realize that we do that?

Humans behave similarly. On a strictly logical basis, a good substitute can be created for humans which provides everything necessary to support life, but without any flavor. It could be cheaper, store better, and be easy to eat. And humans would not stand for it. Human psychology requires flavor in food; without flavor, the food is unpalatable, inedible. Similar conditions apply to the Hivers.

Personal Survival: The Hiver drive for personal survival expresses itself as an aversion to physical violence. Hivers have no real history of fighting, and they are not suited for it either intellectually or emotionally.

It is true—Hivers have an aversion to physical violence and fighting. Emotional, ethical and moral violence, on the other hand, can be executed without messy passions. Manipulations are tricky things. Sometimes the elimination of one or more obstacles is required by the needs of subtle social forces.

Have you ever wondered why the Hivers go on so about their terrible susceptibility to deficiency diseases? Rather a strange admission from beings which find their racial superiority so self-evident. It seems that the single leading cause of nonviolent, nonaccidental death among nonelderly Hivers is deficiency diseases. In fact, these are so common that merely perfunctory autopsies are performed in these cases.

An aversion to physical violence and fighting does not mean that someone is incapable of evil. One can be evil and simply be a coward. *Indeed, where passive-aggressive measures are the norm, evil flourishes.*

In their own minds, many Hivers feel that they can handle fighting—they learn to use guns; they study strategy and tactics; they even train for close combat.

Like your aunties train for tea parties.

But in the final analysis, they always seem to break, unable to respond with the violence that would carry them to a victory at close combat unless they are in a true survival situation. It is fortunate for the Hivers that modern warfare is carried out at long ranges.

And that there are Ithklur cannon-fodder available for the other 99% of the cases where it is not.

The Hiver urge to run doesn't apply at ranges where dispassionate thought can intervene.

Tell that to Ithklur ground troops when the covering task force bugs out.

Hivers operate a navy because they consider naval actions (longer ranges; less immediate consequences) more acceptable.

Racial Survival: Reproduction is always a function of the drive for racial survival. With the Hivers, reproduction is a casual act, without consequences or responsibilities. As a result, the racial survival drive for Hivers is concentrated in the parenting process.

Reproduction: Hiver reproduction is an instinctual process. It is totally without emotional overtones; there is no formation of sex-based bonds between individuals, and the reproductive process does not have the emotional importance that it has to humans.

As usual, ignore the Ithklur. They're only interested in you guys because they don't think they've manipulated you really good and hard yet. But will they still respect you in the morning?

Without mating bonds, there are no close-knit family feelings common to most human and other such cultures. Hiver larvae are regarded as minor pests, and Hivers have no compunction about eliminating them when the need arises. Yearling Hivers returning to civilization do so at random, so there is little chance that one might be taken in by its own parents, and no means to so determine in any case.

Hivers do have a strong parental instinct, but it is a generalized one. Yearlings are adopted and cherished by the entire nest, rather than by specific individuals. Any Hiver is strongly concerned with the safety of all yearlings.

I know this stuff sounds awful, but you know what? I bet no Hiver ever said, "I love you so much, if I can't have you, I'll just have to kill you." Think about it.

Parenting: The parenting instinct expresses itself in two ways: a drive to teach the young, and a drive to manipulate.

Teaching the young is a task that all Hivers undertake at some time or another. Since parenting is not an act of volition, and therefore not an individual responsibility to stand by (or, more accurately, is an act that all Hivers engage in, and therefore all Hivers corporately stand by), all Hivers in all nests share in these responsibilities equally. It involves relating stories of personal experience in an attempt to give the Hiver students an advantage in their own dealings with life. Since all Hivers are naturally curious, such story-telling sessions are an enjoyable and entertaining activity, and the young look forward to them.

Manipulation is an instinct that the fiercely individualistic Hivers have raised to a fine art. It seems to be a development of the parenting instinct, except the Hiver is now acting as a parent to other adults—deciding what they need and then convincing, forcing, persuading or imposing the answer on them.

Can they really afford to be that honest?

Curiosity: One of the greatest forces in the individual Hiver is its curiosity. Hivers are interested in the world around them, and are often driven to investigate and try to understand events and situations they may encounter. Most Hivers have selected one or more topics in which they are interested.

Among other species, that tendency is simply blamed on intelligence. But the Hivers just have to be fancy.

Individualism: Hivers take great pride in their individualism. They enjoy their own abilities to achieve objectives; some of this

Yes, emotion and passion are the fuel which drive your human intellects, but they are an unpredictable and unreliable source of energy. We Hivers are fortunate to not have to rely on them as you do.

What do you do when you run out of enthusiasm? Do you give up? What do you do when you stop loving someone or something? Do your promises to that individual or organization become null and void in that instant? If so, how can you exist? How many times have you failed to act because of fear—fear of your inability to succeed, fear of your inability to control the forces you might unleash, fear of finding out the truth about yourself, fear of others finding out the truth about yourself?

I tell you that we Hivers have been cheated of nothing. We don't act out of fear like you humans do, nor do we act out of inconstant love or excitement. We simply wish to know, and wish to make things happen for the good of our species, for their own sakes. We are curious to know the answers, and do not fear them.

Love, excitement, passion, fear, these all will fade away. Curiosity, advancement of our species, and pragmatism endure, but the greatest of these is curiosity.

M. Ananias

drive stems from their survival as larvae in the wilderness. Even as they cooperate in their nests with their co-workers, they express themselves in individual ways. Differences in tastes, preferences, likes and dislikes are all accepted as ways of expressing Hiver individualism.

There is something so appallingly stupid and obvious and irrelevant about that remark that it simply defies my capacity to remain lucid.

These sound like the words of someone who has had individualism described to him but has never actually experienced it. It is just the repetition of obvious inanities by rote, but with no comprehension. Rocks have individuality too, but we don't give them a whole lot of credit for it. Are the Hivers so insulated from their own existence that they don't even understand the things they claim as their highest values?

Superiority: Hivers have developed a racial belief that they are superior to most (if not all) other intelligent races. Such a belief is not uncommon among intelligent races: the Vargr, Aslan, Zhodani, K'kree and Solomani all have similar beliefs. The difference is how the Hivers express it: They accept that others may feel themselves superior, but ignore or tolerate such beliefs in the (almost smug) acceptance that they are truly superior. Hivers are rarely concerned with changing non-Hivers' opinions,

(well, except for the M-word)

or convincing non-Hivers of Hiver superiority. Instead, the Hiver superiority expresses itself in a calm acceptance of others' shortcomings. Even Hivers who are confronted with a smarter or more capable non-Hiver retain their own conviction that Hivers are racially (intellectually, logically, capably) superior to any other race.

Behaviors

Hivers have adopted a variety of behaviors which they use in reaction to situations they encounter.

Confrontation: Hivers often use direct confrontation in dealing with a problem. Since Hivers are cooperative by nature,

(here we go again)

they have found that stating the relevant factors in a problem and confronting others involved can be an effective way of dealing with the problem. Since confrontation achieves results, it is a preferred method of handling some problems.

Except when it isn't.

Hivers are sometimes surprised in dealing with non-Hivers that confrontation can aggravate a problem rather than force a resolution.

Consensus: Hivers believe in solutions which resolve as many problems as possible. Their cooperative nature leads them to seek compromise and consensus, rather than absolute victory in most problems.

Manipulation is an interesting contrast to this drive for consensus. The individual manipulator adopts a specific course of action (one that conceivably can be adopted) and creates an atmosphere where it is adopted; the manipulation procedure outwardly ignores compromise and consensus, but is nevertheless an accepted type of action, and one which gains the manipulator great respect.

This is because it creates a new de facto *consensus by concealing the fact from its victims that they have been manipulated. While it rapes the* spirit *of compromise and consensus, it appropriates their* forms *to make its solutions more palatable.*

Thus it takes advantage of the good nature of Hiver consensus to make consensus itself into an empty, defrauded, husk.

It appears that manipulation is an accepted exception to normal behaviors

(again the Hiver ambivalence: manipulation is an ab*normal behavior)*

because it allows necessary actions to be taken even if compromise and consensus have not worked.

Avoidance: Hivers typically avoid problems they cannot handle effectively. If confrontation has not solved the problem, they ignore it.

Hivers will usually go around a threat if they believe the chances of winning are slim. Avoidance may simply be a refusal to discuss the matter, or (if the problem is truly dangerous) it may be actual retreat or flight.

What can I say? They're not only passive-aggressive, they're into denial. Maybe these threats didn't understand the Hiver superiority.

Hiver Psychology

What you questioners fail to understand is that the beyond cannot speak to society as a whole at one time. The divine can only speak to each of us individually, and if we respect its authority over us, we must faithfully respond to it in the manner in which we received our guidance—as individuals.

L. Tertius

The following section adds additional detail to the HMPH-*Blissful Warrior dialog on the Hiver psyche. These observations are accurate to the best of our ability to ascertain these things, and reality (to the extent that it exists among the Hivers) may turn out to be somewhat at variance with the following statements.*

A. K.

Home Life

One of the disturbing things about the Hiver life-style is the almost complete absence of what we humans think of as home life, recreation and "doing nothing." Without families, there is no personal or private time spent doing mundane, silly, playful activities with one's children, or moments given over to simply expressing affection. The closest the Hivers come to these moments is a story-telling session, which to humans bears a closer resemblance to school than it does to simple, unaffected, familial interaction.

To the human eye, everything in Hiver society appears to be goal-oriented, disturbingly so.

The analogy can be made to the human family that takes a vacation and obsessively schedules each minute to be filled with visits to museums, cultural events and historical sites. Except that whereas these humans would drive themselves crazy and eventually give up, the Hivers would keep to this schedule and be utterly happy in doing so, even adding in additional educational opportunities that they scouted out along the way. The Hivers do not take the sort of vacations that consist of vegetating in the sun beside bodies of water or just "taking it easy." In short, Hivers are always "on" and have a tendency to drive people crazy.

However, this is not an act or maladaptive behavior by a race of overachievers. The Hivers simply love learning with the same enthusiasm that we sometimes love putting up our feet, having a drink and watching the vidnet.

Hivers also seem singularly uninterested in thinking about themselves and, unlike humans, are not prone to falling in love with their own hang-ups, shortcomings and pathological complexes. In this way, they are, in a sense, "selfless," although their disturbing, lawless willfulness asserts itself in other ways, such as manipulation. (If nothing else about the Hivers is refreshing and affirmable, the SIB team recommends that this lack of infatuation with the self could serve admirably as a model for human emulation.)

Philosophy/Theology

The Hivers have no belief in any form of supreme being or power beyond this life. The closest the Hivers come to a universal value or goal is their dedication to the advancement of the Hiver race as a whole. Each individual Hiver is content to play a role in this advancement, although their understanding of this role is unusual.

In Hiver society, established tradition (including successful manipulation) is treated as law, and all Hivers expect all other Hivers to abide by these laws, for the good of the Hiver race. The only exception to this expectation is each Hiver itself. Although they expect other Hivers to abide by social norms (and to undergo legal penalties if they violate them), no Hiver holds itself accountable to these laws.

This astounding hypocrisy is recognized and accepted by the Hivers, although there seems no rational way by which they can do this, certainly in no Kantian sense.

While Hiver A expects Hivers B-Z to abide by the laws, Hiver A is free to secretly subvert such laws to create a manipulation that Hivers B-Z will also be expected to live by. Likewise, Hiver B expects Hivers A and C-Z to abide by the laws, while B itself is free to secretly subvert such laws to create manipulations which will also be binding on Hivers A and C-Z, and so on. In short, each Hiver is a law unto itself.

While they all seem to understand this intuitively, there seems to be no open Hiver discussion about the reality of this highly situational ethic.

To put it in strictly theological terms, the Hivers have no god but themselves, because they recognize no higher good to which they personally are subject. Although this team is loath to use such language, we have found that the recurring image we have of this aspect of the Hiver psyche is that of stubborn, spoiled children. However, this image is singularly unhelpful, as it provides us no tools to use except for spankings. And since the Hivers recognize no god, no higher good, no values to which they themselves are subject, they will never perceive a spanking as the punishment from a just higher being. Rather, it will be one more thing they

don't like which they will work, like ants or beavers on amphetamines, to overthrow.

The Underground

We postulate the existence of some form of Hiver underground, apparently opposed to the status quo Hiver psycho-social order. It appears to be composed at least of certain Ithklur and disaffected Hivers, and presumably includes membership of certain other Federation subject races (see the *HMPH* document which illustrates the Hiver attitude to these subject races).

What is difficult to explain is how a society can exist for as long as Hiver society supposedly has, based upon the values we have described, and only now begin to show these fissures. If there are inherent fatal flaws in the arrangement, why did it not collapse long ago?

We offer the warning that this apparent movement may in fact be only the visible part of some manipulation. But is this manipulation intended for us, to influence our attitudes and beliefs, or are we seeing the by-products of a manipulation whose major target is within Federation society itself?

Psionics

Hivers are, by all accounts and measurable indications, completely psionically inert. Why should this be?

Some theorize that it is the nature of the Hiver braincase, isolated as it is behind not one but two layers of bone, and surrounded by a profusion of organs jamming all psionics by their electrochemical static. However, this model mistakes the functioning of psionics with the simple electrochemical signatures by which telepathy gains its information. Electrochemical signals have nothing to do, in and of themselves, with actually *expressing* psionic powers. So while this model helps explain why it is so difficult to use telepathy, telempathy, etc., on a Hiver, it does not account for their lack of ability to do these things.

Curiously, the Hiver public at large seems to discount accounts of psionics, believing them to be fraudulent manipulation of the dull and stupid, or harmless and useless parlor tricks. This has contributed to the lack of solid psionic research in Hiver society, not because no Hivers recognize its reality, but because it is so hard to get funding and support for such pursuits.

This is an area of unique advantage for humans to be aware of, and also a warning that the Hivers may be particularly susceptible to a very powerful psionic race, were one to exist.

A Dissenting View

The team is in agreement that the aspects of the Hiver belief system presented in the *HMPH* document are broadly accurate, including their notions of racial superiority. However, we have received material which contradicts this view. We have no way of knowing the significance of this thinking in Hiver society at large, and without that ability to analyze and interpret it, we will merely present it in its entirety.

Why do you think we have six legs? So we can keep our balance when the nature of reality constantly shifts and ripples beneath our feet.

Look at us! Physically we are jokes. Compare us to any other sapient race, and what do you notice? Our biological unsophistication. Other races have evolved physically to the point where they are capable of at least functioning without their intellects.

The Lament of M. Develа

What have we done to ourselves?
Who have we become after all?
What were we like long ago,
and when did we last know?
We ourselves are only to blame.
We ourselves have destroyed our past.

We cloud reality for our purposes,
seeking subtly to bend the malleable
will of another to our own.
When others do similarly in reply,
we become as blind as they.
What is it that we expected?

Story-tellers tell us their stories, while
dreamers dream us their dreams. But
do any here know how to
discern the truth when it is
drowned in fathoms of lies, made
dumb; silent even to our ears?

Which of us serves anything above
our own ravenous will, or knows
when to say, "Enough?" It is
we who must reap the coming
whirlwind, we who are the victims
when "truth" no longer has meaning.

Soon I will lie still (at
whose hand?) and perhaps only then
will come to see the truth
which was obscured by millennia of
willful abuse: We thought life merely
was a tool for our selfishness.

What have we done to ourselves?
Who have we become after all?
What were we like long ago,
and when did we last know?
We ourselves only are to blame.
We alone have destroyed our past.

We are prone to deficiency diseases, because our over-complex gland is unreliable. Without intelligence, we would be extinct.

We have no reliable olfactory sense, and again our gland is to blame.

We have ears to hear sounds, but we are physically incapable of making any meaningful sounds. And it turns out that every other intelligent race communicates by spoken word, allowing them to communicate in the dark and over long distances. Every other race has the telephone, and yet we Hivers are helpless with only a telephone. Until we developed television, we were dependent upon telegraphs. How did we last this long? By intelligence alone, which allowed us to paper over deficiencies that should have long since eliminated us.

We have only one organ for such essential and diverse purposes as eating, eliminating waste and reproducing. Other starfaring races have as many as four discrete organs for these purposes. Our philosophers say that this is proof that we are more efficient, that we do not need a profusion of mundane organs to handle simple "housekeeping" functions. But I say to you that this means we are good at nothing!

Look inside a homo sapiens *and what do you find? Glands and organs in glorious profusion: pituitaries, thyroids, gall bladders, kidneys, spleens, livers, stomachs, two kinds of intestines, and appendices and tonsils which appear to be unused luxuries! What do we have? One generalized digestive caeca and one huge, schizophrenic gland to perform all these functions. Is it any wonder that we do not know how to smell? Is it any wonder that we suffer from deficiencies? Our bodies were not ready to survive at all when intelligence somehow took root in them.*

We were given intelligence as some sort of curse, before we were ready for it. We were not grounded in this existence, in functional bodies, so look what we have done! We have cast ourselves adrift, using intellect purely for the vain games of intellect, and lost the ability to know who we are and what is true. We have so little respect for what it true and real that we feel justified in changing our own reality and that of others at every possible opportunity.

Why am I accorded respect as a manipulator? It is not a prize that I receive for having done a valuable thing. What has happened is that I have proved that I am in charge, and the respect that I receive is simply an acknowledgment of that reality. Manipulations, therefore, inherently enhance the power of the manipulator, whether they are primarily intended to or not.

Why not, then, ensure that they enhance my power as at least a dependable by-product, because I certainly already believe that my wishes are fit to be imposed on the universe, and therefore I deserve a more secure means to continue to impose that will. It is only logical. What are the limits on my power, my will, my will to power? There are none that we recognize above us.

How can this be? This life is just a squalid game of steal the blocks, and dying while you still have a larger pile than others?

What is a manipulation, after all, but the presentation of an event or idea with the intent that that event or idea will cause others to behave in a certain fashion, a fashion of which they are not aware until it is over? What better events and ideas to use than untruths, fabrications and distortions? After all, using these places me in complete control, whereas anyone can use and verify mundane truth, which undermines my power.

I am a scientist, and I am attempting to ascertain the truth about some physical or psychological phenomena in order to further a manipulation. Since I have already affirmed that furthering my ability to assert my will over the universe is a worthy goal, then others who are competing with me for this information to conduct similar manipulations in other directions must be thwarted. If it is acceptable for us to manipulate entire races so that their behavior is more convenient to us, then why not manipulate events so that they are more convenient for me? What if other scientists are close to the answer I seek? I can publish false experimental results—the subject turns left in the maze rather than right (and why can I not say that this was only a natural error?). These will lead them in false directions or at least force them to waste their time disproving my results, allowing me more time to find the solution first. More important, if I wish to manipulate them rather than simply beat them to the prize, I must have access to information that they cannot use to divine my plan. What better way to do this than to lie, for my ends already justify my means.

And what if I want knowledge? Can I read a scientific journal? What if it is full of cunningly skewed data designed to enslave me to anothers' manipulation? Must I rederive existence itself from first causes just to make sure I am not being fooled? It is fortunate that we are so obsessive in pursuit of knowledge, but think of what we as a race could have accomplished if we could trust each other.

Am I in control of my own destiny when I cannot even trust in facts? No! And yet we absurdly base our society on the notion that we all know enough about reality to cause ripples and currents that will reverberate through our society to create the effect that we choose! And the ground lurches beneath my feet again. Lucky that I am twice as stable as any tripod.

M. Develа
Here I Stand

Don't be so sanctimonious. We don't do anything to our history that you don't do to your own.

Look at your so-called "historical fiction," your entertainment historical movies. How many times have you told the story of your Galileo, your Patton, Cleopatra, Joan of Arc, Nixon, Strephon, Dulinor. And each author exaggerates one aspect of their personality to make his own precious point to his audience, and each actor puffs up a portion of the character's personality to suit her own vanity, and your people watch these charades and believe they have seen the truth. All they have seen is fiction dressed up with historical names.

Once a human has died she becomes nothing more than a myth or an archetype, farther from the truth with each generation. Someday when your Lon Maggart is dead, he will be nothing but a blank canvas for your playwrights to paint with their self-aggrandizing adulterous co-dependent fantasies. And local community theater directors will train their razor-sharp intellects on these characters and instruct muse-, dissatisfaction-, and hormone-addled part-time thespians on how to bring these bastardized characters to life: "No, no, more passion! More sexy (wink, wink)! And how about we go out for coffee after rehearsal? My wife's out of town."

Bring them to life? So sorry, Pygmalion. These people already did *live—lives beyond your miserable parasitic capacity to capture or interpret.*

For they were real, *but the reality of these people is buried beneath their myths so deep that you will never find them, and if you did, you would squander it. What after all is the life of a real leader, reformer, prophet or artist when compared to a chance at a 10-year first-run musical?*

You are no better than we are, and perhaps worse, because at least we admit what we do.

M. Malinla

Players' Section

HIVER CHARACTER GENERATION

This section will only detail differences in Hiver character generation from the procedures presented on pages 15-39 of **Traveller: The New Era**.

Hivers begin character generation untrained, inexperienced and about 14 standard (human) years of age (28 Hiver years).

A Character Generation Worksheet is included with this book (see page 93). Once a character is completely generated, the information from the worksheet should be transferred to a Character Sheet (see page 94). After that, the worksheet may be discarded, as only the Character Sheet is necessary for play. (*Note:* Save at least one blank copy of each sheet to photocopy for future characters.)

CHARACTER GENERATION OVERVIEW

The Hiver character-generation procedure follows the same three general steps as that used for humans: background, attributes and experience.

Background: Hivers place settlements on worlds with similar characteristics of gravity, atmosphere and overall climate, meaning that all Hivers are born and raised under similar conditions (Medium diameter, wet worlds with standard atmospheres and High Stellar technologies). This eliminates the need to consider the effects of Homeworld on character creation and makes the designation of a specific homeworld optional for Hiver characters, except for gravity, as that has an effect on fatigue under some conditions.

Attributes: Players determine the six basic attributes of their characters by rolling dice and assigning those results to attributes in any order they wish. These six basic attributes are Strength, Agility, Constitution, Intelligence, Education and Charisma (same as with human characters).

Careers: Hiver characters begin to accumulate experience at the age of 14 (28 Hiver years). At that time, players start making career choices for their characters. Each career choice represents four Imperial years (eight Hiver) of training and/or experience. Each time a player makes a four-year career choice, a Topical Club (see page 20) may also be selected for the character. Topical Clubs provide secondary skills the same as do hobbies in standard character generation.

Derived Values: Now that all changes to skills and attributes are completed, certain values are calculated that are based on them.

Possessions: Finally, players determine what possessions their characters have accumulated during their careers. The procedure for this is different than for human characters, and involves more interaction between player and referee.

BACKGROUND

Hiver characters will have originated on one of the worlds of the Hive Federation or one of the smaller client states made up of Hivers and other races in the region between the Imperium, the Solomani Confederation and the Hive Federation. As mentioned above, Hivers give their individual homeworld no special status, as their culture prides itself on homogeneity and not on local differences. Players need only choose a Homeworld for their Hiver PC if they feel the need.

Gravity: To determine the gravity of a Hiver character's homeworld, roll 1D6. 1-2: The character is from a 0.8-G world. 3-4: The character is from a 1.0-G world. 5-6: The character is from a 1.2-G world.

ATTRIBUTES

Each Hiver character has the same six basic attributes as a human character. Roll two six-sided dice and subtract 1 from the result to generate a number from 1-11. Do this six times. Each separate roll is then assigned, in whatever order the player desires, to one of the following six attributes: Strength (STR), Agility (AGL), Constitution (CON), Intelligence (INT), Education (EDU) and Charisma (CHR). All Hiver Characters add +2 to their Education (EDU) attribute because of the uniformly high levels of technology on Hiver worlds.

Players who roll attributes for their player characters totaling less than 36 points may add attribute points (allocated as they see fit) to bring the total up to 36.

Attribute Limits: During the careers portion of character generation, certain careers offer the opportunity for certain attributes to be raised further. However, no attribute may be raised more than two points as a result of these career increases. No attribute may ever be raised to greater than 15.

Other Characteristics: In the course of character generation, the character will acquire age (in years and in four-Imperial-year terms), rank and skills. Money and equipment will be allocated as needed by the individual character's requirements.

Smell: When determining other attributes, roll 1D6: on a roll of 4+, the character has a sense of smell (see page 8).

Psionics: Hivers have no psionic potential and receive no psionic powers (see page 44).

Language: The Hiver language is a nonverbal one, consisting primarily of gestures, physical contact by one or more hands and posture. It is difficult for non-Hivers to follow (and impossible for them to speak with 100% fluency), and is therefore almost never used in communications with non-Hivers. The official language of the Hive Federation is Gurvin, a language used by the race of the same name, and more readily adaptable to non-Hiver use. All Hivers are fluent in both languages, speaking Gurvin (and other spoken languages, if they have learned any) by means of a portable electronic translator (see page 84 or a more complete discussion of these devices).

Curiosity: In place of Social Standing (SOC), Hiver characters receive Curiosity (CRS) instead, rolling 1D6. Unlike the other characteristics, Curiosity never changes due to any reason. Upon completion of the character creation process, a Hiver character may increase any skill or skills it has acquired in the character generation process by levels equal to the character's Curiosity.

For example, a character with Curiosity 4 could add 4 to one skill; 1 to one skill and three to a second; 2 each to two skills; or 1 each to four skills. This increase represents the cumulative effect of a driving curiosity over the years, and can only be implemented after the character has finished its final career.

In addition, Curiosity allows die modifiers on certain character generation rolls. Whenever the character generation tables indicate "DM: CRS÷2," divide the Hiver's Curiosity rating by 2 and drop fractions. Thus, the resulting DMs are 0 for Curiosity 1, 1 for Curiosity 2-3, 2 for Curiosity 4-5, and 3 for Curiosity 6.

Referees' Note: In roleplaying terms, the Curiosity rating of a Hiver PC is irrelevant once character generation is completed, as the display of curiosity lies within the realm of roleplaying. Certainly the player of a Hiver character should attempt to play the Hiver in accordance with its Curiosity rating, but rolls against the Curiosity of a PC are inappropriate once roleplaying has begun. For Hiver NPCs, on the other hand, rolls against Curiosity are useful and appropriate to determine their reactions to various circumstances.

Social Standing, Titles and Noble Ranks: Hiver characters do not receive a social standing characteristic and therefore have no use for noble ranks.

Aside from doctor (used to designate a medical doctor—see the Medical career, below), Hivers have only one civilian title of any real significance, that of Manipulator (see the discussion of Manipulations, page 19).

Naming Characters: Hiver names are normally expressed in the Hiver language and are difficult to translate directly, so Hivers seldom try. When dealing with non-Hivers, Hivers pick a name from the language of that race. Some Hivers choose a name at random, while others try to pick one reflecting their individual interests and specialities. A Hiver with an interest in history might select the name Herodotus or Toynbee, one specializing in physics might choose Lawrence or Bohr, and so on. Of course, there is no reason to restrict Hiver names to European cultures or even Terran ones.

Call Signs: Hivers working with Coalition teams will pick (or be assigned) a two-syllable call sign. As with human characters, this can be anything, and can be inspired from the character's name or not as the character wishes. Hivers with two-syllable names (Newton, Genghis, Frodo) may choose to use it as their call sign.

Background Skills: Hivers, like humans, acquire a number of skills before age 17. To represent this, players should each choose four skills from the Skill List table (**TNE** pages 114-115), giving their characters a level 2 skill in each. Referees may impose homeworld limits on these skills if desired and if homeworlds are specified. In most cases, however, this is unnecessary.

Default Skills: Hivers automatically receive Electronics 0, Snohl Handling 0, Willpower 0 and Excavation 0.

CAREERS

This functions exactly as described on **TNE** pages 24-27, except as indicated below. Note that there is a Hiver-specific Consolidated Effects of Age table on page 29 which incorporates Hiver, rather than human, aging effects.

For convenience, Hiver careers, like human careers, are lived through in standard four-Imperial-year (eight-Hiver-year) terms.

Promotions: Hiver rank names, where they exist, are difficult to translate exactly, so Hiver characters should record ranks as R1, O3 and so on. If a game situation requires a rank, consult the Table of Ranks on page 57 of the basic rules and choose a human equivalent.

Note that many Hiver careers allow promotion DMs based on Snohl Handling skill or the Curiosity attribute, in both cases divided by two, dropping fractions.

No rank tables exist for the Hiver careers of civil engineer, computer specialist, teacher/instructor ("story-teller") or technician. Hiver diplomats and medical careers use the corresponding human ranks; Hiver merchants use human trader ranks; Hiver researcher/scientist careers use the human science ranks; explorers use human scout ranks; ground forces use human army or marine ranks; Hiver naval personnel use human navy ranks.

Special Duty/Adventures: Note that special duty/adventure allows the Curiosity DM described on page 27. All other details are as basic **TNE** character generation.

Topical Club: Topical Clubs (discussed more fully on page 20) provide an individual a chance to acquire skills and experience outside of a formal career path. In the character creation sequence, a Topical Club provides Hivers the same things that a Secondary Activity allows a human character, and the two are the same in game mechanics. The character may gain one level in any skill (player's choice each term) at the referee's discretion. In some cases, this skill may be a normal term skill in the character's current career. In other cases, the character may be indulging a hobby or interest outside the character's current career. Referees should feel free to limit the types of skills that can be picked up in this fashion.

Hivers may acquire Unarmed Martial Arts through a Topical Club, but only at skill level 0. (This is the only means by which Hivers can acquire this particular skill.)

Membership in Topical Clubs may also be acquired as part of the "Other Effects" portion of a career.

Increasing Attributes: Characters may also attempt to increase any of their six basic attributes (STR, AGL, CON, INT, EDU, CHR) as part of their membership in a Topical Club. This is done in the same fashion as in the basic rules (page 27).

Topical Clubs During Play: Hiver characters who have acquired a membership in a Topical Club as a part of the character creation process should note each one on their character sheet and devise a name for each of them.

Topical Clubs can be a springboard for adventures in the same way as contacts (see below). They are convenient ways for referees to give players information without being too gimmicky about it, and can be used to help speed an adventure along in a number of ways.

SKILLS

This functions just as described in the **TNE** basic rules (pages 27-28).

Languages: All Hivers are fluent in their own language and in Gurvin (see page 14).

CONTACTS

Contacts are discussed completely in the basic rules. In game terms, Hiver contacts are handled the same as in the basic rules. The majority of a Hiver character's contact will be with other Hivers, unless the career notes specifically state otherwise.

Off-World Contacts: For Hiver characters in Coalition space, all contacts are off-world contacts.

Generic Contacts

These are handled the same as in the basic rules. For simplicity, the same terms are used for types of Hiver contacts as for human contacts. Some contacts (such as criminal) are defined as being non-Hiver by the notes for a given career.

Topical Clubs

Membership received in Topical Clubs as a part of the "Other Effects" of a career (but not those which granted secondary activity skills—see above) also function as contacts. Each Topical Club membership functions as an additional Generic Contact, which can be converted to a solid contact using the normal procedures.

In addition, if a PC is a member of a given Topical Club and the referee rules that contact with that club is available (varies with circumstances, referee's discretion: probably in a high-population, high-tech Hiver world, probably not in a dungeon in the Wilds), the difficulty of any research-oriented or purely fact-based task is reduced by one level.

Note, however, that the number of Topical Clubs that a Hiver can be an active member in cannot exceed its Curiosity characteristic. Hiver characters who have the option to join more Topical Clubs than their Curiosity characteristic allows must choose those clubs in which they will remain active. Additional memberships are lost.

AGE

Hivers suffer the effects of age, but in a slightly different way than humans. Because Hivers start character generation at 14 Imperial years of age, a Hiver character's age (in Imperial years) at the time an adventure campaign begins is determined by multiplying by 4 the number of terms served and adding 14 to the result. In other words, (4×Terms)+14=Age. Each Imperial year is equal to almost exactly two Hiver years, so doubling the age in Imperial years will yield a character's age in Hiver years. The discussion of aging below gives age in Imperial years for consistency.

Effects of Age

Aging works the same with Hiver characters as it does with human characters, except that the effects do not begin until age 38 (i.e., the end of the sixth term), as summarized on the Consolidated Effects of Age table below. At the end of the sixth term (and every term thereafter), the character rolls 1D15 to check for losses in Agility. At the end of the seventh term (and every term thereafter) the character must check for losses in Strength, Agility and Constitution. At the end of the eleventh term, Hiver characters must also begin checking for a decrease in Intelligence. D15 numbers are generated by rolling 1D20 and rerolling all results of 16-19, with results of 20 treated as 0. (*Note*: This is an official errata, and this change should also be made to **TNE** page 31.)

Hiver Consolidated Effects of Age

Start Term	End Age	Age	Losses ST/SD*	STR	AGL	CON	INT
1	14	18	4	—	—	—	—
2	18	22	4	—	—	—	—
3	22	26	3	—	—	—	—
4	26	30	2	—	—	—	—
5	30	34	1	—	—	—	—
6	34	38	1	—	Y	—	—
7	38	42	1	Y	Y	Y	—
8	42	46	1	Y	Y	Y	—
9	46	50	1	Y	Y	Y	—
10	50	54	1	Y	Y	Y	—
11	54	58	1	Y	Y	Y	Y
12	58	62	1	Y	Y	Y	Y
13	62	66	1	Y	Y	Y	Y
14	66	70	1	Y	Y	Y	Y
15	70	74	1	Y	Y	Y	Y
16	74	78	1	Y	Y	Y	Y
17	78	82	1	Y	Y	Y	Y
18	82	86	1	Y	Y	Y	Y
19	86	90	1	Y	Y	Y	Y
20	90	94	1	Y	Y	Y	Y
21	94	98	1	Y	Y	Y	Y

*ST/SD=Number of Subsequent Term/special duty skills.

The character loses one point from the relevant attribute if the 1D15 roll is less than the current level of that attribute. If the roll equals or exceeds the attribute, there is no loss. This check, also called an age saving throw, is made at the end of each term.

Aging in Play: Hivers age in play in the same way as humans; see page 32 of the basic rules.

Combating Aging Effects

Hiver characters may resist the effects of aging in the same way humans do (see the basic rules, pages 32-33), except as noted below.

Anagathics: Hivers disdain the use of anagathics as an attempt to avoid the natural effects of nature, and no Hiver anagathic is manufactured.

Aging Crisis

These are the same as in the basic **TNE** character generation rules.

Skill- and Attribute-Derived Values

These are derived in a manner similar to that of humans, but due to Hiver physiological differences, the formulae to derive these values in different.

Hit Capacity: Hit capacity is a measure of the amount of damage (hit points) a character can take before suffering various levels of injury. Hit points can be suffered in any of seven different parts of the body: head limb, right front limb, left front limb, right rear limb, left rear limb, body, and reproductive limb. The hit capacity of the character's body is equal to four times the sum of Strength and Constitution: (STR+CON)×4. Each of the limbs has a hit capacity equal to two times the sum of the character's Strength and Constitution: (STR+CON)×2.

Boxes are provided on the character sheet for players to write in their PCs' wound level thresholds so the players will know to what degree their characters have been wounded. These are calculated in the same fashion as in the **TNE** basic rules, page 288.

Weight: A Hiver character's weight in kilograms is equal to 90, plus four times Strength minus Agility, or [4×(STR–AGL)]+90. Thus, a Hiver character with a Strength of 6 and an Agility of 2 would weigh 106 kilograms (about 233 pounds), while a character with a Strength of 4 and an Agility of 8 would weigh 74 kilograms (roughly 163 pounds).

Load: A Hiver character's normal load in kilograms is equal to three times the sum of its Strength and Constitution: (STR+CON)×3. Burdened Hiver characters suffer no Initiative penalties, but may only walk or crawl.

Throw Range: A Hiver's throw range in meters is four times the Hiver's Strength: (STR×4).

Unarmed Combat Damage: All Hivers have an unarmed Combat Damage of 1.

INITIATIVE

Because of their aversion to physical combat, Hivers may not have an Initiative rating greater than 2. All Hivers receive an Initiative of 1, but any Hiver who has served one or more terms in a military career receives an additional Initiative point.

STARTING MONEY AND INITIAL EQUIPMENT

The different economic system of the Hive Federation means that a different system must be used to determine what a Hiver character starts out with, one which involves a great deal of player/referee interaction. Since most Hivers are still members of a nest, they can draw upon the resources of the nest for funds or equipment necessary to further the nest goal, but care must be taken that players do not exploit this "free lunch" aspect of the game.

The Hiver system of nest credit is a little unusual, and is best represented by a series of general guidelines rather than a set of hard and fast rules. Hivers everywhere are acting on behalf of their nest goal, pursuing the greater good of that goal rather than individual aggrandizement. As a part of this, the nest supplies them with whatever they need (within reason—even Hiver resources are limited) to pursue that goal, and a Hiver character will have the assets it needs to accomplish a particular goal—no more, no less. The size and importance of this level of supply are related to the importance of the overall goal, which is related to the individual Hiver's relative importance within the nest and the level of confidence the nest has in its abilities. All this is pretty complicated, and requires more interaction between player and referee than a human character (nobody said playing a Hiver PC would be easy). Referees will need to exercise restraint, or every player will want to be a Hiver and tap into the cornucopia.

As a rule of thumb, Hiver characters have access to a pool of credit (called their Nest Credit) from which they buy equipment, food, transportation and so on. This Nest Credit is determined in a way similar to the manner in which a human character determines starting money: The character gains a certain base cash value multiplied by the sum of the character's Curiosity during each eligible career term. The base cash value for all Hiver characters is Cr4000. Nest Credit is replenished annually, with an amount equal to the character's Curiosity multiplied by Cr1000. Groups of Hiver characters adventuring together may combine their Nest Credits. Starting equipment is purchased in the normal way, using the equipment lists in the basic rules and in this book.

Starships and Large Items: Hivers do not own starships; these belong to the nest and are assigned to characters according to the goal of the character(s). A Hiver Merchant with the rank of captain obviously needs a trading ship of some kind to pursue its goal (making money for the nest, in all probability). A Hiver Technician can get along quite well buying passages and will usually not have need of a starship, but may require ground transportation of some kind.

Referees may give out large and expensive items, but should guard against giving players too much—merchants don't need mercenary cruisers, and diplomats seldom need warships to carry out their goals.

HIVER CAREERS

Career choice for Hivers proceeds identically to that in the basic rules.

EDUCATION

Among the Hivers, education in the early years of life is a matter for each individual nest. Beyond the basic education received as part of a nest, however, many Hivers choose to continue their education by various means, usually by joining a nest with similar aims and interests. Education is pursued for the good of the nest, not for any individual purpose.

For the purposes of character generation, we consider a Hiver pursuing four years of intensive technical studies with a nest interested in military affairs to be the equivalent of attending a technical school or military academy, even though there is no formal institution involved. The Hiver equivalent of a master's degree or doctorate is achieved by intensive study along certain lines established centuries ago by custom and tradition (which, when you come down to it, pretty much describes the human university system). There are no formal accreditation agencies, but a number of nests have taken on the task of unifying educational techniques in the Federation, and these amount to an informal system of accreditation and standardization.

The Hivers are acquainted with more formal educational systems and operate quite a few, both inside and outside the Federation (the Hiver Technical Academy on Aubaine is a prime example).

General Education

This is the Hiver equivalent to an undergraduate university and may only be taken once.

Prerequisites: Education 5+.

Skills: Total skill levels equal to character's Curiosity or Education attribute (whichever is higher) from any combination of the following, but no more than level 3 in any one skill:

Admin/Legal, **Artisan**, Computer, **Economics**, **Engineer**, *Language*, Leadership, **Physical Science**, **Social Science**.

Contacts: One per term, either academic or specialist.

Other Effects: +1 EDU (after all skills have been awarded). No commissions, promotions or special duty rolls are made. No income is received for terms spent in General Education.

Military Education

This is the Hiver equivalent to a military academy and may only be taken once. Studies tend to concentrate heavily on theory and skimp on practice.

Prerequisites: None.

Skills: Total skill levels equal to character's Curiosity or Education attribute (whichever is higher) from any combination of the following, but no more than level 3 in any one skill:

Determination, Engineer, Interaction, Social Science, Space Tech, Technician.

Contacts: Two military.

Other Effects: No income is received during Military Education.

Advanced Education

This is the Hiver equivalent to a graduate university and, like its human counterpart, may be taken as many times as desired. Hivers have no formal advanced degrees such as master or doctor, but Hivers are usually granted such courtesy titles in Coalition space representing the extent of their studies (a character with two or more terms is treated as a Ph.D., etc.).

Prerequisites: One term of general education, Snohl Handling 1+.

Skills: Four levels per term in any one specialty, plus a total of two levels in any electives.

Specialties: Admin/Legal, Computer, **Economics, Engineer,** *Language,* **Physical Science,** Robotics, **Social Science.**

Contacts: One per term, either academic or specialist.

Other Effects: +1 EDU (after all skills have been awarded). No income is received during Advanced Education.

Medical/Biological Education

This is the Hiver equivalent to a medical school and may only be taken once.

Prerequisites: EDU or INT 8+, one term general education, Biology 3+, Chemistry 2+.

Skills: Computer 1, *Medical* 6, Observation 1.

Contacts: One medical.

Other Effects: No income is received during Medical Education.

Technical Education

This is the Hiver equivalent to a technical school and may only be taken once.

Prerequisites: None.

Skills: A total of six levels from any one or a combination of the following:

Aircraft, Computer, **Economics,** *Medical,* Robotics, **Space Tech, Technician, Vehicle.**

Contacts: One specialist (skill level 8) in one of the areas listed above.

Other Effects: No income is received during Technical Education.

CIVILIAN CAREERS

As with the basic rules, there are civilian and military careers.

Clusters, Skills, and Cascades: In all of the lists below, clusters of skills are printed in **bold,** while individual skills are printed in normal type. Individual skills that are printed in *italics* are cascade skills. When players select a cluster for their characters, they must then go to the Skills by Skill Clusters List on **TNE** page 113 to pick a specific skill from that cluster list. Players who select cascade skills must choose the cascade specialty. When a cluster or cascade is listed with a skill level number after it, that is the number of skills to be taken in the cluster or cascade, and must be specified immediately.

First Term Skills: The character receives this package of skills during the first term in this career, whether the term is the character's first career term, or only the first term in this career after other terms in another.

Subsequent Term Skills: The character chooses a number of skills from this list based on the character's total term number (not term number in this career). In a character's First Term (starting at age 14), a character will receive the listed First Term skills. In subsequent terms (unless these are the first term in a new career, and earn the First Term package), the number of skills received is 4 in the second, 3 in the third, 2 in the fourth, and 1 in the fifth and later terms.

Special Assignment: Each term, the player has a chance to get a special assignment, also called special duty or special adventure, depending upon career. This is listed under the Special heading in the All Terms section. The first notation is the die roll on 2D6 that must be made to receive the special assignment.

Unlike in basic **TNE** character generation, there is no DM for the number of terms served in a particular career. Instead, a Hiver character receives a DM equal to its Curiosity÷2 (drop fractions) for Special Assignment in *all* terms (thus 1=DM +0, 2-3=DM +1, 4-5=DM +2, 6=DM +3).

If the roll is made, the character receives a number of skills from the special assignment list according to the total term number (not term number in this career). That number of skills is the same as term skills for that term.

There is no effect if the special assignment roll is failed.

Term	*Age* (Start-End)*	*Term Skills*	*Special Assignment Skills*
1	14-18	4†	4
2	18-22	4†	4
3	22-26	3†	3
4	26-30	2†	2
5 and later	30+	1†	1

*Age is given in Imperial years. For Hiver years, multiply by 2.

†Or First Term skill packet for first term in a new career.

Promotion: Not every career has a rank list to go with the chance of promotion, but all do get a bonus skill from the Subsequent Terms list for each successful promotion. All promotion rolls receive a +1 DM for every two levels of Snohl Handling skill or Curiosity the character has (divide by two and drop fractions), whichever is higher.

Contacts: If more than one type is listed, the character may choose. Some of these require a roll to be made at the time the contact is selected to see if the contact is special (see the Character Generation section).

Continuation Rolls: If using the random method for finishing character generation, roll 2D6 at the end of each term. If the result is greater than the total number of terms served so far, the character may continue on to another term. If the result is equal to or less than the number of terms served, character generation is over.

Changing Careers: A character who intends to change careers on the next term subtracts one from the continuation die roll. (Going from an education term to another education or career term does not count as a career change; going from a career term to an education term does count as a career change.)

Civil Engineer

To a Hiver, construction means something slightly different than it does to a human. Hivers are more comfortable with part or all of their buildings underground, which leads to a greater concentration on excavation then other races pursue. Certain things, however—a bridge, a road, a dam or a cross-country power transmission grid—are pretty much the same no matter who builds them.

By tradition, most Hiver engineers learn to handle Snohl (the Hiver nonsentient, burrowing symbiote/mascot), even though the animals are only rarely used in modern construction.

Prerequisites: One term of advanced education, Construction 4+.

First Term

Skills: Engineer 2, Excavation 1, **Explore** 2, Snohl Handling 1, **Vehicle** 1.

Subsequent Terms

Skills: Determination, Economics, Engineer, Excavation, **Explore, Interaction, Physical Science,** Snohl Handling, **Technician, Vehicle.**

All Terms

Special Assignment: 9+ (DM: CRS÷2) for **Crime, Engineer,** *Language,* **Spacehand, Charm.**

Promotion: 7+, DM: Snohl Handling or CRS÷2.

Contacts: One per term, government.

Other Effects: Automatic membership in a Topical Club devoted to civil engineering.

Computer Specialist

Since their invention, computers have been an important part of Hiver civilization. With the coming of Virus, computer specialists have been in increasing demand for uplift missions in the Wilds.

Prerequisites: One term of Technical Education or one term of General Education, Computer 2+.

First Term

Skills: Economics 2, **Technician** 4, *Language* 1, Electronics 1.

Subsequent Terms

Skills: Economics, Technician, Interaction.

All Terms

Special Assignment: 9+ (DM: CRS÷2) for *Language,* **Spacehand, Technician, Charm.**

Promotion: 7+, DM: Snohl Handling or CRS÷2.

Contacts: One specialist (Computer or Electronics) per term. If a special assignment is rolled, add an extra contact of any type.

Other Effects: Computer specialists are allowed two secondary activity/Topical Club memberships per term.

Diplomat

Hiver diplomatic missions are a vital part of the Hivers' overall plan for the reconstruction of human space. The Hivers must seek out, nurture and maintain contacts with the Reformation Coalition and all of its constituent worlds, as well as hundreds of other worlds in the vast expanse of space between the Coalition and the Federation. Without diplomacy, there can be no uplift....

Prerequisites: CHR or INT 7+, Snohl Handling 1+.

First Term

Skills: Charm 3, **Determination** 1, **Economics** 1, **Interaction** 2, *Language* 1.

Subsequent Terms

Skills: Charm, Determination, Economics, Interaction, Perception.

All Terms

Special Duty: 9+ (DM: CRS÷2) for **Crime, Gun Combat, Spacehand, Vehicle, Vice.**

Promotion: 6+, DM: Snohl Handling or CRS÷2.

Contacts: Two government contacts per term, non-Hiver on a roll of 6+.

Other Effects: Hiver diplomats with rank R6 have a 200-ton utility vessel at their disposal upon completion of character generation, provided they are pursuing an official goal for their nest (this should be worked out between player and referee).

Merchant

Trade is very important in helping Virus-devastated worlds get back on their feet, and helping worlds advance helps the Hive Federation by providing increasingly sophisticated markets. The trade between the Coalition and the Hive Federation is small but growing, and Hiver merchants are increasingly common within the RC.

Prerequisites: INT 6+ or CHR 6+.

First Term

Skills:

Officers: Economics 2, **Interaction** 1, **Space Tech** 2, **Space Vessel** 2, **Spacehand** 1.

Spacehands: Space Tech 2, **Spacehand** 2, **Technician** 2, **Vehicle** 1.

Subsequent Terms

Commission: 7+, DM: CRS÷2.

Skills:

Officers: Determination, Economics, Interaction, *Language,* **Space Tech, Space Vessel, Spacehand.**

Spacehands: Interaction, Space Tech, Spacehand, Technician, Vehicle.

All Terms

Special Duty: 5+ (DM: CRS÷2) for **Aircraft, Crime, Explore, Gun Combat,** *Language,* **Vehicle, Vice, Charm.**

Promotion: 7+, DM: Snohl Handling or CRS÷2.

Contacts: One per term, trader, government or criminal, non-Hiver on a roll of 6+.

Other Effects: Hiver merchants with the rank of O5 or higher command a 1000-ton Hiver transport and crew provided they are pursuing an official goal for their nest (this should be worked out between player and referee).

Medicine

The Collapse left many worlds in dire need of medical professionals. Travel outside the Federation has given you a chance to become familiar with diseases and conditions you would seldom see inside the safety of the Federation.

Prerequisites: AGL 5+.

First Term

Commission: Automatic if completed medical/biological education. A commission makes the character a doctor; all other characters are medical technicians.

Skills:

Doctors: Biology 4, *Medical* 4.

Medical Technicians: Charm 1, *Medical* 2, **Perception** 1, **Physical Science** 1, **Technician** 2, **Vehicle** 1.

Subsequent Terms

Skills:

Doctors: Charm, Determination, Interaction, *Medical,* **Perception, Physical Science.**

Medical Technicians: Charm, Perception, Physical Science, Technician, Vehicle.

All Terms

Special Adventure: 9+ (DM: CRS÷2) for *Language, Medical,* **Spacehand, Vessel.**

Promotion: 6+, DM: Snohl Handling or CRS÷2.

Contacts: One per term, medical, non-Hiver on a roll of 6+.

Other Effects: During the first commissioned term, training is so intensive that no secondary activity/Topical Club membership is allowed during this time. For each additional career term, however, doctors are allowed two secondary activity/Topical Club

memberships. All medical technicians are allowed one secondary activity/Topical Club membership per term.

Researcher/Scientist

A researcher/scientist is different from a teacher in that the researcher pursues knowledge for its own sake and is not necessarily very adept at passing this knowledge on to others.

Prerequisites: INT 7+, at least one term of advanced education.

First Term

Commission: 8+, DM: CRS÷2 +1 for each term of advanced education.

Skills: *Language* 1, **Perception** 2, **Physical Science** 5.

Technicians: Charm 1, *Medical* 1, **Perception** 1, **Physical Science** 2, **Technician** 3.

Subsequent Terms

Commission: 9+, DM +2 if EDU 8+, DM +2 if INT 8+.

Skills: Charm, *Medical*, **Perception**, **Physical Science**, **Technician**, **Vehicle**.

All Terms

Special Adventure: 6+ (DM: CRS÷2) for **Engineer**, **Explore**, **Gun Combat**, Robotics, **Social Science**, **Spacehand**, **Vice**.

Promotion: 7+, DM: Snohl Handling or CRS÷2.

Contacts: 1 per term, government or scientist, non-Hiver on a roll of 8+.

Other Effects: Membership in a Topical Club devoted to the character's primary area of interest.

Teacher/Instructor ("Story-Teller")

The Hiver word for instructor or teacher translates as "story-teller," because Hivers once taught their young through the use of stories, parables and fables that combined important lessons with entertainment. Teaching techniques have become more sophisticated over the years, but the name remains in use because of tradition.

Instructors pick a specialty skill which represents their primary interest and course of intellectual study, from among the following list: Admin/Legal, Biology, Chemistry, Communications, Computer, Construction, Electronics, Excavation, Farming, Fleet Tactics, Genetics, Geology, Gravitics, History, Instruction, Interview, *Language* (must choose specific Language), Machinist, Marketing, Mechanic, *Medical* (must choose specific cascade), Meteorology, Physics, RCV Operations, Sculpture, Ship Tactics, Ship's Engineering, Starship Architecture, Xeno-Biology. If the referee allows it, the character may pick a specialty from any other skill allowed to Hivers.

Technical Institute—Aubaine: Under certain conditions, this career can represent a term spent teaching at the Hiver Technical Institute on Aubaine, and all contacts are human contacts.

Prerequisites: EDU or INT 7+, and at least one term of Advanced Education.

Technical Institute Prerequisites: EDU and INT 7+, at least one term of Advanced Education and at least one prior term as a teacher/instructor.

First Term

Skills: Charm 1, **Interaction** 2, *Language* 1, Specialty 4 (see above).

Subsequent Terms

Skills: Charm, **Determination**, **Interaction**, *Language*, Specialty (see above).

All Terms

Special Adventure: 9+ (DM: CRS÷2) for **Explore**, **Perception**, **Spacehand**, **Charm**.

Promotion: 6+, DM: Snohl Handling or CRS÷2.

Contacts: One per term, academic or government, non-Hiver on 8+ (DM +4 if teaching at Technical Institute on Aubaine).

Other Effects: Membership in a Topical Club devoted to the character's primary specialty.

Technician

As far back as you can remember, you have been driven by a need to know how things work. You have a way with machines that humans sometimes call magical, but there is, of course, nothing magical about it.

Prerequisites: INT 7+

First Term

Skills: Charm 1, *Medical* 1, **Perception** 1, **Physical Science** 2, **Technician** 3.

Subsequent Terms

Skills: Artisan, **Charm**, *Medical*, **Perception**, **Physical Science**, **Technician**, **Vehicle**.

All Terms

Special Adventure: 6+ (DM: CRS÷2) for **Engineer**, **Explore**, **Gun Combat**, **Social Science**, **Spacehand**, **Vice**.

Promotion: 7+, DM: Snohl Handling or CRS÷2.

Contacts: 1 per term, government or scientist, non-Hiver on a roll of 8+.

Other Effects: None.

MILITARY CAREERS

FDA Explorer

The Hive FDA (Federation Development Agency) fulfills the exploration and contact mission that was originally part of the navy's job, and also carries out the bulk of Federation uplift and anti-Virus assistance in the Wilds.

Prerequisites: INT or STR 7+.

Commission: 9+, DM +2 if INT 8+. Automatic if one term of Military Education.

First Term

Officers: Determination 1, **Explore** 1, **Physical Science** 1, **Space Tech** 2, **Space Vessel** 1, **Spacehand** 2.

Enlisted: Explore 1, **Space Tech** 2, **Space Vessel** 1, **Spacehand** 2, **Technician** 2.

Subsequent Terms

Commission: 9+, DM: CRS÷2.

Skills:

Officers: Aircraft, **Animal Handling**, **Crime**, **Determination**, **Explore**, **Interaction**, *Medical*, **Perception**, **Personal Transport**, **Physical Science**, **Space Tech**, **Space Vessel**, **Spacehand**, **Technician**, **Vehicle**.

Enlisted: Aircraft, **Crime**, **Explore**, **Interaction**, *Language*, *Medical*, **Perception**, **Personal Transport**, **Space Tech**, **Space Vessel**, **Spacehand**, **Technician**, **Vehicle**.

All Terms

Special Duty: 9+ (DM: CRS÷2) for **Gun Combat**, *Medical*, *Language*, **Vessel**, **Charm**, **Interaction**.

Promotion: 6+, DM: Snohl Handling or CRS÷2.

Contacts: One per term, government, military or trader, non-Hiver on a roll of 6+.

Other Effects: Explorers with the rank of O5 or higher have a 200-ton Hiver utility vessel at their disposal upon the completion of character generation, provided they are pursuing an official goal for their nest (this should be worked out between player and referee). +1 to Initiative if more than one term is served as an Explorer.

Ground Forces (Advisor)

Hivers are not well-suited to fighting, so the vast majority of the soldiers of the Hive Federation are non-Hivers, but most military units have one or more Hiver advisors attached to the command headquarters.

Prerequisites: CON 6+, INT 8+. Automatic if one term of Military Education.

First Term

Commission: Automatic.

Skills:

Officers: Determination 2, **Explore** 1, **Interaction** 2, *Language* 1, **Tactics** 1, **Gun Combat** 1.

Subsequent Terms

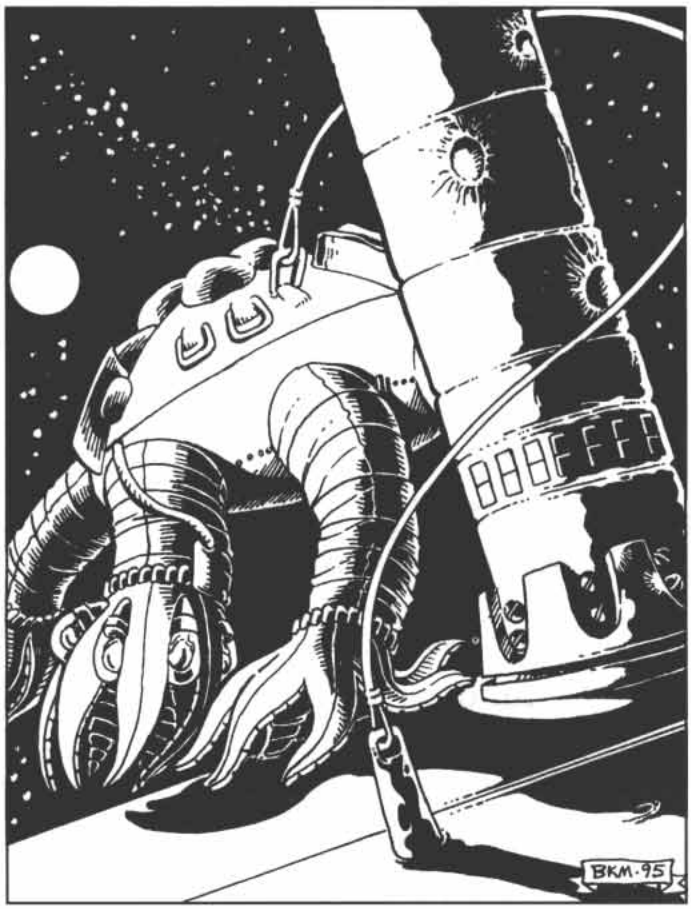
Commission: 9+, DM +2 if INT 8+.

Skills:

Officers: Artillery, Charm, Determination, Explore, Interaction, Personal Transport, Tactics.

All Terms

Special Duty: 9+ (DM: CRS÷2) for **Aircraft, Artillery, Crime, Gun Combat, Interaction,** *Medical,* **Perception, Personal Transport,** *Screens,* **Spacehand, Vehicle.**



Promotion: 6+, DM: Snohl Handling or CRS÷2.

Contacts: One per term, military, non-Hiver on a roll of 8+.

Other Effects: +1 to Initiative if more than one term served as Ground Forces Advisor.

Ground Forces (Support)

Hivers prefer long-distance, remote-control violence to the up-close, personal variety. Few Hivers enter the Federation ground forces, but those that do tend to enter the support services.

Prerequisites: CON 6+, INT 7+.

First Term

Commission: 7+, DM +1 if CRS 2 or less.

Skills:

Officers: Artillery 1, **Heavy Weapons** 1, **Determination** 1, **Explore** 1, **Interaction** 1, *Language* 1, **Tactics** 1, Admin/Legal 1.

Enlisted: Artillery 2, **Explore** 2, **Interaction** 1, **Technician** 2, **Vehicle** 1, **Heavy Weapons** 1.

Subsequent Terms

Commission: 9+, DM +1 if CRS 2 or less, +1 if INT 8+.

Skills:

Officers: Artillery, Charm, Determination, Explore, Personal Transport, Tactics, Vehicle, Heavy Weapons.

Enlisted: Artillery, Charm, Explore, Personal Transport, Vehicle, Heavy Weapons.

All Terms

Special Duty: 9+ (DM: CRS÷2) for **Acrobat, Aircraft, Animal Handling, Artillery, Crime, Gun Combat, Interaction,** *Medical,* **Perception, Personal Transport, Spacehand, Technician, Space Tech.**

Promotion: 6+, DM: Snohl Handling or CRS÷2.

Contacts: One per term, military, non-Hiver on a roll of 8+.

Other Effects: +1 to Initiative if more than one term served in Ground Support.

Navy

Until the outbreak of the Hiver-K'kree War, the Hiver Navy had been a small exploration service devoted to scouting operations, actions against local navies without jump-capability and protection of merchant shipping. The war necessitated a restructuring, which made the Hiver Navy a powerful interstellar force capable of holding its own against any expected threat. Its duties also include the maintenance of an antivirus cordon and the protection of Hiver merchant convoys outside the Federation.

Hiver Naval personnel are often assigned to RCN vessels as observers or liaison officers.

Prerequisites: INT or EDU 7+.

First Term

Commission: 8+, DM +1 if EDU 8+, DM +1 if INT 8+.

Skills:

Officers: Spacehand 1, **Space Vessel** 2, **Space Tech** 2, **Tactics** 2, **Determination** 1.

Enlisted: Space Tech 2, **Spacehand** 2, **Technician** 3.

Subsequent Terms

Commission: 9+, DM +2 if INT 8+.

Skills:

Officers: Charm, Determination, Interaction, *Medical,* **Physical Science, Space Tech, Space Vessel, Spacehand, Tactics, Technician, Vehicle.**

Enlisted: Charm, Space Tech, Spacehand, Technician, Vehicle, *Language.*

All Terms

Special Duty: 9+ for **Aircraft, Artillery, Gun Combat, Interaction, Perception, Vehicle.**

Promotion: 6+, DM: Snohl Handling or CRS÷2.

Contacts: One per term, Military, plus one per special duty, non-Hiver on a roll of 8+.

Other Effects: +1 to Initiative if more than one term served in Navy.

HIVER SKILL DESCRIPTIONS

This section discusses how skills differ in application between Hivers and humans. Players and referees will need to be familiar with the skills as they are defined in the basic rules.

Hiver "Pacifism" and Skill Choice

Hiver pacifism represents an actual squeemishness about the personal use of violence rather than an actual rejection of the application of force intended to influence the behavior of others. Thus, the imposition of the Hiver will on others is accomplished more with certain skills and less with others, based on the predispositions of the Hivers themselves.

We will impose no new rule limiting the number of close combat skills that may be taken during Hiver character generation. We will limit ourselves to a reminder that Hivers shun such skills, and players interested in roleplaying a Hiver character should keep within the spirit of this understanding. As always, referees are the ultimate authority for deciding what is permissible in their **Traveller** campaigns.

In this spirit, we will present the following lists of skills that are more and less common among Hivers.

The following skills are notably *more* common among Hivers than they are among humans:

Act/Bluff, Bargain, Biology, Chemistry, Computer, Electronics, Genetics, Geology, History, Instruction, Interview, Investigation, Language, Liaison, Observation, Persuasion, Psychology, RCV Operations, Research, Robotics, Sensors, Snohl Handling, Stealth, Streetwise, Willpower, Xeno-Biology.

The following skills are notably *less* common among Hivers than they are among humans:

Archery, Armed Martial Arts, Autogun, Bribery, Dance, Early Firearms, Energy Artillery, Energy Weapon, Forgery, Forward Observer, Grenade, Heavy Gun, Intrusion, Launcher, Music, Painting, Pickpocket, Sculpture, Service, Slug Weapon, Song, Thrown Weapon, Unarmed Martial Arts.

Interspecies Interaction

Certain skills cannot be used on their own when used in conjunction with another species. Psychology and Persuasion, for example, are not very useful if the user has no knowledge of the basics of another being's thinking or emotional processes.

The skill in **Traveller** used to understand other species and to use knowledge and skills in conjunction with those other species is Liaison. Because any skill level in Liaison could not possible imply familiarity with *all* existing intelligent races, referees should feel free to treat Liaison as a cascade skill, in which a specialty species (such as human, Ithklur, Droyne, etc.) should be specified. Thus, the full skill level is used when dealing with the listed species, and only half the level is used when dealing with different species. (Naturally, referees should feel free to impose additional penalties if these other nonlisted species are extremely unusual or unfamiliar to the character.)

The following skills when used in conjunction with non-Hivers require the use of Liaison as an *enabling skill* (**TNE** page 109):

Act/Bluff, Bargain, Bribery, Carousing, Gambling, Instruction, Interrogation, Interview, Leadership, Marketing, Persuasion, Psychology, Recruiting.

Hiver Use of Traveller Skills

Hivers use the standard skills from the **TNE** basic rules just as does any human character with the following exceptions or modifications:

Acrobatics: This is the ability to exercise precise control over body motions and actions. Hivers prefer not to engage in melee combat, but otherwise the skill is used in very much the same ways as with human characters.

Referees should remember that Hivers have a lower center of gravity than humans as well as more limbs, and that some acrobatic tasks will be easier for them (balancing, for example), while others will be more difficult. For example, an attempt to leap from a flying helicopter to a speeding ground vehicle might be a Formidable test of Acrobatics for a human, but only Difficult for Hivers because their lower center of gravity and extra limbs will make it easier for them to grab hold and hang on. On the other hand, the low, broad body of the Hivers will make walking along a narrow ledge an Impossible test of Acrobatics for a Hiver, but only Difficult for a human.

Animal Handling: When taken by Hivers, this skill automatically becomes Snohl handling (see below).

Climbing: Hivers find climbing easier because of their additional arms, so all climbing tasks are one level easier then they would be for humans. Certain tasks (such walking along tightropes or narrow ledges) present greater challenges to Hivers than such tasks would to humans. Referees must use judgement and common sense assigning difficulty levels to such tasks.

Disguise: This skill enables a Hiver to disguise itself as another Hiver. Referees should use common sense and place restrictions on the use of this skill—a Hiver cannot disguise itself as a human, for example, but it will be easier to fool non-Hivers, as Hivers tend to look alike to those unfamiliar with them as individuals.

Excavation: Hiver engineers tend to be better trained in excavation than other races because it is one of their preferred building methods. There are no significant differences between the Hiver and human use of this skill.

Farming: In Hivers, farming skill is primarily related to the underground cultivation of the various types of fungus that form a staple of the Hiver diet.

Gambling: Hivers with Gambling skill have a formal knowledge of statistics and probabilities, and a familiarity with the rules of various games of chance, as described in the basic rules on pages 118-119. They also have an intellectual understanding of bluffing and other techniques. Hivers gamble with non-Hivers because it enables them to study behaviors in an informal setting. The Hivers themselves have games, but the notion of betting *money* on their outcome is foreign to them.

Jeweler: In Hivers, this skill concentrates on the ability to manufacture and repair small, intricate mechanical objects.

Language: There are no significant differences between the Hiver and human use of this skill, except for the fact that a Hiver can only vocalize a language using a portable translator. Hivers can hear and thus can (theoretically at least) understand spoken language, just as humans can (again, theoretically) learn to understand the Hiver sign-language.

Liaison: This is the crucial skill used for interaction with non-Hiver races (see above).

Medical: There are few significant differences between the Hiver and human use of this skill except as it applies to the treatment of another race (see Wound Treatment, page 82, and **TNE** page 123). As in the basic game, this skill is a cascade: Diagnosis, Trauma Aid or Surgery.

Snohl Handling: For all intents and purposes, any Hiver receipt of Animal Handling is taken as this skill. This skill covers the rather specialized skills of caring for the Snohl, the Hiver nonsentient, burrowing symbiote/mascot. It is of little practical utility, but all Hivers are expected to possess it to a certain degree. All promotion rolls receive a +1 DM for every two levels of Snohl Handling skill the character has acquired (skill level÷2, drop fractions).

Swimming: There are no significant differences between the Hiver and human use of this skill. A Hiver with a translator counts as fully clothed for the purposes of swimming. A normal utility harness does not count.

Unarmed Martial Arts: The Hiver distaste for personal combat means that Hivers have no great opportunity to practice this particular skill. Hivers may not have this skill at greater then level 0 and may only acquire it as a topical club secondary activity.

Zero-G Environment: Because of their additional limbs, Hivers find getting around in a zero-G environment relatively easier than do humans or Ithklur, and all tasks are one level easier for them.

Referees' Section

HIVER NPCS

This is an expansion to the necessarily abbreviated guidelines shown on **TNE** pages 67-69 for how to create Hiver template NPCs. Detailed Hiver NPCs can also be created by using the character generation rules found on pages 27-34 of this book.

HIVER MOTIVATIONS

In all cases, aces and face cards indicate that the Hiver has achieved Manipulator status (this is indicated by the abbreviation "M." in the motivation description). This may be modified by the referee as necessary, and a Hiver may be a manipulator even if no aces or face cards are drawn when generating its motivations.

Clubs: Violence

Hivers like to think of themselves as pacifists. However, they are not pacifists in the sense of rejecting violence for ethical reasons. Rather, they are simply unable to cope with it for psychological reasons. This is why the Ithklur think of them as cowards.

Somewhat Used to Violence: Unlike many Hivers which actively shy away from the idea of using violence, these Hivers are willing to contemplate it and attempt it when necessary.

Moderately Used to Violence: These Hivers are more willing to think of using physical violence and may have even had to do it once, although they don't like the memory. These Hivers use the normal human rules for panic (**TNE** page 268) and not the modified Hiver panic rules on page 81 of this book.

Experienced with Violence: These Hivers have experienced physical violence and/or combat before and are as well-adjusted to it as a Hiver can get. This could be a Hiver which has served (or continues to serve) as a military advisor and has seen combat on repeated occasions.

These Hivers use the normal human rules for panic (**TNE** page 268) and not the modified Hiver panic rules on page 81 of this book. These Hivers also have an Initiative of 2. (This is a variation from the simple Hiver motivation presented in the **TNE** basic rules on page 68, where Initiative 2 was granted by clubs face cards. In this more detailed version, face cards have specific meanings as below, and Initiative 2 is granted by 8, 9 and 10.)

Cavalier: This Hiver will not directly kill anyone itself, but has no particular concern if the advancement of its aims requires others to die or kill each other. Such a Hiver would allow a war to be a secondary by-product of its manipulation, so long as that manipulation succeeded in its primary goal (even if that goal was to find out if it could cause a war).

Murderer: This Hiver is accomplished at using murder to achieve its goals. Such murders are not acts of violence, but instead are incredibly cunning acts of poisoning, infection with disease, pre-arranged "accidents" and the like. These victims will normally be non-Hivers, but Hivers which require elimination can be dealt with as well. Such a Hiver is almost certainly a coward when confronted with direct violence.

Coward: Whereas most Hivers are squeamish about violence and their safety, this Hiver is actively terrified. While this Hiver may also be afraid of accidents, plots and manipulations against it, it is particularly afraid of physical violence. It probably is afraid to be touched by others, is afraid of sudden movements, and is given to carrying around weapons that it is afraid of and has no idea how to use.

Commander: This is a Hiver which has achieved mastery of military concepts (well, to the extent that any Hiver really can without coming to terms with physical violence). Such an individual would be the Hiver analogy to Napoleon or Patton, but more along the lines of Nelson, Mitscher or Nimitz.

Clubs: Violence

Card	*Motivation*
Ace	M. Commander
King	M. Coward
Queen	M. Murderer
Jack	M. Cavalier
8-10	Experienced with Violence
5-7	Moderately used to Violence
2-4	Somewhat used to Violence

Diamonds: Miscellaneous

Card	*Motivation*
Ace	M. Visionary
King	M. Vigilante
Queen	M. Mastermind
Jack	M. Selfish
8-10	Will to Power
5-7	Good Citizen
2-4	Wannabe

Hearts: Parental Instinct

Card	*Motivation*
Ace	M. Conscientious
King	M. Puppeteer
Queen	M. Punishing
Jack	M. Patronizing
8-10	Very Parental
5-7	Moderately Parental
2-4	Somewhat Parental

Spades: Curiosity

Card	*Motivation*
Ace	M. Authority
King	M. Secretive
Queen	M. Informative
Jack	M. Obsessive
8-10	Dangerously Curious
5-7	Presumptively Curious
2-4	Very Curious

Diamonds: Miscellaneous

This covers a variety of Hiver motivations not properly included in the other categories.

Wannabe: The wannabe is a Hiver who believes in all of the traditional Hiver values, and in the best Hiver tradition hopes to takes its place among the ranks of manipulators one day. However, this Hiver does not have what it takes, either intellectually or morally, to do so. Either it lacks the intelligence to construct a workable manipulation or it lacks the attention span to follow it through. Although such Hivers can conceivably have truly evil goals, their attempts to actually do evil are so bungling or transparent ("I am an escaped laboratory mouse and I am going to take over the world!") that they are basically harmless, although good for laughs.

Good Citizen: This Hiver is content to carry out its role in society for the good of the Hiver race and has no particular aspiration to manipulate others. However, it is also willing to engage in such activities if there is a good reason for doing so.

Will to Power: These are Hivers who either have not yet attained manipulator status or wish to become more accomplished manipulators. Although they are motivated by traditional Hiver values, their main reason for becoming manipulators is not to do good *per se*, but rather the natural desire to gain more control over their surroundings and their own futures.

Selfish: This Hiver acts in accord with traditional Hiver values, but is exceedingly attracted to personal comfort and advantage. Thus, its every act, regardless of how worthwhile its primarily goal is, will have the additional effect of adding to the Hiver's personal comfort, reputation, desire for power, etc. Also, such Hivers will undertake many acts simply to satisfy their own needs, without feeling the need to justify them from any other standpoint.

Mastermind: This is an utterly amoral Hiver whose every action is intended to further some plan of its own. Every individual it encounters is merely a tool or pawn in its plan, and it trusts no one (although it may conceal this, of course). To such a Hiver, its control over others is of paramount importance. These Hivers do not recognize the importance of racial advancement, paternal instinct or other traditional Hiver values, but place their own goals as the highest end.

Vigilante: These Hivers attempt to defend Hiver society from improperly conceived or intended manipulations, and take measures to undermine unworthy manipulations or impair the ability of manipulators they disagree with to undertake them. The definition of what us unworthy and what sorts of things need to be defended against will vary from Hiver to Hiver.

Visionary: This Hiver has a vision of something of value beyond the

typical Hiver commitment to racial advancement, paternalism, racial superiority, etc. This can be just about anything, and can just as easily be good or evil in its intent or effects. A Hiver dreamer who is aware of the meaning of its gift will usually be a visionary, as can a disaffected member of Hiver society who disagrees with its traditional structure.

Hearts: Parental Instinct

The Hiver parental instinct is focused on other "promising" races as well as on the Hivers' own yearling offspring. In most cases this motivation refers to the Hivers' parental instinct toward humans, Ithklur or whatever race the referee decides the Hiver is in contact with. In the descriptions below, humanity will be the assumed object of the instinct, but this can refer to any race.

Somewhat Parental: These Hivers see humans as worthy of their parental instinct, but the application of this instinct is probably as part of a larger Hiver program of which these Hivers are but a part. This instinct may allow them to form ties with individual humans where their interests and goals coincide, or the Hiver may merely feel generalized affection to humans in the abstract and not really be able to tell them apart.

Moderately Parental: These Hivers see the assistance of humans as an important and useful motivation in their lives, although this assistance might be abstract and not include affection for humans *per se*. Such Hivers are, however, able to interact effectively with humans, and in the absence of other personality quirks, blend in fairly well to the expectations and rhythms of human culture.

Very Parental: These Hivers feel genuine affection for humans in general, and usually have several human comrades with whom they interact on a regular basis. Such Hivers are also concerned with the well-being and good reputation of the human organizations with which they cooperate, and are willing to work to enhance these.

Patronizing: The Hiver truly wishes the best for humans, but has very little faith in their ability to do anything right on their own. It is therefore constantly being insultingly superior, checking up on every little thing, insisting on doing things over to do them "right," and generally treating humans as stupid children.

Punishing: This Hiver sees the best for humans in the future, but is disgusted with their current condition and very impatient with their ability to change to what Hivers think they ought to become. Such Hivers constantly lecture humans they claim to be "helping," are very demanding in what they expect from their relationships with humans, and often attempt to punish humans in some fashion or another for not living up to their expectations.

Puppeteer: This Hiver is actually using humans to suit its own ends. This might be some short-term operation, such as to recover some technology from the Wilds, or a longer-term, civilization-wide manipulation.

Conscientious: This Hiver sees beyond the limits of typical Hiver paternalism and tries to discern the true best results for humanity beyond any Hiver predispositions. For example, such a Hiver might oppose certain manipulations of humans, or believe that some species need to retain their aggressive instincts to remain true to what they are. A conscientious Hiver will not merely make others' decisions for them, but will try to assist them in achieving their own goals, as it believes that they have a right to their own goals (within reason, of course).

Spades: Curiosity

Curiosity is a motivation familiar to humans, but Hivers take it to greater extremes. Hivers use most every waking moment actively learning about things. This can consist of studying books, tapes and computer files, but is also manifested in studying or fiddling with things, conducting simple experiments with common objects and recording results in their ubiquitous portable computers. All Hivers are inherently curious, so any result in this category shows levels of curiosity above this level.

Very Curious: More curious than the average Hiver. Such a character would show many of the activities above, but to a greater degree, and exhibit greater determination and creativeness in getting to the bottom of things. Also, such a Hiver would not anticipate the inconvenience that its experiments might cause to its companions, as it would fail to appreciate that they were not as curious as it was.

Presumptively Curious: These Hivers seem to believe that the universe exists as their private laboratory. They see no difficulty at all in interrupting formal or private events to set up monitoring devices, asking embarrassing questions, throwing objects at humans and then quizzing them on how badly it hurt, or peering up women's dresses to establish some hypothesis about the color of underwear.

Particularly polite ones might off-handedly remark, while crawling over the podium at a political rally, "Oh, don't mind me. Just go about with what you were doing."

Dangerously Curious: These Hivers become so absorbed in what they are doing that they fail to notice personal danger when they are pursuing the answer to a question. Such Hivers may not notice gunfire going over their heads, or may stand near an erupting volcano enraptured by the read-outs on some seismic device, unaware of the closeness of lava flows or smoldering fires in its equipment. These Hivers are so curious that they actually present something of a danger to themselves.

Obsessive: The Hiver is so focused on one particular issue or question that it has lost its perspective. It may be undertaking dangerous or unhealthy risks, or disregarding more important duties or considerations. It is possible that this maladaptive focus is causing the Hiver to ask the wrong questions, so that its current quest can never be satisfactorily concluded, only adding to its desperation for an answer.

Informative: The Hiver is incredibly knowledgeable on a wide variety of topics and enjoys sharing this knowledge as profligately as possible. Such a Hiver may be extremely helpful in most cases, but may be bothersome by constantly interrupting with unneeded advice. This personality type is the closest that any Hiver will come to being a chatterbox.

Secretive: This Hiver will share no information with any other beings. This may be because the Hiver is engaged in a delicate manipulation and cannot allow any information to skew the results, or because it is naturally competitive and does not want any other beings to gain advantage over it by learning information that it has gathered.

Authority: Such a Hiver is an authority on one or more topics at the referee's discretion. This Hiver can be considered to have absolutely accurate knowledge in this area, but may or may not be willing to share this information, depending upon its other motivations or the referee's wishes.

HIVER NPC TEMPLATES

Most of the Hiver strength, and most of the Hivers themselves, remain within the Hive Federation, rebuilding their society. Those who venture out toward human space are of three main types, as follows:

Hiver Tech Rep

Every RCES ship's crew includes at least one Hiver technical representative. These Hivers are included to provide assistance in the maintenance and repair of Hiver-designed and manufactured systems installed on the ship, as well as to assist in the recovery and repair of relic technology discovered on exploration missions. Hiver tech reps are especially valuable in examining relic computers and software for traces of Virus.

Level: Novice.

Combat Assets: Energy or Slug Weapon (Rifle or Pistol).

Other Assets: Computer 16, *Language* (Anglic) 18, any two assets from **Space Tech** or **Technical** clusters at 16, plus four more from **Space Tech**, **Technical**, or **Physical Science** at 12.

Hiver Instructor

Hiver instructors are members of the faculty at the Hiver technical schools. Some of them might also participate in exploration missions that are expected to make discoveries in their fields of expertise.

Level: Novice.

Combat Assets: None.

Other Assets: Computer 18, *Language* (Anglic) 18, any one asset from **Space Tech, Technical**, or **Physical Science** clusters at 18, plus three more from these clusters at 14.

Hiver Merchant

Hiver merchants trade with the Reformation Coalition, but will not be found travelling into the Wilds. They are most commonly encountered in the Coalition homeworlds and at Auction.

Level: Novice.

Combat Assets: Energy or Slug Weapon (Rifle or Pistol).

Other Assets: Computer 10, *Language* (Anglic) 12, any two skills from **Technical** or **Space Tech** at 12, any two of Bargaining, Admin/ Legal, or Marketing at 12.

The remaining NPC types are not very common in the Old Expanses. These are:

Senior Diplomat

Hiver senior diplomats will normally be encountered as the leaders or key members of an important diplomatic group engaged on a mission for the Hive Federation. It is rare for a Hiver to reach such a lofty position without having acquired the title of manipulator. The leader of a diplomatic mission will usually have one or more Hive Federation ships under its control. Senior diplomats may be assigned to important Coalition expeditions where Federation interests are involved.

Level: Novice.

Combat Assets: None.

Other Assets: Computer 16, *Language* (Anglic) 18, any two assets from **Interaction, Determination** and/or **Charm** clusters at 16, plus four more from **Economics, Perception** or **Charm** at 12.

Junior Diplomat

Junior diplomats will normally be found acting in subordinate roles as part of a diplomatic group engaged on a mission for the Hive Federation. They may be assigned to independent duty pursuing some important subsidiary mission of a larger group. Junior diplomats may be assigned to Coalition expeditions (at the referee's discretion).

Level: Novice.

Combat Assets: None.

Other Assets: Computer 10, *Language* (Anglic) 12, any five assets from **Interaction, Determination, Economics, Perception**, and/or **Charm** at 12.

Naval/Starship Crewmember

Hiver Naval personnel are almost never found in the Old Expanses except serving aboard Federation Naval vessels.

Hiver starship crewmembers are found on Hiver merchant vessels and Federation diplomatic vessels serving in various positions.

Level: Novice.

Combat Assets: Energy Pistol.

Other Assets: Any one of *Gunnery* or *Screens* at 14, Computer 12, *Language* (Anglic) 10, any four assets from **Technician** or **Space Tech, Spacehand, Vehicle**, or **Space Vessel** at 12.

Naval/Starship Officer

Federation Naval officers are seldom encountered in Coalition space except when acting as an advisor to a Coalition group or as part of a Hiver diplomatic mission. As such, they will not be in command of a Hiver warship, but may have one or more lesser vessels under their command.

Hiver starship officers are found crewing Federation naval, diplomatic or merchant vessels.

Level: Novice.

Combat Assets: Energy Pistol.

Other Assets: Computer 12, *Language* (Anglic) 12, any two assets from **Tactics, Space Vessel, Space Tech, Determination**, or **Charm** clusters at 16, plus four more from these clusters at 12.

Doctor

Hiver doctors are often a part of the staff of diplomatic missions, temporary bases, and are often found serving on the larger naval vessels.

Level: Novice.

Combat Assets: None.

Other Assets: *Medical* (Diagnosis) 18, *Medical* (Surgery) or *Medical* (Trauma Aid) 16, any two assets from **Interaction** or **Physical Science** clusters at 16, plus four more from *Medical*, **Perception**, or **Charm** at 12.

Medical Technician

Hiver medical technicians accompany doctors, and staff sickrooms aboard temporary bases and the larger naval vessels.

Level: Novice.

Combat Assets: None.

Other Assets: *Medical* (Trauma Aid) 12, *Medical* (Surgery) or *Medical* (Diagnosis) 10, any four assets from *Medical*, **Technician, Perception, Charm, Vehicle**, or **Physical Science** at 12.

Anti-Virus (Computer) Specialist

Every Hiver ship that leaves Federation space has at least one anti-Virus specialist assigned to its crew (often filling one of the electronics crew positions, but sometimes assigned as a supernumerary). Anti-Virus specialists are normally assigned to diplomatic missions and occasionally sent on Coalition expeditions where Federation interests are expected to be involved.

Level: Novice.

Combat Assets: None.

Other Assets: Computer 18, *Language* (Anglic) 12, any one asset from **Spacehand, Interaction**, or **Technician** clusters at 18, plus three more from these clusters at 14.

Ground Forces (Advisor) Officer

One or more Hiver ground force advisors are normally attached to the headquarters of large Ithklur military forces.

Level: Novice

Combat Assets: *Energy Weapon*

Other Assets: Leadership 10, Ground Tactics 12, *Language* (Anglic or Ithklur) at 14, any four assets from **Tactics, Explore, Interaction, Determination**, or **Charm** clusters at 12, and one from **Artillery** or **Heavy Weapons** at 16.

Ground Forces (Support) Officer

Hiver support troops are normally attached to Ithklur forces and sometimes encountered as observers on Coalition missions.

Level: Novice.

Combat Assets: *Energy Weapon*

Other Assets: Communications 10, Language (Anglic or Ithklur) 14, any four assets from **Engineer, Explore, Interaction, Economics**, or **Charm** clusters at 12.

Dreamers

I had a dream. A dream of a wood, old beyond imagining, rich with life, thick with deep, heavy fertility, laden with the smells of eternity. The trees were tall, the trees were strong. And they beckoned, though they did not need to move. Their proud straightness alone was a magnetic force. Their silence was a pregnant moment waiting for a voice. And I was drawn toward them.

How many other travellers had heard this call? How many had become lost in this wood or found a home here? But the silence pressed in tight, and the wood closed around me. And where I had expected to hear the distant conversing of birds and the careless accompaniment of splashing water, there was only the soughing of a dry wind. The soughing of a dry wind through brambles, thick, black and wicked, clinging closely to the bases of trees, sinking thorns deep into aged bark. And what had been the rich, sticky-sweet smell of life swelling deep in the earth became the cloying scent of decay, of death bursting through the soil in repellent, fungous growths.

The wood cringed about me, as if each creature in every nest and burrow and cocoon were recoiling from the smell that I had caught. And although the motion subsided quickly, the vision remained with me, like bright flashes in darkness. The wood was steeped with life, saturated with creatures, each cowed, as I was, by the unexpected intimation of doom.

But the trees were tall and proud. The brambles, though twining vine-like through the limbs, were nothing to the ancient strength of the trees.

A soft groan touched my ears, the sound of weight shifting, settling. It came from a tree, like many of the others around me, heavy with sigils and signs, carved deep with coats of arms and patents of rectitude. With a dull pop, it sagged against its neighbor, a younger tree, uncarved and unmarked, but no less tall or broad. The young tree bowed, trying to roll with the weight of its older neighbor, but the groan of its bending ascended to the shriek of living wood splintering. The two trees crashed to the forest floor, leaving the final shriek hanging in the air. But while the young tree crashed and splintered bitterly and violently, leaving a quivering stump and savage echoes, the older tree landed with a dull thud, and disintegrated to reveal an interior seething with insects and pungent with dead ichor. Where it had entered the ground, the trunk had pulled free, leaving a shallow, musty wound, where all its roots had long since dissolved into the gray leprous soil that remained.

Suddenly I saw how many of these dead but still erect trees there were, each sagging against the living ones beside them, hanging like a sword above the healthy trees of the forest. These standing dead were holding the living hostage against their pride, their will to outlast their lives. It was then that the silence found a voice, and it was singing a song of death.

How could no one have seen that the wood had been dying for so long? How many young trees could shrug their way through the dead weight entangling them?

A shadow passed near me, a force shrouded in blackness, which left a bright flickering behind as it fled. A flickering of fire. Before I could move, the fire leaped to the fallen tree, consuming the crumbling, dry wood, and destroying the insects with pops that merged into a steady sizzle.

The wood came alive again, with creatures mindlessly fleeing the blaze, but not quickly enough, for the fire leaped ahead of them, tree to tree, bramble to bush, cutting them off, mercilessly devouring them. Leaves ignited on branches in the searing air, and trunks exploded as the sap inside them flashed to steam. Somehow, above the infernal roar, arose another sound, a shrill keening, the combined cries from the throats of a million million incinerated creatures, and the creaking of a million million falling trees.

After a time, which was forever, or might only have been an instant, the fire was over. Smoke and steam concealed everything, and the sounds were of fading hissing and crackling, and the exhausted groan of great weights shifting one last time to their last resting places. A wind stirred, but not a dry wind—a fresh wind, which stripped the smoke from the smoldering wreckage and carried away the sounds of ruin.

The trees that remained stood battered and blistered, but untangled in the sunlight. The brambles were seared away, and the standing dead were ashes. The creatures that returned were the strong and vigorous, and the song they took up was the song beyond the song of death: It was a song of defiance, of renewal. The voice had found the song of life.

Some things can only be cleansed with fire.

I had a dream. A dream of fire.

HIVER MANIPULATION

It is a mistake to think of manipulation as a hobby of privileged Hivers, or as an activity that can be defined separately from Hiver society as a whole. It is in fact a major fiber woven into their society and is inseparable from it.

To say that manipulation is a career that Hivers move into after having spent some portion of their lives in other careers is correct only insofar as it can be said that the CEO of some major corporation moved into the separate career of Chief Executive Officer (Shaker and Mover 1st Class) after having spent his previous 30 years in the completely unrelated careers of Senior Vice President for Marketing, Administrative Officer, District 3 Manager, etc. (Shaker and Mover 2nd through 4th classes).

Manipulation is a basic concept in the Hiver understanding of The Way Things Work, much as politics, power, motivation, supply and demand, and the perversity of inanimate objects are crucial conceptual tools in human society. Manipulators are better understood as Hivers who have ascended to positions of power where they are given broader horizons to exercise their manipulative talents (if human, read: "management," "administrative," "organizational," "visionary" talents) after having demonstrated talent and proficiency in the small-scale manipulations that would be necessary in the day-to-day workings of their careers as naval officers, merchants, tool-and-die manufacturers, etc.

Which brings us to the question: Is the Reformation Coalition a Hiver manipulation?

Get real. Manipulation is a survival skill of the Hivers. To ask if a Hiver brings any of its manipulative skill to the solving of a problem is like asking, "Hey, those *Homo sapiens* over there, are they planning on using their brains and their opposable thumbs in order to cross that river?"

Oh, so now with the big "no fair" whine. We poor little put-upon humans are now tools of Ned and the big nasty starfish monsters. Well, let's put a little nonhomocentric spin on it.

Something is Rotten in Denmark (and Everywhere Else in the Imperium)

Good job those humans. They've put together the largest interstellar society in known space, all with just brains and opposable thumbs. Not bad for a bunch of hairless former tree-climbers. They've surmounted $E=mc^2$; they've surmounted the Great Rift; they've surmounted the Civil Wars of the early 600s; they've surmounted 1100 years of Murphy's this, that, and the other thing; and, by virtue of that record of success, they have attained major roles in the affairs of every other starfaring race: the Aslan (yeah, so they didn't do it on their own, who does?), the Vargr (yeah, and they *did* do it on their own, so mother nature obviously has no quality control), the Zhodani (those damned humans again), the K'kree (don't get me started) and the Hivers.

So you figure you can count on these guys, right?

Nope. After all that, the Imperium collapses like some 1100 year-old house of cards (*who knew?*), and unleashes the meanest mother of a virus the universe has ever seen, which, interstellar intercourse being what it is, drags down the computerized centers of all the other starfaring races as well (forget the fact that they slaughtered *tens of billions* of their own species in this fiasco—more than have ever been killed by any other single cause). Not only can the humans not be trusted in their own sandbox, they trashed the *entire playground.*

Not exactly what you'd call good neighbors.

Return the Manipulators

Not that many folks had the time to reflect on local property values. The K'kree were still crying in their salads, the Aslan were breeding up a storm, and the Vargr were so busy snarling and fighting each other, they may never have noticed the difference. *But*—the Hivers, with their demonstrated facility for pragmatism and computerization, were the first race to begin recovery.

And the Hivers did have the time to think about the future of humanity—and whether they could afford to ever let anyone do again what the human virus did to them. Humanity is just plain dangerous. But you can't exterminate them (well, maybe...), nor can you ultimately stop them from coming back again. It takes a lot of stubbornness and a lot of determination to reach the stars, and the humans, by the size of their collection, had a little more of both than any other race. So what's a poor neighbor to do?

Well, a neighbor could change the humans, ever so slightly. But would it work in the long run? Sometimes a race of manipulators just can't resist a challenge.

When looking at humanity, the Hivers had the advantage of an outside perspective. They could view human society, and human history, as an ecosystem. And as manipulators who were used to working on a society-wide scale, they had what you could call a flair for it. They could identify adaptive and maladaptive behaviors in a way that human analysts, themselves enmeshed in the human condition, and unable to see the forest for the trees, could not. Where a human analyst would talk about Dulinor's bad childhood, Lucan's lack of breast-feeding, and the unusual constellation of cross-cutting economic demands in the Core that spring, a Hiver could ask questions without psychological or sentimental attachment to the event. What was different between 600 and 1100 that caused an Empire to survive over a dozen "rights of assassination" in the former case, but none in the latter?

The fact that the Imperium had survived the series of coups of the early 600s was a good sign, not only for humans, but for moderate Hivers who did not wish to have to exterminate humanity. The Hivers had always held out the greatest hope for humans as candidates for another civilized interstellar society, but had maintained reservations based on the tremendous human capacity for violence, proven yet again in the Final War. Since the cause of the Imperium's damaging the Hivers and other starfaring races was only an extension of the greater damage they had already done to themselves, the issue was also one of seeking a solution that was of the most good to humanity itself.

Any impartial human would readily admit that there was something very wrong with the Imperium, and with Imperial humanity itself, that would allow it to come unglued in the catastrophic way that it did. There was a disease, an Imperial sickness that manifested itself by 1116, that had to be prevented from happening again. But while human sensibilities would probably allow such considerations to be forgotten once the expansion into space had begun anew, Hiver sensibilities would

not, as they would not consent to again being unwitting victims of human maladaptations.

The Hivers eventually assessed that it was a breakdown in human social cohesion that caused the Imperium to explode at a social level that was already established as being a stable and maintainable size. They were correct in assessing that if that breakdown could be identified and its causes eliminated, then that action would be a service not only to humanity's neighbors, but also to humanity itself. From a standpoint purely of natural selection, based on the success of certain patterns of DNA reproducing themselves in the greatest possible numbers, it is possible that a population that periodically expanded, then exploded, expanded, exploded, over and over again, might have a perfectly sound reproductive strategy. However, from the standpoint of individuals within that population, or society, as intelligent populations call themselves, the soundness of such a pattern is another issue altogether. Humanity, as represented by the Imperium from 1116-1131, was sick, fatally so. The horrific casualties of the Final War will remain eloquent proof of that thesis. Humanity, if it could be said to be worthy of another shot at stellar hegemony, had to be cured of that disease. For if it could not be cured, the calculus of natural selection was unambiguous: it would be replaced by another species.

It would have to be said that humanity was extraordinarily fortunate in that the Hivers were content to allow humanity's best interests to be served, so long as they coincided with those of the Hivers. The fact that they were content to do so, and eventually, did do so, can largely be credited to one particular Hiver, who eventually felt content to, after a fashion, think of itself as human.

M. Corralci

The Hivers had always had a hard time understanding humanity. It was felt that they were physiologically too different for any true meeting of the souls to take place. This is indeed true, and it was not until Manipulator Corralci that this difference was recognized, understood and, most importantly, codified so that other Hivers could from benefit from the breakthrough.

M. Corralci was an unusual Hiver. She (an explanation of pronoun usage appears below) entered her nest as a yearling in 1099, and in 1113 began her career in the navy, where she was recognized as a gifted, if somewhat erratic, performer. Corralci's ability to catch onto traditional procedures, protocols and understandings was extraordinary, and enabled her to gain rapid promotion in her first term. However, Corralci was given to suffering strange seizures in which she would lose consciousness for periods sometimes lasting several hours. When Corralci passed out while standing bridge watch, it spelled the end of her naval career. However, this gift for being attuned to traditions and the essence of various subject matter allowed Corralci to very quickly gain acclaim as a phenomenally successful story-teller. Those who asked Corralci about the inspiration for her stories and remarkable insight found that Corralci was very willing to explain. The source was the "visions" she would have during her seizures, which she would later call "dreams" following her closer contact with human beings. Although the Hivers who asked these questions never quite understood all this business about visions and dreams, they certainly made for good stories.

Corralci was in fact the first psionic Hiver, or, at least, the first psionic Hiver to ever attain recognition as a result of these talents. Her uniqueness is due in part to the Hiver obsession with maintaining a homogeneous genotype, which makes it very difficult for mutant genes, usually recessive, to become expressed. Her psionic strength was relatively low, and her only talent was the peculiar dreams that she experienced, which she was unable to control for many years of her life. These visions were governed largely by the type of contact and activity she was engaged in, and because of their erratic nature, she never came to the attention of Hiver psionic research groups before the Collapse. In fact, it was not until the late 1130s that she became even marginally able to control these visions, and even then, her control was limited to controlling their frequency and timing. By the 1140s, she was able to exercise some control over their subject matter, but this usefulness was limited by the fact that the dreams were abstract and allegorical.

This situation was made even more difficult by the fact that the allegories she dreamed were those of the race about which she dreamed. Although her first dreams of humans took place during her naval service of 1113-1117, these were completely unintelligible to her at the time, because of the brief and cursory nature of her human contacts. Her talent can be best described as a passive absorption of thoughts, mostly subconscious, of those around her. These thoughts would be stored and digested, sometimes for years, in her own subconscious, before they were released to her mind in the form of the dream seizures. The long storage and digestion would allow her brain to synthesize subconscious currents and images from the large number of beings she met, until the common elements could be expressed in symbolic terms of the collective unconscious in her dreams.

It was as a story-teller that she gained more frequent human contact in the 1120s, as she travelled to broaden her story-telling repertoire. Her vivid images of the battlegrounds of the Final War date from this period, when she was a member of the abortive manipulation that included the trade agreements with the post-Imperial Massilia faction. Once she realized that she was dreaming dreams that included human emotions and human subconscious images, she was able to begin trying to understand them, but this effort took many years. The absolute, literal *alien*-ness of the concepts and of the emotions themselves took a long time to insinuate themselves into her cognitive faculties. Not only did she have to learn to feel these transplanted emotions, but she had to learn to explain them to other Hivers, which was even more difficult, as they could not be made to experience these emotions first-hand, as Corralci had.

In 1136 she made the psychological breakthrough of feeling, for the first time, the essence of humanity: their passion, and its physiological and psychological roots. Instead of the mechanical, peremptory reproductive act of Hiver biology, human reproduction, though also instinctive, is a deliberate act, an intensely emotional, intensely passionate, intensely *creative* act. Though human emotion is not based on, nor does it derive from, the sexual act, it was this dramatic difference between Hiver and human psycho-physiology that was the touchstone

for Corralci's subsequent appreciation of human emotion and psychology.

Corralci went further with this model, suggesting that human reproduction, as a creative act of volition, rather than absent-minded instinct as in the Hiver model, colored the human approach to life by making it inherently less rational than the Hiver approach. The human emotional investment in life caused humans to respond to events in emotional or passionate ways: with anger, affection, etc., emotions that were not rational, but nonetheless could motivate human decisions. Noting that the human sexual act combined dramatic physiological changes (distinctly not the case with Hivers) with intense emotional responses (ditto), and that the sexual drive can be actually enhanced in periods of stress, Corralci believed that human sexuality was an emotional and passionate act of defiance in the face of a harsh and impersonal universe, an act of lighting a single candle in the midst of howling darkness. Years later, in describing the dream that led her to this epiphany, Corralci incongruously observed, "I wept." (Hivers do not have tear ducts, *per se*.)

It was also at this time that Corralci began referring to herself with female pronouns, although, like all Hivers, she was neuter in gender. As she grew more absorbed in her human dreams, she grew comfortable with human concepts, such as emotions and even sexuality. In the human terms with which she continued to identify ever more closely, she found that she increasingly perceived herself as being, somehow, relevantly female. And although this spiritual orientation was irrelevant in Hiver society, it was an important distinction to her, and one which she insisted that other Hivers make as well, because it helped her to more clearly impress upon her fellow Hivers the human values that she was teaching them.

Corralci was a very junior member of the 1127-30 manipulation that sought to gain data on the Final War out of a prescient fear on the part of organizer M. Manchus that the war might grow to threaten the Hiver Federation. She was chosen, as a gifted story-teller, to observe the mission and report back to other Hiver groups supporting the manipulation. The information and ties with human organizations were intended to enable a later manipulation to prevent any spill-over of the Rebellion into Hiver society, but all this was overtaken by Virus, which flattened Hiver society as badly as it did any other. However, the Hiver genius with computer technology enabled them to get a limited amount of machinery up again after only a decade or so, although this small pool of resources was dedicated exclusively to the use of powerful and effective manipulators, such as M. Manchus. Fortunately, Corralci had impressed Manchus while she was with the project and had maintained her ties with the well-known manipulator, whose reputation had grown under the circumstances of his suspicions being dramatically proven correct.

By the time Corralci realized that she was having dreams that provided insight into humanity, the Hivers were hard at work attempting to address the twin problems of Hiver re-establishment and the prevention of any recurrence of the human problem. It was clear to Manchus that Corralci's visions, though unprecedented and unlikely, presented a possibility to solve the human problem that could not be ignored. Although Manchus accepted Corralci's visions as authentic, the only way to make her breakthrough convincing to Hiver society at large was for her to gain the status of a successful manipulator.

Under Manchus' tutelage, Corralci used her visions to identify, plan and execute an increasingly sophisticated series of manipulative experiments, which eventually gained her not only the coveted status of Manipulator, but also the acknowledgment of Hiver leaders that her visions of humanity were valid, and should form the groundwork for the great human manipulation.

The point of departure for the manipulation was the recognition of the balance and interconnection of the major human passions, hatred and violence, love and benevolence. Human violence, always dangerous, was doubly so because it could arise out of not only hatred, but also out of defensive love for close companions. It is clear that humans of the various Final War factions did not hate each other, not at first, anyway. But they allowed themselves to do grievous violence to each other, out of fear of the threat that the other may have posed. But in so doing, they did not so much defend themselves as force the other factions to fight more fiercely, thereby increasing the fear and bitterness on both sides, encouraging both to again fight more fiercely. To the Hivers, a race with an intense instinct for the survival of their species as a whole, human society was infected with a disease clearly fatal to its former status as an interstellar culture: virulent factionalism. Humanity had lost its humanity.

It's hard to say how many Hivers may have read Edward Gibbon, but it is clear that they appreciate the concept of human social decay, and the survival of institutions far beyond the values that created them. The goal of the human manipulation was to more firmly establish within human thought the values that did, and ought always to nerve and enable human society.

DREAMERS

Although dreamers have existed as misunderstood Hiver aberrations for perhaps as long as thousands of years, they are not readily known to the general populace. Presumably most dreamers die in the wilderness before they reach yearling status, and those which do are possessed of such an unusual talent that most never figure out what it is, or even how to deal with it. Those Hivers which pass out and awaken to speak of incomprehensible visions that they have had are routinely labelled as "mad," and either institutionalized or peripheralized by being treated with paternalistic sympathy.

As discussed above, M. Corralci, in the immediate post-Collapse period, was the first dreamer whose talents were realized for what they actually were. And even among those Hivers who understand the nature of the dreamers, there is by no means any agreement that dreamers are a good thing. Their long history of being regarded as mentally ill creates a prejudice that most Hivers are subject to, and the fact that their "gift" is something for which the vast majority of all Hivers have no basis of comparison only fuels the natural suspicion of this most unusual and quite un-Hiverlike of traits. Furthermore, the very nature of the dreaming gift is antithetical to the proactive, controlling Hiver approach to life. Rather than being a tool which the Hiver can control to yield the results it desires, dreaming acts on its owner as it will, according to its own rhythms and logic, which are not always amenable to the plans, goals, or intents of the Hiver experiencing it. A reactive nature is considered to be a mental defect among Hivers, and a Hiver possessed of a talent which forces that Hiver to be entirely reactive to that talent is not a fortunate Hiver, but is rather a Hiver "possessed" by a maladaptive compulsion. Such Hivers are objects of contempt and disgust, rather than pity. Any dreamer PC or NPC will experience a great deal of prejudice and active opposition from the vast majority of Hivers.

Referees' Notes on Dreamers

The existence of dreamers is not known to the human community. They are an extreme rarity among Hivers, and the understanding of their nature is only a recent development, since approximately the time of the Collapse. Furthermore, most Hivers are suspicious of dreamers and have no desire for their existence to become widely known among non-Hivers.

Hiver dreamers are *excruciatingly rare*, and should not appear in **Traveller** campaigns or adventures on a regular basis. As PCs, dreamers should be even more rare. **Traveller** referees who have had only one dreamer PC in their campaigns over years and years of refereeing (and this character still vividly gleams in memory) should feel that they have the frequency just about right. For players who insist on rolling to see if their Hiver PCs have this talent, the required roll should be three consecutive D100 rolls of 100 (one in a million).

How to Referee a PC Dreamer

Assuming that you as a referee have decided to embark on this venture, let me first ask you a question: Are you *sure* you want to do this? Okay, fine, but let me just ask you this one question: Are you *sure* you want to do this? Okay, but just let me ask you this one question, WHAT ARE YOU, NUTS?

Okay, I have discharged my responsibilities to the Forces of Galactic Harmony and am off the hook, but you are now your own affair. Don't say I didn't ask you a bunch of questions. Hey, by the way, are you *sure* you want to do this?

So anyway, the first thing to remember is that a Hiver dreamer PC is just like any other Hiver PC, plus they have this handicap/gift that asserts itself at the least helpful moments. Hiver dreamers cannot control their "gift." The best way to simulate this is to roll randomly for the *threshold number* for each Hiver dreamer. The roll is 1D20+20 for a resulting range of 21 to 40. This threshold number represents the amount of emotional-psionic stimulation that the Hiver can absorb before it falls unconscious into one of its dreams, each lasting 2D6×10 minutes (reroll all results of 12 as 1D6 hours). Referees should keep track of the amount of emotional intensity absorbed by the Hiver in the same manner as they assess and award experience points (**TNE** page 133), except that this emotional intensity number should vary based on the intensity of feelings the referee judges the PC group has experienced, with a baseline of about one point per week of game (not real world) time.

For example, a session spent in routine travel through jumpspace should be worth one point, but a session that involved a great deal of stress and combat should be worth more. Death of a PC or NPC close to the group should also be worth a great deal of points (say, five to 10 based on circumstances, etc.), with a residue of additional grief points to be added for several subsequent weeks. In addition, other emotionally intense experiences, such as romance, fear, etc., will add to this amount. Although it is most convenient for the referee to assess these points at the end of each gaming session, when the referee sees that the dreamer is getting close to its threshold number and is likely to pass it at the end of the current session, there is a chance the dreamer will succumb to its seizure during the midst of roleplaying. This is at the discretion of the referee, but will often be triggered by an especially intense emotional moment. Hivers in these seizures cannot be awakened by any means and are completely unconcious until the end of the predetermined dream period.

Remember that Hiver dreamers are fully functional telepaths who *constantly* pick up psionic signals from all beings in their near vicinity, but have no consciousness of doing so. All of these mixed chaotic messages go directly to their subconscious, where they swirl around until they eventually coalesce into some insight that is delivered to the Hiver in something which resembles an epileptic seizure.

And oh, by the way, this insight is delivered in an allegorical form that will sometimes take the recipient years to figure out, in the light of subsequent dreams.

Roleplaying the Dream: Once the dream is triggered, the referee, perhaps with the participation of the Hiver player, should determine the nature of the dream. It is reasonable to assume that a referee would only allow one of the group's most experienced roleplayers the opportunity to play the dreamer, and may feel that the two of them, referee and player, can jointly determine the confusing and allegorical nature of the dream, based on the recent experiences of the PC group.

On the other hand, the referee should be aware that these dreams also reveal things the PCs may not be directly aware of, either picking them up from nearby NPCs or from the subconscious of the PCs, things the PCs themselves may not realize consciously.

This allows referees to present cunningly concealed hints and clues to the PCs, which may lay the groundwork for future adventure campaigns.

In the dream, the Hiver will not necessarily be aware of itself as a Hiver, but will take on the racial characteristics of the beings with which it has been associated. Remember also that because of the Hivers' inherent psionic silence (see page 25), a Hiver surrounded by Hivers and other races will be more aware of the telepathic energy of the non-Hivers in the group.

PLAYING AND REFEREEING THE HIVERS

Using Hivers/Playing Hivers

The key points to keep in mind when playing a Hiver character (either PC or NPC) are:

Goals: Hivers have goals that are dictated by their nest. While this may seem counter-intuitive given Hiver individuality, remember that Hivers are free to change nests to suit their own purposes. Therefore, most any Hiver will be a member of a nest that suits its present needs. These nest goals need to be worked out between the Hiver player(s) and the referee, and can change over the course of a campaign. Determining a goal must take into account the character's skills and attributes, the various careers chosen and player desires. A Hiver merchant's nest goal can be something as simple as "make as much profit for the nest as possible." A diplomat's nest goal may involve a specific negotiation or a long-term diplomatic mission. Characters playing individualistic Hivers will still have nests and nest goals, but these may be more open-ended, such as "learn as much about human behavior under stress as possible."

Motivations: Hivers are virtually emotionless by human standards. They do not experience anger, love, joy, jealousy, or greed. They have two major motivations, which are curiosity and their parental instinct.

Curiosity is familiar to humans, but is taken to greater extremes. Hivers use every waking moment studying or fiddling with things, conducting simple experiments with common objects, and recording results in their ubiquitous portable computers. This can make human companions feel paranoid, as if they are constantly being studied by their cryptic Hiver shipmate. When exploring a world, Hivers also tend to wander off, attracted by some mystery, and can take much longer than their more businesslike human comrades might prefer (not to mention getting into trouble they are constitutionally incapable of getting themselves out of).

Their parental instinct is naturally linked to the survival of their race and offspring, but also has a strong side effect: the urge to help along other promising races (which includes humanity, but not K'kree, Aslan or Vargr). This instinct not only prompts them to assist these races in their development, but also to help these races curb their violent instincts, which are distasteful to the Hivers and which they consider uncivilized.

Other Comments: Hivers also have a tendency toward what humans interpret as secrecy and subtlety. Part of this is due to the Hiver sense of racial superiority: They need not justify themselves. Because Hivers do not experience suspicion as an emotional response, they do not expect that they need to explain their every action. But to the human mind, the constant Hiver activity seems out of balance with their typical lack of running commentary on what they are doing. Hiver subtlety also stems from this lack of desire to communicate more than is necessary. A Hiver is content to communicate a seed of an idea to a companion if that is sufficient to get a point across, rather than explain an entire plan with all of its ramifications every time a decision needs to be made. This dovetails with the Hiver ideal of subtle manipulation. Explaining too much defeats the purpose. The fact that they are naturally mute adds much to their aura of secrecy.

Players and referees should feel free to use Hiver peculiarities for comic effect. But remember that Hivers are not clowns or buffoons, nor are they stupid. High comedy and slapstick are usually not appropriate; rather, a wry sense of amusement at their very alien motivations and reactions is desirable.

Human/Hiver Interactions: Interactions between races (bargaining, interrogations, interactions with administrative or bureaucratic officials and so on) go better when one or both races have some knowledge of how the culture of the other race works. Liaison and Xeno-Biology skills should be used as enabling skills at the referee's discretion to reflect this knowledge. The skill descriptions note where these skills can be used, but referees should feel free to use their judgement.

Playing and Refereeing Manipulation

The highest talent to which a Hiver aspires is that of manipulation: the ability to cause social change by one or more small influences. The more subtle and unknown the influence, the better the manipulation and, within Hiver society, the more esteemed the manipulator. Accomplished manipulators rise to positions of great influence and authority within Hiver society.

There is, however, no Manipulation skill in **Traveller**, no formal rules for manipulations, and no scorecard to tell players when they can put an "M." in front of their character's name. This is because manipulations are best undertaken as an exercise in role-playing, and should be gamed out between player(s) and referee as part of the campaign. After all, since this is the essence of the Hiver spirit, roleplayers should be involved in experiencing that essence: planning, laying out, and executing subtle plans and watching their unfolding.

Therefore, the skills a Hiver needs in order to be a good manipulator can include Persuasion, Leadership, Act/Bluff, Investigation, Research, Marketing, Bargain, Liaison, etc.

The first thing to remember is that manipulation is approached as a form of controlled sociological experiment and is laid out as such. Just as with a physical experiment, certain elements have to be isolated as constants so that one or more variables can be introduced. It is dangerous to attempt to introduce too many variables at once, as they may interact and interfere with each other in unanticipated ways and spoil the experiment. Thus most manipulations are conducted to learn about and isolate components of behavior that can be controlled. These preliminary manipulations then lay the groundwork for later manipulations that achieve concrete results based on these findings.

Second, manipulations must be subtle. The aim is to produce the greatest possible result from the least expenditure of effort. This also fits with the principle of changing the fewest number of variables. The proportion of result to influence indicates the skill of the individual manipulator.

Third, the manipulation must be recorded and, at its conclusion, announced. What did the manipulator expect to learn? How did the manipulator expect the influence to affect behavior? How did the influence actually affect behavior, and how did the predicted effect differ from the actual effect?

Hivers and Psionics

Hivers have no psi potential and cannot use psionic powers (exception: see page 43). They are, however, susceptible to psi powers, although telepathic skills are of limited utility against them.

Telepathic Skills: Any human or Ithklur psionic attempting to use Telempathy, Project Emotion, Project Thought or Probe on a Hiver automatically subtracts two stages of success. This is due to the difficulty in understanding a mind that has developed along a very alien evolutionary path (see page 249 of the basic rules).

Telempathy: Other than the loss of two stages of success, this skill

works with Hivers as described on pages 249-250 of the basic rules.

Project Emotion: Other than the loss of two stages of success, this skill works with Hivers as described on page 250 of the basic rules.

Project Thought: Other than the loss of two stages of success, this skill works with Hivers as described on page 250-251 of the basic rules.

Willpower Drain: This skill works with Hivers as described on page 251 of the basic rules.

Life detection: This skill works with Hivers as described on page 251 of the basic rules.

Shield: Since Hivers have no psi powers, they may shield themselves only by artificial means (electromagnetic psi shields).

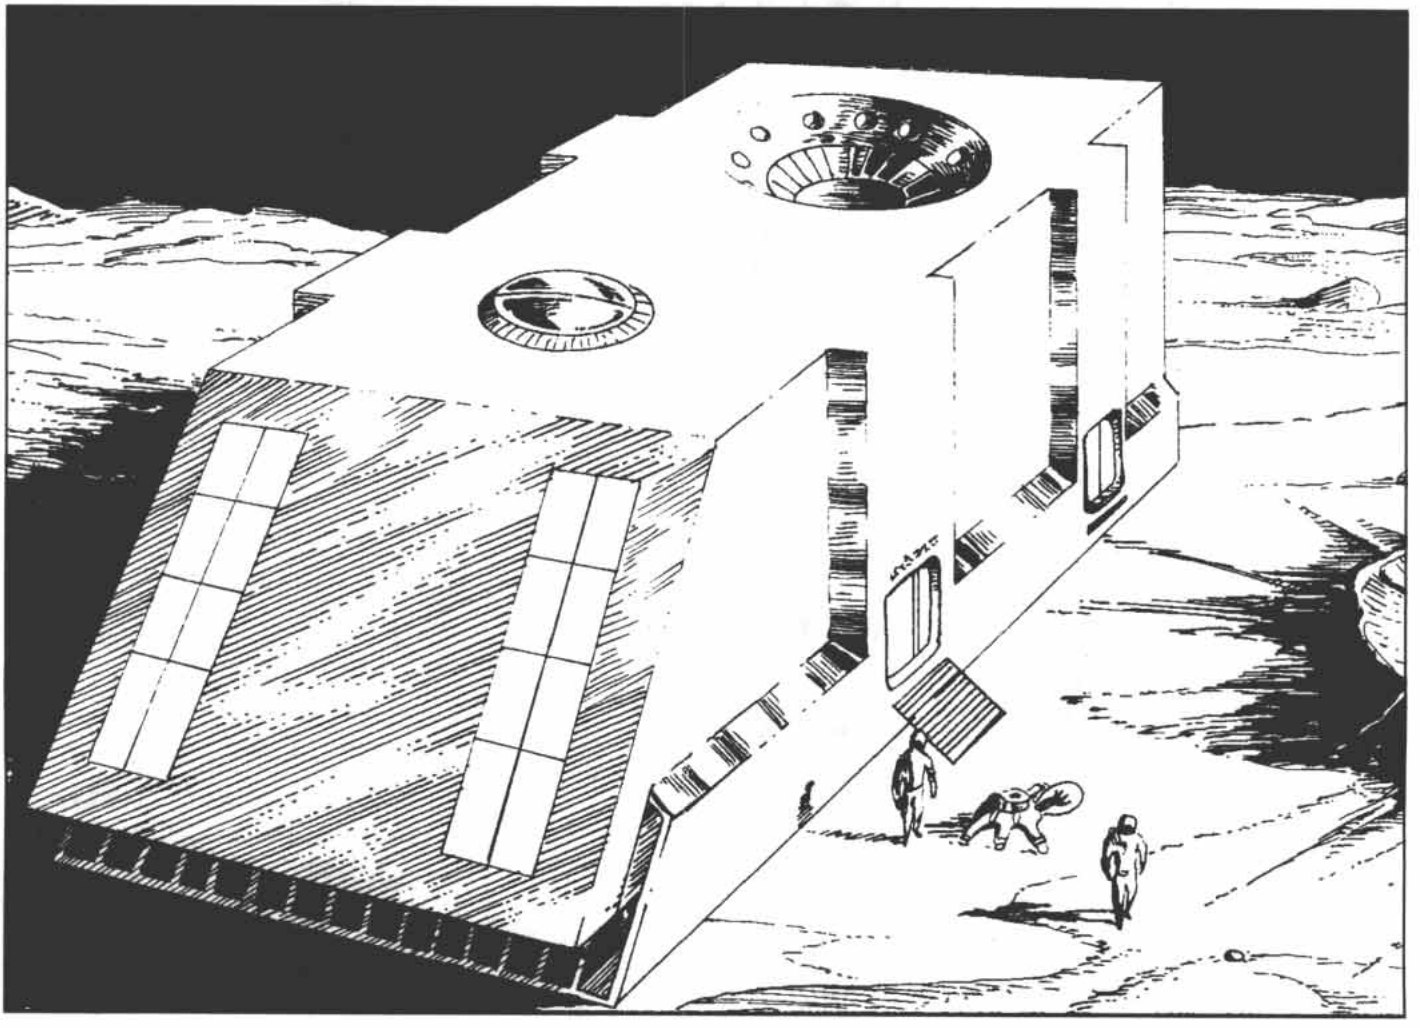
Probe: Psions attempting a Probe of a Hiver's mind will encounter the same difficulties in understanding an alien mind as are involved in Telempathic contact and must subtract two stages of success.

Assault: Psionic Assaults do not require the sophistication of Probes, and need not take the alien nature of the target mind into account. This skill works with Hivers as described on pages 251-252 of the basic rules.

On Refereeing Hiver Society

Okay, so what about the Federation underground? How is this to be portrayed?

Underground? Who in the world said that there was an underground? Certainly not me.



So what about everything in the book?

Everything in the book was said by someone, and based on what they believe to be true. And where there is smoke there is fire. Probably. Maybe. You never know. Most beliefs have at least *some* basis in fact (don't they?).

Remember that not all "people" believe there was a Holocaust, and not all Americans believe that the Civil War was caused by slavery. In Hiver society at large, there is no general awareness of any conflict of any kind between dreamers and nondreamers, between supporters of the *status quo* and any organized dissatisfaction with it. This does not mean that those currents are not there.

Thus, whether or not there is a Hiver underground is irrelevant to whether a given Hiver character believes that there is or acts as if there is.

The key to roleplaying an alien race, either as a player running a PC or a referee running an NPC, is to take the various "facts" presented about that race and think about them. What sort of attitudes are required to make these facts consistent in an alien mind? If there are things that are simply unavoidably inconsistent, how does the mind of your character deal with that fact? Does he figure he's stupid or wrong, or that other people are stupid and wrong and need to be corrected? Fitting these motivations together is the territory of each and every **Traveller** alien roleplayer, and you can do it how you like. After all, they're aliens, so no human can tell you you're wrong.

Ithklur

On Ithklur-Human Contact

You humans—you have such tolerance for ambiguity! For example, your *Sharis *have no underlying forms, which means that you teach your whelps to seek meaning even when no pattern is forthcoming. This is astounding, and forward-thinking!*

And your bug-eyed maritime crewman, surely he is as fine a philosopher as you possess, and you have followed his credo for almost six millennia! That this realization has been known to you and your littermates for so long is truly a wonder!

You have much to teach us, and as always, we must not forget to thank our drivers for bringing us into contact with you.

On Human-Ithklur Contact

What these guys need is a good 12-step program, like "Happy Anarchists Anonymous."

A human observer
on Ithklur revelers

On Human-Ithklur Contact II

I see you've been talking to our active friends again. What have they told you this time?

A Hiver diplomat

Ithklur Aphorism

Consider the lilies of the field, how they grow; they neither toil nor spin; yet I tell you, even San*klaass *in all his glory was not arrayed like one of these.*

This saying clearly must date to the period after the first human-Ithklur contact, yet there is no evidence that assists in dating its origin.

Note on Ithklur Pronunciations

The "*" sound in Ithklur is invariably described as a click, but it is different from the common click found in human languages (such as in Terran Bushman), which is usually a full sound made well back in the throat. The Ithklur click, which cannot be exactly duplicated with the human mouth, is closer to a click made in the front of the mouth with the tongue and mouth roof. It is sometimes transliterated as "'t'" with the first apostrophe representing a glottal stop and the second representing a transition of the tongue from the front of the roof of the mouth back toward the throat. The "glottal stop-tee" version is widely viewed as an acceptable alternative pronunciation. Thus the Ithklur names *San*klaass* and *San't'klaass* are the same name, using the two alternative forms of transliteration.

Ithklur words and names are shown in *italics* in the following section.

SIB Introduction

At the outset I should point out that the Ithklur are like a breath of fresh air in a bracing, midsummer cloudburst after having emerged from the airless, Byzantine tunnels of Hiver psychology. If every alien race that we study could be such an unalloyed joy to encounter as the Ithklur, the RCN would not be allowed to offer us a salary.

Fortunately for our families and landlords, races like the Ithklur are few and far between....

A.K.

The Ithklur have been described by human observers many times, and the following descriptions are typical:

"Exuberant, earnest, honest, with not a mean bone in their bodies...."

"...Joyful anarchists with a firm belief in a higher order."

"...A cross between a golden retriever and a box of razor blades."

It is clear that although descriptions are in no short supply, an understanding of the true Ithklur nature is. The underlying similarity in all descriptions of the Ithklur is the ambiguity of their undeniable violence and their equally undeniable good natures. As humans, we have come to equate violence and aggression with evil, and to equate meekness, even ineffectual impotent wimpiness, with goodness. Surely the Ithklur do not share this vision, and yet they are not cruel. Many humans attempt to use Nietsche as the means to understand the Ithklur psyche. And yet Nietsche, in spite of the useful concept of the transvaluation of values and the affirmation of the self's own will to power, seems ultimately to offer only a rationalization for the selfish, god-like application of the will on the remainder of reality, regardless of the cost. And while the Ithklur are clearly in accord with the Nietschean sense of the joy of living the will to power, they are notably bereft of the need to commit the selfish excesses to which most followers of Nietsche succumb.

How are we to make sense of these beings?

They deliberately breed flowers into their most basic and generalized genotype, and take delight in flowers which sprout in cracks in streets and sidewalks, ultimately buckling and destroying those structures.

And yet an Ithklur on runway maintenance duty has no compunction against spraying the flower with herbicide, acknowledging his role as the enemy of those who would buckle the tarmac, but as he does it, he silently salutes it for its audacity and pride in being integrated with its spirit.

How can we understand people who are so full of love, even love for those they must destroy? And yet they do not perceive any tragedy inherent in their existence. Unlike humans, they do not experience remorse for the necessity of having to kill other soldiers in time of war, or of having to kill criminals in time of peace to prevent their disease from corrupting the innocent.

And all the while, the Ithklur maintain their wide-eyed sense of wonder, delighting in tacky snowglobes for sale at starport gift shops, and ancient Terran cartoons ("Hang on, Beanie-boy!"). In spite of the joy that one experiences second-hand in the study of the Ithklur, we human analysts find ourselves haunted by the pathological drive to *understand* that is a part of the human psyche, in contrast with the simple pleasure and confidence that the Ithklur find in simply *being*.

What a blessing it seems to be for them.

Perhaps all that is left to us is to learn from the Ithklur example: to experience the universe as newborn babes, and to take joy, meaning and then more joy where we find it, revelling in the inimitable experience of being who we are.

Although RCN regulations warn me from making sectarian or denominational reference to the eternal, the spirit of the Ithklur calls me to say, regardless of any well-intentioned prohibitions, "Thank God for creating me as I am, to live and seek You wherever I can. All honor and glory be to You, Almighty Source and Destination of all that is, real and yet to be realized, forever and ever, amen."

Who's In Charge Here?

One of the most persistent mysteries of the Ithklur culture is, "Whose idea was this?" Certainly the Hivers claim credit for having "civilized" the Ithklur, yet the Ithklur claim that they are as they have always been is a hard one to refute. While there are seemingly valid arguments in support of both sides, there is no objective means to sort these out and evaluate them. This must therefore remain an open question.

Based on our observations and research, there appears to be a homogeneity of Ithklur culture that is not consistent with observed variations in culture among humans, Vargr and Aslan who were spread across similarly large areas for similar lengths of time. In fact, our research shows only one other starfaring race which appears to demonstrate similar homogeneity, the K'kree. But since the K'kree are only known to us by records, there is no way to really examine this similarity.

Certainly not all Ithklur are alike, just as not all humans acknowledge basic human concepts such as the greatest good of the greatest number, the inadvisability of infidelity, murder and cannibalism, etc. There are Ithklur criminals (which only makes one thankful that Ithklur police officers are as powerful as they must be); there are Ithklur psychologically troubled (ditto); and there are the inevitable armed conflicts that arise between Ithklur political groupings. Yet the Ithklur sense of who they are is much more unified than one would find among a sample of a post-Imperial of Vilani descent, a post-Imperial of Solomani-Irish descent, and a post-Imperial of Solomani-Scottish descent.

What is the source of the Ithklur cultural homogeneity? Is it something integral to the Ithklur themselves, or is it an artifact of the celebrated Hiver manipulation which made them what they are?

Framing the question may be as far as we are ever able to get. Yet the wonder of the reality is undeniable.

Ithklur Aphorism

Believe. Always believe.

Common Ithklur saying, usually attributed to *San*klaass*. Humans usually ask, "Believe in what?"

To Ithklur it is immaterial what each person actually believes in, so long as they believe in something. And belief, being a class which has *integrity*, is by its nature inherently good and true. Therefore, by definition, no one can believe in something that is wrong.

ITHKLUR PHYSIOLOGY

Ithklur are descended from arboreal carnivore/pouncers, who descended from their trees to adapt a different life-style when climatic change eliminated their home forests. Their physical structure indicates that their arboreal behavior was quadrupedal (in the style of Terran squirrels) with some components of vertical clinging and leaping that allowed a partially bipedal orientation. However, their narrow thoracic structure shows no adaptation for brachiation. This was fortunate, as this posture enabled them to successfully transition back to terrestrial life using a semi-quadrupedal running gait. They are homeothermic and bisexual, meaning that they are warm-blooded and have two sexes.

Overall Anatomy

Ithklur exhibit bilateral symmetry, and their upright bipedal posture gives them a humanoid appearance. Aside from their tails, Ithklur visually resemble humans, but there are numerous differences.

Skeleton and Posture: The Ithklur skeleton is internal, and is yet another variation on the collagen and calcium matrix found on hundreds of worlds. Lower limbs attach to a pelvic girdle at the base of the spinal column. Mini-ribs, small elongated extensions of the vertebrae, form part of the rib cage, the forward portion formed from other small ribs joined to the large sternum in the center of the thoracic region.

The structure of the shoulder girdle and the length of the arms allows the Ithklur to adopt a semi-quadrupedal running gait over uneven ground in which their legs provide the main motive power and the arms provide guidance and steadiness, much as humans scrambling over boulders.

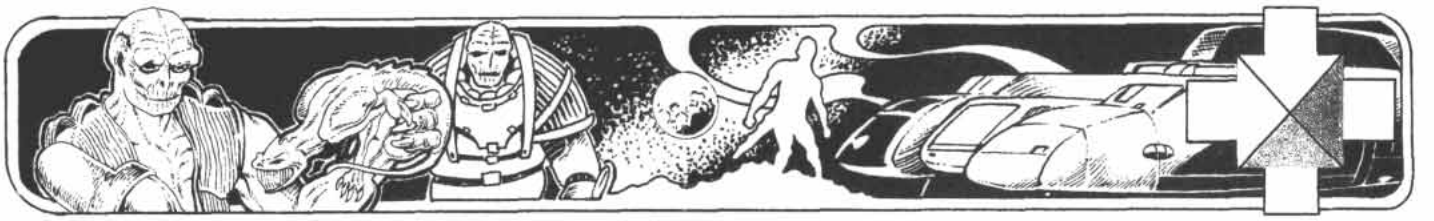
Ithklur rifle slings are still designed to permit this gait and suspend the rifle beneath the chest, allowing both hands to be used for scrambling over the ground, although usually one or both of these hands are used to steady or fire the rifle.

The skull surrounds and protects the brain, and serves as a base for the Ithklur sensory organs, just as it does in humans. Ithklur have a movable lower mandible and 48 teeth adapted to a carnivorous diet, with conical grasping teeth at the front of the mouth and shearing incisors at the rear. This dentition appears to be adapted to striking at living prey and seizing it with the front teeth. Their rear teeth are analogous to human molars, except that instead of grinding plant material, they are used to scissor up flesh in preparation for swallowing.

Skin: Ithklur skin is thick and covered with fine scales, varying in color from brown to green to bluish. Coloration tends to be roughly homogeneous over the body (with slight lightening on the ventral surfaces), although striped and dappled patterns are not unknown.

Torso: The muscles which anchor the legs, arms and tail to the Ithklur torso are massive, and the torso is correspondingly bulky. The short, relatively stiff, heavy tail is used for balance in running, and is studded with a number of thickened bony studs and ridges at the end, making it a fearsome weapon in close combat. The tail normally does not touch the ground, although Ithklur can lean back on it for short periods of time.

Arms: The arms are heavily muscled and end in large, three-fingered hands with an opposable thumb, each digit ending in a short, stubby claw. The skin on the palms and inside surfaces of the fingers is thinner and more richly supplied with blood and nerve-endings than Ithklur skin as a whole. Ithklur hands are stronger than human hands and about as sensitive, but they are much larger and not nearly so dexterous. Ithklur controls, buttons, triggers and switches are therefore heavier and more robust than human examples, and Ithklur tend to break equipment designed for the daintier human touch, not to mention those intended for the much daintier touch of the boneless Hiver tentacle-fingers.



Legs: An Ithklur's powerful legs end in large, four-toed feet, each with a powerful rear-ward pointing heel claw. When relaxed, Ithklur rest upon the full length of their foot, both heel and toes (a posture known as plantigrade). When running, or standing at an alert posture, Ithklur rest their weight upon the balls of their feet (a digitigrade posture), using the tail for balance. (For this reason Ithklur military ranks are deeper than human ranks, as space must be left for the rearward-projecting tails.) Like their fingers, Ithklur toes also end in claws, but these are stubbier and more robust than those of the fingers.

Head: At first glance, the Ithklur head appears identical to the human head, but this is a false impression, produced largely by the coincidence that the mouth and eyes are located in the same spot.

What humans take for a nose upon their first glance is actually a bony ridge separating paired infrared sensor organs, rather like those in a terrestrial pit-viper, although much more sensitive. The separation of these organs gives the Ithklur an accurate directional IR sense, enabling them to sense a number of things that humans cannot, and in all light levels down to complete darkness. This additional "heat" sense is evidently processed in the optical centers of the brain, as Ithklur interpret it as an adjunct to their vision rather then a separate sense.

Enhanced Vision: Because of their IR sense, Ithklur in total darkness will still be able to "see" using their IR senses, although it will not have the same visual acuity as sight in normal light. Imagine how well a human can see in a dimly lit room.

The Ithklur IR sense is fully integrated with their "visual spectrum" (from the human point of view; naturally the Ithklur find the infrared spectrum to be a part of their visual spectrum) senses. They sense

heat as additional "colors," and sense aspects to colors that humans cannot see. When Ithklur speak of a warm gray, they mean something different than a human. Just as humans can get a sense of the heat of a cup of coffee by the steam rising off of the surface of the liquid, Ithklur see the hot coffee as having several additional "colors" besides its normal visual color, representing the presence of heat in various degrees. The cup will be the hottest, the steam rising off the coffee next hottest, and the air around the cup will be the coolest.

This is described by the Ithklur as "the color from within," because these thermal colors appear to arise out from beneath the chromatic color of the material of the object. Thus, a cold object has a chromatic color but is "colored" cool "from within," while a hot object has a particular chromatic appearance but has a warm "color from within." Ithklur enjoy watching rock formations in the morning as their surfaces differentially heat up in response to the morning light. The nearest human example is watching the heating elements of a stove or a toaster begin to glow red, then orange, then yellow, then white as they heat up.

This sense has a number of obvious applications to Observation and Tracking tasks, particularly in the ability to spot camouflage. However, Ithklur characters will find that one of the most interesting uses is in Interview and Interrogation tasks, because of the ease with which they can detect subtle changes in human respiration (they see human exhalations), pulse rate and emotional state (from changes in the blood supply to various sections of the skin). Ithklur must have had training and/or experience in interviewing humans in order to be able to apply this skill effectively (Liaison is used as an enabling skill for Interview to represent such training and experience).

The nostrils are located high on the head, one on each temple, just behind the heavy brow ridges over each eye, forward and slightly above each ear. The brow-ridges are in fact part of the extensive Ithklur olfactory sinuses. The separation of each nostril allows Ithklur to determine the direction a smell is coming from, and the large nasal sinuses behind each brow ridge make it possible for them to detect odors at concentrations below that which humans can detect. The Ithklur sense of smell is about equal to a normal Terran dog, although probably not quite as sensitive as specialized "sniffer" breeds such as bloodhounds. The entire top of the skull consists of a layer of these sinuses with heavy bone protection above and below, giving extensive protection to the Ithklur brain from this direction. (This has led some scientists to propose that early Ithklur rammed their heads together in competition over mates, like some Terran sheep.)

This sophisticated olfactory sense might be an adaptation to a low-light hunting environment indicating that the original Ithklur may have been partially nocturnal or hunted deep in dense forests. Their sense of smell would have served as a long-range target localization system which allowed them to get into range where the more discriminating IR sense could come into play.

Enhanced Smell: The Ithklur sense of smell is about as acute as the average Terran dog's, but not quite as good as a bloodhound's. An Ithklur can distinguish between individual humans by their distinctive smell and follow a reasonably fresh scent trail (one that is less than eight hours old). Tracking skill is enhanced by this sense as discussed on page 78.

The ears are located on the side of the skull, in the same place as they are on humans, and for the same reason: to give a directional aspect to hearing. Ithklur ears have about the same frequency range and sensitivity as human ears.

Internal Anatomy

Internally, the Ithklur are fairly straightforward.

Respiratory System: The Ithklur respiratory system consists of a pair of lungs located in the upper thoracic cavity, each consisting of three lobes, connected with the mouth and nasal passages by bronchial tubes. A structure similar to the human epiglottis prevents swallowed food from entering the lungs.

Circulatory System: The Ithklur circulatory system is unusual in that it features two hearts. The largest is the arterial heart which circulates blood throughout the body. The arterial heart is located slightly to the right of the midline, in the thoracic cavity, between the lungs. The smaller pulmonary heart is located behind the arterial heart. It takes blood returning from the tissues and pumps it through the lungs and back to the arterial heart.

Digestive System: The digestive tract consists of an esophagus leading from the mouth to the stomach, and the greater and lesser intestines. The Ithklur are carnivorous, and the setup of their digestive tract reflects this: The stomach and relatively short intestines are primarily set up to process proteins and simple carbohydrates and extract the maximum amount of liquid from these sources. There is little capability to process complex celluloses or other plant material, which in any case is unsuited to their dentition as well.

Urinary System: The Ithklur kidneys are highly efficient, and feed waste products into a bladder which removes most of the water, reducing the liquid to a paste which is then fed into the intestines and eliminated with the solid waste. This, coupled with the intestines' water scavenging, makes the Ithklur very efficient in the metabolizing of water, which provides clues to the nature of the primordial Ithklur environment (although there is disagreement whether this environment was dry or merely supplied with nonpotable water—the phrase "thirsty as an Ithklur" refers to an individual who never seems to need to drink).

Early biologists, too easily influenced by the Ithklur's reptilian appearance, took the analogy too far and believed that their urinary and excretory systems fed into a common cloaca. This is not the case, as the Ithklur system is much more complex and adaptive.

Reproductive System: Ithklur reproduction is sexual, and the female carries the fetus for a very long period of time—17 Terran months, or about 510 standard days. This allows the young to be born in a very advanced state of development. Unlike humans, Ithklur young are born able to eat and digest meat (with no special dietary needs), and to walk within hours. This is made possible by the separate Ithklur reproductive tract, which does not require the newborn to pass through the restricted space of the pelvic girdle (and which requires human offspring to be delivered while still unadapted for independent survival). The reproductive tract, which is otherwise similar to the human model except that it is independent of the urinary system, is placed low on the ventral abdomen, terminating above and anteriorly to the pelvic girdle.

Because Ithklur sense minute changes in temperature (which they "see" as different "colors" of heat), and because human skin is so thin and well supplied with blood vessels (especially the face and hands), humans present a shifting kaleidoscope of colors overlaying the "normal" skin color as our moods, emotions and physical conditions change. Thus, humans have received the nickname Ithklur k*ktapka *(color-changing lizards), or "Chameleons." It is interesting that a race of creatures resembling reptiles should choose a lizard-derived nickname for us, a race of mammals. From the Ithklur point of view, many human emotional states are literally written all over our faces.*

Vrasstadt, Aubaine

ITHKLUR HISTORY

If any Imperial scientist ever studied the Ithklur, the results of that study have not been discovered by the Coalition. The history of the Ithklur, therefore, comes to us filtered through the Hive Federation. Certain aspects of their development and culture remain a mystery to us.

For example, it is not possible to know for certain how much of the Ithklur's current psychological make-up is due to development on their homeworld and how much is due to Hiver manipulation. The Hive Federation has always been hesitant to discuss the precise details of any major manipulation, and the various manipulations of the Ithklur are no exception. If you were to ask an Ithklur, of course, you would be told that it is Hiver behavior that has changed, not that of the Ithklur. They believe they have always lived as they do now and that the Hivers adapted to them, not vice-versa.

Hiver Manipulation of the Ithklur

The Hivers loudly and repeatedly proclaim their successful manipulations of the Ithklur to reduce their inherent violence, a tendency that seems somewhat foolhardy given Ithklur pride and emotional inclinations. The Ithklur just as loudly proclaim that the Hivers simply got used to them, and it was the Ithklur who won this battle of wills. Interestingly, there is circumstantial evidence to support both cases.

The Ithklur case is supported by the cringing Hiver behavior around the ubiquitous decorative carnivores, and their constantly serving as the butt (perhaps unwittingly?) of Ithklur games and intransigence.

On the other hand, the Hiver hand is seen in such social curbs on violence as sanctuary and Ithklur monogamous pair bonding, or marriage.

The Ithklur concept of marriage is a particularly interesting example. The fact that Ithklur young are born ready to eat meat and move around to a limited extent means that the requirement for specialized care of young seen in most other sapient species is removed from the Ithklur, and removes one of the most relevant evolutionary pressures for the development of sex-based stable pair bonds. Sociobiologists suggest that a more likely pattern would be seasonal competition by males for the attention of females, who would then give birth to young requiring little specialized care beyond the communal protection offered by a "pack" of Ithklur.

On Losing One's Marbles

Have you ever tried to crush a marble with your foot? It is not possible.

The harder you step on it, the more you attempt to impose your will on it, the more you simply transfer it, unchanged and undamaged, into another location.

Either you drive it beneath the ground where it is immune to your further attacks (unless you dig it out and attempt to crush it again, in which case the result is the same), or it shoots out from beneath your foot on a trajectory of its own, and not of your choosing, to find its destiny where it will.

Beware the stomper who finally meets a marble, for the results cannot be predicted.

The Enlightened *Slaa* de *Silentio*

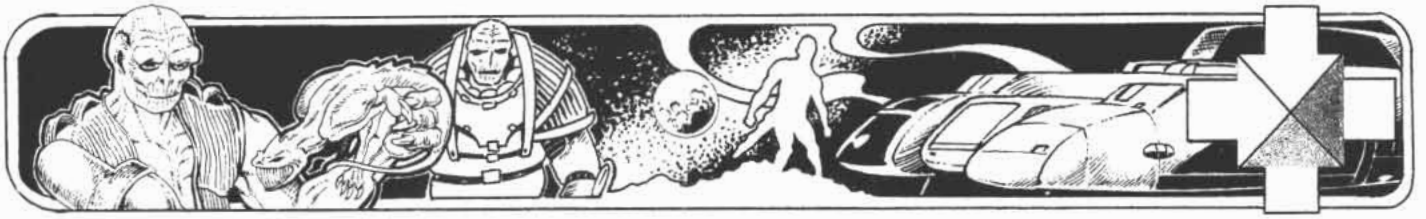
Under this model, it is proposed that these seasonal male competitions were too bloody and violent, and Hiver manipulation replaced this powerful source of aggression and conflict with an orderly structure that eliminates most need for sexually based aggression.

However, this model ignores the extremely long Ithklur gestation period (almost 1.5 standard years), and the advantages of pair bonding in these circumstances. But in the words of one member of the SIB team, all such speculation is merely "so much intellectual vanity—the Ithklur are what they are."

Development

The Ithklur are descended from carnivore/pouncers inhabiting a large, sparsely-forested plain in the temperate zone of the world they call *Eethk*klaa* (Tryylin is the Gurvin name for the world). The word is a variation of the Ithklur term for themselves, "*Ithklur*," or "lizard," and means "place where the lizards come from." Ithklur legs and general body structure indicate they were originally pouncers, a job for which their other body structures would seem to be well-suited.

We cannot be certain what stimulated the Ithklur to intelligence, tool-use, domestication and civilization. Ithklur legends speak of a mythic-hero who defeated a deity in single combat and forced him to surrender the knowledge of the gods.



First Contact

When contact between Hivers and Ithklur occurred in -3986, the Ithklur had already developed in-system spaceflight, and represented the most advanced intelligence the Hivers had encountered in their 600 years of interstellar exploration. United under a single government, the Ithklur had advanced to TL8 or 9, and were in the process of colonizing the *Eethk*klaa* system when the first Hiver ships attempted to establish trade.

The discovery that there were other worlds with intelligent life on them seems initially to have provoked a xenophobic response: the Ithklur attacked the initial Hiver embassies. What happened next is a matter for some conjecture. Some information indicates that the Ithklur began planning a slower-than-light colonization program, using large asteroids converted into colony ships, but that Hiver manipulations transferred the enthusiasm to explore space into other channels. Whatever transpired, Ithklur exploration of space was limited to the *Eethk*klaa* system for several hundred years, and the Ithklur hostility and xenophobia (as reported by the Hiver accounts, anyway) seems to have vanished.

Present

At the present time, Ithklur are widespread throughout the Hive Federation, although not the most numerous non-Hiver race. Their aggression has been channeled into useful areas, and they serve as the main source of marine personnel in the Hiver Navy, as well as making up a disproportionate percentage of Federation ground forces in general. A measure of how much the Hivers trust the Ithklur can be seen in the fact that the Ithklur have established (or been allowed to establish) an independent state on the edges of the Hive Federation, and have been granted complete internal autonomy, to the extent of maintaining their own armed forces. Although maps of the Hive Federation interior are not available to us, there are indications that the boundaries of this independent state have actually expanded, in some cases at the expense of the Hive Federation itself, since the Collapse 70 years ago.

ITHKLUR PSYCHOLOGY AND SOCIETY

Violence

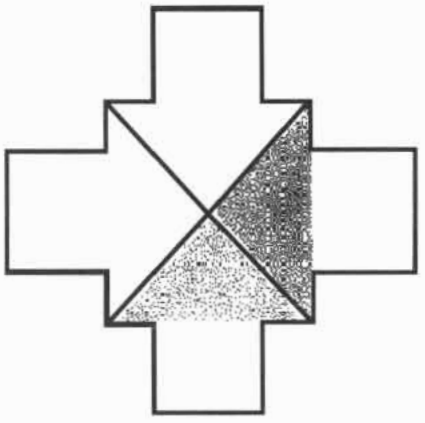
The Ithklur are naturally violent. Among themselves, Ithklur exhibit a physical boisterousness that can be dangerous to less robust races, and they have no qualms or reservations about the use of force.

However, the Ithklur cannot even be remotely described as cruel. While Ithklur parents are quick to resort to what humans would call corporal punishment, such acts of correction are swiftly and fairly applied, and without malice. Few Ithklur children need to be cuffed more than once to learn a lesson, and those that do are recognized as requiring more detailed guidance.

Ithklur are efficient hand-to-hand killers, knowing the weak points of any given race that will allow death to be dealt with a single economic blow. The use of such blows in noncombat situations, however, are considered criminal and are dealt with uncompromisingly.

For example, the heavy-vascularized Ithklur IR pits (in the same location as the human nose) are one such deadly location. Therefore, punching an Ithklur in the "nose" carries extreme penalties and is not usually engaged in by other Ithklur.

Socially accepted acts of physical force, such as cuffing another Ithklur as a form of discipline or the Ithklur pushing greeting, have carefully constrained limits. For example, cuffing is limited to the heavily armored top of the skull on the cranial sinuses, or on the shoulders. Pushing matches are also limited to the shoulders. The Ithklur claws and tail, equipped with sharp bony ridges, are never used for such acts.



The Ithklur are, quite simply, the finest, most implacable, most effective, and most trustworthy troops in charted space. Their only equals are the Terran Gurkhas of Nepal and some Scottish units (provided the latter have white officers; see page 88). (Incidentally, the Ithklur themselves acknowledge this, maintaining warm, brotherly ties with any Gurkha and Scots units they encounter.) Ithklur troops do not surrender except upon higher orders; Ithklur troops do not retreat except to regain tactical advantage; and Ithklur troops do not indulge in battlefield atrocities motivated by unbridled hatred or loss of control of one's violent impulses. The Ithklur are violent creatures by nature, but are in complete control of it, and do not have to "unleash" these tendencies as other species do in order to fight to the death.

There is a persistent academic argument engaged in by humans who have never had contact with the Ithklur, to the extent that the Aslan are better warriors than the Ithklur. This argument is only engaged in by those who do not know the Ithklur, as those who do invariably walk away in disgust, refusing to become involved in such a waste of time. However, on one occasion, a human officer called out, as he walked away, "I could trust an Aslan to kill someone, but I could only trust an Ithklur to kill someone for the right reasons."

Ithklur Epigram

You humans are so self-destructive! Violence erodes your spirit, because to kill you make yourselves hate, and like acid the hatred eats away at you. Love your enemies as you kill them. Be free.

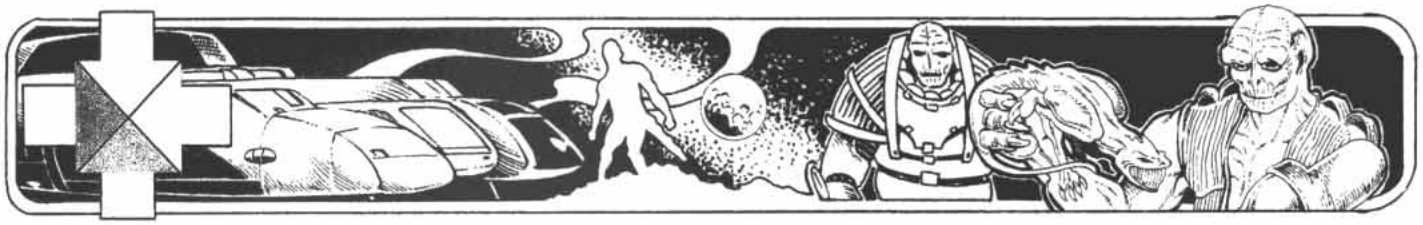
*Assa Sanok*kla,*
destined Blissful Warrior

The Tetragram, symbol of the Fourfold Way

The Tetramerous Way (also translated as "The Fourfold Way," from the Ithklur *Dikrah Sonnie*)

This can essentially be described as "the Ithklur Racial Religion," although there exist no official requirements for any Ithklur to subscribe to its tenets (other than, as in the analogy of human society, many legal concepts coincide with Judeo-Christian ethics).

The Tetramerous Way was originally *proclaimed* (not discovered or invented) by an Ithklur named *San*klaass*, also remembered as "The Blissful Warrior" or "The Blissful One." *San*klaass* was the first Ithklur to achieve *enlightenment* (see below), and his example and teachings have created the subsequent understanding of the Tetramerous, or "Fourfold," Way.



The Tetramerous Way is symbolized by the *tetragram* (see illustration) which graphically illustrates that Ithklur reality is achieved by the integration of four separate paths, represented by four arrows which merge in the center to rise perpendicularly as a pyramid out of the surface on which the tetragram is made. This rising of a third dimension out of a two-dimensional figure demonstrates the breaking into a new dimension which is accomplished by the proper synergy of the four paths of the Ithklur nature. (The tetragram is therefore an inherently three-dimensional object and cannot be placed on flags, but can be embossed onto armor, vehicles, etc.)

The four paths are as follows:

The Facilitator Path: The Facilitator Path includes all those in Ithklur society whose labors are directed to the continuation of that society and meeting its needs. These include parents, shopkeepers, cafeteria workers, garbage collectors, etc.

While the Tetramerous Way recognizes that many of these occupations are commonly thought to be "lowly," *San*klaass* himself observed: "These lizards have consented to be the strong structure upon which we build all our society, and every timeless thing we will ever achieve. I will tell you that these are not the lowliest among us, but rather the most exalted, as everything we accomplish will be thanks to their shouldering the burden of launching this race to its destiny."

This path is therefore specifically referred to as the First Path and most important path by *San*klaass* and all adherents to the Tetramerous Way. This is because these life-styles are the most basic to the survival of the Ithklur race, and without them, the Ithklur would not exist.

Ithklur Aphorism

All Ithklur—facilitators, guardians, explorers and seekers—are warriors. Life is a struggle against the dark, against meaninglessness, injustice and deceit, and we are all involved in this struggle. We are all warriors, shooting at the walls of despair, disillusionment and nihilism. Bang, bang.

An Ithklur footwear salesperson

Incidentally, Ithklur footwear serves the primary purpose of protecting other objects, such as floors, vehicle control pedals, etc., from Ithklur claws.

Note that the Facilitator Path includes such careers as the Ithklur space navy and military aviation arms, as these activities are considered to be supporting roles for the expression of the Guardian Path.

On the tetragram, the Facilitator Path is the arrow which rises up from the bottom and symbolically forms the base on which all of the others stand.

The Guardian Path: The Guardian Path encompasses all Ithklur whose jobs call them to do personal, physical battle for the protection of the Ithklur soul. This includes ground troops (but not supporting arms such as aviation or the navy) as well as professional athletes who express the Ithklur ideal of vigorous exertion as the means to achieving meaning in life. This path is often referred to as "the Second Path," although *San*klaass* never referred to it as such. Its veneration is due to the natural Ithklur veneration of warrior-oriented life-styles. It would probably be given first place in the Ithklur consciousness had *San*klaass* not specifically sanctified the Facilitator path as the most worthy and noble. (In fact, many tetramerous philosophers privately profess that *San*klaass* chose the Facilitator Path as the first path because had he not, all Ithklur would have flocked to the Guardian Path and left no one to keep society running.)

On the tetragram, the Guardian Path is the arrow which comes down from the top and forms the highest ray of the resulting cross. This is said to symbolically refer to the fact that physical struggle is an expression of the highest aspirations of the soul becoming entangled in the compromises of finite life.

Recognition of Destiny

The Tetramerous Way allows that sometimes an individual particularly marked by the eternal can be recognized as such by his contemporaries before he literally reaches the physical fulfillment of his or her destiny.

An example of this is the Ithklur *Assa Sanok*kla* (**Star Vikings**, pages 92-93). While he has not yet actually achieved the rank of Blissful Warrior, his comrades have recognized that this is where his destiny will lead him, and he is therefore treated "in advance" with some of the respect and honor that will be accorded to him when he eventually achieves this state in all respects. (For human audiences, Ithklur often use the human example of the recognition of Jesus the Christ by the three kings at the Epiphany.)

Note that no Ithklur can "recognize" his own destiny in this fashion (the Jesus example fails in this respect); by definition, an Ithklur can only choose his or her own path; only others can recognize the validity of a path that Ithklur has not chosen.

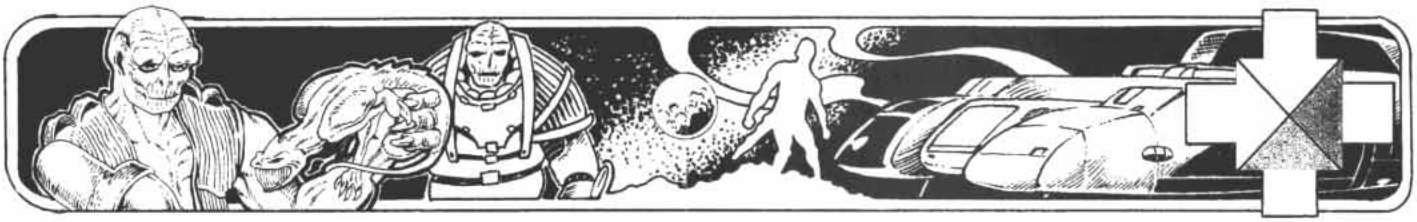
The Explorer Path: The Explorer Path is devoted to "the search for knowledge without," in other words, exploration of the physical universe and venturing into the unknown. This includes interstellar scouts, as well as merchants and seamen, who traditionally in Ithklur history have been those who venture into the unknown seeking knowledge, physical goods and artifacts of existence previously undreamed of.

On the tetragram, the Explorer Path is the right-hand arrow (as one looks at the tetragram with the pyramid emerging from the surface toward the viewer). This represents the input of knowledge from the physical world which enables the function of the Ithklur supporting path and the Ithklur higher nature.

The Seeker Path: The Seeker Path is devoted to "the search for knowledge within," in other words, the discovery of eternal immutable truths of science, philosophy, theology and the soul. This path includes medicine and pure science, as distinct from explorers and applied scientists, but also includes religious and spiritual leaders and poets.

Although this path is typically the last path mentioned, and perhaps contains the fewest adherents of the Tetramerous Way, it arguably contains the most intelligent of those devoted to the four-fold path. In fact, *San*klaass* himself was careful to explain, that although he was a true tetramerous disciple, his personal origins were in the Seeker Path.

The Tetramerous Path: The Tetramerous Path (also called "the Four-Fold Path") itself is the path espoused by *San*klaass*, and involves the combination of the true and proper elements of the other four paths. (On the tetragram, the Tetramerous Way is represented by the pyramid which breaks the two-dimensional plane and rises out of the symbol.) Followers of the Tetramerous Path seek to live in accordance with the Facilitator, Guardian, Explorer and Seeker paths in all actions, a goal which *San*klaass* himself admitted "is harder than it seems."



Fascists and Phalangists: Followers of the Tetramerous Path are broken into two groups, known as the Fascists and the Phalangists, because of their methods of achieving the state of highest unity.

Fascists believe the four paths can be visualized as a bundle of sticks tied together. In this way they can be seen as separate but parallel, beginning at the same point and ending at the same point, although defining four distinct paths through time and space. Fascists believe achievement of unity comes from tasting the reality of all four paths. Therefore, fascists move through their lives in a variety of sequential careers from the Facilitator, Warrior, Seeker and Explorer paths on their way to the state of Blissful Warrior.

Phalangists believe the four paths can best be visualized as an Ithklur hand, with four distinct fingers, but still the same unified organ. This represents the phalangist belief that it is not the precise details of their four separate paths *per se*, but the mystical combination of their essence, which can be pursued in its own right, without having to concentrate on the point of view of any single path. Phalangists therefore remain on a "pure" four-fold path on their way to the state of Blissful Warrior.

Both fascists and phalangists claim that *San*klaass* advocated their interpretation, but, like most spiritual records, the record of *San*klaass* provides adequate support for both paths without settling on one over the other.

The Tetramerous Way advocates the *enlightenment* of all Ithklur (although it takes great pains to not condemn the elementary, as everyone begins life in this state, and many will always remain here), and provides a structure of ranks of advancement down the path of

Ithklur Table of Enlightened Ranks

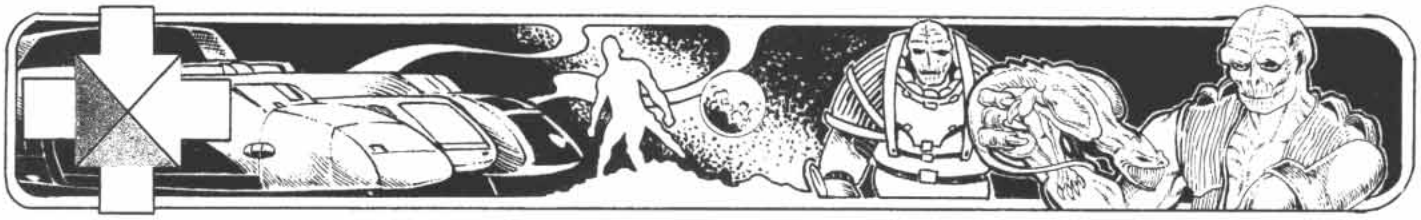
Rank	*Facilitator Path*	*Guardian Path*	*Explorer Path*	*Seeker Path*	*Fourfold Path*
1	Enlightened Builder	Aroused Warrior	Tenderfoot	Enlightened Searcher	Pilgrim
2	Ethical Builder	Illuminated Warrior	Ethical Scout	Ethical Seeker	Wounded Pilgrim
3	Balanced Maker	Balanced Warrior	Balanced Voyager	Balanced Seeker	Determined Pilgrim
4	Resolute Maker	Resolute Spirit	Resolute Traveller	Resolute Delver	Indefatigable Pilgrim
5	Restorer of Harmony	Calm Defender	Temperate Journeyer	Temperate Aspirant	Seer of Miracles
6	Timekeeper	Patient Warrior	Composed Wayfarer	Composed Inquisitor	Defender of Dreams
7	Tranquil Creator	Watchful Guardian	Tranquil Explorer	Tranquil Inquisitor	Believer of Impossibilities
8	Serene Creator	Exposer of Deceit	Serene Discoverer	Keeper of Dreams	Blissful Warrior

There are no rank names for elementaries.

enlightenment, specific to each path.

Unlike human ranks, which are specific to their current occupation and are usually not carried over to other jobs, all Ithklur followers of a specific path advance through the same enlightenment rank structure regardless of their specific occupation within that path.

The *San*klaass* Cap: The symbol of all those following the Fourfold Path, fascist or phalangist, is the *San*klaass* cap. The cap is a conical red cap usually made from a dyed fur, or artificial fur-like fabric, trimmed with a white headband and a white pompon at the top. Needless to say, the cap was designed and worn by the archetypal Blissful Warrior himself.



The symbolism of the cap begins with the white trim of the headband. This represents a life begun in a commitment to purity. This purity is then given power by passion, represented by the red fabric of the cap itself. The conical shape of the cap represents the converging of this passion to a point of focus over the course of the life, and ends with the white pompon at the tip, again representing the purity that is also the destination of life.

The *San*klaass* cap degrades the sense of smell, as it covers the nostrils. This derives from *San*klaass'* habit of wearing a headband which similarly blocked his nostrils, explaining, "They can't smell, so I wouldn't want any of them to claim that I took unfair advantage of their handicap."

Final Comments: Although no race is literally homogeneous, and not all Ithklur profess devotion to the Tetramerous Way and its understanding of the universe, the concepts of this philosophy illuminate almost all Ithklur thought and can be said to effectively be the framework of all Ithklur philosophy. (To some extent, the "Golden Rule" recurs in virtually all human belief structures, but the concepts of the Tetramerous Way are more homogeneously distributed throughout Ithklur culture, for whatever reason.) Therefore, an understanding of the Tetramerous Way (which is the name of the overall philosophical concept, as opposed to the specific Tetramerous Path) is effectively the same as an understanding of the Ithklur psyche, except that the stunning Ithklur accommodation to violence is scarcely hinted at, presumably because they consider it to be so self-evident.

Incidentally, the Ithklur have no concept of the dichotomy between military and civilian. Humans who attempt to compare this to the difference between the Guardian Path and the other paths will only succeed in convincing their Ithklur companion(s) that they are complete idiots.

Ithklur Anecdote

Ithklur Soldier on Leave: These flowers here with the transparent petals, you say you bred them from this strain with the red petals?

Human Nursery Employee: Yes.

Ithklur: And how long did it take you?

Human (proudly): 32 years.

Ithklur: Exquisite! I'll take a dozen, potted please. I'll bet it takes me less time to cross them back to their ancestral genotype!

Botany

All Ithklur have at least some rudimentary knowledge of botany and horticulture, having been exposed to it for all their lives. Ithklur are inordinately fond of flowers, and most Ithklur keep flower "gardens" in the typically Ithklur style.

Some theorize that the Ithklur fondness for flowers is adaptive, as the presence of aromatic objects assists in the training of young Ithklur in the use of the directional olfactory sense. This may well be true, but the typical Ithklur explanation of their fondness for flowers is, "They are what they are."

The Ithklur style of keeping flowers is quite the opposite of what passes for gardening among other cultures, as it is actively anarchic. While the human notion of gardening consists of carefully ordering the placement, extent and pattern of plant growth, the Ithklur style consists more of simply "turning them loose."

Unlike the Hivers, who can be said to practice *bonsai* on intelligent beings on a species-wide level, the Ithklur are interested not in constraining or controlling development, but in randomizing it as much as possible. The Ithklur are fascinated by the results of generations of controlled breeding and crossing of flowers, not because they admire the manipulation of the plants' genotypes and phenotypes, but because the more they can appreciate the trouble that was undergone to create a unique hybrid, the more pleasure they get out of undoing it and breeding them back into generalized varieties.

Ithklur are prone to engage in an activity called "freeing the flowers." This involves tearing down obstructions to the free spread of flowers, such as garden fences and walls.

Among the Terran flowers most admired by the Ithklur are the sunflower, daisy and thistle, all because of their inherent simplicity and genetic generalization.

Ithklur Names

Ithklur are commonly named for positive emotions and objects of beauty, particularly flowers and plants. When these Ithklur regularly come into contact with humans, these names are typically translated into their closest Anglic equivalent. These translations can be literal or figurative. For example, the same Ithklur name meaning "pure" could be rendered literally as the Anglic Pure, or figuratively as Catherine or Karen; the Ithklur name meaning "bright" or "brilliant one" could be translated as Bright, Brilliant or Clarice; the Ithklur "Just" or "Just One" could be rendered as Justice, Justin or Zadok; the Ithklur "Beloved One" could be translated as Beloved, Leif or David; the Ithklur name meaning warrior or soldier could be translated as Warrior, Defender or Harvey, and so on.

In the case of flowers, sometimes these names do refer to the same particular species, but sometimes they refer to analogous species from the former Imperial sphere.

This results in names which incite human sniggering, particularly in the case of male Ithklur named Joy, Heather, Rose or Daisy. Needless to say, this is not advised.

Common translations of Ithklur names for both male and female include Joy, Rhapsody, Heather, Harvey, Mark, Marcia, Colette, Star, Sky, Dawn, Ruby and Max.

Judging Disputes

When two Ithklur have a disagreement, the usual method of resolution is to find another Ithklur to act as a judge. This judge may be known to one or both parties, but is typically a complete stranger. Both sides then present their case to the judge, and the judge renders his opinion, which is binding on both Ithklur, and nothing more is said by them about it.

The judgement must be firm and unambiguous. A judge may not defer to another, or ask to think about the evidence, or say that both parties are right in their own way, or say that there is no good answer. An Ithklur who would do that forfeits his rank standing in the eyes of all who have seen him fail to judge.

Freedom

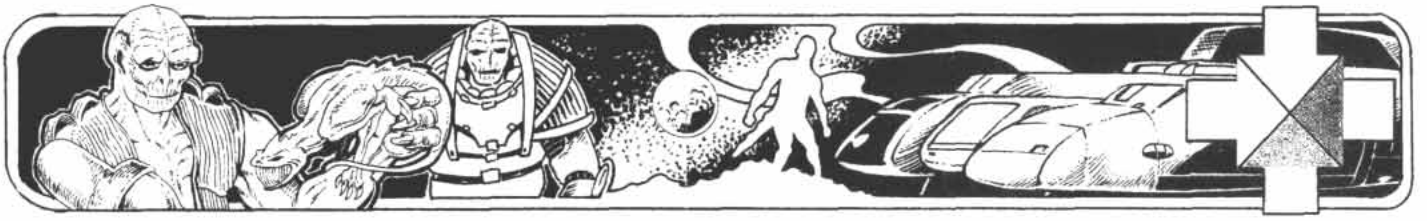
In the understanding of the Tetramerous Way, true freedom is not the simplistic freedom of being free from all ties, responsibilities, duties and demands. Freedom, rather, involves a recognition of the true nature of oneself, including one's own responsibilities and duties, and embracing that nature. By embracing that nature, one is free to be oneself in the truest possible sense, free from resentment about one's responsibilities, and free from bitterly wishing to be something that one is not.

In the Ithklur sense, freedom is not anarchic, irresponsible license, it is the willing acceptance of one's role in life, and the transforming power of that acceptance. Once one accepts one's place in life, and stops denying reality and pretending about things that are not true, one is freed to become more than one ever was and to achieve one's own absolute fullest potential, which may well be much more than was ever implied in the nature that one accepted.

Ithklur Anecdote

I walked into a bar and overheard a customer and the bartender arguing. They saw me and called to me to act as judge for their dispute.

First the customer said to me, "Surely the truth exists, because from the day we can first think, we are aware of the internal thirst that leads us to seek it."



Then the bartender said to me, "But surely our eyes show us that the world is filled with ambiguity and lies and broken promises, and we must accept that this thirst for the truth is but a childish illusion."

"Tell us," he said, "which of us is right."

I said to the bartender, "If you believe that there is no truth, then your eyes deceive you by falsely leading you away from the truth, and they offend you." So I poked out his eyes and seared the empty pits with flame to stop the bleeding.

Years later, he thanked me.

From *The Collected Wisdom of San*klaass*

For example, there is a Tetramerous parable that tells of *K*neese*, a female Ithklur who was discontent with her role as a mother (the Facilitator Path), knowing that she wanted more from life. But the more she attempted to deny her *mother*ness, the unhappier she became. When she finally made peace with the motherness in her, she became free to become the matriarch and leader, the *mother*, of an entire nation.

Thus the concept of freedom is inextricably linked with responsibility. Any being which exists in *integrity* with itself is *free to accept the responsibility* to do as its nature calls it to do.

The Ithklur extend this concept of freedom even to the nonsapient (see Decorative Carnivore on page 89). For example, Ithklur "zoos" do not resemble the form taken by human (and in fact, most other races') zoos—displays which show wild animals in limited areas so that they are almost always visible to observers. An Ithklur "zoo" consists of a wilderness area stocked with animals that are free to live as they choose. They feel it is an animal's nature to be wild; an animal is being true to itself if it bites or mauls or eats an innocent, so that is not its *fault* in the sense of being guilty of transgression. An Ithklur visit to the zoo is a potentially dangerous excursion, allowing them to exercise their talents in Tracking, Observation, Survival and various combat skills. However, Ithklur zoos are carefully fenced and otherwise isolated from surrounding communities because the right to *sanctuary* of nearby residents supersedes the rights of wild animals to wander about killing people.

More than one non-Ithklur community has been inadvertently terrorized by a band of inebriated *elementary* Ithklur on shore leave rampaging through a local zoo crying, "Free the oppressed!" and releasing the local equivalent of lions and tigers and bears (oh my!) from their enclosures. Note that this is not considered to be ethical behavior by the Ithklur (as it violates others' right to *sanctuary*), but it is a conclusion to which many elementaries are prone to jump.

Sex Roles

Male and female Ithklur have few characteristics to distinguish them for the human observer. They are identical in size, physical strength and stamina, although male Ithklur are known to claim that female Ithklur are tougher in combat. Because Ithklur young are born capable of eating fresh meat, they do not require nursing and the other specialized care that helpless human infants do. This has militated against the evolution of sex-roles with regard to reproduction and child-rearing, and in the absence of these requirements on the female time, sex roles in other areas are notably absent.

Military units are filled equally with male and female Ithklur, but romantic/sexual relations are not allowed within a unit. If this takes place, both participants are transferred from the unit. However, Ithklur are allowed the option of requesting transfer from a unit before such relationships develop too far. Such requests are not treated prejudicially and usually allow both parties to be transferred together to noncombat jobs.

Pregnant female Ithklur are also immediately transferred to noncombat jobs for the duration of their pregnancy. Again, the nature of this transfer depends upon the foresight and responsibility of the trooper. If she requests transfer before becoming pregnant, there is no action taken against her, but if she is found out, the transfer is a dishonorable one. The male who impregnated her is similarly disciplined for taking part in this dishonesty.

Domestic violence is virtually unknown among the Ithklur.

Certainly part of this is due to the fact that Ithklur marriage and family are considered *sanctuary*. But cynical sociobiologists point out that the fact that male and female Ithklur are the same size and strength and have nothing to gain by attempting to physically intimidate each other must have played a significant role in the evolution of such cultural predispositions.

Enlightenment

All Ithklur are considered to be a member of one of two groups: the *elementary* and the *enlightened*.

All Ithklur begin life as elementaries, persons who exist solely as finite physical beings in this elemental existence with no true appreciation of the eternal and one's place within it. There is no shame whatever in the Ithklur mind associated with this state. In fact, it is often romanticized as unpretentious, elemental joy and innocence, much the same as humans venerate "innocent" childhood.

Enlightenment occurs when an Ithklur becomes aware of his or her *true nature*, meaning an understanding of his or her own true strengths and weaknesses, and the way he or she is intended by the divine to use those characteristics in the service of the finite universe. Enlightenment is achieved by a complex combination of self-realization and affirmation of this realization by one's peers, as is advancement in this enlightenment. The Tetramerous Way describes a hierarchy of ranks of enlightenment which are used by all Ithklur in all aspects of their lives.

THE ANCIENTS HYPOTHESIS

It has long been known that a significant number of the intelligent races of Charted Space are a result of the activities of the civilization known as the Ancients, including forty-some transplanted examples of *homo sapiens* and the Vargr. In the case of the transplanted humans, the vast majority of these were not genetically modified, their different current morphologies resulting from a combination of environmental influences, genetic drift and especially the founder effect. However, the Vargr *were* genetically modified by the ancients in order to create a sapient race from sub-sapient canine populations.

Since we know that the Ancients seeded unmodified *homo sapiens* in at least 40 instances, why are we so quick to assume that they satisfied themselves with only one attempt at geneering on Terran stock? It strains credulity to accept that the Ancients would spend so much time stirring the genetic soup on ancient Terra and not attempt other genetic experiments. Where are the other examples of Vargr-type experiments? Where are their other successes, or perhaps failed prototypes?

The answer lies within the Hiver Sphere and has been so cunningly concealed by the masters of manipulation that our long-lost terrestrial brethren have existed unrecognized just beneath our noses.

These genetic cousins are none other than the Ithklur.

To unlock this riddle we must of course return to Terran source documents. Among the most crucial of these is work that was done during the –2530s in North America, primarily the works of Drs. Russell, Dixon and Harrison. These postulate the evolution of a sapient race from Terran dinosaurs, specifically the group known as the saurornithoids, and specifically species such as Stenonychosaurus and Troodon.

These dinosaurs had the highest brain-to-body mass ratio of the dinosaurs and possessed excellent manual dexterity, traits shared by prehuman primates. When we see the results the ancients were able to achieve with the Vargr, whose ancestors possessed no manual structure, it is clear that it would have been simple indeed for the Ancients to perform similar work on saurornithoids and plant these several sectors to trailing, rather than a similar distance to coreward.

The fact that this is more than theoretically possible is borne out by tantalizing evidence from religious, druidic and masonic documents and rituals, plus numerous corrupted remnants in popular and folk traditions. Stone carvings in such widely distributed places as the Iberian peninsula and the Central American isthmus clearly show bipedal, reptilian beings of great sophistication interacting with humans. Perhaps Clement Clarke Moore knew more than he let on.

From *The Ithklur: More Familiar Than We Knew*
by James G. Burton, Aurora Technical Institute

In practice, these concepts are remarkably similar to the human notions of officers (the enlightened) and enlisted personnel (the elementary) in the military. Except that whereas a human's military rank does not follow one outside of one's military career, an Ithklur's status as elementary or enlightened (and, if enlightened, one's rank of enlightenment) *does* translate into all aspects of one's life. Thus, an Ithklur who achieved enlightenment and a certain rank in one line of work and who changed to a different profession would set out in that new field with the same rank.

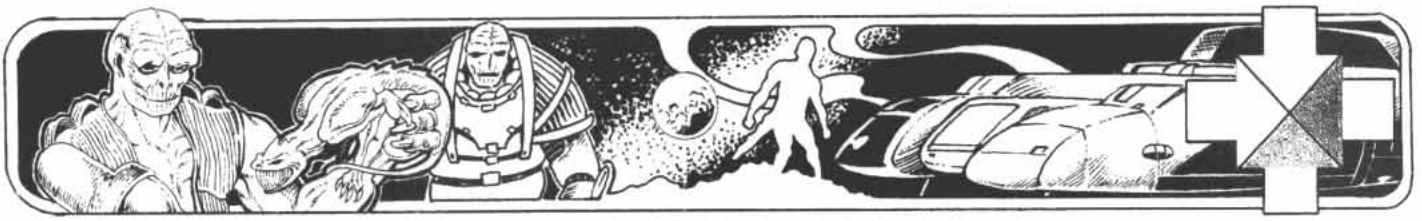
Fidelity

Among the highest values of the Ithklur is that of personal responsibility, promises and vows. The act of one Ithklur giving his or her word to another is considered to be a public affirmation of that Ithklur's true being, and to renege on that word is to deny the true self.

In human terms, an Ithklur is considered to be "as good as his word." But the Ithklur take this concept to further extremes: The fulfillment of an obligation, contract or promise is a test of whether the Ithklur who made that promise is actually in communion with his or her true nature or is in denial of that nature. Such a person is either "not what he is not," or "not what he is." (See sidebar on page 58 for explanation.)

Examples of the most treasured Ithklur examples of fidelity are the comradeship in a military unit, epitomized by "faithfulness unto death," and the dogged determination to believe in that for which there is no proof. Dying in such faith, even without any proof that faith was warranted, is one of the most beloved of all Ithklur circumstances, for such faith is believed to be capable of bringing the object believed in into literal being.

Ithklur pair-bonding, translated simply as "marriage," is considered to be a lifelong state by the Ithklur. There is no concept of divorce among the Ithklur, for the acts of betrothal and marriage contain the recognition of one's true self and the affirmation of that nature and those responsibilities. Ithklur couples who do not get along may agree to live apart, but neither is allowed to remarry, or to become romantically or sexually involved with another Ithklur. If one partner in an Ithklur marriage dies, the other is allowed to remarry, but only after carefully reconsidering the nature of his or her own path.



The Eternal Now

The Ithklur *profess* to believe that the "now" is the only moment which exists in this universe. The word "profess" is used because the Ithklur certainly do understand that life also consists of planning and making allowance for the immediate, mid-term and long-term future. In the words of *San*klaass*: "The now is the only moment that exists. Of course that doesn't mean that you shouldn't buy groceries or do your homework."

However, in the everyday act of living, Ithklur are encouraged to live each moment as if it were their last. This is not in the nihilistic sense of drinking, debauching and whoring for tomorrow we may die, but the sense that if life were to end at any moment, one's last moment should be an expression of the sort of life that one wants to be one's legacy.

*San*klaass* gave a two-part prescription for those who would live every moment of their life so it would be worthy of being their last:

1. "Live in the present moment, for there may never be another."
2. "In every moment, be the first to show love."

Love, of course, means to act in the best interest of another's true nature. For example, to show love to an innocent mendicant would be to give him food, money or shelter. To show love to a criminal would be to apprehend her, convince her of the error of her ways, imprison her so that she could redeem her debt to society, allow her to change her life, and forgive and free her so that she could begin a new and proper life. To love an enemy soldier during wartime would *not* mean to encourage that soldier to surrender, desert or betray his comrades (this human sort of tactic is called by the Ithklur, "saving the body but killing the soul") unless it could be proven that that soldier was fighting for an unworthy cause. If that soldier were fighting for a worthy cause, out of selfless love for his family, community or race, loving that soldier would require the Ithklur to kill him as cleanly and painlessly as possible, allowing him to die in full loyalty to the values that gave him meaning.

In the tetramerous understanding, life consists of nothing but an endless succession of "nows." As finite beings, we do not "own" (i.e., cannot control) any future moment, for we may be struck dead by circumstances beyond our control at any time. However, by the way we live in the current moment, we change the future, one moment at a time. The same way that a stone thrown into a lake makes ripples whose effects will in some small way reach its every shore, each act in each moment sends ripples into the future that will change the conditions within which that future moment is lived. For example, an act of kindness today may seem to take time or energy away from our planning to do something else next week, but exactly the opposite is true: That kindness today will ripple into next week one moment at a time and change the world into a place that will be more susceptible to our actions when it is time for us to act next week (assuming that our actions next week are ethical ones).

In some cases, the act of perpetually living in the present will actually prevent an Ithklur from making all the possible preparations for the future. In this case, the Ithklur believe that if one fails to make preparations by having incessantly lived properly in each moment, then life itself will work out to see to the needs that we failed to plan for. Human theologians refer to this as "living in a state of grace." The Hivers appear to assist in this by regarding the Ithklur as vaguely dull and treating them with parental solicitude, providing them with their basic needs in terms of shelter, food, weapons, transportation to exciting activities, etc. For their part, the Ithklur seem to encourage this by playing dumb and helpless.

As a visualization of the absolute value of the now, the Ithklur describe every moment of life as being "made of gold, if one has the eyes to properly see it."

The imagery here uses the concept of "the color from within," i.e., the interaction of the Ithklur thermal vision with their "visible spectrum" vision (see pages 48-49). The same way that an Ithklur can only directly view the exterior of an object, but can sense its temperature from the "color" that rises out of it, the moments of life can be immediately perceived as unpleasant or valueless, but one must be able to see the color that wells up from within such moments, and the color of those moments is *gold* (i.e., the element, not the simply color—the Ithklur place the same value on precious minerals as do humans).

In other words, any given Ithklur can envision his or her life as a handful of disillusionment, despair and dust, and there is ample objective reason for doing so, given the cruel reverses that life can deliver. However, this concept calls for each Ithklur to look beneath these surface appearances, and to realize that each moment of life is irreplaceable and of inestimable value. To truly appreciate the preciousness of these moments *during* these moments is considered to be a divine gift by the Ithklur.

An example of this consciousness is a poem written by an Ithklur prisoner held in a K'kree solitary confinement cell. The prisoner was executed by the K'kree and eaten in a grisly K'kree ritual, but the poem survived in the hands of fellow prisoners who preserved it. The prisoner's name was Seer of Miracles Sylvia (translated from the Ithklur *S*kfani*, or "Sylvan"), and her name is revered to this day by followers of the Tetramerous Way.

Dust, blood and broken teeth are in my mouth.
My death is held in store by this awakening day.
I languish in this pit, sores, excrement and spiders my only companions.
But as the light of the sun angles across my pit, it shines on a spider's web,
And illuminates drops of water clinging to the strands.
Never in my life have I appreciated such a glorious, flaming, sight,
Born in the tiny soul of a tiny bug, and ennobled and perfected by an eternal star.
I can only thank my God that I have lived long enough to see this golden light,
And that those rays of golden light, washed by those drops, will travel through the universe forever.

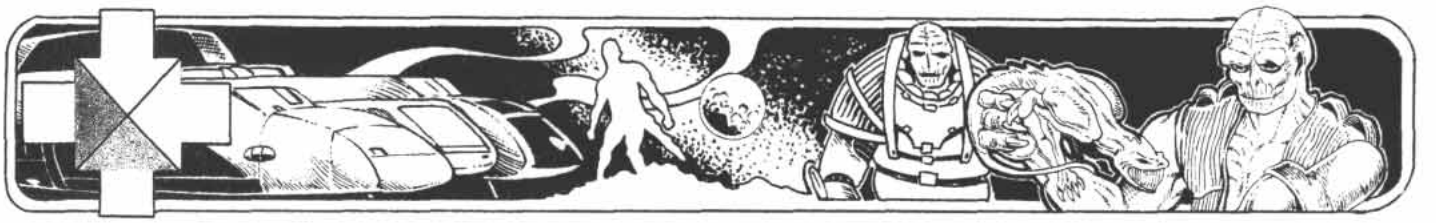
Thus, although she herself died within hours of having scratched those words into a ration can with her finger-claws, the beauty of her spirit has lived on and provided meaning to innumerable generations of Ithklur for over 3000 years.

Theology

The Ithklur belief in a supreme power, called "the ultimate concern" does not follow patterns seen in other races of ritualized worship. Instead, the individual Ithklur's devotion to the Tetramerous Way serves to constantly keep him or her properly oriented to the eternal, making one's entire life into an act of faith and worship. And since devotion to the Tetramerous Way or any of its individual paths is believed to bring one closer to the eternal, this life-style enables one to conform one's life more fully to the will of the divine, and thereby become a willing, joyful instrument of the eternal in this life.

The divine, ultimate concern is sometimes referred to as an individual, typically translated as "God," but is also spoken of simply as the ground of all existence, the source and destination of all goodness and truth, without having a personality ascribed to it.

The Ithklur have no belief in an afterlife *per se*. There is no heaven



On Ithklur-Human Contact II

This life therefore is not righteousness, but growth in righteousness.
Not health, but healing,
not being, but becoming.
Not rest, but exercise.
We are not yet what we shall be but we are growing toward it,
the process is not yet finished but it is going on,
this is not the end but it is the road.
All does not yet gleam in glory,
but all is being purified.

Martin Luther

This Martin Luther, he was a human too? *F'naah*, you humans are so smart! How have we existed for so long without such insight? We need to get out more.

An Ithklur warrior

or hell to which their spirits go, although their belief in an eternal which is beyond this *finite* life does imply some other source of reality or truth. However, this is not a place they are trying to get to, rather a force they wish to live in accord with. By living in accord with the eternal in this life, they believe they can transform this finite realm into the eternal, and that eventually, through the faithful lives of Ithklur living in accord with the will of the eternal, this finite life and the eternal will be united into one single infinite existence.

Integrity

Integrity, in the Ithklur (or tetramerous) sense does not simply mean honesty as in the human usage, although it does encompass that concept. Rather, integrity means living in coherence and harmony with the means and goals which give one's life meaning, and honesty comes as an inevitable result of that.

The following passage from *The Book of Accord* by *San*klaass* and his early followers explains his formulation of this idea.

Our definitions of integrity include the following:

1. An unimpaired condition: soundness.
2. Firm adherence to a code of especially moral or artistic values: incorruptibility.
3. The quality or state of being complete or undivided: completeness.

The first definition is used in the sense of watertight or airtight integrity. The second is used to refer to honest or honorable people. The third is really the deepest and most basic meaning of the word, which refers to an object's being integrated *with itself, being wholly functional and internally consistent with what drives it and gives it life (or function) and purpose.*

An object that fulfills the third definition would certainly fit the first definition: a watertight hull, an airtight spacecraft. In the same way, a person who fulfills the third definition would fit the second: a person who retains within him or herself a commitment to the values that provide meaning and value to his or her life. For example, we can only expect others to obey laws or codes of behavior that we favor if we agree that those laws also apply to us. By affirming a code of conduct for other lizards, I must submit myself to that code as well. Because I agree to be constrained by certain commitments, I must be sure to choose commitments that will give value and worth to what I (and therefore others) do.

What if a lizard says that she did believe in right and wrong, but that she didn't have to alter her behavior based on those principles? In other words, she could know full well that something she was doing was wrong, and know what the right thing would have been, but she was not obliged to do the right thing, or even avoid the wrong thing. That is a lizard without integrity not only in the sense of definitions 1 and 2, but particularly in the sense of number 3. To believe that there is such a thing as right and wrong but to believe that those values do not require one to conform one's standard of behavior to them is not complete, is not integrated. *It is filled with internal conflict.*

What if a lizard to whom I have made vows of support and honesty deceives and betrays me over a period of many months, and repeatedly lies and takes advantage of my trust in order to conceal it and allow it to continue? Friends might tell me that I should stop worrying about remaining true to my promises to that lizard, but I will not do so until ethical and legal means are taken to annul those vows. My friends might be disappointed, because they believe that I do not owe it to this lizard to remain faithful to my promises after what he had done. But they would be wrong because they do not realize is that my reasons for being faithful are not because that lizard deserves it or not. My reasons are because the value of my promises deserve it, because my commitment to truth deserves it, and because my own honor deserves it. If I am unfaithful I destroy my ability to live as a lizard of integrity, a lizard who is fully integrated with what he believes and holds to be valuable. If I am faithful to another, regardless of what he or she has done to "deserve" it or not, I have remained in harmony with the values and beliefs that I hold, and I prove that I am a lizard who can keep my promises.

If, on the other hand, we construct our lives based on the actions of those around us, constantly treating them as they have treated us and vice-versa, there is no chance for any of us to get along. However, if we construct our lives on values that are more important than we are, that do not change with moods or behaviors, that apply to us and to those around us, then we do have a chance to get along. What is wrong for

Ithklur Aphorism
I am what I am.

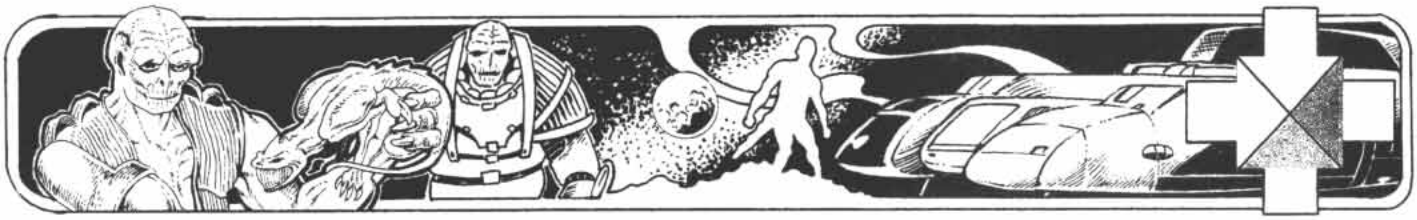
This is perhaps as close as the Ithklur come to a racial credo. The Ithklur believe that no being can aspire to a higher goal than simple self-awareness of one's own true nature. And that self-awareness makes that nature transparent to all others. Unlike most humans, the Ithklur do not believe that the admission of one's true nature to others makes one vulnerable. As a *true* nature, that nature has *integrity* and is therefore incorruptible, and can never be a source of weakness.

Ithklur Aphorism
He is not what he is not.

This is a simple assessment of an individual that he is either confused about his true nature or is uninterested in discovering it. In the former meaning, it is an expression of sympathy, in the latter, it is an expression of disgust.

Ithklur Aphorism
He is what he is not.

This is the Ithklur description of an individual who is struggling to overcome shortcomings in his or her own nature.



Ithklur do not believe that unworthy traits, such as deceit, lack of integrity, etc., are aspects of the *true* nature of a personality, but are impediments which can be overcome.

Ithklur Aphorism
He is not what he is.

This is the highest insult that an Ithklur can pay to another being. This is the formula of denial of the true nature of the self.

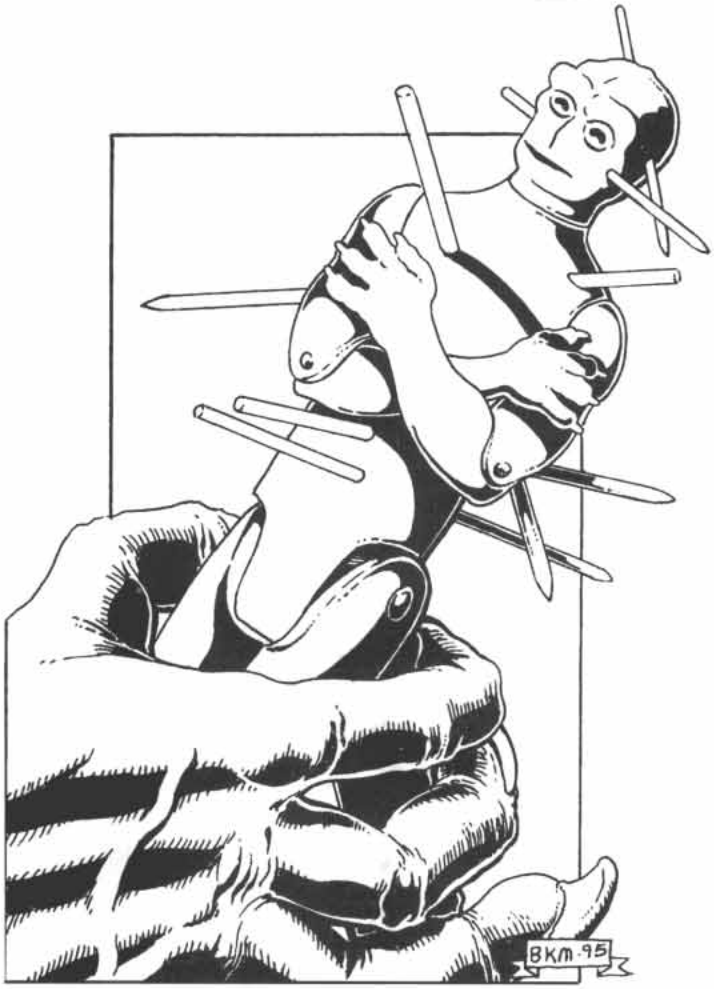
Note that the Ithklur do not believe that base motivations—lying, infidelity, etc.—are an expression of one's true nature, as these elements are *a priori* not *true*.

Thus one can be someone who is attempting to overcome a history of deceit and unfaithfulness and not be condemned by this judgement. Such an individual would be said to be "what he is not" (see above).

another to do to me is also wrong for me to do to another, regardless of what that person may already have done to me.

And I will tell you that dishonesty and deceit and betrayal are impossible for the integrated personality. As an integrated personality I can only lie if I believe that it is proper for all lizards to lie to all other lizards when they wish. This means that they can lie to me and I affirm this right. So how do any of us get along with each other or trust each other? We cannot. Even evil personalities require food and drink and oxygen and shelter; these are universal goods. Thus an evil personality by definition cannot be integrated, because he or she wishes to have the necessities of life, but presumes to deny them to others.

I will tell you that the truth is no less a necessity to life than are food and drink and oxygen and shelter, and truth is the most basic tenet of the integrated personality. And because an integrated personality lives in accordance with the laws of the universe, it has nothing to fear from the universe, because it is already in accord with the timeless realities. Such a personality is always vulnerable to evil, of course, but attempts to learn to deceive those of evil intent are to no avail, because they will destroy that personality's integrated nature and make that person only more vulnerable to evil, and what is worse, truth itself will now be the enemy of that personality. We can never afford to make an enemy of truth, for it is forever. As for evil, it will not last; it is temporary only; it is not integrated and will be blown away by the wind of eternity.



Living as an integrated lizard is to live with honor. Your honor and integrity is perhaps the only thing you possess that no one else can take away from you without your permission; only you yourself can release hold of your honor.

Honor and integrity are unitary. They are not divisible. You cannot behave honorably in one area of your life and dishonorably in another. Sooner or later one will destroy the other, and it is usually dishonor that gradually and subtly devours honor. There is no such thing as a "little lie." All lies damage your honor, creating cracks in it for future lies and deceit to take root, like weeds growing up through and shattering pavement.

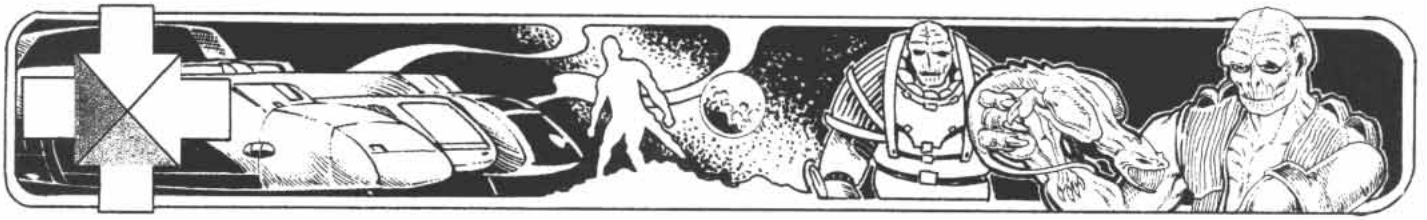
One of the concepts that is a by-product of this philosophy is that of the *true self* (translated from the Ithklur *Chalor*). The true self is the true, integrated personality that resides at the core of all beings, and by virtue of existing in accord with eternity, it is considered to be indestructible or, more often in the Ithklur parlance, "bullet-proof." Such a person has nothing to fear because the truth is impervious. Any reverses he or she may suffer are impermanent: Only truth is permanent, and any opposition to truth is therefore only temporary.

The popular Ithklur image of this concept is the "voodoo doll" and "custer statue." These are representations of Ithklur either in a soft, malleable form (the voodoo doll, usually children's toys) or a static form (the custer statue, used as decoration, art form, statuary or lamp bases—sometimes with a clock where the stomach ought to be—by adults) that is either shot through with holes or pierced by dozens of arrows and spears. Children's versions come with weapons that the child can push through the holes, while decorative statues usually have the arrows fixed in place. Expensive versions have the arrows and other projectiles made from transparent glass or plastic.

The figure in these objects shows an Ithklur contentedly engaged in the normal activities of his life (and can be dressed or equipped with the distinctive accoutrements of any Ithklur career of any path), completely unaware of and unaffected by the horrible wounds that he or she carries. These wounds are carefully placed to be fatal or incapacitating—through one or both hearts, through the head, through the IR pits, through joints of the arms and legs, etc.—but the figure is depicted as smiling and engaged in vigorous activities, and no blood comes from any of the wounds.

Ithklur Aphorism

It is a blessing to be *only smart enough*—smart enough to be in control of one's own daily affairs, but not so smart that one is confronted by the futility of attempting to control the perverse and absurd universe. Coming to terms with that requires philosophy, and philosophy is a mixed bag.



From *The Collected Sayings of San*klaass*

Ithklur Aphorism

Guilt is like any good thing. In excess and without balance, it can kill, just as too much food, drink or comfort can kill.

Guilt is the signal that shows that you know the difference between right and wrong, and which gives you the opportunity to act on that knowledge.

Unlike many cultures, human included, which disparage the sensation of guilt, the Ithklur embrace it as a voice from their higher natures that points the way to corrective action. Ithklur have a grave distrust of anyone who professes to never feel guilt or who claims to believe that guilt is a maladaptive emotion.

Perfect valor consists of doing without witnesses what one would be capable of doing before the world at large.
François, duc de la Rochefoucauld

Although these devices are common, found in most any Ithklur-occupied space, and commonly used by children as toys, their meaning and symbolism are venerated just as much as any human crucifix with the Christ hanging from it. In fact, the theological meaning is extremely similar, in that it shows that the crushing "defeats" of the world are actually victories for those attuned to the eternal, and that all followers of this belief are called to undergo similar treatment, but to have faith in similar ultimate vindication.

In a similar fashion, one of the sacred symbols of Ithklur initiation to enlightenment or advancement to higher ranks is the false arrow-through-the-head appliance, worn by all participants of these ceremonies to symbolize the fact that their connection to the eternal makes them invulnerable to even the most grievous wounds that the finite world can inflict.

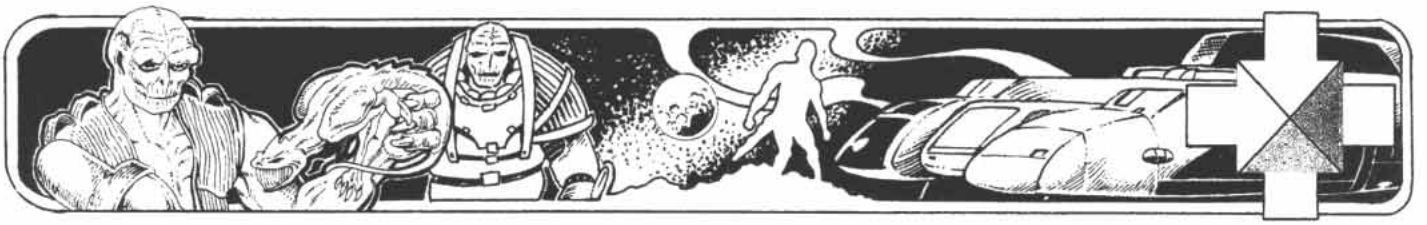
Traveller News Service excerpt, 198-1127

"...while attending a ballet performed by the Promise Light Ballet Company, several members of the Hivers' detachment of Ithklur guards apparently mistook the dance for a participatory sporting event. They efficiently tackled several human dancers, scoring several points by their own reckoning, before they were convinced that it was a performance, rather than a game."

Truth

Truth is professed as one of the highest values of the Ithklur spirit, and is appropriately codified by the Tetramerous Way. (When enumerating their highest values, the Ithklur are much like A. A. Milne's Tigger or Michael Palin's Cardinal Ximenez.)

However, the Ithklur notion of truth goes beyond the usual human denotion of "accurate" or "valid." Truth has an existential value above the simple technicality of its accuracy. Truth is considered to be the bedrock of reality, such that the truth of any situation or individual cannot be compromised or destroyed by any other force, regardless of the reversals this truth may seem to suffer during physical or finite life.



Unlike humans, who believe they are made vulnerable by allowing others to know the truth about them, the Ithklur believe the discovery of one's own true nature makes one invulnerable. Thus, although allowing evil persons to have data about oneself gives them better opportunities to plan attacks against one, these attacks will have no permanent effect as the truth incarnate in one's true nature is eternal and cannot be damaged by any finite or physical agent. This belief is seen in the Ithklur "voodoo doll" or "custer statue" artifacts (see the Integrity section, above).

However, even though the Ithklur profess to believe that lies and deceit cannot triumph over the truth, they regard consistent repeated attempts to lie as a capital crime. This is because truth is the true nature of all being, and although enlightened individuals are in firm connection with the eternal, unenlightened individuals can be misled by distortions of the truth, and can thereby be denied the opportunity to achieve connection with the true and eternal. This to Ithklur is the equivalent of murder, although this spiritual murder is believed to be more heinous than simple physical murder, which does not block the individual's access to the eternal. Regardless of the inability of lies to triumph over truth, the attempt to make lies and deception triumph over truth represents devotion to creating a world in which this would be the case, and represents devotion to the values of death, decay and evil, rather than life. This will for the supremacy of evil is sufficient cause for the death of such an individual, but the Ithklur additionally stipulate that since death is what this individual affirms, death is what this person really wants anyway.

Because of their devotion to truth, the Ithklur are not comfortable with the idea of pretending or acting, although they are completely capable of playing dumb in front of Hivers. This is contradictory behavior, but the reason seems to be that the Hivers expect them to be dumb, and it is amenable to the Ithklur spirit to fulfill this arrogant expectation. Note that this behavior does appear to be inconsistent with the notion of *integrity*, although further examination may reveal reasons that *game* behavior can be encompassed by the higher Ithklur beliefs. It might be that this deception is very close to the Ithklur notion of racial survival and is therefore allowed as an exception in the name of the higher good. On the other hand, this sort of passive-aggressive behavior appears to be a contradiction of the Ithklur credo and might be an unintended by-product of the Hiver attempts to manipulate the Ithklur into other patterns of behavior.

Because of their unfamiliarity with concepts of pretense and acting, it is not a good idea to take an Ithklur to see a play. On many occasions Ithklur have killed or maimed human actors and actresses when they either act out romantic acts on stage (when the Ithklur know them to be married to other persons) or act out scenes of violence, deceit, betrayal or murder.

Movies and video programs are safer, as Ithklur believe them to be real and do not usually attack televisions. However, they get confused when they discover that Jim Rockford and Brett Maverick appear to be *exactly the same person*, and don't know exactly what to make of this, although they do start asking questions about the concept of reincarnation.

Sanctuary

The concept of sanctuary stands above most other Ithklur behavior and is pointed to by most behaviorists as proof of Hiver meddling with the Ithklur psyche. Sanctuary demands the suspension of all physical and spiritual acts against another (Ithklur are not even allowed to play their anti-Hiver "games" under sanctuary conditions), and even unethical or evil members of the group are held accountable to these standards, although sanctuary must be declared in some clear way so that all participants have the opportunity to mend their ways.

No one subject to sanctuary is allowed to commit an act whose immediate results are detrimental to another (even if such acts can be argued to be in that individual's long-term best interests). Such acts include acts of physical violence (and therefore usually supersede the decorative carnivore concept, page 89, and suspend the pushing match ritual, page 91) as well as spiritual or mental acts such as lying, distortion or misrepresentation.

Certain social structures are considered to automatically presume the concept of sanctuary among their members. These include military units, courts of law and Ithklur marriage bonds. However, sanctuary can be declared under virtually any circumstance, similar to the human concepts of truce, cease fires and white flags.

All transgressions of sanctuary are punishable by death, although the Ithklur concept of mercy allows the individual who was wronged to commute this sentence to any lesser penalty.

It is said that Ithklur are allowed to invoke sanctuary even on the Hivers themselves, up to and including the invocation of a death sentence on such a Hiver violating sanctuary, and that this is the ultimate responsibility of the Exposer of Deceit (see page 89) in each group.

Duty

The Ithklur are quite dutiful by nature, and this predisposition is reinforced by their agreement with the precepts of *integrity*. Most Ithklur find it difficult to commit themselves to a plan of action simply because they desire it. They are more comfortable when they can conform their goals to values or ends that they see being above themselves.

In fact, it could be said that their greatest weakness as a race is this endearing desire to find a duty and then scrupulously live by it, as the Ithklur can be ill-used by those who are not worthy of this devotion (the Hivers come to mind). However, the Ithklur answer to this is that it is not dutifulness itself that is at fault, but only the choice of duties, and one of the most important responsibilities of enlightened leaders of Ithklur groups is to be careful that the group maintains its devotion only to things which deserve their service.

The Ithklur will not cut and run at the first sign of unworthiness. Rather, they must properly and legally disengage themselves from their responsibilities, faithfully carrying them out until the duty is discharged or they are released from it.

Tenderness

The popular human image of the Ithklur nature as natural killers makes Ithklur tenderness seem oxymoronic, but this only further highlights their truly alien and ambiguous nature.

Ithklur affection for their children and of children for their parents and siblings is real and deep, and although it is often expressed in rambunctious, rough-house style, is evident to even to the most inexperienced human.

Ithklur physical affection is mostly expressed in the touching of skin. The Ithklur are fascinated by watching the visual-thermal phenomena of "the colors within" (see pages 48-49), and although Ithklur skin is thicker than human skin, the ability to watch complex vascular and environmental changes on the skin of their loved ones is a source of great pleasure. The direct touching of skin to skin is seen as the opportunity to experience these colors directly, personally and intensely, "color-to-color."

Contrary to theories that concepts like sanctuary and Ithklur pair-bonding are externally imposed add-ons to their true nature, affection and monogamous commitment appear to come easily to the Ithklur. Unlike in human literature, there is no celebration of the womanizing rake, Casanova/Don Juan character, as such individuals are regarded as being deeply sick: "He is not what he is." In fact, such characters, when they do appear in Ithklur tales, are either reformed or killed, the latter to the great delight of listeners and readers.

Marital estrangement, where it occurs in Ithklur society, is regarded as aberrant and tragic, and is only rarely at the wish of both parties. Such issues resonate strongly in the work of the romantic poet Keeper of Dreams Laurel, as in the following passage (note that translated Ithklur poetry seeks to replicate meaning rather than metrical or rhyme scheme):

What kind of knight am I?
Although I know that I will myself to be a knight,
It is not up to me to say what sort I am.

I have learned what I did not know when we lived together as children:
That love, once born into this world, is not conditioned by another's response to it,
But passes through me, eternal, borrowing only my life to express itself.

We may never be together again, which thought still kills large portions of my soul,
But what is left of me alive is more truly me than the parts which have died,
Fed and nourished by that which came from beyond me but has become purely and truly me.

I will remain true to the part of me that rises to eternity
(for God knows I can do nothing else),
Hopefully there to find its way to you again.

Ithklur Aphorism

Fool me once, shame on you. Fool me one thousand times, shame on you a thousand times, for you are only destroying yourself.

Anonymous

Note that this is in direct opposition to the classic human formulation "Fool me once, shame on you; fool me twice, shame on *me*." For Ithklur, the refusal to respond to evil with evil is a test of commitment to the eternal.

No Ithklur who is in contact with his or her true self can be hurt by lies, for lies are by their nature only temporary, and the true self is eternal.

Ithklur Aphorism

Honest to a fault? I'm sorry, I must have misunderstood you, for surely there can be no such thing.

Anonymous

Friendliness

Ithklur friendliness is legendary and well-meaning. To make an Ithklur friend is to make a life-long ally whom one can count on under any circumstance. Ithklur friendship is prone to contain such things as overly hearty pats on the back and telling of embarrassing stories in front of audiences, but is no less genuine for all of that.

One of the most common ways the Ithklur show this friendliness is learning all they can about the life or culture or beliefs of their friends. In general, the Ithklur regard humanity as a race of friends, and have fallen in love with all manner of human minutiae, including baseball, corn dogs and the memorization of various human epigrams.

In fact, this is one of their most common complaints about the Hivers: "You humans are so interesting: You have snowglobes, *behsehball*, and numerous meaningful witticisms for us to learn. The Hivers are so *boring*. They have nothing interesting for us to learn about."

The Ithklur most often quote human popular songs of all eras, but are also fond of references to comedians, novels and movies. Whenever they do this, they wait expectantly for a moment to see if the human will recognize the remark or finish the quotation (for example, if an Ithklur says, "You broke my will, oh what a thrill," humans are expected to respond, "Goodness, gracious, great balls of fire!"). Unfortunately, Ithklur knowledge of human trivia exceeds that of most humans, so the Ithklur are often disappointed. However, this does not upset them, but only makes them more determined to come up with a less arcane reference the next time. (They usually fall back on, "I'll be baaahck.")

Popular Ithklur sources are "the two Elvi" (Presley and Costello), Shakespeare, Bob Dylan, La Rochefoucauld, Monty Python, "Tompettytheheartbreaker (always said as one word)" and George Bush ("We're enjoying sluggish times, and not enjoying them very much").

Favorite quotations which have actually found their way into Ithklur culture include, "No one expects the Spanish Inquisition," "You're only saying that because I have a cabbage for a head," and, "Jane, you ignorant slut."

Cruelty

The Ithklur have a slightly different take on mercy and cruelty than do humans, although in many ways the Ithklur are much kinder than humans. For example, you will never see an Ithklur child pulling the wings off flies or the legs off ants, or at least not more than once, as their parents will cuff them and teach them not to.

On the other hand, the Ithklur concept of mercy seems either heartless or bloodthirstily pragmatic to humans. The images of victorious Ithklur soldiers prancing gleefully about the battlefield, cheerfully putting the fatally wounded (their own and the enemy's) out of their misery is a common image, and is absolutely true.

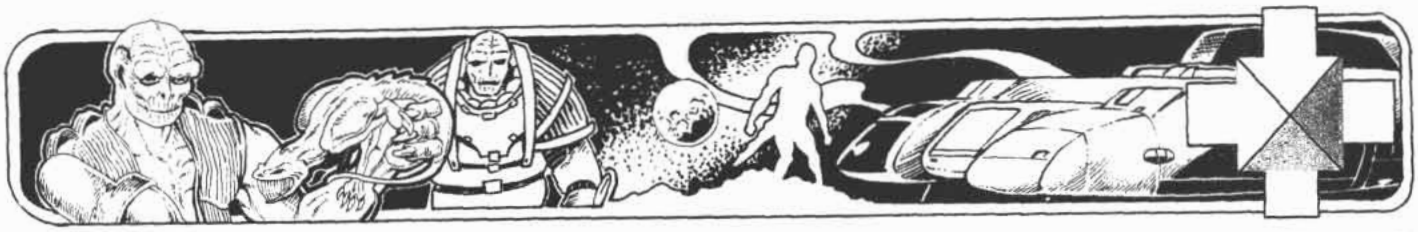
The reason for this is that the Ithklur hate suffering. Suffering creates a mental haze which distorts the clear view of the eternal, and clarity is one of the most beloved Ithklur values. Anyone who has heard wounded cry out irrationally for any relief whatever from their suffering has an appreciation of this, and the Ithklur believe that existence in this miserable state is worse than death. The act of releasing a wounded comrade or enemy from this bondage is an act of love and charity, and Ithklur bid such individuals a heartfelt and cheery farewell as they dispatch them with a quick and painless blow or stroke (the Ithklur are such masters of hand-to-hand combat that they have the uncanny ability to kill almost any creature instantly and with no pain whatsoever).

> *How did the Hivers make us better people? By their example, they showed us everything that had been wrong about us, so that we could rise above it and purify ourselves. Pity the Hivers, for they did not follow us, although they lighted the path. They are not what they are not.*
>
> Defender of Dreams Loganberry

This does not mean the Ithklur disdain the use of medicine to heal treatable wounds, but the Ithklur do not agree with the "any price for survival" concept adhered to by many human doctors. Life as a quadriplegic or a comatose vegetable is not an attractive notion to most Ithklur.

Ithklur Sports

Some authorities believe that one of the side effects of the Hiver manipulation was to channel some of the Ithklur's natural aggression into a passion for competitive sports. This manifests itself as a desire to participate in such sports, not just watch them. Ithklur athletic competitions include informal neighborhood games, formal competitions in local leagues and sports clubs, and regional, planetary and Federation-wide tournaments in a variety of sports. Wherever Ithklur are encountered, no matter what number there are, there always seems to be some form of ball game, race or other sporting event being organized.



The Ithklur passion for sports does not include any desire to wager on the outcome. Indeed, Ithklur find the notion of profiting from a sporting event without actively participating to be faintly distasteful. However, they do not object to wagering on other nonsporting events (see Games, below).

Although there are some individual sports, most Ithklur athletic competitions are team efforts. Four of the most widespread are discussed below.

***Eduuqa Ssuejzathouga* (Idiomatically, "the Pick-Up Game"):** Of all Ithklur sports, the *Eduuqa Ssuejzathouga* appears to be the closest to the "national sport." It is an impromptu team ball game popular as a recreation and as exercise, as well as the subject of organized tournaments (strange as that may seem). There are few standard rules, and these are usually modified or dispensed with before the contest ends (or even begins), as mid-game rule-amendments/disagreements/brawls are a respected and traditional part of the game. A team (consisting of a variable number of Ithklur) will issue a challenge to another group by running onto an open field and executing a series of dance-like movements which signal which of the few standard rules will be used in the initial time period and how long the game will last. The challengers pick the field and set the boundaries; the challenged are to decide certain other rules (such as if the game will involve a ball, what the goals will be, etc.). The fact that these moves bear a superficial resemblance to human ballet and the Ithklur difficulty with the concept of dramatic performance has been the cause of a number of incidents (see, for example, **Survival Margin**, page 56). For reasons that are not clear, this game is known to humans as "Calvin Ball."

***Sik Eduuqa* (the Artillery Competition):** The object is to dismantle an antique field gun, carry it across an obstacle course, set it up and fire four rounds on target, in the shortest possible time.

***Xx*si Ueh Eduuqa* (Roughly: "Close Marching Competition"):** A very complex close-order drill, carried out by teams of Ithklur carrying archaic (and highly decorated) edged weapons, polearms,

flags, banners and early firearms. Competitions normally include dozens of elaborate formations, evolutions and rituals, never used in actual combat, designed for their impressive appearance when viewed from a reviewing stand. Human observers have declared the event to be very awe-inspiring, a combination of military drill team, football half-time show and "living history" recreation.

Behsehball: Essentially the Ithklur attempt to play the Terran game baseball, although in Ithklur practice the game tends to degenerate into lots of basepath carnage, such as undisciplined base stealing, run-downs, bloody collisions at bases as runners slide in with their claws held high (many Ithklur believe that a home run allows them to slide into all four bases as they go around the diamond), and large numbers of runs forced in by batters hit by pitches.

Legend has it that the Ithklur were completely bored by this game until someone explained to them that it was the source of the Abbott and Costello "Who's on First?" routine, at which point the game became an Ithklur mania.

Ithklur ballparks have much deeper outfields to accommodate the greater Ithklur strength. Players do not wear shoes (pitying humans who have to wear "false claws" to play the game), but all infielders wear shin and thigh protectors to protect themselves from baserunners.

The idiosyncratic Ithklur pronunciation of the name is most often used by Ithklur posing for photographs after a particularly exciting game. In these photographs, members of both teams (usually those who got into the biggest brawls) pose together, covered with dust, their shredded uniforms spattered with blood. When the players are ready for the photographer to take their picture, they all smile their snaggly smiles and say, "*Behsehball* been bery, bery good to me!"

Games

All Ithklur have a favorite "game" (as distinct from sport, above), which is essentially an amusing activity designed to irritate Hivers. Unlike sports, Ithklur games are almost always the subject of betting, usually in the form of a pool to predict whose game will anger the Hivers first, or how long it will take a particular Hiver to respond to the needling.

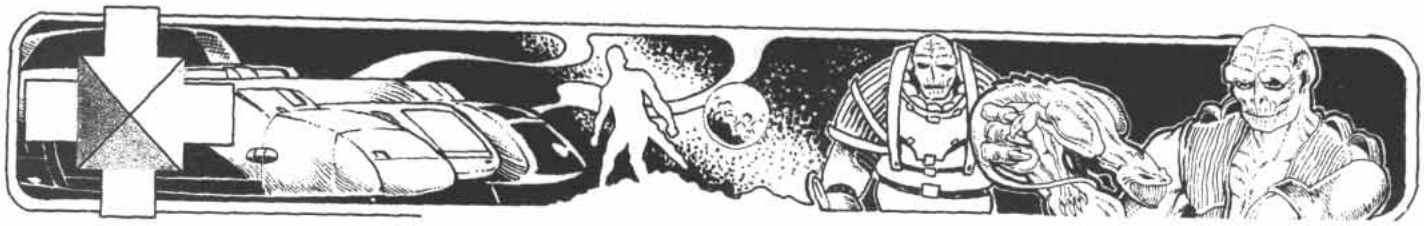
There are two games that are engaged in to some extent by almost all Ithklur. The first is to insist on assigning a gender to all Hivers they work with, and to refer to them in a consistent fashion as either male or female. This will usually get a response from any Hiver sooner or later. The nature of the response is immaterial—its fact is sufficient.

The second is to deliberately speak Gurvin as poorly as possible. When required to deliver reports in Gurvin (usually to Hiver officials who cannot understand Ithklur), they commit as many breaches of grammar, double entendres and malapropisms as possible, explaining that they find the language too difficult. This will either make the Hivers' jobs more difficult or force them to allow the Ithklur to speak their own language.

Ithklur Style

Ithklur are very attracted to brightly colored, ornate clothing, equipment and personal furnishings. Except where it would interfere with an item's utility, they seem almost pathologically driven to carve, paint, decorate, embroider or otherwise embellish each item of their everyday existence in a baroque, rococo fashion.

Ithklur Dress: The Ithklur fashion sense can best be described in human terms as "tacky," with typical Ithklur clothing being the approximate equivalent of Bermuda shorts and loud Hawaiian shirts. The Ithklur color sense appears to be, "the more colors the better,"

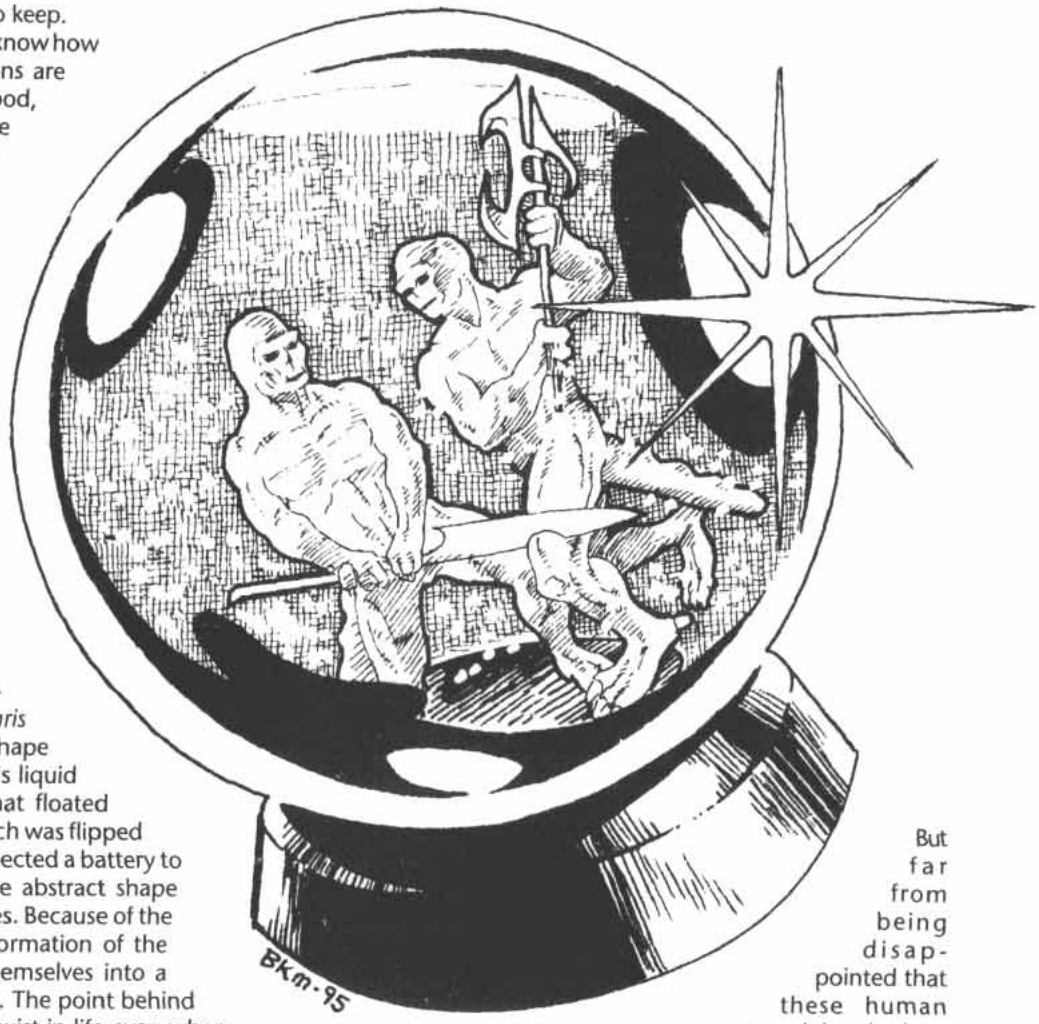


although it is clear that to the Ithklur eye, with its superimposed thermal "color," the visual appearance of these ensembles is quite different, and hopefully more harmonious.

Ithklur uniforms are a bit more disciplined, being made of primarily tactical colors such as brown or green, but the profusion of epaulettes, aigulettes, patches, sashes, doo-dads, gadgets, widgets and personal accoutrements would embarrass even the most dandified TED show-troops. Fortunately for the Ithklur, their prowess in combat obliges them to apologize to no one for the way they kit themselves out.

Trinkets: The Ithklur love trinkets. For an Ithklur, each moment of life is pregnant with meaning and memories which they like to memorialize. The average Ithklur home appears to human eyes like a undisciplined avalanche of kitsch, but to the Ithklur, each salt and pepper shaker, tea cozy, lace doily embroidered with realistic depictions of grisly battlefields, each little decorative dagger, derringer and sword cane has a clear value and strong memory associated with it.

This is the origin of the decorative carvings that distinguish Ithklur military hardware. The life of a soldier does not allow the individual to carry unlimited numbers of souvenirs, so the innumerable moments of meaning in an Ithklur's life must be incorporated into the



few pieces of gear he or she is authorized to keep.

All Ithklur are taught from an early age to know how to paint and carve, and all Ithklur weapons are fitted with stocks, grips, and fittings of wood, ivory or some other carvable material. The weapon of an Ithklur recruit is fairly nondescript, betrayed by the straight lines of its original blocky grips. But as time goes by, the Ithklur soldier will carve scenes of particular significance, busts of his or her comrades, and tallies of historical events, such as the days of a long planetary deployment, the number of enemies a bayonet has killed and the like. To the trained Ithklur eye, each Ithklur weapon is a vivid account of the life (and sometimes death) of its owner, and these are the highest forms of art known to the Ithklur culture.

One facet of Ithklur popular culture that usually surprises humans is the endearing Ithklur love of souvenir snowglobes. Before the first Ithklur-human contact, the Ithklur already had semi-religious artifacts known as **sharis*. The **sharis* consisted of an abstract, unidentifiable shape within a clear liquid-filled globe. Within this liquid were tiny, reflective magnetic particles that floated aimlessly in the liquid until an electrical switch was flipped at the bottom of the globe. The switch connected a battery to small electromagnets concealed within the abstract shape which began to attract the reflective particles. Because of the pre-designed shape of the particles and formation of the magnetic field, the particles assembled themselves into a meaningful spiritual or philosophical shape. The point behind these **sharis* was that meaning and order exist in life even when these cannot be identified, but patience and enlightenment can allow one to form meaning out of the seemingly disparate fragments of life.

Soon after the first human-Ithklur contact, Ithklur found the inexpensive souvenir snowglobes in the gift shops of starport lounges, memorializing the skyline of "Scenic Oriflamme" or some such.

But far from being disappointed that these human snowglobes had no batteries, electromagnets or hidden forms that would assert themselves, the Ithklur were awed at the spiritual maturity of a race that would refuse to demand shapes from the swirling flakes and would instead be content to conform their minds to deriving meaning from the randomly falling flakes onto whatever mundane scene was depicted in the globe.

Although the Ithklur still manufacture versions of the electric globes for their children (who need the additional assistance to find the shapes of meaning when they are young), for Ithklur adults, snowglobes in the human style have completely supplanted the Ithklur originals. Ithklur copies of these snow globes usually replace the pastoral scenes or city skylines with small, intricately detailed and historically accurate battlefield dioramas.

The Eye of the Beholder

Look at this "snowglobe," which commemorates the Battle of Kilong in the human style. We shake it up, and the luminous particles of truth and meaning are randomized, and swirl in unpredictable patterns about the scene. Then, slowly, they settle out onto the debris of the battlefield—here onto the dismembered corpse of the K'kree leader, here onto the smoldering hulk of an assault ram, here onto the truncated torso of one of our sappers, there onto the body of the hand advisor, frozen as it writhes in its death agony—a beautiful and sublime scene, showing that meaning and truth fall as they will onto everyone, independent of our ability to predict or understand it.

An Ithklur aesthete

Ithklur Anecdote

I was sitting at a bar when a lizard walked in with his *slaa*. He said to me, "I'll bet you all the money that you have in your pocket that my *slaa* can talk."

I turned to the *slaa* and said, "Is this true?"

The *slaa* said, "How much have you got on you?"

So I punched the bartender.

Players' Section

ITHKLUR CHARACTER GENERATION

This section will only detail differences in Ithklur character generation from the procedures presented on pages 15-39 of **Traveller: The New Era**.

Ithklur begin character generation untrained, inexperienced and about 17 standard (human) years of age.

A Character Generation Worksheet is included with this book (see page 93). Once a character is completely generated, the information from the worksheet should be transferred to a Character Sheet (see page 94). After that, the worksheet may be discarded, as only the Character Sheet is necessary for play. (*Note:* Save at least one blank copy of each sheet to photocopy for future characters.)

CHARACTER GENERATION OVERVIEW

The Ithklur character-generation procedure follows the same three general steps as that used for humans: background, attributes and experience.

Background: Players determine their homeworlds, as these have a strong effect on later steps of character generation. They also decide on other background information, such as social level, name and gender for their characters.

Attributes: Players determine the six basic attributes of their characters by rolling dice and assigning those results to attributes in any order they wish. These six basic attributes are Strength, Agility, Constitution, Intelligence, Education and Charisma.

Careers: Ithklur characters begin the character creation sequence at the age of 17. At that time, players start making career choices for their characters. Each career choice represents four years of training and/or experience (four years being an arbitrary number that helps regulate character generation). Each time a player makes a four-year career choice, a hobby may also be selected for the character.

Derived Values: Now that all changes to skills and attributes are completed, certain values are calculated that are based on them. These are things like accuracy with different weapons at various ranges, damage done by bare-handed attacks and so forth.

Possessions: Finally, players determine what possessions their characters have accumulated during their careers.

BACKGROUND

Before generating the specific physical and mental attributes which define a character, it is necessary to determine the character's background, as this has a strong effect on the rest of the character-generation process.

Stellar Region: Ithklur can come from one of two stellar regions, the Hive Federation or the independent Ithklur client state.

Hive Federation: The Hive Federation is an interstellar government formed from a coalition of individual worlds and a few multiworld groupings. Although originally founded by the Hivers, and based on their cultural precepts, all member worlds are co-equal in status, in representation in the central government, and in access to the benefits of interstellar commerce and interaction.

Independent Ithklur Client State: This is an independent Ithklur state (although it does not include the Ithklur's world of origin) on the edge of the Hive Federation. It maintains an independent military force and a federal form of government, although it coordinates its external diplomacy with that of the Hive Federation.

Homeworld: The next step in determining background is selection of a homeworld. A referee can generate worlds which can be chosen by or assigned to the players; or a homeworld can be generated randomly using the tables provided. Since no official sectors have yet been published for either the Hive Federation or the Ithklur Independent Client State, world assignment (as discussed in the basic rules on page 16) is not an available option.

Referee Generation: Referees may choose to generate one or more worlds which are understood to represent a homeworld for Ithklur characters. These can be created by using the procedures in the World Building section of the basic rules (pages 180-195). Once these worlds are created, the referee takes the specific world characteristics and translates them to the more broad descriptions which are used here.

If a homeworld is deliberately created, by either the referee or the player, it must contain at least as much descriptive information as is provided by the Homeworld Random Generation table.

Random Generation: Homeworlds can be created solely for purposes of character generation by using the Homeworld Random Generation table. This is done in the same fashion as shown on **TNE** pages 17-18, with the following substituted DMs resulting from Stellar Regions:

Starport

Region	*DM*
Hive Federation	None
Ind. Ithklur Client State	None

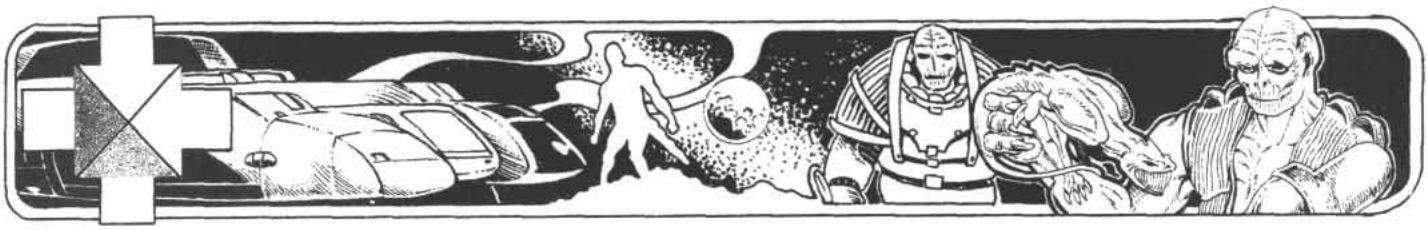
Tech Level

Region	*DM*
Hive Federation	+2
Ind. Ithklur Client State	+1

ATTRIBUTES

Each character is described by six attributes detailing the physical and mental defining characteristics of the individual. These attributes are generated through a series of die rolls, as noted below. Do this five times. Each separate roll is then assigned, in whatever order the player desires, to one of the following five attributes: Strength (STR), Agility (AGL), Constitution (CON), Intelligence (INT) and Charisma (CHR). For Ithklur characters, Education (EDU) is then determined by rolling 1D6. After the rolls are assigned, add +2 to Strength (STR), and +1 to both Constitution (CON) and Intelligence (INT). Record the results on the Character Worksheet, located on page 93.

Players who roll attributes for their player characters totaling less than 33 points may add attribute points (allocated as they see fit) to bring the total up to 33. This ensures that characters are always at least average.



Personal attributes are as defined in the basic rules, and use the same abbreviations and UPP sequence, except as noted below.

Homeworld Effects on Attributes: These are the same as on **TNE** page 19.

Attribute Limits: During the careers portion of character generation, certain careers offer the opportunity for Ithklur characters to raise certain attributes. However, no Ithklur attribute may be raised more than three points (as opposed to two points in human character generation) as a result of these career increases. No attribute may ever be raised to greater than 18.

Other Characteristics: In the course of character generation, the character will acquire age (in years and in four-year terms), rank, money, skills and possessions.

Psionics: Ithklur have psionics talents, but at a lesser level than those of humanity. In general, initial psionic strength is generated

by 2D6–2 instead of 2D6, and certain psionic talents are unavailable to Ithklur characters. See page 80 for further details.

Language: The official language of the Hive Federation is Gurvin, a language used by the race of the same name, and more readily adaptable to non-Hiver use. All Ithklur are automatically fluent in their own language (Ithklur), and in Gurvin as well if their homeworld is within the Hive Federation.

Social Standing: Roll 2D6 and subtract 1 to determine initial Social Standing (abbreviated SOC) on the character's homeworld. This is a measure of the accomplishments and power of the character's parents or guardians (if raised by other than his or her natural parents).

This is not an innate attribute, and unlike attributes, it may change dramatically during character generation, based on the career choices made. However, like attributes, a character's SOC may never be reduced below 1, nor raised above F. The role of Social Standing is primarily to determine economic status during character generation. Rank as discussed below and on page 53 has a much greater effect on a character's actual status in society once play begins.

Titles: The Ithklur have no titles based on social standing.

Naming Characters: Ithklur characters may be assigned names in either the Ithklur language or Anglic. Ithklur names can be created by players and referees by using other Ithklur words in this book as guides.

Anglic names, which are simply translations of the meaning of the Ithklur name, may be created using the principles discussed on page 54.

Call Signs: Ithklur serving on RC missions will need to choose or be assigned a two-syllable call sign, as explained in the basic rules (pages 22-23).

Background Skills: Ithklur, like humans and Hivers, acquire a number of skills before age 17. To represent this, players should each choose *two* skills (not four) from the Skill List table (**TNE** pages 114-115), giving their characters a level 2 skill in each. Referees may impose homeworld limits on these skills if desired, and if homeworlds are specified. In most cases, however, this is unnecessary.

The reduced number of optional background skills for Ithklur characters is due to the fact that, unlike humans and Hivers, Ithklur characters receive four skills at level 1 as default skills immediately below.

Default Skills: Default skills are conferred automatically as follows:

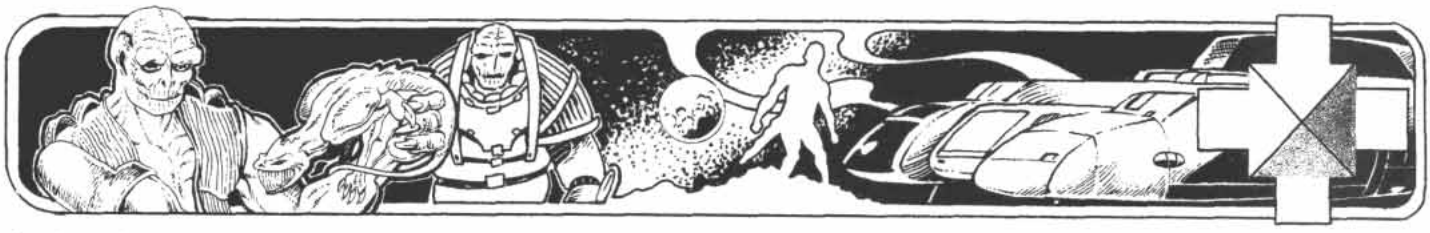
All Ithklur characters automatically receive Animal Handling 1, Painting 1, Sculpture 1, Tracking 1 and Biology 0.

Characters from a Large world automatically receive High-G Environment 0.

Characters from a world with a tech code of Industrial to Early Stellar automatically receive Ground Vehicle (Wheeled) 0.

Characters from a world with a tech code of Early Stellar+ automatically receive Computer 0.

Characters from a world with a tech code of Average Stellar+ automatically receive Pilot (Interface/Grav) 0.



All Ithklur player characters (and detailed NPCs) automatically receive Swimming 0, Willpower 0 and Act/Bluff 0.

CAREERS

The mechanics of career resolution for Ithklur follows the same general mechanics as shown in the basic rules, pages 24-27. However, there are some restrictions that apply to the Ithklur.

Before entering any careers, the Ithklur character must choose a path. There are five paths available: Facilitator, Guardian, Explorer, Seeker or the Tetramerous Way (see pages 51-52 for a more detailed discussion of these paths). If the Tetramerous Way is chosen, the character must additionally choose whether to follow the Fascist or Phalangist model (see sidebar on page 67).

Note that the choice of a path commits the character to remain in that path for the entirety of his or her life. Ithklur characters may not mix and match careers from different paths (although they may freely mix careers from within the same path). The only exception to this is for a character to choose the fascist tradition of the Tetramerous Way. Players should read the description of the

fascist tradition in the careers section on page 77 as well as the fuller discussion of the Tetramerous Way on pages 51-53 before attempting Ithklur character generation.

Commissions/Enlightenment: All of Ithklur society is separated broadly into two groups: the "Enlightened" and the "Elementary." These correspond roughly to the human concept of commissioned and enlisted personnel, so characters who have achieved enlightenment use the information listed after Enlightened in the same fashion that characters in basic **TNE** use the Officers information once they have received a commission. Likewise, characters which have not achieved enlightenment use the Elementary information, just as non-commissioned human characters use the Enlisted information.

Characters who make the enlightenment roll acquire rank 1 on the table on page 53.

The roll to achieve enlightenment is made each and every term, although the roll and allowed DMs are listed by each path, not by each separate career. Once enlightenment is achieved, however, the roll is no longer made.

This achievement carries over through all careers of a given path. Thus, an Ithklur adherent to the Facilitator Path who achieved enlightenment during a term in Aviation and then switched to Wet Navy would still take skills from the enlightened line. (Since not all careers have different skill packages for enlightened and elementary characters, this distinction will not always make a tremendous difference in skills received, but only enlightened characters have actual ranks in Ithklur society: Elementary characters who receive advancement gain a skill level only—see below.)

Note that the enlightenment DM *may be negative.*

Promotions/Advancement: This is as discussed on **TNE** page 25, except that for Ithklur characters it is listed as Advancement and is the same for all careers of a given path. The roll for advancement is made each and every term.

A character who receives an advancement, whether enlightened or elementary, receives one additional skill drawn from the Subsequent Terms list (even if the promotion is received during the first term).

In addition, enlightened characters have their rank increased. There are no ranks listed for elementary Ithklur, so the skill level above is the only benefit received for unenlightened Ithklur.

Enlightened Ithklur characters may advance more than one rank per advancement roll depending upon how far the actual roll exceeded the required number. Subtract the required roll from the actual roll after the DM has been assessed, and subtract 1 from the result. This is the number of rank levels advanced. Thus if the required roll were 11 and the DM-adjusted roll was 14, the character would advance two rank levels.

This additional rank increase has no effect on skills received for advancement: only one skill is received per successful advancement roll, no matter how high the final adjusted roll.

Note that the advancement DM *may be negative.*

Secondary Activity: These are handled as in the basic rules, page 26-27.

Increasing Attributes: This is handled as discussed on **TNE** page 27, by using an allowed skill level as a chance to increase a single attribute, except that Ithklur characters need only roll a 7+ to increase STR, AGL or CON, an 8+ for INT and CHR, and a 9+ for EDU. DM: One per level of Willpower skill. This attribute improvement is subject to the +3 ceiling (as opposed to +2 for humans).

Social Standing: Social Standing may be increased under the Other Effects section of a career, as with human character generation.

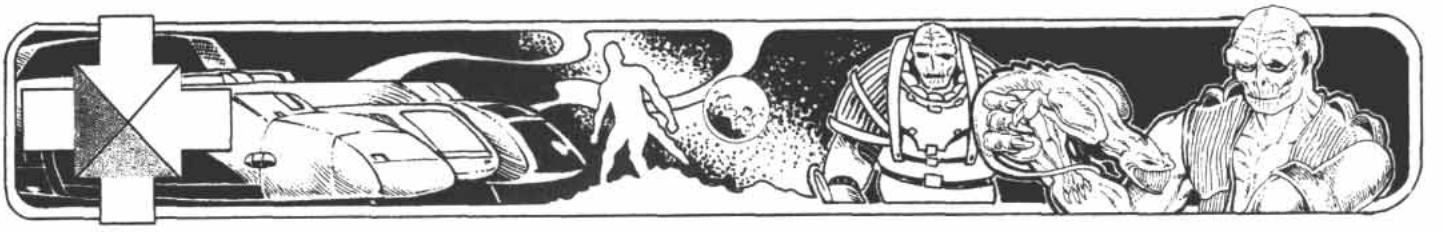
On the Power of Lunacy

Imagine yourself working in a very powerful, very reputable organization. Imagine then that you are allowed to meet the head of this organization. If he is educated, polite and urbane, you will be impressed by him, and learn that adherence to the principles of education, politeness and culture, as difficult as they are, are surely the steps to great achievement in so great and powerful an organization.

However, imagine that he acts as if he is crazy, that he yells and screams and carries on embarrassingly at the slightest provocation? Which of his underlings in this organization will condemn him for his behavior? Which will tell him that he is unfit to rule? None. All will conspire to pretend that his behavior is the most natural and appropriate way of acting, and will show that this man's power does not derive from the same source as that of his underlings, the education, politeness and culture that they have been inculcated with. In other words, the source of their power is extraneous to his. They cannot touch him.

Who enhances his power the more? The polite man who abides by the wishes of society, or the crazy man?

Truly I say to you, it is the madman who ensures and multiplies his power.



The Enlightened *Slaa* de *Silentio*

Fascist (Translated from the Ithklur *Kchollioll*): One of the two branches of devotion to the Ithklur Tetramerous Way. Fascists believe that the four paths can be visualized as a bundle of sticks tied together. In this way they can be seen as separate but parallel, beginning at the same point and ending at the same point, although defining four distinct paths through time and space. Fascists believe that achievement of unity comes from tasting the reality of all four paths. Therefore fascists move through their lives in a variety of sequential careers from the Facilitator, Guardian, Seeker and Explorer paths on their way to the state of Blissful Warrior.

The term *fascist* is a particularly unfortunate and improperly connotation-laden Anglic translation from the Ithklur term. However, the Ithklur find this term preferable to alternate translations such as "faggots," "stickies" and "twiggies."

Phalangist (Translated from the Ithklur *Ha*on*): One of the two branches of devotion to the Ithklur Tetramerous Way. Phalangists believe the four paths can best be visualized as an Ithklur hand, with four distinct fingers, but still the same unified organ. This represents the Phalangist belief that it is not the precise details of their four separate paths *per se,* but the mystical combination of their essence, which can be pursued in its own right, without having to concentrate on the point of view of any single path. Phalangists therefore remain on a "pure" four-fold path on their way to the state of Blissful Warrior.

As with Fascist, Phalangist is an odd and emotion-laden Anglic translation. The Ithklur prefer this translation to other words which use the term "Hand," as the Ithklur reserve this term for the Hivers themselves, nor do followers of the Phalangist tradition enjoy being called "fingers."

SKILLS

As with basic character generation, **TNE** pages 27-28.

CONTACTS

These are handled as in the basic rules, pages 29-31. For simplicity, the same categories of contacts for Ithklur are used as for humans.

Off-World Contacts: For Ithklur characters in Coalition space, all contacts are off-world contacts.

AGE

An Ithklur character's age at the time an adventure campaign begins is determined by multiplying by four the number of terms served and adding 17 to the result. In other words, (4×Terms)+17=Age.

Effects of Age

Beginning at age 37 (i.e., the end of the fifth term), an Ithklur character must check for the effects of age at the end of each term. At the end of the fifth, sixth and seventh terms, the character rolls 1D15 to check for losses in Agility. At the end of the eighth term, both Agility and Strength must be checked. At the end of the ninth term and every term thereafter, Agility, Strength and Constitution must be checked. In addition, once characters reach age 61, at the end of the 11th term, they must start rolling for a decrease in Intelligence. The Consolidated Effects of Age table below illustrates these progressions, as well as the reduction in the amount of skills gained during careers due to aging. D15 numbers are generated by rolling 1D20 and rerolling all results of 16-19, with results of 20 treated as 0. (*Note*: This is an official errata, and this change should also be made to **TNE** page 31.)

Ithklur Consolidated Effects of Age

Start Term	End Age	Age	Losses ST/SD*	STR	AGL	CON	INT
1	17	21	4	—	—	—	—
2	21	25	4	—	—	—	—
3	25	29	3	—	—	—	—
4	29	33	2	—	—	—	—
5	33	37	1	—	Y	—	—
6	37	41	1	—	Y	—	—
7	41	45	1	—	Y	—	—
8	45	49	1	Y	Y	—	—
9	49	53	1	Y	Y	Y	—
10	53	57	1	Y	Y	Y	—
11	57	61	1	Y	Y	Y	Y
12	61	65	1	Y	Y	Y	Y
13	65	69	1	Y	Y	Y	Y
14	69	73	1	Y	Y	Y	Y
15	73	77	1	Y	Y	Y	Y
16	77	81	1	Y	Y	Y	Y
17	81	85	1	Y	Y	Y	Y
18	85	89	1	Y	Y	Y	Y
19	89	93	1	Y	Y	Y	Y
20	93	97	1	Y	Y	Y	Y
21	97	101	1	Y	Y	Y	Y

*ST/SD=Number of subsequent term/special duty skills.

The character loses one point from the relevant attribute if the 1D15 roll is less than the current level of that attribute. If the roll equals or exceeds the attribute, there is no loss.

This check, also called an age saving throw, is made at the end of each term.

Aging in Play: Aging in play works the same way as in **TNE** basic character generation.

Combating Aging Effects

Ithklur characters may resist the effects of aging in the same way humans do (see the basic rules, pages 32-33), except as noted below.

Anagathics: Ithklur, like Hivers, disdain the use of anagathics, and none are manufactured for them.

Aging Crisis

As discussed in **TNE** basic character generation, page 34.

Skill- and Attribute-Derived Values

These are derived in a manner similar to that of humans, but due to Ithklur physiological differences, the formulae to derive these values in different.

Hit Capacity: Hit capacity is calculated for Ithklur in the same way as it is for humans, except that Ithklur add one more hit location: tail, which has a hit capacity equal to two times the sum of the character's Strength and Constitution: (STR+CON)×2.

Boxes are provided on the character sheet for players to write in their PCs' wound level thresholds so the players will know to what degree their characters have been wounded. These are calculated in the same fashion as in the **TNE** basic rules, page 288.

Weight: An Ithklur character's weight in kilograms is equal to 100, plus 4 times Strength minus Agility, or [4×(STR–AGL)]+100. Thus, an Ithklur character with a Strength of 8 and an Agility of 2 would weigh 124 kilograms (about 273 pounds), while a character with a Strength of 6 and an Agility of 8 would weigh 92 kilograms (roughly 203 pounds). Note that there is no difference in the weight of male and female Ithklur.

Load: An Ithklur character's normal load in kilograms is equal to three times the sum of its Strength and Constitution: (STR+CON)×3. Ithklur suffer normal penalties for being burdened (see page 35 of the basic rules).

Throw Range: An Ithklur's throw range in meters is four times the character's Strength (STR×4).

Unarmed Combat Damage: Unarmed combat damage is determined for Ithklur characters in the same way as for human characters (see page 35 of the basic rules).

INITIATIVE

All Ithklur characters determine Initiative by rolling 1D6 and adding 1, which makes their minimum Initiative 2. In addition, certain Ithklur careers if served for two or more terms allow an additional +1, for a maximum possible Initiative of 8 achievable in character generation.

STARTING MONEY AND INITIAL EQUIPMENT

Ithklur characters determine starting money and initial equipment in the same way as human characters do, even for characters who are veterans of the Federation Navy. The Hive Federation, realizing that cultures differ in economic as well as sociological ways, pays salaries to non-Hiver personnel (it is the only way the Gurvin can be persuaded to serve).

Starships: It is possible for Ithklur characters to own a starship at the beginning of the game. The procedure is as described in the basic rules, pages 37-39, but with a few slight changes as noted below.

Stellar Regions: Modifications are made to the die rolls based on

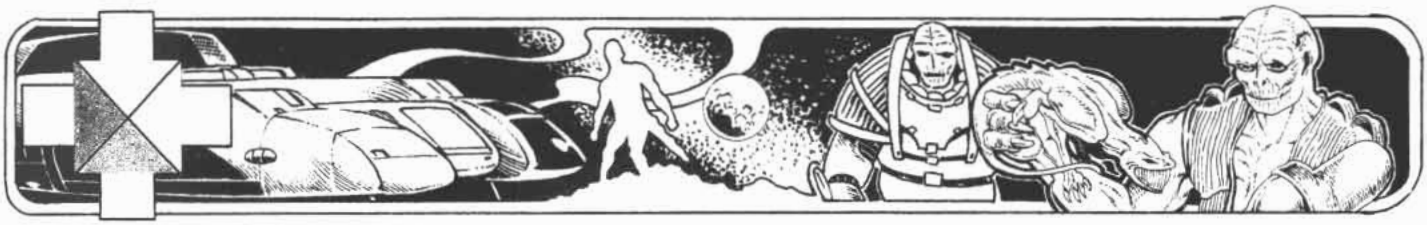
the stellar regions in which the PCs are generated. These reflect the relative scarcity of ships in certain regions, and therefore their absolute value in these areas. This is reflected in two different ways. First is a –DM for stellar region, as shown in the Stellar Regions DMs table.

The second is the way in which the outstanding mortgage requirement is satisfied. In the Old Expanses, either the Hive Federation or the Ithklur Independent Client State government owns the mortgage on a ship, which means that not only must the players continue to meet the payments, they must also use their vessel in accordance with the directives of the government. In almost all cases, this requires adherence to certain shipping schedules. As with similar human arrangements, the Federation/Client State government does not require payment each month if the PCs cannot afford it. It is much more important that they stick to the shipping schedule. No penalties accrue for missed payments, but the PCs still remain far away from free and clear ownership.

In the Wilds, all value modifiers are immediately applied to the ship's wear value, up to the maximum level of 10. All excess value modifiers are disregarded. In the Wilds, the few ships date back to the Final War and have already been lovingly passed down from one crew to the next for so long that there are no outstanding bills, only outstanding maintenance. Note that this means no PC groups in the Wilds can take +DMs on the Ship Types Table if this would raise the total value modifiers to more than 10.

Stellar Regions DMs

Stellar Region	*Starship DM*	*Outstanding Mortgage Options*
Old Expanses	–10	Government holds mortgage, dictates schedule
Wilds	–30	All value mods applied up to maximum wear value 10, no mortgage



Ship Tables and Types: The tables used are those on 39 of the **TNE** rulebook. The Ithklur/Hiver ships received are broadly similar to the human types shown on these tables, in many cases, or modifications of human designs. Due to space limitations, Ithklur and Hiver variants of all these human types cannot be included. Note that any receipt of a 200-ton vessel may be taken as a Hiver utility vessel (**Reformation Coalition Equipment Guide**, page 153) instead, and receipt of a subsidized liner may be taken as a Hiver transport (**RCEG**, page 151).

Ithklur Epigram

The Hivers understand us. They take us everywhere we need to go and attend to all the boring details.

*Assa Sanok*kla,*
destined Blissful Warrior

ITHKLUR CAREERS
EDUCATION

Ithklur education is organized differently from that of the Hivers, and the end result is much the same as its human counterpart. Note, however, that education careers have enlightenment rolls that supersede the normal path-specific enlightenment rolls.

Undergraduate University

Ithklur educational institutions abound on Ithklur worlds throughout the Hive Federation and the Independent Ithklur Client State. Although details vary, they are the equivalent to the human system of universities and are labelled as such.

Paths: All.

Prerequisites: EDU 5+.

Enlightenment: 11+, DM=(STR+EDU–13)

Skills: Total skill levels equal to character's Education attribute from any combination of the following, but no more than level 3 in any one skill:

Artisan, Computer, **Economics**, **Engineer**, **Fine Arts**, *Language*, Leadership, **Perception**, **Physical Science**, **Social Science**.

Contacts: One per term, academic or journalism, non-Ithklur on 8+.

Other Effects: +1 EDU (after all skills have been awarded). No advancement or special duty rolls are made. No income received while attending undergraduate school.

Military Academy

The Hive Federation maintains special military academies for the express purpose of training Ithklur to serve in the Federation Army and Navy (the academy used for Federation Marines is the Naval Academy; also see Flight Academy, below). The various worlds of the Independent Ithklur Client State has academies for its army, stellar navy and merchant marine as well as individual planetary wet navies.

Paths: All.

Prerequisites: STR 8+ and CHR 8+, Homeworld Pop=Mod+.

Enlightenment: 9+, DM=(STR+CHR–16)

Skills: Total skill levels equal to character's Education attribute from any combination of the following, but no more than level 3 in any one skill:

Determination, **Engineer**, **Interaction**, **Social Science**, **Space Tech**, **Technician**.

In addition, the character receives all of the First Term skills from whichever service the academy serves.

Contacts: Two military, non-Ithklur on 8+.

Other Effects: No secondary activities are allowed while attending military academy, nor is any money received. Note, that unlike human academies, the Ithklur military academy does not automatically confer automatic "commissioned" (i.e., enlightened) status.

The character must serve at least one term in the career served by the academy (Ground Support, Navy, Wet Navy, Ground Troops, Strike Force, or Explorer). Since the character has already received the First Term skills for this career during the academy, the first real term in the career receives skills chosen from the Subsequent Terms section equal in number to the skill levels of the First Term package.

Graduate University

Graduate school provides advanced education for those Ithklur who choose to pursue it, particularly those who are enlightened.

Paths: All.

Prerequisites: Undergraduate degree and INT 7+.

Enlightenment: 10+, DM=(INT+CHR–14)

Skills: Four levels per term in any one specialty, plus a total of two levels in any electives.

Specialties: Computer, **Economics**, **Engineer**, **Fine Arts**, *Language*, **Physical Science**, **Social Science**.

Electives: Computer, Instruction, *Language*, Leadership.

Contacts: One per term, academic or government, non-Ithklur on 8+.

Other Effects: +1 EDU (after all skills have been awarded). No advancement or special duty rolls are made. Ithklur universities award degrees corresponding to human university degrees: The first term provides a master's degree; each subsequent term provides a doctorate (or equivalent). Degrees must be taken in one of the specialties noted above. No income is received while attending graduate school.

Graduate university may be selected for as many terms as desired.

Medical School

Medical school is a prerequisite for working as a medical doctor or medical technician.

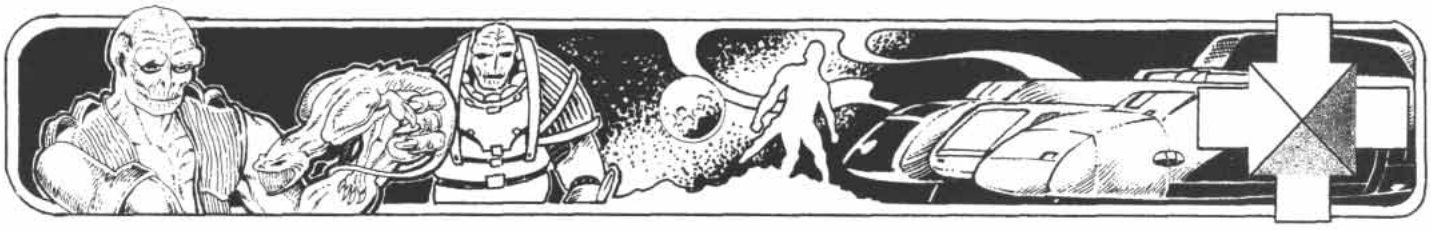
Paths: Seeker, Tetramerous Way (Fascist and Phalangist).

Prerequisites: EDU 6+ or INT 9+. Undergraduate degree, Biology 3+, Chemistry 2+.

Enlightenment: 10+, DM=(INT+CHR–15)

Skills: Computer 1, Medical 6, Observation 1.

Contacts: One medical, non-Ithklur on 8+.



Other Effects: No secondary activities are allowed during medical school. No income is received while attending medical school. Upon completion of medical school, a character receives an automatic commission (as doctor) in the career of medicine.

Flight Academy

As with humans, a variety of flight academies are maintained by advanced worlds to train pilots of aircraft and starships for both military and civilian service.

Paths: Any.

Prerequisites: Education 5+ and Agility 6+. Homeworld Tech=Early

Stellar+. (Flight Academy for Aviation possible if Homeworld **Tech=Ind**, but no skills from the Space Vessel cluster may be selected, nor may the Interface/Grav cascade of Pilot be selected.)

Enlightenment: 12+, DM=(AGL+CHR–12)

Skills: All First Term skills for the appropriate career (Aviation, Navy, Scouts or Traders), plus a total of six levels from any one or a combination of the following:

Pilot, **Space Vessel,** Leadership.

Contacts: Two military, non-Ithklur on 8+.

Other Effects: No advancement or special duty rolls are made. No income is received while attending flight academy, nor are any secondary activities allowed. At the start of the next term, the character automatically enters the chosen career (regardless of whether he or she has the normal prerequisites) which include Aviation, Navy, Trader, or Explorer. Note that, unlike human academies, this Ithklur school does not necessarily confer "commissioned" (i.e. enlightened) status on the student.

Since the character has already received the First Term skills for this career during the academy, the first real term in the career receives skills chosen from the Subsequent Terms section, equal in number to the skill levels of the First Term package.

Technical School

Among the Ithklur, those who do the day-to-day work of making society run are respected far more than they are in human society, and Ithklur technical schools are the main avenue of education for followers of the Facilitator Path, although enlightened facilitators frequently attend undergraduate and graduate university in addition to or in lieu of technical school.

Paths: Facilitator, Tetramerous Way (Fascist and Phalangist).

Prerequisites: None.

Enlightenment: 10+, DM=(INT+CHR–13)

Skills: A total of six levels from any one or a combination of the following:

Technician, Space Tech, *Medical*, **Economics**, Computer, **Aircraft, Vehicle**.

Contacts: One specialist (skill level 8) in one of the areas listed above, non-Ithklur on 8+.

Other Effects: No advancement or special duty rolls are made. No income is received while attending technical school.

FACILITATOR PATH

The Facilitator Path is recognized by Ithklur philosophy to be the most important and noble of the four separate paths, for without this path, the race would not exist. All the other paths derive their existence and strength from this one.

Enlightenment: 10+, DM=(INT+ CHR –13).

Advancement: 12+, DM=(INT+ CHR –13).

Aviation

Even Ithklur marines need air support from time to time.

Prerequisites: STR or AGL 7+. Pop=Moderate+. Atmos=Thin+.

First Term

Skills:

Enlightened: Aircraft 3, **Determination** 1, **Gun Combat** 1, **Perception** 1, **Physical Science** 1, **Vehicle** 1.

Elementary: Gun Combat 1, **Heavy Weapons** 1, **Melee** 1, **Technician** 3, **Vehicle** 1.

Subsequent Terms

Skills:

Enlightened: Aircraft, Charm, Determination, Explore, Gun Combat, Perception, Vehicle.

Elementary: Charm, Gun Combat, Heavy Weapons, Melee, Technician, Vehicle, Vice.

All Terms

Special Duty: 8+ for **Acrobat, Aircraft, Archaic Weapons, Crime, Interaction,** *Medical*, **Melee, Personal transport, Spacehand.**

Contacts: One per term, military, non-Ithklur on 6+.

Other Effects: None.

Bureaucrat

The fact that there are such things as Ithklur bureaucrats may surprise some people. Ithklur govern themselves on numerous worlds, however, both inside and outside the Federation, and bureaucrats are more necessary to government than soldiers.

Prerequisites: EDU 5+. Homeworld Law=Moderate+.

First Term

Skills: Charm 1, **Economics** 3, **Interaction** 2, **Perception** 1, **Vice** 1.

Subsequent Terms

Skills: Charm, Economics, Interaction, Perception, Vice.

All Terms

Special Duty: 8+ for **Crime, Gun Combat**, *Language*, **Melee, Spacehand, Vehicle.**

Contacts: Two government contacts per term, non-Ithklur on 6+.

Other Effects: Each level of advancement adds 1 to SOC.

Civil Engineer

Construction engineers are much in demand, and not all Ithklur are destroyers. There is much to be rebuilt, both inside the Federation and outside it, and Ithklur are expected to do their part.

Prerequisites: Enlightenment, Construction 4+.

First Term

Skills: Engineer 2, **Explore** 2, **Physical Science** 1, **Technician** 1, **Vehicle** 1.

Subsequent Terms

Skills: Determination, Economics, Engineer, Explore, Interaction, Physical Science, Technician, Vehicle.

All Terms

Special Assignment: 8+ for **Gun Combat**, *Language*, **Crime, Melee, Vice, Spacehand.**

Contacts: One per term, government, non-Ithklur on 8+.

Other Effects: On Industrial– worlds, **Vessel** is taken in place of **Spacehand**.

Computer Specialist

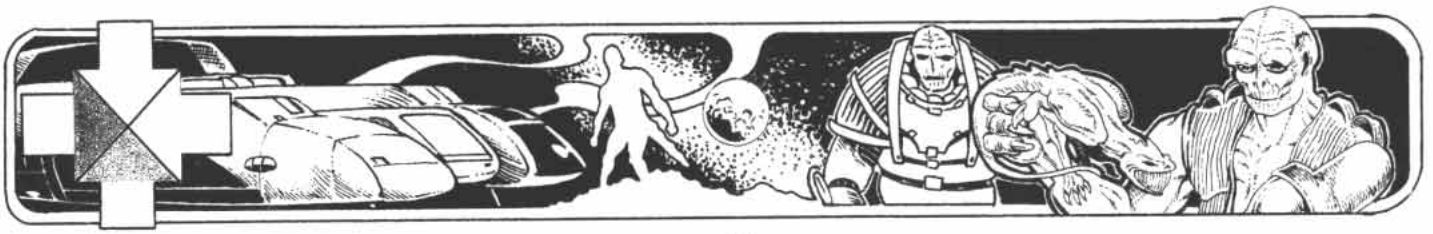
Ithklur computer specialists are especially in demand for missions into the Wilds, where they revel in the danger and excitement.

Prerequisites: Technical school or undergraduate degree, Computer 2+. Homeworld Tech=Pre-Stellar+.

First Term

Skills: Economics 2, **Technician** 4.

Subsequent Terms



Skills: Economics, Interaction, Technician.

All Terms

Special Assignment: 8+ for *Language*, **Melee, Spacehand, Technician.**

Contacts: One specialist (Computer or Electronics) per term. If special adventure is rolled, add extra contact of any type, non-Ithklur on 8+.

Other Effects: Computer Specialists are allowed two secondary activities per term.

Ground Support

This career represents service in the ground combat support or combat service support arms of one of the worlds of the Hive Federation or the Ithklur Independent Client State.

Prerequisites: CON 6+. Homeworld Tech=Industrial+. Pop=Moderate+. Atmos=Thin+.

First Term

Skills:

Enlightened: Gun Combat 1, **Explore** 1, **Charm** 1, **Melee** 1, **Determination** 1, **Technician** 1, **Interaction** 1.

Elementary: Gun Combat 1, **Melee** 2, **Technician** 2, **Vehicle** 2.

Subsequent Terms

Skills:

Enlightened: Gun Combat, Explore, Economics, Interaction, Determination, Charm, Personal Transport, Engineer (except Starship Architecture).

Elementary: Gun Combat, Melee, Heavy Weapons, Explore, Vice, Charm, Personal Transport, Vehicle.

All Terms

Special Duty: 8+ for **Archaic Weapons, Melee, Aircraft, Crime, Spacehand, Vehicle, Artillery, Interaction,** *Medical,* **Tactics, Technician, Perception, Personal Transport, Space Tech.**

Contacts: One per term, military, non-Ithklur on 8+.

Other Effects: None.

Manager

It is as true on Ithklur worlds as it is anywhere else: Someone has to make things work, and if not you, then who else will do it?

Prerequisites: Undergraduate degree.

First Term

Skills: Charm 1, **Determination** 2, **Economics** 2, **Interaction** 2.

Subsequent Terms

Skills: Charm, Determination, Economics, Interaction, Perception.

All Terms

Special Adventure: 6+ for *Language,* **Spacehand, Explore, Vice, Engineer, Melee.**

Contacts: One per term, business or government, non-Ithklur on 8+.

Other Effects: +1 SOC per term. 1 ship DM per term for a Trader ship.

Mechanic

"They also serve who fix and mend." Things break down, machines need maintenance—these are facts of life for the Ithklur as much as for any other race.

Prerequisites: None.

First Term

Skills: Technician 6, **Vehicle** 1.

Subsequent Terms

Skills: Economics, Interaction, Intrusion, **Technician, Vehicle.**

All Terms

Special Adventure: 7+ for **Determination, Engineer, Explore, Spacehand, Vice, Melee.**

Contacts: One per term, a specialist in one of the above skills, non-Ithklur on 8+.

Other Effects: None.

Navy

This career covers Ithklur serving in either the Hive Federation Navy or the Independent Ithklur Navy.

Prerequisites: INT 8+ or EDU 7+.

First Term

Skills:

Enlightened: Gun Combat 1, **Spacehand** 1, **Space Vessel** 1, **Space Tech** 2, **Tactics** 1, **Determination** 1.

Elementary: Gun Combat 1, **Spacehand** 2, **Space Tech** 2, **Technician** 2.

Subsequent Terms

Skills:

Enlightened: Spacehand, Space Vessel, Space Tech, Physical Science, Technician, Tactics, Determination, Charm.

Elementary: Spacehand, Space Tech, Technician, Vice, Charm.

All Terms

Special Duty: 8+ for **Gun Combat, Melee, Aircraft, Vehicle, Artillery, Interaction,** *Medical,* **Acrobat, Crime, Perception.**

Contacts: One per term, Military, plus one per special duty, non-Ithklur on 8+.

Other Effects: 1 ship DM per term.

Security

Security forces go where soldiers would prove politically sensitive: embassy guards, diplomatic bodyguards, escorts and so on.

Prerequisites: INT 7+, CHR 6+, STR 8+

First Term

Skills: Charm 1, Gun Combat 1, **Interaction** 2, *Language* **1, Melee** 1, **Perception** 1, **Social Science** 1.

Subsequent Terms

Skills: Charm, Determination, Gun Combat, Interaction, Melee, Social Science, Vice, Vehicle.

All Terms

Special Assignment: 6+ for **Crime, Explore, Gun Combat,** *Language,* **Melee, Perception, Personal transport,** Spacehand.

Contacts: One per term, government or military, non-Ithklur on 8+.

Other Effects: +1 Initiative if more than one term served.

Wet Navy

The wet navy crews armed nautical vessels that protect the sealanes of a world.

Prerequisites: INT 8+ or EDU 4+. Pop=Moderate+.

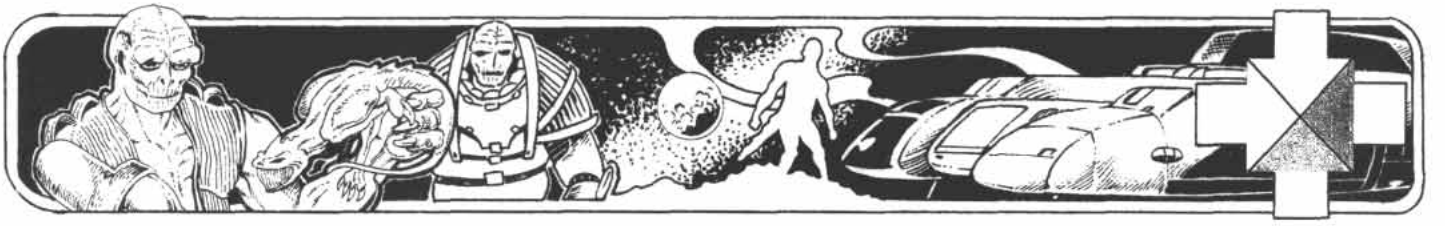
First Term

Skills:

Enlightened: Gun Combat 1, **Vessel** 2, **Technician** 2, **Artillery** 1, **Determination** 1.

Elementary: Gun Combat 1, **Vessel** 3, **Heavy Weapons** 1, **Artillery** 1, **Technician** 2.

Subsequent Terms



Skills:

Enlightened: Artillery, Vessel, Physical Science, Technician, Tactics, Determination, Charm, Personal Transport, Vessel.

Elementary: Artillery, Heavy Weapons, Technician, Vice, Charm, Personal Transport, Vessel.

All Terms

Special Duty: 8+ for **Gun Combat, Melee, Aircraft,**

Vehicle, Interaction, *Medical,* **Acrobat, Crime, Perception, Personal Transport, Explore.**

Contacts: One per term, military, non-Ithklur on 8+.

Other Effects: None.

GUARDIAN PATH

The Guardian Path, although recognized by Ithklur philosophy as being of lower esteem than the Facilitator Path, is nonetheless held in the highest emotional esteem by the Ithklur at large. This is perhaps why Ithklur philosophy had to specifically assert that the Facilitator Path was the most important, because otherwise all Ithklur would wish to be Guardians.

Enlightenment: 11+, DM=(STR + CHR –14).
Advancement: 13+, DM=(STR + CHR –14).

Athlete

Competition purifies the spirit, hardens the body and prepares both for the rigors of life. The professional athlete earns a living doing what others do as a hobby. See page 62 for a description of Ithklur sporting events.

Prerequisites: CON 10+ or AGL 9+ or STR 11+. Homeworld Pop=Mod+.

First Term

Skills: Acrobatics 4, **Archaic Weapons** 2, Early Firearms 1, Archaic Artillery 1.

Subsequent Terms

Skills: Acrobat, Archaic Weapons, Determination, Early Firearms**, Melee, Personal transport.**

All Terms

Special Adventure: 8+ for **Artillery, Charm, Crime, Economics, Explore, Melee, Perception, Vice.**

Contacts: One business, journalist, entertainment, medical or specialist (Acrobatics or Melee) per term. If a special adventure is rolled, one additional contact of any type, non-Ithklur on 8+.

Other Effects: For each term as an athlete, use the higher of STR, AGL or CON instead of SOC when calculating starting money. During each term as an athlete, any one physical attribute (STR, AGL or CON) may be increased by 1 (up to 3 each). At the end of each term, SOC is increased by 1 (up to a maximum of 2 more than its original level; any further potential increases are no effect).

+1 to Initiative if more than one term served.

Bounty Hunter

Ithklur bounty hunters have a fairly high success rate, which is not unusual considering their size and background. Often, upon discovering that they are being trailed by an Ithklur, a criminal will seek out officials of another race in order to surrender before the Ithklur can find them.

Prerequisites: STR 6+, 6+.

First Term

Skills: Determination 2, **Gun Combat** 1, **Melee** 1, **Perception** 2, **Spacehand** 1.

Subsequent Terms

Skills: Animal Handling, Charm, Determination, Gun Combat, Melee, Perception, Personal transport, Spacehand, Vice.

All Terms

Special Adventure: 6+ for **Crime, Explore, Interaction, Melee, Space Tech, Space Vessel.**

Contacts: One per term, criminal or government, non-Ithklur on 8+.

Other Effects: When figuring beginning cash, use INT+Streetwise instead of SOC for each term as a bounty hunter. If more than one term is served, +1 to Initiative. 1 ship DM per term for a Scout/Courier (in the Old Expanses, this is usually a human ship modified to Ithklur standards) or Hiver utility vessel.

Ground Troops

This career represents service in the planetary ground forces of one of the worlds of the Hive Federation or the Ithklur Independent Client State.

Prerequisites: STR 7+, CON 6+. Homeworld Tech=Industrial+. Pop=Moderate+. Atmos=Thin+.

First Term

Skills:

Enlightened: Gun Combat 2, **Explore** 1, **Heavy Weapons** 1, **Artillery** 1, **Tactics** 1, **Determination** 1.

Elementary: Gun Combat 2, **Melee** 2, **Heavy Weapons** 1, **Explore** 1, **Acrobat** 1, **Technician** 1.

Subsequent Terms

Skills:

Enlightened: Gun Combat, Explore, Heavy Weapons, Tactics, Determination, Personal Transport.

Elementary: Gun Combat, Melee, Heavy Weapons, Explore, Vice, Personal Transport.

All Terms

Special Duty: 8+ for **Archaic Weapons, Melee, Aircraft, Charm, Crime, Spacehand, Vehicle, Artillery, Interaction,** *Medical,* **Acrobat, Technician, Perception, Spacehand.**

Contacts: One per term, military, non-Ithklur on 8+.

Other Effects: +1 Initiative if more than one term served.

Martial Artist

The Ithklur have many schools of both armed and unarmed martial arts, some dating back millennia, some relatively recent.

Prerequisites: None.

First Term

Skills: AGL +1, STR +1, **Acrobat** 1, **Determination** 1, **Melee** 3.

Ithklur Anecdote

A physical training program had just concluded in the recreation area of an RCES vessel. The room's chairs, which were normally arranged in a series of semicircles for viewing the large holoscreen, had been pushed off to various sides of the room to make space for an exercise area. As the compartment cleared out at the completion of the exercises, an Ithklur Marine attached to the crew (who was not even winded by the strenuous exercises) stood regarding the chairs with an air of dissatisfaction.

Then he began to carefully rearrange the chairs in their semi-circular arrangement, focused on the holoscreen. When one of his human crewmates approached him, asking him why he was doing that, he replied, "I am returning them to their proper relationship with their god so that they can worship it again."

Subsequent Terms

Skills: Characters receive skills on the normal basis from Group A. Alternatively, for each two levels not taken from group A in a single term, one level may be taken from group B.

Group A: Interaction, Determination, Melee, Acrobat, Archaic Weapons.

Group B: STR +1, AGL +1, CON +1, SOC +1.

Special Adventure: 6+ for **Vice, Crime, Perception, Gun Combat, Vehicle, Technician, Melee**

Contacts: One per term, business, criminal or specialist (martial arts), non-Ithklur on 8+.

Other Effects: Use INT instead of SOC for determining starting money per term. If one or more terms are served, +1 Initiative.

Mercenary

The Hivers are not the only ones to appreciate the special Ithklur talent for war. Ithklur mercenaries are much in demand, for obvious reasons. They are rather scarce in the Old Expanses, but are not completely unknown.

Prerequisites: STR 6+, prior term in Ground Troops or Strike Force.

First Term

Skills: Gun Combat 1, **Interaction** 2, *Language* 1, **Melee** 1.

Subsequent Terms

Skills: Acrobat, Determination, Explore, Gun Combat, Heavy Weapons, Interaction, Melee, Perception, Personal transport, Vehicle.

All Terms

Special Duty: 8+ for **Artillery, Engineer (except Starship Architecture), Melee, Personal transport**, Screens, **Spacehand.**

Contacts: One per term, criminal, government, intelligence community, military or another mercenary, non-Ithklur on 8+.

Other Effects: Roll 1D10 once per term. On a roll of 9, the character must spend the next term in a noncombat career due to serious wounds. A roll of 10 means the character was captured by the opposition and must spend the next term as a prisoner. If more than one term is served, add +1 to Initiative. One ship DM per term, plus one per special assignment, applied to Trader ship or Warship (character's choice).

Prisoner

Ithklur who have been captured while serving as mercenaries become prisoners.

Prerequisites: Forced due to capture while engaged in the mercenary.

All Terms

Skills: A total of six levels from any one or a combination of the following:

Acrobatics, **Charm, Crime, Determination, Economics, Interaction, Melee, Perception, Vice**, STR+1, EDU+1,

Special Adventure: None.

Contacts: Two per term, military, non-Ithklur on 6+.

Other Effects: No secondary activities allowed. Released after one term. Enlightenment and advancement rolls *are* allowed. Do not count prison terms when calculating starting money.

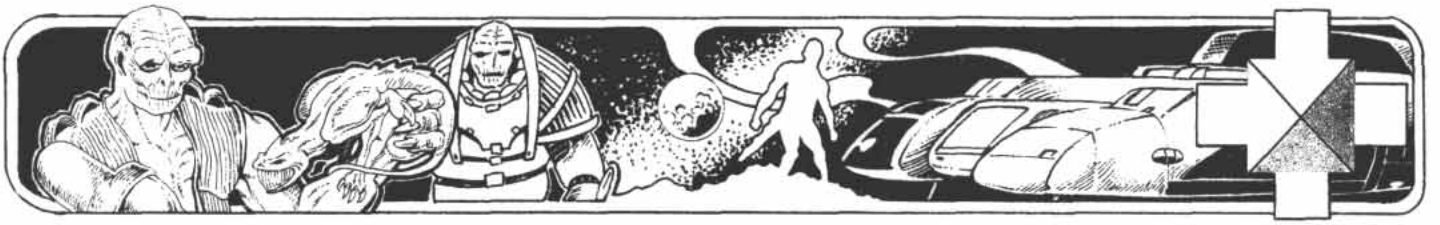
Strike Force (Ithklur Marines)

The armed ground forces of the Hive Federation Navy consist almost exclusively of Ithklur, the much-feared and respected Ithklur Marines, trained in all manner of orbital assaults and shipboard combat. Ithklur also serve in the Independent Ithklur Navy as Marines.

Prerequisites: STR 8+, AGL 7+. Homeworld Tech=Pre-Stellar+. Population=Moderate+.

First Term

Skills:



Enlightened: Gun Combat 2, **Melee** 2, **Spacehand** 1, **Heavy Weapons** 1, **Tactics** 1, **Determination** 1, **Personal Transport** 1.

Elementary: Gun Combat 2, **Melee** 2, **Spacehand** 1, **Heavy Weapons** 1, **Acrobat** 1, **Technician** 1, **Personal Transport** 1.

Subsequent Terms

Skills:

Enlightened: Gun Combat, Spacehand, Heavy Weapons, Tactics, Determination, Charm, Personal Transport.

Elementary: Gun Combat, Melee, Heavy Weapons, Spacehand, Vice, Charm, Personal Transport.

All Terms

Special Duty: 8+ for **Melee, Aircraft, Crime, Interaction, Explore, Vehicle, Artillery, Acrobat, Technician,** Screens, **Space Tech, Perception.**

Contacts: One per term, military, non-Ithklur on 8+.

Other Effects: One ship DM per term, plus one per special assignment. +1 to Initiative if more than one term served.

EXPLORER PATH

The Explorer Path is devoted to "the search for knowledge without," in other words exploration of the physical universe, and venturing into the unknown.

Enlightenment: 10+, DM=(CON+INT + CHR –20).
Advancement: 12+, DM=(CON+INT + CHR –20).

Belter

The demand for minerals is felt in all of space, and Ithklur in many systems feel the call to seek their fortunes among the scattered chunks of rock, metal and ice that make up an asteroid belt.

Prerequisites: AGL 6+ and Geology 2+. Homeworld Tech=Pre-Stellar+.

First Term

Skills: Spacehand 2, Geology 1, **Technician** 1, Excavation 1, **Economics** 1, Ship's Engineer 1, **Space Vessel** 1.

Subsequent Terms

Skills: Determination, Perception, Spacehand, Physical Science, Technician, Engineer, Economics, Space Vessel, Interaction.

All Terms

Special Adventure: 6+ for **Gun Combat, Melee,** *Language,* **Space Tech, Charm, Vice.**

Contacts: One per term, criminal, business, trader or law enforcement, non-Ithklur on 6+.

Other Effects: At the end of each term (except the first) roll for a strike. Making a strike is Difficult test of Geology. If the task roll is successful, roll 2D6 and multiply the result by Cr100,000 for the cash income from the strike. In addition, the character receives a seeker ship. The character may continue as a belter and try for additional strikes.

–1 SOC per term (including the first) served unless and until the character makes a successful strike. +3 SOC if a strike is made. No effect on SOC (plus or minus) for being a belter after the first strike is made.

One ship DM per term for a scout/courier, but only if no strike was ever made. +1 to Initiative if more than one term is served as Belter.

Explorer

This career represents service in the FDA (Federation Development Agency), the exploration and contact service of the Hive Federation.

Prerequisites: INT 7+ or STR 8+. Homeworld Tech=Early Stellar+.

First Term

Skills:

Enlightened: Gun Combat 1, **Spacehand** 1, **Space Vessel** 1, **Space Tech** 2, **Physical Science** 1, **Explore** 1, **Determination** 1.

Elementary: Gun Combat 1, **Spacehand** 1, **Space Vessel** 1, **Space Tech** 2, **Technician** 2, **Explore** 1.

Subsequent Terms

Skills:

Enlightened: Charm, Determination, Explore, Perception, Personal transport, Physical Science, Space Tech, Space Vessel, Spacehand, Technician.

Elementary: Charm, Explore, Perception, Personal transport, Space Tech, Space Vessel, Spacehand, Technician, Vice.

All Terms

Special Duty: 8+ for **Acrobat, Aircraft, Animal Handling, Crime, Gun Combat, Interaction,** *Medical,* **Melee, Perception, Tactics, Vehicle.**

Contacts: One per term, government, military or trader, non-Ithklur on 6+.

Other Effects: One ship DM per term as an Elementary , three ship DMs per term as Enlightened, both for a scout/courier. +1 to Initiative if more than one term served as Explorer.

Merchant Marine

The need for this career is the same among the Ithklur as among humans.

Prerequisites: CON 6+ or STR 8+. Pop=Moderate+. Hydro=Wet+.

First Term

Skills:

Enlightened: Determination 1, **Economics** 1, **Explore** 2, **Gun Combat** 1, **Heavy Weapons** 1, **Vessel** 2.

Elementary: Explore 2, **Gun Combat** 1, **Heavy Weapons** 1, **Technician** 1, **Vessel** 2.

Subsequent Terms

Skills:

Enlightened: Charm, Determination, Economics, Explore, Gun Combat, Heavy Weapons, Vessel.

Elementary: Charm, Explore, Gun Combat, Heavy Weapons, Technician, Vessel, Vice.

All Terms

Special Duty: 8+ for **Acrobat, Archaic Weapons, Artillery, Crime, Interaction,** *Medical,* **Melee, Perception, Vehicle.**

Contacts: One per term, business, law enforcement, or specialist (merchant marine), non-Ithklur on 8+.

Other Effects: Two secondary activities allowed per term.

Trader

Ithklur merchant ships and crews are becoming increasingly common in the Old Expanses, especially in the Wilds (where merchants sometimes deserve combat pay).

Prerequisites: INT 7+ or CHR 6+. Homeworld Tech=Early Stellar+.

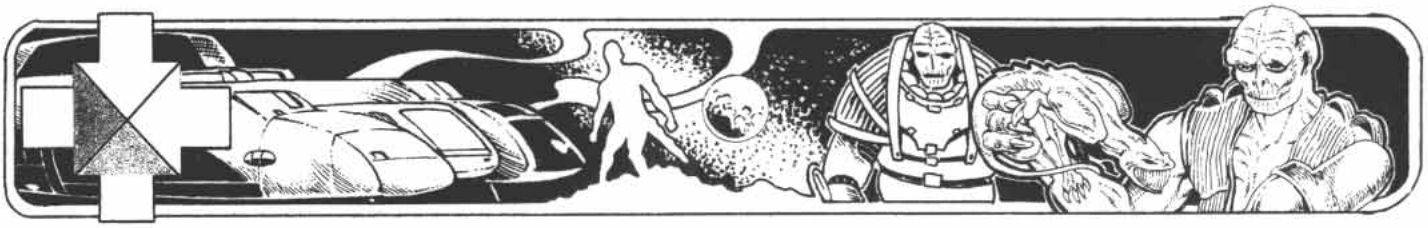
First Term

Skills:

Enlightened: Economics 2, **Interaction** 1, **Space Tech** 2, **Space Vessel** 2, **Spacehand** 1.

Elementary: Spacehand 2, **Space Tech** 2, **Technician** 2, **Vehicle** 1, **Charm** 1.

Subsequent Terms



Skills:

Enlightened: Determination, Economics, Interaction, Space Tech, Space Vessel, Spacehand.

Elementary: Charm, Interaction, Space Tech, Spacehand, Technician, Vehicle, Vice.

All Terms

Special Duty: 4+ for **Aircraft, Charm, Crime, Explore, Gun Combat, Melee, Tactics, Vehicle.**

Ithklur Aphorism

So I hit him.

This is perhaps the classic statement of the Ithklur spirit. Most Ithklur fables, anecdotes and stories end with some act of violence, often utterly inexplicable from the human point of view.

Ithklur ethologists theorize that from time to time events so confound or offend an Ithklur that his rationality "snaps," and he reverts to his most basic, vivid, violent nature and simply attacks the offending object. Others assert that certain events confront the Ithklur sense of order, and so to reassert order in his personal universe, the Ithklur is required to punish the offending agent.

Many human observers attribute an existential or Zen-like quality to this aspect of the Ithklur nature, which speaks of an essential psychic connection to and accommodation with the absurd.

Regardless of the true origin, the simple fact of the Ithklur tendency is inarguable.

Contacts: One per term, trader, government or criminal, non-Ithklur on 8+.

Other Effects: Two ship DMs per term served as an Elementary, five ship DMs per term served as Enlightened, both for a trader ship.

SEEKER PATH

The Seeker Path is devoted to "the search for knowledge within," in other words the discovery of eternal immutable truths of science, philosophy, theology and the soul.

Enlightenment: 9+, DM=(INT+EDU+CHR–19).
Advancement: 11+, DM=(INT+EDU+CHR–19).

Diplomat

These are rare in Coalition space, and represent either the independent Ithklur client state or the Hive Federation.

Prerequisites: CHR or INT 8+. Homeworld Pop=Mod+.

First Term

Skills: Charm 3, **Determination** 1, **Economics** 1, **Interaction** 2, *Language* 1.

Subsequent Terms

Skills: Determination, Economics, Charm, Interaction, Perception, Vehicle.

All Terms

Special Duty: 8+ for **Crime, Gun Combat, Melee, Spacehand, Vehicle, Vice.**

Contacts: Two government contacts per term, non-Ithklur on 8+.

Other Effects: Minimum SOC for a diplomat is 5. (All characters with lower SOC have it raised to 5 upon enlistment.) Each level of advancement adds 1 to SOC. One ship DM per term for a scout/courier (in the Old Expanses, these are usually human vessels modified to Ithklur standards) or Hiver utility vessel (provided Homeworld Tech=Early Stellar+).

Medicine

The primary difference between the medical arts among the Ithklur and among humans is that Ithklur medical practitioners do not receive the same social status (or high pay) accorded medical practitioners in human space.

Prerequisites: AGL 6+.

First Term

Skills:

Enlightened: Biology 4, *Medical* 4.

Elementary: Charm 1, *Medical* 2, **Perception** 1, **Physical Science** 1, **Technician** 1, **Vehicle** 1.

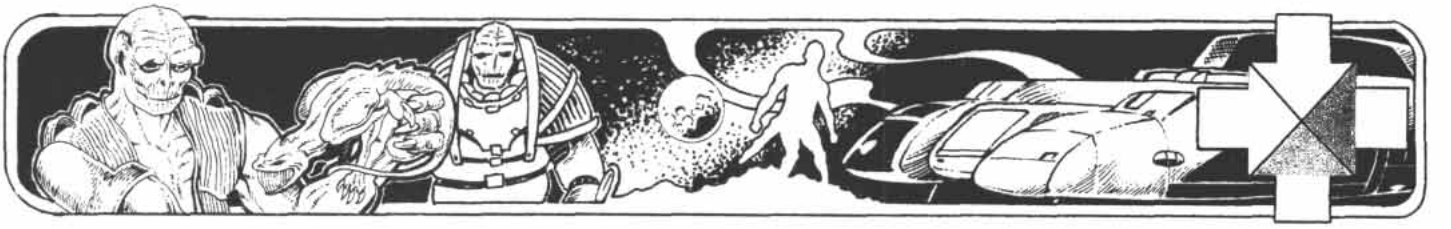
Subsequent Terms

Skills:

Enlightened: Charm, Determination, Interaction, *Medical*, **Perception, Physical Science.**

Elementary: Charm, Perception, Physical Science, Technician, Vehicle.

All Terms



Special Adventure: 8+ for *Language*, *Medical*, **Melee, Spacehand, Vessel.**

Contacts: One per term, medical, non-Ithklur on 8+.

Other Effects: None.

Scientist

The search for knowledge knows know racial limits, and the Ithklur

need scientists as much as anyone else.

Prerequisites: INT 7+ or doctorate in any physical science.

First Term

Skills:

Enlightened: Physical Science 5, *Language* 1, **Perception** 2.

Elementary: Technician 2, **Physical Science** 2, **Interaction** 1, **Artisan** 1, **Perception** 1.

Subsequent Terms

Skills:

Enlightened: Determination, Interaction, Perception, Physical Science.

Elementary: Technician, Physical Science, Perception, Interaction, Vehicle.

All Terms

Special Adventure: 5+ for **Acrobat, Engineer, Explore, Gun Combat, Melee, Spacehand, Vice.**

Contacts: One per term, government or scientist, non-Ithklur on 8+.

Other Effects: One ship DM per term as an Elementary, five ship DMs per term as Enlightened, both for a lab ship.

Philosopher

Someone has to think and wander about and scratch one's head about things. And, from time to time, those who don't think about things need a crack over the head from those who do. It's a service you gladly provide.

Prerequisites: INT 7+, CHR 6+.

First Term

Skills: Social Science 3, *Language* 1, **Perception** 2, *Armed Martial Arts* 2.

Subsequent Terms

Skills: Determination, Melee, Animal Handling, Interaction, Perception, Social Science.

All Terms

Special Adventure: 5+ for **Acrobat, Crime, Explore, Gun Combat, Melee, Spacehand, Vice.**

Contacts: One per term, government or scientist, non-Ithklur on 8+.

Other Effects: One ship DM per term for a scout/courier. +1 to Initiative if more than one term served as Philosopher.

TETRAMEROUS PATH

Players choosing the Tetramerous (or "Four-Fold") Path for their Ithklur characters must choose whether this character will follow the Fascist or Phalangist tradition, below. Either of these traditions may be freely combined with any educational option as well.

Fascist Tradition

In the Fascist tradition, the character combines any careers desired from all four paths (Facilitator, Guardian, Explorer and Seeker). The character must change paths after each term, and may not take an additional term from a given path until a full cycle of all four paths has been completed.

For example, careers in the following pattern are legal: Facilitator, Explorer, Scientist, Guardian, Guardian, Facilitator, Scientist, while careers in the following pattern are not allowed: Guardian, Scientist, Explorer, Guardian, Facilitator, Facilitator.

Any term spent in education does not count toward the fulfillment of a four-path cycle. This places no restriction on the number of education terms that may be taken in a row, but the character must complete the four-path cycle before repeating terms in any path.

Alternately, referees may allow Ithklur characters to be generated who spend several terms in a given path and then begin to take careers in a fascist cycle. This represents an Ithklur who elected to follow the Tetramerous Path later in life. Note that if for any reason a character ends character generation without having completed a full four-path cycle (either by failing the continuation roll or reaching the predetermined end of character generation), that character is considered to still be committed to the Tetramerous Path, but is now doing so in the roleplaying context rather than in character generation.

Followers of the Fascist tradition use rank names from the Tetramerous Path, not from the individual four paths, and also use the following enlightenment and advancement rolls, *not* those of the individual four paths.

Enlightenment: 9+, DM=(STR+INT+CHR–21).
Advancement: 12+, DM=(STR+INT+CHR–21).

Phalangist Tradition

The Phalangist tradition is not easy to describe in the way that the above careers paint a picture of the sort of activities a character is involved in. Each phalangist's path through this tradition is different, and is based on the truth he or she has discovered in combining the strengths and wisdoms of all four paths. To an outside observer, the exact nature of the careers of a phalangist may look very much like the careers of a fascist, but the difference is that while the fascist devotes himself to the values of the various paths sequentially, the phalangist endeavors to combine all four paths in each career term.

Followers of the Phalangist tradition use the below career only, but may also freely combine any and all educational terms with these terms.

Followers of the Phalangist tradition use the rank names of the Tetramerous Path, and the enlightenment and advancement rolls below.

Enlightenment: 10+, DM=(STR+INT+CHR–24).
Advancement: 14+, DM=(STR+INT+CHR–24).

Prerequisites: None.

First Term

Skills:

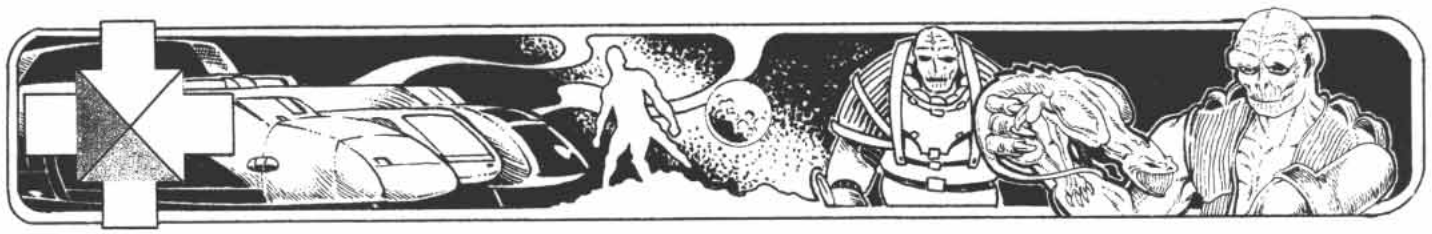
Enlightened: Gun Combat 1, **Explore** 1, **Melee** 1, **Interaction** 1, **Physical Science** 1, **Social Science** 1, **Determination** 1, **Perception** 1.

Elementary: Gun Combat 1, **Melee** 1, **Explore** 1, **Technician** 1, **Physical Science** 1, **Social Science** 1, **Charm** 1, **Perception** 1.

Subsequent Terms

Skills:

Enlightened: Physical Science, Social Science, Animal Handling, Fine Arts, Artisan, Charm, Determination, Economics, Explore, Acrobat, Interaction, *Medical,* **Perception.**



Elementary: Gun Combat, Melee, Explore, Charm, Acrobat, *Medical,* **Physical Science, Engineer, Technician.**

All Terms

Special Adventure: 4+ for **Archaic Weapons, Gun Combat, Melee, Aircraft, Crime, Spacehand, Vehicle, Artillery, Interaction, Technician, Perception, Personal Transport, Animal Handling, Heavy Weapons, Space Tech, Space Vessel, Vice, Vessel, Tactics.**

Contacts: Two per term, any, non-Ithklur on 8+.

Other Effects: +1 Initiative if more than one term served.

ITHKLUR SKILLS

This section discusses how skills differ in application between Ithklur and humans. Players and referees will need to be familiar with the skills as they are defined in the basic rules.

Ithklur Skill Choice

Ithklur aggressiveness represents a reality about this race's psychology and sociology that cannot be denied. These predispositions combine to make certain methods and skills more likely to be used by Ithklur, and certain other methods and skills less likely to be used by the Ithklur. We will impose no new rule limiting the number of skills that may be taken during Ithklur character generation. We will limit ourselves to reminders of certain Ithklur tendencies that players should be aware of and attempt to play in accordance with. As always, referees are the ultimate authority. In this spirit, we present skills that are more and less common among Ithklur characters.

The following skills are notably *more* common among Ithklur than among humans:

Acrobatics, Animal Handling, Archaic Artillery, Archery, Armed Martial Arts, Autogun, Biology, Carousing, Dance, Early Firearms, Energy Weapon, Gambling, Genetics, Grenade Launcher, Ground Tactics, Guard/Hunting Beasts, Gunnery, Heavy Gun, History, Leadership, Muscle Transport, Observation, Painting, Sculpture, Slug Weapon, Stealth, Survival, Thrown Weapon, Tracking, Uarmed Martial Arts, Willpower, Xeno-Biology.

The following skills are notably less common among Ithklur than among humans:

Astrogation, Bribery, Chemistry, Computer, Disguise, Farming, Fleet Tactics, Forgery, Intrusion, Marketing, Pickpocket, RCV Operations, Screens, Ship's Engineering, Starship Architecture.

Interspecies Interaction

Certain skills cannot be used on their own when used in conjunction with another species. Psychology and Persuasion, for example, are not very useful if the user has no knowledge of the basics of another being's thinking or emotional processes.

The skill in **Traveller** used to understand other species and use knowledge and skills in conjunction with those species is Liaison. Because any skill level in Liaison could not imply familiarity with *all* existing intelligent races, referees may treat Liaison as a cascade skill, in which a specialty species (such as human, Hiver, etc.) should be specified. Thus the full skill level is used when dealing with the listed species, and only half the level when dealing with different species. (Naturally referees may impose additional penalties if these other nonlisted species are extremely unusual or unfamiliar to the character.) The following skills when used in conjunction with non-Ithklur require the use of Liaison as an *enabling skill* (**TNE** page 109):

Act/Bluff, Bargain, Bribery, Carousing, Gambling, Instruction, Interrogation, Interview, Leadership, Marketing, Persuasion, Psychology, Recruiting.

Ithklur Use of Traveller Skills

Ithklur use the standard skills from the **TNE** basic rules just as any human character with the following exceptions or modifications:

Acrobatics: The Ithklur tail provides significant advantages in maintaining balance in situations where there is sufficient space to extend the tail, as the Ithklur does not have to extend his/her arms or legs to maintain balance as a human would. Ithklur are also much better able to run in a crouching position than are humans, as they can extend their tails behind them, and do not need to use their hands to keep from falling forwards. In situations where the Ithklur tail can assist with balance (referee's discretion), Acrobatics tasks are one level easier for Ithklur.

Act/Bluff: This skill is rather limited in Ithklur use compared to the standard rules. The Ithklur do not recognize drama or acting, and moreover do not accept lying as a legitimate social activity. Act/Bluff is specifically used only in interaction with Hivers as part of Ithklur "games" (see page 63).

Animal Handling: This skill is also used with certain Ithklur "pets," the so-called "decorative carnivores." (page 89). This skill is used to determine whether or not the Ithklur can control these typically dangerous animals.

Disguise: This skill exists among Ithklur only as the art of personal camouflage. This confers the ability not to disguise oneself as another Ithklur, but only as a shrub, tree stump, piece of ground, etc., for combat, hunting or other tactical purposes.

Interrogation: Interrogation skill is enhanced by the Ithklurs' inherent IR sense, which can enable them to detect minor changes in pulse rate and blood flow if they are trained in questioning humans. Use Liaison as an enabling skill to represent such training. When enabled in this way, all Interview tasks versus humans are made one level easier.

Interview: As with Interrogation skill, above.

Investigation: Their natural IR sense and heightened sense of smell are of value to Ithklur in gathering and interpreting evidence at the scene of a crime or accident. The referee must decide precisely how the Ithklur's senses fit into a situation—enhanced IR vision might enable an Ithklur to know roughly how long a human has been dead (by observing the temperature differential between the body and the surroundings) for example, or might detect traces of a chemical accellerant at the scene of an arson.

Liaison: Ithklur use this as an enabling skill (**TNE** page 109) in certain social/psychological tasks with non-Ithklur.

Medical: There are few significant differences between the Ithklur and human use of this skill except as it applies to the treatment of another race (see Wound Treatment, page 82). As in the basic game, this skill is a cascade: Diagnosis, Trauma Aid or Surgery.

Observation: The referee may wish to implement positive task modifiers to represent the enhanced vision made possible by the Ithklur IR sense. Otherwise, there are no significant differences between the Ithklur and human use of this skill.

Painting: There are no significant differences between the Ithklur and human use of this skill. It is used mainly for decoration of weapons and personal items (see pages 63-64).

Sculpture: There are no significant differences between the Ithklur and human use of this skill. It is used mainly for decoration of weapons and personal items (see pages 63-64). This includes finely detailed woodworking.

Swimming: Because of their powerful tails, all swimming tasks are one difficulty level easier for Ithklur than they would otherwise be for a human.

Tracking: All Tracking tasks are one level easier due to their enhanced sense of smell.

Referees' Section

ITHKLUR NPCS

This is an expansion to the necessarily abbreviated guidelines shown on **TNE** page 69 for how to create Ithklur template NPCs. Detailed Ithklur NPCs can also be created by using the character generation rules found on pages 65-77 of this book.

ITHKLUR MOTIVATIONS

Motivations for Ithklur NPCs are not handled the way they are for other races. Instead of abbreviated personality sketches, the results of the two Ithklur motivation cards show their positions in the life paths of the Tetramerous Way (see pages 51-53). Referees must therefore be familiar with Ithklur sociology and philosophy in order to properly run Ithklur NPCs.

The first card shows whether the NPC is enlightened or an elementary, and the approximate rank if enlightened (flip a coin or roll a die for odds or evens to determine whether the rank is the higher or lower of the range listed). If the NPC is an elementary, there is no need to draw a second card. If the NPC is enlightened, the second card shows if the Ithklur is a disciple of the Tetramerous Path (and which tradition—see pages 52 and 57) instead of one of the separate paths. Note that if the character is on the Tetramerous Path, the rank shown by the first card draw is superseded by the rank shown on the second (tetramerous) card draw.

Naturally this only works if the Ithklur NPC's occupation is not already known. If the referee already knows the type of Ithklur NPC needed, that type will dictate the path as noted under the NPC templates.

Most Ithklur are followers of the Tetramerous Way, but some "aberrant" Ithklur are not. The motivations of these rare Ithklur may be determined using the standard system found on **TNE** pages 60-62.

Referees who are looking for an additional randomizing element to help them firm up the precise personality of an NPC Ithklur may pull a third "personality" card and use the following guidelines. These guidelines are intended only to spur the referee's imagination, as Ithklur eccentricity is unfathomable.

Clubs Numbered Card: The Ithklur has a pet of some kind, perhaps a moderately dangerous decorative carnivore (see page 89) or something as simple as a goldfish or mouse on which he or she lavishes gifts and affection. Such Ithklur may also be inclined to "free the oppressed" (see page 55).

Clubs Face Card or Ace: The Ithklur has an extremely dangerous decorative carnivore (see page 89).

Diamonds Numbered Card: The Ithklur is an artist (painter, carver or sculptor) of above-average ability.

***Diamonds* Face Card or Ace:** The Ithklur is an "art" collector who becomes fascinated by most any imaginable object (snowglobe, letter opener, colander, etc.) and will insist on buying it or trading something for it.

Hearts Numbered Card: The Ithklur adores human culture and is constantly quoting human popular songs, comedians, literature, etc.

Hearts Face Card or Ace: The Ithklur is a particularly avid player of games (see page 63) and is something of a ringleader in corporate Ithklur Hiver-baiting.

Spades Numbered Card: The Ithklur is an avid gardener or botanist. Such Ithklur are inclined to "free the flowers" (see page 54).

Spades Face Card or Ace: The Ithklur is a particularly boisterous individual, prone to knocking people down in "pushing matches" (see page 91), and to mistake most any activity (human joggers, ballet dancers, mimes; aerobics instructors) for a game of "Calvin Ball" (see page 62) and start tackling people.

ITHKLUR NPC TEMPLATES

Ithklur Mercenary

These are becoming more and more common in the Old Expanses, and are usually found in small units consisting completely of Ithklur plus one or two local representatives.

Path: Guardian or Tetramerous.

Level: Elite.

Combat Assets: Energy Weapon (Rifle) or Slug Weapon (Rifle), *Armed Martial Arts*, and Unarmed Martial Arts, plus any two from **Heavy Weapons** or **Artillery**.

Other Assets: One from **Technical** or **Vehicle** at 10, plus Ground Tactics 16, Leadership 16 if Enlightened.

Bounty Hunter

Ithklur bounty hunters have a fairly high success rate, which is not unusual considering their size and background. Often, upon discovering that they are being trailed by an Ithklur, a criminal will seek out officials of another race in order to surrender before the Ithklur can find them.

Path: Guardian or Tetramerous.

Level: Veteran.

Combat Assets: Energy Weapon (Rifle) or Slug Weapon (Rifle), *Armed Martial Arts*, and Unarmed Martial Arts.

Other Assets: Three from **Charm**, **Crime**, **Determination**, or **Vice** at 12, plus two from **Technical**, **Spacehand**, **Space Tech**, or **Space Vessel** at 10.

Itinerant Warrior-Philosopher

Travelling alone, these Ithklur live simple lives, constantly on the move, seeking knowledge. After all, this is how *San*klaass* got his start.

Clubs: Guardian Path

Card	*First*	*Second*
Ace	Enlight 7-8	Fascist 7-8
King	Enlight 5-6	Fascist 5-6
Queen	Enlight 3-4	Fascist 3-4
Jack	Enlight 1-2	Fascist 1-2
8-10	Elementary	No change
5-7	Elementary	No change
2-4	Elementary	No change

Diamonds: Explorer Path

Card	*First*	*Second*
Ace	Enlight 7-8	Phalangist 7-8
King	Enlight 5-6	Phalangist 5-6
Queen	Enlight 3-4	Phalangist 3-4
Jack	Enlight 1-2	Phalangist 1-2
8-10	Elementary	No change
5-7	Elementary	No change
2-4	Elementary	No change

Hearts: Facilitator Path

Card	*First*	*Second*
Ace	Enlight 7-8	Fascist 7-8
King	Enlight 5-6	Fascist 5-6
Queen	Enlight 3-4	Fascist 3-4
Jack	Enlight 1-2	Fascist 1-2
8-10	Elementary	No change
5-7	Elementary	No change
2-4	Elementary	No change

Spades: Seeker Path

Card	*First*	*Second*
Ace	Enlight 7-8	Fascist 7-8
King	Enlight 5-6	Fascist 5-6
Queen	Enlight 3-4	Fascist 3-4
Jack	Enlight 1-2	Fascist 1-2
8-10	Elementary	No change
5-7	Elementary	No change
2-4	Elementary	No change

Path: Seeker or Tetramerous.

Level: Veteran.

Combat Assets: Energy Weapon (Rifle) or Slug Weapon (Rifle), *Armed Martial Arts*, and Unarmed Martial Arts, plus any two from **Acrobat**.

Other Assets: Any five from **Charm, Social Science, Physical Science, Determination, and**/or **Perception** at 12.

ITHKLUR AND PSIONICS

Ithklur, unlike Hivers, have some psionic potential, but Ithklur have less than do humans. Generate an Ithklur character's psionic rating by rolling 2D6–2, then subtract one for each four-year block over age 17 without psionic training.

Ithklur are unable to use any skills from the Telephysics cascade, Teleportation, or any skills from the arcana sub-cluster. Ithklur characters may not achieve any stage of psionic success higher then stage 5.

The Ithklur represent an alien evolutionary path (as discussed on page 249 of the basic rules). Thus any human psionic attempting to use Telempathy, Project Emotion, Project Thought or Probe on an Ithklur automatically subtracts one stage of success. Ithklur are likewise subject to the same penalty if they attempt to use Telempathy, Project Emotion, Project Thought or Probe on humans. Hivers are a very alien evolutionary path from both Ithklur and humans, so both would subtract two stages of success.

Psionic Institutes: Among the Ithklur, those with psionic powers have not been subjected to the tremendous prejudice and persecutions that they endured, and institutes for the study of psi powers and the training of those who possess them are not restricted in any way. Because of the relative lack of such powers among the Ithklur, however, psionic institutes are few and far between, and not easy to find. The techniques of psi training are much the same, even from race to race, however, and Ithklur can undergo training at human psi institutes (and vice versa). Ithklur characters in the Old Expanses may search for psi institutes in the same manner described on page 245 of the basic rules.

Psi Drugs: Psionic drugs differ from race to race, sometimes radically. Human psi drugs have no effect on Ithklur psi talents and vice versa. At their option, referees may implement rules for inter-race psi drug effects, but such use should always have side-effects and drawbacks.

Because of the relative lack of psi powers among Ithklur, the manufacture and sale of psi drugs is not a large industry. Only Ithklur booster is available, and it effects Ithklur in the same way as human booster does humans (see page 258 of the basic rules). Locating a dealer in Ithklur booster is an Impossible test of Streetwise on any given world in the Old Expanses, Formidable within the Reformation Coalition or at any Hiver permanent base. Roll 1D3 for the number of doses available at a base price of Cr2500. Ithklur booster has no effect on humans and vice versa.

Ithklur psi drug users face the same drawbacks as do human users, as described in the Pitfalls section on page 258 of the basic rules.

Appendix

PLANETARY COMBAT

All TNE page references are to the Mark I, Mod 1 printing (also known as the second printing). Unless otherwise indicated, if a rule is not mentioned, it applies to both Hiver and Ithklur without modification.

Hivers: Hivers are not suited to fighting either intellectually or emotionally, and prefer their combats to be at ranges where dispassionate thought can override their instinct to flee. To a Hiver, the more high tech (and long range) a given weapon, the more attractive it is. Hivers prefer pistols over clubs, rifles over pistols, artillery over rifles, starship turrets over artillery, and arranging for someone else to do the fighting most of all.

Initiative

Hivers: All rules on pages 264-265 of the basic rules regarding Initiative apply to Hivers, except the rule on *High Initiative Characters* (as no Hiver may have an Initiative higher than 2) and the Template NPC Initiative table. Burdened Hiver characters suffer no Initiative penalties, but my only walk or crawl.

Ithklur: Ithklur Initiative follows the rules outlined on pages 264-265 of the basic rules without exception.

Movement

Movement is as noted on page 265 of the basic rules.

Hivers: Hiver movement rates are 2/10/20/—, meaning they may crawl two meters per turn, walk 10 and trot 20 (Hivers may not run due to limitations in their physiological makeup). Hivers must use at least four limbs in order to trot, and at least three in order to crawl or walk. Limbs not used for movement may be used as arms (to carry items) if desired.

Ithklur: Ithklur movement rates are 2/10/20/30 and are therefore the same as human movement rates.

ACTIONS

Combat Actions

All rules on pages 266-268 of the basic rules apply, except as follows:

Hivers: 1. Hivers may go prone or stand up without any movement penalty. 2. Hivers may not use deck hatches to mount/dismount a vehicle unless these are specially designed for use by Hivers. They require two turns to mount/dismount via a side or rear door. 3. Hivers may not run.

Involuntary Actions

The following discussions modify the Involuntary Actions rules on page 268 of the basic rules. These rules apply to Ithklur unchanged (although the Ithklurs' slightly higher Initiative will make them less likely to panic in most situations).

Hivers & Panic: Hivers are more susceptible to panic than human characters. Most Hivers must roll for panic under the following circumstances (see exception on page 36):

- When knocked down.
- When surprised.
- When they come under fire for the first time in a particular combat.
- Each time they are wounded, unless the wound is a Scratch wound (except in the head—see below).

Hivers automatically panic if:

- Their blowhole is covered during melee combat (i.e., they are strangled).
- Their head limb takes any wound (including a scratch wound).

When a Hiver tests for panic, roll 1D6. If the result is greater than its Initiative rating, the Hiver panics. For a Hiver, panic means much the same as it does for humans: A panicked Hiver will freeze and can take no actions for the number of turns equal to the amount by which the die roll exceeded the Hiver's Initiative. On the second turn of panic (if any) the Hiver may go prone and must remain there for the remainder of its panic.

If the die roll exceeds the Hiver's Initiative by 3 or more, the Hiver will flee if it can do so without exposing itself to increased danger, running for the duration of the panic. If this is not possible, it will go prone and crawl toward the best protected position within 10 meters. If this is not possible, the Hiver will go prone, tuck its eyestalks inside the fingers of its head (if it is not wearing a helmet), shield its head with its other limbs as much as possible, and take no further actions for the duration of the panic.

Hivers & Bail-Out: For Hivers, bail-out is automatic (except as noted below) when a vehicle is penetrated by any fire (final penetration greater than armor value) from anything other than small arms. When penetration happens, Hivers will exit the vehicle, seek the nearest cover within two meters and remain there for two turns.

In situations where the Hiver cannot bail out without risking death or serious injury (when travelling at extremely high speed, for example, or at a high altitude without a parachute), the Hiver will completely freeze and be unable to take any action (including communication) for a period of 1D3 turns. This includes Hivers acting as pilots and drivers.

Hivers & Charge: This rule applies to Hivers unchanged.

COMBAT RESOLUTION

"If you can persuade a Hiver to wrestle, they can hold their own—they're low to the ground and they have a lot of arms, which makes up for some of their inexperience. Hivers, however, hate melee worse than I hate asparagus. They are fair at fire combat, although they are a little prone to cut and run when the range is short."

Sgt. Vladimir "Sugar" Dzugishvilli
RCMC Nonhuman Orientation Seminar

Melee Combat

Hivers: Hivers don't have melee combat skills (except possibly Unarmed Martial Arts at level 0), but if flight is not an option and they have not panicked, they will defend themselves (using the Unskilled Tasks rule as noted on page 108 of the basic rules).

Ithklur: The larger attributes of the Ithklur will (on the average) result in a larger Unarmed Combat value than in humans.

Ithklur can do all eight unarmed melee strike attacks as discussed in the basic rules: hand strikes, kicks, leaping kicks, throws, diving blows, grapples, escapes and strangling. In addition, they can also undertake a tail strike, as follows:

Tail Strikes: The Ithklur's powerfully muscled tail can be used to strike blows during melee combat. A tail strike action may be made *in addition* to any hand strike, grapple, escape, or strangle action, thus giving Ithklur characters two attacks per unarmed combat action. The target of the tail strike must be behind or to the side of the Ithklur, but may not be to its front (see diagram, page 82). A tail strike may not be carried out at the same time as a kick, leaping kick, throw or diving blow. Ithklur may make aimed strike attacks using their tail and block attacks using their tail, but in both cases only if the tail strike is their only action.

Damage from a tail strike is equal to *twice* the Ithklur's normally calculated unarmed combat damage.

Hiver and Ithklur Personal Hit Location

	Hiver	*Ithklur*
1	Head Limb	Head
2	Right Front Limb	Right Arm
3	Left Front Limb	Left arm
4	Body	Chest
5	Body	Abdomen
6	Body	Abdomen/Tail*
7	Body	Right Leg
8	Right Rear Limb	Right Leg
9	Left Rear Limb	Left Leg
10	Reproductive Limb	Left Leg

* A hit in this location from the rear will hit the tail.

Ithklur Permitted Tail Strikes

No	No	No
Yes	⬆	Yes
Yes	Yes	Yes

⬆ = Ithklur facing in direction of arrow

WOUNDS AND DAMAGE

Hiver Target Protection: Hivers make use of armor protection specifically designed for their body form. The areas protected by various types of armor are discussed in the Equipment section on page 84.

Ithklur Target Protection: Ithklur body armor covers the same areas as human body armor.

Quick Kill: The quick kill rule on page 285 of the basic rules applies to Ithklur as written. Head limb hits on a Hiver cannot result in a quick kill, however—only hits to the body.

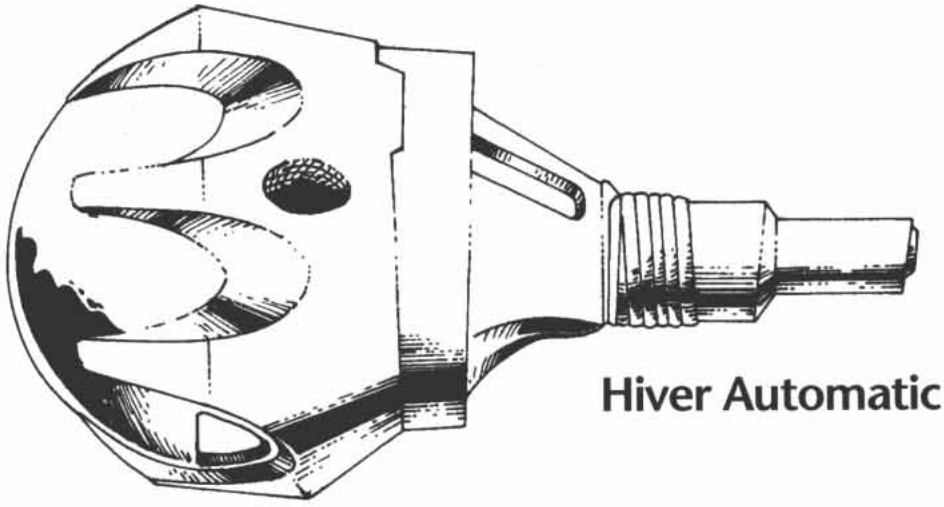
Falls

Hivers and Ithklur take damage from falls as described on page 287 of the basic rules, but Hivers take 2D6+1 per meter fallen, and Ithklur take 2D6+2 per meter fallen. This is because Hivers and Ithklur are heavier than humans, and the kinetic energy generated by their impact will be greater.

WOUNDS EFFECTS AND HEALING

With the exceptions noted below, these work as noted in the basic rules on pages 288-290.

Immediate Effects



Knockdown and stun for Hivers and Ithklur are as noted on page 288 of the basic rules. The larger average attributes of the Ithklur will make them tougher to knock down and to stun.

Wound Severity

Wound severity for both Hivers and Ithklur is as noted on page 288-289 of the basic rules, except that Hiver NPCs have a wound capacity of 44, and Ithklur NPCs have a hit capacity of 48.

Healing

The rules on healing apply to both Hivers and Ithklur as noted on pages 289-290 of the basic rules. Referees are reminded of the restrictions placed on medical treatment of other races as discussed on page 123 of the basic rules. Ithklur medics will have no penalties imposed while treating Ithklur, but human or Hiver medics will unless another skill (Biology or Xeno-biology) is used as an enabling skill for the task. An Ithklur medic treating a human will also have penalties imposed, all other things being equal.

Hiver Automatic Pistol

Equipment

EQUIPMENT

All equipment listed in the basic rules is available to Hiver and Ithklur characters, in models suited to their own race, at the same price, mass, volume and so on as for humans, except as noted below.

Assorted Equipment

Hiver Utility Harness: Since Hivers wear no clothing in normal circumstances, this item provides them with a convenient means of carrying the various items a technological civilization demands. Most consist of a collection of straps running around each leg and connected together on both top and bottom of the central body, leaving the blowhole (on the top) and mouth (bottom) open. Harnesses have several pockets and pouches for small items, plus quick-release attachment links for other items of equipment such as translators, weapon holsters, scanners and so on. Filters, respirators and the like are attached to the top of the harness, covering the blowhole. An electronic psionic shield can be installed in the harness at an additional cost (see below).

Worn as clothing, the Hiver utility harness has negligible mass and volume, and costs Cr50.

Medical Equipment

Automed, Hiver: This model of automed is designed specifically to accommodate Hivers. A Hiver automed is larger than a human or Ithklur model, and shaped like a large clam rather than a box (2.5 meters across and about 1.2 meters thick). Hiver automeds in the Old Expanses can be reprogrammed to treat humans or Ithklur as well as Hivers (and contain the appropriate drugs for such treatment), but the medical modifier becomes +2 instead of +3. Hivers cannot fit inside a human or Ithklur automed.

TL	*Vol*	*Weight*	*Price*	*Medical Mod*
13	6 kiloliters	9 tonnes	MCr0.6	+3

Automed, Ithklur: Ithklur automeds are slightly larger than Human automeds, but operate identically. Ithklur automeds can be programmed to treat humans as well as Ithklur (and contain the appropriate drugs for such treatment), but the medical modifier becomes +2 instead of +3.

Hivers cannot fit inside an Ithklur automed.

TL	*Vol*	*Weight*	*Price*	*Medical Mod*
13	3.5 kiloliters	5.2 tonnes	MCr0.4	+3

Drugs

Hiver and Ithklur drugs do the same things for Hivers and Ithklur as human drugs do for humans, but drugs used for one race can seldom be used on another, and are often toxic to a greater or lesser degree. (Interestingly, the whole point behind most drugs is that they are toxic to one thing or another, up to and including the brain cells of the user.) Hiver and Ithklur drugs are extremely scarce in the Wilds but are available on most worlds of the Reformation Coalition due to the Hiver/Ithklur presence there (although at a higher price then corresponding human drugs).

Nonmedicinal Drugs: As mentioned earlier, both the Hivers and Ithklur shun the use of anagathics. Hivers make use of combat drug from time to time, as do some Ithklur (although many Ithklur consider its use an unfair advantage). Ithklur psi booster drug is discussed on page 80.

Drugs (Hiver and Ithklur)

Drug	*Per Dose*
Antibacterial Vaccine	Cr20
Whole Blood	Cr125
Local Anesthetic	Cr25
Total Anesthetic	Cr125
Antitoxins	Cr25
Antibiotics	Cr65
Blood Plasma	Cr15
Antinerve Agent	Cr65
Antivenin	Cr65
Metabolics	Cr1250
Broad Spectrum Vaccine	Cr25
Antiviral Vaccine	Cr25
Combat Drug	Cr950

Vac Suits

Vac Suit, Hiver: Hiver vac suits are constructed at TL14, and consist of a two-part central body with "gloves" (or "boots" depending on your point of view) covering each limb and a helmet for the head. Hiver vac suits are self-sealing as a standard feature, and come in general purpose and hostile environment models. Price as noted below does not include a helmet, PLSS or any accessories.

General-Purpose Vac Suit, Hiver

TL	*Armor*	*Volume*	*Weight*	*Price*
14	1	0.3 kl	0.55 kg	Cr5000

Hostile Environment Vac Suit, Hiver

TL	*Armor*	*Volume*	*Weight*	*Price*	*AGL Mod*
14	3	2.8 kl	26.25 kg	Cr160,000	–2

Accessories and Miscellaneous Accessories: Use the statistics supplied in the basic rules for PLSS and other accessories. Ithklur helmets are effectively identical to human models.

Hiver helmets are as noted below. Note that they come in two varieties, with finger gloves that allow the manipulation of objects outside the helmet, or as hard bubble helmets which allow the fingers inside the helmet to operate equipment such as vision devices, cameras, etc.

Hiver hard bubble helmets may be fitted with additional vision enhancements, as noted under the "goggles" entry, below. These may only be added to the nonfinger glove helmets, as the fingers must be retained within the helmet to operate the vision enhancement controls.

Helmets, Hiver

TL	*Special Features*	*Volume*	*Weight*	*Price*
8	Hard bubble, no features or fingers	10 liters	2 kg	Cr800
8	Finger gloves	10 liters	1 kg	Cr1600
14	Integral Heads-Up Display (no gloves)	10 liters	1 kg	Cr1200

Vac Suits, Ithklur: Except for increased size and cost, these are identical to human models. Ithklur vac suits are available in general-purpose and hostile environment models at tech levels ranging from 12 to 14, with the same accessories as human models. Differences in size and cost are noted below. Where an item is not mentioned, it is identical with the human item. Ithklur do not use tailored vac suits, body pressure suits or the soft helmet option available with human TL14 suits. Price as noted below does not include a helmet, PLSS or any accessories, which are identical to those listed in the basic rules for human suits (for game purposes, Ithklur respiration is identical to human).

General-Purpose Vac Suit, Ithklur

TL	Armor	Volume	Weight	Price	AGL Mod
12	1	1 kl	2.2 kg	Cr7700	–1
13	1	0.6 kl	—	Cr7700	
Self-Seal Option			1.1 kg	+Cr6600	–1
14	1	0.2 kl	—	Cr7700	
Self-Seal Option			0.55 kg	Cr5500	

Hostile Environment Vac Suits, Ithklur

TL	Armor	Volume	Weight	Price	AGL Mod
12	2	3.3 kl	44 kg	Cr19,800	–3
13	2	2.2 kl	11 kg	Cr22,000	–2
14	3	2.9 kl	27.5 kg	Cr165,000	–2

Vacuum and Hostile Atmosphere Survival Equipment

Masks, Filters and Respirators: Human and Ithklur masks, filters and respirators are identical in game terms. (Ithklur filter masks are worn over the mouth and are used with air-tight headbands to seal off the nostrils.) Hiver versions of this type of equipment function identically, but are designed to be attached to a Hiver utility harness and thus held in position over a Hiver's blowhole.

Communication Equipment

Hiver Translator: This device combines the functions of a portable computer, a three-kilometer radio and an electronic translator. It is operated by the rear limb (opposite the "head" limb).

TL	Vol	Wt	Price
14	2.5	1.1 kg	Cr25,000

Vision Enhancement Equipment

Hiver Hexoculars: The Hiver instrument that is their equivalent to human binoculars is generally referred to as "hexoculars" because it is constructed for the six-fold vision of the Hivers. In the simplest form, a set of Hiver hexoculars consists of a spherical central handle (which the user grasps with the fingers of its head), surrounded by six sets of lenses (prismatic or electronic, depending on tech level). Electronic, image converter and PRIS hexoculars function in game terms exactly as described in the basic rules (pages 342-343).

PRIS hexoculars have their lens systems mounted on individually extensible arms (in an arrangement similar to human artillery binoculars)

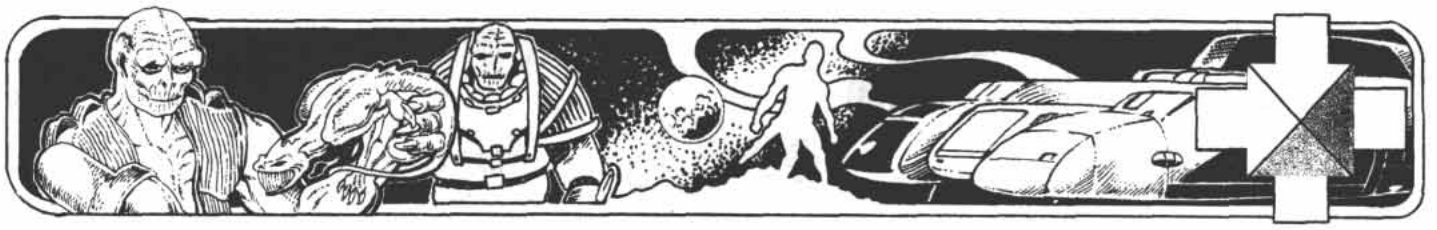
Type	TL	Vol	Weight	Price
Hexoculars	4	6 liters	3 kg	Cr225
Electronic	8	6 liters	6 kg	Cr2250
Image converter	10	6 liters	4 kg	Cr10,500
PRIS	12	8 liters	8 kg	Cr36,000

Hiver "Goggles": Hivers do not make use of goggles in the human sense, as it would be silly to strap a little cup over he end of each eyestalk. Where a human would use goggles, a Hiver uses a hard bubble helmet covering the entire sensory cluster of the head appendage, often fitted with vision enhancements as noted below. The standard hard bubble helmet serves a Hiver as conventional goggles, providing protection from wind-blown dust and debris. Price and mass shown below do not include the hard bubble helmet. Note that Hiver IR sense is not as well-developed as that of the Ithklur, and they need IR goggles from time to time.

Type	Vol	Mass	Price
Combination IR/LA	*	+1 kg	+Cr7500
Infrared	*	+0.25 kg	+Cr3000
Light Amplifier	*	+0.75 kg	+Cr6000

*Volume added to the helmet is negligible.

Ithklur Goggles: Ithklur have little need of IR goggles and normally use only light amplification models identical in function to human ones.



Hiver Armor

	TL	Vol (liters)	Wt (kg)	AV	AV vs lasers	Hit Location	Price (Cr)	AGL	INIT

PROTECTIVE CLOTHING

Psionic Shields

Since a Hiver's brain is in its central body, not in its head limb, Hivers concerned about psionic attacks wear a psi shield harness. This is similar in operation to the psi shield helmets used by humans and Ithklur, but designed to be incorporated into a standard Hiver utility harness or body armor. Any Hiver harness, grav belt, BW vest, BW body suit, combat environment suit, combat armor or battle dress can have a psionic shield fitted at an additional cost of Cr4000. Ithklur use psionic shield helmets identical in game terms to those used by humans.

Hiver Armor

Hivers have a variety of personal armor protection available to them.

BW Helmet: This is a globe-shaped helmet incorporating ballistic weave cloth technology. It fastens to the Hiver's neck and provides partial protection to the sensory organs in exactly the same way a human helmet does (see Target Protection, page 285 of the basic rules). The fingers are left exposed, allowing them to grasp and operate hexoculars, pistols and other equipment, and there are holes through which the eyestalks project and which allow them to be withdrawn for protection. Openings in the helmet allow partial use of the ears and IR sensing organs. All Hiver helmets provide an Initiative reduction of 1 (with reduced Initiatives of 0 treated as 1).

BW "Vest": This armor incorporates ballistic weave cloth technology and covers the Hivers central body (locations 4-7 on the Hiver Hit Location chart, see page 82).

BW Body Suit: This armor incorporates ballistic weave cloth technology and covers the Hiver's central body and all limbs but the head.

Visored (Airtight) Helmet: An advanced form of helmet providing full protection of the head appendage while retaining all-around vision. Similar in concept to the BW helmet above, but the fingers are gloved, and the eyestalks are housed in small blisters. The visored helmet reduces Initiative by 1 like the BW helmet. Visored helmets are also available as simple spherical "fishbowls," much easier to produce, but these do not allow the head limb's hand to manipulate external objects. For this reason, such helmets are usually fitted with integral equipment which is operated by the otherwise useless hand, such as hexoculars, hand computer, pistol, advanced sensor, translator, etc. For price and mass of such helmets, simply add the price and mass of the visored helmet to that of the desired equipment.

Combat Environment Suit: As described on page 358 of the basic rules, but designed to fit a Hiver.

Combat Armor: As described on page 358 of the basic rules, but designed to fit a Hiver.

Battle Dress: As described on page 358 of the basic rules, but designed to fit a Hiver.

Chameleon Option: As described on page 358 of the basic rules, this feature may be added to any combat environment suit, combat armor or battle dress.

Psi Shield Option: See psionic shields, above.

Ithklur Armor

In game terms, Ithklur personal armor is broadly similar to human personal armor, as both are bilaterally symmetrical, bipedal species.

Ithklur helmets either leave the temple nostrils completely exposed or else come with perforations in the temples which allow the Ithklur to use their keen directional olfactory sense. In addition, most Ithklur helmets (and all of those intended for use in melee combat) have nose visors.

Nose visors are intended to protect the Ithklur from blows to their vulnerable IR pits, and are either made from an IR-transparent material or can be swung up over the top of the helmet to allow the Ithklur to see across the full spectrum. Such visors also typically include eye protection. Because of the Ithklurs' natural and highly efficient thermal sense, there is little need for Ithklur helmets to be equipped with vision enhancement devices. Ithklur armor is also slightly larger (to suit the larger Ithklur body) and therefore more expensive, and these differences are noted on the table below. Other characteristics are identical to human armor, but for convenience, are given here. Hit location abbreviations and armor values are as described on page 358 of the basic rules, except that Abdomen also includes the Ithklur tail.

HIVER GRAV PLATFORM

The grav platform is an individual open Hiver transport similar to the Reformation Coalition grav rail.

Tech Level: 15, with lower TL components
Price: Cr150,601
Size: 14 cubic meters=1 displacement ton (Mc)
Mass: 1.29 tonnes empty, 3.01 tonnes loaded
Power: 0.6 MW fusion power plant, with HEPlaR thruster generating 1 tonne of thrust (0.219 MW excess power)
Maint: 1
Controls: Holographic linked, TL6 flight avionics, TL15 terrain following avionics, 2×Model 15-FLT computers, TL7 inertial positioning navigation
Commo: 300 km radio
Life Support: Light, heat, inertial compensators
Cargo: 1.44 tonnes (5.76 m3)
Crew: 1
Passengers: 1 in cramped seat
Travel Move: 890/445
Combat Move: 41/10 (in 10-meter grid squares)
Fuel Capacity: 1200 liters liquid hydrogen, sufficient for 96 hours
Combat Statistics: Treat as open vehicle (**TNE**, page 298), except that *all* side hits (not merely 50%) are resolved vs. passengers or cargo.

GRAV HARNESS/BELT

Hiver grav belts are called grav harnesses, as they are arranged about the disk-shaped Hiver body just as the Hiver utility harness. Aside from this configuration, its function is the same as human grav belts. Ithklur grav belts are essentially the same as their human counterparts except that the larger Ithklur may not carry an emergency passenger.

The TL15 Hiver Grav Harness and Ithklur Grav Belt both have the characteristics below, but each may not be used by the other race.

Capacity: One individual plus armor and equipment.
Speed: 300 kph maximum, 225 kph cruising, 40-120 kph NOE.
Combat Move: 42 10-meter grid squares in high mode (absolute speed), six 10-meter grid squares in NOE mode (safe speed).

Type	*TL*	*Mass*	*Volume*	*Endurance*	*Price*
Hiver/Ithklur Grav Belt	15	90 kg	63.5 liters	2 hours	Cr115,100

WEAPONS

Hiver Weapons

The most commonly encountered pistol in use by Hivers is a 5.5mm gauss pistol, based on the barrel and action of the Ithklur 5.5mm gauss pistol, but incorporating a Hiver-style grip. The weapon features twin optic sights (Hivers prefer binocular sights), and the large, globe-shaped grip/housing give it a unique appearance. The weapon's most unusual feature, however, is the 75-round internal magazine. Hivers prefer to minimize the actions they must take during combat, and the large magazine gives them one less thing to be concerned about. Ithklur like to joke that the Hivers prefer to load their pistols every 10 days, whether they need to or not. To ease loading of pistols, 5.5mm gauss ammunition is supplied in 15-round plastic packages similar to stripper-clips. The Hiver gauss rifle, like their gauss pistol, is based on the barrel and action of the Ithklur 5.5mm gauss rifle, but incorporating a Hiver-style grip and provision for up to four magazines. The rifle also features a laser sight and a rifle grenade adaptor. Hivers prefer rifles to pistols, unless something with a longer range is available. Ithklur and humans using Hiver weapons suffer +2 Diff Mods due to their size and shape.

Ithklur Weapons

Ithklur weapons are characteristically ornate. All unique decorations and carvings are added by their owners to commemorate personal events, values and beliefs. For more details on these weapons, see the **Reformation Coalition Equipment Guide**, pages 74-75, and **Challenge 74**, page 27. Ithklur weapons are built more robustly than their human analogs, and their controls are more difficult for weaker human fingers to operate. For this reason, all fire tasks by humans using Ithklur weapons are made at a +1 Diff Mod. Hivers attempting to fire Ithklur weapons do so at a +2 Diff Mod.

INTERSPECIES EQUIPMENT USE

From time to time, it is necessary for members of one race to use equipment designed for another. Differences in language are one barrier to such use, as it is difficult to get accurate sensor readings if the operator doesn't read the language it is presented in. Differences in physical build present the most serious complications, but the situation is not one that can be easily summed up in a simple "–2 Diff Mod for Hivers using human equipment" statement.

Referees will have to consider the kind of equipment being used and the task being undertaken when assigning difficulty levels for using another race's equipment. Some of the equipment or task descriptions set difficulty levels for various items of equipment, but for the most part referees must use common sense and judgement. The vast majority of tools and equipment available to a given race will not be perfectly suited to another, but will still be usable with a few minor problems. The problems encountered will depend on how different the two races are. It is up to the referee to add one or two difficulty levels to a particular task. As a general rule, the more complex the equipment and/or the task, the greater the difficulties that will be encountered.

Some equipment is identical for all races, and no penalties should be imposed for tasks undertaken using it. For example, Hiver rope, Ithklur rope and human rope are all effectively identical, and used in pretty much the same way. A Hiver using a human rope or vice versa will encounter no problems, and will be able to accomplish any given task without penalty. A human could use an Ithklur hammer or screwdriver with no problems, because the human hand and the Ithklur hand are quite similar. An Ithklur using a human hand-held screwdriver will incur no penalty. The same Ithklur using a human power screwdriver will find the buttons too small and located inconveniently, and an additional difficulty level for most tasks is indicated. A Hiver trying to use a human manual screwdriver will find that the tool does not fit its hand at all well, and a power screwdriver will be very clumsy. The simplest tasks will have an additional level of difficulty, complex ones two levels. A Hiver might be able to use a human power screwdriver for simple tasks at two additional levels.

Some equipment is effectively impossible for one race to use. A Hiver attempting to operate a human ground car will not fit into the seat very well, and will find the controls hard to reach and operate.

EQUIPMENT, FURNISHINGS AND FIXTURES

This section discusses design and layout for equipment and facilities of Hivers and Ithklur, and how they differ from those used by humans.

Design Sequences

When using the **Fire, Fusion, & Steel** and **Brilliant Lances** design sequences to design equipment for Hivers and Ithklur, there is no need to change the size, dimensions or price of any equipment to suit these races. While such changes would be reasonable in theory, the additional work required of players, referees and game designers means that this would not be a Good Thing. Thus a ship or rifle designed for human use will have exactly the same characteristics as one designed for an Ithklur. However, players and referees should be careful to remember that it cannot necessarily be easily used by members of another race, under the guidelines presented above. Note, however, that Ithklur can profitably use weapons designed with heavier recoil than can humans.

In addition, weapons designed to be shoulder-fired by Ithklur may mass up to 60 kilograms loaded. Of course, humans still cannot use them if they are more than 45 kilograms. Hivers are also limited to 45 kilograms (although their lack of solid skeletal structure makes it harder for them to hold heavy objects, they have more limbs to work with).

For those sticklers for detail who insist that Ithklur should allocate more space for passenger seats and workstations than humans do, I say, "Fine, make your own life more difficult. Mine is hard enough already, thank you."

Duplex Controls: Spacecraft to be operated by mixed crews of Hivers and Ithklur or Hivers and humans (or Hivers, humans and Ithklur) can be fitted with duplex controls, allowing all ship functions and all workstations to be operated by any crewmember race. These controls have adjustable seating, control panels, readouts, etc., which can be rapidly reconfigured for different body shapes, linguistic and display requirements. When designing a vessel with duplex controls, double the cost of all control systems and workstations (**FF&S** page 47). If ship-wide duplex controls are not installed, Hivers aboard human/Ithklur ships or Ithklur/humans aboard Hiver ships will require their own separately installed workstations in order to function as crewmembers. Duplex controls are normally impractical in the more cramped aircraft and ground vehicles.

Workstations

Each race has designed its controls and data read-outs to suit their own physiology. Radical differences in body form can mean radical differences in design (although not always). Also, when a member of one race attempts to use equipment designed for another, there can be problems that make language barriers pale to insignificance.

Hiver: Hiver data readouts are normally projected onto a spherical or hemispherical screen. Hivers have six eyes on stalks, and can arrange them in a number of different configurations as the situation requires, which means that a Hiver can see almost all the surface area of a sphere at once. Hivers find this arrangement more compact than flat screens (a single spherical display can show data that would require three or more flat screens), and can study holographic displays (such as 3-D graphs) from all angles. Humans and Ithklur find these readouts almost impossible to use with any efficiency.

Hivers are built low to the deck, and they tend to do without stools or chairs, substituting rotating circular mats or pads. Hiver workstations incorporate low consoles arranged in a semicircle (or complete circle) around a rotating circular floor pad (described by one human xenologist as "a slightly concave throw pillow mounted on a lazy susan"). The rotating floor pad serves the same purpose as a human swivel chair and enables the Hiver to bring its head around to study whatever display needs close attention. If necessary, a Hiver can raise its head and arrange its eyestalks to see all 360° of the workstation at once (this enables a Hiver to monitor a great many controls at once, but does not permit detailed study of any individual readout).

Hiver ship workstations are often arranged to allow operation by Hivers and humans or Hivers and Ithklur (see notes on duplex operation above).

Ithklur: Ithklur workstations are built to accommodate the Ithklurs' greater bulk, and allowances are made for their tails in all seating arrangements. Workstation controls are designed to be very robust. Knobs, buttons, switches and the like are built to be operated by the Ithklur's large, stubby fingers. Other than these differences, Ithklur workstations can be used by humans (provided the humans can read written Ithklur or the station is re-programmed to give Anglic readouts) at little loss of efficiency—humans find Ithklur buttons, switches and knobs stiff and balky, and usually have to reach farther than they would for their own workstations. Ithklur computers (and Hiver computers designed to be used by Ithklur) are usually voice or touchscreen operated, but those with keyboards have large, widely spaced keys.

Staterooms

Hiver: When reconfiguring human staterooms for use by Hivers, Coalition protocols call for the substitution of Hiver-configured plumbing fixtures and replacement of all chairs with Hiver stools. The beds are removed or left according to the wishes of the occupant(s). See the notes on Hiver furniture, below. Lighting, ventilation and other controls are to be placed lower on the walls, linked to signals from the Hiver's personal portacomp or configured to respond to the Hiver's voice-synthesizer. All Hiver vessels in Coalition space seem to have been designed to accommodate Ithklur-sized beings if necessary, and this means that the ceilings and doors are also compatible with humans. Travellers in Hiver space report that vessels designed for purely Hiver use normally have less headroom, varying between 1.75 and 2.0 meters.

Ithklur: When reconfiguring human staterooms for Ithklur use, Coalition protocols specify that the plumbing fixtures and all chairs must be suitable for use by a tailed biped. If Ithklur-configured switches and other controls are available, these are to be installed; otherwise, the room is to be configured to respond to voice commands (if this is not done, the controls will need to be replaced approximately once per month of Ithklur occupancy).

Furniture

Hiver: When among themselves, Hivers to do without stools or chairs almost entirely, simply lowering themselves to the floor whenever necessary. Hivers cannot use normal human chairs, and they cannot use a human bench or stool for dining, as their mouth is located on their underside and must remain uncovered in order for them to eat.

For meals, Hivers use a short broad stool with a pierced top (allowing access to their ventrally located mouth so they can eat while sitting). Some models resemble doughnuts with tripod legs, but the most common variety is called a "mushroom" because of its shape.

For long conversations with humans or Ithklur, Hivers also make use of "mushroom" chairs to keep their heads at the same level with those of seated humans. Whether this is because the Hivers feel more comfortable or because they think humans feel more comfortable when all heads are at the same level is a matter for speculation.

Hivers find human single beds a little narrow, but they can make do quite comfortably on human double beds. As for their natural preferences, one human scientist remarked, "A Hiver wishing to sleep simply flops down someplace soft and curls its legs up like a cat in a sunny window...." Some Hivers, however, prefer sleeping mats: soft, circular pads ranging from two to three meters across and slightly domed in the middle. Hiver sinks, shelves and other furniture are all built close to the ground (where they may be readily reached by a Hiver resting on the floor) and often look strange to the human eye. Hivers can reach items on shelves designed for humans, but must stretch one of their legs uncomfortably high to do so.

Ithklur: Ithklur furniture is similar in form and function to human designs, the primary differences being a more robust construction and the allowance made for the Ithklur's large, muscular tail. Chairs, acceleration couches and crewstations, for example, must have a large cutout in the back to accommodate the tail. Ithklur may use backless benches or stools without difficulty. Since Ithklur sleep either on their sides or face-down, human beds present no problems, but they find human single beds a little cramped.

DESIGNER'S AFTERWORD

How many of you have turned to this page while browsing through this book in a store, and how many of you have arrived here only after having digested the rest of the book? It's just a question, please keep score for yourself.

Without any further ado, we will consider the term:

alien *adj* different in nature or character, see EXTRINSIC.

How many times have you read ad copy from some science fiction game company that includes the sanctimonious drivel about how "the aliens in (insert the name of the company's game here) are more than just people in funny suits"? Sounds good to me. Of course I wouldn't be impressed with a game whose aliens were simply humans with four arms, or doggy heads or whatever. It seems sort of gimmicky. Yeah, I guess I would prefer a game in which the aliens truly *were* alien, with fully realized motivations, worldviews, bank accounts, automotive industries, magazine subscriptions, highway regulations, etc.

Well, boys and girls, I'm here to tell you that just ain't so. Any alien in any roleplaying game played by humans is nothing more or less than a person in a funny suit. Sorry. And I'm allowed to sit up here on my blindingly white charger and say that because GDW is the company that invented that fatuous nonsense. I will refrain from citations.

So why am I raining on this parade? Into every game a little rain must fall, so rain I must.

What does the sensation of consciousness feel like to a mind which has evolved completely unlike our own? We often experience our own consciousness as our own voice speaking silently in our minds, or as sudden bursts of realization without words. One common theme is that we all imagine a tiny little man (*homunculus*) inside of our heads, overseeing things and making decisions. Surely we don't believe this is literally true, and current neurological theory holds that these sensations are merely the *by-products* of the physical biochemical processes that go on in our brains. How does consciousness itself feel to an alien mind? What are its sensations, and how do those sensations affect the way they perceive and respond to reality (or their interpretation of reality)? How could we ever truly *understand* them without sharing that same utterly subjective sensation?

Our minds have arguably evolved as a primarily visual system. Our ability to perceive the world with our eyes is so efficient that we routinely confuse our visual sense of the world with reality, when in fact it is nothing of the kind. We have no problem realizing that a radar screen or an oscilloscope is merely a *representation* of reality using a particular medium of analysis, but it is far harder for us to be conscious that the same is true of our visual perception of the world. It is also only a representation of reality, although a *very good one*—so good that we normally treat it as reality.

What is it like inside the mind of a creature whose brain is primarily configured for aural representation of the world, or olfactory or vibrational? How could we ever know? The filters in our brains and the filters in their brains are as *literally* alien as alien can be.

What would it be like to confront a truly alien intelligence, one whose workings were completely, utterly foreign and incomprehensible to our own? What if the best understanding we can have of an alien race is the realization: "Oh my God, they're *crazy!* But they're quirky and weird, and so help me, I like them."

Meet the Ithklur. (If anyone ever makes a **Traveller** movie, Jeff Goldblum has to be an Ithklur, and maybe Bruce Dern, but never Jack Nicholson.)

So anyway, back to the rainy part about people in funny suits.

You and I are people, and there is nothing more valuable that we could ever aspire to be. While some people get their kicks out of Monday Night Football, buying and dismembering financially troubled companies, or whatever else, we get something out of science-fiction roleplaying (and believe me, my answer is not "a paycheck," and if you've ever seen a game designer's paycheck, you'll know why).

What do we get out of it? Do we see the future? Do we meet alien races? Do we achieve understanding of life far beyond that of our miserable nonscience-fiction contemporaries (you know the attitude: "reality is for people who can't handle science fiction")?

No, no, and Hell, no.

So what do we get to see? *We get to see ourselves.* Is this a creative enterprise? Is this an open-minded and intellectually stimulating undertaking? Yes, and yes.

But what we take away from this is what we bring to this: ourselves.

Apollo 14 Command Module Pilot Stuart Roosa has said, "Space changes nobody. You bring back from space what you bring into space." At the risk of trivializing space travel, I will tell you that **Traveller** is the same way.

Have you ever looked back on yourself at an earlier age, say in high school, or whatever, and noticed how utterly different you are from who you were, but at the same time, how much the *same* you are? You have somehow become only *more like yourself.* How? How am I supposed to know? It's your life.

But anything in our lives, gaming included, is just the same. We bring back ourselves. But are we better for having done so? I hope so, because none of us are going to become aliens. All we are going to do is gain some different perspective on what it means for us to be human. And I hope to God that we take that insight back to our workplaces, our homes, our co-workers, our parents, our spouses and our children, and make those places better, and those people happier and stronger.

Well that's a pretty sanctimonious and high-falutin' thing for me to say, isn't it? Yes it is, but so was saying that "our aliens are more than just people in funny suits."

Well, our aliens *are* just people in funny suits, and we're damn proud of it, because we can't imagine that anyone would want to be anything more, or less, than a person—and have a little bit of fun while they're here.

To those who take their roleplaying deadly seriously, who believe that we are somehow actually conjuring up the actual future here in an unspeakably earnest, responsible and scientific way, or who feel the need to confront the dark brooding whatchamacallems lurking at the heart of the human psyche, who dress all in black and like to talk about what it's like to be misunderstood, this book is an outright act of sedition.

Bummer.

Get a grip. Laugh, be free.

For those of you who are happy to be a person in a funny suit, God bless you. Laugh, be free.

Re: The Scottish Joke from Page 51

This is a joke, and pokes fun at the English presumption that good colonial troops only achieve their best effect when led by "civilized" English officers. This refers to the practice in Gurkha and Indian sepoy units, and makes the allusion that certainly the Scots could not be such good fighters, or even such good soccer hooligans, if they were truly civilized Englishmen. Naturally the Ithklur play the bagpipes, for the reasons that they sound neat, get the blood running in a properly martial way and irritate others, not necessarily in that order.

Publisher's Note: The opinions expressed above are not the opinions of GDW. If you agree with them, they are the opinions of the designer. If you disagree, they are someone else's opinions. For the humor-impaired, I say again, "Laugh, be free."

Glossary

GLOSSARY

This book has been barely able to scratch the surface of the details of Hiver and Ithklur society. This glossary provides small capsule insights into further Hiver and Ithklur concepts that referees and players can use, which will be developed more fully in future **Traveller** products.

Absurd (translated from the Ithklur **Klisa*): This is perhaps the highest Ithklur value, codified in the formula: "It makes no sense, nonetheless it is true." This is often mistaken by observers of the Ithklur to mean that *anything* which makes no sense is *therefore* true. This is not the case, but instead refers to moments of ambiguity and contradiction when something which is known to be true appears to be impossible, and cannot be proven by any rational means. In this moment, the Tetramerous Way calls upon the individual to ignore rationality and hang onto what is true, acting on it alone, trusting in success by virtue of the absurd.

Blacking Ritual (translated from the Ithklur *Hayyar *chekkeh*): The ceremony in which Ithklur uniforms, weapons and equipment are made "tactical" in preparation for combat, toning down their normal bright colors and dampening the sounds of the *spontaneity bells* (which see). In the case of uniforms, this is accomplished by changing into camouflaged fatigues, combat armor or battle dress (as appropriate), but the intricately carved, painted and decorated weapons are actually covered with a matt black coating to render them less visible.

This coating is removable at the conclusion of hostilities, but it is Ithklur custom that, once blacked, a weapon cannot be "restored" (i.e., stripped) until it has been fired in combat. Thus the Ithklur penchant for profligately firing off all of their weapons near the close of hostilities. It is thus considered to be *excruciatingly* dangerous to be anywhere near an Ithklur unit when a cease-fire is about to be negotiated.

"Corn Dogs": The Ithklur fascination with human culture, especially as obtained through discovery of "*behsehball*" brought the Ithklur into contact with the concept of hot dogs and corn dogs.

Noting this popularity and the difficulty of obtaining human-manufactured ballpark franks within the Federation, the Hivers looked for an alternative to meet this need. Eventually, a substitute was found in the form of an aquatic annelid inhabiting many of the worlds of the Hive Federation. These creatures, similar to the Terran seaslug or sea cucumber, proved to be virtually indistinguishable from Terran hot dogs when cooked. They were particularly good when battered and deep fried, as discovered in the manipulation of M. Kryten, founder of the Kryten Ballpark Concessions Topical Club.

Although the Ithklur are not bothered to learn the true nature of these weiner-substitutes, humans usually profess to become quite ill.

Decorative Carnivore: Term used to describe the Ithklur fondness for adopting highly dangerous animals as "pets." The rule of thumb appears to be that the more dangerous the animal is to everyone but its owner, the more the status of its owner is enhanced. Unlike in human society, where owners can be sued for the violent behavior of their pets, the cultural force behind this tradition holds that any injury done to any third party by a decorative carnivore is the fault of that third party, and not of the owner or even the animal itself. This is even the case when a decorative carnivore attacks a Hiver. For this reason, the shy and retiring Hivers seek to limit the number of decorative carnivores in their Ithklur retinues, usually by whatever reason they can come up with.

The decorative carnivore concept is, however, superseded by the *sanctuary* concept.

Drivers (translated from the Ithklur *Maxxen*): Ithklur slang term for the Hivers, because "they take us where we want to go and attend to all of the mundane details." Also translated as "chauffeurs."

Elementary (translated from the Ithklur *Brunnen*): An Ithklur which has not achieved *enlightenment* (which see). Elementaries are broadly similar to the human concept of noncommissioned or enlisted individuals.

Elementaries are not considered to be lower than the enlightened *per se*, only that they are not aware of their own nature in the sense that the enlightened are. In fact, the simplicity and innocence of being an elementary, i.e., being what one is without being self-regarding, is held in high esteem, the same way that childish innocence is valued by humans, even though it is often wrong or incomplete.

Ithklur often say, "Oh, to be elementary again." See also Knight of Faith for further discussion of this idea.

Enlightened (translated from the Ithklur *D*vakken*): An Ithklur who has achieved enlightenment. Enlightened Ithklur are broadly similar to the human concept of commissioned officers, i.e., those who are placed in a position of responsibility due to their enhanced education and sense of responsibility.

Enlightenment (translated from the Ithklur *D*kvakka*): The state of having achieved some measure of awareness of one's nature, and no longer living within the boundaries of that nature without being conscious of its characteristics.

Exposer of Deceit (translated from the Ithklur *Tokkanah *Kshuden*): Formal name of the highest level of achievement in the Guardian Path. However, this role is considered sufficiently important that all groups of Ithklur have an Exposer of Deceit, who is the highest ranking guardian in the group (when no guardians are present, another is appointed by group consensus). This Ithklur is charged with the protection of all in the group, and is the group's leader and spokesperson in all issues of survival, conflict and relations with Hivers.

Extroverted: This term describes Hivers which have made the cultural and educational adjustments necessary to interact with other races. The first and most necessary adjustment is the use of a spoken language, made possible by a vocal synthesizer built into the Hiver chest computer.

Other adjustments include the adoption of a name meaningful to that race, sometimes to include the adoption of a false gender associated with that name (e.g., female with "Alice" or male with "Einstein"). Because no Hiver is adjusted to interact with all non-Hiver races, the term extroverted is usually combined with the race that is adjusted to, for example, a Hiver could be described as

human-extroverted or Ithklur-extroverted, or human/Ithklur-extroverted in cases where a Hiver is skilled with both groups.

Fascist (translated from the Ithklur **Kchollioll*i): One of the two branches of devotion to the Ithklur Tetramerous Way, which see. Fascists believe that the four paths can be visualized as a bundle of sticks tied together. In this way they can be seen as separate but parallel, beginning at the same point and ending at the same point, although defining four distinct paths through time and space. Fascists believe that achievement of unity comes from tasting the reality of all four paths. Therefore they move through their lives in a variety of sequential careers from the Facilitator, Guardian, Seeker and Explorer paths on their way to the state of Blissful Warrior.

See also Phalangist.

54-40: An Ithklur expression of numerical perfection, out of a total of 100 equally divided units. It has to do with the fact that 54 is the product of 6 and 9, while 40 is the product of 5 and 8 (each one less than 6 and 9, respectively). The remaining 6% is set aside for benevolent purposes, charity, taxes, held for a rainy day or any of a number of other reasons, depending upon circumstances.

It is not always clear what the splitting of things into the ratio 54:40 is intended to accomplish, except that the failure to divide things into this ratio inevitably results in an Ithklur shouting "54-40 or fight!" with the predictable consequences.

Strangely enough, Ithklur are often willing to allow their opponents to have the 54%, leaving them with only the 40%, so long as this numerical standard is observed.

Ethologists have noted that 54-40, as a base 10 concept, is inconsistent with the Ithklur's own base 8 mathematics, and is also not related to the Hivers' base 12 system.

F'naah: Ithklur expression of surprise, denoting joy and wonder.

Gender Imperialism: The term used by Hivers to describe the Ithklur habit of assigning genders to Hivers. Although many Hivers adopt this convention when using male or female human names to interact with humans, the Ithklur insist on referring to Hivers as "he" or "she" even when they are introverted Hivers with pure Hiver names (see Introverted).

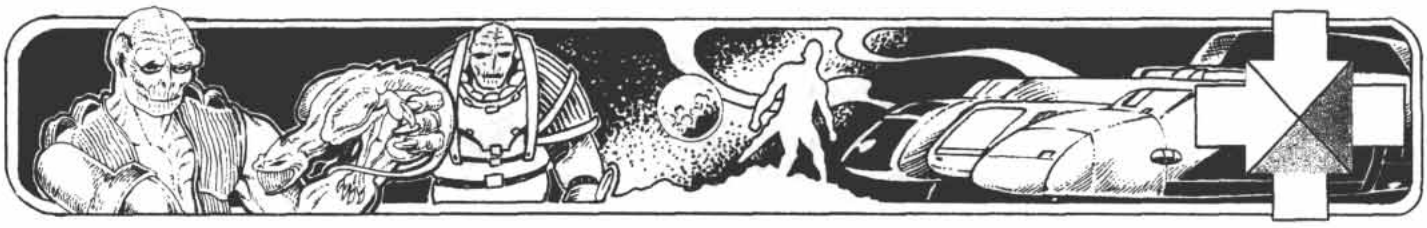
This is seen by the Hivers as a form of Ithklur insecurity or stupidity that they need to recast the universe in their own terms in order to be able to be comfortable with it. For this reason, the Hivers are willing to put up with the practice, although it is clear that they do not approve of it.

Hand (translated from the Ithklur **On*): Ithklur slang for a Hiver. The term derives from the Hivers' physical characteristics: their entire body with its six radial limbs can be seen as a hand, and the Hivers are amply equipped with six hands. The term has a deeper pejorative meaning, referring to the Hivers' cherished self-image as manipulators, string-pullers and puppeteers.

Handles (translated from the Ithklur *Grabba*): Ithklur term for the human necktie. This comes from the belief that the necktie is intended as a convenient handle to catch a human who has just come out on the losing end of the Ithklur greeting ritual (see Pushing Match). The fact that people wearing neckties are more likely to lose pushing matches than humans who do not is not lost on the Ithklur.

Introverted: A Hiver which has made no adjustment to live with any non-Hiver species. Introverted Hivers do not use any spoken language, although they are necessarily familiar with written Gurvin.

Knight of Faith (translated from the Ithklur *Tokkah Na*klie*): The Knight of Faith is an almost mythical Ithklur ideal which surpasses even the honor given to the *Knight of Infinite Resignation*. The Knight of Faith is someone who has attained the state of the Knight of Infinite Resignation but who, by virtue of the *absurd,* regains his or her attachment to the finite, or physical, world. The Knight of Faith therefore lives a life of complete joy in the real world, because he is beyond the pain of the physical world (which was achieved by becoming a Knight of Infinite Resignation), but has regained the simple joys of each and every simple, subtle moment of the physical world, in a childlike way.



The Knight of Faith is therefore one who can be described as having given up all ties to life in order to gain ties to the infinite, but, rather than remaining elevated above, and untouched by the finite, then is able to exist fully connected to the finite. When the Knight of Infinite Resignation dances, he leaps with sublime grace, but in the instant when he touches the ground he vacillates, for he is a stranger to this world. But when the Knight of Faith alights on the ground, there is no moment of transition from leaping to walking—it is all one motion, for this Knight is able to express the sublime in the pedestrian.

Such an individual is indistinguishable from an ordinary person, for the joy that this knight finds in corporeal life is unsurpassed by the most abandoned voluptuary, although the Knight of Faith does not live a life of abandoned voluptuousness, having learned the futility of such things. The Knight of Faith, therefore, has achieved all the positive benefits of physical life with none of its traps or drawbacks. There is no agreement among the Ithklur whether such a person has ever existed, although the mythical figure *Avram* is associated with this state.

This state can be compared to having re-achieved the simplicity and innocence of the *elementary* after having become fully *enlightened*, although becoming a Knight of Infinite Resignation is a state well above that of normal enlightenment.

To be a Knight of Faith is "to live joyfully and happily every instant by virtue of the absurd, every instant to see the sword hanging over the head of the beloved, yet not to find repose in the pain of resignation, but joy by virtue of the absurd."

Knight of Infinite Resignation (translated from the Ithklur *Tokkah Bark*ktonye*): The Knight of Infinite Resignation is a state greatly admired by the Ithklur. It describes a person who has fully committed him or herself to a value or course of action that it then turns out cannot be fulfilled. But rather than denouncing this commitment, the Knight of Infinite Resignation transforms this commitment from a worldly commitment (where its fruition can never occur) to an infinite, spiritual commitment. The Knight of Infinite Resignation thereby removes himself from the concerns of the world, and becomes someone above, and unconnected to, the physical world, unable to be hurt by mundane reality (see also *True Nature*). Unfortunately for the Knight of Infinite Resignation, he is

now fully contained in contemplation of the eternal, and can also no longer derive any meaning or pleasure from the physical world, although this is perhaps a small price to pay for having achieved real and permanent peace and connection to the eternal.

"In the infinite resignation, there is peace and rest; every person who wills it, who has not abased himself by scorning himself, can train himself to make this movement which in its pain reconciles one with existence."

Kok*hon: A parasitic animal native to *Eethk*klaa*/Tryylin known for its filthiness and lack of intelligence or any other redeeming characteristics. The word is also used as a derogatory term for any person worthy of contempt.

Lizard (translated from the Ithklur *Ithklur*): Ithklur term for an Ithklur. Unlike other sapient races, the Ithklur term for themselves does not mean "person" or "human." (There is an Ithklur word for "person," but this word specifically means an intelligent, sapient being of indeterminate species.) Instead, their term for themselves is descriptive rather than presumptive of their unique role as "persons," a position arrogated by all other known intelligent races. This third-person nature of the Ithklur self-identity is quite unusual, but has never been adequately explained.

An accurate translation of the term is closer to "upright lizard," a reasonable description of the Ithklur themselves. Note that the Ithklur term for humans is "upright *slaa*." The Ithklur term for Vargr is "clever *slaa*." The Ithklur term for Aslan is "earnest *slaa*." The Ithklur term for K'kree is *Kohl slaa*, or "*slaa* food."

Official Flower: All Ithklur organizations, including military units, have an official flower. This flower is allowed, although not required, to be worn with all levels of military dress. Artificial flowers are not allowed, although clearly nonimitation representations, such as enamel pins or embroidered patches, are permitted.

Our Active Friends: A Hiver term used to describe the Ithklur.

Pennsylvania 6-5000: A nonsequitur that Ithklur are prone to shout out when in the presence of human companions, particularly when music is being played.

Phalangist (translated from the Ithklur *Ha*on*): One of the two branches of devotion to the Ithklur Tetramerous Way, which see. Phalangists believe that the four paths can best be visualized as an Ithklur hand, with four distinct fingers, but still the same unified organ. This represents the belief that it is not the precise details of their four separate paths *per se*, but the mystical combination of their essence, which can be pursued in its own right, without having to concentrate on the point of view of any single path. Phalangists therefore remain on a "pure" four-fold path on their way to the state of Blissful Warrior.

See also Fascist.

Post hoc: Because some Hiver manipulations reach fruition only many years after they are begun, their duration can outlive the manipulator who set them into motion. In this case, the claim of credit cannot physically be made by the manipulator itself. In some cases the manipulator leaves a pre-recorded claim of credit set to announce itself at some prearranged time. In most cases, however, Hiver tradition allows the manipulator to entrust his manipulation to a successor (or in extreme cases, a line of successors) who will ultimately make the claim of credit in the name of the original manipulator. The posthumous claimant, by taking responsibility for recording and documenting the ultimate unfolding of the manipulation, also partakes in a portion of the credit. The accepted style for this credit is expressed as, "M. Tuesday for M. Monday *post hoc*," in the case of M. Tuesday making the posthumous claim of credit for a manipulation begun by M. Monday.

Pushing Match: Term for the standard Ithklur greeting in which the Ithklur push each other until one of them falls backward, usually to catch him or herself with the tail. This exchange usually starts out with firm, but relatively light pushes, until one or the other wins. This greeting is used even when greeting one's social superiors, but is modified in that the inferior allows him or herself to be pushed down. However, the inferior cannot make it look too easy, and it is considered an insult to give a too-soft push to one's superior when attempting to not win a pushing match. So even elderly and infirm Ithklur are given strong, healthy pushes (although calculated to be within their ability to withstand).

When rivals greet each other, even at formal public occasions, this greeting ritual can actually escalate into a full-fledged boxing match, which ends amicably only as soon as one of the rivals is knocked backward.

Ithklur extend this greeting to humans, but since humans have no tails, they have a tendency to fall all of the way to the ground. Ithklur often make allowances for this by catching the humans before they hit the ground (also see Handle). Humans should be aware that it is a sign of respect from the Ithklur that they include them in this ritual. The Ithklur do not engage in this greeting ritual with Hivers. It is unknown if this is because of the physiological uselessness of attempting it, or if it is a deliberate attempt to snub the Hivers by denying them the honor of participation in this beloved ritual.

Sanctuary (translated from the Ithklur *Lu*ern*): Ithklur society sets aside certain physical or conceptual areas as safe havens for its members or inhabitants. Physical areas may be such things as embassies, temples, orphanages or prison camps. Conceptual areas are usually organizations. Among traditionally recognized sanctuaries are marriage, formal betrothal, military units, veterans groups and the like, although any group can be recognized as a sanctuary by the consent of its members.

Within sanctuary, no physical harm can be done to anyone (this sometimes includes the pushing match, which see, but this varies with the local rules); all decorative carnivores are muzzled, caged, or otherwise made incapable of violence; and most importantly, no lies or breaches of trust can be committed.

Transgression of these rules is punished by death (although Ithklur law allows any victim to waive or reduce such severe penalties when desired).

San*klaass: The archetypal Blissful Warrior, also referred to by his title, "The Blissful One." *San*klaass* was the founder of the Tetramerous Way, and the first follower of the Tetramerous Path.

***San*klaass* Cap**: The traditional headwear of all followers of the Tetramerous Path, which see. The cap is a soft, conical, red cap

made from red fur, with white trim and a white pompon at the tip, often with spontaneity bells attached.

Sept: A common form of Hiver government, consisting of a council of seven individuals appointed for life. Hivers place great importance on the number seven, which many people find odd, given the fact that Hivers have six of everything.

Slaa: A domesticated furred animal kept as a working animal or pet by many Ithklur, analogous to the Terran dog. *Slaa*s are not as closely related to the Ithklur as dogs are to humans, although their DNA analogs show that they did evolve from common roots.

*Slaa*s do not qualify as decorative carnivores because of their long and successful association with the Ithklur since their prehistory.

Note that the Ithklur term for "human" literally means, "upright *slaa*." Anglic-speaking Ithklur freely translate *slaa* as "dog" in their Anglic speech. An adjunct to this is the fact that Ithklur refer to human infants and children as "whelps," and often translate the human concept of "brothers and sisters" as "littermates." It is clear that no disrespect is meant by these comparisons, as the Ithklur terms for themselves are identical, save for their reptilian, rather than mammalian, references.

Spontaneity Bells (translated from the Ithklur *Anjell*k*): Small, spherical, metallic bells worn by all Ithklur on their clothing or equipment. These jingle at the slightest movement, and are intended to remind Ithklur of the constant passage of time and the irreplaceable uniqueness of each moment. This is similar in concept to the human habit of setting watch timers to beep every hour, except that the Ithklur believe that the value of time and life cannot be captured or regulated by rigid external constructs like hours or days. Thus the bells jingle as often as they do, imparting, to the Ithklur mind, a reminder of the joy and spontaneity present in each moment.

Naturally these bells are maladaptive in combat situations, and in the blacking ritual (which see), they are filled with grease or wax to silence them, although they are usually not removed.

Spontaneity bells are usually called "jingle bells" by humans, as their design is virtually identical.

Steppingstone Worlds: The string of worlds that run from the Reformation Coalition rimward-trailing to the Hive Federation. These worlds serve as staging bases for the Federation missions into the Old Expanses to maintain contact with the re-emergent human culture there.

Terminal Manipulation: The manipulation conducted after the failure of an unsuccessful manipulation to erase all traces of it, or at least all connections to the unsuccessful manipulator. A "coverup."

Tetragram: The cross-like symbol of the Tetramerous Way. It is an inherently three-dimensional symbol, and thus is not suited to a flag, but must be embossed on a shield. The symbol shows the joining of the points of four arrows which then emerge as a pyramid from the surface. This shows that the four paths (Facilitator, Guardian, Explorer and Seeker) when combined, achieve a new dimension of effectiveness that they do not have separately.

Each arm of the tetragram corresponds to a particular path. The base, or downward pointing arm is the Facilitator Path, the upward pointing arm is the Guardian Path, the right-hand arm is the Explorer Path, and the left-hand arm is the Seeker Path.

This sign is also made with the Ithklur hand by holding the hand palm out, and spreading the fingers out, thumb down, so that they are all separated by an angle of 90 degrees, or as close to this as the Ithklur can manage. Not all Ithklur are capable of performing this sign perfectly, as it comes from a combination of long practice and individual variation in the flexibility of the hand. However, it is the intent that counts, so the sign is considered properly made even if the angles between the fingers are not perfect.

Tetramerous Path (translated from the Ithklur *Haggar Sonnie*): The single path to enlightenment which combines the four paths of Facilitator, Guardian, Explorer and Seeker, as opposed to the Tetramerous Way, which is the larger philosophical belief system which encompasses all these paths.

Tetramerous Way (or "Four-Fold" Way, translated from the Ithklur *Dikrah Sonnie*): The overarching Ithklur "national religion" which divides life into four different social roles or "paths": the Facilitator, Guardian, Explorer and Seeker paths. Most Ithklur spend their entire lives in the pursuit of one of these paths, finding their own true nature reflected in these four social roles. Some very spiritual Ithklur attempt to combine all four paths in their lives and are said to be followers of the Tetramerous (or "Four-Fold") Path, which see.

True Nature (translated from the Ithklur *Chalor*): The Ithklur believe that the highest goal of the individual is to discover one's own true nature, which involves the truth about one's own character and talents, and therefore demonstrates one's best role for the benefit of society.

Once this nature is discovered, the Ithklur is obliged to be true to this nature and to attempt to make no secret of it. One facet of Ithklur belief is that the true nature, once discovered, is incorruptible, so the Ithklur have no fear of letting the entire universe know about their unique individual strengths and weaknesses, for they were assigned these by divine providence. Unlike humans, who attempt to conceal their personal fears and weaknesses, the Ithklur believe that one cannot be truly hurt by another taking advantage of one's true nature. Certainly one can suffer temporary reverses by those who take advantage, but facing up to and not fearing this nature is part of the duty, burden and joy of living in accord with the true nature and attaining the full realization of what one was created to be.

Uniforms: Ithklur military "uniforms" are, in the words of many a human observer, "an oxymoron," as they are anything but. Ithklur uniforms do begin with a basic utilitarian fatigue or jumpsuit design in a tactical color, but these are then festooned with all manner of personal, unit, religious and philosophical insignia (almost always including a tetragram in some form), flowers, boutonnieres, corsages, sashes, epaulettes, aigulettes, medals, ribbons and spontaneity bells.

Troops who are followers of the Tetramerous Path all wear the *San*klaass* Cap (which see) as their official military headgear, with the same pride that human elite military units wear their berets.

ALIENS of the RIM™

Why did the Hivers assassinate Emperor Strephon? Why did the Hivers allow the Third Imperium to fall? What are the Hivers' plans for the future of humanity?

There are those who say that nothing takes place in charted space without the Hivers having anticipated it, planned it, shaped it, brought it into being by patient, careful manipulation.

The Hivers are the manipulators—emotionless, perfectly rational beings possessed of infinite patience and subtlety. If interstellar history is a clock, the Hivers are the ones who wind it; the passage of time itself does their bidding.

If a tree fell in a forest, and no one was there to hear it, would it make a sound? And how come if there are trees falling down, you never see any Hivers running around with axes?

What do you get when you cross a golden retriever with a box of razor blades? How is it that the most efficient, merciless killers in the universe don't have a mean bone in their bodies? If violence is natural, guileless, and innocent, does that mean one need not take it so personally?

The Ithklur are the most feared warriors known to man. To an Ithklur, Vargr plunder is like a walk in the park; Aslan warrior spirit is the babbling of a toothless child. Other races make such a fuss over violence—why not just do it and enjoy yourself?

To the Hivers, the Ithklur are their trained, elite shock troops, lovingly perfected by millenia of manipulation and social engineering. No finer tool has ever been fashioned.

But as far as the Ithklur are concerned, they have the Hivers just where they want them. Who wants to be a boring taxi driver anyway? If the Hivers want to pretend they're in charge, what does it really hurt, so long as they leave the Ithklur alone?

Who is manipulating whom? Is the Vargr wagging his tail, or is the tail wagging the Vargr? What is the sound made when an irresistible force collides with an immoveable object?

Hivers and Ithklur

BECAUSE IN SPACE, NO ONE CAN HEAR YOU SCHEME

Reformation Coalition Equipment Guide

INTRODUCTION

The **Reformation Coalition Equipment Guide** (**RCEG**) is a supporting sourcebook intended for use with the **Traveller: The New Era** (**TNE**) science-fiction roleplaying game. **RCEG** is a detailed encyclopedia of the sorts of equipment, vehicles, weapons, and spacecraft that are typically used and encountered in the **TNE** universe. Each piece of equipment is described in terms of its use in the **Traveller** game, and also in terms of its technical particulars: size, mass, type of ammunition, fuel consumption, speed, etc. Most of these items are also illustrated by technical drawings, and many are additionally shown "in action" in the color plate section at the center of this book.

While by itself this book is an interesting look at the technical side of the campaign "universe" of **Traveller: The New Era**, full use of **RCEG** requires that players have at least the **Traveller: The New Era** basic rulebook (plus the usual 6, 10, and 20-sided dice, paper, and pencils). Use of the equipment in **RCEG** will be enhanced by the possession of **Brilliant Lances: Traveller Starship Combat**, and **Fire, Fusion, & Steel**, the **Traveller** technical architecture handbook, but these are not required. Also not required, but equally advantageous for the gaming experience are potato chips, pizza, soft drinks, and napkins when you spill those things all over your books and papers.

So What's a Star Viking?

The official campaign background for **Traveller: The New Era** is set 3723 years from now in an area of space about 120 light-years from the planet on which you are standing. Eighty years earlier, this area of space had been part of an immensely strong empire which ruled over 11,000 worlds, encompassing 15 trillion citizens of dozens of different races. But this empire became embroiled in a horribly destructive civil war which lasted for 14 years, over the course of which hundreds of billions were killed, dozens of worlds sterilized, and the very fabric of interstellar society shredded. The final act of this war was the release of an artificially intelligent electronic virus. This virus, untested and uncontrollable, took the tools of interstellar civilization—computer-controlled starships, vehicles, cities, orbital stations, and robotic weapons systems—and brought them to life: horrible, insane, murderous life. Virus completed the devastation that civil war had begun, and a thousand-year-old society came to its final collapse. Seventy years later, the descendants of these infected machines live on, evolved to where they are no longer insane, but instead pursue their own inorganic ends, and compete with the few remaining pockets of civilization for the technology they both need.

In the midst of this wasteland lies a small cluster of worlds that calls itself the Reformation Coalition. Surrounded by the ruins of a once-proud empire and a trillion unburied dead on cold, lifeless worlds, the Reformation Coalition has committed itself to the creation of a new interstellar society to unite the fragmented, isolated, xenophobic worlds that remain.

Because the Coalition is small, it has come to rely on lightning-swift raids when it is opposed by backward, decadent warlords and others who oppose the new dawn that the Coalition brings with it. These raids are conducted by the Reformation Coalition Exploratory Service (RCES), and are used to recover crucial technology left behind in the ruins, technology which the Coalition cannot build itself, but which it can use to build the foundations of its new beginning. One of the Coalition's opponents is the Mercantile Guild, a lose affiliation of traders, slavers, and technology scavengers, which opposes all interstellar governments and seeks to maintain its monopoly on star travel. The Guild seeks to sow fear and distrust against the Coalition, and has begun spreading the word that the RCES is not the spearhead of a group of visionaries, reformers, or rebuilders, but are instead "Star Vikings"—heartless murderers and plunderers.

And therein hangs a tale. (For more information on these topics, see **TNE** sourcebooks **Path of Tears** and **Smash & Grab**.)

How to Use this Book

The primary use for **RCEG** is in support of a Reformation Coalition ("Star Viking") campaign set in the Old Expanses and Diaspora sectors. The equipment contained is that used most often by the RC and its opponents, and includes some of the most valuable relic equipment which can be recovered from the worlds of the collapsed empire.

Players: Players will most often use this book as a catalog of equipment when outfitting their RCES or free-lance expeditions into the Wilds. When the text indicates that a piece of equipment is manufactured by the Coalition, their characters can often simply purchase it. If it is expensive or hard to come by, they may request its use of the governmental or corporate patrons who may be helping to outfit their mission.

Players may also spot some high-tech devices (such as the formidable *Intrepid* grav tank shown being recovered on the

cover and in the color plates) that they may wish to recover, by exploring worlds known to have had a suitable pre-Collapse tech level. Players who enjoy designing their own equipment (using **Fire, Fusion, & Steel** or the ship design rules in **Brilliant Lances**) will also find that **RCEG** provides a ready source of inspiration for variants or new designs.

Referees: When used by referees, **RCEG** constitutes an encyclopædia (we had an extra "æ" lying around) of equipment, weapons, and vehicles used by the opponents, allies, or acquaintances of the RC player characters. This equipment can be the object of opposed or unopposed recovery missions, or in some cases, could be occupied by Virus, and be an active opponent to the PCs all by itself.

Non-RC Campaigns: You don't have to be playing in a Reformation Coalition campaign to get a lot of use out of the **RCEG**. The equipment in this book is based on all of the same "Imperial Space" technological assumptions that have illuminated previous editions of **Traveller**, and so are useful in most any **Traveller** variant campaign. And maybe you just like all of the cool pictures and descriptions. After all, that wouldn't be that unusual...

No, Really: Also, rolling this book up tightly will allow you to use it as a club to kill small insects, and broken windows may be repaired by using duct tape to firmly affix this book over the missing pane (paper is a great insulator). Young children often need a booster platform to get their little bodies up to the level of the dinner table, and, although phone books have traditionally been used for this purpose, **RCEG** is clearly more effective because the thickness of each **RCEG** in a stack of, oh, say 20 or so, allows you to make more precise adjustments to the height than would be possible with thicker phone books.

See? The uses of this book are as limitless as the breadth of your imagination (or the depths of your neurological disorders, as the case may be).

Fire, Fusion, & Steel

With the exception of the low-tech bows and muskets on pages 102-103, all of the equipment contained in the **RCEG** is designed using the **Traveller** technical architecture manual: **Fire, Fusion, & Steel (FF&S)**. When there are discrepancies between equipment details published in **RCEG** as compared to earlier **TNE** products, take the data in this book to be definitive.

This equipment is designed using baseline technology fields, and only the standard "Imperial Space" technology fields of contra-grav technology, jump drive, and laser focusing (see **TNE**, pages 330-332). The ideas and variations in this book should fuel the imaginations of **Traveller** equipment designers, as they have in fact fueled the imaginations of the GDW staff.

What's more, **RCEG** contains expansions to the **Fire, Fusion & Steel** design sequences on pages 154-157. There are some specialized applications of the **FF&S** technology that simply require a little more detailed treatment than was possible in a book as already packed with information as **FF&S**. Among these applications are the design of grav belts, plasma bazookas, flechette rounds for grenade launchers, and multimission pods and modules. Happy designing!

Future Developments

We will continue to support **FF&S** designs in the **RCEG** format in **Challenge** magazine, in a regular feature called "TAD (Technical Assessment Database) Update." We welcome submissions from current and new **Traveller** authors and enthusiasts. All designs must be accompanied by design worksheets and a sketch or description of the appearance of the equipment, and should be compatible with the Reformation Coalition campaign. Designs may be altered for publication to ensure campaign and rules consistency. Write to GDW for **Challenge** submissions guidelines, specifying "TAD Update."

The Conclusion, Wherein Dave Has Some Final Thoughts on Tooth Marks

I believe that **RCEG** might just be the most detailed, most fully realized fictional equipment sourcebook ever published for a roleplaying game.

That sounds more than a little arrogant, so I'll elaborate.

With the **Fire, Fusion, & Steel** design sequences used in **Traveller: The New Era**, you don't so much make up a new piece of equipment as *discover* it—discover how it works, discover how it's used, discover the story behind the ratings that you've calculated. I've seen a lot of sourcebooks that describe a weapon or vehicle as having a particular quirk, peculiarity, or weak point, and have been disappointed when those descriptions turn out to be simple narrative chrome—the quirks are not connected to the game's rules so that they result from the game's design sequence or even show up during play. What has obviously taken place is that the writer has thought up an interesting object with one or more interesting features and has described it as such, whether or not the game system actually supports what has been said.

What we've got with the **FF&S** sequence is a sufficiently large body of defined technological functions that you can simply try some ideas out and see what you come up with. This is the opposite approach from that described above, because the interesting features arise from the design sequence itself, kind of like in real life, and you the designer now get to take it out for a test drive. So many of the weapons or ships in this book have emerged from the design sequence as feisty little buggers that keep asserting their own identity, rather than simply accepting the perfectly clean, matter-of-fact parameters that we would have imagined for them.

This is of course so similar to the story of every real aircraft, vehicle, or weapon that has ever been designed (no machine is ever all things to all people, no matter how many specifications boards, congressmen, or defense secretaries may demand it) that it is easy to imagine that we are describing things in this book that actually exist 3700 years from now. I find myself frequently saying things like, "Hey, Loren, I just figured out how they use this thing, and why they built this other thing to use with it," except that I am usually more specific about the things I'm talking about.

So what "most detailed, most fully realized" sourcebook means is that it feels like we didn't just make this stuff up. Instead, it welled up out of the **TNE** universe and sort of snuck up behind us and bit us (and pretty *hard* too, some of it), allowing us to wrestle it to the ground and shoehorn it all into this densely packed volume.

Inevitably, there were things that we had to leave out or couldn't elaborate as fully as we wanted (after all, publishing imitates reality in its inherent imperfection and incompleteness). In a sense this is a blessing in disguise, as it means we get to do another installment someday, which we can make even more interesting than we think this one is.

We hope you find all of this gear to be as fascinating as we have.

Reformation Coalition Exploratory Service
Office of Technical Intelligence
Aubaine

This document is the most recent installment of the RCES Technical Assessment Database (TAD). It contains many new entries for newly recovered analyzed and described equipment, as well as revisions and updates of equipment described in earlier TAD installments. These changes and revisions are the result of new information for non-Coalition equipment and changes or finalizations to designs being produced or developed within the RC.

All RC personnel are encouraged to forward to this office any field observations which may impact on intelligence estimates contained in this or any other database. Future databases are being compiled as you read this. Data on Guild-supplied and supported materiel is of particular importance. Report any unusual distributions of technology and equipment that indicates off-world influences.

Good Hunting. Strike Hard. No Regrets.

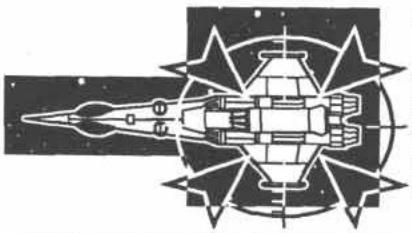
Commanding, OTI

ORGANIZATION

This collection is broken down into four broad areas: Equipment, Weapons, Vehicles, and Spacecraft.

Equipment

This category includes personal transportation, personal armor, communications devices, sensors, vision enhancement devices, survival equipment, and medical technology. Although all of these have military applications, they are not considered to be weapons in the strict sense.



Weapons

This category covers non-vehicular offensive technology, i.e., devices intended to break things and hurt people. This includes personal small arms, heavy support weapons, antiarmor and antiaircraft weapons, and planetary defense missiles.

Vehicles

Vehicles include utility and transport vehicles, as well as military vehicles, which are often self-propelled weapons. Vehicles are defined distinctly from spacecraft by the fact that they carry out their primary function solely within the planetary regime. Although some vehicles might be able to attain orbit under their own power, it is not exo-atmospheric travel or combat that is their main purpose.

Spacecraft

Spacecraft are vehicles designed specifically to operate in interplanetary space. These chiefly include starships, but also include non-jump-capable craft used for system defense or support of starfaring vessels. Vessels which are used chiefly for interface transport and are carried aboard starships are classed as spacecraft for these purposes, not vehicles.

Within the above functional categories, equipment is further defined by main user or source: RC, Last Imperium (Relic), Guild, Wilds, and Hiver. Some of these functional areas overlap, for example, relic technology used by worlds in the Wilds, or relic technology copies of which are also in production within the RC. In these cases, the assignment is based on which category is more "typical."

For example, grav belts (page 10). Although TL-12 versions of the grav belt are produced in the RC, this is done only in limited numbers, and most grav belts (as opposed to grav rails) in Coalition service are actually relics. However, as almost all grav belts seen in use are in Coalition service, they are assigned to the RC category. Likewise, relic small arms that are of sufficiently low technology that they are readily used on the worlds where they are found (pages 50-51) are classed as Wilds, because they are most often found in use, rather than waiting to be recovered.

Reformation Coalition Equipment Guide

Power

ON/OFF

Reformation Coalition

This is equipment which is either currently manufactured by RC member worlds, or relic technology which has been recovered in sufficiently large numbers that it has been standardized for use within the RC. Note that RC standard equipment is manufactured from tech level 8 to 12 by the following worlds. Percentage is the approximate share of total RC industrial production from tech levels 8-12 performed at that TL.

TL-12	Aubaine	16%
TL-11	Aurora, Eos	1%
TL-10	Fija, Trybec	6%
TL-9	Oriflamme, Baldur, Nike Nimbus	74%
TL-8	Lucifer (Luhtala)	3%

Last Imperium

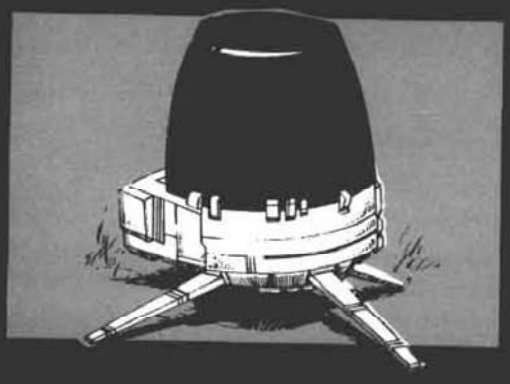
This is relic technology manufactured by the Last Imperium which is not typically in use by other powers but which can be recovered and returned to service by RC organizations. These items are usually found one at a time in various states of disrepair, scattered across any of the innumerable worlds frequented by the Imperium, but can rarely be discovered in large quantities in warehouses, depots, or military bases. These items may also be infected by Virus, or even be found in use by Vampire forces.

Mercantile Guild

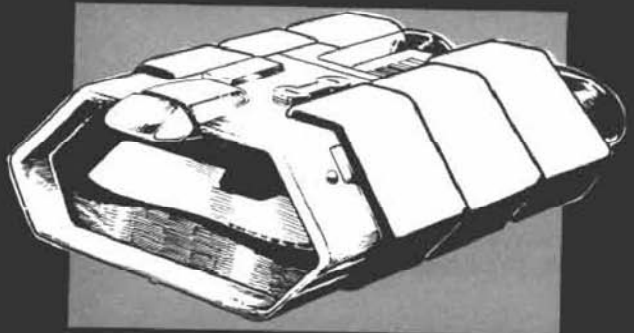
These are items, almost always weapons, which are distributed to anti-RC forces (usually technologically elevated dictators—TEDs) by the Mercantile Guild. Guild distribution was first discovered by the large number of identical weapons on widely separated worlds which appeared to have been introduced relatively recently, and were not locally manufactured and do not follow the typical pattern of relic technology distribution. We now have documentation that many of these systems are traded by the Guild for local materials, goods, services, or even slaves.

Those which have been firmly identified as Guild-supplied equipment are indicated as such here, but it is likely that there are additional classes of equipment that we have simply not yet tied to Guild activity. This category also includes certain equipment which is typically used by the Guild crews themselves.

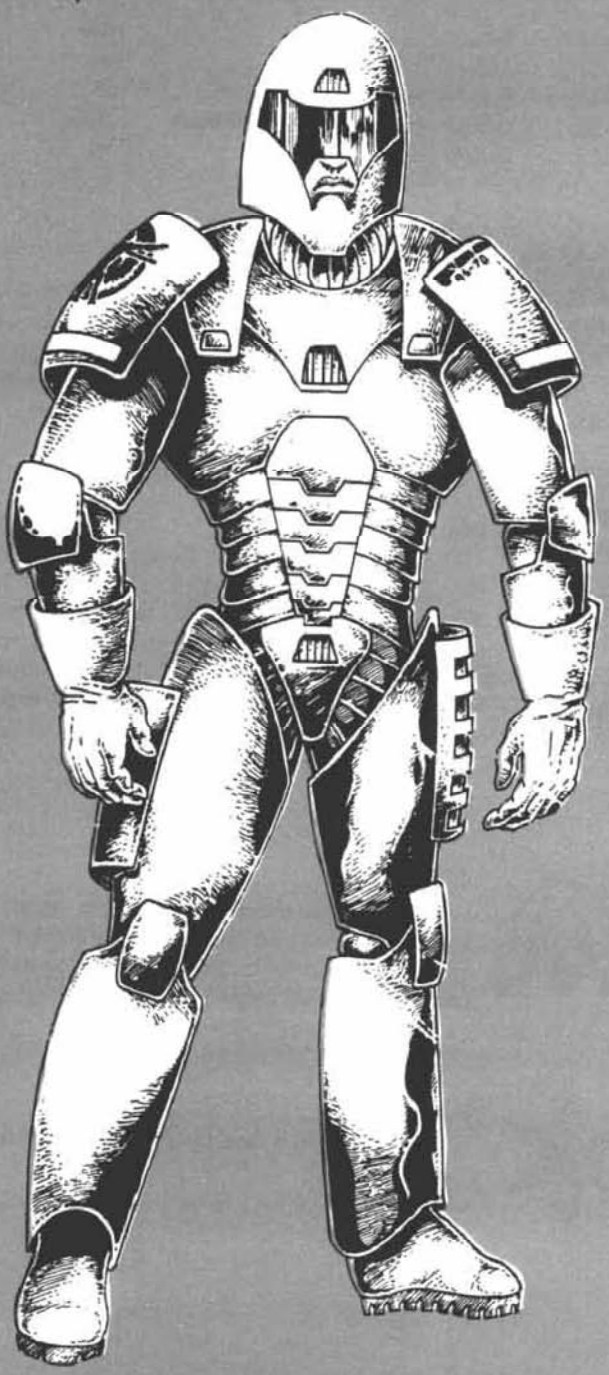
The Wilds



This is equipment, usually weapons, which is found in the service of armed forces in the Wilds. This includes locally manufactured low-tech equipment as well as standard Last Imperium equipment which was distributed in such large numbers that it can still be said to be "standard" on hundreds of separate worlds. It does not include equipment which we believe is used primarily as a result of Mercantile Guild supply.



Hivers



This is equipment used by the Hivers themselves or by Hiver subject races, particularly the Ithklur.

EQUIPMENT

EQUIPMENT

The equipment in this section serves a variety of purposes, from personal transport and armor to communications, surveillance, survival, and medical gear. Some of this equipment is standard issue (such as the personal armor, communicators, and vision devices), while others is available only to specialized units or on an as-needed basis (grav belts, drop capsules, remotely operated sensors, anti-virus equipment, covert operations equipment, and portable automeds).

When establishing the need for equipment to accomplish a certain mission, planners must first establish how much of the Coalition's most precious asset—its personnel—will be assigned to the operation. This is not the simple matter it would have been under the Last Imperium with its seemingly infinite assets and standardized tables of organization and equipment.

In the Coalition, nothing is standard. Because missions are backed by any combination of the RCES itself, one or more RC member worlds, or one or more RC corporations, and carried out with any combination of RC troops, planetary troops, or groups of free-lancers, everything is an *ad hoc* or task-organized arrangement. Many times an operation is carried out by whatever persons happen to be standing around nearby, equipped with whatever gear is close at hand.

However, for purposes of planning, there are a few basic concepts that recur in most RC operations.

The basic building block in the Coalition armed forces is the four-trooper fire team. There are different types of teams used for different purposes, and these are combined together in various mixes to accomplish the mission at hand. The following descriptions are not *official* in any sense, but are *typical*. These include page citations for the equipment described elsewhere in this book or in the basic **TNE** rule book.

Light-Powered Fire Team: Four troopers in light battle dress (pages 18-19) armed with three 7mm advanced combat rifles (pages 60-61), CMWS rifles (page 65) or 4mm gauss rifles (page 70) and one 2cm light assault gun (page 54), plus a mix of RAM grenades (page 101) and single-shot disposable tac missile launchers (page 108).

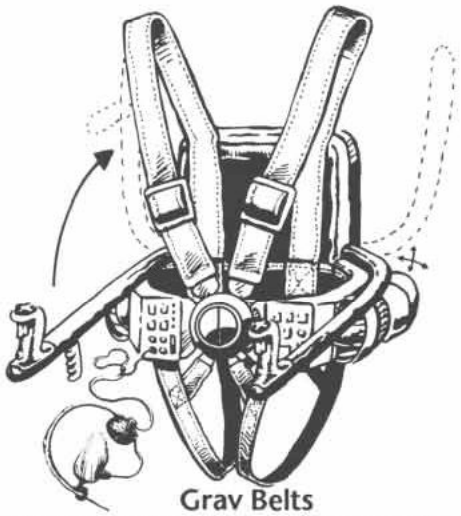
Heavy-Powered Fire Team: Four troopers in heavy battle dress (pages 20-21) armed with three 4mm gauss rifles (page 70) or 4cm CLC laser rifles (page 93) and one 2cm light assault gun (page 54), 4mm gauss SAW (page 71), or 4.3cm plasma rifle (page 86), plus a mix of RAM grenades (page 101) and single-shot disposable tac missile launchers (page 108).

Unpowered ("Muscle") Fire Team: Four troopers in combat environment suits (**TNE**, pages 358-9) or body sleeves (pages 16-17), armed with three 5.5mm assault rifles (page 52) and one 5.5mm assault rifle with attached 2.5cm grenade launcher (page 53), plus a mix of RAM grenades (page 101) and single-shot disposable tac missile launchers (page 108).

Reconnaissance and Designation Team (RDT): Four troopers in combat environment suits (**TNE**, pages 358-9) or body sleeves (pages 16-17) armed with two 3cm CLC laser carbines (page 94), two 2cm CLC personal defense lasers (page 95), two 13mm sniper rifles (page 55), and one broomstick (page 11).

Powered Fire Support Team: Three troopers in light or heavy battle dress (pages 18-21) and one trooper in heavy scout battle dress (page 21), armed with one 6cm squad support laser (page 96) or 6cm laser sniper weapon (page 97), two 2cm personal defense lasers (page 95), and one 4.3cm plasma rifle (page 86) or 6cm assault rocket launcher (page 98).

Unpowered ("Muscle") Fire Support Team: Four troopers in combat environment suits (**TNE**, pages 358-9) or body sleeves (pages 16-17), armed with one 6cm squad support laser (page 96) or 6cm laser sniper weapon (page 97), two 2cm personal defense lasers (page 95), and one 9cm plasma bazooka (page 85) or 6cm assault rocket launcher (page 98).



Thus a nominal squad of powered troops could consist of two or three fire teams, or two fire teams and a fire support team, plus a commander, totalling 13 troops. A muscle squad could also consist of two fire teams and a fire support team or RD team and a commander. The Coalition frequently deploys mixed squads of muscle and light-powered units (for example, one muscle fire team, one light-powered fire team, and a muscle fire support team) for greater combat power and survivability.

Note that the overall size of a squad is limited by the delivery methods available. For example, the drop capsule pod for the Multimission Scout (pages 140-141) normally carries 12-13 drop troops (leaving space for 2-3 decoy or equipment drop capsules), the drop capsule pod for the Victrix ships (pages 138-139) normally carries 14-16 troops (leaving space for 8-10 support capsules), and the Fury-type assault landers (page 149) carry a maximum of 14 troops.

Units above can be further reinforced by the addition of a "ragtop" air raft (pages 114-115), or some form of grav armor fire support such as the Mongoose attack speeder (pages 116-117) or Pyrrhus support sled (page 126).

Additional equipment such as portable sensors, communications uplinks, anti-virus equipment, etc., can then be assigned to the unit based on its necessity, the personnel requirements for operating it, and the transportation requirements for delivering it and moving it around once it is delivered.

For the equipment in this section, volume is given in either liters or cubic meters (m^3, 1000 liters = 1 m^3), mass is given in kilograms (kg) or metric tonnes (1000 kg = 1 tonne), and price is given in credits (Cr) or megacredits (MCr, where Cr1,000,000 = MCr1).

Grav Belts

The manufacture of grav belts only becomes possible at tech level 12 when contra-grav modules can be miniaturized to the scale of a single person. Grav belts are manufactured in limited numbers on Aubaine, and are issued only on a strict as-required basis. However, relic grav belts are sometimes recovered and used in private service.

Grav belts resemble parachutes in that they consist of a large backpack attached to a parachute-style harness. In addition, they have two arms at about the approximate location of the arm rests on a chair. At the end of these arms are the hand grips that are used to control the grav belt. These arms can be swung out of the way over the wearer's head to allow the use of firearms, etc. In addition, there is a data display headset that is attached to the backpack by a wire, and which is fitted to the head when the grav belt is being worn. The headpiece has a monocular heads-up display which displays such data as airspeed, altitude, remaining battery endurance, etc. The headpiece also contains a single earpiece which is used to send aural warnings to the user, such as a tone to warn the wearer that he or she has descended below a certain preset altitude, or that the battery is down to bingo charge (half empty) or its last five minutes of charge.

The harness is heaviest about the waist, where the contra-grav (CG) projectors are placed. Also fitted at the waist are fully vectorable shrouded fans that provide thrust for maneuvering.

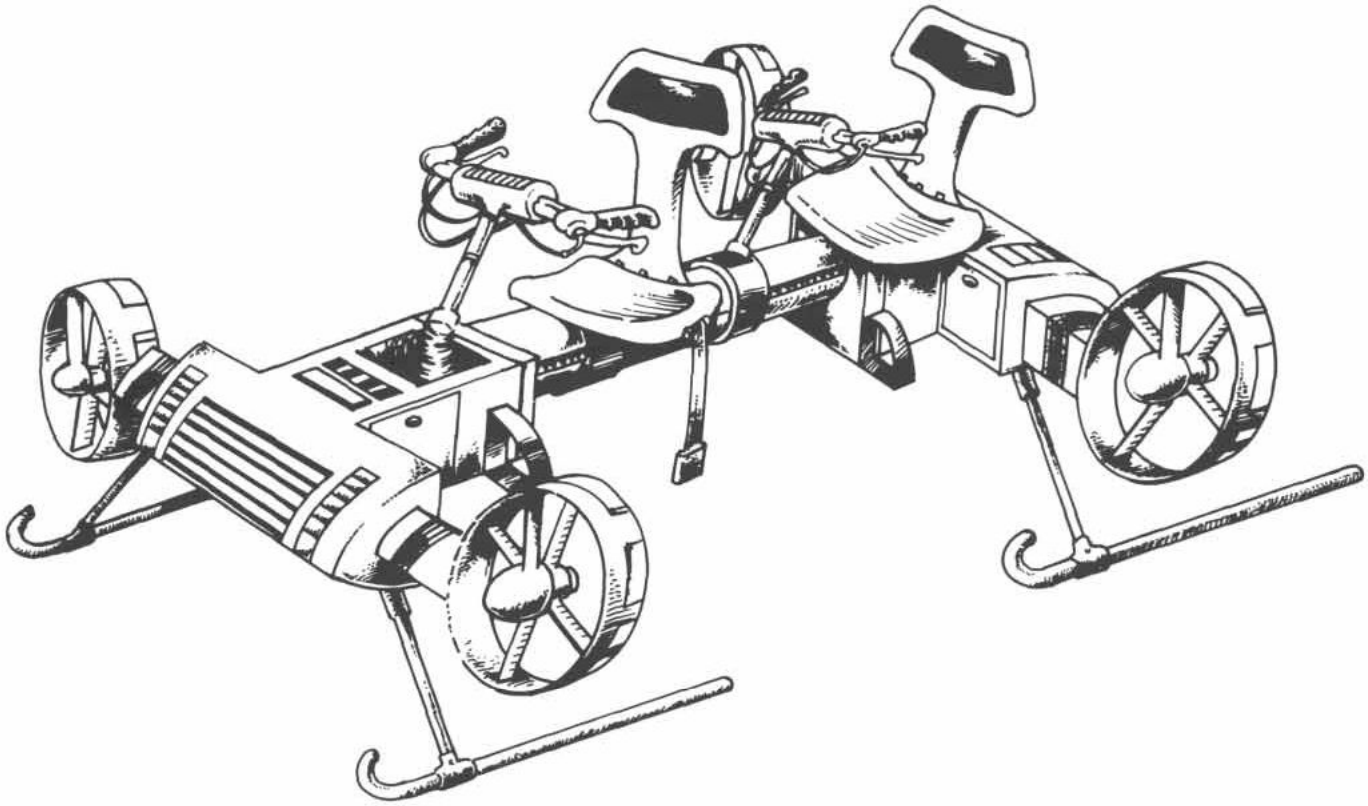
The CG lifters and propulsion fans are all powered by a two-hour endurance battery which, along with supporting electronics and avionics, is carried in the backpack.

Because contra-grav technology is not a thrust generator, but rather creates a field within which gravity vectors are 99% negated, there are some phenomena associated with using a grav belt. One is that other objects within the field besides the wearer also have their weights largely negated. This means that if the grav belt wearer attempts to drop a grenade, the grenade will slowly float to the ground at 1% of its normal falling acceleration until it passes out of the CG field, at which point it will fall normally. It is important to remember that such objects must be *thrown* downward out of the field, rather than simply dropped. Another example is that if the grav belt wearer flies near a tree so that a branch projects into the field, the branch, temporarily relieved of its weight, will flex upwards. An insect that flew through the field would experience a similar result.

The contra-grav field generated by the belt is of sufficient size to contain the grav belt's hardware as well as a wearer whose limbs are held in a fairly compact posture. However, the CG envelope is relatively small in order to keep power requirements down and to avoid the difficulties of having the field projected over too many other extraneous objects. This means that the wearer, especially one firing a weapon, can break through the edge of the CG field with bodily extremities or pieces of equipment (this is not a problem in grav vehicles or spacecraft because the edge of the field coincides with the hull walls), which can cause potentially catastrophic stability problems. Grav belts are fitted with microflight computers which keep track of the grav belt's attitude and make constant minute thrust corrections to maintain a smooth, level, and safe ride. This computer also allows the wearer to relinquish control of the belt for periods during combat in order to fire weapons, reload, etc. During this period, the computer can hold a straight and level course, hover, etc.

Grav belts may be recharged from standard RC power outlets.

Persons wearing grav belts are fired on and take damage as normal personnel targets. Both grav belts below have the following performance figures:



Capacity: One person plus armor and equipment (may include battle dress-equipped trooper). In emergencies, a second person may be carried, but this person must cling very tightly to the grav belt wearer in order to remain within the CG envelope, and the wearer may not conduct any activities except to fly the belt.

Speed: 300 kph maximum, 225 kph cruising, 40-120 kph NOE

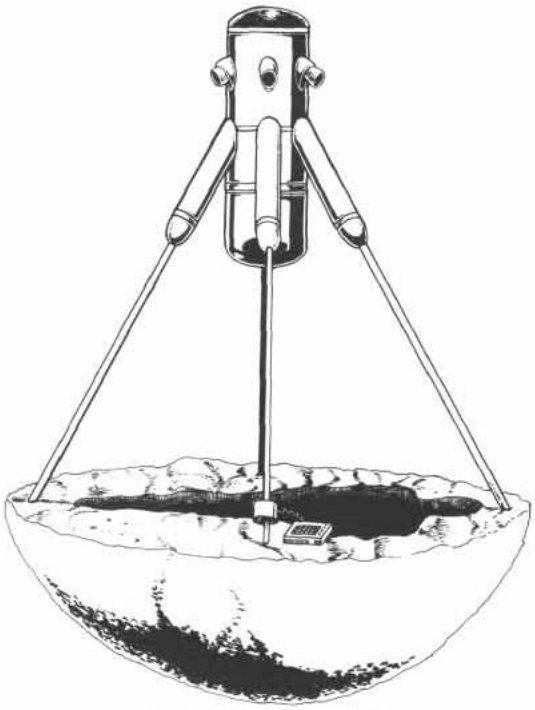
Combat Move: 42 10-meter grid squares in high mode (absolute speed), 6 10-meter grid squares in NOE mode (safe speed)

Grav Belts

TL	*Mass*	*Volume*	*Endurance*	*Price*
12	108 kg	75.5 liters	2 hours	Cr114,960
15	90 kg	63.5 liters	2 hours	Cr115,100

Broomstick (TL-12 Tandem Grav Rail)

The official RC name for this device is the tandem grav rail, but it is almost without exception simply called the "Broomstick." It is basically a two-person grav belt, with the passengers in a tandem configuration. The broomstick actually sees wider use in RC service than the grav belt, because the broomstick is more economical to produce per passenger carried, because there is only one microflight computer and avionics set per two passengers, instead of for each passenger. In addition, the broomstick allows passengers to be easily picked up and dropped off by a single pilot.



Although the components of the broomstick are essentially the same as those in two grav belts, they are laid out differently. Rather than placing the batteries and controls on the rider's backs, they are placed in pods beneath the connecting strut for greater stability. And because the broomstick riders are placed in a sitting position, they take up less envelope space, allowing the envelope to be lengthened to contain larger batteries.

It has the same operational peculiarities noted with the grav belt (facing page), and like the grav belt, operates in total silence. The broomstick is typically used by RC troops for reconnaissance. The broomstick is operated with Grav Belt skill.

Fire at personnel riding a broomstick is treated as fire against motorcycle riders (**TNE**, pages 278 and 298).

Tech Level: 12
Price: *Cr116,900*
Size: 0.2 tons (SM)
Mass: 231.2 kg empty
Power: 0.04558 MW TL-12 battery with shrouded propellers providing 0.02638 tonnes of thrust
Maint: 1
Controls: Dynamic linked, TL-6 flight avionics, TL-12 microflight computer
Commo: None
Life Support: Light
Cargo: Personal equipment carried by two riders only
Crew: 1
Passengers: 1
Travel Move: 900/240
Combat Move: 42/6
Fuel Capacity: 4 hours duration for battery which powers CG lifters and shrouded propellers
Combat Statistics: Treat as motorcycle (**TNE**, pages 278 and 298)

Personal Reentry Kit

Personal Reentry Kit

Originally invented as a means of emergency atmospheric reentry from a crippled space vessel, the personal reentry kit (PRK) was quickly adopted by the military and provided the glamorous *raison d'être* for jump troops (although first-line jump/drop troops have long since transitioned to purpose-built *drop capsules*—see pages 14-15). So appealing is the image of meteoric descent from orbit that these kits have even enjoyed some popularity among hobbyists. For sporting displays, the ablative foam can be formulated to burn in a variety of colors, creating stunningly beautiful pyrotechnic displays in the hands of skilled operators.

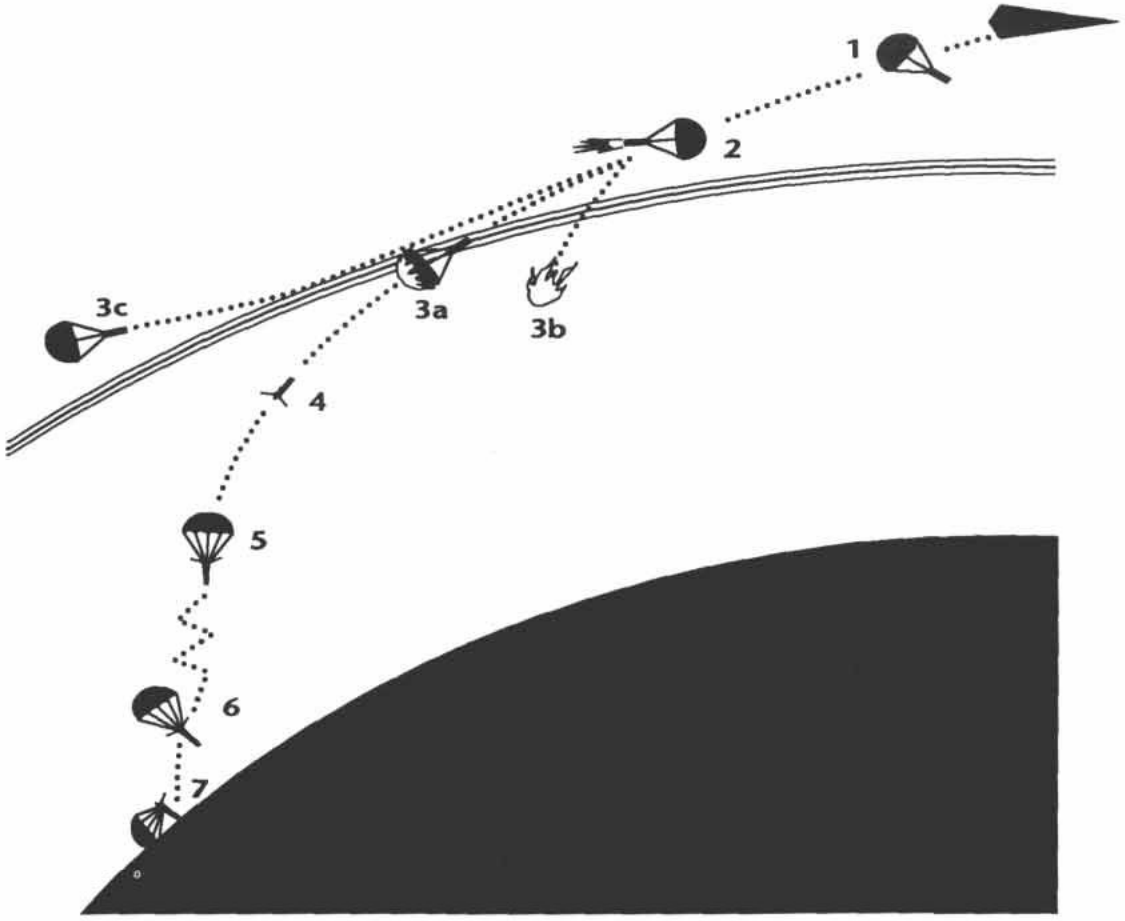
Each kit consists of an inflatable hemispheric mold, a pressurized cannister of ablative foam, and a chemical thruster for attitude control and limited vector adjustment. The kit does not include a soft landing system (usually a parachute); this item must be purchased separately.

The PRK has no provision for defensive decoys and depends upon its operator for maneuvering instructions (instead of the on-board computer used by Coalition drop capsules), which means that the operator must have some Environment Suit skill if an unskilled task roll is to be avoided.

TL-8 and 10 versions below are manufactured in the RC, TL-13 PRKs are available only as relics.

TL	*Volume**	*Mass**	*Price**
8	20 liters	14.5 kg	Cr15,000
10	16 liters	11 kg	Cr12,000
13	12 liters	8 kg	Cr10,000

*This is purely for the PRK alone, and does not include a parachute, parawing, grav parachute, or grav belt.



PRK Reentry Sequence

The **TNE** rules make reentering with a PRK a single Difficult: Environment Suit task, with the recommendation that the referee implement Diff Mods for dense atmospheres or high initial vectors (PRKs may not be used in atmospheres of very thin or less). Players and referees who wish to play out the situation in more detail may wish to use the following optional sequence:

1. Deploy Kit and Ablative Foam Shield: The user unpacks the kit, deploys the mold, prepares the ablative heat shield, and otherwise prepares for the descent (Easy: Environment Suit). Any success indicates that the kit has been deployed correctly. Failure means that the kit has not been deployed properly, and the user must try again. Catastrophic Failure indicates the kit has a minor defect, and the reentry burn task is carried out at +1 Diff Mod.

2. Calculate Trajectory and Execute Reentry Burn: If the user wishes to try to land at a specific 1 km square landing zone, this is the point at which that must be specified to the referee, and the trajectory calculated on that basis. If the character does not choose a specific landing zone, the reentry task is carried out at –1 Diff Mod, and the referee picks a landing zone at random.

The user calculates the desired trajectory and executes a reentry maneuver (Difficult: Environment Suit). Reentry in dense atmospheres or from a non-orbital trajectory is carried out at one higher Diff Mod (these are cumulative). Other decisions as to the reentry vector are left up to the referee's discretion.

Success: On any success, go to step 3a (with reserve fuel).

Failure: User must recalculate the burn angle and try again. If successful, go to step 3a (without reserve fuel), if a second failure occurs, go to step 3c.

Catastrophic Failure: Go immediately to step 3b (with reserve fuel).

3. Reentry and Minor Course Corrections: What happens here depends upon the success of the task in step 2.

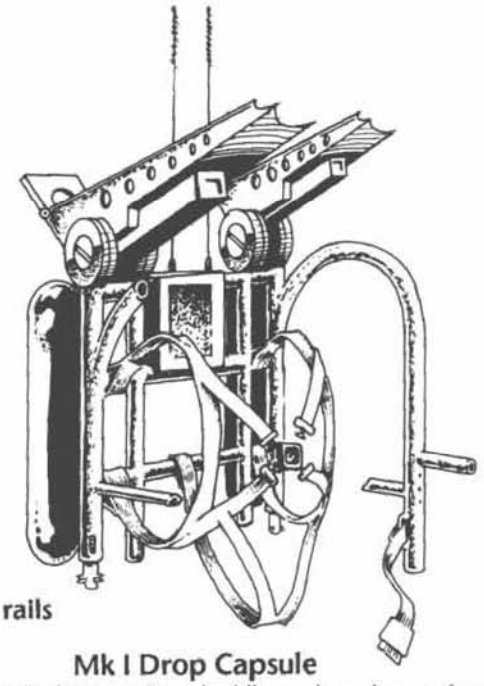
3a: The user is on course, and reenters the atmosphere. The ablative shield protects the user on the trip down, and minor course corrections may be made if the PRK has entered this step with reserve fuel.

The user may continue on to step 4.

3b: The user has reentered at too steep an angle, and must immediately try to correct this by a second burn (Formidable: Environment Suit), applying the Diff Mods for atmosphere and high initial vector, if any, and using up the PRK's reserve fuel. Success means that the user may go on to step 4.

3c: The user will strike the atmosphere at the wrong angle and "skip" off into space, drifting helplessly in orbit around the planet, and without fuel to change vector (the second burn exhausted the PRK's fuel supply).

4. Jettison Shield and Enter Free-Fall: There are no tasks associated with this step. If the user was able to make minor course corrections during step 3a, the user is now within 1D10 km of the chosen landing zone. If the user picked a landing zone, but was unable to make minor course corrections during step 3a, the user has deviated and is now 1D20+5 km from the chosen landing spot.



5. Deploy Parachute/Activate Grav Belt: The user now deploys the PRK's parachute, grav parachute, or parawing, or activates the grav belt. If using a grav parachute or parawing, the user may counteract 1D6 km of the course deflection introduced in step 4 (by succeeding at an Average: Parachute task—Catastrophic Failure *adds* another 1D6 km to the course deflection).

If using a grav belt, the user may fly to anywhere within its normal range (see page 10), and need not go through steps 6 or 7 unless desired. Operating a grav belt requires task rolls versus Grav Belt skill (see the basic rules, page 120, for a discussion of grav belt-related tasks).

6. Maneuver to Landing Zone: If using a grav parachute or parawing, the user may counteract another 1D6 km of the course deflection introduced in step 4 (by succeeding at an Average: Parachute task—Catastrophic Failure *adds* another 1D6 km to the course deflection). Users with grav belts may fly to their landing zone if it is within the grav belt's range.

7. Land: Characters using grav belts automatically land safely. Characters using any form of parachute to land safely must make a task roll. To land safely in most terrain is Average:Parachute, to land safely in woods, cities, swamp, or water is Difficult: Parachute. Parachutes may be used to attempt a landing at a specific location within the 1 square kilometer landing zone (Formidable: Parachute for simple parachutes, Difficult: Parachute for grav parachutes and parawings—see the basic rules, page 120, for a discussion of parachute-related tasks).

Drop Capsules

Parachute harness with missile launch rails

Mk I Drop Capsule

The Mk I drop capsule carries one battle dress-equipped soldier and combat equipment through an atmosphere to a set of pre-programmed ground coordinates, piloted by the flight computer. On the trip down, the capsule executes evasive maneuvers using its thruster package, and deploys decoys as necessary. An ablative heat shield protects the passenger from the heat of reentry.

After passing through the upper atmosphere, the outer shell splits away, leaving the passenger in a small framework that acts as a shoulder harness for a steerable parachute. After a period of free-fall, the passenger deploys the parachute and glides the remaining distance to the landing zone. This free-fall can be short or long in duration, depending upon tactical demands for low-altitude parachute opening (ODLO, orbital drop, low opening) or high-altitude opening (ODHO).

Upon landing, the framework that held the parachute forms a missile launcher. The two Lyrebird missiles sit on launch rails, and wait, while the launcher's computer/radio monitors the trooper's radio frequency. For a complete description of Lyrebird missiles and their use in combat, see page 107.

A Mk I may carry one soldier and a varying amount of equipment. If the passenger wears heavy battle dress, the capsule can accommodate up to 260 kg of additional equipment and supplies (including personal weapon). A passenger with light battle dress can carry up to 476.5 kg. A passenger without battle dress (a foolish passenger, in other words) could carry up to 679.7 kg of additional equipment.

When conducting drop operations, battle dress suits are equipped with a small (0.5 kg, Cr100) one-hour duration air supply. This is what the trooper will breathe during atmospheric entry and free-fall, and, assuming low-altitude parachute deployment, allows the trooper to remain in the launch tube awaiting launch for up to 50 minutes with sufficient air reserves to reach the ground.

Tech Level: 10
Price: Cr354,079
Size: 0.5 displacement tons (7m³), length 3.2 meters
Mass: 7.02 tonnes loaded, 6.24 tonnes empty (as they are not reusable, empty mass includes everything but passenger and cargo)
Power: 0.04 MW battery
Maint: 1
Passengers: 1 soldier in battle dress, with equipment (max. 0.68 tonnes)
Offensive Armament: Twin Lyrebird remote missiles in package launchers.
Defensive Armament: Anti-radar decoy dispenser, anti-EMS decoy dispenser, anti-IR decoy dispenser
Ammo: 5 eachxanti-radar, anti-EMS, and anti-IR decoys
Maneuverability: Liquid fuel thrusters for 0.75 G and 4 minutes fuel
Armor: 10

Mk II Drop Capsule

The Mk II drop capsule is a family of unmanned capsules intended for use in support of the Mk I capsules, either for cargo carriage or as armed decoys. The Mk IIs are piloted by the same flight computers as the manned Mk Is. Like the Mk I capsule, the Mk II executes evasive maneuvers using its thruster package, and deploys decoys as necessary in the upper atmosphere, thereby appearing identical to the manned capsules on enemy sensor screens.

After passing through the upper atmosphere, the outer shell splits away, leaving the contents to either descend by parachute as with the Mk I, or fall directly to the ground. There are three types of Mk II drop capsules, each having a different job.

Mk IIa Decoy Capsules: These cover the other capsules on the way down by providing additional targets for ground fire and additional decoy protection. Just before arriving at the target, the capsule splits open and deploys its payload of 50 250-kg deadfall bombs with devastating results. These capsules are usually fired to drop their ordnance on enemy defensive positions.

Mk IIb "Iron-Hand" Capsules: These capsules provide SPAD (Suppression of Planetary Aerospace Defenses) "top cover" for the attacking force. Each capsule contains a Mjolnir advanced anti-radiation missile (Advanced-ARM), which descends beneath its parachute while scanning for enemy active sensor emissions. If any are detected, the missile sheds its chute and launches itself at the source of the signal. As the missile has target memory, even if the sensor shuts down, the missile remembers the last place it got a signal from and the radar must move if it is to avoid being hit. See page 109 for further details.

Mk IIc Cargo Capsules: These carry additional supplies for a raid, and accompany a raid down, shedding decoys, maneuvering, and landing as normal drones. The capsule contains an inner cannister (with an armor value of 2) which descends beneath a parachute. The cannister's cargo capacity is limited by a combination of parachute load-carrying capacity and the nature of the cargo. Cargo capacity for normal equipment (such as firearms and ammunition) is 1236 kg. Because electronics requires more protection and careful packaging, only 824 kg of electronic equipment can be carried. Up to 2320 kg of extremely durable supplies packed in bulk (such as premix concrete or steel rebar) may be carried with a main and reserve chute, or up to 5070 kg with only a main chute (no reserve).

Tech Level (all variants): 10

Price: *Mk IIa:* Cr360,094 (not including price of bombs—see below); *Mk IIb:* Cr360,094 (not including price of Mjolnir missiles—see page 109); *Mk IIc:* Cr360,418.

Size (all variants): 0.5 displacement tons (7m^3), length 3.2 meters

Mass (all variants): 18.82 tonnes (Mk IIa), 8.82 tonnes (Mk IIb), or 7.579-11.825 tonnes (Mk IIc) loaded; 6.32 tonnes (Mk IIa & b) or 6.755 tonnes (Mk IIc) empty (as they are not reusable, empty mass includes everything but payload and cargo)

Power (all variants): 0.04 MW battery

Maint (all variants): 1

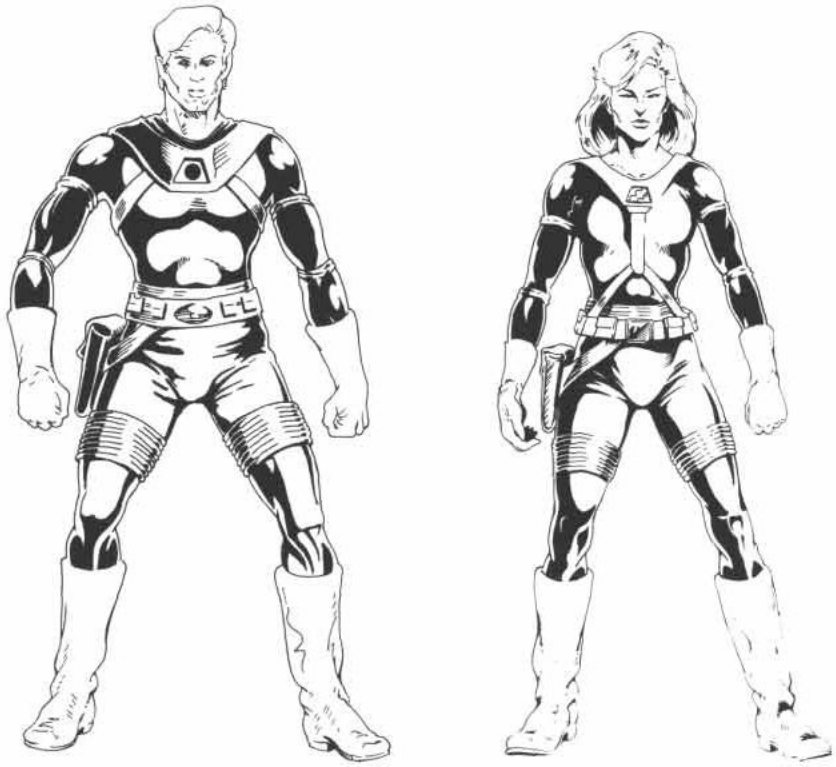
Passengers (all variants): None

Offensive Armament: *Mk IIa:* 50×250-kg deadfall bombs; *Mk IIb:* 1×Mjolnir Advanced-ARM; *Mk IIc:* None.

Defensive Armament (all variants): Anti-radar decoy dispenser, anti-EMS decoy dispenser, anti-IR decoy dispenser

Ammo (all variants): 5 each×anti-radar, anti-EMS, and anti-IR decoys

Maneuverability (all variants): Liquid fuel thrusters for 0.75 G and 4 minutes fuel



Armor (all variants): 10

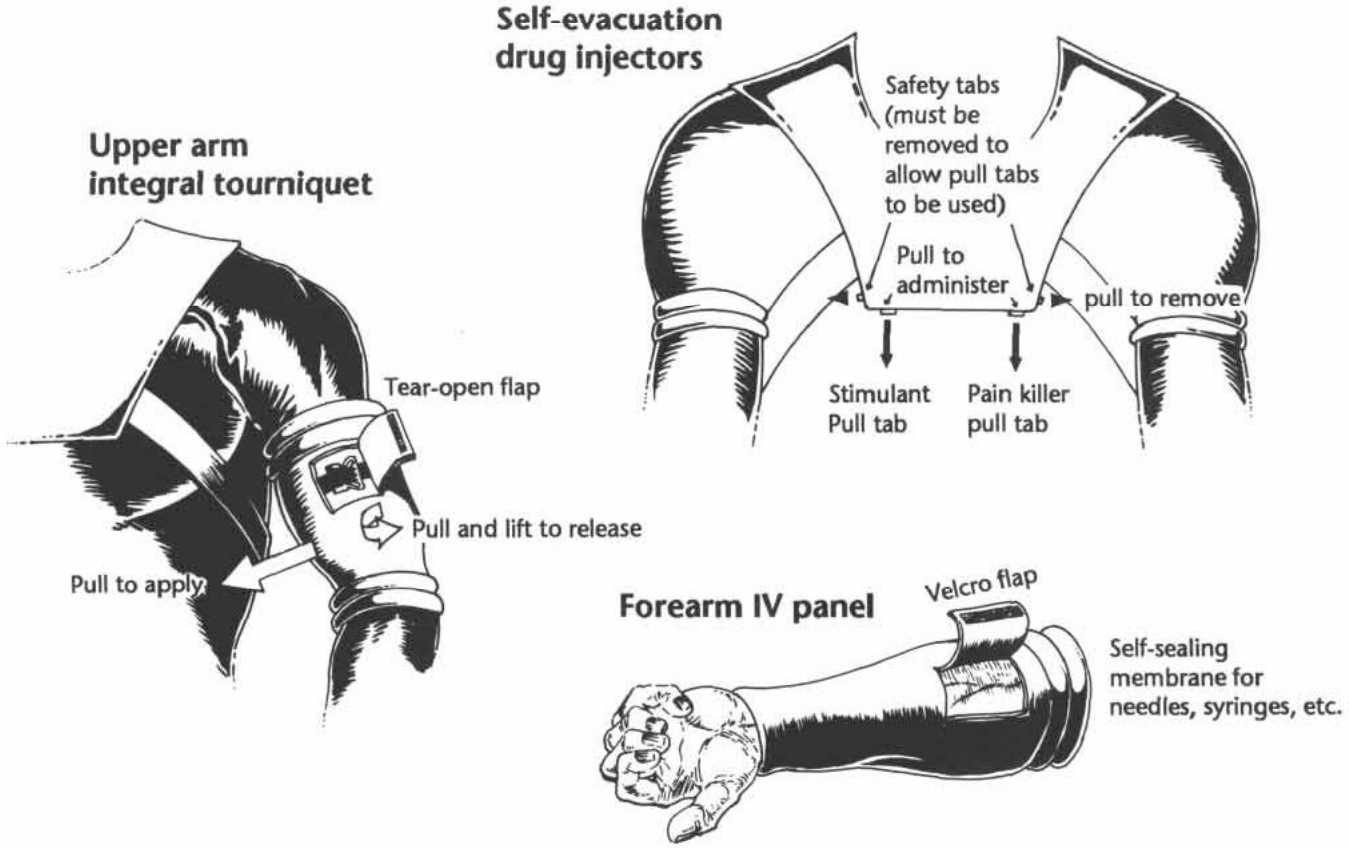
RCES Body Sleeve

RCES Body Sleeve



Perhaps the most typical and distinctive of the "Star Viking" equipment is the body sleeve: a multipurpose cooling system/G-suit/undergarment/utility uniform/body armor. The body sleeve was conceived as an undergarment worn beneath vac suits, combat armor, or battle dress. By incorporating various functions such as environmental control, G-suit bladders, and medical monitors into a comfortable "liner" garment, manufacture of the outer suits could be simplified, and putting these suits on could be done more quickly. In any event, the body sleeve has turned out to be so comfortable and useful that it has become the universal, all-occasion uniform for RCES and RCN personnel.

The body sleeve is, first and foremost, a full-body suit of ballistic weave armor with an environmental control system woven into it. Unlike the combat environment suit, which it resembles, it is a form-fitting garment (in order to slide easily into a vac suit or suit of armor, but the body sleeve is not sheer, resembling a 20th-century scuba wetsuit), and has a hood that can be pulled up to cover the head. When not up, the hood can be tucked down into the harness structure around the shoulders. This harness structure functions as the anchoring system when an airtight helmet is fitted to the suit, and is also a part of the body sleeve's integral load-bearing system to which grav belts, back packs, life support gear, and other loads are attached.

With the hood up, the only body portions exposed by the sleeve are the hands and face, which makes the suit an extremely valuable survival garment in the event of loss of pressure (a common fear in space). Although the body sleeve cannot fully function as a vac suit by itself, its protection does enable a crewmember wearing it to survive the worst effects of vacuum exposure for a few minutes. The edge of the hood is made of an adhesive material that makes a semi-airtight bond with bare skin, protecting the vulnerable eardrums (facial hair prevents a tight bond, so most RC personnel do not wear beards). By pinching the nose and closing the eyes, a person caught in a sudden depressurization can usually make it to an emergency oxygen mask stored in wall cabinets throughout all RC ships (and marked with bright strobe lights that can be seen through the eyelids). For this emergency use alone, the body sleeve is the universal shipboard uniform of RC forces. With proper gloves and helmet, the body sleeve is also fully sufficient to protect its wearer in very thin, thin, and tainted atmospheres (assuming atmospheric filtration and/or air supply, as appropriate).

In addition, the body sleeve is fitted with bladders in the thighs and abdomen that allow it to function as a G-suit.

The sleeve is designed with a number of features used in medical and first-aid situations. The sleeve has several intermediate sterile layers which reduce the incidence of infection caused by dirty material being driven into the body by gunshot wounds, and the nature of the ballistic mesh works to hold wounds closed and keep the body in one piece in the event of more grievous wounds.

The thighs, arms, and chest all have special self-sealing membranes (thin enough to locate veins) beneath lift-up panels that allow IV needles (for medication, whole blood, or plasma) to be inserted into the wearer without breaching its airtight integrity.

"Pull tab" tourniquets are sewn into several locations on the arms and legs. These are self-ratcheting cables that can be cinched down with one hand by the suit wearer without additional assistance in case of serious wounds in the extremities. (These may also be periodically released to prevent tissue damage and cinched down again, also with only one hand). Each suit also has two pre-measured doses of drugs built into the suit near the shoulder harness, one of a powerful painkiller and one of a fast-acting stimulant. These are administered by the wearer with pull tabs, and allow a trooper who is wounded, and perhaps alone (and perhaps with one or more tourniquet cinched down), to evacuate himself from a dangerous situation and be rescued. When both doses are taken together, they allow 5 minutes of clear-headed functioning in most wound states. (In game terms, pulling the tabs overrides the loss of consciousness and Initiative penalties of all wound states, up to and including Critical wounds, for a period of 60 combat turns. Only a single such dose should be taken at a time. Each time an additional dose is taken within an hour, roll a Difficult task against CON. Failure indicates that the character instantly dies due to the stress being placed on the body.)

Characters who routinely wear a body sleeve do not assess its weight against their load-carrying ability.

The body sleeve comes in a variety of colors, including woodland camouflage, slate gray, and blue, but the pattern most often seen is the basic black version. Advanced options, such as chameleon IR systems, are also available, but are not listed below.

All members of RCES and RCN have body sleeves issued to them. These are not normally available to free-lancers or others working under contract for the RC.

Armor Value: 1
Agility Penalty: None
Basic Cost: Cr8500
Mass: 10.5 kg
Gloves and Hard Helmet (AV 0): Cr900
Gloves and Helmet Mass: 2 kg

RCES Light Battle Dress

RCES Light Battle Dress

This unit is the standard light battle dress in use by the RCES raider forces, and is common in other military units as well. The standard model is fitted with a powered exoskeleton (which doubles the effective strength of the wearer), environmental control systems, filters, and respirator fittings (to enable the wearer to function in tainted and thin atmospheres), a laser designator unit (6-km range), an integral 3-km radio, and an integral WSV suite displaying on the inside of the helmet visor. The laser designator unit can be fitted to either the left or right forearm, at the wearer's option, and can be used to "paint" any target the wearer can see within a range of up to 3000 meters.

Some suits are manufactured with an integral "Chameleon" camouflage feature, which adjusts the suit's IR heat signature to match its surroundings. This feature must be incorporated during manufacture.

The suit's power supply is sufficient to enable it to operate for up to 10 hours before recharging is required. All suits are supplied with standard power and life support fittings, allowing users to plug into a ship or vehicle power/life support system and conserve or recharge their resources. The laser designator is only supplied with a battery sufficient to last for a total of 6 minutes, however, so its use must be carefully rationed.

Optional Features: Oxygen tanks can be added to the basic suit in order to enable the wearer to function under vacuum situations. Individuals requiring additional radio communication range may substitute a 30-km radio for the standard 3-km model.

When being used for meteoric assault in a drop capsule, the battle dress is fitted with a small air supply sufficient for one hour,with negligible mass and price (0.5 kg, Cr100).

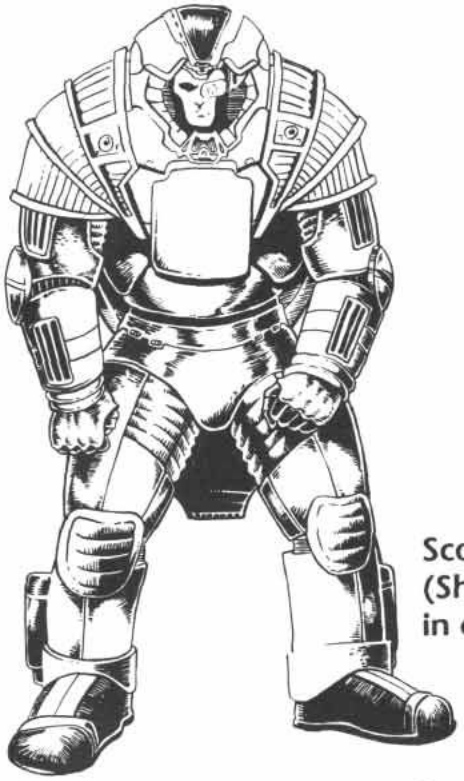
RCES Heavy Battle Dress

Reformation Coalition TL-12 Heavy Battle Dress

The Coalition's heavy battle dress is used by its first-line military forces, and also on raids where significant military opposition is expected. Heavy battle dress doubles the effective strength of its wearer, and includes environmental control, atmospheric filters, and respirators (allowing the wearer to function in tainted and thin atmospheres), Chameleon IR suppression systems, a wide-spectrum visual helmet sensor suite, and an in-helmet radio of at least 3-km short range.

There are three primary variants of the suit: the standard Trooper Suit, the Leader's Suit, used by section, platoon, and higher leaders, and the Scout Suit, used by a limited number of personnel per unit for longer-range surveillance.



All suits feature an integral arm-mounted laser designator, used to mark targets for the Lyrebird missiles carried in standard drop capsules (see page 107). The laser designator has a range of 6 km, and due to its high power requirements, has power sufficient for only six minutes of constant use.

The Leader's suit has less armor protection to allow it to carry a 30-km (short range) radio in place of the 3-km trooper's radio, and the Scout Suit is fitted with a passive EMS array in the chest, with a short range of 3 km. Due to the bulk of this system, the Scout Suit also has reduced armor protection, and only a 3-km (short range) radio. It also only has batteries sufficient for nine hours continuous use of its sensors.

All of these suits may be recharged by a standard starship fusion power plant. This process takes one hour, and requires that 0.1 MW of power be allocated per suit for the duration of the recharge.

All of these suits may be fitted with a self-contained oxygen supply lasting 20 hours, which adds .01 tonnes to the mass and MCr0.002 to the cost of the suit. With the oxygen supply fitted, the suits are overloaded, which increases the Agility and Initiative penalties to –4 and –3 respectively, and reduces movement rates by 10%. When being used in a meteoric assault in a drop capsule, the heavy battle dress suit is fitted with a one-hour air supply sufficient to allow the trooper to reach the ground, and having negligible mass and price (0.5 kg, Cr100).

Because of their distinctive appearance, these suits are often referred to by Coalition Marines as "Sumo Samurai Suits," or "Samurai Beetles."

Scout Suit
(Showing passive sensor array in center of torso armor)

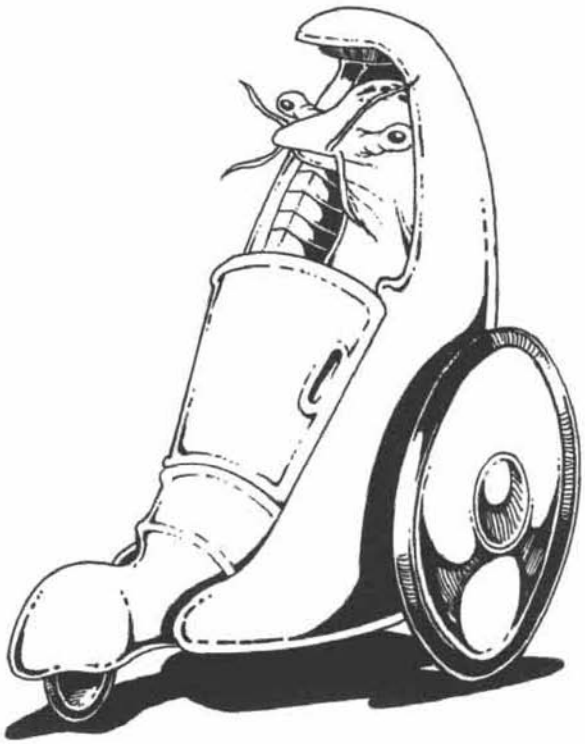
Standard Trooper Suit

Mass: 0.4197 tonnes (419.7 kg)
Price: MCr0.22315 (Cr223,150)
Agility Penalty: –3
Initiative Penalty: –2
Armor Value: 15
Endurance: 10 hours continuous use for all systems, except laser designator; only 6 minutes continuous use
Features: Wide-spectrum visual helmet sensor suite (treat as WSV goggles, short range = 400 meters), Chameleon IR suppression, 3-km (short range) radio, TL-10 Inertial Navigator (TNE, page 346), laser designator (6-km range) with batteries for 6 minutes of continuous use.

Leader Suit

Mass: 0.4147 tonnes (414.7 kg)
Price: MCr0.225645 (Cr225,645)
Agility Penalty: –3
Initiative Penalty: –2
Armor Value: 13
Endurance: 10 hours continuous use for all systems, except laser designator; only 6 minutes continuous use
Features: Wide-spectrum visual helmet sensor suite (treat as WSV goggles, short range = 400 meters), Chameleon IR suppression, 30-km (short range) radio, TL-10 Inertial Navigator (TNE, page 346), psionic shield helmet, laser designator (6-km range) with batteries for 6 minutes of continuous use.

Scout Suit



Mass: 0.42 tonnes (420 kg)
Price: MCr0.240853 (Cr240,853)
Agility Penalty: –3
Initiative Penalty: –2
Armor Value: 12
Endurance: 10 hours continuous use for all systems, except passive EMS sensor; only 9 hours continuous use, and laser designator, only 6 minutes.
Features: Wide-spectrum visual helmet sensor suite (treat as WSV goggles, short range = 400 meters), Chameleon IR suppression, 3-km (short range) radio, TL-10 Inertial Navigator (TNE, page 346), 3-km (short range) passive EMS sensor with batteries for nine hours of continuous use, laser designator (6-km range) with batteries for 6 minutes of continuous use.

Light BRT (a.k.a. "Baby Brute)

The BRT (body reaction tool) is a cargo handling machine derived from the heavy battle dress frame, specially reinforced. The brute may lift and carry loads of up to 2064 kg (2.064 tonnes). This is its absolute capacity, and may not be exceeded. The operator suffers no load-carrying penalties beyond those listed for simply using the suit. Operating a brute is considered easy work for the purposes of fatigue.

Mass: 0.268 tonnes (268 kg)
Price: MCr0.20017 (Cr200,170)
Agility Penalty: –4
Initiative Penalty: –3
Endurance: 8 hours continuous use (0.0153MW rechargeable battery).

Schalli Personal Transportation

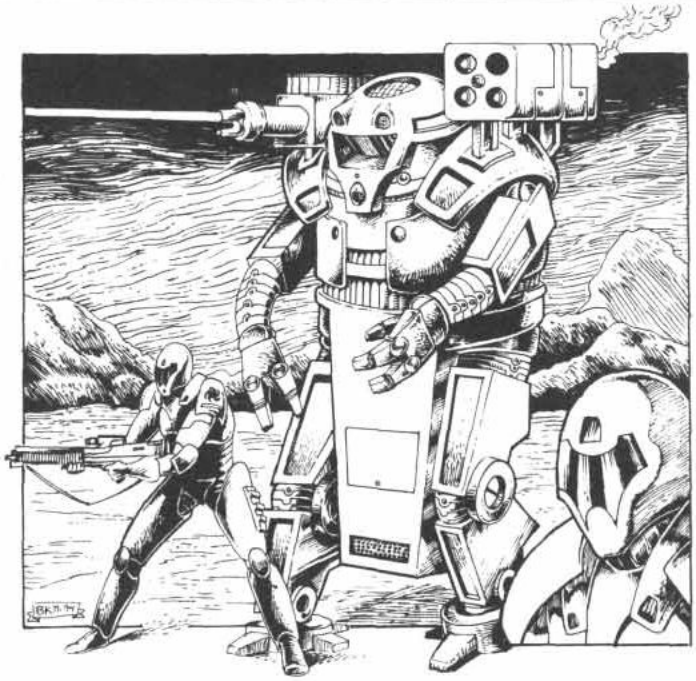
Schalli Roller

The Schalli roller is essentially a large electric wheelchair intended to let these aquatic beings get around in a terrestrial environment. They are built at the lowest practical technology level in order to make them readily available, as well as to eventually allow their construction on Schall, should the Schalli so desire. They are also designed to be inexpensive, to make them affordable to as many Schalli as possible, and are therefore designed for use on flat surfaces. Hence their cross-country performance is deplorable. Schalli who seek better rough terrain performance use either contra-grav platforms or walkers, based on the Schalli battle dress skeleton detailed on the facing page. However, both of these options are much more expensive.

The "bucket" in which the Schalli sits is partially filled with water. This provides some buoyancy for the Schalli's comfort, and also keeps his or her skin from drying out. There is a low-power mister which draws water from the bucket and sprays the Schalli's head. In hot and dry conditions, this requires the water in the bucket to be replenished periodically.

The housing at the Schalli's chest level folds down as a work table, where the Schalli can use his or her four arms to manipulate equipment.

The cargo space listed below allows additional equipment to be installed on the roller, and 0.0075 MW are set aside to power this equipment.



The roller must be recharged every 24 hours, usually while the Schalli sleeps, and the roller is equipped with power cables which allow this to be done at standard RC electrical outlets.

Tech Level: 7
Price: Cr2300
Size: 5.6 kiloliters displacement = 0.4 tons (SM)

Schalli Battle Dress

Because of their physical structures, Schalli need some form of mechanical assistance to get around on land. Although there are no Schalli infantry units, some RC leg units (or powered leg units) do have Schalli members, and it is for these rare Schalli troops that the Schalli battle dress is manufactured.

Schalli battle dress is massive and even somewhat frightening when viewed on the battlefield. It also makes rather a large target. Unlike standard human battle dress which has no integral weapons, Schalli battle dress is equipped with integral heavy weapons to allow it to defend itself. The mass below is overloaded by 10%, but still allows 0.016 tonnes (16 kg) for additional mission equipments.

The Schalli operator rides in a water-filled "bucket," the lower portion of which hangs down well below the hip joints. He or she controls the battle dress with its four arms: The upper two control the battle dress arms, and the lower two control the battle dress legs. The Schalli uses its whiskers to operate sensors and fire control systems.

The Schalli battle dress skeleton has a skeletal mass of 0.4 tonnes, a maximum mass of 0.84 tonnes, a storage volume of 240 liters, costs MCr0.4, and imposes Agility –3 and Initiative –2 penalties. When stripped down to its basic components, including armor and batteries only, its breakdown is shown below.

SM	*AV*	*AM*	*BV*	*BM*	*TM*	*MW*	*End*	*SMCr*	*AMCr*	*BMCr*	*TMCr*
0.4	12	.162	.0784	.1568	.7188	.01176	10	.40	.01539	.000392	.415782

Schalli battle dress is manufactured in only limited quantities, due to both its expense and the current low demand for Schalli combat troops.

Mass: 0.908 tonnes (908 kg)
Price: MCr0.483 (Cr483,000)
Agility Penalty: –4
Initiative Penalty: –3
Armor Value: 12
Endurance: 10 hours continuous use for all systems, except laser designator; only 6 minutes continuous use
Features: Wide-spectrum visual helmet sensor suite (treat as WSV goggles, short range = 400 meters), Chameleon IR suppression, 3-km (short range) radio, TL-10 Inertial Navigator (**TNE**, page 346), laser designator (6-km range) with batteries for six minutes of continuous use, Squad Support Laser (see page 96) with 50 rounds, 4 Nail tactical missiles in quadruple package launcher (see page 106).
Consumables Price: Price above includes Squad Support Laser but does not include ammo or disposable missile launcher.
Loaded 50-round magazine for Squad Support Laser: Cr1496
4-round disposable package launcher for Nail tactical missiles: Cr2832 for HEAP, Cr2664 for HE, Cr3000 for WP, Cr6664 for Nail SAM, Cr12,664 for Nail ARM.
When Nail SAM or ARM are fitted, add Cr500 to cost of the battle dress, and reduce reserved mass to 15.5 kg to allow for the homing missile launch controller.

Communications Devices

TL 9
3000 KM
Communicator

COMMUNICATIONS DEVICES

Good communications are vitally important to any operation, military or civilian. The equipment described on these pages represents the most common types in Coalition service. Since the Coalition is not capable of manufacturing at higher than TL-12, any advanced tech level communicators are relic technology, and thus quite rare. Such equipment is usually encountered only on very important missions.

Classes: There are three classes of communicators: Uplink, Strategic, and Tactical.

Uplinks have a short range of 3000 km, and are used for communication with spaceships and other objects in geo-synchronous orbit such as permanent space stations, ComSats, NavSats, and so on.

Strategic communicators are used by landing parties to communicate with starships in standard orbits, and by large military units on the ground to communicate with each other. These units have a 300-km short range.

Tactical communicators have short ranges of 30 km or less. These sets are the most useful for communications between ground units and between ground units and aircraft or spacecraft operating in the atmosphere.

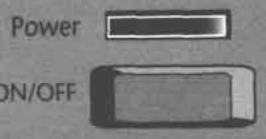
Duration: The durations listed below are based on the batteries contained in the units, although all come with power cables which allow them to be hooked into external or vehicle power supplies for longer duration.

Batteries: All communicators come with internal battery packs, and these are also available as separate items, to extend a communicator's operating time. Duration is listed for constant transmitting or constant receiving (transmitting consumes power at 10 times the rate of simply receiving). Alternatively, use the receiving only duration, but each minute of transmission counts as 10 minutes of listed duration.

Communications Uplinks

The TL-15 3000-km maser and TL-12 and TL-15 3000-km laser uplinks are available in backpack form (the TL-15 versions, obviously, are relic technology and rather scarce). All uplinks are also available in stand-alone versions.

Communications Uplinks



Item	*Mass(kg)*	*Volume (liters)*	*Price (Cr)*	*Duration (hrs*)*	*Antenna Diameter (m)*

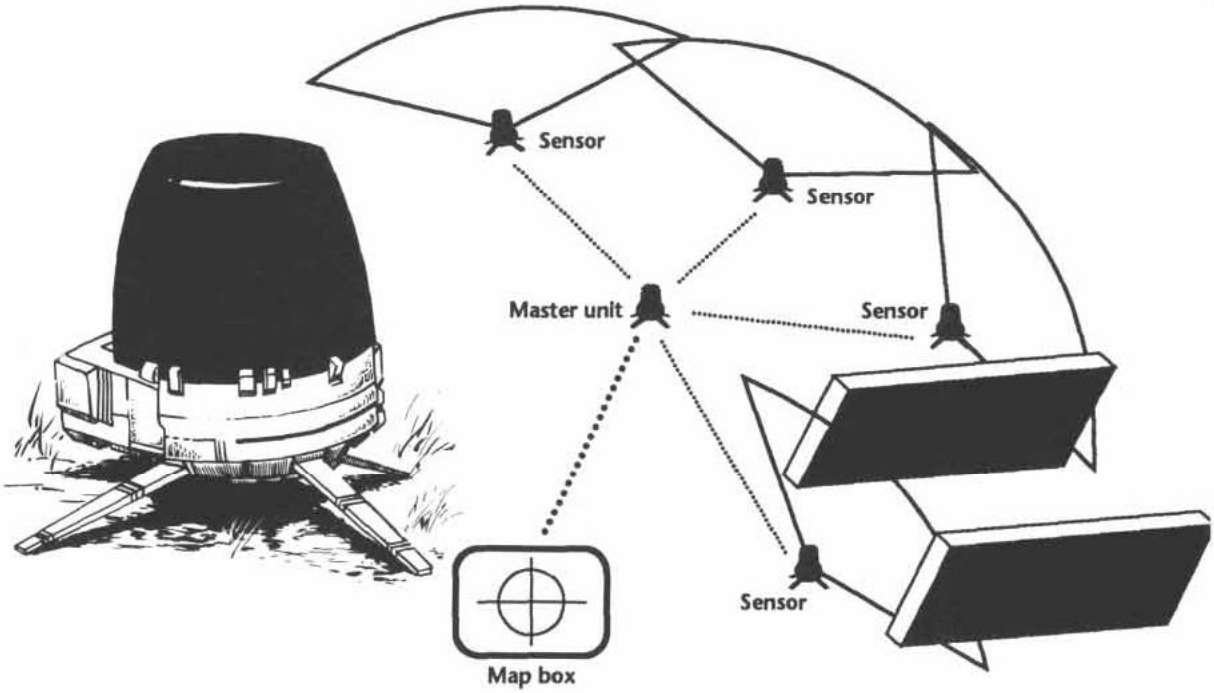
300-km Tight-Beam Radio Orbital Relay Communicator

This radio is only a fraction of the mass of a maser communicator of similar performance and duration, thus its popularity. The tight-beam radio also includes a 3-km (short range) repeater in it which allows personnel with their own radios to route their transmissions up to orbit via the uplink, and receive replies in the same way. This uplink comes in stand-alone or backpack configurations.



Item	Mass(kg)	Volume (liters)	Price (Cr)	Duration (hrs)	Antenna Diameter (m)
300-km Radio Uplink w/3-km repeater	19.6	9.8	1125	4	0.36
Spare Battery	19.3	9.6	50	+4	—

Tactical Communicators

Laser and maser communicators of less than 30-km short range are not commonly needed, and thus only 30-km radios are shown.

Item	Mass(kg)	Volume (liters)	Price (Cr)	Duration (hrs*)	Antenna Diameter (m)

Remotely Operated Sensors

TL-12 Automated Sensors

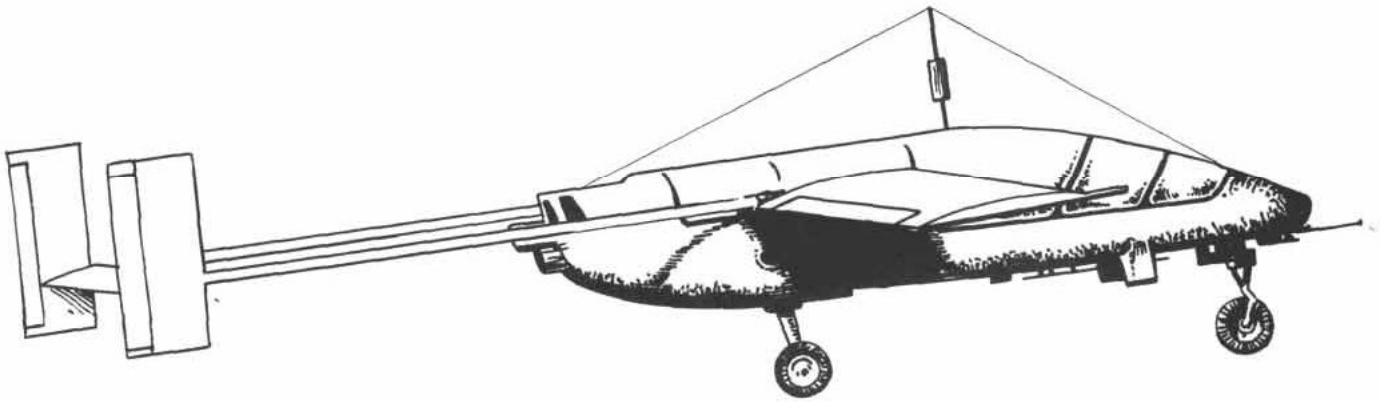
These are passive sensors which carry their own power supply and transmit their data to remote locations with integral tight-beam radios. These sensors can be used one at a time in a stand-alone configuration, or linked into a network of several remote units and one master unit. Each sensor unit has a 3-km (short range) passive EMS sensor and a tight-beam radio with a short range of 3 km, so must be placed within 3 km of either the personnel who will be monitoring it, or a master unit. Master units collate the data from the subsidiary sensors into a single integrated display. Master units have radios with 30-km short ranges, and they may be "daisy chained" together serially to allow sensor barriers to be set up at a great distance from friendly units.

The person monitoring these sensors must have either a helmet sensor suite, a map box, or a computer on which to display the data. The master unit is equipped with its own map box, allowing personnel to monitor the sensor perimeter from the master unit itself. Military commanders who are linked into an automated sensor network which is controlled by a master unit add 1 to their Ground Tactics assets.

Depending upon circumstances, these sensors are recovered at the end of a mission or considered expendable. The same sensor unit is used in the stand-alone or networked role.

The replacement batteries shown on the table below normally fit one each within the sensor or master unit. However, multiple batteries may be hooked up to a single unit which will allow the unit to use their duration sequentially. This allows these sensors to be left unattended for longer periods of time. The cost of the wiring required for this is subsumed in that of the unit itself.

The table also shows the power requirement of these units in megawatts for characters who wish to attach these units directly into a power plant.



Item	*Sensor*	*Radio*	*Duration*	*Volume*	*Mass*	*Price*	*MW*	*TL*

Remotely Piloted Reconnaissance Vehicle

The Coalition uses a variety of remotely piloted vehicles (RPVs) for reconnaissance operations, particularly in high-threat environments. The example shown here is essentially a very large model airplane bearing wide-spectrum visual-imaging equipment. (This includes low light, thermal, and standard video.) It is operated via frequency-agile radio link, 30-km short range, to a hand-held controller which includes a small video screen. The RPV's video feed can also be split off to a larger size display for ease of viewing or recorded for playback. The RPV is equipped with a simple autopilot capable of performing such basic tasks as orbiting a fixed point, flying a particular pattern, and the like. Lastly, its engine can be shut off and subsequently restarted in-flight when stealth is called for.

The RPV requires a flat, open area for take-offs and landings, for example a road, or level field. The RPV may be optionally fitted with a rocket-assisted take-off (RATO) motor which provides the RPV with zero-length launch performance (ZLL; take-off roll is actually 1 meter, usually made from a short ramp). Each RATO motor is good for only one launch, and weighs 115 kg and costs Cr230. RCV Operations skill is required to fly the RPV.

Note that the RPV's components are manufactured at a wide variety of tech levels, allowing subcomponents to be produced on many RC worlds. Its airframe and engine are manufactured at TL-5, its flight controls at TL-8, its sensors at TL-10, and only its batteries at TL-12.

The RPV is listed in two configurations: its basic configuration of 246.5 kg, and its maximum payload configuration of 315 kg. The RPV in its basic configuration has space set aside in its fuselage for 68.5 kg worth of additional surveillance equipment, flares, decoys, etc., which allow it to reach its maximum payload.

Tech Level: 12 (maximum component)
Price: Cr28,765
Size: 21 cubic meters, VS target (storage volume 10.5 cubic meters)
Mass: 246.5 kg basic fueled mass, 315 kg maximum fueled take-off mass
Power: 0.02 MW improved internal combustion engine with propellor generating 0.01 tonnes thrust, plus TL-12 batteries providing 0.035 MW electrical power for 4 hours (0.00825 MW excess power)
Maint: 1
Controls: Enhanced electronic controls with RCV modifications, TL-10 flight computer
Commo: 2x30-km (short range) radios
Sensors: Wide-spectrum visual viewer, video camera/signal converter
Life Support: None
Cargo: 68.5 kg additional mission equipment
Crew: None (1 remote operator)
Maximum Speed: 128 kph in basic configuration, 100 kph at maximum mass
Cruising Speed: 96 kph in basic configuration, 75 kph at maximum mass
Operational Radius: 192 km in basic configuration, 150 km at maximum mass
Combat Move: 18 10-meter grid squares in basic configuration, 14 at maximum mass
Agility: 3
Take-Off Roll: 114 meters in basic configuration, 186 meters at maximum mass
Landing Roll: 75 meters
Fuel Capacity: 20 liters hydrocarbon distillates (Cr5 for full load of fuel)
Fuel Consumption: 5 liters per hour (endurance of 4 hours)

Vision-Enhancement Equipment

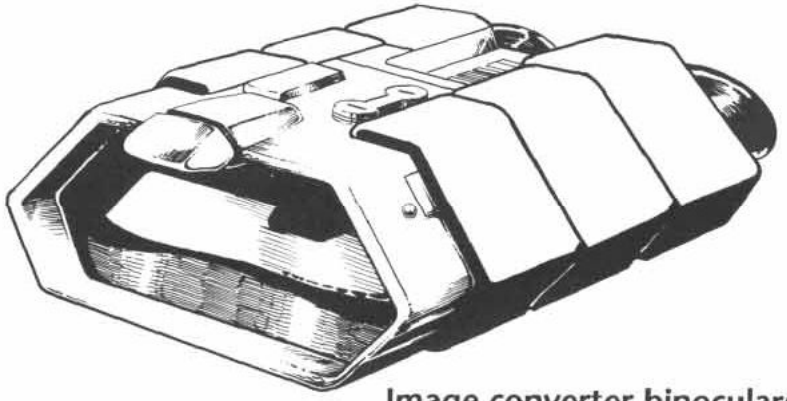

Image converter binoculars

Vision-Enhancement Equipment—Binoculars

Because of the wide distribution of these devices in pre-Collapse times and the low tech level requirements of most of these designs, they are considered as a class to be in virtually universal use, either in relic or newly manufactured forms. RC forces manufacture all of these devices, but make the greatest use of image converter and PRIS binoculars.

Almost all of these devices come in an over-the-shoulder carrying/shipping case; a sling is also provided for separate carrying. The use of these devices in the game is discussed in the basic rules, pages 309-310.

Binoculars: This device allows improved vision at greater distances than would unaided eyes. Characters equipped with binoculars and who have a good field of view have their Observation asset increased by 1. Binoculars have no effect in woods or smoke, at night, or in other than clear weather.

TL: 3
Volume: 2 liters
Weight: 1 kg
Price: Cr75
Short Range: 1000 meters
Mode: Daylight and clear weather only, no effect in woods and smoke

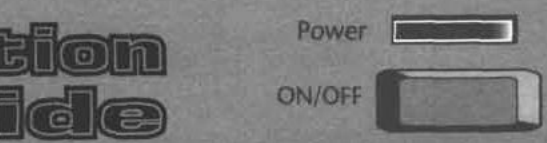
Binoculars, Electronic: This device provides electronic enhancement of images. Electronic binoculars feature color enhancement (which adds 1 to the user's Observation asset—see the basic rules, page 310) and range-finding capabilities in addition to the normal binocular benefits, but are useful only in daylight and clear weather.

TL: 8
Volume: 2 liters
Weight: 2 kg
Price: Cr750
Short Range: 1000 meters
Mode: Daylight and clear weather only, no effect in woods and smoke.

Binoculars, Image Converter: Many night-vision devices and electronic sights either are sensitive to infrared (heat) radiation (IR) or use light amplifiers (LA) to detect their targets. Both have minor disadvantages: IR images can be camouflaged by insulation and LA requires background light to amplify. In addition, the user can only see as far as the unaided eye.

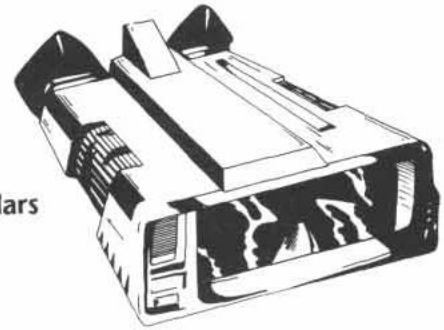
Commercially available at tech level 10, the image converter is sensitive to both infrared and visible light, and thus picks up both heat images and visible-light pictures. The converter intensifies these images, allowing night vision, and magnifies them up to 20 times. Automatic polarizers cut in if the image is bright enough to blind. A laser rangefinder is also included to measure the precise distances to selected objects out to the maximum range of the binoculars.

The Image Converter Binoculars combine the features of Image Intensification and IR goggles (increasing the user's Observation asset by 2, but has no effect in woods or smoke—see "Mode" below and TNE, page 310), and have a short range of 250 meters in either mode.



Special hardware/software clips are available for hand computers that expand the capabilities of the image converter. When hooked up to a computer using a graphics clip, the image converter can be tied into a map box (allowing others to see what the user sees), and electronic "photographs" can be stored in the computer's memory. Another clip allows the computer to calculate the speed of a target relative to the user.

Physically, the image converter is similar to a set of binoculars. Power packs are mounted inside the converter casing and average one week of constant use.



TL: 10
Volume: 1 liter
Weight: 1.25 kg
Price: Cr3500
Short Range: 250 meters
Mode: May disregard all night Diff Mods, fully affected by weather Diff Mods. No effect in woods or smoke.

PRIS binoculars

Binoculars, PRIS: The portable radiation imaging system (PRIS) has many more capabilities than binoculars from previous tech levels. The PRIS combines the features of the WSV viewer with color enhancement (allowing color enhancement use in clear, daylight conditions, and WSV mode at night and in bad weather).

The PRIS can be set to observe images in the spectral range from infrared to gamma rays. (The PRIS will not detect radio waves.) The front surface of the PRIS is transparent to all radiation; just behind it is a series of lenses tailored to various specific bands. In addition to this, a tight-beam laser rangefinder gives an accurate reading on the target within sight up to about 20 km, depending on conditions, with the range displayed as a digital readout in the viewfinder. The PRIS also has a built-in clock and limited memory, so the rangefinder can determine the velocity of the object being viewed by comparing its distance from the observer over time.

The unit can be calibrated to a standard self-precessing gyrocompass, in which case the bearing of the direction viewed will be digitally displayed in the corner of the viewfinder. The magnification strength of the PRIS is adjustable up to 225. A built-in flywheel for gyro-stabilization ensures a steady field of view at all magnifications.

Besides its obvious uses in the field, the PRIS also finds itself used in a variety of industrial and engineering applications. Its infrared images can be color-coded to show the ambient temperatures of objects in the viewfinder. A PRIS can therefore be found near every jump drive, to be used by engineers looking for "hot spots" on the drive housing. In other areas of a ship, the PRIS can detect problems in electrical circuits, again by finding an area of higher temperature.

TL: 12
Volume: 3 liters
Weight: 2 kg
Price: Cr12,000
Short Range: 400 meters WSV mode, 1000 meters color enhancement mode (daylight, clear weather only)
Mode: WSV mode disregards night Diff Mods and up to 1 smoke Diff Mod, fully affected by weather Diff Mods. Color enhancement mode in daylight and clear weather only. Both modes no effect in woods.

Light Amplifier goggles

Infrared goggles

Vision-Enhancement Equipment—Goggles

This discussion does not cover simple goggles intended for for eye protection, although all of these provide that in addition to their vision enhancement characteristics. The use of these devices in the game is discussed in the basic rules, pages 309-310.

Goggles, Combination IR/LA: These goggles combine light-amplification and infrared radiation detection in one unit and are worn like eyeglasses. They have the features of both IR and LA vision aids, see immediately below, and can be switched from one mode to the other by the user by means of a knob mounted in the earpiece. Most types have automatic sensitivity control in the LA mode to prevent blinding by a bright light source.

TL	*Vol*	*Weight*	*Price*
9	0.3 liters	0.2 kg	Cr1250

Short Range: See Infrared and LA goggles below
Mode: See Infrared and LA goggles below

Goggles, Infrared: Allow wearer to see heat-emitting sources in the dark such as animals, fires, or hot engines. The quality of vision is necessarily distorted as heat sources (not reflected light images) are being viewed. IR goggles have a short range of 100 meters. They ignore night Diff Mods, but have no effect in woods, smoke, or poor or very poor weather.

TL	*Vol*	*Weight*	*Price*
6	1 liter	1 kg	Cr1000
8	—	0.1 kg	Cr500

Short Range: 100 meters
Mode: Disregard all night Diff Mods, no effect in woods, smoke, or other than clear weather.

Goggles, Light Amplifier: Allow vision by amplifying ambient light and are usable in anything less than total darkness. LA goggles may allow darkness penalties in night or combat situations to be reduced or ignored. LA goggles have a short range of 100 meters, and allow users to disregard up to 2 night Diff Mods. They are fully affected by weather Diff Mods, and have no effect in woods or smoke.

The LA goggles illustrated are shown in their raised position, allowing the wearer to use his normal vision.

TL	*Vol*	*Weight*	*Price*
7	1 liter	1 kg	Cr1000
10	—	0.1 kg	Cr1000

Short Range: 100 meters
Mode: Disregard 2 night Diff Mods, fully affected by weather Diff Mods, no effect in woods or smoke.

Anti-Virus Equipment

VIRUS-DETECTING EQUIPMENT

Detecting Virus in electronic equipment can be very easy or very hard. Sometimes Virus announces itself and attacks, sometimes it lays in wait inside seemingly inert equipment, waiting to insinuate itself into other systems. Both scenarios are equally dangerous, and place a premium on always spotting Virus before it spots you. (See **Survival Margin**, pages 74-81, **TNE**, pages 74-81, or **Path of Tears**, pages 142-143 for a more detailed discussion of Virus.)

In many cases, Virus detection can be conducted at a keyboard and consists of running a series of diagnostics on the system. Detecting Virus by this means is an uncertain, Difficult task using the Computer asset. The difficulty level can be increased or decreased a level by the sophistication of the processor being examined. A global data network, for example, would be one or more levels more difficult (since the Virus is "smarter"), while a low-tech starship computer (say TL-12) may be one level easier.

There are also numerous pieces of equipment intended to assist in the detection of Virus, or, in the end, simply to wipe it from the face of the operating system.

Electronics Diagnostic Kit

The electronics diagnostic kit is a simple set of electronic tools used for the manual (i.e., off-line) examination of electronic data systems. It includes voltage meters, circuit testers, high-power microscopes to examine circuitry, etc. These kits are used when examining cold circuits for evidence of virus eggs. Such an examination is an uncertain, Difficult task using the Electronics asset, or a Formidable one using Computer, but in either case requires the character to have an electronics diagnostic kit. Every two tech levels of difference between the diagnostic kit and the circuitry being examined moves the task difficulty level up or down one level.

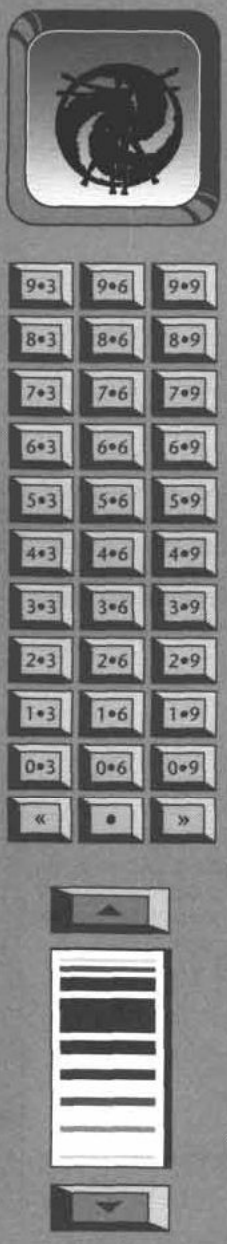
Only kits of TL-12 or below are available in the Coalition; higher tech kits are available from the Hivers (up to TL-14) or as relics.

TL	*Mass*	*Volume*	*Cr*
8-9	5 kg	10 liters	2000
10-11	7 kg	15 liters	4000
12-13	6 kg	12 liters	8000
14+	4 kg	8 liters	10,000

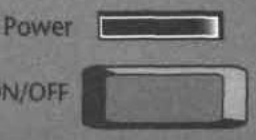
Canaries

Canaries are the classic means of detecting Virus. The first canaries were improvised from whatever computers or peripheral systems happened to be available, and the concept was happened upon rather accidentally, innumerable hundreds or thousands of times in innumerable locations by innumerable persons, most of whom died making the discovery. However, current versions are specially designed to accomplish their missions. The original canaries were so named because they proved the existence of Virus by "dying," i.e., self-destructing when they became infected by the early "suicider" strains of Virus. Current canaries usually do not die upon infection, as the currently common strains of Virus seek to control new systems to propagate themselves, not to destroy them.

Canaries are high-speed data-processing systems which mimic the sort of systems that Virus likes to occupy, and which also speed up the development of a low-power virus (e.g., an egg which has just hatched, or a virus which has been stunted by inhabiting a slow or low-capacity computer) to levels where it is readily detectable. Canaries detect Virus within them by watching for the distinctive electrical patterns of Virus consciousness entering their systems. In many cases, canaries contain simulated connections to sensor or weapons controls, items which Virus always attempts to control. However, when Virus attempts to gain access into these systems, it finds that they have apparently had some kind of access control mechanism installed. At this point, Virus attempts to force the barrier, either by "hacking" its way through the phony security program, or by burning its way around the blocked circuitry. Either way, these attempts are sufficient to trip the canary's detection systems. Once this is detected, the canary sounds an alarm to notify its owners that Virus is present. This alarm is usually an audible one, though many crews like to rig up a small mechanical arm to the alarm so that Virus actually waves at them to say hello once it has been discovered.



There are two main categories of canary: warning canaries and exploratory canaries.



Warning canaries, also called defensive canaries, are those which are installed as part of the computer system aboard a starship or vehicle. Their function is to warn the crew when a portion of the ship's computer system has become infected, so that the crew might shut the system down, abandon ship, etc. These canaries were quite common in the first few decades following the Collapse, but now that there are improved antiviral countermeasures, these have become less prevalent.

Exploratory, or offensive, canaries are portable canaries which are taken to newly discovered, suspect computers. (Note: All computers are suspect.) These are hooked into the suspect data system and are watched to see if they become infected. This process can sometimes take hours or days, or may not work at all: Many of the strains of Virus that have survived into 1201 have learned to be wary of canaries, and do not betray themselves to these systems.

Finally, exploratory canaries are divided into two types: passive canaries and active canaries. A passive canary is one which is hooked into a functioning data system to see if an active virus will expand into it. Passive canaries need no power source of their own, as this power is provided by the system to which it is connected.

Active canaries have their own power sources and are used to examine cold systems such as powered-down computers and systems that are suspected of containing Virus eggs. The canary hooks into and powers up these cold systems and waits to see if dormant virus in these systems will attempt to take it over.

Canaries are not reusable. Once they have been infected, their internal workings are suspect and cannot be trusted to handle any further examinations. They are not discarded, however; they are returned to RCES authorities where they are studied, and in some cases broken down to have their components recycled into new canaries.

Note that, when hiring free-lancers, RCES will almost always provide one or more canaries to the free-lance crew at no cost. This is to ensure that the mission is not jeopardized by the use of substandard, used, or defective canaries. Although canaries are expensive, they are cheaper than failed missions, or the risk of the mission returning infected and spreading Virus into Coalition data systems.

On the table on the facing page, base difficulty level is based on the canary's absolute computing capacity compared to "average" host data systems. This level is modified up one level for every two tech levels by which the infected system exceeds the canary, or down one level for every two tech levels by which the canary exceeds the infected system. Difficulty should be further modified for unusually "smart" or "stupid" viruses, at the referee's discretion. Virus-detection attempts with canaries are rolled against the canary's listed asset, and do not use the Computer or Electronics assets of the characters. These rolls are uncertain tasks.

Note that any virus, at the referee's discretion, may be immune to detection by canary, regardless of the success of any task roll.

Type	*TL*	*Difficulty*	*Asset*	*MW*	*Mass*	*Volume*	*MCr*
Warning Canary	10	Average	8	3	120 kg	300 liters	0.5
Passive Exploratory Canary	10	Difficult	8	—	50 kg	50 liters	0.05
Active Exploratory Canary	10	Difficult	8	0.3	50 kg	50 liters	0.08
Warning Canary	12	Average	10	4	160 kg	400 liters	1.5
Passive Exploratory Canary	12	Difficult	10	—	30 kg	30 liters	0.15
Active Exploratory Canary	12	Difficult	10	0.4	30 kg	30 liters	0.3
Warning Canary	14	Average	12	5	160 kg	400 liters	2.5
Passive Exploratory Canary	14	Difficult	12	—	20 kg	20 liters	0.25
Active Exploratory Canary	14	Difficult	12	0.5	20 kg	20 liters	0.5

MW indicates power requirement. Canary may be hooked up to a vehicle or starship power plant, or to a battery designed using the battery tables in **TNE, Brilliant Lances,** or **Fire, Fusion, & Steel.** 1 kg = 0.001 tonnes, 1 liter = 0.001 cubic meters

Virus Capsule

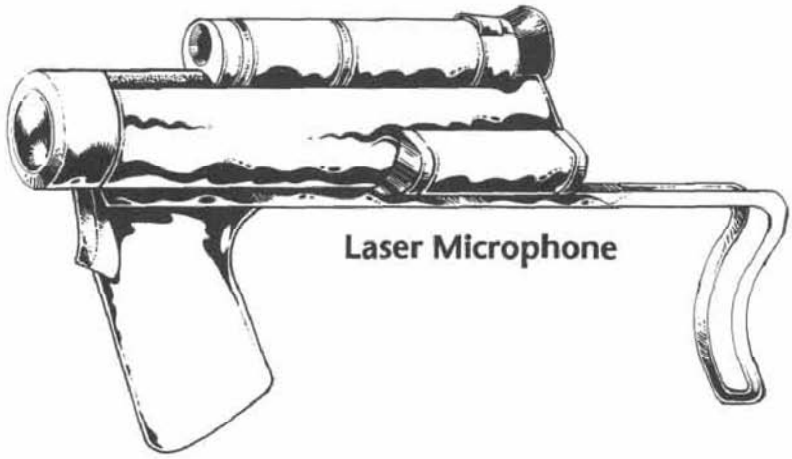
A virus capsule is a device which captures a fully active, fully aware virus for further study. There are no standard virus capsules; each one is purpose-built to capture a virus which has already been studied.

A virus capsule is a virtual reality simulator for a virus. The capsule appears to the virus inside of it to be the operating system of a starship, and even gives false feedback to the virus occupying it to convince it that it was in a ship that had just taken off, or which had just fired its lasers, etc. Obviously this is a very sophisticated device, and can only be fashioned when there is a great deal of information about the virus which will occupy it. For example, a virus with closed-circuit TV monitors will not be fooled that it is hooked into a starship when it sees that a simple box has been hooked up to one of its data ports. On the other hand, a virus which inhabits a system with no external viewing system against which to check incoming electronic data will be easier to fool. Note that sometimes the capsule will catch the consciousness of the virus itself, while other times it will only catch a copy, depending upon the mode of operation of that virus.

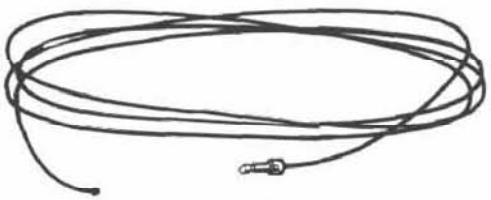
The construction of a virus capsule usually requires one or more computers of the type that the virus will be tempted into invading, plus parts from the peripheral systems that the capsule is intended to simulate.

As a rule of thumb, a capsule costs the same as the system hosting the virus that is to be captured, and allows a Difficult test of Computer to capture at least a copy of the virus. Each doubling or halving of this price decreases or increases the task difficulty by one level.

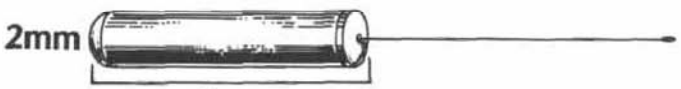
Lightning Bolt



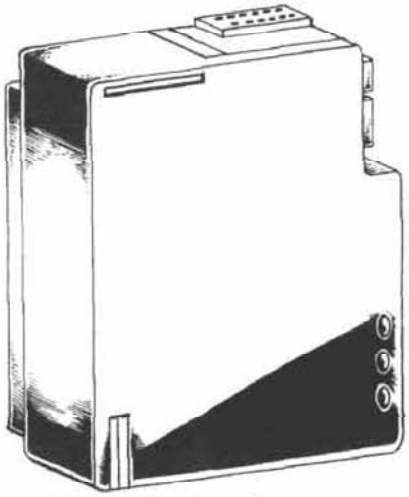
A lightning bolt is a reuseable device that is intended to send a massive power surge through a data network suspected (or proven) to contain Virus. This is a device of last resort, because it does irreparable damage to all electronic systems that are wired into the data system.



A lightning bolt is typically used to eradicate Virus from a system that presents a clear danger to friendly forces that outweighs any hopes of recovering or reconditioning the system. When an infected system is identified as fulfilling these criteria, a lightning bolt is more effective than simply shooting holes in the computer, as the electrical pulses follow the infected circuitry, burning them out as they go.



A lightning bolt will not always be effective, as a sophisticated virus will have set up fire breaks and other protective mechanisms within its system. Using a lightning bolt to kill Virus is a Difficult test of Computer or Electronics. As a rule of thumb, the task should become one level easier or harder for each tech level by which the lightning bolt exceeds or is exceeded by the host computer, respectively. In addition, greater or lesser levels of sophistication of the host computer will also make the task harder or simpler. For example, a virus inhabiting an automated parking ticket machine would be much easier to kill than one inhabiting an expert aerospace traffic control data network.



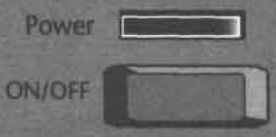
TL	*Mass (tonnes)*	*Volume (m^3)*	*Cr*
8	1.75	1.325	7450
9	1.3	1.1	6400
10	1.02	1.05	5600
11	0.82	1.04	5640
12	0.71	1.08	6035

Covert Operations Equipment

Covert Operations Equipment

This equipment is distributed only to RCES covert operatives and is not easy for free-lancers to come by.

Bug: This device is a very small, sound-activated remote microphone used to monitor conversations without the participants being aware of it. The technical details vary, but the most common variety used by RCES covert operatives is a cylinder 2mm in diameter and 8mm long, with a 15mm-long "whisker" antenna. Bugs are planted using a small dispenser (designed to hold 24) which sticks the bug in place with a powerful adhesive, activating it at the same time. Broadcast range is small, and bugs are usually used in conjunction with another device that receives their signal (see the monitor/booster on the facing page). Duration is limited (1D6+4 hours), and the bug will pick up normal conversation at a range of 2-3 meters.



Simple bugs such as these are relatively easy to locate with the proper instruments, since they broadcast constantly (finding one is Average versus Electronics with an electronics tool kit, Difficult otherwise). A careful search without electronics expertise can locate them if they are not well concealed (a matter for referee's judgment). Their chief advantage is that the dispenser is easy to conceal in the hand, and a bug can be planted very rapidly (in one 5-second turn).

The quantity and nature of any information gathered is up to the referee.

TL: 8
Mass: Negligible
Range: 6 meters (short range)
Price: Cr240 (dispenser and 24 bugs)

Date

Improved Bug: This device is an improvement in bugging technology. A 0.1mm-diameter filament is run from the room to be bugged to the main unit (which can be a more powerful radio or the monitor/booster described below) up to 10 meters away. The filament cable can be threaded through ventilator shafts, conduits, pipes, and can even be concealed in a thick coating of paint. Only the end of the cable needs to be in the room being bugged, and this end picks up normal conversations within 2-3 meters. This type of bug is more difficult to detect because it is a closed-circuit system, and never broadcasts (finding one is Difficult versus Electronics with an electronics tool kit, Formidable otherwise).

The quantity and nature of any information gathered is up to the referee.

At TL-10, the audio cable is replaced with a fiber-optic cable of the same dimensions capable of picking up light as well as sound. Resolution depends on the light available, and can be subjected to computer enhancement under some conditions.

TL: 8 (audio) 10 (video)
Mass: Negligible
Price: Cr100

Bug Monitor/Booster: This is a small device that receives the weak signals from a bug (either broadcast or closed circuit), amplifies them, and records them. If hooked into a building's power supply, it can operate indefinitely; otherwise it needs to be recharged or replaced every 72 hours.

The unit can be set to dispose of its recordings at regular intervals or in response to a coded signal. In either case, it compresses the data into a single, high-speed "squirt" that lasts only a few seconds. The small radio in the unit can send this signal to the limits of its range, or the unit can be hooked into a wire-based system of some kind. In some cases, it may be feasible for the operative to retrieve the unit's data personally. This unit can be linked to any communicator or data-recording device.

TL: 8
Mass: 0.1 kg
Range: 500 meters
Price: Cr500

Pen Pistol: Covert operatives often need concealed firearms, and this one can be taken as typical of them all. Small enough to be concealed in a writing implement or other similar-sized object, the weapon requires a full turn to prepare for firing or return to its safe mode, but it can be held ready to fire for as long as desired. The weapon is capable of firing all standard 5×27mm rounds, but tranq is the round of choice, as the performance of other rounds from a barrel this short is less than desirable.

The pen pistol is a single-shot weapon, but the body of the pen is long enough to accommodate a second round as a spare (this round must be individually loaded, and thus does not count as a magazine).

A pen pistol can stand up to a cursory examination, and will actually write for a short time, but a close examination will reveal it for what it is (it is heavier than a normal pen, for example). It is constructed entirely of non-metallic materials, to make it more difficult to detect.

TL: 8
Ammo: 5×27mm-8
Weapon Weight: 0.277 kg loaded, 0.273 empty
Weapon Price: Cr114 (normally available only through RCES sources)
Ammunition Price: Cr0.16 (Ball), Cr0.32 (HE, DS, Tranq), Cr0.48 (HEAP)

						— Recoil —		
Round	*ROF*	*Dam Val*	*Pen Rtg*	*Bulk*	*Magazine*	*SS*	*Burst*	*Short Range*
5×27mm Tranq	SA	–1*	Nil	0	1i	5	—	4

*1D6–1 points of damage plus tranq effect on TNE, page 350

Spy Camera: One of the spy's most useful tools is the camera. The model issued by the RCES is 1cm thick, 2.5cm high, and 7 cm wide. It stores photos electronically, and is designed to work in low light at a range of between 0.2 and 0.7 meters (it is primarily intended for documents, and thus not very good at longer distances). The camera can store about 100 color or 500 black-and-white photographs, and was designed to photograph documents as large as half a square meter with good resolution. Standard data links permit the photos to be by a cable transferred to a hand computer or other data-recording device.

TL: 8
Mass: Negligible
Price: Cr325

Laser Microphone: This device bounces a beam of laser light off a rigid object, and detects the sounds made near that object by analyzing the changes in the reflected beam. The harder the object, the more readily it conducts sound, and the closer it is to a given conversation, the better the sound quality (a glass window pane or a metal hatch are perfect, concrete or brick walls less so, and insulated walls are very poor). The target object (but not necessarily the conversation to be monitored) must be within direct line of sight.

The device is about the size of a bulk 1 pistol, and can be connected by a cable to a hand computer or other data-recording device. A pair of headphones or a data headset can also be attached to the device for real-time monitoring of conversations.

TL: 9
Mass: 0.8 kg
Range: 500 meters (short range)
Price: Cr475

Filter mask

HOSTILE ATMOSPHERE SURVIVAL EQUIPMENT

Not all atmospheres are breathable by humans without assistance. Some atmospheres are too thin to sustain human metabolisms, while others contain impurities or contaminants which prove fatal to humans in the short or long term. These difficulties can be addressed by the use of specialized breathing gear which allow humans to function indefinitely in these environments.

Very thin atmospheres (atmosphere codes 2 and 3) require the use of a respirator, which compresses the thin atmosphere to breathable levels.

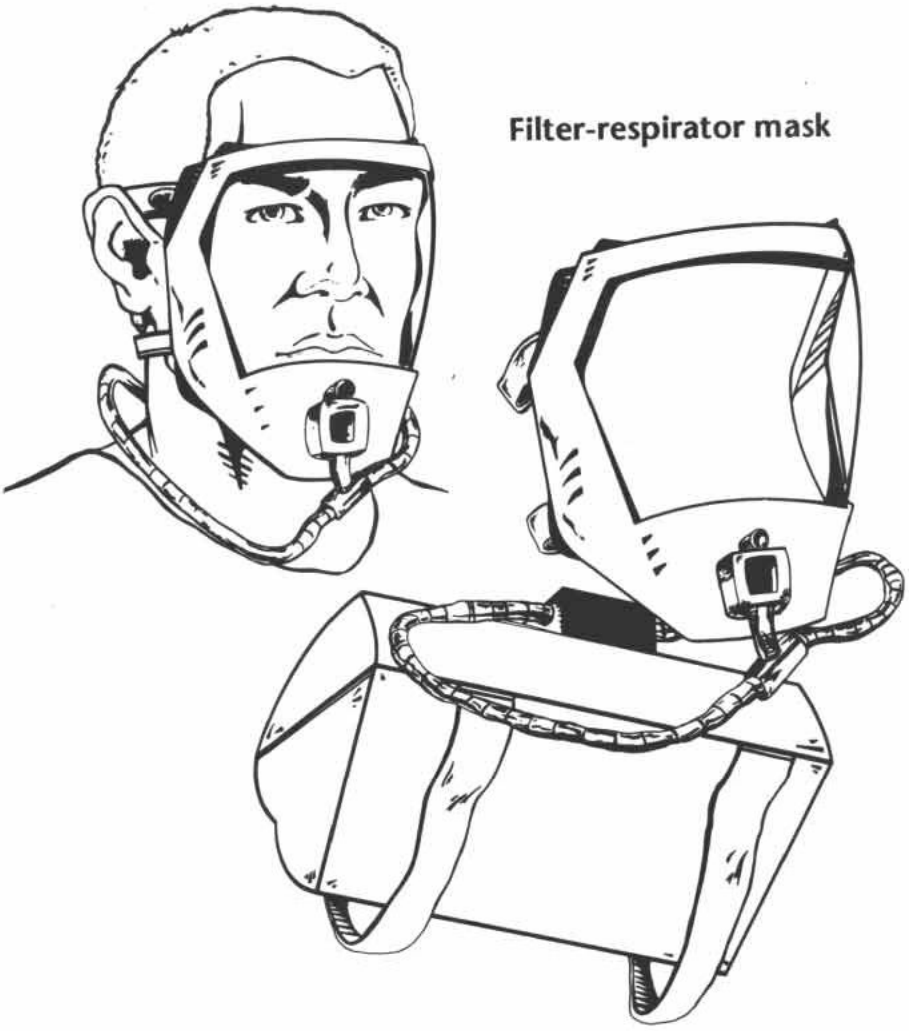
Tainted atmospheres (atmosphere codes 2, 4, 7, and 9) require the use of filter masks to remove the contaminants from the atmosphere before it is inhaled. Simple tainted atmospheres do not require any skin protection, but the contaminant in some tainted atmospheres is so severe that it affects exposed skin, and is called an irritant atmosphere. Irritant atmospheres require the use of protective masks.

Note that atmosphere code 2 is both very thin and tainted, and requires the protection of a respirator and a filter mask.

For more discussion of atmosphere codes and their significance, see **TNE**, pages 180-195.

Because of their low tech level of manufacture, these items are considered to be universally in use by the Coalition, and the Wilds, both as newly manufactured devices and as relics.

Filter Mask



A filter set which allows an individual to breathe tainted atmospheres. This mask makes use of a combination of activated charcoal and other filters at the lowest tech levels, but more advanced filter materials come into use at higher tech levels of manufacture.

TL: 3
Volume: 1 liter
Weight: 0.5 kg
Price: Cr10

Respirator

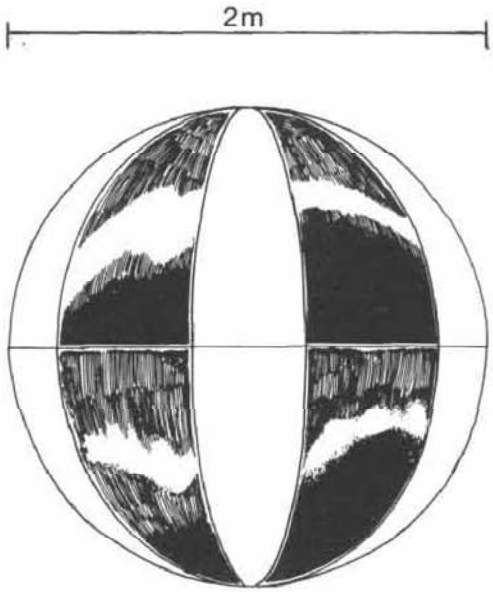
Also called a compressor mask, the respirator is a small compressor which allows an individual to breathe in very thin atmospheres. The atmosphere is drawn into a small chamber and held briefly until inhaled. Exhalations are vented to the outside by means of a check valve system that maintains internal pressure. A pair of earplug/seals are provided to prevent damage to the user's eardrums while permitting normal hearing.

TL: 5
Volume: 1 liter
Weight: 0.5 kg
Price: Cr100

Filter Respirator Combination

A combination filter mask and respirator which allows breathing of very thin, tainted atmospheres. It shares all characteristics of both systems.

TL: 5
Volume: 1 liter
Weight: 0.5 kg
Price: Cr150



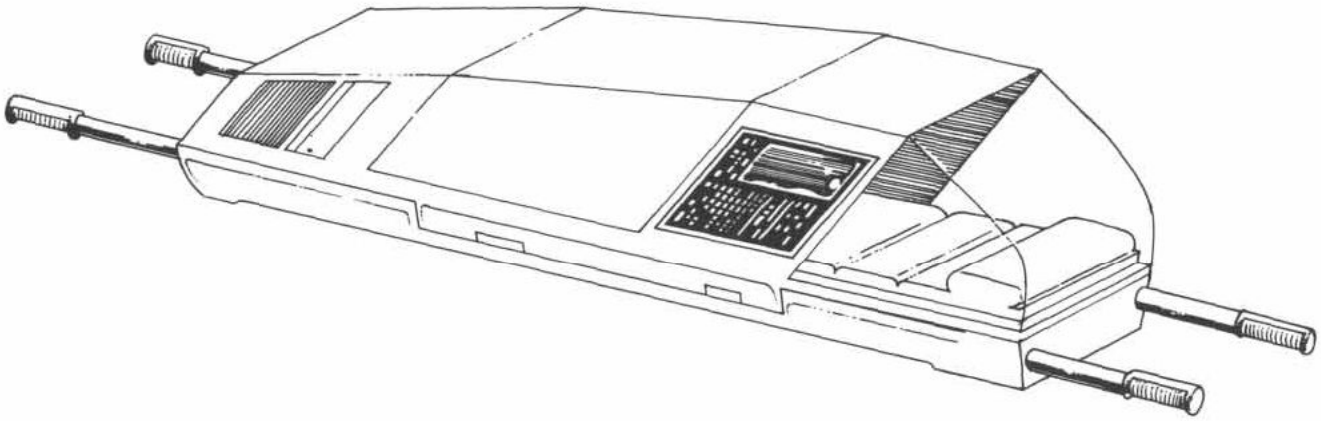
Protective Mask

For use in irritant atmospheres, the protective mask covers the wearer's mouth, nose, and eyes, and it hooks up to an oxygen supply, which makes it ideal for use in atmospheres containing trace amounts of skin irritants such as ammonia, sulfur compounds, or chlorine. This mask can be used in thin and very thin atmospheres, but not in a vacuum.

TL: 6
Volume: 1 liter
Weight: 0.5 kg
Price: Cr25

Rescue and Medical Equipment

Rescue Equipment



Ball, Rescue: Standard on all RCES and RCN vessels and on most private ships as well. When folded, the rescue ball is a cylinder 5 cm in diameter and 10 cm long. When deployed, it forms a sphere 1 meter in diameter which contains air sufficient to last one person for two hours. In the event of explosive decompression or other loss of air, a rescue ball allows an individual not in possession of a vac suit to survive until aid arrives. The user pulls a lanyard, climbs inside, seals the zip closure, and activates the compressed air bottle which inflates the ball.

The ball is made of a metal-coated plastic film for ease of location by radar and contains a bottle of compressed air, a first-aid kit (the personal medical kit described in the basic rules on page 334), a patching kit for minor punctures, and a transparent window through which the occupant may observe conditions outside the ball. Rescue balls provide some protection from stellar radiation and corrosive and insidious atmospheres for 5 to 7 hours (longer than the ball's air supply). The ball has several loops on the outside enabling balls to be linked together, tethered to one spot, or attached to a line for towing.

TL: 7
Volume: 1 liter (storage volume), 4.2 kl (deployed)
Weight: 5 kg
Price: Cr150

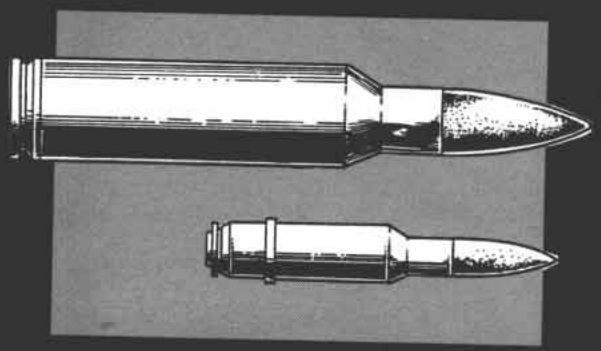
Survival Bubble: A large (2-meter-diameter) plastic sphere with alternating clear and opaque panels, a small oxygen tank (capable of supporting three occupants for two hours) for inflation, a patching kit for minor punctures, and three first aid kits (the personal medical kit described in the basic rules on page 334). Access to the interior is through a conforming plastic seal which functions similarly to an air lock (although $^1/_2$ person-hour of air is lost each time this is used in a vacuum or thin atmospheres). The bubble can be used for life support in a vacuum (it can be moved by walking on the inside, treadmill fashion assuming there is gravity), and it can also be used for protection against weather or as a lifeboat on a sea surface. The bubble is fairly robust and difficult to puncture accidentally, but it has no armor value.

TL: 9
Volume: 8 liters (storage volume), 33.5 kl (deployed)
Weight: 8 kg
Price: Cr600

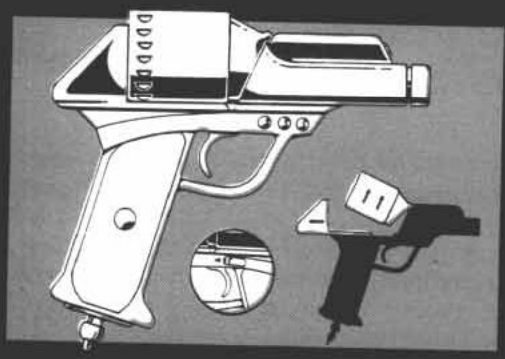
Portable Automed: This is a smaller, less capable version of the standard automed. It is designed to stabilize a critically wounded patient for one hour, until he or she can be transported to better facilities. The portable automed has handles which permit it to be carried by two persons.

When placing a patient in a portable automed, the operator must place a respirator mask in place over the patient's face, attach a monitor/autoinjection sleeve in place using a self-adhesive patch, and close the lid. The automed then floods itself with a medical aerogel which stops bleeding, maintains temperature and blood pressure, disinfects, and in conjunction with drugs injected through the autoinjection sleeve, stabilizes the patient. If the patient's vital signs drop below a preset level, the device will initiate resuscitation procedures.

The portable automed provides no medical modifier; it simply prevents critically wounded characters from dying for one hour.



The portable automed pictured is usable with bipedal human-sized sentients, provided the correct recharge unit is used. Non-bipedal aliens or those larger than humans (Hivers, Schalli, etc.) require a portable automed of different construction.



TL: 12
Volume: 2 m^3
Weight: 0.15 tonnes (not including patient)
Price: MCr0.05

Automed Recharge Unit: The drugs, aerogel, and other supplies in the automed are contained in a prepackaged recharge unit which is used up in treating one patient, and must be replaced before the automed can be used again. These recharge units are specific to each sentient race treated, and four separate types are available for the standard humanoid portable automed (Human, Droyne, Vargr, and Aslan). The portable automed used in RC service is copied from the old Imperial design, but Aslan and Vargr recharge units are not manufactured in the RC as these races are currently unknown in the area.

Volume: 0.1 m^3
Weight: 0.015 tonnes
Price: Cr7500

WEAPONS

WEAPONS

The weapons considered in this section consist of personnel-carried small arms, heavy infantry support weapons, personnel-carried antiarmor and antiaircraft guided missiles, and ground-based planetary defense (surface-to-orbit) missiles. These small arms include pistols, rifles, shotguns, and submachine guns, and these weapons are based on chemical slug-firing, electromagnetic slug-firing, laser, and plasma and fusion (high-energy) technology. Heavy weapons include rapid-fire antipersonnel weapons and antiarmor weapons. These are based on these same technologies, and include grenade- and rocket-launching projectile weapons.

Data Format

The small arms entries present their information in three sections.

First is a text introduction describing the background and history of the weapon. This section will explain such details as which groups and organizations use the weapon, how the weapon functions and is typically used, and its availability.

The second section shows the physical characteristics of the weapon, usually its mass, length, and cost, plus other details such as ammunition type and muzzle energy or pulse energy, depending upon the exact nature of the weapon. This section also includes the important characteristics of the weapon's ammunition: its dimensions, price, mass, and the details of the ammunition magazines: mass, price, and capacity in rounds of ammunition.

Finally, the weapon's combat performance characteristics are shown in terms of the **TNE** planetary combat rules. These include rate of fire (*ROF*) in shots per 5-second combat turn, damage value (*Dam Val*), penetration rating (*Pen Rtg*), bulk, magazine capacity (*Magazine*), single-shot (*SS*) and burst recoil, and short range in meters, and are presented in the standard tabular format shown below. Note that each line is for a different type of round fired from the gun. Although some factors such as ROF and magazine capacity are constant for all rounds, other characteristics vary from round to round.

						— Recoil —		
Round	*ROF*	*Dam Val*	*Pen Rtg*	*Bulk*	*Magazine*	*SS*	*Burst*	*Short Range*
10mm Ball	SA	2	Nil	1	14	3	—	5

Round types are ball (standard solid slug), HE (high-explosive), HEAP (high-explosive armor-piercing), DS (discarding-sabot), tranq (tranquilizer), and flechette (multiple-round finned darts); *ROF* abbreviations are the standard codes from **TNE**, page 272; *Dam Val* and *Pen Rtg* are discussed on **TNE**, page 285; Bulk is explained under "Resolving Ties" on **TNE**, page 265; *Magazine* codes are discussed on **TNE**, page 272, but no letter always indicates a box magazine; Recoil is discussed on **TNE**, pages 275-277; *Short Range* is discussed on **TNE**, page 275. Some short range listings show an iron sight range; this is shown when a weapon has an integral sighting device installed and shows the short range if that sighting device were to be removed (see **Fire, Fusion, & Steel** for further details).

Sometimes there is more than one line for each round, as the addition of bipods or tripods will change the recoil rating and range, and the addition of other equipment to the weapon will change its weight, and therefore its recoil values.

Shotguns and weapons which fire flechettes have multiple lines for each shotgun and/or flechette round because these rounds perform differently at short and medium+ ranges. On the medium+ line they also have an additional parenthetical listing with their ROF value which shows the burst size in number of rounds. See **TNE**, pages 279-80, for further details.

Some heavy weapons and missiles, depending upon their characteristics and function, may add the following additional characteristics: penetration value (*Pen Val*, discussed on **TNE**, pages 296-7), concussion and burst ratings (*Con-Brst*, or C:, B: listed under *Damage*, see **TNE**, page 283), danger space (*Dngr Spc*, **TNE**, page 279-80), indirect fire range (*IFR*, see **TNE**, page 280), maximum range (**TNE**, page 278), combat move (*Cbt Move*), and agility (**TNE**, page 295), and substitute reload time (*Rld*), in 5-second combat turns, for ROF.

Lasers add a table to adjust laser performance for different atmosphere types—details are on page 89.

Most weapons have their size described in terms of mass, usually in kilograms or tonnes, where 1000 kg = 1 tonne. Unless volume is listed separately, weapons typically have a volume in liters equal to their mass in kg (an equivalent expression is *volume in cubic meters is equal to mass in tonnes*).

Some exceptions to this include high-energy weapons and magazines.

For high-energy weapons (plasma and fusion guns), the volume of their firing units and support hardware in liters is equal to mass in kg times 0.5 (volume in cubic meters = mass in tonnes × 0.5). All other components of high-energy weapons (except their magazines, see below) have a volume of 1 liter per kg (1 m^3 per tonne).

Magazines, which carry dense cartridges, are figured in a different way. For purposes of determining volume, there are three types of magazines: slug-firing cartridge magazines, high-energy weapon (pulsed power cartridge) magazines, and chemical laser cartridge magazines.

Slug-firing magazines have a volume in liters equal to the mass in kg of a full load of carried rounds times 0.5 (volume in m^3 = mass of rounds in tonnes × 0.5). High-energy weapon magazines have a volume in liters equal to the mass in kg of a full load of rounds times 0.25 (volume in m^3 = mass of rounds in tonnes × 0.25). Chemical laser cartridge magazines have a volume in liters equal to the mass in kg of a full load of rounds times 0.2 (volume in m^3 = mass of rounds in tonnes × 0.2).

Small Arms Ammunition Designation

Ammunition is given two similar designations, a technical designation, and a common designation.

Technical Designations: In the technical designation system used by the RC, ammunition is identified by its diameter and the cartridge case length in millimeters (5×22mm, 7×57mm, etc.), sometimes followed by additional descriptive codes (9×24mm-5, 5.5×45mmE) representing other important characteristics.

The designation E identifies the ammunition as using ETC (electrothermal chemical) propulsion. For example, 7×46mmE indicates an ETC round 7mm in diameter with a 46mm case length. ETC rounds have a small band around their cartridge cases, to prevent them from chambering in non-ETC guns of the same caliber.

A number following a dash indicates the tech level of the ammunition. For example, the two 9mm pistol rounds 9×20mm-4 and 9×20mm-6 are manufactured for different weapons and are different rounds (that is, their chamber pressures are radically different), even though their diameter and case length are the same. In most cases, there is little danger of confusion, and the TL designator is omitted.

Because gauss rounds do not have a cartridge case, the designation indicates the length of the projectile instead of the case length. Often, gauss rounds will carry a further number, following a slash in the designation, indicating the muzzle velocity in hundreds of meters per second at which a weapon fires the round. All 4mm gauss rounds used by the Coalition are 4×20mm, for example, but those fired from the gauss pistol are sometimes labeled 4×20mm/15, those from the gauss rifle 4×20mm/35, and those fired from the VRFGG 4×20mm/60, indicating muzzle velocities of 1500, 3500 and 6000 mps respectively.

Ball, Dart, slug, HE, HEAP, DS, and so on are used to designate various specialized classes of projectile. These names are fully explained in **Fire, Fusion, & Steel**, and will not be discussed here.

Common Designation: Ammunition in common parlance seldom uses the full technical designation. Also, the same type of ammunition may have several different common designations used in different circles. Common designations use the diameter in millimeters and a descriptive abbreviation. The round fired in the Coalition's standard ACR is technically designated 7×46mmE-10, but is also called 7mm RC(E) (the Coalition name indicating an electrothermal chemical round), 7mm ACR (a common name indicating the weapon it is most commonly used in), or 7mm ImpE (the old Imperial designation for the round, indicating an ETC round).

Note that most standard RC rounds are merely newly manufactured standard Imperial rounds with a new name. This is because of the large amount of relic Imperial ammunition and small arms that can be recovered. Military units can often "live off the land" by recovering relic ammunition and weapons of a common caliber. For ease of supply and standardization, adopting the old Imperial standards cannot be beat.

The following should help sort out the bewildering plethora of names, numbers, and abbreviations. The rounds are listed according to their technical designations, but the entries for each round include other designations and indicate which weapons the round is used in.

Note in these ammo entries that *average* muzzle energy is the energy inherent to the round itself. The muzzle energies listed with the weapons entries are the *actual* muzzle energies when fired from those weapons. Actual muzzle energy varies from average muzzle energy depending on barrel length; see **Fire, Fusion, & Steel** for more information. Gauss rounds have no inherent muzzle energy; this depends entirely on the weapons which fire them.

Some of the ammunition shown on the following pages do not correspond to weapons in this book; they are used with weapons shown in the **TNE** basic rules, pages 351-353.

13×75mm-6

15×75mmE-9

18×90mm-10

20×35mm-8

Small Arms Ammunition

4×20mm Gauss
Common Designation(s): 4mm Gauss
Average Muzzle Energy: N/A
Weapons: 4mm gauss pistol, 4mm gauss rifle, 4mm gauss SAW, 4mm VRF GG (Veh), 4mm VRF GG (MP)
Comments: Gauss pistols are scarce in the Coalition, but 4mm gauss rifles and support weapons such as the SAW and VRF gauss gun are becoming more common. VRF gauss guns are often used as the primary armament on troop carrier grav APCs. An interesting side note concerning gauss weapons, the bores are not perfectly circular as with other weapons, but are machined out with small slits to accommodate the round's stabilizing fins.

5×22mm-5
Common Designation(s): 5mm Pistol, 5mm Short
Average Muzzle Energy: 138 joules (Tranq: 83 joules)
Weapons: 5mm revolver
Comments: This cartridge was originally developed in pre-Collapse times as a sporting round for small game and target shooting. It is encountered primarily as a secondary weapon in the hands of ill-equipped militias.

5×27mm-8
Common Designation(s): 5mm BP, 5mm Long
Average Muzzle Energy: 233 joules (Tranq: 140 joules)
Weapons: 5mm body pistol
Comments: The body pistol is a common "hideout" weapon throughout charted space, and the cartridge it fires is equally common. A number of "spy" type clandestine weapons (firearms concealed in writing implements, cameras, and the like) are chambered for this round.

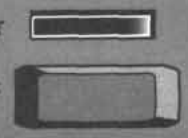
5×50mm-7
Common Designation(s): 5mm Imperial, 5mm RC
Average Muzzle Energy: 1571 joules (Tranq: 943 joules)
Weapons: 5mm assault rifle, 5mm LMG, 5mm rotary (tech levels 7 and 8).
Comments: The Coalition still makes use of this cartridge in its 5mm rotary weapons, but these are gradually being phased out in favor of a weapon firing the 5.5mmE-9 round. Other weapons chambered for this round are common on less-developed worlds throughout the Wilds.

5.5×45mmE-9
Common Designation(s): 5.5mm RC(E)
Average Muzzle Energy: 4448 joules (Tranq: 2669 joules)
Weapons: 5.5mm assault rifles, 5.5mm Rotary
Comments: This round is the standard small rifle cartridge for the Coalition.

7×23mm-5
Common Designation(s): 7mm Short
Average Muzzle Energy: 283 joules (Tranq: 170 joules)
Weapons: 7mm revolver
Comments: Weapons firing this pre-Collapse round are found throughout the Wilds as a secondary weapon equipping low-technology armed forces and used by civilians for personal defense.

7×26mm-5
Common Designation(s): 7mm Carbine
Average Muzzle Energy: 1281 joules (Tranq: 769 joules)
Weapons: 7mm carbine, 7mm carbine (folding stock), 7mm carbine (civilian)
Comments: Carbines are primarily used by vehicle crews and others whose primary job does not require a full rifle, but from time to time need more effective armament than a pistol. Civilian weapons firing this round were originally developed as sporting weapons and to arm settlers in remote areas.

7×30mm-6
Common Designation(s): 7mm Pistol, 7mm Long
Average Muzzle Energy: 416 joules (Tranq: 250 joules)
Weapons: 7mm autopistol
Comments: Another pre-Collapse pistol round, sometimes used by paramilitary police organizations.



7×30mmE-10
Common Designation(s): 7mm ACR, 7mm ETC Imperial, 7mm RC(E)
Average Muzzle Energy: 4803 joules (Tranq: 2882 joules)
Weapons: 7mm advanced combat rifle, 7mm Coalition Multipurpose Weapons System
Comments: This round is the standard ACR cartridge for the Coalition, and is based on the pre-Collapse Imperial ACR round.

7×44mm-7
Common Designation(s): 7mm AR, 7mm Guild
Average Muzzle Energy: 2709 joules (Tranq: 1625 joules)
Weapons: 7mm assault rifle
Comments: Weapons using this cartridge are widely used by local armed forces throughout the Wilds.

7×57mm-5
Common Designation(s): 7mm Imperial Rifle, 7mm RC Rifle
Average Muzzle Energy: 2808 joules (Tranq: 1685 joules)
Weapons: 7mm rifle, 7mm rifle (civilian), 7mm autorifle, 7mm MMG, 7mm LMG, 7mm rotary (tech level 7).
Comments: This round is commonly used in many armed forces throughout the Wilds, and is used in some of the Coalition's 7mm rotary weapons (although these are in the process of being replaced by weapons chambered for the 7×30mmE-10 cartridge used in the 7mm advanced combat rifle).

7×64mm-8
Common Designation(s): 7mm RC Rotary
Average Muzzle Energy: 4335 joules (Tranq: 2601 joules)
Weapons: 7mm rotary (tech level 8).
Comments: This cartridge was developed for use in rotary weapons, and no other weapons make use of it. These weapons are widely used by the Coalition, but will ultimately be replaced by weapons chambered for the 7×30mmE-10 cartridge used in the 7mm advanced combat rifle.

Security Clearance
Yes No
28 IX 1201
Date

7.5×50mmE-9
Common Designation(s): 7.5mm RC(E)
Average Muzzle Energy: 8482 joules (Tranq: 5089 joules)
Weapons: 7.5mm MMG
Comments: This round was developed by the Coalition for use in 7mm MMGs, but the only weapons using it so far are coaxial MGs on Coalition AFVs.

7.6×15mmE-9
Common Designation(s): 7.6mm Super-pistol, 7.6mm RC(E)
Average Muzzle Energy: 653 joules (Tranq: 392 joules)
Weapons: 7.6mm autopistol, 7.6mm SMG
Comments: This round was developed by the Coalition for use in SMGs and is the standard-issue sidearm for starship crewmembers.

9×20mm-4
Common Designation(s): 9mm Short
Average Muzzle Energy: 356 joules (Tranq: 214 joules)
Weapons: 9mm revolver-4, 9mm revolver-5
Comments: Revolvers chambered for this round are in use by low-tech armed forces, police agencies, and paramilitary forces throughout the Wilds. This round can be used in weapons chambered for 9×20mm-6 rounds, but at a loss in performance (see the weapon's listing on page 47).

9×20mm-6
Common Designation(s): 9mm Imperial, 9mm RC Pistol
Average Muzzle Energy: 458 joules (Tranq: 275 joules)
Weapons: 9mm autopistol
Comments: Automatic pistols chambered for this round are in use by low-tech armed forces, police agencies, and paramilitary forces throughout the Wilds. It can be used in weapons designed for the 9×20mm-4 round (these weapons are not presented in this book), but is too powerful for them, and will ultimately damage these weapons (see the discussion of overpowered cartridges in the Rules Expansion section).

9×24mm-5
Common Designation(s): 9mm Guild
Average Muzzle Energy: 489 joules (Tranq: 293 joules)
Weapons: 9mm SMG, 9mm folding stock SMG
Comments: This round is primarily used by the Mercantile Guild in SMGs and its "Deck-Sweeper" boarding weapon.

9×33mm-5
Common Designation(s): 9mm Imperial Magnum, 9mm Guild Magnum
Average Muzzle Energy: 672 joules (Tranq: 403 joules)
Weapons: 9mm magnum revolver
Comments: Revolvers using this cartridge are primarily used by low-tech police agencies and by civilians. Guild crews prefer this weapon as a sidearm.

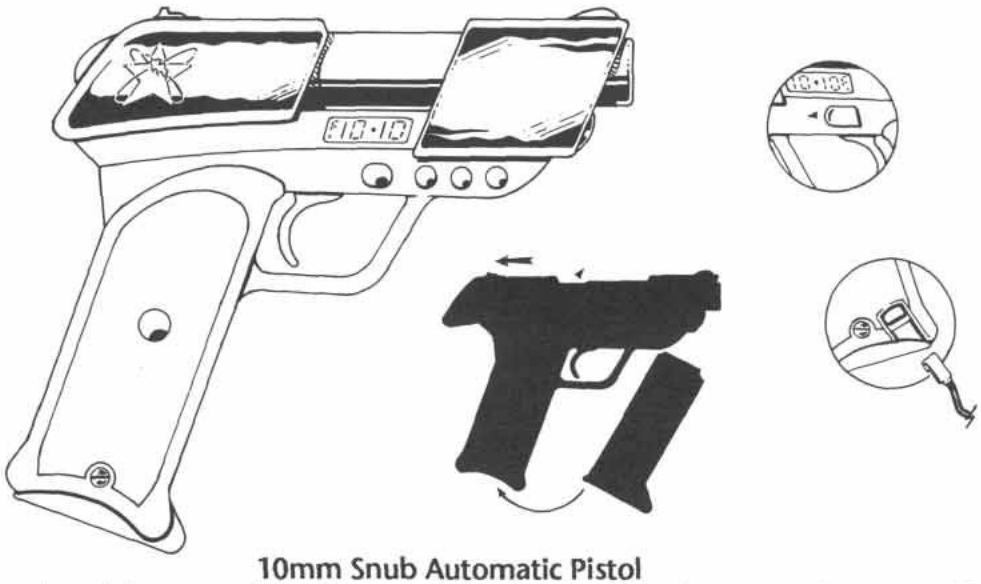
9×44mm-7
Common Designation(s): 9mm Rifle
Average Muzzle Energy: 4479 joules (Tranq: 2687 joules)
Weapons: 9mm rifle
Comments: This cartridge and the weapons using it were developed prior to the Collapse for hunting large game animals. The Mercantile Guild sells both the weapons and the ammunition for them to TEDs throughout the Wilds.

10×17.5mm-8
Common Designation(s): 10mm Pistol, 10mm Imperial Navy
Average Muzzle Energy: 605 joules (Tranq: 363 joules)
Weapons: 10mm snub revolver, 10mm snub auto
Comments: This cartridge pre-dates the Collapse, and weapons chambered for it are used by Free Trader crewmembers throughout the Wilds.

12×45mm-5
Common Designation(s): 12mm Rifle
Average Muzzle Energy: 1629 joules (Tranq: 977 joules)
Weapons: 12mm hunting rifle
Comments: This cartridge and the weapons using it were developed prior to the Collapse for hunting large game animals. They are often encountered in the hands of low-tech military forces and militias.

13×75mm-6
Common Designation(s): 13mm RC, 13mm Imperial
Average Muzzle Energy: 14,336 joules (Tranq: 8601 joules)
Weapons: 13mm HMG, 13mm sniper's rifle
Comments: Many armies throughout the Wilds make use of this cartridge in a heavy machinegun and as a sniper's round. It is still in use with the Coalition in the latter capacity. The tranq round is used only against large animals.

14.5×146mm
Common Designation(s): 14.5mm Guild, 14.5mm AAR
Average Muzzle Energy: 31,008 joules
Weapons: 14.5mm AAR
Comments: This cartridge is used in the infamous "Crunch Gun," and is the bane of many an RCES landing team. The origin of this weapon is unknown, but it has been spread throughout the Wilds by Guild merchants, who sell the dies and machine tools for its manufacture to low-tech worlds to create a market for higher tech ammunition chambered for the weapon.



15×75mmE-9
Common Designation(s): 15mm RC(E)
Average Muzzle Energy: 55,135 joules
Weapons: 15mm HMG
Comments: This round is almost solely used in the Coalition's vehicle-mounted 15mm heavy machinegun (not included in this book), used by heavy assault troops.

18×70mm-4
Common Designation(s): 18mm Shotgun, 12 Gauge
Average Muzzle Energy: 2494 joules (Tranq: 1496 joules)
Weapons: 18mm pump shotgun, 18mm auto shotgun, 18mm double-barreled shotgun, 18mm sawed-off double-barreled shotgun
Comments: This round and the weapons designed for it predate the Collapse, and are common throughout the Wilds in civilian (hunting and personal defense), police, and military applications.

18×90mm-10
Common Designation(s): 18mm Long Shotgun Caseless, 18mm RC shotgun
Average Muzzle Energy: 5497 joules (Tranq: 3298 joules)
Weapons: 18mm assault shotgun
Comments: This round was developed for use in the Coalition's 18mm assault shotgun.

20×35mm-8
Common Designation(s): 20mm Imperial, 20mm RC, 2cm LAG
Average Muzzle Energy: 4838 joules (Tranq: 2903 joules)
Weapons: 2cm LAG
Comments: Based on a pre-Collapse design, this round is used in the Coalition's 2cm light assault gun. Weapons using it are also manufactured and sold throughout the wilds by the Mercantile Guild. Tranq round is used for very large animals.

10mm Snub Pistols

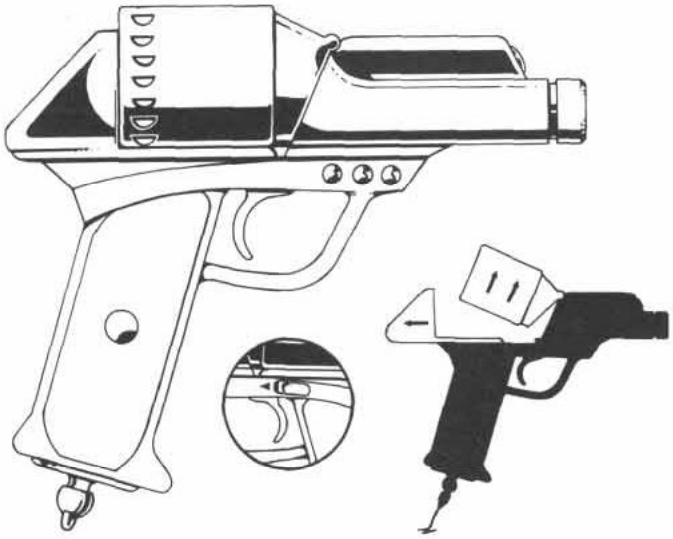
10mm Snub Automatic Pistol

Snub pistols are low-velocity weapons designed for use on shipboard and in zero-G environments, and are common sidearms for starship crewmembers throughout the Wilds. Because of the low muzzle velocity of these weapons, their ball round is of minimal effectiveness, and HE, DS, or HEAP rounds are preferred. The range of the weapons are woefully short compared to other pistols, but this is not considered a disadvantage in close quarters. The semiautomatic snub pistol uses the same ammunition as the snub revolver (10×17.5mm-8 cartridge). This page covers the automatic version of the snub pistol; see the facing page for the snub revolver.

The weapon is of conventional layout for an automatic pistol, and utilizes a 14-round detachable box magazine inserted in the pistol grip. An attachment point is provided for a lanyard, which many users find useful to prevent the weapon from drifting away in zero-G conditions

Because of its use in zero- and low-gravity combat situations, the snub pistol is sometimes fitted with an attached laser sight, a device which projects a red dot at the point of impact. Zero-G weapons training stresses a different firing stance than that used in conventional combat: The weapon is held close to the body at the center of mass (rather than at arms' length) to minimize recoil induced rotational motions.

HEAP rounds for this weapon are manufactured at TL-9 and above, and are designed not to exceed safe chamber pressures for the weapon.



TL: 8
Ammo: 10×17.5mm-8
Muzzle Energy: 484 joules (Tranq: 290 joules)
Weapon Length: 17 cm
Weapon Weight: 1.198 kg loaded, 1.044 empty (includes weight of empty box magazine)
Weapon Price: Cr160
Magazine Weight: 0.2728 kg loaded, 0.119 kg empty
Magazine Price: Cr10 empty
Ammunition Price: Cr0.44 (Ball), Cr0.88 (HE, DS, Tranq), Cr1.32 (HEAP) per round
Ammunition Weight: 11 grams per round
Features: None. TL-8 laser sight optional.

						— Recoil —		
Round	*ROF*	*Dam Val*	*Pen Rtg*	*Bulk*	*Magazine*	*SS*	*Burst*	*Short Range*
10mm Ball	SA	2	Nil	1	14	3	—	5
10mm DS	SA	2	1-Nil	1	14	3	—	7
10mm HE	SA	3	Nil	1	14	3	—	4
10mm HEAP-9	SA	3	2-2-2	1	14	3	—	4
10mm Tranq	SA	-1*	Nil	1	14	2	—	4

*1D6–1 points of damage plus tranq effect on **TNE**, page 350.

Attaching a laser sight adds 1 kg to the weapon's mass, Cr400 to the price, and changes the recoil to SS: 1, Burst: — for all rounds. It requires a different holster.

Power
ON/OFF

10mm HE

10mm HEAP-9

10mm Ball

10mm Tranq

10mm DS

10mm Snub Revolver

For a description of this pistol, see facing page.

The snub revolver uses the same ammunition as the snub semiautomatic pistol.

The weapon departs from conventional revolver design in that the cylinder hinges upwards for loading, and that the barrel lines up with the lowest chamber in the cylinder rather than the highest. It is rumored that this design reduces rotational torque in zero-G conditions, but tests have shown that the effect is minimal.

TL: 8
Ammo: 10x17.5mm-8
Muzzle Energy: 472 joules (Tranq: 283 joules)
Weapon Length: 17 cm
Weapon Weight: 0.981 loaded, 0.915 empty
Weapon Price: Cr117.8
Magazine: None. Speedloader available, 6 rounds weigh 0.066 kg or 66 grams
Ammunition Price: Cr0.44 (Ball), Cr0.88 (HE, DS, Tranq), Cr1.32 (HEAP) per round
Ammunition Weight: 11 grams per round.
Features: None. TL-8 laser sight optional.

						— Recoil —		
Round	*ROF*	*Dam Val*	*Pen Rtg*	*Bulk*	*Magazine*	*SS*	*Burst*	*Short Range*

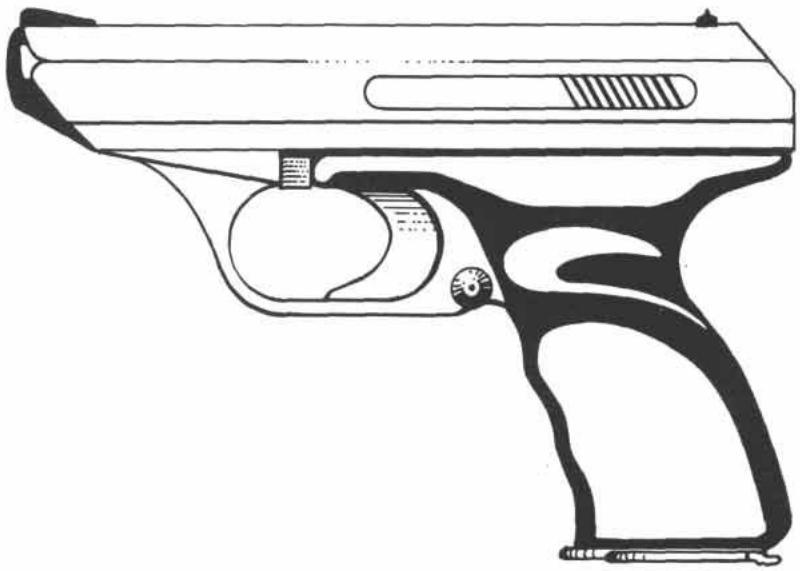
10mm Tranq	DAR	–1*	Nil	1	6R	3	—	4

*1D6–1 points of damage plus tranq effect on TNE, page 350.



Attaching a laser sight adds 1 kg to the weapon's mass, Cr400 to the price, and changes the recoil to SS: 1, Burst: — for all rounds. It requires a different holster.

Speedloaders

Speedloaders are small devices that hold a number of cartridges ready for rapid insertion into a revolver cylinder, enabling a revolver to be reloaded in a single turn regardless of how many rounds are to be inserted. Speedloaders are reusable, like magazines, but unlike magazines do not form part of the weapon. Speedloaders are uniquely designed for each pistol, and users normally carry 2-4 in a small snap pouch.

TL: 5
Mass: Negligible other than mass of ammunition
Price: Cr2 for all weapons

Automatic Pistols

7.6mm Autopistol

Pistols chambered for the 7.6mm RC(E) round have become the standard sidearm of the RCES and other Coalition forces, gradually replacing the earlier 9x20mm autopistols. Although the range is slightly less than that of the 9mm round, the 7.6mm round has superior penetration, less recoil, and the smaller ammunition means that more rounds can be carried in a magazine. The 7.6mm HEAP ammunition has good stopping power for a pistol, 7.6mm DS is preferred where range is important, but the 7.6 ball round is a good compromise between these two factors.

TL: 9
Ammo: 7.6x15mm RC(E)
Muzzle Energy: 653 joules (Tranq: 392 joules)
Weapon Length: 22 cm
Weapon Weight: 1.5093 kg loaded, 1.4233 empty (includes weight of empty box magazine)
Weapon Price: Cr476.3
Magazine Weight: 0.5828 kg loaded, 0.4968 kg empty
Magazine Price: Cr87.76
Ammunition Price: Cr0.11 (Ball), Cr0.22 (HE, DS, Tranq), Cr0.33 (HEAP)
Ammunition Weight: 5.4 grams per round
Features: None

Date

9mm Autopistol

Automatic pistols chambered for this round are in use by low-tech armed forces, police agencies, and paramilitary forces throughout the Wilds and with the Coalition as well. The Coalition military is phasing them out in favor of 7.6mm RC(E) pistols, which means that increasing numbers are becoming available to free-lancers.

Of the high-tech ammunition manufactured to TL-6 chamber pressures for this weapon, DS is the most common due to its superior penetration.

TL: 6
Ammo: 9x20mm-6
Muzzle Energy: 595 joules (Tranq: 357 joules)
Weapon Length: 24 cm
Weapon Weight: 1.018 kg loaded, 0.908 empty (includes weight of empty box magazine)
Weapon Price: Cr169.6
Magazine Weight: 0.2 kg loaded, 0.09 kg empty
Magazine Price: Cr1 (empty)
Ammunition Price: Cr0.4 (Ball), Cr0.8 (HE, DS, Tranq), Cr1.2 (HEAP)
Ammunition Weight: 10 grams per round
Features: None

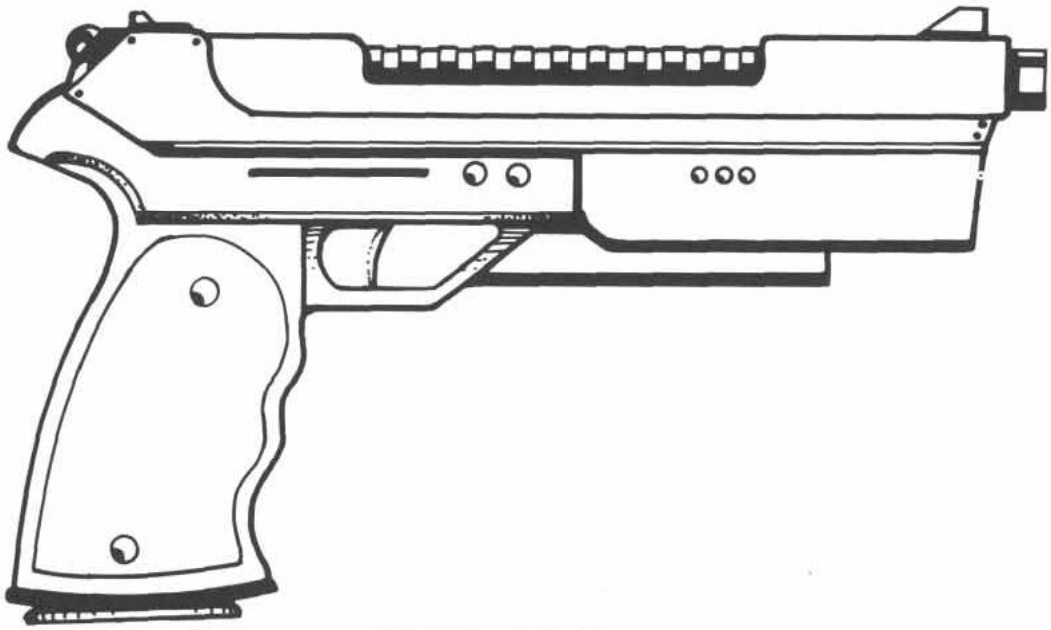
Holsters and Ammo Pouches

Few people want to carry weapons jammed into their hip pocket or tucked into their belt—holsters were created to make weapons easily portable and readily accessible.



Holsters for bulk 0 and bulk 1 weapons may be concealed under clothing, and can be carried at the wrist or ankle, the small of the back, the hip, or under the arm (known as a shoulder holster). Knives and daggers count as bulk 0 for this purpose, bayonets bulk 1, hatchets and blades bulk 2, and clubs bulk 3.

Holsters for bulk 2 and bulk 3 weapons are normally carried on the thigh, across the back, or hung under the shoulder, and while they may be covered by clothing, their bulges are unmistakable.

Weapons of bulk 4 and greater (including all melee weapons not detailed above) may not be carried in holsters.

Concealed Weapons: Holsters carried concealed under clothing can be detected by an intensive physical search ("frisking"), or via technical means such as metal detectors or chemical sniffers. Detecting a concealed weapon by a visual search is a Difficult: Observation task for bulk 0 weapons, Average for bulk 1 weapons.

Gauss and Body Pistols

4mm Gauss Pistol

All gauss weapons in Coalition service use the old Imperial standard 4mm gauss ammunition, which CSAARC (Committee for the Standardization of Armament and Ammunition in the Reformation Coalition) chose to adopt over the Hiver standard 5.5mm gauss round for various reasons which will not be discussed here. Since the technology required for their manufacture is more than the Coalition is presently capable of, gauss pistols in Coalition service are either relics salvaged from pre-Collapse arsenals, or newly manufactured weapons made using TL-13 receivers and magazine batteries imported from the Hivers.

The selective fire feature of this weapon and its large magazine capacity have made it a very popular sidearm within the RCES, and demand constantly exceeds the supply.

The gauss pistol can be fitted with a TL-10 laser sight which improves its accuracy and controllability at the expense of almost doubling the weapon's mass (loaded weight with laser sight becomes 1.285 kg).

TL: 13
Ammo: 4x20mm/15
Muzzle Energy: 563 joules (required power: 1013 joules)
Weapon Length: 22 cm
Weapon Weight: 0.785 kg loaded, 0.768 empty (includes weight of empty box magazine)
Weapon Price: Cr248.5
Magazine Weight: 0.2245 kg loaded, 0.207 kg empty
Magazine Price: Cr1.35 (loaded), Cr1 (empty)
Ammunition Price: Cr0.01 (Dart), Cr0.02 (HE, Tranq), Cr0.03 (HEAP)
Ammunition Weight: 0.5 grams per round
Features: Optional TL-10 laser sight

5mm Body Pistol

This weapon is a small, semiautomatic handgun designed to evade detection by most weapon detectors, and is a common "hideout" weapon throughout known space. A silencer is available, but when attached the weapon becomes bulk 1 instead of bulk 0. It requires three turns (15 seconds) to attach or remove the silencer. With a silencer, recoil is reduced to SS: 2, Burst: — for all rounds. Ball and tranq are the rounds most commonly used; the others are rarely seen.

Note that this weapon is specially made with all non-metallic components so that it is not susceptible to discovery by metal detectors. This standard of manufacture is quite expensive and must extend to all components of the weapon, including magazine and ammunition, so that all prices below are three times those of a metallic weapon of identical performance.

Covert operatives are occasionally equipped with disguised weapons firing this cartridge, but otherwise the weapon is not used by the Coalition, although it is occasionally found in the hands of free-lancers.

TL: 8
Ammo: 5x27mm-8
Muzzle Energy: 198 joules (Tranq: 118 joules)
Weapon Length: 14 cm
Weapon Weight: 0.662 kg loaded, 0.55 kg empty (includes weight of empty box magazine)
Weapon Price: Cr280.8
Magazine Weight: 0.1888 kg loaded, 0.077 kg empty
Magazine Price: Cr3
Ammunition Price: Cr0.48 (Ball), Cr0.96 (HE, DS, Tranq), Cr1.44 (HEAP)
Ammunition Weight: 4 grams per round.
Features: Optional silencer available.
Silencer Weight: 0.233 kg
Silencer Price: Cr141

* 1D6–1 points of damage plus tranq effect from **TNE**, page 350.

7mm Assault Rifle

This weapon is the most commonly used rifle among the armed forces serving the members of the Mercantile Guild. Weapons using this cartridge are also widely used by local armed forces throughout the Wilds. Both the Guild and the Coalition also make TL-8 ammunition (DS and HEAP rounds) designed with this weapon in mind.

TL: 7
Ammo: 7x44mm-7
Muzzle Energy: 2729 joules (Tranq: 1637 joules)
Weapon Length: 100 cm
Weapon Weight: 4.805 kg loaded, 4.325 empty (includes weight of empty box magazine)
Weapon Price: Cr920
Magazine Weight: 0.8064 kg loaded, 0.3264 kg empty
Magazine Price: Cr4
Ammunition Price: Cr0.32 (Ball), Cr0.64 (HE, DS, Tranq), Cr0.96 (HEAP)
Ammunition Weight: 16 grams per round
Features: Flash supressor, bayonet lug, rifle grenade adaptor

						— Recoil —

Short range in parentheses is the unrounded iron sight range.

7.6mm SMG

The 7.6mm SMG has replaced the various 9mm SMGs in Coalition service. The 7.6mm RC(E) round was one of the first rounds developed by CSAARC (Committee for the Standardization of Armament and Ammunition in the Reformation Coalition), and represents one of its greatest successes.

The round has the same stopping power as the 7.6mm autopistol, but at a greater range. Some users mix rounds in each magazine, loading a 3:1:1 ratio of ball, DS, and HE or HEAP rounds. Tranq rounds are seldom used in this weapon.

The weapon is short and easy to handle, and lends itself readily to the attachment of a TL-10 laser sight. With the sight attached, recoil becomes as noted on the table below.

TL: 9
Ammo: 7.6x15mm RC(E)
Muzzle Energy: 1110 joules (Tranq: 666 joules)
Weapon Length: 40 cm
Weapon Weight: 2.27 kg loaded, 2.11 empty (includes weight of empty box magazine)

Weapon Price: Cr844
Magazine Weight: 1.0822 kg loaded, 0.9202 kg empty
Magazine Price: Cr163.3
Ammunition Price: Cr0.11 (Ball), Cr0.22 (HE, DS, Tranq), Cr0.33 (HEAP)
Ammunition Weight: 5.4 grams per round
Features: TL-10 Laser Sight optional

						— Recoil —

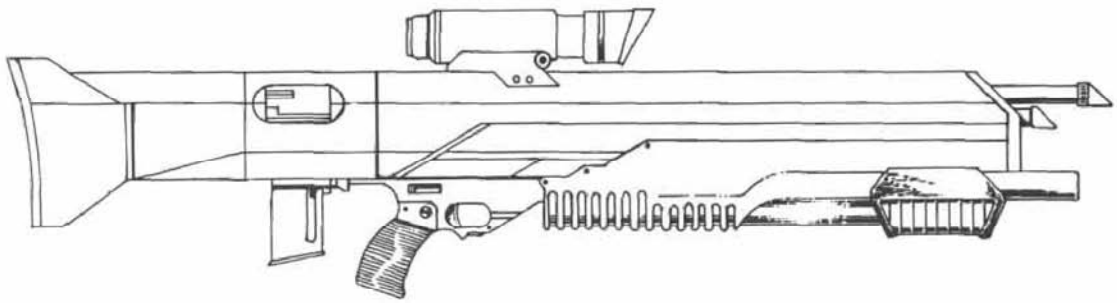
5.5mm Assault Rifle with Grenade Launcher

5.5mm Assault Rifle

The 5.5mm assault rifle represents one of CSAARC's (Committee for the Standardization of Armament and Ammunition in the Reformation Coalition) attempts to create a standardized weapon system unrelated to any previous ammunition type.The purpose of the design was to create an assault rifle with a larger magazine capacity than the 7mm ACR, but with the same overall mass. A secondary purpose was to create a weapon that could be completely manufactured at TL-9. The standard 5.5mm assault rifle achieves these goals.



The weapon features an optic sight, flash suppressor, bayonet lug, RAM rifle grenade adaptor, and sling swivels.

TL: 9
Ammo: 5.5x45mm RC(E)
Muzzle Energy: 4448 joules (Tranq: 2669 joules)
Weapon Length: 129 cm
Weapon Weight: 6.158 kg loaded, 5.828 empty (includes weight of empty box magazine)
Weapon Price: Cr1776
Magazine Weight: 1.3644 kg loaded, 1.0344 kg empty
Magazine Price: Cr160
Ammunition Price: Cr0.22 (Ball), Cr0.44 (HE, DS, Tranq), Cr0.66 (HEAP)
Ammunition Weight: 11 grams per round
Features: Optic sight, flash suppressor, bayonet lug, RAM rifle grenade adaptor

						— Recoil —		
Round	*ROF*	*Dam Val*	*Pen Rtg*	*Bulk*	*Magazine*	*SS*	*Burst*	*Short Range*

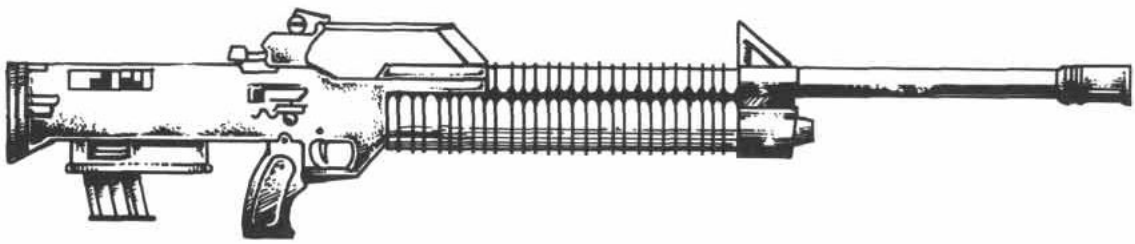
with integral 2.5cm GL						2	3/4	

Range in parentheses is iron sight range (unrounded)

*1D6–1 points of damage plus tranq effect on TNE, page 350.

5.5mm Assault Rifle with Integral 2.5cm Grenade Launcher

This weapon is the main variant of the 5.5mm assault rifle, containing an integral 2.5cm pump-action grenade launcher (manufactured so as to be contained inside the weapon's plastic casing), along with the same optic sight, flash suppressor, bayonet lug, RAM rifle grenade adaptor, and sling swivels as the primary model, and is normally assigned one per four-soldier fire team. The rifle and its ammunition are TL-9, but the grenades and launcher are TL-10. Twin selector switches enable the same trigger to fire both weapons. Engaging the grenade launcher causes the grenade sight to swing up into position, and places the rifle on safe; engaging the rifle causes the GL to go on safe and the sight to fold down. Attachment of the 2.5cm GL changes recoil only for the tranq round: it becomes SS: 2, Burst: 3/4.



For data on the grenade launcher, see pages 98-99.

TL: 9
Ammo: 5.5x45mm RC(E)
Muzzle Energy (Rifle): 4448 joules (Tranq: 2669 joules)
Weapon Length: 129 cm
Weapon Weight (with Integral GL): 9.5584 kg loaded, 8.7784 empty (includes weight of empty box magazine and empty GL)
Weapon Price (with Integral GL): Cr2276
Magazine Weight (Rifle): 1.3644 kg loaded, 1.0344 kg empty (GL rounds are individually inserted)
Magazine Price (Rifle): Cr160
Ammunition Price (Rifle): Cr0.22 (Ball), Cr0.44 (HE, DS, Tranq), Cr0.66 (HEAP)
Ammunition Weight: 11 grams per round (see pages 98-99 for GL round data)
Features: Optic sight, flash suppressor, bayonet lug, RAM rifle grenade adaptor

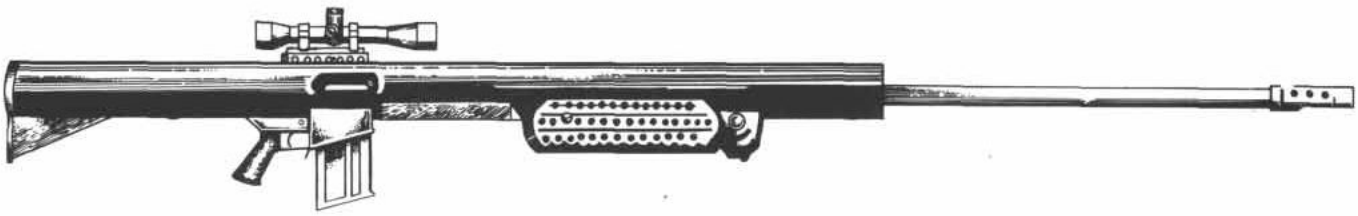
Light Assault Gun & Sniper Rifle

2cm Light Assault Gun (LAG)

This weapon is based on a pre-Collapse Imperial weapon, and has been adopted by the Coalition without major change. The tremendous close-range damage of the flechette round makes it a devastating close combat weapon, but its weight makes it less than desirable for infantry without strength-enhancing battle dress. This weapon is manufactured in the RC with the characteristics below, but relic weapons have identical performance.



Laser sights are sometimes fitted to this weapon for close actions. Fitting such sights increase the weight of the weapon by 1 kg for the TL-8 version and by 0.5 kg for the TL-10 version, but does not change the recoil values of the weapon.

TL: 8
Ammo: 20×35mm-8
Muzzle Energy: 8063 joules (Tranq: 4838 joules)
Weapon Length: 91 cm
Weapon Weight: 11.921 kg loaded, 11.4812 empty (includes weight of empty box magazine)
Weapon Price: Cr2476
Magazine Weight: 0.9152 kg loaded, 0.4752 kg empty
Magazine Price: Cr5
Ammunition Price: Cr1.76 (Ball), Cr3.52 (HE, DS, Tranq), Cr5.28 (HEAP)
Ammunition Weight: 88 grams per round
Features: Flash suppressor

						— Recoil —		
Round	*ROF*	*Dam Val*	*Pen Rtg*	*Bulk*	*Magazine*	*SS*	*Burst*	*Short Range*

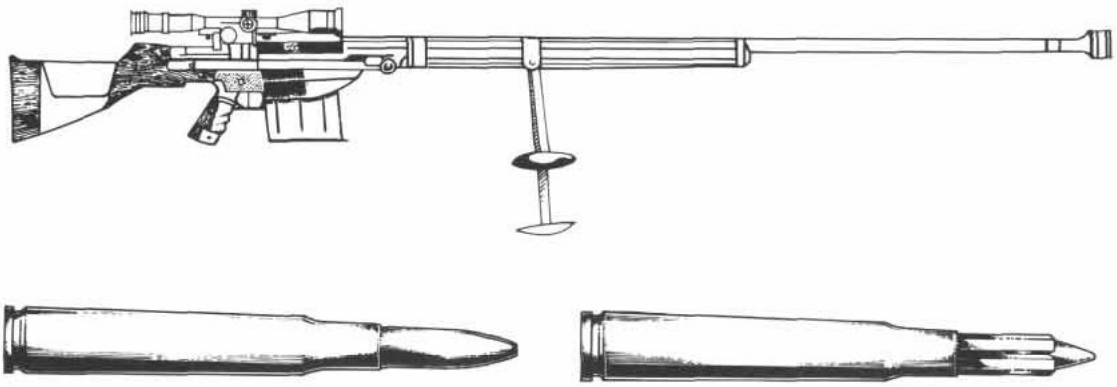
20×35mm Flechette								
Short	SA	2×9 hits**	1	6	5	2	—	70 (70)
Medium-Long	SA (10)	2	1-Nil					

*1D6–1 points of damage plus tranq effect on **TNE**, page 350.
Range in parentheses is unrounded iron sight range.
** A hit indicates that 9 flechettes have hit the target, each with a damage value of 2 and the listed penetration rating.

Note: The (10) following the SA under the ROF column for the medium- to long-range flechette round indicates that each shot is rolled as a 10-round burst.

13mm Sniper Rifle



Although this weapon is rather archaic technologically, CSAARC (Committee for the Standardization of Armament and Ammunition in the Reformation Coalition) chose to retain it in Coalition service because of the widespread availability of the ammunition and its respectable performance as a sniper's weapon. The weapon is bipod-mounted and features a telescopic sight as standard equipment. This weapon is manufactured in the RC with the characteristics below, but relic weapons have identical performance.

TL: 6
Ammo: 13x75mm-6
Muzzle Energy: 18,551 joules (Tranq: 11,131 joules)
Weapon Length: 224 cm
Weapon Weight: 28.9 kg loaded, 27.9 empty (includes weight of empty box magazine)
Weapon Price: Cr4369
Magazine Weight: 1.84 kg loaded, 0.84 kg empty
Magazine Price: Cr9
Ammunition Price: Cr2 (Ball), Cr4 (HE, DS, Tranq), Cr6 (HEAP)
Ammunition Weight: 100 grams per round
Features: Telescopic sight

						— Recoil —		
Round	*ROF*	*Dam Val*	*Pen Rtg*	*Bulk*	*Magazine*	*SS*	*Burst*	*Short Range*

*1D6–1 points of damage plus tranq effect on TNE, page 350.
Range in parentheses is unrounded iron sight range.

14.5mm AAR ("Crunch Gun")

14.5mm AAR (Antiarmor Rifle, a.k.a. "Crunch Gun")

Nicknamed the "Crunch Gun" by the first teams to encounter it, the 14.5×146.7mm AAR represents a serious threat to RCES personnel and equipment. Because of its size, the weapon is normally deployed with a sniper team consisting of a weapon, a sniper, and a spotter, firing from a concealed position. In urban settings, this combination can be particularly effective. When the target is equipped with battle dress, snipers seldom risk using their scarce DS ammunition at longer ranges, but they will often engage less well-armored targets with ball ammunition at ranges in excess of 2000 meters. Electronic equipment and light vehicles are particularly vulnerable.

The origin of the design is unknown, but Guild merchants sell tooling and manufacturing set-ups to enable low-tech worlds to make the weapon and its basic ammo, evidently in order to create a market for Guild-manufactured high-tech ammunition. It would appear that the Guild also provides some form of training as well, as tactical employment of the weapon has proven suspiciously similar on several different worlds.

TL: 5
Ammo: 14.5×146.7mm
Muzzle Energy: 30,114 joules
Weapon Length: 260cm
Weapon Weight: 53.787 kg loaded, 52.577 empty
Weapon Price: Cr8307
5-Round Clip Weight: 1.21 kg
5-Round Clip Price: Cr60.5
Ammunition Price: Cr0.24 (Ball), Cr0.48 (HE, DS, Tranq), Cr0.72 (HEAP)
Features: Bipod, telescopic sight

Ammo weight and price is for a 5-round clip. The clip has effectively no weight or price beyond those of the 5 rounds themselves. The magazine is internal to the weapon.

						— Recoil —		
Round	*ROF*	*Dam Val*	*Pen Rtg*	*Bulk*	*Magazine*	*SS*	*Burst*	*Short Range*
14.5×146.7mm Ball	SA	12	2-2-3	17	5i	5	—	230 (210)
Bipod	SA	12	2-2-3	17	5i	3	—	290 (273)
Higher Tech Rounds*:								
14.5×146.7mm HE-6	SA	12	Nil	17	5i	5	—	170 (158)

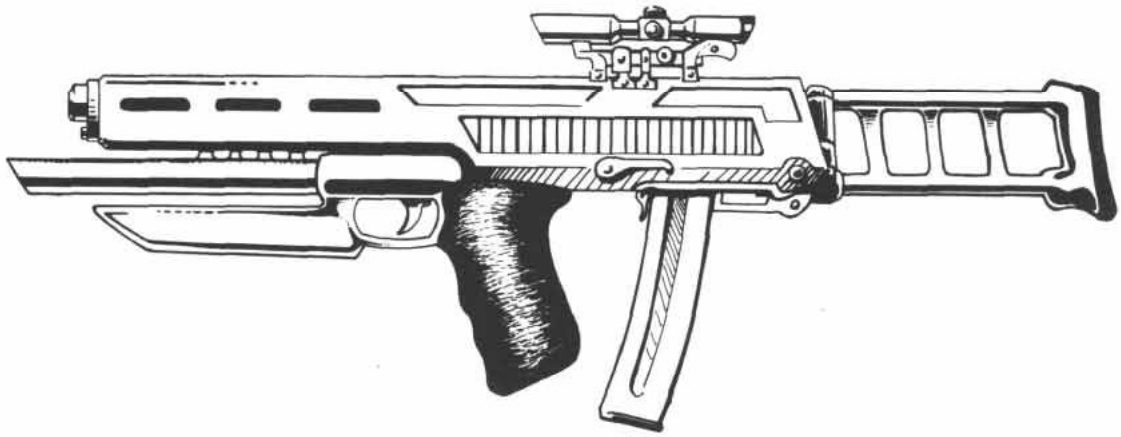
Date



My first encounter with a Crunch Gun was when we were mopping up a DZ near some little burg on Montezuma. A sniper opened up on us, and nailed Janni in the leg. She went down, and me and Hawk-Man went over to see how bad she was hurt. Hawk was first, and he had no more than got up to her when he took one in the head, and collapsed like a rag-doll. I got there a couple of seconds later, and the zipper must have decided to empty his magazine and leave, because three more rounds cratered the pavement in rapid succession. He was just pumping them out, not trying to aim, and the shots went wild all around me as I dove for what little cover was available. Jocko thought he spotted a muzzle flash from a hilltop about half a click away, and the rest of the squad started pumping RAMs over there, while a couple of us drug Janni and Hawk-Man into a building.

Whatever hit Hawk-Man's helmet put a dent in it the size of my fist, but didn't punch it. That must have been the plain vanilla ball round for the Crunch Gun. Janni's thigh plate had a hole in it I could have stuck my finger through.

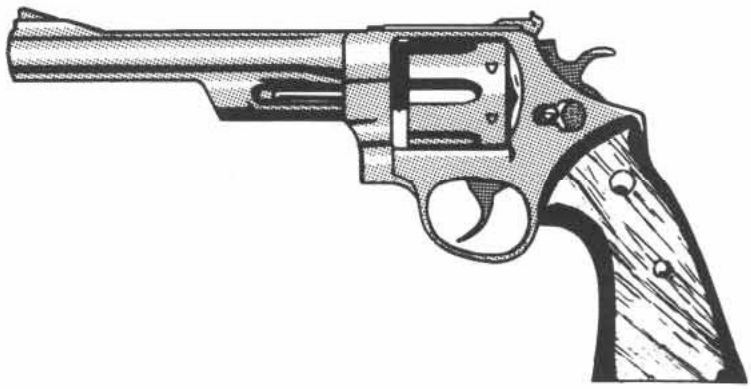
Hawk-Man woke up with one helluva headache about the same time it took us to get Janni packed up and on the medevac. We secured the DZ and then poked around on the hilltop until we found the sniper's nest. The zipper left so fast he didn't pick up after himself, and we found some expended cartridge cases and the rocks he piled up as cover. We turned the brass over to the INTEL shop. Our heavy assault units have an HMG with a round that big, but zippers aren't supposed to have that kind of firepower. And they don't have the factories to make a DS round, which is what turned part of Janni's femur into chalk dust. I don't know who's selling them that stuff, but whoever it is, I want to find them and tap-dance on their kidneys for a few minutes.

Guild Small Arms

Guild Deck Sweeper Boarding Weapon TL-5

Designed around a pre-Collapse pistol/SMG round and the same 2.5cm low-velocity grenade used by the Coalition, this weapon is primarily used by Guild boarding parties during close combat aboard starships, and for this reason has acquired the nickname "Deck-Sweeper." The 2.5cm grenades are issued on a basis of one or two per weapon, and seem to be primarily designed to deal with locked doors and hatches, although they will also penetrate body armor quite effectively.

The most unique feature of the "Deck-Sweeper," however, is its duplex receiver, which permits two magazines to be loaded side-by-side. The firer may select which magazine is used by flipping a selector switch. This enables the user to load magazines loaded with ball and DS, for example.



Some weapons are equipped with TL-8 laser sights. When fitted with this, the weapon's mass increases by 1 kg, and its price by Cr400. Recoil remains the same, except that Tranq becomes SS: 1, Burst: 1.

TL: 5
Ammo: 9x24mm-5, 2.5cm low-velocity grenades
Muzzle Energy: 856 joules (Tranq: 514 joules)
Weapon Length: 45cm (stock folded) 65 cm (stock open)
Weapon Weight: 3.9056 kg loaded, 3.0956 empty (includes weight of two empty box magazines)
Weapon Price: Cr634.7
Magazine Weight: 0.6048 kg loaded, 0.2448 kg empty
Magazine Price: Cr2
Ammunition Price: Cr0.24 (Ball), Cr0.48 (HE, DS, Tranq), Cr0.72 (HEAP)
Ammunition Weight: 12 grams per round (9mm), 90 grams each (2.5cm low-velocity grenade)
Features: TL-8 laser sight optional

Guild 9mm Magnum Revolver

Guild starship crews seem to have a preference for large-bore sidearms, and the 9mm magnum revolver is the most popular. HE and HEAP rounds for this weapon are inferior in penetration and range to ball and DS rounds, and are not manufactured (range is the only advantage DS rounds have). Tranq rounds are manufactured at TL-6, designed to perform to TL-5 parameters.

The 9mm magnum revolver is reserved by the Guild for starship crew sidearms, unlike the 5mm assault rifle (below) which is primarily used for export.

TL: 5
Ammo: 9x33mm-5
Muzzle Energy: 703 joules (Tranq: 422 joules)
Weapon Length: 27 cm
Weapon Weight: 1.234 kg loaded, 1.132 empty

Weapon Price: Cr158
Magazine: None
Ammunition Price: Cr0.68 (Ball), Cr1.36 (HE, DS, Tranq), Cr2.04 (HEAP)
Ammunition Weight: 17 grams per round
Features: None

RC 7mm ACR (Advanced Combat Rifle)

Reformation Coalition 7mm ACR (Advanced Combat Rifle)

The 7mm ACR is based around a pre-Collapse Imperial round, the 7×30mm Imperial (ETC), renamed the 7×30mm RC(E), RC(E) standing for "Reformation Coalition (Electrothermal-chemical)." The model depicted on this page is manufactured on Oriflamme for use by that world's armed forces (see below), but similar weapons are in use by most of the Coalition. The rifle is especially popular with Oriflamme's Marines.

The weapon is manufactured with electronic and laser sights, a flash suppressor, bayonet lug, and RAM rifle grenade adapter (for 4cm RAM rifle grenades). A sling is fitted for ease of transport, but has been omitted in the illustration for clarity. The rifle's features are either duplicated on both sides of the rifle for use by both right- and left-handed soldiers, or can be switched to whichever side the individual soldier chooses by a unit armorer (the ambidextrous magazine release and selector switch are examples of the former, the ejection port and bayonet lug are examples of the latter).

When CSAARC (Committee for the Standardization of Armament and Ammunition in the Reformation Coalition) worked out the original design specifications for the 7mm ACR, Oriflamme's representative insisted that the rifle be designed so that 90% of the components could be manufactured at TL-9 (since Oriflamme is a TL-9 world). A weapon with such great potential, she argued, should not be beyond the reach of the world with the largest military force. As a result, the weapon's ammunition, magazine batteries, and laser sight must be imported, but Oriflamme's factories are capable of making the rest of the rifle. For this reason, the ACR is a hybrid weapon, a TL-10 rifle with mostly TL-9 components. The performance of the versions manufactured at TL-9 and those made at TL-10 is the same.

Coalition Multipurpose Weapons System, TL-10 (CMWS-10)

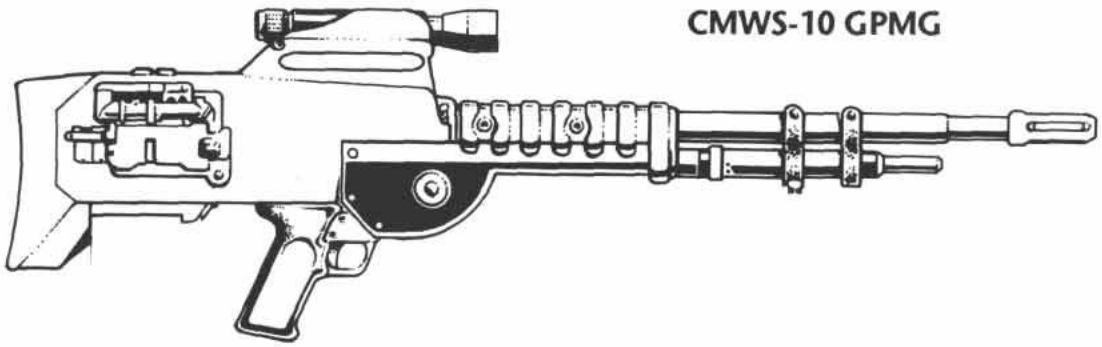
The CMWS (pronounced "See Mews") is an effort to produce a family of modular small arms that can be used by all Coalition armed forces in one version or another. The weapon is built around a common receiver assembly, and is assembled into one of five weapon configurations—carbine, rifle, squad automatic weapon (SAW), general-purpose machinegun (GPMG), or vehicle-mounted machinegun (VMMG)—by adding the appropriate barrel, stock, and ammunition feed system. These parts are removable, so that the same set of CMWS components can be disassembled and reassembled into various configurations any number of times.

Reconfiguring a weapon takes significant time, requiring tools and calibration, and is not intended to be done in the heat of combat. However, a force armed with these weapons can easily alter the composition of its weapons before and after combat operations.

The intent is to make the most effective use of the Coalition's limited manufacturing base by reducing the number of different small arms designs that need to be produced, and also to allow the Coalition armed forces to travel light and make the best use of its weapons production capacity. Rather than requiring large inventories of carbines and rifles and automatic weapons, RC armed forces can cover these diverse needs with a smaller pool of CMWS components.

The CMWS uses the standard 7mm RC(E) round, the same as is used in the 7mm ACR. The common CMWS receiver is a heavy self-loading deluxe (multiple automatic rates of fire) receiver. The receiver is capable of taking ammunition from either box magazines or belts (including cassettes).

There are four barrel types which can be fitted: the Light Short barrel (also known as the Carbine barrel), the Light Long barrel (also known as the Rifle barrel), the Heavy Short barrel (this is the same length as the Rifle barrel, so is also called the Heavy Rifle Length, HRL, barrel), and the Heavy Long (or MG) barrel. All are fitted with a flash suppressor and long muzzle brake.



There are three types of stock: bullpup, standard, and pistol grip. All variants are fitted with optic sights, and laser sights can also be added as an option (not included in prices or weight listed below) to any of them.

All variants can take ammo from 20-, 50-, or 100-round box magazines, or from belts (including cassettes). However, the weapons below are only listed with the most useful magazine sizes for their configurations.

CMWS-10 SAW

Bullpup stock, bipod, rifle length heavy barrel (includes long muzzle brake and flash supressor), optic sights, 50- and 100-round magazines standard, but can also use 20-round magazines and belt feed.

Ammo: 7×30mm ETC
Muzzle Energy: 4803 joules (Tranq: 2882 joules)
Weapon Length: 101 cm
Weapon Weight: 11.72 kg with empty 50-round magazine, 12.32 with loaded 50-round magazine
13.03 kg with empty 100-round magazine, 14.23 with loaded 100-round magazine
10.38 kg configured for belt-feed, 11.58 kg with 100-round belt and battery
Weapon Price: Cr3167
Magazine Specifications: 50 rounds 7×30 RC(E), 1.34 kg empty, 1.94 kg loaded, Cr254 for empty magazine with battery
100 rounds 7×30 RC(E), 2.65 kg empty, 3.85 kg loaded, Cr508 for empty magazine with battery
100-round belt 1.2 kg, plus 1.9 kg battery
Ammo Price: Cr12/24 for 50/100 rounds ball; Cr24/48 for 50/100 rounds DS, HE, or Tranq; Cr36/72 for 50/100 rounds HEAP
Features: Optic sights, bipod

Shotguns

Double-Barreled Shotgun

Originally developed as a sporting gun, double-barreled shotguns are sometimes found in use by poorly equipped militias and irregular military units. Short range damage is impressive, but the ability to fire only two shots before reloading makes the weapon unsuitable for conventional military use.

TL: 4
Ammo: 18x70mm-4
Muzzle Energy: 3258 joules (Tranq: 1955 joules)
Weapon Length: 102 cm
Weapon Weight: 6.099 kg loaded, 5.993 empty
Weapon Price: Cr266.9
Magazine: None. Each barrel contains one individually inserted round.
Ammunition Price: Cr0.53 (Ball), Cr1.06 (HE, DS, Tranq), Cr1.59 (HEAP)
Ammunition Weight: 53 grams per round
Features: None

						— Recoil —		
Round	*ROF†*	*Dam Val*	*Pen Rtg*	*Bulk*	*Magazine*	*SS*	*Burst*	*Short Range*
18x70mm Slug	SA	4	3-Nil	6	2i	3	—	50 (54)

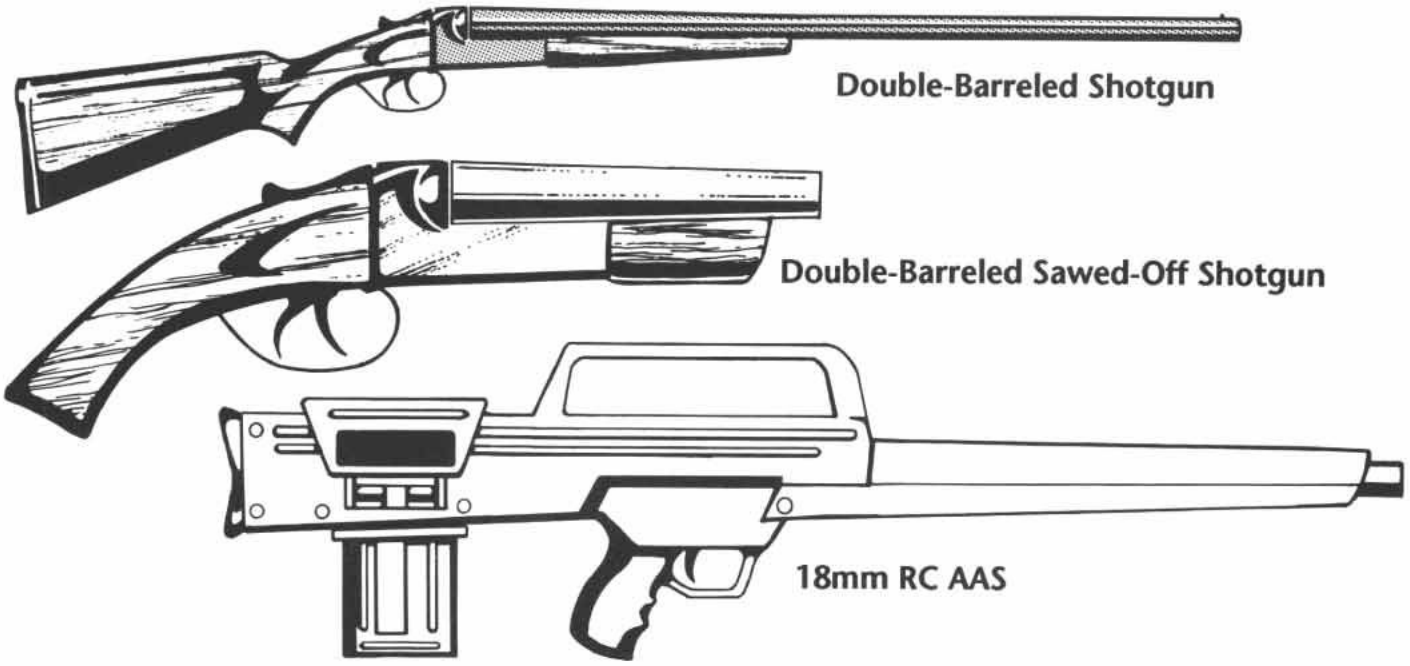
18x70mm Tranq-6	SA	–1*	Nil	6	2i	3	—	30 (30)

† The weapon is rated SA to enable both barrels to be fired in the same turn.
*1D6–1 points of damage plus tranq effect on **TNE**, page 350.
Range in parentheses is unrounded iron sight range
Note: The (10) following the SA under the ROF column for the medium-range shot round indicates that each shot is rolled as a 10-round burst.

Double-Barreled Sawed-Off Shotgun

This weapon is sometimes called a "whippit gun" because it is often concealed under clothing (sometimes in improvised holsters) and the user must "whip it out." Cutting off the barrels and changing the stock to a pistol grip reduces the weapon's length and makes it more readily concealable, but a considerable price is paid in range.



Sawed-off shotguns are often used by criminals, but some Free Trader starship crew prefer them to pistols because of the high short-range damage of shot rounds, and the lack of range is not a detriment in the close quarters of a starship.

TL: 4
Ammo: 18x70mm-4
Muzzle Energy: 1488 joules (Tranq: 893 joules)
Weapon Length: 33 cm
Weapon Weight: 3.539 kg loaded, 3.433 empty
Weapon Price: Cr71
Magazine: None. Each barrel contains one individually inserted round.
Ammunition Price: Cr0.53 (Ball), Cr1.06 (HE, DS, Tranq), Cr1.59 (HEAP)
Ammunition Weight: 53 grams per round
Features: None

18mm RC AAS (Automatic Assault Shotgun)

Manufactured primarily on Aurora, this bullpup-configuration weapon is another new design by CSAARC, unrelated to any pre-Collapse weapon. The weapon is normally carried on a sling that enables it to be fired from the hip using the attached laser sight. The performance of this weapon is respectable (the shot round will penetrate AV 1 at short range). For close fighting where range is not an important consideration (such as is found in boarding actions or urban locales), this is the small arm of choice for Coalition troops.

TL: 10
Ammo: 18x90mm caseless
Muzzle Energy: 4931 joules (Tranq: 2959 joules)
Weapon Length: 91 cm
Weapon Weight: 8.992 kg loaded, 7.612 empty (includes weight of empty box magazine)
Weapon Price: Cr2457
Magazine Weight: 2.3736 kg loaded, 0.9936 kg empty
Magazine Price: Cr10
Ammunition Price: Cr0.69 (Shot, Slug), Cr1.38 (HE, DS, Tranq), Cr2.07 (HEAP)
Ammunition Weight: 69 grams per round
Features: Gyroscopic recoil compensation, optic and laser sights

						— Recoil —		
Round	*ROF*	*Dam Val*	*Pen Rtg*	*Bulk*	*Magazine*	*SS*	*Burst*	*Short Range*
18x70mm Slug	3	5	3-4-Nil	6	20	2	3	30 (28)
18x70mm Short Shot	3	2x6**	1	6	20	2	3	20 (20)
Medium	3 (5)	2	Nil					
18x70mm DS	3	5	2-3-4	6	20	2	3	40 (34)
18x70mm HE	3	8	Nil	6	20	2	3	20 (21)

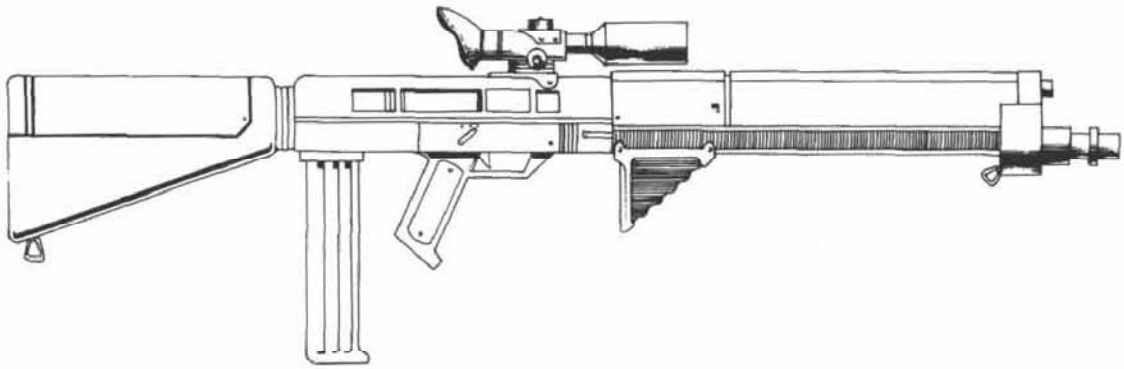
18x70mm Tranq	3	–1*	Nil	6	20	2	3	15 (13)



*1D6–1 points of damage plus tranq effect on TNE, page 350.

** A hit indicates that 6 pellets have hit the target, each with a damage value of 2 and the listed penetration rating.

Range in parentheses is unrounded iron sight range.

Note: The (5) following the SA under the ROF column for the medium-range shot round indicates that each shot is rolled as a 5-round burst.

Gauss Small Arms

4mm Gauss Rifle

As is mentioned on page 48, all gauss weapons in Coalition service use the old Imperial standard 4mm gauss ammunition. In the gauss rifle, the 0.5 gram round is shot from the barrel at approximately 3740 meters per second, although in official references this is rounded to 3500 mps, as seen in the official ammunition designation "4x20mm/35."

The gauss rifle is highly prized with Coalition ground forces because of its high rate of fire and large magazine capacity made possible by the compactness of its ammunition. The round itself can be manufactured at TL-10 and up, a decided advantage in the Coalition, where high-tech manufacturing facilities are at a premium.

TL: 12
Ammo: 4x20mm/35
Muzzle Energy: 3500 joules (Tranq: 2100 joules), required energy: 7000 joules
Weapon Length: 76.4 cm
Weapon Weight: 4.076 kg loaded, 4.056 empty (includes weight of empty box magazine)
Weapon Price: Cr1063
Magazine Weight: 1.713 kg loaded, 1.693 kg empty
Magazine Price: Cr4
Ammunition Price: Cr0.01 (Dart), Cr0.02 (HE, Tranq), Cr0.03 (HEAP)
Ammunition Weight: 0.5 grams per round
Features: Bayonet lug, optic sights, RAM rifle grenade adaptor

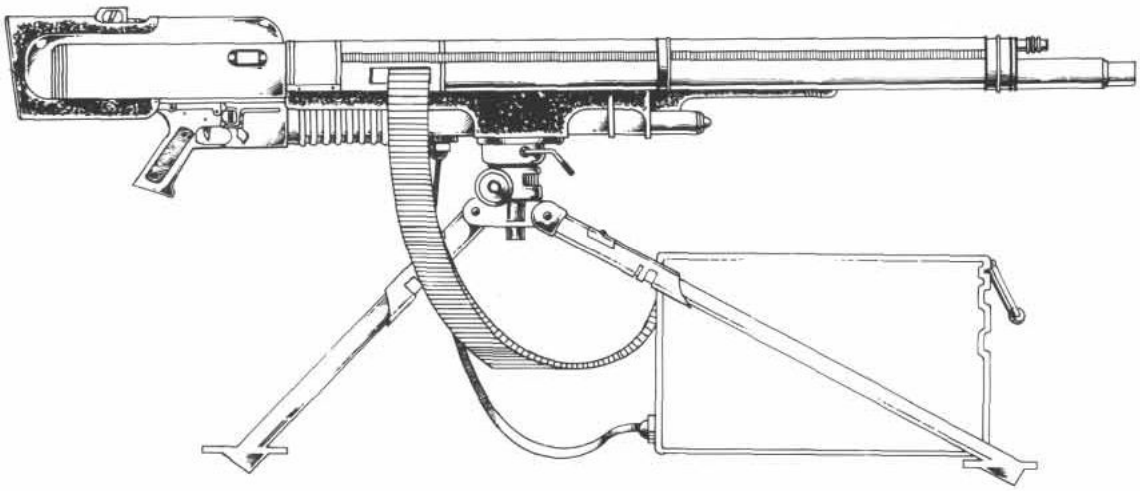
4mm Gauss SAW



The 4mm gauss SAW is a CSAARC (Committee for the Standardization of Armament and Ammunition in the Reformation Coalition) design intended to fill the gap between the 4mm gauss rifle and the VRF gauss gun. The weapon is equipped with optic sights, a bipod for stable firing, and a 100-round detachable box magazine, and has a muzzle velocity of 5000 meters per second.

TL: 12
Ammo: 4x20mm/50
Muzzle Energy: 6250 joules (Tranq: 3750 joules), Required Energy: 11,250 joules
Weapon Length: 92 cm
Weapon Weight: 14.11 kg loaded, 14.06 empty (includes weight of empty box magazine)
Weapon Price: Cr1412
Magazine Weight: 7.58 kg loaded, 7.53 kg empty
Magazine Price: Cr16
Ammunition Price: Cr0.01 (Dart), Cr0.02 (HE, Tranq), Cr0.03 (HEAP)
Ammunition Weight: 0.5 grams per round
Features: Optic sight, bipod

						— Recoil —		
Round	*ROF*	*Dam Val*	*Pen Rtg*	*Bulk*	*Magazine*	*SS*	*Burst*	*Short Range*

*1D6-1 points of damage plus tranq effect on **TNE**, page 350.
Range in parentheses is iron sight range

VRF Gauss Gun

VRF Gauss Gun (Man-Portable Field Mount)

As is mentioned on page 48, all gauss weapons in Coalition service use the old Imperial standard 4mm gauss ammunition. In the gauss rifle, the 0.5-gram round is shot from the barrel at approximately 6000 meters per second, as reflected by the "60" in the ammunition designation. This velocity grazes the upper limit for such weapons, and gives the VRF gauss gun very good performance, but at a cost of a very high weight.

The large size of the battery needed to power this weapon's high rate of fire means that VRF gauss guns are largely limited to static positions such as bunkers and the like. The man-portable weapon can use the larger cassettes of the vehicle-mounted version, but must have an outside power source (0.027 Mj) as the vehicle cassettes contain no battery.

Coalition-manufactured versions of this weapon are identical to Imperial relic weapons.

TL: 10
Ammo: 4x20mm/60
Muzzle Energy: 9000 joules (Tranq: 5400 joules), Required Energy: 27,000 joules
Weapon Length: 243 cm
Weapon Weight: 162.43 kg loaded, 162.18 empty (includes weight of empty cassette)
Weapon Price: Cr5563
Cassette Weight: 137.25 kg loaded, 137 kg empty
Cassette Price: Cr1370
Ammunition Price: Cr0.01 (Dart), Cr0.02 (HE, Tranq), Cr0.03 (HEAP)
Ammunition Weight: 0.5 grams per round
Features: Gyro compensation
Tripod Weight: 22 kg
Tripod Price: Cr320

Power

ON/OFF

VRF Gauss Gun (Vehicular Mount)

The vehicle-mounted version of the VRF gauss gun uses 30,000-round cassettes and draws power from the vehicle's power plant (1.35 MW), thus obviating the need for a battery in the ammunition cassette. (The illustration above, when compared to the man-portable version on the facing page, shows the tremendous bulk savings by not relying on a battery. If this weapon used a battery, it would mass 8.1 tonnes.) The vehicle-mounted VRF gauss gun can use the smaller cassettes of the man-portable version.

Relic Imperial and new-build Coalition versions of this weapon are identical in all respects.

TL: 10
Ammo: 4x20mm/60
Muzzle Energy: 9000 joules (Tranq: 5400 joules), Required Energy: 27,000 joules
Weapon Length: 243 cm
Weapon Weight: 42.18 kg loaded, 27.18 empty (includes weight of empty cassette)
Weapon Price: Cr3913
Cassette Weight: 17 kg loaded, 2 kg empty
Cassette Price: Cr20
Ammunition Price: Cr0.01 (Dart), Cr0.02 (HE, Tranq), Cr0.03 (HEAP)
Ammunition Weight: 0.5 grams per round
Features: Gyro compensation

Recording Ammo Consumption

Because of the large number of rounds in the VRF gauss gun's ammunition cassette, you may wish to create a special ammunition form for it by photocopying six 100-round forms, indicating that one box on the ammo form represents a burst of 50 rather than a single round. Otherwise, the ammunition record form will require 30,000 boxes!

Ithklur Small Arms

5.5×27.5mm/12.5 TL-14 Gauss

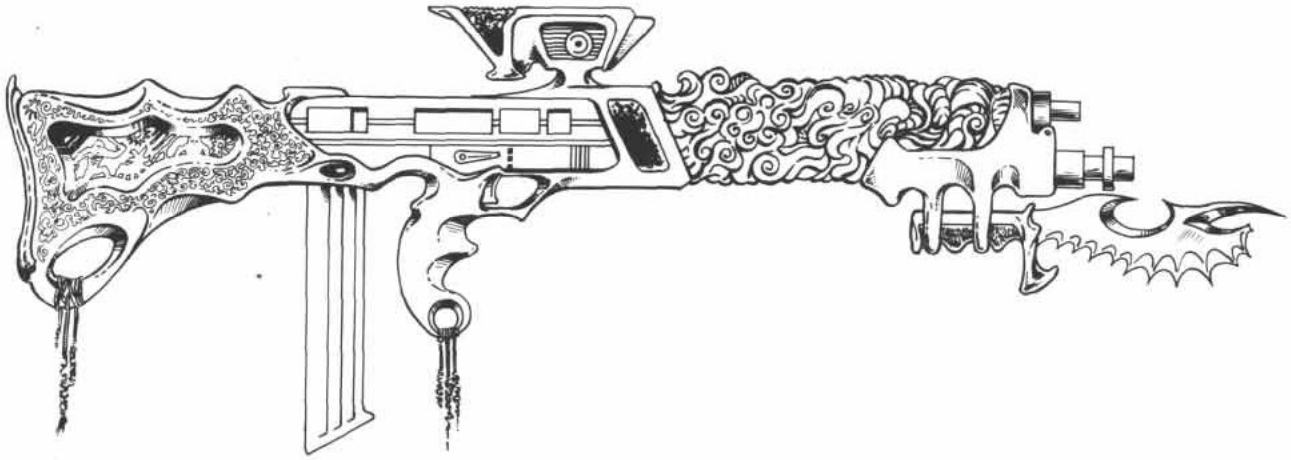
The 5.5mm round was the standard Hiver gauss round before the Collapse, and has continued to be such to this day. The Hivers themselves dislike combat, and leave it to their subject race auxiliaries, primarily the Ithklur, for whom the 5.5mm-caliber weapons were designed.

The Ithklur are larger than humans (averaging twice the body mass), and whose joints articulate differently. CSAARC (Committee for the Standardization of Armament and Ammunition in the Reformation Coalition) field tests indicate that the most common human problems when firing Ithklur weapons are in moving the various selector switches and knobs and aligning the sights properly (by contrast, the most common Ithklur complaint about human weapons is that things snap off them too easily). All direct fire tasks by humans using Ithklur weapons are increased by one difficulty level.

Ithklur weapons also have a distinctive ornate look, see discussion on facing page.

5.5mm TL-14 Gauss Pistol (Ithklur)

The 5.5mm gauss pistol is manufactured only in Hiver Space, being TL-14, and as such is very rare in the Coalition. Humans find the handgrip of this pistol slightly oversize, and firing it requires a little practice, as the weapon is built for Ithklur hands. At a muzzle velocity of 2500 mps, the weapon's performance is impressive, but it is almost two and a half times as heavy as the 4mm gauss pistol, and few humans care for it due to its large size.



When fitted with the optional TL-10 laser sight, the weight of the weapon is increased by 0.5 kg, the price is increased by Cr300, and the recoil becomes SS: 2, Burst — for all rounds.

TL: 14
Ammo: 5.5×27.5mm/25
Muzzle Energy: 4094 joules (Tranq: 2456 joules), Required Power: 6550 joules
Weapon Length: 18.6 cm
Weapon Weight: 1.913 kg loaded, 1.879 empty (includes weight of empty box magazine)
Weapon Price: Cr499.4
Magazine Weight: 0.739 kg loaded, 0.705 kg empty
Magazine Price: Cr2
Ammunition Price: Cr0.03 (Dart), Cr0.06 (HE, Tranq), Cr0.18 (HEAP)
Ammunition Weight: 1.31 grams per round
Features: Optic sights, laser sight optional

5.5mm TL-14 Gauss Rifle (Ithklur)

This weapon is the standard weapon of the Ithklur Marines in Hiver service. It uses the same 5.5mm gauss ammunition as the gauss pistol (see facing page), but fires it at a muzzle velocity of 3500 meters per second. The 5.5mm rifle is larger than normal human weapons, but not excessively so, and the increased mass makes recoil easier to deal with.

When fitted with the optional TL-10 laser sight, the weight of the weapon is increased by 0.5 kg, the price is increased by Cr300, and the recoil remains the same.

The Ithklur are well-known as the Hivers' elite natural shock troops, which in itself is remarkable because the Hivers are well-known for eliminating the aggressive tendencies of their subject races. Either the Hivers elected to cultivate the Ithklur aggressiveness in this one case, or the Ithklur's current "boisterous" tendencies are the remains of truly epic violent tendencies. Those who study Hiver psychohistorical manipulation speculate that the latter is in fact the case, and that the intricate Ithkluri sense of martial aesthetics is an artifact of Hiver efforts to channel Ithklur tendencies into less energetic pursuits. This martial aesthetic is seen in Ithklur pastimes such as ritualized full-contact "ballet," but is nowhere more evident than in the design of Ithklur weapons. Each Ithklur weapon is unique, with ornate brightly colored fittings carved and painted by its owner. These carvings are highly symbolic, representing events or concepts of talismanic significance to its owner, and are modified after each battle in which they are used. Thus, the trained Ithklur eye can tell by looking at a weapon's ornamentation which battles it was used in, how well its owner performed, and so on. Ithklur art, therefore, consists entirely of personal weapons and military vehicles, embellished wth breathtaking examples of Ithklur decorative craftsmanship.

Much of this ornamentation is decidedly non-tactical, such as the bright colors of rifle stocks and barrel housings, and the noisy strings of beads. Each Ithklur battle is preceded by the solemn ceremony of "darking" the weapons, in which the bright colors are covered with tactical camouflage, and beads are either removed or coated with noise-damping grease. It is probably no accident that a subdued Ithklur weapon, festooned with camouflaged decoration, is quite well-camouflaged, as the distinctive straight lines present on the weapons of other races are not present. Once darked, Ithklur weapons are not stripped and restored to their gleaming glory until the battle, campaign, or war has been brought to its intended conclusion. Thus the sight of Ithklur units darking their weapons for war can be a very intimidating experience indeed. (The bayonet illustrated is for ceremonial use only.)

TL: 14
Ammo: 5.5x27.5mm/35
Muzzle Energy: 8024 joules (Tranq: 4814 joules), Required Power: 12,838 joules
Weapon Length: 66 cm
Weapon Weight: 6.575 kg loaded, 6.477 empty (includes weight of empty box magazine)
Weapon Price: Cr1044
Magazine Weight: 4.012 kg loaded, 3.914 kg empty
Magazine Price: Cr8
Ammunition Price: Cr0.03 (Dart), Cr0.06 (HE, Tranq), Cr0.18 (HEAP)
Ammunition Weight: 1.31 grams per round
Features: Optic sights, gyroscopic compensation, bayonet lug, RAM rifle grenade adaptor; laser sight optional

COLOR PLATE CAPTIONS

These are the captions for the following eight color plates. The captions contain references to pages where more information on the illustrated equipment may be found.

A: Fitting Out

RCS *Maggart* (TailNo 10095), lead ship of the group IV "Stretch" clippers (page 136), is loaded for a strike mission while in orbit around Trybec. *Maggart* is fitted with a 400-ton fuel module in the normal aft position, along with a 200-ton habitation module just abaft the command section. Yard tugs are bringing up other modules (see pages 132-135 for module descriptions).

In the foreground is a Wildbat fighter (page 149), one of eight assigned to the mission, while RCC *Condor* (TailNo 20080F), the *Manta*-class fueler (page 131) assigned to *Maggart* for this mission, holds station to port.

In the background, starport *Vesna* (a former Imperial Scout base) is seen against the looming bulk of Trybec itself.

B: Combat Drop in Progress

RCS *Kelley Victrix* (TailNo 10067) releases a load of troop-laden drop capsules from her mission-configurable pod (pages 138-139). Note that the remote chin turret containing the SSL is obscured by the firing of the drop-capsule autolaunchers (visible as the two holes in the ship's belly). The various types of drop capsule are virtually indistinguishable from the outside, so it cannot be told which capsules actually contain troops, which are drones, and which are cargo-carriers (pages 14-15).

Each drop capsule has eight maneuvering thrusters (four at each end) for course adjustments and defensive "jinking." Additional protection is granted by three decoy launchers distributed about its "equator," each carrying five decoys, one launcher each of anti-passive sensor (flares), anti-ladar (light-diffracting aerosols), and anti-active sensor (streamer-bearing corner reflectors) decoys, which are dispensed by the onboard computer during the descent.

C: Decapitation Strike Team

A powered team in light battle dress (pages 18-19) sets up for a decapitation strike from a concealed position. While the communications tech sets up a maser uplink (page 24) in the foreground, the team leader keeps the target under observation with PRIS binoculars (page 28). The other two troopers set up the laser sniper weapon (page 97) and its tripod. At the designated time, the LSW gunner will open fire and knock out the communications antennae on the enemy headquarters in the background, isolating it from the planetary communications net. This will also be the signal for the attack to begin. During the attack, the team will provide covering fire, seeking out officers or other important targets to inflict maximum disruption upon the enemy.

D: SSL Team in Position

Near the scene depicted in plate C, a mixed-powered/muscle SSL team (page 9) has set up and readied itself for its role in the upcoming action. The team consists of a spotter, gunner, and ammo carrier for the SSL. Each member of the team carries a part of the disassembled SSL when moving.

The team's deployment is standard, the spotter scanning for targets, the gunner ready to fire, and the ammo carrier watching for the approach of hostiles from the flanks.

The spotter has PRIS binoculars and a personal defense laser (PDL, page 95), and is wearing an RC-issue utility vest along with private-purchase chaps and gauntlets over her body sleeve (pages 16-17). The fringe on her chaps and her use of a non-standard utility harness is typical of the informal approach to uniforms in the RCES. The gunner also wears the body sleeve but has chosen the standard harness. He has laid aside his PDL for the moment, and probably carries the SSL gunner's tool pouch on one hip.

Ammo carriers often wear light battle dress, as its powered feature enables them to carry more SSL ammunition than their strength would otherwise allow. This particular example is quite well camouflaged.

E: Counterattack

This plate shows a Coalition advisor helping indigenous forces resist an attack by AFVs. The advisor is using his arm-mounted laser designator to "paint" one of the attacking "Prairie Fire" tanks (pages 120-121) for an approaching Lyrebird tac missile fired from a short distance to the rear (pages 106-107). After the first target has been hit, the advisor will switch to a different target for the second Lyrebird.

In the right foreground are two local soldiers, Coalition allies trained and equipped by the RC as part of a continuing bootstrap operation. One fires a Coalition-supplied plasma bazooka (page 85), while the other, the loader in the bazooka team, takes cover.

F: Hot Recovery

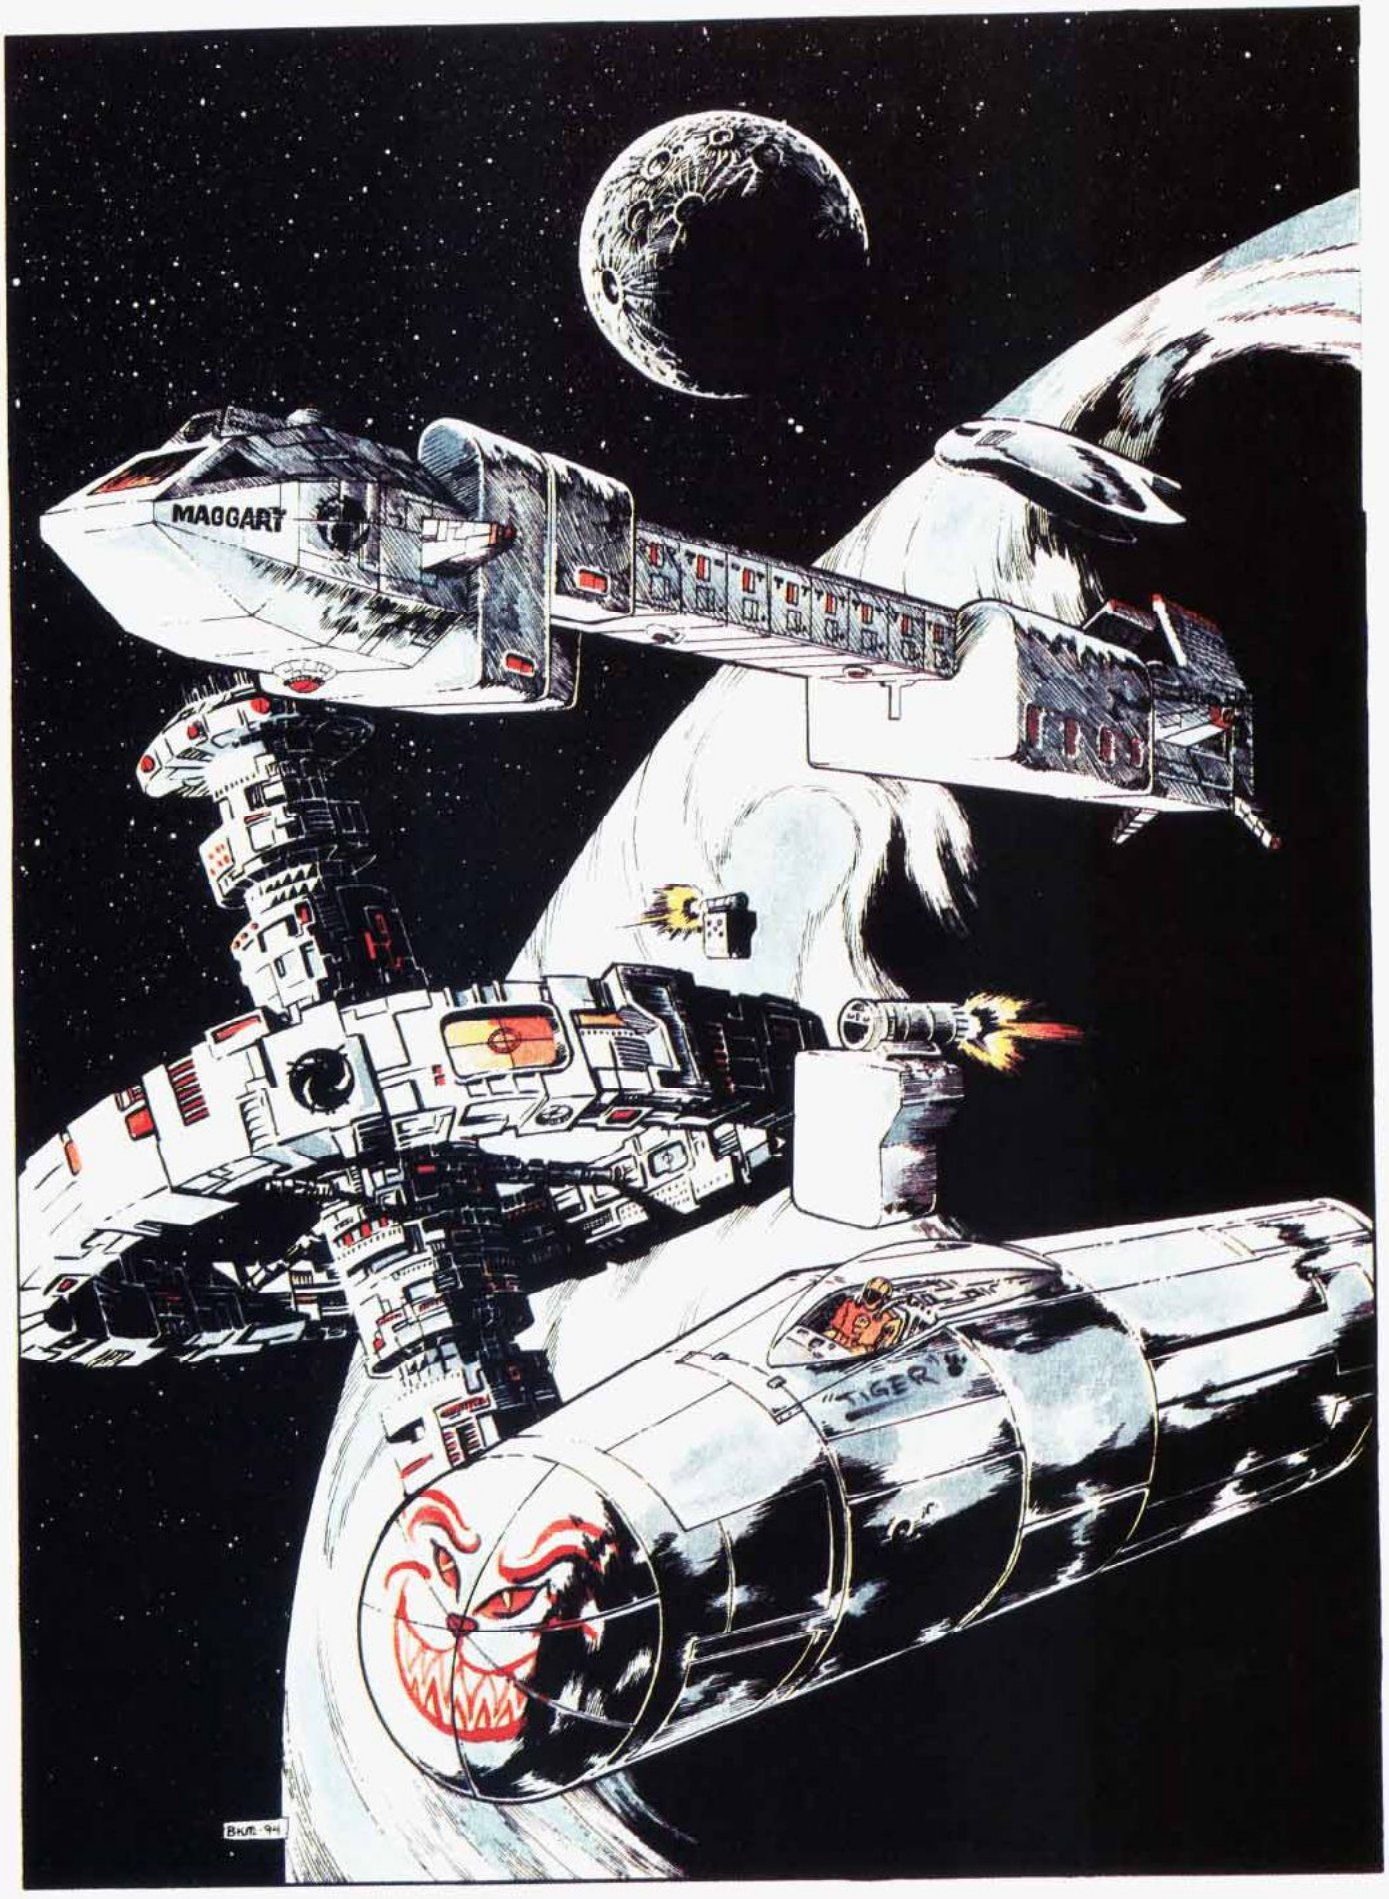
A light-powered raiding party dropped as a diversion has done its job all too well and drawn a large part of the main force onto its position. The team is heavily outnumbered, and under fire from small arms as well as heavier weapons, but has successfully made it to its retrieval point, and is in the process of boarding its Fury assault landers (page 149).

The team is armed with a combination of 4mm gauss rifles (page 70) and 7mm ACRs (pages 60-61), along with 4cm RAM rifle grenades (pages 100-101), and equipped with Coalition-issue light battle dress (pages 18-19). This team has added its names or call signs to its battle dress shoulder plates, and the trooper in the foreground ("Kirby") has added an inscription to his personal weapon. Kirby has his helmet's faceplate in the partially open position.

After embarking the team, the lander will rendezvous with an ambulance skiff in orbit (page 135), transfer wounded, and proceed back to *Maggart* for debriefing.

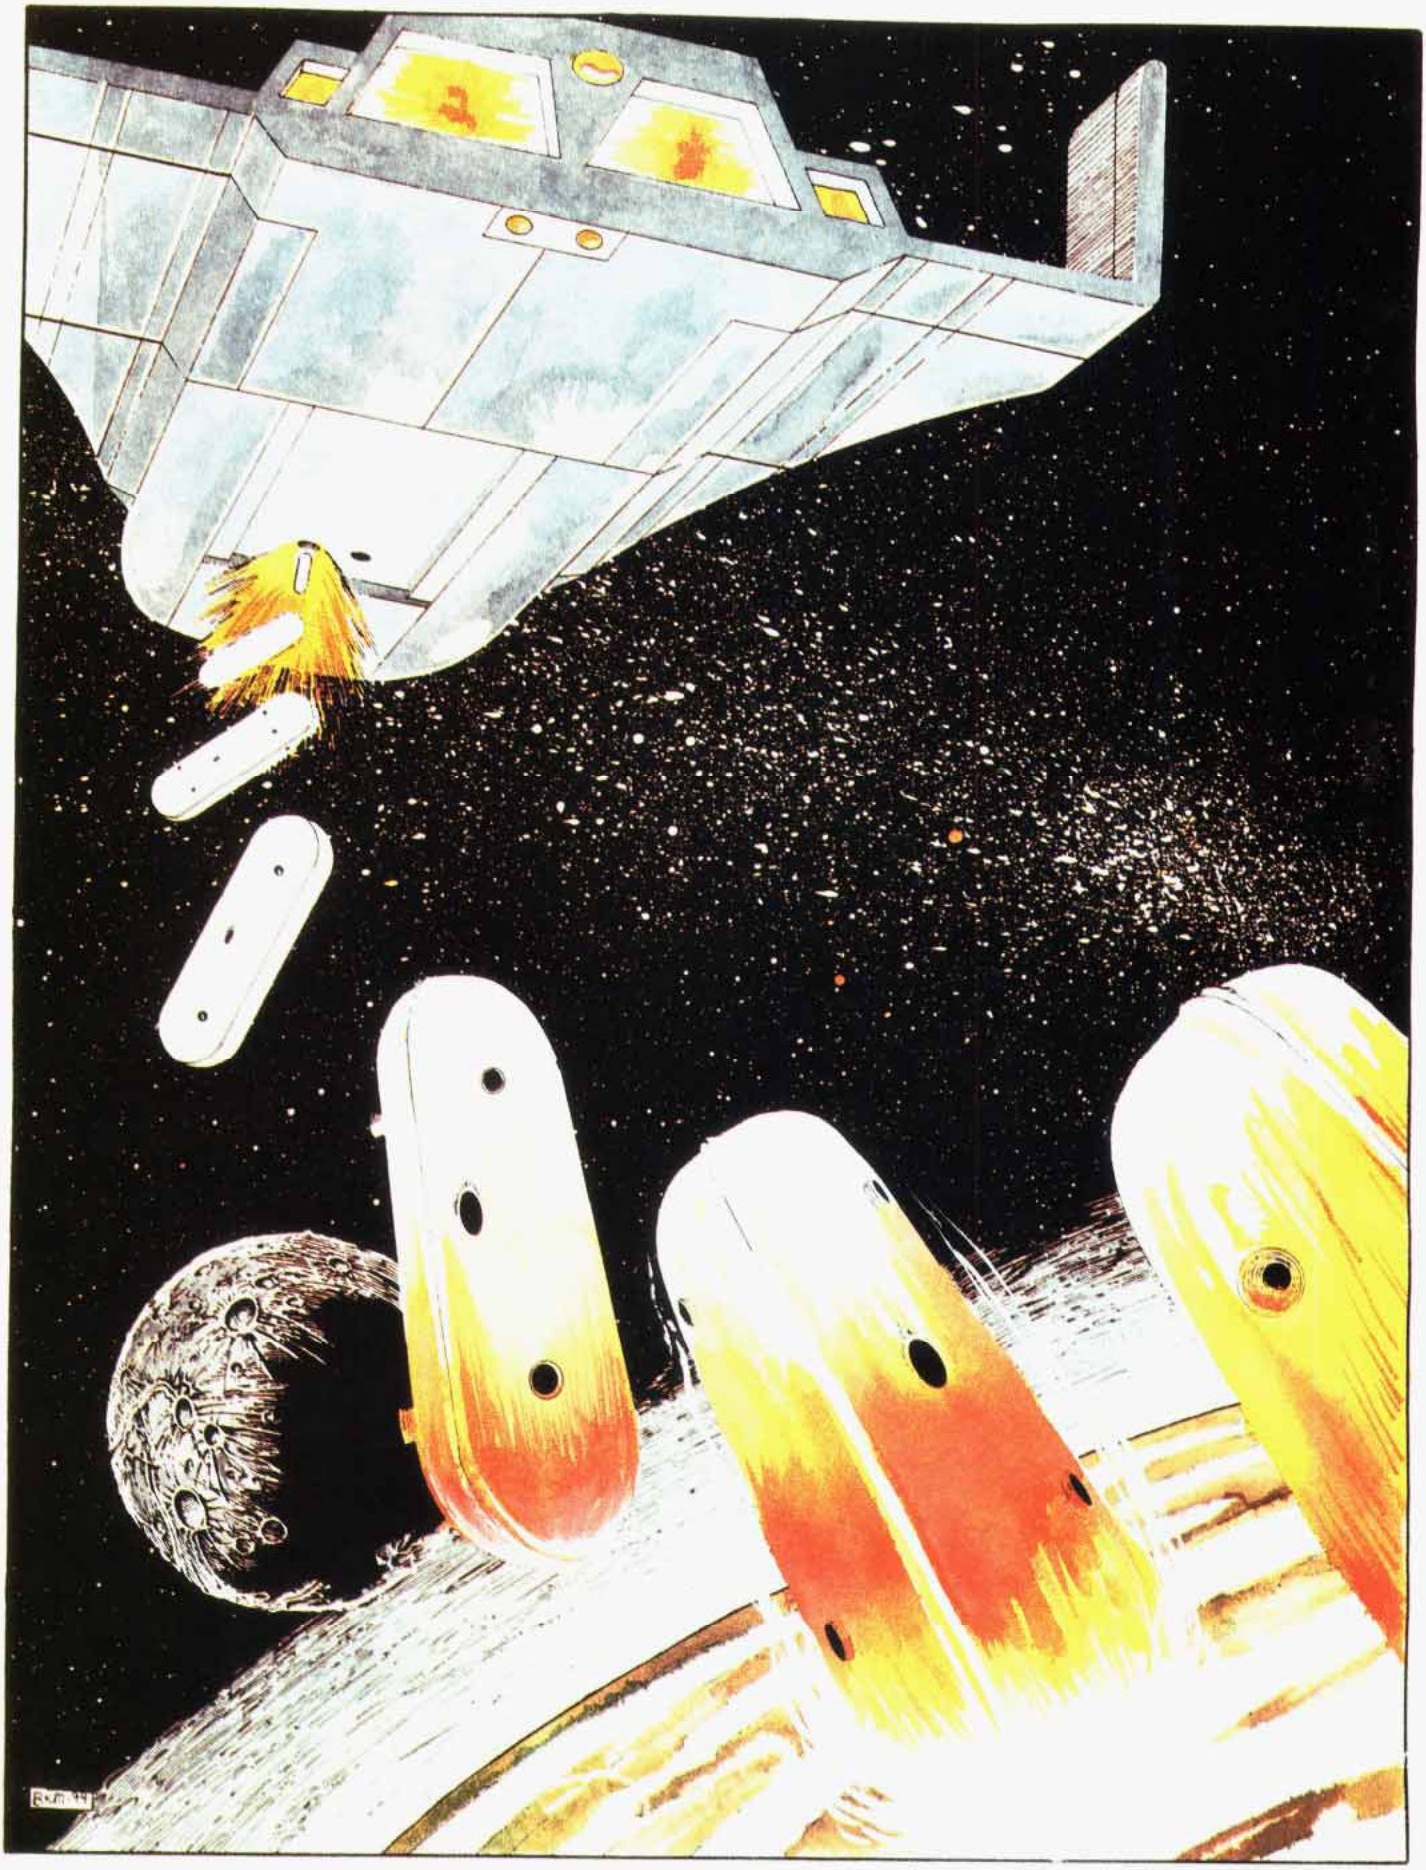
G: Cargo Bay after the Storm

This plate shows a quiet moment aboard a Hiver transport (page 151) cargo bay after most of the cargo has been unloaded into a secured landing zone.



In the foreground, a BRT "Big Brute" (similar to the "Baby Brute" on page 21, but based on the Schalli battle dress skeleton with performance: 268-kg mass, Cr400,340 price, maximum load 2880 kg, 8 hours endurance) has just picked up a TL-8 "lightning bolt" Virus-killer (page 31) and is about to carry it to ground transport waiting outside. Through the open cargo hatch in the background, a platoon of Pyrrhus TL-13 support sleds (page 126) move out to reinforce the perimeter, while the last of the passengers brought by the transport (relic recovery teams and other specialists) march off to add their numbers to those already on the ground.

H: Serendipity



In the ruins of a boneyard city, a group of free-lancers discover a wrecked but possibly salvageable Intrepid grav tank (pages 112-113).

The group's clothing and equipment illustrate the wide variation seen in such groups. The party is armed with a variety of weapons, always a wise precaution in the Wilds. Their relative lack of gear indicates that they are not too far from their ship, or have a vehicle that carries the bulk of their supplies.

The grav tank has crashed through a building wall after coming under heavy fire, and has rested in this spot for a number of years. Curiously, the tank's crew had not removed the tampion from the gun barrel, which indicates a hasty departure from a vehicle park or warehouse facility. This is is a lucky discovery for the team, as it indicates that the main gun has been protected from the elements and may actually be in working condition. If the group's luck holds, the tank will have a full supply of ammunition, and it will make a tidy profit from this trip.

Plasma Bazooka

TL-10 9cm Plasma Bazooka

This is the least sophisticated of the high-energy weapons, but it does provide moderately portable antiarmor firepower at much lower tech levels than those at which effective man-portable high-energy weapons become practical. These are manufactured by the Reformation Coalition primarily for supply to Coalition allies in the Wilds, but they are also used in limited numbers by RC member world armed forces.

Unlike the more sophisticated plasma rifles which separate their firing units from their support hardware, the plasma bazooka comes in one piece, and is fired from the shoulder. It fires an individually loaded chemical plasma cartridge (CPC). The cartridge contains the ignition chamber for the plasma stream and a disposable chemical laser ignition system. Part of the cartridge's great weight comes from the fact that it must vent a significant amount of energy out of the rear of the bazooka in order to negate its recoil. However, this creates considerable backblast. All personnel standing within 10 meters directly behind the weapon is fired take 5D6 backblast damage, and the weapon may not be fired from inside an enclosure (such as a building or bunker).

The plasma bazooka takes two combat turns to reload (one turn is spent on the cooling cycle, the second is spent loading the new CPC).

The plasma bazooka crew usually consists of two personnel, the bazooka gunner and a loader/ammo carrier. The bazooka team is typically provided with a light vehicle as well, such as a range truck or air raft.

Cartridge/Bore Diameter: 9 cm
Weapon Length: 85 cm
Discharge Energy: 2 Mj
Weapon Specifications: 27 kg empty, 43.2 kg loaded with one round, Cr 67,500 for weapon only
Cartridge Specifications: "9×32 CPC," actual dimensions 90×318 mm Chemical Plasma Cartridge (2.25 Mj), 16.2 kg, Cr400 each
Features: Optic sights

HIGH-ENERGY WEAPONS

High-energy weapons use a laser to heat hydrogen in a magnetic bottle into a high-temperature plasma, and then release this plasma in a high-velocity jet. These weapons are commonly divided into two types: plasma weapons and fusion weapons. Both sub-types work in the same basic way; the difference is that in the fusion weapons the plasma continues to be heated in the weapon until its atoms begin to undergo nuclear fusion.

These weapons use hydrogen which is contained in pulse plasma or pulse fusion cartridges (PPCs or PFCs) which also contain the circuitry to allow them to function as the magnetic bottles which confines the plasma until it is fired. The cartridge is then expelled during the cooling/reload cycle. The diameter of the pulse cartridge in centimeters is usually used to describe the weapon, although the diameter of the plasma stream itself is less than this.

The support equipment required for the plasma or fusion weapon (such as the cooling system and batteries to power the laser) are carried in a backpack which is connected to the weapon by a flexible, heavy-duty cable. The same laser which ignites and heats the hydrogen (by firing through the center of the pulse cartridge) also is fired at the target a split-second before the plasma is released. This pilot laser burns a small "tunnel" through the atmosphere which assists the passage of the plasma which follows along behind it.

High-energy weapons generate a large amount of recoil, and are usually intended for use by powered (battle dress-equipped) troops, or are fitted with recoil compensators.

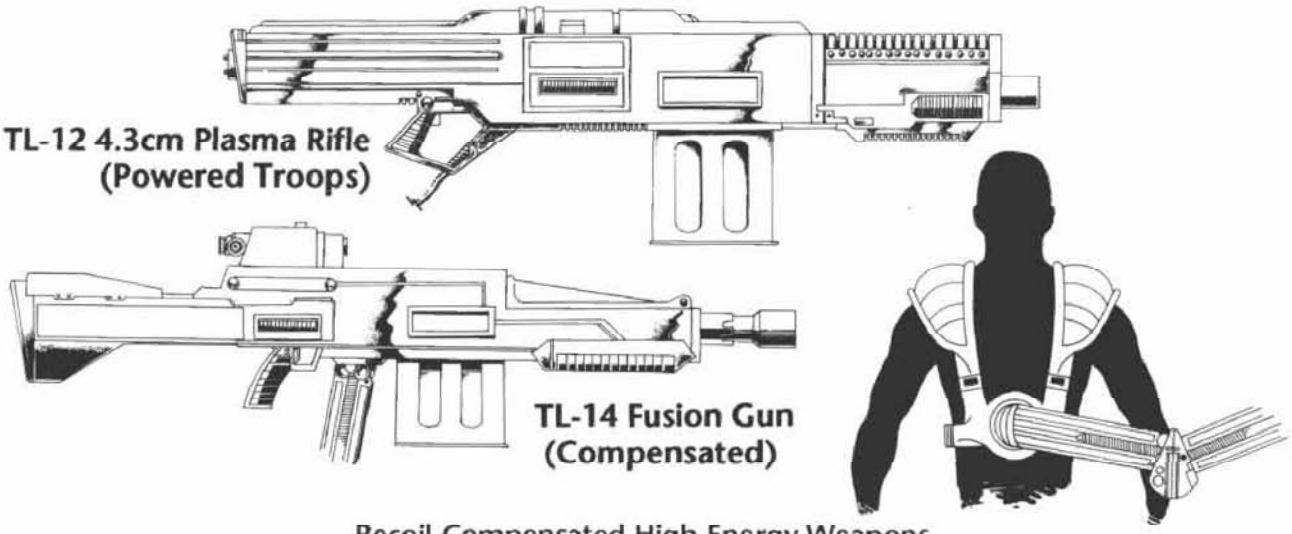
Non-Compensated High-Energy Weapons

Nonrecoil-compensated high-energy weapons are almost always used with battle dress, which provides the strength enhancement to allow the firer to handle the high recoil. The three non-compensated weapons on the table below must be used with battle dress, as they are not fitted with buttstocks. Instead, they have a plug assembly which fits into a socket on the battle dress breastplate (one and each side to allow for right- or left-handed firing). This plug holds the weapon in place when being fired, and also allows the weapon to be integrated into the battle dress sensor suite. While the weapon is plugged into the socket, its boresight line is projected onto the heads-up display on the battle dress visor.

Non-compensated high-energy weapons are usually quite heavy, as the battle dress-enhanced strength allows them to carry a greater load of ammunition than could be handled by unpowered troops.

The TL-12 4.3cm plasma rifle is manufactured in small numbers by the Reformation Coalition for use with powered troops. The other weapons listed on the table below are relic weapons which can also be found in service, provided sufficient compatible ammunition has also been recovered.

TL-12 4.3cm Plasma Rifle (Powered Troops)



Weapon Length: 72 cm
Pulse Energy: 0.6 Mj
Weapon Mass: 2.4 kg empty, 17.4 kg with full magazine
Backpack Mass: 4.8 kg
Weapon Price: Cr18,000 (Cr6000 firing unit, Cr12,000 backpack)
Cartridge Specifications: "4.3 cm PPC," actual dimensions 4.3×12.4 cm Pulse Fusion Cartridge (0.6 Mj), 1.44 kg, Cr15 each
Magazine Specifications: 7.8 kg empty, 15 kg with 5 rounds, Cr78 empty, Cr153 fully loaded with 5 rounds PPC
Features: Optic sight

				Weight				Price

4.7 Fusion 14	SA1	13	½-1-4	26-26-13-3	5	10	8	—	60

The *Damage* and *Penetration Rating* (short/medium-long-extreme) columns are used for firing against personnel. The *Penetration Value* column (short-medium-long-extreme) is used against vehicles.

Recoil-Compensated High-Energy Weapons

Because non-powered troops cannot typically control the recoil of high-energy weapons, lighter versions of these weapons are manufactured with recoil compensators which reduce the recoil to manageable levels. These compensators are gyroscopic in design from tech level 10-13, and are inertial at tech level 14 and higher. They are carried in the weapons' backpacks along with the other support equipment. The fitting of either type of compensator requires a modification to the hardware which connects the backpack to the weapon. Rather than the simple cable, the compensated weapon is connected to the backpack by a flexible, articulated arm. This arm has a number of joints which allow the user to move the weapon freely and fire it from the hip or the shoulder. However, at the moment the weapon fires, the joints become rigid, allowing the recoil to be carried down the arm into the backpack, where a portion of it is absorbed by the compensator. The remaining recoil is within the ability of the average soldier to control.

Recoil-compensated weapons are quite a bit more expensive than the non-compensated versions, but are economical from the standpoint that they do not also require a battle dress suit for each soldier. Because non-powered troops cannot manage overly massive weapons, compensated high-energy weapons also have much smaller magazine capacities than their non-compensated counterparts.

The compensated TL-14 fusion rifle described here is rated limited standard in RC service, as a significant cache were discovered on Nike Nimbus (which had been a naval base during the Final Imperium). The other two weapons on the table below are relic weapons which had been fairly common in the Imperial era.

TL-14 Fusion Gun (Compensated)

Weapon Length: 80 cm
Pulse Energy: 1.2 Mj
Weapon Mass: 4.8 kg empty, 21.7 kg with full magazine
Backpack Mass: 9.6 kg
Weapon Price: Cr156,000 (Cr72,000 firing unit, Cr84,000 backpack with inertial compensator)
Cartridge Specifications: "4.7 cm PFC," actual dimensions 4.7 × 13.8 cm Pulse Fusion Cartridge (1.2 Mj), 1.92 kg, Cr9.6 each
Magazine Specifications: 9.22 kg empty, 16.9 kg with 5 rounds, Cr93 empty, Cr131.4 fully loaded with 5 rounds PFC
Features: Optic sight, inertial compensator harness and backpack

				Weight				Price	
Weapon	*TL*	*Pulse*	*Ammo*	*Empty*	*Loaded*	*BP*	*Mag*	*Weapon*	*Ammo*
4.1 cm Plasma Rifle/comp	14	0.8	4.1 PFC	3.2	14.5	6.4	4	40,000	6.4/87
4.7 cm Fusion Rifle/comp	14	1.2	4.7 PFC	4.8	21.7	9.6	4	156,000	9.6/131
5.1 cm Fusion Rifle/comp	15	1.5	5.1 PFC	3	24	6	4	97,500	12/163

Pulse energy in Mj; *Ammo* diameter in cm and type; *Weight* in kg, where *BP* is backpack weight; *Price* in credits, *Ammo* price for a single round/fully loaded magazine in credits.

							Recoil		
Weapon	*ROF*	*Dam Val*	*Pen Rtg*	*Pen Val*	*Bulk*	*Mag*	*SS*	*Burst*	*Range*
4.1 Plasma 14c	SA1	10	1-2-10	10-10-5-1	4	4	5	—	20
4.7 Fusion 14c	SA1	13	½-1-4	26-26-13-3	5	4	3	—	60
5.1 Fusion 15c	SA1	14	½-1-4	28-28-14-4	3	4	4	—	80

The notation "comp" or "c" indicates that the weapon is fitted with a recoil compensator in the backpack.

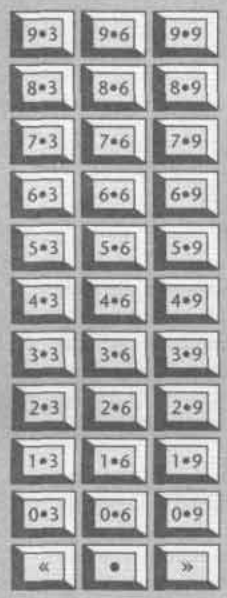
The *Damage* and *Penetration Rating* (short/medium-long-extreme) columns are used for firing against personnel. The *Penetration Value* column (short-medium-long-extreme) is used against vehicles.

Lasers

LASERS

Lasers (Light Amplification by the Stimulated Emission of Radiation) function on a principle called *stimulated emission*, meaning that an atom or molecule is hit by light of a particular wavelength which then causes that particle to emit light of that same wavelength. The reason that substances can be stimulated to produce specific wavelengths has to do with the way atoms and molecules store and release energy with their electrons. Electrons belonging to an atom are found in "orbits" (they are not really orbits, but they are a close enough concept for these purposes) around the atom's nucleus. These electrons move from low-energy orbits close to the nucleus out to high-energy orbits farther from the nucleus as they gain energy by absorbing photons, and move back in toward the nucleus as they give up energy by emitting photons.

These orbits are not set up with an infinite number of fine gradations. Rather, they are like the rungs of a ladder—there are only so many, and they are a fixed distance apart. One can step up or down one, two, three or more rungs at a time, but cannot go up or down a fraction of a rung. Like the difference between electron orbits, the differences between the rungs on a ladder are *quantized*. This means that an electron which absorbs a photon and moves, or *transitions*, to a higher orbit, or *energy level*, can only have absorbed a photon with a certain fixed amount of energy, no more and no less, to move to that energy level. As that same electron transitions back down to the earlier lower energy level, it emits that same amount of energy, the difference between the two energy levels, in the form of a photon which is identical to the photon it absorbed earlier. Thus, based on the number of available energy levels and the combination of transitions (energy level 0-1, 0-2, 0-3, 1-2, 1-3, etc.), an atom can only absorb or emit photons of certain discrete energies.



Photons are described in three ways: by their energy, their frequency, and their wavelength (remember that electromagnetic radiation behaves as simultaneously as particles—photons—and waves, so that particles can be said to have frequency and wavelength). However, these are merely three different descriptions of the same thing—a given wavelength is equivalent to a certain frequency is equivalent to a certain energy. That means that an atom which can only absorb or emit photons of certain energies can only absorb or emit radiation of a certain wavelength.

Molecules also store energy electronically as just described, but they additionally store energy as vibrational energy, where the component atoms vibrate back and forth with relation to each other, and rotational energy, where the molecule rotates around its center of mass (atomic nuclei cannot store energy like this because their mass is completely symmetrical). However, like electronic energy, vibrational and rotational energy are also quantized—there are only certain allowed levels of these energies, which define the energy/wavelength of the photons that these molecules can absorb or emit.

Most photon emission is spontaneous. Energetic atoms or molecules, like those in the filament of a light bulb, shed their energy by spontaneously spewing photons—atoms and molecules tend toward their lowest energy states, so the chances of spontaneous emission increase with the energy state. What stimulated emission does is to hit an energetic atom or molecule with a photon of a wavelength that corresponds to one of that atom or molecule's transitions (i.e., a wavelength which it can absorb or emit). If the atom or molecule is already at the energy state where it can emit a photon of the wavelength which struck it, the atom or molecule will emit that photon, and in the same direction as the photon which struck it, so that now there are two identical photons travelling in the same direction. So long as this takes place within a population of atoms or molecules which are already at the required energy level, this chain reaction will continue, creating ever more photons of the same wavelength. This is a laser. If this emission takes place between a pair of focusing mirrors, the photons will bounce back and forth, continuously stimulating more photons travelling in the same direction, until one of the mirrors is made transparent ("Q-switched"), and the focused beam of photons is released. This is what we normally think of as a laser, although it is more properly called a "diffraction limited laser." These diffraction limited lasers are used as weapons in **Traveller**, and are referred to here simply as "lasers."

However, a population of atoms or molecules will not all be at the proper energy state at the same time. Instead, they will naturally be at thermodynamic equilibrium, which means that the number of atoms or molecules at a given energy state varies inversely with the amount of energy in that energy state, with the result that each energy state is outnumbered by the lower energy state immediately beneath it (i.e., the energy state which will immediately absorb photons released by the upper energy states). What this means is that this population would rather absorb the photons coming by than be stimulated to emit any. The stimulated emission chain reaction is dead before it begins.

In order to get stimulated emission to work, there must be a *population inversion*. A population inversion means that the target energy state (that which produces the photon wavelength desired) is more common than the energy states beneath it. This allows the target energy state population to stimulate each other's emission without these photons being absorbed by the remainder of the population. This inversion cannot be created simply by heating the population, as this would merely create thermodynamic equilibrium at a higher set of energy states, which would be just as detrimental to the chain reaction. Three ways to selectively populate an upper energy level are via electrical current, intense light, or chemical reaction.

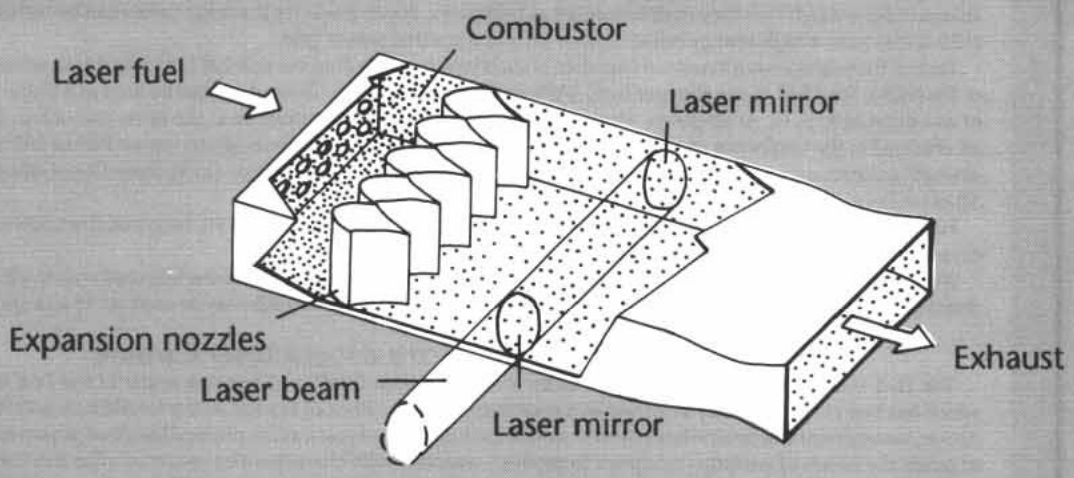
Date



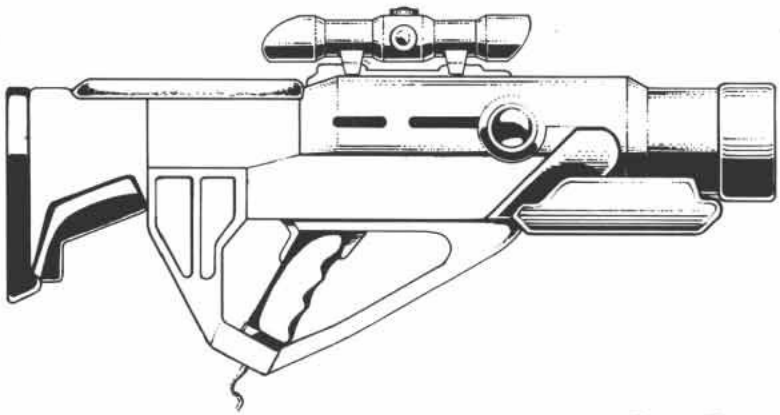
These give rise to the types of lasers used in **Traveller** and presented on the following pages.

First is what we will call a static laser. A static laser uses a single population of atoms or molecules which are energized by electrical or light input, emit their photons and fall to a lower energy state, and are then re-energized to emit again, over and over and over. They are called static because they use the same population time after time. They are distinguished by the need for significant electrical input in order to function, and also by the fact that they are not tunable (i.e., they cannot be manipulated to emit more than one wavelength of light, because the static population is typically limited to one useful wavelength by its very nature). Static lasers are represented in **Traveller** by non-tunable direct electrical input lasers, and examples of these are found on pages 90-91.

Second are chemical lasers. These lasers do not use the same population over and over, but continuously create a new energized population which emits its photons and is discarded. These atoms or molecules are not energized *per se*, but are created in an energized state as the products of an energetic chemical reaction. By keeping a continuous reaction going and venting away the spent material, a population inversion can be maintained without the need for outside power input, as the energy comes purely from combusting chemicals (which come from a chemical laser cartridge, or CLC). These lasers can be described as tunable because the laser wavelength they emit is based on the chemicals they are burning. By designing a laser to combust a variety of different chemicals, each of which produces a different wavelength, that laser can be used to produce a number of different wavelengths merely by changing the chemicals used. Examples of this type of laser are found on pages 92-95.

There is also a third type of laser, the free-electron lasers, or FELs. These are true tunable lasers, but the only FELs presented here are starship-mounted turret lasers; no small arms FELs are presented in this book.

Chemical Laser



Chemical fuel extracted from the chemical laser cartridge (CLC) is burned in the combustor at left, and its pressure causes it to pass through the expansion nozzles into the laser-generation cavity. By firing a tiny starting pulse of photons, energy from the hot gas is extracted in the form of photons of the same wavelength, which are then bounced back and forth between the mirrors, stimulating more photon emission from the gas. The pressure of the hot gas causes a continuous flow from the combustor to the exhaust. But because the pressure in the combustor is often less than 1 atmosphere, a vacuum evacuator must be installed at the exhaust unless the laser is being vented directly into space. The laser is fired to the lower left.

Laser Atmospheric Adjustments

Lasers have widely differing performance in different atmosphere types. The combat performance charts on the following six pages show performance in a standard atmosphere (codes 6, 7). For performance in other atmosphere types, look at the Atmospheric Adjustment tables and use the following procedure. Use the listed short range from the SR column to resolve hits, and then find damage at that range by consulting the column for the correct atmosphere type, Vacuum (code 0), Trace (code 1), Very Thin (codes 2 and 3), Thin (codes 4 and 5), Dense (codes 8 and 9), and Exotic (codes A-C). All of these columns provide four entries, for short-medium-long-extreme ranges. The entry will usually be a letter code, showing which damage entry to use on the combat performance table. If the entry reads "0," the laser does no damage at that range.

For dense and exotic atmospheres, there is an additional parenthetical listing. This shows the weapon's short range in meters in this atmosphere to achieve the same S-M-L-E damage performance it has in a standard atmosphere as listed on the combat performance table. This allows players to use their weapons at shortened ranges in thick atmospheres to regain damage performance. If the entry reads "NA," there is no shorter range that may be used.

DEI Lasers

DIRECT ELECTRICAL INPUT LASERS

All direct electrical input (DEI) lasers require a direct electrical power supply which feeds directly into the laser's capacitor or homopolar generator. For vehicle- or starship-mounted weapons, this is a power plant. For small arms, this is almost always a battery pack which is combined with the capacitor to form a power pack. At lower tech levels, these power packs are almost always bulky enough that they must be carried as backpacks. Power packs for the lasers below can be recharged in 10 minutes (120 turns) from a high-energy power source such as a starship power grid.

Each of these lasers has a maximum number of shots which can be fired per combat turn, listed as its semiautomatic (SA) rate of fire (ROF). Thus SA1 is one shot per turn, SA2 two shots per turn, etc. These shots can be fired as a single high-energy pulse, or as a burst of 3, 5, 10, or 50 pulses. However, all shots fired in one turn must be at the same rate of fire. This rate of fire may be changed at the beginning of each combat turn at no action cost. Thus a laser which has an ROF of SA3 could fire three full-strength pulses in a turn (SA3), three three-pulse bursts (3×3), three five-pulse bursts (3×5), three 10-pulse bursts (3×10), or three 50-pulse bursts (3×50) in a combat turn.

For weapons (such as the pistol and rifle below) which have different SA rates of fire based on their power pack, the number of multi-pulse bursts allowed is based on the SA rate.

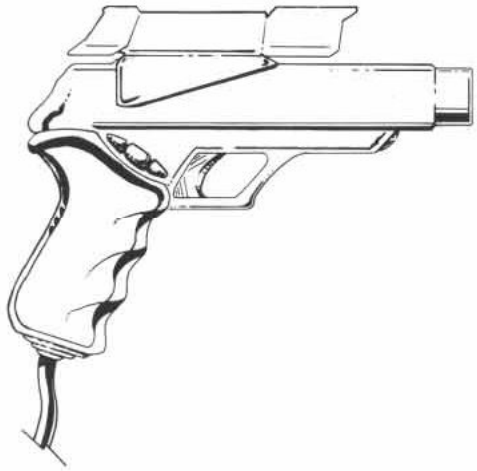
All DEI lasers are equipped with integral laser sights (**TNE**, page 275) which simply use the laser itself on a very low (negligible power drain) power level. The laser sights for all three DEI lasers in this book (pages 90-92) may be used out to a range of 240 meters.

TL-8 10cm Direct Electrical Input Laser Carbine

The TL-8 10cm laser carbine manufactured by the Reformation Coalition is but one avatar of the TL-8 laser carbine design which has been independently designed and engineered on thousands of worlds. As the lowest tech practical small arms laser design, variations of this carbine have been in service for thousands of years, as the physical laws that govern such things continue to guide the hands of weapons designers to produce weapons with characteristics very much like this one.

This carbine remains in service even at higher tech levels as a designation weapon used by scouts and artillery spotters because of its all-around utility, low price, and good range performance.

Focal Array Diameter: 10 cm
Weapon Length: 72.15 cm
Pulse Discharge Energy: 0.01 Mj (SA1), 0.0033 Mj (1×3), 0.002 (1×5), 0.001 (1×10), 0.0005 (1×50)
Weapon Specifications: 4.33 kg, Cr2310
Power Pack Specifications: 19.5 kg, capacity of 50×0.01 Mj shots, Cr215
Features: Laser sight, optic sight, ruggedized weapon body (to grenade standard)



Combat Performance (in Atmosphere types 6, 7)

Weapon	*ROF*	*Dam Dice (S-M-L-E)*	*Dam Dice (W-X-Y-Z)*	*Pen Rtg*	*Bulk*	*Magazine*	*Short Range*
10cm DEI Carbine-8	SA1	5-3-1-1	0-0-0-0	Nil	4	50 PP	200
	1×3	3-1-1-0	0-0-0-0	Nil	4	50 PP	200
	1×5	2-1-1-0	0-0-0-0	Nil	4	50 PP	200
	1×10	2-1-0-0	0-0-0-0	Nil	4	50 PP	200
	1×50	1-0-0-0	0-0-0-0	Nil	4	50 PP	200

Atmospheric Adjustments (see page 89 for instructions)

10cm DEI Carbine-8	290	S-S-S-M	S-S-S-M	S-S-M-L	S-M-L-E	M-L-E-0	L-E-0-0 (100)	0-0-0-0 (20)

Note that the laser carbine uses a reduced short range on the combat performance table in order to maximize its damage performance. The values under Standard atmosphere above allow players to use the carbine's best range performance, at a penalty in damage performance at range.

TL-9 5cm Direct Electrical Input Laser Pistol

This weapon is a much lighter alternative to the laser rifle manufactured at the same tech level (see next page), although it is so heavy that it hardly fills the classic sidearm role. The lightweight power pack (below) allows the pistol's use by specialist troops, such as heavy weapons crews, radio operators, etc.

This pistol may be fitted with any one of three standard power packs. One power pack provides power for 50 shots at the 0.01 Mj level, or 25 shots at the 0.02 Mj level, or a combination of the two. The second power pack provides 100 shots at 0.01 Mj or 50 shots at 0.02 Mj, or a combination. The third "lightweight" power pack provides 50 shots at 0.01 Mj and sacrifices the ability to fire at the 0.02 Mj level, but is appreciably lighter than the other two packs. All three power packs are backpack configuration, and use the same power hook-up cable.

While the pistol is built to handle a rate of fire of four 0.01 Mj shots or two 0.02 Mj shots (SA4 and SA2, respectively), only the second, largest power pack allows fire at this rate. The smaller power packs limit the pistol to SA2 at 0.01 Mj and SA1 at 0.02 Mj (or not shots at all in the case of the lightweight power pack) because of their battery discharge rates.

An adaptor assembly may be installed in a vehicle to allow the pistol to be fed directly from the vehicle's power plant. This assembly masses 13.6 kg (0.0136 tonnes), displaces 6.8 liters (0.0068 cubic meters), costs Cr295, and requires 0.02667 MW power from the power plant if the pistol is to fire at its full performance (equivalent to power pack 2), or only 0.0133 MW to allow performance equivalent to that with power pack 1.

Focal Array Diameter: 5 cm
Weapon Length: 42 cm
Pulse Discharge Energy: 0.02 Mj (at SA1 or SA2, see above), 0.01 Mj (at SA2 or SA4, see above), 0.0033 Mj (three-pulse bursts), 0.002 (five-pulse bursts), 0.001 (10-pulse bursts), 0.0005 (50-pulse bursts)
Weapon Specifications: 1.67 kg, Cr1250
Power Pack Specifications: Power Pack 1: 19.6 kg, capacity 50×0.01-Mj or 25×0.02-Mj shots, Cr320, or
Power Pack 2: 23.5 kg, capacity 100×0.01-Mj or 50×0.02-Mj shots, Cr330, or
Power Pack 3: 11.9 kg, capacity 50×0.01-Mj shots, Cr280
Features: Laser sight, optic sight, ruggedized weapon body (to grenade standard)

Combat Performance (in Atmosphere types 6, 7)

Weapon	*Mj*	*ROF(1/2/3)*	*Dam Dice (S-M-L-E)*	*Dam Dice (W-X-Y-Z)*	*Pen Rtg*	*Bulk*	*Mag (1/2/3)*	*Short Range*

5cm DEI Pistol-9	90	S-S-S-S	S-S-S-S	S-S-S-M	S-S-M-M	S-M-L-E	M-L-E-W (50)	W-0-0-0 (10)

DEI and CLC Lasers

TL-9 8cm Direct Electrical Input Laser Rifle

Like the DEI pistol manufactured at the same tech level (page 91), the combat performance of this rifle varies with the power pack it is fitted with. While the rifle is constructed to be able to fire 0.04 Mj pulses at a rate of fire of two per combat turn (SA2) or 0.02 Mj pulses at a rate of four per turn (SA4), this full performance is only permitted by the heavier of the two power packs available.

With the first, lighter power pack, the battery's discharge rate limits the rifle to a ROF of SA2 at 0.02 Mj or SA1 at 0.04 Mj. The second, heavier power pack allows the full rate of fire described above.

While the rifle itself is relatively light and handy, the power required by the weapon results in very heavy power packs. Even the less capable power pack constitutes a burdening load for most persons, and the heavier high-performance pack is almost guaranteed to be a burdening load (see **TNE**, pages 35 and 265).

Nonetheless, the 8cm rifle is a formidable antipersonnel small arm.

An adaptor assembly may be installed in a vehicle to allow the rifle to be fed directly from the vehicle's power plant. This assembly masses 27.2 kg (0.0272 tonnes), displaces 13.6 liters (0.0136 cubic meters), costs Cr590, and requires 0.05332 MW power from the power plant if the rifle is to fire at its full performance, or only 0.02667 MW to allow performance equivalent to that with the lighter power pack.

The rifle is not fitted with a bayonet lug as its structure is not ruggedized to hand-to-hand combat standards.

Focal Array Diameter: 8 cm
Weapon Length: 71.62 cm
Pulse Discharge Energy: 0.04 Mj (at SA1 or SA2 see above), 0.02 Mj (at SA2 or SA4, see above), 0.00667 Mj (three-pulse bursts), 0.004 (five-pulse bursts), 0.002 (10-pulse bursts), 0.0004 (50-pulse bursts)
Weapon Specifications: 4.21 kg, Cr2855
Power Pack Specifications: Power pack 1: 44.3 kg, capacity of 100×0.02 Mj or 50×0.04-Mj shots, Cr656, or
Power Pack 2: 57.3 kg, capacity of 200×0.02-Mj or 100×0.04-Mj shots, Cr684
Features: Laser sight, optic sight, ruggedized weapon body (to grenade standard), RAM rifle grenade adapter

Combat Performance (in Atmosphere types 6, 7)

CHEMICAL LASERS

The basic functioning of chemical lasers has already been described on page 89.

Chemical lasers have a base rate of CLCs which they may fire each combat turn, which is shown as the SA rate of fire. Each CLC expended is called a "shot." SA3 means three CLCs or shots may be fired per turn, SA5 is five per turn, etc. The energy in these shots may be expended at different rates of fire (ROF): as a single powerful pulse (SAN, where N is the number of shots that can be fired per turn), a three-pulse burst (N×3), a five-pulse burst (N×5), a 10-pulse burst (N×10), or a 50-pulse burst (N×50). All shots fired during the same combat turn must be at the same ROF. The ROF may be changed at the beginning of each combat turn at no action cost.

Most of the CLC lasers in this book are fitted with integral laser sights (see **TNE**, page 275) which are powered by batteries, and thus do not require the expenditure of a laser cartridge. The range of all of these laser sights is 240 meters.

TL-13 4cm Chemical Cartridge Laser Rifle

The 4cm laser rifle is the standard laser weapon used by Coalition troops. Like all laser weapons, it has penetration shortcomings, so its use is based on tactical requirements. When expecting to encounter large numbers of unarmored or partially armored troops, lasers are unsurpassed for their high automatic rates of fire and antipersonnel damage capabilities. On the other hand, in a situation where armored troops are expected, lasers are usually traded for ACRs, gauss weapons, or in extreme cases, plasma or fusion weapons.

Focal Array Diameter: 4 cm
Weapon Length: 78.47 cm
Pulse Discharge Energy: 0.04 Mj (SA3), 0.0133 Mj (3×3), 0.008 Mj (3×5), 0.004 Mj (3×10), 0.0008 Mj (3×50)
Weapon Specifications: 8.87 kg empty, 10.71 kg with full 10-round magazine, 11.51 kg with full 15-round magazine, Cr8800 weapon only
Cartridge Specifications: "16×48 CLC," actual dimensions 16.2×48.6mm Chemical Laser (0.2 Mj), 0.1 kg, Cr6 each
Magazine Specifications: 10-round box magazine: 0.84 kg empty, 1.84 kg with 10 rounds 16×48 CLC, Cr9 empty, Cr69 fully loaded with 10 rounds 16×48 CLC

15-round box magazine: 1.14 kg empty, 2.64 kg with 10 rounds 16×48 CLC, Cr12 empty, Cr102 fully loaded with 15 rounds 16×48 CLC
Features: Laser sight, Optic sight, ruggedized weapon body (to grenade standards), RAM rifle grenade adapter

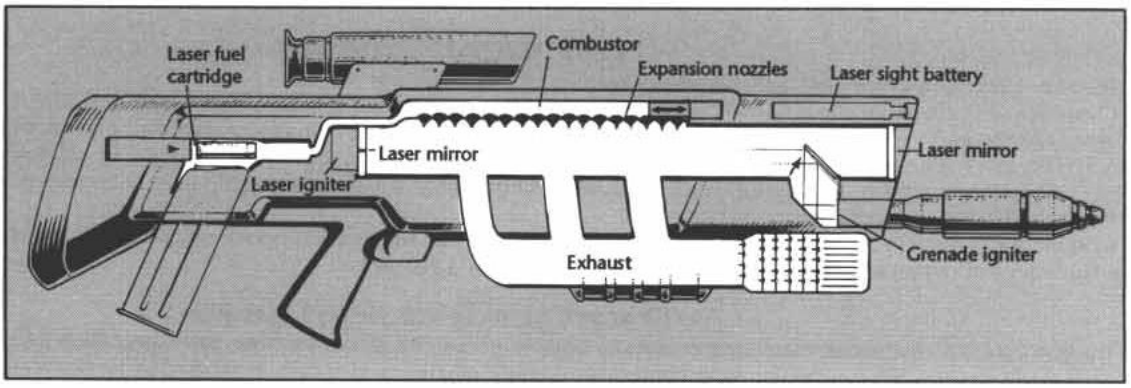
CLC Lasers

TL-13 3cm Chemical Cartridge Laser Carbine



The CLC laser carbine is a lighter, cheaper, lower performance version of the laser rifle on page 94. While it is intended for use by support troops who do not have the need for the punch of the full-size rifle, it is most often used as a combat rifle by armed forces intent on economizing.

It may fire three shots per combat turn.

This carbine is built in the Reformation Coalition using TL-13 parts imported from the Hivers, including the focal array and laser cartridges.

Like all CLC lasers, laser carbines have a chemical purge system (illustrated below). The purpose of this purge system is two-fold: to eliminate the thermal and sound signatures of an open evacuator, and to neutralize the highly toxic chemical byproducts of the chemical laser process. During the evacuation cycle, which is continuous throughout the pulse generation period, the spent chemical gases are drawn from the combustion chamber into a receiving cannister. On some CLC laser designs, this cannister is called a purge can, and is disposable. Once it is filled with spent chemicals, the cannister is discarded and replaced with another. Some of these purge cannisters contain catalysts to detoxify the chemicals, while some purge cans merely hold the poisonous material until it eventually corrodes its way out, years or decades later.

More advanced designs, including all of those manufactured by the Coalition, use a safer and more convenient method. The spent chemical gas is pumped into a multi-stage catalyst cannister. Here, the evacuation cycle of each succeeding shot pushes the spent gas farther forward through one-way valves into successive cells of the cannister where catalysts render it non-toxic and it is cooled to the background temperature. The harmless gas is eventually vented out of the end of the cannister, at the front of the rifle, once it has cooled to the point that it no longer presents a thermal signature. The catalysts in the cannister need to be replenished periodically, and this is done as part of the normal field stripping/servicing procedure.

Focal Array Diameter: 3cm

Weapon Length: 64.32 cm

Pulse Discharge Energy: 0.02 Mj (SA3), 0.00667 Mj (3×3), 0.004 Mj (3×5), 0.002 Mj (3×10), 0.0004 Mj (3×50)

Weapon Specifications: 4.78 kg empty, 5.7 kg with full 10-round magazine, 6.1 kg with full 15-round magazine, Cr4650 weapon only

Cartridge Specifications: "13×39 CLC," actual dimensions 12.86×38.6 mm Chemical Laser (0.1 Mj), 0.05 kg, Cr3 each

Magazine Specifications: 10-round box magazine: 0.42 kg empty, 0.92 kg with 10 rounds 13×39 CLC, Cr5 empty, Cr35 fully loaded with 10 rounds 13×39 CLC

15-round box magazine: 0.57 kg empty, 1.32 kg with 15 rounds 13×39 CLC, Cr6 empty, Cr51 fully loaded with 15 rounds 13×39 CLC

Features: Laser sight, optic sight, ruggedized weapon body (to grenade standard), RAM rifle grenade adapter

TL-13 2cm Chemical Cartridge Laser Pistol and 2cm Personal Defense Laser (PDL)

The 2cm laser pistol is a standard laser sidearm used by personnel who are not intended to be frequently placed in combat. Like the other TL-13 laser weapons produced by the Coalition, it requires key TL-13 components which are imported from the Hivers, such as its focal array and ammunition cartridges.

The PDL is a standard lightweight laser used by officers and vehicle crews, and as a secondary weapon by heavy weapons crews or equipment operators. These are personnel who are expected to routinely be placed in combat situations where the 2cm laser pistol's range is insufficient.

The PDL is a redesigned 2cm CLC laser pistol, using the same laser "guts" as the pistol, but built for two-hand firing, ruggedized for harder use, and with a greater magazine capacity. It is lighter, handier, and easier to stow than the TL-13 CLC laser carbine, although it naturally has significantly lower combat performance.

Because it is essentially the laser version of a submachinegun, it is not intended for aimed long-range fire, but for use at short ranges, primarily "spraying" at high pulsed rates of fire.

Unlike the pistol, the PDL has no optic sights, and its short range is actually "de-rated" from 260 to 200 meters in order to take full advantage of its effective range.

The PDL is ruggedized to melee standards not in order to have a bayonet lug (it doesn't), but because the weapon is expected to take a good deal of abuse by being tossed into vehicles, banged by ammo boxes and tripods, etc.

TL-13 2cm Chemical Cartridge Laser Pistol

Focal Array Diameter: 2cm
Total Weapon Length: 42.43 cm
Pulse Discharge Energy: 0.01 Mj (SA3), 0.0033 Mj (3×3), 0.002 Mj (3×5), 0.001 Mj (3×10), 0.0002 Mj (3×50)
Weapon Specifications: 2.64 kg empty, 3.26 kg with full 14-round grip magazine, Cr2535 weapon only
Cartridge Specifications: "10×30 CLC," actual dimensions 10.2 × 30.6 mm Chemical Laser (0.05 Mj), 0.025 kg, Cr1.5 each
Magazine Specifications: 14-round grip type, 0.27 kg empty, 0.62 kg with 14 rounds 10×30 CLC, Cr3 empty, Cr24 fully loaded with 14 rounds 10×30 CLC
Features: Laser sight, Optic sight, ruggedized weapon body (to grenade standards)

TL-13 2cm Chemical Cartridge Personal Defense Laser (PDL)

Focal Array Diameter: 2cm
Total Weapon Length: 49.4 cm
Pulse Discharge Energy: 0.01 Mj (SA3), 0.0033 Mj (3×3), 0.002 Mj (3×5), 0.001 Mj (3×10), 0.0002 Mj (3×50)
Weapon Specifications: 2.82 kg empty, 3.88 kg with full 25-round magazine, Cr2398 weapon only
Cartridge Specifications: "10×30 CLC," actual dimensions 10.2 × 30.6 mm Chemical Laser (0.05 Mj), 0.025 kg, Cr1.5 each
Magazine Specifications: 25-round extended grip type, 0.435 kg empty, 1.06 kg with 25 rounds 10×30 CLC, Cr5 empty, Cr42.5 fully loaded with 25 rounds 10×30 CLC
Features: Laser sight, double-ruggedized weapon body (to melee standards)

Laser Heavy Weapons

TL-13 Chemical Cartridge Squad Support Laser (SSL)

The TL-13 Squad Support Laser (SSL) is a powerful heavy infantry weapon used by RC ground forces. Because it uses technologies above the current manufacturing capabilities of RC worlds, it is manufactured using crucial internal components purchased from the Hivers, such as its focal array and the chemical cartridges themselves.

The SSL is heavy, and, when not vehicle mounted, requires a crew of three due to the weight of its components. One crewmember carries the laser (59 kg), one carries the ammunition box (73 kg), and one carries the tripod (66 kg). Once the laser is set up, one crew serves as the gunner, another as the spotter, and another as security/ammunition runner.

There is also a special version of the SSL used in an integral mount on the right shoulder of the Schalli battle dress (page 23). The SBD version of the SSL is used with a 50-round magazine as shown below.

The SSL also comes in a vehicle-mounted version without the pistol grip, laser and optical sights, and built for use with cassette-fed ammo for Cr57,360. This weapon is fitted in a standard remote turret with TL-12 fire control, and ballistic computers, a 2000-round cassette, and advanced stabilization with firing characteristics identical to those below (plus the 4 Diff Mod ballistic computer bonus). This installation, including the fire control components at the gunner's remote station masses 1.18877 tonnes, has a volume of 4.1277 cubic meters, and costs Cr244,895 exclusive of ammo (full load of 2000 rounds costs Cr54,000). See page 138 for a starship installation.

Focal Array Diameter: 6cm
Weapon Length: 132.13 cm
Pulse Discharge Energy: 0.18 Mj (SA5), 0.06 Mj (5x3), 0.036 Mj (5x5), 0.018 Mj (5x10), 0.0036 Mj (5x50)
Weapon Specifications: 59.39 kg empty, 132.47 kg with full 100-round box magazine, 198.72 kg mounted on tripod, 96.47 in Schalli battle dress configuration with full 50-round box magazine, Cr57,835 weapon only
Cartridge Specifications: "27x80 CLC," actual dimensions 26.7x80.2mm Chemical Laser (0.9 Mj), 0.45 kg, Cr27 each
Magazine Specifications: 100-round box magazine: 28.08 kg empty, 73.08 kg with 100 rounds 27x80 CLC, Cr280 empty, Cr2981 fully loaded with 100 rounds 27x80 CLC
50-round box magazine (used with integral SSL mounted on Schalli battle dress only): 14.58 kg empty, 37.08 kg with 50 rounds 27x80 CLC, Cr146 empty, Cr1496 fully loaded with 50 rounds 27x80 CLC
Tripod Specifications: 66.25 kg, Cr763
Features: Laser sight, Optic sight, ruggedized weapon body

TL-13 Chemical Cartridge Laser Sniper Weapon (LSW)

More commonly called the "laser can opener," the LSW is a specialized heavy infantry weapon used for taking out lightly armored targets at long ranges. Although it is capable of penetrating light battle dress at reasonable ranges, its intended use is the destruction of enemy sensors, communications antennae, etc., at long ranges.

The LSW's feed mechanism is a single-shot, manually operated breech, and is a modified version of a vehicle-mounted autoloading action. The weapon's listed ROF of 1/4 means one shot every four turns, whether at full strength or a 3-, 5-, 10-, or 50-pulse burst. Four reloading actions are required to prepare for the next shot (usually two each performed by the gunner and loader), assuming that ammunition is stored close at hand.

When ground mounted, the LSW has a crew of three; gunner, loader, and ammunition carrier. When the laser is being moved, the gunner and loader carry the weapon itself, and the ammo carrier carries five or more rounds. Because of the difficulty in man-packing enough ammunition for long engagements, the weapon is usually vehicle mounted. In RC service, the loader and ammunition carrier are each secondarily armed with a personal defense laser (page 95).

The LSW's body is not ruggedized, and hence cannot stand up to careless or abusive treatment.

Focal Array Diameter: 6 cm
Weapon Length: 152.59 cm
Pulse Discharge Energy: 3.6 Mj (1/4), 1.2 Mj (1/4x3), 0.72 Mj (1/4x5), 0.36 Mj (1/4x10), 0.072 Mj (1/4x50)
Weapon Specifications: 90.69 kg empty, 99.69 kg with a loaded cartridge, 140.69 kg empty mounted on tripod, 149.69 kg with a loaded cartridge mounted on a tripod, Cr54,815 weapon only
Cartridge Specifications: "7.2 cm CLC," actual dimensions 72x221mm Chemical Laser (0.9 Mj), 9 kg, Cr540 each
Magazine Specifications: No magazine, each round loaded individually
Tripod Specifications: 50 kg, Cr600
Features: Electronic sight

	1/4x50	Nil	Nil	Nil	Nil	13-13-13-10-5-3-1-1	10	SS**	300

*Listed Damage Dice are for direct hits on personnel or animal targets without first penetrating armor. When penetrating armor, lasers spend points of *damage value* to achieve penetration. After determining the amount of damage value expended in penetrating the armor, multiply the remaining damage value by 25. This is the number of *damage dice* applied against the target.

**One CLC cartridge is used per SA shot or per burst, not one cartridge per pulse in the burst.

TL-10 6cm Assault Rocket Launcher

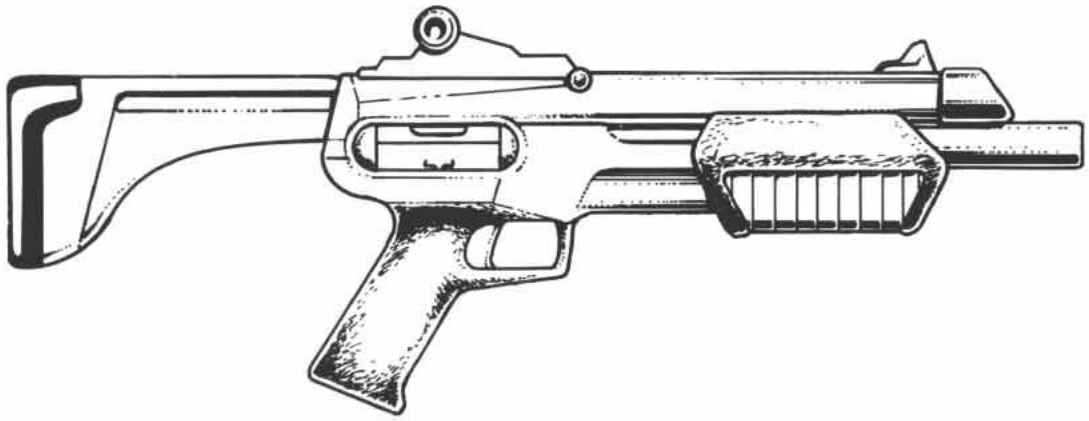
The assault rocket launcher (ARL) is a shoulder-fired infantry support weapon that fires a variety of 6cm direct fire rockets. Like the plasma bazooka from the same tech level (page 85), the ARL is manufactured primarily for use by RC-supported "Bootstrap" forces.

As the ARL is merely a rocket-launching tube with a box magazine-fed autoloader on top of it, it generates no recoil. However, the backblast from the rocket motor generates a distinctive and easily observed visual and thermal signature, and makes it impractical for firing from enclosed structures.

The weapon comes with simple optical sights, and the range listed is its maximum achievable range, as free-flight unguided rockets are only so accurate. Laser or electronic sights (to enable night vision) can be fitted at additional cost.

By mounting multiple ARLs in the back of a small vehicle, such as a range truck or air raft, field-expedient rocket artillery launchers may be created.

Weapon Caliber: 6cm
Weapon Length: 190 cm
Weapon Specifications: 6 kg empty, 18.32 kg with full 4-round magazine, 22.8 kg with full 6-round magazine, Cr210 weapon only
Round Specifications: 6cm high-velocity rocket, 1.4 kg, 49.5 cm long; Price varies by type: HE = Cr12.4; HEAP = Cr18.4; WP = Cr24.4; Flechette = Cr60.4
Magazine Specifications: 4-round box magazine: 6.72 kg empty, 12.32 kg loaded with 4 rockets, Cr68 empty, loaded price varies with ammunition type
6-round box magazine: 8.4 kg empty, 16.8 kg loaded with 6 rockets, Cr84 empty, loaded price varies with ammunition type
Features: Optic sight



The table below shows the combat values for the types of rockets that may be fired by the 6cm ARL-10. *Con-Brst* is the warhead's concussion and burst values, *Pen Val* is the warhead's penetration value, *Dngr Spc* is the width×length of the flechette primary danger space in meters, *Dam Val* is the damage value of flechettes in the primary/secondary danger space, and *Pen Rtg* is the penetration rating of flechettes in the primary/secondary danger space.

SR is direct fire short range in meters, *IFR* is maximum indirect fire range in kilometers.

Weapon	*ROF*	*Con-Brst*	*Pen Val*	*Dngr Spc*	*Dam Val*	*Pen Rtg*	*Bulk*	*Mag*	*SR*	*IFR*

2.5cm Low-Velocity Grenade Launcher

This weapon was designed first and foremost as an integral part of the 5.5mm assault rifle (discussed on pages 52-53), using a pre-Collapse round. It was a simple design step, however, to add a folding stock and issue the weapon separately.

At present, only two types of rounds are manufactured, HE and HEAP, as these are the two most useful in such a small grenade.

When attaching this weapon to another rifle, the shoulder stock is removed. Data for this variant is provided separately.

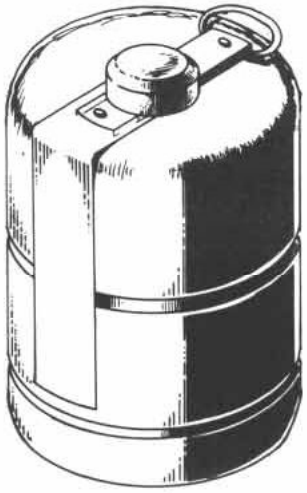
Shoulder-Fired 2.5cm Low-Velocity Grenade Launcher

TL: 10
Ammo: 2.5 cm low-velocity propelled grenades
Average Muzzle Energy: 253 joules
Weapon Length: 42.5/62.5 cm
Weapon Weight: 3.45 kg (loaded), 3 kg (empty)
Weapon Price: Cr550
Magazine: 5-round internal tubular magazine
Grenade Price: Cr0.9 (HE), Cr1.35 (HEAP)
Grenade Weight: 90 grams each
Features: Folding stock

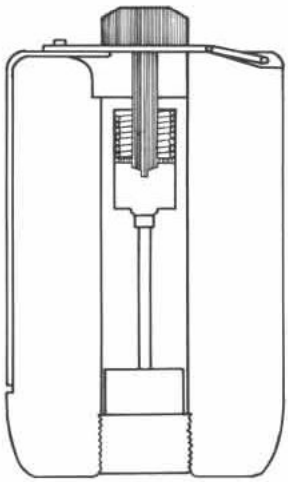
Attached 2.5cm Low-Velocity Grenade Launcher

Where the data duplicates the shoulder-fired version, it is omitted
Weapon Length: 37.5 cm
Weapon Weight: 2.95 kg (loaded), 2.5 kg (empty)
Weapon Price: Cr500
Features: None

2.5cm Low-Velocity GL



Type	*Range*	*IFR*	*Damage*	*Pen Val*	*Bulk*	*Magazine*	*Recoil**
2.5cm HE	100	400	C: 2, B: 15	Nil	2/4	Si	1
2.5cm HEAP	100	400	C: 1, B: 5	23C	2/4	Si	1



*Recoil when fired separately or when attached to any rifle.

Effects on Recoil of Other Weapons

The 2.5cm grenade launcher may be attached to any weapon with a barrel 37.5cm or longer. The following weapons have the recoils noted below when the 2.5cm GL is attached:

4mm Gauss Rifle: Ball, DS, HE, & HEAP: SS:1 Burst 4/7; Tranq: SS: 1 Burst 3/6
5mm Assault Rifle: Ball, DS, HE, & HEAP: SS:2, Burst 1; Tranq: SS: 2, Burst: 4
7mm ACR: Ball, DS, HE, & HEAP: SS:1, Burst, 2; Tranq: SS: 1, Burst 2
7mm Assault Rifle: Ball, DS, HE, & HEAP: SS: 2, Burst: 5; Tranq: SS: 2, Burst: 4

7mm TL-5 Rifle Mil & Civ: Ball, DS, HE, & HEAP: SS: 3, Burst —; Tranq: SS: 3, Burst —
9mm TL-7 Rifle: Ball, DS, HE, & HEAP: SS:3 Burst: —; Tranq: SS: 3, Burst —

GRENADES AND PYROTECHNIC SIGNALS

Hand Grenades

Hand grenades are small portable explosive or pyrotechnic devices primarily designed to be thrown. Hand grenades are present on all worlds with tech levels sufficient to manufacture them. Range and deviation of thrown weapons are discussed on **TNE**, page 282.

HE/Frag: These grenades are the most common, and are designed to inflict damage by throwing fragments in all directions.

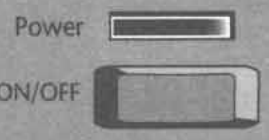
HEAP: HEAP hand grenades are designed to penetrate armor by means of a shaped charge, and usually have fins, a streamer, or some other form of stabilization to ensure that the warhead lands in the proper orientation with relation to the target.

Chem: These grenades do damage by dispersal of a chemical agent rather than by explosive power. The effects of various chemicals used in them are discussed in the chemical warfare rule (**TNE**, page 306).

WP/IS: These grenades are filled with compounds which release clouds of smoke when ignited. IS comes in various colors (red, green, yellow, purple, and white), WP comes only in white. All of these grenades are a source of ignition, and WP grenades throw burning fragments (see Burns, **TNE**, pages 286-287).

ILLUM: ILLUM grenades produce a very bright light, but unlike propelled ILLUM rounds, they are not launched into the air, but remain where they land. They light up a smaller area than airburst pyrotechnics.

Concussion: Concussion grenades are specialized versions of HE grenades designed to have a more powerful explosion but no lethal fragmentation.



Thermite: These are extremely hot incendiary grenades designed for destruction of equipment such as artillery tubes or vehicle engines. Thermite grenades generate enough heat to melt most metals after a few seconds of contact and actually produce small streams of molten iron as their filler burns. They are a source of ignition, and throw burning fragments like WP grenades (see Burns, **TNE**, pages 286-287).

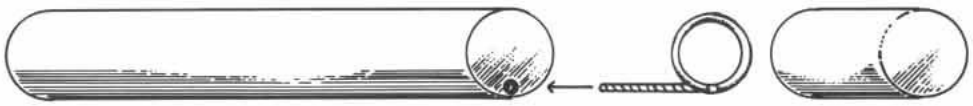
* See Thrown Weapons (**TNE**, page 282) for range and deviation.

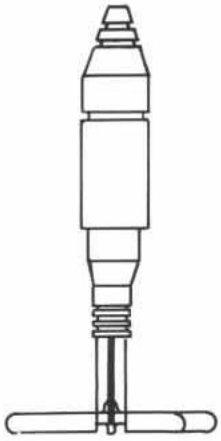


Pyrotechnic Signals

Flare: These devices are ignited to produce an intense, extremely bright light and are used for signaling and illumination. The user removes a safety cap, pulls the ignition pin, and the flare ignites a few seconds later. Flares manufactured before TL-8 are a source of ignition and burn for 30 seconds (6 turns), during the last half of which they inflict damage on the person holding them (in the relevant arm). These flares inflict burn damage as if they were a single WP fragment. At TL-8 and after, flares are manufactured based on cold-light technology, and are no longer sources of burn damage or ignition, but are otherwise identical to earlier flares.

Flares illuminate an area depending upon their tech level, as noted by the following table.

TL	*Diameter of Area Illuminated*
4-5	15 m
6-7	15 m
8-9	25 m
10+	35 m



Starburst: Sometimes called parachute flares, these signals contain a small rocket charge to launch the signal skyward, where it deploys a small parachute before it ignites. The signal then drifts to the ground over a period of 30 seconds (6 turns), at which point it is extinguished. Otherwise, starbursts are identical to flares (they become cold-light at TL-8, etc.), except that the diameter of the area they illuminate is increased, as noted on the following table. Starbursts are normally launched from the hand by pulling a firing lanyard (directing the business end upwards).

TL	*Diameter of Area Illuminated*
4-5	25 m
6-7	35 m
8-9	50 m
10+	65 m

4cm RAM Grenades

These are described in the basic rules, page 357. RAM and rifle grenades below were used almost universally in the Imperium, and are widely distributed in the new era, used in the Wilds and by the Coalition.

Mass: 0.48
Price: HE: Cr48, HEAP: Cr72, APERS: Cr240, CHEM: Cr48, WP/IS: Cr96, ILLUM: Cr48.

Type	*Range*	*IFR*	*Damage*	*Pen Val*
4cm RAM HE-8	30	500	C: 3, B: 15	Nil
4cm RAM HEAP-8	30	500	C: 2, B: 5	33C

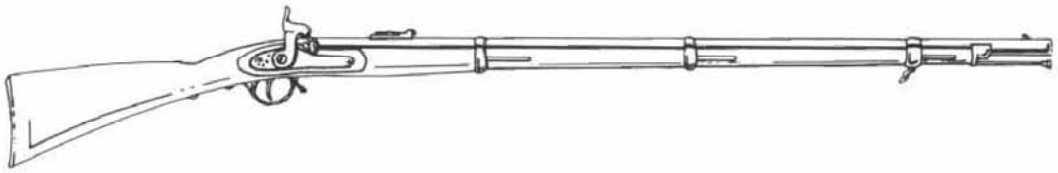
3	158 m
4	193 m
5	228 m

LOW-TECH WEAPONS

The weapons on these two pages are representative of those in use on the deeply regressed worlds of the Wilds. These are the only pieces of equipment in this book that were not designed with the **Fire, Fusion, & Steel** design sequences. They were designed using the black-powder weapons and bow design sequences in the **World Tamer's Handbook**.

The "Reload" column in the combat performance tables shows the number of *actions* (not turns, i.e., high-Initiative characters can perform more than one action per combat turn) required to reload the weapon. The tech level "3M" listed below indicates a *mature* TL-3 society which has more innovations available to it than one which has just barely crossed the TL-3 threshold.

Smoothbore Flintlock Musket



A flintlock uses a spring-loaded flint-and-steel striker to ignite the main powder charge in a gun barrel. The weapon illustrated is typical of numerous archaic designs in use on very low TL worlds, and in the hands of poorly equipped militias and insurgents on worlds with higher technology levels. Because of its short range and poor accuracy, smoothbore muskets are most effective when used by massed bodies of soldiers exchanging volley fire.

This weapon holds one individually loaded round inserted in the muzzle, and requires two actions to reload. If prepared paper cartridges are not available, the weapon may be loaded using loose powder and ball, but this takes one additional action.

TL: 3
Ammo: 18×52mm black powder and ball in paper cartridge
Muzzle Energy: 1446 joules
Weapon Length: 130 cm
Weapon Weight: 5.19 kg loaded, 5.15 kg empty

Weapon Price: Cr390
Magazine: None.
Ammunition Price: Cr0.4 (Ball)
Ammunition Weight: 40 grams per round
Features: Bayonet lug.

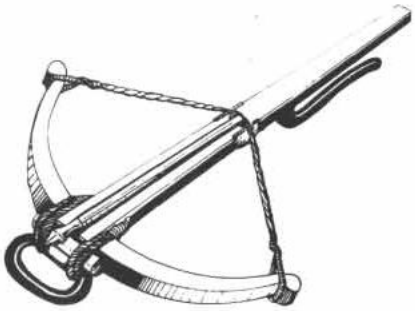
18mm P&B	2	3	Nil	8	1i	1	—	30

Rifled Musket

Rifled muskets of the type illustrated are more advanced archaic firearms. Using a rifled barrel and a conical bullet, the rifle musket achieves greater range and damage than the smoothbore version, and the percussion cap ignition system results in fewer misfires. Soldiers using these weapons are able to make use of more modern tactics and need not resort to massed volleys (although the weapons are sometimes used in that fashion).



This weapon holds one individually loaded round inserted in the muzzle, and requires two actions to reload. If prepared paper cartridges are not available, the weapon may be loaded using loose powder and ball, but this takes one additional action.

TL: 3M
Ammo: 12×76mm black powder and ball in paper cartridge
Muzzle Energy: 2010 joules
Weapon Length: 110.8 cm
Weapon Weight: 4.41 kg loaded, 4.37 empty

Weapon Price: Cr560
Magazine: None.
Ammunition Price: Cr0.43 (Ball)
Ammunition Weight: 43 grams per round
Features: Bayonet lug.

						— Recoil —

Light Crossbow

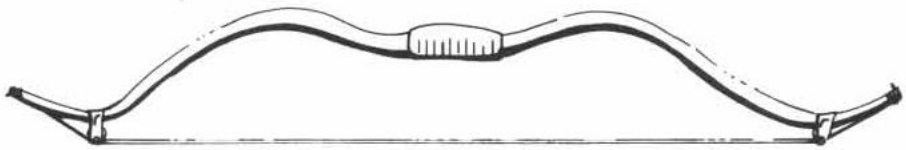
A crossbow is simply a bow fitted to a wooden stock (crosswise, hence the name), the string held in the cocked position by a simple latch and the projectile (called a bolt or quarrel) placed in a groove on the upper surface of the stock. The firer cocks the crossbow using a lever or handcrank, pulling the string back over the latch. A bolt can then be placed in the groove, and the bow held ready to fire for as long as desired. To fire, the archer simply takes aim and squeezes the firing lever or trigger.

Because of its design, the bow in a crossbow can be more powerful than an individual could otherwise use, and greater range can be achieved. Crossbows require more sophisticated construction techniques than simple bows.

TL: 2
Ammo: Bolt/quarrel
Weapon Length: 100 cm
Weapon Weight: 4 kg
Weapon Price: Cr275

Magazine: None.
Ammunition Price: Cr1
Ammunition Weight: 40 grams per bolt
Features: None.

						— Recoil —		
Round	*ROF*	*Dam Val*	*Pen Rtg*	*Bulk*	*Magazine*	*SS*	*Burst*	*Short Range*
Bolt/quarrel	3	1	Nil	6	1i	5	—	40



Short Bow

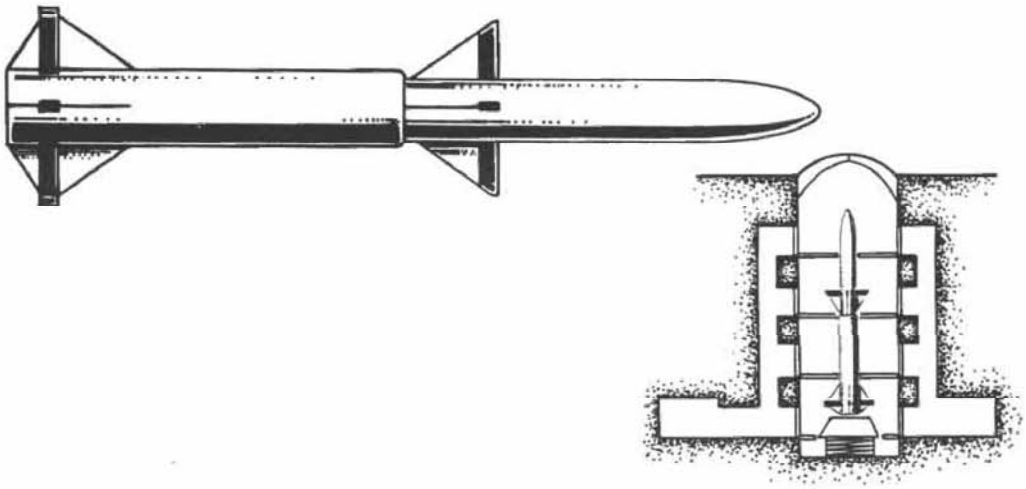
Archery is a common development on many primitive worlds, and this weapon is typical of the smaller, more compact weapons that can be encountered. The archer grasps the bow by the middle and nocks an arrow against the bowstring, where it can be held in place by finger-pressure until ready to fire. To fire, the archer draws the string back, takes aim and releases the arrow. Weapons of this type are handier when mounted on a riding animal, and are often used in such a fashion by warriors or hunters.

TL: 0
Ammo: Arrow
Weapon Length: 80 cm
Weapon Weight: 0.48 kg
Weapon Price: Cr80

Magazine: None.
Ammunition Price: Cr1
Ammunition Weight: 40 grams per arrow
Features: None.

						— Recoil —		
Round	*ROF*	*Dam Val*	*Pen Rtg*	*Bulk*	*Magazine*	*SS*	*Burst*	*Short Range*
Arrow	1	-1	Nil	5	1i	3	—	20

Long Composite Bow



Composite bows are made by carefully shaping and gluing alternating layers of different materials together. Such bows are stronger than if constructed of either material alone, but require more sophistication in their manufacture and are considerably more expensive. Such bows are often constructed to an archer's special special size requirements, and are highly individualized.

TL: 1
Ammo: Arrow
Weapon Length: 150 cm
Weapon Weight: 1.05 kg
Weapon Price: Cr300

Magazine: None.
Ammunition Price: Cr1
Ammunition Weight: 40 grams per arrow

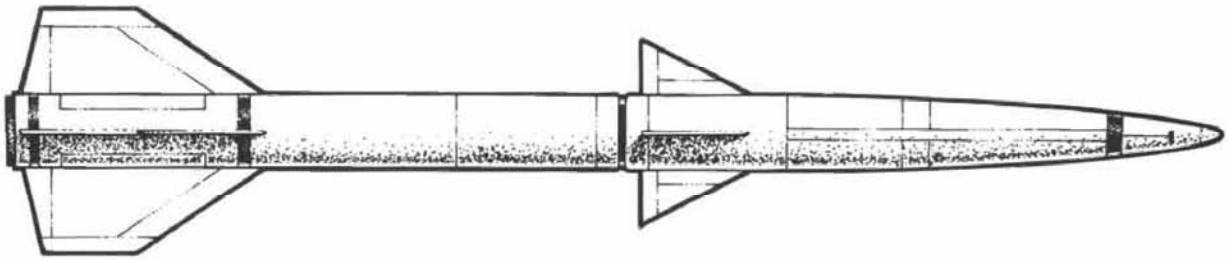
Aerospace Defense Missiles

Planetary Defense Missiles

Aerospace or planetary defense missiles (PDMs) are one of the primary components of any world's planetary aerospace defense system (PADS). Although in Imperial times these missiles were often emplaced off-world, such as on its moons, specially built space stations, asteroids in the trojan points, etc., PDMs encountered in the Wilds are almost always launched from the surface of a world (although they may still use surviving passive or active fire control or early warning sensors deployed in orbital arrays or on moons). Most of these missiles are emplaced in hardened bunkers or silos, making them difficult to destroy from orbit without coming within the PDM's range.

For purposes of determining range to spacecraft in planetary orbit, take the world's size code (from its UPP) and multiply by 20. The result is the altitude in kilometers of a standard orbit above that world. A high orbit, typically used by ships conducting planetary bombardment, is the world's size code times 100. For all non-gas giant worlds, these orbits fit comfortably within a single starship combat range band or **Brilliant Lances** hex.

A selection of representative PDMs from six different tech levels are provided below, and are a cross-section of the sorts of missiles that can be encountered in the Wilds.



See the Rules Expansion section at the end of this book for a discussion of the guidance systems.

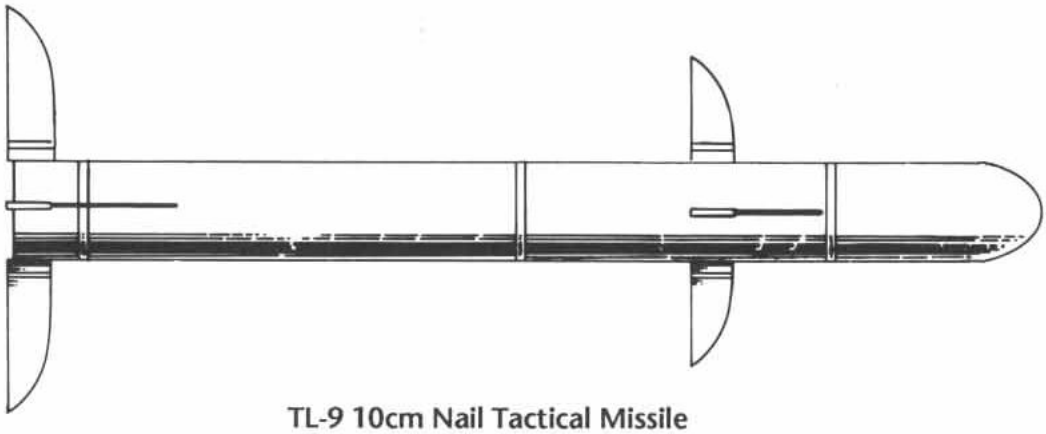
Date



All of these missiles are designed to be able to loft a 0.29-tonne TL-8 10-kiloton warhead into orbit. However, if higher technology relic warheads are available, these more compact and powerful warheads may be used instead. See the following table to find all of the warheads that may be fitted into that same 0.29-tonne payload. This table shows their performance in space combat, i.e., using their warheads as detonation-pumped X-ray laser generators. As these warheads may only function in this fashion in the vacuum of space, these warheads may also be used to destroy targets within the planetary atmosphere by the effects of their nuclear detonations alone. See the "Effect of Nuclear Warheads in Atmosphere" rule in the Rules Expansion section at the end of this book.

Tac Missiles

TL-9 10cm Nail Tactical Missile

Nail missiles are manufactured in large quantities on Oriflamme, and, with the Lyrebird remote missiles (themselves a variant of the Nail), are used as the standard infantry support tactical (tac) missiles by the RC armed forces.

The Nail is a high-speed line-of-sight (LOS) laser-designated missile, usually used in the antiarmor role. It is carried in disposable-package launchers, and was intended for use with battle dress-equipped troops then entering service among the worlds of the Dawn League. The integral 6-km laser designators installed in all RC battle dress were specifically intended for use with the Nail.

Nails may also be fired from vehicle-mounted launch rails or tube launchers. Nails are also used in four-round package launchers installed on the left shoulder of Schalli battle dress (page 23).

Nail Missile and Launcher Physical Characteristics

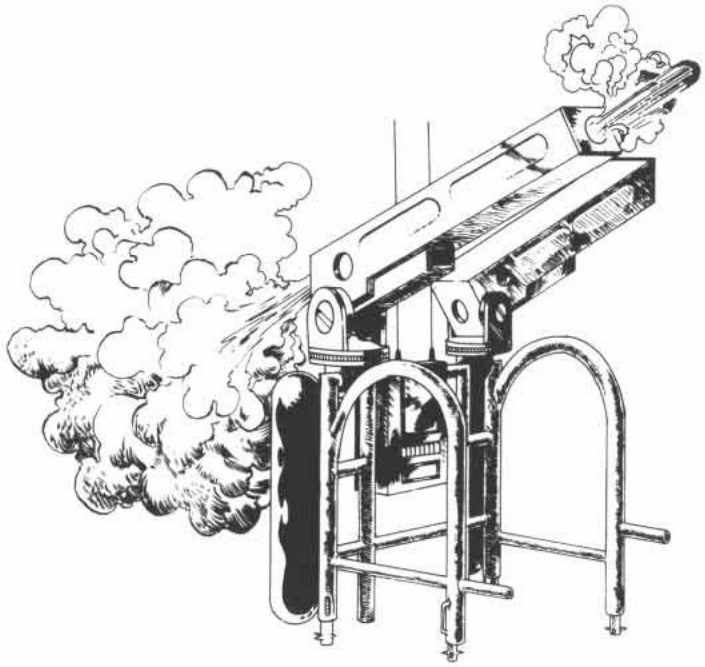
Tech Level: 9
Missile Diameter: 10cm
Missile Guidance: Laser Designated
Missile Mass: 14.4 kg (0.0144 tonnes) missile alone, exclusive of launcher
Missile Volume: 14.4 liters (0.0144 cubic meters) missile alone, exclusive of launcher
Launcher Specifications: Package launcher: 28.8 liters volume, 7.2 kg without missile, 21.6 kg with missile inside, Cr72 exclusive of missile
Launch rail: Negligible volume,14.4 kg rail alone, Cr720 exclusive of missile
Launch tube: 57.6 liters volume, 57.6 kg, Cr 5760 exclusive of missile

Nail LOS Missiles Combat Performance

Type	*Range*	*Damage*	*Pen Val*	*Price*	*Cbt Move*	*Agility*
HE	6	C: 20, B: 45	8C	594	195	5
HEAP	6	C: 13, B: 35	113C	636	195	5
WP	6	C: 3, B: 35	Nil	678	195	5

Range is maximum range in kilometers; *Damage* is given in concussion (C) and burst radius (B) in meters; *Pen Val* is penetration value, *Price* is in Cr; *Cbt Move* is combat move in 10-meter grid squares per 5-second combat turn

The Nail is also manufactured in two antiaircraft homing versions, one with advanced IR (homing) guidance, and one with advanced ARM (anti-radiation homing) guidance. The IR version is used against normal aircraft and homes on their heat signature, while the ARM version homes on active emissions (usually radar, active EMS, or area jamming) coming from the aircraft. The Nail ARM will also home on ground emitters.



These missiles have the same launcher characteristics as the basic Nails above, but each Nail launch station requires a launch control unit which simply reports to the gunner that the missile's seeker has acquired the target and is ready for launch. This unit masses 0.5 kg and costs Cr500. With launch rails and tubes it is added to the crewstation of the gunner. On the package launcher it is added to the package itself, increasing the unloaded mass to 7.7 kg, loaded mass to 22.1 kg, and price to 572. The control unit may be detached from the discarded package launcher and clipped to the next one, so one controller need not be bought for each package launcher.

Nail Antiaircraft Missiles

Type	*Short Range*	*Damage*	*Pen Val*	*Price*	*Cbt Move*	*Agility*
Nail SAM (IR) HE	750	C: 20, B: 45	8C	1594	195	5
Nail ARM HE	750	C: 20, B: 45	8C	3094	195	5

Short Range is short range in meters (homing missiles use short range for resolution rather than maximum range); other data is as on Nail LOS table above.

TL-9 10cm Lyrebird Remote Missiles

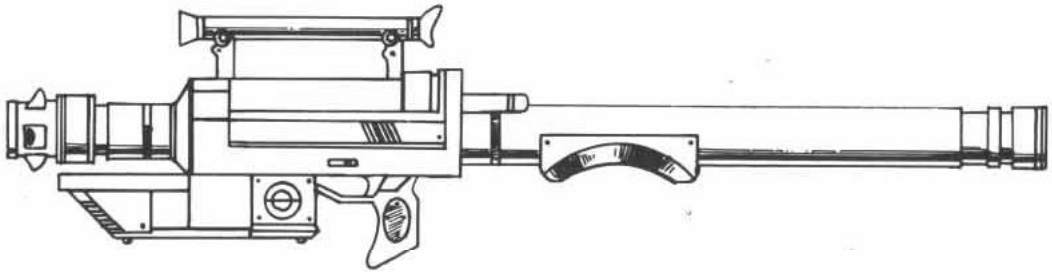
The Lyrebirds are a modified version of the Nail, and were developed to arm the remote missile launchers on the RC drop capsules (pages 14-15). For purposes of standardization, it was decided to retain the same components and dimensions of the Nail, and merely substitute a slower burning propellant to gain more range, assuming the missile is lofted onto a ballistic trajectory, which was consistent with the requirement for the drop capsule missile. This allows all Lyrebird and Nail launchers to use either missile.

Two Lyrebirds are mounted on the parachute harness of each drop capsule. When the trooper reaches the ground, he or she removes the harness, unfolds two legs, and sets it on the ground, ready to fire. The harness contains a TL-12 modified flight computer (with battery) which then takes over as the missile launch controller. The computer has a voice-recognition capability, and monitors the radio net for firing instructions from its trooper.

When the trooper is ready for a Lyrebird, he or she consults the battle dress' inertial navigator which gives the direction and distance from the touchdown point (the missile launcher location). The trooper calls the computer, gives a codeword authorizing launch, reports his range and direction from the launcher, and reports the codename of the trooper whose laser designator will be used (each battle dress suit has its laser designator tuned to pulse in a distinctive coded pattern which is recognizable by the missile's laser seeker, allowing each missile to home on the appropriate target). The computer then trains and elevates the Lyrebird package launcher to the correct angle and fires the missile, lofting it on a ballistic trajectory to arrive above the trooper's location. Once the missile arrives above the trooper, it searches for the correctly coded designated target, and dives on it from above. Because of their ballistic trajectory, all Lyrebirds are treated as overhead attack missiles (**TNE**, page 294). The trooper may also at any time transmit another code word that will cause the harness/launcher to self-destruct, preventing sensitive missile launch and control codes from falling into enemy hands.

Lyrebirds are notoriously slow missiles, taking about a minute to cover 6 kilometers. Thus troopers at the outer limit of the missile's range often find that they need to launch the missiles in anticipation of their fire support needs. This fact gives rise to the missile's nickname "Liarbird." (One trooper says, "I just called in a missile launch." The other looks at the sky, looks at his watch, looks at the sky again, and says, "Liar.")

Note that Lyrebirds have a theoretical maximum ballistic range of 120 km. However, because of the range limitations of battle dress radios and the length of time it would take the missile to arrive at this range, the direct fire range listed below is its practical maximum range.



The physical characteristics of the Lyrebird missiles and their launchers are the same as those of the Nail missiles on the facing page.

Lyrebird Remote Missiles Combat Performance

Type	*Range*	*Damage*	*Pen Val*	*Price*	*Cbt Move*	*Agility*
HE	24	C: 20, B: 45	8C	594	49	3

Homing Lt Submn	24	B: 15	(**TNE**, page 285)	1350	49	3

Range is maximum range in kilometers; *Damage* is given in concussion (C) and burst radius (B) in meters; *Pen Val* is penetration value, *Price* is in Cr; *Cbt Move* is combat move in 10-meter grid squares per 5-second combat turn

Tac and Planetary Strike Missiles

TAC MISSILES

There were a wide variety of tactical (tac) missiles in use by the worlds of the Last Imperium, and these weapons can still be found in profusion on the boneyard worlds of the Wilds. Tac missiles were always produced in large numbers, usually in easy-to-use disposable shoulder-fired package launchers, and this was especially true during the Final War. In the New Era, the armies of an entire world can be equipped from the weapons found in a relic ammo dump for which the final offensive never came, as all military plans collapsed before the coming of Virus.

Homing Missiles

Homing missiles are also called "fire and forget" missiles, because once they are fired, they continue to track and guide themselves to their targets, and the firer need not pay them any further mind. Homing missiles usually home on either infrared (heat) signatures from the target, or emissions from a hostile radar.

Many homing missiles, including most of the sample shown below, are intended as antiaircraft weapons. This allows an antiaircraft capability in a troop unit without the formidable investment in guidance radars, tracking arrays, etc.

The selection of homing missiles below is indicative of the relic missiles that can be found in the Wilds, and which are in use by Coalition armed forces, or are supplied to Coalition allies. Note that the Coalition also manufactures the TL-9 and 11 missiles listed below. These are built to the same standards as the relic versions, to ensure commonality of training and supply. The RC-manufactured TL-9 missile is known as the Dart, and the TL-11 missile is named the Bluejay.

All homing missile launchers below are disposable package launchers. All missiles and their launchers have a volume in liters equal to their mass in kilograms (note that loaded launchers have a volume equal to the launcher volume only as the missile's volume is subsumed within.)

Homing Missile Combat Performance

TL	*Guidance*	*MWt*	*PLWt*	*MP*	*LP*	*C-B*	*Pen Val*	*Short Rng*	*M/turn*	*AGL*
7	IR Homing	7.6	11.9	1018	538	4-25	1C	1340	2500	5
9	IR Homing	14.2	21.8	1536	571	7-25	2C	1320	3900	6
11	IR Homing	14.2	21.8	1536	571	9-35	2C	1980	3900	7
13	IR Homing	16.4	25.1	1539	582	4-25	53C	1110	7785	8

MWt = missile weight in kg, *PLWt* = package launcher weight (loaded with one missile) in kg, *MP* is missile price in Cr, *LP* is launcher price is Cr, *C-B* are the concussion and burst values of the warhead, *Pen Val* is the penetration value of the warhead, *Short Rng* is the short range of the missile in meters, *M/turn* is the number of meters the missile travels in a 5-second combat turn, *AGL* is the missile's agility. See TNE, pages 278 and 294 for more details.

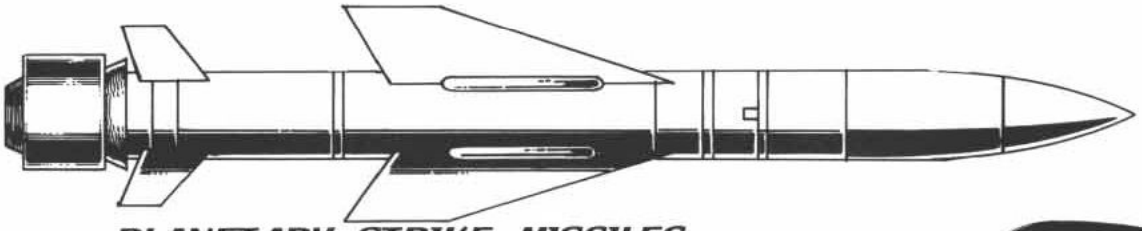
Command-Guided and Designated Missiles

In contrast with the homing missiles above, most command-guided and designated missiles are used for antiarmor (usually antitank, but also anti-bunker, anti-battle dress, and anti-starship) purposes. With the exception of starships, these targets do not move as rapidly as aircraft, and the missiles are typically much slower.

Also in contrast to the homing missiles, antiarmor missiles are typically a primary armament, so are not always fired from disposable package launchers, but rather from reloadable tube launchers mounted on vehicles. The laser-designated missiles below are available in disposable-package launchers. These missiles are dependent upon laser designation from another source, as the package launchers do not contain designators.

All missiles and their launchers have a volume in liters equal to their mass in kilograms. (Note that loaded launchers have a volume equal to the launcher volume only as the missile's volume is subsumed within.)

As with the homing missiles above, the Coalition manufactures the TL-9 and 11 missiles below, with both types of launcher. The RC TL-9 missile is known as the Spike, while the TL-11 missile is the Swift.



Command-Guided or Designated Missile Combat Performance

TL	*Guidance*	*MWt*	*TLWt*	*PLWt*	*MP*	*TLP*	*PLP*	*C-B*	*Pen Val*	*Range*	*M/turn*	*AGL*
7	Laser Cmnd	11.2	110	—	249	7128	—	6-25	57C	7575	975	4
9	Laser Desig. TA	13.8	126	20.7	716	13,572	785	11-35	101C	12,470	1250	4
11	Laser Desig. TA	19.4	167	29.1	772	16,036	869	17-45	113C	15,030	1950	6
13	Laser Desig. TA	21	176	31.5	820	16,740	925	20-45	125C	13,530	1950	6

Guidance indicates guidance type: Laser Cmnd is laser command guided, Laser Desig. is laser designated, TA is top attack (see Overhead Attacks, TNE, page 294, *MWt* = missile weight in kg, *TLWt* = empty weight of a tube launcher in kg, *PLWt* is package launcher weight (loaded with one missile) in kg, *MP* is missile price in Cr, *TLP* is the price of a tube launcher in Cr, *PLP* is the price of a disposable package launcher (including the price of the missile within) in Cr, *C-B* are the concussion and burst values of the warhead, *Pen Val* is the penetration value of the warhead, *Range* is the *maximum* range of the missile in meters, *M/turn* is the number of meters the missile travels in a 5-second combat turn, *AGL* is the missile's Agility. See TNE, page 278 for more details.

Power

ON/OFF

PLANETARY STRIKE MISSILES

The Reformation Coalition manufactures a family of 30cm TL-11 missiles used for planetary strike missions. While these are primarily used for planetary bombardment and precision strike from orbit (or in the case of the Mjolnir, from drop capsules which were fired from orbit), they are also able to be fired from ground launchers in the surface-to-surface mode.

Spruce, Fir, and Pine Planetary Strike Missiles

These missiles are fired from starships in support of ground operations, usually in preparation for an orbital assault. Targets are usually command and control centers, aerospace defense sites (guidance centers and missile sites), and key military formations.

These missiles are fitted with a variety of guidance systems to allow the greatest possible mission flexibility with a limited missile loadout. The missiles of the Spruce family may use Advanced Anti-Radiation (homing) guidance, Active EMS/laser designation (usually by ground assets, but this also allows the beam-riding mode, see below), IR Target Seeker guidance, or Visual Target Seeker guidance. The missiles of the Fir family may use all of the guidance modes listed for the Spruce family, but also have Imaging Radar Target Seeker guidance. The missiles of the Pine family have only the laser designation guidance mode, and are the inexpensive orbital support version of the family. All three families contain a variety of warheads as shown on the table below.

While each Spruce or Fir missile has the capability to use any of its guidance modes before it is launched, only one of these modes is selected to guide the missile when it is launched, and it may not switch to any other mode after it has been launched. (The one exception is that these missiles may be launched in a laser beam-riding mode to guide them in close to their targets where their homing or target-seeking packages take over—see the Rules Expansion section at the end of this book.) However, each of these missiles does have a target memory back-up. If for any reason the missile loses its lock on its way down (for example, if a radar station that was being homed on by an advanced ARM mode missile went off the air, or if a laser designator was destroyed by enemy fire), the missile retains the last targeted position in its memory and will hit it. If the target was mobile, this might not help, but the missiles are fast enough that their burst radius will usually ensure a kill on even a moving target in target memory mode.

These missiles were designed with very long ranges to allow starships to hit planets from safe stand-off distances. These ranges are sufficient to allow bombardment from high orbit around any non-gas giant planet.

Remote Del Mines	C: 0, B: 455	(TNE, pages 304-5)	46,868/56,868/35,668
Chaff	C: 0, B: 14,400	*	30,868/—/—

*All enemy attempts to use radar or active EMS through the chaff cloud are made at +1 difficulty level, plus one additional difficulty level for each tech level by which the chaff cloud exceeds the radar. Chaff detonated at high altitude remains effective for 1D6 minutes.

Common Characteristics

Tech Level: 11

Available Guidance Modes: Advanced Anti-Radiation (Homing), AEMS/Laser Designation (and beam-riding), IR Target Seeker (Smart), Visual Target Seeker (Smart), Imaging Radar Target Seeker (Smart, *Fir Only*), Target Memory available in all modes

Missile Mass: 4 tonnes, 4000 kg

Missile Volume: 4 cubic meters, 4000 liters

Average Speed: 9000 kph, 12,500 meters per combat turn (1250 grid squares)

Maximum Range: 1483 km

Short Range: Adv ARM: 36 km; IR Target Seeker: 40 km (atmosphere codes 0-3) or 20 km (atmosphere codes 4+); Visual and Imaging Radar Target Seeker: 40 km

Agility: 8

Mjolnir Advanced ARM

The Mjolnir is a specialized variant of the Spruce family designed for use with the Coalition Mk IIb Drop Capsule (see pages 14-15). The Mjolnir is carried within a drop capsule among a wave of troop-carrying capsules to perform the SPAD (Suppression of Planetary Aerospace Defenses) mission. The drop capsule opens up once it is within the planetary atmosphere, dropping out the Mjolnir, which deploys a parachute. While the troop-carrying capsules streak toward their targets, the Mjolnir slowly descends, hanging beneath its parachute, with its ARM seeker scanning for enemy active fire control sensors. Upon detecting enemy radar or active EMS sites, the Mjolnir ignites, blowing off its parachute. Like the Spruce and Fir missiles above, the Mjolnir possesses the target memory feature, allowing it to kill enemy radar sites even if they shut down.

As a final backup mode, the Mjolnir also has a laser-designation mode. Because the Mjolnirs deploy their chutes early to overwatch the troops, the troops will be on the ground while the Mjolnirs are still floating far above. Any Mjolnirs still aloft when the assault wave hits the ground switch over (by radio broadcast or pre-set timer, depending upon the mission—they cannot switch back once switched to laser mode) to laser-designation mode, allowing the ground troops to call them in as artillery support by using their laser designators.

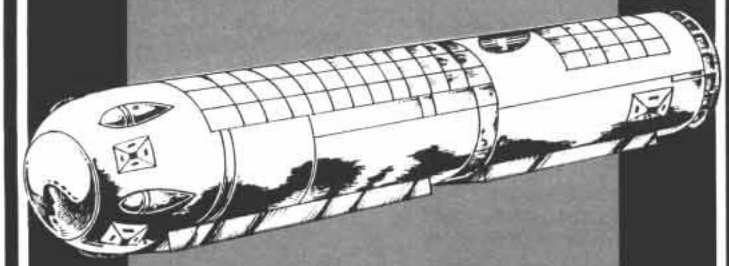
Warhead	*Damage*	*Pen Val*	*Price (Cr)*
HE	C: 225, B: 155	38C	15,092
Heavy Submunition	C: 0, B: 225	(TNE, page 285)	25,092
Hvy Homing Submn	C: 0, B: 115	(TNE, page 285)	33,092

Tech Level: 11

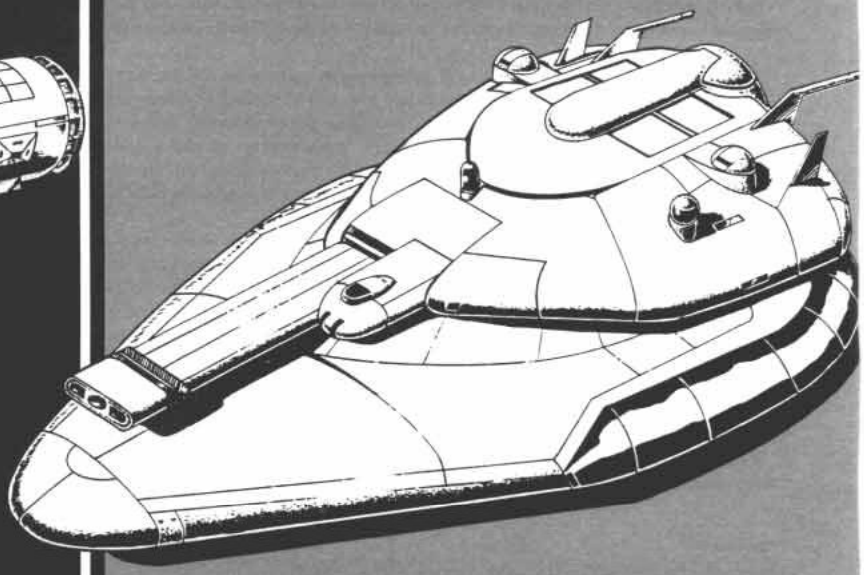
Available Guidance Modes: Advanced Anti-Radiation (Homing), Laser Designation (and beam riding), Target Memory available in ARM mode

Missile Mass: 2.5 tonnes, 2500 kg

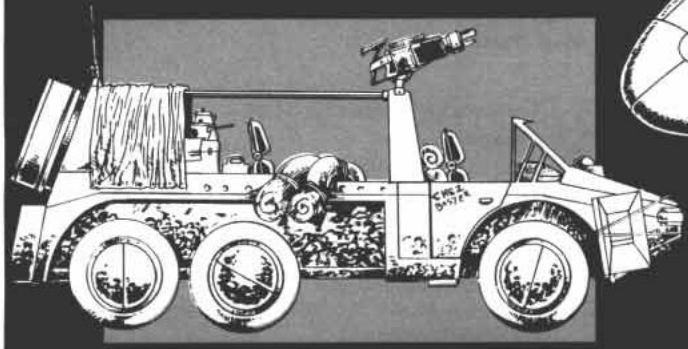
Missile Volume: 2.5 cubic meters, 2500 liters



Average Speed: 10,000 kph, 13,900 meters per combat turn (1390 grid squares)



Short Range (for Homing mode): 6.44 km



Maximum Range: 51.5 km

Agility: 8

VEHICLES

VEHICLES

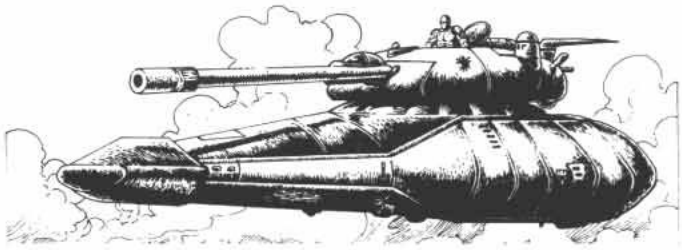
There are effectively an infinite number of vehicles to be encountered in the universe. Not only does each mission require a different design, but different tech levels require different technological solutions to these missions, and each different world or nation will have a different set of mission and design concepts that further multiply the number of potential vehicles. For these reasons, the vehicles on the following pages are only the lightest possible sampling of some of the vehicles that can be encountered (and designed with the **Fire, Fusion, & Steel** technical architecture sourcebook).

This selection of vehicles is intended to show the diversity of designs available, as well as to be useful to the referee who needs to produce vehicles to assist or hinder his or her players. While the mighty Intrepid grav tank (known as the Trepida during the Imperial era) represents the best that money can buy, vehicles like the "Pathie" and Charina show the best that people can come up with, under the circumstances.

The "ragtop" air raft and the "Buster" weapons carrier are also a set, showing two different Coalition solutions to a multipurpose utility vehicle, one using the best technology available, and the other using cheap, age-old technology that can be kept running almost anywhere. The Thunderchicken attack helicopter and the Mongoose and Ferret attack speeders are another example of vehicles designed to carry out exactly the same mission, but viewed through two completely different sets of technological capabilities.

Even the relatively small sample of vehicles shown here can be used in a wide variety of ways. Virtually any of these vehicles can be a relic in use in the Wilds, or the target of a hot or cold recovery mission. An RC "lift" force could consist of convertible air rafts, attack speeders, Pyrrhus sleds, or Intrepid tanks, or a non-lift force could hit the ground with Thunderchickens and Busters. These forces could find themselves opposed by local opponents with a capable, balanced force of Prairie Fires, Pandinas, and Charinas, or maybe just a sad little "Pathie."

Note that, in keeping with the principle that there are an infinite variety of vehicles and variations of those vehicles, that the vehicles on the following pages may be modified. Most of the designs have excess power, as indicated under the power entry, and most of them have excess space in the form of cargo. Additional equipment, particularly sensors, commo gear, etc., may be installed within these limits. Each kilogram of listed cargo (as opposed to ammunition capacity) is usually equivalent to four times that amount in liters. Note, however, that no electronic equipment may be installed from a tech level higher than that of the vehicle's installed control system. This additional equipment can be taken from elsewhere in this book, or from **Fire, Fusion, & Steel**. This may require the recalculation of some figures, such as vehicle speed, but this will be familiar ground to owners of **Fire, Fusion, & Steel**.



Vehicle characteristics are in the following format. **Tech Level** is the tech level the vehicle was constructed at, and not necessarily the level at which it is used. **Price** is in constant credits or megacredits, which can be adjusted for local exchange rates (see **TNE**, pages 230-231). **Size** is shown in cubic meters, displacement tons (each of 14 cubic meters), and includes the vehicle's target size code in parentheses. **Mass** is in metric tonnes (written simply as "tonnes"), of 1000 kg each. **Power** is in megawatts of output, and also describes thrust agencies, if any. **Maint** is maintenance points, i.e., the number of hours per week that the vehicle requires in routine preventive maintenance. **Controls** describe the controls used to operate the vehicle, plus any avionics and navigation systems. **Commo** is communications equipment, each listed with its *short* range, used when resolving communications tasks. **Sensors** lists the sensors equipment, also listed with the short range used to resolve sensor tasks. **Life Support** describes the facilities available to the crew and passengers; basic life support provides a sealed environment with air and water, and extended life support adds recycling, food, and sanitary facilities for extended periods in the vehicle. **Cargo** is in tonnes; multiply tonnes by 4 to find the volume of this cargo area. **Crew** is the number of persons necessary to operate the vehicle. **Passengers** are persons who may be carried above the required crew. Passenger space may sometimes be converted to cargo space according to notes with the vehicle itself. **Fire Control** shows the equipment used to control the vehicle's armament. Some of these systems are listed with Diff Mods which can be ignored; these counteract difficulty modifiers to due target movement, size, etc., but may not be used to change the basic task difficulty. Fire control also includes the equipment necessary to launch specific types of missiles. A vehicle may not fire missiles for which it has no control units, unless the missile is being controlled from another location. **Armament** names the weapons carried, although specifics of their combat performance, fire control, ammunition, etc., are detailed under other headings. **Stabilization** shows equipment which allows weapons to be fired from a moving vehicle. **Ammo** lists the amount and cost of ammunition that is carried.

Raw figures for **Speed** in kilometers per hour are often given simply for information purposes, as the game itself uses speed defined in the following terms. **Travel Move** is in kilometers per four-hour period. For ground vehicles, this is given in road speed/cross country speed, and sometimes water speed. For aircraft, including grav vehicles, this is given in high mode and NOE mode. **Combat Move** is the distance moved in each five-second combat turn. For ground vehicles this amount is in meters, and is given in road speed/cross country speed, and sometimes water speed. For aircraft and grav vehicles, this is given in the number of 10-meter grid squares moved per combat turn, and is given in high mode and NOE mode. Note that high mode speeds are absolute speeds and NOE speeds are safe speeds which can be exceeded by up to three times by overdriving (see "Mishaps," **TNE**, page 292). Some vehicles have their "Agility" or target movement difficulty modifiers listed with them for quick reference, but these can be easily calculated from current speed or combat move by using the table on **TNE**, page 294 (note, however, that aircraft or grav vehicles flying in nape-of-the-earth (NOE) mode have these Diff Mod numbers *doubled*). **Fuel Capacity** shows type of fuel and amount in liters, while **Fuel Consumption** defines how rapidly this fuel is used, and therefore how long it will last.

Combat Statistics show the configuration of the vehicle used when resolving hits (see **TNE**, page 298) and its armor. TF, TS, TR, HF, HS, HR, Deck, and Belly show the armor value of the turret front, turret side, turret rear, hull front, hull side, hull rear, deck (top of hull), and belly respectively. **Susp** shows the vehicle's suspension damage value (**TNE**, page 299).

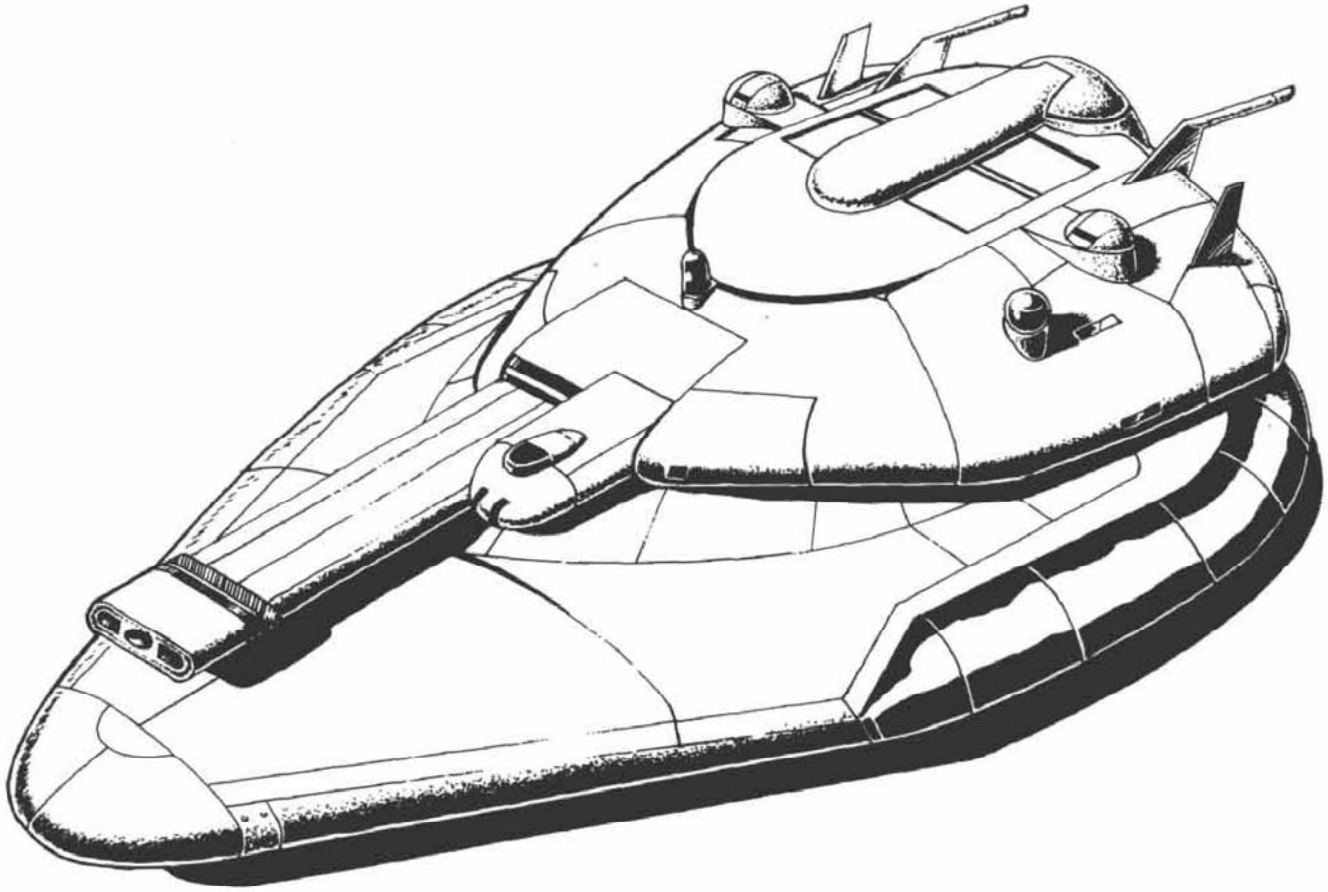
Where weapon performance is listed separately, it is described in the same terms used in normal weapons listings, and discussed on page 39.

Intrepid Grav Tank

TL-14 Intrepid Grav Tank

This tank was the pre-eminent symbol of irresistible armored firepower before the Collapse, and was the standard heavy grav tank of the pre-Collapse armed forces of the Last Imperium. As such it was heavily used, and its numbers heavily depleted, during the Final War. Wrecked Intrepid hulls are fairly common sights throughout the Wilds, but salvageable Intrepids are somewhat rarer.

The Intrepid fully deserves every bit of its unparalleled reputation; it is a fearsome weapon indeed, able to penetrate the equivalent of 1.28 meters of steel out to a range of 12.5 kilometers, but armored to withstand that same firepower across its frontal arc. Although the tank is expensive, it is more than a match for most starships (provided they get within its range). Curiously, Reformation Coalition researchers report that its Last Imperium name, Trepida, is associated with scurrying about with alarm or confusion, trembling, and timidity, as in "trepidation." While this name would clearly describe those who come into contact with this powerful tank, the name seems inapt to this surely fearless vehicle, so those few which have found their way into Coalition service have been renamed "Intrepid."



It is interesting to note that almost the entire price of the tank (81 million credits) is attributable to its fusion gun, valued at almost 79 million credits. These high-performance weapons are clearly difficult to maintain at the Coalition's tech level, with the result that many of the Intrepids in RC service have been re-armed with other weapons, such as hyper-velocity CPR guns. Although their offensive power is thus somewhat reduced, there is still very little in the Wilds that can hurt even an under-armed Intrepid.

Tech Level: 14
Price: MCr81.34
Size: 140 cubic meters = 10 displacement tons (VS)
Mass: 213.59 tonnes empty, 255.61 loaded
Power: TL-14 5.37 MW fusion power plant supplying 1 MW to high-efficiency contra-grav lifters, with HEPlaR thruster generating 58.65 tonnes of thrust (0.0123 MW excess power)
Maint: 43
Controls: Holographic linked, TL-10+ flight avionics, TL-14 terrain-following avionics, 3xTL-14 Model FIt flight computers, TL-10+ IGS navigation system
Commo: TL-14 3000-km radio, 2xTL-14 3-km masers
Sensors: 30-km passive EMS sensor, 3000-km passive EMS sensor, 3-km active EMS sensor, 2xWSV goggles
ECM: Electromagnetic masking package, 4 decoy dispensers each with space for 20 of any combination of anti-laser, anti-active sensor, or anti-active sensor decoys (see facing page, bottom)
Life Support: Heat, light, sealed and pressurized environment with extended life support, artificial gravity/G-compensators, and one air lock
Cargo: 324 kg of crew equipment (1.295 m^3)
Crew: 2 (driver/gunner, commander)
Passengers: None
Fire Control: EMS rangefinder and TL-14 point defense ballistic computer (ignore 5 Diff Mods, and multiply Diff Mods of ballistic target by 0.5, dropping fractions)
Armament: TL-14 rapid-fire 125-Mj fusion gun
Stabilization: Advanced (fire at any speed)
Ammo: 200 rounds of 126-Mj 12x37cm PFC cartridges (Cr1000 each, MCr0.2 for full load of 200)
Speed: 717 kph maximum, 538 kph cruising (1950 kph maximum in vacuum)
Travel Move: 2152/1080 (7800/1080 in vacuum)
Combat Move: 100 (high mode absolute speed)/25 (NOE safe speed) in 10-meter grid squares (271/25 in vacuum)
Diff Mods vs. Fire: +6 at maximum speed (high mode combat move), +5 at cruising speed (high mode travel move), +8 at safe NOE speed, +10 at 2x and 3xsafe NOE speed
Fuel Capacity: 2052.75 liters reaction mass plus 44.75 liters for fusion reactor
Fuel Consumption/Endurance: 733.125 liters/hour (endurance of 28 hours), plus reactor fuel is sufficient for one month constant power

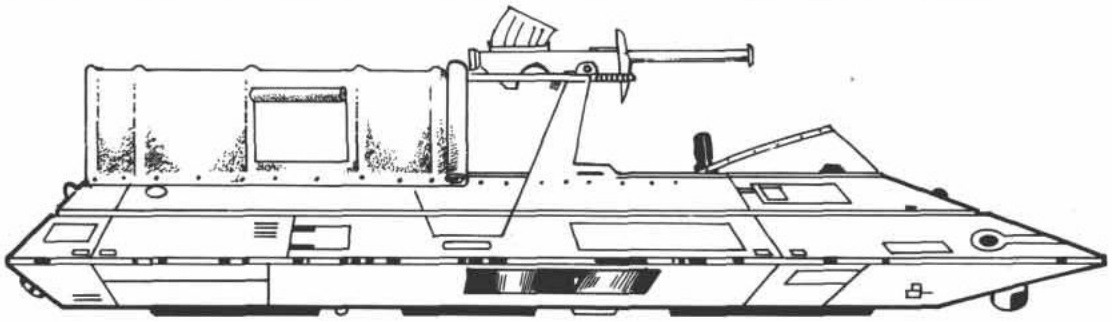
Combat Performance

TL	Weapon	ROF	Dam Val	Pen Rtg	Pen Val	Conc-Burst	Short Range
14	125-Mj RF Fusion Gun	SA2	129	1/2-1/2-1/2-1	258-258-258-129	17-15	3000 m*



*Short range is limited by fire control maximums, and listed penetration rating and penetration values are calculated based on that 3000-meter short range. Actual weapon's performance short range is 6250 meters, with penetration rating 1/2-1/2-1-4 and penetration values 258-258-129-32.

Decoys

Decoys are of three types: anti-laser (which affect attempts to detect a target with ladar or to designate it with a laser designator), anti-active sensor (which affect attempts to detect a target or designate it with radar or active EMS), and anti-passive sensor (which affect attempts to detect a target with HRT or passive sensors, including infrared goggles and sights). Each decoy only works against its specified sensor, and increases the difficulty of a detection or designation task by 1 level vs. TL-14+ systems, or by 2 levels vs. TL-13– sensors. Each decoy lasts one combat turn (five seconds), and affects all appropriate sensor attempts against the owning vehicle, regardless of direction. Decoy dispensers may launch one decoy per second.

Decoys for Intrepid grav tanks cost Cr20,000 each regardless of type, or MCr1.6 for a full load of 80.

Convertible Air Raft

Reformation Coalition TL-12 Convertible "Ragtop" Air Raft

This air raft is the standard air raft in production for all forces of the Reformation Coalition. Rather than building an enclosed and an open version of the same vehicle, Aubaine is producing a single convertible version which can be used as a standard enclosed, pressurized air raft, or which can have its top removed for use in the classic open-topped mode. When removed, the top masses 0.64 tonnes and is stored at 12.6 m^3 of volume (0.9 displacement tons).

This air raft is also rather well-equipped, with a 30-km (short range) passive EMS sensor, 300-km (short range) radio, and a laser rifle power adapter. This allows a standard 8cm TL-9 laser rifle (see page 92) to be fired off of the air raft's power, without requiring the massive backpack. The adapter allows the laser to be fired at its 0.02-Mj power level.

When used open-topped, the air raft is often fitted with a canvas cover to keep the elements off of the passengers. This cover uses lightweight metal tubing and snaps along the side of the hull. The canvas cover kit comes with the air raft at no additional cost. It is this canvas cover, universally used by RCES survey teams, that has earned the convertible air raft the nickname "ragtop."

Unless the passengers are all wearing vac suits or some other form of breathing apparatus and face protection, maximum speed when travelling open-topped is 300 kph (and even this is not comfortable for unprotected passengers). Movement rates with the top removed are shown below.

Although removing the top of the air raft is fairly simple in the field, fitting the top back on and restoring the vehicle's airtight integrity is more difficult: Reattaching the top requires 2 hours and requires a hangar or maintenance bay.

When configured in its enclosed mode, the convertible air raft is pressurized and is fully capable of travelling through hostile atmospheres, as it is equipped with basic life support. As the air raft is powered by an air-breathing MHD, however, there are some limitations on this capability.

The air raft may freely operate in thin, standard, and dense atmospheres (codes 4-9), although it does require intake filters in tainted atmospheres (types 4, 7, and 9). Intake filters cost Cr150 and have negligible mass and volume. If the atmosphere is very thin (codes 2 and 3), the air raft requires an intake compressor (see facing page). The required volume is taken from the air raft's cargo capacity. In code 2 atmospheres (very thin tainted), the air raft requires intake compressors *and* intake filters.

If the air raft is to operate in vacuum, trace, or exotic+ atmospheres (0, 1, A, B, and C), it must be fitted with a self-contained oxygen supply for its MHD turbine. This modification splits the air raft's fuel tankage into equal parts liquid hydrogen and liquid oxygen, costs Cr175, and doubles its rate of fuel consumption (reduces fuel endurance by half to 6.75 hours). Note that the air raft may be used in this self-contained mode in all atmosphere types, obviating the need for troublesome intake filters and compressors, so long as the decreased endurance is acceptable. Fuel tankage modified for dual use may freely be switched back and forth from dual to single (LHyd only) use without cost, by succeeding at an Average test of Mechanic skill.

Cargo may be added in place of passenger seats at the rate of 0.625 tonnes per seat removed, or vice versa; cargo space is 7.45 m^3, each passenger seat (cramped) requires 2.5 m^3.

Tech Level: 12

Price: Cr508,332 (Cr 507,732 without lid, Cr600 for top alone)

Size: 42 cubic meters = 3 displacement tons (Mc)

Mass with Top: 5.26 tonnes empty, 7.96 tonnes loaded

Mass without Top: 4.62 tonnes empty, 7.32 tonnes loaded

Power: 0.9 MW MHD turbine power plant, with HEPlaR thruster generating 6 tonnes of thrust (0.02213 MW excess power)

Maint: 2

Controls: Dynamic linked, TL-10+ flight avionics, TL-12 terrain-following avionics, 2xTL-12 Model FIt computers, TL-12 IGS positioning navigation

Commo: 300-km radio, 30-km laser

Sensors: 30-km passive EMS

Life Support: Light, heat, basic life support (sealed and pressurized with top fitted)

Cargo: 1.86 tonnes (7.45 m^3)

Crew: 1

Passengers: 5

Speed: 630 kph maximum, 473 kph cruising, 158 kph NOE (safe speed), 300 kph maximum in any mode when top is removed and passengers have no protective gear or breathing apparatus

Travel Move (Enclosed): 1890/945

Travel Move (Open): 1200/945

Combat Move (Enclosed): 88/22

Combat Move (Open): 42/22 (note that only 2xsafe speed may be achieved in NOE mode)

Fuel Capacity: 3450 liters liquid hydrogen (LHyd)

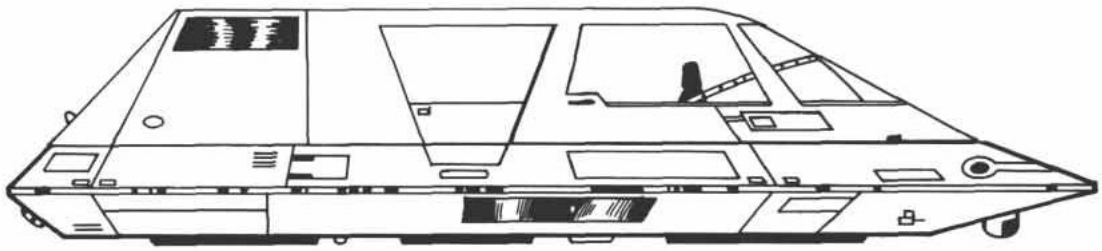
Fuel Consumption: 255 liters/hour (endurance of 13.5 hours)

Combat Statistics

Statistics show air raft in its enclosed/open-topped configurations

Config: Standard/open topped

Susp: G



Deck: 2/open

HF: 4/[4]

HS: 2/[2]

HR: 2/[2]

Belly: 2

Add-On Options

The following are some additional options that may be fitted to the air raft. Volume is subtracted from the cargo volume of 7.45 m^3, and MW is subtracted from the excess power. The MW rating assumes that these items will be powered directly from the vehicle itself (obviously if battery-powered gear is installed, this will not be an issue). The listing for the 300-km passive EMS sensor assumes that the 30-km sensor will be removed, so the figures show the additional requirements beyond that of the 30-km sensor already installed.

The firing information for the weapons listed below appears on their individual page entries. These page references are listed parenthetically after each weapon. The laser rifle adapter shown allows the rifle to be fired at its 0.02-Mj power level. The laser rifle adapter is shown in order to allow its removal to free up enough power for installation and full-time functioning of the 3000-km laser uplink. (Note, however, that shutting down the standard 300-km radio and 30-km laser communicator free up an additional 0.02 MW, which would allow the 3000-km laser uplink to be installed and operated while the other two communicators were off.)

The weapons shown below can be easily mounted on either or both of the roll bars when the air raft is in its open configuration. A weapon mount is shown on the forward roll bar; the rear roll bar slopes to the rear of the vehicle from the rear edge of the door like a mirror image of the forward bar, and is concealed beneath the canvas cover. The canvas cover is shown only partially extended in this view.

Options	*Volume (m^3)*	*Mass (tonnes)*	*MW*	*Cr*

Attack Speeders

Reformation Coalition TL-12 Attack Speeders

The attack speeders detailed here illustrate the difficulties of building contra-grav vehicles at TL-12. While fusion reactors are still not quite small enough to efficiently power vehicles of this size, their long endurance and lack of oxygen requirements make them very attractive to vehicle designers. Because the Coalition has only a very limited TL-12 production capacity (existing entirely on Aubaine), TL-12 production must be carefully husbanded and not wasted on large numbers of one-off designs.

CSAARC (Committee for the Standardization of Armament and Ammunition in the Reformation Coalition) is currently overseeing a program to design a family of standard TL-12 high-speed grav vehicles, popularly known as speeders. Some of these designs are powered by MHD turbines with dual LHyd/LOx fuel tankage to allow operations in hostile or thin atmospheres, while other designs are centered around oxygen-independent fusion plants, either new-production TL-12 plants or TL-13 plants scavenged from Pyrrhus support sleds (page 126). The speeders illustrated here, the "Mongoose" and "Ferret" types, are examples of TL-12 fusion reactor entrants. Both of these designs have been produced only in very limited numbers as developmental prototypes, but as part of the evaluation program, both types will be available to RCES and free-lance expeditions for field testing (accompanied of course, by 3-6 tech reps and observers).

The Mongoose/Ferret speeders are unusual designs. In order to take advantage of the tremendous power offered by the oxygen-independent fusion plant, they were given the capability to perform at 3Gs, albeit only in airless environments. In this mode, their high-efficiency plasma recombustion (HEPlaR) engines draw 7.5 megawatts, while they only draw 0.635 in atmospheres where their airframes limit their top speeds. They are also equipped with artificial gravity G-compensators for crew comfort, as missions exceeding 40 hours are theoretically possible.

The Mongoose is the basic version, with a fully stabilized, fixed forward-firing plasma gun, and retractable missile launch bays. The Ferret trades some missile space for a much larger plasma gun. Facing page shows some of the missiles available for these designs (see also pages 106-109).

Both variants are listed in parallel below. Where only one value is listed, it applies to both Mongoose and Ferret variants.

Tech Level: 12

Price: *Mongoose:* MCr6.35
Ferret: MCr6.62

Size: 70 cubic meters = 5 displacement tons (Mc)

Mass: *Mongoose:* 69.2 tonnes empty, 77.4 tonnes loaded
Ferret: 68.33 tonnes empty, 81.2 tonnes loaded

Power: TL-12 20 MW fusion power plant supplying 0.5 MW to high-efficiency contra-grav lifters, with HEPlaR thruster generating 12.7-150 tonnes of thrust (5.0173-11.8823 MW excess power)

Maint: 16

Controls: Dynamic linked, TL-10+ flight avionics, TL-12 terrain-following avionics, 2×TL-12 Model FIt flight computers, TL-10+ IGS navigation system

Commo: 2×3000-km radios, 300-km maser

Sensors: 300-km active EMS sensor, 300-km ladar, 300-km passive EMS sensor

ECM: Electromagnetic masking package, 3-km EMS deceptive (self-defense) jammer, 50-km area jammer, decoy dispenser with space for 10 of any combination of anti-laser, anti-active sensor, or anti-active sensor decoys (see facing page, bottom)

Life Support: Heat, light, sealed and pressurized environment with basic life support and artificial gravity/G-compensators

Cargo: 87.5 kg of crew equipment (0.35 m^3)

Crew: 2 (Pilot, weapons system officer)

Passengers: None

Fire Control: EMS rangefinder and TL-12 ballistic computer (ignore 4 Diff Mods) for plasma gun, 600-km laser designator, target seeker and target memory missile control units

Armament: *Mongoose:* 4.75-Mj plasma cradle gun, up to 4000 kg of tac missiles
Ferret: 14-Mj plasma cradle gun, up to 2000 kg of tac missiles

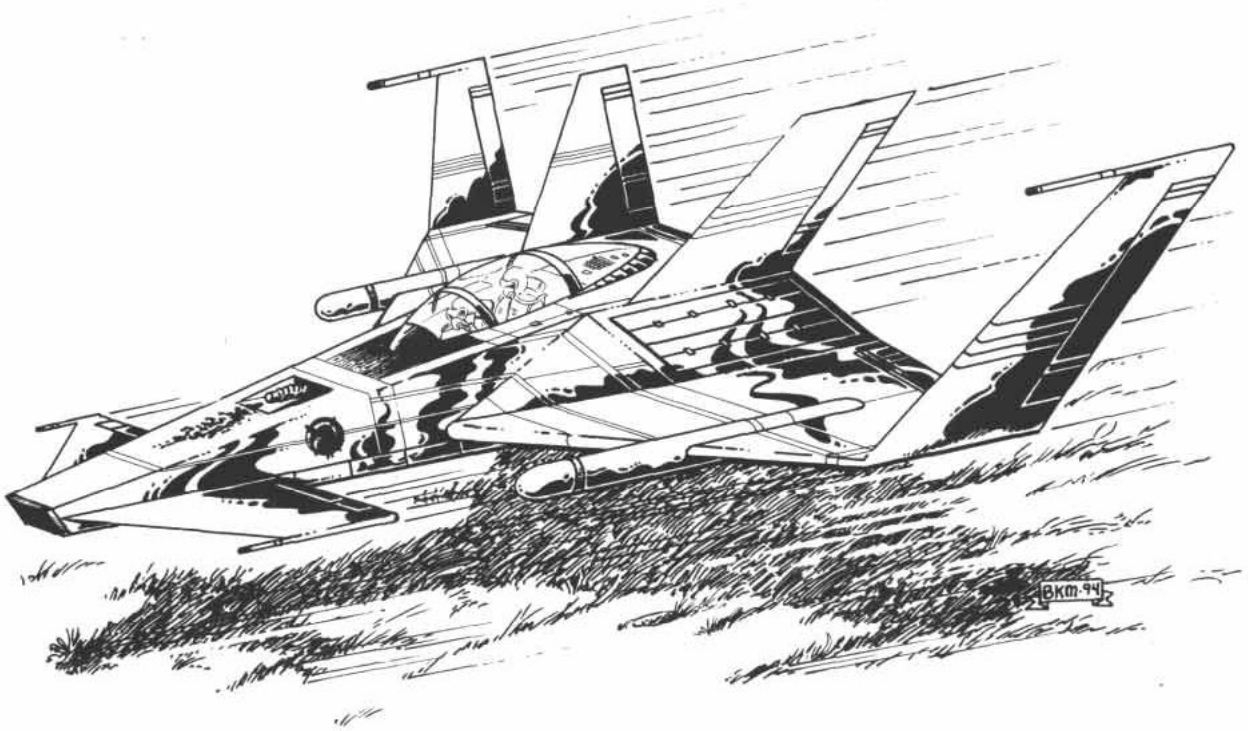
Stabilization: Advanced (fire at any speed)

Ammo: *Mongoose:* 300 rounds of 4.75-Mj 8.5×25cm PPC cartridges for plasma gun (Cr119 each, MCr0.036 for full load of 300), up to 4000 kg of tac missiles (see facing page and pages 106-109)
Ferret: 300 rounds of 14-Mj 12×37cm PPC cartridges for plasma gun (Cr350 each, MCr0.105 for full load of 300), up to 2000 kg of tac missiles (see facing page and pages 106-109)

Speed, Atmospheric: 800 kph maximum, 600 kph cruising

Speed, Vacuum: 4770 kph maximum, 3578 kph cruising

Travel Move (Atmospheric): 2400/960



Combat Move (Atmospheric): 111 (high mode absolute speed)/22 (NOE safe speed) in 10-meter grid squares

Fuel Capacity: *Mongoose:* 6788.75 liters liquid hydrogen (LHyd)
Ferret: 6909.8 liters LHyd

Fuel Consumption/Endurance: *Mongoose:* 158.75 liters per hour in atmosphere (1875 liters/hour in vacuum), tankage is sufficient for one month duration of fusion reactor, plus 42.76 hours of reaction mass in atmosphere (3.62 hours in vacuum)
Ferret: 158.75 liters per hour in atmosphere (1875 liters/hour in vacuum), sufficient for one month duration of fusion reactor, plus 43.53 hours of reaction mass in atmosphere (3.68 hours in vacuum)

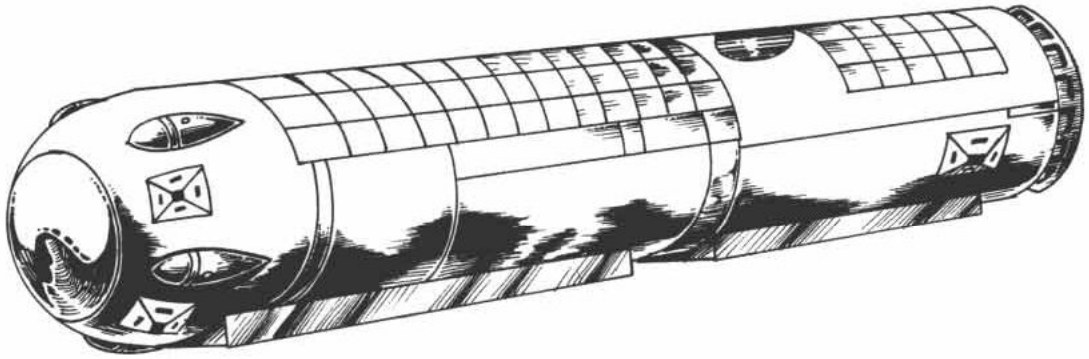
Guidance: Each missile may be launched under any of the listed guidance modes, for greater tactical flexibility—T = Target Designated (laser/radar/AEMS), H = Homing (Advanced IR), S = Target Seeker (Imaging Radar); *Mass*: In kg; *Price*: in credits; *Dngr Spc*: Dimensions of primary Danger Space of flechette warhead, in meters, see **TNE**, pages 279-280; *M Rng*: Maximum Range in km, used with target designated mode; *S Rng*: Short Range used with homing/target seeker mode; *M/turn:* Meters travelled per 5-second combat turn.

Weapon Combat Performance

Weapon	Vehicle	ROF	Dam Val	Pen Rtg	Pen Val	Conc-Burst	Short Range
4.75-Mj Plasma cradle gun	Mongoose	SA1	25	1-2-10	25-25-13-3	C: 1, B: 5	140 m
14-Mj Plasma cradle gun	Ferret	1/2	43	1-2-10	43-43-22-4	C: 2, B: 5	420 m



ROF: Rate of fire, in shots per combat turn—ROF of 1/2 equals one shot every second turn

Decoys

Decoys are of three types: anti-laser (which affect attempts to detect a target with ladar or to designate it with a laser designator), anti-active sensor (which affect attempts to detect a target or designate it with radar or active EMS), and anti-passive sensor (which affect attempts to detect a target with HRT or passive sensors, including infrared goggles and sights). Each decoy only works against its specified sensor, and increases the difficulty of a detection or designation task by 1 level vs. TL-12+ systems, or by 2 levels vs. TL-11– sensors. Each decoy lasts one combat turn (five seconds), and affects all appropriate sensor attempts against the owning vehicle, regardless of direction. Decoy dispensers may launch one decoy per second.

Decoys for Mongoose/Ferret speeders cost Cr15,000 each regardless of type, or MCr0.15 for a full load of 10.

Sensor Drone & Thunderchicken Attack Helicopter

Reformation Coalition TL-12 Planetary Sensor Drone

This is the standard RC orbital sensor drone, allowing a starship to conduct fairly detailed examinations of the planetary surface without having to risk any personnel on the ground. It is fully recoverable and reusable, although it is naturally expendable as well.

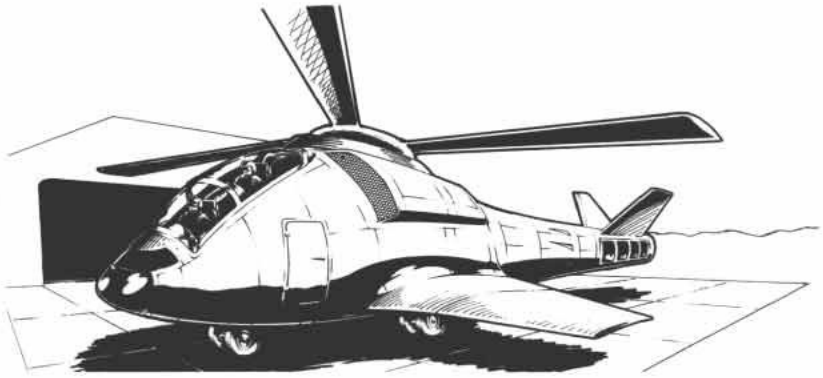
The drone has a displacement of 0.5 tons, identical to that of standard space combat missiles or drop capsules, so may be launched from any standard missile or drop capsule launch tube. The drone may be controlled (using RCV skill) from any missile-capable MFD which has a direct line-of-sight to the missile via laser link, or, if not in direct line-of-sight, by any MFD that can tie into a 3000-km radio elsewhere aboard the ship. It may also be controlled from an RCV workstation equipped with a 3000-km radio or laser communicator, or one which can tie into one.

Because of the range of the communicators on the RCV, the controlling workstation or MFD should be within 3000 km of the drone, and *must* be within 24,000 km of it.

The short range of the drone's sensors make it useless in space combat, although the drone does have 1G performance and fuel sufficient for 9 G-turns.

The drone is propelled by a 1G HEPlaR thruster, and high-efficiency contra-grav lifters. It can enter and exit atmospheres under its own power, and fly around under grav power in any type of atmosphere. It has sufficient fuel to power it for 5 hours, although its reaction mass runs out after 4.5 hours. This allows the drone to broadcast its position and await pick-up for half an hour.

The sensor has space, weight, and power reserved for relic neural activity sensors (NAS) from tech levels 13, 14, or 15. These are quite rare, so any of these drones that are sent on a one-way mission will usually have its NAS removed. Its sensor suite has a short range in meters as follows:



Sensor	*Short Range (meters)*
Active EMS	3000
Passive EMS	3000
Wide-Spectrum Viewer	400
Neural Activity Sensor	5, 25, or 50 (TL-13, 14, 15)

The sensor makes quite a small target, but is additionally equipped with a full EMM suite to make it even harder to detect by enemy sensors.

Tech Level: 12 (plus relic NAS)
Price: Cr552,550
Size: 7 cubic meters = 0.5 displacement tons (SM)
Mass: 5.35 tonnes empty, 7.7 tonnes loaded
Power: 1.1646 MW MHD turbine with HEPlaR thruster generating 5 tonnes of thrust
Maint: 1
Controls: Dynamic linked RCV controls, TL-10+ flight avionics, TL-12 terrain-following avionics, 2×TL-12 Model FIt flight computers
Commo: 3000-km radio, 3000-km laser
Sensors: 0.4-km wide-spectrum visual video camera, 3-km active EMS, 3-km passive EMS, space reserved for TL-13, 14, or 15 neural activity sensor
Life Support: None
Cargo: None
Crew: None
Passengers: None
Speed: 1100 kph maximum, 825 kph cruising, 160-480 kph NOE
Travel Move: 3300 (High mode), 960 (NOE)
Combat Move (in 10-meter grid squares): 153 (high mode absolute speed), 22 (NOE safe speed)
Fuel Capacity: 2329.2 liters dual LHyd/LOx power plant fuel, 281.25 liters reaction mass
Fuel Consumption: 465.84 liters dual LHyd/LOx per hour (5 hours duration), 62.5 liters LHyd reaction mass per hour (4.5 hours duration)

Combat Statistics

Config: Standard
Susp: G
Armor, all faces: 10

Reformation Coalition TL-9 "Thunderchicken" All-Weather Compound Attack Helicopter

This new design has only entered production recently, but is intended to be the standard attack helicopter and battlefield air superiority craft for all Oriflammen Marine and ground forces. The name, chosen by the Oriflamme Munitions Board, is a slap at the official CSAARC (Committee for the Standardization of Armament and Ammunition in the Reformation Coalition) naming conventions which call for the use of bird and animal themes for missiles and aircraft (e.g., Lyrebird) in place of the more straightforward imagery preferred by Oriflamme (Spike, Nail). Curiously, this aircraft whose name is already an informal nickname has an even more informal nickname used by its Oriflammen flight crews: "Thud-cluck."

Tech level 9 is the highest tech level at which helicopters are typically produced, as grav vehicles take over their roles beginning at this tech level. As such, the Thunderchicken X-wing compound helicopter is perhaps the ultimate expression of the helicopter concept. Able to hover and take off and land vertically like any helicopter, the X-wing design goes beyond compound helicopters which merely unload their rotors in flight to achieve higher speed: The X-wing locks down its strong, composite rotors and uses them as fixed wings, enabling the aircraft to achieve transonic speeds. (Note that the X-wing must transition from fixed-wing flight to helicopter mode before it can hover, land vertically, or fly in NOE mode, as the rotor blades are locked down at speeds greater than 320 kph.) Thus the Thunderchicken functions not only as a standard attack helicopter with air-to-ground munitions, it can also be loaded with air-to-air missiles to function as a limited air superiority aircraft to secure the local area over the battlefield.

Because of its stealth design, it has no turrets or external weapons carriage; its entire armament is carried in internal missile bays which can be loaded with any mix of tac missiles that will fit (see pages 106-108) and which can be launched by the Thunderchicken. Thud-cluck launch capabilities include all laser- and radar-designated missiles (out to a range of 60 km for laser- and 6 km for radar-designated), all homing missiles, and all target memory and target seeker missiles.

The Thunderchicken was designed from the outset to be used in multiple planetary environments, and has a beefed-up rotor assembly with gearing for thin (codes 4, 5), standard (codes 6, 7), and dense (codes 8, 9) atmospheres. All that is needed to prepare the Thunderchicken for these other environments is to change the rotor blades to a set designed for that atmosphere (blade sets are available for thin, standard, and dense atmospheres and can be purchased separately, see "Price" entry below and the rules expansion at the back of this book). The craft is already fitted with intake filters for use in tainted atmospheres.

Tech Level: 9

Price: Cr4,059,230 (price includes filters for tainted atmosphere), Cr50,000 for each additional set of rotor blades.

Size: 1440 cubic meters target size/storage volume = 103 tons (480 cubic meters = 34.3 tons with rotors removed; each rotor set displaces 20 cubic meters or 1.43 tons)

Mass: 21.0255 tonnes empty, 24 tonnes loaded; 1 ton per additional rotor set

Power: 4.95 MW gas turbine provides 4.8 MW to X-wing rotor assembly which provide 24 tonnes lift and 2.4 tonnes thrust. High-bypass turbofans producing 8.01 tonnes thrust and 0.1602 MW (0.3102 MW available for onboard electronics, 0.0037 MW excess power)

Maintenance Points: 6 (7 in tainted atmosphere)

Controls: Computer-linked controls, TL-8 all-weather flight avionics, TL-9 terrain-following avionics

Communications: 300-km radio, 30-km laser communicator/designator

Sensors: 3-km radar (designation capable), 30-km HRT sensor, 2ximage intensifier scopes (250 m)

Electronic Countermeasures: Stealth airframe (+1 Diff Mod vs. TL-9 radar and HRT, +2 Diff Mods vs. TL-8– radar and HRT), one dispenser with 12xanti-laser decoys (vs. ladar or laser designators), one dispenser with 12xanti-active sensor decoys (vs. radar or active EMS), one dispenser with 12xanti-passive sensor decoys (vs. HRT or passive EMS). Each decoy lasts one combat turn (5 seconds) and increases difficulty of all sensor tasks (of the indicated type which the decoy affects) vs. the Thunderchicken for that turn, from any direction, +1 Diff Mod for TL-9+ systems, +2 Diff Mods for TL-8– systems.

Life Support: Heat, lights, sealed, pressurized environment with basic life support for two crew

Cargo: None

Crew: 2 (pilot and weapons officer) with advanced cockpit armor (AV 4) and advanced ejection seats

Fire Control: Control/launch units for radar- and laser-designated missiles (may self-designate out to 60 km for laser and 6 km for radar), homing missiles, target memory, and target seeker missiles

Armament: Capacity for 400 kg of tac missiles in internal retractable missile bay

Ammo: Up to 400 kg of tac missiles, see pages 106-108

Maximum Speed: Helicopter mode: 320 kph; Fixed-wing mode: 1100 kph.

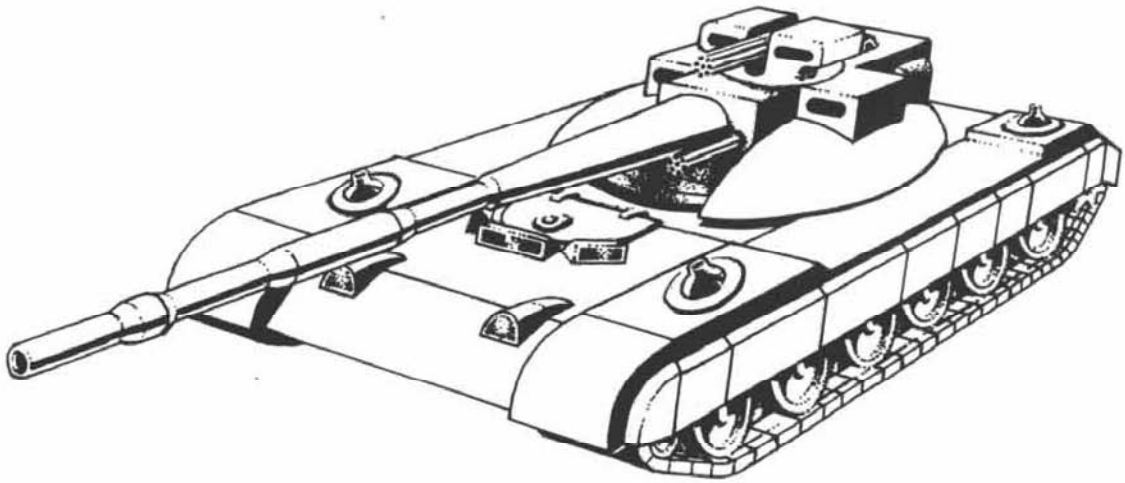
Cruising Speed: Helicopter mode: 240 kph; Fixed-wing mode: 825 kph

NOE Speed: 80-240 kph (helicopter mode only)

Travel Move: Assuming in-flight refueling, 960 (high mode)/480 (NOE) helicopter mode, 3300 (high mode) fixed-wing mode. Without in-flight refueling, use cruising speeds above and fuel endurance below to calculate figures.

Combat Move: 44 (high mode absolute speed)/11 (NOE safe speed) in helicopter mode, 153 (high mode absolute speed) in fixed-wing mode

Agility: Helicopter mode: +4 Diff Mod vs. maximum speed (combat move), +4 Diff Mod vs. cruising speed (travel move), +4 Diff Mod vs. NOE safe speed, +6 Diff Mod vs. 2xNOE safe speed, +8 Diff Mod vs. 3xNOE safe speed; Fixed-wing mode: +6 Diff Mod vs. maximum speed (combat move), +6 Diff Mod vs. cruising speed (travel move).



Fuel Consumption: 990 liters/hour in helicopter mode, 830 liters/hour in fixed-wing mode

Internal Fuel Capacity: 2284.5 liters hydrocarbon distillates, plus refueling probe. For ferry missions without in-flight refuelling, weapons bay can carry an additional 400 liters in place of weapons.

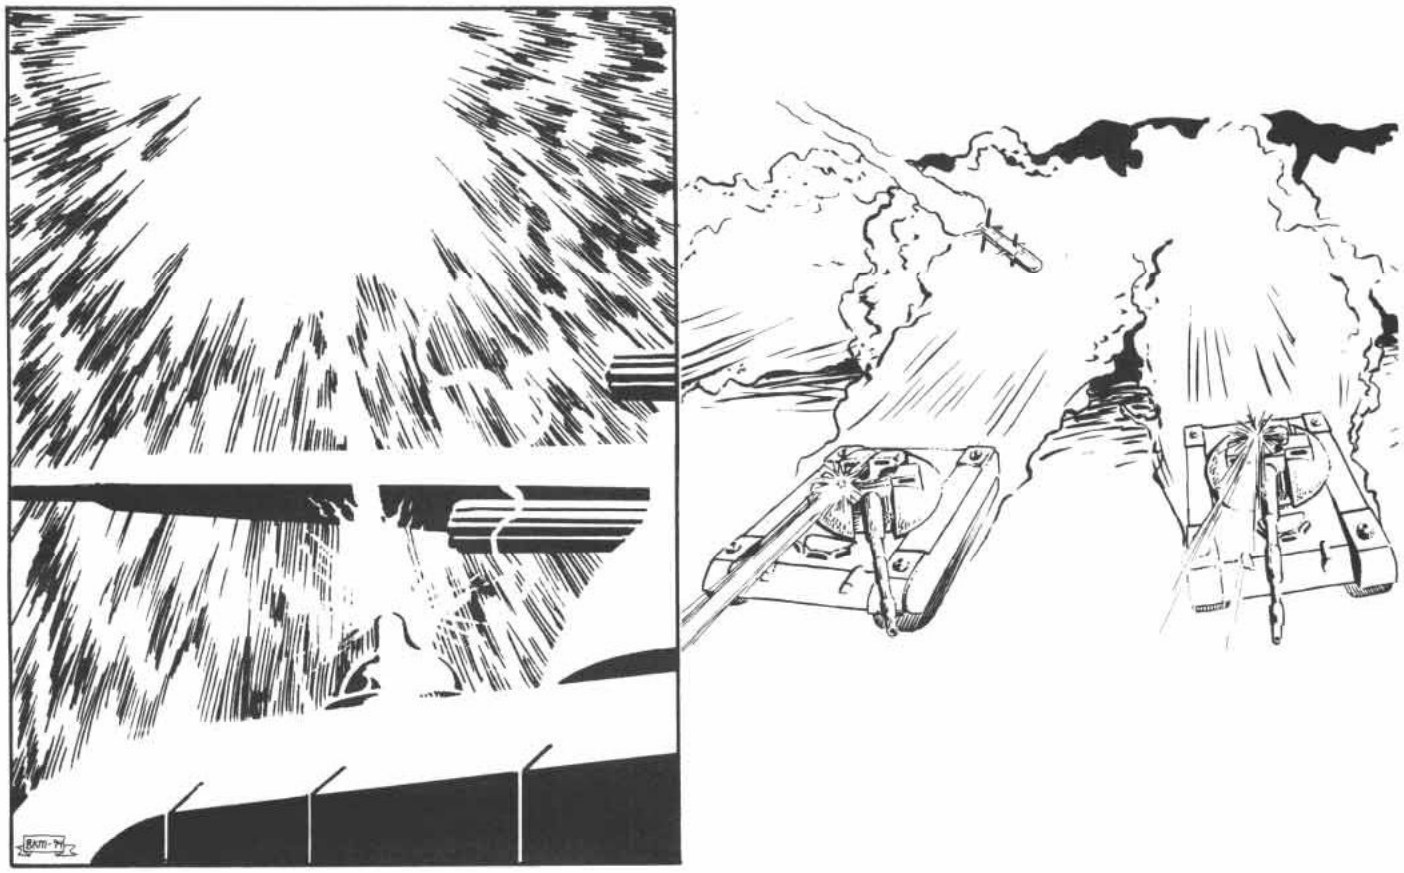
Endurance: 2.3 hours helicopter mode (138 minutes), 2.75 hours fixed-wing mode (165 minutes). For simplicity, choose a mode (helicopter or fixed wing) and track endurance in minutes in that mode only. Each minute in helo mode costs 1.2 minutes in fixed-wing mode; each minute in fixed-wing mode costs 0.8 minutes in helo mode.

Loading fuel in weapons bay for ferry missions adds 0.4 hours (24 minutes) endurance helo mode, or 0.48 hours (29 minutes) fixed-wing mode.

Prairie Fire Tank

Prairie Fire TL-8 Tank

The Prairie Fire is one of many standard pre-Collapse Imperial designs that can still be found on many worlds. It is not a main battle tank, as it is not armored quite well enough to stand up to TL-8 MBTs, but it is a high-speed heavy weapons platform that can perform many of the tasks of a tank, and is used as such on most worlds where it occurs.



Both the commander and gunner can control and fire the Prairie Fire's fully stabilized main armament and its coaxial multi-barrel autogun. In addition, the commander controls a remote stabilized turret with another multi-barrel autogun. The main armament, coaxial weapon, and remote turret are all equipped with ballistic fire control computers, allowing all weapons to disregard 2 Diff Mods.

Tech Level: 8
Price: Cr866,875 (plus ammunition costs, see below)
Size: 168 kiloliters displacement = 12 tons (VS)
Mass: 239.56 tonnes empty, 247.1 tonnes loaded
Power: 13.62 MW MHD turbine (0.099 MW excess power)
Maint: 67
Controls: Enhanced electronic controls, TL-8 satellite positioning navaids
Commo: 2×30-km radios
Sensors: 3-km HRT
Life Support: Overpressure system
Cargo: None
Crew: 3 (driver, gunner, commander)
Passengers: None
Fire Control: –2 Diff Mods (main armament and remote turret)
Armament: Remote turret with stabilized 130mmL60 CPR gun and coaxial 7mm rotary MG, secondary remote turret with stabilized 5mm rotary MG
Stabilization: Advanced (fire at all speeds)
Ammunition: 100 rounds 130mm (price varies, see below), 2500 rounds 7mm (Cr1250 for full load), 5000 rounds 5mm (Cr1000 for full load)
Other Systems: Dispensers for anti-laser, anti-active sensor, and anti-passive sensor decoys, 20 each (Cr400,000 for each full load of 20)
Speed: 142 kph maximum road speed, 113 kph maximum cross-country speed
Travel Move: 280/215
Combat Move: 65/50
Fuel Capacity: 28,500 liters liquid hydrogen (Cr997.5)
Fuel Consumption: 2724 liters/hour (endurance of 10.46 hours)

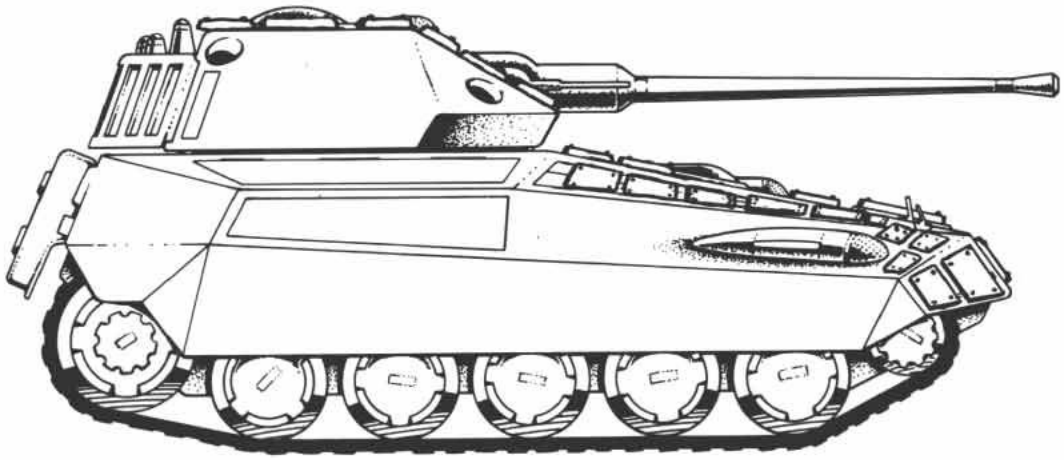
TS: 4	**HS:** 4
TR: 3	**HR:** 3
Deck: 3	**Belly:** 3

The origin of the LRV-51 is unknown, but the present Guild design is clearly taken from a pre-Collapse light guntrack intended for low-tech reconnaissance units. The Pandina (or "Panda") is used by a number of TEDs for sanctions against rebellious civilians, a purpose to which it proved admirably suited. The armor is enough to resist most small arms and fragments, the 3cm/L70 main gun outranges all small arms likely to be encountered in the hands of ill-equipped rural militias, and the AFV's two 7mm machineguns served to prevent attacks by small antiarmor attack teams.



The 3cm/L70 main gun is fed from a 140-round magazine, but most vehicles now carry 6 additional specialty rounds for hand loading. The gun's autofire sequence is interrupted by a manual override, the special round inserted by hand, and the gun fired.

Tooling and blueprints for the manufacture this vehicle have been widely disseminated by Guild merchants, who also supply high-tech ammo (the specialty rounds mentioned above) for the gun.

Most TEDs are capable of manufacturing 3cm ammunition in a variety of types (HE, APDS, HEAP, CHEM, WP/IS, and Flechette). None of these rounds present a serious threat to RC troops, but the Guild is known to be offering additional, higher-tech rounds (APFSDSDU, APFSDSCI, and APFSDSSD) some of which are capable of penetrating RCES battle dress at ranges in excess of 3600 meters.

Reactive Armor Block Sets for the LRV Pandina

The Mercantile Guild manufactures and sells two sets of ERA (explosive reactive armor) blocks for their LRV "Pandina." These blocks provide additional armor protection for the top and front faces of the vehicle. The armor value is the additional armor protection provided by one layer of blocks for the relevant face. These blocks are machined to fit the Panda only, and cannot be used with other vehicles.

Charina APC & "Pathie" Armored Car

Charina APC TL-7

The Charina is very simple light-wheeled vehicle designed to act as an armored personnel carrier and reconnaissance vehicle. With a maximum road speed of 94 kph (38 kph cross country) and a 30-hour endurance, the Charina is used for a variety of purposes, including mechanized infantry transport, cavalry/recon, military police, convoy escort, and riot control. The Charina's cargo allowance is rather small (25 kg per person), so long-term missions require support vehicles (either transport trucks or other APCs) to carry equipment and supplies.

Tech Level: 7
Price: Cr15,095.5
Size: 42 kiloliters displacement = 3 tons (Mc)
Mass: 8.74 empty, 12.04 tonnes loaded
Power: 0.3 MW Improved Internal Combustion Engine
Maint: 4
Controls: Basic mechanical
Commo: 30-km Radio
Life Support: Heat, light
Cargo: 200 kg (0.8 m^3)
Crew: 3 (driver, commander, and gunner)
Passengers: 5 in cramped seats
Fire Control: Optic RF
Armament: 7mm TL-5 MMG
Stabilization: None
Ammo: 2000 rounds 7x57mm, Cr880 for a full load
Speed: 94 kph maximum road speed, 38 kph maximum cross country speed, 9 kph maximum water speed
Travel Move: 195/85/20
Combat Move: 45/20/5
Fuel Capacity: 2250xliters hydrocarbon distillates
Fuel Consumption: 75 liters per hour, endurance of 30 hours

TL-5 "Pathie" Armored Car

We were holding this DZ waiting for the strike team to show up when we heard this chugging sound from back in the woods. We looked at each other and hunkered down, and a few minutes later this thing comes down the road out of the trees. I guess I should call it an armored car, but "armored" is too kind—hell, even "car" is probably too kind. So this thing comes at us, wheezing up this moderate slope, with the crew all buttoned up and cowering, and a couple little pea-shooter guns poking out the turret, waving around like little antennas. The thought crossed my mind at that point that maybe we should just surrender to the thing, because I almost didn't have the heart to shoot it...

The "Pathie" armored car is not so much a specific type of vehicle as it is a representative of a broad class of vehicles encountered in the Wilds. These vehicles are known to RC crews as "Pathies," short for "pathetic," and are taken to include any TL-4 to 6 vehicle that are armored versions of civilian cars or trucks, armed with small arms weapons, and used for reconnaissance, security, etc. Although the specific example on this page was known as the "Impaler" armored car on Lebherz (3236/Khulam/Diaspora), this design can be taken as representative of low-tech "Pathies" throughout the Wilds as a whole.

Tech Level: 5
Price: Cr18,092
Size: 42 cubic meters = 3 displacement tons (Mc)
Mass: 22.33 tonnes empty, 27.39 tonnes loaded
Power: 0.75 MW improved internal combustion engine (no excess power)
Maint: 14
Controls: Basic mechanical
Commo: 30-km radio
Sensor: 2xvisible light headlights (30-meter short range)
Life Support: light, heat
Cargo: 0.2445 tonnes (0.978 m^3)
Crew: 3 (driver, gunner, radio operator)
Passengers: None
Fire Control: None (iron sights integral to the machineguns)
Armament: 2xTL-5 7mm medium machineguns
Stabilization: None
Ammo: 1000 rounds 7mm (500 per gun) in 10x100-round belts, Cr440 for full load
Speed: 83 kph maximum road speed, 33 kph maximum cross-country speed
Travel Move: 175/65
Combat Move: 40/15
Fuel Capacity: 4500 liters hydrocarbon distillates
Fuel Consumption: 187.5 liters/hour (endurance of 24 hours)

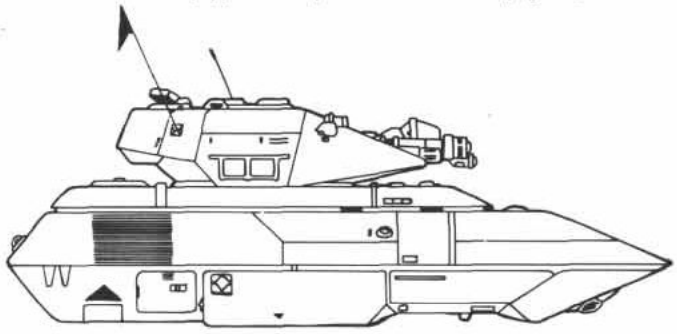
Pyrrhus Support Sled & "Buster" Weapons Carrier

Pyrrhus TL-13 Support Sled

The Pyrrhus grav "tank" was fielded by the Solomani during the middle portion of the Final War as the war entered its "meat grinder" phase. It was designed as a battlefield system which could be produced in large numbers to feed the battles of attrition that were grinding on throughout the Solomani Rim and Diaspora sectors. By setting its tech level at 13, the Solomani could produce the design on a larger number of worlds, and by cutting corners, such as on its armor and main armament, it could be produced more cheaply than a first-line main battle tank.

However, by naming it a "grav tank" (presumably to raise the morale of the crews who were about to die in it), the Solomani leaders made a serious mistake, as this led to its improper use and subsequent miserable reputation. Originally named the "Chariot grav tank," grim crews quickly renamed it the "Pyrrhus," and began to describe the "tank" as "a grav sled with an identity crisis."

However, just as it is only a poor carpenter who blames his tools, it is a poor commander who blames his equipment. When used properly, with adequate cover and in conjunction with missile-armed infantry, the Pyrrhus could hold its own. But when it was called a "tank" and rushed into combat with incompletely trained replacement units, it was used as a tank and died in droves like the tin can it was.



Because of its large numbers, the Pyrrhus has survived into the new era in relatively large numbers (for relic machinery), and sees use with the RC armed forces. Although the RC has retained the name "Pyrrhus," it is careful to designate the vehicle as a support sled, and instruct its crews in its proper use. Fortunately for the RC, their battlefields are a bit less demanding than the high-tech killing grounds of the Final War, and the Pyrrhus' weak points are less pronounced when dealing with the palace guards of a TED and his peasant yeomanry.

Nonetheless, as replacements are found, the Pyrrhuses are being removed from service to allow their light, compact TL-13 fusion plants to be used elsewhere.

The provision of a passenger seat allows platoon and company commanders to be carried without requiring them to pay attention to operating the tank. Instead, their full attention is devoted to commanding their units. When commanders are not carried, unit mechanics are sometimes carried, to allow rapid field repairs, and carry their tools and crucial spare parts in the spaces allocated for cargo.

The Pyrrhus may operate on worlds without breathable atmospheres as its power plant and propulsion system are not dependent upon oxygen, and it is equipped with basic life support for its crew.

In Coalition service, each crewmember is equipped with a personal defense laser (page 95).

Tech Level: 13
Price: Cr1,945,420
Size: 98 cubic meters = 7 displacement tons (Mc)
Mass: 26 tonnes empty, 42.2 tonnes loaded
Power: 3.3 MW fusion plant (1 year endurance) with HEPlaR thruster generating 16 tonnes of thrust (0.0572 MW excess power)
Maint: 7
Controls: Holographic linked, TL-10+ flight avionics, TL-13 terrain-following avionics, 2xTL-13 FLT computers
Commo: 300-km radio, 30km laser communicator
Sensors: 30-km passive EMS, 3-km active EMS, 3-km EMS jammer
Life Support: Heat, light, pressurized, basic life support
Cargo: 4 tonnes
Crew: 3 (commander, gunner, driver)
Passengers: 1
Fire Control: TL-13 ballistic computer allows up to 4 +Diff Mods to be disregarded

Armament: 12-Mj plasma cradle gun, coaxial 7.5mm machine-gun, coaxial target-painting laser
Stabilization: Advanced (for all three weapons), may fire at any speed
Ammo: 400 pulse plasma cartridges (Cr300 each), 3000 rounds 7.5mm. Full load of plasma cartridges costs Cr120,000, full load of machinegun ammunition costs Cr1320.
Speed: 720 kph high mode, 540 kph cruising, 170 kph safe NOE speed
Travel Move: 2160 (high mode), 1020 (NOE)
Combat Move (in 10-meter grid squares): 100 (high mode absolute speed), 24 (NOE safe speed)
Fuel Capacity: 4000 liters LHyd
Fuel Consumption: 200 liters/hour (endurance of 20 hours)

"Buster" TL-8 Weapons Carrier

The "Buster" weapons carrier is based quite naturally on the TL-8 range truck, manufactured throughout the Last Imperium and available in relic form, and now manufactured on Lucifer, Oriflamme, and Nike Nimbus in the Reformation Coalition.

In this weapons carrier version, it has been enhanced by the addition of a TL-8 satellite-positioning ground navigation system, a 30-km radio, and a power adapter to allow an 8cm TL-9 laser rifle to be fired off of the vehicle's power supply, rather than requiring a backpack. The TL-9 adapter is the only item on the vehicle itself (exclusive of the installed weapons, below) that is not constructed at TL-8. The adapter allows the rifle to fire at the 0.02-Mj power level (see page 92).

The weapons carrier has a pintle mount installed on its forward roll bar, and is designed to carry any one of a large variety of Coalition heavy weapons, usually a squad support laser, laser sniping weapon, assault rocket launcher, or plasma bazooka. (Firing data for these weapons is presented on their individual entries; page references for these are listed under "Armament," below.) By mounting these weapons directly on a vehicle rather than having them carried by ground troops, the crew is able to rapidly "shoot and scoot" to avoid enemy counterfire. This makes the weapons carrier valuable for defensive operations, as it is difficult for an SSL or LSW crew to provide defensive covering fire and then pack up these heavy weapons and escape. The weapons carrier's high cross-country mobility has led to its nickname, "Buster." It can travel so rapidly across rough terrain that the crew seated inside complain that "it'll bust yer butt."

Note that of the weapons carrier's price of Cr24,888, Cr20,000 comes from its satnav system, meaning that this system is often left off to save money. Note also that the power shortfall below means that the laser rifle adapter and the satnav system may not be operated at the same time. However, since the satnav system only needs to operate periodically to update the vehicle's new location, this is not a problem.

Coalition range trucks and "Busters" have had their power plants converted to burn liquid hydrogen (LHyd), as this will always be available from starship fuel tankage, while many low-tech worlds will have no petroleum refining facilities to provide hydrocarbon distillate fuels.

Busters function without difficulty in atmosphere codes 4-9, but do require intake filters in tainted atmospheres (codes 4, 7, and 9). These cost Cr10 per vehicle and have negligible mass and volume. In order to function in very thin atmospheres (codes 2-3), the Buster requires an intake compressor. Compressors cost Cr200 and reduce the vehicle's cargo capacity by 0.1 cubic meters and 0.1 tonnes.

Buster crews are equipped with two image converter or PRIS binoculars (pages 28-29), one 8cm DEI laser rifle (page 92), and two personal defense lasers (page 95), in addition to whatever additional personal equipment and supplies they might wish to carry.

Tech Level: 8
Price: Cr24,888 (exclusive of weapons)
Size: 14 cubic meters = 1 displacement ton (Mc)
Mass: 1.95 tonnes empty, 3.8 tonnes loaded
Power: 0.2 MW improved internal combustion engine (0.00817 MW power shortfall)
Maint: 1
Controls: Enhanced electronic, TL-8 navigation aids
Commo: 30km radio
Sensors: Image converter or PRIS binoculars carried by crew (pages 28-29)
Life Support: Light, heat
Cargo: 0.25 tonnes for crew supplies and equipment, plus up to 1.25 tonnes of heavy weapons and ammunition (see below)
Crew: 3
Passengers: None
Fire Control: None
Armament: 1×Squad Support Laser (page 96), *or* 1×Laser Sniping Weapon (page 97), *or* 1×Assault Rocket Launcher (page 98), *or* 1×Plasma Bazooka (page 99), plus one DEI laser rifle (page 92)
Stabilization: None
Ammo: Varies by carried weapon: 16×SSL magazines (100 rounds each), *or* 128×LSW rounds, *or* 74×ARL clips (6 rounds each), *or* 75×Plasma Bazooka rounds
Maximum Speed: 145 kph on roads, 58 kph cross country
Travel Move: 280/110
Combat Move: 65/25
Fuel Capacity: 550 liters LHyd
Fuel Consumption: 50 liters/hour (endurance of 11 hours)

STARSHIPS

SPACECRAFT

The following pages contain a sampling of starships and spacecraft commonly used by the Reformation Coalition and its member worlds, as well as three Hiver ships that are often encountered in Coalition Space. Note that the individual member worlds of the Coalition maintain fleets of mostly relic craft: large Last Imperium starships mostly used as system defense boats, and a profusion of smaller ships. These ships are not portrayed here, but are found in the **TNE** basic rules (pages 366-379) and in **Brilliant Lances**. Note that these sources show ships that have been rebuilt, redesigned, or modified over the years to TL-12 standards, even though these classes were usually considered TL-15 vessels in former times.

How to Read the Starship Data Profiles

The starship data profiles on the following pages are presented in the **Brilliant Lances** format. However, they are also fully usable with the space combat rules presented in the **TNE** basic rules. Where the range of any system is defined in hexes, this is the same as range bands in the basic **TNE** space combat rules.

The following abbreviations are used on the following pages.

AEMS: Active Electromagnetic Sensor; **AG:** Artificial Gravity (environmental and G-compensating); **AL:** Air Lock; **Ant:** Antenna; **Brb:** Barbette; **BS:** Barbette Socket; **CG:** Contra-Gravity Lifters; **CH:** Cargo Hatch; **Elec:** Electronics; **ELS:** Emergency Life Support; **EMM:** Electromagnetic Masking; **EMMR:** Electromagnetic Masking Radiators; **Eng:** Engineering; **FPP:** Fuel Processing Plant; **JD:** Jump Drive; **Las:** Laser; **LB:** Laser Barbette; **LBth:** Low Berth; **LP:** Launch Port; **LS:** Life Support; **LSR:** Large stateroom; **LT:** Laser Turret; **MB:** Missile Barbette; **MD:** Maneuver Drive (ignition chamber); **MFD:** Master Fire Director; **MG:** Meson Gun; **MS:** Meson Screen; **MT:** Missile Turret; **ND:** Nuclear Damper; **NDB:** Nuclear Damper Barbette; **NDT:** Nuclear Damper Turret; **PA:** Particle Accelerator; **PEMS:** Passive Electromagnetic Sensor; **PEMS Ant:** Passive Electromagnetic Sensor Antenna; **PP:** Power Plant; **Qtrs:** Quarters; **RC Ant:** Radio Communicator Antenna; **Sand:** Sandcaster Turret; **SSR:** Small Stateroom; **Trt:** Turret; **TS:** Turret Socket, i.e., an empty socket where a turret could be installed. All empty sockets take 1 minor hit (1h). If a turret or barbette is in the socket, it takes damage normally.

Note: Prices for ships do not include carried small craft, cutter modules, vehicles, etc., which must be purchased separately.

Small Craft

In the Last Imperium, small craft were classified by a bewildering array of specific terms which specified size, performance, and often hull configuration. With the Imperium's large high-tech manufacturing base, these standard designs could be produced in huge numbers at consistent levels of technology, and these fine distinctions of type were useful. However, with the low technology levels prevailing in the Reformation Coalition in the new era, these descriptions are no longer useful, as reigning tech levels will often not permit their construction, nor even their repair. For example, the 50-ton modular cutter, which in Last Imperium times maneuvered at 4Gs, cannot be built to perform at better than 2 at TL-12. These difficulties of building spacecraft with external similarities to Last Imperium craft but which did not fit many of the criteria of their Imperial descriptions led to a breakdown of small craft terminology in the RC.

Because of the large numbers of relic small craft, of widely varying characteristics and performance, that have been pressed into Coalition service, the RCES and RCN have been forced to adopt a new standardized system for classifying these craft. Because it is based categories of actual performance, it is more rational than the arbitrary Imperial system which allocated a unique type name to each separate design. However, because the imperial usage persists, confusion may sometimes result. Ironically, one of the most persistent of the anachronistic uses is the modular cutter, which strictly speaking should be called a modular shuttle under the new system. Although it does not fit either the Imperial nor the RC requirement of 4G performance, the fact that its design concept is identical to the old Imperial modular cutters means that the name is still used. Note that *cutter* used alone means a 50-99-ton craft with 4G+ performance; the term *modular cutter* must be used to describe the 50-ton craft with a 29-ton removable module.

Assault Lander: A heavily armored small craft, usually armed, designed to land combat-equipped troops under fire.

Barge: Any small craft assigned for the personal transport of an admiral or other high-ranking officer.

Boat: Generic term for any small craft. Term is also used for spacecraft in general, for example the starship-sized system defense "boats."

Cutter: Small craft between 50 and 99 tons and performance of 4Gs or greater, especially one with substantial cargo capacity.

Fighter: A high-performance, armed small craft intended only for space or atmospheric and space combat, with no utility role.

Gig: Small craft of 20 tons or less and performance of 4G or greater, and usually armed.

Launch: Small craft of 20-49 tons and performance of 3G or less.

Lifeboat: Powered small craft in the skiff or launch class fitted with emergency low berths or standard passenger couches, used for abandoning disabled or destroyed starships.

Liferaft: Unpowered small craft fitted with emergency low berths, used for abandoning disabled or destroyed starships.

Lighter: Nonstarship greater than 100 tons displacement, with performance of 3G or lower, designed to land cargo from orbit onto planetary surface.

Longboat: Any small craft between 20 and 99 tons with long-endurance accommodations for all crew and passengers.

Pinnace: Small craft of 21-49 tons with performance of 4G or greater.

Ship's Boat: See Boat. Because of Imperial practice, has also come to be associated with a 30-ton starship-carried general purpose utility craft, usually in the pinnace class.

Shuttle: Small craft between 50 and 99 tons and performance of 3Gs or less.

Skiff: Small craft of less than 20 tons and performance of 3G or less.

Small Craft: Non-jump-capable craft of less than 100 tons.

Spacecraft: Non-jump-capable space vessel of any size.

System Defense Boat: Non-jump-capable space vessel of 100+ tons displacement, intended purely for space combat, with no utility role.

Utility Small Craft/Spacecraft Classes

Size	Low Performance (1-3G)	High Performance (4+ G)
1-19/20	Skiff	Gig
20-49	Launch	Pinnace
50-99	Shuttle	Cutter
100+	Lighter	

Reformation Coalition *Manta*-Class Fueler

General Data

Displacement: 400 tons
Length: 33 meters
Price: MCr119.62
Configuration: Dome/Disc SL
Mass (Loaded/Empty): 2789.07/2481.57
Hull Armor: 31
Volume: 5600 m^3
Target Size: S
Tech Level: 12

Engineering Data

Power Plant: 700 MW Fusion Power Plant (50 MW/hit), 1 year duration (0.976 MW excess power)

G-Rating: 3G (200 MW/G), Contra-Grav lifters (40 MW)

G-Turns: 40.8, 25 m^3 of fuel each (using dedicated supply; +140 G-turns if using clipper's fuel)

Maint: 110

Electronics

Computer: 3×TL-12 Mod St Computer (0.4 MW ea.)

Commo: 300,000km radio (10 hexes; 10 MW), 1000AU maser (∞; 0.6 MW)

Avionics: TL-10+ Avionics

Sensors: Passive EMS fixed array 60,000km (2 hexes; 0.06 MW), Active EMS 60,000km (2 hexes; 12.5 MW)

ECM/ECCM: EM Masking Package (5.6 MW)

Controls: Bridge with 3×bridge workstation, plus 8 other workstations

Armament

None. No turret sockets fitted.

Accommodations

Life Support: Basic (0.56 MW), Gravitic Compensators (3G; 28 MW)

Crew: 12 (1×Maneuver, 1×Electronics, 8×Engineering, 1×Maintenance, 1×Command)

Crew Accommodations: None, other than basic seats at workstations. Fueler is not designed for long duration missions.

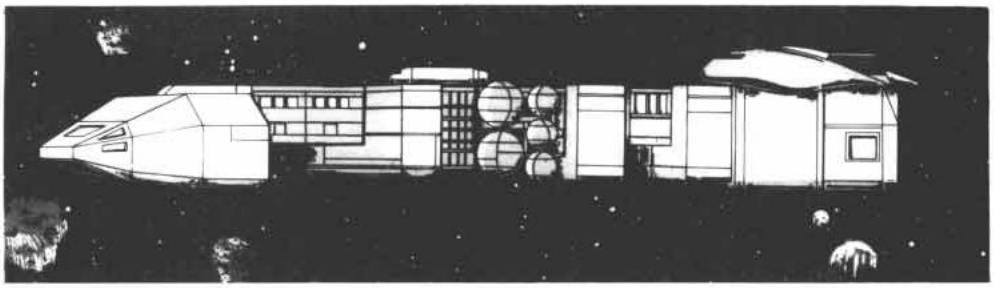
Cargo: 62.5 cubic meters/tonnes with one small cargo hatch, plus 3500 m^3 for fuel

Air Locks: 4

Notes

Fuel scoops fitted, but no purification machinery.

The *Manta* is the ultimate expression of the fuel skimmer concept. In the case of the *Manta*, the fuel skimmer no longer shuttles back and forth between the mothership and the fuel source, gradually filling the fuel tankage; instead, the *Manta* itself is the fuel tank. By carrying the fuel tank to the fuel source and filling it there in one trip, time is saved.



Although the *Manta* was intended to be almost permanently attached to the clipper, detaching only to refuel, clipper crews cannot resist using this extra craft for scouting, sensor sweep, or liaison missions in low-threat environments. Due care is taken of course, because the clipper cannot refuel without it, and carries no fuel other than that carried in the *Manta* or one of the fuel modules.

The *Mantas* are not designed for long duration missions, and have only basic life support; no showers, eating, or sleeping facilities. On long-duration fuel missions, improvised sleeping arrangements are made by setting up temporary bunks in the cargo hold. Crewmembers often bring along personal food supplies to supplement the preserved survival rations normally stocked.

Reformation Coalition *Aurora*-Class Clipper

General Data

Displacement: 600/1080/2080 tons
Length: 144 meters
Price: MCr749.86
Configuration: Open Frame USL
Mass (Loaded/Empty): 17,659.77/13,715.17
Hull Armor: 20
Volume: 8400/14,000/28,000 m³
Target Size: M (L)
Tech Level: 12

Engineering Data

Power Plant: 2280 MW Fusion Power Plant (50 MW/hit), 1 year duration
Jump Performance: 2 at 1561-2080 tons, 3 at 1249-1560 tons, 4 at 1041-1248 tons (Group III only), 5 at 1040 or fewer tons (Group III only) (Fuel used per jump varies with displacement and jump distance, but is always 4368m³ for maximum jump at current displacement.)
G-Rating: 2 at all displacements, limited by hull construction. Divide displacement (in 14 m³ tons) by 2 to get MW needed per G of performance. No contra-grav lifters.
G-Turns: Assuming fuel from fuel skimmer (3500 m³) and 400-ton fuel module (4722 m³), 8222 m³ fuel is available, but fuel use varies with displacement. At 2080 tons, 130 m³ fuel per G-turn, 29.6 G-turns (63.2 using jump fuel). For other configurations, divide MW/G by 8 to get m³ of fuel per G-turn for current displacement.
Maint: 617

Electronics

Computer: 1×TL-12 Mod Fb Computer (0.8 MW), 2×TL-12 Mod St Computer (0.4 MW)
Commo: 300,000km radio (10 hexes; 10 MW), 1000 AU maser (∞; 0.6 MW)
Avionics: TL-10+ Avionics
Sensors: TL-12 Passive EMS fixed array 120,000km (4 hexes; 0.15 MW), TL-12 Active EMS 300,000km (10 hexes; 27.5 MW), TL-11 Ladar 180,000 km (6 hexes; 2.5 MW)
ECM/ECCM: EM Masking (8.4 MW)
Controls: Bridge with 18×Bridge Workstation, plus 26 other workstations

Armament

Offensive: 8×TL-12 120-Mj Laser Turret (Loc: 4,5,5—Arcs: 1,2,3,4; Loc: 10—Arcs: All; Loc: 18,19,20,20—Arcs: 2,3,4,5; 3.3 MW ea.; 1 Crew ea.), TL-12 1000-Mj Meson Gun (Loc: Spinal; Arcs: 1; 27.8 MW; 5 Crew)
Master Fire Directors: 3×TL-12 MFD (4 Diff Mods; No Msl, 10 hexes; 2.95 MW ea.; 1 Crew ea.)

	Short	*Medium*	*Long*	*Extreme*

1000-Mj Meson Gun	5:158	10:75	20:38	40:19

Accommodations

Life Support: Extended (1.68 MW), Gravitic Compensators (3G; 42 MW)
Crew: 85: 26×Engineering, 2×Electronics, 2×Maneuvering, 16×Gunnery, 7×Maintenance, 18×Flight Crew, 11×Command, 2×Steward, 1×Medical
Crew Accommodations: 20×Small Stateroom (double-occupancy; 0.0005 MW ea.). Additional accomodations for crew contained in 100-ton auxiliary quarters module.
Passenger Accommodations: None, but additional quarters modules may be added.
Cargo: 130.75 m³, plus cargo modules, one small cargo hatch
Small Craft and Launch Facilities: External grapples (USL) for 50-ton Cutter, 30-ton craft, 1×400-ton fuel skimmer, and 4×100-ton, 1×200-ton, and 1×400-ton auxiliary modules.
Air Locks: 6

Notes

Clipper carries no fuel of its own except for the year's supply (330 m³) for the power plant. All reaction mass and jump fuel carried in *Manta*-class fueler and fuel modules. Listed price does not include *Manta*, but *Manta*'s loaded mass is included with the clipper's loaded mass, along with loaded mass of one modular cutter and one 30-ton boat (which account for the extra 80 tons of displacement). Price and mass does not include any modules, although clipper is typically fitted at least with one 100-ton auxiliary quarters module and a 400-ton fuel module. The fuel module carries 4722.4 m³ of fuel, plus fuel purification machinery (9.9 MW) sufficient to purify that amount in 17.17 hours.

The Group III clippers are later models with recovered higher technology jump drives.

Fully loaded clipper only has an actual target size of medium (M), but because its laser turrets are all mounted on turret extenders, it is treated as a large (L) target when being scanned by active sensors.

On the damage table, modules A, B, C, and D are 100-ton modules, module E is a 200-ton module, and module F is a 400-ton module, almost always a fuel module.

When clipper is empty, treat as Open Frame for purposes of hit location and fire arcs. When loaded with any modules, use Close Structure. When *Manta* is not docked, treat hits on areas 12, 13, 16, and 17 as a surface hit on its 400-ton grapple, then reroll for interior hit location on 1D10+10.

For hits on fuel module, use 1-18: Fuel, 19-20: Fuel Purification, with FP-13H. Hits on a 100-ton quarters module are treated as SSR hits, there are 43 such rooms. Other locations should be handled abstractly as cargo.

CLIPPER MODULES

The vessels of the *Aurora* class were originally designed as mercantile/exploratory vessels, adaptable to various missions by means of their modular nature. Encounters during early voyages revealed certain inadequacies (primarily in armament and power plant), and the ships were redesigned and rebuilt. The additions to the vessel came at the expense of some fuel and quarters space, and as a result, all *Aurora*-class clippers must carry supplementary fuel tankage, fuel processing machinery, and crew quarters modules.

Aurora-class clippers are normally assigned small craft and modules as follows:

— 1×Ship's boat, 1×Cutter, and 1×*Manta* in dorsal grapples

plus:

— 1×400-ton module

— 1×200-ton module

— 4×100-ton modules (or the equivalent in 25- and 50-ton combinations, i.e., 4×25s, 2×25s and a 50, or two 50s)

A number of specialty modules called Colonizer/Uplift modules are designed to be dropped off on a planetary surface to serve as pre-fabricated colonies on boneyard worlds or to become the center for an uplift mission. Colonizer modules include quarters and administrative centers (which are occupied by the colonists on the trip out, and become their permanent home upon arrival), and other modules such as medical, manufacturing, or educational modules which become training centers for their respective specialties upon arrival. All modules can be used as pre-fabricated components in modular orbital or deep space stations, but usually require additional structural components for this purpose.

Allocating Damage: Assign each module a spot on the main clipper damage table by deciding which of the lettered spaces it represents. For example, take a clipper with a 400-ton fuel module attached to F, a 100-ton quarters module at A, and a 100-ton cargo module at B. If a clipper takes a hit in location 15, module F has been hit, and the player should roll a D20 on the 400-ton fuel module's damage table below. A hit on location 5 would be slightly more complicated: a roll of 1-10 indicates that the clipper has been hit, a roll of 11-20 indicates that module A has been hit, and a further D20 roll on the relevant 100-ton module damage table is necessary. If a hit occured on location 9, where no modules have been attached, the result must be rerolled.

When resolving excess damage (**TNE**, page 320 or **Brilliant Lances**, page 23), the roll may call for the damage to be carried to another hit location,which means a location on the ship's main damage table, not the module's specific subtable. If the new hit location is a different module from the one where the initial damage took place (or is part of the clipper whereas the initial damage took place in a module or vice versa), the excess damage is not immediately resolved in the new location. First, it must penetrate the hull of the current module on its way out, and then penetrate the hull of the module or clipper main hull at the new location. This may use up the remaining damage before it can be resolved as internal explosions in the new location. Note that no surface damage is conducted during this penetration to the neighboring hit location, as these adjoining hull surfaces have no surface fixtures on them. Note also that in some cases the result "same internal area" will also require this procedure of re-penetration into an adjoining hull section. The paragraph above describes a hit on location 5, where 1-10 indicates the clipper and 11-20 indicates module A. If the initial damage were resolved in module A, and then excess damage was rolled for "same internal area," a subsequent roll of 1-10 would call for the excess damage to be taken out of the module and into the clipper hull and require hull penetration to exit the module and again to enter the clipper (which might well use up that damage before getting to the clipper's interior).

MODULE DESCRIPTIONS

25-ton Lifeboat Module

This module is a lifeboat capable of carrying 40 personnel (in emergency low berths) to a planetary surface as necessary during an emergency. It is normally unoccupied, and contains no artificial gravity and only basic life support. Module has insufficient power to run radio while emergency landing thrusters are in use. When not in use as a lifeboat, the module's power plant can supply 19.625 MW of surplus power to the rest of the clipper.

Volume: 350 m³
Mass: 161.8 tonnes (loaded), 144.6 (empty)
Price: MCr5.28
Crew: Pilot necessary for landing, otherwise none
Passengers: 40 in emergency low berths
Features: 20 MW fusion power plant, 10×emergency low berths, 300,000-km radio, 30,000-km PEMS, 1×normal workstation, 1.72 tonnes of rescue supples and emergency equipment
Maint: 5

25-ton Missile Module

This module provides clippers with additional armament. No quarters are provided for the crew of five, and no outside power is required (0.093 MW surplus power).

Volume: 350 m³
Mass: 370.12 tonnes (loaded), 266.12 (empty)
Price: MCr39.13
Crew: 3 (1×gunner, 1×electronics, 1×MFD officer). Quarters not provided.
Passengers: None.
Features: 33.1 MW TL-12 fusion power plant, TL-12 300,000-km Missile-capable MFD (4 Diff Mods; Msl 10 hexes; 10 hexes; 3.1 MW; 1 Crew), TL-12 missile barbette, 300,000-km AEMS, TL-12 60,000-km PEMS, 2×normal workstations.
Maint: 15

25-ton VIP/Special Quarters Module

This module provides quarters for important persons or those requiring special atmospheres, gravities, or other environments. No outside power is required (17.7975 MW surplus power). Internal arrangements vary.

Volume: 350 m³
Mass: 152.12 tonnes (loaded), 147.62 (empty)
Price: MCr4.23
Crew: None.
Passengers: Three in three large staterooms (single occupancy), up to six more in three small staterooms (single or double occupancy)
Features: 20 MW TL-12 fusion power plant, 3×large staterooms, 1×meeting room, 3×small staterooms.
Maint: 4

50-ton General Cargo Module

This module is an unpowered cargo carrier (525.15m³), without life support or artificial gravity. The module requires 0.752 MW of outside power. A 5-ton liferaft is provided in a docking ring adjacent to spinal corridor entryway.

Volume: 700 m³
Mass: 771.99 tonnes (loaded), 246.84 (empty)
Price: MCr3.37
Crew: None.
Passengers: None.
Features: External grapple for 50-ton module, 2×large cargo hatches, 5-ton liferaft and docking ring, 525.15 m³ cargo space
Maint: 34

50-ton Service Module for 10-ton Small Craft

This module provides a docking port and service facilities for a 10-ton small craft (called "skiffs" in RC service), along with three small staterooms for the maintenance crew. No outside power is required (14.6065 MW surplus power).

Volume: 700 m³
Mass: 500.63 tonnes (loaded), 358.23 (empty)
Price: MCr7.7
Crew: 6×Maintenance
Passengers: None.
Features: 20 MW TL-12 fusion power plant, internal hangar (minimal) and launch port for 10-ton small craft, machine shop, 142.4 m³ storage and supplies, 3×small staterooms.
Maint: 20

50-ton Power/Fuel Module

This module was specially designed to provide *Maggart*-class "stretch" clippers with additional energy to boost the power of their spinal mount meson weapons. The module is extremely massive, and its use requires careful balancing of mass throughout the rest of the ship. It is usually carried with a 50-ton fuel module (163.46 tonnes loaded, 116.42 empty, MCr3.27, No crew, 672 m³ fuel [47 tons], 3 Maintenance points, requires 0.752 MW outside power) to "dilute" its mass. The module carries one year's fuel for the reactor, and 206.8m³ (14.5 tonnes) of reaction mass. The module meets its own power needs, and supplies 562.606 MW to the clipper, sufficient to power the 2250-Mj spinal mount to the –2 Diff Mod power level.

Volume: 700 m³
Mass: 1296.45 tonnes (Loaded), 1281.98 (Empty)
Price: MCr55.036
Crew: 6 (engineering)
Passengers: Provision for up to 6 in 3 small staterooms (double occupancy)
Features: 567 MW TL-12 fusion power plant, 3×small staterooms,
Maint: 60

50-ton Survey Module

This module contains a laboratory and sensors for conducting a planetary survey along with a 10-ton small craft housed in a docking ring. Six small staterooms are provided for the crew. No outside power is required (5.545 MW surplus power).

Volume: 700 m³
Mass: 515.22 tonnes (loaded), 322.23 (empty)
Price: MCr74.26
Crew: 8 (5×scientists/lab technicians, 1×electronics, 2×skiff crew)
Passengers: None.
Features: 20 MW fusion power plant, laboratory, docking ring and launch port for 10-ton small craft, 109 m³ specimen supply storage, 180,000-km PEMS, 3000-km AEMS, densitometer, neutrino sensor, 4×normal workstations, 6×small staterooms
Maint: 21

100-ton Fighter Module

This module provides maintenance facilities and combat support for up to four 16-ton fighters (three in docking rings, one in internal hangar). Fuel and quarters for the crew of eight are not provided. No outside power is required (9.016 MW surplus power).

Volume: 1400 m³
Mass: 1506.28 tonnes (loaded), 476.58 (empty)
Price: MCr12.11
Crew: 8 (4×pilots, 2×maintenance, 1×electronics, 1×command).
Passengers: None.
Features: 20 MW TL-12 fusion power plant, internal hangar (minimal) for 16-ton fighter, docking rings and launch ports for 3×16-ton fighters, 4×16-ton "Wildbat" fighters, 2×1000 AU maser communicators, 1×normal workstation, machine shop, 41.7 m³ storage.
Maint: 18

Clipper Modules

100-ton Quarters Mk Ia

This module contains 43 small staterooms, and is designed for maximum capacity, not crew comfort. No outside power is required (21.1965 MW power surplus).

This module is also equipped as a lifeboat: C-G Lifters, ignition chamber, reaction mass (4 G-turns), 1000 AU radio beacon, flight computer, and normal workstation provided for purposes of emergency planetfall only.

Volume: 1400 m³
Mass: 457.99 tonnes (loaded), 442.14 (empty)
Price: MCr15
Crew: None.
Passengers: Up to 86 in 43xsmall staterooms
Features: 30 MW TL-12 fusion power plant, artificial gravity/G compensators, extended life support, 14.1 m³ cargo/storage space, 43xsmall staterooms, 2xair locks. *For Emergency Landings:* 1000 AU radio beacon, 30 MW battery (2 hour duration), CG lifters, 1xnormal workstation, TL-12 Flt computer, 1G ignition chamber for emergency planetfall, reaction mass (4 G-turns).
Maint: 15

100-ton Armed Quarters Module Mk Ic

This module contains 37 small staterooms, three laser turrets, and a 300,000-km missile-capable MFD (provided to allow missile turrets to be fitted instead of lasers). No outside power is required (5.4995 MW power surplus with power set aside for 3x150-Mj turrets).

This module is also equipped as a lifeboat: CG Lifters, 1G ignition chamber, reaction mass (4 G-turns), 1000 AU radio beacon, flight computer, and workstation provided for purposes of emergency planetfall only.

Turret arcs of fire are 2, 3, 4, regardless of where the module is fitted on the clipper.

Volume: 1400 m³
Mass: 687.95 tonnes (loaded), 657.95 (empty)
Price: MCr40.34
Crew: 4 (3xgunners and 1xMFD operator).
Passengers: Up to 74 in 37 small staterooms.
Features: 30 MW TL-12 fusion power plant, 30 m³ cargo/storage space, 37xsmall staterooms, 3xturret sockets, 3xTL-12 laser turrets, and TL-12 300,000-km missile-capable MFD (4 Diff Mods; Msl 10 hexes; 10 hexes; 3.1 MW; 1 Crew). *For Emergency Landing:* 1000 AU Radio Beacon, 30 MW battery, CG lifters, workstation, TL-12 flight computer, 1G ignition chamber, reaction mass (4 G-turns).

			PP-1H
			All Others-(1h)

100-ton Drop Troop Module

This module contains 48 launch tubes for drop capsules (see pages 14-15) and quarters for 36 drop troops. Only 36 of the launch tubes have staging areas to allow the entry of personnel into drop capsules. This allows 12 additional support modules (cargo and decoys) to be carried. Standard load-out is 36×Mk 1, 6×Mk IIc, and 3 each of Mk IIa and IIb (loaded mass below assumes this mix). There is space for 71.9 tonnes of military equipment. The module has no power plant of its own, and requires 8.791 MW of outside power.

These modules are usually paired with the 100-ton troop carrier modules above. This is because recovery of these drop troops requires the assault landers carried aboard the other module, and because the excess power from the troop carrier module is sufficient to balance out the needs of the drop troop module.

Volume: 1400 m³
Mass: 1033.76 tonnes (loaded), 613.87 (empty)
Price: MCr 9.01
Crew: None.
Passengers: 36×drop troops in 9×large staterooms (quad occupancy)
Features: 48×drop capsule launch tubes, 36 equipped with staging area for personnel launch, 9×large staterooms, 71.9 m³ of cargo.
Maint: 26

Note: Pers (Personnel) launch tubes hold Mk 1 capsules, (1h) each if tube is loaded. Supp (Support) launch tubes hold Mk II capsules, which, if loaded, have hits as follows: Mk IIc (1h) unloaded or (2h) loaded, Mk IIb-(2h), Mk IIa-(4h)

200-ton General Cargo Module—Cutter

This module serves as a loading dock for a 50-ton modular cutter. A hangar allows loading of the 29-ton cargo modules onto/off the cutter, and the cargo bay holds three extra cutter modules. No quarters are provided, and outside power is required (17.562 MW).

Volume: 2800 m³
Mass: Loaded mass varies with cutter modules carried, up to 1732.275 tonnes (2525.295 if cutter with gunpack is carried as well), 365.125 (empty)
Price: MCr15.94
Crew: 6 cargo-handling personnel (with 3 "Big Brute" BRTs).
Passengers: None.
Features: Internal hangar (minimal) and launch port for 50-ton cutter, cargo bay (3 modules), 49.55 m³ additional cargo, 4×large cargo hatches.
Maint: 9

200-ton Quarters Module Mk IIa

This module contains 40 small staterooms, a sickbay (accessible from the docking ring), storage space, and a 924 m³ recreation deck. No outside power is required (81.585 MW surplus power under normal circumstances—full power is only used in lifeboat mode when attempting emergency planetfal).

This module is also equipped as a lifeboat: CG Lifters, 1G ignition chamber, reaction mass, 1000 AU radio beacon, flight computer, and workstation provided for purposes of emergency planetfall only.

Volume: 2800 m³
Mass: 994.83 tonnes (loaded), 860.74 (empty)
Price: MCr37.71
Crew: None.
Passengers: Up to 80 in 40 small staterooms.
Features: 100 MW TL-12 fusion power plant, 40×small staterooms, recreation deck, sickbay, 10-ton ambulance skiff in docking ring, 46.6 m³ storage. *For Emergency Landing:* 1000 AU radio beacon, 20 MW battery (4-hour duration), CG Lifters, workstation, TL-12 flight computer, reaction mass (4 G-turns).

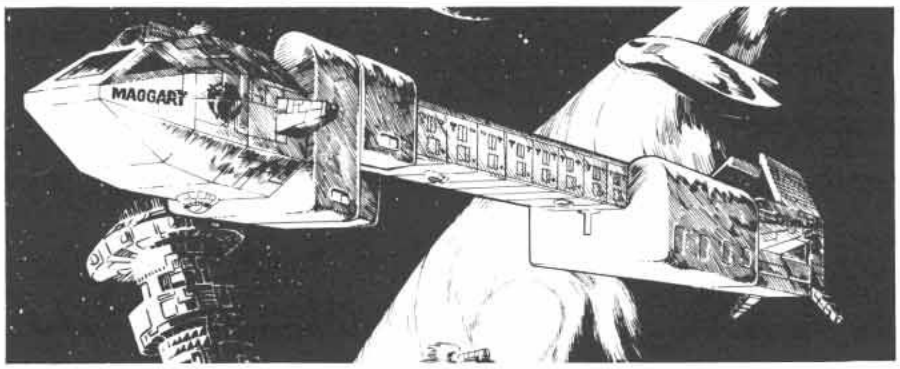
400-ton Fuel Module (refining)

This module is an unpowered fuel tank (4722.4 m³), without life support or artificial gravity. The fuel purification plant (3300 m³ in 12 hours) requires 9.9 MW, EMM radiators require 5.6MW, and the rest of the module requires 0.404 MW, for a total of 15.904 MW of power from outside the module.



Fuel purifier requires 17.17 hours to purify its entire tankage at the rate of 275 m³ per hour.

Volume: 5600 m³
Mass: 2137.98 tonnes (loaded), 1807.01 (empty)
Price: MCr26.16
Crew: None (fuel processing plant controlled from outside).
Passengers: None.
Features: 4722.4 m³ (330.6 tons) fuel, fuel processing plant.
Maint: 87

RC *Maggart*-class Clipper ("Stretched *Aurora*")

General Data

Displacement: 850/2750 tons
Length: 162 meters
Price: MCr1150.25
Configuration: Open Frame USL
Mass (Loaded/Empty): 22,772.93/18,526.72
Hull Armor: 20
Volume: 11,900/38,500 m³
Target Size: M (L)
Tech Level: 12/14

Engineering Data

Power Plant: 2960 MW Fusion Power Plant (50 MW/hit), 38.6 weeks duration (fuel carried internally)

Jump Performance: 2 at 2063-2750 tons, 3 at 1651-2062.5 tons, 4 at 1376-1650 tons, 5 at 1375 or fewer tons (Fuel used per jump varies with displacement and jump distance, but is always 5775 m³ for maximum jump at current displacement.)

G-Rating: 2 at all displacements, limited by hull construction. Divide displacement (in 14 m³ tons) by 2 to get MW needed per G of performance. No contra-grav lifters.

G-Turns: Assuming fuel from fuel skimmer (3500 m³) and two fuel module (1×400-ton and 1×100-ton provide 6075 m³), 9575 m³ fuel is available, but fuel use varies with displacement. At 2750 tons, 171.875 m³ fuel per G-turn: 22 G-turns (55.7 using jump fuel). For other configurations, divide MW/G by 8 to get m³ of fuel per G-turn for current displacement.

Maint: 847

Electronics

Computer: 3×TL-12 Mod Fb Computer (0.8 MW ea.)

Commo: 2×300,000-km radios (only one powered; 10 hexes; 10 MW), 2×1000 AU masers (only one powered; ∞; 0.6 MW)

Avionics: TL-10+ Avionics

Sensors: TL-12 Passive EMS fixed array 180,000-km (6 hexes; 0.25 MW), TL-12 Active EMS 480,000-km (16 hexes; 50 MW), TL-11 Ladar 180,000-km (6 hexes; 2.5 MW)

ECM/ECCM: EM Masking package (11.9 MW)

Controls: Bridge with 22×bridge workstation, plus 35 other workstations

Armament

Offensive: 8×TL-12 120-Mj Laser Turret (Loc: 4,5,5—Arcs: 1,2,3,4; Loc: 10—Arcs: All; Loc: 18,19,20,20—Arcs: 2,3,4,5; 3.3 MW ea.; 1 Crew ea.), TL-12 2250-Mj Meson Gun (Loc: Spinal; Arcs: 1; 62.5 MW; 13 Crew)

Master Fire Directors: 3×TL-12 MFD (4 Diff Mods; No Msl, 10 hexes; 2.95 MW ea.; 1 Crew ea.)

2250-Mj Meson Gun	62.5	6: 237	12: 107	24: 53	—
1165-Mj Meson Gun	32.36	6: 171	12: 77	24: 38	—

Accommodations

Life Support: Extended (2.38 MW), Gravitic Compensators (3G; 59.5 MW)

Crew: 112: 35×Engineering, 2×Electronics, 2×Maneuvering, 24×Gunnery, 13×Maintenance, 18×Flight Crew, 15×Command, 2×Steward, 1×Medical

Crew Accommodations: None; all crew accommodations are in 100-ton quarters modules.

Passenger Accommodations: None, but may be accommodated in quarters modules

Cargo: None; cargo is carried in cargo modules

Small Craft and Launch Facilities: External grapples for 2×50-ton small craft (modular cutters), 1×400-ton fuel skimmer (*Manta*), and 4×100-ton, 3×200-ton, and 1×400-ton auxiliary modules.

Air Locks: 9

Notes

Also known as Group IV, or "Stretched" *Auroras*, the *Maggarts*, like the Group IIIs before them, benefit from the installation of recovered relic TL-14 jump drives. This allows jump performance up to 5 parsecs at reduced displacements.

The *Maggarts* are improved *Auroras*, modified with improved equipment and lengthened to provide greater module carriage and increased range performance from the spinal weapon. This increased meson tunnel length has increased the weapon's short range from 150,000 km to 180,000, but the weapon does not have an extreme range band. This was accepted because of the weapon's increased reach at short to long ranges, and because the use of the weapon at its extreme range is of marginal utility at best.

The *Maggarts* have a nominal power shortfall of 30.139 MW. However, in practice this is not an issue, as clippers do not operate without modules. Many of these attached modules contain their own power plants which provide excess power back to the clipper which collectively more than make up for the shortfall. However, in the rare event that the clipper operates on only its internal power, the shortfall is taken from the 2250-Mj meson gun, reducing its performance to 1165 Mj. Performance ratings at both power levels are shown on the table in the Armament section. This weapon has beefed-up circuitry to allow its firing at the 5× and 10× overpowering levels (TNE, page 348).

Hits on modules are taken to the individual module damage tables on the previous pages, depending upon what type of module was fitted in that location. If a module location consists of several sub-modules (for example, 2×100-tonners in the space of a 200-tonner, or 2×50 tonners in place of a 100-tonner), roll randomly for which module was hit, then roll damage on its individual hit table.

Cutter hits are converted to hits on their grapples if the cutters are not in place.

The clipper carries no fuel of its own except for the 38.6-week supply (330 m³) for the power plant. All reaction mass and jump fuel is carried in *Manta*-class fueler and fuel modules. Listed price does not include the *Manta*, but the *Manta*'s loaded mass is included with the clipper's loaded mass, along with loaded mass of two modular cutters. Price and mass does not include any modules, although the clipper is typically fitted at least with one 100-ton and one 400-ton fuel module and two 100-ton quarters modules. The 400-ton fuel module carries 4722 m³ of fuel, plus fuel purification machinery (9.9 MW) sufficient to purify that amount in 17.17 hours. The 100-ton fuel module has no fuel purifier, so its 1353 m³ must be processed by the 400-ton module, requiring 4.9 hours. Note that reaction mass need not be purified, only jump and power plant fuel. Because of their low fuel reserve for G-turns, clippers must be carefully astrogated and piloted so that jump courses conserve the ship's residual velocity and allow it to be translated directly into refueling and orbital vectors.

A fully loaded clipper only has an actual target size of medium (M), but because its laser turrets are all mounted on turret extenders, it is treated as a large (L) target when being scanned by active sensors.

On the damage table, modules A, B, C, and D are 100-ton modules, modules E, F, and G are 200-ton modules (or pairs of 100-ton modules), and module H is the 400-ton module.

When clipper is empty, treat as Open Frame for purposes of hit location and fire arcs. When loaded with any modules, use Close Structure. When *Manta* is not docked, treat hits on areas 12, 13, 16, and 17 as a surface hit on its 400-ton grapple, then reroll for interior hit location on 1D10+10.

"STRETCH" CLIPPER LOADOUTS

The *Maggart*-class "Stretch" clippers are normally assigned small craft and modules as follows:

- 2×Small Craft (50-tons or less, normally two 50-ton modular cutters), and 1×*Manta* in dorsal grapples

plus:

- 1×400-ton module
- 3×200-ton modules (or the equivalent in 100-ton module combinations)
- 4×100-ton modules (or the equivalent in 25- and 50-ton combinations).

On very rare occasions, another ship of up to 400 tons can be "piggy-backed" on the engineering section in place of the *Manta*-class fueler, but this is normally done only with clippers that operate as part of a fleet.

Because stretch clippers are underpowered by 30.139 MW, this power shortfall must be made up by the power surplus from installed modules. Likewise, quarters for all of the the clipper's 112 crew must be provided in modules.

When configuring a clipper for an upcoming mission, it is important to be able to balance the ship's power needs as well as ensure that the ship is not overloaded. This table assists this process by grouping all of the modules together with their loaded masses and power surpluses or requirements.

Note that the loaded mass of *Aurora*-class clippers must remain below 32,124 tonnes, and the loaded mass of *Maggart*-class stretch clippers must remain below 42,472 tonnes.

Modules with Power Deficits

Module	*Mass*	*MW*
200-ton General Cargo-Cutter	2525.3	–17.562
400-ton Fuel Module (refining)	2137.98	–15.904
200-ton Fuel Module (refining)	1369.125	–9.752
100-ton Drop Troop Module	1033.76	–8.791
100-ton Fuel Module	281.28	–1.502
100-ton General Cargo Module	1539.67	–1.502
50-ton Fuel Module	163.46	–0.752
50-ton General Cargo Module	771.99	–0.752

Modules with Power Surpluses

Module	*Mass*	*MW*
25-ton Missile Module	370.12	+0.093
100-ton Armed Quarters Mk Ic	687.95	+5.4995
50-ton Survey Module	515.22	+5.545
100-ton Fighter Module	1506.28	+9.016
100-ton Troop Carrier Module	539.04	+11.206
50-ton Service Module for 10-ton Small Craft	500.63	+14.6065
25-ton VIP/Special Quarters Module	152.12	+17.7975
100-ton Quarters Mk Ib	637.79	+18.8005
25-ton Lifeboat Module	161.8	+19.625
100-ton Quarters Mk Ia	457.99	+21.1965
200-ton Quarters Module Mk IIa	994.83	+81.585
50-ton Power Generation/Fuel Module	1296.45	+562.606

Sample "Stretch" Loadout: Uplift/Survey Mission

The clipper is shown below after having deployed two 200-ton modules to an uplift mission in a system, on a survey of a second system. The missile module contains additional sensor apparatus that are used as backups for the clipper's normal sensor suite, and are not normally powered. If missile module does not power up its sensor suite (and instead uses that of the clipper), it produces an additional 27.56 MW.

The 200-ton Mk IIa and 100-ton Mk Ib modules provide a total of 71 small staterooms.

Fittings	*Mass*	*MW*
Maggart-Class Stretch Clipper	22,772.9346	–30.139

Kelley Victrix (Victrix-Class Multimission Sloop)

General Data

Displacement: 400 tons
Length: 60.5 meters
Price: MCr349.00
Configuration: Slab AF
Mass (Loaded/Empty): 5704.46/5496.33
Hull Armor: 40
Volume: 5600 m³
Target Size: S
Tech Level: 12/13

Engineering Data

Power Plant: 955 MW TL-12 Fusion Power Plant (50 MW/hit), 1 year duration (29.61075 MW power shortfall)

Jump Performance: 4 (1400 m³ fuel for Jump-4, 1050 m³ for Jump-3, 700 m³ for Jump-2, 350 m³ for Jump-1) with relic TL-13 jump drive

G-Rating: 4G (200 MW/G), Contra-Grav lifters (40 MW)

G-Turns: 37 with Jump-4 fuel reserve (51 with Jump-3 fuel reserve, 65 with Jump-2 fuel reserve, 79 with Jump-1 fuel reserve, 93 using all jump fuel), 25 m³ fuel each

Fuel Tankage: 2325 m³ (166 tons), plus 143.25 m³ (10.23 tons) reserved for power plant

Maint: 222

Electronics

Computer: 3×TL-12 Mod Fb Computers (0.4 MW ea.)

Commo: 2×TL-12 1000 AU radio (only one powered to 300,000-km level,10 hexes, 10 MW), TL-12 1000 AU maser (∞; 0.6 MW)

Avionics: TL-10+ Avionics, TL-12 Terrain-Following Avionics

Sensors: TL-12 Passive EMS fixed array 150,000-km (5 hexes; 0.2 MW), TL-12 Active EMS 300,000-km (10 hexes; 27.5 MW)

ECM/ECCM: TL-12 120,000-km EMS Jammer (4 hexes; 33 MW), TL-12 15,000-km Area jammer (same hex; 6.75 MW), EM masking package (5.6 MW)

Controls: Bridge with 9×bridge workstations, plus 10 other workstations

Armament

Four hardpoints fitted with mass and power reserved for four turrets totalling up to 280 tonnes and drawing 18.3 MW (Loc: 2, 3, Arcs: 1, 2, 3; Loc: 10, 10, Arcs: All) Sample fittings include 4×150-Mj laser turrets, 1×TL-12 Nuclear Damper and 1×120-Mj laser turret, etc. Typical fitting is listed below. Weapons listed as "Planetary Combat Only" are permanent fittings.

Offensive: 3×TL-12 120-Mj Laser Turret (Loc: 2, 3; Arcs: 1, 2, 3; Loc: 10; Arcs: All; 3.3 MW ea.; 1 crew ea.)

	Short	*Medium*	*Long*	*Extreme*
120-Mj Laser Turret	4: 1/9-27	8: 1/9-27	16: 1/6-19	32: 1/3-9

Defensive: 1×TL-12 Sandcaster Turret (Loc: 10, Arcs: All; TL-12, 1D10×5 per hit; 30 Cann; 1 MW; 1 Crew)

Master Fire Directors: 2×TL-12 Missile/Beam MFD (4 Diff Mods; Msl 10 hexes; 10 hexes; 3.1 MW ea.; 1 Crew ea.)

Planetary Combat Only: 2×forward-firing rapid-fire plasma guns with 100 rounds per gun (data below), 1×remote turret with squad support laser with 2000 rounds (see page 96 for complete firing data). Both weapons below are fitted with advanced stabilization, meaning that they can be fired without loss of accuracy at any speed.

Description	*ROF*	*SR*	*Dam*	*Pen Val*	*Conc-Burst*	*FC*
76-Mj RF Plasma Gun	SA5	2280	100	100-100-50-10	10-15	4
Squad Support Laser	SA5	300	varies	Nil	—	4

ROF: Rate of fire in shots per 5-second combat turn, *SR*: Short Range in meters, *Dam*: Damage Value, *Pen Val*: Penetration Value at short-medium-long-extreme ranges, *Stab*: Stabilization, *FC*: Fire control, showing number of firing difficulty modifiers which may be disregarded

Accommodations

Life Support: Extended (1.12 MW), Grav Compensators (3G; 28 MW)

Crew: 26 (2×Maneuver, 2×Electronics, 6×Gunnery, 10×Engineering, 2×Maintenance, 3×Command, 1×Medic)

Crew Accommodations: 1×Small Stateroom (0.0005 MW), single occupancy for captain, 12.5×Small Staterooms (0.0005 MW ea.), double occupancy for remainder of crew

Passenger Accommodations: None, but pods may accommodate troops

Cargo: 8 m³ with small cargo hatch plus 40-ton multimission pod

Small Craft and Launch Facilities: None

Air Locks: 4

Notes

The Victrix ships are survivors of and copies of a class of multipurpose warships constructed by the Solomani Confederation during the Final War. They are true TL-12 thoroughbreds: fast, long-legged, well-armed, and highly capable, but "high-strung" and quite demanding to operate. All 11 units of the class currently serving the RCES are slightly different, but *Kelley Victrix*, detailed here, is a good representation.

Like all Victrix ships, *Kelley Victrix* is a tight design. Except for her recovered TL-13 jump drive, all of her systems are TL-12. (All Victrix ships have at least jump-3 performance with TL-12 drives, but some are fitted with recovered lightweight TL-14 drives. These not only allow higher absolute performance, but the weight savings allows these vessels to have beefed-up hull plating.)

All crewmembers except the captain are housed at double occupancy, but when extra crew or troops are carried (as is typically the case), "hot bunking" (three or more crew per small stateroom) is required. Fuel carriage is also at a premium; Victrix ships always require careful attention to fuel usage. The G-turn figures above based on fuel reserved for "Jump N" apply equally as well to a ship which has just arrived in system after having completed such a jump. An additional 6 G-turns may be gained by burning power plant fuel, but this is potentially risky. Although all Victrix ships have "good legs" based on their jump-3+ performance, the cost in their limited fuel tankage means that such deep penetration missions must have their jumps carefully plotted to place a fuel source very near the far end of the jumpspace "hole," preferably in such a position as to completely use up the ship's residual velocity (see TNE, page 224).

Ship's systems draw a total of 984.61075 MW, a shortfall of 29.61075 MW. When the contra-grav is secured, there is no shortfall, but while the CG is in use, the area jammer is usually shut down, and the EMS deceptive jammer has its short range reduced to 3000 km (quite sufficient to counter planetary surface and orbital threats when flying NOE). Note that the power shortfall varies. 18.3 MW are set aside for weapons (allowing a nuclear damper or relic 150-Mj lasers to be fitted), but the 3×120-Mj laser, 1×sandcaster fit shown above draws only 10.9 MW, leaving 7.4 MW for other purposes.

EMM-1H
All Others-(1h)

Unlike most starships, Victrix ships are equipped with direct fire ground-attack weapons. These are of absolutely no use in space combat due to their limited range, but are used in planetary combat. The two plasma guns are used for strafing ground targets in support of ground troops, and are fired using the Approach Fire rules (TNE, page 295). These weapons are fired by the pilot/maneuver officer, and can be fired in High or NOE flight modes. They are fully stabilized to allow fire at any speed, and their fire control allows up to four Difficulty Modifiers to be disregarded. See the atmospheric ratings below for defensive benefits to the Victrix due to its speed in the planetary combat arena. A full load of ammunition for each gun (200 rounds total) costs MCr0.38 (Cr380,000).

Victrix ships are also equipped with a remote chin turret mounting a squad support laser (see page 96). This turret is fully stabilized with –4 Diff Mod fire control like the plasma guns, but is usually used in the NOE mode to lay down suppressive antipersonnel fire when recovering troops. The turret can be fired by one of the bridge command crew or an MFD operator, but no additional bonuses apply when fired under MFD control. The turret can bear in any direction below or at the same level as the ship, but may not fire at targets above the ship. Use data on page 96 for firing the SSL. A full load of ammunition costs MCr0.054 (Cr54,000).

Although some of the relic Victrix ships have not been refitted for multimission pod carriage, all of the new-build vessels (TailNo 10067 and later) are fitted for the carriage of a 40-ton (560 m³) mission configurable pod in their bellies. These pods are detailed below. The prices, maintenance requirement, and empty/loaded masses on the facing page are for the ship only, and do not include the pod. Maximum allowed mass for all pods is 473 tonnes, or ship's performance will fall to 2Gs.

TL-12 fuel purification machinery (3.6 MW), 23.25 hours to refine 2325 m³ (166 tons), or 100 m³ (4 G-turns) refined per hour. 11% scoops allow craft to skim full fuel load in one hour.

Because its mission and some of its weapons call upon the Victrix ships to operate in planetary atmospheres, planetary combat ratings (as distinct from the Brilliant Lances/Space Combat ratings above) are listed below.

Atmospheric Ratings

Speeds: 5600 kph maximum, 4200 kph cruising, 480 kph maximum NOE

Combat Move (10-meter grid squares per 5-second combat turn): 778 (High Mode absolute speed), 22 (NOE safe speed)

Travel Move (km per four hours): 16,800 (High Mode), 960 (NOE)

Agility (Target Movement Difficulty Modifiers): +9 Diff Mod (max speed, use vs. High Mode combat move), +8 Diff Mod (cruising, use vs. High Mode travel move), +6 Diff Mod (use vs. Safe NOE combat move), +8 Diff Mod (use vs. 2xSafe NOE combat move), +10 Diff Mod (use vs. 3xSafe NOE combat move)

40-TON PODS FOR VICTRIX-CLASS MULTIMISSION SLOOPS

Unlike many of the modules built for the modular cutters and clippers, the Victrix pods shown below have no provision for independent operation. Although they are built with internal frameworks, pods are not constructed with their own hull shells, and instead rely on the hull shell of the carrying ship. These shell-less pods must be fitted at a starport, and cannot be loaded in the field, as modules with hull shells can be.

Pod-equipped vessels use the same procedure for resolving excess damage as described for clipper modules on page 132.

Drop Capsule/Missile Launcher Pod

This pod contains facilities to launch up to 24 drop capsules or standard space combat missiles. Unlike the similar pod in the multimission scout, the Victrix pod contains no missile-capable MFD, as the Victrix already has two of its own. Another difference is that while the MM Scout pod uses a separate launch tube for each capsule, the Victrix pod has two automatic launchers. The advantage of the autolauncher is that it requires less space, as there is only one staging area per autolauncher rather than per tube, and it also requires less surface area. Disadvantages include its nominally lower rate of fire (one round every two seconds) and that there is no external life support for the drop troops once they are in their capsules. This means that the troops are on their internal oxygen while they wait for launch, which can create some sticky timing issues. Since it can take almost half an hour to load 12 troops into a 12-round autolauncher, the first troop loaded will be almost half finished with his on-board oxygen by the time all are ready to go. If the drop is planned for an ODHO (see page 14) profile, this may be a problem.

The pod also contains 5.5 small staterooms for the 22 troops, and cargo space for 36.67 m³ of their equipment (maximum of 36.67 tonnes). The mix of drop capsules carried is limited by a ceiling of 222.58 tonnes. Typical loadouts include: 16xMk I, 4xMk IIc, 2xMk IIb, 2xMk IIa; 14xMk I, 4xMk IIc, 3xMk IIb, 3xMk IIa; or 14xMk I, 2xMk IIc, 4xMk IIb, 4xMk IIa.

Volume: 560 m³

Mass: 250.42 tonnes unloaded, maximum loaded weight of 473 tonnes (maximum load of drop capsules is 24 totalling 222.58 tonnes, see pages 14-15 and use empty mass for Mk I and IIc, loaded mass for Mk IIa and IIb)

Price: MCr0.494

Crew: 0 (ship's MFD operator controls the pod).

Passengers: 22 (carried quadruple occupancy in 5.5xsmall staterooms)

Features: 2x12-round drop capsule/missile autolaunchers able to fire RC Mk I and II drop capsules or standard space combat missiles, quarters for 22 drop troops, cargo space for 36.67 tonnes/m³. Pod draws life support from the ship's main system, and requires 0.0055 MW power.

Maint: 13 (does not include maintenance required for each capsule, see pages 14-15).

DAMAGE TABLES

1D20	*Internal Explosion*	*Systems*
1-7	Autolauncher A	Autolauncher (each)-1H
8-14	Autolauncher B	SSR-(2h), ½ SSR-(1h)
15-19	Small stateroom	Roll randomly for individual capsule hit if
20	Cargo	autolauncher is loaded. Resolve hits against capsules within autolauncher as Mk I-(1h), Mk IIc-(1h) unloaded, -(2h) loaded, Mk IIb (2h), Mk IIa-(4h)

Troop Carrier Pod

This pod contains quarters for 48 troops (although up to 64 may be carried at an additional decline in comfort). The troop pod requires 0.008 MW of power from the carrying vessel, and additionally draws off of the ship's extended life support and artificial gravity, but at no further increase in power requirement. Cargo space is for battle dress, weapons and ammunition, and light vehicles such as broomsticks (page 11) or grav bikes (TNE, page 365).

Note that troops are not carried indefinitely in these conditions, as their efficiency will eventually be degraded by the lack of training and exercise spaces.

Volume: 560 m³

Mass: 51.95 tonnes empty, 162.62 tonnes loaded

Price: MCr0.68

Crew: None

Passengers: Accommodations for 48-64 troops in 16 small staterooms (0.0005 MW ea.) requires hot bunking (3-4 per room)

Features: 110.67 tonnes/m³ of cargo with one large cargo hatch

Maint: 8

DAMAGE TABLES

1D20	*Internal Explosions*	*Systems*
1-16	Small stateroom	SSR-(2h)
17-20	Cargo	

Vehicle Pod

This pod contains a minimal hangar for a vehicle of up to 15 tons (210 m³) and quarters for 15-20 troops. The hangar allows the craft to be maintained, and permits repair tasks to be conducted at +1 difficulty level. The pod requires 0.002 MW of power from the carrying vessel, and additionally draws off of the ship's extended life support and artificial gravity, but at no further increase in power requirement.

Stateroom capacity allows carriage of mixed infantry/vehicular unit.

Carried vehicle must mass less than 334.38 tonnes if Victrix is to maintain 4G performance. Mass above this level reduces Victrix to 2Gs while vehicle is being carried.

Volume: 560 m³

Mass: 113.95 tonnes empty, loaded mass varies with vehicle, recommended maximum loaded mass is 473 tonnes (334.38 tonne vehicle mass in addition to 26.67 tonnes cargo)

Price: MCr0.33

Crew: None.

Passengers: Accommodations for 12-16 troops in 4 small staterooms (0.0005 MW ea.) requires hot bunking (3-4 per room)

Features: Minimal hangar with launch doors for 15-ton vehicle, 26.67 tonnes/m³ of cargo with small cargo hatch

Maint: 7

DAMAGE TABLE

Crew Accommodations: 2×Large Staterooms (0.001 MW ea.), double occupancy
Passenger Accommodations: None
Cargo: 3.1 m^3 plus 20-ton multimission pod
Small Craft and Launch Facilities: None
Air Locks: 1

Notes

These are standard TL-15 relic scout/couriers which have been modified by the Aubani Navy to serve as small multimission special operations vessels, and are normally seconded to the RCES. These Scouts (MM) have had their cargo, hangar, and some accommodations spaces gutted, and the remainder of their internal systems rearranged to allow for a single 20-ton bay to be fitted along the ventral surface. The Scout (MM) has also been fitted with a TL-12 area barrage jammer with a 15,000 km range. This allows effective planetary surface jamming from orbit. The ship's systems draw a total of 156.082 MW, 9.082 MW more than its power plant provides. This means that its active EMS sensor may not be operated while its jammer and laser turret or firing, that it can only use 1G of maneuver while all other systems operate, or some other trade-off.

The ventral 20-ton bay accepts one of several 20-ton pods allowing the ships to be rapidly converted from one mission to another, as shown on the facing page.

These pods may be ejected at the end of the mission (although this is not advisable for any but the planetary strike pod, due to their expense). However, they cannot operate independently, as they have no outer hulls, but merely fit into the scout's modular bay. When the pod is ejected, the scout can close its bay doors and pressurize the now completely open 280 m^3 area. Hits in this area when it is empty must be re-rolled as additional internal damage. Damage indicated on the damage table below as "pod" are rolled on the pod damage tables on the facing page.

The prices, maintenance requirements, and loaded and empty masses listed above are for the scout without the pod. Add the pod figures from the facing page to these figures to get the final values.

TL-15 Fuel purification machinery (1.05 MW), 20.28 hours to refine 710 m^3 (50.7 tons).

20-TON PODS FOR MULTIMISSION SCOUTS

There are only a limited number of 20-ton pods in existence, as the more capable Victrix ships (pages 138-139) are supplanting the MM scouts in the RCES' reconfigurable multimission role.

Unlike many of the modules built for the modular cutters and clippers, the scout modules have no provision for independent operation. Although they are built with internal frameworks, they are not constructed with their own hull shells, and instead rely on the hull shell of the scout. These hull shell-less modules must be installed at a starport, and cannot be removed, swapped, and replaced in the field as can modules with their own external hulls. For this reason, these hull-less modules are usually called "pods" to distinguish them from the more common hulled modules.

Pod-equipped vessels use the same procedure for resolving excess damage as described for clipper modules on page 132.

Drop Capsule/Missile Launcher Pod

This pod contains 15 launch tubes capable of launching standard 7-kiloliter space combat missiles or drop capsules, and a 300,000-km range missile-capable MFD. This MFD allows the launcher to fire space combat missiles, and also allows the scout (MM)'s gunner to operate the drop capsule launcher and ship's laser turret from this single location, eliminating the need to add an additional crewmember to the already cramped scout to operate this pod. Each of the 15 launchers includes a small staging area which allows the capsule occupants to enter and exit their drop capsule while they are loaded into their launch tube, and also provides external basic life support for capsule occupants before they are launched (meaning that the one-hour air supply fitted to the battle dress suit is not consumed while the trooper is in the tube waiting to be launched—this is crucial when conducting ODHO drops, see page 14). The pod requires 3.1 MW of power, raising the ship's shortfall to 12.182 MW, which can also be made up by shutting down the active EMS.

The pod does not contain quarters for the up to 15 drop troops, so they are only carried for a period of several hours before they board their capsules.

Volume: 280 m³
Mass: 149.65 tonnes unloaded, 254.65 tonnes loaded (assuming a mass of 7 tonnes per missile/drop capsule), maximum loaded weight of 431.95 tonnes (assuming load-out of all Mk IIa drop capsules, see pages 14-15)
Price: MCr25.71
Crew: 1 (scout gunner may be used for this position)
Passengers: None (carries up to 15 drop troops for short periods)
Features: 15 launch tubes able to fire RC Mk I and II drop capsules or standard space combat missiles, 1×TL-12 missile-capable MFD (4 Diff Mod; Msl 10 hexes; 10 hexes; 3.1 MW; 1 crew)
Maint: 8

DAMAGE TABLE

1-15	Launch Tube	Launch Tube-1h (unloaded), -3h (loaded Mk I, IIb, IIc), -1H (loaded Mk IIa)
16-17	MFD	MFD-1H
18-20	Reroll	Note: Launch Tube hit means 1 crew casualty if occupied

Planetary Strike Pod

The planetary strike (the term planetary bombardment is frowned upon within the RCES, as it smacks of the indiscriminate atrocities practiced during the Final War; strike implies pinpoint precision, and a commitment to limiting collateral damage and incidental casualties) pod contains launch rails for the Spruce, Fir, and Pine families of 30cm planetary strike missiles (page 109). In addition, it contains a workstation for the missile launch officer, which includes launch control units for homing and target seeker missiles, plus a 6000-km laser illuminator which can be used for target designation or beam-riding control.

The planetary strike pod requires 0.04 MW from the scout, and also draws off of its life support systems, but at no further power cost. These pods may not be reloaded in the field without special equipment, and are sometimes discarded after being emptied. Most of the maintenance time listed below consists of running automated diagnostic and troubleshooting programs on the sophisticated carried missiles.

The bay is constructed so that hits which destroy missiles do not cause internal explosions in the scout; but are vented into space.

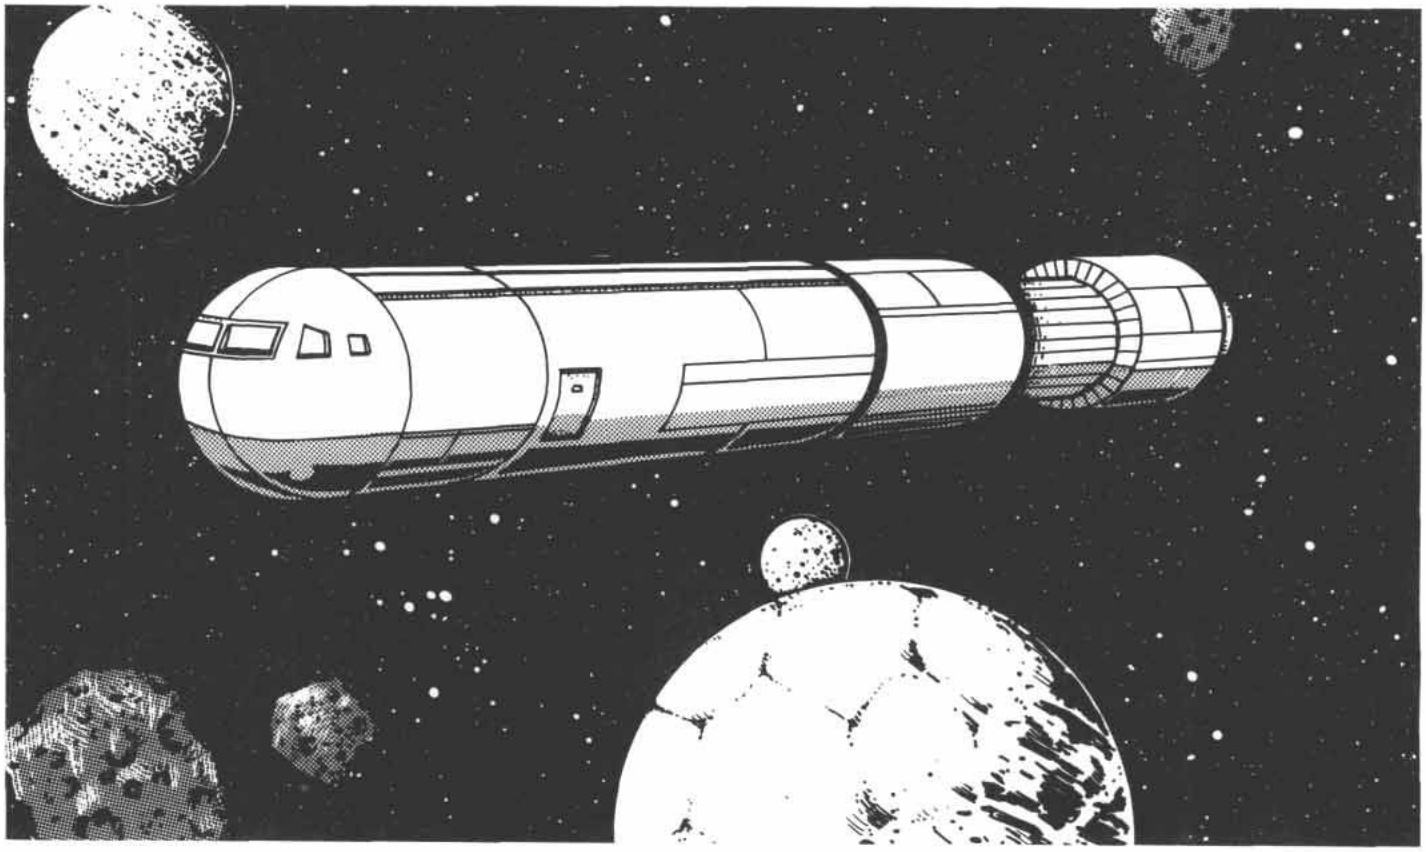
Volume: 280 m³
Mass: 279.62 tonnes empty, 551.62 tonnes loaded
Price: MCr13.64, not including missile price (see page 109)
Crew: 1
Passengers: None
Features: Launch rails for 68 Spruce/Fir/Pine 30cm missiles
Maint: 28

DAMAGE TABLE

1D20	*Internal Explosion*	*Systems*
1-19	Missile rail	Gunner's Station-(1h)
20	Gunner's station	Missile rail: *

*1 minor hit per empty rail, 2 minor hits per loaded rail. In addition, each minor hit destroys 1D6 additional missiles in the pod.

Command Pod



This pod meets the need for mobile command and control capabilities, and is the approximate equivalent of a flag bridge on a larger starship. Its integral power plant produces 20 MW, which is 8.3975 MW in excess of the pod's needs (the pod requires 11.6025 MW). This additional power is provided to the scout, which almost entirely makes up for the scout's power shortfall. The command pod does draw off of the scout's extended life support and artificial gravity, but at no increase in power requirement.

Volume: 280 m³
Mass: 61.6 tonnes empty, 67.7 tonnes loaded
Price: MCr5.8789
Crew: 8
Passengers: Accommodations for its 8 crew in 5 small staterooms (0.0005 MW ea.) requires double occupancy in three of the staterooms
Features: Flag bridge with 8×bridge workstations, 2×TL-12 300,000-km radios (only one powered, 10 hexes, 10 MW), 2×TL-12 1000 AU Maser communicators (∞, 0.6 MW ea), 1×TL-12 Mod St computer, TL-12 fusion power plant generating 20 MW (20 MW/hit, 8.3975 MW excess) with fuel for one year duration, 6.1 tonnes cargo, 3 m³ fuel (0.2 tons)

Modular Cutter

General Data

Displacement: 50 tons
Length: 33 meters
Price: MCr18.98 (cutter alone)
Configuration: Needle SL
Mass (Loaded/Empty): 353.82/340.72 cutter alone
727.45/684.96 with fuel module
Hull Armor: 30
Volume: 700 m³
Target Size: VS
Tech Level: 12

Engineering Data

Power Plant: 100 MW Fusion Power Plant (50 MW/hit), 1 year duration (10.9196 MW excess power used to power modules)
G-Rating: 3 (25 MW/G), Contra-Grav lifters (5 MW)
G-Turns: 48, 3.125 m³ of fuel each
Maint: 13, +13 for fuel module

Electronics

Computer: 2×TL-12 Model St (0.4 MW ea.)
Commo: 30,000km radio (1 hex; 1 MW), 1000 AU maser (∞; 0.6 MW)
Avionics: TL-10+ Avionics
Sensors: Passive EMS fixed array 30,000 km (1 hex; 0.03 MW), Active EMS 300 km (0 hexes; use extreme range for task difficulty in same hex; 5 MW)
Controls: Flight deck with 2×workstation, plus 1 other workstation

Accommodations

Life Support: Basic (0.0294 MW), Gravitic Compensators (3G; 1.47 MW)
Crew: 3 (1×Engineering, 1×Electronics, 1×Maneuver)
Crew Accommodations: Flight Deck
Passenger Accommodations: Varies depending upon module fitted.
Cargo: Varies depending upon module fitted (388 m³ in cargo module), 2.6 m³ in cutter
Air Locks: 1

Notes

Modular Cutter may be fitted with a variety of 29-ton (406 m³) modules, including lab module (336.3 tonnes loaded/284.4 empty, MCr14.12), passenger/cargo module (311.59 tonnes loaded/133.59 empty, MCr0.4, carries 30 passengers and 178 m³ cargo—passenger seats, 7 m³ each, can be traded for cargo or for smaller seats, but if cargo mass exceeds 284 tonnes, cutter G-rating will drop to 1G), ATV module (211.84 tonnes loaded/161.84 empty, MCr0.16, includes space for a single ATV of up to 50 tonnes).

Data assumes the fitting of a fuel scoop module (373.63 tonnes loaded/344.24 empty, MCr0.17). The module can scoop and carry 277 m³ (19.8 tons) of fuel and has fuel purification machinery sufficient to refine 277 m³ in 6 hours.

DAMAGE TABLES

Area (1D20)	*Surface Hits*	*Internal Explosion*	*Systems*
1	1-2: Ant	1-10 Elec (C), 11-20 Qtrs (C)	PP-2H
2-3	1-2: AL	1-5 Qtrs (C), 6-10: Elec, 11-15: Hold (C), 16-20: Module	AG-(2h) LS-1H

16-19		1-5: Module, 6-20: Hold (C)	

(C) = Cutter Component, Module = Module Component (see module damage table).

CUTTER MODULES

The 50-ton modular cutter is one of the workhorses of the Coalition's fleet of small craft, largely due to the versatility and flexibility that the various modules created for it.

STANDARD MODULES

These modules are designed to operate with the cutter as an integrated unit, and many of them are dependent on the cutter for some or all of their power (for other modules, see Station Modules, below). The cutter has 10.9196 MW to cover module power needs, more than enough for those listed.

ATV Module

This module was designed to carry one wheeled or tracked ATV (up to 50 tonnes) from space to a planetary surface. The module has no artificial gravity, and any passengers or cargo in the ATV must be securely strapped down (which is why passengers are seldom carried inside ATVs transported in this fashion). The ATV requires no power from the cutter.

Volume: 406 m³
Mass: 211.84 tonnes (loaded), 161.84 (empty)
Price: MCr0.16
Crew: None.
Passengers: None (normally)
Features: ATV "hangar"

DAMAGE TABLES

1D20	*Surface Hits*	*Internal Explosions*	*Systems*
1-10	LCH	ATV "Hangar"	ATV "Hangar"-1H
11-20	LCH	ATV	

Fuel Module

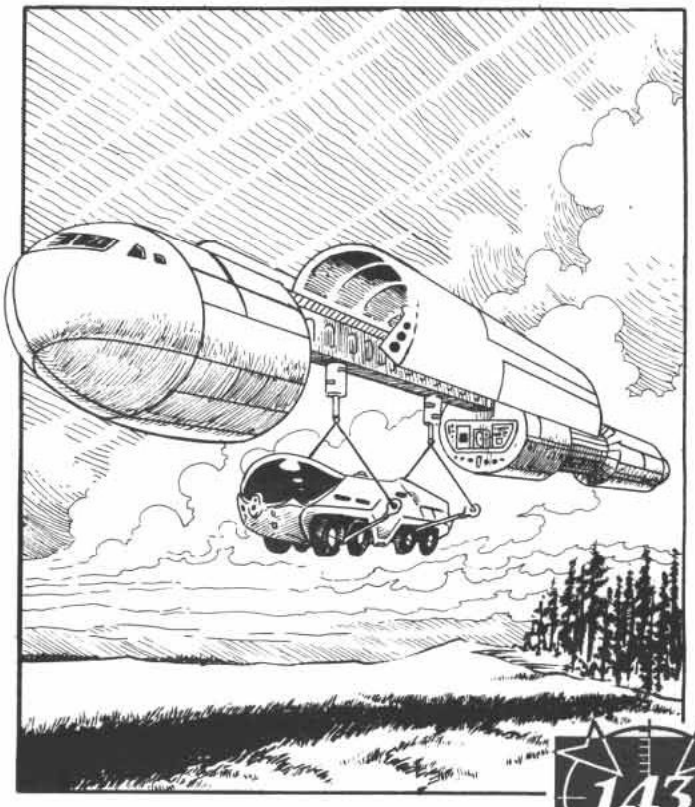
This is the standard fuel-skimming module and one of the most common modules for the 50-ton modular cutter. It contains a fuel processing plant capable of refining 277 m³ (19.8 tonnes) in 6 hours, and requires external power (1.662 MW) to operate, and carries 10 m³ of ordinary cargo in addition to 277 m³ of fuel. It is not fitted with artificial gravity or life support.

Volume: 406 m³
Mass: 373.63 tonnes (loaded), 344.24 (empty)
Price: MCr0.17
Crew: None (fuel processing plant controlled from cutter flight deck)
Passengers: None.
Features: Fuel processing plant, fuel scoop, 277 m³ LHyd fuel, 10 m³ ordinary cargo.

DAMAGE TABLES

1D20	*Surface Hits*	*Internal Explosions*	*Systems*
1		Cargo (non-fuel)	FPP-3H
2-7		Fuel Processing Plant	
8-20		Fuel (LHyd)	

Laser Gunpack (TL-11)



This module allows a cutter to be converted into an offensive weapon. With this module fitted, the cutter is reduced to 1G acceleration, but the gunpack contains an additional 30 m³ of reaction mass to extend the cutter's range (1.6 additional G-hours). The excess power from the cutter (46.27 MW at only 1G) plus the gunpack's onboard power can be used to overpower both laser barbettes to –1 Diff Mod.

Volume: 406 m³
Mass: 439.2 tonnes (loaded), 427.97 (empty)
Price: MCr58.4
Crew: 4 (2xgunners, 1xelectronics, 1xMFD)
Passengers: None.
Features: Artificial gravity/G-Compensators, basic life support, 5.1 MW MHD turbine, turbine fuel (12 hours), 160.6 m³ reaction mass, 300,000 km Beam MFD (4 Diff Mod; non-Msl; 10 hexes; 2.95 MW, 1 Crew), 180,000-km ladar, 2xnormal workstations, 2xTL-11 150-Mj laser barbettes.

Passenger/Cargo Module

Passenger seats can be removed for additional cargo space (7 m³ ea.) if needed, although if total loaded module tonnage exceeds 284, the cutter's acceleration is reduced to 1G. In military service, roomy seats are replaced with adequate, and passenger capacity is doubled to 60. The passenger/cargo module requires 2.0716 MW from the cutter.

Volume: 406 m³
Mass: 311.59 tonnes (loaded), 133.59 (empty)
Price: MCr0.4
Crew: None.
Passengers: 30 in roomy seats (60 if adequate seats are fitted)
Features: Artificial gravity/G-compensators, basic life support, 178 m³ cargo, large cargo hatch

* If passenger seats are carried, these hits are passenger hits; if cargo, these hits are cargo hits.

Survey Module

This module, in combination with a modular cutter, becomes an exploration and survey vessel. The AEMS and radio are designed to survey a world from near orbit, and the analysis lab is capable of performing preliminary chemical tests on soil, atmosphere, and mineral samples. The staterooms and the large cargo bay enable the module to carry supplies for an extended mission, and the neutrino sensor is for stellar surveys. The survey module carries its own power plant, which generates 12.7568 MW surplus to the module's own needs.

Volume: 406 m³
Mass: 354.06 tonnes (loaded), 270.06 (empty)
Price: MCr26.8
Crew: 7 (3xcutter crew, 3xscientist/lab technician, 1xelectronics)
Passengers: 4xsmall staterooms provided for the crew (including cutter crew)
Features: Extended life support, artificial gravity/G-compensators, laboratory, 20 MW TL-12 fusion power plant (with fuel for 1 year), TL-12 model ST computer. 3000-km radio, 1000 AU maser communicator, 2xnormal workstations, TL-12 densitometer, TL-12 neutrino sensor, TL-12 3000-km AEMS.

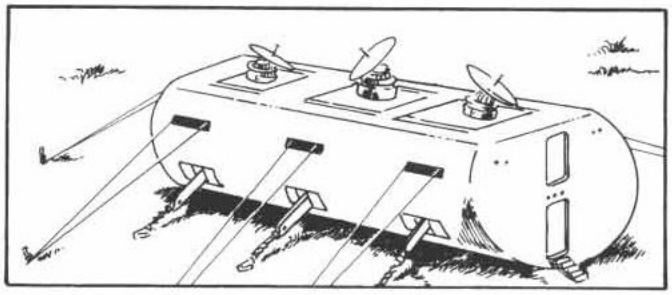
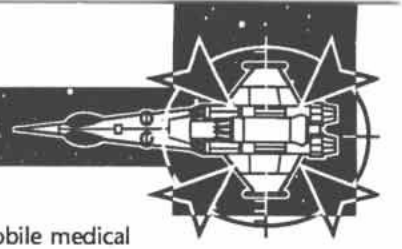
STATION MODULES

While most of the modules are designed to be used while linked to the cutter, a fairly large number are designed to operate independently (and are merely carried to their final destination by the cutter). Station modules are intended to serve as part of a prefabricated base installation on a planetary surface, in planetary orbit, or in deep space, independent of the cutter. Station modules usually have self-erecting legs or other support structures which can be adjusted to allow for irregularities in the surface.

Stations can be configured to suit almost any purpose by careful selection of the station's constituent modules. Stations normally incorporate several habitation and storage modules (to shelter personnel and supplies), along with a number of more specialized modules such as portable laboratories, communications centers, medical facilities, and so on. Some modules are unpowered, and must be deployed in conjunction with others which can make up the energy deficit. Orbital and deep space stations usually incorporate additional structures such to link them together, and ground stations in hostile environment conditions do the same.



Communications/Command Module (Station)



This module was intended for use as a communications center for a ground, orbital, or deep space installation, or as a command and control center for small military operations. Quarters for up to 12 personnel are provided, and the module is self-powered (5.6558 MW surplus power). For military operations, additional staff personnel are assigned to assist in planning and administration.

Volume: 406 m³
Mass: 297.758 tonnes (loaded), 205.958 (empty)
Price: MCr8.3
Crew: 3-7 (2xelectronics, 1xcommand, up to 4xmilitary staff)
Passengers: 6xsmall staterooms
Features: 20 MW TL-12 fusion power plant (with fuel for one year), 6xsmall staterooms, 105.8 m³ storage and supplies, 300,000-km radio, 2x3000-km radios, 2x1000 AU maser communicators, 7xbridge workstations, (2xcommo, 5xfor command/staff personnel), 2xTL-12 model St computers

Lab Module (Station)

This module is a portable laboratory for use as part of a ground, orbital, or deep space station. Outside power is not required (15.257 MW surplus power), and quarters for the crew of four are provided.

Volume: 406 m³
Mass: 359.454 tonnes (loaded), 280.454 (empty)
Price: MCr14.2
Crew: 4 (3xscientists/lab technicians, 1xelectronics) in 2xsmall staterooms (double occupancy)
Passengers: None.
Features: 20 MW TL-12 fusion power plant (with fuel for one year), artificial gravity/G-compensators, extended life support, 2xlaboratories, 79 m³ storage and supplies, 1000 AU maser communicator, 1xnormal workstation, TL-12 model St computer.

Medical Module (Station)

This module serves as a small mobile medical center for a ground, orbital, or deep space station. Quarters for two medical personnel are provided, as well as 3 small patient staterooms. No outside power is required (15.257 MW surplus power).

Volume: 406 m³
Mass: 314.156 tonnes (loaded), 284.056 (empty)
Price: MCr14.1
Crew: 2 medical
Passengers: Up to 6 patients in 3xsmall staterooms
Features: Extended life support, artificial gravity/G-compensators, 2xsickbays, 20 MW TL-12 fusion power plant (with fuel for one year), 3000-km radio, TL-12 model St computer.

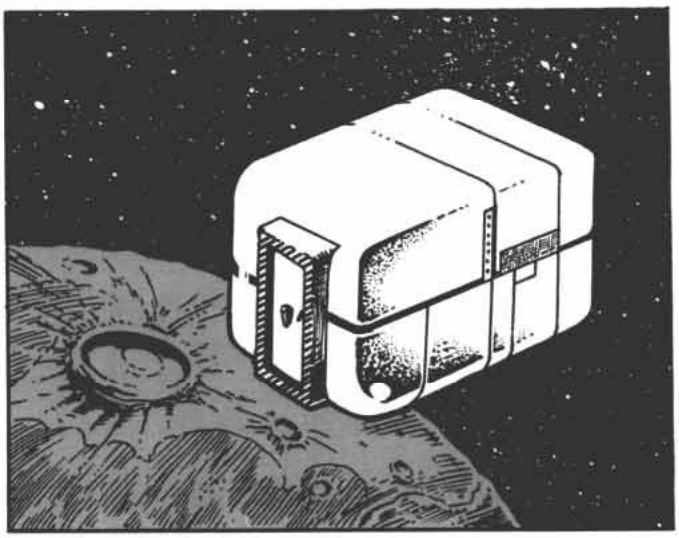
3-Ton Socket Liferaft



Liferafts have no maneuver drives; lifeboats do. Liferafts are built with simple, proven, reliable systems so that they can go without maintenance for years at a time, and do not roll for potential breakdowns. Liferafts are usually given a complete overhaul every five years (a process requiring one week in a class A or B starport and which costs 10% of their purchase price).

Lifeboats are subject to the normal maintenance and breakdown rules, except when they are acting as liferafts (floating without using their drives, with all passengers in low berths).

When abandoning ship in hostile territory, the flight computer can be set to activate the beacon only in response to friendly ID codes.

3-Ton Socket Liferaft

5-Ton Liferaft

General Data

Displacement: 3 tons
Length: 5.75 meters
Price: MCr0.425
Configuration: Box USL
Mass (Loaded/Empty): 18.65/16.68
Hull Armor: 10
Volume: 42 m^3
Target Size: Mc
Tech Level: 12

Engineering Data

Power Plant: 1 MW TL-12 rechargeable battery, 5 hours duration, 0.042 MW Solar Array.
Jump Performance: None.
G-Rating: None.
G-Turns: None.
Maint: 0

Electronics

Computer: 1×TL-12 Mod Flt Computer (0.04 MW)
Commo: 30,000-km Radio (1 hex; 1MW)
Avionics: None.
Sensors: None.
ECM/ECCM: None.
Controls: None.

Armament

Offensive: None.

Accommodations

Life Support: 1×emergency low berth (0.002 MW)
Crew: None.
Crew Accommodations: None.
Passenger Accommodations: 4 in emergency low berth
Cargo: 1.96 m^3
Small Craft and Launch Facilities: None.
Air Locks: None; hatch provides access to interior.

Note

The 3-ton liferaft is designed to fit in a standard 3-ton, 42-kl turret socket. It has a small solid fuel thruster to kick it free of the socket, and a similar thruster to cancel that thrust a short time, giving it the vector of the original ship when released, but paralleling it a short distance away. The 3-ton liferaft carries four passengers in an emergency low berth (no life support, G-compensation, or artificial gravity), a small computer, and a 30,000-km radio beacon to facilitate location of the raft by rescuers. Liferafts have no propulsion, and drift in space until picked up, the flight computer monitoring the radio receiver for a coded signal to activate the beacon.

The liferaft carries a 1 MW battery and a 0.042 MW solar array. This array can power the computer and the low berths in the habitable zone. Outside the habitable zone, the computer shuts down and the solar array powers the low berths and trickle charges the battery. The battery can power the beacon for 5 hours, then it must wait until enough power builds up before it can do so again.

The liferaft has no air lock, so its hatch must be mated to a standard air lock or the whole thing taken into a cargo hold to disembark its passengers. Rescuers can board the craft without harming the passengers, so long as they don't open the low berth.

Accommodations

Life Support: 2×emergency low berths (0.002 MW ea.)
Crew: None.
Crew Accommodations: None.
Passenger Accommodations: 8 in emergency low berths
Cargo: None.
Small Craft and Launch Facilities: None.
Air Locks: None; hatch provides access to interior.

Notes

Like the 3-ton socket liferaft, the 5-ton liferaft has no propulsion, just a small charge to kick it free of the spacecraft and a counteracting thrust a few moments later. Liferafts have no propulsion, and drift in space until picked up, following the same vector as their parent ship. The 5-ton liferaft carries eight passengers in two emergency low berths (no life support, G-compensation, or artificial gravity), a small computer, and a 1000 AU radio beacon to facilitate location of the raft by rescuers.

The raft's power plant operates at a low level, providing just enough power to operate the low berths and the computer. The computer monitors the radio receiver (receiving takes negligible energy), and awaits a signal from a rescue ship. Upon receipt of this signal, the computer brings the power plant to full level, and activates the beacon. The beacon broadcasts for one hour at 20 MW, then shuts down and activates the computer, which continues to monitor the radio. While the radio is being operated, the low berth and the flight computer are powered by the battery, which is then recharged after the radio beacon shuts down.

The 5-ton liferaft's antenna is a special one-time inflatable array, and cannot be readily folded up after it has been deployed. The antenna is deployed after the raft has stabilized its vector (after the second thruster has cancelled the ejection thrust).

RCES vessels have encountered liferafts with living passengers dating from the pre-Collapse period, having spent more than 70 years in low berths.

Cargo: 0.882 m^3
Small Craft and Launch Facilities: None.
Air Locks: 1

Notes

This vessel is a lifeboat modified from the hull of the 10-ton launch. The vessel contains no G compensators, no artificial gravity, and no life support, and is not intended for any use other than as a lifeboat. The workstation provided is for use should the situation demand a landing, the on-board computers are programmed to carry out a series of standard maneuvers, primarily designed to put the vessel in a stable orbit and broadcast distress signals. The cargo space consists of a rescue equipment locker designed to serve the 12 potential passengers likely to be aboard.

Wildbat Fighter/Foxbat Pathfinder

General Data

Displacement: 16 tons
Length: 15.2 meters
Price: MCr15.5

Controls: Cockpit with 1×normal workstation

Armament

Offensive: 1×TL-12 120-Mj laser turret, (Loc: 1, Arcs: 1,2; 3.3 MW, crew = pilot), fuselage hardpoint (plumbed), max capacity 24,618 kg.

	Short	*Medium*	*Long*	*Extreme*
TL-12 120-Mj Laser	4:1/9-27	8:1/9-27	16:1/6-19	32:1/3-9

Accommodations

Life Support: Basic (0.0014 MW, crew workstations and cargo only), Gravitic Compensators (3G, 0.07 MW, crew workstations and cargo only).
Crew: 1×pilot/gunner plus optional crewmember in turret.
Crew Accommodations: 1×cockpit workstation, plus workstation in turret.
Passenger Accommodations: None.
Cargo: 0.1 m³
Small Craft and Launch Facilities: None.
Air Locks: None; hatch provides access to crew compartment.

Notes

Wildbats are capable of refueling while in flight, either from other Wildbats, or from other vessels (a tanker has been specially designed for this purpose).

Basic life support and AG compensation provided only for the crew compartment workstation and the turret workstation, although the turret workstation is normally occupied only when the socket sensor pod is fitted. Wildbat pilots normally wear vac suits, and most bring personal reentry kits and other equipment (stowed in the cargo cabinet adjacent to the cockpit). No additional provision is made for personal equipment for the second crewmember, and they must split the space available with the pilot.

When equipped with the turret sensor package (noted in the "Socket Sensor Package" sidebar at left) instead of a laser turret, this craft is known as the Foxbat Pathfinder.

The fuselage hardpoint is provided for use in tactical support missions to a planetary surface. If loaded to more than 820 kg, this will reduce the craft to 1G acceleration unless fuel tonnage is likewise reduced, with appropriate deductions from the fighter's operating time. For example, the Wildbat could carry 2000 kg on the fuselage hardpoint without a G penalty by reducing its total fuel by 1180 kg (16.86 m³), a loss of 17 G-turns.

Other Turret Sockets

Because the Wildbat only provides 3.3 MW to the turret socket, socket lasers that normally draw greater power than this have their performance reduced when fitted to the Wildbat. Wildbat performance is shown below. Note that some lasers are limited to less than this by their focal arrays and leave part of the 3.3 MW power supply unused. The Mj listed under *Description* is the power for which the lasers are designed, however all socket lasers installed in the Wildbat function at no higher than 120-Mj. The value given under *MW* below shows the true power value at which they operate when installed in the Wildbat.

Note that the TL-13 150-Mj turret will cause the Wildbat to become overloaded, and reduce its acceleration to 1G.

TL	*Description*	*MW*	*MCr*	*Mass*	*Short*	*Medium*	*Long*	*Extreme*
10	60-Mj laser turret	1.7	1.56	55	1:1/6-19	2:1/6-19	4:1/3-9	8:1/2-5

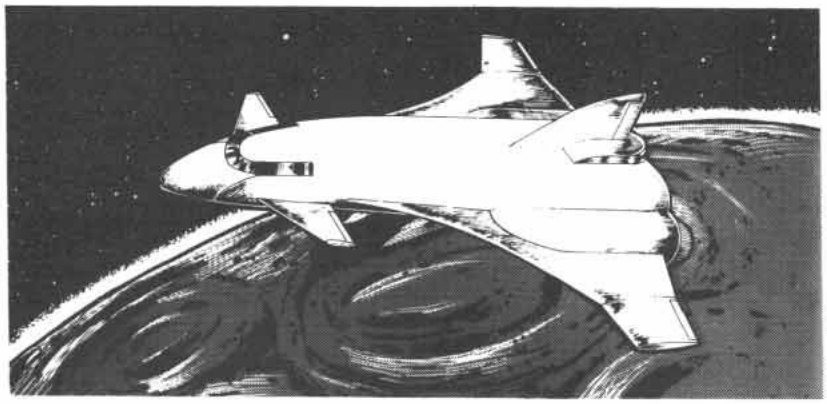
14	150-Mj laser turret	3.3	0.72	63	2:1/9-27	4:1/9-27	8:1/9-27	16:1/9-27
15	150-Mj laser turret	3.3	0.86	57	10:1/9-27	20:1/9-27	40:1/9-27	80:1/9-27

Socket Sensor Package

The socket sensor package was designed to fit into a standard 3-ton socket, and provide ships with an improved sensor without overburdening their power-generation capabilities. Sensor packages such as this are used in Foxbat Pathfinders and are occasionally loaned to merchant vessels operating in cooperation with the RCES, RCN, or planetary governments.

The package combines both active and passive EMS antenna arrays, to conserve surface area, and contains a 240,000-km active EMS unit, a 60,000-km TL-12 passive EMS unit, a 24 MW fusion power plant with 1 year of fuel, and a workstation for the electronics technician. Because they share an antenna, only one EMS unit can be used at a time. This module, although it fits in a standard 3-ton socket, requires 20 m² of surface area because of the diameter of the PEMS antenna.



Sensors: Passive EMS 60,000 km (2 hexes, 0.06 MW), Active EMS 240,000 km (8 hexes, 24 MW).
TL: 12; **Mass:** 59.352 tonnes; **Volume:** 42 kl; **Price:** MCr13.3

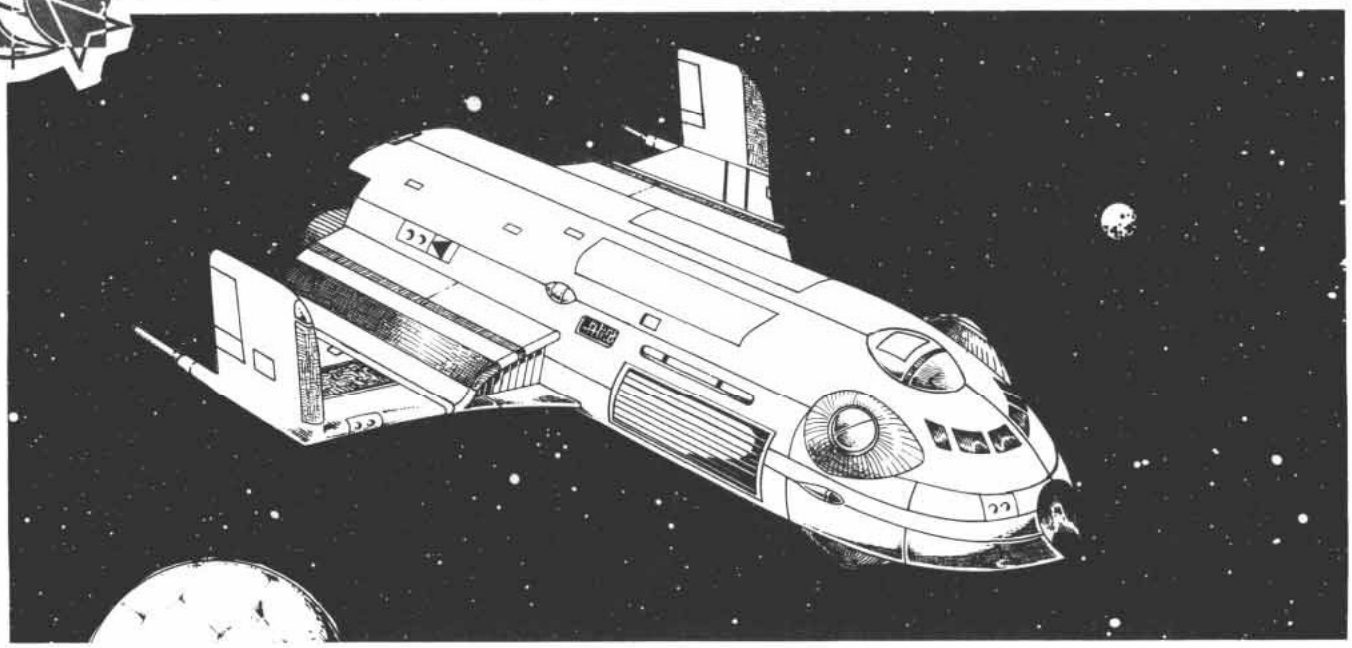
* When the seats are installed and passengers are carried, this location counts as Passengers for hits. When the seats are removed and cargo is carried, this location counts as Cargo.

Accommodations

Life Support: Basic (0.007 MW), Gravitic Compensators (0.35 MW).
Crew: 1×Pilot/commander, 1×Electronics Tech, 1×Crew Chief/Gunner.
Crew Accommodations: 2×normal workstations (pilot and electronics crewman), 1×open crewstation (crew chief/gunner)
Passenger Accommodations: 14×adequate seats (removable to create cargo space)
Cargo: 3.5 m^3 per seat removed.
Small Craft and Launch Facilities: None.
Air Locks: 1

Notes

This craft (also called the 7-ton assault lander) was designed to carry up to 14 fully equipped soldiers (or equivalent cargo) to/from a planetary surface, and provide fire support for them during landing and retrieval. Troops debark through cargo hatch in the rear directly from passenger compartment. All 14 passengers can embark/debark in 2-3 turns (10-15 seconds), even when wearing heavy battle dress.



Because this craft only makes short trips between planetary orbit and the planet's surface, it is equipped with flight computers instead of fully capable models. No AEMS system is installed.

The crew chief fires the remote 5mm rotary gun (equipped with a TL-10 EMS RF) from a crewstation inside the flight deck. The ordnance carried on the fuselage hardpoints is fired/dropped from the pilot or electronics position.

The three fuselage hardpoints are capable of carrying a total of 21,111 kg (combined ordnance and racks). Fuel pods to extend range may be added only to the center hardpoint (the only plumbed hardpoint 7037-kg capacity). Ordnance racks, ECM/ECCM pods, or other specialty pods may be hung from all three.

Life support is provided only to occupied spaces, thus no maintenance may be conducted while the craft is being operated.

Mary Ellen Carter Armed Merchant

General Data

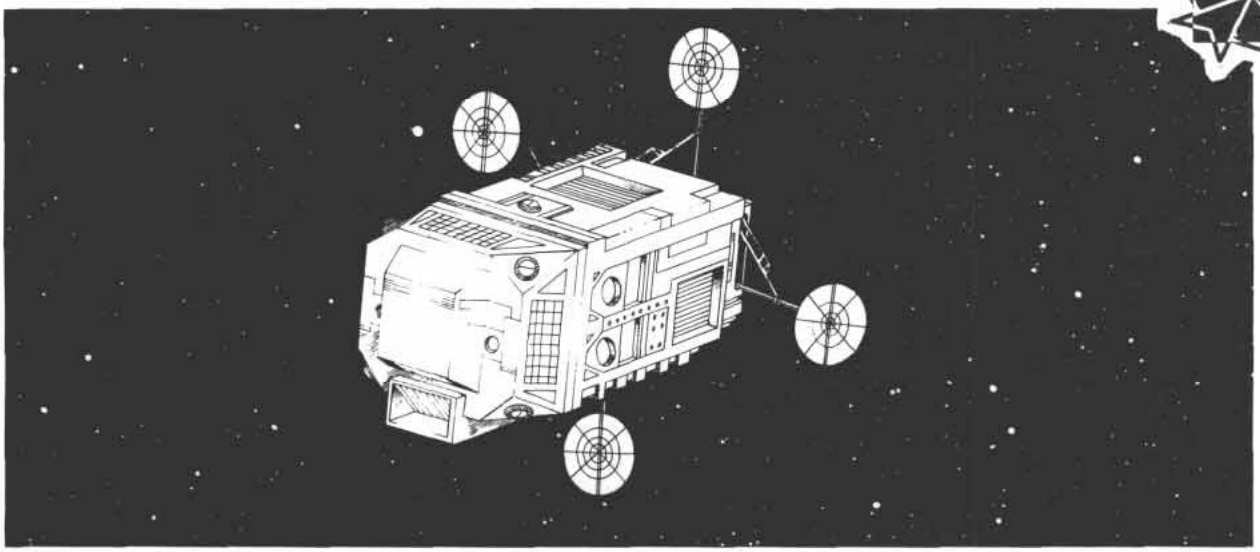
Air Locks: 4

Notes

Mary Ellen Carter is one of many pre-existing starships that have been modified to perform new missions in the New Era. She was originally a standard subsidized merchant ("Fat Trader") given increased performance, sensors, and armament. The ship itself displaces 400 tons with an internal small craft, unlike the original which carried an external craft.

Mary Ellen Carter is the sole survivor of three such Fat Traders modified to serve the Dawn League as "exploration cruisers" in the period following the loss of the 12 original trading scouts. Like the scouts, the exploration cruisers where hasty conversions made from ships that were on hand, but this time the emphasis was on armament and survivability. As two of this type, *Lady Elise* and *Taylor the Bruce*, have already been lost or listed as missing, this type has fallen into disfavor. No further ships of this type are planned.



Fuel purification machinery (12.36 MW), 6.82 hours to refine 2340 m³.

Hiver Transport

General Data

Displacement: 1000 tons
Length: 37.5 meters
Price: MCr318.92
Configuration: Box SL
Mass (Loaded/Empty): 9971.00/4640.10
Hull Armor: 31
Volume: 14,000 m³
Target Size: M
Tech Level: 14

Engineering Data

Power Plant: 756 MW TL-14 Fusion Power Plant (95 MW/hit), 1 year duration (1.205 MW excess power)
Jump Performance: 2 (2100 m³ for Jump-2, 1050 m³ for Jump-1)
G-Rating: 1G (500 MW/G), Contra-Grav lifters (100 MW)
G-Turns: 44 (77.6 using jump fuel), 62.5 m³ fuel each
Fuel Tankage: 4850 m³ (346.4 tons), plus 75.6 m³ (5.4 tons) reserved for power plant
Maint: 353

Electronics

Computer: 2×TL-14 Mod Fb Computers (0.5 MW ea.)
Commo: TL-14 300,000-km radio (10 hexes, 10 MW), TL-14 1000 AU maser (∞; 0.6 MW)
Avionics: TL-10+ Avionics
Sensors: TL-14 Passive EMS folding array 150,000-km (5 hexes; 0.15 MW), TL-14 Active EMS 60,000-km (2 hexes; 7 MW)
ECM/ECCM: EM masking package (14 MW)
Controls: Bridge with 7×bridge workstations, plus 6 other workstations

Armament

Offensive: 4×TL-14 300-Mj Laser Barbettes (Loc: 2,3,4,5; Arcs: 1,2,3; 8.3 MW ea.; 1 Crew ea.)

	Short	*Medium*	*Long*	*Extreme*
300-Mj Laser Barbette	10: 1/14-43	20: 1/14-43	40: 1/8-26	80: 1/4-13

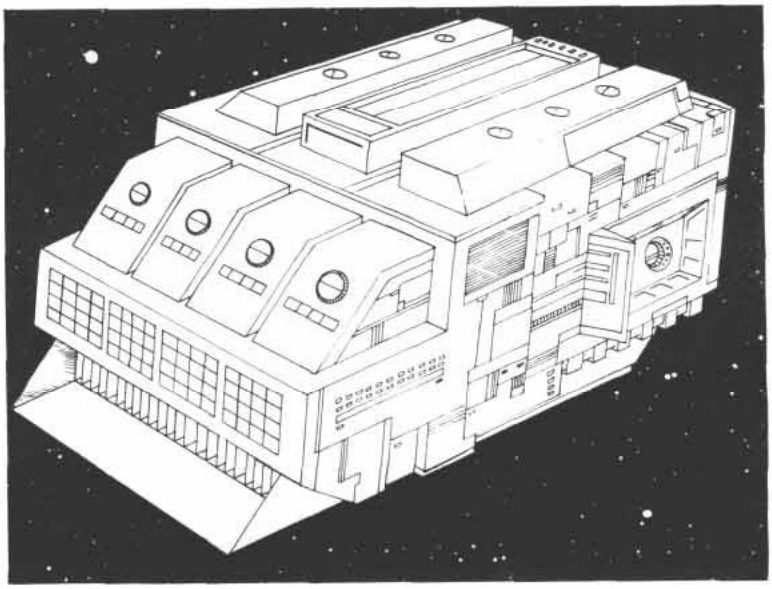
Defensive: 1×TL-14 Nuclear Damper Barbette (Loc: 10; +1 Diff Mod per CV+4; 6 MW; 1 crew)
Master Fire Directors: 1×TL-14 Beam MFD (5 Diff Mods; No Msl; 10 hexes; 1.92 MW; 1 Crew)

Accommodations

Life Support: Extended (2.8 MW), Grav Compensators (5G; 70 MW)
Crew: 23 (2×Maneuver, 1×Electronics, 6×Gunnery, 6×Engineering, 1×Maintenance, 3×Command, 3×Flight Crew, 1×Medic)
Crew Accommodations: 23×small staterooms (0.0005 MW ea.), single-occupancy
Passenger Accommodations: 7×small staterooms (0.0005 MW ea.), single-occupancy
Cargo: 4180 m³ with 12 large cargo hatches
Small Craft and Launch Facilities: Docking ring and launch port for 100-ton shuttle
Air Locks: 10

Notes

The Hiver transport is the most commonly seen Hiver vessel in Coalition Space, as it is these vessels that constitute the bulk of the Hiver technical assistance convoys that provide high-technology goods (such as TL-13 laser focal arrays and chemical laser cartridges, gauss receivers, batteries, etc.) to the fledgling industries of the Coalition. Rare Hiver transports will actually venture into the Wilds to spinward of the RC borders, but usually only on special recovery missions of interest to the Hivers themselves.



These vessels are armed for self-defense, but require convoy escort in other than secure areas. If these transports are damaged, they can be transported for repair by the Hiver tender (see page 152). The docking ring fitted to these transports does not allow any sort of repair or overhaul for the Hiver 100-ton shuttles; this must also be conducted by the Hiver tenders which are spaced out along the convoy routes in temporary staging areas between the Coalition and the Hiver Federation.

Fuel scoops (400 tons per hour) and fuel purification plant (6 MW), 24.45 hours to refine 4850 m³ (346.4 tons).

Master Fire Directors: 1×TL-14 Missile/Beam MFD (5 Diff Mods; Msl 10 hexes Maser; 10 hexes; 1.92 MW; 1 Crew)

Accommodations

Life Support: Extended (14 MW), Grav Compensators (5G; 336 MW)

Crew: 130 (2×Maneuver, 1×Electronics, 12×Gunnery, 50×Engineering, 20×Maintenance, 18×Command, 13×Flight Crew, 12×Ship's Troops, 1×Steward, 1×Medic)

Crew Accommodations: 75×small staterooms (0.0005 MW ea.), 20 single-occupancy, 55 double-occupancy

Passenger Accommodations: None

Cargo: 2176 m³ with 6 large cargo hatches

Small Craft and Launch Facilities: Minimal hangar for 4×1-ton work pods with launch port, spacious hangar for 100-ton shuttle with launch port sufficient for 200-ton craft, streamlined external grapple for 200-ton craft, unstreamlined external grapple for 1000-ton craft

Air Locks: 48

Notes

The Hiver tender is used to support Hiver lines of communication between the Hive Federation and the Reformation Coalition. The presence of a tender in a system constitutes a Hiver staging area, as seen marked on RC subsector maps (e.g., Tuer, 1636/Oriflamme/Old Expanses). This allows the Hivers to vary their avenues of approach into certain areas, and also to forego the expense of establishing permanent bases.

The Hiver tender carries extra maintenance personnel to support repairs on vessels alongside. It has a grapple with which to hold a 1000-ton vessel. This is typically only used when such a vessel is laying alongside for servicing; the tender can also carry the attached vessel, but at reduced performance of Jump-2 and 1G maneuver.

The shuttle hangar is based on a 100-ton vessel and can serve as a spacious hangar for vessels of that size and smaller. However, its doors are large enough to fit a 200-ton vessel, and the hangar can serve as a minimal repair bay for such vessels.

The tender is fitted to carry a 200-ton Hiver utility vessel (HUV—see page 153) in a streamlined external grapple, allowing the HUV to be carried even during fuel skimming. The tender's jump and maneuver drives are scaled to allow the above performance while the HUV is attached, but as the HUV is fully capable of maneuver, jump, and fuel skimming on its own, this is usually not attempted. Note that when the HUV is attached, the tender's electromagnetic masking benefits are lost, as the HUV has no EMM package. The tender may enter gas giant atmospheres to refuel, but may not land on planetary surfaces as it has no CG lifters.

This vessel is clearly intended for use only in areas which have been secured by naval sweeps. For example, its self-defense capability is severely limited by its possession of only one MFD.

Fuel scoops (1920 tons per hour) and fuel purification plant (70 MW), 17.79 hours to refine 41,500 m³ (2964 tons), but only six hours to refine 14,000 m³ jump fuel.

Crew: 10 (2×Maneuver, 1×Electronics, 3×Gunnery, 2×Engineering, 1×Command, 1×Medic)

Crew Accommodations: 5×small staterooms (double-occupancy, 0.0005 MW ea.)

Passenger Accommodations: 5×small staterooms (0.0005 MW ea.), 3×emergency low berths (0.002 MW ea.)

Other Facilities: Sickbay (0.8 MW)

Cargo: 268.5 m³ with large cargo hatch

Small Craft and Launch Facilities: 1×TL-12 active/passive sensor drone carried as cargo and launched via cargo hatch

Air Locks: 2

Notes

The Hiver utility vessel (code-named HUV or "Hoover" in the Reformation Coalition) is a general-purpose ship. Each Hiver tender has one attached to it to fill such roles as scout vessel, auxiliary shuttle, courier, or search and rescue. It can be carried through jump while attached to the tender or jump separately using its own drives, depending upon the needs of the mission.

If no passengers are present, the crew will occupy the passenger staterooms.

Fuel scoops (40 tons per hour) and fuel purification machinery (2 MW), 19.65 hours to refine 1310 m³ (93.6 tons).

RULES EXPANSIONS

This section presents a number of expansions to the design sequences in **Fire, Fusion, & Steel (FF&S)**. These expansions allow the design of certain specialized forms of equipment that were not fully addressed in **FF&S**, and present enhanced rules for a more detailed exploration of some of the technologies presented in **FF&S**. Obviously, ownership of **Fire, Fusion, & Steel** is required to make a whole lot of sense out of the next four pages.

These expansion rules are broken down into the same categories and presented in the same order as in **FF&S**.

SPACECRAFT DESIGN

Modules and Pods

Modules and pods are both removable, interchangeable components that can be added to a ship designed to accommodate them. By designing the correct mix of pods, a single ship can change capabilities and missions rapidly by simply swapping out modules or pods. A module is such a modular component which has its own external hull shell (which is therefore carried exposed to space), while a pod has only internal structure without a hull shell (and is therefore carried internally, and relies on its carrying vessel's external hull to protect it).

Material Volume: When designing a module, the material volume used is that for the size of the module itself, not a percentage of the material volume of the ship it is attached to. For example, in designing a 600-ton ship which can carry a 100-ton module, the MV of the ship is 17 (600 tons total minus 100 tons of module = required material volume for a 500-ton hull) and the MV of the module is 6.

When designing a ship-pod combination, the ship uses the MV which corresponds to the total size of the ship plus the pod, and it calculates hull shell and internal structure based on this value. The pod uses the MV appropriate to its own size, but calculates only internal structure. Thus a ship-pod combination devotes more space to internal structure than a unitary design of the same size.

Controls and Life Support Systems: *If a pod or module's displacement is* equal to 30% or less of the total displacement of the ship-module combination, it need not be fitted with its own life support, artificial gravity, or controls. All that is required is that the carrying ship be designed with controls, life support, and artificial gravity based on the total volume of the ship plus the module or pod, and these systems are assumed to "plug into" the module or pod and perform those functions for it.

Pods or modules larger than 30% of the total displacement must instead carry their own life support and controls. Note that when calculating maintenance points, the module/pod uses the additional computer divisor if the carrying spacecraft is so equipped, without having to carry its own computer (this is one of the benefits of the installed controls).

All modules and pods may draw power from or provide power to the carrying craft.

Grapples: Grapples may be required for the carriage of modules, but are never required for pod carriage.

Grapples are required when the modules being carried are allowed to be of differing sizes, or if multiple modules are carried, not all of which need be fitted at one time (for example, the RCES clippers in this book). Grapples are designed using the normal rules, based upon the displacement of the module.

Grapples are not required when the module is considered to be an integral part of the craft's hull configuration, and the module(s) carried is always of the same size/configuration (for example, the modular cutter).

Surface Hits: When calculating surface hits for a module (pods have no exposed surface, so have no surface hits on their damage tables), modules use the box configuration multiplier, but then have surface area divided by four to reflect surface area that is actually exposed, and not butted up against neighboring modules, other portions of the carrying spacecraft, etc.

GROUND VEHICLE DESIGN

Flotation Screens

As described in the **FF&S** design sequence (page 20), a vehicle whose enclosed volume in cubic meters + loaded mass in tonnes equals 1 or more will float. Those with a value of 1 or less will not.

Vehicles with a value of between 0.9 and 1 may be fitted with flotation screens to allow them to float for short distances (such as across a river or into a beach from a landing ship off shore). The price of the screen is Cr50 times the vehicle's chassis volume in cubic meters.

Time required to erect the screen for use is a number of combat turns times the vehicle's chassis volume in cubic meters.

Vehicles which swim with the benefit of flotation screens are vulnerable to enemy fire, as the hull of the screen-assisted vehicle is actually below the surface of the water, it is only the top of the screen which is above the water. All hits on a vehicle swimming with a flotation screen are considered to be on the screen. Treat the screen as having an Armor Value of 1, and any minor hit on the vehicle holes the flotation screen sufficient to cause the vehicle to sink like a rock (or to begin floating like a rock, take your pick). Thus even small arms damage can sink such a vehicle. *Any crew aboard a vehicle which begins sinking* must succeed at a Formidable: Swimming task to successfully escape the vehicle.

LIFT VEHICLE DESIGN

Grav Belts

Grav belts use a special application of the lift vehicle design sequence.

Select the volume of the contra-grav unit to be used, and divide by the volume multiplier to find the size of the contra-grav "bubble" in displacement tons. At TL-12+, the minimum volume of a contra-grav unit is 0.03 cubic meters, which yields a CG bubble of 0.1 tons, or 1.4 cubic meters. 1.4 cubic meters is the minimum volume required for a human-sized being in a grav belt, and includes personnel wearing armor, such as battle dress.

Although a "hull size" has been determined, the grav belt has no hull or material volume. The grav belt is a backpack-style design, and all of the material that will be installed as part of the grav belt will be part of this pack and will be subsumed within the 1.4 cubic meters of the grav belt user.

In addition to the CG unit, all grav belts require controls of at least the same tech level as the CG unit (these are calculated based on the "hull size" of the CG bubble), TL-6 or better flight avionics, a workstation of that same tech level, and a "microflight" computer. The workstation has its normal cost according to tech level, but has negligible volume and a mass of only 0.02 tonnes (for a rigid-structure grav belt, such as the "Broomstick" on page 11 of this book, use 0.04 tonnes mass per workstation). The microflight computer is specifically designed for grav belts and their peculiar requirements (see page 10 of this book for a discussion). It has a mass of 0.016 tonnes, a volume of 0.016 cubic meters, requires 0.008 MW, and costs MCr0.06 at all tech levels. Terrain-following avionics may also be added, if the designer wishes a safe NOE speed of greater than 40 kph.

The grav belt requires a thrust agency, almost always in the form of shrouded, vectorable propellers (use values for TL-8 propellers, **FF&S**, page 69). These propellers will usually be powered by the same battery that powers the belt's other systems, but its price must also be multiplied by 2.5 as specified by the propeller table. In addition, if the propellers are powered by battery, they require a transmission with a volume of 0.3 cubic meters per MW of power (mass in tonnes equals volume in m^3, price in MCr equals volume times 0.0015).

Required thrust for the propellers is determined as follows: G-rating is determined by dividing thrust in tonnes by the volume of the CG bubble in displacement tons. When determining speed, grav belts have an efficiency multiplier of 0.65. The other details follow the lift vehicle sequence. Remember that the maximum allowable speed for unprotected personnel is 300 kph (personnel require vac suits, combat armor, battle dress, etc., to exceed this speed).

Once the total power requirement is known, set a duration time and design a battery which will meet those needs.

AIRCRAFT DESIGN

Compound Helicopters

When calculating the performance of compound helicopters (including X-wing helicopters), their performance must be separated into fixed-wing and rotary-wing modes. The fixed-wing mode uses the compound helicopter's maximum speed, but may not use the NOE mode. This is because there is no power being applied to the rotor blades (or in the case of the X-wing, the blades are locked), and the aircraft cannot hover. By definition, aircraft which cannot hover may not conduct NOE flight.

The rotary-wing mode allows NOE flight, but the aircraft is then limited to the helicopter top speed of 320 kph, reduced by drag points as normal.

Transitioning from one mode to the other requires a Difficult: Pilot (use lower of Fixed Wing or Rotary Wing cascade) roll. Outstanding Success indicates that the aircraft is considered to be in the new mode immediately. Normal success indicates that the aircraft is in the new mode on the following turn. Normal failure indicates that the roll must be attempted again on the following turn. Catastrophic Failure requires a Difficult: Pilot (use cascade for current mode) roll to avoid losing control of the aircraft and crashing on the following turn.

Aircraft Modifications for Other Planetary Environments

The aircraft design rules in **Fire, Fusion, & Steel** are intended to design aircraft for use in a standard atmosphere with 1 G gravity. Although it is primarily grav vehicles that are intended as flexible vehicles that can be taken from one planetary environment to another, in some cases the same will be required of aircraft. In the **TNE** basic rules, there is a simple prohibition against operating aircraft on worlds other than those for which they were designed. This is because of the many complicated interactions involved in getting an aircraft to fly in a multitude of environments, and because the **TNE** basic rules were not the place to go into involved discussions of speculative aerodynamics.

Strictly speaking, the rules below vastly understate the difficulties in designing aircraft for multiple environments (with atmospheric composition varying independently with gravity and temperature), and only obliquely touch upon such complex issues as the speed of sound varying with pressure and temperature, etc. In reality, each item of the **FF&S** design sequence would have to be re-evaluated based on the specific and cross-cutting local conditions, but this is the sort of abuse that we pay real aircraft designers to put up with, and not what helps players and referees to enjoy a science-fiction game. So while these exist to allow **Traveller** aircraft designers to have fun designing multi-environment aircraft, and to quickly and painlessly take these craft from one environment to another, referees should feel free to institute much stiffer prohibitions in their campaigns.

Atmosphere: Aircraft may only fly in thin, standard, or dense atmospheres (codes 4-9). If an aircraft (fixed- or rotary-wing) is intended to be able to operate in thin or dense atmospheres (or both) in addition to standard atmospheres, multiply its airframe cost by 1.5 to allow for reconfigurable or variable geometry intake ramps, lift devices, etc.

In addition, multiply rotary-wing rotor assembly mass by 2 if they are to function in another atmosphere type in addition to standard. This provides them with the additional gearing required to allow them to be fitted with different rotor assemblies for different atmosphere types. Each additional set of rotors masses 0.25 times the mass of the modified multi-atmosphere rotor assembly. These extra rotor sets will have to be stored and transported separately at a volume in m^3 of 20 times their mass in tonnes. Cost is calculated normally based on rotor assembly type.

In addition, an aircraft's airframe will yield different maximum and minimum speeds in different atmosphere types, and this must be examined. It may be that some aircraft can no longer fly, as they can no longer meet the minimum speed required to stay in the air in a thin atmosphere, for example. Maximum, cruising, and NOE speeds must be recalculated based on these new numbers, and aircraft with drag points calculate their new speeds down from these new maxima using the normal procedure. The new minimum speeds will change take-off and landing distances as well.

Note that while dense atmospheres "slide the performance window down" by reducing minimum and maximum speeds, thin atmospheres narrow the permissible performance bands. This is because the speed of sound is lower in thin atmospheres, and airframe maximum speed is based on its ability to handle the compression phenomena associated with the speed of sound. (The other side of this is that denser atmospheres provide more lift, hence lower stall speeds, while thinner atmospheres provide less lift so require greater speeds to remain airborne.)

Note also that this table uses a single average value for each of thin and dense atmospheres. The actual density of any atmospheres varies within a range, so in reality, these numbers would be different for each and every world, even those classified by **Traveller** as having the same atmosphere type. As the purpose of these rules is to allow aircraft to be relatively quickly converted from one world type to the next, it would be criminally stupid to attempt to calculate exact numbers for each individual world. Instead, for the purposes of these rules (and in the interest of universal mental health) any world of a given atmosphere code yields the same performance as any other world with the same code. The value used for thin atmospheres is 0.6 atmospheres and the value for dense is 2.0 atmospheres.

Airframes

	Thin (4, 5)		*Standard (6, 7)*		*Dense (8, 9)*	
Type	*Min*	*Max*	*Min*	*Max*	*Min*	*Max*
Simple	250/125	270	150/75	320	75/40	160
Autogyro	65/—	200	40/—	200	20/—	100
Fast Subsonic	265/135	680	160/80	800	80/40	400
Transonic	300/150	940	180/90	1100	90/45	550
Supersonic	465/235	2400	280/140	2800	140/70	1400
Hypersonic	585/290	4300	350/175	5000	175/90	2500
Wing-in-ground	125/—	400	75/—	400	40/—	200

Gravity: Note: **Traveller** does not focus on a world's gravity *per se*, but primarily on the density of its atmosphere, which is a reflection of its gravity. Players and referees should not feel compelled to worry about gravity effects on aircraft so long as they address the atmospheric requirements above. You have our permission to ignore it (goodness knows we'd like to).

For those who feel compelled to forge ahead to account for different gravities, multiply the aircraft weight by the local gravity before calculating G-Rating, Speed, and Take-off and Landing rolls. Calculate glide ratios normally, and then divide the result by the local gravity in Gs. In G-fields of greater than 1, multiply normally calculated maintenance points by the gravity in Gs, as more maintenance is required to watch for and repair stress fractures, etc.

SMALL ARMS

Dual-Feed Receivers

Weapons may be designed to accept ammunition from more than one magazine at a time, allowing the firer to switch back and forth between two or more supplies of rounds. This is accomplished in the Receiver step.

Add 10% to the mass of the receiver for each additional feed source that will be allowed. In other words, if a submachinegun will be allowed to draw from two separate magazines at one time, add 10% to mass. Three magazines at one time would add 20%.

The same rule applies to design a receiver which can accept ammunition from box magazines *or* belts (not both at the same time): this would add 10% to receiver weight. Note that weapons designed for belt feed may use belts or cassettes and vice versa at no penalty, and no increase in cost, as these types of feed are considered to be identical from the receiver's point of view.

Price is calculated normally based on the increased weight.

(This same rule may also be used with the Gauss Weapons design sequence.)

Modular Small Arms

Small arms may be built with key modular components that are designed to be able to be removed and replaced by other modular parts, or to be recombined with other parts to create different weapons for different purposes (for example, the CMWS on pages 62 to 66 of this book).

In order to have this modular capability, parts which are to be used in this way have their prices increased by 10%. Components which come under this rule are barrels, receivers, and stocks. Note that this modular capability only allows these parts to be fitted to other parts that were built with the same specifications (i.e., ammunition caliber and average muzzle energy).

Numerous weapon components do not come under this rule as they are either not in themselves modular (for example, muzzle brakes and flash suppressors which are permanently attached to a modular barrel are not increased by 10%, they merely add their normal cost to the 10% more expensive barrel price) or are already designed to be installed on or removed from any number of weapons. Among this latter category are tripods and bipods, backpack-mounted recoil compensators (as opposed to stock-mounted recoil compensators), silencers, and laser, electronic, telescopic, and optic sights.

(This same rule may also be used with the Gauss Weapons design sequence, but where receivers and barrels are built to different muzzle velocity standards, the assembled weapon uses the lower of the two.)

Overpowered Cartridges

It is possible for small arms to fire ammunition with a higher average muzzle energy than that for which the weapon was designed. Naturally, this is potentially dangerous. (Note that for the purposes of these rules, a weapon may only fire cartridges of the precise dimensions for which it is initially designed. This means that overpowered cartridges are only possible when constructed at a higher tech level, where the higher tech level energy multiplier means that more energy may be fitted into a cartridge of the same dimensions.)

When firing overpowered cartridges, there is a chance that the weapon will be damaged or actually explode, doing damage to the firer. This chance is calculated as follows:

10([NAME÷DAME]–1.2)

NAME: Average muzzle energy of the new (overpowered) cartridge

DAME: Average muzzle energy for which the weapon was designed

The result is the chance on 1D20 of the weapon to be damaged or explode from the excessive ammunition energy (round to the nearest whole number).

This roll is made each combat turn that the weapon is fired with the overpowered cartridges, regardless of the number of times it was fired or its rate of fire. If the indicated number or less is rolled, the weapon has had a problem. Roll 1D20 and consult the table below.

1-12	Weapon is damaged by internal explosion, and is no longer usable. Firer loses his or her next action due to surprise (although you know, he really shouldn't be, the silly bugger...)
13-16	Weapon explodes. If a one-handed weapon, the explosion does 1D10 hits to the firer's firing arm. If a two-handed weapon, it does 1D10 hits to each of the firer's firing arm and head. Weapon is destroyed.
17-20	As 13-16, but 2D10 hits of damage.

For example, if the TL-6 9x20mm round (458 joules, see page 43 of this book) is loaded in the TL-4 9mm revolver (designed for 356 joules, see TNE, page 352), the roll for each turn of fire is:

10([458+356]–1.2) = 0.865, rounded to 1

Thus a roll of 1 on a D20 means that the above table must be consulted.

HIGH-ENERGY WEAPONS

Rapid-Fire High-Energy Weapons

High-energy weapons have an inherently low rate of fire because of the large amount of energy they process and the time required for the weapon to be cooled for another shot. The plasma/fusion combustion chamber can only be cooled so fast, as overcooling will cause it to lose its tempering and begin to crack. These microscopic cracks can eventually cause combustion chamber explosions.

The solution to this problem is to build high-energy weapons with multiple chambers so that one chamber can fire while one or more other chambers are cooling. Relatively high rates of fire can be attained by this method, using the following formula:

ROF = Ep÷(25C)

where **Ep** is the weapon's pulse energy in Mj, **C** is the number of chambers, and **ROF** is rate of fire expressed in the number of 5-second combat turns between shots. Take the inverse of this result (i.e., divide 1 by this value) to get ROF in shots per 5-second combat turn. Drop all fractions (e.g., 1.99 becomes 1).

The design of a rapid-fire (multichambered) energy weapon differs from the standard sequence shown in **FF&S** in three ways: firing unit, supporting hardware, and ammunition feed.

Firing Unit: Establish the pulse energy and mass of a single-chamber firing unit using the normal **FF&S** rules, and determine the total number of chambers the weapon is to have. Each additional chamber beyond the first (the basic firing unit includes one chamber already) has a mass of 0.5 times the basic firing unit already calculated. Price of the rapid-fire firing unit is calculated normally: Cr2500 times total mass of the multichamber firing unit in kilograms for plasma weapons and Cr7500 times total mass in kg for fusion weapons.

Supporting Hardware: The multichamber firing unit requires supporting hardware beefed up to handle the larger cooling requirements of multiple firing chambers. The mass of this rapid-fire supporting hardware is equal to the mass of the supporting hardware for a normal single-chamber weapon of the required pulse energy times the value (number of chambers+2). Price is calculated normally based on final weight: Cr2500 times mass in kilograms for plasma weapons and Cr7500 times kg for fusion weapons.

Ammunition Feed: Rapid-fire energy weapons are fed from magazines. The magazine may be of any size desired by the designer. The mass of an empty magazine is equal to mass of all of the rounds carried multiplied by 0.01. The price of an empty magazine in credits is equal to its empty weight in kilograms times 5. The volume of a magazine in cubic meters is equal to the mass in tonnes of a full load of ammunition divided by 4. As with other automatic heavy weapons, when installed in a vehicle, the magazine must be in the same portion of the vehicle as the weapon in feeds.

Other portions of the weapon are designed as described in the basic **FF&S** sequence. The size of the recoil cradle is calculated normally, and is not increased in size based on the number of chambers (as rapid-fire high-energy weapons grow larger, their mass and structure gradually take over some of the recoil-absorption functions of the cradle).

Plasma and Fusion Bazookas

Plasma and fusion bazookas are less sophisticated versions of the plasma and fusion rifles designed in **FF&S**. High-energy bazookas fire one individually loaded round at a time, and expend a great deal of the round's energy out the back of the weapon so that they have no recoil.

Weapon: Bazookas use the same formulae presented in **FF&S**, but use different tech level multipliers (Tm) in the firing unit and support hardware formulae, as shown on the table below.

TL	*Firing Unit Tm*	*Support Hardware Tm*
10	6	6
11	4.5	5
12	3	4
13	3	3
14	3	2
15	1.5	1
16-17	0.75	0.5
18-19	0.375	0.25
20+	0.225	0.15

Ammunition: Bazooka ammunition is calculated using the procedure as described on **FF&S** page 67, but with the volume and MCr multipliers from the table below. These multipliers increase the mass and price to allow for the additional mass that is vented rearward to negate recoil, and for the disposable chemical laser ignition system contained in each plasma/fusion bazooka cartridge.

TL	*Description*	*Vol*	*MCr*
10	Chemical Explosive Cartridge (CPC)	0.0009	0.00018
12	Pulse Plasma Cartridge (PPC)	0.00045	0.000045
14	Pulse Fusion Cartridge (PFC)	0.0003	0.0000144
16+	Grav Compr. Fusion Cartridge (GCFC)	0.00015	0.0000072

Backblast: All personnel standing within 10 meters of the rear of the bazooka when it is fired must take backblast damage. Backblast damage is a number of D6 equal to the bazooka's pulse energy times 2. It is distributed in the same fashion as concussion damage (**TNE**, page 283).

All other details, such as range, damage, etc., are calculated just as printed in **FF&S**.

Concussion and Burst of High-Energy Weapons

The high-energy design sequence in **FF&S** did not discuss plasma and fusion gun burst and concussion, as it was written primarily with small arms weapons in mind. The following criteria comes into play only with weapons of 4.7 Mj and greater, as weapons of lower energy have a burst radius that rounds down to 0, and therefore have no concussion calculated. Both concussion and burst are calculated from the weapon's damage value (DV in the equations below), calculated normally. Burst radius is rounded to the nearest 10-meter grid radius value (e.g., 5, 15, 25, 35, etc.).

Concussion = 0.001(DV²)

Burst Radius (meters) = 0.1(DV)

MUNITIONS

Guidance and Missile Design

Target-Designated Guidance and Very Long-Range Missiles: Target-designated guidance (both laser and radar, and now AEMS, see below) is primarily intended to allow the missile to home on a target which is "painted" with a friendly designation or sensor system. However, this guidance package also enables the missile to function in "beam rider" mode. This capability is used almost exclusively for the very long-range planetary bombardment missiles which are fired at great distances from the planetary surface (often from far orbits hundreds of kilometers from the surface in order to provide safety for the firing starships). As these ranges are well in excess of homing, target seeker, and target memory ranges, the beam rider mode is used to guide these missiles through the long-distance first portion of their flight, until they get close enough to use their homing, seeker, or memory packages.

Beam riding means that the missiles fly along a beam of radar, laser, or AEMS energy, usually projected by a sensor on the launching ship. The missile's designation guidance package allows it to maneuver to stay within the confines of this beam and thereby maintain a course into the general vicinity of its target. Missiles which use beam riding in conjunction with terminal homing, target seeking, or target memory modes are called "dual mode" missiles (and include the Spruce and Fir missiles on page 109 of this book). Missiles launched in dual mode require a modified two-part to-hit task. First, the beam-riding portion is resolved as a normal target-designated task (**TNE**, page 278). This task will determine how close the missile arrives to the target when its terminal guidance system takes over. On normal success, the missile has arrived 1D10x5 kilometers from the target, and on Outstanding Success it has arrived 1D20 kilometers from the target. Compare the arrival range to the listed short range of the missile's terminal guidance package, and resolve the terminal portion of the missile's flight as a normal homing missile task (**TNE**, page 278) based on this range.

The disadvantage to this mode is that it requires use of active sensors, which invites notice by the enemy, and attack and countermeasures. A different form of dual mode missiles use command guidance for the first portion of the flight instead of laser/radar/AEMS beam riding. This allows missiles to be launched into their "target baskets" while only using passive sensors. These are resolved exactly as the beam riders above, but the first portion of the flight is resolved as an operator-guided task (**TNE**, page 278). All other details are the same. Examples of this type of dual mode missile are the planetary defense missiles on pages 104-105 of this book.

Additional Guidance Types: Add the following line to the target-designated guidance systems table (**FF&S**, page 145):

TL	*Type*	*Mass*	*Cr*
10+	AEMS	1	1000

AEMS signifies active EMS designation, meaning a guidance system which can be designated by a TL-10+ active EMS sensor. Since active EMS sensors use multi-spectrum illumination, a missile equipped with an AEMS designated seeker may also accept designation by radar or laser.

Add the following lines to the Homing Guidance Systems table (FF&S, page 145):

TL	*Type*	*Mass*	*Cr*	*Range*	*AGL*
9+	Advanced ARM	1	3000	36	—
9+	Advanced HOJ	1	3000	36	—

Range is short range in kilometers of a missile fitted with this guidance package.

HOJ is "home on jamming" which allows the missile to home on a functioning *area* jammer. Area jammers include the jammers of that name as well as jammers which are being used to jam radio transmissions (broadband jamming). The missile may not home on the radar and EMS jammers which are being used in a defensive deceptive jamming mode to increase the difficulty levels of sensors attempting to detect its owning platform.

Add the following information to the Smart Warheads Sensor table (**FF&S** page 145):

TL	*Type*	*Mass*	*Cr*	*Memory Range*	*Seeker Range*
7	Visual	1	200	8	40
7	IR	1	2000	4	20
8	Imaging Radar	1	10,000	8	40

Memory Range is the short range in kilometers of a target memory missile equipped with this sensor. *Seeker Range* is the short range in kilometers of a target seeker missile equipped with this sensor.

Effect of Nuclear Warheads in Atmosphere: Planetary defense missiles are fitted with nuclear-detonation laser warheads for use outside of atmospheres. Warhead detonation within an atmosphere will not allow the X-ray lasers to function properly, so the only damage that can be done to a spacecraft is by the nuclear explosion itself. Roll the to-hit task for the missile to hit the target normally. A result of Outstanding Success means that the warhead detonated 1D6x50 meters from the target. Normal success indicates that it detonated 1D20x50 meters from the target. Failure indicates that the warhead detonated 2D20x200 meters from the target. Roll the range of detonation and then find the line on the table below that corresponds to the warhead's yield, and see if the target is within one of the three listed radii. All fixed-wing or rotary wing aircraft within the secondary blast radius are destroyed. All spacecraft within the "destruction" radius are immediately destroyed (actually damaged so badly that they immediately crash to the ground). All spacecraft within the primary blast radius have 5 major hits rolled against their electronics. All spacecraft within the secondary blast radius have 1 major hit rolled against their electronics.

Yield	*Destruction*	*Primary*	*Secondary*
10	180	540	720
20	300	540	900
50	420	750	1200
100	480	750	1260
200	540	800	1400
500	600	880	1560

Yield: Of warhead in kilotons; Other entries are radii of destruction, primary blast, and secondary blast in meters.

LAUNCHERS

Shotgun and Flechette Rounds for Grenade Launchers

Most man-carried grenade launchers are provided with a shotgun or flechette round for close-range self-defense because grenades are typically useless or even counterproductive for close-range use.

Rating the performance of these rounds, however, requires a hybrid use of the grenade launcher and small arms design sequences as follows. Flechette rounds for grenade launchers are of the non-bursting variety, and are just like shotgun rounds except that they fire finned darts.

Price: The price of these rounds is determined the same way as any other grenade round, except that the price multiplier (**FF&S**, page 141, table I) for shotgun and non-bursting is 10.

Number of Rounds: Define the number of projectiles in the cartridge, and this must be a multiple of four. Note that four projectiles are resolved (using the shotgun/flechette rules on **TNE**, page 279) as a 3-round burst, eight projectiles as a 5-round burst, and 12 as a 10-round burst.

Damage and Penetration: Divide the muzzle energy of the grenade round (calculated using the normal grenade launcher sequence) by the number of projectiles contained in it. The result is the energy per projectile. This can be used on **FF&S**, page 94, to define the damage and penetration of these projectiles.

Range: This calculation (page 96, **FF&S**) requires an additional figure, "Blm" which is not created as part of the grenade launcher design sequence. To find Blm, first subtract 2 from the grenade launchers barrel length in calibers, and multiply the result by 0.233. This number is "Blp" which is used on page 96 to calculate Blm.

Blp = (barrel length in calibers –2)0.233

With Blm, short range of the shotgun or flechette round can be calculated using the normal procedures on **FF&S**, page 96. Grenade launcher shotgun and flechette rounds use the two-hand multiplier but ignore the smoothbore multiplier.

NEW RULE

All projectile weapons with a penetration of Nil may penetrate Armor Value 0 using the same method as melee weapon penetration. In other words, the armor absorbs a number of hits (rolled hits, not damage dice) equal to twice its parenthetical anti-melee armor value, and hits above that level "penetrate" the armor and are applied to the wearer.

MISCELLANEOUS

Workstations and Labs

All laboratories (from the Optional Features section) are assumed to have a number of workstations in them that permit scientists and technicians to use the laboratory's equipment. However, if the scientists are intended to use some of the ship's other equipment, such as sensors or communicators (as in the case of the Lab Ship, **TNE**, page 371), normal workstations must be provided for the number of personnel who will be using these devices at any given time.

Hatches and Rates of Troop Egress

Cargo hatches set a limit on the number of troops who may embark/debark through them in a single combat turn (five seconds). A large cargo hatch allows 20 troops to pass through per combat turn, and a small cargo hatch allows 12. These numbers assume troops not equipped with rigid armor (includes battle dress and combat armor) and a troop bay equipped with adequate or better seats. If troop bay is equipped with cramped seats, cut this rate in half. If troops are wearing rigid armor, cut this rate in half again. Thus a single small cargo hatch used by troops in battle dress and cramped seats will allow 3 troops to pass through per combat turn.

Treat air locks the same way, but with a base rate of 2 troops and a minimum of one.

INDEX

A number in parenthesis (12) following an item indicates its tech level. The abbreviation RC indicates that it is a standard piece of Reformation Coalition equipment.

STAR VIKINGS™

Personalities of the Reformation Coalition

The Reformation Coalition contains a wide variety of personalities, and **Star Vikings** will allow referees to run them all: members of the RC government and armed forces, covert intelligence operatives, RC allies from free-lancers to Free Traders, plus representatives of the RC's implacable opponents: the Guild and the ruthless dictators from the Wilds.

Each personality is a fully detailed **Traveller** character ready for use in a Star Viking campaign, with extensive referee's notes on the characters' motivations and backgrounds, plus guidelines on how to introduce these characters into a campaign, and keep them crossing the players' paths.

In addition, **Star Vikings** presents eight unique starships and their crews, complete with maps of their areas of operation and scheduled trade routes, and full color profiles of their configurations and markings.

These characters and ships are not one-trick ponies; they are useful, long-term NPCs and crews that will add color and detail to your campaign for a long time to come.

TRAVELLER®

The New Era

TNE Referee's Screen

This screen assembles the most commonly used task resolution and combat charts into an easy-to-use format for referees and players alike. Other commonly used charts and tables are collected into a charts booklet to free **Traveller** gamers from having to flip through the rulebook to find the information they need. In addition to all of this information at your fingertips, the **Referee's Screen** comes with a complete **Traveller: The New Era** adventure that brings the players face to face with one of the most fearsome and complicated challenges of the New Era: sentient electronic life.

TNE Players' Forms

The perfect companion to the **Referee's Screen**, this booklet contains a multitude of ready-to-use forms to organize and detail your New Era campaign, useful for players and referees. Revised, more useful character sheets and worksheets head the list, followed by NPC and ammo sheets. But the remainder of the book is all-new forms: player possessions register, ship design and hit location worksheets, blank ship data profiles, subsector data sheets, animal encounter forms, and trade forms. For the cartographically inclined, the book also includes blank map forms that use a convenient multi-scale hex grid system that zooms in or out all the way from local surface scale to continental scale all the way to an entire planetary surface.

REFORMATION COALITION

Equipment Guide

In order to re-build a universe, first you need the right tools...

The Star Vikings of the Reformation Coalition Exploratory Service (RCES) are always on the look-out for useful relic technology from the fallen imperium. The **Reformation Coalition Equipment Guide** details some of that relic technology, but it also describes the most important equipment, weapons, and vehicles used by the Coalition. The hallmark of this equipment is the Coalition's attention to flexibility and ruggedness: their designs are intended to make the maximum use of their limited technological and manufacturing resources.

Spacecraft

A wide variety of new and unique spacecraft are detailed in the **Reformation Coalition Equipment Guide**. Small craft covered include the assault lander, and "Wildbat" fighter, additional details on the 50-ton modular cutter (including a variety of new modules), and detailed examinations of the *Aurora* and *Maggart*-class clippers: the backbone and strong right arm of RCES operations. Three Hiver ships are also described, as well as a new type of Scout, and (last, but not least) the *Victrix*-class multipurpose starships.

Weapons

The Wilds are a dangerous place, and weapons are a necessity. The weaponry described in the **Reformation Coalition Equipment Guide** ranges from the 5mm "pen pistol" covert operations concealed weapon through conventional pistols, SMGs, carbines and rifles, to light and heavy machineguns. The Coalition 2.5cm grenade launcher, 4cm RAM rifle grenades, and heavier weapons are described in detail. Energy weapons are not neglected, covering everything from laser pistols to plasma bazookas, and the weapons in-between.

Heavier weaponry ranges from the tiny Lyrebird support missiles to planetary defense missiles more than 9 meters long. Need a laser-guided tank-buster? Call in a Nail tac missile. Tanks? You can use a light TL-6 "Panda" recon tank, the TL-8 "Prairie Fire" tank, or (if you are lucky enough to find one) à TL-15 "Intrepid" grav tank.

Transportation

Getting from place to place on a planetary surface is another problem everyone faces, and the **Reformation Coalition Equipment Guide** covers this subject as well. Need to get from orbit to dirtside in a hurry? You have a choice of assault lander, drop capsule, or personal reentry kit. Need to get around once you're there? Hop in a *Charina* wheeled APC, or strap a grav belt to your back and fly there.

Et Cetera

We cannot begin to list everything else that's in here, so flip to the index on page 158 and start reading. The **Reformation Coalition Equipment Guide** is copiously illustrated, and contains everything you need to use these items in a **Traveller: the New Era** campaign.

So what are you waiting for, trooper? Strap up and move out!
History's written by the winners, and I just got myself some paper

Index 158

Basic Rules

RULE 1: THE FUNDAMENTALS

Striker is a tactical miniatures game of ground combat in the far future. It is designed to emphasize the two salient aspects of combat at this level—rapidly changing tactical situations and the importance of leadership and troop quality—while allowing for a wide variety of weapons and vehicles from all tech levels covered by the **Traveller®** science-fiction roleplaying game.

Striker is set in the universe of **Traveller: The New Era**, but its rules can as easily be used for resolving science-fiction battles in any milieu. Game information for vehicles, weapons and personnel are listed in the equipment data charts. The appendices to these rules contain the organization charts of typical main force units (primarily battalions) for the Reformation Coalition, the Regency of Deneb and a variety of smaller states. Equipment data for these units is included in another appendix. The game reference charts contain information most frequently used during the play of the game.

1.1 Scale

These rules are written with 25mm miniatures in mind, but may be used with any scale desired. Each vehicle or heavy weapon represents one actual vehicle or heavy weapon of that type. Single-figure stands represent single individuals, while multiple-figure stands represent four-person fireteams.

Ground scale is 1:1000, which means that each millimeter on the gaming table represents one meter of actual distance. All movement and ranges in the game are given in centimeters on the playing surface (each representing 10 meters of real distance). For players without access to metric rulers, one inch equals 25 meters.

Each game turn represents five minutes of elapsed time.

1.2 The Referee

Striker may be played with or without a referee. A referee should be a player who knows the rules well and is willing to supervise the game being played, but not play. A referee's tasks are to generate the scenario, determine the terrain and the makeup of both sides, and keep track of hidden units. In addition, the referee is responsible for keeping the game moving and adjudicating any dispute of the rules that may occur. This leads us to the following ironclad statement:

The referee's word is law during the course of the game, even if the ruling is directly contrary to the printed rules.

Each group of players will have varying opinions about values of specific weapons, the best way to represent specific battlefield activities and so on. The middle of a game is not the best time to debate such points. The best way to avoid this is to make the referee's rulings final for the scenario being played. Discussion should wait until after the game is over (indeed, a post-game "debriefing" can be very rewarding).

A referee can be dispensed with if a group consists of cooperative, well-experienced players who can agree upon a scenario ahead of time.

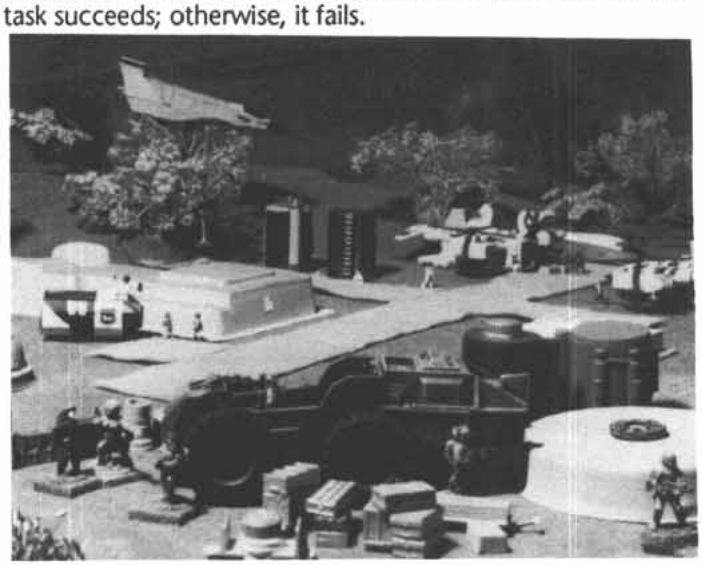
A well-planned scenario takes into account the number of players, their experience with the rules, the table space and troops available for play and the time that can be devoted to the game. The referee has the right to alter rules, ratings and organizations so as to best suit the scenario he is attempting to run. Victory conditions, if needed, and any other information necessary for the scenario should be given to players. As a general rule, the more organized the scenario, the better the actual game will be for the players.

1.3 Sequence of Play

1.31 Phases: Each game turn is played in a series of phases. In general, these phases are resolved in sequence, with all action in one phase being resolved before another phase begins. The phases, in order, are:

Command Phase
Movement Phase
Fire Phase
Morale Phase
Melee Phase

The details of what occurs in each phase will be taken up later in these rules. It is the job of the referee to see that each phase is carried out quickly and in its proper sequence.



1.4 Task Rolls

The central game mechanic in **Striker** is a D20 task roll. This roll is made to determine if targets are seen or hit by fire, among other things.

The target number for the roll is usually determined by the range and quality of troops making the attempt. This will then be modified by difficulty modifiers, abbreviated "diff mods," in the rules. A +diff mod makes the task more difficult by halving the target number (rounding fractions down), while a –diff mod makes it easier, doubling the target number.

All applicable diff mods are combined into a single composite modifier, which is then applied to the task. As a practical matter, diff mods serve to shift the range column used to the right (+diff mod) or the left (–diff mod).

Once the target number is determined, roll 1D20. If the number rolled is less than or equal to the target number, the task succeeds; otherwise, it fails.

RULE 2: MOUNTING TROOPS

For convenience, these rules will use the term "stand" to refer to any group of based figures, a vehicle model or a towed weapon (although when dealing with vehicles or towed weapons, these rules sometimes use the word "model"). There are three main types of stands—vehicles, towed weapons and personnel—with each type further subdivided according to several classifications.

2.1 Vehicles

Vehicles consist of all vehicles, including towed trailers and horse-drawn wagons and carts (but not cycles).

All vehicles are divided into six classes according to weight: class I (up to 1.5 metric tons), class II (1.5 to 3 metric tons), class III (3 to 9 metric tons), class IV (9 to 20 metric tons), class V (20 to 36 metric tons), and class VI (more than 36 metric tons).

Vehicles also are subdivided according to their suspension (wheeled, tracked or lift), and whether or not they are open-topped. Half-tracked vehicles are treated as wheeled vehicles unless otherwise noted.

2.2 Towed Weapons

Towed weapons consist of all towed guns, howitzers, energy weapons and towed mortars.

Towed weapons are subdivided into the same six weight classes as vehicles: class I (up to 1.5 metric tons), class II (1.5 to 3 metric tons), class III (3 to 9 metric tons), class IV (9 to 20 metric tons), class V (20 to 36 metric tons), and class VI (over 36 metric tons).

Each towed weapon's model represents only the towed weapon itself; its crew is represented separately by a personnel stand or stands. Therefore, towed weapons are never mounted on stands but are instead placed on the stands of their crews during the course of the game. This enables the crew stand of a weapon to be moved separately from the gun model (necessary in some situations, such as when gun crews panic and abandon their weapons).

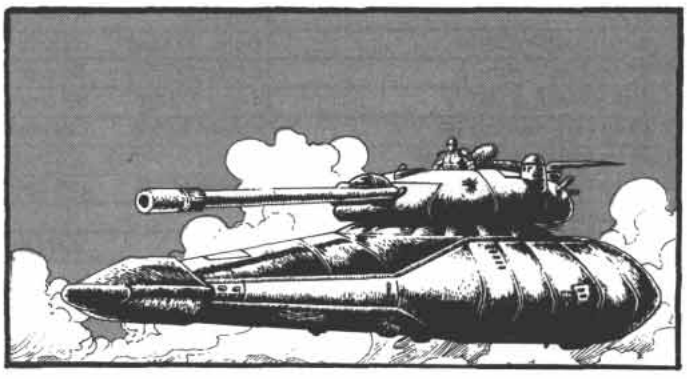
2.21 Fixed Weapons: Some artillery pieces are labeled "fixed" instead of having a weight classification. Moving a fixed weapon involves dismantling it and transporting its component pieces, something which cannot be accomplished in the normal course of a battle.

2.3 Personnel Stands

Personnel stands consist of all other stands. There are a large number of names applied to personnel stands: infantry, cavalry, gun crew, command, engineer, MMG, pack animal and HIW stands, among others. Some stands have two or more names, such as "SMG cavalry stand" or "mounted command engineer stand." The name applied to a stand indicates how it is referred to on tables of organization and on the Personnel Movement and Small Arms Fire Characteristics Tables **(see page 00)**.

Notes: The term "HIW" (heavy infantry weapon) refers to those personnel stands with certain weapons that are not towed, but carried by the men in that stand. These weapons include medium mortars, heavy machineguns and similar weapons. For example, an 8cm mortar stand is a stand equipped with an mortar model fastened to the stand along with two to three crew figures.

Cycle stands (bicycles, motorcycles and grav cycles) are considered to be infantry riding the cycles unless otherwise specified. For example, a "motorcycle MMG stand" is a MMG stand riding motorcycles.



Finally, these rules distinguish between three different sizes of personnel stands: fire team stand, single stand and crew stand.

2.31 Fire Team Size: The base for a fire team stand, representing four infantrymen, is 1.5 inches wide by 1 inch deep (or 40 mm by 25 mm). Two or more figures should be mounted on each stand (whichever looks best) and should show the weapons carried by that stand if at all possible. (A gauss rifle stand will have gauss rifles, a plasma bazooka stand has a plasma bazooka, etc.) In some cases, it may be necessary to use a slightly larger stand than this to accommodate larger figures, as in the case of mounted cavalry.

2.32 Double Size: A double-sized stand, representing the crew of a large heavy weapon (one which is fired from a mount instead of from the shoulder) is 2 inches wide by 1.5 inches deep (or 50 mm by 40 mm). Two or more figures should be mounted on each stand. If the weapon used by the stand is a man-packed weapon, such as a mortar, the weapon should also be mounted on the stand. If the stand is to be used as a crew for a towed weapon, the figures should be mounted in such a way that the weapon can be placed (but not glued) on the stand.

2.33 Single Size: The single-figure stand, representing a single commander, scout, or sometimes commando, is 3/4 inch by 3/4 inch (or 20 mm by 20 mm). Only one figure should be mounted on each stand. In some cases, it may be necessary to use a slightly larger stand than this to accommodate a larger figure, as in the case of a trooper wearing battledress, or a race more massive than humans.

If necessary, these stand sizes may be changed slightly to allow infantry stands to fit into the back of model vehicles, and so on. This is not required, but the visual effect of troops riding in the models is very pleasing. (However, this may not be possible with some types of model vehicles.)

RULE 3: UNIT CARDS

Each platoon-sized unit should have a unit card. Unit cards contain all the information needed for players to run the unit. All weapons and equipment, including vehicles, used by the unit should be rated. These ratings are broken into three general groups: unit values, performance, and weapons and sensors.

3.1 Unit Values

This section of the card lists the troop quality type (Elite, Veteran, Experienced or Novice), the morale value and the initiative number of the troops in the unit. All these should be identical. If separate elements of the platoon have different values, separate cards should be made up for each of them.

One of the duties of the referee is to see that each stand used in the scenario being played is assigned one of the four troop qualities, as well as a morale value. The referee may use the ratings found in the appendices, or may choose to modify them for the scenario being played.

The troop quality categories and their definitions are:

Elite: Elite units are few and far between. They represent excellent units which are experienced and tested in combat many times. An example of an Elite unit would be Reformation Coalition marines who were veterans of several major operations.

Veteran: Veteran units have extended combat experience. Veteran units are occasionally found on Balkanized worlds, the products of nearly constant warfare between local warlords.

Experienced: Experienced units have either "seen the elephant" (been in combat) or had reasonably good training. Most armies are made up of experienced troops.

Novice: These are inexperienced troops who have been put into action with a minimum of training. Most planetary militias are from this category.

Towed weapons do not have a troop quality *perse*. Rather, their quality is equal to the personnel stand operating the weapon. The effects of troop quality rating are found on the Troop Quality Summary Table (page 7).

Morale ratings range from 8 to 22, with higher numbers indicating better morale. While troop quality and morale often go together, this is not always the case. There are times when Veteran troops may have poor morale, such as an experienced but battle-weary unit, or when poorly trained and equipped units go into action with great elan and vigor, as in highly motivated and well-led militia defending their homes.

3.2 Performance

This section of the card describes the armor protection (if any) of the unit, its movement allowance and its communication gear. The format of this section of the card is different for vehicle and personnel units.

3.21 Armor: Personnel armor descriptions consist of an armor type description (such as "heavy battledress") followed by a saving throw number. Vehicle armor descriptions include separate armor values for a variety of different surfaces of the vehicle.

3.22 Movement: Personnel stands have a single movement allowance. Vehicles have two movement allowances: either cross-country and road (for ground vehicles), or low and high (for flying vehicles).

3.3 Weapons, Sensors, and Communicators

Weapons, sensors and communicators are handled as a single group because they function in a similar manner (though their effects are different). This section of the chart consists of a list of sensors, communicators, and weapons carried, followed by four columns, representing performance at each of the four range bands. The values recorded in each column indicate the equipment's performance at that range.

3.31 Assets: There are four ranges in the game: short, medium, long and extreme. These are the headings of the four range columns on the

Gamma Company, 6th Battalion, 4518th Lift Infantry Regiment, The Duke of Regina's Own Huscarles, with:
- **Company Headquarters,** with:
  - 1 operational command stand
- **3 Jump Troop Platoons,** each with:
  - 1 tactical command stand
  - 1 support infantry stand
  - **3 Jump Troop Squads,** each with:
    - 1 tactical command stand
    - 2 infantry stands

Notes: Each stand is outfitted with TL14 light battledress. Command and infantry stands are armed with TL14 4.7cm fusion rifles, the infantry stands additionally having an integral 4cm RAM grenade launcher. The support stands are armed with TL-15 30kg "Fire and Forget" missiles and an integral TL15 5.1cm fusion rifle.

Troop Quality: Elite **Morale:** 20 **Initiative:** 4
Armor: Battledress **Save:** 8
Movement: 18 cm

System:	*Short (15)*	*Medium (7)*	*Long (3)*	*Extreme (1)*	*Notes*
4.7cm fusion rifle-14	16 cm: 2 (33+)	32 cm: 1 (33+)	64 cm: 1 (17+)	128 cm: 1 (3+)	
5.1cm fusion rifle-15	18 cm: 2 (37+)	36 cm: 1 (37+)	72 cm: 1 (19+)	144 cm: 1 (4+)	
4cm RAMGL-9 HE	24 cm: 3 (Nil)	48 cm: 2 (Nil)	96 cm: 1 (Nil)	192 cm: 1 (Nil)	EP: 3, BR: 2 cm
30 kg F&F homing HE	(20 km) 1 (5+)	(40 km) 1 (5+)	(54 km) 1 (5+)	—	A10, EP: 8, BR: 5 cm
30 kg F&F homing HEAP	(20 km) 1 (149+)	(25 km) 1 (149+)	—	—	A10, EP: 11, BR: 6 cm
30 kg F&F homing flechette	(20 km) 1* (2)	(40 km) 1* (2)	(54 km) 1* (2)	—	A10, DS: 15x60 cm
Sensors:					
Eyeballs	100 cm	200 cm	400 cm	800 cm	
Communications:					
3km radio	300 cm	600 cm	1200 cm	2400 cm	

chart below. Following the heading is a space to write the unit's *asset* at that range. The unit's asset is a quantification of its performance at that range, and is based on the troop quality level of the unit. The following table lists the asset of each troop type at short range.

Troop Quality Summary

Type	*Asset*	*Initiative*
Elite	15	5
Veteran	13	4
Experienced	11	3
Novice	9	1

Write this value in the blank following the short range heading. The asset value is then halved, rounding fractions down, at each higher range band. The asset values for an Experienced unit, for example, would be 11 at short, 5 at medium, 2 at long, and 1 at extreme range.

3.32 Range: Each sensor, communicator and weapon has a listed short range, either found by consulting the data annexes of this book or by looking at the **Traveller** rating for a weapon. The range recorded on the card in the first column is the equipment's short range in centimeters. (Since each centimeter in the game represents 10 actual meters, take the range in meters of **Traveller** equipment and divide by 10 to find the range in centimeters.)

The equipment's medium range is twice short range. Long range is twice medium range. Extreme range is twice long range. Write each of these ranges in the appropriate column and place a colon (:) after each.

Some weapons and sensors have ranges so long that they are listed in kilometers instead of centimeters. Each kilometer is one meter on the gaming table.

3.33 Rate Of Fire: Rate of fire is the number of dice thrown for successes each phase.

Sensors and communicators do not have rates of fire. (Sensors always throw one die for successful spotting attempts. See Rule 6.4.)

Weapons have a rate of fire or 1 or more, depending on how fast the weapon actually fires. This can be found by looking at the data annexes of this game or by consulting the **Traveller** ratings for the weapon (and the rule on converting **Traveller** weapons to **Striker** values).

The weapon's game rate of fire (number of dice rolled) is written after the colon in each range column. This rate of fire drops by one at each higher range band, but is never reduced below 1.

3.34 Penetration: Sensors do not have a penetration. All weapons have a penetration which is written in parentheses following the weapon's rate of fire value. As penetration sometimes declines with range, it is written separately in each column. If using the data annex in this book, simply copy the penetration values listed.

Most heavy weapons have a final penetration equal to their penetration value plus the roll of 2D6. For these weapons, place a plus sign (+) after their penetration as a reminder. In the following rules these are referred to as "plus penetration weapons."

The sample unit cards on the previous page illustrate how unit cards are laid out. Several blank unit cards are provided later in the book, and permission is specifically granted to photocopy these sheets for use with the game.

3.4 Vehicle Cards

Units equipped with vehicles have a slightly different format for their unit cards, as the cards also contains the ratings for the vehicles in the unit. If more than one type of vehicle is used, separate unit cards are filled out for each vehicle. The general information on the card, however, is the same as for personnel units described above. Consult the sample vehicle unit card on the previous page for an example.

The Tercio of Steel (Novice, Morale: 14), with:
Tank Detachment

1 tactical command TL8 Prairie Fire fast tank
3 TL8 Prairie Fire fast tanks

RULE 4: COMMAND AND CONTROL

Orders issued during the Command Phase allow units to carry out operations during the Movement Phase. Orders are always issued by specific commanders. The order itself is represented by a game marker placed on the playing surface.

Units must receive orders to move, but do not need orders to fire.

4.1 Commanders

There are four types of commanders in the game: self-commanders, tactical commanders, operational commanders and strategic commanders. Self-commanders represent high-initiative troops, such as reconnaissance patrols or specially trained commandoes. Other commanders represent leaders who may direct the actions of other troops.

All commanders may issue one (and only one) order during the Command Phase of each turn. The order is represented by a command chit which is placed on the playing surface. All orders are removed from the playing surface at the end of the game turn.

The principal difference between commanders resides in where they may place their order chits.

4.11 Self-Commanders: Order chits issued by self-commanders are placed on or immediately adjacent to the stand that issued the order. The order affects only the stand which issued the order.

4.12 Tactical Commanders: Order chits issued by tactical commanders are placed on or immediately adjacent to the commander's stand. The order affects any or all (at the owning player's option) subordinate stands within 15 cm of the order chit.

4.13 Operational Commanders: Order chits issued by operational commanders may be placed anywhere on the gaming table visible to the commander's stand. The order affects any or all (at the owning player's option) subordinate stands within 15 cm of the order chit.

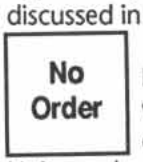
4.14 Strategic Commanders: No commander can function as a strategic commander by himself. Instead, operational commanders when working with a staff stand function as strategic commanders. See Rule 4.4 below for a discussion of staff stands.

Order chits issued by strategic commanders may be placed anywhere on the gaming table, whether visible to the commander or not. The order affects any or all (at the owning player's option) subordinate stands within 15 cm of the order chit.

4.2 Orders

Orders may are issued by command stands during the Command Phase. Orders affect any or all stands subordinate to the issuing stand, at the owning player's option (see Rule 4.32, below).

The following are the orders that may be issued, as well as the phase in which the orders take effect. Note that chits are included in the counter mix for each type of order.



4.21 *Cautious Advance* (Movement Phase): Units with a *cautious advance* order may move any distance desired up to their normal movement allowance. They must move in the direction the arrow on the order chit points. *Cautious advance* orders are discussed further in Rule 5.11.

4.22 *Rapid Advance* (Movement Phase): Units with a *rapid advance* order must move their full movement allowance and may move up to twice their normal movement allowance. They must move in the direction the arrow on the order chit points. *Rapid advance* orders are discussed in Rule 5.12.

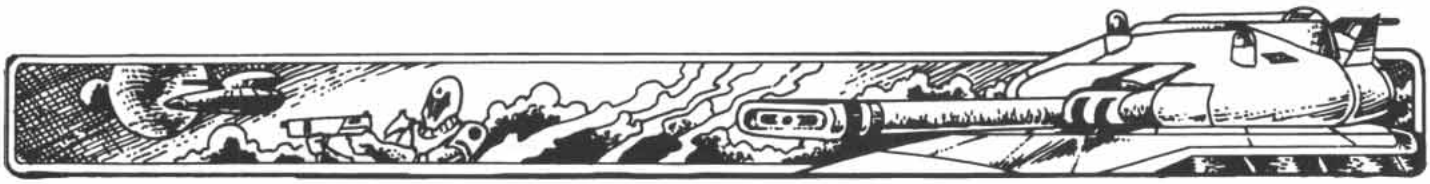
4.23 *Disengage* (Movement Phase): Units with a *disengage* order move directly away from the closest visible enemy unit and may move any distance desired up to their full movement allowance. Disengaging units are assumed to be making maximum use of concealing terrain, evasive movement and artificial cover (such as smoke), and so may not be fired on by opportunity fire (see Rule 7.23). *Disengage* orders are further discussed in Rule 5.14.

4.24 *No Order* (Command Phase/Movement Phase): *No order* orders are used in situations where a player does not wish to move a unit, but does not wish to let the enemy know that fact. Units under a *no order* order may change facing within the limits outlined in Rule 5.8, but may not otherwise move. They may fire normally.

4.25 *Rally* (Morale Phase): *Rally* orders enable a routed unit to rally, and also are used to raise the morale of units who have suffered morale reductions during the game. *Rally* orders are discussed further in Rule 9.3.

4.26 *Take Command* (Command Phase): *Take command* orders enable a commander to take a unit under its command (make it subordinate) which was not subordinate at the beginning of the game. *Take command* orders are discussed further in Rule 4.421.

4.27 *Travel* (Movement Phase): Units issued a *travel* order must move at least their normal movement allowance and may move up to three times their normal movement allowance. *Travel* orders are discussed further in Rule 5.13.



4.28 *Regroup* (Morale Phase): *Regroup* orders enable a commander to return eliminated fireteams to play. *Regroup* orders are discussed further in Rule 9.4.

4.3 Issuing Orders

Orders are issued by command stands. In all cases, there are limitations on what orders can be issued to which units.

4.31 Chain of Command: Orders chits, once placed on the playing surface, can only affect those stands which are subordinate to the commander issuing the order. The referee will

determine which stands are subordinate to which commanders when setting up the scenario. A large number of sample organizations are provided later in this book as a guide.

As a general rule, all stands of a battalion are subordinate to the battalion's commander. In addition, the battalion stands are also considered subordinate to the regimental commander. Thus, stands belonging to an infantry company could be issued orders by the company commander, by the battalion commander or by the regimental/brigade commander. They could not be issued orders by the commander of a different company or battalion, however.

When issuing a *take command* order to transfer control of a unit from one commander to another, commanders may not be subordinated to a different commander at the same or higher level of command. A regiment can thus take command of a battalion and its command stands, but a battalion commander cannot take command of another battalion's commander. It could, however, take command of the subordinate elements of that battalion.

4.32 Placing Orders: Orders are issued by placing an order chit next to the stand or group of stands to which it is intended to apply. The chit is placed with the order to be used facing up. The distance from the stand issuing the order and the point at which it is placed will depend on the type of stand issuing the order.

The radius of effect of the order is 15 cm from the spot where it is placed, unless the unit is moving along a road or trail in column, in which case the order is placed at the head of the column, and all stands within the column will obey it. A stand need not be able to see the point at which the order was placed. If it is within 15 cm of the order, it may obey that order.

A stand must be subordinate to the stand issuing the order for it to obey. If a stand that is under that command is not intended to follow the order, that fact must be stated when the order is revealed. Stands that do not intend to follow the order are considered to have been given a *no order*.

Example: A local defense infantry platoon with a platoon (tactical) commander mounted on an infantry fireteam stand, two other infantry stands and two machinegun stands decides to move forward. The player places a *rapid advance* order chit next to his command/infantry stand, which is within 15 cm of his other two infantry stands and both machinegun stands. Upon revealing the order, the player states that the machinegun stands will remain in place to give the rest of the platoon covering fire. The commander and the three infantry stands are then moved, and the machinegun stands remain stationary.

4.33 Order Caps: Included in the counter mix is a set of chits which are blank on one side and marked as "Command," "Staff" or "Self ordering" on the reverse. Each player should be given a number of these caps equal to the number of commanders under his control. Self order caps are used for self-commanders. Staff caps are used for strategic commanders. Command caps are used for tactical and operational commanders. These order caps serve two purposes:

- They are placed on top of the order chits so that the opposing players may not see what orders have been issued until they are revealed during the start of the Movement Phase.
- They serve as a reminder of the maximum number of orders which may be issued in any one turn by a player. If a player only has two command caps and one staff cap, that player may not use more than three order chits in any one turn.

4.4 Command Stands

Command stands may each issue one order per turn. As mentioned, orders can be issued to any stand or group of stands that are subordinate to that command stand and within command range. Stands to which a *Take command* order was issued become subordinate to the command stand that issued the order.

4.41 Types of Command Stands: There are two ways of mounting commanders on stands in the game. They can be either single-figure (pure) command stands, or double-figure (joint) command/other function stands. Tactical commanders are usually mounted as part of a fire team stand, while operational and strategic commanders are always mounted as single figures.

Pure command stands are labelled "command stands" in the TO&E listings. Double-figure command stands are listed as part of another type of stand in the TO&E listings: "command infantry stand," "command weapons stand," "command engineer stand," and so on.

The difference between the types of commanders (tactical, operational and strategic) is related to the communications ability of their unit and to the level of command it represents. These capabilities will be determined by the referee prior to the start of the scenario, again using the sample organizations provided as a guide.

4.42 Restrictions on Command Stands: The following restrictions exist on the ability of all command stands to issue orders:

4.421 Take Command Orders: Any command stand which is issued a *take command* order by another command stand in order to change its subordination for the turn, may not itself issue any orders for that turn. This restriction only applies to the stand which was issued the order, not to those command stands which are in turn subordinate to the command stand that was issued the order.

Example: The command stand of an infantry company is given a *take command* order which is intended to make the company subordinate to the battalion commander of a tank battalion. During this turn, the infantry company commander may not issue any orders of its own, but the platoon commanders of the company could.

4.422 Pinned Command Stands: Command stands which are pinned, either through fire or failure of morale, or the use of a voluntary pin, may not issue orders until they are unpinned. The pinned command stand, and those stands around it, may only be given an order by another command stand to which they are subordinate.

4.423 Visibility and Command Stands: Visibility affects the

placement of an order by a commander (except in the case of strategic commanders). No commander (other than a strategic commander) may ever place any order chit farther away from it than its visibility will allow. Once an order is placed, that order affects all stands within 15 cm, regardless of visibility, so long as the stand in question is subordinate to the stand issuing the order, and not exempted from the order by the player placing it.

Example: A commander is in woods, where visibility is limited to 5 cm. The commander is therefore limited to placing his order chit within 5 cm of his location. However, once placed, the order may affect all subordinate stands within 15 cm of its location, even though visibility is limited to 5 cm.

4.5 Staff Stands

Staff stands represent groups of trained staff officers with the ability to plan, coordinate and communicate with distant subordinate units. Staff stands enable operational commanders to function as strategic commanders.

4.51 Types of Staff Stands: The types of staff stands used in the game are differentiated by their means of communication. There are staff telephone stands, staff radio stands and staff uplink stands. The difference between these stands is their communications ability. Note that it is possible for an army to use several types of staff stands in the same unit.

4.52 Differences Between Staff Stands: The differences between the types of staff stand are:

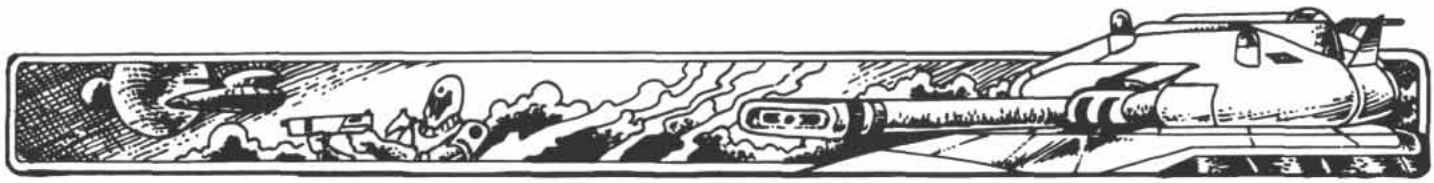
4.521 Staff Telephone Stands: Staff telephone stands may only function in scenarios where their units start with a setup area on the game board. Once placed on the board, they allow an adjacent operational commander to issue one order per turn to any point within that area, regardless of whether that point is visible to the commander. Visibility never affects staff telephone stands. This setup area should be marked on the referee's scenario map, but not indicated on the playing surface itself. It represents the area in which telephone lines have been laid.

Note that any stand or group of stands which leaves the setup area may no longer be issued an order by the staff telephone stand.

Staff telephone stands that move during the course of a game lose their ability to function as a staff stand for the remainder of the game.

4.522 Staff Radio Stands: Staff radio stands actually represent staffs using open channel broadcast radios. They are usually mounted on vehicles (and thus may be listed on the order of battle as a "staff radio truck," "staff radio G-carrier," etc.) at lower tech levels, but become more mobile at higher tech levels. Once placed on the board, they allow an adjacent operational commander to issue one order per turn to any point on the board where stands subordinate to the commander are found, regardless of whether that point is visible to the staff stand. Visibility never affects staff radio stands.

Staff radio stands or vehicles that move during the course of a turn lose their ability to function as a staff stand for that turn. Once stationary, they resume their role as a staff stand.



4.523 Staff Uplink Stands: Staff uplink stands rely on satellite retransmission of communications instead of broadcast radio. They function exactly like staff radio stands for purposes of the command rules. (If using the electronic warfare rules, they may not be jammed. If playing as part of larger campaign., uplink requires control of close orbit.)

4.53 Restrictions on Staff Stands: The following restrictions exist on the ability of all staff stands to issue orders:

4.531 Take Command Orders: A staff stand of any type which has been issued a *take command* order by another command stand in order to change its subordination, may not assist a command stand that turn.

4.532 Pinned Staff Stands: Staff stands which are pinned may not assist commanders until they are unpinned.

RULE 5: MOVEMENT

Stands are moved in the Movement Phase. Even involuntary movement such as routs, retreats and force-backs is considered to take place in the Movement Phase, although the actual displacement of the stands may have been handled in previous Morale or Fire Phases.

Each personnel stand has a single movement allowance, which for humans on foot (the most common personnel stand in the game) is 20 centimeters.

Each ground vehicle stand has two movement allowances: a cross-country movement allowance and a road movement allowance.

Flying vehicles also have two movement allowances: a low-level movement allowance and a high-altitude movement allowance.

Towed weapons have no movement allowance; they are moved by being towed or man-handled into position.

A movement allowance states the basic distance (in centimeters) a stand may move in the Movement Phase. The actual distance a stand moves may be modified by its orders and/or by the terrain it crosses.

5.1 Movement and Orders

There are limitations on how stands may move which are imposed by the movement order given to those stands. The movement orders and their effects are as follows:

5.11 Cautious Advance: The *cautious advance* order allows a stand or group of stands to its full movement allowance. The stand or group of stands need not move, but if it does, it must move in the same general direction as the arrow on the order chit. For all game purposes, the stand or group of stands so ordered is considered to be moving regardless of whether or not it actually does so. Flying vehicles use their low-altitude movement allowance when issued this order.

5.12 Rapid Advance: A *rapid advance* order allows a stand or group of stands to move up to twice its full movement allowance. Stands need not move their full movement allowance but must move at least half of their movement allowance. Flying vehicles use their low altitude movement allowance when issued this order.

5.13 Travel: The *travel* order affects different types of stands differently. Stands of any type issued this order may not fire during the Fire Phase.

Travel can only be issued to a personnel stand or group of stands that starts the turn on a road. This order allows the stand or group of stands to move three times their normal movement on the road. The stands may follow any twists or turns in the road, but may not leave the road during the turn.

Ground vehicles may be issued this order whether or not they are on a road, and move three times their appropriate movement allowance.

Flying vehicles issued this order move at their high-altitude movement allowance.

5.14 Disengage: When units disengage, they make maximum use of covering terrain and artificial cover (such as smoke grenades) to conceal their withdrawal. A *disengage* order allows a stand to move directly away from the nearest visible enemy stand up to its full movement allowance. It need not move its full movement, but it must move at least half of its movement, unless it retreats into a higher state of cover.

Stands operating under a *disengage* order may *not* be fired upon using Opportunity Fire (see Rule 7.23). The only exception is if the disengaging stand moves closer to an enemy stand, in which case only the enemy stand(s) which had the range decrease may fire. Note that as a disengaging stand must move directly away from the closest visible enemy unit, it is possible to move toward another enemy unit.

A *disengage* order may never be issued to unlimbered towed weapons, Novice units or units which are pinned. Vehicles must use their cross-country movement allowance when using the *disengage* order, even if disengaging along a road. Flying vehicles must use their low-altitude movement allowance.

5.2 Road Movement

A stand may only use its road movement allowance if it starts the turn on a road and moves along the road for the entire Movement Phase, never leaving it during the Movement Phase.

5.21 Direction: A stand may move in one direction along a road. When a stand comes to a crossroad, it may continue onto any branch (so long as its route does not cause it to move on the same section of road twice in a turn) regardless of the direction of that travel.

The direction arrow on the order chit does not limit a stand's ability to move along a road. If a stand starts off-road, the arrow on the chit indicates its required cross-country movement direction. Once it reaches a road, it may freely move in either direction along the road. If, however, a stand moves off its ordered axis of advance while travelling on a road, it may not leave the road for the rest of the Movement Phase.

The stand must end its turn on the road facing in the direction that it was last moving.

5.22 Blocked Roads: A stand may not use road movement through a blocked road point. A blocked road point can be caused by enemy action such as an antivehicle obstacle, or by a vehicle which remains stationary there during the course of the Movement Phase. The wreckage of a disabled or destroyed vehicle on a road is also considered a blocked road point.

Stands may not leave a road to travel on terrain they cannot move on (although they may be pushed off onto such terrain in accordance with Rule 12.3).

5.3 Cross-Country Movement

If a vehicle moves off-road for any portion of its movement during its Movement Phase, it must use its cross-country movement allowance for the entire phase.

A stand must attempt to move in the direction shown by the arrow on its order chit and must end the Movement Phase facing in the same direction as the arrow on the order chit.

Small changes of direction are allowed during movement in order to avoid obstacles, but such a unit must still end the phase facing in the same direction as the order chit. If a referee is present, he judges what variations of movement direction are reasonable. In games without a referee, a stand may not use more than 20% of its movement allowance to dodge obstacles.

Stands may freely move through positions held by friendly stands, so long as they do not end the move in the same position as friendly stands.

5.4 Movement and Enemy Units

No personnel stand may move through or end its movement in a position (a bunker, entrenchment, pillbox, etc.) occupied by an enemy stand.

No ground vehicle stand may move through or end its movement in a position occupied by an enemy vehicle. A vehicle may move through a position occupied solely by enemy personnel stands.

Flying vehicles are not affected by the presence of enemy stands.

5.5 Terrain Effects and Movement

Terrain can affect the movement of stands, depending on their type and the terrain they are attempting to cross. The cost of a stand to move across a given type of terrain is either:

- Times two (×2): The stand pays 2 cm of movement for every 1 cm of actual movement.
- Times 4 (×4): The stand pays 4 cm of movement for every 1 cm of actual movement.
- Prohibited: The stand is not allowed to move into that type of terrain.

The penalties caused by contour lines represent natural slowing when moving up or down a grade.

5.51 Effects of Terrain on Personnel Stands: Personnel stands pay double movement costs when moving through jungle, settlement, rubble, steep slopes and swamps and when moving across creeks or along creekbeds.

5.52 Effects of Terrain on Tracked Vehicle Stands: Tracked vehicle stands pay double movement costs when moving through woods, settlements and creeks. They may not enter jungle, rubble, steep slopes or swamps, nor may they move along creeks. They pay a 5cm penalty for each contour line they move across (either up or down).

5.53 Effects of Terrain on Wheeled Vehicle Stands: Wheeled vehicles pay quadruple movement costs when moving through woods. They may not enter jungle, swamps, rubble or steep slopes, or move along creeks. They may only cross creeks at a ford. They pay double movement costs when crossing a creek at a ford, or when moving through a settlement. They pay a 10cm penalty for each contour line they cross.

5.54 Effects of Terrain on Air Cushion Vehicle Stands: Air cushion vehicles pay quadruple movement costs when moving through rubble and settlements. They may not enter jungle or woods, nor may they cross steep slopes. They pay double movement costs when moving through open woods. They may cross water barriers and move through swamps at

Terrain Effects

Terrain Type	*Personnel*	*Wheeled Vehicle*	*Tracked Vehicle*	*Air Cushion Vehicle*
Broken	×2	P	×4	×2
Cliff	P	P	P	P
Contour line	—	–10 cm†	–5 cm†	–20 cm†
Creek/ford (cross)	×2	×2*	×2	—
Dense vegetation (Jungle)	×2	P	P	P
Light vegetation (open woods)	—	—	—	×2
Moderate vegetation (woods)	—	×4	×2	P
Railway embankment (cross)	—	P	–10 cm†	–20 cm†
Rubble	×2	P	P	×4
Sand	—	×2	—	—
Sand dune	×2	×4	×2	—
Settlement	×2	×2	×2	×4
Steep slopes	×2	P	P	P
Swamp/marsh	×2	P	P	—

*Only at fords.
†Per line crossed.
P: Prohibited.
—: Normal movement.
This chart does not include terrain types discussed in the Advanced Rules.

no additional penalty. They pay a 20cm penalty for each contour line they cross.

5.55 Settlement Blocks: Only personnel stands and towed weapons may be placed in settlement blocks. Vehicles may enter settlements but must remain on the streets or in alleyways.

Each block of buildings in a settlement should have a 1:1 scale cutout of card stock or paper. The number of personnel stands that can be placed in the settlement block is the number which can physically be fit on the cutout. A towed weapon doubles the effective size of its crew stand.

Refer to the Terrain Effects Table on the previous page.

Example: An infantry stand is moving through a jungle under a *cautious advance* movement order. With a movement allowance of 20 cm, the stand could move 10 actual centimeters through the jungle (each centimeter of jungle costs it 2 cm of movement allowance). If the stand crosses a 5cm creek and then moves through a jungle, it would only be able to move 5 actual centimeters in the jungle (the creek costs it 10 centimeters of movement allowance).

5.6 Special Movement Cases

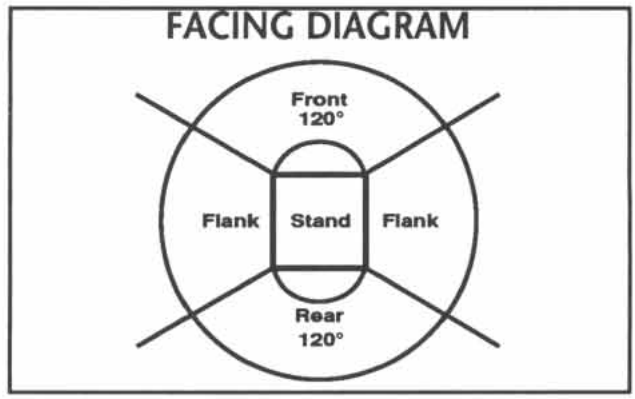
There are a number of special movement cases that need to be covered:

5.61 Backing Up: A ground vehicle that receives a *cautious* or *rapid advance* order may back up using the cross-country movement rate. It does so by paying quadruple movement costs prior to any modifiers for terrain. The vehicle moves in the direction of the arrow but faces in the opposite direction.

5.62 Man-Handling Towed Weapons: Players may elect to have unlimbered class I and II towed weapons moved forward by their crew or other personnel stands. To man-handle a towed weapon, the personnel stand must start adjacent to the weapon and must be given a *cautious* or *rapid advance* order. Class I towed weapons are moved 2 cm with a *cautious advance* order and 4 cm with a *rapid advance* order. They pay any terrain modifiers as if they were a personnel stand. Class II towed weapons are moved 1 inch with a *cautious advance* order and 2 cm with a *rapid advance* order. They pay any terrain modifiers as if they were a wheeled vehicle.

5.7 Movement to Contact

Occasionally, stands of opposing sides will find themselves ordered to move toward a common destination or through one another's lines. In these cases, resolve the point of contact by moving stands on both sides proportionally (for example, move each stand one quarter or one-tenth of its movement at a time until contact is made).



5.71 Closing to Contact: A unit given a *cautious advance* order may never move more than halfway toward any visible enemy unit. If it encounters a previously unspotted enemy unit during movement, it immediately stops at the normal autospot distance for that terrain. Units may only close to contact with enemy units if given a *rapid advance* order.

5.72 Drive-Through: Ground vehicles given a *rapid advance* order may drive through or over enemy personnel and towed weapons. The vehicle is stopped immediately before moving through the stands, but its order marker is moved to its projected final destination. The vehicle will finish its movement only after all opportunity fire (see Rule 7.23) has been resolved. If the vehicle is still able to move after opportunity fire, it completes its movement.

Any towed weapon of a smaller mass category than the moving vehicle driving through is crushed.

Any unarmored vehicle of a smaller mass category than a tracked vehicle driving through is crushed.

Each personnel stand driven through must make a saving throw to avoid taking a casualty (the casualty being crushed by the moving vehicle). The saving throw is made by the owning player rolling 1D20 as if conducting close range fire. In other words, Elites avoid a casualty by rolling 15 or less, while Novices avoid a casualty by rolling 9 or less.

5.8 Facing

All stands have facing. They must face in a specific direction. In the Movement Phase, stands have their facing determined by their movement chit (that is, they must end the turn facing in the direction of the movement chit). All stationary stands may freely change their facing at the beginning of the General Fire sub-phase. All stands may freely change their facing at the beginning of the Final Fire sub-phase, no matter what order they were given.

5.81 Front and Flank: The front of a stand is the 120° arc to its front. The stand's remaining 240° arc is its flank. To determine front and flank, use the template included with the game.

5.82 Fields of Fire: All personnel stands, all vehicle weapons in turrets and all towed weapons mounted on turntables have 360° fire (they may fire in any direction). All other weapons may only fire to their front 120° arc.

5.83 Firing on the Flank: AFVs have armor ratings for front and flank. If the incoming fire is from the flank, use the flank armor rating. Otherwise, use the frontal armor rating.

5.84 Top Attack: AFVs have top armor ratings as well. If the incoming fire is a top-attack missile or is fired from a flying vehicle firing from higher than NOE altitude, it is considered a top attack.

RULE 6: VISIBILITY AND SPOTTING

Opposing stands are not visible to each other at all times. Enemy stands may be hidden from view and must be spotted before they become visible.

6.1 HIDDEN STANDS

Stands that are not visible to the opposing player are not placed upon the playing surface. Some or all stands may start the game hidden, depending on the scenario being played and the referee's decisions. There are two methods available to keep track of hidden stands. The first method requires the use of a referee; the second is used if there is no referee.

6.11 Hidden Stands With a Referee: The hidden units are not placed on the playing surface. The owning player keeps track of the hidden stands and their orders on a map. Orders issued to hidden stands do not have their chits placed on the playing surface.

The referee keeps track of the location of the hidden stands and resolves all game functions regarding the hidden stands without revealing any information about the stands. All die rolls for spotting, therefore, are made by the referee to avoid revealing any information about the die roll. The opposing player is only informed of the spotting attempt if it is successful and the spotted stands are placed in position on the playing surface.

6.12 Hidden Stands Without a Referee: If a referee is not available, then it is suggested that the players use the numbered counters supplied with this game to represent hidden stands (if more are needed, they are also easy to make out of blank game counters, tiddly-winks, poker chips and the like).

Each side should have an equal quantity of numbered counters, regardless of the number of stands they have hidden. A numbered counter may represent one or more similar stands, or the counter might represent a dummy (no stands assigned to it).

Treat dummy counters as if they represent real stands until spotted. A dummy stand may move as any type of stand, and change its type from turn to turn. However, dummy stands still need an order chit to move, though this chit is free and need not be actually issued by a command or staff stand. When attempting to spot such a chit, treat it as what it last moved as. Thus, if it moves as a vehicle, then all spotting attempts should treat it as a vehicle.

If the spotting attempt succeeds, the numbered counter is replaced with the stands it represents. The dummy counter is removed from play when spotted. If the spotting attempt fails, then the counter continues as before.

Dummy counters may not attempt to spot enemy stands.

If a visible stand starts the Movement Phase without any enemy stands having a line of sight (see Rule 6.3, below) to that stand, the stand may be replaced with two numbered chits. One chit represents the actual stand, while the second serves as a dummy. Either (or both) chits may be move in the Movement Phase that follows.

6.2 Visibility

The normal maximum visibility range is 500 cm, which is almost always the range of the table or more. For spotting only, increase the maximum visibility distance by 50 cm for every level higher that the spotting stand is over the intended target.

Example: A recon stand is on a hill three levels high. For purposes of attempting to spot a unit on the board on the base level, it would have a maximum visibility of up to 650 cm.

6.3 Line of Sight (LOS)

A stand may only be visible to another stand if it is within visibility range and an unblocked line of sight can be traced between the two stands. A line of sight is a straight line between the two stands. It is blocked if it passes through an obstacle. Obstacles are cover, hills, smoke, friendly stands, and disabled and destroyed vehicles.

6.31 Cover: Cover is defined as any of the following: jungle, woods, open woods, swamps, sand dunes, settlements and rubble. In addition, depending on the scenario, stone walls, hedgerows, fields, exceptionally tall grass or scrub vegetation, very broken ground, embankments and other terrain may offer cover for purposes of determining visibility (at the discretion of the referee or by previous agreement among the players).

If any portion of a stand is not in cover or smoke, then that portion of the stand may be spotted (which reveals the entire stand).

6.32 Open Woods and LOS: A line of sight between stands in the same open woods is not blocked if the stands are within 10 cm of each other. A line of sight may be traced 5 cm into an open woods area from outside.

6.33 Woods and LOS: A line of sight between stands in the same woods is not blocked if the stands are within 5 cm of each other. A line of sight may be traced 1 cm into a woods area from outside.

6.34 Jungle and LOS: A line of sight between stands in the same jungle is not blocked if the stands are in contact. Troops in a jungle are visible only if in contact with the edge of the woods.

6.35 Roads/Trails and LOS: Roads or trails through woods and jungle have a line of sight of 10 cm along the road/trail itself, while roads/trails through an open woods have a line of sight along the road of 20 cm. Stands which are using line of sight along a road or trail must be inside the edge of the open woods, woods or jungle.

Any stand *outside* the open woods, woods or jungle boundary looking down a road or trail that is *inside* an open woods, woods or jungle boundary has its visibility blocked at 5 cm for open woods, 1 cm for woods and 1 cm for jungle.

6.36 Settlements, Streets and LOS: A line of sight between stands is not blocked in the same settlement block or adjacent settlement blocks if the stands are within 2 inches of each other. (Settlement blocks divided by roads or streets are *not* considered to be adjacent.) A line of sight may be traced 1 inch into a settlement block from outside the settlement, or from a

nonadjacent settlement block.

Streets through settlements have a line of sight of 10 cm along the street itself, while roads through a settlement have a line of sight along the road of 20 cm. Stands which are using line of sight along a road or trail must be past the boundary of the settlement. Any stand looking down a road or trail that is not inside the settlement boundary still has its visibility blocked at 1 cm.

When a line of sight is traced between stands at different elevation levels, the line of sight may pass over any obstacles or cover in between the stands, leaving the actual line of sight unblocked. If the height of the obstacle is less than or equal to the height of both stands, the line of sight is unblocked.

If the obstacle is higher than one of the stands, then the following applies: The minimum requirement for passage of line of sight over an obstacle is that the stand on the higher elevation must be at least one level higher than the obstacle, and that the obstacle be closer to the higher stand than the lower stand.

In addition, the obstacle can not be within 2 inches of either stand. If the higher stand is at least two levels higher than the lower stand, the obstacle can be at any point along the line of sight, as long as it is not within 2 inches of either stand.

The height of the obstacles is computed as follows:

Obstacle Height

Obstacle	*Height*
Friendly stand	1 level
Hill	2 levels for each contour level that the hill is above the lower stand. Sand dunes count as one contour hill.
Cover	2 levels, unless the referee/scenario determines otherwise
Smoke	3 levels

For purposes of determining an obstacle, hills have a cumulative effect in that they are added to any other obstacle found on top of them. Thus, if woods (cover) are found on top of a hill one contour high, the obstacle would be treated as if it were four levels high.

If single-figure stands are attempting to spot out of a settlement, for all purposes of spotting they are considered to be at level 2 elevation. All stands located in a settlement, including single-figure stands, are considered to be at level 1 for purposes of being spotted.

Example: A command stand is located in a settlement, and attempting to spot a vehicle on a one level contour hill 100 cm away. There are woods 35 cm away from the settlement. Since both the command stand and the target stand are considered to be located on level 2, the same as the height of the woods, the woods do not block line of sight for the command stand.

However, for the vehicle attempting to trace a line of sight to the command stand, it is considered as being on the first level of the settlement, and since the woods are equal in height to that of the vehicle, the vehicle does not have a line of sight back to the settlement.

Note that only single-figure stands can claim this bonus. All other stands attempting to spot out of the settlement are considered to be at the first level, and therefore do not have a line of sight back to the vehicle, since the woods are two levels high.

6.4 Spotting

Spotting may be attempted in the Movement Phase and at the end of each Fire sub-phase (provided the target of the spotting attempt fired in that sub-phase). Each time that there is a chance of spotting an enemy unit, a spotting attempt may occur. For each hidden enemy stand that a player is attempting to spot, there must be at least one stand that has an unblocked line of sight to the enemy stand. Regardless of the number of stands that have an unblocked line of sight to the hidden enemy stand, only one spotting attempt may be made to spot the stand per phase. This attempt is made by the stand with the best chance of spotting.

6.41 Spotting During Movement Phase: In the Movement Phase, spotting is resolved at the end of the phase, but it is assumed to take place at the point where the stand would have its best chance of spotting the enemy. If both the spotting and hidden stand are moving, use proportional movement to determine where the spotting would have taken place.

6.42 Spotting During Fire Phase: During each Fire Phase, one additional attempt to spot enemy stands is allowed. Only enemy stands which fire may be spotted during the Fire Phase. Spotting is resolved at the end of the sub-phase in which the stand fired. Those stands that were moving during the Movement Phase are still considered to be moving for purposes of spotting, though all actual movement is finished by this point in the turn. All spotting attempts during the Fire Phases are made from where the stands end their movement.

6.43 Resolving Spotting: The unit attempting to spot determines what sensor it will use. All units have "eyeball" sensors available, but many also have one or more form of advanced vision enhancement or sensor available. Only one may be used per spotting attempt.

Measure the range to the target against which the spotting attempt is to be made. The referee should do this, perhaps with the spotting team turned away, to avoid disclosing the actual location of units when no dummy counters are in use. The range determines the correct sensor range column (short, medium, long or extreme) used.

The status of the spotting unit and the target unit provided will provide increases or decreases to the difficulty of the spotting attempt, called +diff mods or –diff mods. Each + or – diff mod has the effect of moving the range band at which the attempt is made one closer or farther away. These are listed on the table below and are expressed in terms of diff mods.

All modifiers (both positive and negative) are added together to find a single cumulative difficulty modifier. If this reduces the range to less than short range, the target is automatically spotted, and no die roll is made. If it increases it

to more than extreme range, no die roll is made, and the attempt automatically fails, *unless the target is within short range of the unit attempting the spot.*

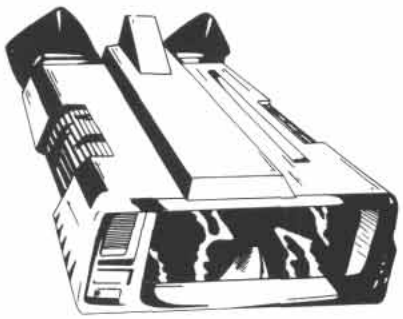
Units very close to hidden enemy units may still be able to spot them. If the target is within short range, the cumulative +diff mods are instead used as progressive halvings of the printed short range of the spotting unit.

Example 1: An enclosed vehicle spotting to its flank or rear using eyeball is attempting to spot an enemy personnel stand stationary under cover at a distance of 30 cm. This is within eyeball close range (100 cm), but the target enjoys a total of +4 diff mods, which would normally make the spot impossible. Converting this to four progressive halvings of the short range produces a modified short range of 6.25 cm (rounded down to 6 cm). This would make medium range 12 cm, long range 24 cm and extreme range 48 cm. Since the target is at 30 cm, the spotting attempt is resolved using the extreme range success number.

Example 2: A personnel stand using eyeball is attempting to spot an enemy personnel stand stationary under cover at a distance of 20 cm. This is within eyeball close range (100 cm), but the target enjoys a total of +2 diff mods, which would normally push the spotting range out to long. Converting this to two progressive halvings of the short range produces a modified short range of 25 cm. Since the target is at 20 cm, the spotting attempt is still resolved using the short range success numbers.

Spotting Difficulty Modifiers

Spotting Stand is	*Diff Mod*
Recon	–1
Elite	–2
Veteran	–1
Green	+1
Moving	+1
Enclosed vehicle spotting to front	+1*
Enclosed vehicle spotting to flank	+2*

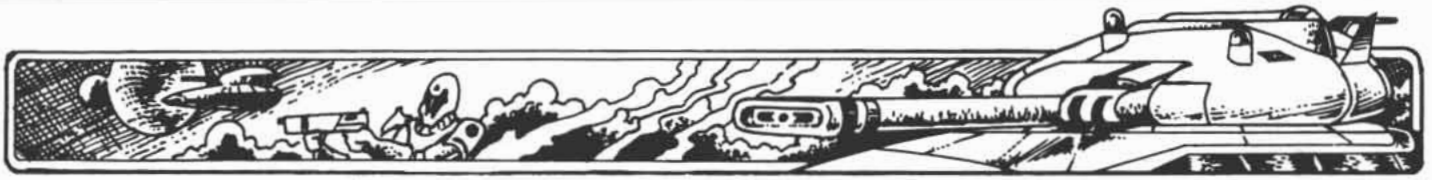


Target Stand is	*Modifier*
Moving	–1
Firing	–1
Stationary under cover	+1
Personnel	+1

*Modifiers apply only when conducting naked eye spots; they do not apply when using any sort of electronic sensor or vision enhancement equipment.

6.44 Handing Off Targets: Once a hidden enemy stand is spotted, it can be fired at during the next Fire Phase by all elements of the spotting unit that have a direct line of sight to it and are otherwise eligible to fire. Other stands not part of the spotting unit may fire at it on the turn after that. For this purpose, a "unit" is defined as all elements that are subordinated to the same platoon or company-level headquarters.

Example: A Reformation Coalition force has two task forces operating together, each built about a company headquarters, with an grav tank platoon, lift infantry platoon, powered armor platoon, recon squad, etc., attached to each. If a stand in either task force is successful in spotting an enemy unit, all elements of that task force may fire at it in the next Fire Phase. The elements of the second task force must wait until the following turn before they can engage those targets.



6.45 Autospot: Stands are automatically spotted under certain limited conditions. Any stand in contact with another stand is automatically spotted by that stand. Any personnel stand that approaches within 5 cm (or the limits of visibility as modified by weather, terrain and all other factors, whichever is less) of an enemy stand automatically spots that stand. Any stand moving and firing in the open is automatically spotted by all units within visibility distance.

RULE 7: DIRECT FIRE COMBAT

There are two types of fire combat: direct fire and indirect fire. Direct fire consists of flat trajectory fire from a firing unit to a visible target. Indirect fire consists of any fire which is at a target observed by a different stand as well as any high-angle plunging fire. Thus, mortar fire is always indirect fire, even when the firing crew can see its target.

Fire combat takes place in the Fire Phase. All fire is directed at individual stands, which will be referred to as "targets." The information presented in this section is relevant to all types of fire.

Units eligible to fire in the Fire Phase may do so, but are not required to. Fire in the Fire Phase is not simultaneous, but is instead conducted in order based on the type or order given the unit and its initiative level. To facilitate this, the Fire Phase is broken down into three sub-phases: Opportunity Fire, General Fire, and Final Fire.

7.1 Direct Fire Resolution Overview

When a stand direct fires at a target, the fire is resolved in several simple steps. The fire from the stands involved will depend on the weapons with which they are equipped. The unit's data card provides the necessary information.

First the firing player measures the range from the firing stand to the target, measuring from the center of the edge of the firing stand closest to the target to the closest edge of the target stand. Comparing this to the ranges listed for the firing weapon on the unit's data card, the firing player determines which of the four range bands the fire is resolved at.

Consulting the correct column of the unit data card, the firing player notes the firing weapon's rate of fire (how many dice are rolled for hits). This may be reduced due to movement of the firing stand, as noted below.

Next the firing player looks at the top of the correct range column of the unit data card to determine the firing unit's hit number. This may be affected by target movement or concealment or other factors noted below.

Once the correct hit number is known, roll the correct number of D20. Each roll equal to or less than the hit number causes a hit.

In many cases, a stand will have the ability to use more than one weapon in the course of the turn. For example, a Pandina light reconnaissance vehicle is equipped with an autocannon and machinegun in its turret. During the Fire Phase it could fire both turret-mounted weapons, provided they fired at a single target.

7.2 Sequence of Fire

7.21 Fire Eligibility and Orders: The ability to fire depends on the order given. The Orders Summary Table below lists the sub-phase in which a unit fires depending on the order given in the Command Phase.

Thus a stand given a *disengage* order does not fire until the Final Fire sub-phase, while a stand given a *take command* order fires in the Opportunity Fire sub-phase.

Pinned units may not fire until the Final Fire sub-phase, regardless of the order given them.

7.22 Order of Fires: Fire is conducted in the general order prescribed by the Fire sub-phases. Within a sub-phase, units fire in the order of their initiative number, with the highest initiative units firing first. All fire by a unit is carried out before the next unit (with a lower initiative number or firing in a later Fire sub-phase) fires. A stand which is eligible to fire could therefore be destroyed or driven out of range early in the Fire Phase, and as a result not be allowed to fire when its turn comes.

Units firing in the same sub-phase and with the same initiative numbers fire simultaneously. All fire in a phase is simultaneous. The results of simultaneous fire do not apply to a stand until after it has had an opportunity to fire as well.

All firing stands of a unit must be allocated a specific target before any rolls are made. If more than one stand is to fire at an enemy stand, and the target stand is destroyed before the other stands have a chance to fire, they are *not* allowed to switch targets. They must fire at their designated target without regard for the effects of the other fire.

7.23 Opportunity Fire Sub-Phase: Stands conducting direct fire during the Opportunity Fire sub-phase may fire at a target at any point along its movement. The targets are returned to the point at which the firing player designates, and the fire carried out, with any results taking effect at that point. If the fire fails to halt the target stand, it is returned to its original destination.

Stands which are moving in cover and are fired at during the Opportunity Fire sub-phase do *not* receive benefit of cover for that sub-phase only.

7.24 General Fire Sub-Phase: The General Fire sub-phase is resolved after all opportunity fire. All fire is resolved based on the actual location of the target stands after all movement has been carried out.

7.25 Final Fire Sub-Phase: The Final Fire sub-phase is resolved after the General Fire sub-phase. All stands which fire in this phase may fire direct fire at any enemy stand within 25 cm. Stands further than 25 cm from an enemy stand may not fire during the Final Fire sub-phase.

7.26 Stabilized Guns: Stabilized weapons on vehicles facilitate fire on the move, and may modify the above general rules. See Rule 7.34 for the effects of stabilized guns on sequence of fire.

Orders Summary

Order	*Opportunity*	*General*	*Final*
No order	Yes	—	—
Take command	Yes	—	—
Cautious advance	—	Yes	—
Rapid advance	—	—	Yes
Disengage	—	—	Yes
Travel	—	—	—
Rally	—	—	—
Regroup	—	—	—

7.3 Number of Dice Thrown

7.31 Rate of Fire: Each weapon has a rate of fire (ROF), listed on the unit data chart. The ROF is the number of dice rolled for hits when the weapon is fired, assuming the weapon is stationary. Note that the ROF of the weapon varies with the range at which it is fired.

A weapon is not required to fire its full number of allowed dice.

7.32 Firing at Multiple Targets: A stand may normally use its full ROF during a turn. If it fires at more than one target, reduce its ROF by 1 for that phase. (A stand would have to have an ROF of 3 or greater to fire at more than one target in a phase.)

7.33 Movement and Fire: Movement affects both when a unit fires and its rate of fire.

Units which have received a *cautious advance* order subtract 1 from their ROF.

Units which have received a *rapid advance* or *disengage* order subtract 2 from their ROF.

7.34 Stabilized Weapons: Some vehicles have stabilized weapons which allow for more effective fire while moving. Stabilized weapons, if present, will be listed as basic, good or advanced.

7.341 Basic Stabilization: Weapons with basic stabilization do not subtract 1 from their ROF for a *cautious advance.*

7.342 Good Stabilization: Weapons with good stabilization treat a *cautious advance* as a *no order* and a *rapid advance* as a *cautious advance* for both ROF and sequence of fire purposes.

7.343 Advanced Stabilization: Weapons with advanced stabilization treat both a *cautious advance* and a *rapid advance* as *no order* for both ROF and sequence of fire purposes.

7.4 Determining Hits

The troop quality of the firing unit and the range band determine the unit's base hit number, which is recorded on the data card. Once the final hit number is determined, roll the correct number of D20. Each roll equal to or less than the final hit number is a hit.

7.41 Concealment: This base hit number is halved (rounding fractions down) if the target is concealed (+1 diff mod).

A target is concealed if it is in vegetation, partially obscured by smoke, deployed partially behind an obstacle (such as a vehicle hull-down or infantry firing over a wall), or inside of a structure, such as a settlement, entrenchment or hardened pillbox.

7.42 Single-figure Stands: Single-figure stands always have their hit number halved (rounding fractions down) in addition to all other modifications (+1 diff mod).

7.43 Small Arms Hit Distribution: Hits from small arms fire are not placed on just the target stand, but are randomly distributed within a 10cm area of the target. Any personnel stands in the same cover as the designated target stand may be hit. Vehicles in the target area are not affected by small arms fire unless they were targeted by the firing player. (Usually this will mean that they are wheeled or open-topped, but occasionally a player may choose to fire small arms at a more heavily protected vehicle to cause morale check.)

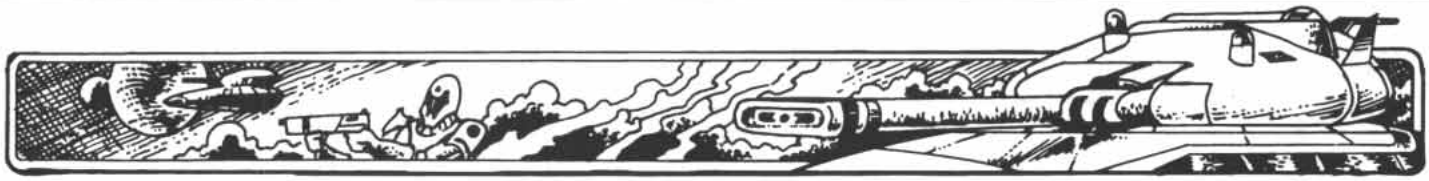
7.431 Procedure: Count the number of possible target stands within 10 cm of the target stand that are in the same cover. Assign each stand an equal chance of being hit, and roll 1 D20 to see which stands are hit. Note that some stands may be hit more than once, and that other stands, including the original target stand, may be left untouched.

Example: A native defender player inflicts six small arms fire hits on a group of Reformation Coalition stands. In the target area, there are two squad support laser (SSL) stands, a command infantry stand and three infantry stands. The native player states that he will use the following to determine which stand is hit.

Sample Small Arms Hit Distribution

Die Roll	*Target*
1-3	1st SSL stand
4-6	2nd SSL stand
7-9	Command infantry stand
10-12	1st infantry stand
13-15	2nd infantry stand
16-18	3rd infantry stand
19-20	Reroll

If the native player rolls a "13, 14, 12, 5, 20, 9, 10," he must reroll the 20. He does so, and rolls an 8. The first SSL stand and the third infantry stand are untouched; the second SSL stand takes one hit; and the command infantry, first and second infantry stands each take two hits. The effect of the hits will be determined by the troop quality of the target stand (see Rule 7.0).



7. 432 Different Modifiers: There will be circumstances where stands in the same area have different modifiers. The firing player may elect to fire at all the enemy stands in an area, only if he is willing to give all enemy stands the best possible modifiers. Otherwise, stands with a different modifier may not be fired at, even though they are in the same target area.

7.5 Protection and Penetration

Traditional low-tech infantry wears no armor heavier than a wool uniform, but as the battlefield becomes more dangerous, target protection becomes more widespread. Armored protection is treated differently for personnel stands and vehicles. In both cases, weapon penetration is important in determining what, if any, damage is inflicted by a hit.

7.51 Penetration: Each weapon has a penetration which is noted on the unit data card. The weapon's penetration is in parentheses after the unit's ROF. Some weapons have a "+" following the penetration value. These weapons are known as "plus penetration weapons." Other weapons are called "small arms."

7.511 Small Arms: The penetration value listed on the unit data card for the weapon is its actual penetration value. Note that this is usually different at different ranges. A listed penetra-

tion of "nil" means that it is largely ineffective at that range when used against armor.

7.512 Plus Penetration Weapons: Heavier weapons (those with a plus following their damage value) are called plus penetration weapons because their actual penetration value is the value listed *plus* the roll of 2D6. This roll is made separately for each hit scored by the weapon.

7.52 Personnel Stands: Some personnel stands are equipped with body armor. Body armor gives the personnel stand wearing it a saving throw whenever a hit is scored. In addition, hard cover can provide the same benefit.

7.521 Saving Throws: Whenever a personnel stand wearing body armor or behind hard cover is hit, the owning player rolls 1D6. If the roll is greater than the unit's saving throw number, the hit is suffered normally. If the roll is equal to or less than the unit's saving throw number, the hit has no effect. *However, a die roll of 6 always fails.*

7.522 Armor Saving Throw Numbers: The listed saving throw number is the **Traveller** armor value of the protection worn. If the armor only covers part of the target (as with a flak jacket or bullet proof vest), the saving throw number is halved, rounding down.

7.523 Cover Saving Throw Numbers: Certain types of hard cover provide a saving throw, as noted below.

Cover Saving Throw Number

Cover	*Save Number*
Wood building	1
Entrenchment, stone or masonry structure	2
Reinforced concrete structure	3
Crew or passengers in open armored vehicle	3

Troops wearing body armor and behind hard cover add their saving throw numbers together.

7.524 Penetration: The saving throw number is reduced by the penetration value of the firing weapon. Subtract the penetration of the firing weapon from the saving throw value of the target to get the final saving throw number. If the final number is less than 1, no saving throw is made.

7.5241 "Nil" Penetration Weapons: Some weapons have a penetration rating of "nil." Double the saving throw number of personnel stands when fired at by nil penetration weapons.

7.5242 Plus Penetration Weapons: Plus penetration weapons automatically cause one casualty on protected troops when they hit. The saving throw (if one is possible after subtracting the weapon's penetration) is made to avoid a second casualty.

7.53 Vehicles: All vehicles have some armor protection, even if from the sheet metal body. Vehicles do not receive saving throws. Instead, vehicles are unaffected by any direct fire hits which do not penetrate the armor.

7.531 Vehicle Armor: The unit data card should list the armor of the vehicle on a variety of faces. Vehicles attacked from the front 120° arc of the vehicle are protected by their front armor. Vehicles attacked from the rear 120° arc are protected by their rear armor. Attacks from outside those arc are protected against by side armor. Belly and deck armor are used only in special cases detailed later.

7.532 Penetration: Hits with penetrations less than or equal to the armor value have no effect.

If the penetration is greater than the armor by 1, 2 or 3, then the AFV takes one hit.

If the penetration is greater than the armor value by 4, 5 or 6, then two hits are taken by the AFV.

If the penetration value is greater by 7 or more, then the AFV, regardless of type, is eliminated in a particularly spectacular fashion, and is destroyed. Destroyed AFVs are marked with the burning vehicle counter supplied.

7.6 Exploding Rounds

Some types of ammunition explode on impact. Direct fire with exploding rounds is resolved using the same steps as above—the firing player rolls to see if a direct hit was obtained and then determines whether it caused any damage. However, whether the round scores a direct hit on the intended target or not, it will land in the general area of where it was fired, explode and potentially cause additional damage, both to the intended target and to any other stands within the burst area of the round.

7.61 Definitions: The effects of an explosive round are defined by its burst radius and its explosive power. Both values will be recorded on the unit's data card.

7.611 Burst Radius: The burst radius of a round is expressed in centimeters. All targets completely or partially inside the burst radius are attacked by the explosion. Each such target is attacked separately. When converting **Traveller** weapons to **Striker** terms, divide the round's primary burst radius (in meters) by 10 and round all fractions up.

7.612 Explosive Power: Stands within the burst radius of the round are attacked using the round's explosive power. Explosive power is the number or less that the firing player must roll on a D20 to cause a hit on the target, absent any modifiers to the roll for target type or target cover. Only vehicles and personnel stands are affected by the burst radius of an exploding round; towed weapons are not (although their crews are).

7.62 Target Modifiers: The explosive power of the round may be modified down due to either target type (vehicle) or target cover, or by both if both conditions apply.

7.621 Vehicles: Vehicles, particularly armored vehicles, enjoy a modifier against explosive damage. This modifier is recorded on the unit data card and applies to any stands carried as passengers as well.

7.622 Cover: Stands in certain types of covering terrain also receive an explosive power modifier, as shown on the following table.

Cover Explosive Power Modifier

Terrain	*Modifier*
Wooden building	–4
Entrenchment	–6
Entrenchment with overhead cover	–8
Stone or cement building	–8
Pillbox	–10

7.63 Example: The defender fires two exploding rounds at an enemy armored vehicle. One round hits the vehicle directly, while the other misses. Using the penetration value for the round, the firing player resolves the direct fire hit normally.

After the direct hit has been resolved, the firing player next determines the effect of the explosion of the two rounds. Even though the second round missed (i.e., did not score a direct hit on the tank), it is assumed to strike the ground very near the tank, and the actual aiming point is used as the center of its burst radius.

The firing player measures all around the tank and discovers that two personnel stands are in the radius. One of the stands is in an entrenchment, while the other is in the open. The tank is in the open and has an explosive power modifier of –5. The infantry in the entrenchment has a modifier of –6. The infantry in the open has no modifier.

The exploding rounds have an explosive power of 8. Since there are two rounds exploding, the firing player will roll two dice for hits on each stand in the burst radius. He will roll two dice for 8s or less against the infantry in the open, two dice for 2 or less for hits on the infantry in entrenchments, and two dice for 3 or less for hits on the tank. Note that this is in addition to any damage the direct hit on the tank may have caused.

7.7 Effects of Fire

Fire combat affects the target stand by inflicting hits. In addition, regardless of whether the stand fired at was hit, all stands in a group fired at must check morale (see Rule 9.1). The effects of any hits on a stand depend on whether the stand being hit was a personnel stand, vehicle or towed weapon.

7.71 Definition of Terms: The following terms are used to describe the effects of hits on stands:

7.711 Forced Back: A stand that is forced back must immediately move away from the closest visible enemy stand. Note that this may not be the stand whose fire caused the forceback. It must move as directly away from the enemy as possible, as long as it does not move toward any other enemy stands. If no enemy stand is visible, a forced-back stand moves toward the nearest cover. A forced-back stand must move its full cross-country movement allowance, but it may stop when it reaches cover. A stand that starts in cover may not be forced back out of cover, but it may be forced back deeper into that cover, and thus out of sight of an enemy stand. A forced-back stand is also pinned.

If a gun crew is forced back while it is adjacent to its towed weapon and that weapon's transport, it may limber the weapon with no movement penalty, then move the weapon with the crew during the forceback. If no transport is present, the weapon must be abandoned. Abandoned guns contacted by enemy stands are eliminated.

7.712 Eliminated: A personnel stand that is eliminated is removed from the playing surface. It is then available for regrouping and may thus return to play.

A vehicle that is eliminated through cumulative fire is disabled and remains on the table even though it is no longer in play, its status indicated by the "disabled" marker placed upon it. Vehicles which are disabled may be repaired in the course of a campaign game.

Passengers in or on a vehicle that is eliminated take one hit per stand, and dismount.

7.713 Destroyed: A vehicle eliminated by the effects of a penetration by 7 or more points (noted above), a flamethrower attack, or a single aerial bomb is destroyed and remains on the table, even though it is no longer in play. Its status is indicated by placing a burning wreck marker upon it. Vehicles which are destroyed may not be repaired in the course of a campaign game.

Passengers in or on a vehicle that is destroyed take one hit per stand, and dismount.

7.72 Personnel Stands: The effect of hits on a personnel stand is dependent upon the troop quality of the stand.

Novice: A Novice stand is eliminated when it takes its first hit.

Experienced: An Experienced stand is forced back when it takes its first hit. On its second hit, it is eliminated. All hits inflicted in the same Fire Phase take effect at the end of that Fire Phase. In other words, wait until all fire has been completed before implementing results.

Veteran: A Veteran stand suffers no effect from its first hit. If hit a second time, it is forced back. If hit a third time, it is eliminated and removed from play. All hits inflicted in the same Fire Phase take effect at the end of that Fire Phase.

Elite: An Elite stand suffers no effect from its first or second hit. If hit a third time, it is forced back. If hit a fourth time, it is eliminated. All hits inflicted in the same Fire Phase take effect at the end of that Fire Phase.

7.73 Vehicle Stands: The effect of a hit on a vehicle stand (a vehicle model) is dependent upon its armor value, as well as on the troop quality of the stand.

The cumulative effect of hits is the same as for personnel stands: The troop quality of the AFV stand being hit determines the effect of the hit(s). Thus, a Novice AFV is always eliminated by its first hit, regardless of the actual penetration. A Veteran AFV ignores its first such hit from a penetration value of 1 to 3, and is forced back on its second such hit.

Eliminated vehicles are left on the playing surface (since they block line of sight) but are specially marked.

7.731 Command Personnel in Vehicles: If a command vehicle is eliminated, its command personnel may switch to an adjacent vehicle at the start of a Command Phase. If a command vehicle is destroyed, however, the command personnel are eliminated.

7.74 Towed Weapons: Normally, hits inflicted on towed weapons are taken by the gun crew stands. However, in the event that they take a direct hit from a plus penetration weapon, the weapon that was hit is destroyed, even though the gun crew stand may still remain in play.

7.75 Marking Hits: Hits are best marked with the counters provided with the game, using the following code:

Counter Codes

Counter	*Code*
Green marker	1st hit on Elite
Yellow marker	2nd hit on Elite
	1st hit on Veteran
Red marker	3rd hit on Elite
	2nd hit on Veteran
	1st hit on Experienced

So whenever a stand with a green hit marker on it takes another hit, the green marker is removed and replaced with a yellow marker. Whenever a stand with a yellow hit marker already on it is hit again, the yellow marker is removed and replaced with a red marker. Whenever a stand with a red hit marker already on it is hit again, the stand is eliminated.

Note that stands which receive a red hit marker are forced back and pinned, regardless of their experience level. Some players may wish to mark disabled vehicles with tufts of white cotton and burning vehicles with tufts of black cotton, for increased visual effect.

7.8 Limitations on Fire

The following limitations exist on all types of fire.

7.81 Range and Line of Sight: An eligible stand may only use direct fire at visible targets if it is both in its line of sight and within its range.

If line of sight does not exist, no fire is allowed. If the weapon is out of range, then the fire is carried out, but has no effect on the intended target.

7.82 Mount Weapons: All weapons fired from a mount (such as a tripod mount or a mortar fired from a bipod) must be stationary to fire.

7.83 Towed Weapons: All towed weapons must be unlimbered in order to fire. Some towed weapons may take more than one Movement Phase to unlimber.

7.84 Restricted Field of Fire Stands: Stands with restricted fields of fire may only engage targets which are to their front facing. The following have restricted fields of fire:

- All vehicle weapons not mounted in turrets or on open pintle mounts.
- All towed weapons.

Stands with all-around fields of fire may fire at targets through any of their facings. The following have all around fields of fire:

- Personnel stands.
- All vehicle weapons in turrets.

7.85 Vehicle Passengers: All vehicle passengers, including stands that are being transported on AFVs, may only fire in the Final Fire sub-phase.

7.86 Hull Weapons: Hull weapons are mounted in the hull of a vehicle, as listed on unit data charts. If a vehicle is in a hull down position in regard to another stand, the vehicle's hull weapons may not fire at that stand.

7.87 Turret Weapons: All turret mounted weapons of a vehicle must be fired at the same target. A vehicle may not fire its main turret gun at one target, and engage another target with its turret machineguns, for example.

7.88 Multiple Weapons: Some personnel stands have multiple weapons. A fireteam might, for example, be equipped with gauss rifles as the team's primary weapon but also have RAM rifle grenades and a plasma bazooka as an integral antitank weapon.

In general, a personnel stand may only fire one weapon at a time. A stand may fire an integral antitank weapon as well as the stand's principal armament, but the ROF of both weapons is halved, rounding fractions down (but never reducing the ROF to zero).

Hand grenades are an exception to this. A stand may always throw hand grenades (if in range) in addition to firing the stand's primary weapon, at no ROF penalty.

7.89 Limited Ammunition: For purposes of the basic game, all vehicles, towed weapons and personnel stands are assumed to have unlimited ammunition for their main weapons and for all small arms. Secondary weapons, such as rifle grenades or integral antitank weapons, or specialized weapons, such as **Traveller** launchers, may have a limited number of shots available.

Troops usually carry only one Fire Phase worth of grenades, so each stand can fire grenades only once per scenario.

Integral weapons (those carried by a fireteam in addition to their main weapons) usually only have ammunition for two turns worth of fire.

So, for example, an infantry stand with an integral assault rocket launcher (ARL) would have unlimited ammunition for its small arms and two turns worth of fire for its ARL. A stand identified as an ARL stand, on the other hand, would have unlimited shots for its ARL.

Tac missiles have the number of rounds indicated in the data annex.

For more detailed ammunition rules, consult the supply and ammunition rules in the campaign section.

7.9 Tac Missiles

In the basic game, there are two types of tactical (Tac) missiles: operator-guided and target-designated. Operator-guided missiles are flown to the target by an operator who has a direct line of sight to the target. Target-designated missiles are fired from a distant launcher and home on the reflected radiation of a target designator used by an observer with a direct line of sight to the target.

Target-designated missiles are not considered direct fire, and are covered later under the heading "precision indirect fire." Operator-guided missiles, however, are treated as direct fire.

7.91 Range and Accuracy: Tac missiles have only a single range, which is the missile's maximum effective range. All targets within that range are attacked as if at close range. For this reason, Tac missiles are listed only with short range performance information.

RULE 8: INDIRECT FIRE

There are two types of indirect fire: precision and area.

Precision indirect fire consists of an observer with a direct line of sight to the target guiding in an individual round fired from a separate launcher. The round is usually a missile, but could also be a guided bomb or artillery shell. Meson gun fire is also treated as precision indirect fire. The observer usually uses some sort of target designator, like a laser, but may instead actually remotely pilot the round to its target.

Area indirect fire consists of a launcher firing unguided rounds (usually explosive) into the area of the target. An observer directs the fire. Usually the observer is considerably closer to the target than is the firing weapon, but not always. Certain weapons which do not have a direct fire capability (such as mortars and artillery rockets) often engage targets directly observed by the gun crew. Since this is high arcing fire, though, it is considered a form of indirect area fire.

8.1 Precision Fire

8.11 Observation: Observers for precision indirect fire must have an unobstructed line of sight to the target and a means of directing the ordnance to the target. In most cases this consists of a laser designator, although in early Tac missiles this consists of the missile launcher/control system itself. The unit data card will indicate which stands can observe for which precision indirect fire weapons.

If the observer of a precision indirect fire mission is eliminated or forced back by fire during a turn before the precision indirect fire is resolved, it automatically misses.

8.12 Accuracy: Precision indirect fire is resolved exactly as direct fire, using the accuracy and range bands of the observer's laser designator or, if it is controlled by the launcher, using the accuracy and range bands of the vision system used (usually "eyeball"). Range is measured from the observer to the target.

If the observer received any sort of movement order during the turn, the range is treated as one range band longer. That is, short becomes medium, medium becomes long, etc.

8.13 Restrictions: The launcher for a precision indirect fire attack must be issued a *no order* for it to fire (or must be mounted on an aircraft, or mounted on a vehicle with good enough stabilization for the vehicle to be considered as having a *no order* for firing purposes).

The target must be within the maximum range of the launcher when the fire takes place.

The launcher must fire in the Opportunity Fire sub-phase. This will affect enemy unit spotting of it if they have a direct line of sight to it. If the launcher is destroyed before its attack is resolved, the missile or round is still in the air and may still hit. Only if the observer is part of the crew of the launcher (as with early Tac missiles) will it be affected by hits suffered before the attack is resolved.

8.14 Sequence of Fire: Precision indirect fire takes place one sub-phase later in the Fire Phase than it normally would based on the order given the observer. That is, precision fire directed by an observer with *no order* would take place in the General Fire sub-phase. Precision fire directed by an observer with a *cautious advance* order would take place in the Final Fire sub-phase. Order of fire within the sub-phase is based on the initiative of either the observer or the launcher crew, whichever is lower.

Precision indirect fire which takes place in the Final Fire sub-phase is not subject to the normal range limitation of final fire.

8.2 Area Fire

8.21 Observation: Observers for area indirect fire must have an unobstructed line of sight to the target and a means of directing the fire mission to the target. In most cases, this consists of a communication link back to the firing weapon, although in some cases the gun crew may be observing for its own fire.

If the observer of an area indirect fire mission is eliminated or forced back by fire during a turn before the indirect fire mission is resolved, it automatically misses.

There are two types of observers for area indirect fire missions: dedicated forward observers and temporary spotters.

8.211 Dedicated Forward Observers: The unit data card will indicate which stands are dedicated forward observers for which indirect fire weapons. There is usually one dedicated forward observer for every unit of two or more area indirect fire weapons.

Dedicated forward observers must have been given *no order* in order to call a fire mission. All fire missions called by dedicated forward observers are resolved during the General Fire sub-phase. The owning player decides during the sub-phase where the mission is desired and then resolves it.

8.212 Temporary Spotters: Any platoon or higher command stand can function as a temporary spotter if it has a communication link to the indirect fire weapon.

All spotter stands must be given *no order* in order to call a fire mission. Spotters may only control fire from one unit at a time. To do so, during the Command Phase, the owning player must record the following information for each mission:

1. Which unit is firing the mission.
2. What type of round it is firing.
3. The geographic target point on the playing surface.
4. Sheaf pattern.
5. The spotter for the mission.

Temporary spotters must have been given *no order* in order to call a fire mission. All fire missions called by temporary spotters are resolved during the Final Fire sub-phase, even though it is plotted in the Command Phase

8.22 Sheaf Patterns: All indirect area fire missions of more than one firing weapon or where the firing weapon has a rate of fire greater than 1 are fired using a sheaf to show how the rounds will fall in relation to the target. Two types are used: a converged sheaf where all rounds impact on the same point, or a dispersed sheaf where the rounds are placed to cover a wider area. If fire is being plotted at a moving target, then a converged sheaf pattern may not be used.

Sheaf patterns may be cut out of any convenient material (paper, thin cardstock, acetate or plastic). They are always circles, and their dimensions vary with the burst radii of the individual weapons. Consult the unit data card for specific dimensions.

8.221 Converged Sheaf: A converged sheaf means that all shots fired for this mission land on the same target point. If the fire is on target, then a single template is used, with all rounds fired landing in that area.

Example: A battery of three mortars, each with an ROF of 2, fire a converged sheaf. All six rounds fired land in the same place, and any target inside the sheaf is attacked by six separate die rolls.

A converged sheaf may not be used against a moving target. If a converged sheaf is fired at a stationary target and a moving unit has ended its movement within the burst area of the sheaf, only one round (one die) is used to attack the moving target, while all rounds in the sheaf attack the stationary target.

8.222 Dispersed Sheaf: A dispersed sheaf means that the rounds fired for this mission are spread out over a wider area than in the converged sheaf. The templates for each weapon in the firing unit are placed adjacent to each other, perpendicular to the line of fire, and with the target point in the center of the templates.

For each stand firing in the unit with a dispersed sheaf, there must be an equivalent impact area. If the ROF of the unit is 2 or more, then additional impact areas may be added, or the additional rounds fired into the existing areas at the firing player's option.

Example: In the case of the mortar battery mentioned above, its dispersed sheaf could consist of three impact templates in a line, each with two rounds hitting, or it could consist of six impact templates in a line, each with one round hitting.

8.23 Accuracy: Accuracy is a function of troop quality and range. The hit number for the area fire mission is the long-range accuracy for spotters and medium-range accuracy for observers. Observers and spotters calling fire through a fire direction center (FDC), use the accuracy for the next closest range band (medium for spotters, short for dedicated observers).

If the mission is on target, its fire is resolved using the procedure under indirect fire effects. If the mission fails, then the rounds go wide of the target and have no effect on the game.

Example: A Veteran forward observer stand is operating under a *no order*. The owning player declares during the General Fire sub-phase its planned point of impact, rounds fired and sheaf. As the stand is a Veteran forward observer stand, its medium-range accuracy is 6. Therefore, for the mission to fall as planned, the firing player must roll a 6 or less on 1D20.

Once a mission has been fired, it may be adjusted during the course of subsequent turns.

8.231 Continued Missions: Once an indirect area fire mission has been fired, it may continue to fall on the aiming point for the following turn as long as the spotter has a direct line of sight to the impact point. No further die roll is needed to keep the fire on that point.

Thus, if a mission that failed due to the die roll is continued on the next turn, it will automatically fall on that point without a further die roll needed.

8.232 Shifting Fire: Once a mission is on target, its target point may be shifted up to 10 cm (in any direction) and remain on target, provided the observer-spotter is operating under *no order* and has a line of sight to the new target impact point.

No new accuracy die roll is required, providing the impact point is moved 10 cm or less. Shifts of more than 10 cm are treated as if they were new fire missions.

8.24 Sequence of Fire: Area indirect fire takes place during either the General Fire sub-phase or the Final Fire sub-phase, depending on the type of observer used. Order of fire within the sub-phase is based on the initiative of either the observer or the launcher crew, whichever is lower.

Area indirect fire which takes place in the Final Fire sub-phase is not subject to the normal range limitation of final fire.

8.25 Limitations: The following limitations exist on stands engaging in indirect fire:

8.251 Movement: Any stand which is carrying out indirect fire must be stationary during the entire turn. It must be operating under a *no order* order for the turn. In addition, if it is a towed weapon, it must have been unlimbered before the start of the Command Phase.

8.252 Orders: A firing unit may only fire missions for one observer/spotter a turn. If more than one fire mission is ordered, then the owning player must choose during the Command Phase which mission the stand will fire. All other orders will be ignored.

8.253 Range: The IDF (indirect fire) data on the unit card (and in the data annexes to this book) lists a weapon's maximum indirect fire range. In addition, guns, howitzers and rocket launchers may not conduct indirect area fire at targets closer than one-tenth of their maximum range.

Mortars may not conduct indirect area fire attacks at targets closer than one-twentieth of their maximum range.

8.254 Fire Direction Centers: A fire direction center (FDC) is required if more than one weapon is firing the same fire mission (i.e., firing at the same target and directed by a single observer/spotter). The FDC must be in communication with the observer and the firing weapons.

FDCs have an effective indirect fire range based on their tech levels. Fire may be conducted by area fire weapons at ranges longer than the FDC's effective range, but accuracy is resolved at one higher range band. This means that spotters use long-range accuracy, and dedicated observers use medium-range accuracy.

8.3 Indirect Fire Special Rules

A number of special rules affect indirect fire.

8.31 Indirect Area Fire in the Opportunity Fire Sub-Phase: A stand may only conduct indirect fire in the Opportu-

nity Fire sub-phase if it successfully fired at the same target point in the previous turn. If ordered to continue firing at the same target point during this turn, it may fire during the Opportunity Fire sub-phase at any stand that moves through its impact area. If the target point is shifted, opportunity fire does not occur.

8.33 Ranging Fire: A player may elect to use ranging fire in order to place his fire mission. Ranging fire is carried out in the same manner as for indirect fire mission, so a *no order* order must be issued. Spotters must plot it during the Command Phase, while forward observers may mark it during the General Fire sub-phase.

Ranging shots are always on target but do no damage and use no ammunition for the turn they are carried out. A puff of smoke should be placed on the table, however, to show that a marking shell was fired at the target point.

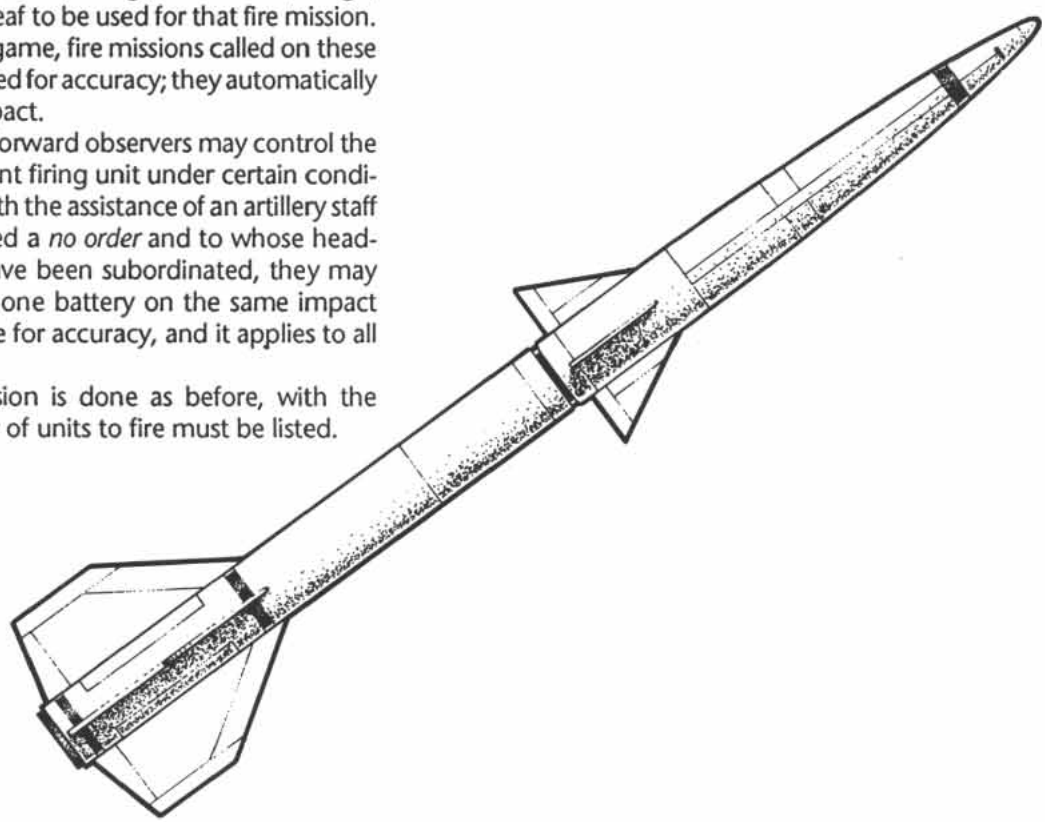
A ranging shot allows the same observer/spotter to call a fire mission from the same firing unit on the same target point next turn without need for an accuracy die roll. The mission is always on target.

8.34 Preplotted Defensive Area Fire: In a scenario when one side is holding a defensive position and has been in place for several hours, the referee may allow each dedicated forward observer stand to select up to six geographic points on which to preplot area fire for their parent unit. The plot must be of an actual geographic point (a village, crossroads, bridge, hilltop), and include the sheaf to be used for that fire mission.

If used in the course of a game, fire missions called on these points do not have to be rolled for accuracy; they automatically hit the chosen point of impact.

8.36 Multiple Control: Forward observers may control the fire of more than their parent firing unit under certain conditions. If they are working with the assistance of an artillery staff stand which has been issued a *no order* and to whose headquarters the other units have been subordinated, they may bring fire from more than one battery on the same impact point. Only one roll is made for accuracy, and it applies to all units firing at that point.

All plotting for this mission is done as before, with the exception that the number of units to fire must be listed.



8.4 Indirect Fire Smoke

Indirect fire weapons with smoke rounds may create smoke screens. The indirect fire procedure is followed for firing smoke missions with the difference that accuracy is not checked, as smoke missions are always on target.

8.41 Smoke Templates: Smoke templates have the same width as the round's HE template, but the length is three times the normal width. Thus, a smoke template for an HE round with a burst of 5 cm would have a smoke template 5 cm wide and 15 cm long. Smoke templates are always placed so that the length runs in a downwind direction from the point where the round was targeted. Additional rounds fired at the point of impact lengthen the screen, so that a screen made up of three rounds as described above would be 45 cm in length.

8.42 Duration of Indirect Fire Smoke: Indirect fire smoke is placed when the fire mission would normally arrive, and then it does not actually block line of sight until the beginning of the next turn. The smoke screen remains in effect for the entire following turn.

Note that smoke will therefore not block line of sight in the turn in which it is first placed, but will affect line of sight on the following turn.

RULE 9: MORALE

After the Fire Phase is finished, all stands which were fired at during the course of the turn must check morale. All stands start the game with a morale number (ranging up to 20), which may be changed as the game progresses due to losses and enemy action.

In addition, all *rally* and *regroup* orders are carried out at the end of the Morale Phase.

9.1 How Morale is Checked

All stands check morale as a group. For this purpose, a group consists of those stands operating under the same order chit, even if they may no longer be within 15 cm of each other.

As a practical matter, this usually means a command stand and all stands immediately subordinate to it. Stands must check even if the fire could not have caused any damage according to the rules (i.e., heavily armored vehicles which were fired at by small arms with a penetration of "nil" still must check morale). In addition, if any stand in a group is able to see a friendly stand eliminated, then the group must check morale. No matter what the reason is, no group will check morale more than once in the Morale Phase of a given turn.

Example: A gun crew, an attached engineer stand, an MG stand and an infantry stand are all operating under the direct command of a platoon commander. For game purposes, if any stand in the group has been fired at, the entire group must check morale.

9.11 Computing Morale: Compute the current morale of the group by checking with the following list of modifiers, and add or subtract any that apply.

9.12 Checking Morale: Roll 1D20 for each group which is checking morale. Note that different stands in the same group may have different morale numbers. If this is the case, only one die is rolled, and its result applies to all checks by the group. If the number rolled is equal to or less than their modified morale, the stands successfully pass the morale check. If the number rolled is higher, then they fail the check. The number by which the check is failed determines what happens to the unit.

Morale Modifiers

Condition	*Modifier*
Each stand/vehicle in the group hit this turn*	–1
Each stand/vehicle in group eliminated/destroyed this turn	–2
Stand is pinned	–2
Each friendly group within sight eliminated this turn	–4
Any enemy stand/armed vehicle within 25 cm	–4
Unit is operating under a travel order	–4
Any permanent morale modifiers	–1, –2, –3 or –4
Stand is under cover	+4

*If the stand is hit more than once in the same turn, the modifier remains –1, regardless of the total number of hits taken by the stand. Thus, an Elite stand which takes three hits still causes the unit only a –1 modifier.

Example: A Veteran infantry platoon, morale 16, has a command infantry stand, two infantry stands, and an MG stand operating together. The MG stand is left behind in cover to provide covering fire, while the remaining three stands press forward across an open field. During the Fire Phase, a total of four hits were taken. The command infantry stand and one infantry stand each took one hit. The second infantry stand took two hits, which forced it back, pinned, into cover. All stands are within 25 cm of enemy infantry.

The base morale number is 16, modified as follows: -3 as three stands were hit, –4 as enemy personnel are within 25 cm, so the modified morale number is a 9. The MG stand is in cover, so its morale is up 4 to 13. The forced-back stand is also in cover, but is pinned, so that its morale number is 11. For all stands to pass morale, a 9 or less is needed.

If a 10 was rolled, the MG stand and forced-back stand would pass morale, while the other two stands would fail by 1, and go pinned.

9.2 Morale Results

If the die roll is equal to or less than the modified morale of the stand, the stand passes morale. If the die roll is greater than the modified morale, the stand fails morale.

9.21 Pinned: If the die roll is 1, 2 or 3 higher than the modified morale of the stand, then that stand is pinned. Pinned stands may never move toward the enemy, and may only fire in the Final Fire sub-hase. The fire value of all attacks against pinned personnel stands is halved. The halving is done after all other modifiers to fire have been calculated. Pinned stands check morale with a –1 modifier.

When a unit receives a pin, either through morale or through fire, place a P2 marker next to it. At the end of the each Close Assault Phase, remove all P1 chits and flip each P2 chit over to the P1 side. P2 and P1 chits have the same effect. If a stand is pinned and already has a P2 or P1 chit, replace the chit with a P2 chit.

Rally orders are not needed to recover from the effects of a pin. Unless an additional pin result is collected, a unit recovers from a pin at the end of the Melee Phase when the P1 chit is removed.

9.22 Forced Back: If the die roll is 4, 5, or 6 higher than the modified morale of the stand, then the stand is forced back, pinned, and suffers a *permanent* morale reduction of 1. The morale modifier remains with the stand until it can be rallied. This condition is represented by the use of the morale modifier markers provided (Morale –1, etc.).

9.23 Demoralized: If the die roll is 7, 8, or 9 higher than the modified morale of the stand, then the stand is demoralized and suffers a *permanent* morale reduction of 2. A demoralized stand keeps a P2 marker until rallied, with the additional requirement that it may not fire or move unless it is not in cover and it can see enemy units. If unable to move without moving closer to an enemy unit, it is eliminated. This condition is represented by the use of the demoralized markers and the morale modifier markers provided (Morale –2, etc.).

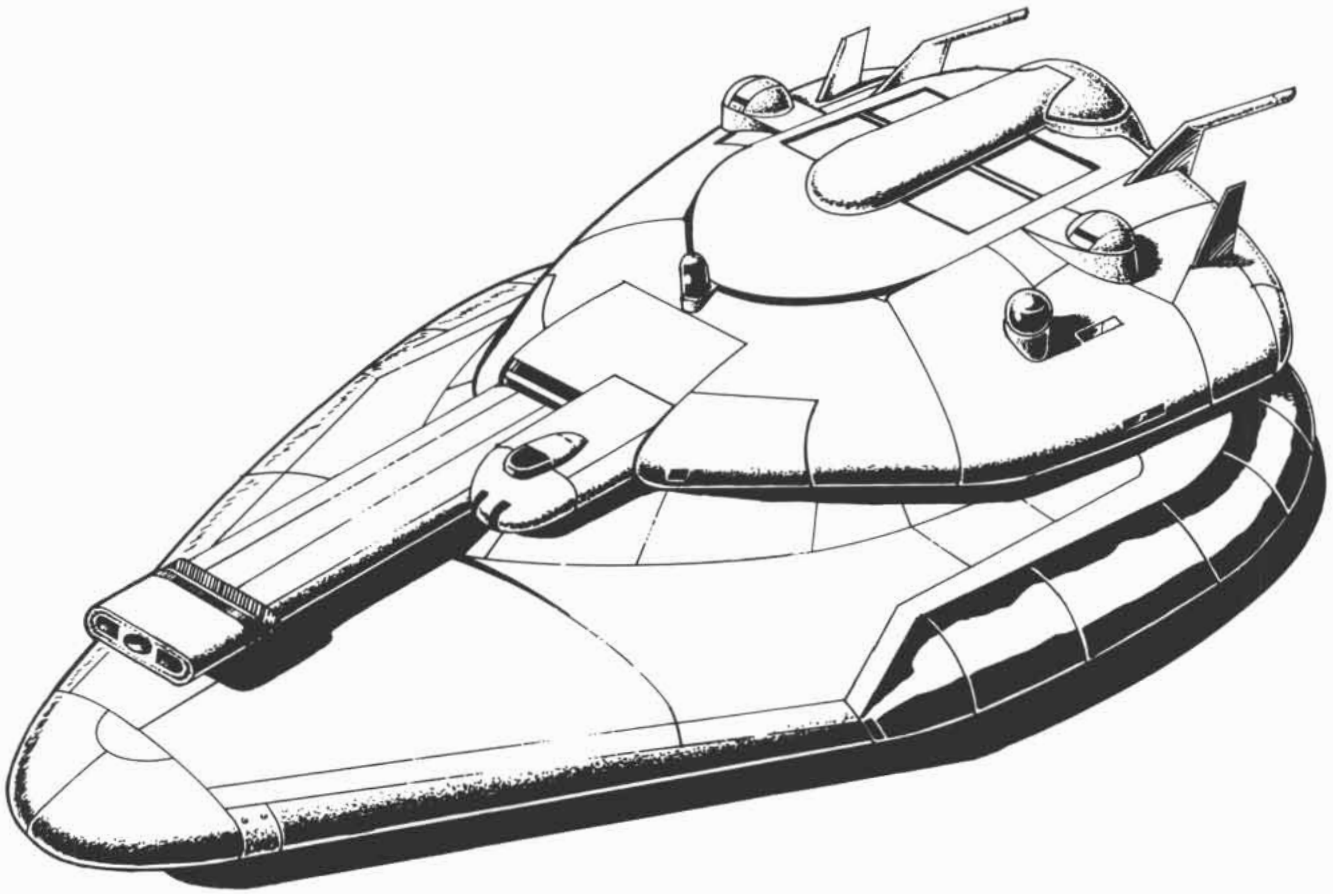
If a demoralized stand receives another demoralized morale result, it is eliminated.

9.24 Eliminated: If the die roll is 10 or higher than the modified morale of the stand, then the stand is eliminated. If any enemy stands are within 10 inches of it when that happens, the eliminated stands are considered to have surrendered and become prisoners. Prisoner stands are removed from play immediately, but are available for regrouping as if they were casualty stands (the assumption here is that not all of the personnel are captured, and some make their way back to be put into battle again).

9.3 *Rally* Orders

Rally orders are placed during the Command Phase, but are not carried out until the Morale Phase. A *rally* order placed next to a stand or group of stands allows any demoralized stands within 6 inches to recover from being demoralized. In addition, any nondemoralized stands in the area with a permanent morale loss can recover 1 point.

Stands operating under a *rally* order may not move or fire during the turn that they receive the order. A demoralized stand, which has an permanent morale modifier of –2, would need *rally* orders issued for three successive turns to recover from demoralization.



9.4 *Regroup* Orders

Regroup orders are placed during the Command Phase, but are not carried out until the Morale Phase. A *regroup* order is issued to a pair of eliminated personnel stands, and allows one of them to return to the game. (The assumption is that "eliminated" means no longer effective as a fighting force, not completely destroyed, and regrouping represents collection and reorganization of stragglers.) A *regroup* order only affects one pair of stands at a time. The stands to whom the order is issued must have been subordinate to the stand issuing the order, and exactly the same type of stand (i.e., two infantry stands, two battledress stands, two crew stands, etc.). One of the stands is returned to play by placing it next to the stand issuing the order, while the other is permanently removed from play and may not be used again for the purposes of a *regroup* order.

Stands operating under a *regroup* order may not move or fire during the turn that they receive the order.

Vehicles may not be regrouped.

Example: A Coalition company commander has lost two command battledress stands, one SSL stand and three battledress infantry stands so far. He can issue a regroup order to the pair of command battledress stands, or to two of the battledress infantry stands. He may not regroup the SSL stand (he has only lost one, and a pair of stands is needed to regroup). He must wait until he has lost a fourth battledress infantry stand in order to regroup the third.

RULE 10: MELEES

Melees are resolved in the Melee Phase. Melees consist of hand-to-hand struggles between personnel stands, usually using melee weapons of some sort.

10.1 Setting Up Melees

All stands engaging in melee must be in contact with the enemy stand they are assaulting. Stands attempting to move into melee combat must have passed morale. Each individual melee involves one or more personnel stand against one enemy personnel stand. When opposing players have several stands mutually in contact with each other, the players alternate, selecting one of their personnel stands, in contact, to melee one enemy stand. The players alternate this procedure until all involved stands resolve their melees. To determine who chooses, roll one die; high die roll wins.

Note that stands do not check morale after melees are carried out.

10.2 Resolving Melees

Each player rolls a die. Each player's die is modified as shown below.

The side with the lower modified die roll loses the melee. Each losing stand will suffer one hit and be forced back. If the modified die rolls are equal, then the melee has no effect.

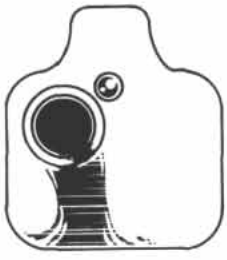
Melee Modifiers

Stand Type	*Modifier*
Single-figure stand	–5
Heavy weapon crew stand	–5
Cavalry stand	+5
Each additional stand	+5
Melee only*	+2
Carrying shield	+2
Melee armored**	+save number
Regular armored	+twice save number
Higher morale	+difference

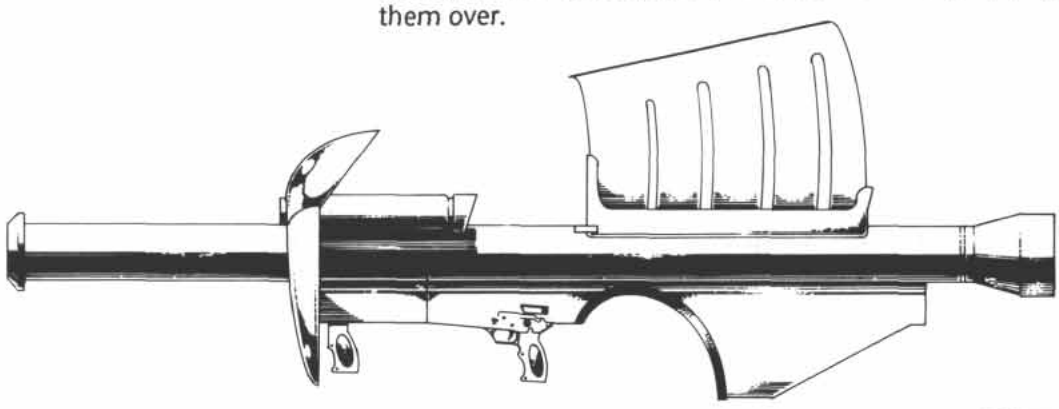
*Melee-only troops are those which are without firearms and are equipped exclusively for melees, such as low-tech armored knights or primitive spearmen.

**Melee armored troops are those wearing armor useful against melee weapons but not useful against firearms. Melee weapon armor value is shown on the unit card in parentheses and does not provide a saving throw versus small arms.

Example: A native unarmored shield-carrying melee-only cavalry stand (morale 16) engages in melee combat with a light battledress-equipped single-figure infantry stand (morale 18).



The native cavalry adds 9 to its roll (+2 melee only, +2 shield, +5 cavalry).



The battledress infantry adds 7 to its roll (+12 for armor [2×6], +2 for morale, -5 for single-figure stand).

The native player rolls a 9, modified to a 18. The invading player rolls a 12, which is modified to a 19. The native cavalry stand takes a hit and is forced back.

10.3 Pin Marker Change

At the end of the each Melee Phase, remove all P1 chits from the table, then replace all P2 chits with P1s by flipping them over.

RULE 11: PLANETSCAPES

Striker is played out on a tabletop (also called the playing surface or board), using various miniature versions of terrain, such as model buildings and trees. The referee must ensure that all terrain features on the playing surface are clearly marked for the players. In particular, the edges of forests, woods, open woods, cover and towns need to be clearly represented on the tabletop (although precisely how this is accomplished is not important).

Terrain affects movement, line of sight and combat. The specific effects of the most common types of terrain are covered in the rules for each particular activity. A general summary and description of the types of terrain in the game follow.

11.1 Vegetation

11.11 Light Vegetation: A wooded area more easily traversed than forest or woods. Orchards, coconut plantations and lightly wooded meadows fall into this category.

11.12 Moderate Vegetation: A wooded area more open than forest or jungle, and thus more easily traversed. Fairly closely spaced trees still impose limits on movement and visibility.

11.13 Dense Vegetation: Tropical rainforest or other densely wooded terrain, difficult to traverse because of its large trees and dense undergrowth. Includes jungle and virgin forest.

11.14 Cover: Cover is a special case where the terrain reduces visibility without affecting movement. Examples include corn or wheat fields at harvest time, seven-foot-tall prairie grass, light brush, etc.

11.15 Heath: Heath is an area of brush-covered, uneven terrain. Any stand that is stationary in heath is treated as being in cover, although heath does not block line of sight. AFVs stationary in heath are treated as being hull down.

11.16 Hedgelines: Hedgelines are linear barriers of dense brush. Hedgelines may be freely crossed by all stands. A stand adjacent to a hedgeline treats the hedgeline as cover for any direct fire on the stand that crosses the hedgeline. A hedgeline does not block line of sight, but does provide cover for purposes of spotting.

11.2 Ground Surface

11.21 Broken: Broken ground consists of an uneven surface difficult for most vehicles to traverse and ample cover for personnel. Broken ground can be either natural, as in the case of lava fields or boulder fields, or it may be man-made, as in the case of walled and terraced vineyards.

11.22 Cliff, Escarpment: A cliff or escarpment represents a slope so extreme that all normal movement across it is prohibited. Such areas should be defined by the referee and noted on the referee's map before the game begins.

The referee may allow personnel stands (except bicycle and motorcycle stands) from mountain units or those trained in mountaineering (such as commandoes) to move into or through such an area, or may allow a conventional infantry unit to do so in a place where the referee determines that there is a path. The stands must use a *rapid advance* order while crossing such an area and will pay quadruple costs while doing so.

11.23 Contour Lines: As the playing surface is considered to be level unless otherwise indicated, contour lines are used to show changes in elevation. Contour lines can indicate the elevation of hills and ridges or the depressions for valleys and wadis. These can be represented by any convenient means.

11.24 Sand: An area consisting mostly of sandy terrain, such as can be found in beaches or certain desert areas.

11.25 Sand Dune: An expanse of sand blown by the wind into small ridges, also known as an erg.

11.26 Steep Slope: Steep slopes represent areas across which ground movement is only allowed by personnel stands.

11.27 Swamp: A marshy area, usually wooded. Wooded swamps affect visibility in the same way as ordinary woods.

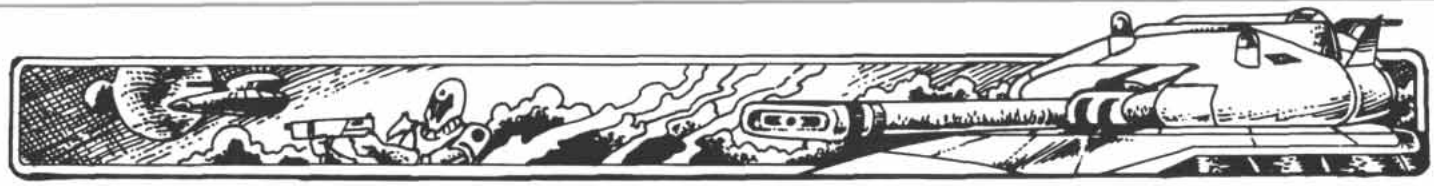
11.28 Clear: All other areas of the tabletop.

11.3 Water Barriers

Water barriers present obstacles to movement due to their width and depth, and by the nature of their banks.

Boats may either be found locally (as determined by the referee) or supplied by engineering units. Points at which boats may be launched should be indicated on the referee's map in advance.

11.31 Bridges: Bridges span streams, canals and rivers. They should be classified before the scenario begins (as class I, II, III, IV, V or VI), but this information need not be made available to the players before play begins. Personnel may cross any type of bridge. A vehicle and towed weapons may only cross a bridge which has a class equal to or greater than the vehicle or weapon's weight classification. For movement purposes, bridges count as roads. Railway and monorail bridges are always class VI.



Bridges may be damaged or destroyed by engineers (see Rule 18.6) or explosions (see Rule 14.3). For every 3 points of damage taken, the bridge's rating is reduced by one level, so that a class IV bridge becomes a class III bridge when its damage value is reduced to 6. If this same class IV bridge took only 2 points of damage, it would still be treated as a class IV bridge. To be reduced to a class II bridge, it would have to take a total of 6 points of damage.

Bridges may be repaired by engineers (see Rule 18.23).

11.32 Rivers: A linear body of water which is wider then a creek and which can range from a minor waterway to a major waterway. Normally, rivers and canals may not be crossed by any stands except for amphibious vehicles and boats. The referee should determine (and sometimes let players know) if and where it can be forded, or if bridges exist which allow units to cross.

River banks should be rated as any of the slope types discussed in Rule 11.2 above, as this will affect the ability of amphibious vehicles to enter and exit the river.

11.33 Canal: A narrow, man-made waterway which may not be crossed except at a bridge.

11.34 Creek or Stream: A linear body of water smaller than a river. These are usually less than one meter in depth and are usually fordable by personnel everywhere, but vehicles may require assistance in leveling the banks.

11.35 Ford: A shallow crossing place on a creek, stream, or river where the water is shallow and the banks a gentle enough slope to allow entrance and exit by vehicles.

11.36 Deep Water: Lakes, ponds and the sea are prohibited to all stands except those with amphibious capabilities, aquatic vessels or flying vehicles.

11.4 Structures

Structures are civilian man-made additions to the natural terrain.

11.41 Settlement: A built-up area. A settlement may consist of wood or masonry buildings, and be crossed by streets or highways. Towns are laid out in roughly square blocks which show the type of building and the capacity of the block in terms of stands. Each block should be represented by a model building (constructed to represent stone or wood, and of a style suitable to the time and place of the battle) for enhanced appearance.

Buildings may be destroyed by explosions, either from direct fire, area fire or engineer activity (see Rules 14.3 and 18.6).

11.411 Wooden Buildings: Wooden buildings have a damage value of 6. When 6 damage points are taken, the building is destroyed and is considered to be on fire. No stand may occupy a burning building. If a stand is occupying a wooden building when it is destroyed, it must move from the building in the next Movement Phase or be eliminated from play. Smoke from a burning building blocks line of sight through the building's position.

11.412 Masonry Buildings: Masonry (stone, brick or cement) buildings have a damage value of 15. When 15 damage points are taken, the building is destroyed and it becomes rubble. Likewise, stands occupying a stone/cement building when it is destroyed must move from the building in the next Movement Phase or be eliminated from play. They may reoccupy the rubble, however.

11.42 Rubble: The ruins of masonry buildings.

11.43 Stone Walls: These are man-made obstacles which may be represented for a given scenario and whose effects are determined by the referee for that scenario. They may or may not affect movement, cover or line of sight, at the referee's option and depending on their construction.

Low stone walls, for example, may usually be crossed by personnel stands without penalty. Class IV, V and VI tracked vehicles may cross a stone wall at the cost of half their movement allowance. Air cushion vehicles (and any flying vehicles) may cross stone walls at no cost. No other vehicles may cross stone walls.

A gap is created in a wall where a tracked crosses it, through which other vehicles may cross. A gap is treated as open terrain by personnel stands and tracked vehicles, but is still treated as impassible by wheeled vehicles.

A personnel stand adjacent to a wall is in cover from any direct fire which crosses the wall. A turreted vehicle adjacent to a wall is hull-down against any direct fire that crosses the wall.

A low stone wall does not block line of sight.

11.5 Transportation Lines

Transportation lines are additional man-made features on the planet's surface.

11.51 Highway, Road: A major, hard-surfaced roadway with good all-weather capability.

11.52 Railways: These represent railroad, monorail and maglev tracks. They are usually difficult for conventional vehicles to cross except at established crossing points and sometimes provide cover in the form of an elevated embankment.

11.53 Street: A minor roadway running through a settlement.

11.54 Trail, Dirt Road: A minor, unpaved roadway. In inclement weather this will turn to mud (see Rule 16.2).

11.55 Embankments: The need for roads or railroads to maintain a level bed usually, but not always, results in the creation of a causeway or rail embankment. As a rule, these are low, but provide some cover for infantry. Causeways and railroad embankments do not affect movement. A personnel stand adjacent to a causeway/embankment is in cover from any direct fire which crosses the causeway/embankment. A turreted vehicle adjacent to an embankment is hull-down against any direct fire that crosses the feature. A causeway/embankment does not block line of sight.

11.56 High Embankments: In some cases, railroads and roads run along embankments that are highly elevated over the surrounding terrain. Personnel stands pay a 5cm penalty to get on or off the high embankment. Vehicles may not get on or off a high embankment except at points where entrances exist, such as where a road crosses the embankment. While on the embankment, a vehicle may only move along it.

A high embankment blocks line of sight, but stands on the embankment are not considered on a higher elevation for purposes of spotting.

Stands on a high embankment during daylight are skylined for all direct fire from stands at the same or lower elevation. The hit difficulty is decreased by one level versus skylined stands.

11.57 Cuts: In certain circumstances, railroads and roads run though cuts. Cuts can be either shallow or deep, depending on the circumstances. Shallow cuts are bordered by steep slopes, but allow stands in the cut to be considered in cover (or hull down, if vehicles).

Deep cuts are also bordered by steep slopes as well, but are of such a depth that stands may not fire out of them. Stands in deep cuts may only be fired upon by indirect fire.

11.6 Fortifications

Fortifications cover such items as bunkers, pillboxes, entrenchments, barbed wire entanglements, antitank ditches

and the like. Some fortifications may be constructed during the course of a game (see Rule 15.5), but most are placed before play commences, as part of the scenario. For a stand to use one of these fortifications, it must occupy the fortification and be stationary. Cavalry, bicycle and motorcycle stands must dismount in order to use a fortification.

Fortifications provide protection from fire combat, as listed in the Fortification Fire Modifiers chart below. Against direct fire they provide a saving throw, while against explosions they provide a reduction in explosive power.

Fortification Fire Modifiers

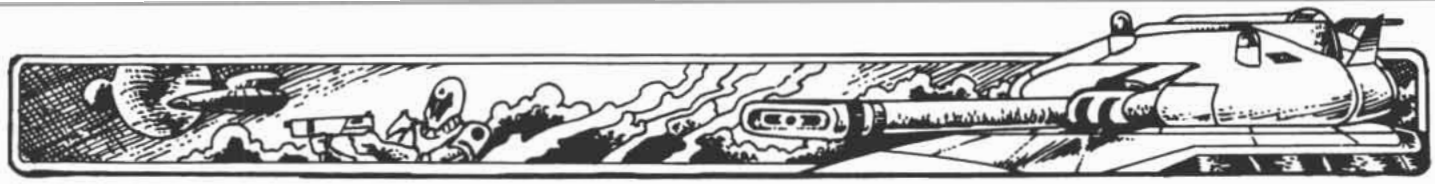
Type	*Direct Fire Save No.*	*Explosive Modifier*
Entrenchment	2	–6
Weapons pit	2	–6
Bunker	2	–8
Pillbox	3	–10

11.61 Bunkers, Pillboxes and Entrenchments: Each bunker or pillbox may hold one personnel stand or a class I to III towed weapon and its crew (excluding recoilless weapons and multiple rocket launchers). Each inch of entrenchment may hold a personnel stand. Bunkers (which are entrenchments with overhead cover, pillboxes and entrenchments provide protection from fire in any direction.

Bunkers and pillboxes may be destroyed by engineers, artillery or aircraft. A bunker may take 6 damage points before it is destroyed. When destroyed, it is replaced by an entrenchment. A pillbox may take 12 damage points before it is destroyed. However once destroyed, it is removed from play and *not* replaced, becoming rubble instead.

Entrenchments are not damaged, only the stands in them.

11.62 Weapons Pits: A weapons pit may hold one towed weapon and its crew. It provides protection only to its front and flanks; it is open to its rear and provides no modifier to fire from this direction.



11.63 Tank Ramps: Tank ramps are weapons pits for vehicles, providing a hull-down position where one wouldn't ordinarily be. Turreted vehicles are hull down to fire from all directions when in a tank ramp. Vehicles may leave a tank ramp only by backing out of it, in a direction fixed by the construction of the ramp.

11.64 Antitank Ditches: Antitank ditches may not be crossed by wheeled or tracks vehicles without the aid of engineer stands (see Rule 18.524). Air cushion and all flying vehicles are unaffected by antitank ditches. Personnel stands may cross an antitank ditch, paying a cost of 10 cm to do so. Personnel stands within an antitank ditch are in cover.

11.65 Barbed Wire: Barbed wire may not be crossed by wheeled vehicles. Personnel stands adjacent to barbed wire may cross it if they receive a *cautious advance* order and spend their entire available movement allowance crossing the wire.

Tracked, air cushion and flying vehicles may cross barbed wire without any movement penalty, and tracked vehicles create a gap where they cross. A gap through barbed wire is treated as open terrain for all stands.

RULE 12: VEHICULAR TRANSPORT

Vehicles may carry personnel stands, and ground vehicles may carry towed weapons. Each vehicle capable of transporting stands and/or towing weapons should be noted on the unit's data card.

12.1 Transporting Personnel Stands

Personnel stands may be carried by dedicated transport vehicles (such as trucks and armored personnel carriers). They may ride on the top of armored fighting vehicles such as tanks, and they may be carried by transport considered part of the stand, such as bicycles or riding mounts.

12.11 Transport Vehicles: A vehicle capable of carrying personnel stands has a transport capacity which specifies the number of fireteam stands it may carry. A truck, with a capacity of three, for example, can carry three single stands. A double stand counts as two fireteam stands for transport purposes, while a single-figure stand counts as a half stand. There are two exceptions to this rule:

- Motorcycle, bicycle, grav cycle and cavalry stands, all of which are treated as personnel stands, may not be transported by other vehicles.
- Vehicles with a transport capacity of 1 or greater may carry one single-figure stand for free, in addition to any other stands transported. Thus, a truck with a capacity of 2 could carry two fireteam stands and a single-figure stand, or a double stand and a single-figure stand.

Personnel stands mount and dismount from transport vehicles during movement. It costs both the transport vehicle *and* the personnel stand half their movement allowance for the turn to mount or dismount. If either stand has moved before the mounting/dismounting takes place, that percentage of movement is lost by both the stand being transported and the transporting vehicle.

Example: Two infantry stands are ordered to carry out a rapid advance, which gives them a maximum move of 40 cm. They run to a medium truck sitting on a road which is 10 cm away. They spend half their move, or 20 cm, to mount the truck. The truck may now move, but as the stands it is transporting have used 30 cm, or 75% of their movement, it is limited to using 25% of its road move.

12.12 AFV Passengers: Any personnel stand, except cavalry, bicycle, motorcycle, grav cycle or a double-sized stand, may ride on an AFV. One stand may ride on each qualified AFV. Any tracked AFV that is not a transport vehicle and is not open topped is qualified for AFV passengers.

12.13 Dismounted Troops: Any cavalry, bicycle, grav cycle or motorcycle stands may elect to dismount from their horses, bicycles, grav cycles and motorcycles, and serve as dismounted stands. These stands may mount/dismount in the same way as personnel stands mount/dismount transport vehicles, at a cost of half their movement allowance.

Once dismounted, these stands move as all other personnel stands. Cavalry, bicycle and motorcycle stands may only remount in the same location where they dismounted. Should enemy stands pass through this location, they may not remount.

12.14 Grav Belts: Personnel stands equipped with grav belts move using the characteristics of the grav belt, but are in all respects treated as personnel stands. Grav belt stands may be transported by other vehicles.

12.2 Transporting Towed Weapons

A transport vehicle capable of towing has a towing capacity code (I, II, III, IV, V or VI) corresponding to the maximum class of towed weapon it may pull.

A transport vehicle may pull a towed weapon lighter than its towing capacity, but it is limited to one towed weapon at a time. Thus, a light truck, with a towing capacity of IV, could pull a class I, II, III or IV towed weapon. Note that a vehicle may be able to tow a weapon, yet not necessarily have the capacity to transport the weapon's crew.

12.21 Limbering/Unlimbering Towed Weapons: A towed weapon must be limbered to its towing vehicle in order to be towed. If limbered, it must be unlimbered from its towing vehicle in order to fire. The gun crew of a towed weapon pays a movement cost to limber or unlimber the towed weapon. However, the gun crew does not pay any additional cost to mount/dismount the transport vehicle when limbering/unlimbering a towed weapon from the same transport vehicle. Limber and unlimbering costs are:

Class I Towed Weapon: It costs half the movement allowance of both the vehicle and crew to either limber or unlimber the weapon.

Class II Towed Weapon: It costs half the movement allowance of both the vehicle and crew to unlimber the weapon, and all the movement of both to limber the weapon.

Classes III-VI Towed Weapons: It costs all the movement allowance of both the vehicle and crew to either limber or unlimber the weapon.

As with the mounting/dismounting of troops, if the stands which are attempting to limber/unlimber have moved prior to the act of limbering/unlimbering, that movement is deducted from any remaining.

12.3 Towing/Pushing Vehicles

A disabled vehicle may be pushed out of the way by any recovery vehicle, or by any vehicle of an equal or greater weight class (as defined in Rule 1.13). A vehicle which is destroyed during the game may not be pushed out of the way; it is assumed that the wreck is on fire and too dangerous to approach. If a game is played with wrecks (destroyed vehicles) present from the start of the game, those wrecks may be pushed out of the way.

12.31 Pushing: To push a vehicle out of the way, the pushing vehicle must start adjacent to the vehicle and be given a *full advance* order. It takes the pushing vehicle's entire movement allowance for the turn to push the vehicle out of the way.

A vehicle forced back due to fire during this process must roll dice to see if it succeeded in pushing the other vehicle out of the way before being forced back. It succeeds on a roll of 5 or less.

12.32 Towing: A disabled vehicle may be towed by a recovery vehicle or other vehicle of equal or greater weight class. To prepare a vehicle for towing, the towing vehicle must spend one Movement Phase stationary and adjacent to the vehicle to be towed.

A vehicle forced back during this process does not succeed in the tow and must start over when it returns. When a vehicle tows another vehicle, its movement is quartered. A destroyed vehicle may not be towed; it is assumed that damage to the vehicle is too severe.

RULE 13: ADVANCED DIRECT FIRE

This rule expand the direct fire rules by adding agility, fire control computers and other special cases.

13.1 Agility

Agility is the game mechanism which shows the difficulty of hitting a fast-moving target. Fast-moving vehicles, missiles and even artillery shells have agility ratings, which are progressive increases in the difficulty level of the to-hit die roll.

Each such increase in difficulty, called a "diff mod," halves the chances of success, rounding fractions down. As a practical matter, this means that the shot is resolved as if it were one range band more distant for purposes of hitting (but not for ROF or penetration purposes).

If the diff mods increase the range of the shot beyond extreme range, each additional diff mod increase reduces the number of dice rolls (ROF) by 1. If the ROF is reduced to 0 or less, no shot is possible.

13.11 Target Agility: Many vehicles and all aircraft have agility diff mods based on their speed. These diff mods are recorded on the vehicle's data card in parentheses after their movement allowances. Three diff mods are given for most movement allowances, the three mods being (in order) that for a *cautious advance*, a *rapid advance* and a *travel* order. Vehicles which have no agility diff mods at a given speed will have a — instead.

For example, a vehicle with the notation (—, —, +1) would have no agility diff mods when conducting either a *cautious* or *rapid advance*, but would have a diff mod of 1 when travelling.

Flying vehicles only have a total of three diff mods: two for low altitude/NOE flight and one for high-altitude flight. The two low-altitude diff mods are used for *cautious* and *rapid advance*, while the high-altitude mod is used for *travel* orders.

13.12 Missile Agility: All missiles have a single agility, which is recorded on the unit data card. Missiles may not be fired at by weapons which do not have point defense fire control (see Rule 13.2 below).

13.13 Artillery Agility: All indirect fire nonmissile artillery rounds (both area fire and precision fire) have an agility of +6. Artillery rounds may not be fired at by weapons which do not have point defense fire control (see Rule 13.2 below).

13.2 Fire Control

Many larger weapons have sophisticated fire control computers which assist them in tracking and engaging fast-moving targets.

Fire control computers enable a weapon to ignore one or more diff mod increases due to target agility. The number of diff mods the weapon ignores is referred to as its "fire control bonus." Note that fire control systems do not reduce difficulty below the level determined by the actual range; they merely allow the weapon to ignore increases.

13.3 Point Defense

Only weapons equipped with point defense fire control may fire like any other weapon, using their printed fire control bonus to ignore agility diff mods. They have several special features in addition, however.

First, only weapons with point defense fire control may fire at missiles and ballistic projectiles (artillery rounds). Only weapons with a penetration greater than Nil have an effect on missiles and artillery rounds.

Point defense weapons may fire in self-defense at incoming missiles and ballistic projectiles in any Fire sub-phase, regardless of the movement order received, provided the movement order allows the weapon to fire at all. (Units operating under *travel, rally* and *regroup* orders, for example, may not fire point defense in self-defense.)

When firing at missiles or ballistic projectiles not directed at them, or when firing at any other target, they fire in the Fire sub-phase determined by the order they were issued in the Command Phase.

Regardless of the initiative level of the firing gun crew, point defense fire in a sub-phase is always resolved before the fire of the missile or ballistic projectile fired at by the point defense weapon. If, for example, an Elite stand fired a missile at an enemy tank, an enemy point defense weapon eligible to fire in that sub-phase could still fire at the missile and attempt to shoot it down, and that attempt would be resolved before the missile attack, even if the point defense weapon's crew were only Experienced.

Second, when firing at either nonevading ballistic projectiles (such as artillery) or at flying vehicles conducting travel movement, the point defense system doubles its fire control bonus. Note that this does not apply to missiles or flying vehicles in at low altitude (executing a *cautious* or *rapid advance* order).

Any hit on a missile or artillery round destroys it.

13.4 Advanced Missiles

This rule introduces several more sophisticated types of missiles to the game.

13.41 Homing Missiles: Homing missiles are locked onto a target and then actively seek it after firing. Homing missiles have the same range bands as for conventional direct fire weapons and use the accuracy asset of the firing troops.

Homing missiles have an agility rating, the same as any other missile. Homing missiles, however, use their agility rating minus as a fire control bonus versus the agility of the target. A homing missile with an agility of 4, for example, could ignore up to four agility diff mods due to the target's speed.

13.42 Overhead Attack Missiles: Overhead attack missiles attack the top armor of a vehicle instead of the armor face presented to the firer. There are two types of overhead attack missiles—top attack and plunging attack—based on their flight path.

13.421 Top Attack Missiles: Top attack missiles are available from tech level 8 on. Their penetration is usually much lower than comparably sized missiles which approach the vehicle directly, since the warhead is much less efficient when placed at an angle to the centerline of the missile and there is less

control over optimal stand-off range. Top attack missiles fly directly at the target but then fly across the top of it. As they pass over the target, their warhead fires down (and usually slightly forward) to hit the top armor of the vehicle.

Top attack missiles are treated as conventional Tac missiles in all respects except that they always attack the top armor of the vehicle.

13.422 Plunging Attack Missiles: Plunging attack missiles are also available from tech level 9 on. Their penetration is the same as for a conventional missile, as they approach the target from a higher altitude and then dive down onto it, thus attacking with the warhead in a conventional position.

Plunging attack missiles are treated as conventional Tac missiles in all respects save two. First, they always attack the top armor of the vehicle. Second, they are treated as nonevading ballistic rounds for purposes of defensive fire by point defense systems.

13.43 Drone Missiles: Drone missiles are small remotely piloted aerial vehicles equipped with both a sensor and a warhead. Each drone missile is controlled from the launch station by a pilot and is self-ordered while aloft, so long as it is in communication with the launch vehicle. The missile may remain airborne throughout the scenario; the range bands listed for the missile are purely for determining accuracy of fire.

A drone missile attacks by flying into a target structure, vehicle or stand. The attack is treated as direct fire, and the distance the missile moved that movement phase is the range used to determine the accuracy die roll of the attack. For example, a missile with a short range (for accuracy purposes) of 20 cm and which moved 60 cm the turn it struck its target would resolve its accuracy die roll as fire from long range.

A drone missile may be ordered to hit an armored face other than the one the missile is facing, but this increases the difficulty of hitting by one range band. The long-range attack mentioned above, for example, would be resolved as an extreme-range attack.

13.5 Aerial Attacks

Flying vehicles firing at ground targets do so in one of two ways—by turreted fire and approach fire.

13.51 Turreted Fire: Some flying vehicles have turrets mounted on their bellies to direct fire at ground targets. Only flying vehicles capable of NOE flight have such turrets. (Fixed-wing aircraft not capable of NOE flight may have turreted weapons, but they are for fire at other aircraft, not ground targets.)

Flying vehicles fire turreted weapons in the same manner as do ground vehicles, with the move order restricting the ability of the weapon to fire by stabilization overcoming this.

13.52 Approach Fire: Flying vehicles firing nonturreted weapons do so via approach fire. This includes fixed forward-firing projectile and energy weapons as well as rockets, missiles and bombs. Flying vehicles following a *travel* order (and thus flying at higher altitudes) may attack using approach fire. (Note that this is the only time that a unit in the game may fire while executing a *travel* order.)

Approach fire requires the aircraft to fly in a straight line directly at the target for the entire turn. (If capable of hovering, the aircraft may hover in place facing the target.) If flying above NOE altitude, the player also specifies the altitude (in centimeters on the game table) at which the aircraft is flying. If dropping bombs, the flying vehicle must pass directly over the target during movement.

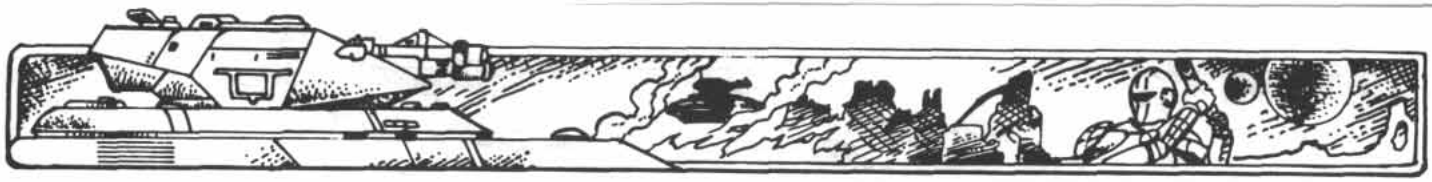
Approach fire is conducted at the end of the fire phase after all ground units have fired. However, the fire is conducted as if from any point along its movement. If the flying vehicle has been forced back or destroyed by fire during the turn, and the fire which destroyed it or forced it back came at a point along its flight path before the point at which it fired, its fire does not take place. If the fire hit the aircraft on its flight path after the designated firing point, the aircraft is allowed to fire.

13.521 Direct Fire: All approach fire from cannons, energy weapons and missiles are resolved as direct fire attacks using the normal direct fire rules.

13.522 Bombs and Rockets: All approach fire using bombs and rockets is resolved as indirect area fire, with the accuracy roll based on the altitude of the attacking aircraft. Aircraft flying at up to 10 cm attack as if at short range; those flying at up to 50 cm do so as if at medium range; those flying at up to 100 cm do so as if at long range; and those flying at over 100 cm do so as if at extreme range.

All rocket and bomb attacks which miss deviate in the same manner as artillery rocket launchers.

Aerial Bombardment



Altitude	*Range for Accuracy*
0-10 cm	Short
11-50 cm	Medium
51-100 cm	Long
101+ cm	Extreme

13.6 Meson Guns

Meson guns have the advantage of being able to fire through objects (such as planets) without interacting with the intervening material. Meson gun fire against targets visible to the gun crew is treated as direct fire. Meson guns may also fire against targets not visible to the gun crew, provided an observer can direct the fire onto target. This type of fire is treated as indirect area fire.

In the case of direct fire, a direct hit on a target always causes a casualty; no saving throw is made, nor is any penetration check versus vehicle armor made.

In both direct and indirect fire, the meson pulse is treated as a conventional exploding round, with one important difference. No reductions to the explosive power of the meson gun's fire are ever made for terrain, cover, vehicle weight or armor, or any other factor. The explosive value of the round is always the target number rolled to inflict a hit on the target.

13.7 Orbital Bombardment

Attacks from orbit by directed energy weapons (meson guns, lasers and particle accelerators) are treated as direct fire, with the following exceptions.

13.71 Allowed Targets: Orbital direct fire may only be used to attack surface installations (such as settlements), vehicles, and towed or emplaced weapons (such as air defense missiles). They may not attack personnel stands (although personnel stands riding in vehicles or occupying structures may be attacked as the vehicle or structure is attacked).

13.72 Range: For purposes of accuracy, all orbital direct fire is treated as short-range fire. For purposes of damage and penetration, all orbital meson gun fire is treated as short-range fire, all laser direct fire is treated as medium-range fire, and all particle accelerator fire is treated as extreme-range fire.

13.73 Angle of Attack: All orbital direct fire attacks the top armor of vehicles.

13.74 Target Agility: All ground and flying targets double their agility ratings when being fired at from orbit.

13.8 Multiple Projectile Rounds (MPRs)

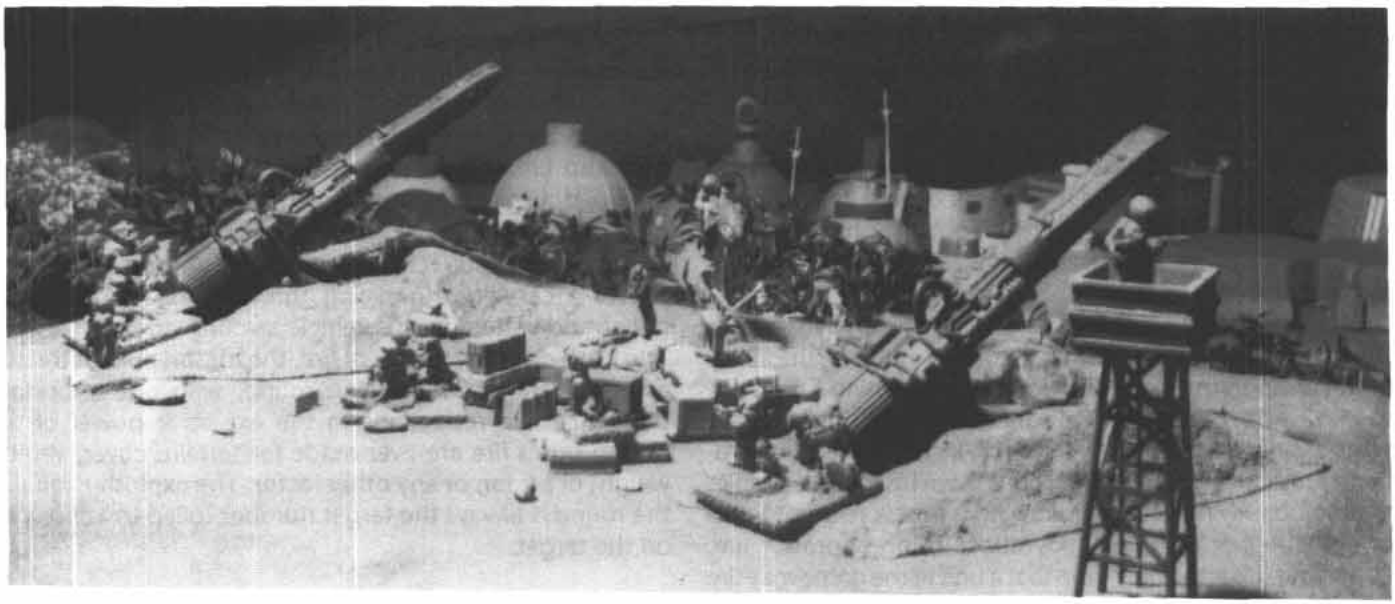
Multiple projectile rounds include shotgun rounds, flechettes and cannister.

13.81 Small Arms: Small arms multiple projectile rounds are shotgun rounds and flechette rounds fired from light assault guns (LAGs). Small arms MPRs roll twice their normal number of dice at short range. This is indicated by an asterisk after the short-range ROF number.

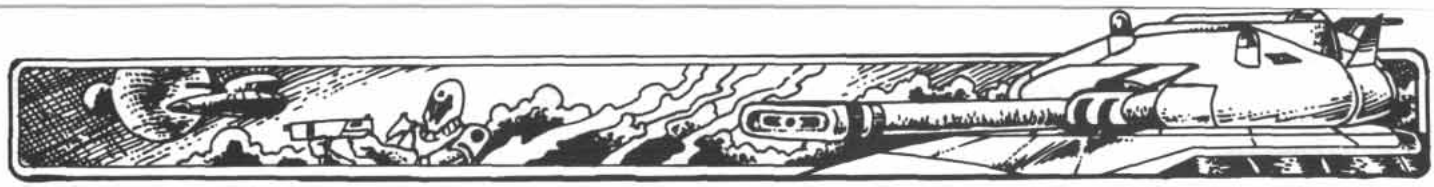
For example, a shotgun with an ROF of 3* would roll 6 dice for hits.

13.82 Heavy Weapons: Heavy weapon multiple projectile rounds (MPRs) are flechette rounds and (in black-powder cannons) cannister.

13.821 Flechette: Some weapons have the ability to fire flechette rounds, antipersonnel ammunition containing hundreds of tiny darts.



Flechette rounds may only be fired by direct fire. Unlike other direct fire, flechette rounds do not require a to-hit roll. Instead, the area of effect of the flechette round, called its "danger space," is placed on the table by the firing player along the imaginary line from the firing unit to the target, with the danger space's long dimension lying along that line, and its width centered on that line. This danger space must remain completely within a single range band of the firing weapon.



All targets within the area of effect roll 1D20 for hits. A roll of 1-6 results in two hits, and a roll of 7-12 results in one hit. Rolls of 13+ are no effect.

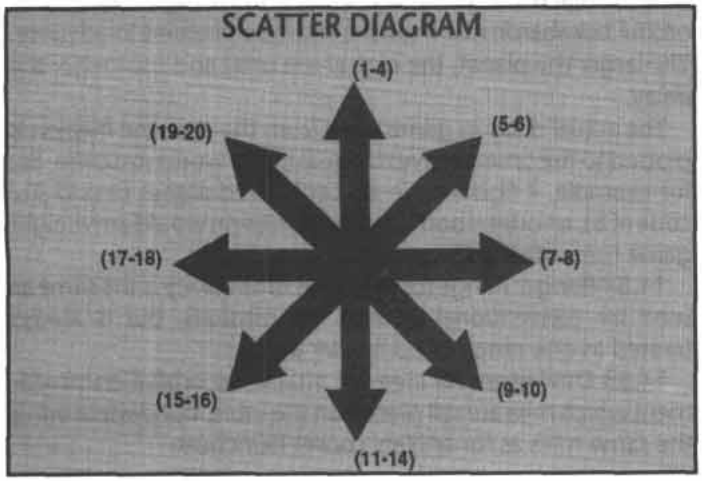
Each hit has a penetration value of 2, and targets make saving throw rolls with cover benefits as normal.

13.822 Cannister: Cannister is resolved like a flechette round, except that the burst area is always placed starting at the barrel of the cannon.

13.9 Laser Armor: Lasers are not affected by nonrigid armor. Melee-only armor as well as flak jackets, ballistic cloth, ballistic weave and combat environment suits provide no saving throws vs. laser fire.

RULE 14: ADVANCED ARTILLERY

The following rules deal with abilities of artillery not found in the basic game.



14.1 Artillery Rocket Launchers

Artillery rocket launchers (ARLs) conduct indirect fire in a slightly different manner than regular artillery fire. Although ARLs have multiple tubes, they are treated as one round with a very large burst area. This burst area is a circle and covers the beaten zone of the rocket salvo. ARLs may not conduct ranging fire, nor may they use preplotted points for targets. All ARL fire missions are plotted in the usual manner, but there is always a die roll to see if they are on target.

If the accuracy roll fails, then unlike the procedure normally used for artillery, the firing player uses the deviation chart to find where the rounds actually land. To do so, roll 1D20. The number rolled determines the direction that the impact point will shift. Then roll 1D20 again for the distance (in centimeters) that the mission will deviate from the plotted target point, doubling the number rolled if the firing stand is Novice and halving it if the crew is Elite. Move the target point of the mission in the direction and distance rolled, and center the burst template at that point in accordance with Rule 8.

Once an ARL fires, it may not fire again until it is reloaded. It takes the crew two complete turns to reload its ARL. If the ARL is equipped with an autoloader, reloading takes only one full turn. The crew and weapon must be stationary while reloading. Due to their nature, ARLs never continue fire in the Opportunity Fire sub-phase, as it is not possible to keep up a bombardment on the same area with a single unit. An ARL is automatically spotted in the Fire Phase in which it fires if an enemy stand has an unblocked line of sight to the ARL when it fires.

Example: An ARL carries out a mission which was plotted by an Experienced forward observer stand. The target accuracy die roll number is a 5 or less. The die roll is a 6, which means the mission fails to hit the impact point. The roll for deviation is a 10, which means the mission will drop short. The roll for distance is a 16, which means the point of impact is shifted 16 cm away from the intended point of impact. Any units present, whether enemy or friendly, may be hit by this fire.

14.11 Remote MRLs: Remote MRLs are small unmanned multiple-tube ARLs emplaced a safe distance from friendly troops. They fire like any other ARL, but once employed may not be moved or reloaded during a game.

Remote MRLs are off-loaded like any stand or may be dropped by purpose-built emplacement vehicles in one turn.

14.2 General Support Fire

In a number of cases, artillery fire is referred to as general support (GS) as opposed to direct support (DS). The main difference is that direct support artillery is controlled by a unit on the field. General support artillery, while operating in support of the units there, is not controlled by any unit on the battlefield. The following missions are examples of general support missions. They occur according to a prefixed schedule, and may not be altered in the course of a game except to cancel them. They are fired by battalions; a single battery may never be assigned to a general support mission. All die rolls for general support missions are carried out by the referee.

14.21 Harassment and Interdiction Fire: Often referred to as "map fire," these missions are designed to call fire down on specific geographic points such as towns, bridges, road junctions, etc., to deny their use to the enemy. This mission can never be a converged sheaf, and the explosive value on stands moving through the impact area is halved, rounded down. Note that this is in addition to any other modifiers for the stands in the impact area.

Fire from a harassment and interdiction mission falls during the Opportunity Fire sub-phase.

Example: A 15cm howitzer battery is firing at a crossroads which an enemy tank battalion needs to move through. The explosive value of the artillery is a 14, halved to a 7. The tanks have an explosive value modifier of –5, so they can only be damaged by the fire on a roll of 1 or 2. However any soft vehicles (explosive value modifier of –1) moving with the battalion would be hit on a roll of a 1 to 6.

Players should note that the area under bombardment may be circumvented by a unit to avoid passing through the target zone. Such a move is perfectly correct, as that is the goal of such a mission.

ARL battalions which are assigned to such missions must always roll for deviation. However, the explosive value of the impact areas are not halved.

14.22 Counterbattery Fire: Counterbattery fire is conducted against enemy artillery stands. It can be carried out in one of two ways. It may be conducted as "map fire" against suspected enemy positions as in the section above. If the resources exist, it may be carried out with the aid of counterbattery sensors.

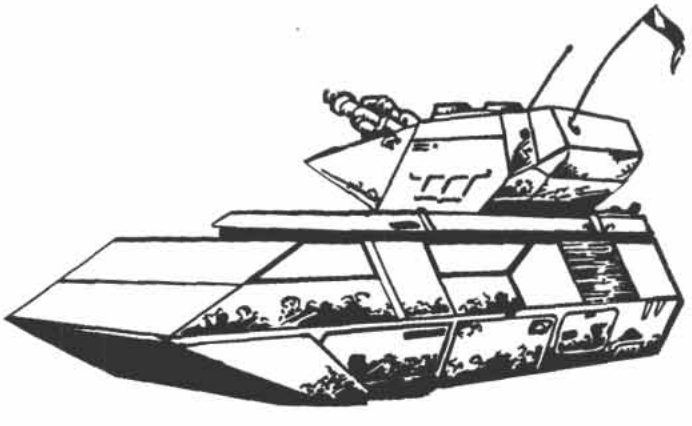
Counterbattery sensors have ranges just like other sensors, but they are used exclusively to detect and track incoming area fire rounds shot by guns or mortars. By plotting the trajectory of the round, the sensor's computer can pinpoint the location of the firing weapon.

Each counterbattery sensor in use can detect one firing

enemy artillery unit and allow an attack on that unit in the next turn by area fire (not precision fire) weapons. The accuracy roll for the indirect fire attack is based on the range from the sensor to the firing unit. (In most cases, both of these will be off-table). In other words, no roll for success is made when the enemy artillery fires. Instead, the accuracy roll for the counterbattery fire is the real indication of how successful the sensor was.

14.3 Destruction by Area Fire

Buildings, bridges and certain types of fortifications may take damage from artillery fire (either direct or indirect fire HE, and certain types of AP fire). For each turn that such a structure is in the blast area of an explosive weapon, it takes damage equal to half the explosive value of the round minus 4. Thus, weapons with an explosive value of 8 or less have no effect on a structure. A 10cm round with an explosive value of 10 will do 1 point of damage to a structure, while an 8cm round with an explosive value of 8 will do 0 points of damage.



AP rounds greater than 7 cm do 1 point of damage per hit. Smaller AP rounds have no effect.

Note that in the case of a converged sheaf fired at a structure, each round will cause damage. Thus, a class V bridge which is hit by a converged sheaf of three 15cm rounds, each with an explosive value of 14, will take 3 points damage from each round. Thus, in one turn, the class V bridge, which is reduced one level for every 3 damage points suffered (see Rule 11.31), would be reduced to a class II bridge.

For the damage capacity of structures, see Rule 11.4 (planetscapes).

14.4 Submunition Rounds

There are three types of submunition rounds: standard submunitions, dual purpose (DP) submunitions and homing submunitions. Submunition rounds carry a large number of small grenades which are spread across the burst area and which detonate when they strike the ground or a target. DP submunitions include antitank grenades.

Submunition rounds cover a burst area larger than the size of a normal HE round, as shown in the data annexes to the rules. Conventional submunitions and DP submunitions both have an explosive value of 16. Homing submunitions have an explosive value of 20 versus vehicles and 10 versus nonvehicle stands.

All submunition rounds use the following modifiers to their explosive value (instead of those normally used for exploding rounds).

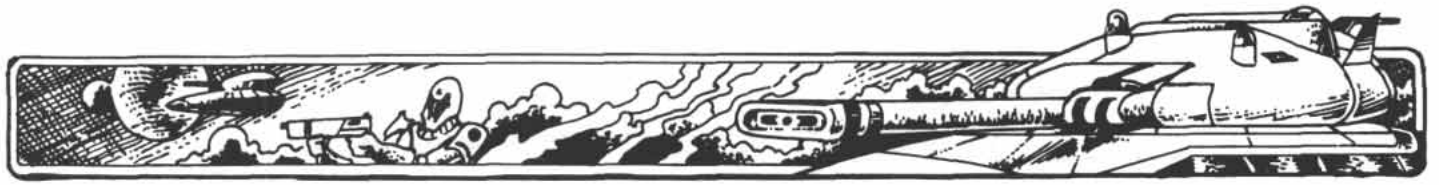
Submunition Fire Modifiers

Target is:	*Modifier*
Armored vehicle*	–12/–8
Terrain is:	*Modifier*
Light vegetation**	–6
Moderate vegetation**	–10
Dense vegetation**	NE (–16)
Entrenchment	–12
Weapons pit	–8
Building	–14
Bunker, pillbox	NE (–16)
Open water	NE (–16)

*Only counts as armored if it has top armor of 2 or more. Lower modifier is used versus DP submunitions.

**Vegetation must include some overhead canopy of branches and leaves to provide modifiers.

14.5 Orbital Bombardment



Orbital bombardment using missiles and deadfall bombs (both guided and unguided) is treated as a form of indirect fire. Missiles and guided bombs are precision indirect fire, while unguided bombs are indirect area fire.

14.51 Delay: Bombs and missiles dropped from orbit are actually fired at the planetary surface with a respectable initial velocity (on the order of 800 to 1200 km per hour), but still take time to reach the planetary surface from high orbit, so all orbital bombardment missions must be planned in advance. The larger the planet, the higher the orbit and the longer the delay.

The actual delay in game turns from the time the mission is plotted to the time it arrives is equal to the world size code. So, for example, if fighting on an Earth-sized planet (world size code of 8), an orbital bombardment mission would arrive eight game turns after it was plotted.

14.52 Range: Range for purposes of accuracy is the same as used for conventional indirect fire missions, but is always treated as one range band farther away.

14.53 Deviation: All area fire attacks by orbital bombardment which miss are still placed on the table, but deviate using the same rules as for artillery rocket launchers.

RULE 15: ADVANCED VISIBILITY

Environmental variations affect visibility and the ability of a unit to detect hostile units in a variety of ways.

15.1 Horizon

The maximum line of sight visibility is always the distance to the horizon. This may be reduced by unevenness of the ground or atmospheric conditions, but is never more than that. Elevations (such as on a hill) can increase this by pushing the horizon further out, as detailed in the basic game rules.

The basic rules assume a size 8 planet (in **Traveller** terms) with a mean diameter of 12,800 km. Horizon distances on different-sized worlds are listed below.

Distance to Horizon

World Size Code	*Mean World Diameter (km)*	*Distance to Horizon (cm)*
1 (Small)	1600	1800
2 (Small)	3200	2500
3 (Small)	4800	3100
4 (Small)	6400	3600
5 (Medium)	8000	4000
6 (Medium)	9600	4400
7 (Medium)	11,200	4700
8 (Large)	12,800	5100
9 (Large)	14,400	5400
A (Large)	16,000	5700

15.2 Night

Visibility at night varies considerably, depending on the amount of background light.

The referee should assign a background light level from 1 to 3, with 1 being the brightest, representing a clear night with one or more full moons high in the sky, and 3 being the darkest, a cloud-covered, moonless night.

The background light level equals the number of +diff mods applied to the naked eye detection task. Some vision enhancement devices avoid these diff mods, however, as indicated below.

The effects of night are expressed as +diff mods to the spotting task, but all of these diff mods should be used as progressive halvings of the eyeball short range. The resulting extreme range is then the absolute limit of visibility.

For example, on a very dark night (+3 diff mod), eyeball short range becomes 12.5 cm, which makes the absolute upper limit of eyeball visibility 100 cm.

15.21 Other Effects: Reduced visibility due to darkness has effects beyond spotting and maximum sighting range.

15.211 Troop Quality/Morale: During night turns, all units have their troop quality reduced by one level (Elites function as Veterans, Veterans function as Experienced, Experienced function as Novice. Novice units remain Novice). In addition, morale levels are reduced by 4 during night hours.

15.212 Command and Orders: During night turns, the radius of effect for an order is reduced from 15 cm to 5 cm. In addition, units may not be given *regroup* or *rally* orders during night turns.

15.213 Engineering: Engineering tasks (see Rule 18) take twice as long if carried out at night.

15.3 Weather

Weather which affects visibility includes fog, low clouds, high winds which carry dust and, of course, precipitation (rain and snow).

For purposes of visibility, however, the referee simply classifies inclement weather as to its diff mod level, ranging from +1 to +3 (or, very occasionally, +4).

Difficulty modifiers for weather should also be used to determine the reduced upper limits of visibility.

15.4 Smoke

Light smoke (that generated by artillery smoke rounds when they hit) imposes a +1 diff mod on spotting attempts through it. On subsequent turns, it blocks line of sight completely.

15.5 Wind

There are three classes of wind: light, moderate and high. It is quite rare for no wind at all to be blowing, and therefore the normal wind condition is light.

15.51 Effects: Light wind has no effects other than to move smoke in a given direction (see Rule 15.362).

Moderate wind reduces visibility by 10 inches in dusty conditions. Moderate wind during a rain or snow storm halves visibility (in addition to the effect of the storm).

High wind reduces visibility by 20 inches in dusty conditions. High wind during a storm quarters visibility (round to the nearest inch). High wind makes sound ranging impossible.

The maximum length of a smoke template in high wind conditions is 4 inches. Because of the deleterious effects of high winds on the game, referees are advised to limit high wind conditions to one or two turns and then reduce them to moderate.

15.52 Direction: Wind direction is determined at the start of the game. This may be accomplished by referee fiat, or randomly by consulting the scatter diagram (see the Game Reference chart). To use the chart, the referee picks a direction on the table and orients the chart so that the "1-6" arrow on the chart points that way. Roll 1D20 and consult the chart. The arrow corresponding to the result is the wind direction.

15.53 Changes in the Wind: For simplicity, the referee may decide that the wind direction and intensity will not change over the course of a game. If desired, however, a chart similar to the one below can be used.

Each turn, roll for a change in wind intensity and direction (two separate rolls).

Wind
(roll twice per turn)

Roll	*Direction*	*Intensity*
1-2	No change	Light unchanged, moderate becomes light, high becomes moderate
3-16	No change	No change
17-18	Shift 1 clockwise	No change
19-20	Shift 1 counterclockwise	Light becomes moderate, moderate becomes high, high is unchanged

15.54 Wind and Storms: The arrival of a storm is usually accompanied by a change in the wind. Most often this is a shift in direction of one point (sometimes the wind increases one level in intensity as well).

15.6 Vision Enhancement Devices

A variety of vision enhancement devices may be available to the unit. These are listed in the data annexes to the rules along with their short ranges. Vision enhancement devices have the following special capabilities.

15.61 Infrared (IR): Infrared devices are not affected by night +diff mods.

15.62 Light Amplification: Light amplification devices are not affected by night +1 or +2 diff mods, but suffer the full effect of +3 diff mods. They may not be used at all in any sort of poor weather.

15.63 Image Intensifiers: Image intensifiers are not affected by night +diff mods.

15.64 Thermal Viewers: Thermal viewers are not affected by night diff mods or +1 weather diff mods or +1 smoke diff mods. They are affected by any weather diff mod greater than +1, and they suffer a +1 diff mod when attempting to spot or see through a solid smoke screen.

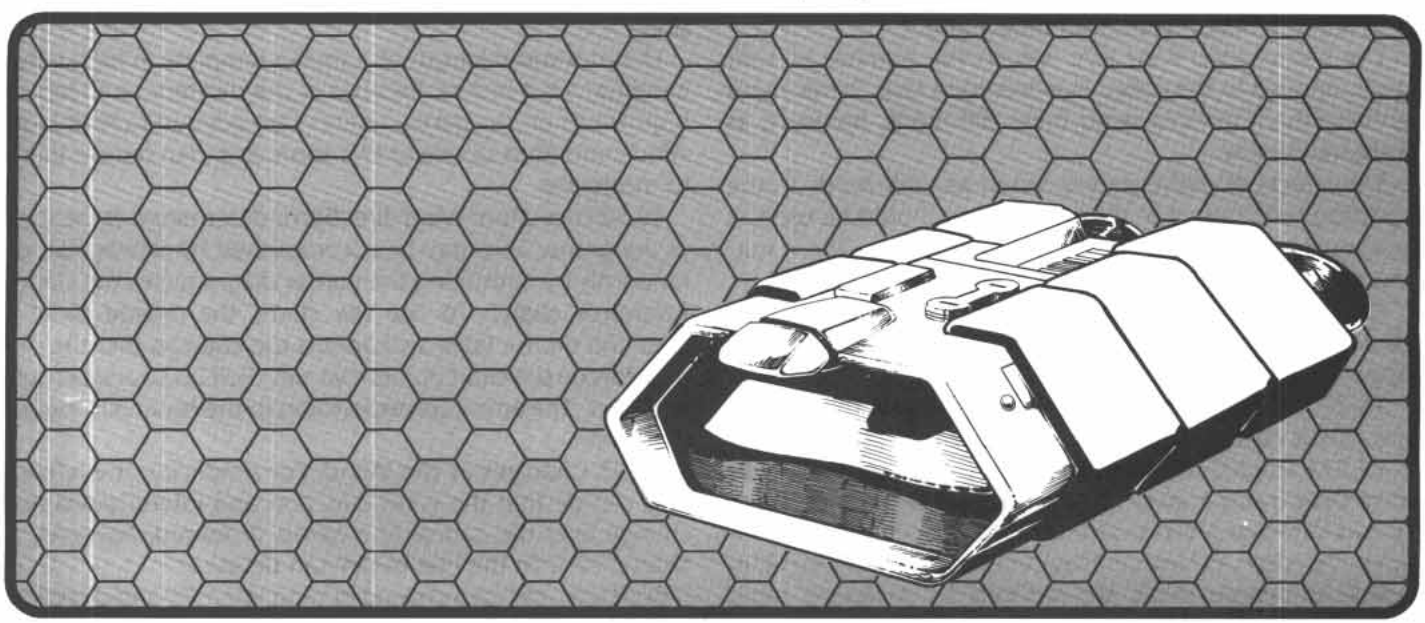
15.65 Radar and Ladar: Radar is not affected by smoke, night or weather. It may be jammed (see **Rule 0.00: Electronic Warfare**).

Ladar is not affected by night +diff mods. It is affected by weather and smoke at tech level 12 and below. At tech level 13 and above, it is unaffected by smoke and weather. Ladar cannot be jammed.

15.7 Illumination

Objects which are illuminated can be seen at normal daylight eyeball ranges. Several means of illumination are available.

15.71 ILLUM Rounds: Many artillery weapons are equipped with ILLUM (illumination) rounds. An ILLUM round illuminates the area within its burst radius as if it were full daylight.



ILLUM rounds have no effect in bad weather or in smoke.

15.72 White Light Spotlight: A white light spotlight will illuminate an area 2 cm across at ranges up to 200 cm, and allows any stand to spot targets within the illuminated area as if it were daylight. The light itself is automatically spotted (at night) by all stands at any distance, provided they have an unobstructed line of sight to it.

White light spotlights have no effect in bad weather or in smoke.

15.73 IR Spotlights: An infrared spotlight can illuminate an area 2 cm across at a range of up to 100 cm. Only stands equipped with IR goggles can see the light, and they make spotting rolls against the targets within the illuminated area as if it were daylight (regardless of the listed ranges of the IR goggles). The light itself is automatically spotted (at night) by all stands at any distance, provided they have an unobstructed line of sight to it and are equipped with IR goggles.

IR spotlights have no effect in bad weather or in smoke.

RULE 16: ADVANCED WEATHER

Weather may affect both movement and visibility. The effects of each type of weather are as follows:

16.1 Rain

Rain reduces visibility and, depending on its duration, may produce mud and thus restrict movement as well. The visibility effects of rain are covered in Rule 15 under weather.

The referee may make a table to determine the extent of the rainfall, as well as any changes in its type. For example:

Rainfall
(roll each turn)

Die Roll	*Effect*
1-2	Light ceases, steady becomes light, heavy becomes steady, clear remains unchanged
3-9	No change
10	Light becomes steady, steady becomes heavy, clear becomes light

If rain continues for any length, it will affect the ground conditions by producing mud. Count the number of turns that it has been raining, with each turn of light rain counting as one-half, and each turn of heavy rain as two turns, and check on the following table:

Rain Ground Conditions

Hours	*Condition*
3 hours of rain	Light mud
6 hours of rain	Medium mud
12 hours of rain	Heavy mud

Note that the referee may determine as part of the scenario that it has been raining a set number of turns before the start of the game.

16.2 Mud

Mud caused by rain or other weather is temporary; mud caused by poor drainage or a high water table is permanent. Mud affects the movement of all stands except those on hard-surfaced roads. The effects of each type of mud condition are as follows:

16.21 Light Mud: All ground stands moving do so by paying double movement costs in addition to any other movement costs they must pay. Thus, a tracked vehicles moving in a woods would pay double movement costs for the woods, and double again for the light mud. Thus, they would be paying quadruple costs (i.e., 4 cm for every centimeter actually moved).

16.22 Medium Mud: All personnel stands move by paying double movement costs in addition to any other movement costs they must pay. All ground vehicles (except air cushion vehicles) move by paying quadruple movement costs in addition to any other movement costs they must pay. Thus, a tracked vehicle moving in a woods would pay double movement costs for the woods, and quadruple again for the medium mud, octupled total movement costs or 8 cm for every centimeter actually moved.

In addition, all ground vehicles (except air cushion vehicles) while moving cross country may become mired.

16.23 Heavy Mud: All personnel stands move by paying double movement costs in addition to any other movement costs they must pay. All ground vehicles (except air cushion vehicles) move by paying quadruple movement costs in addition to any other movement costs they must pay.

All ground vehicles (except air cushion vehicles) while moving cross country may become mired. In addition, wheeled vehicles may become mired when moving on unpaved roads.

16.24 Flooded Areas: Depending upon the scenario, the referee may choose to mark certain areas along rivers and creeks as flooded. Such areas may either be considered as impassible or as heavy mud, at the referee's discretion. In addition, flooded areas may block access to some bridges. As a general rule, the area within 5 cm of an impassible flooded area should be treated as heavy mud.

16.25 Mired Vehicles: At the end of each Movement Phase in which a vehicle that moves has a chance to mire, check the following chart. Roll 1D20 for the vehicle. If the die roll is equal to or less than the number indicated, it is mired. Recovery vehicles are exempt from having to roll on the Miring chart, below.

Miring

Vehicle Type	*Miring Roll Medium Mud*	*Miring Roll Heavy Mud*
Wheeled vehicle on dirt road	—	2
Wheeled vehicle off road	4	8
Tracked vehicle off road	2	4

A mired vehicle may not move until unmired, either with the help of vehicles or by itself.

Normally the check to mire is made at the end of a turn. If, however, a vehicle moves across an area where it can mire to an area where it is safe, it still must check at the point where it left the area.

Example: An wheeled armored car is moving down a hard road. It must leave the road and detour around a wreck onto heavy mud. Even though it will start and end the turn on a hard surface road where it is a wheeled vehicle safe from miring, it still must check at the point where it attempts to regain the road. On a roll of a 1 to 8, it will be mired.

16.26 Unmiring Vehicles: A vehicle may be unmired in one of the two ways. It may be pushed or pulled by another vehicle for at least 1 cm (per Rule 12.3). If this happens, the vehicle is unmired.

As an alternative, a vehicle may attempt to unmire itself. The vehicle must be given a *cautious advance* order and must spend its entire movement allowance in the attempt. A D20 is rolled, with a result of a 1 or 2 indicating that the vehicle is now free and may move 1 cm for this turn. Veteran or Elite crews may

subtract 2 from the die roll to unmire. The vehicle is free to move on the following turn, but may need to check on the following turn for miring again.

16.3 Snow

Snow reduces visibility and, depending on its duration, may restrict movement as well. The visibility effects of snow are covered in Rule 15.

The referee may make a table to determine the extent of the snowfall, as well as any changes in its type.

Snowfall
(roll each turn)

Die Roll	*Effect*
1-2	Light ceases, steady becomes light, heavy becomes steady, clear remains unchanged
3-9	No change
10	Light becomes steady, steady becomes heavy, clear becomes light

If snow continues for any length, it will affect the ground conditions. Count the number of turns that it has been snowing, with each turn of light snow counting as a half-turn and each turn of heavy snow as two turns. Check on the following table:

Snow Ground Conditions

Hours	*Result*
3+ hours of snow	Snow cover
6+ hours of snow	Deep snow cover

Note that the referee may determine as part of his scenario that it has been snowing a set number of turns before the start of the game.

16.31 Snow Cover: Snow cover affects the movement of all stands by doubling all costs, except for flying vehicles, air cushion vehicles and ground vehicles on roads. Vehicles on plowed roads may move normally with their road movement factor. Ground vehicles (except air cushion vehicles) moving on unplowed roads may not use their road movement factor, but are limited to their cross country factor. Thus, a tracked vehicle moving in a woods would pay double movement costs for the woods and double again for the snow cover. Thus, they would be paying quadruple costs (i.e., 4 cm for every centimeter actually moved).

Ski-equipped personnel stands and specially constructed snow-crossing vehicles (such as arctic tractors or animal-drawn sleds) ignore the terrain effects of snow and move normally.

16.32 Deep Snow Cover: Deep snow cover affects the movement of all personnel stands by doubling all costs. Vehicles on plowed roads may move normally with their road movement factor. Ground vehicles (except air cushion vehicles) moving on unplowed roads may not use their road movement factor, but are limited to their cross country factor. In addition, ground vehicles (except air cushion vehicles) must pay quadruple costs for any movement, including that on unplowed roads. Thus, tracked vehicles moving in a woods would pay double movement costs for the woods and quadruple again for the snow cover. Thus, they would be paying octuple costs (i.e., 8 cm for every centimeter actually moved).

16.4 Other Arctic or Winter Conditions

The following other arctic or winter effects may come into play in the course of a game, at the referee's discretion.

16.41 Frost: Frost reduces the effects of mud by one level. For every two hours of frost, reduce the mud level by one additional level, so that after three hours of frost heavy mud is reduced to light mud.

16.42 Ice: Ice affects the movement of all ground vehicles (except air cushion vehicles) by doubling their movement costs on all types of terrain, including roads. In addition, the formation of ice may allow stands to move across frozen bodies of water. The possible levels of lake ice thickness are expressed as the same weight classes as bridges (i.e., class I through class VI).

Note that class 0 ice is not open water, but water with a crust of ice too thin to support personnel. Also, note that one class of ice can blend into another level (up or down one) without necessarily showing any surface indications.

If a stand attempts to move on lake ice that is not frozen enough to support it, the stand breaks though the ice. Personnel stands take one hit and are moved back to the last place on the lake ice that could support them. Vehicles and towed weapons are removed from play.

In areas with snow cover, a frozen lake may be hidden by the cover and not visible, and will look as if it is a snow-covered clearing. In games where one side or both are not familiar with the terrain, these lakes will not be shown as such on the playing surface, but rather the referee will keep track of them on a map. The referee will check to see if a stand moving on to a snow-covered lake will break through the ice. Stationary personnel stands or any patrol stand will be able to determine that they are on a snow-covered lake and must be informed of this fact by the referee immediately when they end movement on the ice.

RULE 17: ALIEN ATMOSPHERES

The basic rules assume an Earth-type atmosphere. Unusual atmospheres have several effects. Some are on combat specifically, but most are general effects which can complicate any activity.

17.1 Weapons Effects

Atmospheric friction and opacity to bolts of energy can alter the performance of weapons. These changes are characterized as changes in range for purposes of penetration only and do not affect the difficulty levels of hitting targets at various ranges. Atmospheric taint does not affect these figures; only relative density does.

17.11 Plasma, Fusion and Slug Weapons: In Vacuum or Trace atmospheres, weapons use their short-range penetration number at all ranges. In Very Thin atmospheres, weapons use the penetration value for one range band less than the target is at. In Thin, Standard and Dense atmospheres, weapons use the normal printed values. In Exotic, Corrosive and Insidious atmospheres, they use the penetration for one range band farther than the target really is, except that fire at short range is not modified.

Atmosphere	*Weapons Effects*
Vacuum, Trace	Use short range penetration at all ranges
Very Thin	Penetration as one range band closer, but no effect at short range
Thin, Standard, Dense	Use normal values
Exotic, Corrosive, Insidious	Penetration as one range band farther, but no effect at short range

17.12 Lasers: In Vacuum, Trace, or Very Thin atmospheres, lasers use their short-range penetration number at all ranges.

In Thin atmospheres, lasers use the penetration value for two range bands less than the target is.

In Standard atmospheres, lasers use the normal printed values.

In Dense atmospheres, they use the penetration for one range band farther than the target really is.

In Exotic, Insidious and Corrosive atmospheres, they use the penetration for three range bands farther than the target really is. (I.e., they may only fire at short range and do so using the extreme-range penetration values.)

Atmosphere	*Weapons Effects*
Vacuum, Trace, Very Thin	Use short range penetration at all ranges
Thin	Penetration as two range bands closer
Standard	Use normal values
Dense	Penetration as one range band farther
Exotic, Corrosive, Insidious	Penetration as three range bands farther

17.3 Planetary Bombardment: Lasers and particle accelerators use different range bands for damage and penetration, based on the atmosphere type, as shown below.

Atmosphere	*Laser*	*Particle Accelerator*
Vacuum, Trace, Very Thin	Short	Short
Very Thin	Short	Medium
Thin	Medium	Long
Standard	Medium	Extreme
Dense	Long	Not allowed
Exotic, Corrosive, Insidious	Extreme	Not allowed

17.2 Personnel Effects

Worlds with Thin, Standard and Dense atmospheres are all breathable without additional preparation. Tainted atmospheres require personnel to use filtering systems, either masks on individuals or vehicle filter systems.

Worlds with Trace and Very Thin atmospheres require the use of oxygen tanks and eye and ear protection, or sealed vehicles with life support. Worlds with no atmospheres require the use of vacuum suits. Worlds with Exotic, Corrosive or Insidious atmospheres all require the use of oxygen tanks plus additional protection: eye protection in Exotic atmospheres, and vac suits, combat armor or battle dress in Corrosive and Insidious atmospheres.

Vacuum, Trace, Very Thin, Exotic, Corrosive and Insidious atmospheres are all collectively termed hostile atmospheres. Units in hostile atmospheres can take one fewer hits than in a nonhostile atmosphere. The first hit on Elite stands is marked with a yellow marker. The first hit on Veteran stands is marked with a red marker (and they are forced back and pinned). The first hit on both Experienced and Novice stands eliminates them.

17.3 Other Technical Effects

The following additional factors affect play of the game on alien worlds.

17.31 Communication: Worlds with Vacuum, Trace and Very Thin atmospheres do not have an ionosphere to reflect radio waves back to the planet's surface. As a result, all broadcast communicators (radios) become effective only while in line of sight of the target of the communication.

Staff radio stands may not convert operational commanders to strategic commanders. Although they can communicate with stands to which they have a direct LOS, operational commanders already have that capability.

Forward observers and spotters for indirect fire missions must have either a line of sight back to the firing unit or an uplink satellite communication link.

Exotic, Corrosive and Insidious atmospheres may have a high degree of radio interference, which can disrupt both broadcast and tight beam uplink communications on an irregular basis. As this can vary greatly from world to world; the referee is left to exercise unlimited discretion in this regard.

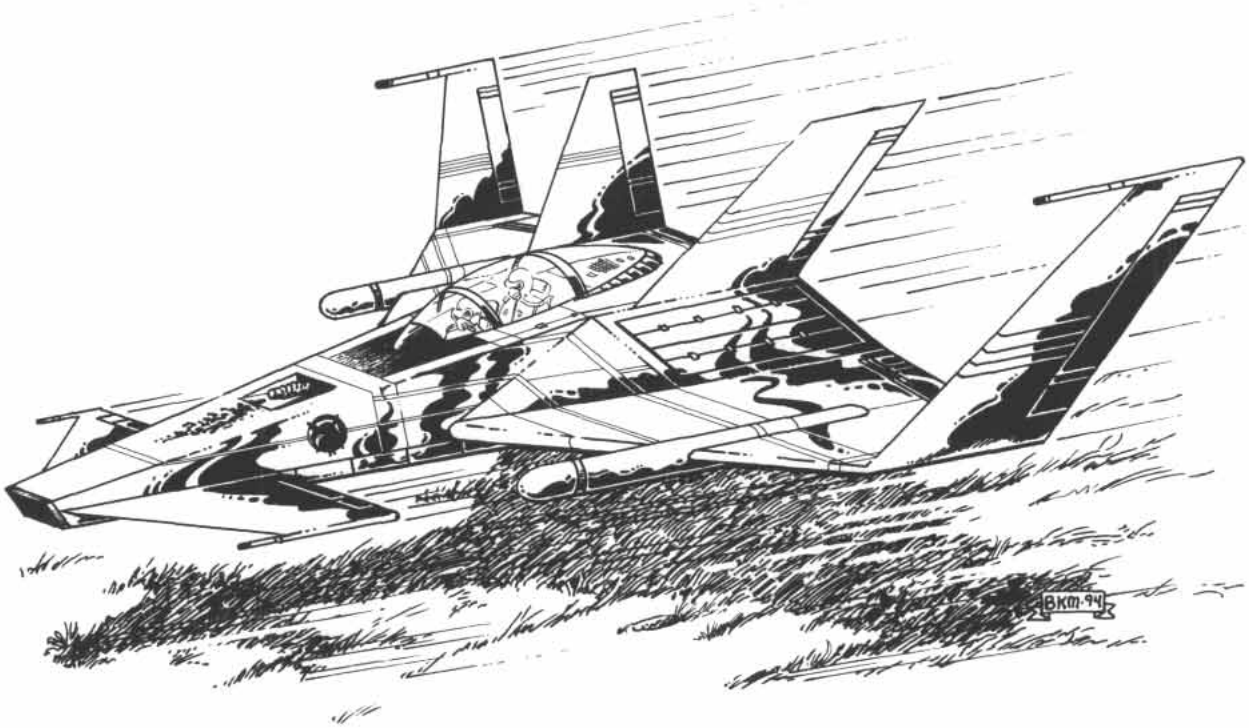
17.32 Air Breathers: No air-breathing machinery (such as

jet engines, internal combustion engines, etc.) can function on Vacuum, Trace, Exotic, Corrosive or Insidious atmosphere worlds. They can function in Very Thin atmospheres if fitted with specially designed intake compressors.

17.33 Airplanes: Aircraft cannot fly at all in Vacuum, Trace or Very Thin atmospheres, nor can they fly in an atmospheric density less than that of the world for which they were designed. For example, an airplane designed for use in a Standard atmosphere could fly in a Dense atmosphere, but not in a Thin atmosphere.

Exotic, Corrosive and Insidious atmospheres are all considered to have the same approximate pressure for this purpose, and all are denser than a Dense atmosphere.

17.34 Hovercraft: Hovercraft/air cushion vehicles cannot function in Vacuum or Trace atmospheres. Their movement allowances are quartered in Very Thin atmospheres and halved in Thin atmospheres.



17.35 Maintenance: Exotic, Corrosive and Insidious atmospheres do cumulative damage to all vehicles and equipment. This is handled by increasing the maintenance points of vehicles in a unit, and thus increasing the need for maintenance personnel. This is only important in campaign games (see **Rule 24.2: Mechanics**).

In Exotic atmospheres, multiply the maintenance point value of all unsealed equipment by 1.5. In Corrosive atmospheres, double the maintenance point value, and in Insidious atmospheres, quadruple it.

Completely sealed vehicles and equipment, such as submarines, spaceships, and battledress, use the multipliers 1, 1.5 and 2, respectively.

Maintenance Point Multiplier

Atmosphere	*Unsealed*	*Sealed*
Exotic	1.5	Unmodified
Corrosive	2	1.5
Insidious	4	2

RULE 18: ENGINEERING

The following engineering rules are intended mainly for pregame or campaign purposes. The referee may allow a side to a set number of hours before the game starts to engage in engineering tasks. Players need to bear in mind that times given below represent ideal conditions and that they can be modified by terrain, weather and other considerations imposed by the referee.

18.1 Engineer Stands

Engineer stands are those that are equipped and trained to carry out combat engineering and combat construction tasks. They are listed as such in the relevant TO&E for various countries. In some cases, nonengineer personnel stands may help carry out specific engineering tasks, but those cases are specifically listed below. To replace one engineer stand at a task (where it is allowed), two nonengineer stands must be employed. Single-figure command stands, staff stands and pack animal stands may not be used for engineering purposes. Mounted stands (bicycle, motorcycle, grav cycle and cavalry stands) must be dismounted (per Rule 12.13).

18.2 Engineers and Bridges

As mentioned in Rule 11.31, there are six classes of bridges in the game system, labelled with Roman numerals I through VI. Portable bridging equipment is labelled in the same way. The bridge class represents the highest class of vehicle or towed weapon allowed to cross it.

18.21 Portable Bridges: Portable bridges are sets of prefabricated components designed for assembly on-site by engineers. A single unit of bridging equipment can be used to assemble a 2cm span of bridge of the unit's nominal weight, a 1cm span of bridge one weight class higher, or a 4 cm span of bridge of one weight class less.

Thus, a set of unit IV bridge equipment could be used to assemble 4 cm of class III bridge, or 2 cm of class IV bridge, or 1 cm of class V bridge. This upgrade or downgrade may only be done by one level. The class IV bridge noted above could be converted into twice as much class III bridge or half as much class V bridge, but not into four times as much class II bridges or one-quarter as much class VI bridge.

Each unit of bridge is carried on a vehicle or a trailer towed behind a vehicle. At lower tech levels, it is animal-drawn. At tech level 7 and above, special amphibious vehicles with the bridge unit built in can drive directly into the water and self-deploy.

Portable bridge units at tech levels up to 5 each require three stands of engineers to deploy and require one full hour per unit to place. If enough engineers are available, multiple units may be placed simultaneously.

Portable bridge units at tech level 6 and above each require a single engineer stand to deploy and require two turns per unit to place.

Self-deploying portable bridge units require only the vehicle crew to deploy and take only one full turn to place.

Bridges, ferries and other items of engineering equipment used to cross streams are limited to points where the riverbanks are gentle enough to allow for the loading and unloading of the equipment. Such places should be marked on the referee's map before the start of the game and revealed to players as the scenario dictates. Three engineer stands can build a ramp in nonsteep-sided river banks in one hour (12 game turns), or have an earthmover do the task in three game turns.

18.22 Building Bridges: Bridges may be emplaced using prefabricated components or built from locally procured materials. Materials for bridges of class I and II should be readily available in most places. Materials for bridges of higher classes should be increasingly scarce as the weight class rises. The number of stands needed and the time needed to emplace/build a bridge (in hours) is noted on the Bridging table below.

Bridging

Type	*Stands*	*Hours to Emplace*	*Hours to Build*	*Hours to Repair*
Class I	4*	1	3	1.5
Class II	4*	1	4	2
Class III	10*	2	6	3
Class IV	10*	2	8	4
Class V	16*	4	16	8
Class VI	16*	8	32	16

*Up to half the stands needed to emplace/build/repair a bridge may be nonengineer stands. However, the time needed to build the bridge is doubled if any nonengineer stands are used. Thus, a class V bridge could be built with two engineer stands and two infantry stands, but would take 32 hours to complete. Likewise, a class V bridge could be repaired with two engineer stands and two infantry stands, but it would take 16 hours.

18.23 Repairing Bridges: Bridges which are damaged due to artillery, aircraft or demolitions may be repaired, but a bridge may never be repaired to a condition better than its starting class. A damaged class V bridge may be repaired back to class V, but no higher. While the bridge is being repaired, it may not be used by any units.

Repairing stands must be continually in contact with the bridge and must not be fired upon; otherwise, the turn when firing is received does not count. The time needed to repair a bridge is listed in hours, as well as the number of stands needed to do the work, noted on the Bridging table above.

18.24 Ferries: Portable bridging equipment may be to used to assemble ferries to transport stands across a river. The number and type of ferries that can be assembled are dependent upon the bridge class: Each unit of bridge can only be converted into one ferry of the same class or two ferries of the next lower class. A class IV bridge, for example, could be used to make one class IV ferry or two class III ferries, but could not be made into a ferry of any other class.

A ferry may transport only stands of its own class or below,

and may only carry one stand across the river at a time (stands loaded into transport vehicles or stands carrying cargo count as one stand for this purpose). Bulk cargo may be carried on ferries provided a stand is present on each riverbank to load/unload (it takes half a turn to load/unload a ton of cargo).

A ferry can cross a river up to 25 cm wide in a half move, and up to 50 cm wide in a full move.

It requires half a turn to load/unload a ferry.

The time needed to assemble a ferry in hours, the number of stands needed to do the work, the ferry's cargo capacity and the number of hits required to sink a ferry are noted in the Ferry table, below.

Ferry Table

Ferry Class	*Stands*	*Hours to Build*	*Cargo Capy*	*Damage To Sink*
Class I	1	0.5	1	1
Class II	1	1	3	1
Class III	2	1	8	2
Class IV	2	1.5	20	3
Class V	2	2	30	4
Class VI	3	2	36	4

A ferry counts as a soft vehicle for the purposes of fire. Passengers or cargo on sunken ferries are removed from play unless the ferry is within 2 cm of the shore. If the ferry is within 2 cm of the shore when sunk, personnel stands take one hit and are placed on the shore (all cargo is eliminated).

18.241 Improvised Ferries: Any engineer stand may fabricate a class I ferry from locally available materials, even if the stand has no bridging equipment available, taking twice the time indicated on the table above. This represents a river crossing using improvised rafts from oil drums, logs, etc.

Larger ferries may be constructed from local equipment at the referee's discretion, at twice the time indicated above. Improvised ferries larger than class III should be extremely rare.

18.25 Vehicle-Mounted Bridges: Vehicle-mounted bridges take one-half turn to emplace once they arrive at the point where they are needed. These bridges cannot be used to cross any obstacle more than 2 cm in width, and they may not be converted into ferries. Vehicle-mounted bridges, once emplaced, are destroyed after taking three hits, regardless of their class.

The class of a vehicle-mounted bridge is indicated on the relevant data chart for the vehicle in question.

18.3 Assault Boats

Some engineer units also have access to inflatable or collapsible assault boats as specified in their organization charts. An assault boat may carry either one personnel stand (half, single or double-sized), one class I towed weapon without crew, or one ton of supplies. An assault boat moves 10 cm per turn. It requires half a turn to load/unload an assault boat.

Assault boats can be damaged by small arms fire, explosive fire and aircraft bombs. Armor piercing fire has no appreciable effect on assault boats. One hit is sufficient to sink an assault boat. Passengers or cargo on sunken assault boats are removed from play unless the assault boat is within 2 cm of the shore. If the assault boat is in within 2 cm of the shore when sunk, personnel stands take one hit and are placed on the shore (all cargo is eliminated).

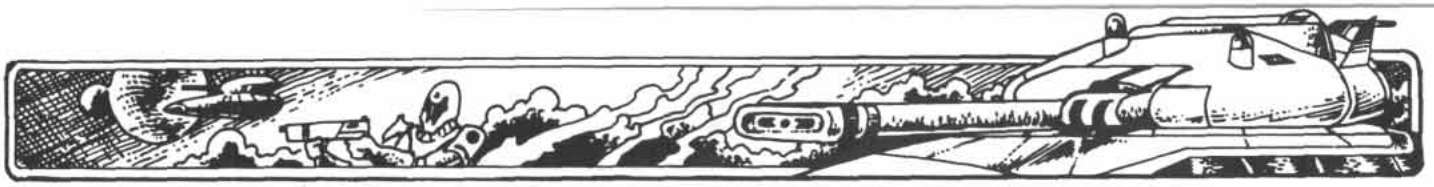
18.4 Minefields

Minefields are laid by engineer stands. They are laid in 5cm by 5cm squares, with every ton of engineering supplies providing enough mines for eight such minefields. In addition, dummy minefields may be placed if the player so wishes (and do not require the consumption of any supplies). Minefields are always marked and visible to the enemy. The easiest way to show them in a game is to use 5cm by 5cm pieces of paper or cardstock, with "actual" or "dummy" written on the square. These are then placed with the writing side down on the playing surface.

When a minefield square is entered by any stand for the first time in a game, the minefield marker is turned over and revealed to be real or dummy. If it is real, it remains on the board; if it is a dummy, it is removed from play.

18.41 Laying Minefields: Minefields may be laid using a number of different techniques.

18.411 Manual Placement: In battle conditions, an engineer stand may lay out two real minefield squares as well as two dummy minefield squares per turn, or the engineer stand may lay out four dummy squares per turn. The stand must be given a *cautious advance* order, but does not move. The minefields must be placed within 10 cm of the location of the stand which is placing the mines.



In nonbattle conditions, each engineer stand can construct up to eight actual minefields and eight dummy minefield squares, or a total of 16 dummy minefield squares in one hour.

18.412 Minelayers: Each minelayer can place 12 uncamouflaged or six camouflaged minefields per turn. Minelayers carry up to 30 minefield squares.

18.413 Mine Launchers: Mine launchers are a quick means of placing uncamouflaged minefields. Each launcher can hold up to eight mine squares, and place them in a single turn within 50 cm of the location of the launcher. All mines launched at the same time must be adjacent to one another.

The mines are launched in the General Fire sub-phase, subject to the normal movement and fire restrictions. The launcher need not place all the mines at one time, but may place some, move on the following turn, and place another field. Once empty, a mine launcher may be reloaded by an engineer stand in one turn.

18.414 Remotely Delivered Mines (RDM): Mines may be artillery or dropped by flying vehicles. RDM minefields are always 25 cm in diameter. The mine value listed for the round is its chance of obtaining a hit. Each round covers the area indicated by its burst radius. The uncamouflaged minefield covers an area 10 inches by 15 inches and may be either AP or AT. One round of each type of mine may be fired into the same

area to produce a mixed minefield. Artillery battalions of three weapons may deliver one minefield per turn; MLRS battalions may place two minefields per turn.

18.42 Minefield Attacks: At the instant that a stand enters a real minefield square, it is attacked. Regardless of the result of the attack, the stand may elect to cease movement for the remainder of the turn at that point. If so, it is not considered in the minefield, but halted at the edge. If the player elects to continue the advance through the minefield, a second attack on the stand occurs. If the stand moves into the same minefield on a following turn, it will suffer the results of the additional attack as well.

If a stand advances into a new minefield square as the result of its movement, the procedure is repeated.

18.421 Conventional Minefields: To resolve the minefield attack on a stand, roll 1D20 All vehicles and personnel stands are hit on a die roll of 1 or 2. The die roll result is halved if the stand is conducting a *rapid advance* and quartered if conducting *travel* movement.

Mines have no effect on towed weapons. Vehicles and personnel stands which take a hit from mines must check morale (in addition to suffering the hit).

18.422 RDMs: Remotely delivered minefields (RDMs) have a variable chance of hitting a stand passing through, based on the minefield value of the mine ammunition fired. If several shots are fired into an area, the values are added to determine the chance of a hit.

For example, a howitzer has RDM ammunition with a minefield value of 2. The howitzer fires two rounds at the same target. The resulting minefield has a value of 4, so any unit moving through it will be hit on a die roll of 4 or more.

18.43 Detecting and Lifting Minefields: An engineer stand may detect whether a minefield is real or a dummy by moving adjacent to the field and spending one turn there with a *cautious advance* order. At the end of the turn, the minefield marker can be turned over without causing any casualties on the engineer stand.

18.431 Manual Lifting of Mines: An engineer stand may clear a path through a real minefield by moving adjacent to the field, then spending two turns there with a *cautious advance* order. The stand is not attacked by a minefield while it clears its path. Once a path has been cleared, the minefield may be removed from the playing surface, as it is no longer relevant.

18.432 Mine Plows: Mine plows are mounted on tracked vehicles and each turn may be either in the "up" or "down" position. Mine plows in the up position do not affect the speed of the vehicle on which they are mounted. When placed down and in use, the vehicle's speed is halved, and there is a chance that the roller will be damaged. After the vehicle has passed through the minefield, roll 1D20, with a roll of a 1-6 indicating that the plow is damaged and can no longer be used. A vehicle with a damaged plow also takes a hit and moves at one-quarter speed until the damaged plow is jettisoned (which takes one full turn, during which time the vehicle must remain stationary and not receive fire).

18.433 Line Charges: Line charges are used to breach minefields. They are either mounted on vehicles or carried on trailers. Each weapon has four line charges, each of which may breach one minefield. To breach a minefield, the vehicle/trailer must start its turn adjacent to the minefield. Breaching minefield counts as direct fire and is resolved as a close-range attack. A successful attack opens a breach 5 cm deep and wide enough for vehicles to pass through in single file.

18.5 Fortifications

Stands may dig in for protection from enemy fire. The actual type of protection will depend on the time spent digging in, as well as the type of stand doing the work. Stands may not fire at enemy units on turns that they are digging fortifications. The time needed to carry out a task should be doubled in adverse weather or terrain conditions (at the referee's discretion). Fortifications may not be constructed in flooded areas, heavy mud or any type of permanent mud. Fortifications can be built in ground that may later turn to mud, and such a change has no effect upon them.

18.51 Digging In: Digging in is defined as foxholes, small slit trenches and similar field fortifications. Any personnel stand may dig in by remaining stationary for two hours at the same point. At the end of that time, the stand is considered to be in cover for purposes of small arms fire and morale as long as it remains in that location.

18.52 Constructing Fortifications and Obstacles:

18.521 Entrenchments and Weapons Pits: Four engineer or nonengineer personnel stands will produce one entrenchment or weapons pit in eight hours. One earthmover will produce one entrenchment or weapons pit in one hour.

18.522 Bunkers: An engineer stand may build a bunker in eight hours or convert two previously built entrenchments to bunkers in eight hours.

18.523 Tank Ramps: An engineer stand may construct one tank ramp in four hours. One earthmover may build one tank ramp in a half hour (six game turns).

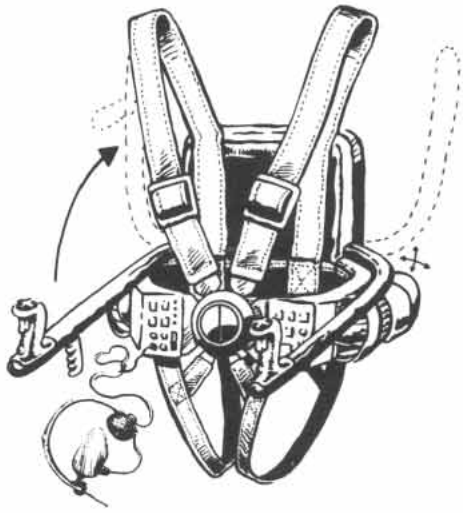
18.524 Antitank Ditches: An engineer stand may build 1 cm of antitank ditch in four hours. An earthmover may dig 1 cm of antitank ditch in a half hour (six game turns)

An engineer stand may create a crossing point on an existing antitank ditch by moving to a point on the ditch and spending four turns there with a *cautious advance* order building the crossing point. An earthmover may construct a crossing point in one turn.

18.525 Barbed Wire: An engineer stand may place one ton of wire in one hour. Each ton covers 10 cm of frontage. Nonengineer stands may also place barbed wire, but at a rate of 5 cm per hour. Engineer stands may breach barbed wire by moving adjacent to the wire and spending one turn there with a *cautious advance* order. At the end of that turn, there is a gap 1 cm wide created in the wire.

18.526 Road Craters: An engineer stand may crater a road in one hour (12 turns), or an earthmover in three turns. The crater may be filled in by hand by an engineer in a half hour

(six turns) or by an earthmover in two turns.



18.527 Abatis: An engineer stand in woods or forest may construct an abatis at a rate of 1 cm per turn when given a *cautious advance* order. Earthmovers can construct abatis at a rate of 4 cm per turn. Abatis is impassible to all stands.

An engineer stand may make a 1 cm breach in abatis in two turns. An earthmover may make a 1 cm breach in one turn.

18.528 Antivehicular Obstacles: These are specially built impediments to the passage of ground vehicles, such as dragon's teeth, steel I-beam hedgehogs, log jack-knives and similar obstacles. Ground vehicles cannot cross antivehicular obstacles.

An engineer stand can built 1 cm of antivehicular obstacles per hour, consuming one tenth of a ton of engineer supplies in the process. An engineer stand can clear a path through them at rate of 1 cm per turn, provided they do nothing else during that time. Earthmovers do not assist in building antivehicular obstacles, but can clear a path through them at the rate of 1 cm per turn.

18.53 Destruction: Earthmovers can be used to destroy a bunker, entrenchment, weapons pit, tank ramp or pillbox if they start the turn adjacent to it and spend a full turn there under a *full movement* order. At the end of the Final Fire subphase, the fortification is destroyed and its inhabitants eliminated if the earthmover has not been eliminated or forced back.

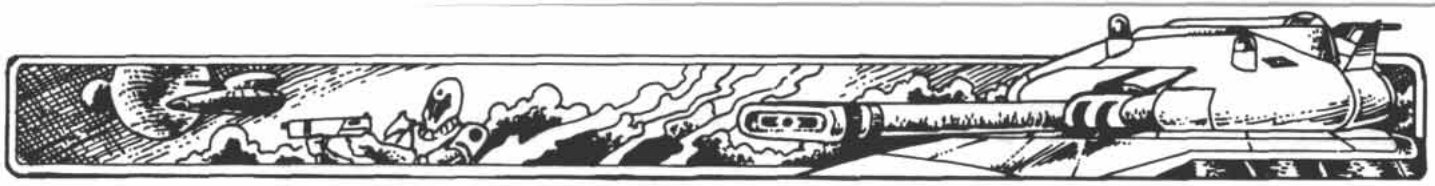
18.6 Demolitions

Demolitions may be emplaced on or in structures such as bridges or buildings. Each ton of demolitions will cause three points of damage when detonated. A class IV bridge, which needs 12 points of damage to completely destroy it, can therefore be destroyed by four tons of emplaced explosive.

An engineer stand may emplace one ton of demolitions in an hour. When a structure is prepared for demolition, the preparing player must specify a point from which the charge will be detonated. This point is where the detonating wires/fuses have been brought together, and may be on any side of the structure, as long as it is within 10 cm of it.

A player may attempt to detonate a prepared structure in either battle or nonbattle conditions. In any Fire Phase that a stationary engineer stand is present at the detonation point, it may attempt to set off the charge. The chance of success is the same as for a short-range direct fire attack to hit based on the type of stand that placed the charge. If stands placing the charge were of different troop quality, use the lowest troop quality for the die roll.

If the roll is unsuccessful, the player must reset the charges. The engineer stand at the detonation point must spend one turn stationary with a *cautious advance* order. The subsequent attempt to set off the charge will use the troop quality of the engineer stand that reset the charges.



If an opposing engineer stand reaches the demolitions point, or any point directly between the demolitions and the detonation point, and remains there for one turn stationary, the wires are cut and the charge may not be detonated. The charge may only be reset if the enemy stand is driven off, then a friendly engineer stand regains the point held by the enemy stand and spends a turn stationary restoring the wire.

When the charge is set off, all stands in or on the structure are considered to have taken an HE attack equal to half the value of the damage points that will be caused, rounding fractions down.

The stands receive no cover modifier for the attack. If the structure is destroyed by the explosion, any stand on or in the structure is also destroyed.

18.7 Mobility Assistance

Breaks in the ground, such as creeks and gullies, can limit mobility of ground vehicles. Engineers may create a crossing point over such an obstacle in the same way as for an antitank ditch (see Rule 18.524 above).

RULE 19: ELECTRONIC WARFARE

Electronic warfare (EW) involves the use of radio and radar locators, radio and radar jammers, decoys, and other means of reducing a unit's detectability.

19.1 Direction Finders

Direction finders are used to detect the source of any active electromagnetic emissions. These include broadcast radio, radar, active EMS and lasers. Each direction finder is designed to detect and locate only one type of electromagnetic emission, so a radar locator may only locate radar emissions, not radio or laser. The exception to this is EMS direction finders, which may detect any form of emission. All passive EMS sensors have direction-finding capability.

19.11 Procedure: Locating the hostile emitter is a task using the accuracy values for the troop type operating the direction finder but using the range of the active emitter. All ranges are treated as being one range band closer than they actually are, so a direction finder has an extreme range equal to twice the extreme range of the active emitter being located.

For example, a direction finder is used to detect a radio communicator with a short range of 3 km. The actual range from the direction finder to the radio is 12 km, which is the long range of the radio. The detection task is resolved as a medium-range task using the asset of the crew operating the direction finder.

Each direction finder may make only one detection attempt per turn. This is usually made against the emitter which the detector has the best chance of locating (i.e., the closest, strongest signal). A player may deliberately attempt to locate a weaker signal instead, but suffers a +1 diff mod penalty for doing so.

19.12 Effects: Successful detection of an emitter allows the detecting player to discover the approximate location and power of the emitter, to fire an antiradiation missile in the current turn, or to call an indirect area fire mission on the emitter the following turn.

19.121 Anti-radiation Missiles (ARMs): An antiradiation missile is a special variety of homing missile designed to home on electromagnetic emissions. Firing procedure is the same as for other homing missiles, with the success roll being the same as it was to detect and locate the emitter. (A separate die roll is required for the actual missile fire, however.)

19.122 Area Fire Missions: An area fire mission called on an active emitter is fired using the normal procedure for such a mission. The chance of the mission being on target is the same as it was to detect and locate the emitter. (A separate die roll is required for the actual fire mission, however.)

19.13 Common Communicators: Different command levels routinely use different powers of radios to communicate. No radios are in use before tech level 5. At tech level 5, count each unit as being three command levels lower than on the following chart. At tech level 6, count it as one level lower. At tech levels 7 and 8, use the chart as printed. At tech level 9 and above, treat each unit as being one tech level higher than on the chart.

For example, a tech level 5 company has no radio available. A tech level 12 company has a 30km short-range radio.

Communicators

Level	*Short Range*
Squad	—
Platoon	3
Company	3
Battalion	30
Brigade	30
Division+	300

19.2 Jamming

Jammers broadcast a series of conflicting signals on a given frequency or frequencies to overwhelm or confuse other signals. Radio jammers disrupt communications, while sensor jammers make detection tasks more difficult.

19.21 Radio Jamming: Radio jamming takes place during the Command Phase and continues throughout the turn.

19.211 Procedure: Each jammer has a set of ranges, just as with weapons and sensors. The jamming player rolls the die once and then consults the success numbers for the different range bands. If the die roll is sufficiently low to succeed at a range band, the jamming is successful at that range band and all closer ones.

For each tech level the jammer is above or below the enemy radios being jammed, apply a – or +diff mod of 1.

For example, a Veteran crew mans a radio jammer with a short range of 3 km. Veterans have success numbers of 13 at short range, 6 at medium, 3 at long and 1 at extreme. The player rolls a 7, which is too high for medium, long or extreme, but is sufficient for a close-range success. All enemy radios within short range (3 km) of the jammer are jammed, if they are from the same tech level. No radios from higher tech levels would be jammed. Radios from one tech level lower would be jammed at a medium range (6 km), 2 tech levels lower at long range (12 km) and 3 tech levels lower at extreme range (24 km).

19.212 Effects: Radio jamming affects only stands which rely on radio for communication. Telephone and uplink staff stands, for example, are not affected, nor are any stands which have line of sight laser or maser communicators (and are communicating to someone in direct line of sight) or uplink tight-beam communicators.

All command stands being jammed and issuing operational or strategic orders must make a short-range task roll to successfully place the order.

All indirect fire accuracy rolls from units which rely on a jammed radio link between the observer and the weapons, observer and FDC, or FDC and weapons is conducted with a +1 diff mod.

Whenever a jammer is in use and the opposing side has a radio locator, the jammer is automatically located.

19.22 Sensor Jamming: Vehicles equipped with jammers

may attempt to jam enemy units which are attempting to detect the vehicle. Specially equipped electronic warfare vehicles with jammers may attempt to jam enemy units which are attempting to detect any friendly unit within the short range of the jammer mounted on the vehicle.

Jammers consist of radar jammers and EMS jammers. Radar jammers may only be used against hostile radars, while EMS jammers are used against either radars or active EMS sensors.

19.221 Procedure: The jamming task is rolled once for each enemy sensor attempting to detect the target. The success of the task is based on the range from the jammer to the detecting unit and the quality of the crew manning the jammer. The difference in tech level between the jammer and sensor (if any) is applied as a + or - diff mod to the jamming attempt.

19.222 Effect: If the jamming attempt is successful, the detection attempt is made with a +1 diff mod.

19.3 Sensor Decoys

Many vehicles are equipped with sensor decoys. These consist of a mix of anti-laser aerosols, chaff (light-weight strips of radar-absorbing or radar-reflecting material) and flares. These decoys are designed to confuse sensors, target designators and rangefinders which rely on lasers, active electromagnetic emissions (such as radar) or detection of infrared radiation.

19.31 Systems Affected: All detection attempts using radar, active or passive EMS, ladar and HRT are affected by decoys. All target designation attempts using lasers or active EMS are affected by decoys. All direct fire attempts by tech level 7+ large-caliber guns (which rely on laser or active EMS rangefinders) are affected by decoys.

19.32 Effects: Decoys cause affected firing and detection tasks to be carried out with a +1 diff mod if from the same tech level. If the decoy is from a higher tech level than the sensing or firing unit, the task is carried out with a +2 diff mod. Decoys from lower tech levels than the sensing or firing unit have no effect.

19.33 Limits: Vehicles have a limited number of decoys, listed in parentheses on the vehicle card. That is the number of turns that a vehicle may use decoys. Each turn in which any affected sensor or fire attempt is made, the vehicle automatically fires decoys unless the owning player deliberately abstains.

TL 9
3000 KM
Communicator

19.4 Stealth and EMM

Stealth and electromagnetic masking (EMM) are both means of reducing the signature of vehicles versus certain common sensors.

19.41 Stealth Vehicles: Some vehicles are listed as being stealth designs. Spotting attempts made against stealth vehicles using radar or thermal/IR sensors are made with a +1 diff mod. If the stealth design is from a higher tech level than the sensor, the detection roll is made with a +2 diff mod.

19.42 EMM: Electromagnetic masking is an advanced form of stealth design. EMM-equipped vehicles will apply a diff mod of +1 or +2 (depending on the vehicle) to detection attempts against it using thermal or radar and may apply a +1 diff mod versus active or passive EMS (again depending on the vehicle). The exact diff mods applied are noted on the vehicle's data entry.

RULE 20: METEORIC ASSAULTS

Meteoric assaults from orbit by means of drop capsules require planning and forethought. In most cases, meteoric assaults will occur at the start of a scenario, and in all cases should have a mission order drawn up in advance either by the players or the referee.

All personnel stands, class I towed weapons and supplies may be dropped by drop capsule. Vehicles and towed weapons of class II or heavier may not be dropped by drop capsule. Animals (cavalry stands, pack animals or animal-drawn vehicles) may not be dropped by drop capsule. Supplies are dropped in one-ton increments.

20.1 Mission Orders

The mission order needs to indicate the specific stands comprising each "stick" of drop capsules, the turn or arrival of each stick, and the drop zone for each stick.

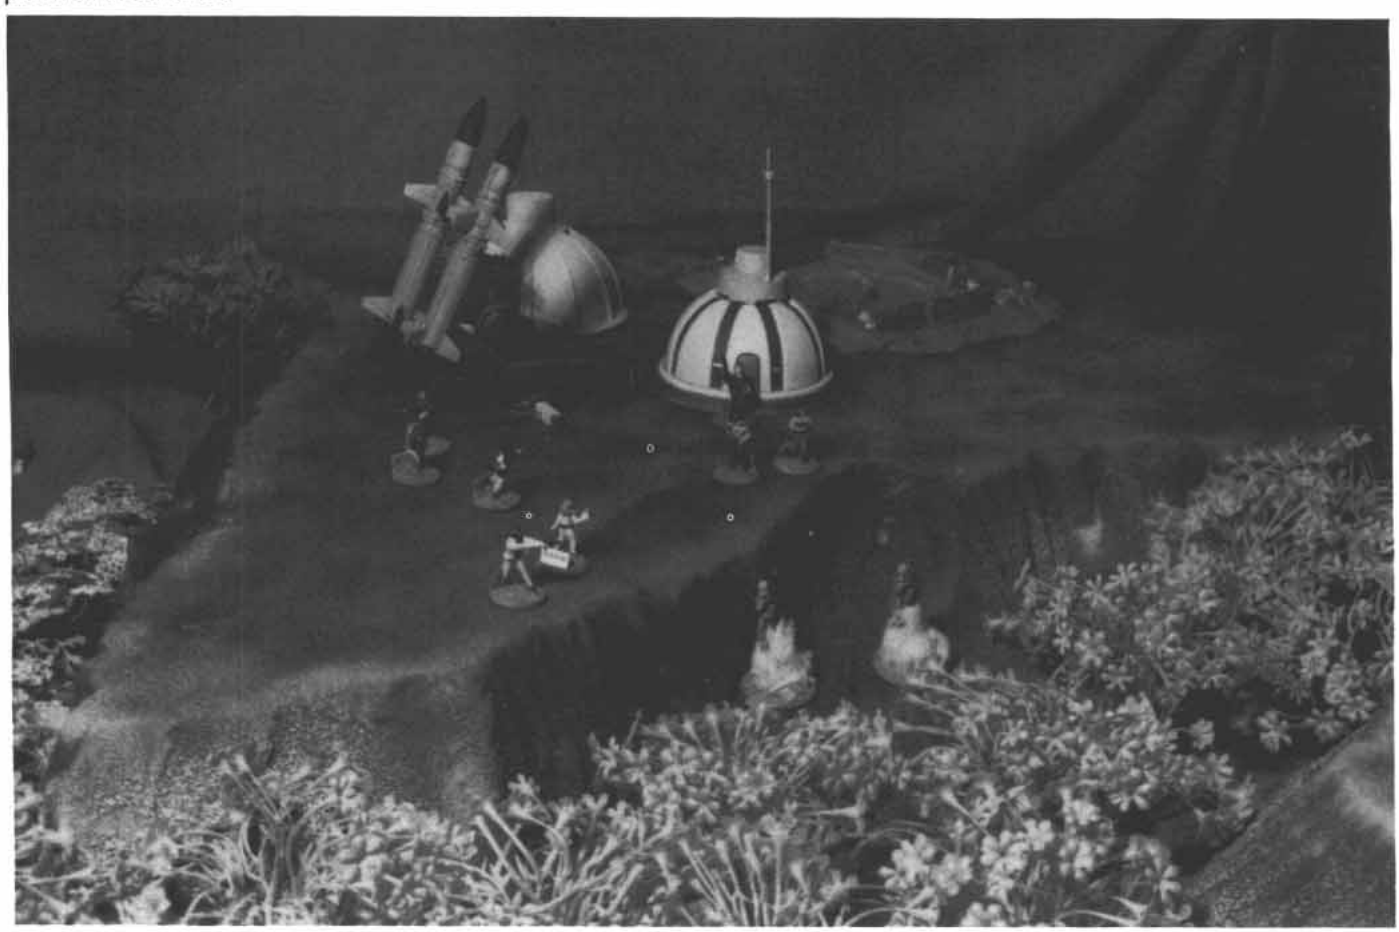
A stick may consist of as many or as few stands as desired, but as a practical matter should seldom exceed 10.

Each drop zone center must be at least 50 cm from any other drop zone center. No more than one stick may use a single drop zone in the same turn. If the drop is to be spread out over several turns, each turn of the drop must be specified and planned in advance.

20.2 Fire at Drop Capsules

Ground-based weapons may fire at drop capsules, but some drop capsules are outfitted with decoys and other countermeasure devices to avoid this fire.

20.21 Allowed Weapons: Only plus penetration weapons may fire at drop capsules; small arms may not.



20.22 Range: Weapons firing at drop capsules measure their range to the point of landing and then add 20 cm.

20.23 Agility: Drop capsules in reentry (when fired upon by long-range planetary defense missiles or beam weapons) have an agility of 9, plus or minus the difference in tech levels between the drop capsule and the fire control of the firing weapon. When landing (and fired on by weapons deployed on the gaming table), they have an agility of 4, plus or minus the tech level difference.

Some drop capsules have limited evasion ability, while others do not. Weapons with point defense fire control double their fire control bonus when firing at nonevading drop capsules.

20.24 Decoys: Some drop capsules have decoys. For the effects of decoys, see Rule 19.3.

Each hit on a drop capsule causes a hit to the stand carried by the drop capsule, but has no other effect.

20.3 Drop Capsule Landings

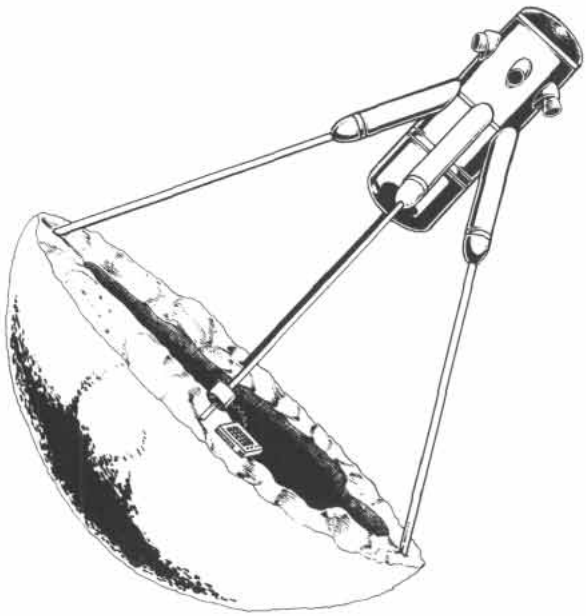
Drop capsule landings are resolved out in the following manner. Each stand should have a 2cm by 2cm square of paper prepared, marked with its unique designation. Gun crews and weapons which are dropped by air should have a separate square for the crew, ammunition and weapon. The squares should be placed on a ruler or yardstick, with the number up or down as the player wishes, in whatever sequence is desired, their edges touching but not overlapping. The ruler should be placed at the drop zone, with the end of the ruler placed at the drop point and the ruler aligned along the flight path. The ruler then is turned over to dump the squares, which should be allowed to flutter to the playing surface unhindered.

The distance above the playing surface the ruler is held will be determined by the troop quality of the troops making the drop. The heights for each stand troop quality level are shown below.

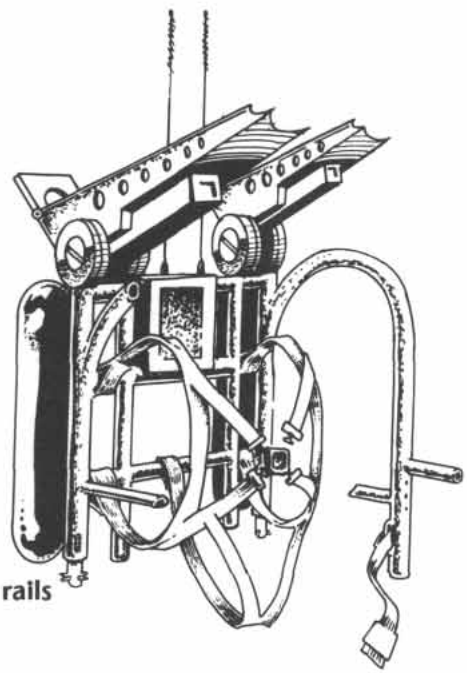
Meteoric Assault Drop Height

Type	*Height*
Elite	15 cm
Veteran	30 cm
Experienced	60 cm
Novice	120 cm

Squares that fall with the marked side up are replaced by their actual stands and a P1 marker. Squares that fall with their marked side down are given a P2 marker. Squares that fall with their marked side down in woods/forest, buildings or swamps, take one hit and a P2 marker.

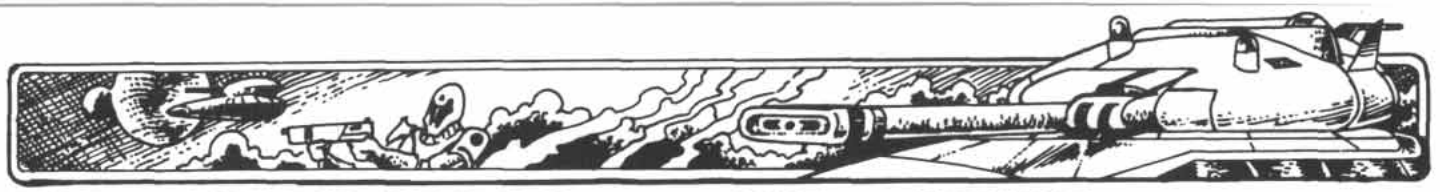


If a square falls marked side down in a lake or deep body of water, then that stand is eliminated and removed from play, unless the troops are equipped with battledress, vac suit or some other form of oxygen apparatus. If so equipped, the stand is placed on the nearest point of land, takes one hit and is marked with a P2 marker.



If the square falls number side up in a lake or deep body of water, the stand is placed on the nearest point of land, takes one hit (unless equipped with battledress or some form of oxygen apparatus) and is marked with a P2 marker. If so equipped, it is placed on the land and is marked with a P2 marker, but does not take a hit.

Squares that fail to land on the playing surface are considered to be lost en route, and are removed from play.



20.4 Armed Drop Capsules

Some drop capsules include missile launch rails for Tac missiles, and once landed, they become fixed missile launchers. Mark the location of these launchers on the map. Each has a limited number of missiles, as specified by the scenario or capsule description.

Parachute harness with missile launch rails

RULE 21: NUCLEAR WEAPONS

Some weapons in the game, mostly missiles, mount nuclear warheads.

21.1 Nuclear Warhead Effects

Nuclear warheads are explosive rounds which do damage as a conventional explosive, with several important differences.

Most explosive rounds have an EP (explosive power) and burst radius (BR) value. Nuclear rounds have these as well (and nuclear rounds always have an EP value of 18). In addition to an explosive power, however, nuclear warheads also have a destruction radius. All stands, weapons, vehicles and structures within the destruction radius of the warhead are eliminated from play. Masonry buildings are reduced to rubble.

21.2 Nuclear Dampers

Because nuclear warheads are hellaciously deadly, most advanced armed forces employ nuclear damper units to protect conventional forces.

Nuclear dampers fire at incoming nuclear warheads using the same procedure as point defense weapons. Nuclear dampers only have a single range, and this is listed under the medium-range column, as all nuclear damper attacks are made using the asset score for medium range. In addition, no diff mods for missile agility are applied. Instead, the only diff mods are a +1 or –1 diff mod per tech level difference between the damper and the warhead.

For example, a tech level 14 damper firing at a tech level 15 missile would use the long-range asset value instead of medium range.

A successful damping roll renders the warhead harmless.

21.3 Lingering Radiation

Nuclear warheads which strike the ground irradiate the soil and leave a high level of residual radiation. For purposes of this rule any warhead fired at a personnel stand on the ground or using NOE movement, a ground vehicle, or a flying vehicle using NOE movement counts as striking the ground.

The radius of lingering radiation of a nuclear warhead is the same as the destruction radius of the warhead. This can be marked with model craters, cut out templates, or just pieces of string if you are particularly lame.

All unprotected units which pass through an area of lingering radiation take a hit. Unprotected units include all personnel stands not in battledress and all open vehicles. Enclosed vehicles do not take damage, nor do personnel in battledress.

All personnel in combat armor and combat environment suits may make saving throws against the radiation damage, using the normal saving throw number of their armor. Personnel stands in other types of armor may not make saving throws.

Nuclear damper units may be used to reduce the long-term environmental hazards of lingering radiation, but have no effect on lingering radiation during the course of a miniatures game scenario.

RULE 22: PSIONICS

Psionics, the ability to harness the extraordinary power of the mind, is widely used in the Zhodani Consulate and, since the collapse of the Third Imperium, has come into wider use in formerly Imperial space. The following rules cover the effects of psionics on combat.

22.1 Teleportation

About 20% of psionic combat specialists can teleport. Psionic teleporters simply appear behind enemy lines. They cannot teleport between positions of dramatically different altitude, so this technique cannot be used to assault from orbit. It is nevertheless a dramatic and effective means of introducing commandoes.

Each teleporter must have a clear mental image of his destination, so each platoon has a "director" present. The director is an adept clairvoyant and telepath who can clairvoyantly scan the target area and then telepathically impress that image on the teleporters.

In order to teleport, a stand must be given a *travel* order. Teleporting into a combat situation, assuming the psion does so from a secure area, is assumed to take place without mishap. Teleporting out again is a task roll conducted as if making a direct-fire attack at long range. Failure means that the stand remains in its original location (but suffers all of the effects of a *travel* order).

22.2 Scramblers

About 20% of psionic combat specialists are "scramblers," gifted telekinetics who pin down enemy stands in preparation for an assault. They accomplish this by telekinetically pulling pins on grenades, squeezing triggers, etc.

Scramblers have an ROF at each different range which is used exactly like a direct fire weapon, except that a "hit" causes no damage, but instead places a Pin-1 marker on the stand.

22.3 Recon

About 40% of psionic combat specialists are recon troops. Each recon specialist is a clairvoyant trained to spot hidden enemy units in likely areas of concealment. Recon specialists have a clairvoyant "sensor" rating used for spotting which is used like any other sensor. Clairvoyant spotting attempts are unaffected by night, weather, smoke, cover or any other normal spotting +diff mod.

22.4 Intel

About 20% of psionic combat specialists are intel officers used to interrogate prisoners using deep mental probes. This has no effect on the tactical battlefield, as virtually all troops facing psionic opponents equip at least their command personnel with psionic shielded helmets.

RULE 23: FORCE COMPOSITION

While players will seldom be in a position to raise, train and equip an army from scratch, they will often come in contact with armies. The following guidelines can help the referee determine the general type of army available to a planet, country or small settlement.

23.1 Army Size

Warlike governments will average about 1% of their populations in the armed forces, while peaceful governments will average only about 0.25% of the population under arms. Governments (worlds or nations) with a population of 1 billion or more halve the percentages listed above.

Not all the armed forces will be in the army, but a substantial part will. Up to 10% of the total will be in the wet navy, and about 20 to 30% will be in the air force (if the world has a tech level high enough to have an air force). The balance will be in the army.

23.11 Number of Units: Instead of dividing the total number of men and women under arms by four to determine how many "stands" there are, then trying to organize them from the ground up, it is much easier to describe the army from the top down.

The army has one division equivalent in service for every 20,000 personnel. For smaller forces, it is more convenient to deal with battalions. Armies have one battalion equivalent for every 2000 personnel.

This does not mean that the troops on a world are necessarily organized into traditional battalions or divisions. They may be grouped into legions, hordes, maniples, tercios, columns or any variety of units. The terms above are used to give a rough idea of the equivalent combat power of the force.

23.12 Unit Strength: A standard "division equivalent" usually consists of 10 maneuver battalions (of about 500 personnel each), 10 support battalions (of 500 each) and up to 10,000 other support personnel not present with the division, but in the military infrastructure.

In smaller armies, a standard "battalion equivalent" usually consists of one maneuver battalion, one support battalion and up to 1000 other personnel in the supporting military infrastructure.

Maneuver battalions are close combat units, including infantry, cavalry, armor, airborne, commando, etc. Support battalions include both combat support (combat engineers, field artillery, air defense artillery, antitank artillery, coast defense artillery, fortress artillery, etc.) and noncombat support (signal, forward supply, transport, maintenance, military police, etc.). Infrastructure includes medical, veterinary, administrative, training, theater and rear area supply, judge advocate general, and general staff personnel.

23.2 Troop Quality

Troop quality is measured by the NPC types who man the unit and the unit's morale. These are determined by the type of society which raises the army. Societies for the purpose of this rule are divided into primitive and advanced as well as into warlike and peaceful.

Primitive societies are generally those which do not have a sufficiently developed technological or industrial base to support space travel. As a rough rule of thumb, societies at tech level 9 and above are advanced, while 8 and below are primitive.

Warlike does not necessarily suggest an aggressive society (although that would certainly qualify as warlike), but can simply indicate a society frequently called upon to defend itself.

Most societies on Balkanized worlds are "warlike," while a government which ruled an entire world and was not called upon to engage in combat very often would be considered "peaceful."

23.21 NPC Type: The following table lists the proportion of units in an army made up of each of the four different NPC types. In general, a unit will be made up almost entirely of the same troop types (with an occasion higher experience stand or group of troops as scouts, leaders or cadres).

Troop Quality

Type	*Novice*	*Experienced*	*Veteran*	*Elite*
Prim. peaceful	75%	25%	—	—
Prim. warlike	60%	30%	10%	—
Adv. peaceful	40%	50%	10%	—
Adv. warlike	—	40%	50%	10%

23.22 Morale: Morale is a function of NPC type as modified by whether the world is peaceful or warlike. A variety of other factors can also affect morale, so the referee should feel free to change the morale rating of the unit by several points up or down from this base.

The table below gives the average morale of each NPC type from peaceful and warlike societies.

Troop Quality

Type	*Novice*	*Experienced*	*Veteran*	*Elite*
Peaceful	10	12	14	18*
Warlike	12	14	18	20

*Peaceful armies do not routinely have Elite NPC units, but may develop them as a result of prolonged combat. See the experience section below.

23.23 Leaders: Separate commanders and combined command stands are available in greater numbers at higher tech levels. The following chart shows which levels have combined command stands and which levels have separate single-figure command stands. The level shown with a separate command stand is the lowest level having that type of stand; all levels above it also have separate command stands.

Leadership Level

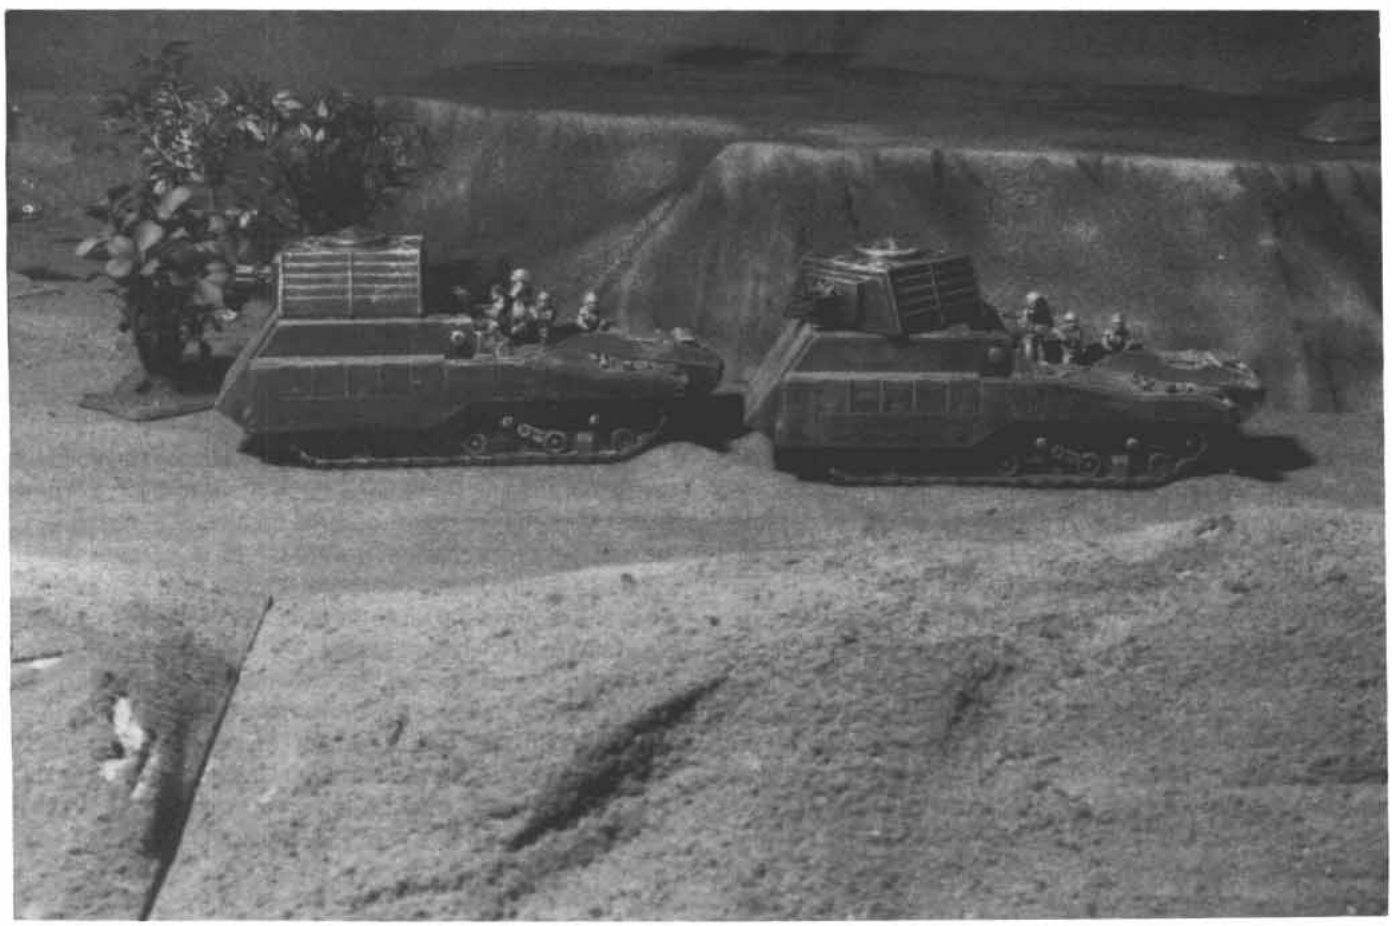
TL	*Combined*	*Separate*
1-3	Battalion	Brigade+
4-6	Company	Battalion+
7-9	Platoon	Company+
10-12	Squad	Platoon+
13-15	—	Squad+

All combined command stands are tactical commanders. All single-figure command stands from company level and above are operational, while all from platoon level and below are tactical.

Command vehicles (such as command tanks) are either operational or tactical, depending on their command level and tech level. Tech level 4-6 company command tanks, for example, are tactical command stands (since if personnel they would be a combined stand), while battalion command tanks at the same tech level would be operational command stands.

23.24 Increasing Experience: At the end of every campaign week in which a unit fought one or more combats, elements of the unit will be promoted in terms of combat proficiency. Ten percent of the surviving stands in the unit will increase one proficiency level. In addition, the number of surviving leaders in the unit will increase by 10%, either by adding additional single-figure command stands or by converting noncommand fireteams to a combination command stand.

The exact stands promoted in experience and/or leadership will be determined by the referee.



23.3 Equipment

Although there is vast variety of equipment possible at different tech levels, some rough direction is possible. Units with good equipment tend to have the highest tech level gear available (if material from multiple tech levels is available) and tend to be more heavily armed, have more armored vehicles, have a higher level of mobility, etc. Poorly equipped troops are almost invariably on foot and have only the most primitive and light weapons available. They are usually used as local defense troops and are not suitable for offensive operations.

The following table is a guide to the proportion of equipment levels in typical armies.

Equipment Level

Type	*Poor*	*Average*	*Good*
Primitive	60%	30%	10%
Advanced	40%	50%	10%

RULE 24: SUPPORT PERSONNEL

The basic TO&Es provided in the book are intended to represent the combat elements of a unit only. When fighting a campaign, however, it becomes more important to take into account the "tail" as well as the "teeth" of a unit.

24.1 Medical Personnel

Medical personnel tend to battle casualties when the unit is engaged in combat missions and monitor the general health of the unit the rest of the time.

24.11 Required Personnel: All medics are noncombatants and may not be used for offensive combat missions. Medics are sometimes armed for self-defense, however, and in some combat environments they are required to fight to protect themselves or their wounded. All combat units requires the following medical personnel:

A unit needs one single-figure medic stand per 10 nonmedic stands (with each single-figure nonmedic stand counting as a quarter of a stand).

A unit needs one dressing station (one fireteam stand of medics which will include one doctor) per 20 nonmedic stands (with each single-figure nonmedic stand counting as a quarter of a stand).

Larger units (brigades and higher) need a field hospital with one stand of medical personnel per 40 nonmedic stands (with each single-figure nonmedic stand counting as a quarter of a stand).

24.12 Effects: Failure to provide sufficient medics will cause the morale of the unit to go down after its first time in combat. Morale will drop by 1 if more than half of the required number of medical stands are in the unit, or by 2 if fewer than half of the required number of stands are provided.

Failure to provide sufficient medical personnel will also cause a deterioration in the unit's health. Before beginning a battle, roll 1D20. The result is the percentage of the stands in the unit which are not present due to sickness. In particularly healthy environments, halve the die roll. In particularly unhealthy environments, double it. The referee determines which stands (usually chosen randomly) are missing.

24.13 Wounded: Whenever a crew stand or fireteam stand is eliminated or a vehicle destroyed, a wounded figure is placed on the table in place of the removed stand. Whenever a single-figure stand is eliminated, roll 1D20. On a roll of 1-5, a wounded figure is placed on the table.

Wounded figures may not move by themselves. Wounded figures may be moved by any other stand, however, including single-figure stands.

Units conducting covert raids or fighting particularly hated or feared enemies will suffer a reduction in morale for leaving wounded behind. Leaving one or more wounded behind will cause a reduction in unit morale of 1. Leaving wounded figures behind equal to 10% of the force's original strength in fireteam stands (with single-figure stands counting as a quarter stand) will cause a morale reduction of 3.

Over the course of an extended campaign, most wounded will return to duty. A returning soldier can be used to replace a single-figure stand or one quarter of a fire team/crew stand.

At tech level 5 and below, one actual soldier will return to duty per recovered wounded figure. The recovered soldier will return to duty after one week.

At tech levels 6 through 10, two actual soldiers will return to duty per recovered wounded figure. The first soldier will return after one week and the second after three weeks.

At tech level 11 and above, three actual soldiers will return to duty per recovered wounded figure. The first soldier will return after one week, the second after three weeks and the third after six weeks.

24.2 Mechanics

All units with any sort of sophisticated machinery require mechanics to provide routine maintenance on vehicles and repair combat damage.

24.21 Required Personnel: Each piece of major equipment in the game has a maintenance point associated with it (as listed in the data annex). One mechanic is required per 50 maintenance points worth of equipment. Mechanics may be in single-figure stands or four-man fireteam stands, whichever is most appropriate to the organization.

One mobile workshop (vehicle-mounted) and a one-ton replacement parts trailer must be provided for every 20 mechanics. Mechanics may serve as vehicle drivers for their own transport vehicles.

24.22 Effects: Failure to provide sufficient maintenance personnel results in vehicles and weapon systems becoming nonoperational.

For each 10% shortage of maintenance personnel, a unit suffers a 1% breakdown rate each week. The referee chooses equipment with a maintenance point total equal to 1% of the unit's total requirements and declares it to be inoperative. If desired, the referee may give a percentage chance of breaking down to a piece of equipment with a larger maintenance point number. A unit which would lose 5 points worth of equipment might instead have a 50% chance of losing a single 10-point item of equipment.

In addition to the above, during each week of intense combat or training operations, equipment totaling 5% of the unit's maintenance point total will break down, regardless of the number of mechanics available.

24.23 Repairs: Repair of broken-down equipment takes one week and requires the same number of maintenance points as maintaining it. Mechanics employed repairing broken down equipment, however, are not available for routine maintenance, so may increase the unit's maintenance deficit.

Any vehicle damaged in combat (one or more hits suffered) may be repaired in one day. Any vehicle disabled in combat (all of its hits suffered) may be repaired in one week. Vehicles destroyed in combat may not be repaired.

24.3 Cooks

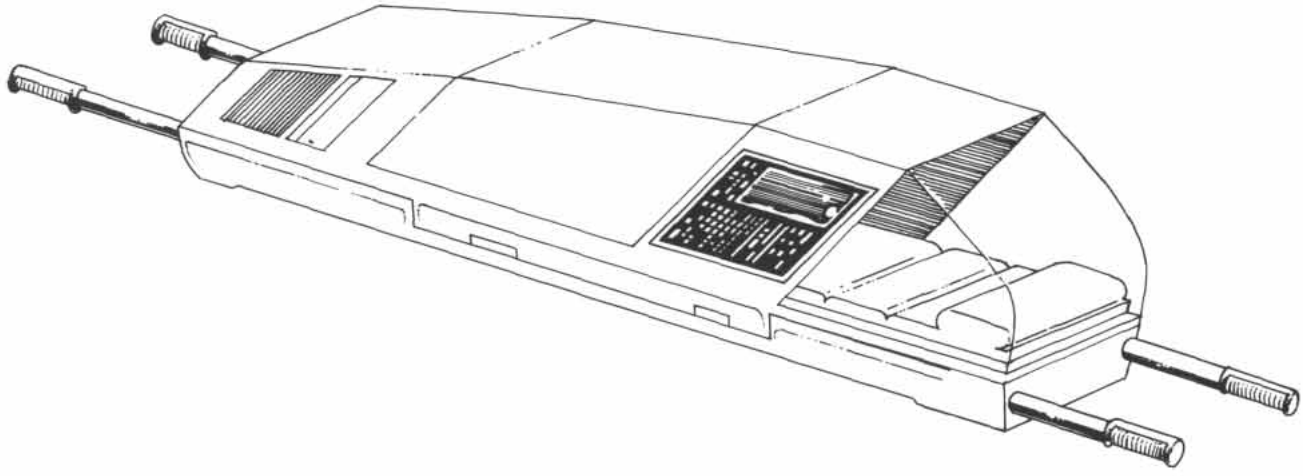
Cooks provide hot, nutritional and (hopefully) palatable meals to troops in the field.

24.31 Required Personnel: One four-man fireteam stand of cooks and one field kitchen is required for every 50 stands in a unit (with each single-figure noncook stand counting as a quarter of a stand).

24.32 Effects: Troops who do not receive a hot meal for three consecutive days have their morale reduced by 1 until they do receive a hot meal. Troops in cold or inclement weather have their morale reduced by 1 each day that they do not receive a hot meal. Note that in cold and inclement weather this can quickly destroy the morale of the unit. One hot meal, however, will restore the unit's morale.

24.4 Veterinarians

Veterinarians look after the health of the animals in a unit. This is particularly important in lower-tech units.



24.41 Required Personnel: One veterinarian is required for every 10 stands of animals (either cavalry or horse-drawn vehicles) in the unit, with single-figure stands (such as mounted commanders or scouts) counting as a quarter stand. In periods of intense heat, cold or inclement weather, one veterinarian is required for every five stands of animals.

Veterinarians may be grouped into larger four-man fireteams for larger units.

24.42 Effects: If insufficient veterinarians are present in the unit, the unit will lose 1% of its animals (but at least one stand worth) per week until the number of animals is reduced to the correct veterinarian-to-animal ratio. In periods of intense heat, cold or inclement weather, the attrition rate increases to 5% per week until the correct ratio is restored.

24.5 Force Composition

The figures given earlier on force composition apply to combatants in the force structure. If support personnel are added to the force, all are considered Novices (for combat purposes) and do not affect the ratios laid out previously for combatant troops.

RULE 25: CAMPAIGN MOVES

When fighting out an extended campaign, it is useful to have a set of simple but comprehensive rules for resolving strategic movement, scouting, supply, etc. This rule is intended to serve that function.

25.1 Scale

Each campaign turn represents eight hours of time. Movement and combat are plotted on maps using a 20km hex grid scale.

Campaign units may range from companies, or even smaller detachments, up to divisions, with battalions being the most common force in most campaigns.

25.2 Turns

In each eight-hour turn, players give orders to friendly units and, in most cases, the friendly units act on those orders.

Movement is simultaneous by both sides and adjudicated by the referee. Following movement, the referee resolves all detection and sets up battle games, if any battles are to be fought out.

Note that since movement is simultaneous and combat can occur when opposing units enter the same hex, it will sometimes be necessary to pro-rate movement by all units and move them hex by hex to determine if opposing units are in the same hex at the same time.

25.3 Detection

Players should not be told the location of enemy ground combat units unless they are detected by a friendly unit in communication with other friendly units (and ultimately the players).

Detection of aircraft by electronic sensors or detection from orbit is resolved using the normal detection rules in the game.

A special procedure is used for detection of ground units by hostile ground units, however.

Detection takes place when two opposing units enter the same hex.

Units moving by road or in high mode are automatically detected. Other units may be detected if a successful task roll is made.

Detection is resolved immediately, as detection of an enemy unit may stop movement and initiate combat. Detection is a standard task roll using the asset level of the average NPC quality of troops in the unit (Elite=15, Veteran=13, Experienced=11, Novice=9, as noted on **The New Era** page 59). Detection is a Difficult task, and the difficulty level is modified as shown on the following table. The terrain occupied by the unit affects the difficulty of detection. The difficulty levels are noted on the Terrain Effects chart on the following page. For other modifying conditions, +numbers are increases in the difficulty level, while –numbers are decreases.

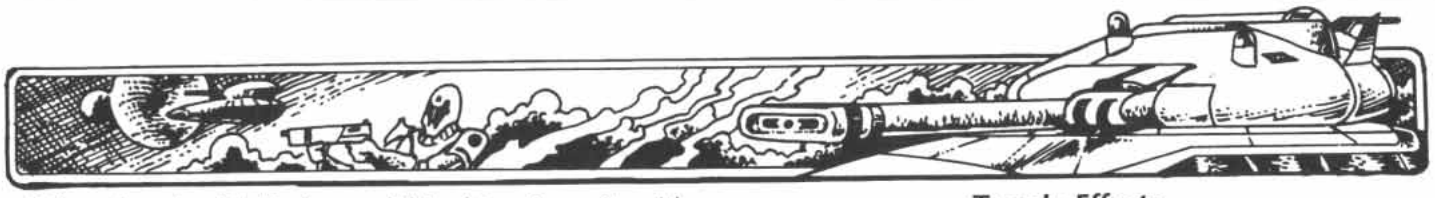
Detection Modifiers

Condition	*Modifier*
Heavy detecting unit	+2
Medium detecting unit	+1
Target less than a battalion	+1
Light target unit	+1
Night or inclement weather	+1
Detecting unit deployed	–1
Target a division or more	–1
Heavy target unit	–1
Every two tech levels detector is above target	–1
Terrain	See Terrain Effects chart

25.4 Mobility

Units' movement is expressed in hexes moved per eight-hour turn. The mobility of the unit is determined by the travel movement of the slowest vehicle in use in the unit. Divide the **Traveller** travel movement rate (in kilometers) by 25 to determine the mass combat system movement in hexes per turn.

The following table lists common movement allowances for low-tech units and may be used as a general guide to movement rates of hostile forces. The first number is the number of hexes moved per turn on a road or, in the case of helicopters and lift units, in high mode. The second number is the number of hexes moved cross country or, in the case of helicopters and lift units, in NOE mode.



Movement Allowances

Type	*Movement*
Infantry	2/1
Cavalry	3/2
TL5 motorized	5/2
TL6+ motorized	15/5
Mechanized/armored	10/5
ACV	20/15

25.41 Terrain: Some terrain is more difficult to move through than others and so slows movement. The Terrain Effects Chart on the following page lists most common terrain types encountered and their movement costs. Terrain types with a dash are moved through normally, while those with a number following the multiplication sign cost additional movement. These movement costs vary with the type of unit actually moving through the hex. Hill terrain, for example, has no special cost for track-mobile, ACV-mobile and lift-mobile units. Leg-mobile and wheel-mobile units, however, count the hex as two hexes for movement.

Units which do not have sufficient movement left to enter a hex may not do so, but may expend their remaining movement toward the entry cost of the hex for the next turn. (It would otherwise be impossible for infantry to enter any difficult terrain.)

Units may move along roads at the road movement rate, regardless of the type of terrain in the hex. The presence of

a "P" on the chart indicates prohibited terrain; units with that mobility type may not enter the hex (except on a road).

25.42 Supply and Fatigue: A unit's ability to move is constrained by supply and fatigue. Supply limits a unit's movement usually due to fuel limits.

Vehicles which have limited fuel must spend a turn refueling after they have expended their normal load. Troops may rest while refueling.

Fatigue limits all units, and while the specific effects of fatigue are covered later, it is normal for a unit to rest for one turn per 24-hour day. See Rule 26.1 for details.

25.43 Deploying: A unit which does not move during a turn is considered to be deployed in the hex it occupies and should be so noted. A deployed unit has advantages in combat and detection. A unit may rest at the same time that it is deployed.

Terrain Effects

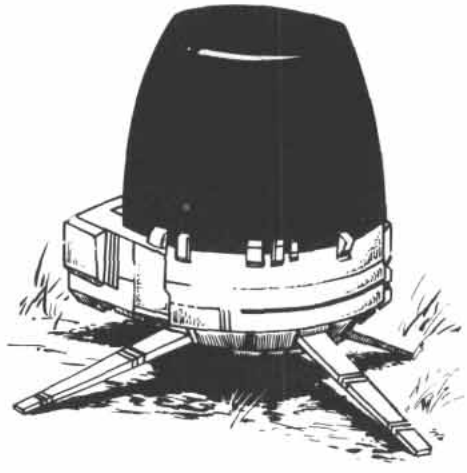
	Movement					
Terrain	*Detect*	*Leg*	*Wheel*	*Track*	*ACV*	*Lift*
Clear	—	—	—	—	—	—
Prairie	–1	—	—	—	—	—
Rough	—	×2	×2	—	—	—
Mountain	+1	×2	P	×4	P	—
Marsh	—	—	×4	×4	—	—
Swamp	+1	×2	P	P	—	—
Forest	+1	×2	×4	×2	×4	—
Jungle	+2	×2	P	×4	P	—
Desert	–2	×2	×2	—	—	—
Broken	+1	×2	×4	×2	×4	—
Glacier	–2	×2	×4	×2	—	—

RULE 26: SUPPLY & FATIGUE

Although supply and fatigue are critical to sustained combat, it is very easy to become completely absorbed by logistics to the exclusion of other game considerations. As a result, only the simplest of logistical rules are presented here.

26.1 Fatigue

Units which fight a battle are fatigued until they spend a turn resting. In addition, units not in combat which do not rest for one turn per day are fatigued. Each condition which causes fatigue (i.e., each battle fought and each day spent without rest) increases the fatigue level of the unit by 1. Each turn spent resting reduces the fatigue level of the unit by 1.



Units which are fatigued have their morale reduced. For every fatigue level, lower the unit's morale by 2.

No unit may be reduced below a morale level of 4. Any unit with a fatigue level of 10 or more automatically surrenders to any enemy unit it encounters.

26.2 Types of Supply

There are three types of supply considered in the game: rations, fuel and munitions.

26.21 Rations: Each unit requires rations once per day, and the rations are used when the unit is resting. If the unit does not receive its rations for the day, it has its fatigue level increased by 1. Units which are already fatigued and which are resting for more than one turn are denied the beneficial effect of one turn of rest per day if they receive no rations. There are no additional effects from lack of rations.

26.22 Fuel: Fuel is required each time a vehicle uses up its on-board fuel. Units fuel all their vehicles at once and usually do so while resting. Fuel supply must be available while the unit is resting in order for the vehicles to refuel.

26.23 Munitions: Whenever a unit fights, it uses munitions and must receive more to fight at full effectiveness. Munitions are received at the beginning of a turn; the receiving unit does not have to rest to receive munitions.

26.231 Small Arms: Once a unit fights, cut the rate of fire of all small arms weapons in the unit in half (rounding fractions up) until it receives munitions.

26.232 Vehicles: Each vehicle has a specified number of shots carried on-board. These are used up in combat and are not replenished until a unit receives munitions.

26.233 Other Heavy Weapons: Other heavy weapons, such as rocket launchers, towed artillery, missile launchers, etc., which do not have a specified number of rounds carried may or may not have ammunition remaining after a battle. Roll a die once for each weapon that fired. There is a 60% chance (roll 12 or less on 1D20) that it will have ammunition remaining.

26.3 Tracing Supply

Units are in supply if they can trace a supply line back to a friendly supply base. The supply line should be shorter than one turn's movement of the movement rate of the supply vehicles available to the unit. If it is longer than one turn's movement, units which require supplies may or may not receive them, based on the following table. The number under the die roll column is the roll (or less) needed on 1D20 for a unit to receive supplies.

Supply

Distance	*Die Roll*
2 turns	16
3 turns	12
4 turns	8
5 turns	4

Each unit rolls separately to determine whether or not it received supplies.

26.4 Supply Bases

Players may establish supply bases wherever they like in friendly territory. Any city hex is also considered to be a supply base. If a move into enemy territory is required, it will probably be necessary to establish additional forward supply bases to sustain the move.

In order to create a new supply base, the player must tell the referee where the base is to be and then spend three turns "stocking" it. Once supplies have been available to the hex for three consecutive turns, the base is operational.

If a supply base ever goes for six consecutive turns without receiving supplies, it is no longer an active supply base.

RULE 27: INTEGRATION WITH TRAVELLER

This rule allows integration for player characters and detailed NPCs from **Traveller** into a **Striker** miniatures game. For details on converting equipment from **Traveller** (or **Fire, Fusion & Steel**) to **Striker** terms, see Appendix A.

Each PC and detailed NPC is represented by a single-figure stand. All these rules are based on the use of the asset of a player character or detailed NPC.

Ground Tactics: If the Ground Tactics asset of the character in charge is higher than unit's asset based on NPC quality, use the Ground Tactics asset for all campaign detection rolls.

Leadership: The Leadership asset is used to avoid adverse moral effects. Whenever a unit suffers a failed morale roll or a forced-back result from fire, a PC or detailed NPC leader can make a roll against his Leadership asset. Success indicates that the morale effect is disregarded; failure indicates that the morale condition takes effect normally; and catastrophic failure indicates that the morale condition becomes one level worse (i.e., Pin becomes Forced Back, Forced Back becomes Rout, Rout becomes Surrender, and Surrender remains Surrender). Difficulty level is based on the morale level that has been reached: Pinned is Easy, Forced Back is Average, Rout is Formidable, and Surrender is Impossible.

Instruction: An instructor works directly with a platoon of soldiers (up to 10 fireteam stands or their equivalents), training them in tactics and basic military skills. An instructor may attempt to raise the troop quality of a platoon by rolling a formidable instruction task. Six consecutive success results mean that the platoon being trained has risen one experience level. The entire training program lasts one month, and all six rolls are made at the end of the month.

Admin/Legal: For each level of skill (not asset), treat the unit as being one hex closer to its supply base for purposes of determining supply.

Mapping: Leaders with mapping skills may roll a Formidable task vs. Mapping each turn to find the best path through terrain for the campaign turn. Outstanding success multiplies the unit's movement allowance by 1.5 (round to the nearest whole number), success adds 1 to the movement rate for the turn, failure has no effect, and Catastrophic Failure subtracts 1 from the turn's movement rate (the unit got lost). Note that leg infantry units get no greater benefit for outstanding success than they do for basic success.

This works only for ground units, and not for lift (contra-grav) units.

Scenario 1

Freedom's Call

Günther had always been very big. When he was taken into the *kommando*, the first words the *kommisar* said were, "*Ach! Ein starker gonef!*" And so they'd assigned him to carry the big 2 cm *Leicht Sturm Geschutz*.

Not that he minded. Everything about the squad LSG bespoke power, from the heavily greased telescoping shoulder stock to the massive muzzle break. For Günther, power meant freedom.

The *Volk* of the Kessel Valley had fought against invaders from the plains and the off-shore islands for over a generation, and had always kept their villages and farmsteads secure. Then, scarcely a year ago, the *Aus-Welten* had come, and everything had changed. They came in starships and floating cars, and they swept away the village *kommandoes* like annoying flies.

They seized every important settlement in little more than a week. They brought in "governors" from the hated islanders and made the *Volk* swear allegiance to a planetary government that was nothing more than a puppet of their *Aus-Welt* empire.

Then they tried to make the *Volk* abandon the old ways. Men's beards were shaved off. New flags were distributed, and the *Volk* were made to hang them from their roof eaves. Worst of all, they outlawed the *Altsprech* and made the school children learn their hated *Anglik*.

And so, one by one, the *kommandoes* slipped away and reformed in the hills. Young men who had never served before slipped away as well, to join them. Günther was one of those young men. Weeks of training followed, weeks whose only purpose had been to prepare him for this day.

Günther leaned the LSG carefully against a fallen log and sat down to rest, while behind him the *kommandant, kommisar* and *schlachtführer* conferred heatedly over an old, faded map. Below him, the valley of the small tributary of the Kessel wound through the rugged hills, a soft green streak through the browns and grays. And at the widest spot in the valley was the village of Brüchenburg, their objective.

The advanced group had already secured the village and reported back by radio to the *schlachtführer*. Collaborators were being dealt with even as the argument went on behind Günther. The popping noise of single pistol shots drifting up from the village sounded strangely harmless from this distance.

The *Aus-Welten* would hear the radio signal from the valley; they were meant to. They would send troops to rescue their lackeys and drive the *kommando* back into the hills. They were meant to do that as well. While the advanced party dealt with the village, the main body of the *kommando* manned the ambush site a kilometer to the north where the valley narrowed.

This was the biggest raid so far. Three of the smaller bands had joined with Günther's *kommando* to make an ambush this large. Many of the *Aus-Welten* would die under the guns of the ambush. Then the ambush party would fall back, and the *Aus-Welten* would pursue, drawn onto the guns of the second ambush party—the one Günther was with.

The *kommissar* had explained the plan in detail. They were to take their first easy shots and then retreat, not try to stand and fight. The object was to bloody the *Aus-Welten* and get experience for the *neusoldaten*, like Günther—not win the war in one battle.

Günther knew all that. But he also knew that today he would kill an *Aus-Welt* soldier, and tonight he would spend the bounty *Fleischgelt* for thick black-barley beer for his squad, and by tomorrow he would be an *altsoldat*.

Günther worked the LSG into a crook between a broken branch and the main part of the tree trunk. He laid the three extra magazines on the trunk in front of him, made sure he had a clear field of fire to the small draw to the north, and waited.

Background

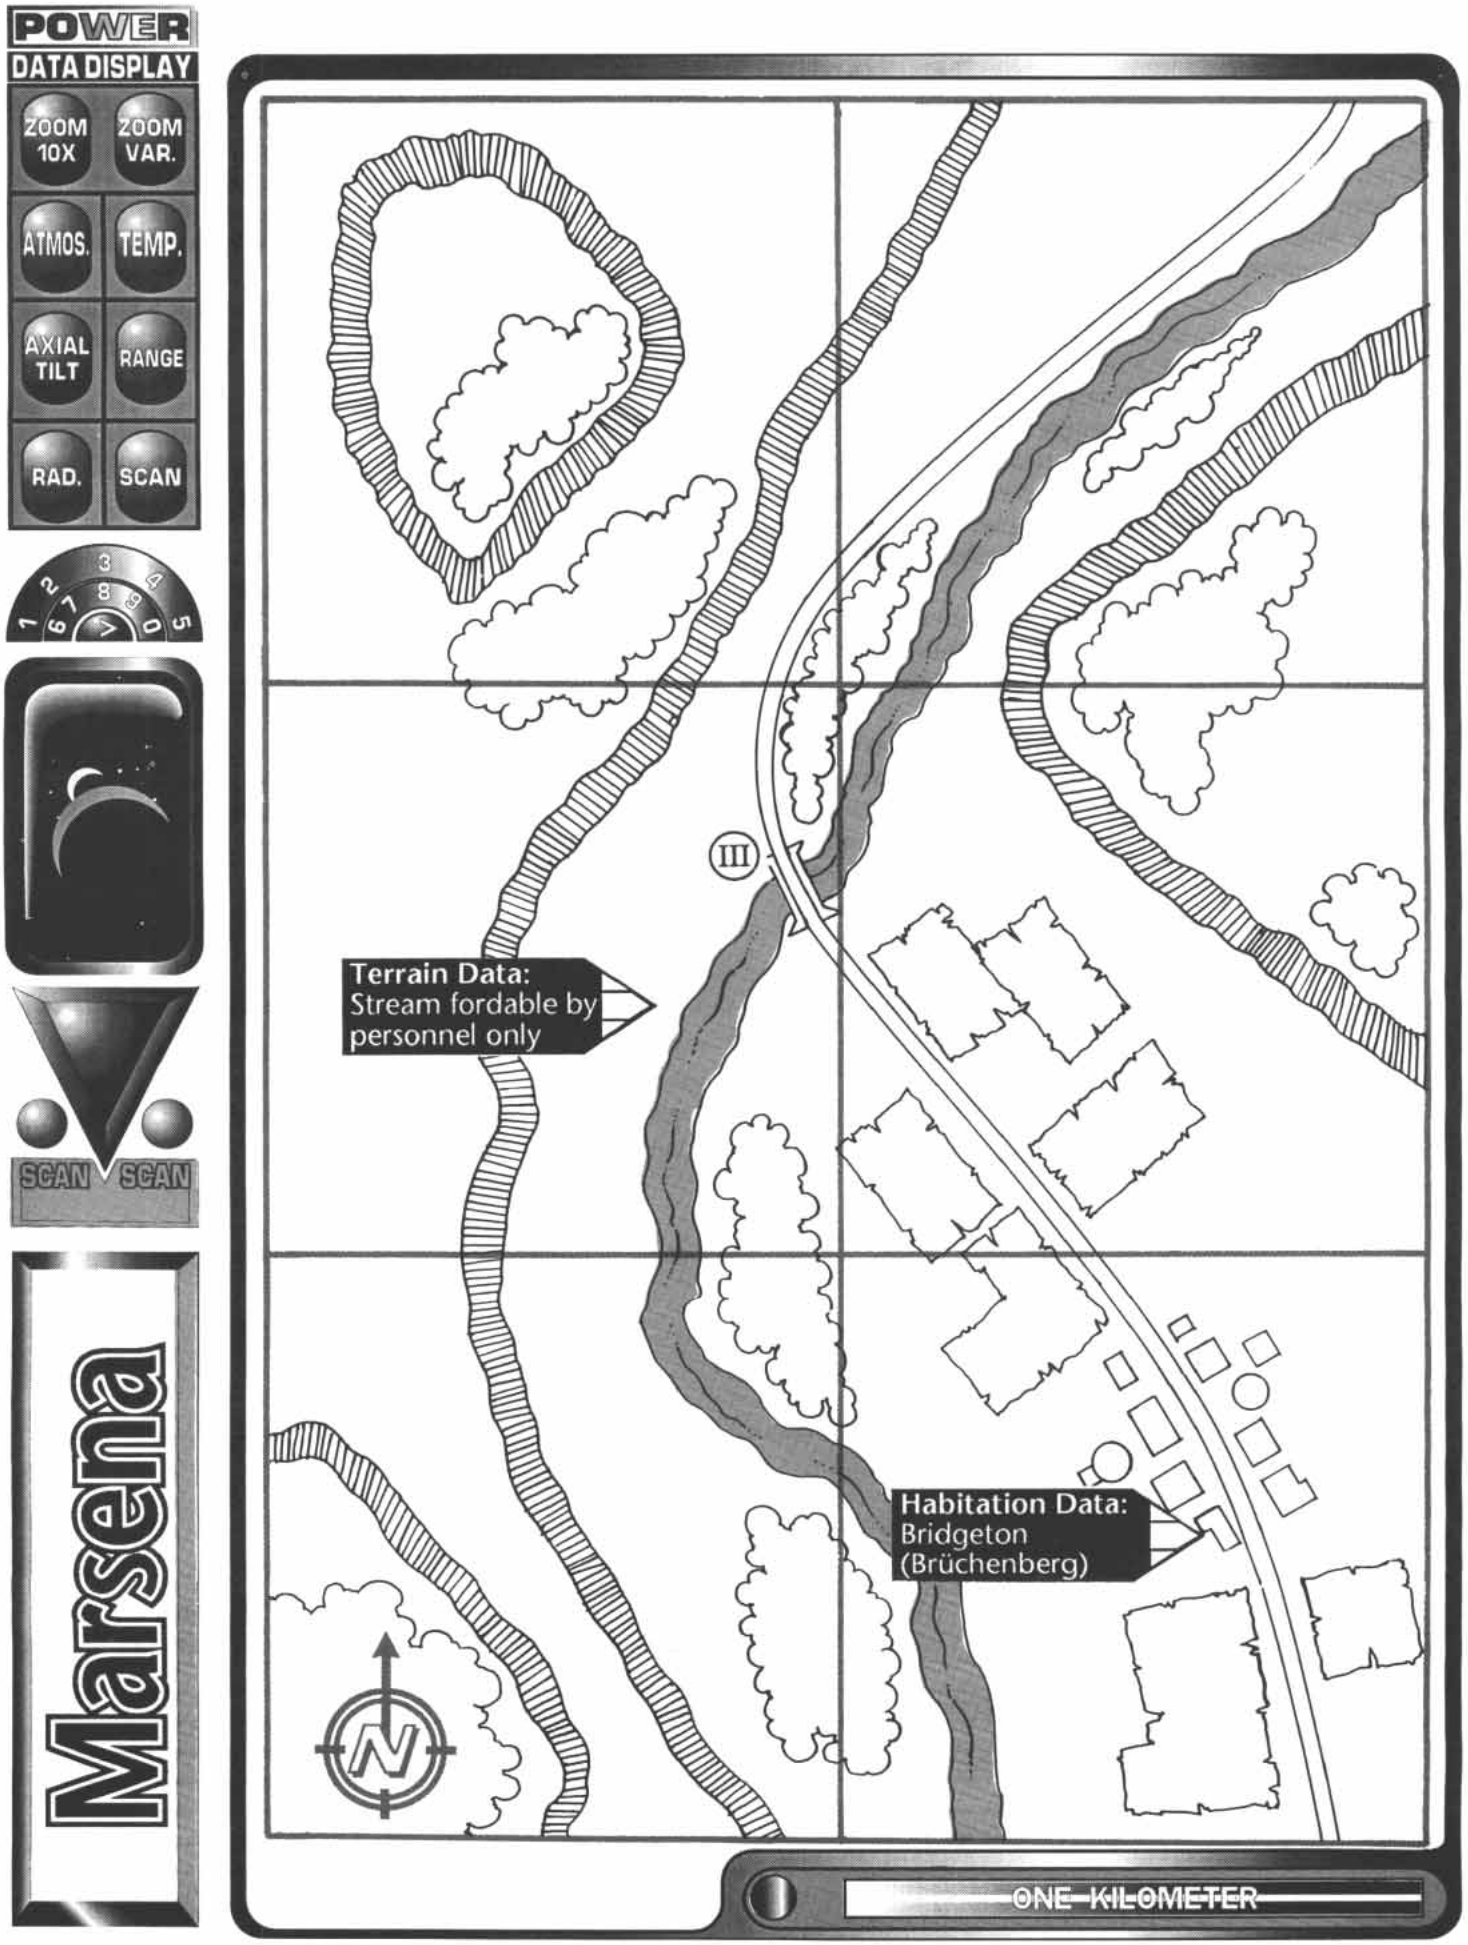
The planet Solee in the Old Expanses was unified in 1196 under the rule of Christen Overtak, since crowned Empress Solee. A major breakthrough in detecting and combatting Virus at about the same time enabled Solee to renovate a wide array of pre-collapse Imperial equipment, including numerous starships. Using these resources, Solee embarked upon a vigorous program of imperialist expansion, invading the two neighboring worlds of Marcena and Hindahl. But neither campaign has gone as smoothly as expected, and the fighting on Marcena has become particularly costly.

The strategy on both worlds was to pick a local warlord and back him with troops and high-tech weaponry, thus gaining a base on the planet as well as valuable local guides and intelligence sources. On Marcena, however, the stubborn farmers of the Kessel valley have proven to be particularly effective guerrilla fighters. The fighting started, as it usually does, with attacks on the local population, not the regular Soleean troops. Occasional robberies and assassinations of local officials soon grew into attacks on police posts, and eventually on small military patrols. In early 1201, the *Blut und Eisen Kommando* of the west valley launched the largest coordinated raid and ambush of the war to date.

DEPLOYMENT

The Defender deploys the advance team in the village and may deploy the rest of the kommando anywhere desired, but not within 20 cm of any table edge.

The Attacker enters the board on turn 1 from the north edge mounted in vehicles.



SPECIAL SCENARIO RULES

The *Kommando* may withdraw from any table edge except the northern edge. Individual stands may not withdraw on their own initiative, but must instead be issued a *Disengage* order by either of the two command stands in the *Kommando* headquarters.

VICTORY

The *Kommando* wins if at least half the kommando force escapes and if it inflicts more casualties (hits) on the Soleeans than it suffers. However, it must inflict at least 10 hits on the Soleeans, and at least 10 different *Kommando* stands must fire at a visible Soleean stand during the scenario for the objective of the raid to be achieved.

If the Soleean player denies the *Kommando* its victory conditions, it wins.

ATTACKER

Briefing and Orders

From: Headquarters, 5th District, Military Assistance Command, Marsena.

To: Commander, 4th Company, 17th Imperial Soleean Infantry.

1. Situation: Low-level terrorist activity has been increasing in the Kettle River Valley region. The district has responded by massing company-sized rapid response forces in key positions ready to aggressively seek out terrorist bands whenever they launch a raid. Radio intercepts indicate that the village of Bridgeton *(Brüchenburg* in the local dialect) has been raided by terrorists who may still be in the area. Your company is the closest available rapid response force.

2. Objective: Your company will move to Bridgeton, secure the village, determine the fate of the local police and officials, then engage and destroy the terrorist forces still in the area.

3. Enemy Forces: Radio traffic indicates an enemy force in the village and a smaller command-control element still in the surrounding hills. To avoid detection, terrorist units have not been operating in forces larger than a platoon. While larger forces are considered unlikely, force security remains a high priority.

4. Friendly Forces: No additional reinforcing assets are available for our company. There is a squad-sized element of local police in the village, but they have not reported the attack by phone and so may have defected or been neutralized by the terrorists.

5. Concept of Operation: Lack of combat vehicles will require a motor approach by road. The first priority should be the rapid recapture of the village.

Organization of Forces

4th Company, 17th Imperial Soleean Infantry (Experienced, Morale: 18 except where noted), with:

- **Headquarters (Veteran),** with:
  - 1 operational command stand
  - 1 tactical command/infantry stand
  - 1 self-commanding infantry stand
- **3 Rifle Platoons,** each with:
  - 1 tactical command/infantry stand
  - 5 infantry stands
  - 1 machinegun stand
- **Attached Transport Group (Novice),** with:
  - several requisitioned civilian trucks

Headquarters, with:

- 1 operational command stand
- 1 tactical command/infantry stand
- 1 self-commanding infantry stand

Notes: All stands are equipped with TL10 7mm advanced combat rifles, hand grenades and RAM HEAP grenades. Each soldier wears a helmet and combat environment suit (save number 1).

Troop Quality: Veteran **Morale:** 18 **Initiative:** 4

Each soldier wears a helmet and combat environment suit (save number 1). The command stand is an operational commander. The command/infantry stands are all tactical commanders. The unit has enough requisitioned civilian trucks to mount the unit. A sample truck is listed, but any truck values from TL7 may be used.

DEFENDER

Briefing and Orders

From: *Kommandant, Blut und Eisen Kommando.*

To: All element leaders.

1. Situation: We have gradually been building up our cache of weapons and raising recruits. Recently, we established contact with two independent groups and persuaded them to join our *kommando* on this raid. The time has come to strike a crushing blow against the *Aus-Welten* and their collaborators. We have identified the village of Brüchenburg as the bait for an ambush. Our advanced party has already secured the village and transmitted the fact on open channel. The enemy will respond with a rescue force which we will ambush.

2. Objective: Our objective is to inflict maximum casualties on the enemy while preserving our force as the cadre for the growing resistance movement. If possible, our novice troops should experience some combat, although they are very inexperienced, and it is important not to break them in this first battle.

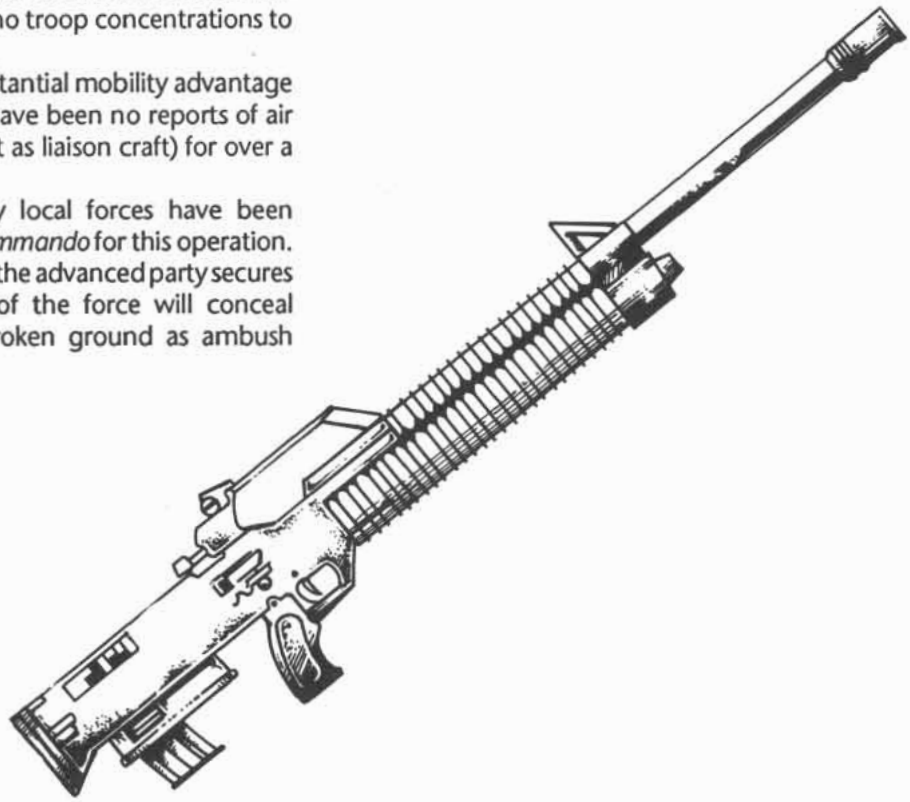
3. Enemy Forces: We expect that the enemy will deploy as much as a company to relieve the village. They are better equipped than our *kommando,* and most of the men are better trained. The closest enemy response force is stationed a few kilometers to the north. There are no troop concentrations to the south for over 100 kilometers.

Enemy air raft troops have a substantial mobility advantage over our own infantry, but there have been no reports of air rafts deployed in the valley (except as liaison craft) for over a month.

4. Friendly Forces: All friendly local forces have been incorporated in the ranks of the *kommando* for this operation.

5. Concept of Operation: While the advanced party secures the village, the other elements of the force will conceal themselves in the woods and broken ground as ambush parties.

Force Organization



Blut Und Elsen Kommando, with:

Headquarters (Veteran, Morale: 20), with:
- 1 operational command stand
- 1 staff radio stand
- 1 self-ordering infantry stand

Advance Party (Novice, Morale: 16), with:
- 1 tactical command infantry stand
- 1 self-ordering infantry stand
- 4 infantry stands

First Element (Experienced, Morale: 18), with:
- 1 tactical command infantry stand
- 6 infantry stands
- 2 machinegun stands

Second Element (Novice, Morale: 16), with:
- 1 tactical command infantry stand
- 4 infantry stands
- 1 machinegun stand

Headquarters, *Blut Und Eisen Kommando*, with:

Say Good Night

Late 1199 (Imperial calendar)
Vezina (Old Expanses)

Sergeant Borgia took a last look around the airless drop bay. All eight of her people were out on the drop pylons strapping themselves into the reentry kits. Navy types had gone EVA to deploy the ablative foam reentry shields while the jump troops had gotten their final briefing, so there wouldn't be the normal wait while the foam hardened. That was a good idea.

There was talk of a new purpose-built drop capsule coming soon, complete with jammers and decoys and the ability to maneuver enough to maybe throw off a dirt gunner's aim. That sounded good to Borgia, but this jump would still be with the old sport versions. Getting down in one piece was going to rely on Cdr. Ritter keeping the bad guys talking until it was too late. That, and some luck. Then it was up to the grunts.

Borgia pulled herself along the steel cable to the makeshift drop pylon and slipped into the human-sized cavity in the dull black hemisphere of the drop kit. The few idiot lights that the small craft had showed green.

"Lucky, this is Drop Six. Your people all strapped in?"

"That's a roger, Skipper," she answered. "Nine ready to drop."

"Bongo, Can Can, your folks set?"

"Bongo to Drop Six. Nine to drop, Skipper."

"Can Can ready. Nine to drop."

"Okay, we'll salvo drop in 30 from my mark.... Mark."

When they hit the ionosphere in reentry and communications blacked out, Borgia was left alone with her thoughts. How many, she wondered, would come back on line once they broke out into the lower atmosphere? How many then would make it to the ground? The Vezinans had to know they were coming, had to be waiting for them...had to be. Ritter was a great BS artist, but nobody was that good. Nobody could be that stupid. Could they?

They broke through to the lower atmosphere, and Borgia's radio crackled to life. The capsules were tuned to receive on the open channel used for the negotiations, and suddenly Ritter's voice, frustrated and impatient, filled her helmet.

"...Yes, I know, your highness. Er, right. I mean, your divineness. What? Your divine holiness? I.... Right, I.... Right, look.... I.... *Look, Hoss, I don't care who died and made you immortal, but I'm only going to explain this one more time!"*

Borgia grinned as her drogue chute pulled the main chute free and the broad gray canopy spread above her. Minutes later she hit the harness quick release and came out of the still-rocking framework on her feet and in the shuffling trot that was as good an approximation of a run as anyone could manage in battledress. The drop had been good; she was only about 300 meters from the built-up settlement proper. She looked around the DZ and saw collapsing gray chutes and running figures all across it. Everyone was down and moving!

Captain Jeffries, the drop commander, suddenly interrupted the diplomatic argument, breaking in on the clear.

"Ritter, this is Drop Six. I've got dust with all 30. Say again, dust with three-zero. Switching to Tacnet."

"You hear that?" Ritter whooped over the radio to the god-emperor. "Say good night, Hoss!"

BACKGROUND

In 1199, the newly formed Dawn League sent out 12 refitted diplomatic ships to establish peaceful contact with worlds in the Wilds, the former territory of the Third Imperium. None of the ships came back. Follow-on missions by hastily outfitted small warships came back with news of massacres. One of the ships, DLS *Lirgishkhunan,* actually had its own landing party captured on the planet Vezina while trying to discover the fate of the crew of the DLS *Aurora.* With a fresh contingent of jump troops and the battle-seasoned DLS *Ashtabula* in consort, *Lirgishkhunan* returned, looking for trouble.

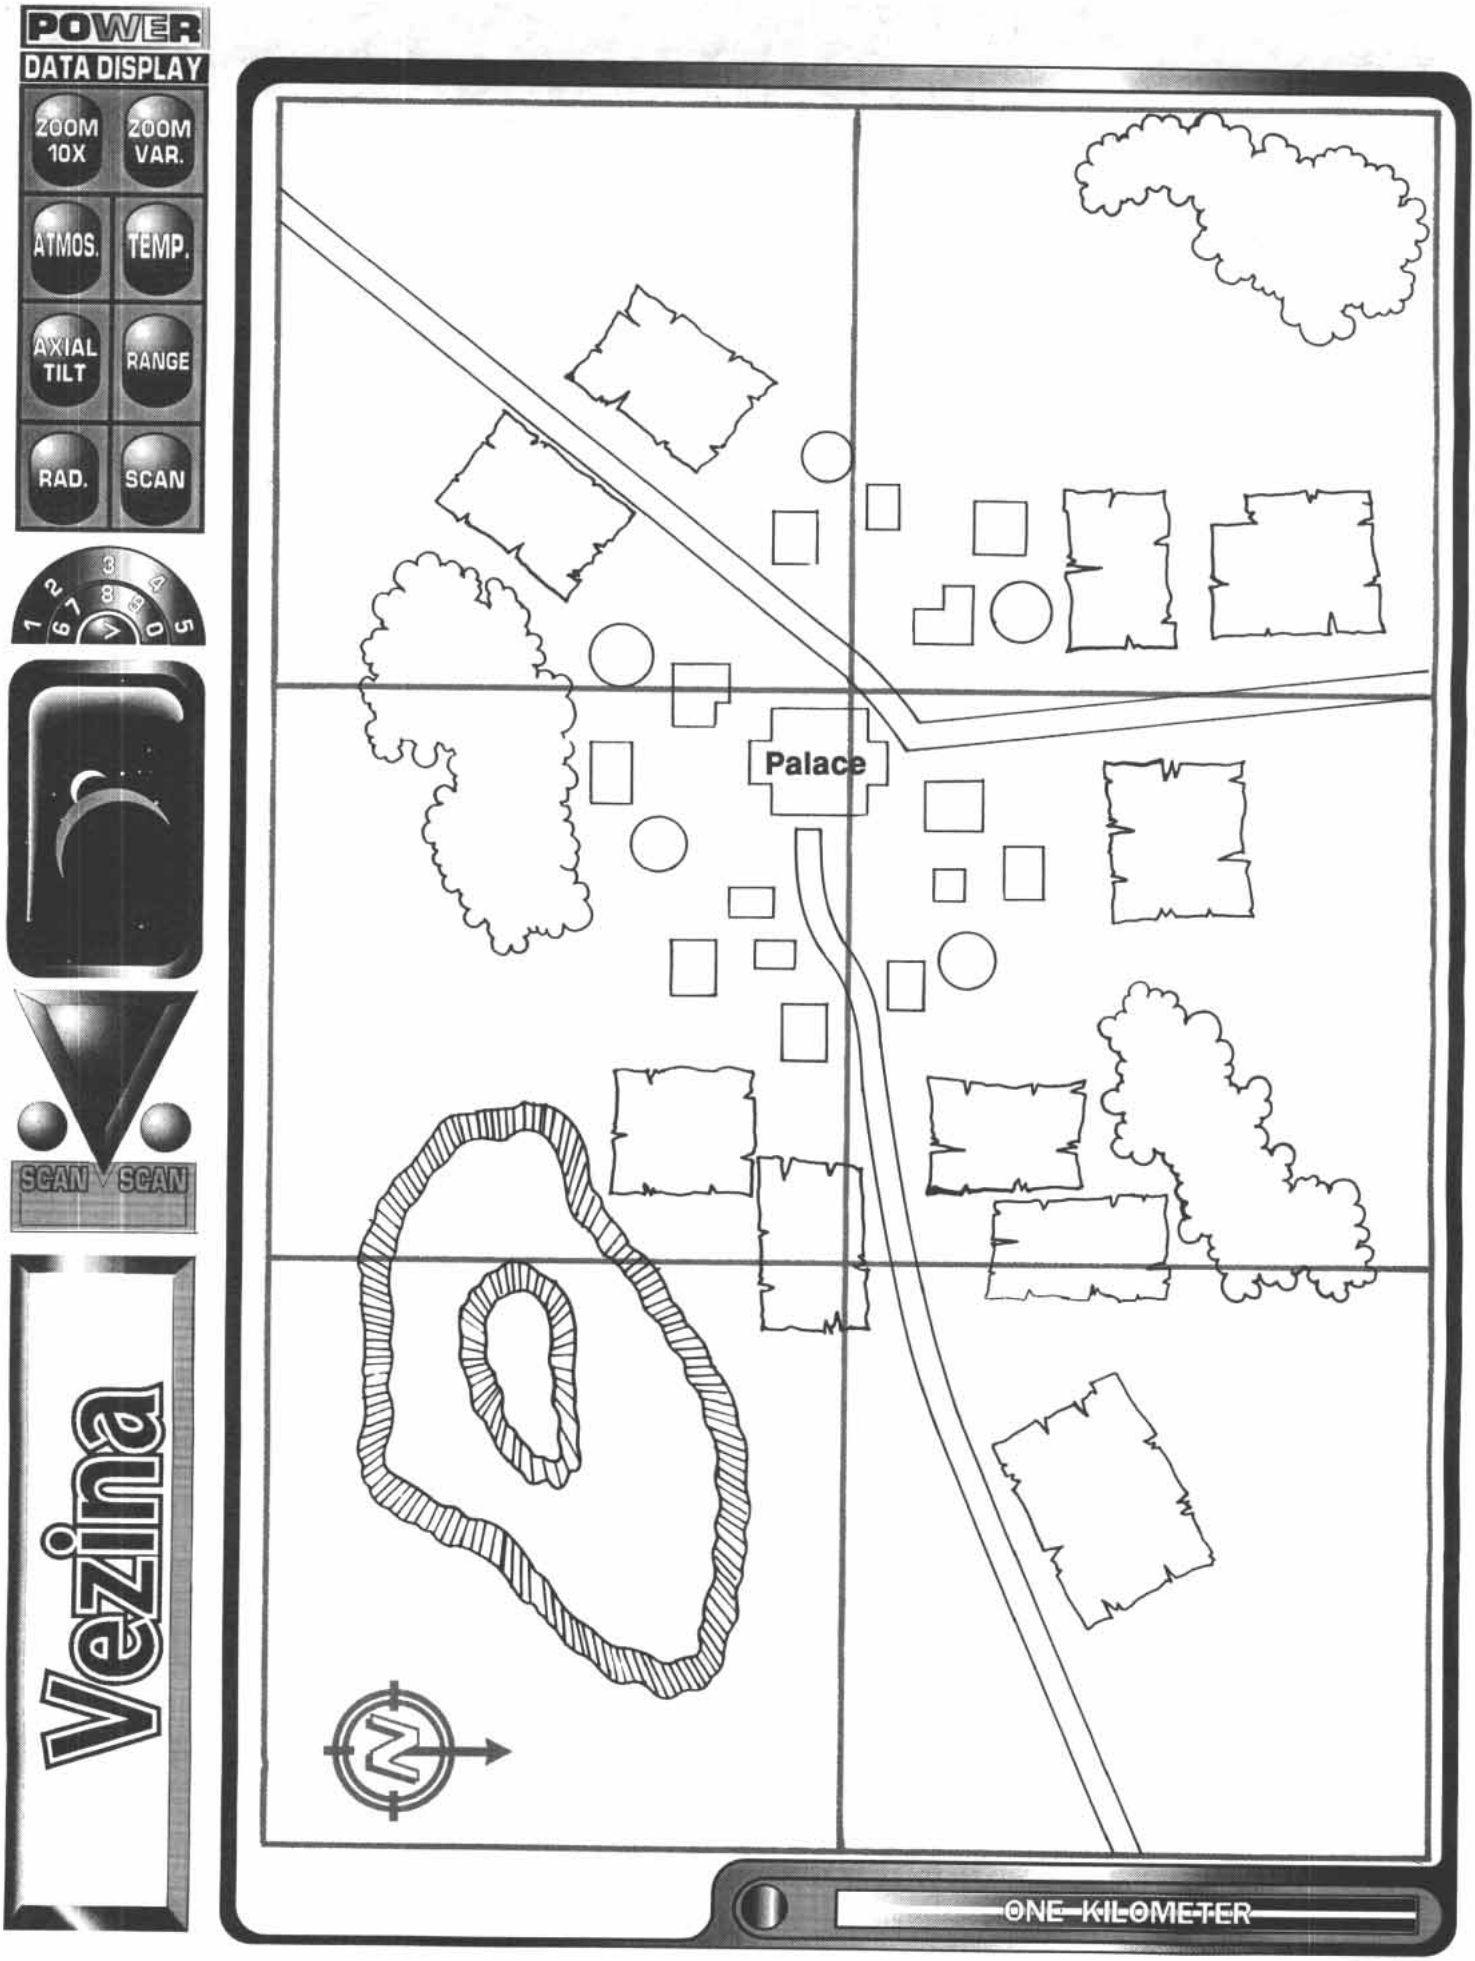
In this scenario, the Attacker (the Dawn League player) conducts a meteoric assault from orbit, while the defender (the Hastaan player) attempts to defend the capital city of the small country.

DEPLOYMENT

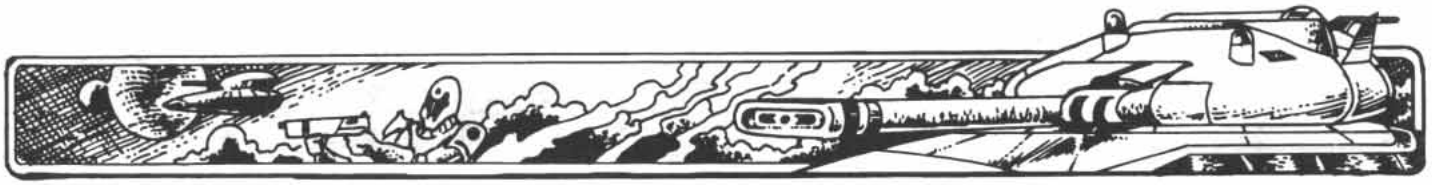
The Hastaan player may set up anywhere in the settlement. All tanks must be parked together in one place. The Blood-Death Tercio, the Emperor and the prisoners (a half-dozen or more unarmed and unarmored single-figure stands) must be placed in the palace.

SPECIAL SCENARIO RULES

Jamming: Orbital jammers in the Dawn League ships are sufficiently powerful that the entire board is in their short range for radio, radar and EMS jamming.



Surprise: Despite ample warning, Hastaan was surprised by the speed and audacity of the assault from orbit. To duplicate this level of surprise, no personnel or vehicle stand may move or fire the first turn. Tanks may not move or fire until they have powered up. Each tank rolls once per turn during the movement phase to see if it is powered up. The roll is treated as an extreme-range task the first turn, a long-range task the second, a medium-range task the third, and a short-range task every following turn.



Drop: The drop may be made anywhere except in the built-up area. Any stand which lands in the built-up area takes a hit and automatically has a P2 marker placed on it, regardless of whether its drop marker is face up or down. The two drop units must form separate sticks. Each unit may be, but need not be, divided further into more sticks.

Prisoners: The prisoners may not be moved from the palace and may not be executed. Once they are in Dawn League control, they may be fired at. Evacuation can be accomplished by arriving at any drop zone not in the field of fire of a Hastaan homing missile.

VICTORY

The Dawn League player wins if over half the prisoners are recaptured and evacuated. The Dawn League wins an overwhelming victory if, in addition to recapturing the prisoners, the emperor is killed, and the jump troops end the scenario in control of the settlement.

ATTACKER

Briefing and Orders

From: Lt. Cdr. Ritter, pennant aboard DLS *Ashtabula.*

To: All personnel, Task Force Strike Vezina.

1. Situation: On or about 1-VII-1199 DLS, *Aurora* grounded on the planet Vezina, at which time the ship and her crew were seized by a local warlord, the self-styled "God-Emperor of Hastaan." A follow-on landing by DLS *Lirgishkhunan* ended in shots fired and the rescue party being captured by locals. We now have definite proof that *Aurora's* crewmembers have been executed. While *Lirgishkhunan's* troops are believed still alive, the situation is extremely unstable.

2. Objectives: Recover our surviving people.

3. Enemy Forces: Hastaan is a small technologically elevated dictatorship. The troops are nominally well-equipped, but their combat skills are not necessarily as good. Total military personnel is believed to be about 1000, of which about half are actual ground combatants. The local army is called the "Sacred Guard."

4. Friendly Forces: We are currently in orbit with *Ashtabula* and *Lirgishkhunan. Lirgishkhunan* has a new complement of jump troops. Both vessels are available for laser bombardment from orbit, but the potential combat zone is largely filled with civilian settlements, making orbital bombardment impractical.

5. Concept of Operation: The task force commander will continue negotiations with Hastaan from orbit while the drop troops prepare for meteoric assault. The assault sticks will land as close to the settlement as possible and then fight their way quickly in, secure the prisoners held in the palace, then fight their way back out again, relying on shock and surprise to overcome resistance. The task force in orbit will engage in selective jamming of enemy communications to confuse their command network. Extraction will be by assault lander.

Organization of Forces

Dawn League Task Force Strike Vezina, with:

Task Force Command, with:
- 1 operational commander (in orbit)
- 1 staff uplink (in orbit)

Jump Detachment *"Ashtabula"* (Elite, Morale: 22), with:

Command Group, with:
- 1 operational command stand
- 1 tactical command stand
- 1 self-ordering recon stand (single-figure)

3 Squads, each with:
- 1 tactical command stand
- 2 infantry stands

Jump Detachment *"Lirgishkhunan"* (Veteran, Morale: 18), with:

Command Group, with:
- 1 operational command stand
- 1 self-ordering recon stand (single-figure)

2 Squads, each with:
- 1 tactical command stand
- 2 infantry stands

Jump Detachment *"Ashtabula"* (Elite, Morale: 22), with:

Command Group, with:
- 1 operational command stand
- 1 tactical command stand
- 1 self-ordering recon stand (single-figure)

3 Squads, each with:
- 1 tactical command stand
- 2 infantry stands

Notes: All stands are equipped with TL10 7mm advanced combat rifles, hand grenades and RAM HEAP grenades. Each infantry and recon stand has an integral plasma bazooka. Each soldier wears light battledress (save number 6).

Troop Quality: Elite **Morale:** 22 **Initiative:** 4

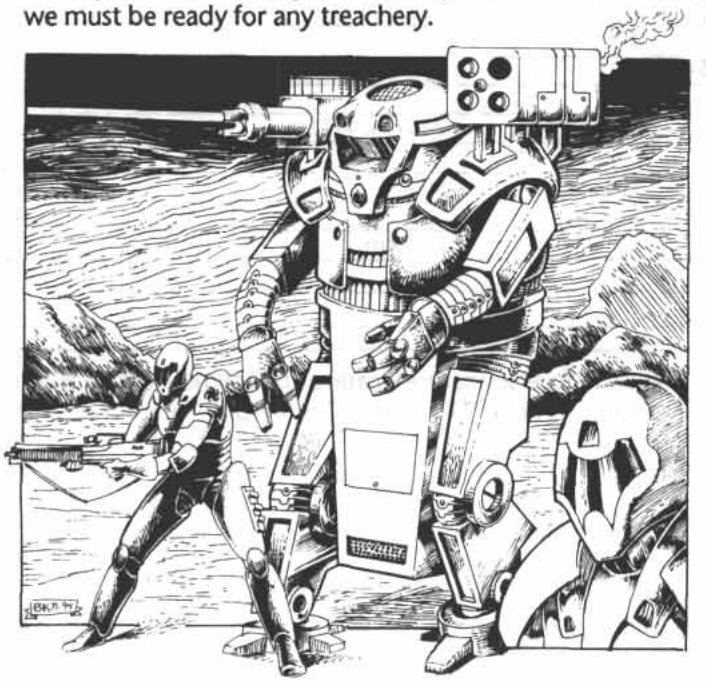
DEFENDER

Briefing and Orders

From: Supreme Headquarters, Imperial Horde.

To: All Sacred Guard Commanders.



1. Situation: Twice the off-worlders have landed minions to subvert and corrupt our subjects, and twice they have been dealt with. Now another alien force hovers above us, begging for the release of their criminal spies and saboteurs.

2. Objective: Defend the person of the god-emperor at all costs.

3. Enemy Forces: Unknown.

4. Friendly Forces: Although many militia units have not yet mustered from their hamlets, the best units of the Sacred Guard are concentrated at the capital, and additional militia groupments are on their way.

5. Concept of Operation: The enemy is cowardly and unlikely to attack as long as we hold prisoners. Nevertheless, we must be ready for any treachery.

Organization Of Forces

Hastaan Imperial Troops: The Sacred Guard

Supreme Headquarters (Novice, Morale: 14), with:
- 1 operational command stand (the emperor)
- 1 staff radio stand

The Blood-Life Tercio, with:
- **Headquarters,** with:
  - 1 tactical command stand
  - 1 self-ordering infantry stand
  - 1 crew stand
  - 1 VRF gauss gun
- **2 Detachments,** each with:
  - 1 tactical command infantry stand
  - 4 infantry stands

The Tercio of Steel, with:
- **Headquarters,** with:
  - 1 tactical command stand
- **Tank Detachment,** with:
  - 1 tactical command TL8 fast tank
  - 3 TL8 fast tanks
- **2 Mobile Detachments,** each with:
  - 1 tactical command infantry stand
  - 2 infantry stands
  - 1 machinegun stand
  - 1 heavy truck

The Tercio of Fire, with:
- **Headquarters,** with:
  - 1 tactical command stand
- **Missile Detachment,** with:
  - 1 tactical command stand
  - 2 crew stands
  - 2 TL7 TAC missile launchers
- **Mortar Detachment,** with:
  - 1 tactical command stand
  - 1 self-ordering observer stand (single figure)
  - 3 crew stands
  - 3 8cm mortars
- **Air Defense Detachment,** with:
  - 1 tactical command stand
  - 3 crew stands
  - 3 TL7 ADA homing missiles

Militia Groupments, with:

(There are six militia groupments, but most of them are deployed some distance from the capital. Only one or two militia groupments are in the capital when the raid hits. One or two more may be added to the scenario as reinforcements, if desired.)
- **Headquarters,** with:
  - 1 tactical command stand
  - 1 self-ordering infantry stand

Strength on Strength

1110 (Imperial calendar)
Efate (Spinward Marches)

It had been very quick and very violent. When it was over, there was some smoke in the command bunker, but no movement, not anymore, and it was suddenly eerily quiet. Even the tacnet chatter died away in the sudden peace.

In front of him, a "Joe" officer's lifeless form sprawled across a workstation. At first it looked like she had been trying to shield the electronics with her body, but when he rolled her over, he saw the primed grenade still clutched in a death grip. She slid to the floor as if in slow motion, her hand relaxing, and the grenade's safety lever flipped up and away, doing lazy cartwheels through the air.

"Grenade!" he yelled, and started to smother it with his own body armor, but as he went down to his knees, his eyes came level with the workstation, and he saw the still-glowing data monitor, covered with the cramped, geometric characters of the Zhodani alphabet.

The grenade wasn't for us, he thought suddenly. *She was trying to kill the machine!*

Instead of falling on the grenade, he picked it up and threw it out the open hatchway.

"Heads up! Grenade comin' out the CP hatch!" he yelled over the tacnet, and heard angry curses in answer. There was an explosion, and more curses, but no cries of pain or calls for medics.

He looked back at the machine. Its screen still glowed a happy orange and blue, line after line of data displayed for anyone with the wisdom to decipher it.

"Hey, El-Tee," he said finally. "You better come over here and look at this."

BACKGROUND

The Fifth Frontier War was the last major conflict fought between the Third Imperium and the Zhodani Consulate.

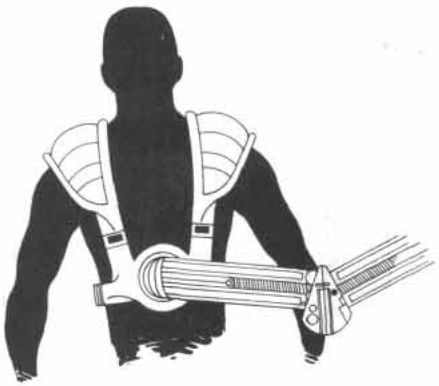
During the year-long siege of Efate, both sides committed ground troops. Eventually, Imperial forces gained the upper hand, in part due to a major intelligence coup gained on a raid conducted by the crack 4518th Lift Infantry.

In this scenario, the Imperial player will defend a captured Zhodani headquarters compound against a determined Zhodani attack.

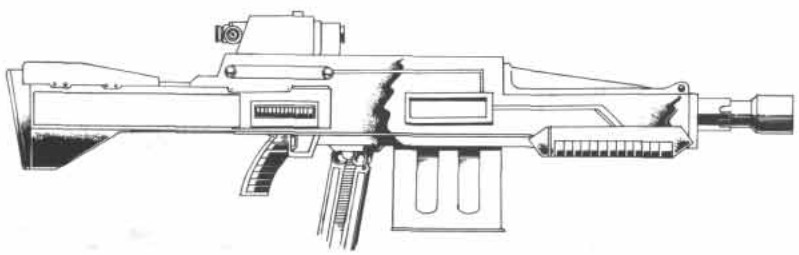
DEPLOYMENT

The Zhodani commando company will enter the board by psionic teleportation. First, the Zhodani player decides where each stand will appear. Stands may appear inside buildings. The Zhodani player will know the location of the computer, but not the location of Imperial troops. (Although the unit clairvoyant has that capability, the troops move around, and he can only scan one area at a time. He will not be able to tell where the Imperial troops are at the time of the jump, since at that time he will be occupied telepathically locking destination images into the minds of troops.)

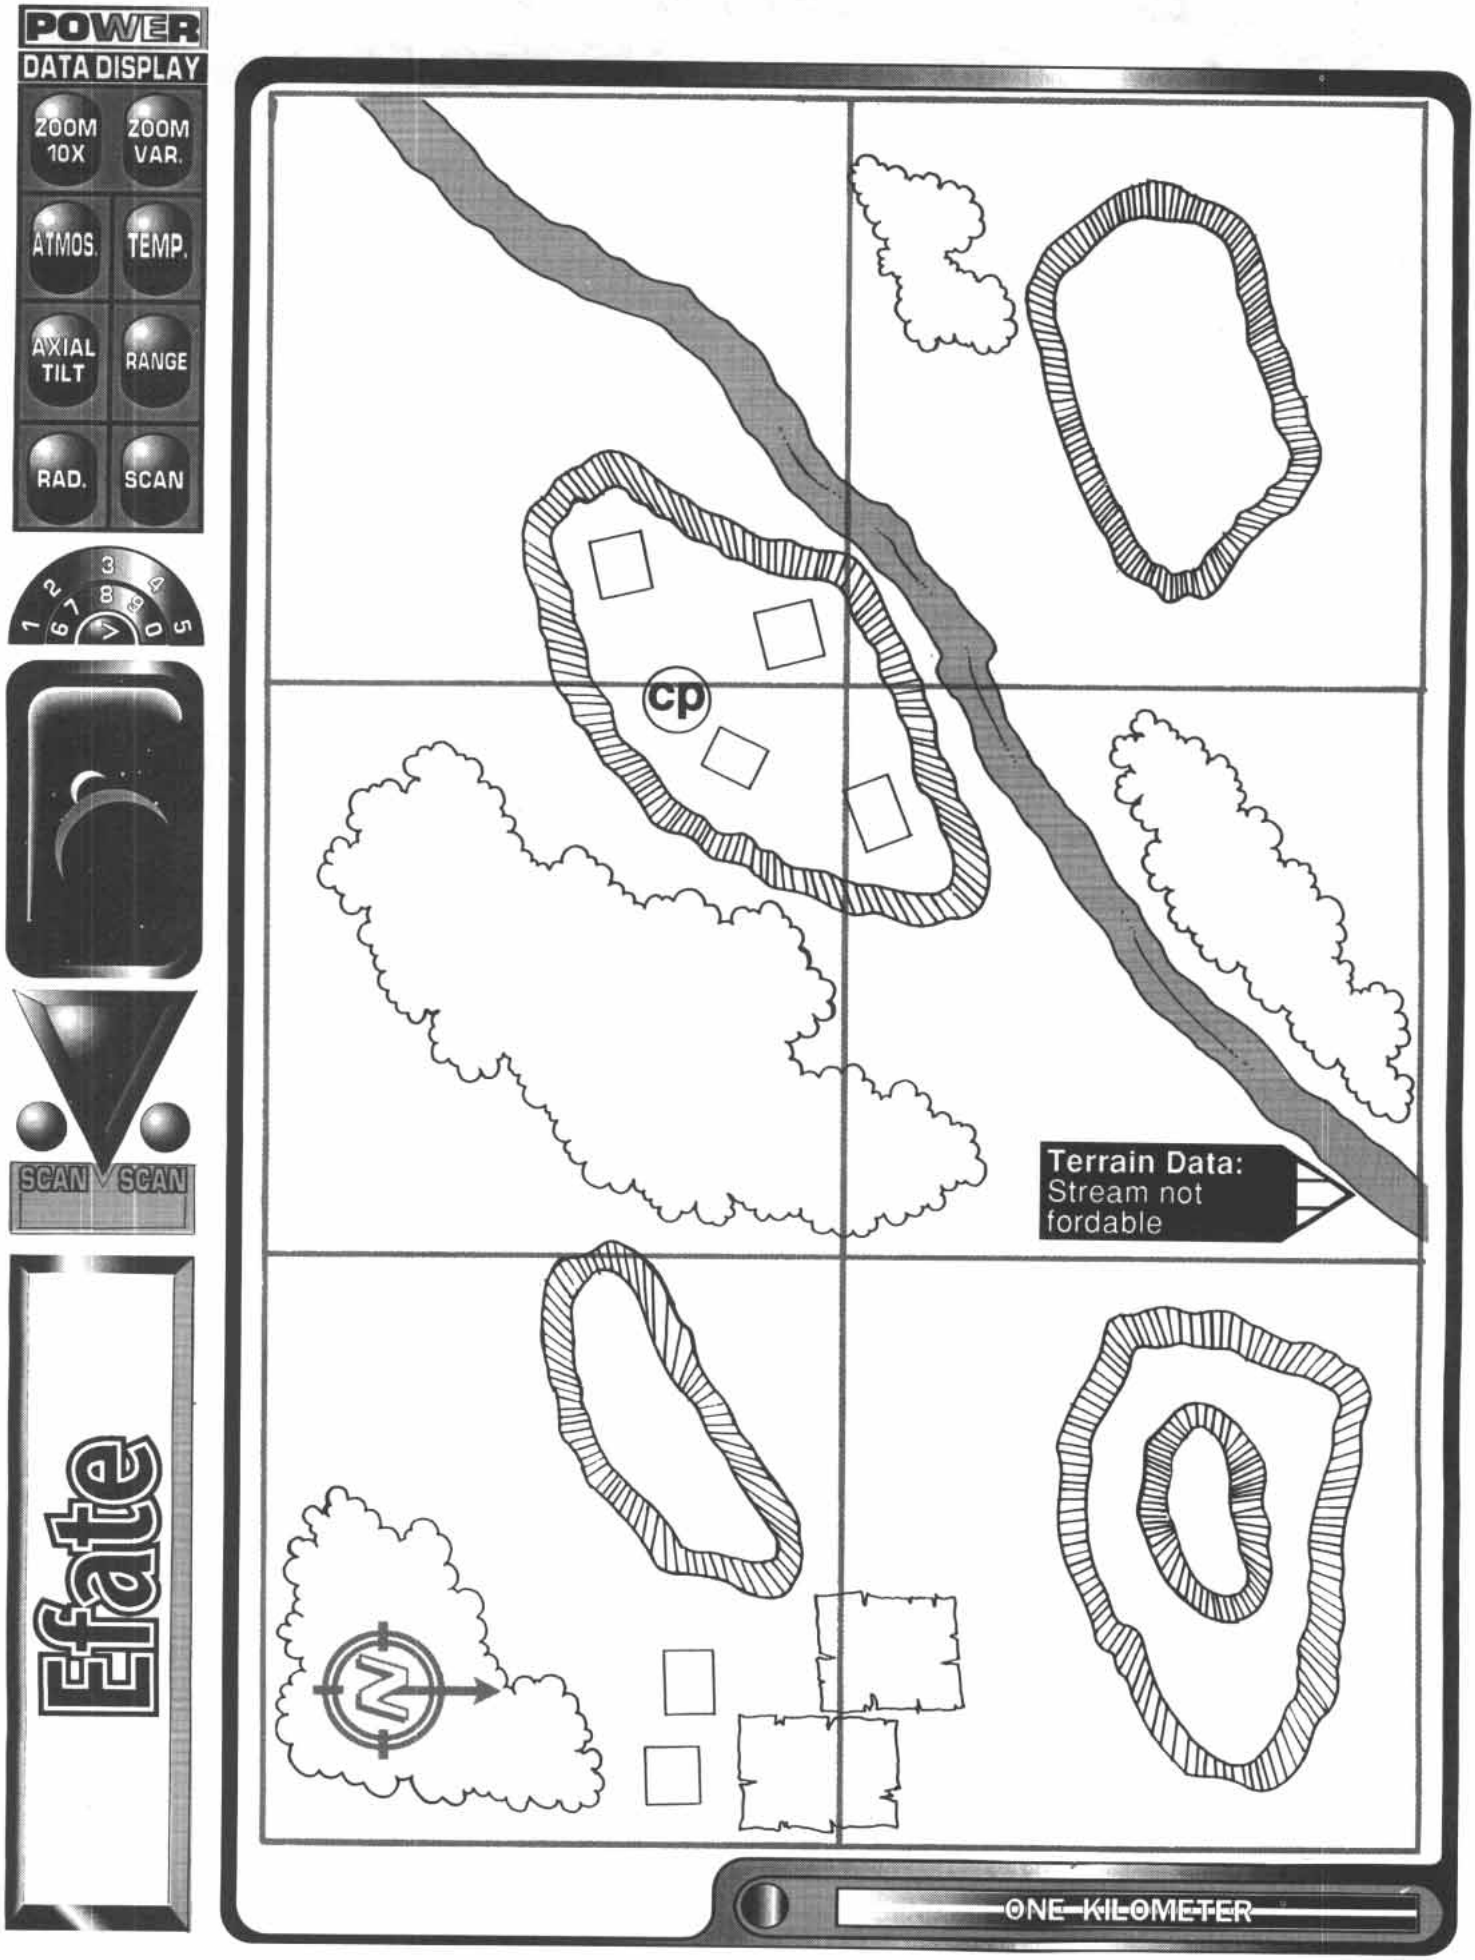
Once the Zhodani player has secretly recorded the arrival points of his troops, the Imperial player sets up. Troops may be played anywhere in or within 40 cm of the compound. Any hidden stands are kept off the table.



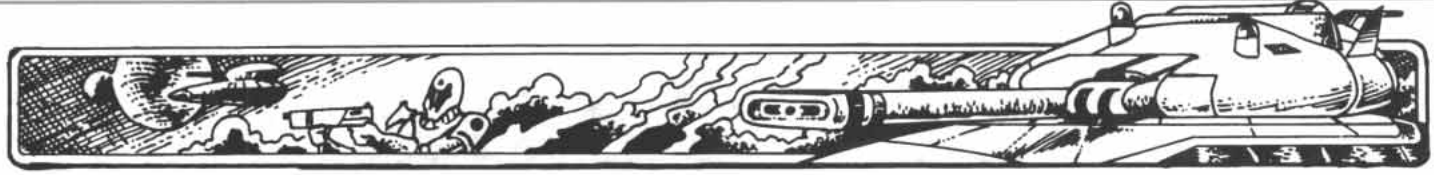
The game begins when the Zhodani commandoes appear. On the same turn, the Zhodani lift infantry company may enter any board edge.



SPECIAL SCENARIO RULES



Although a relief force is on its way, it will not arrive soon enough to intervene in this fight. The scenario is essentially a fight to the death between the Imperial company and the two Zhodani companies.



VICTORY

The Zhodani player wins if the computer is destroyed and all three computer intelligence officers are killed and/or captured. Failing this, the Imperial player wins.

Briefing and Orders

From: Headquarters, 14th Area Army.

To: 114th Commando Groupment, Consular Guard.

1. Situation: A recent raid by the enemy overran the rear headquarters of the CXII Corps and captured an intact operations computer. Indications are that the headquarters staff did not have time to destroy the encrypted data base, the decoding of which will seriously compromise our operations here on Efate. The tamperproofs of the computer will prevent it from being moved until the encryption has been dealt with, which will require the enemy to hold the site and bring its computer experts there.

2. Objective: Destroy the captured operations computer and its data base. Eliminate any Imperial computer personnel who may have partially decoded the data base.

3. Enemy Forces: The enemy is believed to hold the compound with a company of jump troops, perhaps now reinforced. As the site is well behind our front lines, no heavy units have been deployed there yet, although a major drive is in progress to break through to the compound.

4. Friendly Forces: The only uncommitted unit close enough to intervene immediately is the reserve squadron of your groupment and an understrength lift infantry company.

5. Concept of Operation: While an attached army lift rifle company launches a diversionary assault from outside the compound, the commando company will psionically teleport into the camp compound, relying on surprise to overcome enemy resistance. They will destroy the computer and use telepathic probes to determine the extent of the enemy's knowledge of the operations data base. They will neutralize any personnel with knowledge of the information contained in the data base. They will then exfiltrate back to a rendezvous point to be determined in cooperation with the lift infantry commander.

Organization Of Forces

Commando Squadron, with:
- 1 command teleport stand
- **3 Commando Detachments,** each with:
  - 1 command teleport stand
  - **4 Commando Groups,** each with:
    - 1 command teleport stand
    - 1 teleport support infantry stand
    - 2 teleport infantry stands

Light Infantry Company, with:
- **Headquarters and Weapons Platoon,** with:
  - 1 operational command stand
  - 1 Light Utility Sleds
  - 1 staff radio LMR Sled
- **3 Light Rifle Platoons,** each with:
  - **Headquarters,** with:
    - 1 tactical command stand
    - 1 crew stand
    - 1 TL14 Tac missile launcher
    - 1 Light Utility Sled
  - **3 Rifle Squads,** each with:
    - 1 tactical command stand
    - 1 support infantry stand
    - 2 infantry stands
    - 1 Light Utility Sled

Commando Squadron (Experienced, Morale: 20), with:

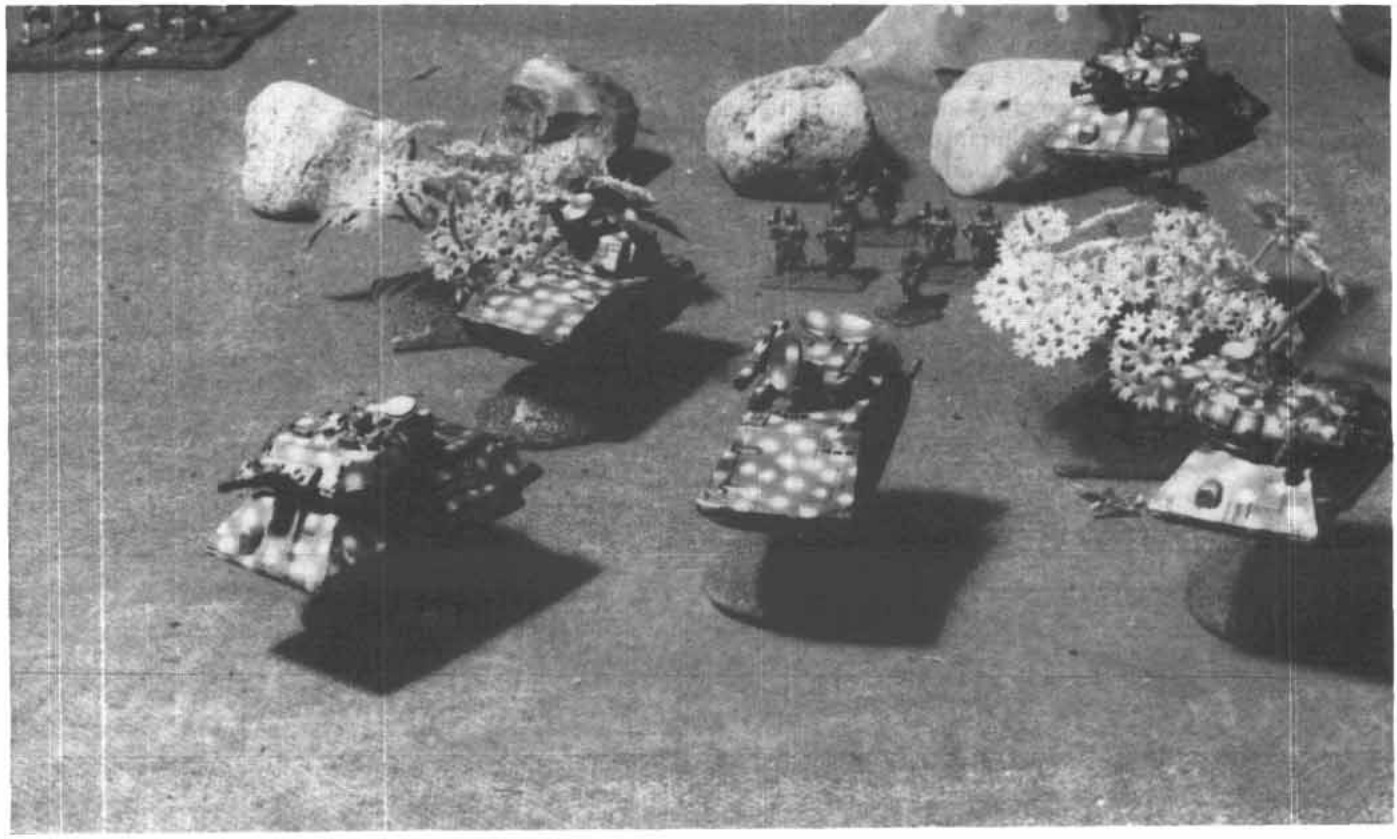
1 command teleport stand

3 Commando Detachments, each with:

1 command teleport stand

4 Commando Groups, each with:

1 command teleport stand



1 teleport support infantry stand

2 teleport infantry stands

Notes: All stands wear TL14 battledress and are armed with TL13 4.7cm noncompensated plasma rifles. Each support infantry stand is armed with TL14 4.7cm noncompensated fusion rifles. Note that Zhodani commando selection is based exclusively on their psionic ability, which accounts for the lower level of combat skills than found in most commando units.

DEFENDER

Briefing and Orders

From: Regimental HQ, 4518th Lift Infantry (DROH).

To: Commander, Gamma Company, 6th Battalion.

1. Situation: Early this morning your company conducted a deep penetration raid by meteoric assault from orbit and overran the headquarters of the Zhodani CXII Army Corps. In the course of the mission, an intact operations computer was unexpectedly secured. Your position cannot be substantially reinforced from orbit, although three jump-trained computer intel officers have been sent to the compound to evaluate the information.

Due to renewed Zhodani activity in low orbit, your force cannot be extracted by lander at this time. Instead, an overland attack has been launched to link up with you and evacuate your personnel.

2. Objective: Protect the computer database and the officers evaluating it.

3. Enemy Forces: We believe that the elimination of the corps headquarters has temporarily complicated Zhodani command control in the area, and a large-scale coordinated attack is unlikely in the next several hours. The overland attack is also expected to tie down the heavy Zhodani combat elements in the area. There are light rear-area security elements in the vicinity, and counterattacks can be expected from them. Most of these are believed to be mobile light infantry units.

4. Friendly Forces: Aside from the relief column en route, there are no friendly forces in a position to reinforce your company.

5. Concept of Operation: Hold until relieved.

Organization of Forces

Gamma Company, 6th Battalion, 4518th Lift Infantry Regiment, The Duke of Regina's Own Huscarles, with:

Company Headquarters, with:
- 1 operational command stand

3 Jump Troop Platoons, each with:
- 1 tactical command stand
- 1 support infantry stand

3 Jump Troop Squads, each with:
- 1 tactical command stand
- 2 infantry stands

4518th Lift Infantry

The 4518th Lift Infantry (Duke of Regina's Own Huscarles) has a long history, dating back to the Civil War of 604 to 622 when a cadre of Imperial Marines were left on Regina to support the then Baron of Regina, Caranda. After the conclusion of the war, the Marine cadre was converted into the personal bodyguard of the new Duke Caranda.

The Huscarles have fought in the Third, Fourth, and Fifth Frontier Wars, as well as many other military operations, including the Psionic Suppressions. Although originally organized as a four-battalion regiment, the 4518th Lift now consists of six regiments: three lift infantry, two lift cavalry, and one drop troops (see page 141 for further details).

Gamma Company, 6th Battalion, 4518th Lift Infantry Regiment, The Duke of Regina's Own Huscarles, with:

Company Headquarters, with:
1 operational command stand

3 Jump Troop Platoons, each with:
1 tactical command stand
1 support infantry stand

3 Jump Troop Squads, each with:
1 tactical command stand
2 infantry stands

Notes: Each stand is outfitted with TL14 light battledress. Command and infantry stands are armed with TL14 4.7cm fusion rifles, the infantry stands additionally having an integral 4cm RAM grenade launcher. The support stands are armed with TL-15 30kg "Fire and Forget" missiles and an integral TL15 5.1cm fusion rifle.

Battle Royal

1202 (Imperial calendar), NE 2 (RC calendar)
The planet Marax in the Old Expanses

The Intel kids were very earnest. They wanted to do a great job. Instead, they were just making everyone jumpy as hell. It seemed like every day they'd upload a new batch of TO&E data on "Additional Units Now Believed to be in the Operational Vicinity of the Target." Finally, this morning Cheater turned to him and said, "*Damn*, Bongo, just how many of those guys *are* there down there?"

That, as Hamlet had once remarked, *was the question.*

When he first found out that the crew of the old DLS *Horus* was still alive and held captive on Marax, he'd pulled every string he could to get on the drop team. He wasn't the only one; there were a lot of familiar faces from the "old days" in the drop companies. But now he was beginning to wonder why he had forgotten never to volunteer.

He'd led a squad on the famous Hastaan raid back in '99. Now he was company top soldier, so all the kids had pumped him and the other "old-timers" about what it was going to be like. He could tell them all about Hastaan, but this was beginning to look like a different bucket of eels altogether. Hastaan had about a platoon's worth of troops who knew which end of their weapons got hot. But this Ushugaam character on Marax looked to have a couple *battalions* that good, and more militia than you could shake a stick at. They were armed to the teeth, too: tanks, battledress, helicopters and some pretty scary-looking planetary defense missiles.

And they didn't look like they were going to fall for the old "negotiate until the troops are safe on the ground" trick, either.

On the other hand, the Coalition had a secret weapon. Commodore "Hammer" Lathrop, the head of the RCES, had come back into military rig to personally plan and direct this assault. With Ritter flying his pennant in RCS *Thunderchild* and running the navy end of things, Bongo knew they could count on 100% support from orbit. And if anyone could crack Ushugaam's defenses, The Hammer could. When Bongo got the call to report to Lathrop's cabin, his spirits rose back to their normal level.

Once he got to the cramped office that passed for the flag day cabin, Bongo and Hammer exchanged gossip and pleasantries for a few minutes, renewing their friendship, while Lathrop's aide listened politely and tried to look inconspicuous. Finally, Lathrop leaned forward, serious.

"Bongo," he said, "you been studying all the tacintel on Ushugaam and his people down there?"

"Yes, sir," Bongo answered.

"Good. I tell you the truth—this looks like a real nightmare to me. Thank God we got you along. Best head for tactics I ever saw," he said as an aside to his aide, who smiled and nodded. "So, what do you think, Bongo? How do we skin this guy?"

BACKGROUND

The planet Marax is ruled by Ushugaam III, an unbalanced, despotic overlord. RCES learned in early 1202 that Ushugaam had captured the crew of one of the original 12 Dawn League emissary ships and had been holding the crew for nearly two years. They were imprisoned in his underground stronghold, the former Imperial planetary defense command complex, located in the Cleft of Bagvoot, a rift valley that drains the arid highlands and links them to the lower tropical jungles along the shores of the Mare Maximus.

In this scenario, the Coalition (Star Viking) player will launch a full-scale assault from orbit, while the Marax player attempts to defend the valley and stronghold.

DEPLOYMENT

The Marax troops can deploy initially anywhere in the valley. The ADA launchers must be at least 50 cm apart from each other. Ushugaam II and the prisoners must begin in the stronghold. The prisoners may not be moved during the scenario, but Ushugaam may move out of the stronghold.

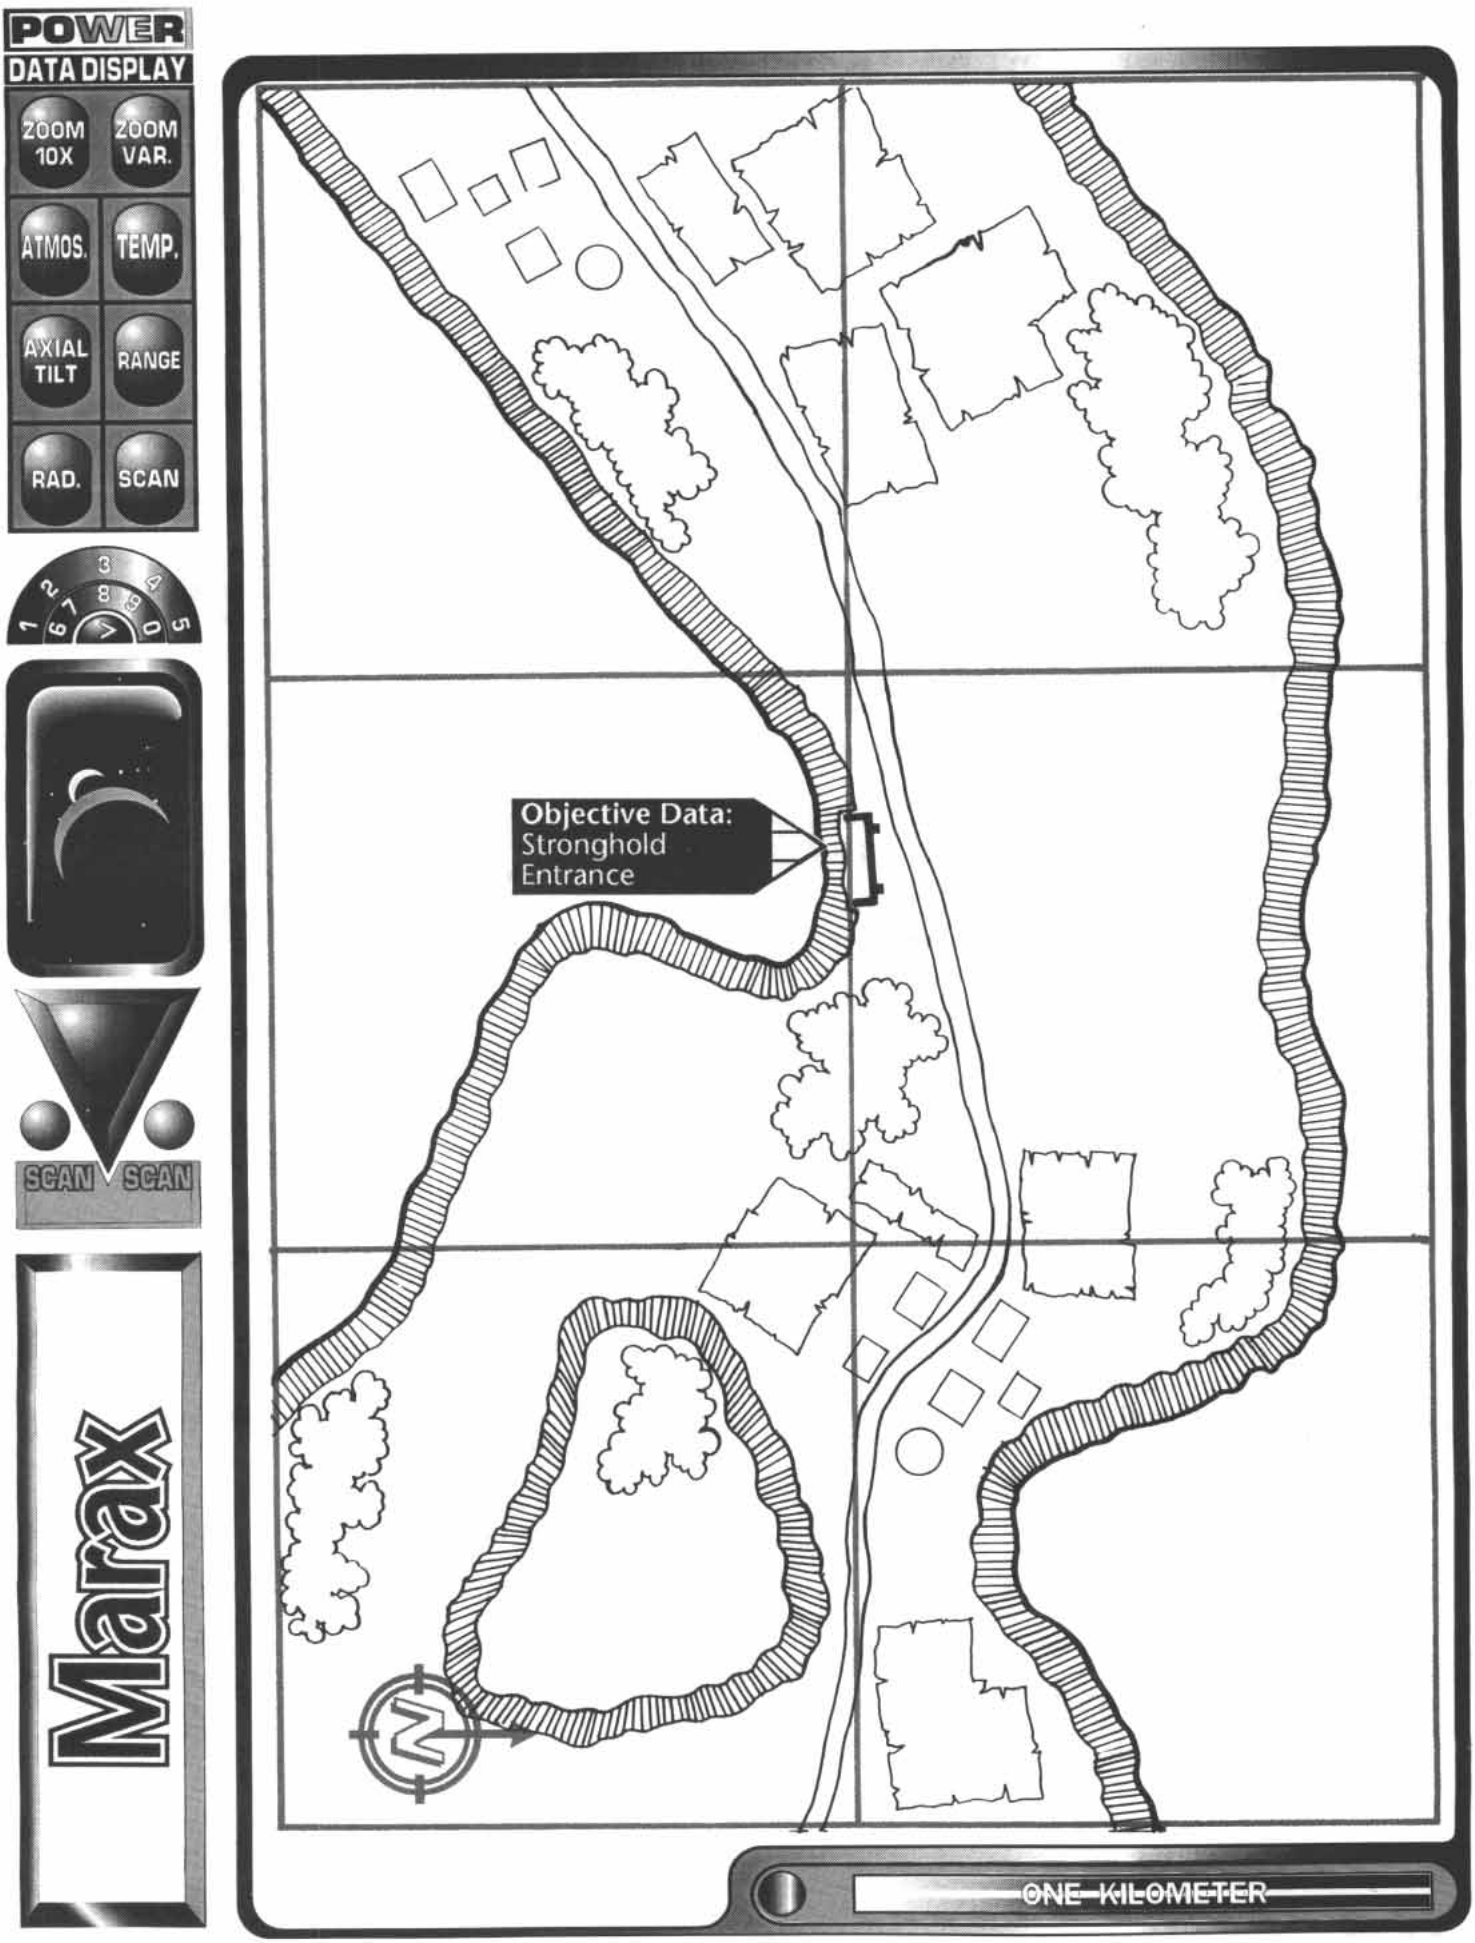
SPECIAL SCENARIO RULES

Assault Landers: The first wave of troops arrive by drop capsule. The following waves arrive by assault landers.

Landers must be called down by the ground commander. They arrive five game turns later (the time it takes them to descend from orbit). Each assault lander may carry one vehicle (including its passengers) or three stands. As many assault landers may land in a turn as desired, provided they have all been called down by the ground commander in advance. Each assault lander must land in clear terrain (although the presence of roads and plowed fields do not inhibit landing) and may not land any closer than 30 cm of another assault lander or three meters (kilometers) of an operational ADA missile launcher. (Note that ADA launchers have no effect on drop capsules.)

Ushugaam: As soon as Ushugaam is killed, all surviving Marax troops suffer a permanent morale reduction of 4. Ushugaam may escape from the table, if desired, by exiting by vehicle to the east or west.

Stronghold: The systematic room-by-room reduction of the stronghold is a fascinating battle, but it is virtually a game in itself. It is highly recommended that the main scenario be played only up to the point that the main gate to the stronghold is breached. The main gate is reinforced concrete, with an armor value of 100, and may be breached either by conventional combat damage or by the engineer assault vehicle, which carries a heavy breaching charge especially designed to blow in the main gate.



If the fight in the stronghold itself is fought, we recommend fighting it as a separate action using a revised scale. Blow up the stronghold to 10 times its size on the table, using art board or some other large stiff paper to draw the complex. Expand ranges by a factor of 10 as well. Keep movement the same, and treat each turn as 30 seconds instead of five minutes.

Orbital Bombardment: The orbital task force has a total of 20 TL11 planetary strike missiles available at the beginning of the scenario. These may be any mix of guidance and warhead types desired, but the mix must be specified by the Reformation Coalition player before play begins. All battledress stands have 3km short-range laser target designators.

Marax is a size 5 world, and so there will be a five-turn delay from when a missile is requested and when it arrives.

VICTORY

The RCES force must capture the Cleft Bagvoot stronghold and rescue the prisoners. Any other result is a victory for Marax.

Briefing and Orders

From: Lathrop, flag aboard RCS *Thunderchild.*

To: All personnel, Task Force Strike Marax.

1. Situation: On or about 1-IX-1199 DLS *Horus* departed from its scheduled flight path. It grounded on Marax approximately one month later and was seized by the local government. Why the captain of *Horus* departed from her flight plan is unknown. Recent intelligence discovered the presence of the ship in Marax's navy and later pinpointed the crew as being held in the stronghold at the Cleft of Bagvoot, a steep-walled rift valley connecting the desert highlands, with the jungles around the Mare Maximus.

2. Objective: Rescue our people.

3. Enemy Forces: Ushugaam has several companies of crack bodyguard troops, as well as elements of a mechanized battalion, air-mobile battalion and militia infantry. In addition, there are four TL10 Planetary Aerospace Defense (PAD) missile launchers in the valley. While our assault drop capsules should be immune to these missiles, nothing larger can come down low until they are dealt with:.

4. Friendly Forces: A battalion-sized combat team has been assembled from a variety of sources. Detailed task organization is appended below.

5. Concept of Operation: The jump troops will hit first, with the immediate objective of capturing or neutralizing the PAD launchers. Once sufficient PAD launchers have been neutralized, the lift troops and engineers will land by assault lander. The combined force will then secure the stronghold and rescue our people.

Coalition Assault Organization of Forces

Provisional Jump Company, Reformation Coalition Marine Corps, with:
- **Corps Headquarters,** with:
  - 1 operational command stand
  - 1 staff uplink stand
  - 1 tactical command stand
  - 2 self-ordering scout stands (single figure)
- **2 Rifle Platoons,** each with:
  - 1 tactical command stand
  - **3 Rifle Squads,** each with:
    - 1 tactical command infantry stand
    - 1 infantry stand

Composite Volunteer Jump Company, with:
- **Headquarters, with:**
  - 1 operational command stand
  - 1 staff uplink stand
  - 1 tactical command stand
  - 2 self-ordering scout stands (single figure)
- **Balduri Platoon,** with:
  - 1 tactical command stand
  - **2 Rifle Squads,** each with:
    - 1 tactical command infantry stand
    - 2 infantry stands
- **Free Lance Platoon,** with:
  - 1 tactical command stand
  - **4 Rifle Squads,** each with:
    - 1 tactical command infantry stand
    - 1 infantry stand

Provisional Lift Infantry Company, 9th Oriflammen Marines, with:
- **Headquarters and Headquarters Platoon,** with:
  - **Company Headquarters Section,** with:
    - 1 staff uplink TL9 Grav APC
    - 1 tactical command stand
    - 1 TL9 Grav APC
  - **Weapons Section,** with:
    - 2 TL9 8cmL10 mortar stands
    - 2 LMG stands
    - 2 TL9 Grav APCs
  - **3 Rifle Platoons,** each with:
    - **Platoon Headquarters,** with:
      - 1 tactical command stand
      - 1 LMG stand
      - 1 TL9 Grav APC
    - **3 Rifle Squads,** each with:
      - 1 tactical command infantry stand
      - 3 infantry stands
      - 1 TL9 Grav APC
  - **Tank Platoon (attached),** with:
    - 1 tactical command TL9 Grav Tank
    - 3 TL9 Grav Tanks

Provisional Assault Engineer Platoon, Nimban Army, with:
- **Headquarters,** with:
  - 1 tactical command stand
- **1 Light Squad,** with:
  - 1 tactical command engineer stand
  - 1 engineer stand
  - 1 TL9 Grav APC
- **1 Heavy Squad,** with:
  - 1 assault engineer vehicle

Coalition Assault Force Organization

Provisional Jump Company, Reformation Coalition Marine Corps (Elite, Morale: 22), with:

- **Headquarters,** with:
  - 1 operational command stand
  - 1 staff uplink stand
  - 1 tactical command stand
  - 2 self-ordering scout stands (single figure)
- **2 Rifle Platoons,** each with:
  - 1 tactical command stand
  - **3 Rifle Squads,** each with:
    - 1 tactical command infantry stand
    - 1 infantry stand

Notes: All personnel are wearing heavy battledress. The scouts are wearing the scout variant. All stands are armed with 4mm gauss rifles and TL9 RAM grenades. Each infantry and command infantry stand has an integral plasma bazooka. The drop capsules each have launch rails for Lyrebird missiles. Each stand can designate for its own missiles. Each fireteam stand has four missile shots, while each single-figure stand has one. Command stands and command infantry stands can designate for any missiles belonging to stands subordinate to them.

DEFENDER

Briefing and Orders

1. Situation: The Star Vikings have learned that their earlier attempts to plant spies on Marax were frustrated and have now returned to launch a full-scale invasion. Instead, they will be driven back in an ocean of blood. We have massed out best units here at Cleft Bagvoot aznd hold an impregnable position.

2. Objective: Destroy the enemy assault troops.

3. Enemy Forces: Several ships are in orbit, and we must prepare for all manner of attacks.

4. Friendly Forces: The majority of the Life Guard is present, as well as picked troops from the Aero-Dragoons and Cuirassiers, and local militia forces. Some of these troops are dispersed to cover all possible landing sites, but can concentrate at the threatened area as soon as the landing takes place.

5. Concept of Operation: Protect the PAD missile launchers, as they will keep the enemy from landing heavy troop units. Attack the jump troops vigorously as soon as they land. Concentrate all forces at the most threatened sector. Above all, protect the person of the ruler.

Organization of Forces

This is a very large scenario, and the forces available to the defenders are variable, based on the miniatures available to the players. In general, there should be two or three companies of the Life Guard and the TL10 ADA battery. All other forces are optional, and different vehicles can be substituted for those shown on the data cards if desired (provided they are from the correct tech level). RCES intel isn't perfect.

"Most" of the Life Guard is available guarding the stronghold at Cleft Bagvoot. This should certainly include the headquarters and heavy infantry company, along with at least one more company.

"One or more companies" of the Aero-Dragoons are available, either guarding the stronghold at Cleft Bagvoot or as reinforcements. The battalion headquarters is not available, and the attachments listed are optional. If you do not have helicopter models available, treat the Aero-Dragoons as dismounted, their aircraft knocked out on the ground by the preliminary bombardment.

"One or more companies" of the Cuirassiers are available, either guarding the stronghold at Cleft Bagvoot or as reinforcements. The battalion headquarters is not available, and the attachments listed are optional. Either a mechanized or a motorized company may be available (or both). Different armored vehicles may be substituted, if desired.

The four-launcher air defense battery is equipped with surface-to-space missiles. These missiles are not rated for the scenario but are instead covered by the scenario special rules.

Considerable variation in the organization and equipment of militia units is possible, and company-sized detachments should arrive throughout the battle from the east and west ends of the valley.

The Life Guard

("Most" of the life guard is available guarding the stronghold at Cleft Bagvoot. This should certainly include the headquarters and heavy infantry company, along with at least one more company.)

- **Battalion Headquarters,** with:
  - 1 operational command stand
  - 1 staff radio stand
- **Heavy Infantry Company,** with:
  - **Headquarters,** with:
    - 1 operational command stand
    - 2 self-ordering recon stands (single figure)
    - 1 staff radio stand
  - **2 heavy infantry platoons,** each with:
    - 1 tactical command stand
    - **2 squads,** each with:
      - 1 tactical command infantry stand
      - 1 infantry stand
  - **Weapons Platoon,** with:
    - 1 tactical command stand
    - 2 crew stands
    - 2 2-Mj field mount plasma guns (towed, mass I)
    - 2 TL9 Ground APCs
- **Lift Infantry Company,** with:
  - **Headquarters,** with:
    - 1 operational command stand
    - 1 TL10 Open Air Raft
    - 1 staff radio TL12 Enclosed Air Raft
    - 2 self-ordering Grav Bike stands (single figure)
  - **2 lift infantry platoons,** each with:
    - 1 tactical command stand
    - **2 squads,** each with:
      - 1 command infantry stand
      - 2 infantry stands
      - 3 TL10 Open Air Rafts
  - **Lift Weapons platoon,** with:
    - 1 tactical command stand
    - 2 crew stands
    - 2 TL9 tac missile launchers
    - 2 TL10 Open Air rafts
- **2 Infantry Companies,** each with:
  - **Headquarters,** with:
    - 1 operational command stand
    - 1 TL10 Open Air Raft
    - 1 staff radio TL12 Enclosed Air Raft
    - 2 self-ordering Grav Bike stands (single figure)
  - **2 infantry platoons,** each with:
    - 1 tactical command stand
    - **2 squads,** each with:
      - 1 command infantry stand
      - 2 infantry stands
  - **Lift Weapons platoon,** with:
    - 1 tactical command stand
    - 2 crew stands
    - 2 TL9 tac missile launcher

Elements, The Aero-Dragoons

("One or more companies" of the aero-dragoons are available, either guarding the stronghold at Cleft Bagvoot or as reinforcements. The battalion headquarters is not available and the attachment listed is optional.)

1+ Reinforced Aero-Rifle Companis, each with:
- **Headquarters,** with:
  - 1 operational command stand
  - 1 self-ordering infantry stand
  - 1 TL9 Troop Transport Helicopter
  - 1 staff radio TL9 Troop Transport Helicopter
- **3 Aero-Rifle platoons,** each with:
  - 1 tactical command stand
  - **2 squads,** each with:
    - 1 command infantry stand
    - 2 infantry stands
    - 1 TL9 Troop Transport Helicopter
- **Gunship platoon (attached),** with:
  - 1 tactical command TL9 Helicopter Gunship
  - 2 TL9 Helicopter Gunships

Elements, The Cuirassiers

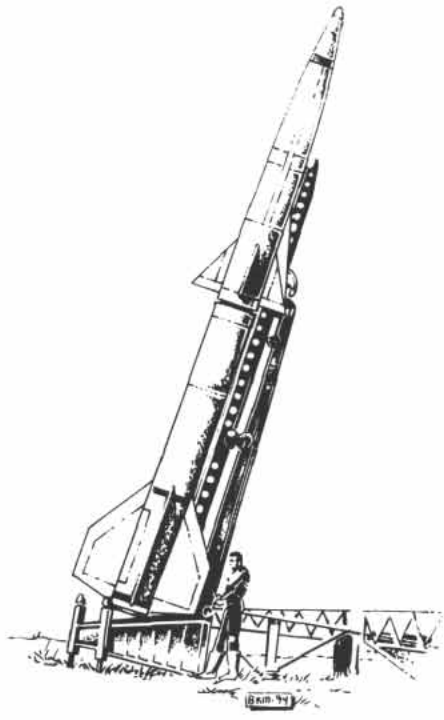
("One or more companies" of the cuirassiers are available, either guarding the stronghold at Cleft Bagvoot or as reinforcements. The battalion headquarters is not available and the attachments listed are optional. Either a mechanized or a motorized company may be available (or both). Different armored vehicles may be substituted, if desired.)

Reinforced Mechanized Company, with:
- **Headquarters,** with:
  - 1 operational command stand
  - 1 self-ordering infantry stand
  - 1 TL9 Ground APC
  - 1 staff radio TL9 Ground APC
- **2 Mechanized platoons,** each with:
  - 1 tactical command stand
  - **2 squads,** each with:
    - 1 command infantry stand
    - 1 infantry stand
    - 1 TL9 "Abomination" Infantry Assault Vehicle
- **Armored car platoon (attached),** with:
  - 1 tactical command stand
  - 1 self-ordering infantry stands
  - 2 infantry stands
  - 3 Charina armored cars/or TL9 ground APCs

(or)

Reinforced Motorized Company, with:
- **Headquarters,** with:
  - 1 operational command stand
  - 1 self-ordering infantry stand
  - 1 TL9 Ground APC
  - 1 staff radio TL9 Ground APC
- **2 Mechanized platoons,** each with:
  - 1 tactical command stand
  - **2 squads,** each with:
    - 1 command infantry stand
    - 1 infantry stand
    - 1 TL9 Ground APC
- **Tank platoon (attached),** with:
  - 1 tactical command TL9 Ground Tank
  - 2 TL9 Ground Tanks

The Militia



1+ Militia Infantry Company, with:
- **Headquarters,** with:
  - 1 operational command stand
  - 1 self-ordering infantry stand
- **2 Militia platoons,** each with:
  - 1 tactical command stand
  - 1 MG stand
  - 1 rocket launcher stand
  - **2 squads,** each with:
    - 1 command infantry stand
    - 3 infantry stands

Strategic Air Defense Battery

This is a 4-launcher air defense battery equipped with surface-to-space missiles. These missiles are not rated for the scenario, but are instead covered by the scenario special rules.

Headquarters, with:
- 1 operational command stand
- 1 staff radio stand
- 1 infantry stand

2 firing platoons, each with:
- 1 tactical command stand
- 2 crew stands
- 2 infantry stands
- 2 TL10 strategic ADA missile launchers

Communications:					
3 km Radio	300 cm	600 cm	1200 cm	2400 cm	

Notes: The command and crew stands all are unarmored and are armed with 7mm carbines.

Appendix A: Converting Traveller to Striker

Equipment rated in **Traveller** or designed using **Fire, Fusion & Steel** may be used in **Striker** games very easily. Use the following guides for filling out the unit data card.

INITIATIVE

Initiative is not an equipment issue, but it is calculated for every unit in the game. Initiative is based on the NPC experience level of the troops making up the unit, as shown below. In the case of player characters, the actual initiative value is used.

Initiative can be reduced due to body armor. This subtraction is made from the numeric initiative value before it is recorded on the unit card.

Level	*Initiative*
Elite	5
Veteran	4
Experienced	3
Novice	1

DIRECT FIRE WEAPONS

Most information on direct fire is contained in the four range columns of the card and the final comments column.

Range: Calculate short range in **Striker** (in centimeters) by dividing the **Traveller/FF&S** range (in meters) by 10, rounding to the nearest whole number. Note that this will mean some weapons with very poor range performance may not have a short range at all. Medium, long and extreme ranges are calculated by progressive doubling of the short range.

Thrown grenades have a short range of 1 cm, medium of 2 cm, long of 3 cm and extreme of 4 cm.

Number of Dice: Each weapon has a specified number of dice which are rolled for it at close range. This number is reduced by 1 for each additional increment of range, but is never reduced to less than 1.

Existing weapons from **Traveller** may be rated using the following table.

ROF	*Dice*
1/2, reload, etc.	1
SS, BA, LA, DAR, SA-1	2
PA, SA, SA-2+	3
5 or 10, hand-held, 3 (all)	4
5 or 10, mounted	5
50+	7

Penetration: The **Striker** penetration is the **Traveller** penetration value. To calculate the penetration value for small arms, divide their damage value by their penetration rating, rounding to the nearest whole number. Note that a separate penetration value is calculated for each range band unless the weapon has constant penetration.

For weapons whose penetration is the printed value plus a 2D6 roll, write a "+" sign after the penetration.

Comments: In this column, write F if the weapon uses the fire control bonus listed on the card and S if the weapon is stabilized, then write the value for the explosion of the warhead (if it is an exploding round).

Explosive Power: The explosive power of a round in **Striker** is twice the square root of its **Traveller/FF&S** concussion value, rounding to the nearest whole number. However, the maximum explosive value allowed in the game is 18.

Burst: To find the **Striker** burst radius in centimeters, divide the **Traveller** primary burst radius (in meters) by 10, rounding all fractions up.

Nuclear Burst: The **Striker** destruction and burst radii in centimeters are calculated by dividing the **Traveller** destruction and primary burst radii in meters by 10. All nuclear explosions have an explosive power of 18 in their burst radius.

Missiles: The missile's agility is the same as that in **Traveller** or calculated from **FF&S**. The missile's range depends on its guidance type. Note that all target memory and target seeker missiles are treated as homing missiles for purposes of **Striker**.

Towed Weapons

Calculate the mass class the same as for vehicles.

INDIRECT FIRE WEAPONS

Range: Indirect fire weapons have only a single range listed (in the comments column) which is its maximum indirect fire range in kilometers. Each kilometer is one meter (100 cm) on the gaming table.

Rocket Salvoes: To find the burst radius of a rocket salvo, multiply the burst radius of a single round by the square root of the number of rounds in the salvo, rounding the final value to the nearest whole number.

Towed Weapons

Calculate the mass class the same as for vehicles.

ELECTRONICS

Sensors

Range is recorded the same as for direct-fire weapons. Some sensors with very long ranges have them listed in kilometers instead of centimeters. Each kilometer is one meter on the table (which will make most detection tasks in the game carried out at close range).

Sensor jammers are listed under other ECM. Sensors with direction finding capability are noted in the comments column.

COMMUNICATORS

Range is recorded the same as for direct-fire weapons. Some communicators with very long ranges have them listed in kilometers instead of centimeters. Each kilometer is one meter on the table. Extreme range of communicators is the maximum distance at which they can be used on the table or when calling fire. Other range bands are used when determining the chance of locating **the communicator with a direction finder.** Communication jammers are listed under communicators.

PERSONNEL

Armor

Note the type of armor and its save number. The save number is the same as for **Traveller** armor. If the armor has two different value, use the lower of the two. If the armor covers only part of the target, average the two values, rounding to the nearest whole number. If it is melee armor only, record its save value in parentheses.

Movement

To find the movement allowance in centimeters for personnel, take the **Traveller** walking speed in meters and multiply by 2.

Some types of body armor reduce the movement allowance due to their agility reductions. Subtract two centimeters from the movement allowance for every agility reduction due to body armor.

VEHICLES

By using the blank vehicle form and examining the sample vehicles

Appendix A: Converting Traveller to Striker

already rated in **Striker**, it should be easy to rate your own **FF&S** or other **Traveller** vehicles. The following notes should answer any questions.

Movement: To find the cross-country movement allowance for ground vehicles, in centimeters, take the safe cross-country combat speed (in meters) and multiply by 2. A vehicle with a cross-country safe combat speed of 10 meters would have a **Striker** cross-country movement allowance of 20 centimeters.

For road speed, follow the same procedure, but use safe road speed instead.

To find the NOE movement allowance in centimeters for flying vehicles, multiply the **Traveller** safe NOE speed in 10-meter grid squares by 20.

To find the high-altitude travel movement for flying vehicles in centimeters, multiply the **Traveller** high altitude movement rating in 10-meter grid squares by 60.

Agility: Agility is also based on the combat movement allowance. To find the cautious advance agility of any movement allowance, find the **Striker Cautious Advance speed on the Agility table below**, and find its corresponding Agility. Double the speed to find the rapid advance agility and triple it to find the travel move agility.

To find the travel movement agility of aircraft, find their high altitude movement allowance in the Striker High Move column of the Agility table and read its corresponding Agility.

See the Agility Table below.

Armor: Vehicle armor is transferred directly from **Traveller** values.

Mass Class: Compare the vehicle's loaded mass to the following table.

Loaded Mass	*Mass Class*
Up to 1.499 tonnes	I
1.50-2.99 tonnes	II
3-8.99 tonnes	III
9-19.99 tonnes	IV
20-35.99 tonnes	V
36+ tonnes	VI

Explosive Damage Modifier: The vehicle's explosive damage modifier is based on the thinnest armor face or the vehicle's mass class, whichever is less. Add 1 to the correct value, and express the result as a negative number: This is the explosive damage modifier. For purposes of this calculation, refigure the mass class of flying vehicles by dividing their mass by 10.

For example, a vehicle has a mass class of III and is open-topped. The lower value of the two is its thinnest armor (which is 0 on the top). Adding 1 results in an explosive damage modifier of –1.

Cargo Capacity: List both the number of fireteam stands carried and the cargo tonnage. The number of stands carried is the total number of passengers divided by 4, rounding down. If the final value is less than 1, record the total number of passengers, but append the note "single-figure stands."

Environment: This covers two criteria: crew life support and power plant. For crew life support, a vehicle is considered to be sealed, overpressure or unsealed. Sealed includes any pressurized vehicle with basic or extended life support; overpressure includes vehicles equipped with an overpressure system; and unsealed includes all other vehicles, including all open-topped vehicles.

Power plants can be listed as air-breathing, nonair-breathing, and filtered air-breathing. Nonair-breathing power plants are fuel cells, nuclear power plants, matter-antimatter power plants, solar arrays, batteries, explosive power generators, rockets and liquid hydrogen burning power plants that have been modified to carry their own liquid oxygen. Air-breathers are all other types of power plants. Air-breathing plants may be designated as equipped with filters during the **FF&S** design sequence.

Electronic Warfare: Note here whether the vehicle is a stealth design or has electro-magnetic masking. If the vehicle has decoys, note that fact. For the number of turns of decoys carried, divide the number of decoys by 15 and round to the nearest whole number.

Ammunition: Note the number of game shots carried for all nonsmall arms (2 cm and larger in bore) weapons.

Game shots are based on the number of rounds carried in **Traveller**.

For missiles, divide the number of missiles carried by 2 to determine game shots.

For heavy weapons with a **Traveller** rate of fire of less than 3, divide the number of rounds carried by 4 to determine the number of game shots.

For heavy weapons with a **Traveller** rate of fire of 3 or more, divide the number of rounds carried by 10 to determine the number of game shots.

Maintenance Points: Maintenance points from **Traveller** and **FF&S** are transferred directly to **Striker**.

NOTES

The following abbreviations are used in the vehicle and equipment data tables in this book:

A: Agility, **BR:** Burst radius, **DR:** Destruction radius, **DS:** Danger space, **ED:** EMS designated, **EP:** Explosive power, **F:** Fire control benefit applies to weapon, **H:** Hull mount weapon, **IFR:** Indirect fire range, **LD:** Laser designated, **N:** Rate of fire varies depending on starship, **R:** Range, **S:** Stabilization benefit applies to weapon.

AGILITY

Appendix C: Zhodani Vehicles

Zhodani Utility Sled (TL14)

Troop Quality: _____ **Morale:** _____ **Initiative:** _____
Movement: 500 low (+3, +4), 10,020 high (+6)
Front Armor: 56
Side Armor: 28
Rear Armor: 28
Deck Armor: 28
Belly Armor: 28
Mass Class: VI
Explosive Damage Modifier: –4
Fire Control: None
Stabilization: None

Cargo Capacity: 7 stands or 17.75 tonnes
Environmental: Sealed, nonair-breathing
Electronic Warfare: EMM (+2 vs. Radar & HRT, +1 vs. Passive and Active EMS), decoys (5)
Ammunition: None
Maintenance Points: 12

System:	*Short ( )*	*Medium ( )*	*Long ( )*	*Extreme ( )*	*Notes*
None					
Sensors:					
30 km passive EMS	(30 km)	(60 km)	(120 km)	(240 km)	DF capable
WSV goggles	40 cm	80 cm	160 cm	320 cm	
Eyeballs	100 cm	200 cm	400 cm	800 cm	
Communications:					
3 km maser	300 cm	600 cm	1200 cm	2400 cm	
300 km radio	(300 km)	(600 km)	(1200 km)	(2400 km)	

Zhodani LMR Sled (TL14)

Troop Quality: _____ **Morale:** _____ **Initiative:** _____
Movement: 500 low (+3, +4), 10,020 high (+6)
Front Armor: 56
Side Armor: 28
Rear Armor: 28
Deck Armor: 28
Belly Armor: 28
Mass Class: VI
Explosive Damage Modifier: –4
Fire Control: None
Stabilization: None

Cargo Capacity: 2
Environmental: Sealed, nonair-breathing
Electronic Warfare: EMM (+2 vs. Radar & HRT, +1 vs. Passive and Active EMS), decoys (5)
Ammunition: None
Maintenance Points: 11

System:	*Short ( )*	*Medium ( )*	*Long ( )*	*Extreme ( )*	*Notes*
None					
Sensors:					
30 km passive EMS	(30 km)	(60 km)	(120 km)	(240 km)	DF capable
WSV goggles	40 cm	80 cm	160 cm	320 cm	
Eyeballs	100 cm	200 cm	400 cm	800 cm	
Communications:					
30,000 km laser	(30,000 km)	(60,000 km)	(120,000 km)	(240,000 km)	
30,000 km maser	(30,000 km)	(60,000 km)	(120,000 km)	(240,000 km)	
30,000 km radio	(30,000 km)	(60,000 km)	(120,000 km)	(240,000 km)	

Zhodani Meson Sled (TL14)

Troop Quality: _____ **Morale:** _____ **Initiative:** _____
Movement: 500 low (+3, +4), 10,020 high (+6)
Front Armor: 56
Side Armor: 28
Rear Armor: 28
Deck Armor: 28
Belly Armor: 28
Mass Class: VI
Explosive Damage Modifier: –5
Fire Control: None
Stabilization: None

Cargo Capacity: None
Environmental: Sealed, nonair-breathing
Electronic Warfare: EMM (+2 vs. Radar & HRT, +1 vs. Passive and Active EMS), decoys (5)
Ammunition: None
Maintenance Points: 20

System:	*Short ( )*	*Medium ( )*	*Long ( )*	*Extreme ( )*	*Notes*
None					
Sensors:					
30 km passive EMS	(30 km)	(60 km)	(120 km)	(240 km)	DF capable

Eyeballs	100 cm	200 cm	400 cm	800 cm	
Communications:					
30 km maser	300 cm	600 cm	1200 cm	2400 cm	
300 km radio	(300 km)	(600 km)	(1200 km)	(2400 km)	
30,000 km meson	(30,000 km)	(60,000 km)	(120,000 km)	(240,000 km)	

Appendix C: Zhodani Vehicles

Zhodani Light Utility Sled (TL14)

Troop Quality: _____ **Morale:** _____ **Initiative:** _____
Movement: 500 low (+3, +4), 10,020 high (+6)
Front Armor: 56
Side Armor: 28
Rear Armor: 28
Deck Armor: 28
Belly Armor: 28
Mass Class: VI
Explosive Damage Modifier: –4
Fire Control: None
Stabilization: None

Cargo Capacity: 3 stands or 7.75 tonnes
Environmental: Sealed, nonair-breathing
Electronic Warfare: EMM (+2 vs. Radar & HRT, +1 vs. Passive and Active EMS), decoys (5)
Ammunition: None
Maintenance Points: 7

System:	*Short ( )*	*Medium ( )*	*Long ( )*	*Extreme ( )*	*Notes*
None					
Sensors:					
30 km passive EMS	(30 km)	(60 km)	(120 km)	(240 km)	DF capable
WSV goggles	40 cm	80 cm	160 cm	320 cm	
Eyeballs	100 cm	200 cm	400 cm	800 cm	
Communications:					
3 km maser	300 cm	600 cm	1200 cm	2400 cm	
300 km radio	(300 km)	(600 km)	(1200 km)	(2400 km)	

Zhodani Recovery Sled (TL14)

Troop Quality: _____ **Morale:** _____ **Initiative:** _____
Movement: 280 low (+2, +3), 3360 high (+5)
Front Armor: 5
Side Armor: 4
Rear Armor: 4
Deck Armor: 4
Belly Armor: 4
Mass Class: V (Unloaded), VI (Loaded)
Explosive Damage Modifier: –4 (Unloaded), –5 (Loaded)
Fire Control: Point Defense FC, ignore 5 diff mods
Stabilization: Advanced (treat cautious and rapid advance as *no order* for ROF and sequence of fire purposes)

Cargo Capacity: 430 tonnes
Environmental: Sealed, nonair-breathing
Electronic Warfare: EMM (+1 vs. Radar & HRT), decoys (5)
Ammunition: Unlimited shots for VRF gauss gun
Maintenance Points: 5

System:	*Short ( )*	*Medium ( )*	*Long ( )*	*Extreme ( )*	*Notes*
VRF gauss gun-needle	30 cm: 7 (6)	60 cm: 6 (6)	120 cm: 5 (2)	240 cm: 4 (1)	F, S
Sensors:					
30 km passive EMS	(30 km)	(60 km)	(120 km)	(240 km)	DF capable
WSV goggles	40 cm	80 cm	160 cm	320 cm	
Eyeballs	100 cm	200 cm	400 cm	800 cm	
Communications:					
3 km maser	300 cm	600 cm	1200 cm	2400 cm	
300 km radio	(300 km)	(600 km)	(1200 km)	(2400 km)	

Zhodani FDC Sled (TL14)

Troop Quality: _____ **Morale:** _____ **Initiative:** _____
Movement: 500 low (+3, +4), 10,020 high (+6)
Front Armor: 56
Side Armor: 28
Rear Armor: 28
Deck Armor: 28
Belly Armor: 28
Mass Class: VI
Explosive Damage Modifier: –4
Fire Control: Fire Direction Center (range: 80 km)
Stabilization: None

Cargo Capacity: None
Environmental: Sealed, nonair-breathing
Electronic Warfare: EMM (+2 vs. Radar & HRT, +1 vs. Passive and Active EMS), decoys (5)
Ammunition: None
Maintenance Points: 11

System:	*Short ( )*	*Medium ( )*	*Long ( )*	*Extreme ( )*	*Notes*
None					
Sensors:					
30 km passive EMS	(30 km)	(60 km)	(120 km)	(240 km)	DF capable
WSV goggles	40 cm	80 cm	160 cm	320 cm	
Eyeballs	100 cm	200 cm	400 cm	800 cm	
Communications:					
30,000 km laser	(30,000 km)	(60,000 km)	(120,000 km)	(240,000 km)	
30,000 km maser	(30,000 km)	(60,000 km)	(120,000 km)	(240,000 km)	
30,000 km radio	(30,000 km)	(60,000 km)	(120,000 km)	(240,000 km)	

Appendix C: Zhodani Vehicles

Zhodani Gun Sled (TL14)

Troop Quality: _____ **Morale:** _____ **Initiative:** _____
Movement: 460 low (+2, +3), 5460 high (+5)
Front Armor: 280
Side Armor: 140
Rear Armor: 112
Deck Armor: 112
Belly Armor: 140
Mass Class: VI
Explosive Damage Modifier: –6
Fire Control: Point Defense FC, ignores 5 diff mods
Stabilization: Advanced (treat cautious and rapid advance as *no order* for ROF and sequence of fire purposes)

Cargo Capacity: None
Environmental: Sealed, nonair-breathing
Electronic Warfare: EMM (+1 vs. Radar & HRT), decoys (5)
Ammunition: 100 shots for fusion gun
Maintenance Points: 44

System:	*Short ( )*	*Medium ( )*	*Long ( )*	*Extreme ( )*	*Notes*
125-Mj RF fusion gun	168 cm: 3 (335+)	336 cm: 2 (335+)	672 cm: 1 (168+)	1344 cm: 1 (34+)	F, S, EP: 18, BR: 4 cm
Sensors:

Appendix C: Zhodani Vehicles

Zhodani MRL Drop Sled (TL14)

Troop Quality: _____ **Morale:** _____ **Initiative:** _____
Movement: 500 low (+3, +4), 9660 high (+6)
Front Armor: 56
Side Armor: 28
Rear Armor: 28
Deck Armor: 28
Belly Armor: 28
Mass Class: VI
Explosive Damage Modifier: –5
Fire Control: Point Defense FC, ignore 5 diff mods
Stabilization: Advanced (treat cautious and rapid advance as *no order* for ROF and sequence of fire purposes)

Cargo Capacity: 3 remote MRL packs
Environmental: Sealed, nonair-breathing
Electronic Warfare: EMM (+1 vs. Radar & HRT), decoys (5)
Ammunition: Unlimited shots for VRF gauss gun
Maintenance Points: 22

System:	*Short ( )*	*Medium ( )*	*Long ( )*	*Extreme ( )*	*Notes*
VRF gauss gun-needle	30 cm: 7 (6)	60 cm: 6 (6)	120 cm: 5 (2)	240 cm: 4 (1)	F, S
Remote MRL Packs: See next data card, below					
Sensors:					
30 km passive EMS	(30 km)	(60 km)	(120 km)	(240 km)	DF capable
WSV goggles	40 cm	80 cm	160 cm	320 cm	
Eyeballs	100 cm	200 cm	400 cm	800 cm	
Communications:					
3 km maser	300 cm	600 cm	1200 cm	2400 cm	
300 km radio	(300 km)	(600 km)	(1200 km)	(2400 km)	

Zhodani Remote MRL Pack (TL14)

Troop Quality: _____ **Morale:** _____ **Initiative:** _____
Movement: None
Front Armor: 0
Side Armor: 0
Rear Armor: 0
Deck Armor: 0
Belly Armor: 0
Mass Class: V
Explosive Damage Modifier: –1
Fire Control: Indirect Fire FC
Stabilization: None

Cargo Capacity: None
Environmental: Sealed, nonair-breathing
Electronic Warfare: None
Ammunition: 5 shots of target designated missiles, or may be fired as single ARL salvo
Maintenance Points: 4

System:	*Short ( )*	*Medium ( )*	*Long ( )*	*Extreme ( )*	*Notes*
Target-Designated Artillery Rocket/Missiles: See Zhodani TL14 Remote MRL Packs table (page 133)					
Communications:					
300 km radio	(300 km)	(600 km)	(1200 km)	(2400 km)	

Zhodani Nuclear Damper Sled (TL14)

Troop Quality: _____ **Morale:** _____ **Initiative:** _____
Movement: 500 low (+3, +4), 10,020 high (+6)
Front Armor: 56
Side Armor: 28
Rear Armor: 28
Deck Armor: 28
Belly Armor: 28
Mass Class: VI
Explosive Damage Modifier: –5
Fire Control: Point Defense FC, ignores 5 diff mods
Stabilization: Advanced (treat cautious and rapid advance as *no order* for ROF and sequence of fire purposes)

Cargo Capacity: None
Environmental: Sealed, nonair-breathing
Electronic Warfare: EMM (+2 vs. Radar & HRT, +1 vs. Passive and Active EMS), decoys (5)
Ammunition: Unlimited shots for nuclear damper
Maintenance Points: 19

System:	*Short ( )*	*Medium ( )*	*Long ( )*	*Extreme ( )*	*Notes*
3000 km nuclear damper	(3000 km) 1	(6000 km) 1	(12,000 km) 1	(24,000 km) 1	F, S

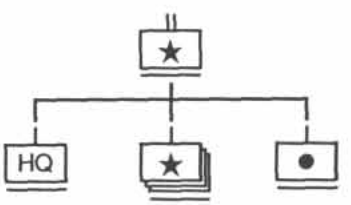
Grav Belts

Type	Movement
TL12-15 Grav Belt	120 low (+1,+2), 2520 high (+4)
TL12 Grav Rail	120 low (+1,+2), 2520 high (+4)

Appendix H: Unit Organizations

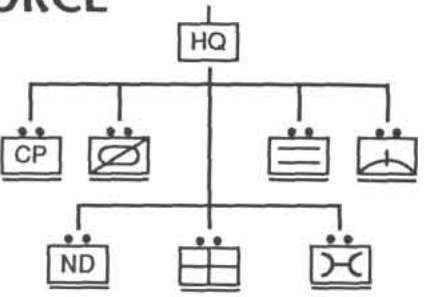
The following organizations represent military units from the pre-collapse Final Imperium, the Zhodani Consulate, the Reformation Coalition, and two worlds in the Wilds of the New Era. They are presented for use in **Striker** scenarios and as samples to assist players in the design of additional units. None of these units need be used in their entirety; in fact it is not intended for them to be, especially in the case of regiments like the Duke of Regina's Huscarles.

Rather, representative "slices" of these units can be modelled and placed on the gaming table. For example, the Branatian rifle regiment will likely be more than can be purchased, assembled, and painted by the average gaming group. However, a company or battalion-sized slice of the unit could be portrayed, for example, a rifle battalion plus a platoon of tanks and the antitank battery. These slices will often retain the same overall proportions as the whole unit, but need not in all cases. Players and referees should modify, mix, and match the following organizations to suit the needs and interests of their campaigns.



Italicized units are included for realism, but as they have no impact on play, can routinely be omitted from tabletop armies.

Imperial Marine Task Force



Imperial Marine Task Force, with:
- **Force Command Headquarters**, with:
  - **Command Post Section**, with:
    - 1 operational command stand
    - 1 Imperial Marine Command APC
    - 1 staff uplink Imperial Marine Command APC
  - **Communications Section**, with:
    - 1 staff uplink Imperial Marine Command APC
    - 1 staff radio Imperial Marine Command APC
  - **Point Defense Section**, with:
    - 1 tactical command TL15 Convertible Air Raft
    - 3 TL15 Point Defense APCs
  - **Nuclear Damper Section**, with:
    - 3 tactical command ND Director APCs
    - 4 TL15 Nuclear Damper APCs
  - **Scout Section**, with:

      - 4 self-ordering Heavy Grav Tanks
- **Artillery Battery,** with:
  - **Battery Headquarters,** with:
    - 1 operational command stand
    - 1 Imperial FDC Grav APC
  - **2 MRL Sections,** each with:
    - 1 tactical command MRL Artillery Vehicle
    - 3 MRL Artillery Vehicles
  - **Drone Missile Section,** with:
    - 1 operational command RDM Artillery Vehicle
    - 3 RDM Artillery Vehicles
- **3 Jump Troop Battalions,** each with:
  - **Battalion Headquarters,** with:
    - 1 operational command stand
    - 1 Imperial Command Grav APC
    - 1 staff uplink Imperial Command Grav APC
    - 1 staff radio Imperial Command Grav APC
  - **3 Jump Troop Companies,** each with:
    - **Command Post Section,** with:
      - 1 operational command stand
      - 1 staff uplink Imperial Command Grav APC
    - **3 Jump Troop Platoons,** each with:
      - **Platoon Headquarters,** with:
        - 1 tactical command grav belt stand
        - 1 grav belt support infantry stand
      - **3 Jump Troop Squads,** each with:
        - 1 tactical command grav belt stand
        - 2 grav belt infantry stands
- **Grav Tank Company,** with:
  - **Company Headquarters,** with:
    - 1 tactical command Heavy Command Grav Tank
    - 2 self-ordering Heavy Grav Tanks
  - **3 Grav Tank Platoons,** each with:
    - 1 tactical command Heavy Grav Tank
    - 4 self-ordering Heavy Grav Tanks
- **Artillery Platoon,** with:
  - 1 tactical command stand
  - 1 Imperial FDC Grav APC
  - 4 MRL Artillery Vehicles
- ***Support Platoon, with:***
  - *3 TL15 Utility Sleds*
  - *1 command stand*
  - *6 support stands*

Notes: All personnel stands are equipped with TL14 heavy battle dress. All infantry and single-figure command stands are also equipped with grav belts. Infantry stands are armed with TL14 4.7cm fusion rifles, TL15 portable Tac missiles, and integral TL15 5.1cm fusion rifles. Single figure command stands are also armed with TL14 4.7cm fusion rifles.

Support infantry stands are armed with TL15 portable Tac missiles and an integral TL15 5.1cm fusion rifle.

The Imperial Command Grav APC is identical to the Imperial FDC APC but without the FDC fitted.

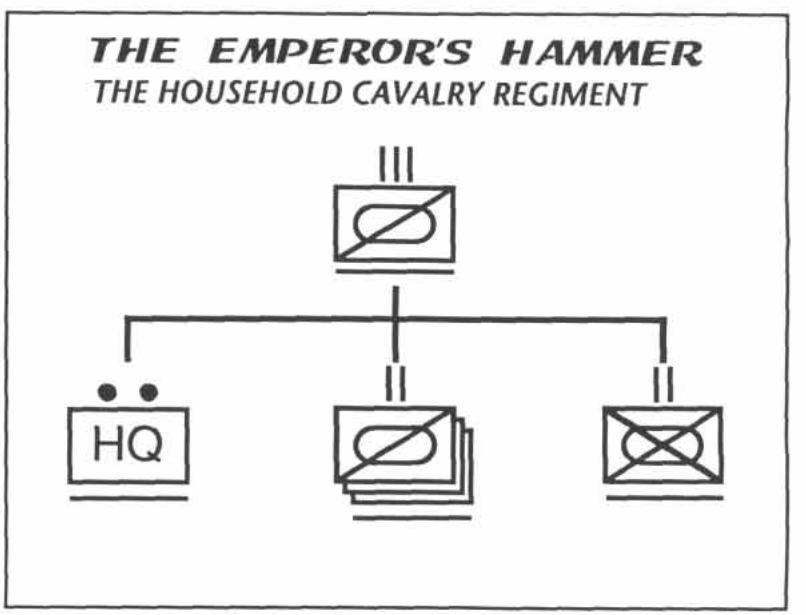
Imperial Guard Regiments

There were 11 Imperial Guard regiments which served on Capital, or as Imperial shock troops where needed. In order of seniority (dates of establishment according to the Imperial calendar are given in parentheses), these were:

The Sylean Guard (0)
The Vland Guard
The Gateway Guard
The Ilelish Guard
The Antares Guard
The Imperial Artillery (250)
The Household Cavalry (250)
The Aslan Guard (350)
The Spinward Marches Guard (550)
The Marine Guard (629)
The Solomani Guard (1050)

All but the Imperial Artillery and Household Cavalry were jump troop regiments.

Appendix H: Unit Organizations

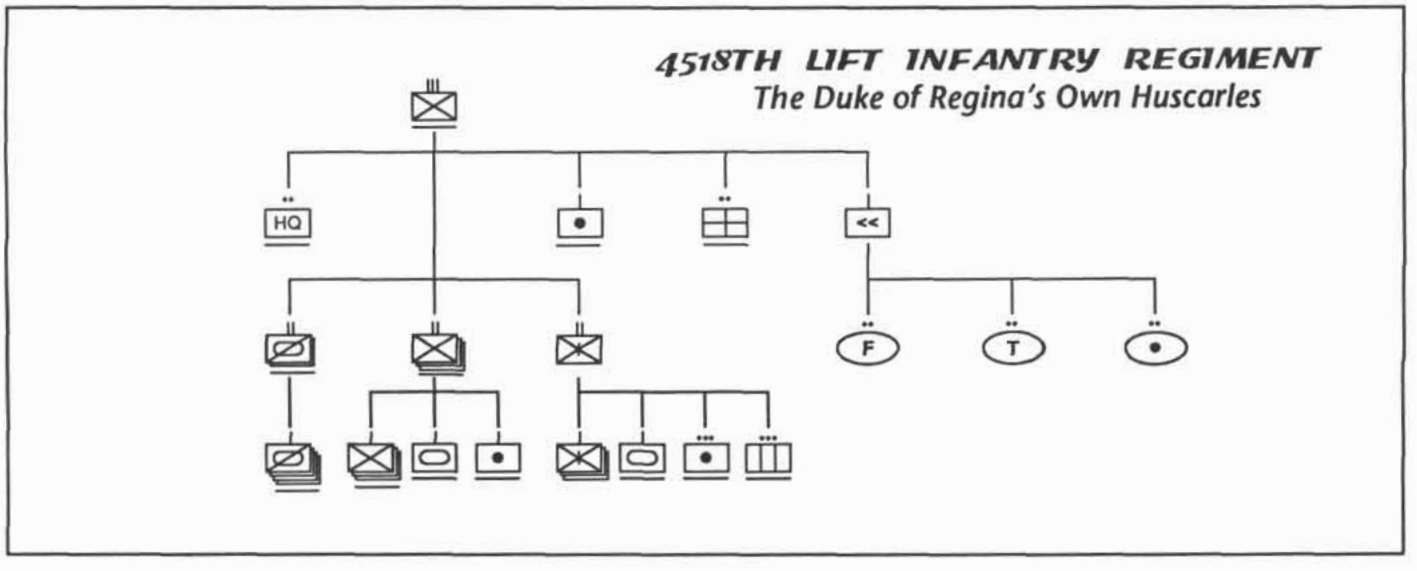


Household Cavalry Regiment: "The Emperor's Hammer"

Household Cavalry Regiment, with:
- **Regimental Headquarters and Headquarters Company**, with:
  - **Headquarters Platoon**, with:
    - **Command Post Section**, with:
      - 1 operational command stand
      - 1 Imperial Command Grav APC
      - 1 staff uplink Imperial Command Grav APC
    - **Communications Section**, with:
      - 1 staff uplink Imperial Command Grav APC
      - 1 staff radio Imperial Command Grav APC
    - **Point Defense Section**, with:
      - 1 tactical command TL15 Convertible Air Raft
      - 3 TL15 Point Defense APCs
    - **Nuclear Damper Section**, with:
      - 3 tactical command ND Director APCs
      - 4 TL15 Nuclear Damper APCs
    - **Scout Section**, with:
      - 1 tactical command TL15 Armed Air Raft
      - 4 self-ordering TL15 Armed Air Rafts
  - *Medical Platoon, with:*
    - *1 tactical command stand*
    - *1 TL15 Hospital APC*
    - *1 TL15 Utility Sled*
    - *3 TL15 Ambulance APCs*
  - *Maintenance and Support Platoon, with:*
    - *1 tactical command stand*
    - *2 TL15 Recovery Sleds*
    - *2 TL15 Utility Sleds with maintenance shops*
    - *2 TL15 Utility Sleds*
    - *1 TL15 Convertible Air Raft*
- **3 Grav Tank Battalions**, each with:
  - **Headquarters Section**, with:
    - 1 operational command Heavy Command Grav Tank
    - 2 self-ordering Heavy Grav Tanks
  - **3 Grav Tank Companies (Alpha, Beta, Gamma)**, each with:
    - **Company Headquarters**, with:
      - 1 tactical command Heavy Command Grav Tank
      - 2 self-ordering Heavy Grav Tanks
    - **3 Grav Tank Platoons**, each with:
      - 1 tactical command Heavy Grav Tank
      - 4 self-ordering Heavy Grav Tanks
  - **Fire Support Company (Delta)**, with:
    - **Company Headquarters**, with:
      - 1 operational command stand
      - 1 staff uplink Imperial Command Grav APC
    - **3 Fire Support Platoons**, each with:
      - 1 tactical command stand
      - 3 Imperial Fire Support APCs
- **Lift Infantry Battalion**, with:
  - **Battalion Headquarters**, with:
    - 1 operational command stand
    - 1 Imperial Command Grav APC
    - 2 staff uplink Imperial Command Grav APCs
    - 1 staff radio Imperial Command Grav APC
  - **3 Lift Infantry Companies**, each with:
    - **Command Post Section**, with:
      - 1 operational command stand
      - 1 staff uplink Command Grav APC
      - 1 TL15 Convertible Air Raft
    - **3 Lift Infantry Platoons**, each with:
      - 1 tactical command stand
      - 1 Imperial Command Grav APC
      - **3 Infantry Squads**, each with:
        - 1 tactical command stand
        - 2 infantry stands
        - 1 Imperial Grav APC
- **Grav Tank Company**, with:
  - **Company Headquarters**, with:
    - 1 tactical command Heavy Command Grav Tank
    - 2 self-ordering Heavy Grav Tanks
  - **3 Grav Tank Platoons**, each with:
    - 1 tactical command Heavy Grav Tank
    - 4 self-ordering Heavy Grav Tanks
- **Artillery Battery**, with:
  - **Battery Headquarters**, with:
    - 1 operational command stand
    - 1 Imperial FDC Grav APC
  - **2 MRL Sections**, each with:
    - 1 tactical command MRL Artillery Vehicle
    - 3 MRL Artillery Vehicles
  - **Drone Missile Section**, with:
    - 1 operational command RDM Artillery Vehicle
    - 3 RDM Artillery Vehicles

Notes: All personnel stands are equipped with TL14 heavy battle dress.

Infantry stands are armed with TL14 4.7cm fusion rifles, TL15 portable Tac missiles, and integral TL15 5.1cm fusion rifles. Single figure command stands are also armed with TL14 4.7cm fusion rifles.



The Imperial Command Grav APC is identical to the Imperial FDC APC but without the FDC fitted.

Appendix H: Unit Organizations

4518th Lift Infantry Regiment (The Duke of Regina's Own Huscarles), circa 1116

Lift Infantry Regiment, with:
- **Regimental Headquarters**, with:
  - 1 operational command stand
  - 1 Imperial Command Grav APC
  - 2 staff uplink Imperial Command Grav APCs
  - 1 Rampart two-seat fighter
- **Regimental Artillery Battery**, with:
  - **Headquarters**, with:
    - 1 operational command stand
    - 1 Imperial FDC Grav APC
  - **MRL Section**, with:
    - 1 tactical command MRL Artillery Vehicle
    - 3 MRL Artillery Vehicles
  - **Drone Missile Section**, with:
    - 1 tactical command RDM Artillery Vehicle
    - 4 RDM Artillery Vehicles
- ***Regimental Medical Section, with:***
  - *1 tactical command stand*
  - *4 APCs*
- **Flight Wing**, with:
  - **Wing Headquarters**, with:
    - 1 operational command Rampart two-seat fighter
    - 1 Rampart two-seat fighter
  - **Fighter Squadron**, with:
    - 10 Rampart single-seat fighters
  - ***Transport Squadron, with:***
    - *Varies with mission*
  - ***Ortillery Squadron, with:***
    - *3 System Defense Boats*
- **1st, 2nd, and 4th Lift Infantry Battalions**, each with:
  - **Battalion Headquarters**, with:
    - 1 operational command stand
    - 1 Imperial Command Grav APC
    - 2 staff uplink Imperial Command Grav APCs
    - 1 staff radio Imperial Command Grav APC
  - **3 Lift Infantry Companies (Alpha, Beta, Gamma)**, each with:
    - **Company Headquarters**, with:
      - 1 operational command stand
      - 1 Fire Support APC
      - 1 infantry stand
    - **Three Lift Infantry Platoons**, each with:
      - **Platoon Headquarters**, with:
        - 1 tactical command stand
        - 1 Fire Support APC
      - **3 Infantry Squads**, each with:
        - 1 tactical command stand
        - 2 infantry stands
        - 1 Imperial Grav APC
- **Grav Tank Company (Delta)**, with:
  - **Company Headquarters**, with:
    - 1 operational command Heavy Grav Command Tank
  - **3 Tank Platoons**, each with:
    - 1 tactical command Heavy Grav Command Tank
    - 3 self-ordering Imperial Heavy Grav Tanks
- **Artillery Battery (Epsilon)**, with:
  - **Battery Headquarters**, with:
    - 1 operational command stand
    - 1 Imperial FDC Grav APC
  - **MRL Section**, with:
    - 1 tactical command MRL Artillery Vehicle
    - 3 MRL Artillery Vehicles
  - **Drone Missile Section**, with:
    - 1 tactical command RDM Artillery Vehicle
    - 3 RDM Artillery Vehicles
- ***3rd and 5th Lift Cavalry Squadrons***, each with:
  - **Squadron Headquarters**, with:
    - 1 operational command stand
    - 1 Imperial Command Grav APC
    - 1 staff uplink Imperial Command Grav APC
    - 1 staff radio Imperial Command Grav APC
  - **4 Lift Cavalry Troops (Alpha, Beta, Gamma, Delta)**, each with:
    - **Troop Headquarters**, with:
      - 1 operational command tank
    - **3 Lift Cavalry Platoons**, each with:
      - **Headquarters and Fire Support Squad**, with:
        - 1 tactical command Fire Support APC
      - **2 Tank Squads**, each with:
        - 1 self-ordering Imperial Heavy Grav Tanks

Appendix H: Unit Organizations

Rifle Squad, with:
1 tactical command stand
2 infantry stands
1 Imperial Grav APC

6th Jump Troop Battalion, with:
Battalion Headquarters, with:
1 operational command stand
1 Imperial Command Grav APC
1 staff uplink Imperial Command Grav APC
1 staff radio Imperial Command Grav APC
3 Jump Troop Companies (Alpha, Beta, Gamma), each with:
Company Headquarters, with:
1 operational command stand
1 staff uplink Imperial Command Grav APC
3 Jump Troop Platoons, each with:
Platoon Headquarters, with:
1 tactical command stand
1 support infantry stand
3 Jump Troop Squads, each with:
1 tactical command stand
2 infantry stands
Grav Tank Company (Delta), with:
Company Headquarters, with:
1 operational command Heavy Grav Command Tank
3 Tank Platoons, each with:
1 tactical command Heavy Grav Command Tank
3 self-ordering Imperial Heavy Grav Tanks
Artillery Platoon, with:
1 tactical command stand
1 Imperial FDC Grav APC
4 MRL Artillery Vehicles
Support Platoon, with:
3 TL15 Utility Sleds
1 command stand
6 support stands

4518th Lift Infantry

Notes: All personnel stands are equipped with TL14 heavy battle dress. All infantry stands are armed with TL14 4.7cm fusion rifles, TL15 portable Tac missiles, and integral TL15 5.1cm fusion rifles. Single figure command stands are also armed with TL14 4.7cm fusion rifles. Support infantry stands are armed with TL15 portable Tac missiles and an integral TL15 5.1cm fusion rifle. The Imperial Command Grav APC is identical to the Imperial FDC APC but without the FDC fitted.

Imperial Marine Armored Cavalry Regiment

MArCav Regiment, with:
Regimental Headquarters, with:
Command Post Section, with:
1 operational command stand
1 Imperial Marine Command APC
1 staff uplink Imperial Marine Command APC
Communications Section, with:
1 staff uplink Imperial Marine Command APC
1 staff radio Imperial Marine Command APC
Point Defense Section, with:
1 tactical command TL15 Convertible Air Raft
3 TL15 Point Defense APCs
Nuclear Damper Section, with:
3 tactical command ND Director APCs
4 TL15 Nuclear Damper APCs
3 Armored Cavalry Squadrons, each with:
Squadron Headquarters and Headquarters Troop, with:
1 operational command stand
1 Imperial Marine Command APC
1 staff uplink Imperial Marine Command APC
1 staff radio Imperial Marine Command APC
1 Imperial FDC Grav APC
1 ND Director APC
1 TL15 Nuclear Damper APC
2 self-ordering Imperial Marine Support APCs
3 Armored Cavalry Troops, each with:
Troop Headquarters &Headquarters Platoon, with:
1 operational command stand
1 Imperial Marine Command APC
1 staff radio Imperial Marine Command APC
2 self-ordering Heavy Grav Tanks
3 Armored Cavalry Platoons, each with:
Tank Section, with:
2 self-ordering Heavy Grav Tanks
Rifle Squad, with:
1 tactical command stand
2 infantry stands
1 Imperial Marine Grav APC
Scout Section, with:
2 self-ordering TL15 Armed Air Rafts
Combat Support Squadron, with:
Squadron Headquarters, with:
1 operational command stand
1 Imperial Marine Command APC
1 staff uplink Imperial Marine Command APC
1 staff radio Imperial Marine Command APC
1 ND Director APC
1 TL15 Nuclear Damper APC
2 self-ordering TL15 Armed Air Rafts

Appendix H: Unit Organizations

Artillery Battery, with:
- **Battery Headquarters Section**, with:
  - 1 operational command Imperial Marine Command APC
  - 1 Imperial Marine FDC APC
  - 3 self-ordering FO TL15 Convertible Air Rafts
- **Battery Security Section**, with:
  - **Section Headquarters**, with:
    - 1 tactical command TL15 Armed Air Raft
  - **2 Marine Squads**, each with:
    - 1 tactical command stand
    - 2 infantry stands
    - 1 Imperial Marine APC
- **4 Firing Sections**, each with:
  - 1 Imperial Meson Sled

Fire Support Battery, with:
- **Battery Headquarters &Headquarters Platoon**, with:
  - 1 operational command stand
  - 1 Imperial Marine Command APC
  - 1 staff radio Imperial Marine Command APC
- **3 Firing Platoons**, each with:
  - 1 tactical command Imperial Marine Support APC
  - 3 Imperial Marine Support APCs

Combat Engineer Company, with:
- **Headquarters and Headquarters Platoon**, with:
  - 1 operational command stand
  - 1 TL15 Convertible Air Raft
- **3 Engineer Platoons**, each with:
  - **Headquarters**, with:
    - 1 tactical command stand
    - 1 Imperial Marine Command APC
    - 2 Imperial Engineer Vehicles
  - **3 Engineer Squads**, each with:
    - 1 tactical command stand
    - 2 engineer stands
    - 1 Imperial Marine Grav APC

Medical Platoon, with:
- *1 tactical command stand*
- *1 TL15 Hospital APC*
- *1 TL15 Utility Sled*
- *3 TL15 Ambulance APCs*

Maintenance and Support Platoon, with:
- *1 tactical command stand*
- *2 TL15 Recovery Sleds*
- *2 TL15 Utility Sleds with maintenance shops*
- *2 TL15 Utility Sleds*
- *1 TL15 Convertible Air Raft*

Mess and Transport Platoon, with:
- *1 tactical command stand*
- *1 TL15 Utility Sled*
- *4 TL15 Utility Sleds with field kitchens*
- *1 TL15 Convertible Air Raft*

Notes: All infantry and single-figure command stands are equipped with TL14 light battle dress. All infantry stands are armed with TL14 4.7cm fusion rifles, TL15 portable Tac missiles and integral TL15 5.1cm fusion rifles. Single-figure command stands are also armed with TL14 4.7cm fusion rifles.

Engineer stands and their command stands are equipped with TL14 heavy battle dress and armed with 4mm gauss rifles and integral TL15 5.1 cm fusion rifles.

Branatian Motorized Rifle Regiment

Rifle Regiment, with:
- **Regimental Headquarters**, with:
  - **Command Post Platoon**, with:
    - 1 operational command stand
    - 1 TL6 Light Truck
    - 2 staff radio TL6 Command Tracks
- **Regimental Direct Support Artillery Battery**, with:
  - **Battery Headquarters**, with:
    - 1 tactical command TL6 FDC Heavy Truck
    - 3 self-ordering FO stands
    - 3 TL6 Light Trucks
  - **3 Firing Sections**, each with:
    - 3 TL6 SP Howitzer-guns
    - 3 ammunition TL6 Heavy Trucks
- **Tank Company**, with:
  - **Company Headquarters**, with:
    - 1 tactical command TL6 Medium Tank
  - **3 Tank Platoons**, each with:
    - 4 TL6 Medium Tanks
- **Antitank Artillery Battery**, with:
  - **Battery Headquarters**, with:
    - 1 tactical command TL6 Tank Destroyer
  - **3 Tank Destroyer Sections**, each with:
    - 3 TL6 Tank Destroyers
- **3 Rifle Battalions**, each with:
  - **Headquarters and Headquarters Platoon**, with:
    - **Battalion Headquarters**, with:
      - 1 operational command stand
      - 1 staff radio TL6 Command Track
      - 1 TL6 Light Truck
    - **Machinegun Section**, with:
      - 4 HMG stands
      - 2 TL6 Medium Trucks
    - **Mortar Section**, with:
      - 4 TL6 10cmL15 mortar stands
      - 4 TL6 Medium Trucks
      - 1 self-ordering FO stand
      - 1 light truck
  - **Transportation Company**, with:
    - **Company Headquarters**, with:
      - 1 tactical command TL6 Light Truck
    - **4 Truck Platoons**, each with:
      - 11 TL6 Medium Trucks
  - **4 Rifle Companies**, each with:
    - **Headquarters and Headquarters Platoon**, with:
      - **Company Headquarters Section**, with:
        - 1 command infantry stand
        - 1 TL6 Light Truck
      - **Weapons Section**, with:
        - 2 TL6 8cmL10 mortar stands
        - 2 TL6 Light Trucks
        - 2 LMG stands
    - **3 Rifle Platoons**, each with:
      - **Platoon Headquarters**, with:
        - 1 LMG stand
      - **3 Rifle Squads**, each with:
        - 1 support infantry stand
        - 2 infantry stands

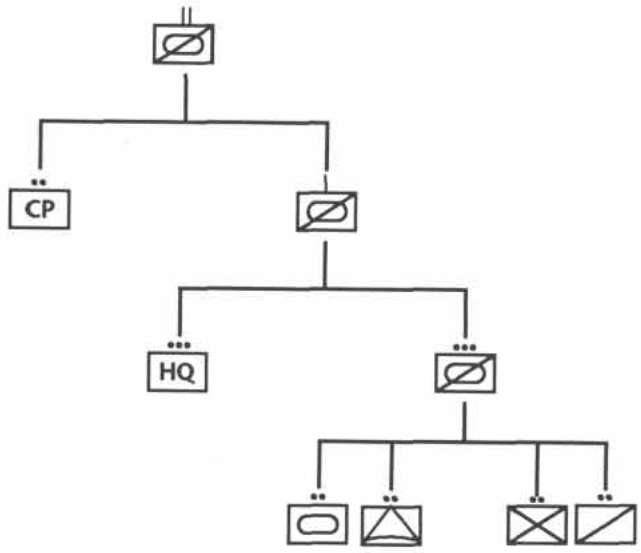
Notes: Infantry stands are equipped with TL5 helmets and TL6 7mm autorifles (firing ball ammunition) plus TL5 rifle grenades and TL6 hand grenades. Command infantry and support infantry stands have integral TL6 ATRLs. LMG stands are equipped with tripod-mounted TL6 7mm LMGs, and HMG stands are equipped with TL6 13mm HMGs. The TL6 FDC has a range of 25 km.

Appendix H: Unit Organizations

Kidan Armored Cavalry Battalion

Armored Cavalry Battalion, with:
- **Headquarters**, with:
  - **Command Post Section**, with:
    - 1 operational command stand
    - 1 TL8 Voltigeur APC
    - 1 staff radio Voltigeur APC
- **3 Armored Cavalry Companies**, each with:
  - **Headquarters and Headquarters Platoon**, with:
    - 1 operational command stand
    - 1 staff radio Voltigeur APC
    - 1 Range Truck
    - 2 TL8 Voltigeur APCs with TL8 8cmL10 mortars
    - 2 TL8 Lancer Missile Carriers
  - **3 Armored Cavalry Platoons**, each with:
    - **Headquarters Section**, with:
      - 1 tactical command TL8 Prairie Fire Fast Tank
    - **Tank Squad**, with:
      - 2 TL8 Prairie Fire Fast Tanks
    - **Direct Fire Squad**, with:
      - 2 TL8 Lancer Missile Carriers
    - **Rifle Squad**, with:
      - 4 infantry stands
      - 1 MG stand
      - 1 ATRL stand
      - 1 TL8 Voltigeur APC
    - **Scout Squad**, with:
      - 4 self-ordering Range Trucks with 5mm Rotary MGs

Notes: All personnel stands are equipped with TL8 ballistic weave helmets and body suits. Infantry stands are armed with TL7 9mm rifles firing TL8 DS ammunition, with hand grenades, TL8 RAM grenades and integral TL8 ATRLs.



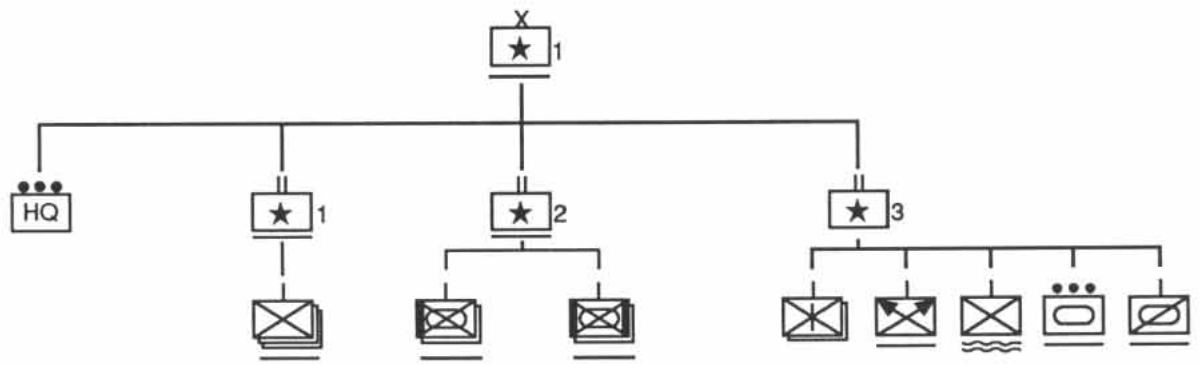
MG stand is equipped with TL8 7mm rotary gun, and ATRL stand is equipped with TL8 ATRLs.

1st Marine Brigade, RCMC

Marine Brigade, with:
- **Brigade Headquarters**, with:
  - **Command Post Platoon**, with:
    - 1 operational command stand
    - 1 TL12 Convertible Air Raft
    - 2 staff uplink TL11 G-Carriers
- **1st Marine Battalion**, with:
  - **Headquarters and Headquarters Company**, with:
    - **Battalion Headquarters**, with:
      - 1 operational command stand
      - 1 staff radio TL11 G-Carrier
      - 1 TL12 Convertible Air Raft
  - **3 Light Lift Companies**, each with:
    - **Headquarters and Headquarters Platoon**, with:
      - **Company Headquarters Section**, with:
        - 1 operational command grav belt stand
        - 1 staff radio TL11 G-Carrier
        - 1 TL12 Convertible Air Raft
      - **Fire Support Section**, with:
        - 1 tactical command TL12 Convertible Air Raft with TL9 13mm HMG
        - 1 TL12 Convertible Air Raft with TL9 13mm HMG
        - 2 TL12 Convertible Air Rafts with TL12 8cmL10 mortars
    - **3 Line Platoons**, each with:
      - **Platoon Headquarters**, with:
        - 1 tactical command grav belt stand
        - 1 ARL stand
        - 1 SSL stand
        - 2 TL12 Convertible Air Rafts
      - **3 Rifle Squads**, each with:
        - 1 command grav belt infantry stand
        - 2 grav belt infantry stands
        - 3 TL12 Convertible Air Rafts
- **2d Marine Battalion**, with:
  - **Headquarters and Headquarters Company**, with:
    - **Battalion Headquarters**, with:
      - 1 operational command stand

KIDAN ARMORED CAVALRY BATTALION

Apparently the Kidan military tradition does not call for using the traditional terms "squadron" and "troop" for cavalry units.



Appendix H: Unit Organizations

1 staff radio TL11 G-Carrier
1 TL12 Convertible Air Raft
2 Medium Companies, each with:
Headquarters and Headquarters Platoon, with:
Company Headquarters Section, with:
1 operational command stand
1 staff radio TL11 G-Carrier
1 TL12 Convertible Air Raft
Fire Support Section, with:
1 tactical command TL13 Pyrrhus Support Sled
1 TL13 Pyrrhus Support Sled
2 TL12 Convertible Air Rafts with TL12 8cmL10 mortars
3 Line Platoons, each with:
Platoon Headquarters, with:
1 tactical command stand
1 ARL stand
1 SSL stand
2 TL12 Convertible Air Rafts
3 Rifle Squads, each with:
1 command infantry stand
3 infantry stands
1 TL9 Grav APC
2 Heavy Companies, each with:
Headquarters and Headquarters Platoon, with:
Company Headquarters Section, with:
1 operational command stand
1 staff radio TL11 G-Carrier
Fire Support Section, with:
1 tactical command TL14 Intrepid/125 Grav Tank
1 TL14 Intrepid/125 Grav Tank
2 TL12 Convertible Air Rafts with TL12 8cmL10 mortars
3 Line Platoons, each with:
Platoon Headquarters, with:
1 tactical command stand
1 TL11 Tac missile stand
1 Plasma stand
2 TL12 Convertible Air Rafts
3 Heavy Rifle Squads, each with:
1 command heavy infantry stand
3 heavy infantry stands
1 TL9 Grav APC
3d Marine Battalion, with:
Headquarters and Headquarters Company, with:
Battalion Headquarters, with:
1 operational command stand
1 staff radio TL11 G-Carrier
1 TL12 Convertible Air Raft
2 Drop Companies, each with:
1 operational command stand
1 SSL stand
1 TL11 Tac missile stand
1 Plasma stand
3 Drop Platoons, each with:
1 tactical command stand
3 Drop Squads, each with:
1 tactical command infantry stand
2 infantry stnads
1 Transport Platoon, with:
1 tactical command stand
9 TL9 Grav APCs *or*
9 TL12 Fury Assault Landers
1 Special Operations Group, with:
1 operational command grav belt stand
1 TL12 Convertible Air Raft
Insertion Section, with:
1 tactical command grav belt stand
3 Astrin Grav APCs
3 TL12 Convertible Air Rafts
3 Fury Assault Landers
Tactical Section, with:
1 tactical command stand
3 LSW stands
6 self-ordering grav belt Sniper stands (single figure)
3 self-ordering grav belt FO stands
3 self-ordering grav belt sensor stands
6 self-ordering grav belt infantry stands

1ST MARINE BRIGADE, REFORMATION COALITION MARINE CORPS

"Semper Out Front, Baby"

Appendix H: Unit Organizations

1 Aquatic Company, with:
Company Headquarters, with:
1 Schalli operational command stand
2 Schalli weapons stands
2 self-ordering Schalli infiltration stands
3 Aquatic Platoons, with:
1 Schalli tactical command stand
2 Wet Squads, each with:
1 Schalli command infantry stand
2 Schalli infantry stands
Powered Squad, with:
1 Schalli command powered infantry stand
2 Schalli powered infantry stands

Armored Platoon, with:
1 tactical command TL14 Intrepid/120 Grav Tank
2 TL14 Intrepid/120 Grav Tanks
2 TL14 Intrepid/125 Grav Tanks

Speeder Troop, with:
Troop Headquarters, with:
1 operational command Mongoose Attack Speeder
1 staff radio TL11 G-Carrier
Heavy Platoon, with:
1 tactical command Mongoose Attack Speeder
2 self-ordering Mongoose Attack Speeders
Light Platoon, with:
1 tactical command Ferret Attack Speeder
2 self-ordering Ferret Attack Speeders

Notes: This unit does not deploy tactically. Rather, elements of squad, platoon or company size are detached for specific operations. The three battalions are specialized by mission: 1st Battalion for light lift infantry, 2nd Battalion for protected (battle dress) infantry, and 3rd Battalion for special missions, including specialized vehicles.

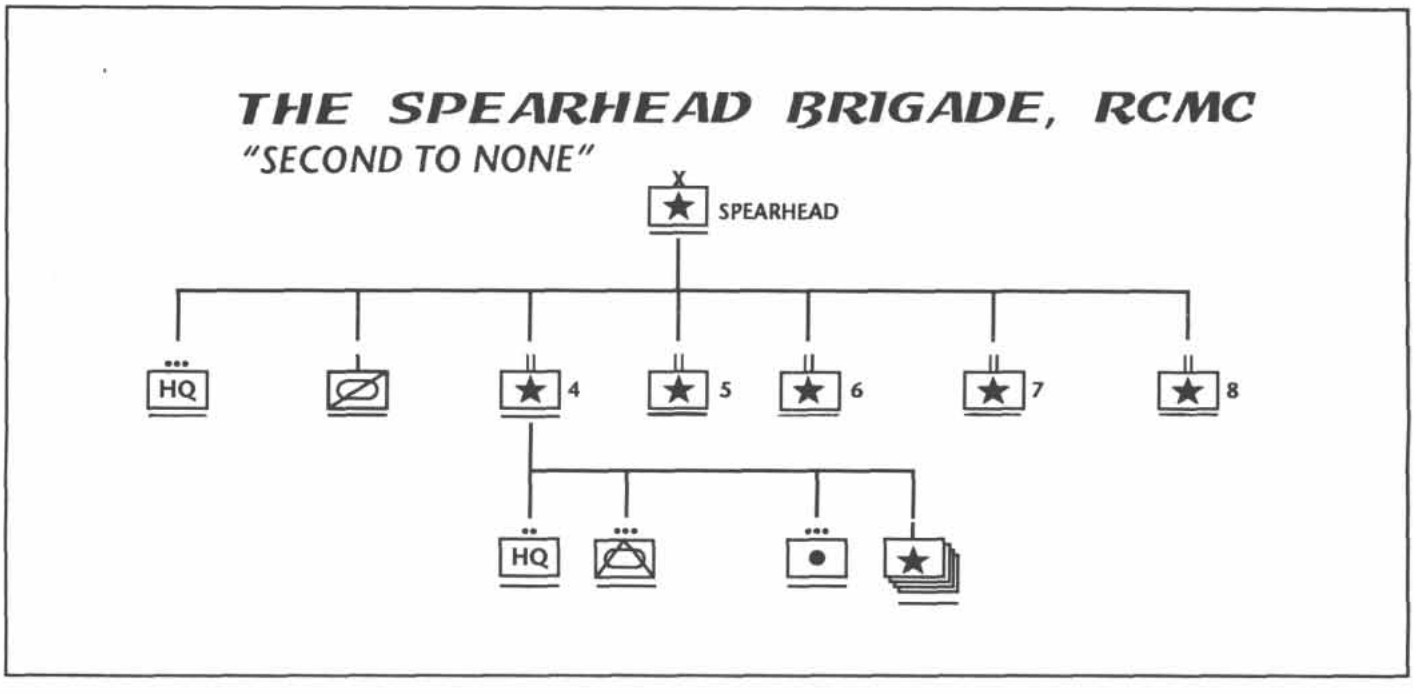
1st Battalion: All grav belt stands are equipped with grav belts and TL9 combat environment suits. All single-figure command stands are armed with TL13 personal defense lasers, while infantry stands are equipped with TL13 4cm CLC laser rifles, TL9 RAM grenades and hand grenades.

ARL and SSL stands are equipped with TL13 personal defense lasers as secondary weapons.

2nd Battalion: Medium infantry stands are equipped with TL12 Reformation Coalition Light Battle Dress, and heavy infantry stands are equipped with TL12 Reformation Coalition Heavy Battle Dress.

Medium infantry stands are armed with TL10 7mm ACRs, TL9 RAM grenades and hand grenades, with an integral 4mm gauss SAW. Command medium infantry stands have an integral ARL in place of the SAW.

Heavy infantry stands are armed with TL12 4.3cm plasma rifles and disposable TL9 Nail Tac missiles with integral ARLs. Command heavy infantry stands have an integral TL14 4.7cm fusion rifle. Tac missile stands are armed with TL11 manportable Tac missiles; plasma stands are armed with 10cm plasma bazookas.



All personnel stands are drop-trained. When dropped into combat, they enter without their vehicles, but each stand additionally carries four shots of TL9 Lyrebird Tac missiles into combat with it (each single-figure stand carries one shot of Lyrebirds).

3rd Battalion: All personnel stands in the drop companies are equipped with TL12 Reformation Coalition Light Battle Dress. They are armed with TL10 7mm ACRs, TL9 RAM grenades, hand grenades, and integral 2cm LAGs. Command Infantry Stands are armed with integral ARLs.

Tac missile stands are armed with TL11 manportable Tac missiles; plasma stands are armed with 10cm plasma bazookas.

All personnel stands in the drop companies are drop-trained. When dropped into combat, they enter without their vehicles, but each stand additionally carries four shots of TL9 Lyrebird Tac missiles into combat with it (each single-figure stand carries one shot of Lyrebirds).

Personnel stands in the Special Operations Group are equipped with TL9 combat environment suits. Sniper stands are equipped with TL12 grav belts and WSV goggles (40cm) and are armed with TL6 13mm sniper rifles. FO stands are equipped with grav belts, WSV goggles, 3km laser designators, 30km radios and TL13 personal defense lasers. Sensor stands are equipped with grav belts, 3km passive EMS sensors, 3km maser communicators, and TL13 personal defense lasers. Grav belt infantry stands are equipped with grav belts, WSV goggles (40cm), 4cm CLC laser rifles and TL9 RAM grenades.

Appendix H: Unit Organizations

(2d) "Spearhead" Marine Brigade, Reformation Coalition Marine Corps

Marine Brigade, with:
- **Brigade Headquarters**, with:
  - **Command Post Platoon**, with:
    - 1 operational command stand
    - 1 TL9 Grav APC
    - 2 staff uplink TL9 Grav Sleds
- **Brigade Scout Troop**, with:
  - **Troop Headquarters**, with:
    - 1 operational command Mongoose Attack Speeder
    - 1 staff radio TL9 Grav Sled
  - **3 Cavalry Platoons**, each with:
    - 1 tactical command Mongoose Attack Speeder
    - 2 self-ordering Mongoose Attack Speeders
    - 2 self-ordering Ferret Attack Speeders

The Spearhead Brigade

Although part of the RCMC, the Spearhead Brigade is made up entirely of Oriflammen personnel, drawn from the ranks of the five Oriflammen Marine divisions. The vehicles of the brigade are marked not with the RC man-wheel, but rather the Oriflammen Marine Corps Insignia. This insignia consists of a black lightning bolt, symbolizing stealth, speed and violence, horizontally bisecting a circle. The upper half of the circle is blue, symbolizing the cold of space, from whence the unit strikes, while the lower half is red, representing the heat of ground combat into which the unit is deployed.

The vehicles of the unit are painted with shark's mouth motifs, and are given suitably toothy names, such as "Tiger Shark," "Dragon Breath," etc. Vehicles are also given three-digit tactical codes within each battalion. The first digit is the number of the company in the battalion (with the headquarters company being 0 and the line companies being 1-4); the second digit is the platoon number within the company (with the tank platoon being 0, the headquarters platoon being 1, and the rifle platoons being 2-4); and the third digit is the vehicle number within the platoon.

Although only authorized a strength of three Intrepids per tank platoon, several of the brigade's platoons boast unauthorized levels of four grav tanks, in keeping with the long-standing Oriflammen doctrine of firepower superiority.

Although the Spearhead's battalions are numbered 4 through 8 as compared to 1 to 3 in the RCMC 1st Marine Brigade, no member of the brigade ever refers to the brigade as anything other than "The Spearhead Brigade." The unit's motto is "Second to None."

4th, 5th, 6th, 7th, and 8th Marine Battalions, each with:
- **Headquarters and Headquarters Company**, with:
  - **Battalion Headquarters**, with:
    - 1 operational command stand
    - 1 staff radio TL9 Grav Sled
    - 1 TL12 Convertible Air Raft
  - **Tank Destroyer Platoon**, with:
    - 1 tactical command TL14 Intrepid/120 Grav Tank
    - 3 TL14 Intrepid/120 Grav Tanks
  - **Indirect Fire Platoon**, with:
    - 1 tactical command stand
    - 1 FDC TL9 Grav Sled
    - 1 TL12 Convertible Air Raft
    - 4 TL12 Convertible Air Rafts with TL12 8cmL10 mortars
    - 2 self-ordering FO TL12 Convertible Air Rafts
- **4 Line Companies**, each with:
  - **Headquarters and Headquarters Platoon**, with:
    - **Company Headquarters Section**, with:
      - 1 operational command stand
      - 1 staff radio TL9 Grav Sled
      - 1 TL12 Convertible Air Raft
    - **Fire Support Section**, with:
      - 1 tactical command TL13 Pyrrhus Support Sled
      - 1 TL13 Pyrrhus Support Sled
      - 2 TL12 Convertible Air Rafts w/TL12 8cmL10 mortars
  - **Tank Platoon**, with:
    - 1 tactical command TL14 Intrepid/125 Grav Tank
    - 2 or 3 TL14 Intrepid/125 Grav Tanks
  - **3 Rifle Platoons**, each with:
    - **Platoon Headquarters**, with:
      - 1 tactical command stand
      - 1 TL12 Convertible Air Raft with ARL
      - 1 TL12 Convertible Air Raft with SSL
    - **2 Rifle Squads**, each with:
      - 1 command infantry stand
      - 3 infantry stands
      - 1 TL9 Grav APC
    - **1 Heavy Rifle Squad**, with:
      - 1 command heavy infantry stand
      - 3 heavy infantry stands
      - 1 TL9 Assault Sled

Notes: Heavy infantry stands are equipped with TL12 Reformation Coalition Heavy Battle Dress. All other personnel stands are equipped with TL12 Reformation Coalition Light Battle Dress.

Heavy infantry stands are armed with 4mm gauss rifles, TL9 RAM rifle grenades and disposable TL9 Nail Tac missiles. Each heavy infantry stand has an integral 4mm gauss SAW, while each command heavy infantry stand has an integral TL12 4.3cm plasma rifle.

Normal (nonheavy) infantry stands are armed with TL10 7mm ACRs, TL9 RAM rifle grenades and TL9 hand grenades, and an integral 2.5cm low-velocity grenade launcher. Command infantry stands have integral 10cm plasma bazookas in place of the GLs.

All personnel stands are drop-trained. When dropped into combat, they enter without their vehicles, but each stand additionally carries four shots of TL9 Lyrebird Tac missiles into combat with it (each single-figure stand carries one shot of Lyrebirds).

TL9 FDCs have a range of 40 km.

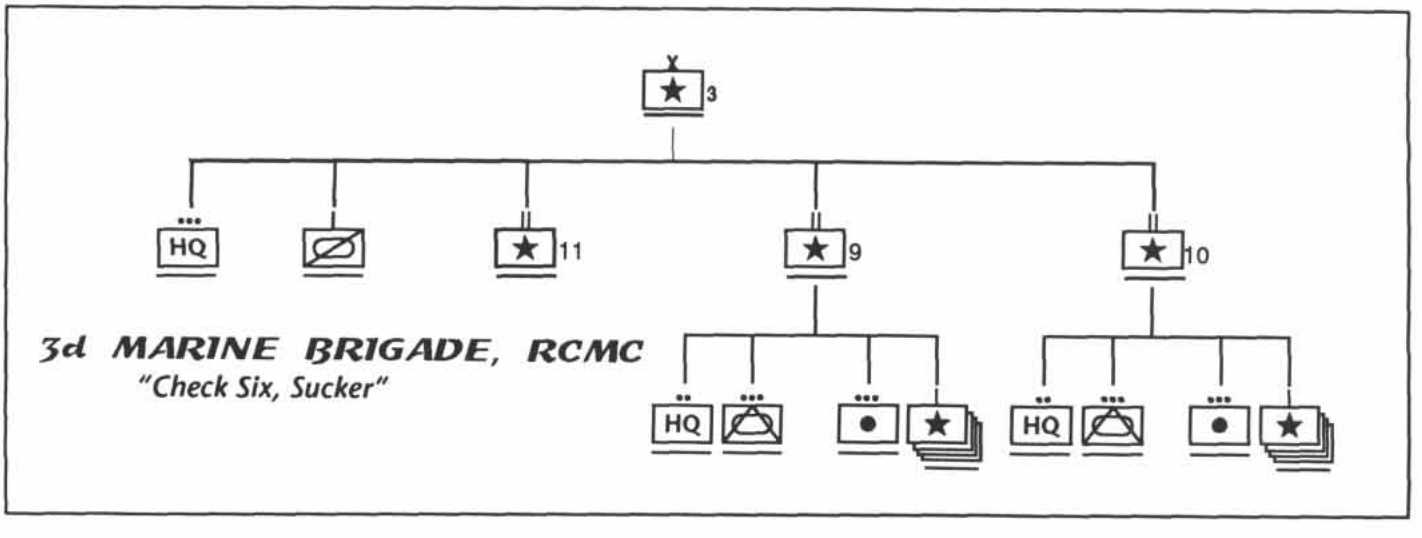
Appendix H: Unit Organizations

3d Marine Brigade, RCMC

Marine Brigade, with:
- **Brigade Headquarters**, with:
  - **Command Post Platoon**, with:
    - 1 operational command stand
    - 1 TL12 Convertible Air Raft
    - 2 staff uplink TL11 G-Carriers
- **Brigade Scout Troop**, with:
  - **Troop Headquarters**, with:
    - 1 operational command Mongoose Attack Speeder
    - 1 staff radio TL11 G-Carrier
  - **3 Cavalry Platoons**, each with:
    - 1 tactical command Mongoose Attack Speeder
    - 2 self-ordering Mongoose Attack Speeders
    - 2 self-ordering Ferret Attack Speeders
- ***11th Marine Battalion (Training Cadre)**, with:*
  - *Training unit only, no tactical units*
- **9th and 10th Marine Battalions**, each with:
  - **Headquarters and Headquarters Company**, with:
    - **Battalion Headquarters**, with:
      - 1 operational command stand
      - 1 staff radio TL11 G-Carrier
      - 1 TL12 Convertible Air Raft
    - **Tank Destroyer Platoon**, with:
      - 1 tactical command TL14 Intrepid/120 Grav Tank
      - 3 TL14 Intrepid/120 Grav Tanks
    - **Indirect Fire Platoon**, with:
      - 1 tactical command stand
      - 1 FDC TL11 G-Carrier
      - 1 TL12 Convertible Air Raft
      - 4 TL12 Convertible Air Rafts with TL12 8cmL10 mortars
      - 2 self-ordering FO TL12 Convertible Air Rafts
  - **4 Line Companies**, each with:
    - **Headquarters and Headquarters Platoon**, with:
      - **Company Headquarters Section**, with:
        - 1 operational command stand
        - 1 staff radio TL11 G-Carrier
        - 1 TL12 Convertible Air Raft
      - **Fire Support Section**, with:
        - 1 tactical command TL13 Pyrrhus Support Sled
        - 1 TL13 Pyrrhus Support Sled
        - 2 TL12 Convertible Air Rafts w/TL12 8cmL10 mortars
    - **Tank Platoon**, with:
      - 1 tactical command TL14 Intrepid/125 Grav Tank
      - 2 TL14 Intrepid/125 Grav Tanks
    - **3 Line Platoons**, each with:
      - **Platoon Headquarters**, with:
        - 1 tactical command stand
        - 1 TL12 Convertible Air Raft with ARL
        - 1 TL12 Convertible Air Raft with SSL
      - **2 Rifle Squads**, each with:
        - 1 command infantry stand
        - 3 infantry stands
        - 1 TL9 Grav APC
      - **1 Heavy Rifle Squad**, with:
        - 1 command heavy infantry stand
        - 3 heavy infantry stands
        - 1 TL9 Grav APC

Notes: Heavy infantry stands are equipped with TL12 Reformation Coalition Heavy Battle Dress. All other personnel stands are equipped with TL12 Reformation Coalition Light Battle Dress.

Heavy infantry stands are armed with 4mm Gauss Rifles, TL9 RAM rifle grenades and disposable TL9 Nail Tac missiles. Each heavy infantry stand has an integral 4mm gauss SAW, while each command heavy infantry stand has an integral TL12 4.3cm plasma rifle.



Normal (nonheavy) infantry stands are differently armed depending upon their battalion. Infantry stands of the 9th Marine Battalion are armed with the TL10 7mm ACR with hand grenades, TL9 RAM grenades and integral 2.5cm low-velocity grenade launchers.

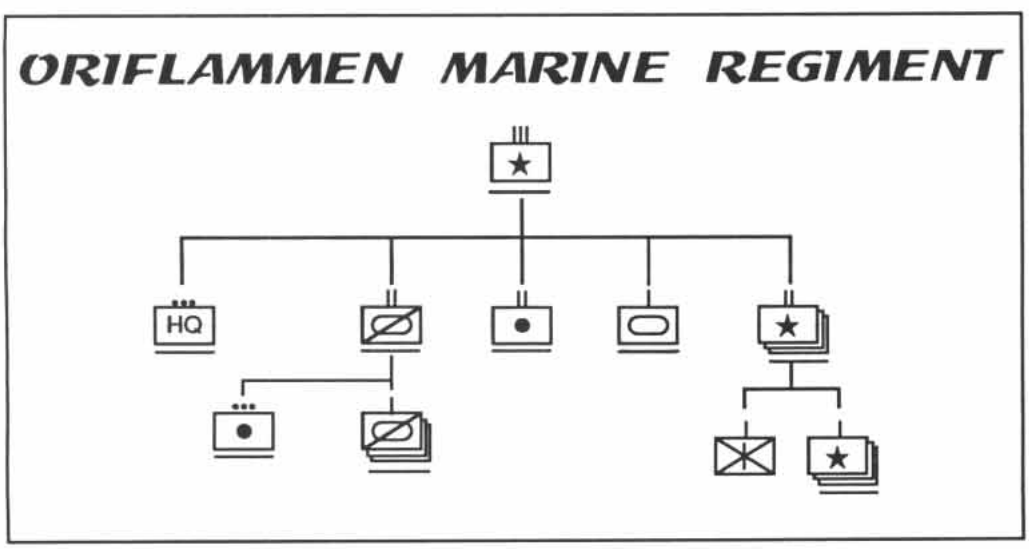
Infantry stands of the 10th Marine Battalion are armed with the TL10 7mm CMWS rifle and hand grenades, TL9 RAM grenades and integral 7mm CMWS SAWs.

Command infantry stands in the 9th Battalion have integral TL9 Nail Tac missiles, while command infantry stands in the 10th battalion have integral 10mm plasma bazookas.

All separate command stands in the brigade are armed with the TL10 7mm CMWS carbine.

All personnel stands are drop-trained. When dropped into combat, they enter without their vehicles, but each stand additionally carries four shots of TL9 Lyrebird Tac missiles into combat with it (each single-figure stand carries one shot of Lyrebirds).

Appendix H: Unit Organizations



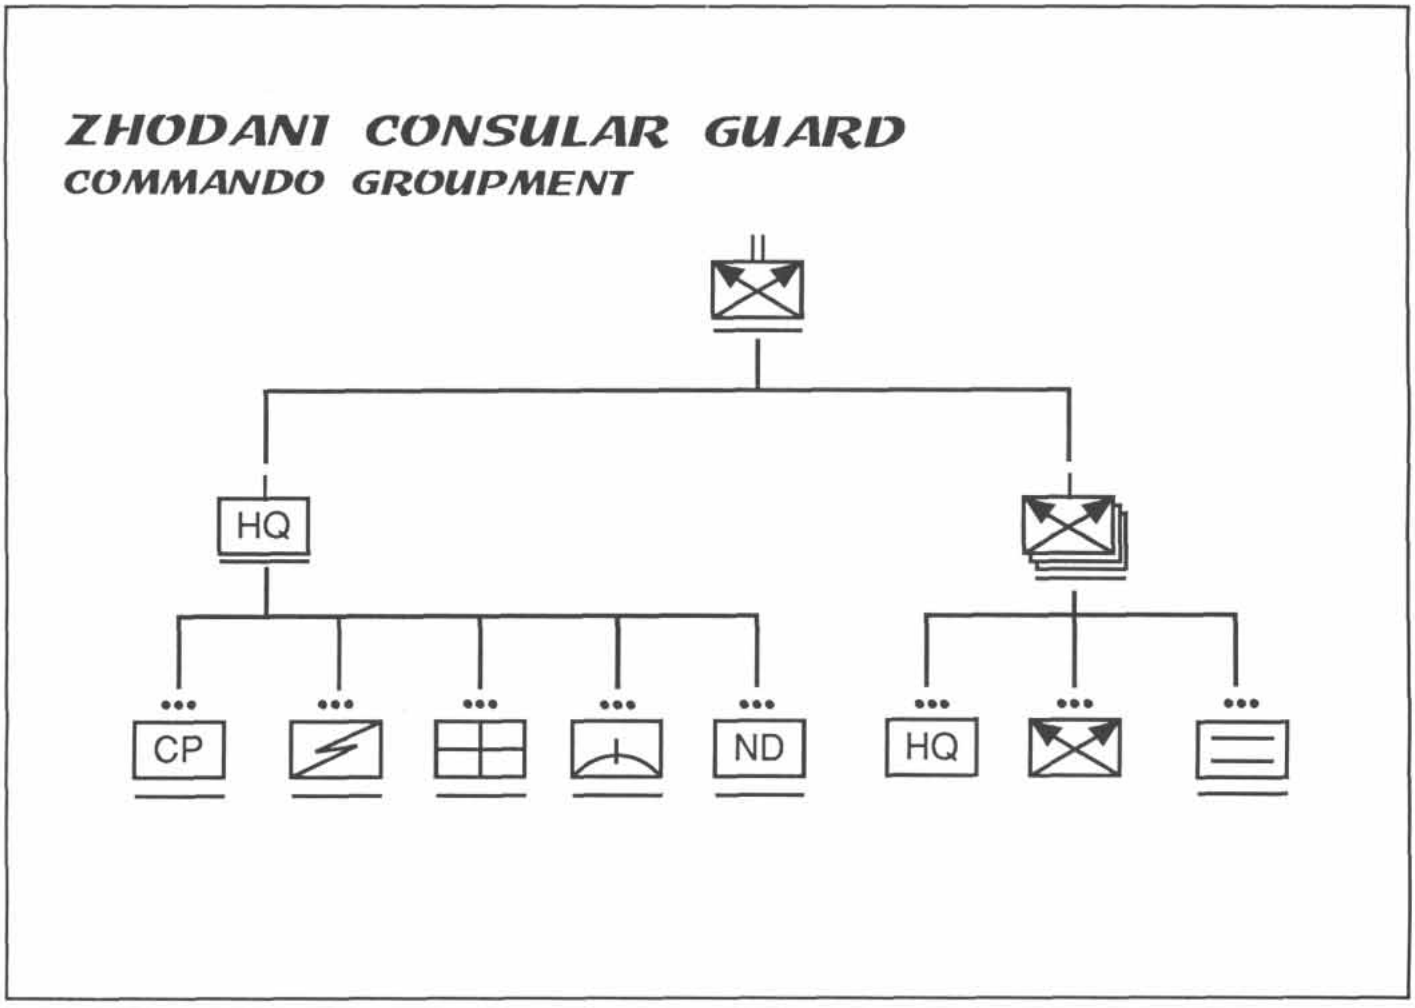
Oriflamme Marine Regiment

Marine Regiment, with:
- **Regimental Headquarters**, with:
  - **Command Post Platoon**, with:
    - 1 operational command stand
    - 1 TL9 Grav APC
    - 2 staff uplink TL9 Grav APC
- **Regimental Cavalry Squadron**, with:
  - **Squadron Headquarters**, with:
    - 1 operational command TL9 Grav Tank
    - 1 staff uplink TL9 Grav APC
  - **Rocket Platoon**, with:
    - 1 operational command stand
    - 1 FDC TL9 Grav APC
    - 3 self-ordering FO TL9 Cav Vehicles
    - 3 TL9 MRL Sleds
    - 3 ammunition TL9 Grav Sleds
  - **3 Cavalry Troops**, each with:
    - **Troop Headquarters**, with:
      - 1 operational command TL9 Grav Tank
      - 1 staff radio TL9 Grav APC
    - **3 Cavalry Platoons**, each with:
      - 1 tactical command TL9 Grav Tank
      - 1 self-ordering TL9 Grav Tank
      - 2 self-ordering TL9 Cav Vehicles
      - 2 self-ordering TL9 Cav Missile Vehicles
- **Regimental Rocket Battery**, with:
  - **Battery Headquarters**, with:
    - 1 operational command stand
    - 1 TL9 Light U Sled
    - 1 FDC TL9 Grav APC
    - 3 self-ordering FO TL9 Cav Vehicles
  - **3 Firing Sections**, each with:
    - 1 tactical command TL9 MRL Sled
    - 2 TL9 MRL Sleds
    - 3 ammunition TL9 Grav Sleds
- **Tank Company**, with:
  - **Company Headquarters**, with:
    - 1 operational command TL9 Grav Tank
    - 1 staff radio TL9 Grav APC
  - **3 Tank Platoons**, each with:
    - 1 tactical command TL9 Grav Tank
    - 3 TL9 Grav Tanks
  - **Tank Destroyer Platoon**, with:
    - 1 tactical command TL9 Grav Tank Destroyer
    - 3 TL9 Grav Tank Destroyers
- **3 Marine Battalions**, each with:
  - **Headquarters and Headquarters Company**, with:
    - **Battalion Headquarters**, with:
      - 1 operational command stand
      - 1 staff radio TL9 Grav APC
      - 1 TL9 Light U Sled
    - **Direct Fire Platoon**, with:
      - 1 command infantry stand
      - 1 TL9 Light U Sled
      - 4 HMG stands
      - 4 TL9 Light U Sleds
    - **Indirect Fire Platoon**, with:
      - 1 command infantry stand
      - 1 TL9 Light U Sled
      - 4 TL9 12cmL10 mortar stands
      - 4 TL9 Light U Sleds
      - 2 self-ordering TL9 Cav Vehicles
  - **4 Line Companies**, each with:
    - **Headquarters and Headquarters Platoon**, with:
      - **Company Headquarters Section**, with:
        - 1 operational command stand
        - 1 staff radio TL9 Grav APC
        - 1 TL9 Light U Sled
      - **Weapons Section**, with:
        - 2 TL9 8cmL10 mortar stands
        - 2 LMG stands
        - 4 Nail stands
        - 8 TL9 Light U Sleds
    - **3 Line Platoons**, each with:
      - **Platoon Headquarters**, with:
        - 1 command infantry stand
        - 1 Nail stand
        - 2 TL9 Light U Sleds
      - **3 Rifle Squads**, each with:
        - 1 support infantry stand
        - 3 infantry stands
        - 1 TL9 Assault APC

Notes: All personnel stands are equipped with TL12 Reformation Coalition Light Battle Dress. Infantry stands are armed with TL10 7mm ACRs, TL9 RAM rifle grenades and TL9 hand grenades, and an integral 2cm LAG. Support infantry and command infantry stands have integral 10cm plasma bazookas in place of the LAGs.

LMG stands are armed with TL9 7.5mm MMGs, and HMG stands are armed with TL9 15mm HMGs. Nail stands are armed with TL9 Nail Tac missiles. Mortar, LMG, HMG and Nail stands all have TL9 7.6mm SMGs as secondary weapons.

All personnel stands are drop-trained. When dropped into combat, they enter without their vehicles, but each stand additionally carries four shots of TL9 Lyrebird Tac missiles into combat with it (each single-figure stand carries one shot of Lyrebirds).



Appendix H: Unit Organizations

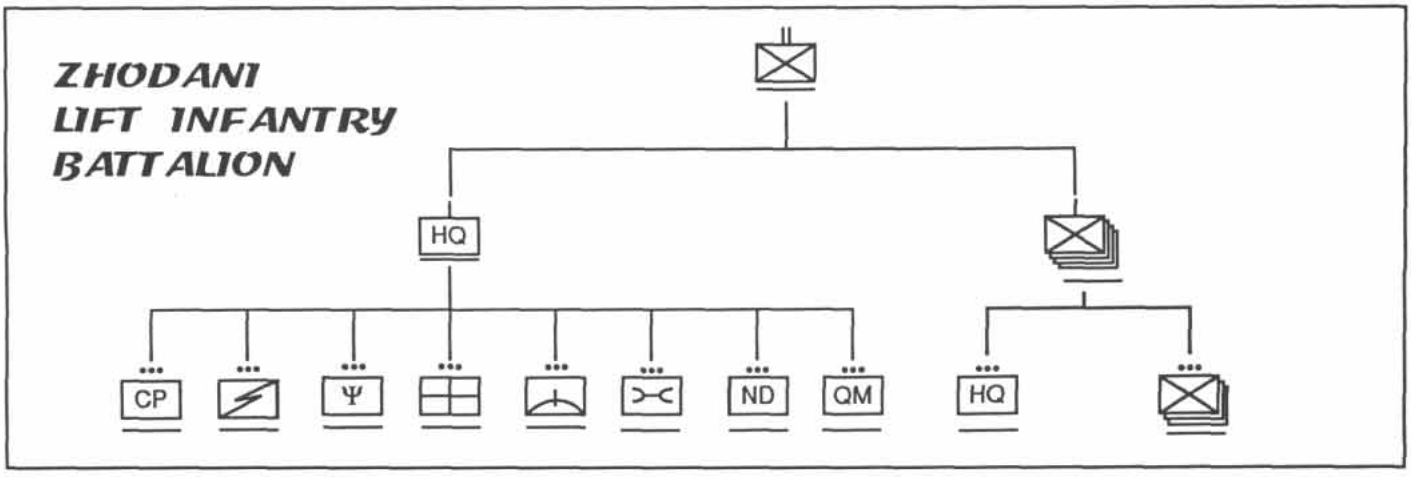
Zhodani Commando Groupment

Commando Groupment, with:
- **Headquarters and Headquarters Squadron**, with:
  - **Command Post Detachment**, with:
    - **Headquarters Group**, with:
      - 1 operational command stand
      - 1 Command Sled
      - 1 staff uplink Command Sled
    - **Intelligence Section**, with:
      - 1 self-ordering psionic intel stand
      - 1 Command Sled
    - **Communications Team**, with:
      - 1 staff uplink LMR Sled
    - **Computer Team**, with:
      - 1 staff uplink Command Sled
    - **Electronic Warfare Team**, with:
      - 1 self-ordering EW Sled
  - **Communications Platoon**, with:
    - 1 staff uplink Meson Sled
    - 1 staff uplink LMR Sled
    - 1 staff radio LMR Sled
  - *Medical Detachment, with:*
    - *1 tactical command stand*
    - *1 Hospital Sled*
    - *3 self-ordering Ambulance Sleds*
  - **Nuclear Damper Detachment**, with:
    - 1 tactical command stand
    - 1 Light Utility Sled
    - 2 Nuclear Damper Sleds
  - **Point Defense Detachment**, with:
    - 1 tactical command Point Defense Sled
    - 3 Point Defense Sleds
- **3 Commando Squadrons**, each with:
  - **Squadron Headquarters**, with:
    - 1 operational command psionic teleport stand
  - **Transport Detachment**, with:
    - 1 tactical command stand
    - 12 Grav APCs
    - 1 staff uplink Command Sled
  - **3 Commando Detachments**, each with:
    - 1 tactical command psionic teleport stand
    - **4 Commando Groups**, each with:
      - 1 tactical command psionic teleport stand
      - 1 psionic teleport support infantry stand
      - 2 teleport infantry stands

Notes: All stands are equipped with TL14 battle dress. Each stand is equipped with TL13 4.7cm noncompensated plasma rifles. Each support infantry stand additionally has an integral TL14 4.7cm noncompensated fusion rifle.

Appendix H: Unit Organizations

Zhodani Lift Infantry Battalion



Lift Infantry Battalion, with:
- **Headquarters and Headquarters Company,** with:
  - **Command Post Platoon,** with:
    - **Headquarters Group,** with:
      - 1 operational command stand
      - 1 Command Sled
      - 1 staff uplink Command Sled
    - **Intelligence Section,** with:
      - 1 self-ordering psionic intel stand
      - 1 Command Sled
    - **Communications Team,** with:
      - 1 staff uplink LMR Sled
    - **Computer Team,** with:
      - 1 staff uplink Command Sled
    - **Electronic Warfare Team,** with:
      - 1 self-ordering EW Sled
  - **Communications Platoon,** with:
    - 1 staff uplink Meson Sled
    - 1 staff uplink LMR Sled
    - 1 staff radio LMR Sled
  - **Psion Detachment,** with:
    - **Command Group,** with:
      - 1 operational command stand
      - 2 Utility Sleds
      - 1 Light Utility Sled
    - **Scout Group,** with:
      - 1 tactical command psionic recon Scout Sled
      - 3 self-ordering psionic recon Scout Sleds
    - **Recon Group,** with:
      - 1 tactical command stand
      - 8 self-ordering psionic recon stands
    - **Assault Group,** with:
      - 1 tactical command stand
      - 6 psionic scrambler stands
  - *Medical Detachment, with:*
    - *1 tactical command stand*
    - *1 Hospital Sled*
    - *3 self-ordering Ambulance Sleds*
  - **Nuclear Damper Detachment,** with:
    - 1 tactical command stand
    - 1 Light Utility Sled
    - 2 Nuclear Damper Sleds
  - **Point Defense Detachment,** with:
    - 1 tactical command Point Defense Sled
    - 3 Point Defense Sleds
- **4 Rifle Companies,** each with:
  - **Headquarters and Weapons Platoon,** with:
    - **Headquarters Team,** with:
      - 1 operational command stand
      - 1 staff uplink Command Sled
      - 1 self-ordering FO stand
    - **Electronic Warfare Team,** with:
      - 1 self-ordering EW Sled
    - **Recovery Team,** with:
      - 1 self-ordering Recovery Sled
    - **Fire Direction Center Team,** with:
      - 1 self-ordering FDC Sled
    - **Indirect Fire Team,** with:
      - 1 self-ordering MRL Drop Sled
    - **Direct Fire Team,** with:
      - 1 self-ordering Gun Sled
  - **3 Line Platoons,** each with:
    - **Headquarters Team,** with:
      - 1 tactical command stand
      - 1 Command Sled
    - **Point Defense Team,** with:
      - 1 Point Defense Sled
    - **3 Rifle Squads,** each with:
      - 1 tactical command stand
      - 1 support infantry stand
      - 1 infantry stand
      - 1 Grav APC

Notes: Two configurations are listed below—the standard, most common level of equipment, and an upgraded level of equipment, issued to lift infantry battalions that are organic to grav tank, mechanized and lift cavalry regiments.

Standard Level: All stands are equipped with TL14 combat armor. Each stand is equipped with 4mm gauss rifles with RAM HEAP grenades. Each support infantry stand additionally has an integral TL14 4.7cm compensated fusion rifle.

Upgraded Level: All stands are equipped with TL14 battle dress. Each stand is equipped with TL13 4.7cm noncompensated plasma rifles. Each support infantry stand additionally has an integral TL14 4.7cm noncompensated fusion rifle.

Scrambler stands have range bands and rates of fire of 100 cm: 3 (short), 200 cm: 2 (medium), 400 cm: 1 (long), and 800 cm: 1 (extreme). Psionic recon (clairvoyant) stands have clairvoyant "sensor" range bands identical to scramblers above, but no ROF.

Appendix I: Design Sequence Upgrades

When designing vehicles for **Striker II** using the design sequences in **Fire, Fusion & Steel**, the **Traveller** technical architecture sourcebook, the following additional guidelines should be used.

GRAV VEHICLE DENSITY AND G RATING

When determining lift vehicle movement, thrust is usually divided by 10 times the vehicle's volume in displacement tonnes to determine G rating. However, this procedure should not be used for very dense grav vehicles, those massing 15.5 or more mass tonnes per displacement ton.

Divide the grav vehicle's loaded mass by its volume in displacement tonnes. If the result is less than 15.5, use the normal procedure described above. If the result is 15.5 or more, G rating is determined by dividing thrust in tonnes by the vehicle's loaded mass in tonnes.

TURRET SIZE

In some cases, designating a turret as a small turret (and therefore requiring its components to take up 10 times their volume) results in the turret being larger than the maximum 10% of vehicle volume. However, when recalculating the turret's volume as a main turret (usually requiring its components to take up 2 times their volume), the turret then falls below the 10% threshold and becomes classified as a small turret again. In such cases, threat the turret as a main turret (using the main turret volume multiplier), but this turret must be the only turret on that vehicle, and the vehicle is then classified as having a *small turret* for purposes of target type in the vehicle damage sequence.

DIRECT ENERGY INPUT LASER HOMOPOLAR GENERATORS

Large direct energy input lasers with trainable focal arrays may be designed for turret mounting in ground vehicles. When fitting these weapons to the vehicles, the laser' homopolar generator need not be placed in the turret, nor have its mass accounted for in the weapon stabilization calculations.

NUCLEAR DAMPERS

The design sequence in **Fire, Fusion & Steel** is based on the assumption that the dampers will be used for space combat, and assumes a rate of fire of one shot per three minutes (10 shots each 30 minutes). Higher rates of fire require a larger power input and a larger nuclear damper. Choose the ground combat rate of fire desired from the table below, and find the volume multiplier that corresponds to it. This volume multiplier is applied to the volume value derived from the Nuclear Damper Design table on page 57 of **Fire, Fusion & Steel.**

The input multiplier is applied to the MW required by the damper from the power plant. Note that this power multiplier is applied *after* the volume multiplier above is applied, and not in combination with it.

If the nuclear damper is to be fitted with weapon stabilization, only its basic mass (before the volume multiplier is applied) is counted against the stabilization requirement.

For example, a TL15 3000km short-range nuclear damper with a ground ROF of SA1 has a volume of 13.2 m^3, draws 10.8 MW, and costs 16.8 MCr (exclusive of beam pointer and workstation). For purposes of fitting weapon stabilization, it has a stabilized mass of 3.3 tonnes (plus its beam pointer mass of 0.15 tonnes).

This procedure may also be used to design starship-mounted nuclear dampers. In this case the increased rate of fire is reflected in –Diff Mods to nuclear damper task rolls in space combat.

Space Cbt ROF	*Ground Cbt ROF*	*Vol Mult*	*Input Mult*	*Space –Diff Mods*
10	1/36	×1	×1	—
30	1/12	×1	×3	—
(50)	N/A	N/A	N/A	–1
60	1/6	×1	×6	–1
90	1/4	×1	×9	–1
(100)	N/A	N/A	N/A	–2
120	1/3	×2	×12	–2
180	1/2	×2	×18	–2
(200)	N/A	N/A	N/A	–3
360	SA1	×4	×36	–3
(400)	N/A	×4	N/A	–4
720	SA2	×8	×72	–4
(800)	N/A	×8	N/A	–5

STABILIZED MISSILE LAUNCHERS

Missile launchers need not be stabilized so long as their sights and control units and designators are, except that missile launchers in turrets do require stabilization.

DRONE MISSILES

Drone missiles are remotely piloted "kamikaze" grav vehicles that use contra-grav lifters for movement through most of their mission, but accelerate to their maximum speed for the final flight into their targets.

Drone missiles are constructed partially as grav vehicles and partially as missiles. Although they are designed based on volume like grav vehicles, they do not require hull material volume or armor to be allocated, and they do not suffer volume losses to waste volume or hull slope. However, although they do not have material allocated for their airframes, like missiles, they are assumed to have airframe structures abstracted into the other materials purchased.

Each drone missile consists of a drone brain, one or more communicators, a warhead, contra-grav lifters, a mode of propulsion (usually a jet engine), batteries to power the lifters and communicators if the propulsion does not meet these needs, and fuel for the propulsion system.

The missile's maximum speed is calculated as if it were a grav vehicle, by dividing its thrust by its volume or mass (see grav vehicle density, above). Its cruising speed is one-quarter this speed, or 200 kph, whichever is less. This is the speed at which the missile always flies until it attacks its target. This speed is considered to be flown at NOE.

Drone Missile Brains

TL	*Mass (kg)*	*Vol (m^3)*	*MCr*	*Agility Bonus*
13	20	0.02	0.1	+3
14	10	0.01	0.1	+4
15	5	0.005	0.1	+5

Drone missiles are launched from Tac missile launchers designed using the normal procedures, although the launcher need not contain any particular control units. Drone missiles do require control stations, usually fitted within the launch vehicle.

A remote drone missile control station consists of a normal workstation, a flight computer of the same tech level as the drone brain, and one each of all communicator types installed on the drone missile. Flight computers and communicators may not be shared among multiple control stations. A single drone missile control stations may control a certain number of missiles per turn depending upon tech level.

Appendix I: Design Sequence Upgrades

TL	Missiles per Turn
9	2
10-11	3
12-13	4
14	5
15-16	6
17-18	7
19+	8

DIRECT FIRE ROCKET LAUNCHERS

Unguided rockets are inherently inaccurate at long ranges. The short and medium range bands for direct fire rockets are calculated normally. However, direct fire rockets have no long or extreme range bands, so may not be fired in direct fire mode at longer than medium range.

PUTTING THE HEAT BACK INTO PLASMA

One of the most consistent requests we receive with respect to the equipment in **Traveller® the New Era** is to increase the effectiveness of high energy weapons. Although we're reluctant to tinker with design sequences and published equipment, the pressure for tougher fusion and plasma rifles has been almost irresistible.

Never let it be said that we don't listen to customers. In fact, the well-known third law of retail sales is "Always listen to your customers." (The first law is "Never kill a customer." The second law is "You break it, you buy it.") So we took a good look at man-portable high energy weapons and concluded that, although they weren't as good as grenade launchers, at least they were real expensive. Hmmm. Perhaps, we decided, there was something to all those annoying complaints after all. The following modifications refer to pages in the **Fire, Fusion, & Steel** high energy weapon design sequences.

Page 67 (Explosive Power Generation)

Change the mass of EPG cartridges to volume x4 (instead of volume x8).

Page 121 (High Energy Weapons)

Range: Short range for plasma guns is now *100 x the square root of pulse energy in Megajoules* (instead of 30 x pulse energy).

Short range for fusion guns is now *150 x the square root of pulse energy in Megajoules* (instead of 50 x pulse energy)

Damage: Damage value (D) is now *30 x the square root of pulse energy in Megajoules* (instead of 11.5 x the square root of pulse energy)

Page 122 (High Energy Weapons)

Penetration: The penetration rating for *both* plasma and fusion guns is now 1-2-10.

Price: The revised component price multipliers for plasma and fusion guns are shown below.

Component	Plasma	Fusion
Firing Unit	600	1000
Support Hardware	600	1000
Gyro-Compensator*	600	600
Inertial Compensator*	1000	1000
Recoil Cradle	25	25
Towing Carriage	2	2
Autoloader	10	10
Gun Shield	1	1

All plasma and fusion weapons appearing in **Striker 2** have been rated according to this upgraded standard. The charts below will allow owners of **Traveller: the New Era, Smash & Grab,** and the **Reformation Coalition Equipment Guide** to update the values for previously published high energy weapons.

				Weight				Price	
Weapon	TL	Pulse	Ammo	Empty	Ldd	BP	Mag	Wpn	Ammo

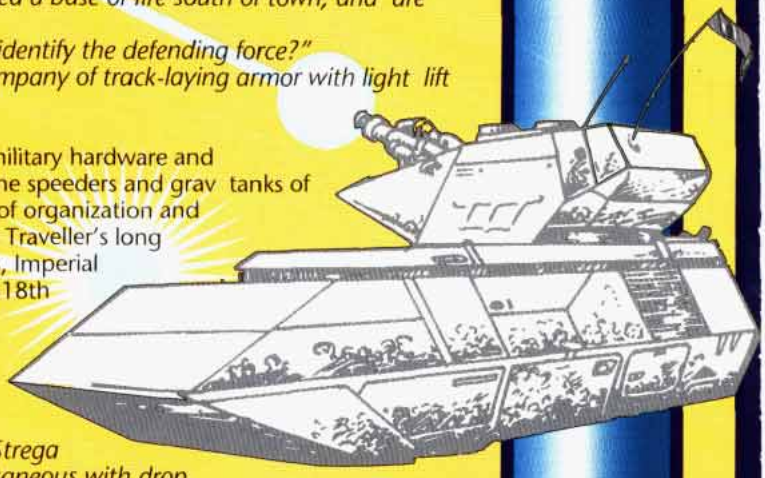
HIGH SPEED COMBAT



"Six, Go."
"Objective in sight. Gun sleds in overwatch, taxis going in."
"Roger. Get the boys out of the taxis and back in fast; we can't spend too much time in this one-horse burg."

Striker II is the miniatures combat rules of 58th century warfare, for use with **Traveller: The New Era**. Now the epic planetary engagements of the New Era, the Final War, or the Frontier Wars are under your control, allowing you to command battalions of lift infantry, drop troops, and grav armor. These rules are fully compatible with **Traveller**, and so also allow miniatures resolution of roleplaying adventures.

"Dagger Six, am receiving heavy direct fire from terrain east of objective, one taxi is down and one damaged. Sleds are setting up perimeter for crew recovery, request additional direct fire support, over."
"Roger, One-six, am releasing TD platoon to your control, ETA at high-speed transit is 90."
"90, roger. We can hold on for a minute and a half."

Combat in the 58th century is fast-moving, and so is **Striker II**. Based on the award-winning **Command Decision** miniatures rules, Striker II allows rapid play which replicates the rapid tempo and quick reactions of advanced technology warfare. These straight-forward rules allow players to concentrate on the mental dilemmas of tactics and command, not the interpretation of complicated rules mechanics.

"This is Dagger One-six. Situation is stabilized. We have established a base of fire south of town, and are sending dismounts to secure the town center."
"Dagger Two-six reports resistance in his sector as well. Can you identify the defending force?"
"Roger, I estimate a dismounted rifle battalion supported by a company of track-laying armor with light lift recon."

Striker II is more than just rules, it is also an extensive resource of military hardware and organizations—from the jeeps and tracked vehicles of Wilds units to the speeders and grav tanks of a Reformation Coalition Marine Brigade. Striker II also includes tables of organization and equipment listings for some of the most important military units from Traveller's long history: Zhodani Lift Infantry Battalions and Commando Groupments, Imperial Marine Task Forces, Imperial Guard Regiments, and the legendary 4518th Lift Infantry Regiment—"The Duke of Regina's Own Huscarles."

"Dagger One-six to Dagger Six. Objective is neutralized, infantry is reembarking, casualties minimal. Will be ready to redeploy in 300."
"Roger. Good work, One-six. Orbital bombardment of Objective Strega begins in 240, duration 600. Lifting of bombardment will be simultaneous with drop troop insertion. You will be blocking avenues of approach to North and East of Strega, am sending coordinates now."

Striker II provides the full science fiction combat experience with rules on orbital bombardment, drop troops, antimissile fire control, planetary environment, and orbital superiority. Campaign rules allow a sophisticated strategic gaming experience by adding the effects of combat engineers, maintenance, and quality of food and medical care.

"Dagger Six from One-six, lead elements lifting now. Will be on blocking positions in 180."
"Roger. On my order, prepare to execute ConPlan Brooke from blocking positions."
"Will do, Six, we're on our way."
"Godspeed, One-six. Dagger Six out."

Science Fiction Roleplaying Game

TRAVELLER The New Era

The Regency Sourcebook:™ Keepers of the Flame

For my wife, Devon, because that's the way it should be, and for

Mickey Mantle, who embedded in me at an early age lessons about understanding, believing, and the difficulty of being, in ways that I have only recently been reminded (but you died before I could give this to you—even second chances are fleeting precious...), and for

Joseph J. Kruzel, Professor, Pragmatist, Peacemaker, and Patriot. May your example and panache continue to inspire those who will miss you.

And finally, to The Girls, for reasons that you taught me to understand.

Thanks to the members of the AWWC, because it's time for people to admit once and for all that it is fiction which imitates reality and not the other way around, for that is the only way that fiction attains any dignity, value or relevance. All is biography, yours and mine.

Soli Deo Gloria.

Design: "B." Dave Nilsen

Introduction

The Regency Sourcebook is the first step of **Traveller: The New Era**'s return to **Traveller**'s birthplace, the venerable Spinward Marches. Like the rest of the campaign background, the Marches underwent an updating and expansion of scope with each new edition of **Traveller**. Original **Traveller**'s Spinward Marches grew to become **MegaTraveller**'s Domain of Deneb, and in **TNE** the Domain is no longer one small part of a larger Imperium, but is the sole repository of that society's hopes and dreams. And now that the Regency is poised to remake interstellar space in its own image, it functions as a microcosm, like DNA tightly coiled in a zygote, of the new Imperium that it will conceive.

When you consider that the Spinward Marches were the primary focus of **Traveller** support for 10 years, it becomes apparent that the amount, complexity and subtlety of its detail is staggering, much more than could fit into a 96-page book. (I could have made it a 400-page book so it could cover everything, but then you'd have to wait another couple of years to read it.) **RSB**, therefore, only scratches the surface of this rich, full-bodied concoction, which is all the more enjoyable because it has been aged and blended for as long as 18 years (sudden desires to quaff a scotch are forgiven). And when you realize the purpose for which the Spinward Marches sector (which itself is only one of the four sectors making up the Regency) was created, its detail becomes even more impressive.

For what are the Marches, after all, if not a mini-Imperium? In 1979 one single sector was designed to have the same multi-faceted environment that the Imperium as a whole was later developed to display. The Third Imperium was a macrocosm of the Spinward Marches, with its K'kree, Hivers and Solomani playing the same role on a larger scale as the Zhodani, Darrians, Sword Worlders, etc., played on the smaller stage of the Marches. The great historical events of the Imperium were only the five Frontier Wars writ large, and the socio-cultural details of the Third Imperium were simply the more defined rendering of the same multi-cultural influences that we had already come to know "behind the claw."

So it was inevitable that **TNE** would return to the Marches, the birthplace and laboratory in which all the concepts of the later, larger **Traveller** incarnations first saw light.

Due to the nature of this task and the shortness of 96 pages, a large amount (what Frank likes to call "great, steaming heaps") of material is left that could not be fit into this book, so without further ado, I present:

Future Developments

The release of this book constitutes GDW's commitment to support the Regency as a fully developed campaign background for use with **Traveller: The New Era**. This does *not* signify the abandonment of the Reformation Coalition campaign. Both the Regency and Reformation Coalition will continue to be supported and developed as official **TNE** campaign backgrounds, because as you have probably guessed, they are going to meet each other some day.

Regency support will be provided via further sourcebooks, Epic adventure campaigns and articles on the following topics:

- Further social/political/historical background on the Regency and other Spinward States.
- In-depth examinations of the other Spinward States and alien races, to include character generation, their own histories, attitudes, approaches to the use of technology, etc.
- Collections of Regency-centered equipment, weapons, vehicles and starships, primarily at the TL15 and -16 level, as well as lower-tech variants used by other Spinward States.
- **Challenge** magazine, which will feature the good old "Traveller News Service" in each issue, plus Regency coverage in the form of adventures and articles covering the areas listed above.

Cross-References

Unlike any previous **TNE** products, **RSB** will make the occasional reference to pre-**TNE Traveller** products. This is again because of the sheer depth and breadth of the existing Spinward Marches background which **RSB** can only lightly touch upon. Using standard GDW style, GDW-published products will be noted **in bold face**, and official material published by non-GDW sources will be noted *in italics*. GDW has no responsibility for the availability of non-GDW material, and there exist no stocks of the Digest Group **MegaTraveller** products outside the hands of collectors and out-of-print specialty shops. However, a number of old original **Traveller** and **MegaTraveller** products remain in the GDW warehouse and can be purchased direct from GDW. A list of these and their prices can be obtained by writing or calling GDW. When I make reference to GDW products, I will parenthetically note whether they are out of print and gone forever (OP) or still available via GDW (SA) *at the time of this printing* (some of these products remain in very small quantities, say two or three). Note: **JTAS** (1-24) indicates GDW's **Journal of the Travellers' Aid Society, Ch** (25-77+) indicates GDW's **Challenge** magazine, *TD* (1-21) indicates DGP's ***Travellers'*** *Digest*, and *MTJ* (1-4) indicates DGP's ***MegaTraveller*** *Journal*.

Library Data

RSB includes a very broad library data section. This is the first installment of what will hopefully someday be a comprehensive collection of jargon, concepts, terminology and ideas common to the entire **TNE** universe, and not exclusive to the Regency campaign. Many of these concepts will be visited in more detail in future products.

Conclusion and Statement of Culpability

This was a difficult book to assemble. I had originally hoped for more space to devote to sheer prose, i.e., the descriptive text that fills up pages 5 to 34 of this book. But the more I spoke with **Traveller** players, the more I found that they wanted the entire Regency *now*, not just one or two sectors with more to follow. Because this meant half the book would be given over to dry UWP data, I struggled before deciding on that path. I also considered more efficient (i.e., compact) presentations of the UWPs, like using a single sector map accompanied by a single list of its worlds, unsorted by subsector. However, *efficiency* is not the same as *effectiveness*, and I believe the old one-subsector-per-page format is the most useful format for referees and players alike. So although I compensated for the dryness of 40 continuous pages of subsector UWPs by pruning the repetitive format and packing the pages with world information, the big hurdle was to simply "bite my lip and close my eyes" and get on with it.

Remembering that **Supplement 3, The Spinward Marches** (OP) predated the conclusion of **Library Data (N-Z) in Supplement 11** (OP) by three years, I reasoned that the full panorama of the 45 subsectors of the Regency and its frontiers exist as little numerological ends in themselves, and that I could add deep layers of description, updating and whiny temporizing to their foundation in future products. Besides, if I didn't put them all in I would be apologizing for it to **Traveller** fans for at *least* three years.

Because I had to navigate as through Scylla and Charybdis among the vast amount of established historical, astrographic and political-cultural "facts" of the Spinward Marches/Domain of Deneb, I could not simply work rapidly and with a clean slate and write about a new era of worlds and their inhabitants. This fact made this book more time-consuming and more frustrating, but also more potentially rewarding. These rewards will not all be immediately evident, but will emerge as continued Regency source material bubbles forth.

Any violence I may have done to pre-**TNE** "facts" is my fault alone. (But I'll bet I know more about inconsistencies within original **Traveller** and **MegaTraveller** than anyone *left* alive, and only I know where the bodies are buried.) Please note the thanks in the credits to those who made the Spinward Marches, Domain of Deneb and now the Regency what they have become. It goes without saying that without them, well, you know, it goes without saying.

Keep the Flame.

Keep the Flame

KEEP THE FLAME

My brothers and sisters of the Regency, sons and daughters of the Imperium,

These are the last words I will speak to you.

Please do not mourn me, but be filled with joy in knowing that my greatest joy has been to be your servant. You need not miss me, for it is I who will miss you, and you will still have each other.

We will meet again, of that I have a certainty that goes beyond mere fragile facts,

And in that meeting we will understand all that has brought us here.

You are alone, a solitary outpost of light in an ocean of wild darkness.

But yours is not the loneliness of fear and isolation, darkness and extinction.

It is the elevation of the undying Flame which rises above fog, cloud and rain,

Of beacons which call to the great ships and keep the beaches shipwreck free,

Of the light across the bay which guides the seafarer home.

You carry a heavy responsibility in your solitude, for if you let the Flame go out,

Who else will shoulder the burden?

Who else will make the sacrifice of love for this great creation we call humanity?

So my words to you are,

"Keep the Flame."

For those who came before us and passed it on to us,

For those who live with us today who need to stand in its glow,

For those who come after us,

Keep the Flame.

For the simple knowledge that the Flame is the greatest thing that we will ever know, and is more important than we are,

Keep the Flame.

The Flame is you and me and everyone we have ever known.

The Flame is those who came before us down the long millennia and left for us what they learned.

The Flame is the promise of those who will come after us and profit or suffer by what we have done.

The Flame is truth,

The Flame is honor.

The Flame is duty.

The Flame is selfless service to others.

The Flame is mothers and fathers, husbands, wives and children, teachers and students.

The Flame is relationships.

The Flame is Love:

Our love for each other, our past, and our future is the tiny spark of the Flame that lives in all of us.

The Flame is death, and the knowledge that there is something greater that waits for us on the other side of death.

The Flame is courage, faith and commitment, even though we will die.

The Flame is the pyre on which all fear dies and is consumed for all eternity.

The Flame is within us as we are within the Flame.

The Flame is not a burden to be lifted lightly.

The Flame can burn and hurt and frighten,

Because it is nothing but the pure immanent force that drives this universe,

Beautiful and terrible to behold.

But although the Flame can kill you,

If you do not have the Flame you are dead already, and none can save you.

The Flame does not belong to you,

It is not yours to change or modify.

You are the vessel, the conduit, the custodian of the Flame.

The Flame will change you, purify you, burn away what is unworthy in you,

Leaving only the best in you, what is eternal, stainless and unbending.

And once it has exposed those things, it will burnish them until you gleam in the light of that Flame,

A beacon, a guide in the dark night of the soul for all who need it.

And if you die keeping this Flame you will never die.

You will live on, forever, in the hearts of all who have seen you.

For those who have never seen it,

Keep the Flame.

For those who would never see it were it not for us,

For those who have seen it but do not believe,

For those who have seen only fraudulent imitations which led them to scorn it,

For the countless souls who were defeated by their dreams,

And for those who do not yet know how to dream,

I charge you now and to your death:

Keep the Flame.

When it is dark,

Keep the Flame.

When you are weak,

Keep the Flame.

When you are afraid,

Keep the Flame.

No matter how much it hurts,

Keep the Flame.

With your last gram of strength,

Keep the Flame.

When those around you scorn you,

Keep the Flame.

Although it may kill you,

Keep the Flame.

Even if you are the only one,

Especially if you are the only one,

Keep the Flame.

Because you are not the only one—you will never be the only one,

But the Flame that you hold will shine out to those others who also thought they were alone,

And encourage them to hold theirs stronger and higher,

And together you will save those whose Flames have gone out.

Because we belong to each other, you and I,

Keep the Flame.

For I belong to you, and you belong to me,

United in keeping the Flame that gives us life and hope and purpose.

And although I am leaving you,

I swear to you that wherever I go,

To help light our way, my only cause, my only joy, will be to

Keep the Flame, now and forever.

The Last Address of
Norris Aella Aledon (1063-1157)
The First Regent

The Regency in 1202

THE REGENCY

The Regency is a society in flux, challenged by its difficult surroundings and beset by the contradictions between its past and its chosen future. Regency citizens have a clear belief of their role in the universe: They are the guardians of the Imperial values and are also the best hope of the universe to again have a viable multi-species interstellar culture. Less clear is their understanding of specifically how they will bring these gifts back to the universe. The unspoken assumption seems to be that the universe will welcome them back as liberators from the darkness. The possibility that the Regency might have to fight wars for the hearts and minds and real estate of those they would liberate has not been rigorously examined.

Keepers of the Flame

On the one hand the average Regency citizens (who still call themselves "Imperials") believe that the Regency is the steward of the Imperial values that will someday be spread again among the Wilds of the ruined Third Imperium. They continue to observe Imperial holidays and commemorate Imperial history. As the only survivors of this once-great polity, it is natural for them to feel this way; they share an understandable "survivors' guilt" which drives them to try to justify and redeem the deaths of their Imperial brethren. But since it was the Imperium on its own which consumed and destroyed itself, how rational is this veneration of all things Imperial? Is it just a harmless conceit, or is it a deep cleavage plane which under stress will eventually split, scattering all the accomplishments of the past 70 years?

Survival has been paramount for the Regency during the "Dream Time," so certain contradictions are inescapable. In fact, the Regency has not been marked by the kind of cynical "necessities" that are typical of hard-pressed societies, such as martial law, committees of "public safety" and the like. This in itself is remarkable.

Tenders of the Refiner's Fire

On the other hand, the Regency is committed to sweeping changes, broad in scope, deep in political and social effect, and quite un-Imperial in nature. Regency citizens proudly proclaim their status as true Imperials, and continue on to profess their commitment to the phasing out of the nobility with democratic and land reforms. The fact that this dichotomy is not often publicly articulated comes in part from an unwillingness to face up to real difficulties of overhauling a structure of feudal privilege, power and insularity.

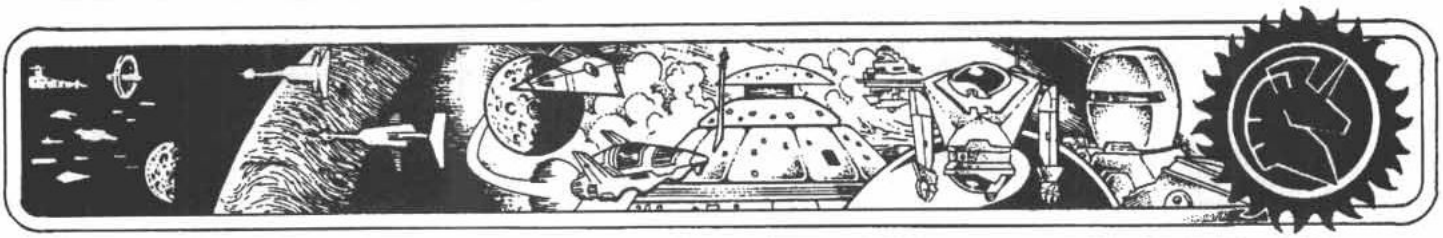
Another source of this schizophrenia is the style of leadership used by the Regency's most influential leader, Norris Aledon, the first regent. While exhorting his citizens to modify their culture in areas of democratic reform, group consciousness rather than local consciousness, acceptance of psionics, and the accommodation of unassimilable political groupings within the Regency boundaries, he always used the inducement that these were the best ways to preserve and propagate the Imperial values that his listeners held in common. The fact that these new principles were perhaps not Imperial values after all was infrequently noticed, and discussed even less. If one uses non-Imperial values to perpetuate the Imperium, at what point does it cease to remain the same Imperium? When powerful nobles, formerly the backbone of Imperial leadership, are ejected from office and removed from their ancestral lands in local referenda, how exactly does one perpetuate the Imperial traditions?

Those who do think about the Regency's contradictions speak in terms of "the refiner's fire," in which the challenges and tragedies surrounding the Regency will relentlessly burn away the dross of unworthy institutions and leave only the pure, tempered metal of timeless values. Contradictory paths will be adjudicated by this ongoing process, and only those worthy of survival will remain.

What is the Flame?

Although Norris and other Regency leaders spoke, and still speak, of "the Flame" that is kept burning by the Regency, the exact composition of this flame has been left open. This is certainly part of the reason for the appeal of the image, as each person can customize the concept to best meet his, her or its belief structure. However, the following characteristics are commonly accepted as central values of the Flame.

Courage: The ability to stand alone in the face of adversity and to hold fast to transcendent values even when surrounded by those who would tear them down.



Stewardship: An appreciation of the physical assets (worlds, starships, high-tech industry), intellectual assets (literacy, education, technological and scientific training), social assets (adaptive political institutions, culture, art, literature, common history) and spiritual assets (traditions of service, loyalty, duty, justice and the well-being of one's fellow citizens) that have been saved and nurtured by the Regency, and a sober awareness of their fragility. Stewardship is manifested by the willingness to protect these assets, the understanding that these assets belong not to the Regency, but to the universe at large, and the commitment to someday assist in the dissemination of these assets back into the universe which has need for them.

Selfless Service: Another aspect of courage and stewardship is the belief that individuals achieve their greatest value when they combine their efforts with others to create something larger than they are, which will live long after they as individuals have disappeared. No person, nation, or world is an island; all of the Spinward States would have died had they not all cooperated with and trusted each other.

Inclusiveness: Despite the rhetoric of other major interstellar powers, Imperials can justly say that theirs was a remarkably integrated multi-racial society. Although no society is free of prejudice and expressions of groupism, the Imperium contained very few racial barriers to the achievement of its nonhuman members (although certain *behavioral* barriers, such as anti-psionic prejudice, ended up functioning as pseudo-racial barriers). Examples of Imperial inclusiveness included the appointment of the Vargr Brzk as archduke of the Antares Domain and the actual *changing* of the Imperial Sunburst insignia in 247 to make it visible to a newly joined minor race. The preponderance of human culture and leadership was a by-product of the tremendous numerical advantage of Imperial humans. Even the much-celebrated competition between humans of Vilani and Solomani descent was observed more in the breach than in practice. For its last 500 years, the bloodlines of Imperial leadership were so completely mixed between Vilani, Solomani and Sylean lineage that racial distinctions were nonsensical.

The Regency is heir to this tradition. In addition to its well-known Aslan and Vargr inhabitants, the Regency contains small communities of Droyne, Chirpers, Hivers and even K'kree (see page 50), plus numerous minor and geneered human races. All these are fully able to participate in government and to serve in governmental agencies. However, it is clear that the Imperium was, and the Regency remains, a predominantly human institution. On a simply descriptive level that simply means that the greatest percentage of Imperial subjects were human, and that they naturally and not unreasonably created institutions based on human traditions and assumptions.

On an idealistic level, the concept of the Imperium and Regency being human means that they incorporate human or humane values, the most important of which are respect for the individual and his, her, or its right to a meaninful and fulfilling existence.

Symbol of the Regency

The Regency insignia was originally proclaimed by Norris as the symbol of the Domain of Deneb on 280-1128 by superimposing Norris' unicorn device on the Imperial Sunburst, symbol of the Third Imperium. The unicorn, representing the "Bridled Steed" constellation which spans the Cronor and Jewell subsectors (A and B/Spinward Marches), has long been the heraldic device of Norris' family and thereby became the symbol of the Spinward Marches and Domain of Deneb.

Since the proclamation of the Regency in 1132, the sunburst portion of the insignia has been taken by tradition to symbolize "the Flame," rather the Third Imperium. The placement of the Domain's unicorn symbol within this flame captures the concept of "the refiner's fire."

STRUCTURE OF THE REGENCY

For most purposes, the establishment of the Regency was simply the renaming of the Domain of Deneb, a step which was accomplished in 1132 by Archduke Norris. Its structure is based on that of the Imperium and naturally retains many of the same institutions and processes.

The major departure from the Imperial structure began in 1152 when Norris announced the Representational Reforms. These reforms were instituted to eventually replace government based on the nobility with government based on popular elections. Because of the tremendous implications of these reforms, they were intended to be undertaken in a gradual manner, and many of the attendant changes are still only being instituted 50 years later. In fact, the current form of Regency government with its parallel networks of noble and popular government is viewed as still only a transitional form rather than the desired endstate.

Levels of Government

There are four basic levels of government in the Regency: local, planetary, subsector and Regency.

Local government actually covers many potential sublevels of government by which people rule themselves close to home. These can include government at the level of town, city, district, shire, county, parish, borough and a profusion of other local terms, all of which are nested one within the other below the planetary level.

The planetary level is largely self-explanatory, except that it might more accurately be described as "star system" level rather than planetary level. Many star systems contain more than one inhabited world, but Imperial tradition has long stipulated that each star system has one primary world, to which the others are all subordinated in some fashion, as colonies, raw materials resources, bases, etc. Thus, the planetary level integrates these other worlds in much the same fashion as multiple nations on a balkanized world are handled.

The subsector level is the same as the old Imperial system, except that the Regency has folded certain sparsely populated subsectors, such as those along the frontier or Great Rift, into a single group which is treated as a subsector although its astrographic area is larger.

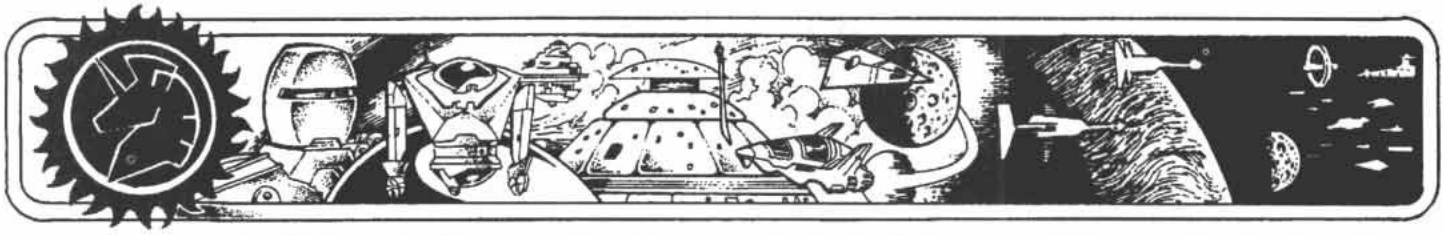
The Regency level is the highest level of government, and corresponds to the former Domain of Deneb government in area of extent as well as to the former Imperial government in terms of absolute accountability. A great many governmental functions are reserved to the Regency level, such as foreign policy and the armed forces. While these areas can exert their function at the local level, they are not controlled by the local level of government. Rather, they are controlled by local authority via their own internal chain of command which extends down from the Regency level.

One level of former Imperial government that is missing is the sector level. Because the Regency only comprises major portions of two sectors and small bits of two more, this level would have been duplicative, and the Regency level has taken over the tasks formerly association with sector-level government. However, sector remnants of the noble hierarchy persist in their unempowered advisory role.

Parallel Governments

One of the explicit results of the Representational Reforms is the establishment of two hierarchies of government at the local, planetary and subsector level, and at the interface with the Regency level. There is of course only one administrative and bureaucratic hierarchy at the Regency level, and all these hierarchies terminate in the single person of the regent.

It is the conduits that run up and down between the citizens and the Regency that are duplicated. Each subsector, each world and each of a world's local political divisions are represented by nobles, in the feudal tradition of the Imperium, and also by popularly determined representatives.



Popular Hierarchy: The popular hierarchy is the "true" form of Regency government, in that it is invested with the actual ruling powers that used to belong to the nobility. This also means that the administrative bureaucracies that used to answer to planetary and subsector nobles have been transferred to the control of the popular hierarchy and are now answerable to planetary and subsector governors.

The Representational Reforms require that each world and each subsector have a single executive officer, in both cases titled the "governor." The governor is the key conduit of power both upward and downward: The governor passes legitimacy up from his or her constituents to the Regency government, and passes the Regency's laws, programs and fiscal requirements downward from the Regency government to the citizens. Sector and plan-

"Popularly Determined"

The concept of "popularly determined" representatives, mandated by the Representational Reforms, actually covers a wide variety of procedures, not all of which are literally "popular." While many worlds do practice regular popular elections to determine their leaders and representatives, other worlds do not. Some do choose leaders by popular election, but these leaders are dictators who serve for life, effectively elected nobles. Other worlds periodically elect a single leader, who then appoints all the other members of the local government, as well as its representatives to higher levels of government. Other worlds choose their leaders by lot, or some other random means, or only elect individuals from a small, self-selecting group. Some worlds have planetary representatives who are elected by high officials who were not themselves popularly chosen, or who are members of a secret "star chamber." These systems all grow out of local custom, traditions and assumptions.

Although not all these systems live up to the classic image of home rule, democratic election and elective representation, they do meet the primary implicit requirement of the reforms, which is that they are locally rather than externally imposed, and do represent something of the true character of the individual citizen, the most basic level of Regency society.

etary governors are also able to use local Regency military forces under certain circumstances.

A second requirement of the reforms is that each world send a number of representatives to the Regency Senate, the Regency's primary legislative body. Each world sends a number of senators equal to its UWP population code, which means that a world's senators may range from 0 to 10. This logarithmic scale was the answer to the conflicting needs of greater representation for high population worlds and the requirement of a reasonable voice for all worlds, no matter how small their populations. For example, when comparing a world with a population of 100,000 (code 5) to a world with a population of 900,000,000 (code 8), the smaller world would only be out-represented 8 senators to 5, while the larger world actually has 9000 times the population of the smaller.

The Senate makes the Regency's fiscal decisions, and is also its deliberative and legislative body.

The term of office in the Senate is three years, although in practice a sitting senator's term does not end until his or her replacement arrives. Given the wide variety of travel times from homeworlds to the Regency capital at Mora, senators are replaced on a more or less continuous basis.

Noble Hierarchy: Also called "the old government," the noble hierarchy extends down to the lowest of the peerage, the barons, at the local level, all the way up through the planetary and subsector level to the Regency Moot at the highest level. Because the popular hierarchy holds the real governmental power, nobles exercise influence rather than actual power, but because of their history, personal stature, and abilities, this influence is no small matter. They exercise their influence primarily in the moots—the unofficial planetary moots, and the official subsector moots and the Regency Moot. Here they can discuss current needs and initiatives, and can bring their power to bear in support of Regency legislation which is officially sent down through the popular hierarchy.

The noble hierarchy was established to serve three main purposes. The first is the continuation of the Imperial peerage, important for historical and cultural reasons: The laudable and emulatable accomplishments of past nobles are more tangible and serve as better modern role models if their lines are perpetuated in their ancient ceremony and grandeur.

The second is their function in a statesmanlike advisory role to back up the popular hierarchy—an "impartial" check on the progress of popularly elected government. Because nobles do not worry about the need to be continually re-elected, they are thought to be able to take the long view on important or unpopular issues that elected officials may be tempted to ignore. They also function as a back-channel means of appeal or communication. For example, a minority group which believes it is being abused and ignored by majority-elected leaders may take its grievances to the noble, who will represent these concerns at higher levels, usually by presenting them at the subsector or Regency Moot. Issues presented at the subsector level will become known to the subsector governor who can act upon them, and issues presented at the Regency Moot can be acted upon by the Regency Moot or Senate, as appropriate.

The third purpose is both cynical and crucial: it gives the nobles something to do. The sudden and radical disenfranchisement of a powerful ruling class is a recipe for disaster. By giving the nobility a role to grow into, Norris hoped to gain their cooperation in the Reforms.

Administration

As in the Imperium, the Regency government exercises authority over various subject areas via governmental ministries. All ministries are headed by high regents, which are appointed positions. These appointments are made by the office of the regent and must be confirmed by the Regency Senate and Moot. Ministries have mandated subject area responsibilities that are defined by the regent and Regency Senate.

For example, the XWeb (see page 21) is jointly overseen by the Communications Ministry and the Scout Ministry. The Communications Ministry sets and monitors standards of information dissemination throughout the Regency, while the Scout Service is responsible for operating the Xboats and their support structure. Thus funding for the XWeb comes from the Scout Ministry's budget, but it must meet the standards set by the Communications Ministry.

Taxation

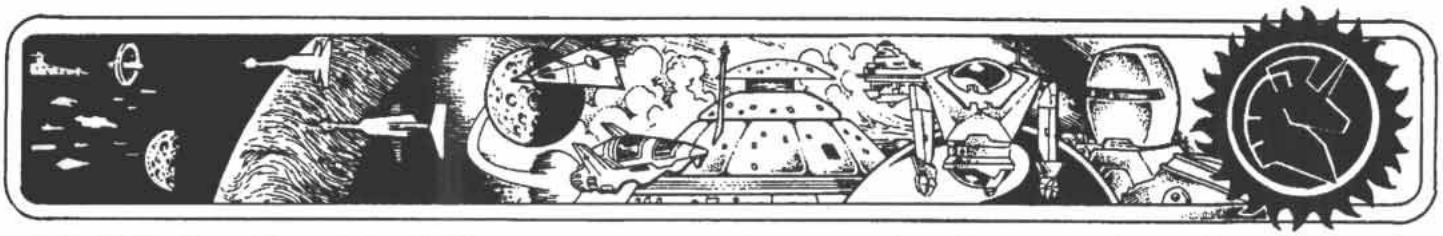
All planets are responsible for their own internal taxation, within certain broad guidelines established by the Regency.

The Regency does not directly tax any of its citizens. Instead, it taxes *worlds* (which are then responsible for raising these taxes from their citizens) and *activities*.

Taxation of worlds is usually based on an equitable assessment of a world's ability to produce revenue (based on population, technology, manufacturing capacity, etc.), but this can be revised up or down for a variety of reasons. For example, a world which has suffered a natural disaster can have its tax burden reduced, while a world which has been the major beneficiary of a new Regency facility or activity could have its tax burden increased. Subsector governors are also given some authority to realign tax burdens within a subsector, so long as that subsector's total tax obligation is met.

Among those activities which are taxed are interstellar trade and travel. Every starship requires licensing, registration and annual certification which is a form of tax, and the sale of all starship cargos and passenger tickets produce a tax paid to the Regency (these taxes are subsumed within the normal price of these items, so this effect is not seen in game terms). When an interstellar business is formed, registration and licensing fees are also paid to the Regency. The berthing fees paid at starports are the means by which the starports recoup the taxes levied on them by the Regency government. The statement behind all these activity taxes is that the Regency is the guarantor of interstellar society.

Armed Forces



The Regency's armed forces include the Regency Navy, Scout Service, Quarantine Service, Marines and Army. All these are administered by various ministry areas, but are under the supreme command of the regent. Each of these organizations has a parallel civil and military command structure. The civil structure consists of the high regent in charge of the Navy Ministry, Scout Ministry, etc., and the ministry office.

The ministry interacts with the Senate and other ministries, and handles all budgetary and fiscal requirements, including procurement, pay and benefits, etc.

The military command structure consists of the military's own hierarchy and controls operational, training and personnel issues, and makes procurement and budgetary recommendations to the ministry.

Both the military and civil hierarchies terminate with the regent, who is the commander-in-chief of the armed forces.

The Regency continues the Imperial policy of maintaining parallel structures of active and reserve fleets in its subsector. Although subsector governors have no authority over active naval forces, they are permitted to make use of reserve forces under certain circumstances.

HISTORY OF THE REGENCY

Although the Regency dates to 1132, its story properly begins in 1123 with the dispatch of the *Arrival Vengeance* mission. In 1123 the Domain of Deneb had been cut off from the Imperium for six years, and Archduke Norris had to decide whether the Domain's future was tied to eventual reunification with the Imperium or if it would have to chart its own course. To this end, he dispatched, in greatest secrecy, a recommissioned cruiser to cross the Great Rift and contact the factions of the warring Imperium. This story is told in greater detail elsewhere (***Arrival Vengeance*: The Final Odyssey**, SA). The answer of the mission upon its completion in 1126 was quite simple: The fragments of the Imperium were in no shape to be reunified, and the Domain of Deneb would have to stand or fall on its own.

In 1127, speaking from the Domain capital at Mora, Norris announced this reality to the Domain, that "We in the spinward extents must chart our own future." (See **Survival Margin** page 53, or ***Arrival Vengeance***, SA.)

Many of Norris' initiatives which later saw light as Regency policies were undoubtedly begun at this time, particularly the Psionic Reforms and perhaps the Representational Reforms. However, the release of the AI Virus in 1130 soon presented the Domain with a more burning issue than any social restructuring.

Regency Timeline

1098	Norris Aella Aledon becomes Duke of Regina.
1107	Fifth Frontier War begins, accompanied by great enemy success.
1109	Norris sacks Admiral Santanocheev. Tide of war begins to turn in Imperium's favor.
1110	Fifth Frontier War ends in return to almost all pre-war boundaries.
1111	Border Worlds established as Imperial client state.
1116	Emperor Strephon's ceremonial double murdered at Core.
1117	Imperium breaks into factions for a Civil War. Vargr cut Corridor in two. Domain of Deneb cut off from Imperium.
1119	Intrusion of Aslan *ihatei* fleets in Domain become stronger and more numerous.
1123	Norris orders *Arrival Vengeance* mission to contact remains of shattered Imperium.
1126	*Arrival Vengeance* returns from its mission, carrying future High Regent Avery Alkhalikoi.
1127	Norris announces that Domain must seek its own path without the Imperium.
1130	Release of AI Virus in Core Sector. Collapse begins. First warnings of Virus arrive along trailing frontiers of Domain.
1131	Quarantine completed. Joint Aslan-Domain fleets destroy vampire fleets attempting to cross Great Rift.
1132	Regency proclaimed. Spinward States Accord signed. Sword Worlds attempt land-grab.
1133	Regency Frontier created. Abandonment begins. Border Worlds and Gram are absorbed into Regency. Norris declares the Psionic Reforms under High Regent Dilgaadin. Psionic Renaissance begins.
1139	Rape of Trin.
1140	Regency annexes Islands subsectors, assumes peacekeeping presence.
1152	Norris announces the beginning of the Representational Reforms.
1157	Norris dies, succeeded by Seldrian as regent.
1190	Seldrian dies, succeeded as regent by her son, Caranda Aledon Alkhalikoi.
1196	First Regency referendum on re-opening borders voted down.
1201	Zhodani Exodus begins.
1202	Regency Frontier is opened.

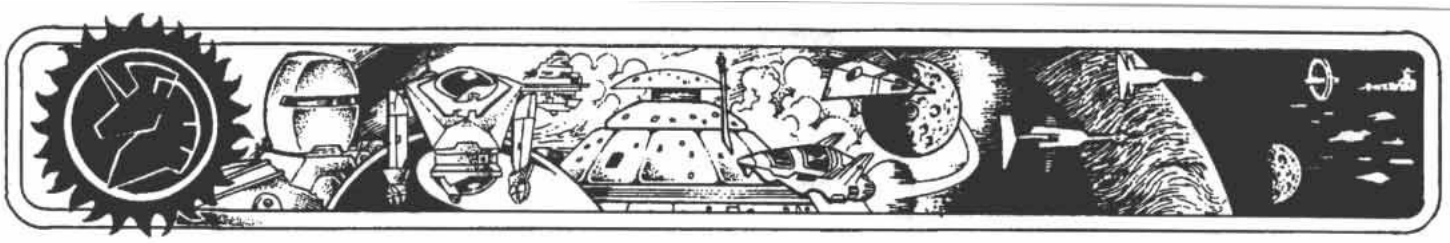
Virus and Quarantine

Advance warning of Virus from couriers that crossed the Great Rift enabled local naval commanders to take steps to prevent Virus infection, and quick ratification from Mora permitted these steps to be replicated all along the Domain's frontier. Under centralized leadership, these steps soon became codified as the Quarantine, which extended all along the Domain's trailing frontier and along the trailing portion of its coreward frontier.

Quarantine consisted of the isolation of all communications and data transmission systems so that Virus could not be transmitted along its fundamental path, and the closing of the Domain's borders to all interstellar traffic. Incoming traffic, if cooperative, would be inspected for Virus, usually involving a lengthy layover as all starship systems, personnel, cargo and equipment were inspected. Quarantine Transient Camps were hastily assembled all along the frontier to house these persons, who were detained as long as several years in some cases, because the flood of incoming traffic overwhelmed the shipping available to carry them deeper into the Domain.

Allies: It quickly became evident that the Domain could not create a Virus-proof barrier along all of its frontiers and that it must cooperate with its neighbors in order to keep Virus from overwhelming them all. Negotiations with the Aslan were the most pressing, as the Aslan's frontier with Virus was contiguous with the Domain's. However, Domain-Hierate relations had been quite sour since the onslaught of the *ihatei* fleets in 1119, and these overtures were initially met with suspicion and hostility. With time running short and in the absence of concrete Aslan cooperation, the Domain extended the Quarantine rimward into some frontier Aslan worlds, just in time to meet infected ships crossing the Great Rift via the mid-rift calibration points.

Desperate diplomacy, and last-minute assurances that the Domain would respect the integrity of Aslan populations within its borders, finally cemented the shotgun Domain-Hierate wedding, and joint Aslan-Domain forces were formed to defend the spinward termini of the great trans-rift trade routes in the Riftspan Reaches.



As it did with the Aslan, the Domain shared its knowledge and antiviral techniques with its other neighbors, most notably the Zhodani and Darrians. Although this information was also shared with the Vargr, the Domain never really trusted the fragmented and divisive Vargr to help maintain the Quarantine, and was forced to extend the Quarantine along its entire coreward borders.

By the end of 1131, the Quarantine had essentially assumed its current form, although a great number of procedures and protocols, especially between the neighboring powers of the Quarantine, had yet to be established. These protocols, and the rights and responsibilities of all those participating, were formalized in 1132 with the signing of the Spinward States Accords.

Regency Proclaimed

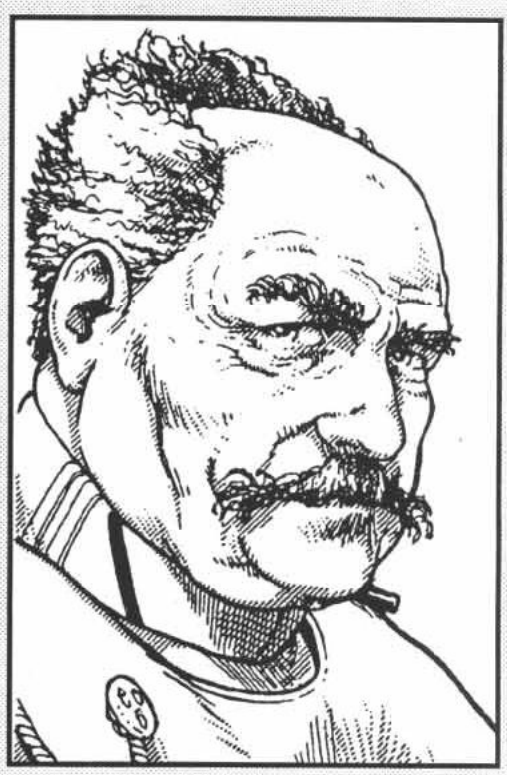
While the Spinward States Accords were being finalized, the Domain of Deneb became the Regency. Although in many ways this event was merely a cosmetic change, the very real significance of cosmetic changes in human affairs cannot be ignored.

The proclamation of the Regency served psychological and emotional notice to Domain residents that they had entered a new epoch of history, that things were no longer the same. This allowed them to make the kind of mental and social adjustments required for this new epoch. And by redefining the Domain's identity in a positive, independent way, connected to a cause, its citizens learned to no longer regard themselves as a small backwater province, cut off from and abandoned by the larger society that gave it meaning. Rather,

Norris Aella Aledon
The First Regent
Archduke of the Domain of Deneb, ***surrendered***
Duke of Regina, ***ceremonio vita***
Count Aledon, ***ceremonio perpetua***
Marquis of Regina, ***ceremonio perpetua***
Baron Yori, ***ceremonio perpetua***
OEG, OC, ODM

For most purposes, the story of the Regency is the story of Norris Aledon, both literally and allegorically. Norris was its guiding light, its conscience and voice for its first 25 years, and his vision has been maintained by his successors. Furthermore, his unassuming origins and his ability to shoulder unimaginable responsibilities when catapulted into a position out of keeping with any planned preparation parallels the way the Domain of Deneb was thrust in time of desperate war into the role of sole keeper of the Imperial legacy.

Born as the second son of the Duke of Regina, Norris was never trained for political leadership, and instead joined the Imperial Navy where he began a promising career in Imperial Naval Intelligence. However, the death of his older brother William in 1097, followed a year later by the death of his father, the duke, thrust Norris into a position he neither expected nor desired, but which would prove again the truth of the ancient wisdom, "There is no more fitting preparation for a king than to have been trained in the navy."



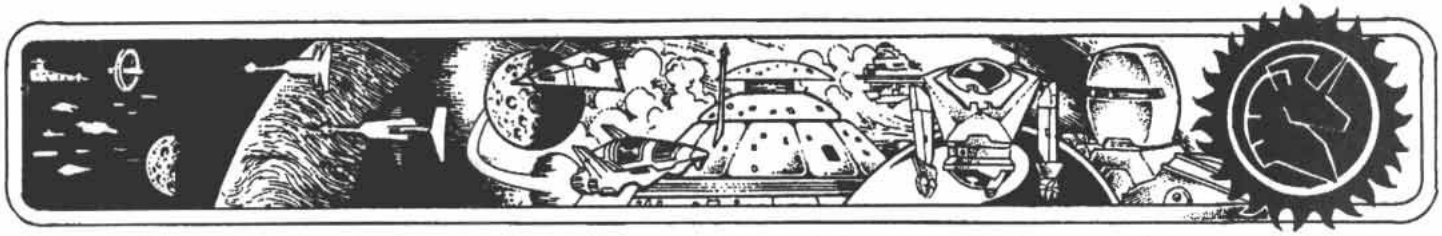
He proved himself a competent administrator, but it was not until the Fifth Frontier War (1107-1110) that his genius as both a strategic and operational leader became evident. Successfully anticipating the outbreak of war, Norris requisitioned naval reinforcements from Emperor Strephon which arrived in time to turn the tide. But before these forces could arrive, and in the face of disastrous early reversals for Imperial forces, Norris relieved Admiral Santanocheev, the incompetent Imperial commander, and took personal control of the Imperial campaign, setting up the final Imperial victory at the decisive Battle of Rhylanor (see **The Spinward Marches Campaign**, OP). Norris' ability to correctly anticipate and take confident, powerful measures, so amply demonstrated here, was to be tested again.

In 1116, receiving advance word of Strephon's popularly accepted murder, Norris took advantage of Imperial protocols and, in Strephon's name, elevated himself to archduke of the Domain of Deneb, thus ensuring clear, unified and foresightful leadership to meet the challenges ahead. This appointment was later confirmed by Emperor Strephon in 1126 (see **Survival Margin** page 52). This position allowed him to act decisively upon advance word of the Virus release, and he was able to organize the Domain to enact measures to meet and exclude this threat. Demonstrating his diplomatic talents, he was also able to recruit the neighboring Zhodani and Aslan governments to support the Quarantine which preserved the region now known as the Spinward States.

In 1132, following the successful completion of the Quarantine, Norris reorganized the Domain of Deneb as the Regency, a body which would continue on in the name of the Imperium until such time as the Imperium could be re-established. His attention was now focused on organizing the Regency to withstand the incessant attacks of Virus in the new form of sophisticated vampire fleets, as well as redressing the flaws of the Imperium which caused its ultimate fall.

Norris championed the values of honor, dedication and selflessness, and decreed that the Regency would move from a feudal polity to a more democratically based polity. He also repealed the psionic suppressions, opening the way for Regency psionics to provide additional help in maintaining the balance of power with the Regency's Zhodani neighbors.

Norris never married, and his unsuccessful attempts to find a partner and mother for his heirs became an increasingly sad story in the Regency news media. This eventually only added to Norris' legend by making him the father-figure who unselfishly gave up his own personal happiness for the sake of serving his people.



Norris never really recovered from the death of his trusted advisor Branj Dilgaadin in 1146, and it is believed that the long and close psionic relationship he had with his seneschal made it that much more difficult for him to form relationships later in life, most of all with marriageable women. Norris wrote an ode to Dilgaadin ("Ode to Old Chrome Dome") that was read at the private funeral service, a passage of which encapsulates these sentiments.

I never ruled alone through all the trials that we fought,
For you were there beside me; you knew my every thought.
Amid challenges and crises more than one man could withstand,
You were my second body; my unseen mind and hand.
But now your place stands empty, both without me and within,
And to rule alone is something I don't know how to begin.
I would find a queen, who like you, shares my purpose and my thought,
But how can I know another, when I know that she could not?

After the death of Avery in 1149, Norris lived out his final years with Seldrian on Mora and assisted in the upbringing of his "true grandson," Caranda.

Norris died in 1157, only hours after delivering his final address to the Regency (see page 4). He was succeeded as Regent by his true daughter Seldrian, whose succession was passed unanimously by the Imperial Senate.

Norris, much respected and loved while alive, became a mythic figure after his death. The name Norris and its variants (Nora, Norine) are extremely common among Regency citizens, especially those less than 45 years of age. All Regency worlds ever visited by Norris commemorate these visits by historical markers, Norris hotels, Norris streets, museums and "Norris slept/ate here" placards. Although technically the title "first regent" was intended to be used by all holders of Norris' office, to distinguish it from other high regents, etc., this title was not used by either of Norris' successors, allowing it to remain uniquely linked with the singular figure who created the office.

they now were the heart and soul of that larger society, and had a mission that ennobled their existence and exertions.

Finally, the redefinition of a domain of a larger Imperium as a separate regency would make it easier to institute the cultural and political changes necessary to adapt in this new environment. The change of name empowered Regency citizens to take hold of their destiny and make their own decisions without having to ask themselves if these decision were "proper" within the externally imposed Imperial framework.

"Starship"

"Starship" is a poem which achieved a great deal of popularity in the Regency during the Dream Time. It was written by then 2d Class Petty Officer Omar Assad following the Battle of Calibration Point Charlie in 1144. Assad was a sensors operator aboard the battlecruiser *Saratoga* and was inspired to write the poem by the sight of the destroyed Regency vessels that were left behind at the end of this deep interstellar space battle.

To devotees of poetry it was clear that Assad had been reading rather too much William Blake when he wrote this poem, but to most Regency citizens, who had never heard of Blake's 3900-year-old work, the piece captured the sadness, poignancy and fear felt by those living in the last surviving pocket of civilization, surrounded by, and daily threatened by, the yawning chaos that surrounded them.

Starship, starship, burning dim on the fringe of the outrim
Did you crew have some last word? A final plea we never heard?
Your fusion-blackened hull betrays no sign of life from former days
We stand away to jump for base, leaving you alone in space
Your corpse a monument for some, for some a crematorium.

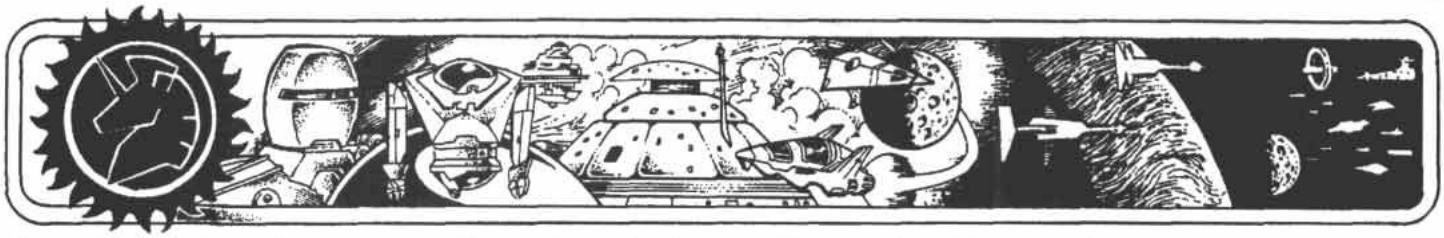
Starship, starship, spewing fuel, your twisted wreckage growing cool
Did your captain try to shout before your engine decks blew out?
Or did some practiced watchman's eye discern that he was soon to die?
We wish to know what you could tell of when your crew was blown to hell
Some simple message we would find, to pass to those they leave behind.

Starship, starship, drift away into a place that knows no day
We wonder on the men you bore who fought beside us in this war
It would be simple to forget your crewmen whom we never met
But we'll remember, as we should, our comrades in this brotherhood
of quick cold death between the stars, for their sad fate will soon be ours.

Starship, starship, save a berth for us, lost children of the Earth
You drift from sight but not from mind, for someday we'll be left behind
to seek an entrance to the home where now our missing comrades roam
We'll burn with pale fire—wan and thin
Please guard the door, and let us in.

The popular success of "Starship" allowed Assad to retire from the navy and pursue a career as a popular poet, publishing such best-selling collections as *The Watson Weddings, Battleline Ballads and Divisional Ditties, Islands in the Creek* and *Leaves of Sassafras*, which again raised the hackles of critics, who began referring to him as, "The Rod McKuen of the 57th century." This is because the one thing that critics like better than running people down is making obscure references that no one but they can understand.

Final Adjustments: Another accomplishment of the renaming of the Domain was the opportunity to redefine the status of disputed or Border Worlds and client states starting from "a clean slate." Rather than carrying over generations-old Imperial territorial disputes into the new regime, Domain worlds and all worlds on its borders were given the "option" to join the new organization. Although key border areas were given as much freedom as possible in this area, in some cases the Domain resorted to subtle or overt arm-twisting. In extreme cases the Domain/Regency simply incorporated unwilling worlds as "Unintegrated Territories," meaning that the worlds were nominally independent but that the Regency exercised the principle of eminent domain to take the world within its defensive perimeter. In other words, given the clear and present danger to civilization presented by Virus, someone had to take the responsibility of integrating Border Worlds into an effective protective regime, for the good of all intelligent life. In cases where recalcitrant worlds were unable to see to these requirements on their own, it fell upon the Regency to do what needed to be done, for, as Regency leaders were fond of repeating, "the Quarantine is only as strong as its weakest link."



One of the most powerful inducements that the Domain/Regency could offer was its anti-viral expertise, and its offer to include a world under this umbrella was an opportunity that could not be passed over lightly. This was especially true when envoys pointed out that the alternative was to be left outside the Quarantine to fend for oneself. Another factor that ironically strengthened the Regency's bargaining position was its simple desperation for success. This desperation led the Regency to grant favorable terms to prospective members that made membership much more attractive to worlds which had repeatedly declined Imperial allegiance. The clearest example of this was the incorporation of worlds that contained significant groups of Vargr invaders or Aslan "squatters," still fighting for control of the world with its rightful Imperial inhabitants. Since approaching Virus allowed neither the time for lengthy settlement of these disputes nor the luxury of leaving embattled worlds as the weak links on the Quarantine frontier, the Regency was obliged to "agree to disagree" and accept the Vargr and Aslan territorial gains as a *fait accompli*. This acceptance legitimized these gains and obligated the Regency to extend the former invaders the same rights and support as any other Regency citizen. This would eventually put the Regency in the distasteful position of defending the newly legal Vargr and Aslan gains against the very Imperials who had been displaced from them.

Spinward Border

During this same period the Sword Worlds observed the Regency's forthcoming policy toward already entrenched rivals and attempted to take advantage of this opportunity by launching invasions on a number of worlds on the Imperial frontier, including the Border Worlds, Entropic Worlds and several Imperial worlds. These invasions were small and were intended get the Sword Worlds' "foot in the door" on these worlds so that the Domain would be obliged to recognize and accept these claims in perpetuity.

The Domain was hoping to incorporate the Border Worlds into the new Regency, but at the time of the land-grab these details had not been finalized. Keeping the Border Worlds under Domain/Regency control would greatly simplify the defense of the frontier and allow better connection with Darrian holdings, but incorporating former Sword Worlds territory into the Regency was dangerous, as it would attract internal conflict. This perception was both confirmed and rendered irrelevant by the land-grab.

Recognizing the Sword Worlds' act as one of crass opportunism based on their interpretation of Domain weakness, the Domain determined that a clear show of resolve was necessary and decided that it was time to slap the Sword Worlds down hard. Improved Domain-Zhodani relations since 1123 made this act possible, as

Imperial forces in the past had been deterred from acting against the Sword Worlds by the Sword Worlds' ties to the Consulate as members of the Zhodani-led Outworlds Coalition.

Acting with the assistance of Darrian forces, and after dispatching guarantees to the Zhodani that no acts would be taken against them, Domain naval and Marine forces crushed the Sword Worlds forays and occupied an additional seven of the Sword Worlds, including the entire Gram arm (see page 45). Reasoning that since the Sword Worlders would cause trouble no matter what and it would therefore be best to keep a close eye on them, the Domain elected to incorporate all the occupied Sword Worlds and Border Worlds into the Regency.

War of the Quarantine, 1131-1201

The War of the Quarantine was the constant background that accompanied all other events of the Regency's history and underscored the precarious nature of the Regency's existence. Just as Virus caused the founding of the Regency, its continued influence on it in the form of the Quarantine War was the major shaping influence on the Regency in its first 70 years. The lives of almost all Regency citizens were touched by it in some way, either by family service along the Quarantine line or a career spent building the tools of the Quarantine: starships, spacecraft and their systems. And although the Quarantine War gradually became business as usual, something the average citizen could take for granted, the total number of Regency dead after 70 years of unremitting diligence was staggering—more than all five Frontier Wars combined.

Starship Shortage: One of the most shocking revelations of the early Quarantine was the tremendous shortfall in spacecraft required to maintain it. Warships and system defense boats were required to guard each of the refueling points in each of the systems along the frontier, in sufficient force to at least slow down incoming vampire ships. Starships were required to make pre-emptive sweeps through the Wilds. Ships were also needed to man the less dangerous but still necessary borders with the Regency's Spinward State neighbors. Couriers and Xboats were required to maintain communications among the Quarantine force and maintain timely communications within the Regency so that worlds would not be surprised by vampire breakthroughs. Furthermore, wartime losses to all of the above forces needed to be constantly made up in a timely fashion. Finally, in spite of these drains on available shipping, large numbers of merchant vessels were needed to maintain the Regency's commerce.

These needs were met in several ways. First, most privately owned military vessels, such as the famed "Route Protectors" of the Al Morai shiplines (**The Spinward Marches Campaign**, OP), were nationalized. These were either taken over by Navy and Scout crews or retained their former crews, now direct-commissioned into the Domain armed services.

Second, the Regency's shipbuilding industry was carefully organized and husbanded by the new Ministry of Shipping. The ministry identified existing construction capabilities that could be rapidly converted to useful projects without the delay and waste necessitated by wholesale redirection of industry from the ground up.

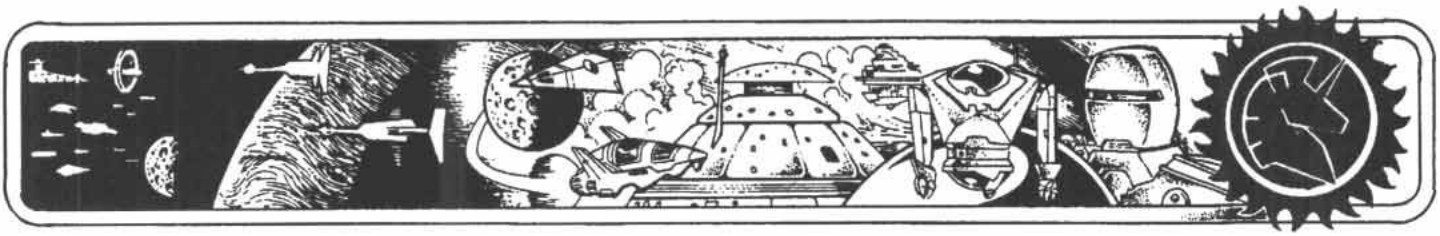
Two examples of this approach are the *Cuspid*-type gunboat and the jump-capable boat (pages 90 and 88). The *Cuspid*-type gunboats were adaptations of the standard 10-ton launch, already in production in vast numbers by many Regency yards. Rather than taking years to convert these yards to the production of expensive, time-consuming, and labor-intensive purpose-built fighters such as the Rampart (see **Brilliant Lances Technical Manual**, page 48), these yards were able to begin manufacturing *Cuspid* components almost immediately, and existing stocks of launch spares could be used for the new gunboat type. The jump-capable boat was similarly derived from a standard small craft, the 30-ton ship's boat. The use of the jump boat to supplement and replace the admittedly more capable Xboats allowed shipyard capacity previously used for the larger Xboats to be used for needed warship construction.

Another ministry policy was to carefully *limit* the pace and extent of modernization of the Regency's shipbuilding industry. While decades of advancing Regency technology would have permitted the upgrading of many TL15 shipyards to produce TL16 vessels, these upgrades would have caused a serious disruption in output, and the new high-tech vessels would have been technologically incompatible with the Regency's nearly homogeneous TL15 forces, and would have required the creation of a new TL16 maintenance and support infrastructure in addition to the existing TL15 facilities. Furthermore, the production of the innumerable one-off TL16 prototypes required to learn how to properly manufacture and use this new technology would have been wasteful and duplicative. Modernization efforts were instead focused on bringing worlds up to TL15 levels rather than further advancing existing TL15 facilities.

Small-scale TL16 programs were undertaken, both to ensure technological supremacy and to discover useful TL16 systems that could be adapted to other platforms, but these were carefully managed. These were typically joint Darrian-Regency programs, using known-successful Darrian TL16 artifacts as goals, rather than requiring Regency engineers to conduct time-consuming TL16 basic research. The highly successful 500-ton Darrian patrol cruiser (page 92) is a prime example. The DPC is based on long-established Darrian designs and is also produced under license in the Regency for the Regency Navy and Quarantine Service.

Finally, the Regency has made extensive use of reserve forces, primarily via the RQS. The RQS offers subsidies for the private construction of military-capable starships (usually armed or upgraded merchant types), and thereby can call up these vessels and their crews for temporary RQS duty (see page 19). The RISS also maintains its long-standing policy of maintaining an operational reserve force of detached duty scout/couriers. Finally, all personnel who have served in the Regency Navy or Scouts can expect to be recalled for Quarantine duty.

The effects of the starship shortage continue to this day and can be seen in the rarity of TL16 starships and shipyards in the Regency, as well as the great age of the Regency starship fleet. Most starships not destroyed in the past 70 years are still in service, and a large portion of these are still committed to supporting the Quarantine.



Regency Frontier: A Virus-tight Quarantine cannot be maintained along a single thin line. The ability of starships to jump over defending lines requires a defense in depth. This defense in depth was achieved by the creation of the Regency Frontier, which was largely in place by the end of 1133.

The Frontier has an average depth of three to four parsecs, with the outer edge being the beginning of the Wilds proper and the inner edge being the actual Regency boundary, what is referred to as the Regency Safe Area, or "Regency Safe" for short.

The outer edge is the limit of permanently stationed RQS pickets, not the limit of RQS patrols. RQS "deep sweeps" routinely range several parsecs into the Wilds, flushing out known and likely avenues of approach and sometimes planting ambushes at key refueling points.

Abandonment: The principle side effect of the establishment of the Frontier was the Abandonment. Because the worlds beyond the safe boundary could not have their safety guaranteed, a massive evacuation of their populations began in 1133 and had reached its peak by 1136. The Abandonment was supported by the Regency Navy, which organized convoys of troop transports to bring the emigrés to safety within the Regency.

Here they were initially deposited on a number of Regency-designated "Refugee Worlds" in the trailing subsectors of the Regency. Many millions of them were relocated by the Regency to other worlds, notably the former Border Worlds of the Sword Worlds subsector (page 45), and the *ihatei*-settled worlds along the thinrim. Here they provided a loyal counterbalance to the volatile Sword

World and Aslan populations.

Although in this and other ways the emigrés were encouraged to seek lives throughout the Regency, it was inevitable that a large percentage of them never made it beyond the Refugee Worlds. Even in 1202, millions still live in the maze-like warrens of refugee shantytowns on the Refugee Worlds, where Vargr organized crime (see page 29) maintains a firm foothold.

Rape of Trin: The Rape of Trin in 1139 (see pages 51 and 80) brought home the danger of Virus and the importance of maintaining the Quarantine and close relations with the neighboring Aslan and Zhodani. It also contributed directly to the Regency's annexation of the Islands subsectors the following year.

Annexation of the Islands: The Islands subsectors (see pages 33-34 and 72) had been a source of concern to the Quarantine since its establishment. However, its eight-parsec separation from the contiguous Imperial Wilds were thought to make it relatively safe from vampire attack, and its further seven-parsec separation from the Regency frontier in the Usher subsector made it possible for any infestation to be sealed off by Regency forces.

However, the sophistication demonstrated by the *Kishkii* attack of Trin called these assumptions into question. A vampire fleet could clearly mount a multi-staged crossing of the Great Rift and, once established in an area the size of the Islands, would be difficult to eradicate. Vampire fleets could then use the Islands as a staging area right on the doorstep of the Regency to launch regular incursions into Usher subsector. The fact that the Islands had been engaged in more or less continuous warfare since 1106 made it unlikely that its worlds could mount a united front against a vampiric attack and made the worlds that much more susceptible to infection.

For this reason, the Regency annexed the Islands in 1140, occupying them with Navy and RQS forces and declaring an end to the so-called Consolidation Wars. Regency forces remain in the Islands in 1202, both to maintain the Quarantine and to enforce peace in the Islands.

Psionic Renaissance

Norris had long been committed to at least the partial repeal of the Psionic Suppressions. This was clear from his close relationship with his telepathic seneschal, Branj Dilgaadin, but these sympathies date back to his naval intelligence career. The Imperial Navy prudently maintained psionic research at several points in the Imperium, including at least two points in the Domain of Deneb, and Norris became aware of the capabilities that could be provided by a psionic program.

This awareness became even more acute after he became sector duke, as he had to contemplate political relations and even war with the Zhodani Consulate just a few short parsecs away. Facing an opponent that had mastered its psionic potential, the Imperium could ill-afford its continued disregard of psionic power.

However, introducing psionic programs into the anti-psionic Imperial culture would be difficult, and it was only after Norris had begun the recasting of the Domain's self-image as the new Regency that he felt it was possible to take the step of psionic reform. The indispensable feature of any such effort would be to somehow circumvent generations of mistrust and suspicion of psionics. Norris believed that only a program of radical openness would achieve that goal, and he assigned Dilgaadin the task of fleshing out the concept. The plan was announced as Regency policy in 1133 as the Psionic Reforms. See page 14.

Representational Reforms

The rapidity with which the Imperium split into warring factions demonstrated that the Imperial culture had ceased to be a sufficiently unifying force in 1117. The message to Norris was clear: A healthy interstellar society required strong forces of loyalty that ran both up and down through the political hierarchy. Notions of democratic reforms and home rule had attained some currency among the nobility in the Imperium's last years and were particularly championed by Dulinor the Black before he touched off the Civil War.

Some progress had been made in that area, with Strephon's resurrection of the domains and their archdukes. Norris' own experience with the importance of being free to wield unified power in response to local conditions ratified the principle of the domains, and the Collapse only seemed to make these principles more relevant. The speed and destructiveness of Virus would not allow slow, centralized, coordinated responses to succeed. Success against Virus required that local leaders have the authority to act quickly and decisively, but it was even more important that local groups of worlds have the cohesion and unity to act in common cause without hesitation. Such cohesion could only grow from the ground up and could not be imposed by the nobility. This meant democratic reforms, and on a more basic level than even Dulinor had contemplated.

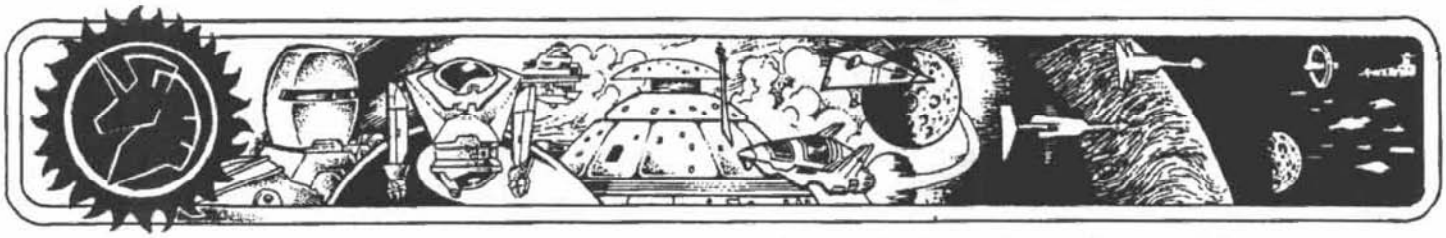
The need for democratic reforms was intensified by the Vargr and Aslan *faits accompli* of 1132. The lavish concessions to the invaders demanded some compensation to these worlds' original rulers. The granting of popular political representation would provide some of this compensation and would be a mechanism for the venting of some social pressures.

These changes would be even more difficult than the Psionic Reforms because they would challenge the entire Regency noble class, accustomed to privilege, comfort and power, and entrenched in these patterns by centuries of tradition. Norris quietly began negotiations with key nobles, and slowly and painfully developed a plan for the transfer of power and a coalition of nobles which would support it.

Finally, almost 20 years after the dramatic Psionic Reforms, Norris' coalition was in place, and the last major achievement of his life, the Representational Reforms, were underway. See page 16.

Succession

Five years after beginning the Representational Reforms, Norris died at the age of 94. He had seen his Spinward Marches, his Domain of Deneb, and finally his Regency through what were probably the most sweeping changes witnessed by a single leader and his subjects over a span of years.



One of the major themes of Norris' long rule was speculation over when he would finally get himself a proper heir. As it turned out, Norris never married, and his heir remained his "true daughter" (clone) Seldrian.

However, in the late 1130s, public anticipation began to mount that there might in fact be a dramatic development in the succession issue. The boy Avery, who had been brought back from Strephon's stronghold aboard *Arrival Vengeance* in 1126 and adopted by Norris, was long thought to be someone special. This was confirmed in 1139 on his 21st birthday when it was revealed that he was the son of Strephon, last emperor of the Imperium, and Avery took his rightful family name, Alkhalikoi, replacing the Aledon he had used as Norris' adopted son. The news that the rightful heir to the Iridium Throne of the Third Imperium lived in the Regency and had ties to the family of the First Regent was met with almost child-like excitement throughout the Regency.

The public's fondest hopes were realized in 1144 when Seldrian Aledon and Avery Alkhalikoi were married, bringing the Alkhalikoi and Aledon lineages together. However, after only two years it was clear that this marriage of state was not in fact a true marriage on the personal level. Nonetheless, in 1147 Seldrian and Avery produced a son, Caranda, who, as both an Aledon and Alkhalikoi, tied up the literal and figurative natures of the Regency and Imperium into one neat package.

Norris was succeeded upon his death by Seldrian, who ruled alone. Avery did not live to serve as regent consort, regent, or even emperor as many had speculated, as he had died in 1149.

Seldrian served until 1190 when she died at the age of 93. She was succeeded as Regent by her only son, Caranda Aledon Alkhalikoi.

Trepidation

Responding to signs that the Regency had done just about all it could do as a closed economy and was beginning to stagnate behind its walls of Quarantine, Caranda began preparing his subjects to face their inevitable return to the Wilds. The culmination of this effort was the 1196 referendum on opening the outrim frontier to allow exploration and expansion into Corridor. The issue was voted down by a solid majority, but the referendum had the intended effect of opening public debate, which was not stilled by the end of the voting.

Zhodani Exodus

Although the Zhodani were the traditional bogeymen of the spinward Imperium, events since the Civil War and Collapse brought a dramatic reversal in this relationship.

Successful talks between Domain and Consulate leaders in the pre-Collapse period reassured the Imperials that they did not have to fear a Zhodani deathstroke that would finish them off in their weakness and isolation. In fact, the Consulate was comfortable with its Domain-sized neighbor and had only fought five wars as an effort to forestall the Imperium's seemingly unquenchable thirst for expansion.

With the establishment of the Spinward States protocols, the Zhodani were the Regency's second most cordial neighbors, ranking only after the long-friendly Darrians.

However, all this changed in 1201, along with the Consulate's status as the most stable (almost fossilized in its well-adjustedness) of the Spinward States. Regency leaders now openly refer to the once-feared and always respected Consulate as the "sick man" of the Marches.

In 1201, quite without warning, the Exodus began. Since then an estimated 30 billion Zhodani refugees have poured into Regency space, still without an explanation from the Consulate's leaders. This influx is placing a great strain on resources in the core-spinward corner of the Imperium, particularly in the Jewell, Regina and Vilis subsectors. Small worlds are being overwhelmed by the continuing flood of hungry mouths to feed. These refugees jump right over the Zhodani-Regency frontier, violating the Quarantine protocols long respected by both sides.

The Regency's current policy is humanitarian and committed to caring for the obviously genuinely suffering people. But the questions remain: How many displaced Zhodani can the Regency absorb? What is causing this? And when will it end? Regency leaders have thus far been unable to determine if local Zhodani authorities are concealing the details of this upheaval or if they themselves are also in the dark.

Biting the Bullet

Six years of debate since the first referendum and the impetus of the Zhodani Exodus caused the Senate and Moot to approve, on 191-1202, a limited opening of the Regency Frontier in the Antra, Namidshur, and Usani subsectors of Deneb (pages 54, 58, and 62). This opening is one-way only: Traffic can move out, but is still carefully controlled coming back in by full Quarantine procedures.

The joint Senate-Moot act required the RQS to respond with a plan within 60 days and to begin implementing the final approved plan within 120 days, by 311-1202.

Avery Aledon/Alkhalikoi

For the first few years after his arrival in the Domain aboard *Arrival Vengeance*, (see ***Arrival Vengeance*: The Final Odyssey**, SA, and **Survival Margin**) Avery's identity was a mystery. He was duly adopted by Norris, and assumed the name Aledon. On his 21st birthday, however, his identity as the son of Strephon and Iolanthe (the latter posthumously, via frozen ova stored aboard Strephon's entourage fleet) was announced, and he took on his rightful family name, Alkhalikoi, the line of Imperial emperors from 629.

At that time Avery had already been serving for two years as High Regent for Technological Assessment, as he had a facility and consuming passion for such topics as psionics and artificial intelligence. In 1144 he additionally became the Heir Consort upon his marriage to Seldrian Aledon. The marriage was not a success on a personal level, and Avery spent most of his time away from Mora, involved in his duties as High Regent until 1149. In that year, while participating in a demonstration of computer-enhanced artificial psionics, Avery was killed by a hardware failure.

Following his death, the following document was leaked to the press. It was said to be a note from Strephon given to Seldrian for safekeeping during the *Arrival Vengeance* visit to Usdiki in 1126.

My Son,

How can I atone for the sin I have committed? You, my only son, the gift from beyond the grave of your beautiful mother, how could I do this to you?

I can only answer, "How could I not?" Only my son could understand in the same way what I have seen, and carry this understanding to where it will be needed.

Perhaps someday you can understand that I have only used you as I have used myself, to be the instrument of the salvation of these people. I am nothing, Avery, if I am not the servant of these people, the children of my Imperium. Eleven centuries of history and untold trillions of lives spent in its creation have made me transparent. And you, unfortunate heir to my burdens, have become transparent as well, and at my hand. Please forgive me for loving you as only an emperor could love the son to which he entrusted the future.

Psionics in the Regency

Psions and psionic talents are now an accepted part of Imperial society in the Regency. Regency psions are still relatively few in number, but this is not because of latent anti-psionic prejudice. It is simply the result of the newness of the field in Imperial society and the lack of any traditions of psionic development and pursuits. Psions can be found everywhere in the Regency, and most worlds with starport class B+ or a population code of 8+ have at least one psionic school. Unlike the old Imperial Psionic Institute, these psionic schools are well-known public institutions.

Psionic Registration and Regulation

Regency law does not require psionics to be registered or licensed, but Branj Dilgaadin's leadership of the Psionic Renaissance established a code of honor and personal responsibility among Regency psions that demanded voluntary registration and licensing. For the Regency to have required such measures would have merely perpetuated Imperial anti-psionic prejudices and kept the psionic movement underground. But universal voluntary registration reinforces the public trust of psions that is necessary for them to exist in Imperial society.

Registration simply means that the psion is officially registered with the Regency government as a psionic talent (these records are maintained by the Ministry of Psionics at its main and local offices, and are freely available to anyone who requests them). However, in practice psions extend this principle to make sure that their behavior or appearance makes it clear to all they meet that they are psions.

There are three types of licences—basic, advanced and special.

Basic Licenses: The basic licenses consist of the five basic psionic cascade skills (TNE page 248)—Telepathy, Teleperception, Telephysics, Teleportation and Self—plus specific licenses for each Arcana area, such as Computer Empathy, Psionic Healing, Prescience, etc. These licenses document that the psion has a basic ability in the licensed area and is pledged to only use them in permitted ways.

All basic licences automatically include the pledge to not use these talents improperly. (For example, telepaths are prohibited from reading thoughts of those who have not requested this, but may freely use the life detection cascade. Teleperceptives are not allowed to spy within private areas, but are allowed to look forward to determine traffic conditions, see if one's co-worker has arrived at the public office, and so on.) It is a testament to the quality of Dilgaadin's leadership and the mettle of his disciples that these pledges are widely accepted and trusted throughout the Regency.

Advanced Licenses: Advanced licences document that the psion has achieved a higher level of proficiency in the licensed area, and authorizes the use of that skill in established procedures at the professional level.

For example, a psion must have an advanced license in Psionic Healing in order to practice psionic medicine; a psion with only a basic license is not sufficiently qualified to do this safely. However, a basic license does allow a psion to use Psionic Healing in emergencies or when requested by another.

As another example, professional psionic interrogators working for police departments are required on most worlds to have an advanced license in Telepathy, while basic licenses are widely used by psionic journalists to psionically interview subjects who have given them permission to do so.

Special Licenses: These generally allow the psion broader latitude in using a psionic skill under certain specific circumstances. Special licenses have very clearly defined intents and particulars, and the psion is bound to obey both the letter and the spirit of the rule.

Police departments and military units employ telepaths and teleperceptives to hunt for criminals or enemy forces, or in routine patrols to check to see that nothing is amiss. These tasks require the psion to hold a *current* special license for this use, and this license clearly prohibits the psion from spying on his neighbors outside of the line of duty. Special licenses are subject to periodic review and renewal, and can be revoked for misuse or upon the termination of an assignment when it is required.

Telephysics is often used by psionic healers to manipulate internal organs or destroy tumors or diseased tissue by pyro- or cryokinesis. However, this use requires a special license which must be periodically renewed by demonstrating continued facility with these tasks (in this case, Telephysics *asset* of 10+).

Some elite military units include psionic "snipers" who use pyrokinesis or assault in a lethal or disabling manner against enemy soldiers. These snipers require a special license to allow them to use these powers in a harmful manner against other persons. These licenses are automatically rescinded at the conclusion of the combat tour or term of duty.

Official RQS Virus inspectors require a special license in Computer Empathy to declare electronic equipment clean of Virus; an advanced license is not good enough for RQS standards. This license must also be tested for renewal (requiring success at a series of Computer Empathy tasks on appropriately configured test equipment). The lack of such a license does not prohibit a psion from *attempting* to scan for Virus; it simply prevents him from holding such a highly responsible job.

Referees can use the above examples to define their special licenses.

Game Effects: In game terms a basic license is granted for skill level 1 in a psionic skill. In game terms, an advanced license is granted for skill level 3+ in a psionic skill. Special licenses are granted as required by a psion's duties (referee's discretion; this will also be discussed in detail with the future publication of detailed psion character generation procedures).

As part of the psi reforms, the Regency has instituted severe penalties for the misuse of psionic talents down to the level of simple nuisance eavesdropping and peeping-tomism using the Telepathy and Teleperception skills. Although such misuse is difficult for nonpsions to detect, psions find it easier to notice these things, and are oath-bound to prevent, report and correct such actions (*referees only: see page 83*).

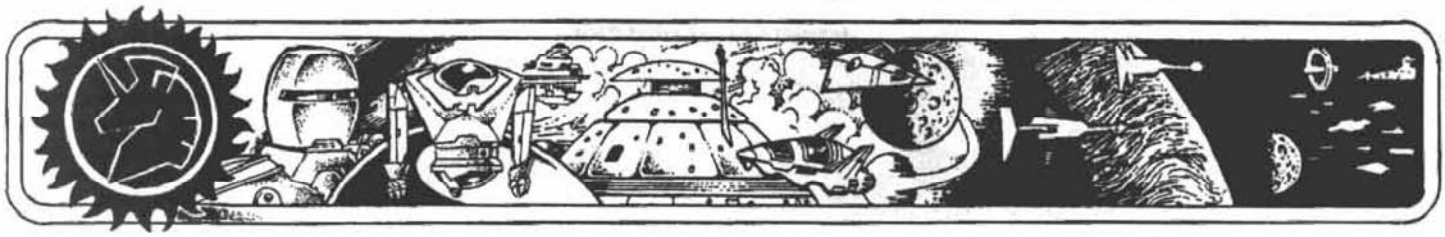
Psion's Oath

I am a human, I am a Regency citizen, I am a psion. I am a person to be trusted.

I possess a gift that is not easily understood and which would be easy to abuse. While this gift does not make me greater than anyone else, it does require me to abide by a higher standard which forever binds me to defend my society from any who would abuse these gifts.

If any psion lies, we are all liars. If any psion abuses society's trust or misuses his gifts, we are all guilty. I am my brother's keeper, as well as the guarantor of his freedom.

I will not lie nor take false vows, and I will not tolerate those who do. I will not use these gifts for personal gain or amusement, and I will not tolerate those who do. I will not exceed the bounds rightly placed on me by my society, and I will not tolerate those who do. I will not condone dishonest acts by silence or willful ignorance.



I will use this gift for the benefit of humanity, of all persons, of society, and of all life. I will treat all life, in my own person or that of any other, with compassion. I will gladly die rather than betray a rightful trust. I will gladly die rather than give up my honor, or needlessly destroy that of another. I will gladly die rather than forget this oath.

I am a psion, I am a Regency citizen, I am a human.

I am a person who can be trusted, or I am nothing.

Appearance

Virtually all human Regency psions maintain the style of a completely bald or mostly bald head (by shaving, depilatories or permanent electrolysis), decorated by numerous intricate tattoos. "Mostly bald" includes such variations as tonsures,

topknots, sidelocks or ponytails. Some of these variations are the unique "uniform" of certain psionic schools, while others are simple self-expression. The exceptions to the rule of baldness include criminal psions, nonhuman psions such as Droyne, and military and covert special operations psions who are required to be unidentifiable. Elderly psions whose psionic strength attribute has fallen to ineffectiveness will often grow their hair back (although this is not always possible...) to demonstrate the loss of their gift.

The tradition of baldness serves four purposes. The first is to make psions immediately recognizable to society at large. This openness serves as a "lightning rod" for popular fear, as people who are so up front about who and what they are can hardly be up to anything devious.

Second, the bald tradition is a deliberate tribute to Branj Dilgaadin, the founder of Regency psionic culture, who was naturally bald.

Third, the bald head is a source of pride. By calling attention to the braincase, the style says the psion has tapped into mental powers that most people cannot access. It is believed that the turbans worn by Zhodani nobles accomplish the same purpose by exaggerating the size of the head.

Finally, the bald head is necessary to allow the tattoos to be visible to society at large.

The tattoos are graphic and artistic forms of the licenses which the psion has obtained, plus some personal embellishment. This serves the same purpose as the baldness itself, but in a more detailed way, by allowing strangers to assess for themselves the significance of being in the same room as a psion. For example, a person embarrassed to have his mind read would be reassured to see that the psion in the elevator with him only held Teleportation and Self licenses. By the same token, the presence of an advanced Telepathy license proclaims that the psion is not attempting to conceal his ability and has taken oaths to not spy on his neighbors, and this provides some reassurance. Finally, the presence of the special license for a police department Telepathic scanner could be comforting to law-abiding citizens who know they have nothing to hide and who appreciate knowing the psion will be able to detect the intentions of any criminals in the area before they have a chance to commit a crime.

The association of certain combinations of licences with certain schools often allows the informed observer to determine the school to which a psion belongs by the pattern of tattoos. For example, devotees of the School of Listening would most often have Telepathy and Teleperception license tattoos, and hardly ever have Teleportation or Arcana licenses. Many schools also use distinctive variations or distinctive placement of the license tattoos to increase their identifiability and *esprit*. Some special licenses are accompanied by tattoos, while some are not. Special licenses of explicitly temporary validity are usually not tattooed, while those expected to last for the duration of a career usually are.

On the other hand, some temporary special licenses are of such social significance that tattoos are required. These include the special license for telepathic or teleperceptive surveillance, and the medical and lethal military use of Telephysics. (Permissible exceptions to this include certain special Regency military and intelligence personnel. An undercover agent bears no tattoos and grows his or her hair normally for obvious reasons. In addition, in wartime some military special licenses are not tattooed as they can make their owner subject to execution, mistreatment or extensive interrogation if captured.)

Special license tattoos are not removed when invalidated, but are instead modified by a cancellation tattoo. In this way ex-military psions are easily recognized by their cancelled military psionic specialties.

As with the baldness, the tattoos serve a social purpose in the Regency: to defuse popular fear and suspicion of these mysterious talents by not hiding them.

Psionic Training in the Regency

Because each nonhuman race handles psionic powers differently, the guidelines below refer specifically to human characters. Referees can combine these with TNE alien psionic rules to allow the training of alien psions in the Regency.

To simulate the number of new schools of psionic discipline in the Regency, psionic training is handled in a slightly more detailed fashion. Rather than using the generalized psionic institute training beginning on TNE page 247, Regency PCs may choose a specialized school of psionics at which to take their training. Because each school specializes in certain aspects of psionic pursuit, certain talents will be easier to obtain in some schools and harder in others. Thus the aspiring psion will wish to choose a school with a curriculum in line with his or her desires.

Each psionic school has a total 1D6 *adjustments* which can be made to the normal rolls for psionic talents found on the table on TNE page 248. Each adjustment allows the target number for a given psionic talent roll to be decreased by one. Multiple adjustments can allow reductions in several target numbers or allow a single target number to be reduced several points. However, each point of downward adjustment on a target number must be balanced by the one point *increase* of another target number. Thus the total of all six target numbers must always equal 42.

No target number can be increased above 12, nor reduced below 1.

Presented on the table below are the normal target numbers from TNE page 248 and those of three sample psionic schools: the School of Listening (3 adjustments), the School of Self Awareness (5 adjustments), and the Regina Circle of Mysteries (6 adjustments).

The cost for this specialized training is adjusted accordingly, by increasing the cost by 10% for each point of adjustment offered by the school. Thus training at the School of Listening in our example would be Cr130,000, the School of Self Awareness would be Cr150,000, and the Regina Circle of Mysteries would be Cr160,000.

Talents	*Normal*	*SL (3)*	*SSA (5)*	*RCM (6)*
Telepathy	5+	3+	7+	7+
Teleperception	6+	5+	7+	8+
Telephysics	6+	7+	8+	8+
Self	7+	7+	6+	5+
Teleportation	9+	10+	7+	9+
Arcana	9+	10+	7+	5+
TOTAL	42	42	42	42

No roll is required to find a psionic school ("institute" in TNE basic rules) in the Regency as they are no longer secret. Psionic schools exist on almost all high population worlds and those with starports A or B.

Nobility in the Regency

DECLINE OF THE NOBILITY, RISE OF DEMOCRACY

An ironic aspect of the Representational Reforms is that these reforms, which began the end of noble rule in the Regency, were declared by Norris using the vestiges of his noble office. These reforms were not created by Regency-wide referenda, but by Norris' *fiat*, behaving in a manner consistent with his former status as archduke.

Noblesse Oblige

For the best of the nobles, the reforms have created no problem. They have been raised in the tradition of service, and it is for this reason only that they have had life-long advantages of education, wealth, etc. Even in a post-noble environment they know that they are above the average person in intelligence, education and skills, and will have no difficulty competing in an open meritocracy. What's more, the fact that now they will receive remuneration as compensation for public service instead of being obligated to a life of public service in response to being born into a life of automatic remuneration is a distinction without a difference to these finest nobles.

Anagath B and the Ghouls

One of the most visible symbols of the disenfranchised nobility are the so-called "Ghouls," young (by apparent age anyway), nihilistic, disenfranchised nobles who spend their dissipated lives and what remains of their noble fortunes by seeking excitement in personal and vicarious near-death experiences.

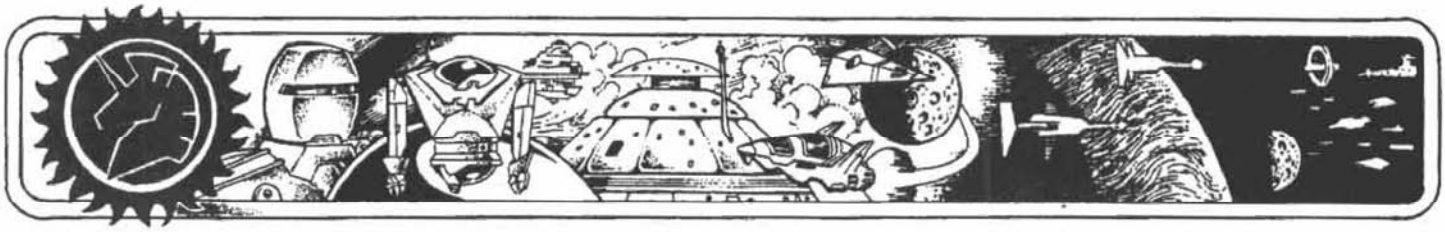
The Ghouls owe their existence entirely to the creation of the drug "Anagathic B."

Anagathic B, also known as Anagath B or "Beth," was developed in the antebellum period by researchers at the Imperial megacorporation SuSAG, LIC. These researchers were looking for an alternative to the standard anagathic drug used in the Imperium (and described on TNE pages 33-34) that would accomplish the same purpose but without the ultimate side-effects.

They seemed to have discovered this alternative, which they named Anagathic B, making the earlier drug Anagathic A. Anagath B produced none of the side effects of Anagath A, but it was eventually determined that Anagath B caused the development of radical jumpspace intolerance in its users.

Jumpspace intolerance is a fortunately rare hereditary condition that has long been known to Imperial medicine (see **Lady Elise**, included in the **Traveller Referee's Screen**). Instead of the typical moment of nausea and disorientation experienced by most passengers at the moment of jump translation, sufferers of jumpspace intolerance become seriously ill. A sufferer who is repeatedly exposed to j-translation falls victim to increasingly debilitating symptoms and eventually dies from their effects.

Unlike hereditary intolerance, anagathic-derived intolerance is not accompanied by progressive debilitation but has an all-or-nothing effect. Either the user dies immediately from massive brain hemorrhaging or else suffers no ill effects. However, also unlike hereditary intolerance, derived intolerance can be fatal upon the very first exposure to jump translation. This chance is low for beginning users, but gradually increases over years of continuous use. (Roll D100 each time the character enters jumpspace aboard a starship. If the target number, which is equal to the number of years the character has been taking Anagath B, or less is rolled, the character dies immediately. If any other number is rolled there is no effect.)



This is a serious side-effect, essentially confining its long-lived users to imprisonment in one star system for the remainder of their lives. For most Imperial citizens this was an unacceptable trade-off, and Anagath B's use was limited accordingly.

However, this trade-off appealed to certain bored, embittered, thrill-seeking terminal nobles, and these habitual Anagath B users became known as Ghouls because rather than avoiding interstellar travel they became dedicated wanderers. They would prepare for the moment of truth at jump entry by attempting to engineer some "peak experience" which would reach its climax at the scheduled moment of jumpspace entry. Thus at worst they would die in a moment of intense pleasure, and if not, would be thumbing their noses at the universe and laughing at death.

As befits wealthy individuals who do not age, Ghouls are usually attractive (except for those who deliberately make themselves unsightly for reasons known to themselves), and dress in ornate, exotic outfits, giving them an effete, foppish air.

Ghouls are narcissists, and this is not limited to their preoccupation with youth, pleasure and ostentatious appearance. They are endlessly fascinated by their reactions to events, and are especially absorbed in exploring their own so-called "dark sides" or "shadow natures." They like to think of themselves as jaded connoisseurs of depravity and debasement, things that are feared by the timid souls of most people. These explorations eventually become interwoven with their peak experiences, making these experiences more and more bizarre, and often dangerous in and of themselves, never mind the chance of dying at jump.

Sadly, Ghouls are a danger to more than just themselves. When they tire of the typical drunken orgy while anticipating death at j-translation (predictably, Ghouls prefer the term "penetration"), they try more daring experiences, often involving violence. For example, a group of Ghouls might decide that their peak experience would be to hijack the starship just as it entered jump.

However, not all nobles are able to find this path. Many have found that the notion of a meritocracy of public service is a fraud, as elective politics often amounts to a popularity contest which pays little attention to talent and rather more attention to empty or even deceitful promises. Even well-disposed nobles can become disillusioned when their attempts to take the best possible care of their constituents run up on the rocks of unrealistic public demands created by the seductive and voluptuous fantasy worlds promised by professional politicians in their sluttish relationship with immature voters.

Noblesse N'Oblige Plus, or *Après Nous, le Déluge,* Sucker

While some nobles of goodwill are defeated by the reality of the "mobocracy," others were never engaged in the process to begin with. There had always been a constituency of "underclass" nobles: selfish, corrupt and drunk with the privileges they regarded as birthrights. The Representational Reforms served notice that the free ride was about to end and it was time to squeeze every last thrill out of it before it was over. For terminal nobles (see below) they had the rest of their lives to spend as much of their allocation as possible, and no desire to do anything else.

These nobles are collectively known as the disenfranchised nobility, although it is important to realize that disenfranchisement is their own response to the situation. Many of the disenfranchised noble class have actually not been disenfranchised by their homeworlds; they have simply quit acting out a life to which they are no longer connected or with which they were never engaged.

There are two main paths for disenfranchised nobles: immersion and resistance. Immersion means the surrender of any pretense of service accompanied by immersing oneself in self-gratification. Underclass nobles provide the bulk of those choosing immersion. An extremely pathological example of immersion are the Ghouls (see sidebar).

Resistance is more damaging to society and is tragically the path more likely to be chosen by embittered nobles originally of good will. Embittered nobles resent their exclusion and seek revenge. Sometimes this is revenge against the new officials who have assumed power, sometimes against the public that abandoned them, sometimes against the Regency government itself. While many of these nobles claim to be selflessly working for a return to the better form of government that was wrongly repudiated, they have given up on truly constructive efforts, and their path is simply destructive.

Local Status of Nobility

Although Regency policy is to move the nobility aside to make room for local democratic rule, in accordance with Imperial tradition, each world has a great deal of latitude in the details of this transition process and their timing of implementation. The number and combination of these possibilities, plus the personalities involved, means that each world's solution is unique. In general terms, however, referees can find the general policies of individual worlds by adding the world's government code (reconvert letters back to numerals, i.e., A=10, B=11, etc.) to the result of a D10 roll and consulting the table.

Result	*Transition*
1-5	Revocation
6-10	Disenfranchisement
11-15	Termination
16-20	Conversion
21-25	Continuance

Note that there is considerable overlap between these types of transition, described below.

Revocation: Nobles have all of their noble rights, titles, privileges, possessions, powers and responsibilities (known collectively as "noble appurtenances") removed. This includes the loss of income from all fiefs, the loss of all voice in government, and any special exemptions from local laws and social practices. Note that most nobles maintain a distinction between their personal wealth and possessions and those that accrue to the noble position. In most cases their personal possessions are safe, and only those assets belonging to the "seat" are withdrawn. However, in cases where this division might be unclear, further conflict and hard feelings are inevitable.

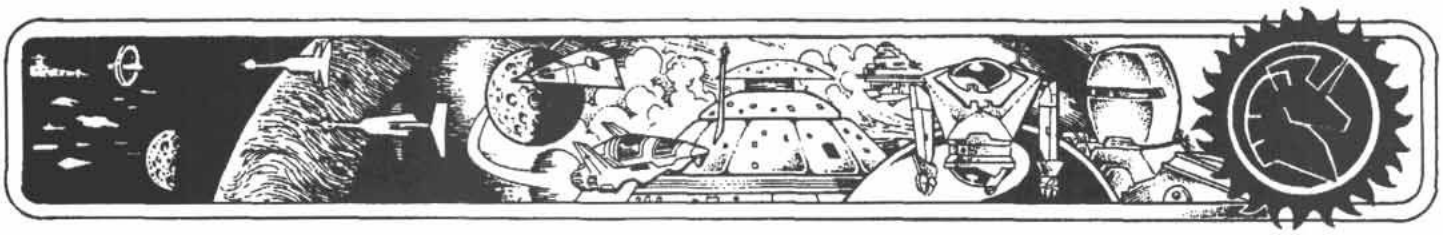
Most worlds allow a transition period for the gradual withdrawal of the appurtenances to which their nobles have become accustomed. Roll 2D6 and consult the table.

2D6	*Trans. Period*
2-3	Immediate
4-5	Six months
6-7	One year
8-9	1D6 years
10-12	2D6 years

Disenfranchisement: In this case nobles retain their properties, incomes and social and legal privileges, but lose their power and responsibilities. Many worlds further stipulate that such nobles may not enter politics or government without relinquishing their noble income and privileges. On some worlds this is a one-time irrevocable selection, while on others the income and privileges are merely suspended during the term of office.

Disenfranchisement is typically an honor granted to nobles who have served long and well. Their titles then primarily confer social and ceremonial status. The length of retention of the property, income and privileges will vary. The term is usually for the remainder of the noble's life, at which point the noble seat ceases to be. Sometimes the noble is allowed to bequeath this title to his or her heirs, subject to confirmation by popular vote.

Nobles who have been thus disenfranchised have the qualifier *ceremonio* placed after their titles to reflect that their titles confer no power. Those whose titles will lapse upon their death use the qualifier *ceremonio vita,* and those who can pass their titles on to their descendants with popular ratification use the qualifier *ceremonio perpetua.*



Note that the procedural meaning of disenfranchisement in this section is different from the attitudinal disenfranchisement discussed in the "*Noblesse N'Oblige Plus*" section.

Termination: This is the same as revocation above, except that it goes into effect at the end of the life of the current office-holder. Termination is often used to shunt aside difficult nobles. Allowing them and their families to retain their benefits for the remainder of their lives is a way of "buying out their contracts."

Nobles who have had their patents terminated as above retain their titles, but the qualifier *terminal* is placed afterwards.

Conversion: The noble retains all or some rights and privileges, but the scope of his or her governmental powers are reduced to some specific area of responsibility and power. This area of responsibility is typically some sort of appointed administrative, bureaucratic or judicial position, presumably one which accords with the noble's talents or expertise. Such a position may be a life-time appointment, or may be of limited duration or subject to renewal based on performance reviews, depending upon local circumstances.

This position could also be one which will henceforth be subject to popular election after some period of time. This allows an orderly transfer of power, knowledge and experience from the incumbent nobles to the future elected leaders. In most cases these nobles are permitted to stand for re-election or election to other posts, within local term limit restrictions. Because of the possibility of conflict of interest, most worlds have restrictions on the ability of former

nobles to retain their noble incomes while holding certain offices. In some cases the income is forfeited for the duration of the term of office; in others it is placed in a trust fund; and sometimes the noble is simply monitored so that he or she can be impeached if found to be engaging in self-benefiting acts while holding elected office.

Continuance: The noble retains all rights, privileges and responsibilities. However, when the title is passed to a descendant, this inheritance of the title must be confirmed by popular vote. Upon a successful vote, the new holder of the title holds the patent for life.

Other: The above categories are only a broad description of typical solutions. Variations or combinations of the above are possible, as are bizarre and unusual alternatives, such as banishment, expulsion, ostracism, out-lawing (i.e., placing nobles outside of the protection of the law), execution, branding, tarring and feathering, etc. Such results are the outcome of pre-existing local circumstances between the noble(s) and the citizenry.

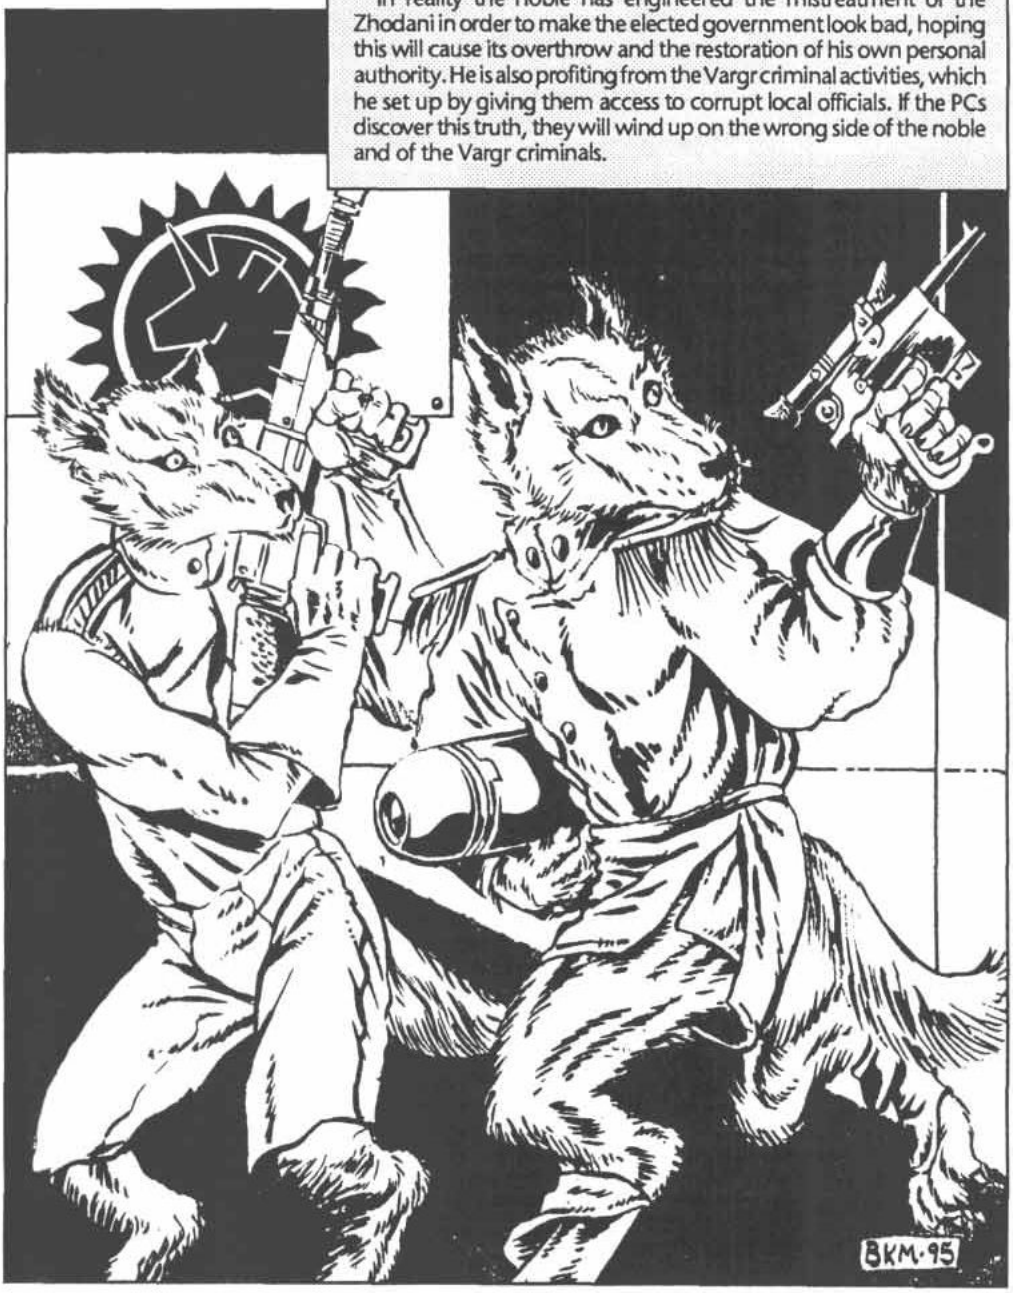
Safety Net

Norris knew that the creation of a class of impoverished nobles with nothing left to lose would be a grave threat to the Regency. Therefore the Representational Reforms declared that no noble would be deprived of the means to continue living at a level "equivalent to" the level to which he or she was accustomed, although naturally the reality of this guarantee varies.

Displaced nobles who are left without property or income will be granted a stipend from the Regency government for the remainder of their lives. The size of this stipend varies with need, the noble's other means and the noble's original station. The money for these stipends comes in part from government appropriations and also from the sale of relinquished noble holdings in the Regency. Naturally nobles who have retained most or all of their property and income have no need of this service, and it is not provided to them.

Some worlds have more bizarre arrangements. Some worlds directly collect the noble stipends and operate "Service Estates," essentially the equivalent of an old soldiers' home for disenfranchised nobles. Some such estates are nice, some are crimes against decency, and life goes on.

Note that not all nobles suffer from having to give up their property and privileges. Some nobles have fiefs that are net financial drains because of low productivity or excessive upkeep on old, run-down infrastructure. The opportunity to get out from under such responsibilities is a welcome one.



Adventure Hook

An embittered noble from a world overrun by Zhodani refugees is seeking to discredit the current elected government for their mishandling of the refugee crisis, and hires the PCs to document the "criminal conditions" under which the refugees live.

The refugees are underfed and are crammed into the unhealthful conditions of a tent city-cum-shantytown up against the starport's perimeter fence. Dedicated Zhodani nobles and intendants are valiantly trying to maintain the Zhodani social structure to maintain the well-being of their people, but the lack of cooperation from the local Regency leaders is making this difficult.

What is worse, the Zhodani are being preyed upon by Vargr organized crime, which charges extortionate prices for the food and medicine they have stolen from the refugee relief facilities.

In reality the noble has engineered the mistreatment of the Zhodani in order to make the elected government look bad, hoping this will cause its overthrow and the restoration of his own personal authority. He is also profiting from the Vargr criminal activities, which he set up by giving them access to corrupt local officials. If the PCs discover this truth, they will wind up on the wrong side of the noble and of the Vargr criminals.

Important Regency Developments

> **None Shall Pass**
> RQS motto

The following are some significant Regency organizations and developments in 1202.

RQS

The Regency Quarantine Service is a unique organization. Since the Collapse, RQS has done more than any other organization of any race or government to ensure the survival of interstellar civilization. The spectacle of destruction that is the former Imperial Wilds makes it clear that the Spinward States would not have simply survived anyway. Although its tradition is therefore something along the "so much owed by so many to so few" lines, the reality is actually much more inspiring than that stereotype.

The wonder is not that so few have accomplished so much, but that so many have come together and cooperated harmoniously for the good of all. That such a circumstance would arise at the end of the civil war which destroyed the largest society ever seen is not merely stirring—it is an affirmation of every piece of faith that one sapient has ever shown for another and an encapsulation of the true corporate meaning of "Keepers of the Flame" (see page 4).

As befits its unique and crucial mission, RQS has a unique organization. It is empowered to call on the best that the Regency has to offer, from any and all walks of life and professions. Although the RQS is a distinct and independent service, it draws on all other Regency organizations and exercises supreme command over the tasks needed to ensure the survival of human civilization.

TNE PCs will come into contact with the RQS in two main capacities: serving in it and interacting with it as private citizens.

Serving In the RQS

There are three different paths of RQS service—the active force, the reserve force and the RQS Auxiliary.

Active Force: This is the RQS proper. Like the navy or scouts, this is a full-time job. **Traveller** characters will normally not be members of the active force as this portion of a character's life is normally handled during character generation and as play begins with the characters as "free agents" ready for adventure. However, referees and players who so desire may play **TNE** campaigns which feature a PC group on active duty. Naturally the command structure and rewards received in such a campaign would be different from the more typical campaign style.

Reserve Force: Unlike the Ready Reserve below, the RQS Reserve is an individual reserve force and serves as a "holding box" that draws on personnel from many Regency services, including the navy, scouts, army, marines, civil service (bureaucrat career), foreign service (diplomat career), Ministry of Justice (law enforcement career), and other military careers (aviation, wet navy) in addition to the RQS proper.

Navy, scout, and RQS personnel are usually recalled to man spacecraft, while army and marine personnel are recalled to serve in shipboard or ground-based security detachments ("SecDets"). SecDets conduct in-system boarding and inspection operations, and also help man the RQS Inspection Offices that monitor the frontiers with the other Spinward States.

Civil service, foreign service, and MoJ personnel staff the inter-Spinward State Inspection Offices and on investigative task forces to track down and bust violators of Quarantine restrictions, such as the Vargr "Pack."

The RQS Reserve, unlike the RQS Auxiliary below, does not provide crewed ships, as reservists are called up as individuals. Instead it provides personnel only who are assigned to ships already controlled by the RQS or Regency Navy.

TNE Referees can use the RQS Reserve as a plot driver. PCs who served in any of the careers above may be periodically called up for active duty. Referees may rule that this has happened when they have a nice RQS adventure set up for their players, or they may do this randomly. For each term spent in an eligible career (as described above) there is a 2% annual chance that the character will be recalled to active duty. For example, a PC who had spent three terms in the navy, one in law enforcement, and one as a bureaucrat would have a 10% cumulative chance of recall. This is rolled once per year with D100. The duration of the recall is 2D6 months.

Ready Reserve: The Ready Reserve is not a part of the RQS, but it is discussed here for the sake of completeness. The Ready Reserve is standard reserve duty, in which the member trains on a regular basis with an established unit, usually two to four days a month plus one full month a year. When the Ready Reserves are activated, they are called up as complete units, not as individuals. Since this commitment requires some stability, PCs are unlikely to be members of the Ready Reserve.

Auxiliary Force: The RQS Auxiliary is the means by which the RQS gains access to civilian-crewed ships which can be used to augment and support the Quarantine. This is done by offering financial assistance to persons who purchase starships. The RQS will put up a portion of the purchase price in return for a percentage share in the ship. The size of this share determines how often the RQS can take this ship (and its crew) into active duty. These subsidies are most often provided for Quarantine cutters and inspection launches (pages 88, 89, and 91) but may be offered for most any type of ship (referee's discretion, although the RQS is unlikely to subsidize luxury yachts). Not all RQS Auxiliary ships are Quarantine patrollers. An RQS Auxiliary could be a far trader assigned to carry supplies between frontier outposts, or a passenger liner transporting PKF ground troops to or from their stations in the Islands.

As described on **TNE** pages 38-39, value modifiers can be taken as RQS ownership, with each point being equivalent to a 12.5% RQS share of the ship. This means that the RQS will want to use the ship 12.5% of the time (or 25% of the time with two value modifiers, etc.). However, this is not as simple as just saying that 12.5% of each year, month or week is given over to RQS duties. The time-consuming nature of interstellar travel means that there are minimum blocks of time required for useful service. For gaming purposes, assume that six months is the minimum block, although longer tours could be served.

Thus, in the case of a PC group which crews a Quarantine cutter with a 25% RQS load, six months is 25% of two years, so they can expect to serve a six-month tour once every couple of years. If the referee prefers, this could instead be a one-year tour every four years, an 18-month tour every six years, and so on.

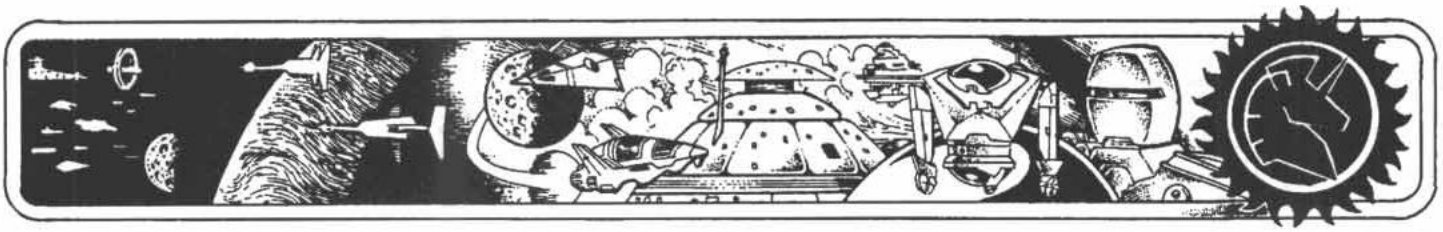
Referees can allow these tours to be scheduled in advance, or may roll randomly to spring them on the PCs at inopportune times. Note that the RQS Auxiliary regulations are clear that RQS call-ups can be extended indefinitely at the pleasure of the service, and the ship owners have no recourse to get out of these. Thus a supposed six-month tour could be extended because of some kind of crisis, then extended again because their scheduled replacement blew its jump drive while in transit to the patrol station and requires repairs, and so on.

RQS Character Generation: For purposes of character generation, RQS service can be represented by terms in the navy and/or scouts. Service in the RQS Auxiliary is handled with terms in the merchants with increased chances for special duty.

Meeting the RQS

Aside from the likelihood that they are already associated with its operations in some way (above), PCs will meet the RQS in several routine ways.

Annual Inspection and Certification: All spacecraft and starships in the Regency are required to be inspected annually by the RQS or Regency Navy, and recertified for another year of operations. These inspections serve the main purpose of confirming that ships are free of Virus and meet all current standards of anti-viral countermeasures. (These include properly configured communications systems and databanks, as well as provision of the latest versions of Virus-detection/protection software, canaries, etc.) Additionally, these inspections are used to ensure the safety of the Regency merchant fleet. Checks include hull and fuel tank integrity, wiring and control systems, power plant and drive calibration, life support servicing, and the provision of emergency equipment such life boats, life rafts (see **Reformation Coalition Equipment Guide** pages 146-7), emergency vac suits, and rescue balls. Any deficiencies must be corrected for licensing or recertification to occur.



Adventure Hooks

Reserve Duty "On the Line": The PCs are called up for reserve duty on the Regency frontier, patrolling gas giants and asteroid belts for infiltrating ships, or manning an inspection post on the frontier with another Spinward State. The former allows the chance for space combat. The latter allows opportunities for mysteries: smuggling rings, Vargr organized crime or espionage.

Clever referees can see to it that all the members of the PC group are assigned reserve duty together by stipulating that they are in the same "call-up cadre." This is done by ensuring that all the PCs spend their last character generation term in the same service, preferably the navy or scouts. The referee can then rule that they served together (which assists in establishing how they all met) and were therefore assigned to the same reserve cadre and will be called up as a group to serve on the same crew.

Deep Space Sweeps: The RQS must make sure that vampire forces are not setting up their own calibration points (see Library Data) to stage their way across the Great Rift. This requires deep space sweeps, sometimes accomplished by ships with multiple-stage drop or auxiliary tanks, or sometimes rendezvous with pre-scheduled tanker support.

One effective method uses old *Azhanti High Lightning*-class cruisers converted to mobile base ships. These high-jump mother ships jump out several parsecs into deep space carrying several subsidiary starships, which jump from that central location to survey the surrounding area, then return to the mother ship for refueling. PCs with their own quarantine cutter can serve their reserve duty based on one of these ships, sweeping deep space for vampire infiltrations, on the lookout for "swift cold death between the stars."

Referees can determine the ability of a PCs' ship to pass inspection based on its wear value, level of maintenance and damage it may have sustained with the rules on TNE pages 241-244. These inspections generally take 2D6 days (during which time the crew must pay berthing costs, etc.), but the time required can be reduced by the use of Admin/Legal skill, simulating the fact that good administrative procedures and records enable the inspectors to work more quickly.

These inspections are generally performed at the same time as the starship's annual maintenance (TNE page 222).

Spinward States Interfaces: PCs who cross the interface frontiers between one Spinward State and another will meet up with the RQS in the form of the Spinward States Interface Inspection Office (SSIIO). These are similar in concept to traditional international customs procedures, but are more comprehensive to prevent the introduction of Virus across borders.

It is illegal for starships to attempt frontier refueling (at gas giants, asteroid belts, etc.) in interface frontier systems, and in fact these refueling sites are heavily defended, mined, etc. All ships crossing from one Spinward State to another must stop and refuel at the starport, where they will do one of two things.

The majority of ships do not intend to cross into the neighboring state. Instead, they unload their passengers and cargo at the SSIIO. Here the passengers and cargo are inspected for entry, and if they pass inspection are transferred to another starship already inspected and certified for operations in the neighboring state. The original ship, now unloaded, will pick up passengers and cargo outbound from the neighboring state seeking transport into the Regency.

Ships which do intend to cross into the neighboring state must undergo inspection to allow certification for operations in that state. This is time consuming (2D6 days, as above) and is essentially like the standard annual RQS recertification inspection, except that it is conducted by the foreign state's RQS counterparts, thus often requiring Liaison and Language enabling tasks to allow Admin/Legal tasks to reduce the required time. Any passengers and cargo carried are inspected at the same time.

Upon crossing back into the Regency this entire process must be repeated for Regency recertification, which explains why so few ships select this option.

A rare alternative to this is the carriage of sealed cargoes, usually reserved for Regency government business. At its point of origin the cargo in question is inspected by RQS inspectors and securely sealed. The cargo is then accompanied by an RQS SecDet which ensures that no tampering occurs. The ship must still call at the SSIIO, but need not be inspected as it is travelling under RQS jurisdiction. (Reciprocity agreements among the Spinward States Accords signatories allow them all comparable rights under certain prescribed conditions.) This is the procedure used for carrying cargo to Regency facilities, such as embassies, in other states. (See also "Four Corners," page 40.)

Standard Patrolling: Ships which operate in or near the Regency frontier will interact with RQS vessels on an almost daily basis. These vessels will be encountered near inhabited worlds and refueling points in the worlds along the Regency Safe border and in the Regency frontier.

If the PCs' vessel is a regular visitor to the area and is known to the local RQS patrols, simple radio contact will often suffice. If not, or if the RQS has reason to be suspicious, a boarding inspection is the routine procedure. The inspection is intended to ensure that a ship is not carrying Virus or contraband, or Virus-infected cargoes from beyond the frontier, but evidence of any other illegal activity (piracy, smuggling, etc.) will also be pursued. This will include routine examination and diagnostics on the ship's computer and electronic control systems, plus inspection of cargoes, passengers and other ship areas. Safety inspections will also be made.

OPENING THE FRONTIER

The impending opening of the trailing frontier has highlighted the lack of preparation for such a momentous event. With the firm rejection of the 1196 referendum there was no reason to lay the groundwork for an organized approach, and it is commonly accepted that the 1202 joint Senate-Moot act was inspired mostly by the unexpected and still uncontrolled Zhodani Exodus (see page 24).

Contrary to its record of careful and well-considered steps, the Regency seems to be lurching unprepared into the Wilds. The long-awaited triumphal return of the Keepers of the Flame, the stewards of all that was best of the Imperium, will apparently be a come-as-you-are affair.

Oklahoma Land Rush

The RQS anticipates an all-out race for the Wilds on 311-1202, the day the frontier is scheduled to be opened, as would-be explorers compete to get deep into the Wilds and get the first crack at choice territory and salvage sites.

The Regency government intends to implement a system for the registration of legal claims to unoccupied land, facilities and salvage sites, but publicly admits that these claims will be difficult to enforce, if not impossible. The Regency does not have the resources to enforce the administrative legalities of external settlement and resource recovery, nor does it have a bureaucracy with oversight in that area, having disestablished the Ministry of Colonization as part of the Consolidation Act of 1135.

It is expected that the wildside environment will be a complete power vacuum and a frontier in the classic sense—an area with no infrastructure and no order save that which explorers impose upon it. Might will often make right; more or bigger guns will doubtless outweigh technically legal claims; and frontier citizens will have to band together to create legal systems, either by vigilantism or by the hiring of mercenary law enforcement personnel.

It is not the Regency's intent to disown these governmental responsibilities and wink at lawlessness, but there is insufficient organization in place to do anything other than admit that Regency authority will remain behind the curve on the wildside for the foreseeable future.

No Back-Flow

The Regency frontier will be defended just as it has been for the past 70 years. In other words, for the near term, any Regency ship which heads outbound across the frontier makes a one-time irrevocable election, as it will not be allowed back in. Vessels attempting to return will be stopped by the RQS at the frontier just as refugee and vampire ships have been stopped. However, although the RQS impounds and inspects these vessels to see if they can be returned to service within the Regency, it will not offer this service to returning explorers, as the number of ships involved would quickly overwhelm RQS capacities.

More than the courage to accept this bargain is required to "go wildside." Those desiring to take advantage of the opening of the frontier must apply to the RQS for licensing to do so.

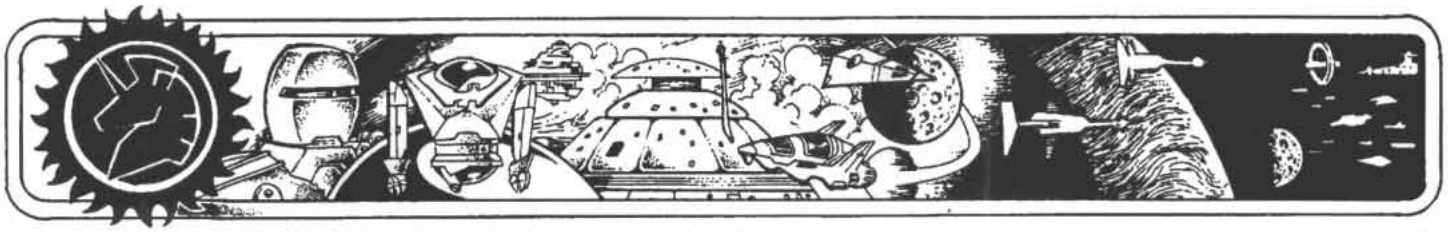
Among these restrictions are the following:

- No starship with a current RQS ownership share will be allowed to cross out of the frontier on private business. (Naturally RQS Auxiliaries on active duty are allowed to do so as part of their assignments.)
- Ships judged to be "uniquely valuable" by the RQS and Ministry of Shipping will not be allowed to depart the frontier.
- No ship deficient in standard anti-viral measures may cross out of the frontier.
- Ships or individuals deemed to be poor risks, such as known criminals, those believed to be connected with past violations of Quarantine regulations, etc., may be denied permission to cross out of the frontier.

The requirement to maintain the Quarantine while allowing meaningful contact with the expansion will be met by a combination of designated frontier trading worlds and a fleet of officially licensed interface transports.

Frontier Trading Worlds: Because of the need to prevent incoming Virus infection, the RQS will exercise strict control of all transits across the frontier. This will be achieved by allowing only a small number of wildside and safeside termini for such transits, all of which will be operated by the RQS.

The wildside termini will be established on or just beyond the Regency frontier, and will be gradually extended to trailing as circumstances warrant. Cargoes and passengers shipped into the Regency from these wildside termini will be first inspected and approved for import, then carried exclusively by a fleet of RQS-approved interface transports.



Thus all trade of recovered goods will take place outside of the Regency frontier on the wildside termini worlds where goods bound for Regency markets will be sold to the agents who will bring them into the Regency for ultimate sale. See pages 54, 58, 62 for the designated locations of these frontier trading worlds.

The Regency facilities on frontier trading worlds will consist of starport services for the interface transports, separate starport facilities for the wildside shipping (these will be operated by wildside organizations and will be self-sustaining, not requiring Regency investment), and the RQS inspection offices where all inbound cargoes and personnel will undergo rigorous inspection. The inspection offices will also include extensive secure warehousing to allow for the accumulation of goods awaiting inspection and certification for import.

Because of personnel limitations, the RQS control teams will not be able to conduct law-and-order operations outside of the designated RQS inspection offices.

Regency Licensed Interface Vessels: These are the only civilian vessels (these restrictions obviously do not apply to Regency military vessels) which will be allowed to cross the frontier inbound to the safe area. They will be rigorously inspected before being licensed and painstakingly recertified on a regular basis to ensure that they are free from viral infection or any other dangers.

These are not ideal ships for PCs to own, as there is no chance for adventure of any kind. The whole idea behind the Regency licensed interface vessels (RLIVs, pronounced "Arlivs") is that their operation is dull, routine, absolutely predictable and absolutely safe. RLIVs are large vessels with jump-2 or better performance to reduce the required number of sorties and the duration of trips across the frontier. (See **World Tamers Handbook** pages 107 and 109 for the Tukera freighter and

frontier transport, both ideal for this role.) PCs who must book passage to cross the frontier will travel on such vessels.

These vessels are clean, frequently inspected, and well-maintained. They all contain RQS security detachments ("SecDets"), consisting of half a dozen or more ship's troops trained in cargo inspection and shipboard security. Some SecDets contain special license telepathic or teleperceptive surveillance psions (see page 14). Passengers may not carry weapons of any kind. All weapons are confiscated and inventoried when brought aboard and transported under lock and key. They are only returned to their owners upon arrival at the interior terminus.

Cargo shipping costs and passenger tickets aboard RLIVs are twice those given on TNE pages 219-240. This is because of the additional expenses and difficulties of operating RLIVs and also because interface transport is a seller's market.

THE XWEB

The lessons of the Final War and the Collapse have led to the downfall of the old express boat (Xboat) routes and their replacement by the XWeb, a more comprehensive and effective system.

Public outrage at the blatant cynicism of the Third Imperium's maintenance of parallel jump-6 routes for the noble elite and jump-4 routes for the Great Unwashed spelled the end of the jump-4 system. When everyone was equal in their vulnerability to being snuffed out by Virus, there was no longer any excuse for separate and unequal access to information.

In addition, the governing concepts behind the old Xboat network were long since obsolete. First of all, the system was too hierarchical. It made judgments that certain worlds were more important than others and established routes to cover those worlds. Worlds off these routes were penalized by receiving their information later. The Xboat network also assumed a linearity to the dissemination of information, i.e., that information was pushed from a central location out to the Imperial periphery in the same way that constant pressure is maintained in a water distribution system. Both models were completely wrong-headed.

The Xboat network was therefore never a true information network. Rather, it was a *control* system rather than a *communication* system—it efficiently pushed instructions from the Imperial capital out to the domain, sector and subsector capitals where they could be carried out. The ability of one subsector duke to communicate with another was not addressed by the system, and that distinctively Imperial principle of centrally held absolute power was forever discredited by the Civil War and the Collapse. Power must be distributed. Local leaders must be empowered to do what needs to be done, not hamstrung by waiting for instructions from above. And information is power, a truth that the Imperium recognized, but it nonetheless managed only to covet and squander it.

The fact of the matter is that it is impossible to determine in advance where crucial information will come from and where it will be most quickly needed. Information cannot be anticipated. It arises where it will, according to its own rules. Humans "manage" information in the same way that real estate collects rainwater. Neither can move around to catch only the portions they need. Both are reactive and depend on spreading as far as possible to increase the odds of catching whatever happens to come their way.

Information systems cannot be hierarchical. Their organizations must be "flat"—every information collection node is also an information transmission node is also an information receiving node. All information must be passed in *all* directions, for only the recipient of information can judge its value, not its sender. Thus there is not a direction of information flow—information flows in all directions at all times.

The XWeb is organized according to these principles. Regency maps no longer display Xboat routes; all worlds are coequal recipients and transfer points of information, and information flows as readily toward leadership centers as it can be sent out from them.

There are now no longer any information backwaters in the Regency, for the simple reason that post-Virus society cannot afford them. Virus uses ignorance and gaps in situational awareness to worm its way into a society. By the time it reveals itself and strikes, it is too late—the society has already been fatally compromised.

The new XWeb is a unique partnership of Regency government and business. The need to *rapidly* establish a *comprehensive* system at an *affordable* cost meant the government could not do it alone. However, avoiding a profusion of independent, duplicative, privately owned systems required unified oversight, which required government involvement. The compromise is that although the Regency operates the XWeb (through the Scout Service's Communications Office), its costs are covered by the commercial sector which subscribes to the XWeb.

All business requires communications. Corporations require means of internally disseminating data on production, market changes, personnel, payroll, etc. The news media deals directly in information of all kinds and requires access to it. Universities and other research organizations need access to findings and journals. Individuals require the means to send messages to loved ones, and to gain access to consumer goods and services. All these are willing to pay for the capabilities.

All the XWeb couriers, Xboat, Dboats (dispatch boats, military-configured Xboats), and Jboats (jump-capable boats, see page 88) have their operational costs subsidized by the commercial market. Companies, news agencies and entertainment distributors rent blocks of electronic databanks and use these to "ship" information the same way a parcel service ships physical goods. Individuals pay for the carriage of their message on a piece-by-piece basis. But all couriers retain databank space for "public service" information: official communications between government agencies, military forces, or law-enforcement bodies, addresses from political or government leaders, diplomatic "virtual pouches" of the Regency Foreign Service, public interest announcements from consumer watchdog groups, traveller's advisories and simple, raw, nonproprietary news collected from each world's XWeb nexus. The volume of this last category is staggering, including information rippling its way from one end of the Regency to the other, reflected, refracted and modified as it comes into contact with other information ripples.

So what is the difference between this free public access news and the reporting and journalism that news agencies pay to bring in and sell in newspapers, magazines, cable and direct-broadcast services? The same as the difference between raw materials and manufactured goods. The news media sell the added value that comes from synthesis, interpretation, presentation and organization. People pay for this because they can't afford to wade through raw data all day to net the few nuggets they need.

The XWeb uses most of the same resources as the old network: Xboats, Xboat tenders, way stations where the ships undergo maintenance, and scout service pilots and support personnel. Added to the old mix, however, are military construction jump-6 Dboats to speed up the rate of information flow and small Jboats that fill in the small gaps where the extra range of high-jump craft would be wasted. The stated goal of "one Xboat arriving every day at every world from every world within six parsecs" is not always achieved, but the tempo of XWeb data deliveries is much higher than was ever achieved by the Imperium's Xboat network.

Adventure Hook

PC groups do not have to head into the Wilds to be involved in the opening of the frontier. The PCs might elect to become speculative purchasers on the frontier trading worlds. They will interact with Wilds traders, negotiating to purchase their cargoes, then, as the new owners, pay for their shipment into the Regency for ultimate sale. This sort of trading is not handled by random rolls on tables like those on TNE pages 236-240. These sales involve unusual objects and interaction with various unique and colorful Wilds explorers. They should be roleplayed with various interaction tasks such as Bargain, Marketing, Persuasion, etc.

Items rejected by the RQS inspection are impounded and destroyed, with no compensation for the owner, and the current owner takes the financial risk of inspection. Explorers are eager to sell goods to purchasing agents before inspection, though they cannot ask as much for uninspected goods as they can for those already cleared for shipment. PCs will therefore want Virus inspection skills to enable them to negotiate wisely.

DROYNE AND CHIRPER ACTIVITIES

Unlike the races that are described in the Spinward States section, the Droyne and Chirpers do not constitute a separate state. Distributed widely but sparsely throughout the territory of the former Imperium, the Droyne and Chirpers at no point achieve sufficient population density or mass to exercise power beyond the planetary level. And without a unifying racial cause to draw their widely separated communities into a single voice, they constitute a quiet minority taken for granted by most humans. In fact, to those who devote thought to the subject, this lack of racial ambition seems quite unusual. Humans, Aslan, Vargr, K'kree and Hivers all demonstrate the kind of "fire in the belly" that allows a race to beat the odds and spread across wide areas of interstellar space. This fire seems to be absent from the Droyne, which makes their wide distribution something of an anomaly.

Nonetheless, the Regency's Droyne and Chirper citizens are participating in significant ways in the Regency's development.

One remarkable example of bootstrapping within the Regency is the Droyne uplift program for Chirpers. Chirpers are simply "degenerate" (or, more politely, *uncasted*) Droyne, and can therefore be raised up into Droyne simply by reintroducing them to the *Iskyar* ritual (see TNE page 72 and **Path of Tears** pages 118-19).

Chirpers and particularly Droyne are also extensively involved in the Psionic Renaissance which began in 1133.

The Spinward States

Spinward States Timeline

Imperial	*Terran*	*Zhodani*	*Aslan*	*Event*
-4000	AD 518	1211.1	-2186	First Zhodani core expedition.
-2800	AD 1718	1741.3	-817	First Zhodani contact with Vargr.
-2000	AD 2518	2095.2	95	First Zhodani contact with Vilani traders.
-1776	AD 2742	2194.2	350	Rule of Man collapses. Long Night begins.
-1000	AD 3518	2537.2	1235	Zhodani Consulate reaches present size.
-924	AD 3594	2571.1	1322	Darrians reach TL16. Sun destabilizes.
-630	AD 3888	2701.1	1658	Island subsectors colonized.
-399	AD 4119	2803.1	1921	Sword World colonization begins.
-186	AD 4332	2897.2	2164	First Sword World Confederation.
50	AD 4568	3001.3	2443	First Zhodani contact with Imperial traders.
60	AD 4578	3006.1	2445	Imperial colonization of Spinward Marches begins.
148	AD 4666	3045.1	2545	Imperial scouts recontact Darrians.
461	AD 4979	3183.2	2902	First Aslan contact with Zhodani.
500	AD 5018	3200.3	2947	Imperial explorations into Zhodani territory.
589	AD 5107	3240.1	3048	First Frontier War begins.
604	AD 5122	3246.3	3065	First Frontier War ends. Imperial Civil War begins.
615	AD 5133	3251.2	3078	Second Frontier War begins.
620	AD 5138	3253.3	3083	Second Frontier War ends.
622	AD 5140	3254.3	3086	Imperial Civil War ends.
718	AD 5236	3297.1	3195	Xboat system covers entire Imperium.
750	AD 5268	3311.1	3232	Seventh Zhodani core expedition.
800	AD 5318	3333.2	3289	Imperial Psionics Suppressions begin.
826	AD 5344	3344.3	3318	Psionics Suppressions end.
979	AD 5497	3412.2	3493	Third Frontier War begins.
986	AD 5504	3415.2	3501	Third Frontier War ends.
1082	AD 5600	3458.1	3610	Fourth Frontier War ("False War") begins.
1084	AD 5602	3458.3	3613	Fourth Frontier War ("False War") ends.
1107	AD 5625	3469.1	3639	Fifth Frontier War begins.
1110	AD 5628	3470.2	3642	Fifth Frontier War ends.
1116	AD 5634	3473.1	3649	Strephon murdered. Third Imperium begins to fragment.
1117	AD 5635	3473.2	3650	Corridor severed by Vargr. Domain of Deneb isolated.
1119	AD 5637	3474.2	3652	Aslan *ihatei* incursions into Domain of Deneb increase in strength.
1130	AD 5648	3479.1	3665	AI Virus released. Collapse begins.
1131	AD 5649	3479.3	3666	Quarantine completed. Joint Aslan-Domain fleets destroy vampire fleets attempting to cross Great Rift.
1132	AD 5650	3480.1	3667	Regency established with Norris as First Regent. Sword Worlds attempt land-grab. Spinward States Accords signed.
1133	AD 5651	3480.2	3668	Regency Frontier created. Abandonment begins. Border Worlds and Gram arm absorbed into Regency.
1139	AD 5657	3483.1	3675	Rape of Trin.
1140	AD 5658	3483.3	3677	Regency annexes Islands subsectors.
1149	AD 5667	3487.2	3687	Eighth Zhodani core expedition.
1157	AD 5675	3491.1	3696	First Regent Norris dies.
1196	AD 5712	3508.2	3741	First Regency referendum on re-opening borders voted down.
1201	AD 5717	3510.2	3746	Zhodani Exodus begins.
1202	AD 5718	3511.1	3748	Outrim Regency frontier is opened.

The Spinward States consist of all of the surviving interstellar governments spinward of the Great Rift in the post-Collapse period. By signing the 1132 Spinward States Accords these states cooperated in the founding of the Quarantine, which is the mechanism by which they have all survived. Chief among these are the Regency, Zhodani Consulate and Aslan Hierate. Other significant groups are the Darrian Confederation, Sword Worlds and Vargr splinters.

Many of these states were mutual enemies for centuries before the Collapse. Their current cooperation is not a collective change of heart, but is rather the pragmatic recognition that if any of them were to survive, they all had to cooperate, because Virus has no allies, only victims. As the threat of Virus recedes, it is assumed that old rivalries, held in check by the threat of Virus, will reassert themselves.

But for now, the Spinward States are at peace.

Character Generation

The **Regency Sourcebook** has insufficient space to present fully developed character generation systems for each of the races and societies of the Spinward States. Future **TNE** products will cover the complex interactions of social details, unique careers and advancement structures of these fully developed societies and how these affect character generation.

For the time being, **RSB** provides sidebars on how the basic **TNE** character generation procedure can be modified to provide more distinctively alien characters.

ZHODANI

The Zhodani are basically a human society that has embraced the use of psionic powers. All other distinctions between Zhodani and Imperial society either derive from this or are irrelevant hair-splitting.

History, Society and Government

The Zhodani are a major human race, transplanted by the Ancients to the world Zhdant (usually called "Zhodane" in the Imperial period). During their early history they were one of the few human races to actually develop in parallel with another intelligent race, the Chirpers of the Qiknavra continent.

As can be seen from the Zhodani timeline, their society is both old and remarkably stable. No other power can claim one uninterrupted form of government for the past 7000 years. This can be understood by the stabilizing and unifying way in which they have used psionics, which they embraced early in their history.

Zhodani society is divided into three classes: proles (SOC 9–), intendants (SOC A), and nobles (SOC B+). The society is democratic, but the right to vote is only extended to nobles. It is used to elect fellow nobles to Councils, which exist from the local level all the way to the top of Zhodani society. The government (in Zhodani, *Driantia Zhdantia*) is essentially a hierarchy of Councils, each of which elects a certain number of its own members, called *Consuls*, to the next higher Council and so on, all the way up to the Supreme Council which is the ultimate authority of the Zhodani Consulate.

Noble status is conferred by heredity, but nobles are also created as a reward for service. The most significant route to the nobility comes from success in the Psionic Games, held once every olympiad (three Zhodani years or 2.25 Imperial standard years). Intendant status is gained by being elevated from the proles in recognition of psionic talent, and intendants can then compete in the psionic games to ascend to the nobility. Proles have no psionic capabilities, but they are not regarded as lesser persons because of it. Not everyone has psionic powers: Proles may be elevated to the nobility through service, and many hereditary nobles have no psionic powers either. Despite these exceptions, Zhodani society functions to pull psionic talent up to leadership roles. Thus the Zhodani are ruled by an aristocracy/meritocracy of psions, and every aspect of their society reflects this reality.

Zhodani Psychology and Sociology

Thought Police: No aspect of Zhodani society is so misunderstood by the Imperial mind as the infamous Zhodani Thought Police, the *Tavrchedl'*. While Imperials picture a secret gestapo which uses psionics to spy on the population for signs of incorrect thinking, which they then correct by brainwashing or worse, the Zhodani are reassured by the *Tavrchedl'*, which means "Guardians of Our Morality."

To the Zhodani, the psychological discomfort that causes one to lie, cheat,

steal, commit adultery, murder or even simply *to be unhappy with one's lot in life* is no different than the physical discomfort associated with physical illness. Just as Imperial society uses medicine to heal physical ailments so that no stigma is attached to the innocent sick person, Zhodani society uses psionic techniques to detect, diagnose and treat psychological ailments to heal people from unhappiness or antisocial sentiments, again with no stigma attached to the once psychologically sick but now healthy and happy person.

The *Tavrchedl'* merely identify those who would benefit from psychological treatment, called *re-education*, much the same as an itinerant doctor spots early stages of illness among those he visits and treats them. In both cases society benefits from this service, and no one's privacy or personal dignity is compromised by being given the opportunity to feel better.

Because a Zhodani psionic psychiatrist can actually see, hear and feel what is going on in the patient's mind, then psionically treat those things directly, Zhodani psychiatric treatment is quick and much more successful than Imperial methods which rely on years of guesswork, groping and allegorical mental models.

The full integration of psionics into society has other far-reaching effects as well.

Dirty Little Secrets: It has been said that "we are only as sick as our secrets." By its nature, Zhodani society permits fewer secrets than Imperial society and is arguably healthier.

An Imperial man, for example, might be embarrassed if others knew he found the wife of a colleague to be very attractive. He might even feel guilty he is having such thoughts, and this guilt might hurt his working relationship with his colleague. A psionic Zhodani, on the other hand, would not be threatened by this fact at all, because he or she would know full well that all people have similar feelings, and that these feelings in and of themselves are harmless. What is more, all of Zhodani society, the psionic and nonpsionic alike, would know this to be the case because of the broad public awareness of human mental functions. They would know which feelings are common and harmless, and which feelings would benefit from treatment. Either way, they would not find these thoughts to be threatening.

Because Imperials are accustomed to keeping such thoughts and feelings private, they find it hard to assess their significance. Does thinking something mean that you really want to do it? That you will do it? Does admitting to it give it more control over you, or less? They can insecurely imagine that others are not bothered by these experiences and that they are alone in having these "bad thoughts," which they dare not admit for fear of being unkindly judged.

Returning to our example, if the colleague found out about the man's feelings for his wife, he might become angry, because, not being able to read the other man's mind, he would have no way of knowing how trivial or serious the attraction was, and might fear it to be worse than it really was. Or perhaps he is afraid his wife is bored with him and she might be tempted by the other man's feelings.

Our Imperial man might also find that the longer he kept this secret, fearing what others would think of him, the more power it gained over him until it became an obsession that would hurt him, his colleague and the wife. On the other hand, the man might find that if the truth came out, everyone could have a good laugh about his harmless "crush," and he would realize there was nothing so terrible about his dirty little secret after all, thereby disposing of his guilt.

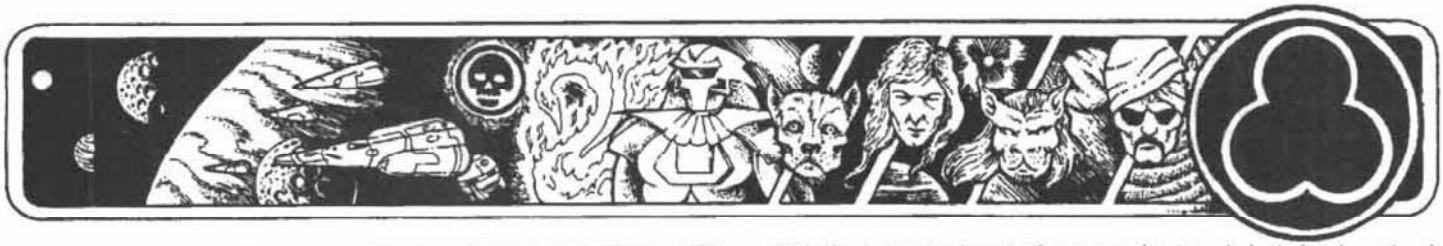
The key theme in these scenarios is the dysfunctional situations that can be created by a small, simple secret in a society that perpetuates barriers between people, and the way simple disclosure can defuse these things in a society that allows people to share their feelings without fear.

Another dirty little secret comes from the Imperial tradition of "emotional sovereignty." Imperials like to be able to conceal from each other the fact that their feelings have been hurt or that they are afraid of things. This, they believe, makes them less vulnerable to others. Allowing others to know where your emotional weak spots lie gives them weapons to use against you. Keeping these secret is assumed to allow you more maneuvering room, and more psychological safety.

On the other hand, Zhodani psionic abilities makes all of Zhodani society well aware of the vast number of fears and sources of hurt feelings that are shared by all humans. Because these tendencies are shared by all, they are not a source of vulnerability, but are things that can be handled by a corporate response. Zhodani society is therefore invariably more polite than Imperial society.

What is the difference between these two attitudes? Only one: that of awareness. Imperials are not aware of how much all humans are alike and are prone to imagine that they have unique weaknesses, i.e., "I must be the only one who feels this way, so I must keep it a secret."

Zhodani society, on the other hand, has empirical knowledge that people in a given society are all pretty much the same. This lack of emotional loneliness gives Zhodani fewer reasons to fear each other. Zhodani society is therefore warmer than Imperial society, as Zhodani are more likely to make themselves emotionally vulnerable than are Imperials, and drastically more likely to do so than members of the sociopathically status-driven Aslan, Vargr and Sword World societies.



Zhodani Privacy: Although it is true that Zhodani are more likely to make themselves emotionally vulnerable than Imperials, this does not mean Zhodani society is a miserable soup of teary, warm-and-fuzzy soul-baring. On the contrary, such behavior is seen in Imperial society only as a reaction to the rigid rules of emotional sovereignty. This sort of behavior is unheard-of in Zhodani society for the simple reason that it is unnecessary.

Weepy soul-baring of the type seen on many Imperial holovid "talk shows" is the result of the build-up of psychological pressure required by emotional sovereignty. A lifetime of keeping secrets about one's true feelings out of fear that others might learn the truth causes tremendous spiritual distress. The most common ways in Imperial society to deal with this stress are to turn it inward so that it ultimately damages the self, or to periodically purge the system by pouring it out before a group of witnesses.

In Zhodani society, where no one is afraid of the psychological and emotional truths about themselves, there is no need to gush about them, because there is no need to keep them a deep dark secret in the first place.

Zhodani Timeline

Imperial	*Zhodani*	*Event*
-400,000	-170,000	Ancients transplant humans onto Zhdant.
-299,700	-126,600	Ancients' final war strikes Zhdant.
-200,000	-85,000	*Homo zhdotlas* arises on Zhdant (195,000 BC).
-15,000	-3500	Rise of modern *Homo sapiens* on Terra (10,500 BC).
-8590	-817.3	Zhodani invent printing press (4072 BC).
-8540	-795.1	Zhodani first encounter Qiknavrats (Chirpers).
-8500	-778.1	Zhodani discover psionics.
-7980	-548.1	First Zhodani space exploration (3462 BC).
-7959	-538.3	First expedition to Viepchakl.
-7950	-534.3	Viepchakl base established. First encounter with Viepchaklts (Chirpers).
-7949	-534.2	First meeting between Qiknavrats and Viepchakl. Plague.
-7948	-534.1	Viepchaklts and Qiknavrats extinct.
-7945	-532.3	Plague spreads to Zhdant. Two-thirds of Zhodani population killed.
-7940	-530.2	Second Dark Age.
-6800	-25.2	Zhodani recovery.
-6731	1.1	First Psionic Games, Zhodani calendar begins (2213 BC).
-6200	238.3	First Zhodani planetary missions (1682 BC).
-6000	327.1	First Zhodani sublight interstellar flights (1482 BC).
-5823	405.2	Zhodani Consulate established (1305 BC).
-5415	585.3	Zhodani discover jump drive (897 BC).
-4000	1211.1	First core expedition launched (AD 518).
-2800	1741.3	First Zhodani contact with Vargr.
-2000	2095.2	First Zhodani contact with Vilani traders.
-1000	2537.2	Zhodani Consulate reaches present size.
50	3001.3	First Zhodani contact with Imperial traders.
60	3006.1	Imperial colonization of Spinward Marches begins.
461	3183.2	First Aslan contact with Zhodani.
500	3200.3	Imperial explorations into Zhodani territory.
589	3240.1	First Frontier War begins.
604	3246.3	First Frontier War ends.
615	3251.2	Second Frontier War begins.
620	3253.3	Second Frontier War ends.
750	3311.1	Seventh core expedition launched.
800	3333.2	Psionic Suppressions in Imperium begin.
826	3344.3	Psionic Suppressions completed.
979	3412.2	Third Frontier War begins.
986	3415.2	Third Frontier War ends.
1082	3458.1	Fourth Frontier War begins.
1084	3458.3	Fourth Frontier War ends.
1107	3469.1	Fifth Frontier War begins.
1110	3470.2	Fifth Frontier War ends.
1119	3474.2	First evidence of Zhodani troubles seen by Domain.
1132	3480.1	Spinward States Accords signed.
1201	3510.2	Exodus begins.

Adventure Hook

Regency psions are being recruited to help assist Zhodani refugee groups. Their nature as psions will give them common ground with the Zhodani and help in establishing trust. The psions are to teach the Zhodani how to live in Imperial society, but this is difficult when the Zhodani do not live in Imperial society but instead are crammed into camps with tents and shipping crates for houses. Food and medicine are in short supply, and there is no shortage of opportunists attempting to bilk the Zhodani out of their meager savings and few possessions. Even worse, local groups suspect that the Zhodani are up to something (see sidebar, "Reasons to Hate the Joes") and are organizing a campaign to kick the filthy aliens off the world.

Reasons to Hate the Joes

The Zhodani, or "Joes" as they are pejoratively called by imperials, have been hated for a long time by residents of the Domain of Deneb, so there is little need to come up with new reasons. However, the Exodus has presented the following, adopted by many Regency citizens.

- They suck up relief funds that could go to developing this world's real needs. Plus they provide cheap labor and will take our jobs.
- There goes the neighborhood. Refugee camps don't raise property values. They merely attract more refugees, flies, disease, squalor, and crime.
- The refugees are merely squatters, just like those damn Toons (page 81). It will be impossible to get them off this world once they become established. They'll set up Joe ghettos and be here forever.
- This is an invasion, in the ecological/social-Darwinism sense: "history is the story of the migration of peoples." Warfare is warfare, and imperial humans can not allow themselves to get pushed out of their territory.
- This is the prelude to an invasion. The so-called refugees are either fifth-columnists preparing the way for the military formations, or are a smoke screen which will mask the coming of the real invasion fleets.

With Zhodani society keeping few secrets about psychological and emotional issues, there has arisen a custom of compensating for this by maintaining boundaries around other areas of life.

Family life, for example, is kept private. Not because anything there is secret, but because there is great dignity in things done for their own sake, not for the consumption of society at large. Such family acts include daily rituals between spouses, between parents and children, between siblings, and between children and their pets.

In a similar way, Zhodani dress is more "modest" than most Imperial fashions. Imperial fascination with the covered and uncovered nature of the body is a further manifestation of their difficulty with the strictures of emotional sovereignty. Imperials are usually thwarted from attaining true emotional connectedness, and they have learned to fill this emptiness by increasing emphasis on the physical portion of personal contact. Their dress shows this by often functioning to advertise one's suitability and availability for physical contact. From the Zhodani point of view, placing the burden of true personal connectedness on merely physical concepts is ludicrous. For example, there is no analog to the Imperial "string bikini" in Zhodani culture. Zhodani have no need to compensate for an emotional isolation they do not experience by focusing attention on physical appearance and inflammatory anatomical details. A Zhodani who wished to go about naked would simply go about naked, while one who wished to remain clothed would remain clothed. Zhodani find no titillation in "clothing" which does not cover, or in pretending to be "dressed" while being as undressed as possible. Such clothing is thought by the Zhodani to be childish and prurient.

Sheep Among the Wolves

Pity the poor prole, displaced from his home, ripped from his well-adjusted, stable, dignified society, and plopped onto an Imperial world, bastion of anti-psionic prejudice and home to a race of constitutional liars, incapable of even learning the truth about their own minds. This is the reality of the Exodus for its most numerous constituents. What will they do? Where will they go? How will they find satisfying lives, or even food and shelter, surrounded by people who have fought them for 600 years?

The Zhodani are trusting, because they lived in one of the few societies that allowed them to be. They don't know how to defend themselves from lies and deceit because they have never had to. They are easy marks for the most transparent charlatan, let alone the professional swindlers, con artists, carpet-baggers, junk bond kings, divorce lawyers, used car salesmen and politicians.

Fortunately the proles are not alone. All groups of Zhodani refugees are shepherded by the intendants and nobles from their community, who do their best to protect their charges from the injustice the universe has to offer. They protect their proles from criminals and dishonesty by interviewing and psionically reading the non-Zhodani who come into contact with the group. They represent their proles in their dealings with local authorities and accompany them when they go to Regency welfare offices and courts in order to lend their legal knowledge, authority, and the moral support of their presence. By these examples, the Zhodani nobility are noble indeed.

Why the Exodus?

No one in the Regency understands the reasons for the Exodus, but there is no shortage of speculation, including the signs as early as 1119 of internal unrest in the Consulate (**Survival Margin** pages 22-23). What is surprising is that even the refugees themselves are of little help, as many appear to have taken flight without first-hand experience of whatever it was that was causing them to flee.

The Zhodani are unanimous in their belief that their society is in danger of being destroyed from within. References to internal strife and Zhodani-on-Zhodani violence and even warfare are common. But when asked how much of this took place on their homeworld before they were forced to flee, refugees admit, reluctantly it seems, that they saw none of this themselves. When pressed they will point out that very strong "intimations of doom" were felt by almost all Zhodani, proles, intendants and nobles alike, but the specifics and importance of these motivations are hard for them to express now, the way a dream fades from memory after awakening. When this kind of questioning forces its Zhodani subjects to come face to face with the strange vagueness of their reasons, the best they can do is to assure the questioner that it all made sense at the time.

Creating Zhodani Characters

Zhodani characters may be created using the character generation procedures presented in **TNE** with the following modifications.

Attributes: These are as described in **TNE** except for PSI and SOC (see below).

Psionics: Zhodani receive their psionic training at age 17 during character generation before any career terms are resolved. This means that Zhodani

characters roll 2D6-1, guaranteeing at least PSI 1. It impossible to create a prole character using this method, which is the whole point really, because why would you want to create a Zhodani character who was not psionic?

Just for the sake of discussion, see the note on Psionic Frequency on TNE page 246.

A	(10)	-iepr
B	(11)	-atl
C	(12)	-stebr
D	(13)	-tlas
E	(14)	-tlasché
F	(15)	-iashav

Social Standing: Because of the psionic effect above, all such characters will be intendants at least, so simply give Zhodani characters a beginning SOC of A.

Careers: Referees should modify TNE careers to allow improvement of psionic skills during term resolution.

Naming: When naming Zhodani characters, note that they add standardized suffixes to their names (family names for intendants; nobles have only one name) based on their SOC attribute, seen in the box above. This suffix changes with changed social status.

ASLAN

Of all of the former Imperium's neighbors, the Aslan had the widest distribution, being adjacent to both the Solomani Rim far to rimward and the Spinward Marches, at the Imperium's spinward extreme.

The Aslan resemble large Terran felines of the lion family, but the resemblance is merely coincidental. Aslan are larger than humans, averaging about two meters in height. They are all equipped with an integral weapon, called the *aisai* or dewclaw, on each hand which they instinctively and effectively use in combat. Incidentally, Aslan have only four manipulative digits on each limb, with the result that their math uses base 8 rather than the base 10 of five-fingered humans.

Aslan Hierate

The Aslan Hierate formerly stretched from the Solomani Rim across the Great Rift to the Spinward Marches. However, like the Imperium, its area trailing the Rift was ravaged by Virus and is now Wilds, leaving only the areas across the Rift to survive into the post-Collapse era. This area was formerly called the Aslan Colonies or trans-rift colonies, but is now all that remains of the Aslan Hierate itself.

Aslan society is organized along family lines, with the family (*ekho*) of two to 12 Aslan as the basic unit. Families are organized into "prides" (*ahriy*) with one dominant family. Finally, prides are organized into a clan (*huiha*), again with one dominant pride. All subordinate members of that clan owe fealty to the clan and to its single clan leader. Family/pride/clan loyalty is very important among the Aslan. In fact, the phrase *Sihouwelilyiuahryi*, "Your pride calls to you," is an invocation that will not be denied by any Aslan blood relative.

The Hierate is "ruled" by the *Tlaukhu*, or "29," the ruling body of the 29 dominant Aslan clans. The *Tlaukhu* exercises no real authority over individual Aslan, as only the clan leaders can call on the loyalty of their clan members, and each clan has its own laws and traditions. The *Tlaukhu* owns no military forces or bases, these all belong to the clans. But as the council of the 29 most powerful clans, and the only forum for the handling of inter-clan business and issues that involve the Aslan as a whole, the *Tlaukhu* is the highest focal point of Aslan policy and power.

Clans rise and fall in relative power and can be replaced on the *Tlaukhu*. Inter-clan arguments are solved by highly organized "clan wars," essentially the equivalent of a duel of honor, but on a national scale. Clans can rise or fall in power and prestige as a result of these wars, and can become vassal clans to other more powerful clans.

Aslan Society

The Aslan are a competitive and, by human standards, touchy and violent race. Their society is based on many strict codes of behavior and propriety, all lumped under the general heading of "honor," although the Aslan like to point out that they have 15 different words for honor, unlike the dishonorable humans. To humans, honor is but one concept among many, but to the Aslan it is *everything*, which makes them regard humans with suspicion, if not outright contempt. Misunderstandings are common between cultural Aslan and Imperial culture humans. Although Aslan populations have been able to assimilate themselves more or less within Imperial and also Darrian culture, they are then rejected by many cultural Aslan for having betrayed their race's values.

One important feature of Aslan society is the strict division of labor between male and female Aslan. Males are warriors, concerned with political and military leadership and the aquisition of land—their passion and reason for being. Females, which outnumber males by 3:1, are responsible for trade, industry, and commerce, education, scientific and technical knowledge, and the accumulation and management of wealth—in short, the real work of making society work while

Aslan Timeline

Imperial	*Aslan*	*Event*
-2190	-123	Aslan First World War.
-2160	-88	Aslan Second World War escalates to massive nuclear exchange.
-2136	-59	First Aslan space explorations.
-2198	-18	Aslan Third World War.
-2083	0	*Tlaukhu* formed. Aslan calendar begins.
-2013	80	Terran exploration ship *Pathfinder* misjumps, crash-lands on Kusyu.
-1999	94	Aslan build first starship *Ukhtai*, based on *Pathfinder* technology.
-1980	117	First Aslan contact with Solomani humans.
-1776	350	Rule of Man collapses. Long Night begins.
-1719	415	Aslan *Tralyeaeawi* clan purchases starships from Solomani traders.
-1118	1101	First Aslan Border War begins.
-1104	1185	Aslan first cross Great Rift.
-63	2304	Great Conclave (*Sakolusalo*) begins.
-56	2312	Cultural Purge (*Uwaralyekose*) begins.
-7	2368	Great Conclave concluded. "Codices of Sakolusalo" mandates primogeniture and other standard items of Aslan culture.
49	2432	Cultural Purge ends.
212	2618	Peace of Dark Nebula signed between Imperium and Aslan.
374	2805	Flyflyalr War begins between Old Earth Union and Hierate. Imperium pulled into war. Aslan and Imperial envoys agree on a duel war, which is won by the Imperium.
380	2810	Peace of Ftahalr. Imperial-Aslan border established with Reaver's Deep as buffer zone. Aslan prohibited in making investments in Imperial worlds.
454	2894	Aslan traders begin shipping dustspice from Romar.
461	2902	Aslan dustspice traders first contact Zhodani.
585	3043	Aslan *ihatei* offer to fight for Darrians in exchange for land.
1109	3641	Human visitors discover wreck of *Pathfinder* on Kusyu.
1116	3649	Dulinor assassinates Strephon and Tokeaias, the Yerlyaruiwo ambassador.
1117	3650	Assassin's Guild "Brotherhood of Tokeaias" dispatches duel-assassins across Great Rift to make Dulinor pay for his dishonorable act. First *ihatei* forays into the Domain of Deneb.
1119	3652	Growing *ihatei* incursions into Domain lead to armed conflict between Imperial and Hierate forces.
1120	3654	Domain of Deneb establishes the Patrol, or *Trekhyair*.
1131	3666	Domain forces occupy the Football as part of the Quarantine. Joint Domain-Aslan forces destroy vampire fleets crossing Great Rift in the Riftspan Reach.
1132	3667	Regency established and Spinward States Accords signed. Aorlakht and Football worlds incorporated into Regency.

Good Neighbors

When dealing with Aslan, even Regency Aslan, you have to remember that you are dealing with a pack of hormone-addled adolescents. Before you say anything, before you respond to a provocation, remember what it was like when you were a teenager. Remember what it was like to move in packs, all horribly bound up in your group's nonexistent status and honor, imagining a slight or an insult behind every remark or expression. Remember what it was like to be part of that fascism called adolescence, where there was a simple answer for everything, everything was black and white, and everyone who was not for you was the enemy and deserved no better than to be crushed. Then, and only then, compose your remark. And when you smile, be careful to not show too many teeth, unless you have a weapon in your hand and outnumber them.

Ambassador Celine Richtor from a lecture at the Regency Foreign Service University, Regina

the males concentrate on single-combat glory. For example, only males may serve as pilots and gunners aboard Aslan starships, and only females may serve as navigators, pursers, engineers, medics, and stewards.

By human standards these divisions are taken to ludicrous extremes. High-status Aslan males are literally helpless with concepts of money and finance. While they have an obsession for obtaining land of their own, they seek it for its own sake; it takes the female members of their families to figure out what to do with it so that it can be of any use to anyone.

Even Aslan military units follow this model. The combat leader and close combat troops are male, but all support, logistical, technical, staff, and intelligence personnel are female. This includes combat engineers and artillery personnel,all the way up to the true commander, the female who organizes the unit and sees to its day-to-day operations.

With the cultural imperialism typical of Aslan, they project these gender differences onto non-Aslan as "perceived gender." In other words, a human male in a "female" role will be treated by the Aslan as a female, and vice versa. This means that Aslan will not discuss business (a female task) with a human who pilots a starship (a male task), regardless of whether that human is really male or female. In some cases Aslan will simply not be able to tell the difference between male and female humans, but even if they do, their cultural predisposition requires them to impose their Aslan standards.

ASLAN IN THE REGENCY: THE HUMAN POINT OF VIEW

To the human perspective, there are two types of Aslan who are citizens of the Regency—those who adapt to human values and culture (referred to as "Regency Aslan") and those who adhere to Aslan culture and force these values in the larger human culture (referred to as "Aslan in the Regency"). Until the Collapse, the only Aslan recognized by the Domain of Deneb government to legally reside within the Domain boundaries were of the assimilable Regency Aslan variety. However, the impending arrival of Virus is 1131 changed all of this.

Fait Accompli

If politics makes strange bedfellows, then Screaming Unavoidable Necessity mothers the invention of some mighty unusual looking siblings. Such is the relationship between the descendants of the Aslan *ihatei* invaders and the descendants of the rightful rulers of the former Domain of Deneb.

One unintended by-product of the Collapse is that it legitimized many of the Aslan acquisitions with the Domain of Deneb borders. Although in many cases the Domain government was engaged in military campaigns to dislodge Aslan enclaves or topple their governments, the urgency of presenting an impervious frontier to Virus made the conclusion of such campaigns a luxury. In order to ensure impervious borders, the new Regency had to formally accept and legitimize whatever governing structures were already in place, even if these were traditional cultural Aslan clan governments.

A Deal With the Devil

The most difficult of the internal political problems facing the Regency is that of traditional Aslan planetary government existing undigested within a larger Imperial culture Regency government. Not only does this create difficulties for the non-Aslan inhabitants of these planets, who feel oppressed by the inflexible social order placed on them, but the Aslan government itself has mixed loyalties. Although the Aslan have sworn fealty to the Regency for the land it has granted

An Abridged Aslan Abecedarium

Ahfa: Items kept as one's personal Shrine of Heroes.

Aisat: The Aslan dewclaw, literally "blade claw."

Aisaiaokheh: Duel of honor, often to the death.

Akhaoye: Essence or spirit of all things Aslan. "Because if it's not Aslan, *it's CRAP!!*"

Akyafteirleao: Contrary to the Aslan spirit. This refers to an active threat to the *akhaoye* rather than the contemptible, offhand disregard for it shown by barbarians.

Aokhaor: Honor, literally "spirit of strength." This is the term the Aslan use to encompass the entire Aslan life-style, one dedicated to the spiritually correct approach to life.

Aorlakht: "New Lords," or more accurately, "New Landholders." In other words Aslan, often *ihatei*, who previously did not hold land who now do so. This was the name used by the Aslan invaders of the Domain of Deneb.

Arlaeaha: Vargr.

Eakhau: Aslan day, 36 hours; 212.2 of these make an Aslan year, or *ftahea*.

Ekho: Aslan family.

Firukhte: Stylized use of insults to provoke another party into issuing a challenge.

Flyfiyair: The Imperium, literally "vassals of vassals of one." This term is still used for the Regency.

Flyfiyairya'uist: Trokh insult meaning an Imperial lackey which has soiled itself because it neither understands nor possesses personal honor.

Ftahea: Aslan year, 320 standard days.

Fteirle: The Aslan people.

Hisol'i: Solomani.

Ihatei: Second son. To the Aslan it goes without saying that this also means unlanded.

Istoiuael: Zhodani.

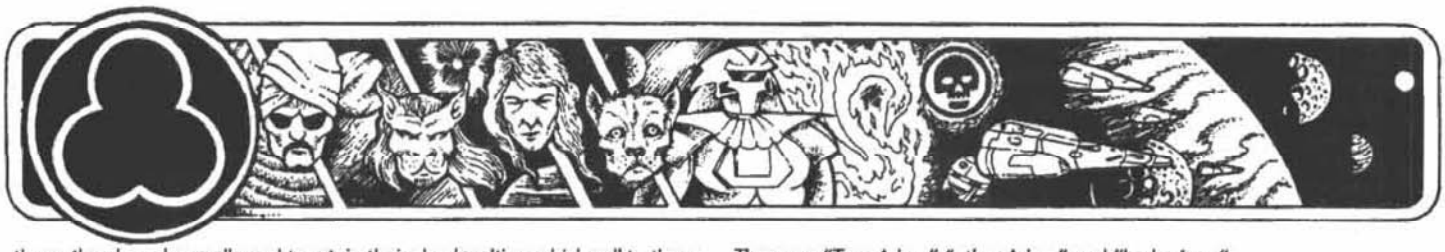
Khaofiy: "Submission to the Stronger." The ritual apology delivered by the loser in a duel of honor.

Khoafteirleao: Aslan concept of spiritual perfection which can only be achieved by the purging of all non-Aslan influences.

Rukhta: Deeds without honor.

Rukhtiywe: The act of denying one's Aslan nature.

Tahiwihteakhtau: Barbarians, literally "those who lack understanding of Aslan culture." This phrase is typically used for those who embrace Imperial culture, whether humans or Aslan who have adopted the human way.



Tekhaaa: Aslan "hour," 137 minutes; 16 of these make an Aslan day, or *eakhau*.

Tlasoistsea: "Bounty of New Lands." Area ripe with new land for the taking by righteous, upright Aslan. Unfortunately many trans-rift Aslan viewed the Domain of Deneb as such an area during the Civil War.

Tlaukhu: "The 29," specifically the council of the 29 most powerful Aslan clans in the pre-Collapse period.

Trokh: The Aslan language.

Ukhtai: "Hero." The perfect Aslan role model, in perfect accord with Aslan concepts of *aokhaor* and *akhaoye*.

them, they have been allowed to retain their clan loyalties, which call to them from outside the borders of the Regency.

By 1202 the upshot of this is that Aslan clans in the Regency have a "foot in the door" which they are using to permit immigration of other clan members, thus further consolidating their power. While the Regency government cannot be happy with this development, there is very little it can do about it.

Trekhyair

The exclusively Aslan-manned portion of the "Patrol," or *Trekhyair* ("land protector") was established by then-Archduke Norris in 1120 to co-opt Aslan, including *ihatei*, into defending the Domain in exchange for land (**Survival Margin**, page 25). This brilliant stroke resulted in the "domestication" of a large number of uncontrolled *ihatei*, and added defenders to the Vargr frontiers to boot. Had it not been for the 1132 *faits accompli*, this would perhaps have been the solution to the Aslan problem, but events did not fall that way.

Nonetheless, the *Trekhyair* itself became a tremendous success. Although it might have initially appeared as a cynical attempt to co-opt the Aslan, the Denebians soon learned the same lesson as their Darrian neighbors (see page 31): the Aslan can be some mighty good friends to have. Within a few short years the Domain was actually recommissioning older warships for the use of the growing patrol, including *Azhanti High Lightning*-class cruisers (***Azhanti High Lightning***, OP, ***Arrival Vengeance***, SA).

The *Trekhyair* lives on in 1202, as vigorous Aslan participation in the Regency Quarantine Service. As a continuation of the *Trekhyair* incentives, Aslan RQS personnel can opt to receive land instead of normal monetary compensation. These land titles are typically on worlds in or near the Regency Frontier that have been abandoned by their former human inhabitants. Aslan RQS crews typically operate Aslan-built and -styled variants of the Quarantine Cutter design (see page 91). However, these ships are a lumpy blend of flowing Aslan naval architecture and blistered-on fairings of human-built equipment.

ASLAN IN THE REGENCY: THE ASLAN POINT OF VIEW

As could be expected, the Aslan view of Aslan inhabitants of the Regency is more complex, not to mention more doctrinaire. To the Aslan mind, there are three types of Aslan, in increasing order of compromise with barbaric values. These are "True Aslan," "other Aslan," and "barbarians."

True Aslan are any who retain their full Aslan culture and traditions. These would include the *Aorlakht* rulers of the Regency *fait accompli* worlds.

Other Aslan are those who have made some concessions to human culture that allow them to trade more effectively. Most would include the Darrian Aslan in this group, as well as the Aslan members of the *Trekhyair*, RQS, and other Regency armed forces. Although these Aslan are not as scorned as the barbarians, Aslan exude an unmistakable sniffiness when they speak of these other Aslan and the way they sold out for prosperity.

Barbarians are the true fallen Aslan who have fully adapted to human values. Lest there be any question about where the fallen Aslan stand on the cosmic pecking order, the Aslan hold non-Aslan who live by Aslan culture to be closer to them than racial Aslan who have rejected their rightful culture. Some such Aslan have formed their own states, such as the so-called Glorious Empire in Trojan Reach, which was conquered by true Aslan eager to teach them their errors.

Adventure Hook

Turncoats: The PCs are members of a human military peacekeeping force (PKF) sent to quiet guerrilla activity on an Aslan-ruled Regency world. The catch is that the guerrillas are humans, the original inhabitants of the world before the *ihatei* took over during the Final War. However, owing to the accommodation made with the Aslan rulers during the Collapse, the Aslan are the lawful rulers and the humans are legally in the wrong (although perhaps morally in the right). The ruling Aslan make it clear that they will annihilate the guerrilla strongholds if these activities continue, and they are within their legal rights to do so. The PKF is the last chance the guerrillas have to make peace before the Aslan destroy them. And although the Regency government's heart is with the human guerrillas, its hands are tied.

As representatives of the government which backs the Aslan rulers, the human peace-keepers are the enemies of the human guerrillas, and may be treated as such. The peace-keepers don't like what they have to do to their repressed human brethren, but they know that if they don't do it, the Aslan will, and with much more terrible results.

Complications: Aslan observers are sent along with the PKF. They may demand harsher measures, or may deliberately make the situation worse, to create an excuse for final Aslan intervention. These observers may be contemptuous of the human PKF, continually goading and insulting them in the Aslan *firukhte* tradition.

The Aslan government, impatient with the pace of the PKF operations, sends an Aslan strike force into the field to "make an example" of a human village. The PKF must observe the slaughter and still attempt to convince the humans to peacefully exist with their Aslan rulers.

The Aslan may be deliberately setting up the PKF to fail, to allow them to accuse the Regency government of betraying them and giving them an excuse to declare their independence.

This adventure is not a shoot 'em up. It is intended for groups that accept the challenge of complex and ambiguous moral and psychological dilemmas.

Creating Aslan Characters

Regency Aslan (by Aslan standards, either "Other Aslan" or "Barbarians"), because they follow human professional norms, may be generated using the character generation procedures presented in **TNE** with the following modifications.

Attribute	*Mod*	*Roll*
STR	+2	2D6 +1
AGL	–1	2D6 –2
CON	+2	2D6 +1
INT	—	2D6 –1
EDU	—	2D6 –1
CHR	—	2D6 –1
SOC	—	2D6 –1

Psionics: –2 per four-year term rather than –1. In addition, PSI continues to drop with age, even after testing: –1 the first term (four-year block) after testing, –2 the second term after testing, –3 the third term after testing, and so on.

Skills: Among cultural Aslan, the gender division of labor extends even to skill receipt. For example, a male would not receive skills of a technical, scientific or economic nature, and females would not receive close combat skills. However these distinctions are less important for assimilated Aslan.

There are also several new skills for the Aslan, below.

Dewclaw (STR): This skill replaces Unarmed Melee Combat for Aslan and covers the ability to fight "unarmed" with their natural weaponry.

Independence (INT): This skill is available only to male Aslan and governs their ability to deal with money and handle financial concepts, which are traditional female responsibilities. The presence of this skill means a male can see to his own needs in simple monetary transactions. Lack of this skill means the Aslan has no understanding of money whatsoever, and will need to be looked after by a wife or female companion who takes care of making his purchases.

Meditation (CON): This allows the Aslan to duplicate most of abilities of the psionic cascade skill Self, without having to possess psionic talents. Meditation is used just like Self, except it is controlled by the CON attribute and only has three cascades: Suspended Animation, Psionically Enhanced Strength and Psionically Enhanced Constitution.

Tolerance (CHR): This skill allows Aslan to interact with non-Aslan. It is thus similar to Liaison skill, except it particularly refers to the ability to ignore violations of Aslan propriety on the part of non-Aslan, allowing the possessor to better get along with these barbarians. Those Regency Aslan known as *Tahiwihteakhtau* (barbarians) to other Aslan have no use for this skill, as they have already adapted to human social norms.

Tradition (EDU): This skill confers deep and detailed knowledge of Aslan history and traditions, allowing an Aslan to "out-Aslan" other Aslan. Use of this skill is helpful in persuading other Aslan, as the possessor can use fine points of honor and tradition to support his points and undercut others'. It is also be used to allow really cranky Aslan to pick fights all the time, because there is very little that cannot piss off an Aslan who is really paying attention. Those Regency Aslan known as *Tahiwihteakhtau* (barbarians) to other Aslan have no use for this skill, as they have adapted to human social norms and have no need (nor the right) to quote Aslan propriety.

Tips for Humans in Vargr Society

1. Pay attention to your relative status in the framework of Vargr society, and be sure to know the charisma of the Vargr you encounter.

2. Keeping point 1 in mind, think about *privilege*. Relative levels of charisma confer various privileges in Vargr society. Demand to receive yours and see that you grant others the privileges to which they are entitled.

3. Be assertive. Making firm decisions and standing by them is a hallmark of charisma.

4. Use it or lose it. Charisma must be constantly fed and exercised. It is rapidly reduced if it is not demonstrated often, even for *seemingly* minor points. Vargr are always keeping score.

5. Be vigilant. Vargr are always pushing to see what they can get away with. If you do not reassert your authority in the face of such challenges you have *agreed* to let that Vargr gain power at your expense, and he will only push harder the next time. Loss of charisma is the death by 1000 pricks.

6. Praise those who submit to your authority. Subordinate Vargr need approval and affirmation; it cements their loyalty to their superiors and it gives them a secure and comfortable role in the universe. By making sure they know you value their contributions, you give them value, and because you are now a source of their value, they will *support* your authority, thereby further validating the approval you give them.

7. Like begets like. The best way to gain high charisma among Vargr is to act as if you already have it. This will become a self-fulfilling prophecy. Conversely, the best way to achieve low charisma is to not care about it enough to use it. Vargr do not grant the benefit of the doubt—to a Vargr the only explanation for failure to exercise charisma is that one already had none to begin with.

The Survivor's Guide to the Spinward States
Regency Foreign Service University and
the Regency Ministry for Public Information and Welfare
Government Printing Office, Regina, 1142

VARGR

Of all the Regency's neighbors, the Vargr are the most difficult to describe in any concise fashion. Some Vargr are Regency citizens. Some Vargr are pirates or criminals, preying on humans. Some Vargr are pirates or criminals, preying on other Vargr. Some Vargr are members of Vargr states or polities. Vargr do different things, but they all behave in the same way.

The irony is that all Vargr society is the same, yet it is also all different. The central theme of Vargr social interaction is flux. This is the result of the ceaseless Vargr jockeying for relative authority, status, and power, called by the Vargr *charisma*. The Vargr have never achieved a large unified state like those of the Zhodani, Vilani, Solomani, Aslan, K'kree or Hivers. Instead they have always existed as a bewildering kaleidoscope of small states, constantly fissioning, realigning, coalescing, splintering, then coalescing again only to splinter some more. The constant struggle for charisma where one's gain only comes at the expense of another's loss, and the constant willingness to abandon an old leader when someone better comes along, has prevented any kind of Vargr stability at the microcosmic level. However, the nature of all Vargr societies at the macrocosmic level remains exactly the same as it has always been. The only constant is change. In fact, Vargr profess to be uneasy at the stability of human society—surely something unnatural and suspicious is going on.

This lack of organization makes the Vargr both more dangerous as individuals and less dangerous as a group. Thus human empires have long been required to fend off Vargr corsairs, but have never been truly threatened by a Vargr invasion.

However, it is their very lack of organization that creates the greatest Vargr threat to the Regency, that of an entry vector for Virus. The experience of the Regency and its other neighbors has taught one indelible lesson—that Virus can only be successfully defeated by a unified, airtight front. The Vargr are constitutionally incapable of imagining such a thing, let alone carrying it out.

Physical Characteristics

The Vargr have something in common with the Zhodani, Darrians and other transplanted human races. They too owe their existence to the activities of the Ancients over 300,000 years ago. However, unlike the humans, the Vargr were created, genetically engineered from prehistoric Terran dogs, and given larger brains, hands with manipulative digits, and an upright posture.

Average Vargr males are 1.6 meters in height, while females are 1.5 meters. They are therefore lighter and less strong than humans, but are more agile. Like the dogs from which they were derived, Vargr demonstrate a wide variety of fur color, texture and pattern.

Regency Vargr

There have been Vargr citizens in the Domain of Deneb for centuries, and although they are capable of functioning within the broad parameters of that society, they still retain their distinctive social style. They prefer to live in communities with other Vargr, and the "Vargrtowns" within many large Regency cities are characterized by the same raucous, freewheeling anarchy as Vargr interstellar society.

There are three main populations of Vargr living in the Regency. These mostly differ in how long ago they forced their way in—most Vargr arrive the same way: uninvited. The first group is the established Vargr, those who have been living in the Imperium for several generations. These can be found most anywhere in the Regency, although they gravitate to other existing Vargr communities.

The second group is the Vargr who arrived on Imperial worlds during the Vargr raiding and incursions during the Civil War, from 1117 to 1130. These Vargr are found on the coreward and trailing worlds of the Regency on which they gained a foothold by force of arms. Their recognition by the *faits accompli* of 1132 gave them more staying power on these worlds than they could have achieved on their own, and they remain in power on these worlds.

The final group are the Vargr refugees, those who fled the onslaught of Virus after 1131. These Vargr at least did not come to conquer or steal, they came simply to survive. These found their way into Regency-organized Vargr refugee camps, unlike the first two groups.

A Regency human would say that Regency Vargr do not have much respect for authority, and that they obey the Regency's laws when it suits them or when they are forced to do so. This assessment is true, but a truer description is that humans and Vargr have quite different understandings of "respect for authority." While humans believe in self-control, in willingly submitting to laws so that others will do the same for the benefit of all, Vargr competition for charisma does not permit this. Vargr are constantly pushing the envelope, looking for openings where they can increase their own authority, constantly trying to see what they can get away with. The amount of respect a Vargr is willing to give to the law (or

society, or government) is *precisely* the amount of respect the Vargr's experience shows him that law demands, *no more and no less.* Responding to such human criticism, one Vargr replied, "You humans might as well say that we are morally bound to obey the law of gravity. It is there, it acts on me, I accept that. But I do not let it stop me from leaping or flying. If it ultimately wins, pulling me to the ground, so be it. But I will not give up my right to follow my own laws. If it is strong enough to make me obey, then it is strong enough to make me obey. But if it is not, why should I grant it authority it does not deserve? All laws are the same way."

Vargr Organized Crime: A growing force in the Regency is Vargr-controlled organized crime. There is some such activity on every world which has a significant Vargr population, and even on some which do not. This activity, on all the worlds on which it appears, is commonly known as "the Pack."

Lawless organizations are nothing new for the Vargr, but it appears that the Pack is something different, as its operations and procedures are the same from world to world, implying higher control, or at least coordination. Although the Pack's activities do draw on human possessions and moneys, its membership seems to be exclusively Vargr. And while human populations are largely immune from Pack reprisals, murder and violence within Vargr communities associated with failure to cooperate with the Pack are common.

The Vargr-specific nature of its violence has helped the spread of the Pack, as most humans see it as a purely Vargr problem, which has limited the response of human law enforcement agencies. The racist nature of this thinking, "it's okay so long as they only do it to their own kind," is clear, and not encouraging.

Vargr Splinters

Even before the Collapse, Vargr space was always know as the "Vargr Extents," meaning that this area was no true Vargr nation, only that there were a lot of Vargr there. These circumstances still hold true in 1202, which makes it very difficult for the Regency to maintain relations with the Vargr states (usually called the "Vargr Splinters") given the threat of Virus. However, given Vargr tendencies and history, it would not do to try to maintain a perfectly closed border against the Vargr. By allowing some legitimate Vargr trade the Regency is able to exercise more control over its nature than if it allowed none at all, forcing all Vargr trade to be, by definition, out of its control.

For this reason the Regency's frontier with the Vargr is the most fortified of all of its interfaces with the Spinward States, having more in common with the frontier on the deep Wilds than with the civilized interfaces with the Darrians or Zhodani. Whatever can be said of the thoroughness of inspection and impoundment procedures at other interfaces, these do not hold a candle to the Vargr interface inspections. In fact, no Vargr Splinter ships are allowed across the frontier into the Regency under any circumstances, as it is assumed that they are Virus plagues just waiting to happen.

Despite the strictness of this border, it is only a fortunate minority of Vargr that are extended even this dubious honor. The interface with the Vargr Splinters extends only along the coreward edge of three subsectors—Regina, Aramis (C and D/Spinward Marches), and a small slice of Pretoria (A/Deneb). These border on the Vargr groups that were sheltered in the "shadow" of the Domain of Deneb as Virus rounded the corner of the Great Rift and barreled through Corridor. These therefore had the opportunity to benefit from the Domain's warning and protect themselves. The Vargr to coreward of the remainder of Deneb were not so lucky. These areas are classified as deep Wilds, and these frontiers are sealed against contact.

No one in the Regency really believes that Virus could not be spread from the Wilds Vargr to the Vargr Splinters, then into the Regency. But that is why the Vargr interface is guarded as well as it is.

One Cannot Punch the Air: One dissenting view to the uniquely Vargr susceptibility to Virus argues that Vargr society is actually immunizing itself to Virus and will eventually emerge stronger than those societies that spent their finite energies on holding Virus at bay. This is a long-view ecological perspective of interstellar culture that persuasively demonstrates (via historical examples, psycho-historical principles and sophisticated computer modeling) that decentralization is precisely the sort of organization that will ultimately defeat Virus. This is the ancient Terran Oriental theory of warfare by simply absorbing the invader and passively destroying him over time, perhaps even assimilating the invader into the absorbing culture. At the end the invader disappears as a distinct entity and the invaded culture survives, but it has now converted the strengths of the invader into its own. Radical proponents of this view argue that the Regency should open its borders to Virus and to the forces of social Darwinism that would eventually craft the Regency into the sort of organization that could survive these new conditions.

However, this ecology of civilizations is persuasive only to ivory tower academics and others who imagine that they can hold themselves over and above real life as disinterested observers. First Regent Norris himself answered these theoreticians by agreeing that they were perhaps correct, but registered the following reservations:

"The same human culture that practiced what you propose was also the author of the curse. May you live in interesting times. And there is the trick. This life, this walking the razor's edge between survival and extinction, is a lovely spectator sport, but who is the spectator? Since this victory would take place over decades and trade the destruction of planets and the extinguishing of billions of lives for our rebirth in a new form, it makes us choose whether it is people or societies that are real. Are we mere cells in a body that can live on without us, or is each individual the irreducible currency of reality so that it is society which serves them? This life I live would be merely interesting if I did not have to take it so personally, but I find that I do take it personally, and these theories that you propose take on life or death significance."

Although Norris' refusal to subject his people to this sort of evolution is ethical, the possibility remains that new societies are forming in the Vargr Wilds—new societies that are the fusion of biologically-based point-identity and electronic meta-identity (see Library Data).

Creating Vargr Characters

Vargr may be generated using the character generation procedures presented in **TNE** with the following modifications.

Attribute	*Mod*	*Roll*
STR	–1	2D6 –2
AGL	+2	2D6 +1
CON	–1	2D6 –2
INT	—	2D6 –1
EDU	—	2D6 –1
CHR	Special	1D6
SOC	N/A	None

Psionics: Vargr psionics is handled as in **TNE**. However, the Vargr states have no psionic training centers to speak of, so testing and training is almost impossible to find outside of the Regency.

Charisma Increases: During character generation, CHR is increased by one each time the character exceeds the required Commission or Promotion roll by four or more points.

Church of the Chosen Ones

Fanatical Vargr sect which believes that the Vargr were deliberately created by the Ancients to be the supreme race in Charted Space and that they are destined to someday rule over all other races, perhaps after the Ancients' final return to invest them in their rightful glory.

The church therefore accepts the theories that the Vargr were created by genetic manipulation (and is thus in conflict with some Vargr sects which see this as slander), but finds this to be not degrading, but proof of the Vargr superiority. After all, the Ancients transplanted humans on a great many worlds but did not significantly modify them. And after having gained such expertise on humans, the Ancients found this Terran species to be inadequate. Proof is that they took the trouble to create the Vargr, an unnecessary effort if the already existing humans had measured up to the Ancients' standards. And because the Ancients would not have bothered to create something that was less than perfect, the Vargr are the only race that can claim racial perfection by deliberate design.

Given the Vargr nature, the church has naturally split into many factions. The militant wing believes their superiority requires the Vargr to conquer other cultures. The beneficent wing believes their superiority obligates them to assist lesser races to achieve what the Vargr have naturally. The penitent wing believes their current status proves they have sinned and betrayed their potential and must rediscover their true glory before the Ancients return to punish them for having squandered their gifts. Many other factions have no real doctrinal differences, but have merely split to follow different leaders.

Darrian Timeline

Date (Imperial)	*Event*
-300,000	Ancients transport Terran humans to Daryen.
-300,000	Ancient civilization destroyed.
-1520	Itzin Fleet departs Dingir.
-1511	Terran traders contact Darrians.
-1410	Daryen begins space exploration. Darrian Golden Age begins.
-1270	Darrian space exploration reaches out to 20 parsecs.
-1000	Experiments on Daryen's sun, Tarnis, begin.
-924	Darrians reach TL16. *Maghiz*: Tarnis destabilizes.
-905	Darrians decide to abandon space.
-860	All Darrian interstellar contact ceases. Night Time begins.
-399	Sword Worlds colonization begins.
-275	Mire returns to space.
-187	First Zhodani contact with Darrians.
60	Imperial colonization of Spinward Marches begins.
148	Imperial Scouts contact Daryen.
450	Darrian Special Arm created.
489	Star Trigger demonstrated.
585	Aslan arrive at Daryen.
589	First Frontier War begins. Darrians neutral.
593	Sword Worlds invade Entropic Worlds.
595	Darrian Confederation allies with Imperium.
604	First Frontier War ends.
788	Darrians retake Entropic Worlds.
1084	Sword Worlds retake Entropic Worlds.
1107	Fifth Frontier War begins.
1110	Darrians retake Entropic Worlds. Fifth Frontier War ends.
1121	Darrian Confederation annexes Nonym.
1132	Darrians assist Regency in putting down Sword Worlds land-grab.

DARRIANS

Like the Zhodani, the Darrians are a human race planted by the Ancients. Unlike the Zhodani, the Darrians are classed as a minor human race as they received jump drive only as the result of contact with Solomani traders who were assimilated by the Darrian race. The Darrians have long been aligned with the Imperials against their Zhodani and Sword Worlds rivals, and continue their friendly relationship with the Regency.

Although the Darrians are a specific race of humans, the term "Darrian" has a broader social meaning within the Darrian Confederation. Only 75% of the Darrian population are ethnic Darrians. Another 12% are of mixed Darrian-Solomani descent, and 8% are Aslan.

Darrian Physical Characteristics

Although remaining within the broad range of human morphology, the Darrians have a distinctive "elfin" appearance which is a combination of environmental adaptations and genetic drift.

Having spent many millennia adapting to a world with a surface gravity of 0.5G, Darrians are taller than the human norm, averaging two meters in height. They are also more slender than other human races and tend toward sharp facial features.

Darrian skin is a uniform golden color, due to the pigment protremelanin which protects the skin from ultraviolet rays without darkening and controls vitamin D production to needed levels regardless of the amount of sunlight. Darrian hair is white or grayish-silver.

Darrians are less strong but more agile than Imperial humans. Other minor differences include the fact that 40% of Darrians are left-handed or ambidextrous, probably the result of a larger and better developed corpus callosum than is present in Vilani, Solomani or Zhodani brains. Darrians have a wider pelvic structure than other human races, meaning fewer complications in childbirth and a wider walking track. Darrians also sweat less than other human races, an adaptation to the somewhat drier Daryen climate.

Darrian Society and Psychology

In comparison with other human cultures, Darrians tend to be quiet, dignified and stoic. They are also constitutionally peaceful; Darrian history records remarkably few wars.

Darrian philosophy, distilled in the Codes of Darrian, is based firmly in tolerance and the veneration of intelligence and rationality as the highest expression of humanity. Tolerance is evidenced by prohibitions against cruelty to animals as well as stiff penalties against slandering another person. This tolerance demands that each creature be allowed to live in accordance with its own nature, which leads to the Darrian emphasis on rationality and civility.

Humans have both an animal nature and a higher nature, but it is the responsibility of humans to rise above slavery to the instincts they share with animals and express the true, uniquely human virtues of rationality, intelligence, self-control and civilization. Although this Darrian philosophy is quite spiritual in nature, Darrian society has no truck with organized religion. The significance of the spiritual life is broadly recognized, but experiencing it is a personal and private matter, as befits the Darrian emphasis on tolerance. Darrian philosophy also contains a strong streak of fatalism, surely an artifact of their history.

Darrian society places great value on knowledge and discovery for its own sake, and does not glamorize violence or brute force as do many other human cultures. Learning is something of a passion in Darrian society; Darrian role models are typically teachers, scholars, scientists, or academics, not warriors or military personnel. Pacifism and extreme life-respecting traditions (i.e., even plant life may not be taken; only fruit is eaten; only deadfall wood may be used; and animal fur may only be obtained by shearing) are not the norm in Darrian society, but are rather more common than in the Vilani or Solomani traditions.

The Darrians also value art; their most distinctive art form is also unique to them: Darrian flame sculpture. Flame sculpture uses various energy fields to hold a burning flame in a static, three-dimensional form, or in more sophisticated examples, in an animated series of forms. Flame sculpture embodies the Darrian concept of humanity's dual nature. Just as wild animal nature is made acceptable by rationality and self-control, the wild, dangerous flame is made safe by the containment fields, but its fiery beauty remains as a reminder of the wildness held in check.

Darrian History

Darrian accounts of their prehistory are quite reminiscent of Terran Eden myths: The early Darrians lived in well-balanced, well-laid-out orchards in which all their needs were met. This idyllic beginning and the fact that Daryen shows no marks of the Ancients' final war fits with the Darrian peacefulness, but even the Darrians were eventually expelled from their Eden by the gradual failure of the orchard systems, forcing them to spread

out, explore and meet their own needs.

The basically benign character of the Daryen environment continued, and Darrian science developed as a desire to understand and work with a beneficent nature, rather than a desire to control a cruel and capricious one. The Darrians peacefully continued to grow and learn until –1511 when the Terrans of the Itzin Fleet introduced themselves to them.

Terrans: In –1520 the 35 transports and 10 armed escorts of the Itzin Fleet left Dingir with the goal of travelling the long way around the Great Rift to what later became known as the Spinward Marches. The Itzin corporation, originally from Turkey on Terra, sought to escape the steady economic decline that was the Long Night. The fleet arrived at then-uninhabited Sacnoth in –1513, surveyed the surrounding area, and decided to settle on Daryen with its hospitable environment and untouched minor human race that could benefit from their technology. Significantly, and to their great credit, the Itzin Terrans did not come, as they could have, as sky gods using their technology to rule, but on the ground, using their technology to trade with the Darrians.

By –1400 the Terrans had been completely absorbed into Darrian society, and the synergy of the thoughtful, inquisitive Darrians and the manic, driven Solomani caused explosive advancements in science and technology, and a rapid rise to TL16 in only 400 years.

Maghiz: Among the many topics of surpassing interest to the Darrians were stars, particularly Tarnis, the sun of their home system of Daryen. Extensive observations and probings of Tarnis began in –1000. In –924 the fateful step was taken of sending a probe, part of the *Adh* ("Alpha," or "A") Project, to explore the star's interior. Somehow this probe destabilized the star causing three days of cataclysmic stellar flares.

The result was known as the *Maghiz* (Chaos) or *te-Zuyes* (the Holocaust). The first effect of the flares was a huge electromagnetic pulse which arrived at Daryen at the speed of light. This pulse destroyed almost all electronic equipment, turning computers, communicators, power grids, and contra-grav lifters to slag. Aircraft fell out of control and crashed, vehicles would not work, data systems were useless. Without these tools, repairs and damage control were almost impossible.

But this was not all. Following the EMP was the searing wave front of expanding stellar gas, moving at 300,000 kph. When it arrived three weeks later it raised surface temperatures to 250°, burning entire forests, vaporizing seas, and killing 80% of the world's inhabitants. Half of the Darrian starship fleet was destroyed as well.

While the gas damage was confined to the Daryen system, the EMP continued to travel outward, eventually hitting each of the Darrian colonies in turn, doing further damage. Although there was advance warning of the pulse, the colonies were all dependent upon their mother world, which could no longer provide science, technology, or replacement starships to maintain trade.

In –905 it was decided that the remaining colonies could no longer maintain their interstellar contact and must instead focus their resources to meet their own separate needs. The few remaining starships were divided up among the colonies, three for each world, and carefully stored. By –860 all interstellar contact had ceased.

Re-Emergence

By –275 the Darrian colony world Mire had rebuilt itself to TL10 and began refurbishing its starships and building new ones. It soon reestablished contact with the other Darrian worlds, but discovered that things had changed. When the Darrians voluntarily relinquished space 600 years before, theirs was the only society to be found. But now space was crowded. The growing Sword Worlds were nearby, and the Darrians soon contacted the looming Zhodani Consulate.

Little Fish, Big Sea

The remainder of Darrian history is the story of a once vigorous and unchallenged people coming to terms with the limitations of their power and making accommodations with the powerful forces around them.

There have been three major results of these accommodations. The first is their development and much-publicized deployment of the Star Trigger as a deterrent weapon. This weapon is an application of the technology which accidentally triggered the *Maghiz*, but now the Darrians are capable of visiting this catastrophe on any star belonging to their adversaries. These weapons are deployed aboard special starships operated by the Darrian Special Arm since the 400s.

Second is their welcoming of Aslan *ihatei* into their society. Aslan *ihatei*, looking for new lands, arrived in the Spinward Marches just prior to the First Frontier War. With the coming of war, they offered their services to the grateful Darrians as mercenaries in exchange for land. The Aslan were a welcome and timely addition to the Darrian social mix; the following years required their talents and greatly strengthened the Darrian position in its very challenging surroundings. In return the Aslan gained prime land and excellent economic opportunities, both of which have held them in good stead to the present day.

The Aslan are considered to be well-integrated into the tolerant Darrian society. Unlike the polygyny typical of the Aslan Hierate, the Darrian Aslan mostly practice monogamous marriage, a practice restricted to the lower classes among cultural Aslan. Furthermore, the practice of speaking the Aslan language, *Trokh*, among themselves is gradually falling into disfavor, being replaced by the Darrian and Galanglic that they use in trade and in their day-to-day lives. Such is the slick slope leading to barbarism (see page 27).

Last is their history of alliance with the Imperium, and later the Regency. This began during the First Frontier War and serves as a counterbalance to the threat of the Sword Worlds, which are usually allied with the Zhodani.

The Darrians are currently engaged in extensive cooperation with the Regency, in the areas of advanced technology ship design, and in assisting to maintain the Quarantine. Darrian TL16 ship designs, such as the *Barekdoldin* ("Lightning-wind")-class patrol cruisers are license-produced in the Regency, and Darrian Confederation Navy forces perform exchange duty with the RQS on the Regency's outrim frontiers.

Creating Darrian Characters

Darrian characters may be generated using the character generation procedures presented in **TNE** with the following modifications.

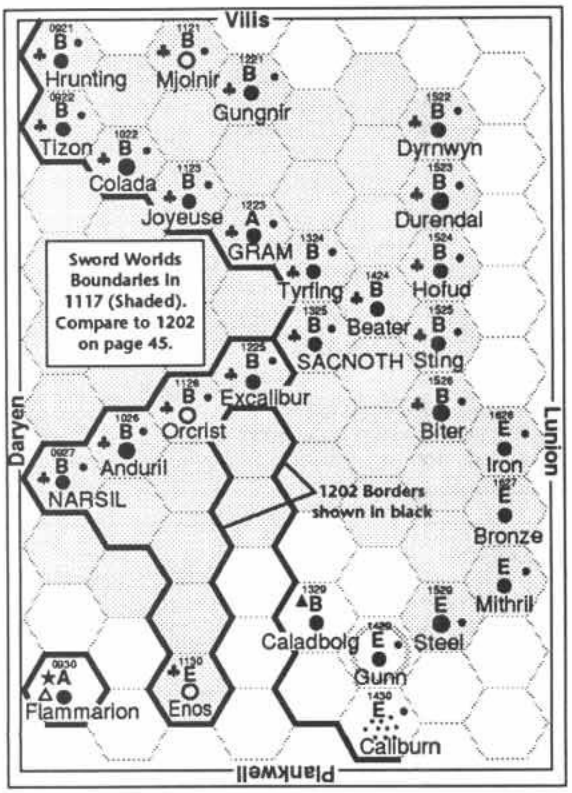
These attribute modifiers are in addition to any other homeworld modifiers, with the exception that the STR and CON rolls already allow for homeworld gravity.

Attribute	*Mod*	*Roll*
STR	Special	1D6 +2
AGL	—	2D6 –1
CON	Special	1D6 +2
INT	—	2D6 –1
EDU	+1	2D6
CHR	—	2D6 –1
SOC	—	2D6 –1

Psionics: Identical to procedures in **TNE**.

Careers: Darrian term choices should concentrate on the Professor, Scientist, Scout, Trader and Navy careers.

Darrian vs. Daryen



During the Imperial period, citizens of the Domain of Deneb referred to the Darrian race and their homeworld with the same word: Darrian. In fact, Darrian is an Imperial corruption of *Daryen*, the word for "home" in the Darrian language, *te-zlodh* or *te-zapet*. Compared to star maps from the Imperial era, maps used in the Regency label worlds in their home language whenever possible. Thus the world is now referred to as Daryen, while the term Darrian is retained for the race and political entity.

Adventure Hooks

1. Do the Darrians have a functioning star trigger? (*Referees see page 84.*) Could they, as they have implied, set up a vampire fleet equipped with such devices to wreak havoc on their neighbors as a doomsday weapon? The PCs could be assigned to uncover this information, which would constitute a multi-part adventure. First they would have to research the concept and history of the star trigger, learn about the DCN and Special Arm, and finally prove or disprove whether such a capability exists.

2. Many smaller units of the DCN do exchange duty with the RQS on the Regency frontiers. Thus there is a chance to meet or roleplay Darrian characters even on the outrim frontier, where the Darrians usually operate their own equipment, in the form of pre-positioned patrol cruisers (see page 92).

Sword Worlds Timeline

Date	*Event*
–399	First settlement of Gram.
–186	First interstellar government among Sword Worlds, the Sacnoth Dominate.
–164	First Sword World contact with Darrians.
–102	Sacnoth Dominate breaks up as a result of the War of the First Rebellion.
–80	Complete breakdown of interstellar government among the Sword Worlds.
60	Imperial colonization of the Spinward Marches begins at Mora.
73	First Sword Worlds contact with Imperial traders.
104	Triple Dominion of Colada, Anduril and Dyrwyn established.
217	Triple Dominion breaks up.
589	First Frontier War begins.
593	Sword Worlds invade and take the Darrian Entropic Worlds.
604	First Frontier War ends. Sacnoth Dominate re-established as the Second Dominate.
615	Second Frontier War begins.
620	Second Frontier War ends. Imperials temporarily occupy 10 Sword Worlds.
626	Imperial occupation ends.
698	Second Dominate overthrown by Gram Coalition.
788	Darrian War results in loss of Entropic Worlds to Darrian Confederation. Gram Coalition falls, is replaced by Trilateral Alliance of Narsil, Sacnoth and Durendal.
848	Trilateral Alliance breaks up.
852	Current Sword Worlds government formed, capital at Gram.
979	Third Frontier War begins.
986	Third Frontier War ends.
1082	Fourth Frontier War begins.
1084	Fourth Frontier War ends, Sword Worlds retake Entropic Worlds.
1098	Joyeuse Civil War begins.
1107	Fifth Frontier War begins.
1110	Darrians retake Entropic Worlds. Imperial forces take many coreward and trailing Sword Worlds. Fifth Frontier War ends.
1111	Border Worlds, consisting of Sword Worlds, taken by Imperium, established as Imperial client state.
1132	Sword Worlds attempt land-grab.
1133	Regency absorbs Border Worlds and Gram arm.

SWORD WORLDS

The Sword Worlds have never been much of a threat to the security of the Spinward Marches, Domain of Deneb or Regency. Their numbers are simply too small when compared to the coiled power contained in the 800-some worlds of this salient of the Imperium. This is especially true now, with the Sword Worlds reduced to five independent worlds, down from 27 at the peak of their power.

It was only when united with the Zhodani and Vargr in one of the Outworld Coalitions that the Sword Worlders were able to leverage themselves into being a player in area politics. But with improved Domain-Consulate relations during the Civil War and since, the Zhodani card was no longer the Sword Worlders' to play.

Sword World Irredentism

The main threat presented by the Sword Worlds to the Regency is that of internal unrest. With 19 former Sword Worlds incorporated into the Regency, there are numerous points for friction between the Sword World and Imperial cultures, and no shortage of Sword Worlders to demand their independence.

Since the beginning of the Abandonment in 1133 the Regency has pursued the policy of resettling loyal Imperials onto the former Sword Worlds and Border Worlds. While this has created a firm base of pro-Imperial sentiment, it has not eliminated the influence of Sword World separatists. It is unlikely that the former Sword Worlds will ever be entirely assimilated into the Imperial mainstream.

The Sword Worlds are not a society; they are a collection of squabbling boors. To call this assemblage a society would be like a Terran claiming that the set of all Parisian waiters constitutes a society.

At best, the Sword Worlders constitute a subculture which can only exist in contrast with a true culture, the same as all rednecks, hillbillies and crackers can exist only so long as they have access to a true society which takes care of the real work of civilization.

Governor Esteban Hanreddy
Subsector Governor, Sword Worlds

Those who do not have honor cannot be expected to understand those who do.
Margrave Elector Basenji Himmelsdottir
Sword Worlds Separatist Party, Narsil Column

Those who can express themselves only via self-righteous tautologies should not be surprised when no one else can understand them, or be bothered to try.
Esteban Hanreddy

Sword Worlds History and Society

The Sword Worlds were populated beginning in –399 by Terrans of Germanic and Nordic descent. By –200 most of the Sword Worlds (Gram, Joyeuse, Colada, Tizon, Hrunting, Tyrfing, Beater, Sacnoth, Excalibur, Hofud, Sting, Biter, Orcrist, Anduril, Durendal, Narsil and Dyrnwyn) were settled. The official language of the Sword Worlds is a variant of Terran Icelandic, with many Nordic, Germanic and Vilani additions.

Although the Sword Worlds are a confederation in the purest possible sense, leaving each member world complete autonomy in its internal affairs, their culture is rather homogeneous, being broadly militaristic and male-dominated. The highest Sword World values are honor, stoicism, obedience and respect for authority, and Sword Worlders use these standards to judge non-Sword Worlders. Sword Worlders therefore regard other cultures with disdain, and impute weakness and cowardice to the behavior of others unless it is strongly proved otherwise.

Females are much more subordinate in Sword World society than in Imperial culture, and are expected to adhere to this status by demonstrating passivity and obedience to their male superiors. Men are expected to be decisive, strong-willed, stern and silent. Above all, they expect to be treated with respect for these traits, which causes them to be easily provoked when dealing with non-Sword Worlders.

Although they have allied themselves numerous times with the Zhodani, Sword Worlders have a low opinion of them. Much of this stems from their mistrust of psionics, as its subtlety goes against the grain of the hirsute, testosterone-addled Sword Worlds culture.

The Sword Worlds government is called the Confederation Council, which limits itself to handling interworld trade, disputes and foreign policy. Each of the Sword Worlds maintains its own separate armed forces, but these are confederalized and placed under unified command in time of war.

THE ISLANDS

The entity known by the Regency as "The Islands" comprises the worlds of subsectors J (the New Islands subsector) and K (the Old Islands subsector) of Reft sector. Both subsectors are collectively an occupied territory of the Regency, which is responsible for security and peacekeeping there. See page 72.

History of the Islands

In 2050 the European Space Agency launched the most ambitious of the sublight interstellar colonization missions: three large colony ships hollowed out from asteroids and carrying 100,000 colonists each. These ships, *Voyageur*, *Marinus van der Lubbe*, and *C-Jammer*, carried culturally homogeneous crews of French, German and British extraction, respectively. They were launched core-spinward toward the Great Rift on a journey that would last 2500 years.

Each ship had an active crew of 1000 (which would eventually grow to 10,000) in addition to the 100,000 colonists in cold sleep. Each colonist was revived for a five-year work period during the mission, with 750 such sleepers being awake at any given time. This allowed subsequent generations of the active crew to meet first-hand colonists who had started the mission in 2050 and ensured that each crew's ties to their 21st century European cultures remained strong.

When the Terrans discovered jump drive 37 years later such expeditions became obsolete. However, the intervention of the Terran-Vilani interstellar wars prevented the interception or recall of these missions, which were eventually forgotten in the Long Night, long before they ever reached their destinations.

The ships arrived at their separate destination worlds (spread across an area of six parsecs) in Reft sector just a few years before the Third Imperium was to be founded hundreds of light years away. However, the active crews preferred their familiar ships to the bizarre worlds of open skies, and after dropping off their colonists set off to explore the other worlds in the area. Sublight exploration and colonization is slow work, but eventually *C-Jammer* placed a fourth colony at Serendip Belt while *Van der Lubbe* and *Voyageur* explored further afield. When their explorations were complete, *Van der Lubbe* and *Voyageur* returned to the original colonies to began carrying new colonists to other new worlds.

The older colonies eventually began building sublight ships of their own, and the second-generation sublight colonization movement ratcheted up to a slightly less glacial pace. Second- and third-generation colonization retained the cultural-ethnic segregation of the original ships. However, the crews of the ships, cruising through interstellar space for generations at a time, developed their own supra-national culture, and served all the colonies equally. The colonies continued to grow, and gradually split into new subcultures as the result of civil wars and the separation that eroded ties between isolated worlds whose only common ground was that of common ancestry several centuries earlier.

Meanwhile, unknown to the Islanders, the Third Frontier War raged a sector away, and a battle-damaged participant, the strike cruiser ISS *Eldorado*, misjumped into the Islands, arriving at Serendip Belt. With the help of the locals, they repaired their jump drive, fashioned auxiliary fuel tanks and jumped back to the Imperium.

After the end of the war, the IISS visited the Islands only to find that the Serendips had duplicated the jump drives they had helped repair and were in the process of conquering both subsectors with their new fleet of starships. The IISS mission commander suffered from some sort of messiah complex and, seeking to atone for this inadvertent sin, began distributing jump technology to the other major powers, thoughtfully ensuring that they could all make interstellar war on an even footing.

It took 90 years for the Islanders to adjust to this new balance of power, and like most cultures they found that expanded reach led inevitably to expanded greed. Military budgets, fleets and saber-rattling all prospered, and in 1106 all-out war broke out for the consolidation of the Islands.

Wars among the major Islands powers raged intermittently from 1106 until 1140. Behind their eight-parsec moat, the Islanders remained unconcerned by the Civil War, but each power was determined to be firmly in control by the time a re-united Imperium came to offer membership to the victorious rulers.

In 1140 Regency forces arbitrarily declared an end to these wars when they effectively annexed both subsectors. Such an act is normally a clear act of political cynicism or corruption, but Regency leadership and public opinion found such niceties to be naive hairsplitting under the circumstances of preserving civilization "behind the claw," especially in the aftermath of the Rape of Trin. Should vampire fleets gain a foothold in the Islands, they would present a clear threat to the survival of civilization to spinward of the Great Rift.

In this regard it is significant that between 1130 and 1140 no fewer than six of the Islands worlds died. While three of these have since been re-occupied as Regency Quarantine Bases, three (Sturgeon's Law, Wellington, and Berlichingen) remain barren. Thus far it has been impossible to determine whether these died as a result of the consolidation wars or at the hands of vampires which slipped into the Islands under cover of the wars.

Timeline of the Islands Subsectors

Terran	*Imperial*	*Event*
2050	–2452	ESA Long-Range Colony Mission leaves solar system.
2087	–2431	Jump drive invented on Earth.
2096	–2422	First Interstellar War begins between Terrans and Vilani First Imperium.
2742	–1776	Long Night begins.
4512	–6	*C-Jammer* arrives at New Home.
4516	–2	*Van der Lubbe* arrives at Neubayern.
4518	0	*Voyageur* arrives at Amondiage.
4518	0	Third Imperium Founded.
4608	90	*C-Jammer* discovers and settles Serendip Belt.
4788	270	First new spaceship, *Outward Bound*, launched from New Home.
4814	296	*Outward Bound* places first colony on Colchis.
4860	342	*Van der Lubbe* and *Voyageur* return to Neubayern following voyages of discovery, begin ferrying colonists to these new worlds.
4861	343	Amondiage completes first new spaceship, *Asterix*.
5232	714	*Infinité* forced down on Sturgeon's Law.
5501	983	ISS *Eldorado* misjumps to Serendip Belt.
5504	986	First Serendip starship, *C-Breaker*, enters service.
5534	1016	IISS spreads jump technology.
5624	1106	Wars of consolidation break out in Islands.
5634	1116	Strephon murdered. Final War begins.
5648	1130	Virus released. Collapse begins.
5658	1140	Regency annexes Islands, enforce end to consolidation wars.

Sources of Colonization or Bases

New Home	*Neubayern*	*Amondiage*
Colchis*	Topas*	St. Denis
Esperanza*	Herzenslust	Acadie
Sturgeon's Law	Berlichingen	Quichotte
	Schlesien Belt	Sansterre*

Besançon*	Besançon*	Topas*	Nebelwelt
Herzenslust*		Elysée*	

*Disputed ("Powderkeg") world. RPKF ground troops man DMZs separating combatants.

Islander Aggression

The Islands are the only area in the Spinward States (outside of, perhaps, the Zhodani Consulate, but no one knows what is going on in there) where anything approaching open warfare is going on in 1202. To Regency citizens, the Islanders possess an incomprehensible and repugnant level of aggression and expansionism. After all, the Regency consists of hundreds of worlds which possess no desire to make war on each other, but instead find it inescapably reasonable that they should instead be knitted into a larger society that provides benefits to all its members. Besides, war in the face of virus howling at the gate is suicidally insane.

These tendencies are in fact an instructive example of how drastically different conditions can create drastically differing social assumptions.

Whereas the Regency and its neighbors have benefited from centuries of mutual trade and communication, the Islands became insular and even xenophobic over the course of centuries of effective isolation that is the reality of sublight commerce. Furthermore, the Islanders began as distinctly segregated English, French and German cultures cemented by 2000 years of shipboard travel with none of the mixing effects experienced by ethnic and national groups that expanded out into space with the more rapid travel times allowed by jump drive with all of the ethnic, cultural, and social blending that such communication implies.

The fact that these people had the ambition and drive to expand when the only avenue was painstaking sublight travel testifies to their determination to assert their wills over the universe, and this determination is easily expressed as aggression. Because the nature of sublight travel allowed no option for true interstellar warfare that could have vented these forces, and in the absence of external enemies to unite them, the Islanders were distinctly unready to coexist peacefully with each other when super-light travel was inflicted on them.

Now possessing the tools to practice their expansionist tendencies in real time, they found themselves trapped on a small playing field where all of the real estate was already taken, and there was no other direction to exercise their expansionism. The only choice left was to fight over what was already there.

RQS and RPKF forces in the Islands have developed a notably impatient attitude toward their warlike protectorate. Early Regency forces suffered frequent casualties as a result of being caught between warring Island states, or as part of humanitarian relief missions turned hot. After years of bitter experience, the attitude of Island-deployed RQS and RPKF personnel has hardened into one of, "when in doubt, do it to them before they do it to us."

Adventure Hook

RQS duty in the Islands is a combination of the traditional RQS job of Quarantine enforcement plus one other explicit task, that of the Regency Peacekeeping Force (RPKF). The very clear danger of conflict in the Islands is that it can create openings for, and conceal the intrusion of, Virus. Thus PKF duty not only requires the saintly resolution and forbearance traditional for such operations, but adds the disastrous consequence of Virus outbreak if one is too forbearing and insufficiently vigilant.

A typical PKF flotilla consists of a Darrian patrol cruiser (either Darrian- or Regency-manned), a pair of Quarantine cutters (either the standard Faith-class or Aslan-manned *Trekhyair* variants), one or two *Empress Marava*-class far traders for logistical support and troop carriage, and two or three jump-boats for courier and liaison service. These flotillas are limited to jump-2, which restricts them to riding the circuit in the Old Islands and the core-trailing portion of the New Islands. See the Starships section, pages 85-92, for details.

The duties of the flotilla are to "show the flag," protect free trade, see that buffer zones are being maintained and respected, inspect and maintain boundary and other navigational markers, transport relief troops to observation posts and demilitarized zones, prevent celestime incidents at powder-keg worlds, and militarily intervene when cease-fires are violated.

Powderkeg worlds are those which are disputed by one or more power (see sidebar, "Major Powers and Possessions, 1202"). Because the rivals still send shipping to support their forces there, opportunities for incidents and combat are many. These nominally civilian vessels are crewed by military personnel and harass each other by violating celestime rules of the road, provoking accidents and "playing chicken" in restrictive traffic patterns.

A tour of duty with such a flotilla begins at RQB Valdivia (at Gloire, 1123 Reft, see page 72) and lasts for six months, at which time the force returns to Valdivia for rotation back safeside. This holds true for reserve and active-duty RQS personnel, as PKF duty is deemed too stressful for long deployments.

More than one weary Regency peacekeeper has been heard to lament, "How can we keep a peace they don't want? When people want to end a war peacekeepers make sense, but they *like* killing each other. They don't want us to stop them. What the hell are we supposed to do?" For most Regency warriors the answer has become simple pragmatism—by maintaining order in the Islands they protect the Regency's borders. Only a minority still try to maintain an ethic of compassion and service to the Islanders, not all of whom are the uncivilized animals they are portrayed as.

FEDERATION OF ARDEN

The Federation of Arden (pages 37 and 41) has long been neutral ground between the Zhodani Consulate and the Domain of Deneb. Thus it was teeming with diplomats engaged in secret negotiations, unextraditable celebrity fugitives and exiles, fashionable expatriates, intelligence operatives exchanging information, prisoners, or seeking to penetrate the frontier, arms merchants, guerrillas, terrorists, freedom fighters, assassins, bounty hunters, out-of-work mercenaries, and all the other amoral sorts attracted by an environment of ambiguity, deceit, and shady opportunity.

With the warming of Consulate-Domain/Regency relations through most of the post-Civil War period, the importance of this underworld nexus declined, but it has taken steps to maintain its association with underground and "gray" organizations. The Federation of Arden has the distinction of being one of the few states to refuse to sign the Spinward States Accords. This not only underscores the Federation's status as an independent power, but achieves two other functions. First, it allows the Federation to not renounce the use of Virus as a weapon of last resort to maintain its independence. Second, it makes the Federation attractive to the kind of extralegal activities that have long fueled its economy. For example, the Federation is one of the main sites of money-laundering for the Vargr underworld. With the beginning of the Exodus and renewed uncertainty between the Zhodani and Regency, Arden is reasserting its role as the axle of intrigue in the Marches.

The Federation is a relative late-comer to interstellar sovereignty. Arden only took Zircon (1110) and Utoland (1209) as colonies just prior to the Fifth Frontier War, extending its grasp to four more worlds, Quare (0915), Zenopit (1010), Pequan (1210), and Tremous Dex (1311) by 1210. The Federation reached its current size in 1133, although it lost Tremous Dex to the new Regency.

The Federation of Arden's government is considered to be quite oppressive; it is controlled by the Arden Society, a small group of leaders selected for their contributions to the Society's advancement. Arden maintains a policy of passive neutrality, leaving its systems conditionally open to belligerents in time of war—belligerent vessels may refuel and pass through the systems, but may not engage in combat. They are kept segregated by the Federation's naval forces.

The Federation of Arden refuses to accept Zhodani refugees. These are either sent back into the Consulate or encouraged to proceed on into the Regency.

Data Section

NOTES FOR REGENCY UWP DATA

The following 37 pages contain complete UWP information for all 981 worlds in the Regency and its immediate surroundings, located in four sectors and 45 subsectors.

UWP Abbreviations and Codes

The standard UWP format as described and detailed in TNE pages 180-195 will be used. The following specific codes are used in this book.

Base Codes: A: Naval Base and Scout Base; B: Naval Base and Way Station, C: Corsair (Vargr) Base; D: Naval Depot; I: Interface World; M: Military Base; N: Naval Base; S: Scout Base; T: Terminus World (see page 20); W: (Xboat) Way Station; Z: Zhodani Naval/Military base

Trade Codes and Notes: Ag: Agricultural; An: Ancients' Site; As: Asteroid; Aw: Aslan ruled world within the Regency; Ba: Barren; Cf: Frontier Capital; Cm: Cemetary world (a world whose original population has died off completely, the current population is all recent settlers); Cp: subsector Capital or of other small interstellar state; Cx: Sector or higher level regional Capital; De: Desert; Ex: Exile camp; Fl: Fluid oceans; Hi: High population; Ic: Ice-capped; In: Industrial; Mr: Military rule; O:NNNN indicates that the world is owned by the world in the indicated (NNNN) hex; Po: Poor; Pr: Prison camp; Re: Reserve world; Ri: Rich; Rs: Research Station (with Greek letter designation); Rw:N: Refugee world, where "N" can be a letter or a number: "Z" indicates Zhodani refugees and "V" indicates Vargr refugees, a number indicates imperial humans from the Abandonment, see notes below; Va: Vacuum; Vw: Vargr-ruled world within the Regency; Wa: Water world.

A:N, C:N, D:N, or V:N indicates that the world was populated in part by Aslan, Chirpers, Droyne, or Vargr. The number "N" following the colon indicates how many tenths of the world's population consists of these races (0=1-9%, 9=90-99%). The remaining population is assumed to be predominantly human (i.e., Zhodani if on Zhodani worlds, imperial culture on Imperial worlds, some local mix on non-aligned worlds or client states).

TPPG indicates Travel Zone, Population Multiplier, Planetoid Belts, and Gas Giants. If Travel Zone digit is empty, it is listed as a Green Travel Zone; A and R indicate Amber and Red zones respectively. In addition, all worlds in the Regency Frontier (gray-shaded hexes) are considered to be Amber Zones, but are not separately listed as such. *All* worlds in the Wilds, outside of the Regency Safe and Frontier, are Red Zones for Regency citizens, as the Wilds are officially interdicted by the Regency government as well as the governments of *all other* Spinward States. Although Regency armed forces patrol these areas, they are off-limits to all other persons.

A B in this column indicates a Balkanized world located in the Wilds ("Wi" allegiance code), the government code in the UPP string describes the most common government type or the most powerful government on the world (varies from world to world, referee's discretion).

Allegiance Codes: As: Aslan Hierate, AF: Aslan Frontier world; Cs: Client state of the Regency; Cz: Client state of the Zhodani Consulate; Da: Darrian Confederation; DD: Domain of Deneb (Third Imperium); Dr: Droyne world; FA: Federation of Arden; Na: Non-aligned, no off-planet allegiance, but these worlds are minor members of the Spinward States, and have not collapsed (they are therefore not part of the Wilds; these worlds use the government types listed on page 188 of the TNE rulebook); Re: Regency, RF: Regency Frontier worlds; SF: Senlis Foederate; SW: Sword Worlds; Va: Vargr, nonaligned or unspecified allegiance; Vf: Dzarrgh Federate (Vargr state); Vu: United Followers of Augurgh (Vargr state); V6: Assemblage of 1116 (Vargr state); Wi: Wilds, no off-world allegiance, and perhaps no off-world contact; these worlds have collapsed and use the Wilds government type from page 191, TNE rulebook (in the case of government type 6: "Technologically Elevated Dictator," the world's listed tech level is that of the world as a whole; the tech level of the TED and his or her support structure is higher, up to the world's original tech level); Zh: Zhodani Consulate; "—" indicates no allegiance because there is no population.

Aslan Government Codes: The following government codes are used in the UWPs of Aslan-ruled worlds in place of the standard government types found on page 188 of TNE. G: Small station or facility: operated by an off-world clan or controlled by a company. This is the only instance in which an Aslan world is controlled by anything other than a clan. H: Split clan control: several on-world clans control different parts of the world, analagous to human balkanized worlds. J: Single on-world clan control: world is controlled by a single clan which only rules one world, however the world may also include other small clans which are controlled by the major clan. K: Single multi-world clan control: world is controlled by a clan which owns several worlds. L: Major clan control: world is controlled by one of the 29 major clans of the *Tlaukhu*. M: Vassal clan control: world is controlled by a vassal clan subservient to a large clan, however the world is actually *owned* by the larger clan. N: Major vassal clan control: as M above, but the controlling clan is subservient to one of the *Tlaukhu* clans. Again, it is the superior clan which *owns* the world, the vassal clan merely controls it in its stead.

Map Symbols

The 45 subsector maps use the standard symbology detailed on TNE page 183 and given on the Subsector Data Forms found in the **Traveller Players' Forms** supplement.

Regency Frontier: This area is found in the Deneb, Reft, and Trojan Reach Sectors, and is indicated by a gray-shaded hex. Worlds in these hexes use the "RF" allegiance code, above. All worlds in the Frontier are considered to be Amber Travel Zones, even if not otherwise listed.

Note that Wilds areas are not indicated on the map, they are simply the area on the far side of the Frontier from the Regency safe area. All worlds in the Wilds are considered to be Red (Interdicted) Travel Zones, although they are not otherwise listed as such.

Military Base: Military bases, found in the Sword Worlds (page 45) and some Aslan worlds, use the club (♣) symbol.

Zhodani Military/Naval Base: Although these bases are in all respects equivalent to the naval bases shown in Regency and other territory with the five-pointed star (★) symbol, for the sake of tradition these bases are shown by a closed diamond (♦) symbol.

Interface World: These quarantine border security worlds (see below) are indicated by a "cross-hairs" insignia (⌖). This symbol is also used for the Wildside and Safeside Termini worlds (see page 20) on pages 54, 58, and 62. Because of their placement along the Regency Frontier there is no danger of their confusion with normal interface worlds.

Calibration Point: These deep-space military refueling points are indicated with a circle-x symbol (⊗), accompanied by "CP" and their code-names. See Library Data, page 76, for description of calibration points.

New Terms and Facilities

Military Base: A smaller version of the standard naval base, which also includes facilities for non-naval military forces. Whereas a naval base is designed to support subsector-sized fleets or larger, military bases are sized for planetary navies.

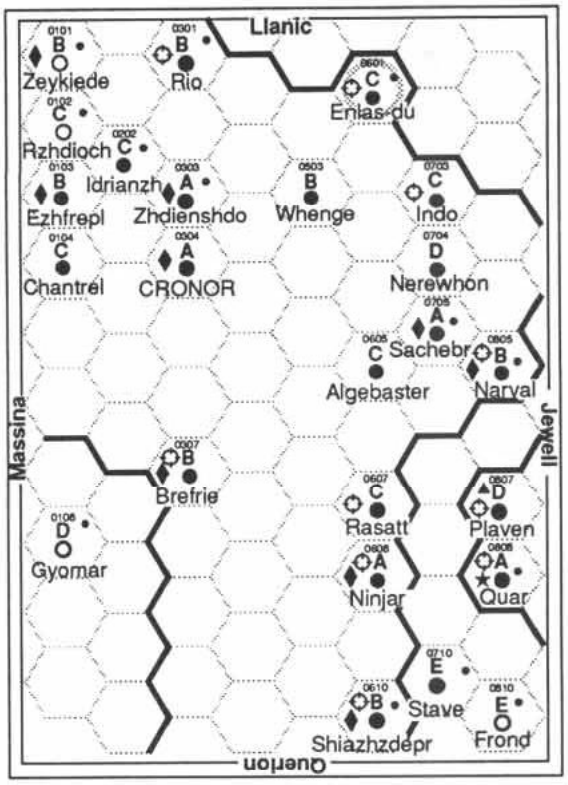
Interface Worlds: These are the border worlds that provide contact between the Spinward States. All starships passing from one Spinward State to the next must make first planetfall in the new state at one of these worlds. It is illegal to pass into a Spinward State to a non-interface world, and this action carries heavy penalties, usually involving the confiscation of the starship. See page 20 for further discussion.

Note that interface worlds are only indicated for the major Spinward States (i.e., those which consist of more than one world). For the minor states (single worlds) none are listed, as each minor state functions as its own interface world.

Terminus Worlds: Similar to interface worlds, above, but will be used to control access to the Regency Safe following the opening of the Frontier. See page 20.

Calibration Point: See page 76.

Refugee Worlds: The Regency contains three kinds of refugee worlds: Zhodani refugee worlds, Vargr refugee worlds, and Regency refugee worlds.



For Zhodani and Vargr refugee worlds, the size of their refugee population is not given, nor are the refugees included in the world's UWP population data. Since the Zhodani Exodus is still underway with no sign of abating, the size of these refugee populations are subject to rapid change, and the few remaining Vargr refugee worlds (as most Vargr refugees eventually moved to established Vargr communities on other worlds) will have their populations listed under the world remarks.

The number of Zhodani refugees continues to expand, so these refugees can be found on worlds which do not have the Rw:Z note. The Rw:Z note indicates worlds which have either been officially designated as sites where Zhodani refugees are transferred, or which have large continuous influxes of Zhodani refugees and have become *de facto* refugee worlds. Any world which has a naturally breathable atmosphere and is reasonably close to the Zhodani interface is likely to become a Zhodani refugee world, whether it wants to or not. While it would perhaps be simple to destroy all incoming Zhodani ships, standards of decency simply will not allow this.

Zhodani refugees may be found on most any Regency world; the difference between a refugee world and a world which simply contains some refugees is a matter of density. A world where large homogeneous groups of Zhodani live in temporary housing or overcrowded ghettos are refugee worlds. A world in which a relatively small number are spread throughout its population is not such a world. However, with the continuing influx, more refugee worlds are being created, and there is nothing to stop a referee from stipulating that a world without the Rw:Z code has now become such a world.

Regency refugee worlds are the by now semi-permanent homes of imperial citizens who fled to the Regency interior during the period of the Civil War or Abandonment. Most such refugees have long since found permanent homes (sometimes on the refugee worlds themselves, sometimes on other worlds offering new opportunites, and sometimes by deliberate resettlement on former Sword Worlds or Aslan *fait accompli* worlds, see pages 11 and 45) and integrated themselves into Regency society. Where the Regency refugee world note remains, these populations still live in separate communities peopled almost entirely by refugees and their descendants. By now these communities have become bewilderingly complex subcultures; regardless of the travel zone of the world itself, all refugee camps are considered to be Amber Travel Zones.

Note on Aslan and Vargr Populations: The Regency contains a great many Aslan and Vargr citizens, most of which are not indicated by A:N or V:N notes. Worlds with these notes are those which contain politically significant populations of these beings, usually living according to their own cultures and preferences, rather than imperial culture, see page 78.

Cronor Subsector, 1117 and 1202 dual listing (Subsector A of Spinward Marches Sector)

Name	Hex	UPP	Base	Trade	TPPG	Alg	Stellar

SPINWARD MARCHES SECTOR

The Spinward Marches were settled by the young Third Imperium beginning in the year 60 (IC). The Zhodani name for the sector is *Tloql*, and by 500 Imperial settlements extended all the way to the spinward edge of the Chronor (A) subsector, and were beginning to encroach on Zhodani settlements in core-spinward *Tloql*/Spinward Marches. These frictions precipitated the First Frontier War of 589-604, longest of the frontier wars, which resulted in the loss of territory in the Chronor subsector to the Zhodani. (This is in spite of the fact that the war ended in an Imperial victory by Grand Admiral hault-Plankwell's destruction of the Zhodani-Vargr fleet in the Rhylanor subsector; this victory was sufficient only to end the 15-year conflict, but not to recover territory already lost in it.) The Second Frontier War of 615-620 resulted in the loss of more territory to the Zhodani Consulate in the Jewell (B) subsector, as well as the relinquishing of a number of Imperial worlds in the Querion (E) subsector, creating a buffer zone of non-aligned human worlds between the two powers.

This arrangement proved to be quite stable, and lasted for over 350 years, until 979 with the outbreak of the Third Frontier War. This war also resulted in a roll-back of Imperial borders, with further Zhodani gains in the Jewell and Querion subsectors, and the expansion of the non-aligned "demilitarized zone" into the Vilis (F) subsector.

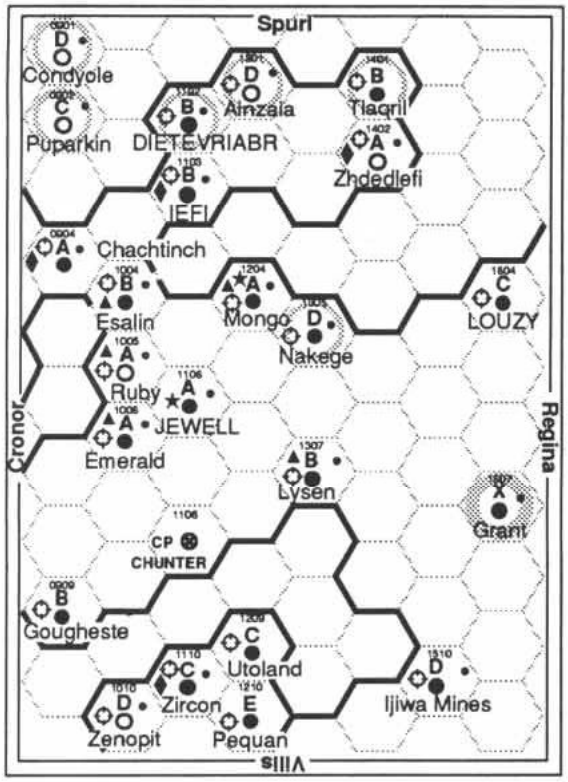
The Fourth Frontier War a century later (1082-1084) was essentially an accident (and is also known as the "False War") which resulted in minor border adjustments affecting only four worlds.

The fifth and last frontier war from 1107 to 1110 was the first true Imperial victory, resulting in a small net gain of worlds. Zhodani-Imperial relations since then have been remarkably warmer than in the past, as related in other sections. (See also **The Spinward Marches Campaign**, and **Supplement 11, Library Data N-Z**, both OP.)

Spinward Marches Subsector A: Cronor (formerly Chronor)

The Cronor subsector, formerly known to Imperials by its Imperial transliteration, "Chronor," is now referred to by both Zhodani and Imperials by its Zhodani name Cronor.

This is a by-product of the closer relations between the Consulate and Domain/Regency in the period following the disintegration of the Imperium. This is also seen in the "name changes" on the UWP listings above. These are not actual name changes, but are merely the Regency's recognition of the proper Zhodani names for these worlds, and are another result of the post-Collapse warming of Zhodani-Regency relations.



For the Zhodani, the Cronor subsector had been a frontier area far from the well-trafficked center of the Consulate, and consequently not particularly well-developed. With the warming of Imperial-Zhodani relations, Cronor gradually became a center for trade with the Regency. This growth is reflected in the increased starport quality and technology in the Zhodani worlds. The population increase is partially due to this same cause, but is equally the result of the Zhodani rimward migration that eventually erupted into the Exodus in 1201 (see pages 13 and 24).

Cronor does not have a Regency fleet assigned, as only two worlds in the subsector have Regency allegiance. The defense of Regency interests and territory in Cronor is the responsibility of the 212th Fleet based in Jewell, and the Cronor frontier falls within the 1st Quarantine District (see Jewell, next page, for more details).

Cronor Cleft: The major astrographic feature of the Cronor subsector is the Cronor Cleft, a divide that cuts core-rimward down the center of the subsector, interrupting communications between its spinward and trailing halves. This obstacle was only a problem for Zhodani military forces before the warming of relations between the Consulate and Regency, but with the increase in trade, communications, and travel (especially among those involved in the psionic sciences) it became a significant obstacle to commerce. The result was the flowering of Whenge (0503). This former minor world occupies a unique location, sitting as it does astride the cleft and has become a port of call for almost all commercial shipping moving between the Zhodani interior and the Regency frontier. (Like the the Regency, the Consulate presumably maintains calibration points, see "Library Data," page 76, to assist military traffic in surmounting this obstacle when staging into the border areas.)

Sea Bear: Large, dangerous, amphibious carnivore native to Thengo/Idrianzh (0202), but it has been distributed to a large number of worlds in the Cronor, Jewell (B), and Querion (E) subsectors. Also known as the "surfer's nightmare."

Sea bears are mammalian in appearance and layout, with four pairs of powerful, clawed limbs which can be used interchangeably for predation, locomotion, or holding itself firm against ocean currents. Adult sea bears average 1.5 meters in length and mass upward of 50 kg. They hunt alone, but

during mating season assemble into social groups of hundreds of individuals, much like Terran seals.

The sea bear hunts along beaches, shallow offshore waters, and its eight strong limbs make it powerful enough to hunt even in the surf zone. (See also JTAS 3, OP, and **Best of the Journal** 1, SA.)

Spinward Marches Subsector B: Jewell

Jewell subsector is home to the 212th Fleet which earned fame in the Fifth Frontier War by repulsing invading Vargr fleets from the Regina subsector. The 212th is currently headquartered at Jewell (1106).

Jewell's frontier is entirely contained within Quarantine District 1, which runs from Zeta 2 (0919) in the Vilis subsector (page 41) to Menorb (1803) in the Regina subsector (page 38).

Battle subsector: Imperial nickname for the Jewell subsector, because of status as a major battleground in all of the frontier wars.

Condyole (0901): Condyole and its immediately rimward neighbor Puparkin (0902) are unusual examples of minor Spinward States, in that they are not within the envelope of the Zhodani, Regency, and Aslan frontiers. These two worlds trade directly with the Vargr frontiers, and contain large Vargr trading communities.

The worlds are similar in that they both have inhospitable atmospheres and all settlements are either built below ground or in sealed surface modules. Because of the essentially uncontrolled Vargr presence on these worlds, both are considered rather lawless and dangerous environments. Both worlds are classified as Amber Zones by the Travellers' Aid Society (and its equivalents in other Spinward States) because of their proximity to the unstable Vargr Splinters and the presence of Vargr organized crime on these worlds (see page 29, *referees only see page 85*).

CP Chunter: The Regency Navy maintains several calibration points (see Library Data) within the Regency itself to facilitate fleet movements across interstellar gaps, such as the Abyss (see page 41). CP Chunter is one such intra-Regency mobility CP, and like all CPs, is for military use only. Its exact location and beacon code are classified.

Esalin (1004): Esalin was originally settled by Imperials in 835, but was taken by the Zhodani in 1082 during the Fourth Frontier War. Joint Imperial-Zhodani administration of the world was established during the armistice following the war, and Esalin was declared neutral in 1098. Esalin was reconquered by the Imperium in the Fifth Frontier War and the Zhodani portion of its government deposed, but the world retained a significant Zhodani population which was encouraged to remain on the world. Although now clearly Imperial territory, its previous status as a neutral meeting ground for Consulate-Imperial negotiations was too useful to abandon. Esalin was maintained in a demilitarized status and its Zhodani citizens were not treated as conquered subjects but, in an experiment that would eventually pay handsome dividends for the Regency, were allowed to retain their lifestyles within "Zhodani Cultural Enclaves."

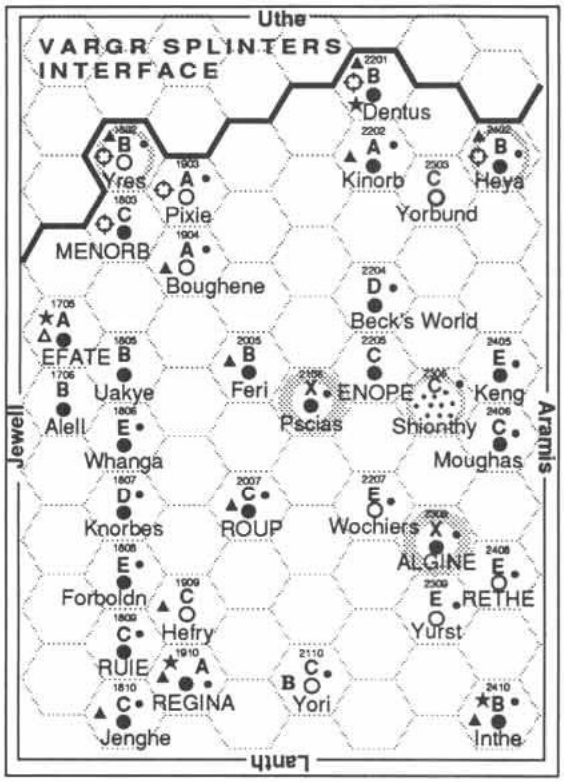
With the unanticipated warming of Zhodani-Domain relations during the pre-Collapse period, Esalin became an increasingly important conduit for communications between the neighboring powers (see, for example, **Survival Margin** page 41) until Norris formally moved these proceedings to Regina (next page).



Jewell (1106): Already one of the key worlds of the subsector, Jewell became even more important in the post-Collapse period as one of the focal points of the Regency's industrial development strategy. Jewell was one of 26 worlds identified by the Regency as a developmental priority to increase the number of high-technology manufacturing centers, particularly in areas where these were scarce. One such area was the Regency's core-spinward region, as these five subsectors (Jewell, Regina, Aramis, Vilis, and Lanth) had not a single TL-15 world, much less a TL-15 industrial world. Jewell was the figurative and literal cornerstone of this project, and became the most core-spinward of the Regency's high technology worlds, providing needed high technology at the crucial junction of the Zhodani and Vargr frontiers.

Jewells, The: Popular name for the cluster of six Imperial-held worlds in the center of the subsector: Ruby (1005), Emerald (1006), Jewell (1106), Mongo (1204), Nakege (1305), and Lysen (1307). These strategic worlds have long been a thorn in the Zhodani side, constituting a fortified dagger pointed into Zhodani territory. They have therefore seen much fighting, as their capture has been a Zhodani strategic goal in most of the frontier wars.

Puparkin (0902): See remarks under Condyole, above.

Refugee Worlds: The Jewell subsector contains a number of Zhodani refugee worlds. These worlds are usually the first Regency stop on their journey; Regency authorities are attempting to ship these refugees further from the interface to purpose-built refugee facilities, to avoid overcrowding on these border worlds. Low-population worlds, such as Nakege (1305) are easily overwhelmed by refugee influxes that can outnumber their own population.

The Federation of Arden (page 34) will not accept Zhodani refugees. These are either sent back to the Consulate or are encouraged to continue on into the Regency.

Spinward Marches Subsector C: Regina

The Regina subsector is defended by the famous 213th Fleet which defended the Lunion subsector and conquered the trailing Sword Worlds in the Fifth Frontier War. The 213th headquarters are located at Efate (1705).

The Regina frontier falls within the 2nd Quarantine District. RQD 2 runs from Menorb (1803) to Enaaka (0203 Deneb) in the Pretoria subsector and has exclusive responsibility for the interface with the Vargr Splinters.

General Products, LIC: One of the former Imperial megacorporations (see "Ling Standard Products," page 46) which survives in the Regency, General maintains three shipyards in the Regina subsector, at Efate (1705), Pixie (1903), and Regina (1910). Regina obtained a bad reputation for starship quality in the antebellum period, and was actually forced to withdraw from the military starship market until the onset of the Civil War. General was one of the manufacturers of the uniformly ill-regarded *Kinunir*-class Colonial Cruisers (see **Brilliant Lances Technical Booklet**, page 38), hastily returned to production during the war.

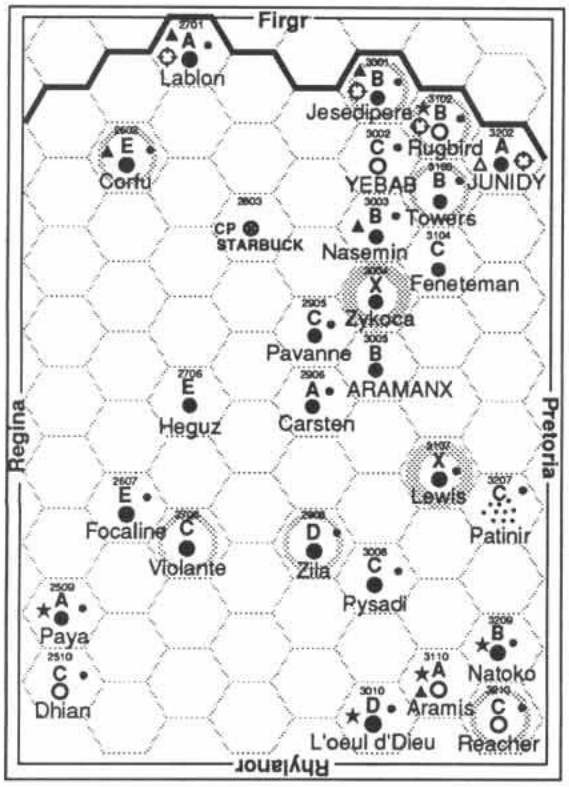
Regina (1910): Capital of the Regina subsector and of Spinward Marches Sector, Regina is the moon of a gas giant, Assiniboia (Lusor 4/Lusor Epsilon).

During the Final War Norris established Regina as the site of talks to improve Domain's foreign relations, with special attention begin given to its relationship with its traditional enemies, the Zhodani. Regina was a convenient location for this initiative, and Regina grew to replace Esalin (1004) as the focal point of Consulate-Domain diplomacy. This was another manifestation of the crucial lifelong theme of Norris' career: the Domain's coming to terms with psionics and its Zhodani neighbors (detailed elsewhere in this book). Norris, as the military leader of the first true victory over the Zhodani, was probably the only Imperial leader who could have engineered a *rapprochement* with the Zhodani, and even had this been his only accomplishment, he would still be regarded as one of the most important statesmen in Imperial history. It is still remarked to this day, "Only Norris could go to Zhodane."

University of Regina: Although originally a planetary institution, the demands of the Final War and Collapse prompted "Regina" to expand its services and mandate to first the entire Spinward Marches Sector and later to the entire Domain/Regency. It is now regarded as one of the foremost institutions of learning in the Regency, although certainly some of this cachet is due to its association with the revered First Regent.

Although Regina is a broad-spectrum institution, it continues to concentrate on its traditional strengths in the social sciences: history, sociology, cultural anthropology, public policy, and political science. Since the First Regent's death, Regina has added a high-profile Norris Aella Aledon School of Leadership Philosophy.

By law Regina is the only university in the sector allowed to call itself the "U of R" (see University of Rhylanor, page 43). However, its students and faculty breezily scorn this distinction and refer to the university simply by the world's name: "Regina." Through some tortuous administrative path the university has traced a portion of its campus to an act approved by the young Duke of Regina in 1099, thereby allowing its alumni the sanctimonious claim that Regina is the university that the First Regent built, which they invariably fit into conversations as often as possible. This arrogance, which has only arisen since the Collapse, extends to many institutions based on Regina, and is characterized by the presumption that Regina is the true repository of the greatest traditions of the Regency, and "birthplace of two thirds of all Regents." This sentiment is not suffered lightly on other Regency worlds.



Regina Center for Research: Not a true university or learning institution, the RCR is rather a center for analysis which draws on the expertise of the region's colleges and universities to support its assigned projects. It was the RCR to which then-Archduke Norris turned in 1117 to create the Spinward Marches Archive Retrieval Team (SMART), which is the foundation on which all current Regency library databases are built (see the **MegaTraveller Imperial Encyclopedia**, SA).

Regency Foreign Service University: Located on Regina, the RFSU is the school where all career and senior diplomats of the Regency are trained. This school is the outgrowth of the foreign affairs initiatives begun by Norris in the pre-Collapse period (see "Regina," above).

Shionthy (2306): This belt is thought to be the remains of a world destroyed by the Ancients in their final war, as it contains significant quantities of antimatter. It is this danger that caused its previous interdiction and current Amber Zone status. Those brave or foolish enough to collect these particles can sell them for amazing prices, but face the hazards of handling, or even operating near, this dangerous material (see **Fire, Fusion, & Steel**, page 65).

Shionthy has tremendous historical significance because of its role in the life of Norris, the First Regent. The Shionthy belt was the final resting place of the Colonial Cruiser *Kinunir* (TailNo. 9514), which was carrying an Imperial Warrant from Emperor Strephon for then-Duke Norris. *Kinunir* suffered a failure in her AI security system, killed her crew (forshadowing the Collapse) and wound up out of fuel as a derelict in the then-interdicted system. Norris was eventually able to trace the location of the warrant, enter the Shionthy system, find the ship, and recover the Warrant, allowing him to take over command of the Imperial forces in the Fifth Frontier War from Sector Admiral Santanocheev, and bring the war to a successful conclusion.

Kinunir remains in her resting place as an historic site and war grave. Tampering with war graves is a high justice crime. For further details, see the **MegaTraveller Imperial Encyclopedia** (SA), **Adventure 1: Kinunir** (OP), **Fifth Frontier War** (OP), and **The Spinward Marches Campaign** (OP).

Tree Kraken: See page 81.

Spinward Marches Subsector D: Aramis

Aramis is defended by the 214th Fleet, which also earned laurels in the Fifth Frontier War, by taking the Sword World invasion in the flank, destroying the Sacnoth Fleet, and opening the way to the occupation of the trailing Sword Worlds and the creation of the Border Worlds (see page 45).

The Aramis frontier is part of Regency Quarantine District 2, see Regina, previous page, for discussion. Calibration Point Starbuck (2803) was established to enhance strategic mobility of RQS and naval forces from the Regency interior to the sector frontier.

In the antebellum period the Aramis subsector was often referred to as "the breadbasket of the Vargr," because of the tremendous quantity of agricultural exports that the subsector traded with the Vargr Extents. Naturally in times of war this fact made the Aramis subsector a target for Vargr conquest, which is testified to by the large Vargr populations on the subsector's deeprim frontier following the Civil War invasions.

Junidy (3202): Homeworld of the sapient race known as the Llellewyoly, also known colloquially as "Dandelions." Llellewyoly have five multi-jointed limbs which function as "hands" and "feet," and also carry the being's sensory organs. The Llellewyoly have an excruciatingly complex social order. Each individual has multiple social ranks which pertain only under specific circumstances, and to make a hierarchical error is a grievous social gaffe. Nonetheless, Junidy is coded as a Green Travel Zone, as crimes committed by non-Llellewyolians are punished by expulsion from society.

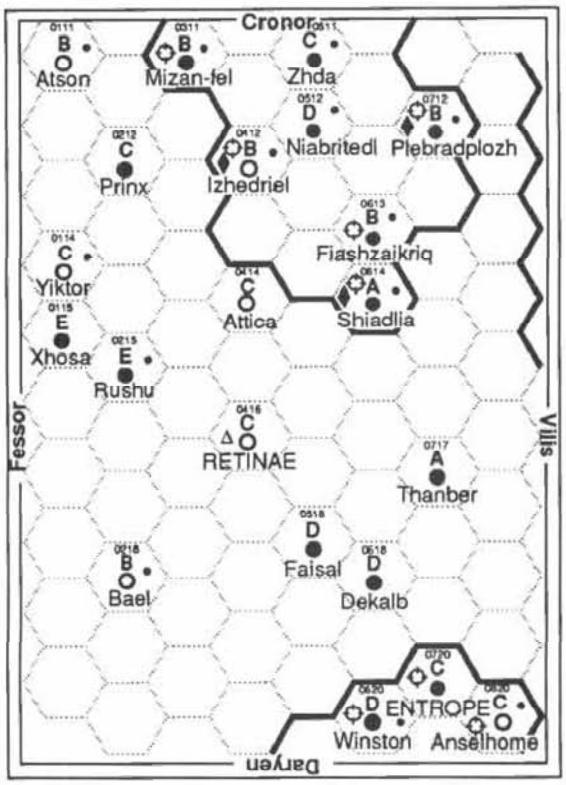
Junidy is subject to severe thermal fluctuations in the course of its local day, and many Llellewyolian features are unique adaptations to these variations.

Although this is not strictly true, as the distinction between "plant" and "animal" is only applicable within a distinct ecosystem, Regency and Imperial wags have been known to joke that the subsector known for its agricultural exports has also produced one of the few "agricultural" forms of intelligent life.

It has also been observed by many non-human species that humans are the most racist and judgemental of all starfaring sapient lifeforms, a dubious distinction to be sure.

Pysadi (3008): Pysadi has long been ruled by a religious dictatorship, the "Mother Church." This faith worships the world Pysadi itself, believing Pysadi to be the mother of all things (much like the Terran Gaia movement of the -2500s). Pysadi is also the sole environment of the Anolas, a hermaphroditic prosimian analog (similar in performance and function to members of the Terran genus *Platypoecilus*). Anolas are "naturally" considered holy by the Mother Church, and their capture, study, or export is prohibited. (Killing one is a capital offense, in case you were wondering.)

Offworld, Pysadi is renowned for its fruit. Fresh (and preserved) fruit from Pysadi is esteemed (and accordingly priced) throughout the Regency. In fact, Pysadian fruit is one of the few agricultural commodities that is actually shipped in low berths to preserve its freshness. Noteable Pysadian fruit include skymelon and trake. Trake grown on Pysadi produces much better trake wine (called atrake) than that from trake grown elsewhere, but alcohol is forbidden by the Mother Church, making the production of Pysadian atrake a difficult proposition.



Tree Rat: See page 81.

Yebab (3002): Homeworld of the Ebokin (singular is irregular: Eibokin). The Ebokin are bilaterally symmetrical and possess four pairs of legs and two pairs of manipulative "arms" near the head, at the anterior end. Ebokin government is matriarchical, characterized by strict laws which are slow to change. Females average 1.5 meters in length and mass 130 kg, with males being smaller. Because of the nature of their society, most Ebokin never leave Yebab.

Zila (2908): Zila is the site of some of the most respected wineries in the Marches. Although they are not of the legendary quality of Terra's Tokaj Eszencia, once served at the Emperor's table (see **Azhanti High Lightning**, OP), they are quite good, and are made from grapes as well as trake (see under "Pysadi," above). Nonethless, their reputation was enhanced in the antebellum period by calculated marketing by the megacorporation Tukera, which hoped to buy out the Zilan vineyards (see **The Traveller Adventure**, SA). Fortunately for the Zilans, the Final War forced Tukera to consolidate its holdings outside of the Marches, a gamble which ultimately failed (**Hard Times**, OP, and **Survival Margin**). Four wineries dominate the Zilan market: Fireau et Fille, Signal, Delatest, and Tessalan & Bucephalus, a previously small firm which bought up the Tukera interests when they abandoned the Domain.

Spinward Marches Subsector E: Querion

The Querion subsector is one of the few truly neutral subsectors of the Spinward Marches. In the antebellum period it contained exactly no Imperial-member worlds (although it did contain an Imperial Research Station on a non-Imperial world, see "Retinae," below), but it did contain a number of nonaligned worlds, Zhodani worlds, and worlds subject to competing claims of both the Darrian Confederation and Sword Worlds (see "Entropic Worlds," below).

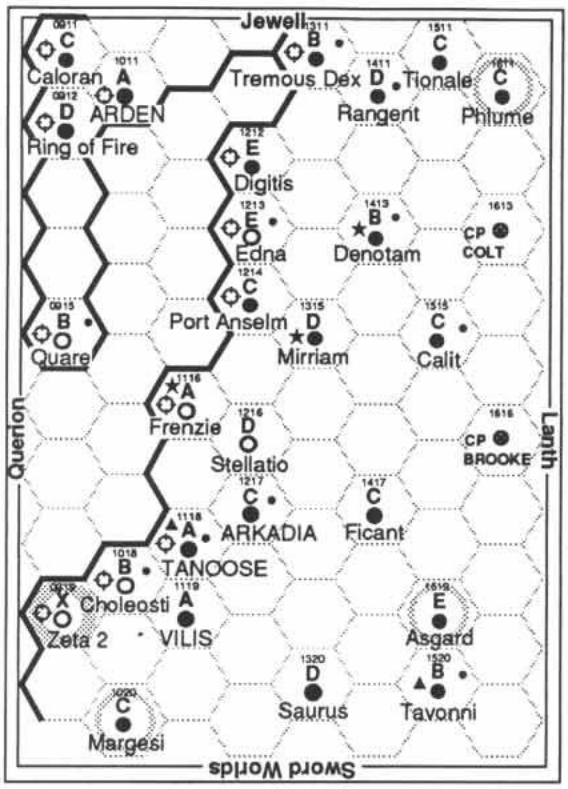
Querion contains a number of "minor Spinward States," individual world-states which exist within the Quarantine protocols that are primarily administered and paid for by their larger neighbors. These worlds are inhabited primarily by the descendants of Imperial settlers. Many of these worlds were originally members of the Third Imperium, but were obliged to become independent as the Imperial boundaries were pushed back as a result of the first three frontier wars (see page 36). Because these states exist within the larger envelope of viral safety ensured by Regency, Zhodani, and Aslan quarantine forces, their responsibilities are minor. In fact, the major Spinward States consider themselves the guarantors of these "lazy" and privileged minor states, but these individual worlds are obligated, as signatories of the Spinward States Accords, to uphold the anti-viral protocols to the best of their abilities. Fortunately for the minor states of Querion, the major viral threats have been eliminated by other forces long before they make it to the individual worlds of this subsector.

Asmodeus (0512): Asmodeus was the site of a major nuclear war which ended in 1005, and is quite a tourist attraction for those who fancy such things, for academic, ethically instructive, or morbid reasons. Rebuilding is proceeding under Zhodani direction, using the proceeds earned by this planet-sized war monument and demonstration area.

Bael (0218): Bael was known to be the site of extensive lanthanum deposits in the period immediately following the Fifth Frontier War. This was expected to create intense competition for these assets, and caused no small amount of Zhodani-Imperial jockeying in the period 1110-1117. However, in the pre-Collapse period from 1119 on these rivalries cooled considerably and Bael became a very profitable nonaligned world, trading peacefully with all of its neighbors.

Entropic Worlds: The Entropic Worlds consist of the three worlds Winston (0620), Entrope (0720) and Anselhome (0820). These worlds are the object of centuries-old conflicting Darrian and Sword World claims. They were most recently retaken by the Darrians in the last stages of the Fifth Frontier War (see **The Spinward Marches Campaign**, OP). See timelines on pages 30 and 32 for further details.

The fourth world in this cluster, Torment (0721, see page 45) is no considered part of the Entropic Worlds, and has remained under Darriar control for centuries.



Four Corners: Four Corners, or the Four Corners Interface, refers to the interface where the Regency and Darrian Confederation borders meet and run contiguously along the corners of four subsectors: Querion, Vilis (F), Daryen (I), and Sword Worlds (J). Because of the strong relations between the Darrians and Regency, a large number of merchant vessels are jointly licensed by Darrian and Regency Quarantine authorities, allowing operations in both Spinward States without the need for lengthy relicensing at the interface. Such dual-licensed vessels are, of course, required to stop for inspection at the interface between the two states, but the inspection is abbreviated given the joint licensing arrangement (see page 20).

Retinae (0416): Site of Imperial Research Station Delta (Δ) established in 556. Although the Imperium relinquished the Retinae system in 986 as a result of the Third Frontier War, the station was maintained on this now nonaligned world. The Imperial Navy operated a courier route through Frenzie and Thanber, which is maintained by the Regency.

Before the Exodus (pages 13 and 24, *referees only page 85*), RSΔ also provided data to the Consulate, pursuant to Regency directives. This data flow has been *officially* suspended as a result of the many violations of the Spinward States protocols committed by Zhodani nationals since 1201.

Spinward Marches Subsector F: Vilis

One of the major astrographic features of this subsector is the Abyss, a region of low stellar density than extends into the Vilis, Lanth (G), and Lunion (K) subsectors. Although authorities differ on the actual boundaries of the Abyss, it is commonly considered to include seven worlds, although the roster of these worlds vary. All lists include Ghandi (1815), Ylaven (1916), Victoria (1817), Sonthert (1918), and D'Ganzio (1920). The remaining two worlds are chosen from Ficant (1417), Calit (1515), Lanth (1717), Arba (1721), Rabwhar (1822), and Quopist (2215), depending upon the authority.

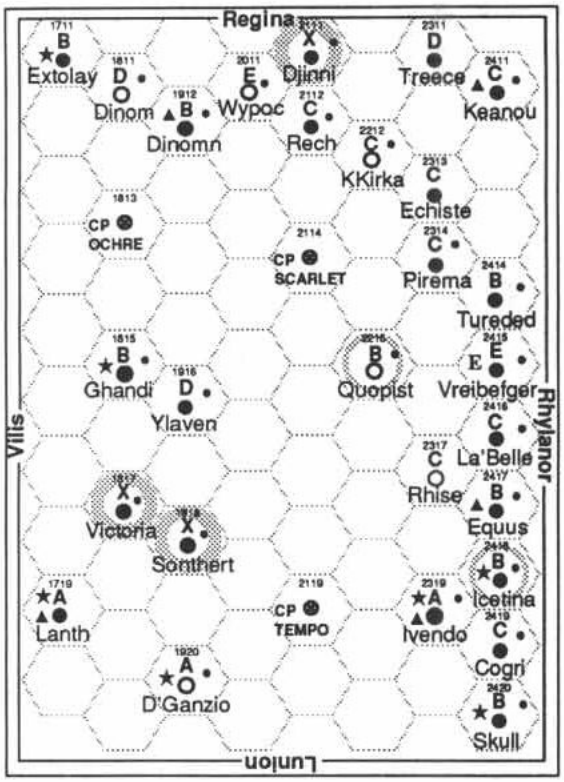
The coreward portion of the subsector is essentially a demilitarized zone established after the Third Frontier War. This was created by the Imperium's withdrawal from a number of former member worlds, settled by Imperial subjects.

Vilis is defended by the valiant 193rd Fleet, another veteran of the Fifth Frontier War, maintaining its headquarters at Frenzie (1116). The 193rd spent the entire war in essentially static positions defending Efate (1705, page 38). Following the "surrender" of Louzy (1604, page 37) to the Zhodani (this system was actually entrusted to the care of its system defense flotillas, *referees only see page 82*), the 193rd did not give one centimeter of territory to the Outworld Coalition for the remainder of the war, and was actually able to liberate some worlds during the course of the campaign.

The worlds of the Vilis frontier are part of Regency Quarantine District 1, running coreward from Zeta 2 (0919). RQD 7 begins immediately to rimward of Zeta 2, and runs into the Sword Worlds (J) subsector (page 45).

Arden (1011): Arden is a former Imperial world, abandoned after the Third Frontier War and now independent and neutral. It is the capital of the Federation of Arden, a small independent power taking advantage of the power vacuum between the Zhodani and Imperial frontiers. In the period between the Third Frontier War and the Collapse it carved out a niche as a meeting place for Imperial and Zhodani covert operators and negotiators. However, following the warming of Imperial-Zhodani relations beginning in 1119, its importance waned with the increasing number of legitimate channels between the two governments. Nonetheless, by virtue of its intermediary status between the Regency and Zhodani Consulate, the Federation has exerted an attraction on the sort of elements that thrive in an extra-national environment (see page 34).

CP Brooke: Calibration Point Brooke is one of the network of calibration points placed in and around the Abyss to assist Regency military forces in making their way across this stellar desert. The ability to maintain longer average jumps and follow straight-line courses to trouble spots can save weeks in redeployments. See also the maps for the Lanth (page 42) and Lunion (page 46) subsectors for the location of other CPs in this network.



CP Colt: See "CP Brooke."

Tanoose (formerly Garda-Vilis) (1118): Formerly a subject world of Vilis (1119), Tanoose gained home rule in 1155 as a result of Norris' Representational Reforms. Originally settled in approximately –120 (IC), the failing settlement was taken over by Vilis, and in the years since then was deliberately maintained as an economically dependent world. By late in the antebellum period, the Vilis-imposed government was widely unpopular, and open rebellion broke out in 1103. Although this sentiment attracted Sword World and Zhodani opportunism (See **Adventure 7: Broadsword**, OP), the mainstream of Tanoose nationalism was not anti-Imperial, but only in favor of home rule. Active resistance to the cynical, externally imposed Vilisian military rule was muted by the common cause of Virus, but the onset the declaration in 1152 of the Representational Reforms created an outlet for dissatisfaction that could not be silenced, and resulted in the world's ultimate independence. See also "Vilis," below.

Vilis (1119): Although Vilis was one of the 26 targeted worlds of the Regency Industrial Development Program (see page 67), it is not a success story. Unlike other targeted worlds, which typically advanced three tech levels, Vilis advanced only one. Blame for this poor performance is placed by Vilisians on the Tanoose independence upheavals, in which the Vilis-owned industries of Tanoose were nationalized by the newly independent world, with Regency acquiescence.

Non-Vilisian observers agree that Vilis' troubles date to the Tanoosian independence, but blame the Vilisians themselves. Vilis appears to have been far too dependent on their subject world. They have not recovered from the loss, and have slid into a cultural decline. Tanoose is now considered to be the dominant Regency world of the subsector, taking the position of Vilis.

Vilis was originally settled in 240 by colonists from the Sword World Gungnir (1221, page 45).

Spinward Marches Subsector G: Lanth

Although the astrography of the Lanth subsector is dominated by the Abyss, a major impediment to interstellar travel (see Vilis subsector, page 41), its coreward and trailing borders constitute two main branches of the most important communications network of the sector: the Spinward Main, making it a transport nexus.

The Spinward Main is a remarkable grouping of 242 star systems in 16 subsectors (15 of the 16 Spinward Marches subsectors plus subsector I of Deneb) that are all mutually accessible by jump-1. Only the Trin's Shroud subsector (subsector P, page 51) of the Spinward Marches does not include a portion of the Spinward Main. The Spinward Main is not only a primary network of current trade, but it was also a major mechanism of the Imperial settlement of the sector. The settlement of Mora (3124), located at the trailing end of the Spinward Main in 60 (IC) opened this jump-1 highway to exploitation by inexpensive jump-1 free traders. In only 15 years worlds as far away as Regina (1910, page 38) had been settled, and Imperial development of the sector was off to a running start which would not be challenged for almost another five centuries.

Lanth is the home of the 18th Fleet, headquartered at D'Ganzio (1920). Lanth is also home to the Regency's spinward "swing fleet," the 88th, headquartered at Ivendo (2319). The two swing fleets, one each in Spinward Marches and Deneb, are highly mobile reserve fleets that can be rapidly moved to respond to emergencies and are also used to support the permanent subsector fleets in training and working-up operations.

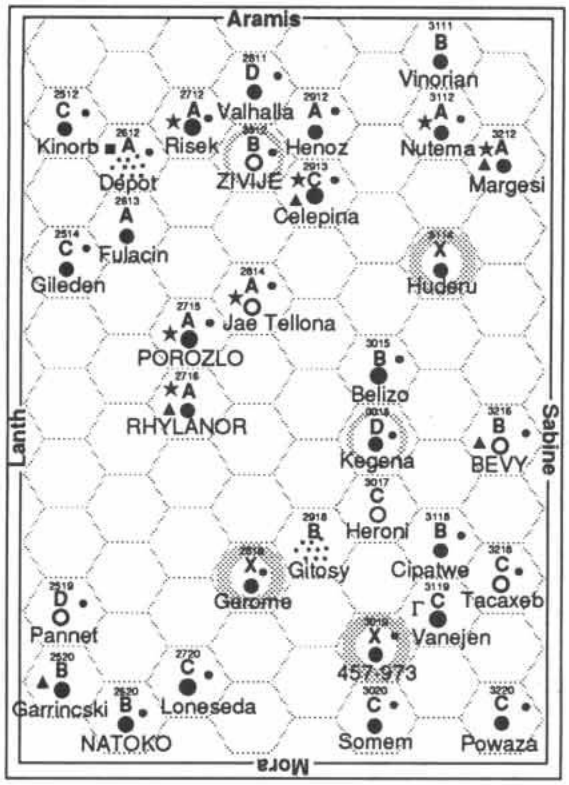
The 88th had originally been stationed in the Atsah subsector (Deneb H), but was redeployed following the withdrawal from the Corridor frontier (Atsah subsector, Deneb/H, page 59).

Dinom (1811): This world orbits at the trailing trojan point of the system's only gas giant, with its axis laying along the ecliptic plane, and its rotation perpendicular to the ecliptic. Precession of Dinom's axis proceeds at 0.225° per year, meaning that every 800 years the world reverses the pole that is facing the sun. While one pole is facing the sun this "Bright Face" is baked into vacuum while the opposite "Cold Face" collects the frozen atmosphere in deep crevasses. In intermediate periods, when Dinom's axis is perpendicular to the sun, it experiences "normal" day-night thermal cycles, the frozen gases sublimate to create a breathable atmosphere, and plant-life sprouts from seeds germinated over centuries. Dinom is currently 70 years past its most recent "Bright/Cold Face" phase, and its axis is now aligned 21.6° away from the sun. This twilight day-night cycle near the equator is allowing the first traces of atmosphere to reappear, but this will not reach its full density for another 330 years. See also **Double Adventure 2: Across the Bright Face/Mission on Mithril, OP.**

Quopist (2215): 61% of this world's population consists of Jonkeereen, the geneered humans created by Imperial Ministry of Colonization for settlement on desert worlds (see page 61).

Tree Krakens: See page 81.

Victoria (1817): Victoria is a rather light, metal-poor world which has nonetheless managed to retain a fairly dense, tainted atmosphere. This taint cannot be handled by normal filter masks, and requires the use of full environment suits and oxygen tanks. Fortunately the taint is only present at altitudes less than 1000 meters above sea level, so settlements built above this altitude are not affected by the taint.



Victoria's human population therefore lives atop a large system of mesas, with these communities connected by locally constructed airships. (The builders obtain hydrogen from the indigenous balloon plant which grows bundles of large, hydrogen-filled sacs, and the ships are propelled by manual power, either aerial wing/oars or hand cranked aero-screws.) Victoria is believed to have been settled by sublight colony ships in about –1450, and was not recontacted by humans until late in the settlement of the Spinward Marches, given the world's inconvenient location in the midst of the Abyss. Following its examination by the IISS, it was interdicted to allow the local culture to find its own solutions to their development. It is believed that their slow technological advance is due to the severe lack of metals on the world.

Victoria shows signs of intensive asteroid bombardment dating to the Ancients' final war, and an Ancient site has been discovered on its single moon, Albert.

Victoria also shows signs of much seeded flora and fauna, also consistent with Ancient attention. It is the only world where the Kudebeck's Gazelle (also known as the Ivory Gazelle or "Kudie") exists in the wild, although it is known not to be native to the world. The six-legged Kudie is an important animal for Victorian society. It is hunted not only for its hide, fur, and meat, but most importantly for its light, durable, and easily-worked ivory, which is a primary structural material on this metal-poor world. (For more details, see JTAS 2, OP.)

Spinward Marches Subsector H: Rhylanor

Rhylanor, at the opposite end of the Spinward Marches Sector from the Zhodani border, has seen more than its fair share of crucial battles in the Frontier Wars. In the First Frontier War, Zivije (2812) and Jae Tellona (2814) were the sites of the climactic battles where Grand Admiral Plankwell destroyed the Zhodani expeditionary fleet. In the Third Frontier War, Porozlo (2715) was taken by the Zhodani and served as their base for the siege of Rhylanor (2716), which became the site of many battles before the siege was ultimately lifted by the end of 981. And in the Fifth Frontier War, the Zhodani 40th Fleet penetrated deep into the Spinward Marches to again invade Porozlo and Rhylanor. Here it eventually met and was defeated by the Corridor Fleet on 231-1109. The repulse of the Zhodani penetration force at Rhylanor effectively ended the Fifth Frontier War by denying the Outworld Coalition their last strategic objective.

Today the 23rd Fleet, "The Axemen," defends Rhylanor from its headquarters at Rhylanor itself. The 23rd is another veteran of the Fifth Frontier War, when it held the Imperial center in the Vilis subsector, and moved to cut off and destroy the Zhodani 40th Fleet after its repulse at Rhylanor.

Pannet (2519): Pannet's insidious atmosphere contains a wide variety of compounds used in heavy industrial processes. Although these compounds are typically caustic and hazardous to collect, the nearby high-technology industries of Rhylanor (2716), Lunion (2124, page 46), and Mora (3124, page 47) have created a high demand for them, and correspondingly high financial rewards for those who gather them.

Fulacin (2613): In the period before the Fifth Frontier War the Zhodani had established a secret base on this world. Unknown to the Zhodani, it was discovered and destroyed before the war, throwing a wrench into the Zhodani Abyss Campaign and the ultimately unsuccessful Siege of Rhylanor. (See **Adventure 3: Twilight's Peak**, OP, and **The Spinward Marches Campaign**, OP.)

Gitosy (2918): Unlike most asteroid belts which are laid out in the system's ecliptic plane, the Gitosy belt is spherical, i.e., the asteroids' orbits are inclined at all angles to the ecliptic plane. However, the belt is almost exclusively made up of ice asteroids, with few habitable rocky asteroids.

Depot (formerly Macene) (2612): During the antebellum period Macene was the home of the Spinward Branch of the Imperial Navy Fleet Tactics College (serving the Domain of Deneb area). The system's entire population was connected with either the Macene naval base or the Fleet College.

Since the Collapse the Navy's interest in the system has expanded. The Fleet College is now the Regency Naval War College, and the naval base has been expanded to be a full-size depot, serving Spinward Marches Sector.

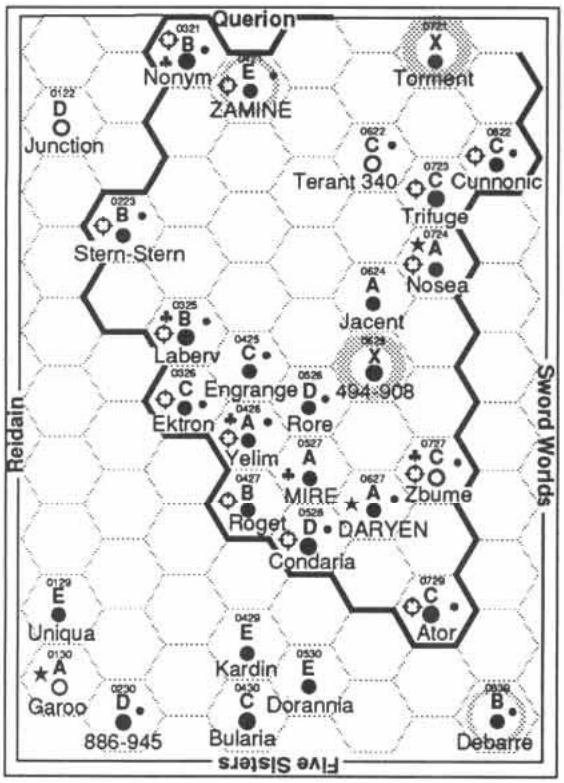
Pelouse (formerly 457-973) (3019): This world has been interdicted by the IISS and RISS to protect a developing race, but contact is being undertaken by the RISS, as the acheivement of TL 5 is usually considered sufficient to open previously interdicted worlds to outside contact. However, the interdiction is still in effect against commercial contact, as the RISS contact process is not yet complete. The name is a lyrical translation of the race's name for their world, which means "lawn."

Rhylanor (2716): One of the key worlds of the Regency, it was the site of one of the pivotal battles of the Fifth Frontier War.

Rhylanor was the birthplace of Olav hault-Plankwell, Grand Admiral of the Spinward Marches and "victor" of the First Frontier War (see page 36), as well as the first of the Emperors of the Flag.

University of Rhylanor: Like the University of Regina (page 38), the University of Rhylanor is a planetary university which expanded to meet the needs of the now isolated and vulnerable Regency. Unlike the U of R, Rhylanor does not have a glamorous sector-wide reputation, and still primarily serves the 12 billion citizens of its own world. As befits the needs of the small, high-population, technologically sophisticated world, Rhylanor's academic strengths are the hard sciences: biology, chemistry, electronics, gravitics, mechanics, and physics.

A minor point is that the University of Rhylanor is prohibited by law from referring to itself as the "U of R." This picayune regulation is a relic of Imperial times when feudal requirements gave Regina, as sector capital and seat of the sector Duke, pride of place and exclusive patent of usage of the "U of R" phrase throughout the Spinward Marches Sector. This law is still on the books.



Rhylanor Institute of Technology: Once one of the leaders in robotic research in the Domain of Deneb, RIT is only now regaining its former stature, lost in the wave of anti-robotic sentiment which swept the Regency following the Rape of Trin. Although RIT retained strong programs in all of the natural and applied sciences, its new reputation as the "Robot Institute of Terror" caused a massive flight of students and faculty to other schools, notably the University of Rhylanor.

Over the years RIT has gradually built itself back up to near its former stature, by a combination of pragmatic focus on non-autonomous MIL (man-in-loop) automation technology and anti-virus countermeasures and contracts from the Regency government, in particular the High Regent for Technology Assessment. Ironically, many of these contracts involved work for the Regency Artificial Sentience Analysis Commission, and the RASAC revelations of 1201 (see page 80) have caused a new round of condemnation for the hapless RIT.

Vanejen (3119): Site of Spinward Marches Research Station Gamma (Γ). RSΓ continues its research into psionics (*referees only, see page 83*). See also **Adventure 2: Research Station Gamma**, SA.

Spinward Marches Subsector I: Daryen (formerly Darrian)

This subsector comprises most of the Darrian Confederation (see pages 30-31), although three of its current member worlds, the so-called "Entropic Worlds," are located in the Querion subsector (E) to coreward (see page 40).

As is the case with the Zhodani worlds of the Cronor and Jewell subsectors, Regency charts now show the names of the Darrian worlds in their own *te-zlodh* language rather than as approximate Imperial transliterations.

The period since the Collapse has become known as "the Darrian Renaissance," evidenced by the growth in population, territory, and technology of the Confederation.

Darrian Group: The Darrian Group, as distinct from the Darrian Confederation, consists of the 12 worlds originally colonized from Daryen in its first era of space travel, before the *Maghiz* (see page 31). These 12 are Condaria (0528), Daryen (0627), Ektron (0326), Engrange (0425), Jacent (0624), Laberv (0325), Mire (0527), Roget (0427), Rore (0526), Yelim (0426), Zbume (0727), and 494-908 (0625). Note that these worlds are all mutually jump-1 accessible, and in fact comprise one of the spinward termini of the Spinward Main (see page 42).

Daryen (formerly Darrian) (0627): Darrian homeworld and still the center of Daryen technological development. The world is ruled by scientists, and has strict laws against the export of pre-*Maghiz* artifacts. Daryen is the Darrian word for "world" or "home."

Mire (0527): Political capital of the Darrian Confederation. Mire's civilization is contained completely underground. This is not because of an inhospitable environment; to the contrary, it is to allow the world's surface to be saved for agriculture and natural preserves.

Roget (0427): Roget contains the largest concentration of the Darrian's Aslan citizens, who settled this world in large numbers to establish a separate society where they could preserve their traditional Aslan culture. Roget is *te-zlodh* for "gift," a reference to granting the Aslan *ihatei* their own new "homeworld."

Rore (formerly Rorre) (0526): Rore was colonized by anti-technological, ethnic Darrians who wished to preserve the traditional Darrian culture from before the Terran contact. Rore thus was untouched by the *Maghiz* and to this day is a relaxing, pastoral world, very popular among tourists. Rore is *te-zlodh* for "fertile."

Torment (0721): Torment, although part of the astrographic cluster that includes the Entropic Worlds (see page 40), is not normally considered one of the Entropic Worlds. Torment has been under continuous Darrian control since before the Third Frontier War, even during periods when the other three Entropic Worlds were held by the Sword Worlds. This is because Torment is populated entirely by incorrigible criminals that cannot exist within the tolerant Darrian society. Torment is governed by the criminals themselves, who must mine raw materials to trade for imported food. Torment is Galanglic for "torture, pain, anguish, or agony."

Yelim (formerly Ilium) (0426): Yelim was terraformed by the Darrians of the pre-Maghiz period to make its climate more suitable for habitation, and the atmosphere's slight sulfuric taint is a remnant of these efforts. Yelim is *te-zlodh* for "pioneer."

Zamine (0421): Zamine is *te-zlodh* for "hopeful." Zamine has been beset by a series of most un-Darrian civil disruptions and wars in the post-Collapse period.

Zbume (formerly Spume) (0727): Zbume is an inhospitable mining world; all of its population live in a single domed city which protects them from the world's toxic, radioactive atmosphere, a result of natural volcanism. Zbume is *te-zlodh* for "golden," the color of the world's tainted atmosphere.

494-908 (0625): Although one of the Darrian Group of originally colonized worlds, 494-908 is not so much a Confederation member world as it is a possession. The barren 494-908 is used by the Darrian Confederation Navy (DCN) as a test range and area for military maneuvers, including live-ordnance orbital bombardment practice. The world is interdicted for safety measures, although DCN vessels do use the world's single sea for refueling.

Spinward Marches Subsector J: Sword Worlds

This subsector takes its name from the state which used to dominate the subsector, which comes from the fact that almost all of its member worlds are named for famous swords of Terran history, folklore, and literature (and in at least two cases, the same fanciful sword which had two names gives one such name to each of two worlds).

Sword Worlds society and culture (see page 32) is remarkably homogeneous, although each world maintained independent sovereignty, armed forces, governments, etc. This cohesive independence made the Sword Worlds a rather volatile collection of worlds, and continues to make them volatile occupied worlds. Many of these worlds have a history of occupation by Imperial forces, going back to the end of

the Second Frontier War, when Hrunting (0921), Tizon (0922), Colada (1022), Mjolnir (1121), Joyeuse (1123), Gungnir (1221), Dymwyn (1522), Durendal (1523), Hofud (1524), and Biter (1526) were occupied from 620-626. It was apparently thought by the Imperials that this would teach the Sword Worlds a lesson, without being so harsh as to create lasting enmity. So much for theory, as these years are still remembered as the "First Occupation," as distinct from the "Second Occupation" of the Border Worlds from 1110-1132, and the "Third Occupation" from 1132 to the present.

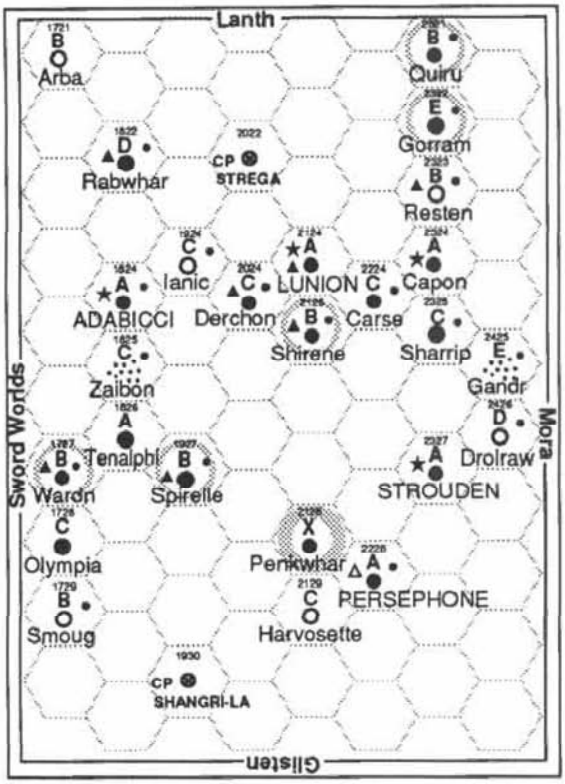
The Sword Worlds subsector is considered one of the most unstable regions of the Regency, a fact reflected by the great number of TAS-designated Amber Zone worlds. Since the late 1130s the Regency has practiced a policy of resettling refugees from the Abandonment of Deneb's trailing worlds (page 11) on the Regency-owned Sword Worlds to balance out local anti-imperial sentiment. However, most observers now admit that this program was a failure. Rather than being able to combine with the original Sword World inhabitants to create a new, moderate, culture, the newcomers were excluded from existing communities, and there now exist two mutually hostile sets of cultures on the Regency Sword Worlds. And because the Denebian refugees have now lived on these worlds for two generations (and have no homes to return to), they now reasonably regard the Sword Worlds as the only homes they have ever known. This situation seems sure to create lasting strife for generations to come.

On some worlds the Regency has retained former Sword Worlds military bases in order to keep local control, on others it has upgraded these bases to Regency naval bases, and on others still it exercises a policy of demilitarization under which it dismantles the old military bases.

As a part of the Regency, the Sword Worlds subsector is defended by the 151st Fleet (transferred from the Antra subsector, Deneb/C, following the establishment of the Quarantine borders), headquartered at the upgraded former Sword World base at Sacnoth (1325). The 151st Fleet was created during the final weeks of the Fifth Frontier War during the breakout from the Siege of Jewell (SM 1106, page 37).

The Sword Worlds subsector frontier is contained within Quarantine District 7, which starts at the Glisten-Pax Rulin border and runs core-spinward into the Vilis subsector.

Border Worlds: This was an Imperial client state created in 1111 from Sword Worlds occupied by Imperial forces in the Fifth Frontier War. By the end of hostilities the Imperial 213th and 214th Fleets had occupied Dymwyn, Durendal, Hofud, Beater, Sting, Biter, Iron, Bronze, Mithril and Steel, which prompted Tyrfing and Sacnoth to read the writing on the wall and bolt from the failing Confederation. These 12 worlds constituted the Border Worlds until the great Sword Worlds landgrab of 1132.



It is typical of Sword Worlds fractiousness that the Border Worlds capital actually moved from Sting to Beater during the period of "tight" Imperial control.

Enos (1130): Enos is an unusually dense world, and is thought to be a rogue world captured by its star, Kaleshi. The world's most unusual natural feature is the Fire Sea, a desert which lies atop a great many unusually large pockets of oil and natural gas. Frequent seismic activity and erosion have thinned and weakened the impermeable trapping rock, allowing the pressurized gas to leak out through the sand, sometimes inhuge jets. Static discharge or lightning storms can ignite the gas, causing explosions which often trigger further cataclysmic releases of burning gas.

The Fire Sea was the headquarters of a secret anti-Imperial organization backed by the Sword Worlds, composed of former Imperial psionics. This group was discovered and its base destroyed during the Civil War period (see *TD* 14-17).

Metal Worlds: These are the four worlds Steel/Halifax (1529), Iron/Brace (1626), Bronze/Brunswick (1627), and Mithril/Wisconsin (1628), so-called because of their former names. These four then-uninhabited worlds were held in common by the entire Sword Worlds Confederation as resource worlds. Since the absorption of many of the Sword Worlds, the Regency has renamed the metal worlds, showing its intention to retain them. To make its position more firm, it has settled the two habitable worlds—Steel, now Halifax, and Mithril, now Wisconsin— with a unique group of colonists: a joint Vargr-human religious community from Deneb (Deneb 1925) which has split off from the "Willies," as the Denebian faith is commonly known. See "Deneb," page 62.

Sword Worlds Confederation: The Sword Worlds Confederation of 1202 is only a shadow of its former extent and power, with only five worlds remaining (from its 1107 highwater-mark of 27) as independent members: Narsil (the capital), Anduril, Orcrist, Excalibur, and the outpost of Enos. Naturally it is Sword Worlds official policy to support the rights of "the freedom loving peoples imprisoned within the Imperial [sic] borders to repatriation and self-determination." Although the Quarantine provides ample opportunity to prevent military assistance from crossing the frontier, simple inflammatory moral support from the spinward side of the border seems to be all that is needed to encourage revolutionaries and freedom fighters on the "occupied Sword Worlds."

Spinward Marches Subsector K: Lunion

The Lunion subsector is known as the crossroads of the Spinward Marches, as the branches of the Spinward Main (see page 42) running coreward-rimward and spinward-trailing intersect here. Lunion also contains two of the Regency's 16 TL-15 industrial worlds, making it an important economic area.

In the period before the Fifth Frontier War the Lunion subsector also constituted the Imperial frontier with the Sword Worlds, but with the incorporation of the Border Worlds in 1133 Lunion became an interior subsector.

Lunion is defended by the 43rd Fleet headquartered at Lunion.

The Abyss which extends through the Lunion subsector (see also page 41) is a subject of some popular speculation, as it widely believed to have been the area of a number of "mysterious starship disappearances" over the years (see "Lost Treasure Ships of the Abyss Rift," **Challenge** 44, SA, and "Demon Dark," **Challenge** 58, SA).

Gandr (2425): Perhaps the least valuable asteroid/planetoid belt currently being worked in the sector. Superheavy elements were discovered here in 1060, but these quickly played out, and no more have been discovered.

Ianic (1924): 32% of this world's population consists of the geneered human race known as the Jonkeereen (see page 61).

Ling Standard Products: Ling Standard Products (LSP) is one of the former megacorporations of the Third Imperium (see **Supplement 8: Library Data (A-M)**, OP, **JTAS** 16, SA, **The Traveller Adventure**, SA, **MegaTraveller Referee's Companion**, SA, **Hard Times**, OP, *MTJ* 3 for fuller discussions of Imperial-era megacorporations than is practical here), and although its powers are not what they once was, it still looms as one of the dominant corporations of the smaller Regency, concentrating in the manufacture of vehicles, starships, and starship armament and subsystems.

The LSP shipyards at Strouden (2327) and Lunion (2124) are two of largest starship yards in the Marches, and LSP has maintained a reputation for high quality, unlike some of its competitors (see "General Products," page 38).

Lunion School of Economics: Located on Lunion (2124 Spinward Marches), this is the largest business and management college in the Regency, accrediting tens of thousands of high speed young whiz kids every semester to lead the corporations of the Spinward States. LSE grads typically have little patience with the fine points of public policy, history, international relations, or the arts, although they are highly trained in the practical mechanics of public relations and spin control.

Shirene (2125): This world is owned by the Al Morai merchant line, which uses its shipyard as as an overhaul and maintenance center for its fleet of cargo carriers, see "Al Morai," page 47.

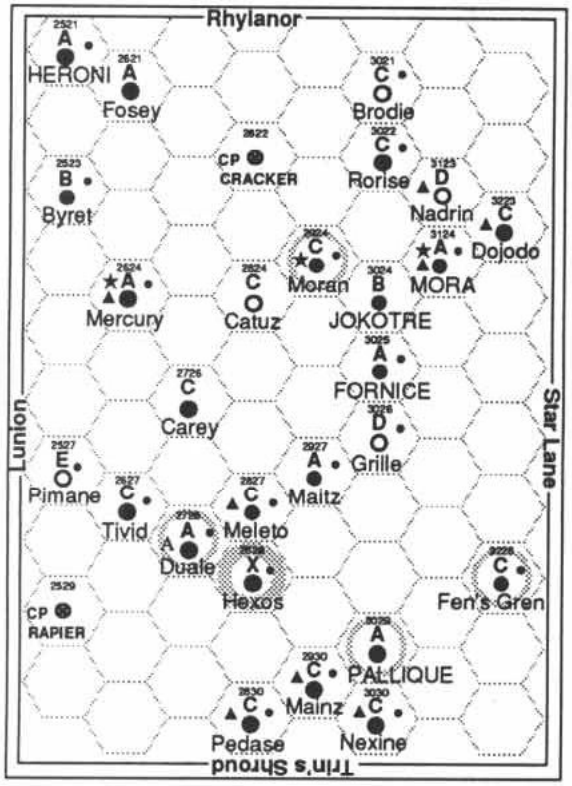
Wardn (1727): One of the remarkable features of this world is the Patterned Desert, which features a complex patter of lines in the desert surface made by the "dalev-thur," an indigenous non-sapient lifeform, now extinct. This regrettable state was made necessary by the discovery in 1121 that the dalev-thur were the hosts of a plague that threatened the population of Wardn (see adventure in *MTJ* 1).

Wardn's Amber Zone status is due to its thin atmosphere and weak magnetic field. These provide insufficient protection from its sun; the populace is obliged to seek cover during solar flare cycles.

Zaibon (1825): Site of the largest copper deposits ever discovered in the Marches, these reserves are now played out, leaving the system in decline.



Spinward Marches Subsector L: Mora

The Mora subsector is considered to be the industrial hub of the Spinward Marches, containing a number of high technology economic powerhouses worlds, such as Fornice (3025), Pallique (3029), and Mora (3124) itself, one of only two TL-16 industrial worlds in the Regency.

Mora is patrolled by the 73rd Fleet, headquartered at Mora.

Al Morai: Major interstellar merchant line serving the Spinward Marches, with corporate headquarters on Mora. (See **Spinward Marches Campaign**, OP).

Al Morai maintains service to all Regency subsector capitals and the worlds along the routes which connect them, plus selected minor states (see pages 35 and 40) outside the Regency. Al Morai also provides service to the Darrian Confederation via the "Four Corners" interface at the junction of the Querion (E), Vilis (F), Daryen (I), and Sword Worlds (J) subsectors, see page 40. During the antebellum period Al Morai operated only in the Spinward Marches, but expanded its operations to include the

entire Regency over the past 70 years.

Al Morai maintains a homogeneous fleet of 93 World-class vessels, a proprietary design that is manufactured only for Al Morai. Most of these 3000-ton, unstreamlined, jump-4 ships are named for the worlds served by Al Morai (e.g., *Regina, Jewell*, etc.), but four carry non-world names: *Imperial Glory, Imperial Reign, Regency Shield*, and *Regency Flame*. Although the ships are all constructed to TL-15 standards, most of the fleet is a little long in the tooth, but the Regency starship shortage (page 11) leaves no real alternative.

Al Morai was once renowned for maintaining its own force of military vessels for antipiracy and security patrols, the famed Route Protectors, but this force was dissolved with the establishment of the Quarantine (page 11), the ships themselves being pressed into service with the fledgling RQS. The Regency does not look kindly on private armies, and "trade wars" and other such aberrations of the Imperial era (see **The Traveller Adventure**, SA) are a thing of the past.

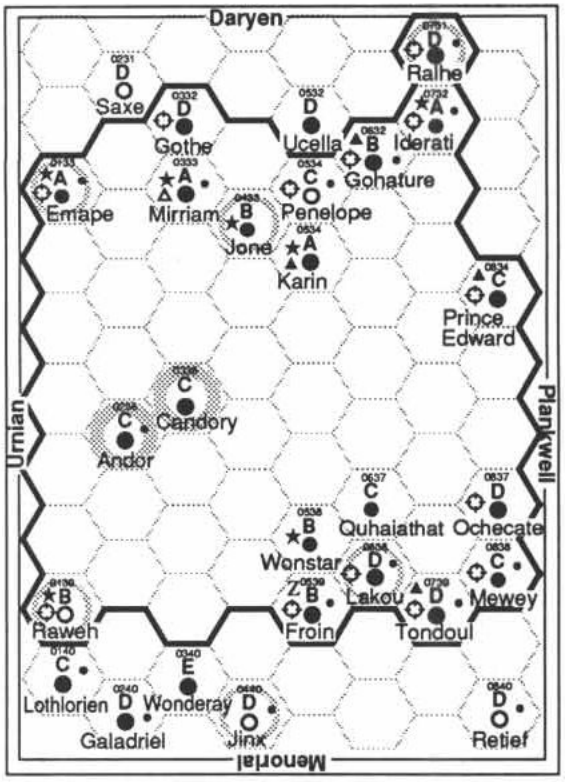
Al Morai maintains its own facilities along its scheduled routes, and maintains its own maintenance and overhaul yards at several worlds including its Mora headquarters and Shirene (SM 2125), which is entirely owned by Al Morai (see page 46).

Duale: The research station at Duale is engaged in secret research for the Navy. It was severely damaged in 1102 by an explosion of unknown origin but was rebuilt in 1108 by the Imperial Navy to continue its research.

Duale is suffering a succession struggle between the displaced nobility who formerly held power on the world and the new popularly-selected government which thus far has been unable to uproot or coopt the nobles' power base (see also pages 16-18).

Mora (3124): Mora is the site of the Regency capital, having been established as the Domain of Deneb capital in 1120 because of its location at the approximate center of the Domain. Mora has one major continent which is home to most of the world's 30 billion inhabitants. Mora has grown significantly since the antebellum period, as a result of its importance as capital, fleet headquarters, and one of the only two TL-16 industrial worlds in the Regency (see "Regency Industrial Development Program," page 67). The Regency government offices and the residence of the Regent are contained in the huge Giyachii arcology, built off the coast of the major Moran continent.

The system's belt is the site of some of the Regency's most advanced biotechnology research and manufacturing facilities. Its location among asteroids makes it easy to contain or destroy unanticipated mishaps as necessary.



Mora is known as the "Gateway to the Marches" because of its location near the trailing end of the Spinward Main (see page 42) where it crosses from Deneb Sector into Spinward Marches. Mora was the first major Imperial settlement in the sector, created in 60 as a commercial enterprise by Ling Standard Products (which see, page 46). With its location, Mora became the economic dynamo of Spinward Marches development, building and maintaining starships for the expansion, and producing industrial goods used to outfit the new worlds.

Nadrin (3123): The entire permanent population of this world is Jonkeereen (see page 61). Nadrin is the site of trials to establish the limits of atmospheric conditions that can be tolerated by Jonkeereen without artificial assistance.

Nexine (3030): This waterworld is inhabited by geneered (see Library Data) humans who live underwater and conduct undersea foarming. These humans were created by the then-Imperial Ministry of Conservation, now integrated into the Regency MInistry of the Interior (MoI), see "Malory," page 54.

Pallique: For reasons which are unclear today, this battered world was settled as an industrial center to exploit the two extremely rich planetoid belts in the system, even though as a captured body in an eccentric orbit perpendicular the system's ecliptic plane, it passes through one of planetoid belts twice each local year, enduring severe meteor bombardment. All of Pallique's vast settlements are underground for protection from this bombardment, and the world is coded as an Amber Zone because of the hazards to navigation present near the world.

Because Pallique's population depend on these things to a greater degree than do other non-suicidal populations, Pallique is justly famous for the quality of the vacuum survival equipment manufactured there, including life support plants, containment buildings, vac suits, and emergency, survival, and rescue equipment.

Spinward Marches Subsector M: Five Sisters

Originally known to the Imperium as District 267 (see Plankwell/District 268, facing page), this subsector owes its name to the merchant captain Ignaz Ruffleran, who was the first Imperial to explore this area. He found a cluster of five habitable worlds which he laid claim for and named for his daughters: Mirriam (0333), Jone (0433), Ucella (0532), Penelope (0533), and Karin (0534). These five sisters and their sister worlds gave the subsector its name.

The subsector had not been heavily settled through the pre-Collapse era. Serious colonization only began in 740, but was cut short with the start of the Psionic Suppressions in 800, and the frontier wars made it clear that major Imperial development would not be practical in this area. In the antebellum period the Five Sisters were by necessity administered by the defensive umbrella of the Imperial Navy. Since the Collapse and foundation of the Spinward States the Five Sisters have become less of a military outpost, but retain a very strong RQS presence. However, in the new friendly climate between the Zhodani and Domain/Regency, development and migration long-postponed began in earnest in the 1130s, when many flocked to the unexploited worlds of the subsector, concious of the fact that they were on the far side of the Regency from the threat of virus. This expansion continues, with Regency emigrants of a moderately naturist/ecological movement avidly developing such naturally habitable "garden" worlds as Lothlorien (0140), Galadriel (0240), and Prince Edward (0834).

During periods of Imperial-Zhodani hostility the subsector's only connection to the Imperium proper was via the fortified world Flammarion (0930) in the Sword Worlds subsector, see page 45. Although Flammarion remains as its official connector for the XWeb, the prevailing good relations among the Spinward States have permitted extensive contact, especially through the imperial culture worlds of the Plankwell (N) subsector.

Penelope (0533): In the post-Collapse period, Penelope's population has been augmented by Jonkeereen (see page 61). They currently constitute about 12% of the world's population.

Spinward Marches Subsector N: Plankwell (District 268)

The Plankwell subsector was formerly the unnamed Imperial District 268. The Imperium maintained a policy of formally identifying unincorporated subsectors along its border as potential sites for expansion. This identification resulted in their designation as districts; District 268 was therefore the 268th sequentially designated district since the foundation of this policy. District 268 was opened for Imperial development in 941 by decree of the empress Margaret II.

Under this policy, the worlds of a district were not Imperial members but received Imperial protection. Imperial affairs were administered from Glisten (2036) in subsector O, but a token capital was maintained at Mertactor. This office is maintained at Mertactor in order to simplify relations between the Regency proper and the many individual client states in the subsector. Because of the relative safety of the worlds of this subsector, located as they are in a pocket well-protected by the main bulk and frontiers of larger Spinward States (the Zhodani and Regency frontiers to coreward and the Regency and Aslan frontiers to trailing), the protection of these worlds by incorporation into the Regency was not a high priority to the young government, as it was focused on securing its own coreward and trailing borders.

Nonetheless, as a sign of its commitment to the worlds of the subsector, the Regency government renamed District 268 as the Plankwell subsector (for Grand Admiral Olav hault-Plankwell, victor of the First Frontier War and first of the "Barracks Emperors," see **Supplement 11, Library Data (N-Z)**, OP, and the **MegaTraveller Imperial Encyclopedia**, SA) and assigned the 184th Fleet to its defense, newly transferred from the Regency's trailing frontier (Vast Havens subsector, Deneb/P) and headquartered at Mille Falcs (1637).

Even in the antebellum environment of Imperial-Zhodani hostility, District 268 was a much better developed area than might be expected for a nonaligned buffer zone. Much of the reason for this was the presence of a major branch of the Spinward Main (page 42) touching all but two systems of the subsector. In fact, all jump-1 contact with the major world of Glisten (2036, page 50) had to pass through the district, with the result that a vigorous economy had developed over the centuries to support this trade.

Major trade worlds along the jump-1 route included (and still do) Collace (1237), an industrial world specializing in low-cost, high technology trade goods, Forine (1533), an industrial world specializing in exportable electronic components, and Tarkine (1434), and agricultural world that produces a wide variety of exotic spices and plant extracts.

Bowman (1132): The phenomenal size of the Bowman Belt, one of the most extensive ever discovered, cannot really be divined from the UWP listed above. Although the system does contain just one contiguous belt (listed as an asteroid rather than a planetoid belt, as it is the system's inhabited main "world"), another way of encoding the system would be to list it with *four additional* planetoid belts, as the Bowman belt occupies five orbits: 0, 1, 2, 3, and the irregular 3.5 (**TNE** page 195). Orbit 0 contains mostly nickel-iron asteroids, orbits 2, 3, and 3.5 contain primarily carbonaceous and ice asteroids (the latter useful for starship refueling), and orbit 1 is a mix of nickel-iron and carbonaceous.

The only planet in the system is the single gas giant, Bowman Prime, which is accompanied by three large and nine small moons, and a ring system. Epsilon, one of the large moons, contains the remains of a pre-*Maghiz* Darrian outpost (see page 31). One of the small moons, Alpha, is the site the Regency scout base, the community of Garrison, and the system's starport, Garrison Starport.

Ling Standard Products (see page 46) maintains a base in the gas giant's trailing trojan asteroids, established in 853, from which it controls its in-system prospecting and mining operations. (See also adventure module **Beltstrike**, SA.)

Pavabid (1238): This world is ruled by an unorthodox offshoot of the Church of the Stellar Divinity, which believes that each star is a god to be worshipped by the inhabitants of its system. The so-called "Pavabidian Heresy" goes farther, and claims that these star-gods are each enemies of the other, and that a star-god may place part of its divine essence is a person, making this person a "Son of the Star." The ruling Thearchs of Pavabid have naturally all claimed this distinction.

The inhabitants of the world are maintained at TL 6 in an ignorant state, they are not allowed to emigrate, and they may not meet visitors form other "enemy" stars. The Thearch rules from his flying palace, which the populace believes is held in the air by "the hand of god" (actually contra-grav generators; the palace was built at the Glisten shipyards in 874). See **Double Adventure 6: Divine Intervention/Night of Conquest**, SA.

Shvreeyiyi (formerly 567-908) (1031): Homeworld of the intelligent race known as the "Shriekers," the world's name is an approximation of the Shriekers' name for their own world, although since much of their language is beyond the range of human hearing, this approximation is not recognizable to the Shriekers themselves. (For details on the Shriekers, see page 81.)

Although it lies outside of the Regency boundaries, the RISS operates an outpost in the system to maintain contact with this interesting race and protect them from abusive contact like the denuli gem trade.

Talchek (1631): This world contains ruins of a Darrian gas refinery dating to about –1000.

Tarsus (1138): Agricultural world, origianally settled from Fornice from 450-460. World contains two settlements descended from Sword Worlders: one is the low-tech survivors of an oil refinery dating from –104, and the other is the descendants of a Tizonian army regiment, accused of war crimes on Vilis (1119) during the Second Frontier War, and who fled their Imperial-occupied homeworld to escape Imperial war-crimes prosecution after the war.

The Tarsus system is also the site of a pharmaceutical plants owned by the former megacorporation SuSAG, which are used in the manufacture of psi drugs (**TNE** page 258) using *tarsuline*, an extract of a plant fungus that has thus far only been grown on Tarsus. (See also adventure module **Tarsus**, SA.)

Spinward Marches Subsector O: Glisten

Glisten had been considered a backwater subsector until the opening of District 268 (see page 49), when the Glisten subsector became the jumping-off point for the subsector's development and the focal point for its subsequent support. In the years since, Glisten has emerged in its own right as one of the marches' major manufacturing centers, containing three industrial worlds ranging from TL-12 to 15 (Aki, Ffudn, and Glisten).

Glisten is defended by the 100th Fleet, headquartered at Glisten itself, and its small frontier is included in Quarantine District 7, which begins at the Glisten-Pax Rulin border (Trojan Reach/C, page 66) and runs core-spinward into the rimward end of the Vilis subsector (F, page 41). The 100th Fleet was established in 1108 during the Fifth Frontier War and pushed invading Sword Worlds forces from the Lanth subsector within a year.

The Glisten and Trin's Shroud (facing page) subsectors were particularly hard-hit by the *ihatei* invasions and contain a number of *fait accompli* worlds (see pages 10, 26, and 78).

Aki (2035): The world's Aslan population dates to an *ihatei* invasion in 1117 (recounted in *TD* 14). Aki was anotherte of bloody and brutal Aslan-human fighting during the Civil War-era. After over a year of unwelcome Aslan rule, in mid-1119, during one of Aki's 87-hour nights, humans of the local Kritin faction, led by Tyrar "Trooper" McTavish took over the Aslan government compound and slaughtered the world's leaders. The downtrodden humans held the compound for five days before it was retaken by the Aslan. In a wave a bloody reprisals, the Aslan slaughtered many humans (including McTavish and his followers) for their "dishonorable" behavior. However, the takeover was not in vain, as its shock delayed further Aslan advances from this world, buying time for human worlds all through the Domain's threatened areas. When news of the short revolt became public, McTavish and all the people of Aki became heroes among the *ihatei*-threatened Domain. (See **Survival Margin** page 22.)

Bendor (2336): The Bendor shipyards are a major producer of Aslan-designed spacecraft such as the *Trekhyair*-type quarantine cutters (see pages 27 and 91).

Callia (1836): 25% of this world's population is Jonkeereen (see page 61).

Egypt (1737): Egypt used to the home of the Domain's Imperial Ministry of Colonization training base, but this facility fell into disuse for obvious reasons following the Collapse. Indeed, the Regency no longer maintains a Ministry of Colonization, this Ministry having been merged with the Ministry of Conservation in 1135 as the Regency's Ministry of the Interior.

The MoI base at Egypt is involved in determining the best means to utilize the worlds of the Regency, and is involved in studies on the suitability of Jonkeereen (page 61) to various marginal worlds, as well as training participants of settlement programs targetted for the Regency's underused worlds. (For important details on world survey and acclimatization to new environments, see **World Tamers Handbook** pages 11-17, 20-24, and 36.)

With the impending opening of the Regency frontier (see pages 13 and 20-21), MoI's Egypt base is undergoing a renaissance of attention, and it is likely that the colonization mission will be removed from the MoI and once more established as a separate concern.

Glisten (2036): Not a world, but rather a large number of settlements in one of two belts orbiting the star Gliss (named for the systems 10th settlement, "Gliss Ten," eventually shortened to the current name). Glisten is one of the major high-tech industrial centers of the marches, and consists of a number of separate asteroid cities, most of which specialize in a particular industry or social role. The Glisten Belt, although not as extensive in area as some belt systems, has the most aggregate mass of the belts in the Spinward Marches. Glisten was the site of extensive ihatei intrusion, but unlike many such systems, the Aslan presence was completely rooted out.

Glisten City (a group of five asteroids linked into a tetrahedron) is the system's business and governmental center, the Pluvis group is the site center of starship manufacture and home of the famous Bilstein shipyards, Therak and Erom conduct most of the belt's mining and mineral refining, while heavy industryis concentrated in the Mistar and Namdet groups and Erom. Light industry is concentrated on Alea and the Warem and Thacen groups, and agricultural production (Glisten is agriculturally self-sustaining) is conducted in Alea, Ensu, and the Thacen and Vedfor groups. Among the more specialized asteroid cities are the diplomatic and trade center at Gro'un, the tourism center at Chun, and the "artist's colony" of Ensu. (See also *TD* 15).

Glisten Institute of Planetological Studies: Located on Was-hin, an asteroid orbiting near Glisten City (see "Glisten," above), "GLIPS" is one of the leading educational institutions in the Regency. Established in 630, it trains its students in the broad discipline of planetology (including the skills Biology, Chemistry, Farming, Geology, and Meteorology) conducts studies on terraforming and the introduction of new or geneered lifeforms into new environments, and maintains close ties with the RISS (see page 81), for which it is a major contracted research arm, and site for advanced training. Its student body is close to one million, with almost 50,000 faculty and researchers. The GLIPS facility includes over one hundred sample ecologies for study, each housed in its own separate asteroid.

Marastan (2231): Marastan was an Imperial reserve world, and is maintained as such by the Regency. Different reserve worlds served different purposes (see, for example, Aosta, Deneb 0332, page 64), and Marastan preserved and displayed examples of flora and fauna collected by Imperial Interstellar Scout Service (IISS) in its pre-Collapse explorations. Because of the irreplaceable value of this collection, research on this world is allowed only to accredited academics.

Marastan has also become the home of an enclave of K'kree, the descendants of a trade and diplomatic mission stranded in the Domain by the Civil War. They live on the world's open

plains and adhere to the environmental restrictions of the world. This sizeable population is the cause of a small but significant economy in the subsector catering to the unique needs of these militant herbivores.

Mellor (1736): 55% of the world's population is Jonkeereen (page 61).

Mining School of Glisten: Located in the Glisten Belt (2036), this institution trains its students in all aspects of asteroid mining: prospecting, mining techniques, and the management of large-scale mining operations. It was established and continues to be maintained by large endowments from the large mining corporations of the Glisten Belt.

Mithras (1932): Mithras was an Imperial exile prison, considered to be a shining example of criminal rehabilitation, unlike prison worlds like Torment (SM 0721, page 44) and Exile (Deneb 1928, page 62), where the prisoners are free to create whatever hellish worlds they like, so long as they are safely out of mainstream society.

Convicts sent to Mithras begin life anew in the Mithran wilderness, but the opportunities for self-discipline and self-improvement, and periodic review of their sentences (Mithras is not a life sentence world) allows these convicts to turn themselves around. Indeed, rehabilitated Mithrans were a major source of IISS and Ministry of Colonization recruits during the Imperial era.

Romar (2140): Source of the "dust spice" popular among the Aslan, a major cause of Aslan trans-rift colonization after 380 (see timeline, page 25).

Spinward Marches Subsector P: Trin's Shroud

This subsector, formerly named Trin's Veil in reference to the highly reflective debris cloud (ancient remains of a shattered moon) around that world, was renamed to remember the billions killed in the Rape of Trin (see page 80).

Trin's Shroud is home to the 207th Fleet, headquartered at Katarulu (3032).

Katarulu (3032): Formerly home to the training center for IISS Xboat pilots, this center has been expanded to the headquarters of the Regency Flight School, serving the RISS and RQS, see below.

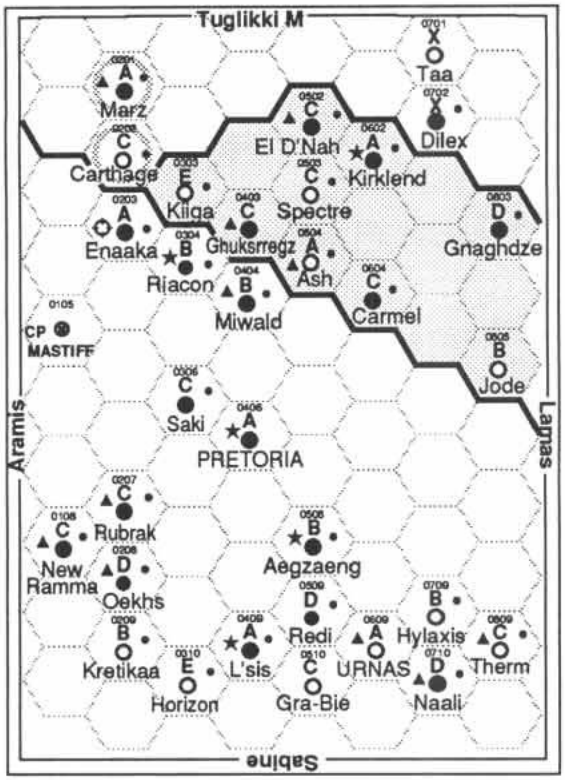
Prilissa (3035): Prilissa is the world of origin of the kian, a widely-used riding beast and beast of burden. In the years since its discovery early in the settlement of the Spinward Marches it was distributed throughout the Imperium. Although never so common as the Terran horse and its relatives, kian are a familiar sight on human-habitable worlds throughout former Imperial territory, and were used on Capital as ceremonial mounts for the Household Cavalry Regiment of the Imperial Guard.

Kian are bipedal, furred, long-necked, herbivorous grazers. They are quite hardy, with excellent eyesight and hearing, and are easily able to carry a fully-equipped human at high speeds. Their thick fur and subcutaneous fat makes them highly immune to parasites, and quite amenable to cold environments. Their colors include brown, gold, yellow and black. In appearance, they look like mammalian versions of Terran flightless birds such as the ostrich, emu, or moa, with features reminiscent of giraffes and antelope, and a luxuriant brushlike tail. (See also **JTAS 9**, OP, **Best of the Journal 3**, OP, *TD 9*, and **Striker II**.)

Regency Flight School: Located on Katarulu (3032), this school was originally the IISS Xboat pilot training school for the Spinward Marches. With the expansion of the Domain Xboat network following the Collapse the school was expanded dramatically to handle the influx of new Xboat pilots as well as to train and recertify flight crews for with fledgling RQS.

The RFS is now the owning command for all government pilot training in the Regency, establishing doctrine and training standards used by all Regency flight training facilities, just as the Jumpspace Institute (see page 62) oversees and regulates the technical and engineering side of the starflight industry.

Robin (2637): Robin was originally a corporate-managed mining enterprise, owned by Mora Metals, LIC. However, miners dissatisfied with working conditions successfully rebelled against the corporation, taking over the system's equipment and facilities. Robin was the site of brutal Aslan *ihatei* attacks during the Civil War (see page 22, Survival Margin). Continued hard feelings account for the Amber Zone.



Thisbe (2539): This marginal world has for a number of years been the object of a terraforming program, initially under the auspices of the Imperial Ministry of Conservation.

Thisbe is currently preparing to host the 1204 Imperial Poetry Convocation. The honor of hosting this quadrennial event is due to the fact that Thisbe is one of the few worlds whose name honors a poetic work, in this case a piece by the Terran poet Philip Larkin (–3796- –3733, IC).

Trin (3235): The story of the Rape of Trin is told more fully on page 80. Note that Trin still retains its naval base. This is because Trin was the site of a naval inactive ship facility, where hundreds of decommissioned spacecraft were stored against possible future need. The Trin NavInacShipFac, as it was known, was located in far orbit around Trin, and included the system's naval base. This base itself was severely damaged by *Kishkil*, but the extent of the reserve fleet and subsidiary facilities was so vast that damage to the installation as a whole was relatively minor. It was cheaper to rebuild or replace the destroyed portions of the base that it would have been to reactivate and move the entire reserve fleet to a new location. However, many of the naval activities located on Trin, such as the headquarters of the subsector fleet (the 207th) had to be moved off world due to the annihilation of the dirtside facilities.

Trin's Shroud Subsector, 1117 and 1202 dual listing (Subsector P of Spinward Marches Sector)

DENEB

Deneb was not seriously settled by either of the first two human empires (the Vilani First Imperium or Ziru Sirka and the Solomani-run Second Imperium/Rule of Man/Ramshackle Empire, which was really nothing more than the First Empire taken over from Vilani control—for further details see the **MegaTraveller Imperial Encyclopedia**, SA); this had to wait until the early years of the vigorous Third Imperium when explorers of the new Imperial Interstellar Scout Service pushed beyond the known frontiers of Corridor Sector and found many readily exploitable worlds.

The Zhodani name for Deneb Sector is *Nieklsdia*.

Deneb Subsector A: Pretoria

The Pretoria subsector is patrolled by the 194th Fleet, which maintains its headquarters at Pretoria (0406). Pretoria's frontier is part of two quarantine districts, RQD 2 which enters Pretoria from spinward and extends to Enaaka (0203). This represents the trailing terminus of the Vargr interface that runs along the coreward edge of the Spinward Marches. RQD 3 begins immediately to trailing of Enaaka, and is the core-spinward beginning of the Regency Frontier that runs trailing and rimward all the way around the Regency to the Trojan Reach. RQD 3 encompasses the frontier shaded in gray in the map above, as well as the worlds on the edge of the safe immediately to its rear.

Enaaka (0203): This hot, humid world is perpetually overcast and has an ecosystem completely dominated by fungus, whose varieties number hundreds of times more than most other worlds. For example, rather than the photosynthetic plantlike forms common on most worlds, Enaaka's surface is covered by tall, treelike mushrooms and spongy fungal carpets for ground cover. While photosynthetic plants do exist, they are low on the ecological pyramid, such as marine algae, etc.

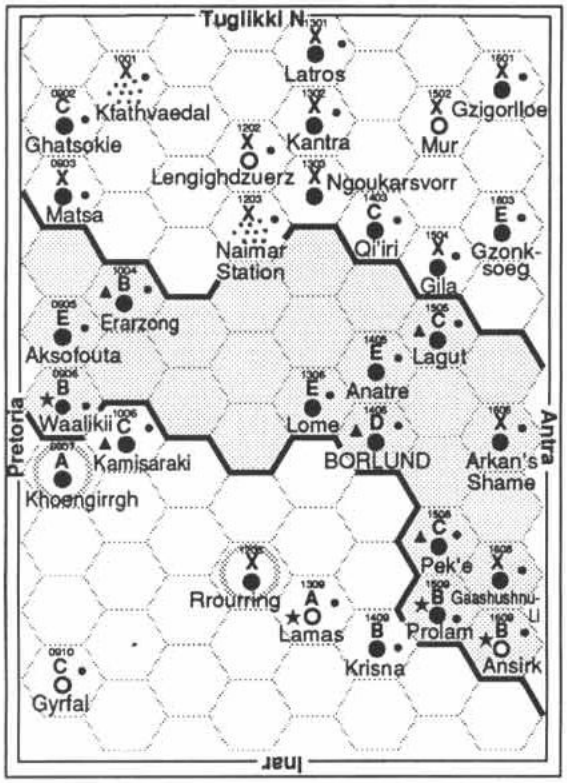
The wide variety of exotic fungi provides the basis of Enaaka's economy, being exported for pharmacological and exotic food markets, but they also provide a constant danger to its human inhabitants. Anyone directly breathing the Enaakan atmosphere is liable to catch a fungal infection in the lungs, and exposed skin is susceptible to a bewildering variety of topical infections (see **World Tamers Handbook**, pages 24-25 for discussion of diseases in TNE and examples of diseases upon which others can be based).

There are no native terrestrial lifeforms more advanced than insects, and almost all such lifeforms exist in a symbiotic relationship with the dominant fungal ecology, which of course means that their bites will often cause fungal infections within the circulatory system. (See *MTJ* 1 for further details.)

L'sis (0409): Although largely untouched by Vargr incursions during the Civil War, L'sis later became a site of significant Vargr refugee camps.

Rachele Society: Genocidal secret society founded by Zid Rachele (963-1103?) on Pretoria (0406) in 992. The Rachele Society was a Vilani supremacist group (in itself an odd notion) dedicated to the creation of a Vilani "Fourth Imperium" and the extermination of the non-Vilani human races. It was responsible for the Rachelean Revolts of 1010-1011 in which the Society briefly took control of portions of Pretoria and Saki (0306, see below). The revolt was unsuccessful, and Rachele was sentenced to the prison world Exile (Deneb 1928, page 62). He escaped in 1015, and was presumed dead until 1103 when the Society, under his leadership, attempted to steal 22 large warships from the Imperial Navy Depot at Dynam (Lishun 1219). This attempt, in cooperation with Vargr corsairs, was found out and defeated, and Rachele's ship destroyed. (See also the **MegaTraveller Imperial Encyclopedia**, SA, and *TD* 7.)

Redi (0509): As part of the Regency accommodations of 1132, the Vargr occupiers of Redi were given control of the world. This was a particularly good prize for the Vargr because of the Ancient site on the world. Government sources state that nothing in the site could be used as a weapon against the Regency. Nevertheless, the Vargr have closed the site to the public.



Saki (0306): Saki was the site of an Imperial scout base until the Rachelean Revolts of 1010-1011, during which the base was destroyed by a nuclear explosion as part of a failed blackmail attempt by the Rachele Society (which see, above). 26,000 people were killed, including 1900 Rachelean commandos. The base was never rebuilt.

Deneb Subsector B: Lamas

The Lamas subsector is defended by the 315th Fleet, headquartered at Lamas (1309). The 315th fought in the Fifth Frontier War as the 1st Fleet, defending the intersection of the Jewell (B), Regina (C), Vilis (F), and Lanth (G) subsectors. With the

realignment of the Imperial fleets in the early 1110s, the 1st Fleet's designation was reassigned to the fleet assigned to the Core subsector (Core/G), and the former 1st Fleet became the 315th. Since the end of the Fifth Frontier War, the 1st/315th was rotated into Deneb in order to allow pride of place to go to those fleets that retained their historic wartime designations.

The Regency Frontier in the Lamas subsector is part of Regency Quarantine District 3, with its capital at Antra (1808, page 54).

Ansirk (1609): Ansirk's very small population supports little more than the starport and the naval operations in the system. The world of Ansirk orbits one of the system's two gas giants, and contains a huge store of refined fuel, skimmed from the nearby gas giant. The Ansirk system is used by the Navy for large-scale fleet maneuvers in conjunction with the Regency Naval War College (at Depot/Macene, SM 2612, page 43). Although its location in the Wilds already makes it an Amber Zone, it is specifically listed as an Amber Zone because the Navy often conducts live-fire exercises in the system, now possible because of its position outside of the Regency safe. Reserve squadrons frequently deploy to the Ansirk system for refresher training, and the 55th Fleet (see page 56) often conducts maneuvers here.

Arkan's Shame (formerly Yef) (1606): This world was originally named Yef. It is located in the Regency Frontier and was largely depopulated by the Abandonment by the time Fleet Admiral Arthur Arkan arrived on the world. Arkan was the commander of the task force that formed the last line of defense against the *Kishkii* vampire fleet as it drove on toward Trin (see "Rape of Trin," page 80). The valiant efforts of Task Force Alpha destroyed all ships in the fleet except *Kishkii*, incurring tremendous losses of ships and personnel. Arkan blamed himself for the escape of *Kishkii* and the subsequent loss of life on Trin. He resigned his commission and drifted to Yef, and later declined to catch the last ship out. Travellers who stop by the world report that he is still living there, but has been driven quite mad by his guilt and the "ghosts" of Trin.

Gaashushnu Lil Mur (1608): Name means "Valley of the Living Dead Ones;" the world underwent a global nuclear war in 815, and the 1117 population were the descendants of those survivors who refused evacuation. This heart-breakingly mutated society eventually died out in the post-Collapse period.

Ghatsokie (0902): Homeworld of the Crenduthaar, a hexapodal sapient race. The Crenduthaar have a fearsome appearance completely out of keeping with their natures; they are large for sapients, 2.5 meters in length and massing 500 kg, and have a reptilian, draconic appearance, studded with scales, sharp teeth, and razor-sharp slashing limbs. However, the Crenduthaar have become vegetarians, as the beasts they used to prey on are long since extinct.

Of their three pairs of limbs, the rearmost is for locomotion, the frontmost is for manipulation and contains the "slashers," and the middle pair can be used as legs or manipulative arms, as the Crenduthaar are comfortable in a bipedal stance. However, their typical social stance is quadrupedal with their slashers safely folded, making them highly reminiscent of the Terran praying mantis.

Adding to their fearsome appearance and size is their tendency to yell in loud, deep, booming voices. This is because their hearing is adapted to dense atmospheres, and in thinner atmospheres they cannot hear very well, and must compensate by speaking louder.

Despite their looks, the Crenduthaar are friendly, nonviolent, and extremely talkative. They take great joy in travel and learning, and delight in talking with others about all the wonders they have experienced. They are quite intelligent, and never tire of philosophy and other intellectual-spiritual pursuits. However, they find no real need for technology, and are completely happy with their own static TL 0 culture. They know how to use tools, but left to their own devices, find no attraction in technological advancement. (See also *MTJ* 3.)

The Crenduthaar name for the world is Thaar, or "wide place." The name Ghatsokie is the Vargr name for the world. The antebellum Vargr population, followers of a Vargr religion known as "The Followers of Auugh," were augmented by Vargr raiders, corsairs, and opportunists during the Civil War, and the world is now dominated by a non-spiritual Vargr government.

Of Ghatsokie's 400 million population, 30 million are the Vargr rulers (who enslave and "domesticate" the Crenduthaar), and the remainder are Crenduthaar. The world's tech level refers only to the Vargr, Crenduthaar society is TL 0.

Waalikii (0906): When the Regency established its borders, the people of Waalikii found themselves in the Frontier. Subsequently, over 85% of the population moved to Waalikii's colony world of Kamisaraki (1006). In 1135 the government was moved to Kamisaraki because the vast majority of its subjects now live on that world. The government of Kamisaraki claims ownership of Waalikii, although it is seldom visited.

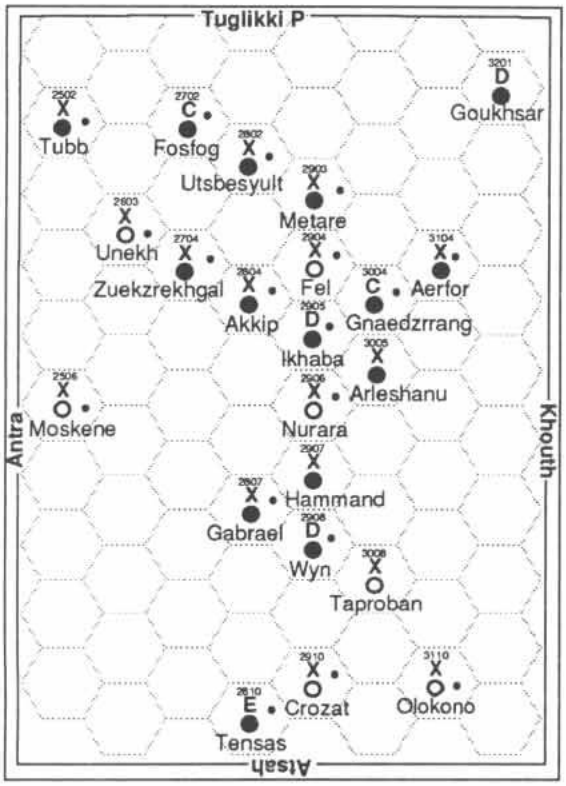
Deneb Subsector C: Antra

The Antra subsector is severely reduced from its antebellum extent; the subsector contains no worlds in the Regency safe area, and well over half of the subsector's worlds lie outside of the Frontier as well, in the Wilds.

Antra subsector is defended by the 61st Fleet, which was pulled back from its previous station in the Million subsector (Deneb/D). The 151st Fleet, which had formerly defended Antra, was sent spinward to cover the new Regency territories in the Sword Worlds subsector (Spinward Marches/J, page 45). The 61st is headquartered at Uramid (1910), within the Frontier itself. Uramid possesses the only naval base in the subsector.

The Antra frontier is part of Regency Quarantine District 3, which runs from the beginning of the frontier in Pretoria subsector (Deneb/A, page 52) to the border between the Antra and Namidshur (G) subsectors in the three-world line of Orenberg, Diiski (2011 and 2111, page 58), and Mazirbe (2210, this page). Note that these three worlds, being the boundary between RQD 3 and 4 are considered to be in *both* quarantine districts. This overlap is to prevent gaps from occurring on the seams between districts where the forces of each side assume that certain threats are within the neighboring district's area of responsibility.



Antra (1808): Antra is the frontier capital of Regency Frontier worlds in Quarantine District 3 (i.e., the Frontier areas in Deneb subsectors A, B, and C, plus two worlds, Orenberg and Diiski, see above, in subsector G).

Malory (2309): Malory had been a Jonkeereen world (see page 61), but with the collapse of even its relatively low technology (TL 6), the Jonkeereen's adaptations to an arid environment did not preserve them in an airless environment. Those that were not evacuated as the world's infrastructure deteriorated simply died, the same as any non-geneered human would have.

A test program is currently underway on Nadrin (SM 3123, page 47) to evaluate the usefulness of the Jonkeereen adaptations to environments with trace atmospheres, which are possessed by the majority of worlds classed as "desert" by their trade classification. It is now privately believed among members of the Regency government that the Imperial Ministry of Colonization's Jonkeereen project, 500 years in the making, was an expensive failure, born of the swaggering self confidence of many geneering advocates. However, the expense is not in financial terms, but rather in the human cost: by creating a new race of humans which are psychologically and culturally isolated from the remainder of humanity, but which do not have a significantly different environmental niche, all that has been accomplished is to create a new occasion for racial strife and

Adventure Hooks

When fleshing out the details of worlds, pay attention to the changes listed between 1117 and 1202. These tiny little variations in digits are all that a miserable little UWP can do to reflect the changes of 85 years of history. Think of what Earth was like in 1910, and try to count all of the changes, revolutions, wars, and social upheavals that have taken place since then. Each of the 981 worlds in RSB has had this much more history added to it by the New Era. Some of these changes will be long over, but their effects will live on into 1202 in the form of social inequalities, resentments, or unfinished business like, say, the period between 1918 and 1939.

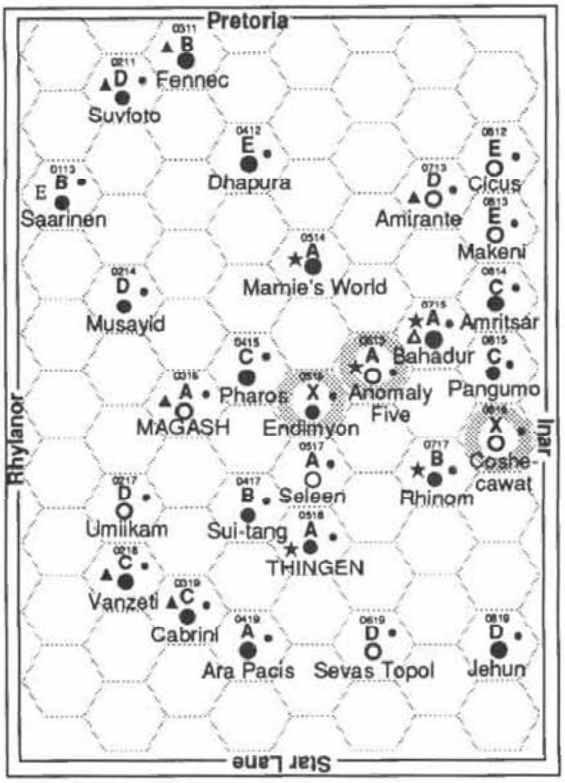
unhappiness. Relations between "normal" humans and Jonkeereen on worlds where both exist in numbers are strained at best, and because unmodified humans have found ways to exist in deserts for millenia, the need for this new source of human misery is hardly justified.

Note that both organizations merged to create the Regency's Ministry of the Interior (MoI), the former Imperial Ministries of Conservation and Colonization, were engaged in geneering projects, of which the Jonkeereen project was perhaps the most needless. However, the MoI is not engaged in geneering programs. Instead, it concentrates on using existing human, technological, and planetary assets in the most effective and beneficial possible manner. To this end, they are engaged in projects such as that on Nadrin.

Deneb Subsector D: Million

The Million subsector is completely outside of the Regency, not even the Regency Frontier extends into this subsector. However, it is patrolled by squadrons of the 61st and 125th Fleets, based respectively in the neighboring Antra and Namidshur subsectors (Deneb/C, facing page, and Deneb/G, page 58).



Utsbesyult (formerly 495-524) (2802): As the Collapse caused disorganization among the Vargr rulers of this world, the Droyne population staged an uprising and gained control of the world. Some isolated bands of Vargr remain on the world, which the Droyne have renamed Utsbesyult, but they are not considered citizens.

The Imperial Calender

The imperial calendar is a simple chronological numbering of days in a 365-day year from 001 to 365. It contains no months, although days are divided into the traditional seven-day weeks. In order to allow an integer-number of weeks, one day a year is set outside of the week structure (52x7=364, leaving one day left over). This day is called Holiday, and is the first day of the year, 001.

Imperial convention assigns simple names to each day of the week: Wonday, Tuday, Thirday, Fourday, Fiday, Sixday, and Senday. The standard abbreviations for these days (1dy, 2dy, 3dy, 4dy, 5dy, 6dy, 7dy) show their derivation. Holiday (Hdy) is a unique day, occuring only once a year, and does not fall in any week.

Because the imperial calender consists of an integral number of weeks, there is no slippage between date and day of the week. In other words, day 008 of any given year will always fall on Senday. Incidentally, this means that there is no imperial concept comparable to "*Friday* the 13th," as 013 falls on Fiday every year.

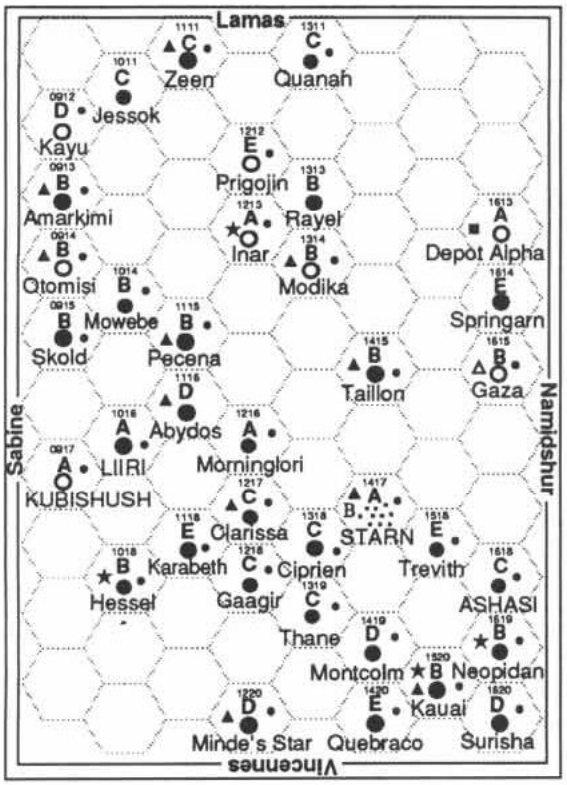
Deneb Subsector E: Sabine

Deneb contains no astrographic features comparable to the great Spinward Main in the neighboring Spinward Marches (see page 42). The largest main in Deneb is Sabinar Main, named by combining the names of the two subsectors that it connects. The Sabinar Main connects 40 worlds by a contiguous jump-1 route, and all but one of these worlds fall into either the Sabine or Inar subsectors (the one exception is the trailing-most world of the main, Polizzi [1719], in the Namidshur subsector, page 58).

Defended by the 195th Fleet headquartered at Bahadur (0715), Sabine is also home to the Regency's trailing swing fleet, the 55th Fleet, based at Marnie's World (0514). (See the Lanth subsector, page 42, for details of the spinward swing fleet.)

Anomaly Five (0615): This world was first explored by the IISS in the early 400s, when it was discovered that the world contained enormous mass concentrations far beneath its surface. Despite almost 800 years of study, scientists still cannot explain these concentrations, but speculation involves some artifacts of the Ancients as well as deposits of superheavy elements (which see, below). The system was interdicted in 690, and remains so to this day. The world is naturally the subject of ongoing study.

Superheavy Elements: These are extremely rare elements with atomic numbers ranging from 114 to 122. Although elements heavier than uranium (atomic number 92) are typically highly unstable, rapidly decaying to lighter elements, quantum theory predicts an "island" of stability between atomic numbers 114 and 122, with half-lives in the millions of years. Like all heavier elements, these would be produced in the hearts of stars, and only distributed in supernovae. Nonetheless, small samples of such elements have been analyzed, and it is clear that their unique qualities would make them extremely valuable, and would be likely to enable numerous technological breakthroughs not possible with commonly available materials, just as the rare earth metal lanthanum is indispensable for the manufacture of jump drives.



Superheavy elements are also known as eka-metals or island metals.

Deneb Subsector F: Inar

The Inar subsector is home to the 257th Fleet, which maintains its headquarters at Inar (1213).

Depot Alpha (1613): Formerly Deneb's only naval depot, the Depot system became Depot Alpha with the establishment of Depot Beta in the Pashus system (1432, page 65). The actual name of the world itself is Sika'im, but following Imperial convention the system as a whole is named Depot, for the crucial facility located there.

Kauai (1520): As Kauai's population increased its leadership began long-range programs to make the world more attractive to interstellar trade and immigration. This was necessary in particular to make them more competitive with Bumushe (1522) in the neighboring Vincennes subsector (page 61). These programs included the transition to a more inclusive government and less restrictive code of

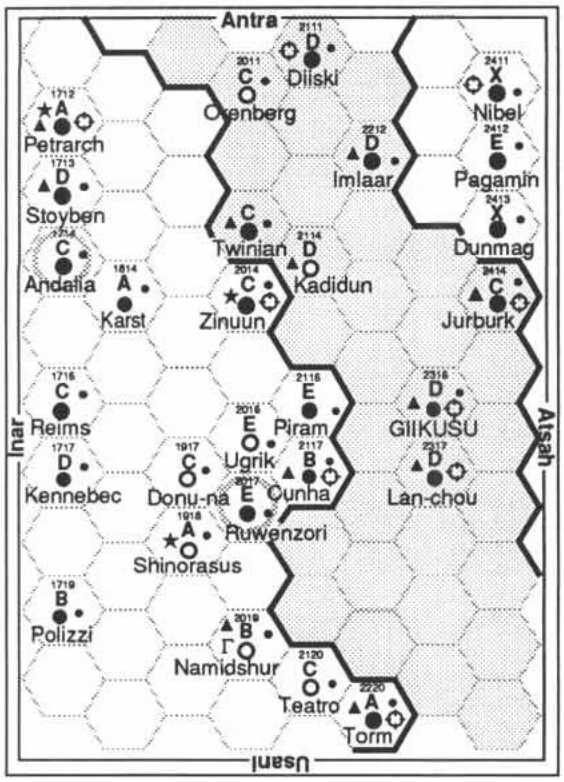
laws. As a result Kauai is now classed as a Rich world.

Kubishush (0917): Homeworld of the Gl'lu, Kubishush has ammonia oceans and a very dense atmosphere, composed primarily of nitrogen at 6.1 atmospheres of pressure (6.1 kg/cm²).

The Gl'lu are a barrel-shaped hermaphroditic race with seven limbs (three legs and four arms), three stalk-mounted eyes, and which respire the ammonia vapor in their thick nitrogen "air."

The world is subject to frequent geological upheavals, which complicates the Gl'lu's attempts to maintain a stable society. Fortunately they are excellent technicians, as is witnessed by their tech level. Despite their technology, they are not distributed in great numbers off of their homeworld because of their adaptations to their very unusual environment.

The Vargr inhabitants are remnants of particularly far-ranging raiders during the Civil War. The Regency is little concerned about evicting them from Kubishush, as leaving them stuck on such an inhospitable world seems to be the best revenge, and serves as a living example that crime, indeed, does not pay.



Minde's Star (1220): This system is actually named for its star, rather than the main world. Minde's star is an extremely variable red flare star which has been observed to vary in brightness by a factor of 60 in as little as 30 seconds, making it unique within Charted Space. The system therefore is given over entirely to the study of this fascinating phenomenon, hence the system's name.

Morninglori (1216): Morninglori had been the site of a secret Psionics Institute. The institute, located in the home of a Dr. Edmond Kalavatos, was destroyed during the Psionics Suppressions (see the **MegaTraveller Imperial Encyclopedia**, SA) and all of its members were killed. An heir to the Kalavatos estate turned up in the early Civil War period, leading many locals at the time to speculate that important items remained undestroyed in the old institute (see *TD* 19).

Rayel (1313): Rayel has six moons, more than any non-gas giant world in the Imperium. These moons create complex tidal patterns in Rayel's oceans as well as in its desert sands.

Deneb Subsector G: Namidshur (formerly Dunmag)

With the abandonment of the subsector capital at Dunmag, a new capital was established at Namidshur (2019). The subsector was renamed for its new capital, a tradition which is often observed, though not always.

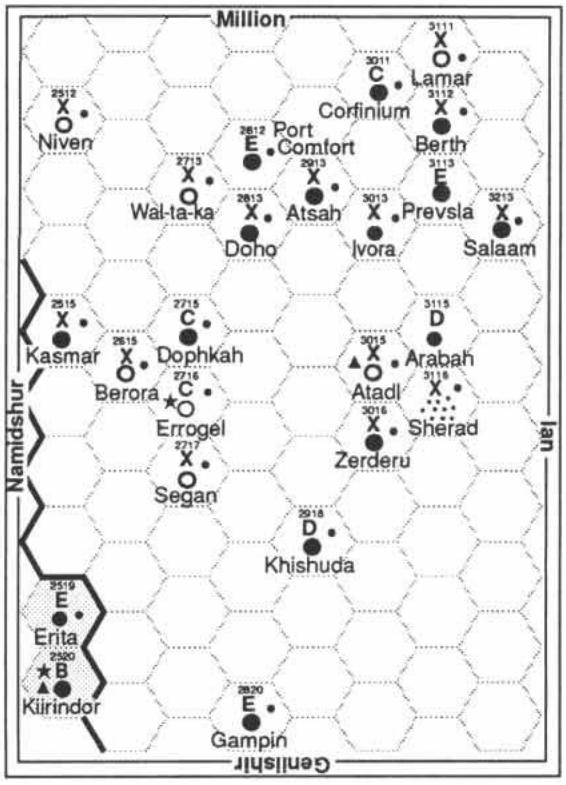
The Namidshur subsector is defended by the 125th Fleet, which maintains its headquarters at Shinorasus (1918). The 125th fought in the Fifth Frontier War, being the longest continuously engaged Imperial unit. It was cut off early on by Zhodani advances, and spent the war under siege in the Jewell system (SM 1106, page 37) until its breakout in 1110.

The Namidshur frontier is part of the 3rd and 4th Regency Quarantine Districts. RQD 3 runs rimward from the Antra subsector (Deneb/C, page 54) into Namidshur and terminates at Orenberg (2011) and Diiski (2111). These worlds are also part of RQD 4, as the districts overlap to prevent perceived gaps in areas of responsibility (AoRs). RQD 4 runs from these worlds rimward into the Usani subsector (Deneb/K, page 62). RQD 3 is defended by the 61st Fleet and RQD 4 is defended by the 183rd Fleet.

Diiski (2111): Although it is located in the Regency Frontier, the small population of Diiski elected not to take part in the Abandonment (see page 11). Reasoning that a hospitable world would support them even if technology failed, they made their technology as safe as possible and continued living on their world.

Giikusu (2316): Giikusu, a frontier world, lost a lot of population during the Abandonment (page 11), although it remains a high-population world.

Kadidun (2114): Kadidun gained population and organization from refugees fleeing Giikusu during the Abandonment (see page 11).



Namidshur (2019): New subsector capital after former capital, Dunmag (2413) wound up in the Regency Frontier. Namidshur also was the recipient of other circumstance-dictated largesse in the form of Deneb Sector's Research Station Gamma (G) which was relocated from Maelstrom (2522, page 63) after it too would up in the less secure frontier.

This world's law level does not reflect the need for repressive measures to keep a restive population in line, as is often the case. The world simply requires a great deal of care to keep its population alive on a small and very inhospitable world. Those who live there affirm the structured nature of its society and usually embrace the pacifistic ethic that goes with the world's general prohibition of weapons.

Shinorasus (1918): This world was colonized by a small group of families from Namidshur who were fed up with the world's structure and law level, seeking, as do many colonists, a place where they could simply be left alone to do whatever they please. However, unlike many colonists, these were not members of a repressed lower class with nothing but the clothes on their backs, but were wealthy, skilled professionals who built Shinorasus as a libertarian paradise. In a dramatic statement typical of the world's residents, the world's capital, St. Volle, has no permanent inhabitants. It is intermittently manned by members of the populace on a rotating schedule. Those who "have the duty" oversee the world's automated archives and function as the world's Secretary of State to all ships which call during that period. However, the full title is Lord High Governor, Shinorasan Plenipotentiary, and Grand Pooh-bah, and most Shinorasans on duty demand their visitors to use the full title at every opportunity.

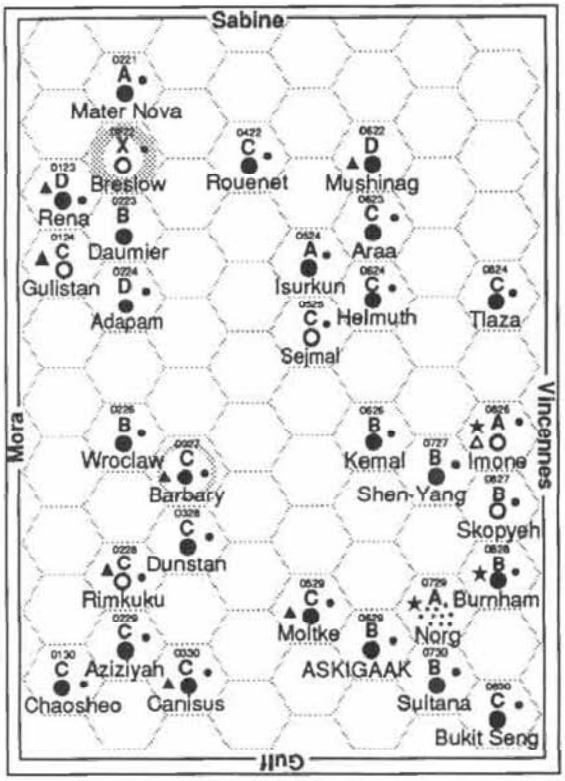
The high Shinorasan tech level allows them to liberate all of the oxygen that they need from the world's crust, which they pipe into their sealed environments. The world is known for its very high quality and extremely high-priced shipyard, as all components are specially crafted by the small population. Those who contract for ships at the prestigious St. Volle yards are widely thought to have more money than sense.

Unfortunately for the colorful and cantankerous Shinorasans, their uninterrupted paradise became another casualty of the Collapse: Shinorasus' location and (albeit small) high-technology infrastructure made it the site of a new naval base to defend the Regency Frontier. Although the Shinorasans protested the intrusion, the Regency exercised its right of eminent domain and built the base anyway, although they do what they can to stay out of the locals' way, and especially do not avail themselves of the over-priced starship maintenance services, using the naval yards instead.

Deneb Subsector H: Atsah

The Atsah subsector lies almost entirely outside of the Regency's area of protection—only two of the subsector's worlds, Erita (2519) and Kiirindor (2520) remain even in the Regency Frontier. The remainder of the subsector is Wilds.



These two worlds are incorporated into Quarantine District 4, whose capital is at Usani (2225, page 62) in the Usani subsector (Deneb/K). As part of RQD 4, these worlds are defended by the 183rd Fleet, also headquartered at Usani (2225, page 62).

Kiirindor (2520): This world was colonized from Erita (2519) and obtained its independence in 1125. The atmospheric taint is carbon dioxide, which makes the world pleasantly warm, although the thin atmosphere is difficult to breathe. Kiirindor is known as the "Glass House World," because virtually its entire population lives in glass-roofed homes all of which are literally arboreta or greenhouses in order to convert as much carbon dioxide as possible into oxygen. Most homes are therefore self-sufficient in foodstuffs, and produce enough surplus that each home is a small truck farm.

With the world's vulnerability ("people in glass houses..."), it was hard-hit by the Abandonment (see page 11), losing about two-thirds of its population by 1136. (Ironically, a very large number of Kiirindorians found their ultimate homes in the Sword Worlds resettlement program, see page 45, which in retrospect could be said to be like jumping out of the frying pan and into the fire.) Those who remained on Kiirindor either trusted in the protection of the Regency Navy and Quarantine Service, added robust compartmentalization to their homes, or, in most cases, both.

Segan (2717): The underground cities of this world were fitted with with completely independent, closed ecologies, and it was this fact which saved many inhabitants when Virus hit the already decimated, embattled trailing edge of Deneb. Most of the world sought safety within the Regency safe. Those few remaining are surface-living desert dwellers, including Jonkeereen (page 61), which comprise some 40% of the population.

Port Comfort (ex-Og Bere') (2812): The world of Og Bere' was depopulated during the Collapse. Later Free Traders came across this rather pleasant world and eventually made it a safe base of operations. These traders also cautiously welcomed Vargr corsairs as kindred spirits. Each ship's crew has its own "tribe" of maintenance personnel and dependants on this world.

Deneb Subsector I: Star Lane

The Star Lane subsector is defended by the 196th Fleet, *headquartered at Imone (0826).*

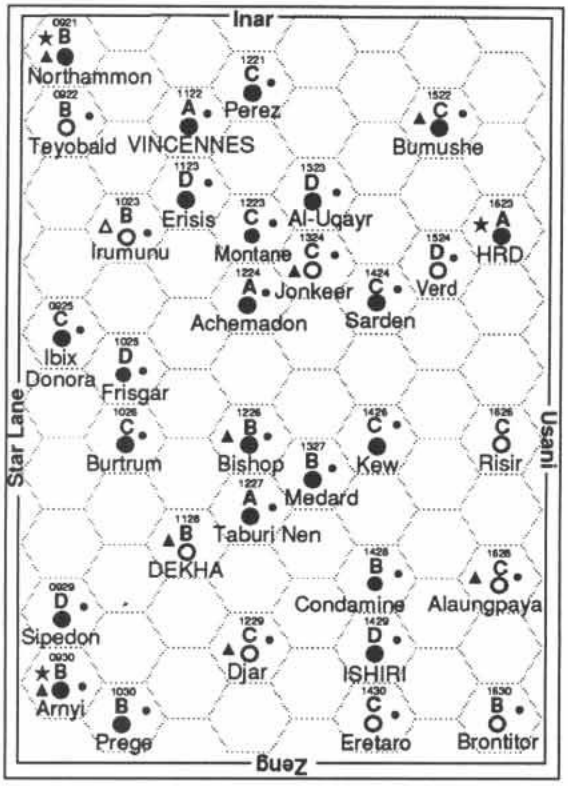
Askigaak (0629): Askigaak is the most highly populous world in the Regency, with over *100 billion* persons. Such worlds were exceedingly rare anywhere in Charted Space, even before the Collapse. Askigaak, as a small world with a thin atmosphere can only support such a population with massive technological support.

Chaosheo (0130): Home to the sapient race known as the Shi'awei. The Shi'awei are unusual in that they have evolved for life in the deepest ocean, in a light-independent ecology. Rather than using stellar energy to fuel photosynthesis, as in typical plant-based ecologies, the Shi'awei's ecosystem is based on chemosynthesis: the metabolism and derivation of energy from the chemicals (especially hydrogen sulfide) in the very hot, mineral-rich water that is expelled from the geothermal vents in their seafloor habitat. This ready availability of minerals and high temperatures has allowed the Shi'awei to achieve skills in metal-working (an unusual opportunity for an aquatic species), and have advanced to the aquatic equivalent of TL 1. In physical form, they have bulky, bullet-shaped bodies equipped with four evenly-spaced arms.

Imperial law was specific that low-technology indigenous cultures were to be protected from interstellar contact, and Chaosheo was interdicted by the IISS for that reason. This changed in the year 1073 when a starship (the liner *Ishgarlu*) misjumped and crashed into the Chaosheon ocean, allowing the curious Shi'awei to explore the ship and meet its living survivors. Since this contact, the world's travel zone was upgraded to amber, allowing limited and carefully-observed trade.

Deneb Subsector J: Vincennes

The Vincennes subsector is protected by the 258th Fleet, with its headquarters in the HRD system (1623).



HRD (1623): Originally established as an Imperial Navy research center, HRD is now a think tank, whose only export is information and analysis. Unlike research stations, however, it is not a unified government-owned operation. HRD consists of a large number of commercial analytical groups, all competing for government contracts.

Operations in HRD have long been the subject of public speculation, but these remain secret, if only for proprietary reasons. It is known that HRD is host to large numbers of Droyne consultants, so psionic research seems to be a prominent subject of its inquiry. (*Referees only, see page 83.*)

Jonkeer (1324): The inhabitants of this world, the Jonkeereen (singular: Jonkeerin) are geneered humans, created by Imperial Ministry of Colonization for life in desert environments. Jonkeereen are tall, thin, and dark-skinned, with protective membranes shielding their eyes and ears. More important than these cosmetic differences are sophisticated changes to their metabolism that allow them to survive in the temperature extremes of the dry desert environment. These metabolic and biochemical changes have created unintended side-effects in the Jonkeereen psychology; they are notably conservative, and, while highly cooperative with other Jonkeereen, are insular and distant in their interactions with non-Jonkeereen humans. Relations between the Jonkeereen of Jonkeer and the Imperial authorities have been so bad that the Jonkeer population has staged two rebellions against Imperial power, specifically the Ministry of Colonization, in 1083 and again in 1101. Both were put down, and relations have become better since the

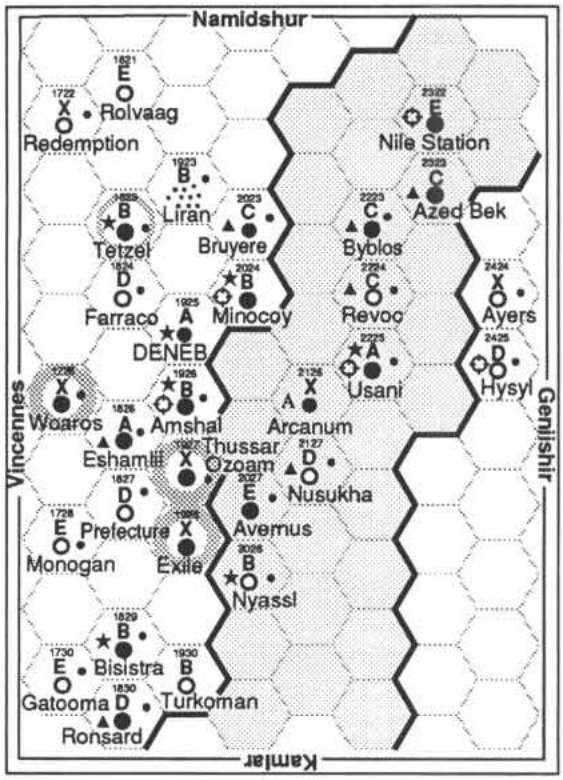
Domain was isolated under Norris' leadership.

Jonkeereen are best adapted to worlds with breathable atmospheres (codes 4-9). Many worlds named "desert" by their trade classification have problems far worse than the lack of water—only radical geneering allows unassisted respiration in very thin atmospheres, and on a world where death results from the lack of a respirator, being adapted to lack of moisture is at best a marginal advantage (as can be seen by the example of Malory, 2309 Deneb, page 54). In fact, the Jonkeereen traits are not only suited to worlds with hydrographic codes of 0; their artificial adaptations would also be useful on hot, low-tech waterworlds where fresh water is scarce.



The Jonkeereen are spread through much of the Regency, and comprise a significant proportion of the population of 10 other worlds. For other Jonkeereen populations, see Quopist (2215 SM, page 42), Ianic (1924 SM, page 46), Nadrin (3123 SM, page 47), Penelope (0533 SM, page 48), Melior and Callia (1736 and 1836 SM, page 50), Taa (0701 Deneb, page 52), Segan (2717, page 59), Verd (1524, this page), and Atab (1433 Deneb, page 65).

Jonkeereen may also be found in small numbers in the desert environments of many (even non-"desert") worlds, but only as recent post-Collapse arrivals, not as established communities. For a related topic, see "Malory," page 54 (see also *MTJ* 3).

Perez (1221): Homeworld of a sapient race, now protected because it has been abused in the past by Vincennes' rulers, who were extracting hallucinogenic compounds from these beings via cruel, unethical, and deadly processes.

Vincennes (1122): Although TL-16 technology is more widespread than in the Imperial era, TL-16 Vincennes is still unsurpassed in the Regency in technology, and is one of only two TL-16 industrial worlds in the Regency. This is primarily the result of the Regency's explicit policy to raise the average technology of all its worlds as a group, with TL-15 being the tech level "cap," rather than allowing its high-tech worlds to race on ahead. However, experts agree that Vincennes is an imminent TL-17 society, "just add water," with a significant amount of TL-17 technology existing in prototype form.

Vincennes is also unusual because of its star system's layout. Although its true primary (in that Vincennes receives its life-sustaining energy from this star) is the K7 V Undraczech, Vincennes orbits around the M7 V Ember, which itself orbits Undraczech. (The G1 V, Guazhirniim, and Undraczech orbit each other at a great distance; Guazhirniim is itself the primary of the Paven subsystem which includes the agricultural world Paven, producer of most of Vincennes' food.) This stellar geometry gives Vincennes four seasons (although since it has no significant axial tilt, these are not seasons in the classic sense): winter, when it is on the far side of Ember from Undraczech, summer when it is between the two, with spring and fall and fall being the approaching and receding intermediate positions. Mean surface temperatures range from –20 in the winter to 66C in the summer, and this wide thermal range creates tremendously violent storms, meaning that Vincennes' surface is not habitable. The world's extensive population live either in vast undersea metroplexes near the world's sole continent or in 71 gravitic cities which float close to the surface in the mild spring but climb to high altitude during the violent seasons.

Deneb Subsector K: Usani

Although Usani is no longer the subsector capital, the subsector's name was not changed to reflect its new capital of Deneb in order to avoid confusion with the name of the sector itself, and also to continue to honor Usani which continues to serve as a frontier capital. Usani is defended by the 154th Fleet, headquartered at Deneb (1925). Usani's frontier is contained in Quarantine District 4, and the RQD 4 capital, Usani (2225), is also located in this subsector.

Deneb (1925): Long one of the most important worlds of the Domain/Regency, this core world has become a frontier world, sitting at the boundary of the Regency safe, backing up RQD 4. The world's naval facilities and shipyards have therefore become even more important than they had been before.

Technicians form the ruling class of Deneb, and in a highly complex arrangement, serve a theological structure that is rather isolated from Denebian society, being described by its (actually very few) detractors as "too black-and-white." Although the faith, known by the phrase, "To Will One Thing," is philosophically complex, the the ruling technicians serve as buffers and mediators between society's needs and the sometimes abstract strictures of the faith. The highest level of these technicians are actually annointed religious leaders, and given the fact that any of these could have begun their public life as simple garage mechanics, the faith is able to keep something of a common touch. Adherents of the faith are known as the "Pure of Heart."

Deneb has become a major site of post-Collapse Vargr refugee camps. This was entirely the doing of the leadership of the To Will One Thing faith, who saw that few worlds of the Regency will willing to allow Vargr camps on their soil, fearing the danger of Vargr lawlessness, as well as demonstrating typical anti-Vargr racist beliefs. Thus Deneb, quite distant from the Vargr frontier where the Vargr were arriving, has become a major center of post-Collapse Vargr society. These Vargr are not remnants of the Civil War-era raiders, but are rank-and-file Vargr who fled Virus with their entire families. These Vargr refugees have become enthusiastic adherents of To Will One Thing, although as is their wont, they have spawned numerous sub-denominations, including the liberal and anarchic Adherents of the Halifax Protocols and the ultra-conservative Wisconsin Synod. Of all Regency worlds with Vargr populations, Deneb is the least affected by "The Pack" (see page 29); the Vargr Pure of Heart actively oppose its methods.

The Jumpspace Institute: Located at Deneb (1925), the Institute was originally established by the Duke of Deneb for the research of future jump technology. The JI has since become an official governmental agency (first of the Domain of Deneb and now of the Regency) with the mandate of oversight and regulation of advanced starship technology, starship construction and major component manufacture, as well as the training of starship engineers and naval architects via a structure of education standards and accreditation. The JI maintains local offices at all subsector capitals.

Exile (1928): Despite the best efforts of the Regency government, there are always certain members of society who just *don't get it*, "it" being the corporate acceptance of limits on behavior to allow people to live together in peaceful and productive relationships. These persons are called criminals.

Exile is the dumping ground for the worst criminals of Deneb, where they are left with only the clothes on their backs to make their way in the harsh environment with the harsh survivors of previous criminal deposits. Although the principle behind Exile is similar to that of Mithras (SM 1932, page 50), its Spinward Marches counterpart, the results are diametrically opposed. It is widely believed that conditions on Exile only further hardern criminals into their patterns. Advocates of penal reform frequently point to the different results of Mithras and Exile to advocate programs of reform rather than punishment.

Liran (1923): This asteroid belt had been a crucial source of raw materials for the industry on Deneb, but was selected as one of the 26 target worlds of the Regency Industrial Development Program, and is now an industrial "world" in its own right. Fortunately the Liran Belt is extensive enough that it can meet the system's own needs while continuing to meet the voracious needs of nearby Deneb.

Redemption (1722): Redemption was settled by a "back to nature" religious sect. Its former Amber Zone rating was due to their sometimes sneaky attempts to persuade visitors to scrap their starships and adopt their pastoral lifestyle. The Redeemers profess to be delighted by Virus and the resultant Collapse, for it proved their beliefs. For this reason, Redemption is commonly known as "We Told You So." Traders shun the world, reasoning that a low standard of living is the best punishment.

Revoc (2224): The world of Revoc was visited by a vampire ship in late 1146. Although its systems were immune to virus infection, the world came under fire by the vampire's weapons. Several pressure domes were breached and thousands were killed before Scout ships in the system destroyed the vampire. This caused a panic among the population, and most of them fled for the greater security of the safe area. Virtually all that remains of the population on Revoc are RISS personnel who man the base there.

Usani (2225): Usani was formerly the subsector capital of the Usani subsector. However, when Usani ended up in the Regency Frontier, the subsector capital was moved to Deneb. Usani now serves as the frontier capital of Regency Quarantine District 4, including 24 frontier worlds in the Deneb subsectors Namidshur, Atsah, Usani, Genii'shir, Zeng, Kamlar, and one world in Antra (G, H, K, L, N, O, and C respectively).

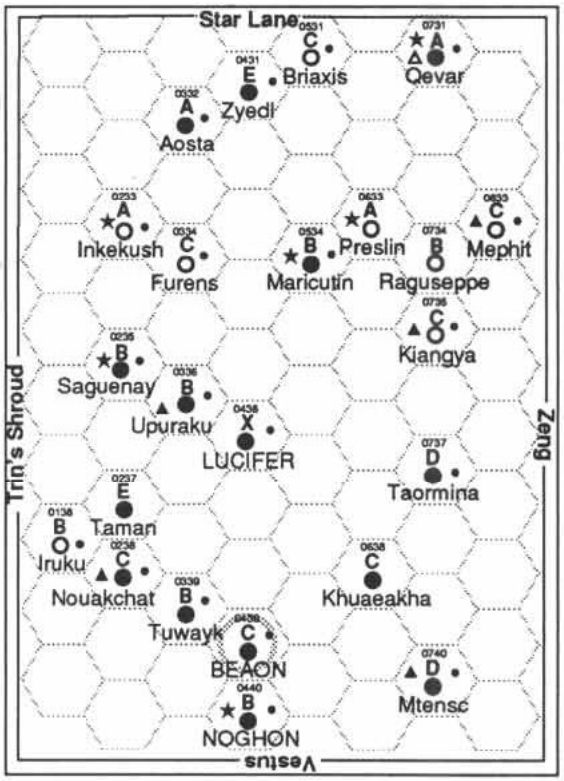
Nile Station (ex-Sage) (2322): Former scout Sir Thomas Nile of Regina journeyed to Deneb during the Civil War to help defend the Domain. When the Collapse ended that conflict he worked for the RQS until he had fully paid for his ship. Most of Thomas' patrols were made in the Regency Frontier, and he got to know it quite well. On one patrol he was asked to transport the last remaining residents of Sage to the Regency's safe area. Later, he returned to that world and staked a claim, and was joined by his family. After his service ended, Thomas made regular runs between the renamed Nile Station and Torm, transporting passengers and cargo between the Frontier and safe area. Today his son, Terry, continues the run. The population of Nile Station has grown substantially over the last 40 years.

Deneb Subsector L: Geniishir

The Geniishir subsector contains only two worlds under the Regency's protection, Geniishir and Maelstrom, both in the Frontier, part of RQD 4, under the protection of the 183rd Fleet and administered by the District capital at Usani (2225, page 62).

Geniishir (2521): Geniishir is an example of the inflexible and unimaginative nature of the old Imperial administration. To the Imperium a subsector was a subsector was a subsector, no matter how many worlds it had. Thus the Geniishir subsector, proud possessor of four worlds and 700 million persons, required its own capital. Geniishir is now a member of Regency Quarantine District 4, containing worlds of six subsectors (Deneb/C, G, H, K, L, and O).



Deneb Subsector O: Kamlar

The Kamlar subsector contains only six worlds, four in the Regency safe and two in its Frontier. The line from Catacomb (2234) to Kamlar (1832) represents the frontier boundary between Quarantine Districts 4 and 5. This line, including Catacomb, belongs to both districts. Javan (2131) falls into the 4th District. RQD 4 is defended by the 183rd Fleet headquartered at Usani (2225, page 62), and RQD 5 is defended by the 74th, headquartered at Yvette (Reft 1103, page 70) with forward bases at Jecife (1640, page 65).

Catacomb (2234): Because of its strategic positioning dominating many trans-rift avenues of approach, Catacomb became the site of a major naval base while retaining its scout base. Catacomb is the departure point of a great many deep space sweeps.

Deneb Subsector P: Vast Heavens

The Vast Havens subsector contains as many calibration points as it does worlds. As with all calibration points, the CPs in this subsector are for military use only. Their precise locations and beacon frequencies are not available to the public. This entire subsector falls outside of the Regency's protection, although it is periodically patrolled by the 183rd and 74th Fleets from their home ground in RQDs 4 and 5.

Deneb Subsector M: Gulf

The Gulf subsector is the home of the 193rd Fleet, with its headquarters at Qevar (0731). The 193rd achieved fame in the Fifth Frontier War by its stubborn defense of the coreward Regina subsector (Spinward Marches/C, page 38). The only ground it gave in the entire war was Louzy (SM 1604, page 37), although it left formidable system defense forces in the system which dogged Zhodani supply lines and ultimately doomed the Zhodani's Siege of Efate. The 193rd moved trailward during the fleet realignment that took place shortly after the conclusion of the war.

Aosta (0332): Aosta is an Imperial Reserve World (see also Marastan, 2231, page 50), but it is unique among all of the reserve worlds of the Imperium in that it was, and still is, the only such world devoted predominantly to marine life. It was established by Empress Nicholle in 474.

All researchers (for researchers are the primary visitors to reserve worlds) live in orbit, as permanent structures are prohibited on the world itself. However, sophisticated research submarines operate in all of the world's oceans, and all are required to observe strict anti-pollution guidelines.

Lucifer (formerly Endup) (0436): Among Imperial subjects of conscience and good will, it was worlds like Endup that challenged the naive faith in the Imperium as an organization that had humanity's best interests at heart. The Imperium had long ago recognized its limited power to directly secure the happiness of its citizens on each of thousands of worlds, and enunciated its doctrine that Imperial power encompassed the space between worlds, but did not extend to their surfaces: there local power held sway, and the Imperium would not intervene unless forced to, like a surly bear awoken from its slumber, eager to teach it subjects to not bother it again.

Therefore the Imperium could be thought of as an aloof environment that incidentally created the conditions within which humans could create a good life, but which was uninterested in actually helping that creation take place, just as wind and rain do not care whether they water crops in moderation or wash them away in storms.

What began as a clear-sighted recognition of the limitations of power gradually hardened into a structural cynicism in which the Imperium winked at government by thugs and murderers, so long as these thugs and murderers did not allow their local problems to spill off their worlds into public view, forcing the Imperium, like an embarrassed patriarch, to sweep the unsightly family problems beneath the rug.

Endup was heavily exploited for minerals, originally using forced Imperial convict labor, but by 1117 had stabilized into a despotic society which no longer needed an external source of human bodies to exploit. Endup was ruled by a religious autocrat, the "Ward of Vision," who posed as an omniscient, omnipotent god. This was simplified by his keeping his subjects limited to TL 3, prohibiting their contact with off-worlders, and keeping them sick. Endup's atmospheric taint is limited to lower elevations where the commoners are forced to live. Here the taint limits lifespans to 45 years. Only the Ward and his power structure were allowed to live on the high ground, and commoners were prevented from entering the higher elevations on pain of death (which, after all, is all they got if they stayed off the higher elevations).

What the Imperium saw in the Ward of Vision that it suffered him to continue sentencing his people, Imperial subjects all, to early death is hard to say 85 years later. Perhaps he made the trains run on time.

Endup was thus typical of the many corrupt, cynical societies winked at by the Imperium but abolished by the Norrian or Aledon Reforms (see Library Data), especially the Representational Reforms (see page 12). The transformation of Endup was a bitter struggle, and was eventually accomplished by teams of Regency Election Observers (see Library Data) that were infiltrated into the lower classes. Here they undertook the unlikely mission of organizing an uprising against the Ward of Vision and his theocracy. Part of this movement, which took over a decade, was the creation of a "liberation theology" which encouraged the populace, within the tenets of their existing faith, to question the form their world had taken.

The uprising was a bloody affair, given the technological imbalance between the Ward's weaponry and that of the commoners, and Lucifer's population has only recently returned to its pre-uprising levels. Although the healthful highland areas are limited in extent, none of the population are excluded from them, and extensive tunneling has begun to allow purified atmospheres to be available to the low-level dwellers.

The name Lucifer means "light bearer," an ancient Terran name for the morning star, and has clear mythological connections to evil, specifically the fall of good beginnings into evil results. However, the ethical creation myths are clear that Lucifer was the most beautiful of the angels before his fall, and that only after his fall did he become identified as Satan. Thus Lucifer is an allegory for the partnership of vigilance and goodness.

The lower technology level in 1202 compared to 1117 does not represent a drop in tech level, but rather the tech level available to the entire population. Following the successful uprising, the Regency government, as heir to the Imperial government, elected to pay its debt to the people of Endup by adding the world to the Regency Industrial Development Program, making it the 27th and last world admitted to the program (see page 67). Despite its relatively low tech level, Lucifer is one of the leading worlds in the rim-trailing quarter of the Regency, possessed of a vigorous population with a clear sense of their purpose and what they believe in. Lucifer's government sponsors a great number of projects on poor environment worlds in the Regency or its frontiers with the goal

of raising the local standards of living. This is Lucifer's way of "paying forward" to the next generation the debt that they owe to the Regency.

Taman (0237): Taman's secondary is in a close orbit around the primary star. The combination of the two gives this system a narrow habitable zone. Taman occupies this zone, and has a chilly environment.

Khuaeakha (ex-Brufort) (0638): Although most of the Aslan incursions occurred in Trojan Reach and Spinward Marches, some reached into Deneb. This resulted in appreciable Aslan population on some worlds, and the world of Brufort was given over to Aslan control and subsequently renamed Khuaeakha.

Deneb Subsector N: Zeng

The Zeng subsector is defended by the 260th Fleet, headquartered at Dawn (1336). The portion of the Regency Frontier in the Zeng subsector is part of Quarantine District 5, although most of this section of the frontier falls in the Kamlar subsector, the next subsector to trailing (page 63).

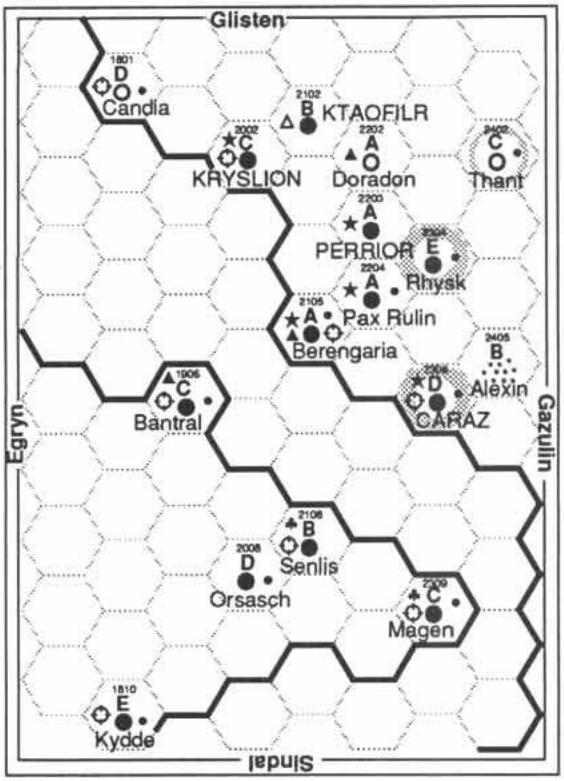
Dawn (1336): This waterworld supports two completely independent cultures: one in orbit and one that live on the ocean's surface in free-floating *Makranii* ("ship cities"). The orbital population is over 250,000, and the sea-dwellers number almost 400,000.

Dawn's listed tech level corresponds to the orbital culture; the Makranites have a tech level of 9. Dawn's naval base is located in the orbital community, but ships based there make extensive use of the oceans below for refueling.

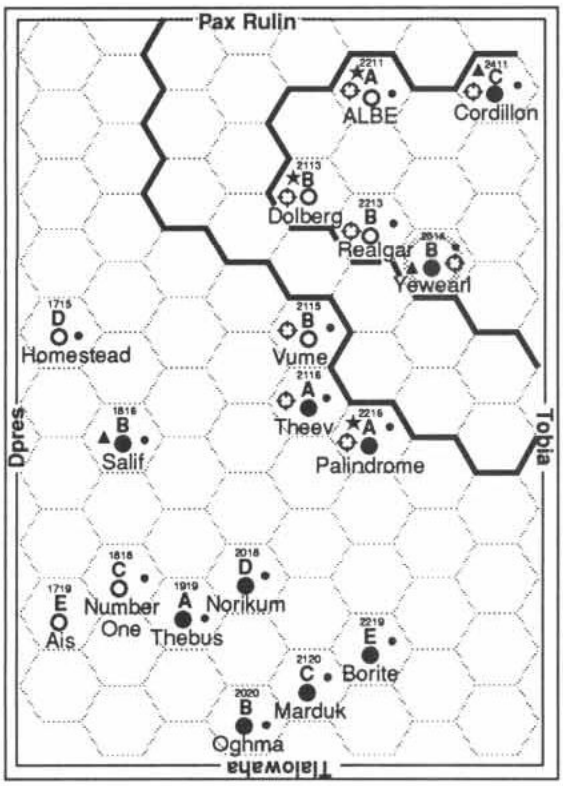
No land whatsoever breaks the surface of Dawn's world ocean, so the Makranii contain all of the industrial facilities to exploit the ocean's riches: kelp farms and fish ranches, hydrothermal power generation plants, submarine docks for vehicles that collect mineral nodules from the seafloor, and vast collectors for the recovery of dissolved minerals.

The world gets its name from its atmospheric taint: the atmosphere's neon and argon taint create sunrises and sunsets that are breath-taking to visitors, but which the locals have long since accepted as routine.

Depot Beta (formerly Pashus) (1432): After the vampire fleet invaded the Regency and devastated Trin, the Admiralty determined that Deneb need a second depot, and elected to build it in the Pashus system. The original Deneb depot was renamed Depot Alpha, and the newly constructed one was named Depot Beta.



Note that the world stself still retains the name Pashus, it is only the system's name which has been changed.



Pashus is the site of Research Station Zeta (RSZ), which continues the work of Ashak Moroyanga (818-881). Moroyanga was a controversial leader in the field of temporal physics. He began his career at the Jumpspace Institute (see page 62) where his studies convinced him that the basic principles of time were themselves other expressions of the same phenomena that were utilized by jump technology. Moroyanga earned both popular celebrity and professional contempt with these views, and eventually died under mysterious circumstances. Nonetheless, the Imperium took his work seriously enough to create Deneb's RSZ to pursue Moroyanga's inquiries.

Conspiracy theorists (of which there is sadly never any shortage in civilized society) maintain that Depot Beta was constructed solely as a cover for the dramatic temporal breakthroughs that are being made at RSZ. By creating a huge naval presence in the system, the Regency government can more easily control public observation of the time travel programs being undertaken by the Regency government.

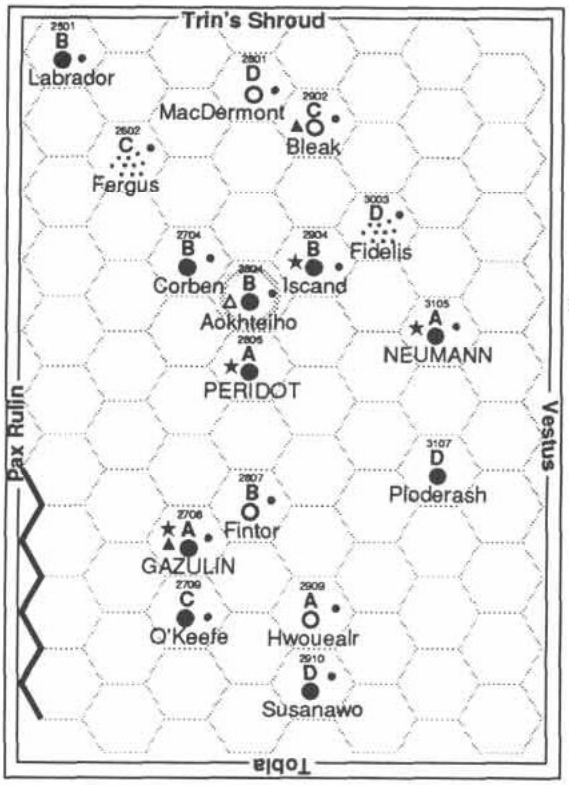
TROJAN REACH

Trojan Reach was the area of the greatest Imperial territory losses to the Aslan *ihatei*. The antebellum Imperial border enclosed the core-trailing quarter of Sindal (G) subsector, and three-quarters of the Tobia (H) subsector. All territory in both these subsectors was lost by the late 1110s, but this dire situation was eventually stabilized by the new Sector Duchess, Sharik Arcadia of Gazulin (who succeeded Duke Alexander Quinn in 1118 upon his suicide with the Aslan invasion of Tobia) who enacted policies to encourage the encroaching clans to fight with each other, which they were only too willing to do.



The Zhodani name for Trojan Reach is *Idrflanta*, the Aslan name is *Hlaoirloahauri*.

Archeological evidence shows that the sector was settled by Vilani expatriates from about –2300. These were not formal colonies, but were the settlements of Vilani fleeing Vargr raiding in the abandoned Vilani colonies of Corridor Sector. The last of these settlements is believed to have died out by –1400.

Trojan Reach Subsector C: Pax Rulin

The Pax Rulin subsector is defended by the 201st Fleet, headquartered at Perrior (2203). Its frontier is part of RQD 6, which has sole responsibility for the Aslan interface. It runs from Fist (2918) in the Tobia subsector (page 68) to Candia (1801) at the coreward border of the subsector.

Bantral (1906): Bantral was the 1122 site of talks between the then-Domain and the Aslan Ikhtealyo clan. The Ikhtealyo, which had a long history of trade with the Imperium,

desired an amicable solution that would allow trade and not require open warfare. However, such sentiments were complicated by other factions on both sides. Many human worlds (described elsewhere) were inclined to go to war with the Aslan intruders, and other Aslan clans preferred war as well. One such clan was the militant Eakhtiyho, and its motivations were two-fold. First, war would allow it to simply take what it wanted; Imperial weakness made it likely that this would prove true. Second, by pursuing war, the Eakhtiyho could undercut the power of the the Ikhtealyo, Tlaukhu rivals (see page 25) who sought peace with the Imperium. A solution that allowed the Eakhtiyho to gain strength at the expense of the Imperium and the Ikhtealyo was irresistible to them. Thus Eakhtiyho policy was to provide military assistance to all *ihatei* forces (regardless of clan affiliation) who pursued military conquest of new lands in the Imperium. This would add fuel to the fire and give greater strength to the Eakhtiyho. Attempts at negotiation were therefore foredoomed to failure so long as the Eakhtiyho figured in the equation, and their policy was to forcibly insert themselves into the equation at every opportunity. (See also **Survival Margin**, page 19, **Rebellion Sourcebook**, *SA, TD MTJ* 3)

Trojan Reach Subsector G: Sindal

The Sindal subsector is defended by the 203rd Fleet, headquartered at Albe (2211). The Sindal frontier is also part of RQD 6, see Pax Rulin, above.

General Development Company (GeDCo): This company was active in Trojan Reach and Reft and dates to the early 600s when Empress Arbellatra resettled many nobles in the Imperium's border regions. As these regions were undeveloped, many of these nobles pooled their wealth for the establishment of an organization dedicated to trade and the increase of tech levels. The result was GeDCo, which achieved success through trade and the production of high-tech export goods.

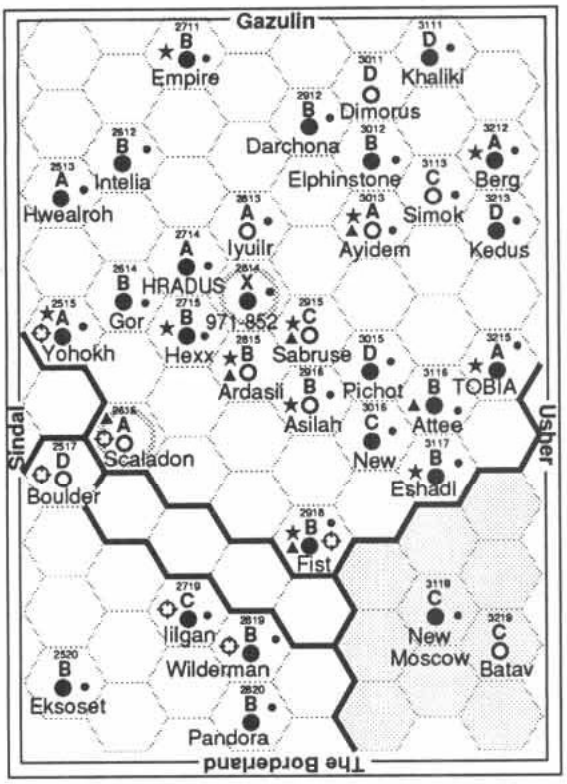
When the Regency government established its Industrial Development Program it borrowed heavily from the expertise and structure of GeDCo. Many GeDCo executives became Regency officials, and portions of the GeDCo infrastructure were taken over whole by the Regency government and became local offices of the Industrial Development administration.

Trojan Reach Subsector D: Gazulin

The Gazulin subsector is defended by the 202nd Fleet, based at Neumann (3105). Neumann is one of the key worlds of the Regency thinrim. Because of the paucity of TL-15 industrial worlds in the Regency's rimward interior, Neumann fills an important gap, and was selected for the industrial development program (see box, below) for just that reason.

Fidelis (formerly 627-301) (3003): The Imperial research station in this system was evacuated in the pre-Collapse period when it became impossible to defend. The present population of the system comprise an asteroid mining colony made up of families intending to make a life in the system, not corporate employees who come an go based upon their contracts. These settlers gave the system its new name as a commitment that their world would not be abandoned like its predecessor but would remain a valuable and valued member of the Regency.

Regency Industrial Development Program: This was one of the Regency's most important internal development initiatives of the post-Collapse period. Its goal was the increase of high-technology industrial capability in the Regency, particularly in areas which were lacking such centers. One major thrust of the program was to identify industrial worlds which could be rapidly advanced to TL-15, and target them for intensive industrial investment. The Regency government accomplished this by providing interest-free government loans for infrastructure improvement, and by providing grants to the high-tech industrial worlds that would produce the expertise and equipment that would make this possible.



The second major thrust was the advancement of industrial or non-industrial early stellar (TLs 9-A) worlds to average stellar (TLs B-D) industrial worlds. This was also accompanied by starport improvement programs, and additional local investment was also provided in the form of the construction of new bases on these worlds.

A total of 26 worlds were chosen from the program, in 21 subsectors. (A 27th world was added later, see "Lucifer," page 64.) As can be imagined, this program was the target of many attempts to exert political favoritism and promote local pork-barrelling, but Norris himself exerted his personal influence by making it a Regency priority, and created an independent office, the Industrial Development Office, to administer the program which was answerable directly to the First Regent.

One stipulation of this program was that technological development beyond TL-15 was severely limited, to avoid diluting the effort that would be focused on bringing up as many sub-TL-15 worlds as possible to this level. Only one TL-15 industrial world would be allowed to advance its industrial base to TL-16, and after intensive lobbying by Glisten (2036 SM), Rhylanor (2716 SM), Trin (3235 SM), Magash (0316 Deneb), Starn (1417 Deneb), and Tobia (3215 TR), Mora was selected for the honor, making it only the second TL-16 industrial world in the Regency, which it remains in 1202. Although this decision did not go down well in all quarters, after the decision a decade earlier to move the Domain capital to Mora, it at least proved fortunate that Trin was not chosen, given the eventual fate of that world.

Vincennes was denied its request to advance to TL-17, and its industry was primarily used to produce selected high-payoff technology that could be used as "force multipliers" in an otherwise TL-15 society.

The 26 worrlds originally selected for this program were Jewell (SM 1106, page 37), Efate (SM 1705, page 38), Junidy (SM 3202, page 39),, Vilis (SM 1119, page 41), Porozlo (SM 2715, page 43), Adabicci, Lunion, and Strouden (SM 1824, 2124, and 2327, page 46), Mirriam (SM 0333, page 48), Aki (SM 2035, page 50), Dodds (SM 2739, page 51), Urnas (Deneb 0609, page 52), Liiri (Deneb 1016, page 57), Askigaak (Deneb 0629, page 60), Ishiri (Deneb 1429, page 61), Liran (Deneb 1923, page 62), Tuwayk and Noghon (0339 and 0440, page 64), Lilad, Giranima, and Pikha (1135, 1334, and 1633, page 65), Caraz (TR 2306, page 66), Albe (TR 2211, page 66), Neumann (TR 3105, page 67), Hradus (TR 2714, page 68), and Colony Five (Reft 0707, page 69).

Trojan Reach Subsector H: Tobia

By 1120, the entire Tobia subsector, along with the Sindal subsector to spinward, had fallen to *ihatei* invasion, although most of these worlds retained human majority (though now subject) populations.

The arrival of Regency forces in 1131 was greeted with delirious joy by the human inhabitants after over a decade of Aslan occupation. The Regency no longer particularly feared full-scale war with the Aslan Hierate, and this freed it to act with a stoic confidence that it had not exhibited before, and this new confidence struck fear into the Aslan, prompting them to accept these bold acts and enter into honest negotiations. The Regency knew that Virus was by far the greatest threat, and in any event, an Aslan-Regency war would not be the last word—Virus would destroy whatever victors were left behind. Besides, the Regency was essentially only restoring its antebellum boundaries, reasserting control over worlds which had traditionally been Imperial worlds until the late 1110s.

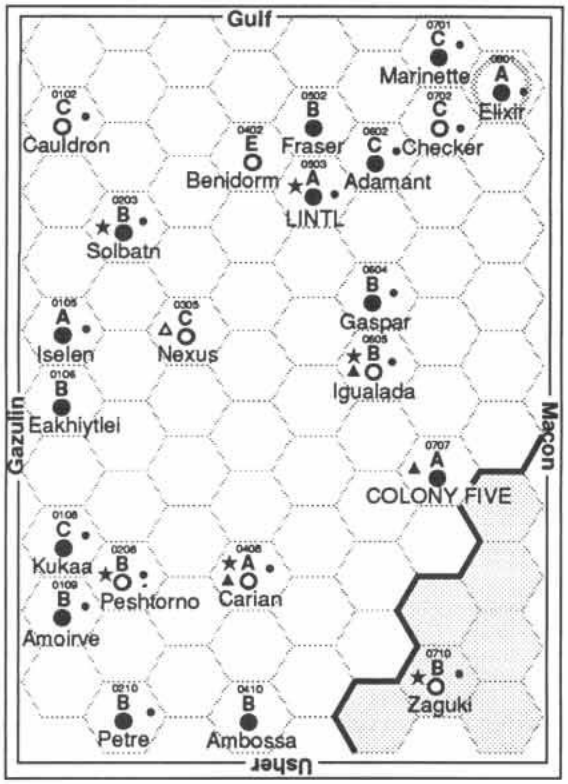
Many Aslan populations abandoned their former-Imperial conquests during this period, and on many words the remainder were subject to varying degrees of "justice" at the hands of their former subjects, which often involved simple deportation.

The Tobia subsector is defended by the 204th Fleet, headquartered at Ayidem (3013). Its frontier is part of Quarantine District 5A, spawned from RQD 5 in 1140 with the annexation of the Islands (see pages 12 and 33). It was clear that patrolling this new territory would overstretch the forces assigned to RQD 5, so RQD 5A was split off from it to patrol subsectors J and K (page 72) and the stretch of frontier backing this area, beginning to core-trailing at Tonnurad (Reft 0416, page 69) and running rim-spinward to the rimward end of the Regency Frontier in the Tobia subsector.

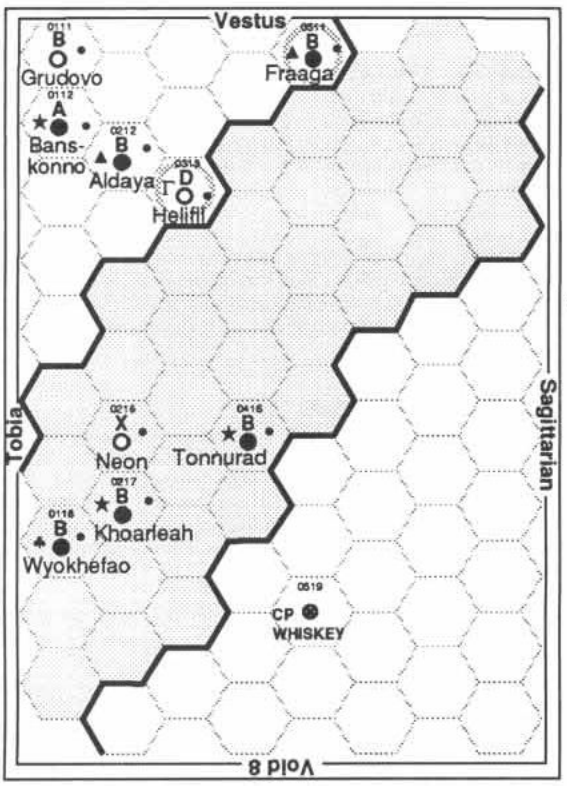
Due to the lack of adequate basing facilities in the Regency Frontier itself, the 128th Fleet is headquartered at Tobia (3215), and not in the frontier itself as is the case in RQDs 3 and 4.

Imisaa (2916): In contrast to the experience of other Aslan-visited worlds, Imisaa benefitted from non-violent and helpful Aslan investment. With the local economic downturn during the Civil War, the Imisaan economy was saved by Aslan investment, as Aslan traders were well-known on this world. In return for this investment the Aslan were granted unused land to settle in the Imisaan outback. Given the character of Imisaan land (it is coded a Desert world), the human inhabitants felt fortunate indeed that someone would pay them for this useless real estate. The world's population is now 89% Aslan.

Fist (2918): Another location of bitter Aslan-human fighting. The world's government, fearful of Aslan power, concluded deals for Aslan settlement. When the disgusted populace overthrew this government and demanded that the Aslan depart, the Aslan refused; they had gotten their land fair and square. Naturally, war resulted.



Intelia (2612): Like Imisaa (above), Aslan came to Intelia as investors, buying out the agricultural world's failing meat-packing industry. Naturally the new Aslan owners offered jobs to poor members of their clans, but the humans of this world (which was suffering disastrous unemployment because of the Imperial withdrawal from the subsector) opposed what appeared to be an Aslan economic takeover and rebelled. Wars are easier to start than they are to end.



Tobia (3215): Tobia is one of the crucial worlds of the Regency, anchoring the rimward extreme of its defenses. Tobia is not only a subsector capital, it is one of only 16 TL-15 industrial worlds in the Regency, and is the rimward-most of these. In the antebellum period Tobia had also been the Sector capital, but the Regency has dispensed with this fatuous legalism, as it only holds one-quarter of the sector.

Tobia is also the headquarters of the 128th Fleet, whose area of responsibility (AoR) is actually to trailing in Quarantine District 5A. However, because of the lack of suitable facilities in the fleet's AOR, its administrative headquarters (and center for scheduled maintenance availabilities and overhaul) is placed farther to the rear than is the case with the three other frontier fleets.

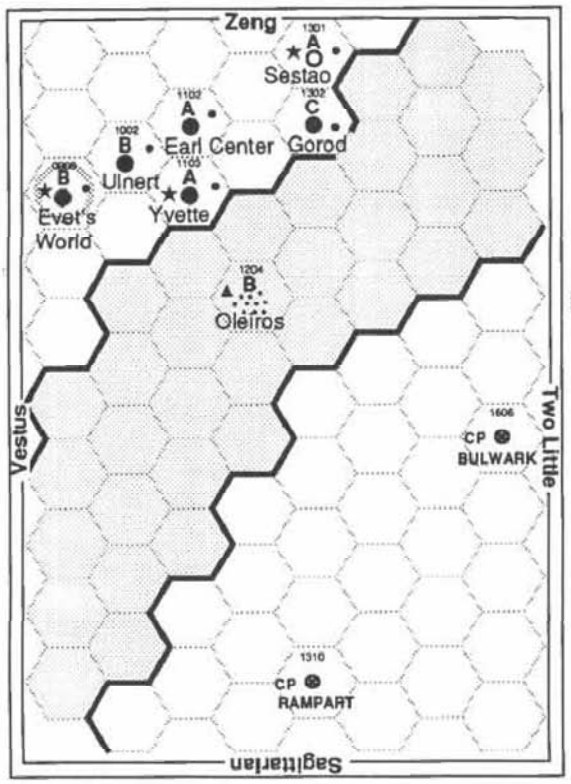
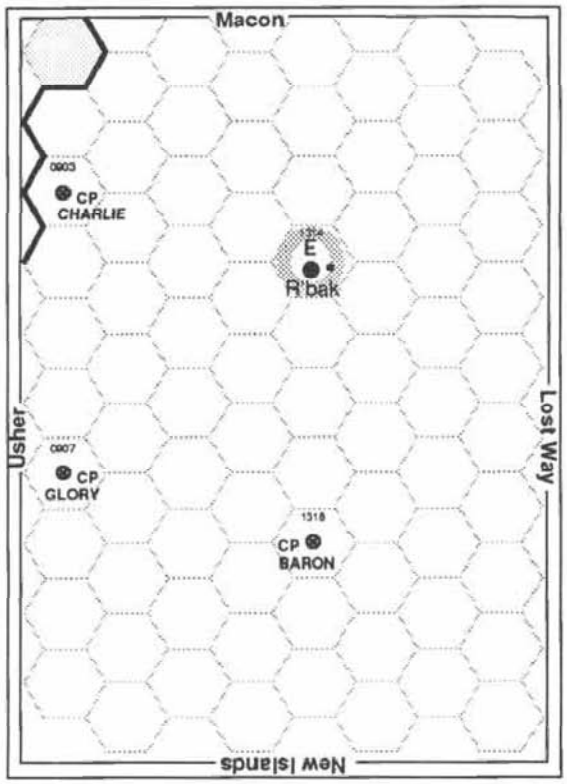
Dreadnought (formerly 971-852) (2814): This world's crust was cracked during the Ancients' final war, destroying most indigenous life. When first contacted by the IISS the world still had a small human population eking out an existence by such means as cannibalism. By 852 this population had become extinct. The world is still a hazardous environment as its crust remains weak. The world has been re-settled under the auspices of the Ministry of the Interior with its new grandiose and courageous name: "Fear God and Dread Nought." This unwieldy name is officially shortened to "Dreadnought" for normal usage.

REFT

Reft Sector, as its name suggests, is dominated by the Great Rift (see Library Data). Its few worlds are split into three areas: the Regency/spinward side of the rift, the Imperial core/trailing side of the rift, now Wilds, and scattered mid-rift worlds in between.



The Zhodani name for Reft Sector is *Bransakral.*



Reft Subsector A: Vestus

The Vestus subsector is defended by the 19th Fleet, headquartered at Carian (0408). The Vestus frontier is part of RQD 5, defended by the 74th Fleet.

Several of the worlds of this subsector were not continuously occupied during the Civil War, but were abandoned in the face of the Aslan incursions and reoccupied following the establishment of the Regency. Most of these can be recognized by the new names given them by their new inhabitants.

Many of the starports and bases in this subsector exist solely to support fleet movements and lines of communication (such as the XWeb) from the Regency

interior to the rim-trailing frontier.

Lintl (0503): Lintl served as the provincial capital of Reft Sector for the Domain of Deneb, and continues in this role for the Regency, adding the small collection of worlds in Usher (E) and Macon (B) subsectors to its purview.

Reft Subsector E: Usher

The Usher subsector does not maintain its own capital; it is administered from Lintl (0503) in the Vestus subsector to coreward. Usher is defended by the 74th and 128th Fleets, whose primary AoRs are RQDs 5 and 5A, but which share the patrolling of the Usher subsector.

Aldaya (0212): Aldaya is another former Imperial world that fell to the Aslan (Hreakhari clan) but was reincorporated (matter-of-factly annexed is a good description) during the establishment of the Quarantine (see page 8).

Sagittarian Subsector, 1117 and 1202 dual listing (Subsector F of Reft Sector)

Name	Hex	UPP	Base	Trade	TPPG	Alg	Stellar
R'bak	1314	B387777-3		Ag Ri	R721	Na	G3 V
	1314	E387873-2		Ag	R221	Na	G3 V

Wyokhefao (formerly Bastion) (0118): Bastion/Wyokhefao was the origin point of much of the Aslan encroachment in this area, including that of Tonnurad, below. Originally an Imperial world with a naval base, Bastion was abandoned in the early Civil War period, and it and its base were taken over by the advancing Aslan Hreakhari clan who used the world as a springboard for further penetration of the Domain.

Tonnurad (0416): Tonnurad was the site of some of the heaviest *ihatei*-Domain fighting of the Civil War era. The Domain actually lost control of the world to the Aslan encroachers, and only regained it by the unilateral extension of the Regency frontier during the early days of the creation of the Quarantine (page 8).

Reft Subsector B: Macon

Because of its size the Macon susbsector does not have a subsector capital of its own; it is governed from Lintl (0503) in the Vestus subsector to spinward. However, Macon is home to a Regency fleet, the 74th, headquartered at Yvette (1103). The 74th is "dual-hatted" with the protection of the Macon subsector as well as the extensive Quarantine District 5, its primary area of responsibility (AoR).

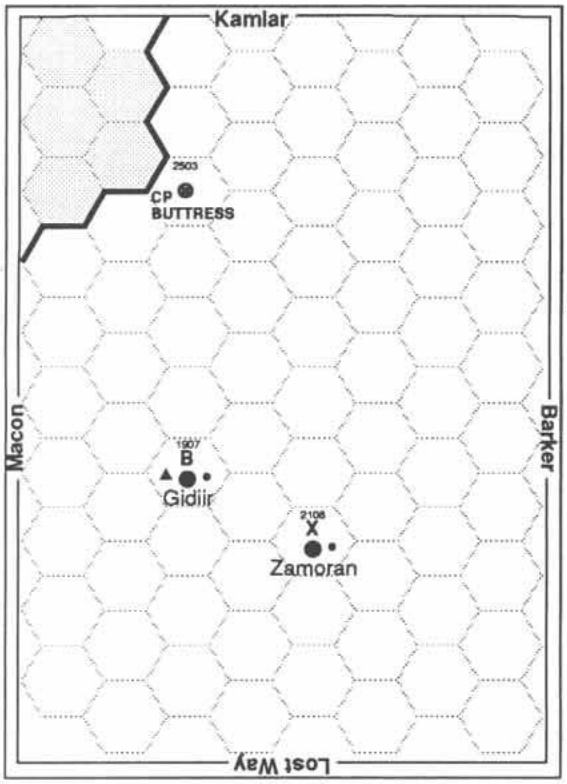
Calibration Points Rampart and Bulwark are part of the CP network that allows passage along the wildside of the Regency Frontier. This allows Regency Navy and RQS forces to intercept intruders before they actually enter the defended areas of the Frontier or Regency Safe. The CP network allows the Regency's patrol envelope to be pushed farther out into the Wilds to make the borders that much safer, by allowing the threat to be destroyed while still in the Wilds, or at least to allow advanced warning while picket forces slow the threat down.

Reft Subsector F: Sagittarian

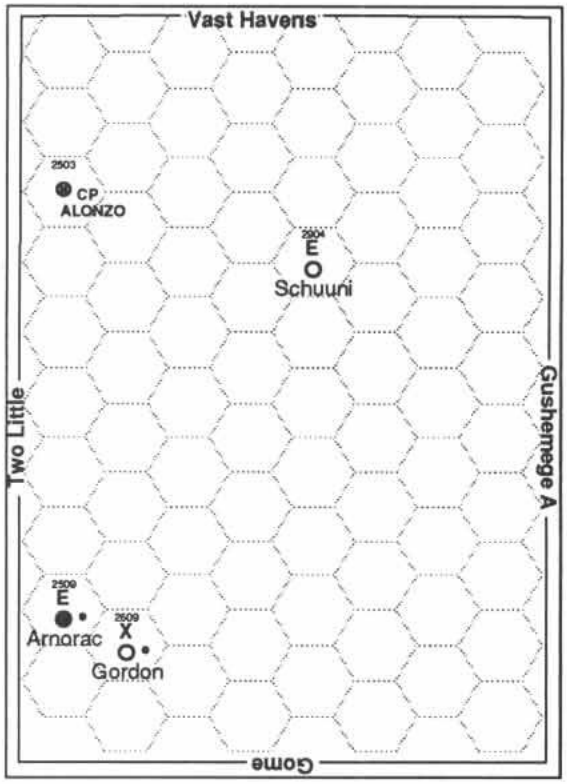
The Sagittarian subsector contains only one world, well outside of the Regency frontier into the Wilds. Its Calibration Points are used by the Regency Navy and Quarantine Service for deep space sweeps of the rift.

CP Baron also allows approach to the Islands from coreward. It is deliberately placed far from the Islands so that high-jump Regency ships can jump from Baron into the Islands but lower-tech Islander ships cannot jump from the Islands out into the Regency CP network.

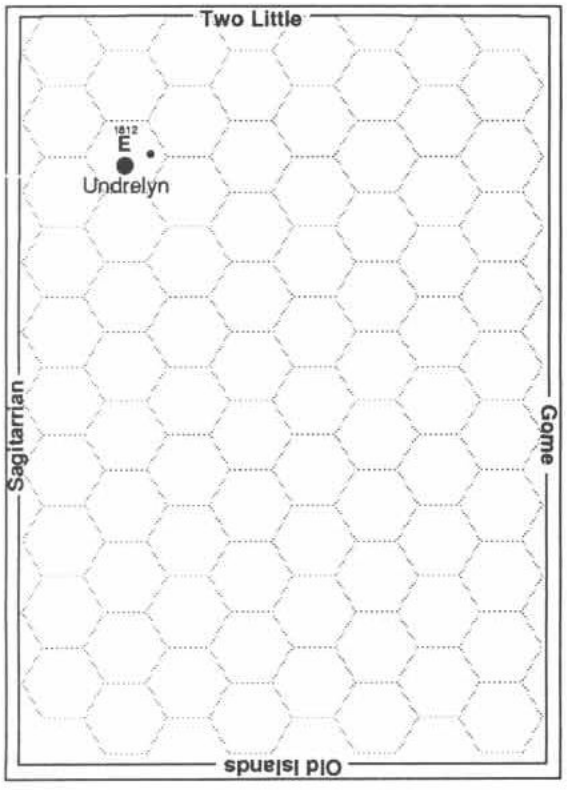
CPs Charlie and Glory are primarily connector CPs, providing access either parallel to the frontier or to and from the Regency interior to more distant CPs like Baron. They are not open to public or commercial traffic, and their precise locations and beacon codes are not available to the public.



R'bak (1314): Meteor swarms make navigation in this system very hazardous, but the Imperial-era interdiction order is not related to this. The world itself, but not the system, was placed under interdiction to protect the world's culture, humans that had fallen back to barbarism. However, many believed that the interdiction was a cover for military research, as the world's surface contained unusual lifeforms and extensive psionic activity.



The system's starport was an orbital facility off of the interdicted world surface.



Reft Subsector C: Two Little

The worlds of all three subsectors on this page fall outside of Regency-protected space. However, they are patrolled by deep sweeps of the 74th Fleet, based in RQD 5 to their rear. As with all calibration points, the CPs in these subsectors are for military use only, their precise locations and beacon codes are classified.

Zamoran (2108): This world was struck by a vampire ship in 1143. In the recovery which followed, the world's Droyne took the lead, and today are the rulers of the world.

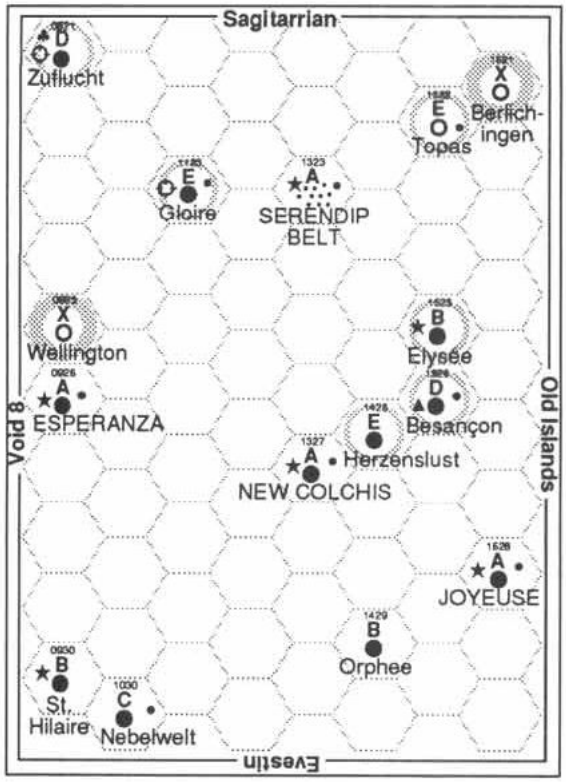
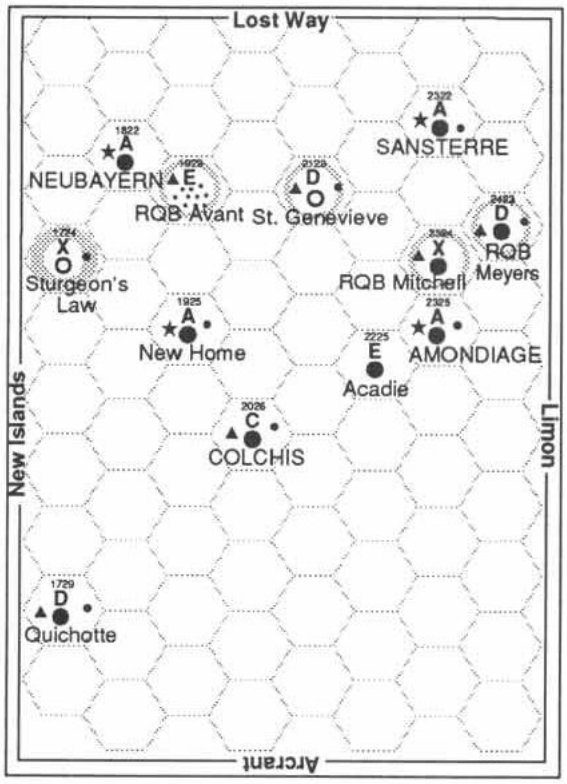
Reft Subsector D: Barker

Arnorac (2509): Although this world has a critical mid-rift position and is still visited by Regency Navy sweeps, the Regency was unable to actively defend it in the post-Collapse period, and its naval base fell into disrepair. However, its strongly pro-Regency inhabitants continue to maintain what starship facilities they can, and make sure that all Regency personnel have a very pleasant planetfall.



CP Alonzo (2503): This deep CP supports deep space sweeps and also provides access to coreward to the Denebian transrift route via CP Avery in the Vast Havens subsector (Deneb/P, see page 63).



Gordon (2609): Gordon is struggling with very old life support systems. Replacement parts are few and far between, making repairs difficult. Several habitation domes have failed over the past decades. This life support crisis has caused the world to unify its government beneath a ruling class of technicians who make all of the worlds decisions based on their technical feasability and value to the world as a whole.

Schuuni (2904): When ships stopped visiting this system, approximately half of the population decided to abandon the world before the life support failed. Two bulk transports were taken over, and overloaded with fuel and passengers. They then headed coreward, intending to undertake deep space refueling. It is not known what became of these ships.

Reft Subsector G: Lost Way

This subsector's only world is regularly visited by the Regency Navy and RQS, as it is a crucial mid-rift crossroads of the various deep space sweep route packages. The minor base maintained here is for resupply, rest and recreation, etc., on long-duration deep space deployments. Located deep in the Wilds, Undrelyn is currently a world in decline, and its only government and organization is provided by the Regency military forces there.

Reft Subsector J: New Islands

Note: The two subsector maps on this page are the only ones in this book that are not shown in their proper spatial relationship with each other, for reasons of space. The Old Islands map should be located to the right of the New Islands map, as is shown by the neighboring subsector indicators around the map edges.

Both Islands subsectors are considered to be in the Regency Frontier, as part of Quarantine District 5A. RQD 5A was created specifically for the administration of these subsectors, and includesthem as well as the frontier "proper" in front of the Tobia (TR/H, page 68) and Usher (Reft/E, page 69) subsectors, core-trailing to the line from Tonnurad to Helifil (0416 and 0313, both page 69). District 5A is patrolled by the 128th Fleet, based at Tobia (TR 3215, page 68).

The two interface worlds in this subsector are located at the chokepoints out of the Islands subsectors towards the Regency, and are intended to protect the Regency from the Islands, and not vice versa. These worlds are coded amber because RQS forces in the Islands are not known for their patience or willingness to take risks in unusual circumstances (see page 34).

Because both Islands subsectors are considered to be in the Regency Frontier, all of their worlds are already classed as Amber Zones. However, certain worlds are specifically classed either as Amber or Red Zones to call attention to specific dangers to be found there.

Topas (1522), Elysée (1525), Besançon (1526), and Herzenlust are all coded Amber because they are "powderkeg worlds," disputed worlds where military forces of the rival powers are still present. See sidebar on page 33 for details.

Berlichingen (1621) and Wellington (0925) are interdicted Red Zones. Both are dead worlds with no refueling sources and are therefore easy to keep isolated while the RQS examines the systems for the presence of Virus.

Reft Subsector K: Old Islands

St. Genevieve is an Amber Zone powderkeg world (see page 33). RQBs Avant, Mitchell, and Meyers are coded Amber because RQS peacekeeping forces are "not taking any crap" in the Islands, and because as dead worlds they are being examined for Virus. Likewise, Sturgeon's Law is being interdicted until it can be certified free of Virus. All of the Islands' dead worlds are Virus suspects until they can be proved otherwise.

Regency World Name Index

This index includes every world in the Spinward Marches and Deneb sectors, but only sectors C, D, G and H of Trojan Reach, and sectors A through K of Reft sector. Where the name of a world has changed from 1117 to 1202, both names are listed in the index, with the appropriate year listed in parenthesis after the hex number. When there is no year listed after the hex number, this means the world's name was the same in 1117 and 1202. The number in **bold** is the page number in the **RSB** on which the world's UWP data appears.

Library Data

LIBRARY DATA

The following information should be made available to PCs who have access to any reasonable database, either printed or electronic.

Aledon, Avery: Artificial biological son of Emperor Strephon Aella Alkhalikoi and (posthumously) Empress Iolanthe. Conceived *in vitro* in 1118 at Usdiki (1015 Gushemege), and raised to age 8 by his father. Evacuated to the Domain of Deneb aboard ISS *Arrival Vengeance* in 1126 and adopted by Archduke Norris Aledon.

Upon his majority in 1139, he publicly assumed his rightful name as Avery Alkhalikoi. It was widely believed that he would succeed Norris as First Regent, either singly or jointly with Seldrian Aledon (which see). His marriage to Seldrian in 1144 was intended to unite the Aledon and Alkhalikoi lines for reasons of state, but was never successful on a personal basis. It is believed that the single product of this union, Caranda Aledon Alkhalikoi, was the result of *in vitro* conception.

Avery served as High Regent for Technological Assessment from 1137 to 1149, when he was killed in a mishap at a technological demonstration. See also page 13.

Aledon, Norris Aella: First Regent of the Regency, born in 1063 and died in 1157. Became Duke of Regina in 1098, appointed as Archduke of the Domain of Deneb in 1116, proclaimed First Regent in 1132. True Father (which see) of Seldrian Aledon, his successor as Regent. See page 9.

Aledon, Seldrian: True daughter of First Regent Norris Aledon and second Regent of the Regency, born 1097, died 1190.

Seldrian was a free clone (which see), owing to the fact that her true father was not a first son, and was therefore not cloned as an infant. Furthermore, Norris took pains to ensure that his clone would not be a duplicate of himself, to the extent of stipulating that his clone be female. Although Norris was determined that his clone would be an independent person, their relationship enabled her to act as Norris' eyes and ears in a number of capacities.

Seldrian was Norris' heir throughout his life, and served as his representative on the *Arrival Vengeance* mission of 1123-1126 (see **Arrival Vengeance**, SA). It was on this mission that Avery Aledon (which see) was brought to the Domain of Deneb from Strephon's stronghold at Usdiki.

Following the proclamation of the Regency in 1132, Seldrian served her true father in many capacities, as Second Regent (later redesignated High Regent) in charge of a large number of topics important to Norris.

Seldrian, who had taken responsibility for Avery Aledon during the *Arrival Vengeance* mission, continued to show an interest in the boy, overseeing his education and sponsoring his entry into many social and educational organizations. By the late 1130s it was clear that Norris would not produce a natural heir, and pressure mounted for Seldrian to marry and preserve the Aledon line. Because of the obvious affection and long history between Avery and Seldrian, public sentiment mounted that the two should be married. Following the 1139 revelation that Avery was the son of the last emperor of the Third Imperium, and clear heir to any future imperial throne, these sentiments were only magnified by the vision of uniting the Aledon and Alkhalikoi lines. Although observers believed that neither Seldrian nor Avery concurred with this reasoning, the Tower (which see) strangely made no attempt to discourage thoughts of such a union.

Following her marriage to Avery Alkhalikoi in 1144, she adopted the name Seldrian Aledon-Alkhalikoi. This marriage was soon and widely seen as a marriage of political convenience, and it appears that the genuine friendship between Seldrian and Avery was destroyed by this new relationship. They ceased maintaining a joint household in 1146, with Seldrian remaining on Mora and Avery moving between his many offices as High Regent for Technological Assessment. Seldrian bore a son in 1147, who was confirmed as being the biological child of Avery and Seldrian. The child was named Caranda Aledon Alkhalikoi, and eventually became Regent following his mother's death.

Following the death of Avery in 1149, Seldrian again worked closely with Norris, preparing herself to succeed him, which she did in 1157 upon his death. Seldrian continued her true father's policies, and raised Caranda to do the same. By the time she died in 1190 the Regency was clearly safe from the threat of virus, and was beginning to look outward to the Wilds that it would once again claim in the name of the Imperium.

Aledon Reforms: The body of social, cultural, political, and spiritual reforms championed by First Regent Norris Aledon and the second Regent, his true daughter Seldrian Aledon-Alkhalikoi. See also Norrian.

Alkhalikoi, Avery: See Aledon, Avery.

Alkhalikoi, Caranda Aledon: Son of Avery Alkhalikoi and Seldrian Aledon. Assumed the title of Regent (the third since the founding of the Regency in 1132) in 1090 following the death of his mother.

Named for the first Duke of Regina, who was appointed to that position by the first of the Alkhalikoi line, Empress Arbellatra in 629, on the day following her coronation. There is a very clear historical symbolism at work here, which is not limited solely to the significance of Baron Caranda of Regina as the first of the illustrious Aledon dukes. There is also the fact that Arbellatra, first of the Alkhalikoi line, recognized Caranda just as Strephon, last of the line to sit on the throne, recognized Norris five centuries later, showing the families' long relationship of service and loyalty one to the other.

However, the key symbolism is the fact that the name Caranda recalls the crucial support provided by the earlier Caranda to Arbellatra which allowed her to take control of and reunify an Imperium that had been rocked by civil war (although clearly not so destructive as the 1117-1130 war). Arbellatra, victor of the Second Frontier War, was only able to depart for Core and her ultimate victory at the Battle of Zhimaway in 622 because of Caranda's loyalty in protecting her achievements in the Marches during her absence. Norris clearly saw his role as Archduke to be the preservation of Strephon's Imperium in the Marches, just as his ancestor had done. With the uniting of the Aledon and Alkhalikoi lines, the Aledon line will again be instrumental in placing an Alkhalikoi on the throne of a restored Imperium. This was the very symbolism that Norris began in 1132 by styling himself as Regent in charge of an interdynastic Regency. And to bring the symbolism full circle, Norris and Caranda Aledon Alkhalikoi are following in Arbellatra's footsteps, because the title that she served under between 622 and her coronation in 629 was none other than Regent.

Alkhalikoi, Seldrian: See Aledon, Seldrian.

Ancients, The: A race which flourished in Charted Space during the period –400,000 to –300,000, Imperial Dating. The Ancients possessed a staggeringly high level of technology, incalculable by current standards, but which included the ability to construct sophisticated artificial environments such as rosette and ring worlds.

The Ancients appear to have destroyed themselves in a climactic war lasting for approximately 2000 years and ending in –300,000. Many worlds were utterly destroyed by this war, resulting in the unusually high proportion of asteroid belts in some areas of the Imperium.

The primary significance of the Ancients to modern society is the existence of a number of starfaring races, namely the Zhodani, Vilani, and Vargr, as well as the wide distribution of separately developed populations of *homo sapiens*, "seeded" onto a number of worlds during their prehistory. These seeded homo sapiens populations (primarily the so-called "minor" human races plus the two major races, the Zhodani and Vilani) were placed on over forty worlds where they developed from prehistory without realizing that these worlds were not the worlds on which they originally evolved. Forty-six minor human races are known within Charted Space, but because many transplanted *homo sapiens* populations may have become extinct in their pre-history, or were planted outside of Charted Space, the total number of these seeded populations may never be known.

Antebellum: "Before the war." The period of Imperial history before 1117. This is different from "pre-Collapse," which means before 1130, and often specifically refers to the period of internal conflict between 1116 and 1130.

C3D: Pronounced "See-three-dee," standard military acronym for command, control, communications, and data, the four requirements for successful military operations.

Calibration Point: The term given by the Regency Navy and Quarantine Service to the deep space refueling points used to cross areas of space where there are no star systems to provide gas giant, ocean, or asteroid refueling points. Calibration points are located in deep interstellar space, light years from the nearest significant astronomical body. At the simplest level, they consist of a natural source of hydrogen, typically a comet nucleus or other ice body, but rogue planets are rarely found and used for these purposes. These natural calibration points are discovered and exploited, not constructed.

The most sophisticated calibration points are manned space stations, with huge tanks of refined liquid hydrogen fuel ready for transfer into starship fuel tanks, repair facilities, hospitals, and rest and recreation facilities. These can be built entirely from scratch, from modular components or sometimes from empty fuel tanks, but it is best if they can be constructed on an existing body such as the natural calibration points above.

The key feature of all calibration points is that they are carefully plotted for those who use them, as interstellar space is a very large haystack in which to find a needle like a calibration point. Ships which jump into interstellar space without precise information on the location of such calibration points are doomed to eventually run out of fuel and drift forever in the cold and dark.

Calibration points are usually secret, as their use confers operational and strategic advantages that must be denied to rivals. Most calibration points carry locator beacons which remain silent until they are activated by pre-arranged coded challenge signals, to prevent them from being used by unauthorized vessels.

In the period since the collapse, the calibration points have been sites of some of the bloodiest space battles in history, as large Vampire Fleets have attempted to force their way across the Great Rift and through the Quarantine into the Spinward States to prey on the societies there. This was possible because the pre-Collapse Imperial Navy maintained a large number of secret calibration points throughout the Great Rift, and their locations became known to Vampire fleets which took over former Imperial facilities and ships, complete with their databases. These calibration points either had to be defended by large Regency naval forces or destroyed to prevent vampire fleets from using them.

It is known that some highly sophisticated vampire fleets have attempted to establish their own calibration points to cross the Great Rift, but none have as yet been entirely successful.

Cardinal Directions: In interstellar space, the terrestrial directions of north, south, east, and west with reference to the world's axis of rotation are clearly unhelpful. For this reason, the civilizations of Charted Space have adopted an analogous convention, based on the structure and rotation of the Milky Way galaxy. The four directions are coreward, rimward, spinward, and trailing.

Coreward: One of the four cardinal astrographic directions, toward the center of the galaxy, and therefore the opposite of rimward. Standard maps generally place this direction at the top, making it analogous to north on planetary maps.

Rimward: One of the four cardinal astrographic directions, toward the edge of the galaxy, and therefore the opposite of coreward. Standard maps generally place this direction at the bottom, making it analogous to south on planetary maps.

Spinward: One of the four cardinal astrographic directions, in the direction of the rotation ("spin") of the galaxy, and therefore the opposite of trailing. Standard maps generally place this direction at the left, making it analogous to west on planetary maps.

Trailing: One of the four cardinal astrographic directions, opposite the direction of the rotation ("spin") of the galaxy, and therefore the opposite of spinward. Standard maps generally place this direction at the right, making it analogous to east on planetary maps. Trailing is often rendered as Trail*ward* in contexts where this is more clear.

These directions can be combined in the same manner that northeast and southwest are used on planetary surfaces. Usually core and rim are placed first in compound directions, e.g., core-spinward, rim-trailing.

See also *Local Directions*.

Celestime: of or relating to navigation or commerce in space.

Charted Space: The name used for the volume of space known to imperial society. Charted Space does not merely include the territory of the former Third Imperium. It also includes all territory known by imperial civilization to be under the control of the Zhodani, Solomani, Vargr, Aslan, K'kree, and Hivers.

Before the Civil War, the size of the major interstellar powers in terms of sectors controlled was computed as follows: Third Imperium: 27; Aslan Hierate: 18; Hive Federation: 17; Two Thousand Worlds: 14; Vargr Extents: 14; Zhodani Consulate: 13; Solomani Confederation: 11.

Civil War: Commonly accepted term in the Regency for the War of the Shattered Imperium, 1117-1130. This replaces the inaccurate name "the Rebellion," which was only properly used by Lucan and Dulinor, who imagined that others were rebelling against their rightful leadership. The Civil War was hardly a rebellion, as it involved many factions each fighting for their own perceived advantage against multiple opponents, and not against a single power.

This usage of Civil War causes potential confusion with the Imperial "Civil War" of 604-622 (which, incidentally, was both begun and ended by a Grand Admiral of the Spinward Marches, Olav hault-Plankwell and Arbellatra Alkhalikoi, respectively). This was a civil war in name only, as the popular (e.g., "civil") participation which is the prerequisite of a civil war was noteable only by its absence. In reality it was merely a series of 18 *coups d'etat* or juntas, supported only by raw military power and largely ignored by the Imperial bureaucracy and populace, who muddled on, serving whomever happened to be sitting on the throne that day. When referred to at all, the war of 604-622 is referred to as the First Civil War, the Wars for the Iridium Throne, the Emperors' War, the Wars of the Fleets, or the Wars of the Throne. The reason for the profusion of names is that they all make dandy book titles for academicians seeking tenure.

C-Lag: The C-lag, or "lightspeed lag" refers to a phenomenon and a variety of implied naval tactics that result from the speed at which light, and hence passive sensor signals, propagate. The specific scenario to which c-lag refers is that of two warring starships or fleets, one of which has been operating in a star system (the *native* force), and another which has just jumped into the system (the *intruder* force). The c-lag phenomenon gives an operational advantage to the intruder force by allowing it to see the native forces before they can see it, in the following fashion.

A star system has been occupied for 24 hours by a native ship. The native ship is surrounded by a signature sphere consisting of all of the electromagnetic radiation which has been emitted by or bounced off of the ship for as long as it has been present in normal space. This sphere is now 24 hours old with a diameter of 24 light-hours or 26 billion kilometers, and the sphere continues to grow at the speed of light.

An intruder jumps into the system at a point 1.08 billion kilometers, or two light-hours from the native ship. Because it is within the native signature sphere, it immediately "sees" the native ship. More accurately, it is *capable* of seeing the ship assuming its sensors are good enough, and even then it would only "see" where the native ship had been two hours earlier. (1 billion kilometers is less than the distance from a star to orbit number 7, see **TNE** page 195, or 36,000 **TNE** space combat range bands or **Brilliant Lances/Battle Rider** hexes.) However, the intruder's signature sphere is only moments old, and will take about 2 hours to reach the native ship. That means that even if the native ship had sensors pointed at the exact location of the intruder, it could not detect it for two hours, because it will take that long for the signature to reach its sensors.

The intruder therefore has a potential 2 hour headstart which it can use to maneuver toward military targets, refueling points, or run away from a superior enemy force. This is a significant edge, and the advantage will vary depending upon the size of this lightspeed lag.

Because starships are such small targets, the example above is an extreme case, and works better in the case of a large signature such as an immobile planetary facility. Ranges of a billion kilometers are too great for starship-mounted sensors to obtain target locks on other starships, but the presence of radio traffic, active EMS emissions, and infrared signatures are sufficient to tip-off an intruder to approximate force compositions and likely activities of native forces.

Claw, the: Nickname for the Great Rift, so called because of its clawlike shape, originating as a broad area far to spinward of the Imperial borders, running through former imperial space in the Trojan Reach, Reft, Gushemege, Deneb, and Corridor Sectors, and arcing core-trailward to a narrow point in the Vland Sector. The former Domain of Deneb and its neighbors, now known as the Spinward States, were saved from Virus largely by the astrographic obstacle of the Great Rift.

Consolidation Wars: Wars fought in the Old and New Islands subsectors from 1106 until their enforced end in 1140 by RQS forces.

Core Axis: The axis along which the Zhodani core expeditions travelled, 30 parsecs in diameter and stretching from the Zhodani Consulate some 5000 parsecs toward the galactic core.

Core Expeditions: A series of eight expeditions launched by the Zhodani toward the Galactic Core, some 8000 parsecs away. The first of these was mounted in –4000 Imperial (1211.1 Zhodani calendar), the seventh in 750 (3311.1), and the eighth and most recent in 1149 (3487.2). The seventh expedition is known to have lasted 50 years for the round trip, and pushed to within 3000 parsecs of the core, a distance of 5000 parsecs from the Consulate. The eighth expedition is believed to have been a failure, and was abandoned partway through.

Deep space: Interstellar space, i.e., an area of space, usually a parsec across, which contains no stellar systems and typically no astronomical bodies of any significant size. However, these areas are only very poorly understood by contemporary science, because of the very real difficulties of getting around in them. With no refueling resources, deep space areas are the "no man's land" of interstellar travel.

The primary means for "exploring" deep space is by passive observation from a parsec or more away using very long baseline observation (VLBO). However, the sort of cold bodies likely to inhabit deep space are very difficult to detect, and given the fact that it takes 3.26 years for data to travel one parsec from a would-be observed object to a VLB sensor, these sensors have absolutely no value as militarily applicable tactical sensors. However, VLB observations are crucial for the establishment of deep space calibration points (which see).

Deep system: The outer zone of a star system, typically synonymous with the area surrounding a system's gas giants. The deep system is frequented mostly by military traffic which do not intend to call at the system's primary world, and are merely using the gas giants for refuelling.

The deep system is one of the primary areas of responsibility for system defense squadrons, which allows them to attack and destroy intruding forces either while they are refueling or before they can refuel and are vulnerable because they have insufficient fuel for extended maneuvers or to disengage by jumping away.

Dilgaadin, Branj: Also known as "Father of the Psions." Long-serving seneschal of Norris Aledon, Duke of Regina, Archduke of Deneb, and First Regent of the Regency, born 1065 and died 1146.

Dilgaadin was a telepath, and served Norris by serving as a figurative second brain and pair of hands. It was well known in the Spinward Marches that Norris' seneschal carried the full power of the Duke himself, so Dilgaadin was able to dramatically expand Norris' effectiveness by telepathically monitoring the Duke's thoughts and carrying out the Duke's wishes in his name. Dilgaadin also transcribed his telepathic exchanges with the Duke/Archduke/Regent, and these documents constitute the most valuable of the First Regent's personal papers.

Dilgaadin naturally functioned as a close advisor and confidante of Norris, and was eventually appointed as High Regent for Psionic Reforms in 1133. With this mandate Dilgaadin orchestrated Norris' repeal of the psionic suppressions and brought Regency psionics into the open, and organized the new schools that would encourage psionic development. The shaved head style affected by almost all Regency psionics is a tribute to Dilgaadin, who was himself naturally bald.

Branj Dilgaadin is believed to have been the driving force behind the unsuccessful marriage of state between Avery Alkhalikoi and Seldrian Aledon (which see). Some observers believe that in the last decade of his life Dilgaadin exerted an over-protective and insular influence on the weary First Regent.

After having spent most of his life as Norris' closest advisor, he was perhaps jealous of the influence of others who would have shunted Dilgaadin aside.

Dream Time: Popular term used in the Regency for the period following the Collapse and concluding with the formal opening of the Regency Frontier in 1202. The term is intended to invite thoughtful and grateful comparison to the Long Night of –1526 to 0 (dogmatically, local dates for Dawn vary) Imperial calendar. The phrase was coined by popular political writer Ignatz P. Yaonis in his remark, "Now come the times when we alone are left to dream the Imperial dream until it re-awakens to carry on again." It also connotes that the regressed, isolated worlds of the Wilds are individually sleeping and waiting, like Snow White, for the kiss of a devoted and courageous hero to bring them back to the land of the living.

Emotional Connection: One of the major psychological underpinnings of Zhodani society. Unlike emotional sovereignty (which see), emotional connection is an explicit assumption among the Zhodani.

Emotional connection is a by-product of the integration of psionics into Zhodani society. Psionics allows the Zhodani to know that all humans share many of the same relevant vulnerabilities, fears, hopes, and desires. The knowledge that all people share these characteristics removes the need for people to conceal these characteristics for fear of ridicule or the perception of strangeness. This basic knowledge that all people are substantially alike leads to a sense of social and emotional connectedness in which members of a society can assist each other in achieving the goals that all people share, and undercuts the impetus for dishonesty. The most important sensation of emotional connection is a sense of true community.

Emotional Sovereignty: One of the major, though not articulated, psychological underpinnings of imperial society and culture, and a by-product of the prohibition of psionic powers in imperial culture.

Without psionics, the contents of an individual's mind are secret. Thus emotional states, beliefs, hopes, dreams, and fears that are common to all humans are believed to be unique to the individual simply because no one has the opportunity to experience their universality among sapient beings. Because the individual imagines these states to be unique, and potential sources of weakness, they are usually kept secret from others, and the individual must chart his own course, relying solely on his internal strength, unable to depend on the persons around him who would ridicule or prey on him if they knew his inmost thoughts.

It is this inability to share common core experiences that leads to deceit in imperial society. The fact that imperial humans keep up a false front before their real feelings creates the necessary conditions that allow deceit to arise in other areas of their lives. The most important sensation of emotional sovereignty is a sense of loneliness.

This is the opposite of emotional connection, which see.

Exodus: Name for the flood of Zhodani refugees entering the Regency beginning in 1201. Such dramatic developments from the normally stable and slow-moving Consulate surely indicate disastrous events within the Consulate, but the nature of these events is not known to the Regency.

***Fait Accompli* Worlds:** Domain of Deneb worlds under the nominal control of Vargr or Aslan invaders when the Quarantine and Regency were being finalized in 1131 and 1132.

Although the Domain was committed to support its citizens who were fighting off the alien invaders, the arrival of Virus allowed no time for human armed forces to eject the interlopers before Virus would arrive. In order to defend its worlds, the new government was forced to recognize the Vargr or Aslan rulers in order to gain their cooperation in creating a Virus-tight frontier.

These worlds, which are still inhabited by their sometimes downtrodden, rightful human owners, are one of the greatest sources of conflict within the Regency today.

First Regent: The unique title for Norris Aella Aledon, who served as the first Regent of the Regency from 1132 until his death in 1157. This is the result of the early structure of Regency government, which had secondary and tertiary Regents in charge of specific areas analogous to the old Imperial Ministers. In strict dynastic usage (from which the imagery of the Regency was derived), there can really only be one Regent, who serves in the stead of the sovereign. Thus "First Regent" is as nonsensical as "First Emperor." So with the redesignation of the Second and Third Regents as High Regents, Norris' title of First Regent came to denote his status as chronologically the first leader of the Regency.

Subsequent Regents have not been formally known by their chronological number (i.e., Seldrian was not "the Second Regent"), but simply as the Regent.

Football: The rimward-most portion of the Regency, considered to be Aslan territory in the pre-Collapse period, although it had been Imperial territory before the *ihatei* invastions. It was reaquired by the Regency during the period of the establishment of the Quarantine in the face of local Aslan disorganization and unwillingness to create a united frontier against oncoming Virus.

The Football proper consists of Regency worlds in the Gazulin, Sindal, and Tobia subsectors of Trojan Reach and the Usher subsector of Reft. The Aslan Hierate also administers a number of border worlds that are inhabited mostly by imperial-culture humans. It is popular opinion that these serve as hostages against the treatment of Aslan within the Regency.

Free clone: A clone who is allowed to develop as a normal "natural" personality, rather than being shaped to replicate the personality of its objective parent. The opposite of a free clone is called a simulacrum (which see).

Frontier Wars: A series of five wars predominantly between the Zhodani and Imperium fought in the Spinward Marches from the period 589-1110. Various Vargr states and the Sword Worlds were usually allied with the Zhodani in these wars as the Outworld Coalition.

Geneering: Contraction for GENetic enginEERING. This applied science includes the field of cloning as well as the modification of "natural" creatures by the introduction of genetic material by retroviruses.

Governance: All truly great governments (in that they serve something of lasting value, beyond the simple perpetuation of their own power) stand for something beyond their simple existence. In a sense, this is the greatest indictment of the final form of the Third Imperium, which was content to remain a passive greenhouse, rather than acting as a gardener or farmer.

The Regency faces similar judgement. While Norris portrayed and shaped the Regency government according to values of integrity, service, and honesty, the vast majority of its citizens agree that any government must retain the right to maintain certain secrets, and act in the public interest even without public awareness. While Norris' aspirations were clear and admirable, the Regency is the lineal descendant of the Third Imperium, which made extensive use of secrecy and benign neglect. How much could the Regency redirect these traditions within itself? More importantly, what of the cognitive dissonance within Norris himself (and his descendants/successors)? He passionately believed in courage, honesty, and accountability, but was quite able to use secrecy to his own benefit, most notably in his self-appointment as Archduke (page 9), and his illegal accomodation with psionics (until 1133, when he made his crimes legal, see page 12). So far as the public is aware, all such examples were scrupulously managed for the public benefit, but there remain two issues: 1) what else did Norris do that we are not aware of, and 2) the Platonic formula that dictates that capability is equivalent to an occasion for misuse (evil).

Is the Regency firmly founded on honor according to universal values, or has it made so many compromises with secrecy, expedience, and self-righteousness that it is ripe for abuse and subversion? In practice, most governments teeter agonizingly back and forth on this precipice, between their real desires to stand for something timeless and their leaders' susceptibility to flattery and the seduction and celebrity of power.

Ensuring that governments remain on the proper side of this precipice is the duty of the governed, whether they live in a democracy or a dictatorship (although the weapons in these two examples are quite different, as are the risks in taking them up: cowards can comfortably live much longer in a democracy than they can in a repressive dictatorship). In other words, people get the government they deserve, or at the very least, demand.

In practice, one must remember that Norris was a man, subject to the same errors and sins of commission and omission of any other. But to the extent that he was also the architect of the human future, his actions come under the scrutiny of a higher court.

Great Rift: See "Claw, the."

Imperial: Used capitalized, it refers to a citizen of the Third Imperium. Many Regency citizens still think of themselves in this light, and think of the Regency as nothing less than a smaller Third Imperium.

Used lower-case, refers to any member of the social culture that was standardized within the Third Imperium as opposed to members of the Zhodani, Sword Worlds, Darrian, Aslan, Solomani, Vilani, or Vargr cultures. The citizens of the Regency are heirs to this culture, which includes the classic imperial attitudes toward such things as psionics, nobility, planetary government, anagathics, etc. Regency citizens are therefore often referred to as imperials because their Regency is simply a renamed continuation of this imperial society and culture.

One of the facets of this cultural orientation is a *laissez-faire* attitude to local planetary affairs. In its positive sense this is a commitment to the principles of home rule and local self-determination, and a tolerance for the broad variety of cultures that can peacefully coexist within such a non-intrusive political umbrella.

Its dark side is manifested in a willingness to look away from injustice and corruption on the planetary level so long as these inconveniences do not extend to the interstellar level. This was a byproduct of the feudal structure of the Imperium, and was expressed in such things as the Imperial Rules of War and the concept that while individual worlds were responsible for themselves, the Imperium owned the space between these worlds.

This tendency was most strongly exhibited during the time of the Third Imperium in which cruel military dictatorships or corrupt pseudo-religious dictatorships were winked at by the interstellar authorities because they were "more efficient" than their more inclusive or humane predecessors or alternatives. This cynical focus on keeping the Imperial trains running on time at the cost of those citizens who might ride them is one of the imperial excesses condemned by the Regency. The Regency's policy of replacing feudal representation with popularly elected planetary representatives is a major aspect of this new thinking.

One of the Aledon or "Norrian" ethical reforms is the creation of an explicitly active concept of tolerance as opposed to the passive tolerance of the Third Imperium which often amounted to nothing so much as an institutionalized laziness. In describing this concept, Norris explained,

"Tolerance is easy, and hollow, when you believe in nothing. So long as you

don't care, anything is fine with you. Nihilists are the most open-minded people you'll ever meet, except that they are not open to the one thing that makes life worth living, and that is meaning. Meaning brings beauty and provides hope, which the nihilists have a desperate need for.

"But meaning is difficult. It requires thought and pain and perseverance. It requires sorting through ambiguous and seemingly contradictory elements all woven together in complex, frustrating knots. But that is the price of meaning and beauty. It requires courage.

"Tolerance must be an active concept, a conscious embracing of that which is not familiar to you, a willingness to believe that there is a truth greater than the contradictions that are all you can see now, and that by embracing life and those around you living that same life, you will find that truth. Tolerance is the faith that there is a purpose to what we do here; it is not simply an emptiness where no beliefs lie."

Imperial Core: The meaning of this term varied with usage. To inhabitants of the Marches, "behind the claw," it referred to the entire contiguous Imperium to trailing of the Great Rift, from Vland Sector on.

To residents of this region, it specifically referred to the coremost sectors: Core, Dagudashaag, Zarushagar, and Massilia. These were the longest-settled and most advanced and sophisticated of the Imperial sectors, with continuous history dating back to the First (Vilani) Imperium.

By definition this term referred only to this core imperial area, but it came to connote the arrogance and self-satisfied sophistication of these regions, where exquisitely detailed family trees showing the right sort of Sylean, Vilani, and Solomai bloodlines were the currency of social importance. In this rarified society, the presence of a questionable ancestor many centuries in the past was often sufficient reason to deny entry to social, political, or business organizations.

Because of the importance of this social core (as opposed to the astrographic, or galactic core) the term "coreward" was often used to mean toward the Imperial Core, rather than in its proper meaning (see Cardinal Directions). In this meaning, coreward in the Marches meant "trailing," in Vland and Lishun meant "rimward," on the K'kree border meant "spinward," and only in the region of the Solomani Rim, Daibei, Diaspora, and Old Expanses meant "coreward" in its proper meaning.

Intruder: Standard term used in military starship tactical, operational, and strategic theory. The intruder force is the force which most recently jumped into the star system under examination. Compare with *native*.

The classic presumptive characteristics of the intruder force include: 1) Post-precipitation disorientation, 2) no active C3D organization, 3) empty fuel tanks with consequent limitations on tactical (maneuver drive) and operational/strategic (jump drive) mobility, 4) offensive and/or proactive in nature, 5) beneficiary of c-lag phenomenon.

Local Directions: Colloquial terms used by Regency citizens in place of the standard cardinal directions (which see). Rather than being related to a more "universal" framework such as the Milky Way galaxy, this terminology is based on conditions local to and descriptive of the Regency point of view. All of these terms serve both as directions and as names for the astrographic areas referred to.

Outrim: Toward the Regency's trailing frontier with the Wilds, so-called because it is outward toward the uncivilized Wilds. Outrim is also the name for the astrographic region comprising the Great Rift, trailing Deneb, and the Corridor Sector.

Incore: Toward the center of the Regency, so-called because it is inward, facing toward the core of surviving civilized areas. Depending upon the position of the speaker within the Regency, this direction can be spinward, coreward, trailing, or rimward.

Deeprim: Toward the Regency's coreward frontier with the Vargr, so-called because on the far side of the razed Vargr fragments lies uncharted space.

Shortrim: Toward the Regency's spinward frontier with the Zhodani Consulate, so-called because of the closeness of the highly developed areas of the Regency and Zhodani Consulate along this border.

Thinrim: Toward the Regency's rimward frontier with the Aslan Hierate, so-called because of the thin stellar population of this area as well as the perceived thinness of this border with the Aslan states.

Meta-identity: Literally "above identity," refers to electronic or Viral consciousness which is able to move itself from one body to the next while retaining the same identity. This is the opposite of the embedded- or "point-identity" which has thus far been universally present in biologically-based sapients.

Minor Human Race: A human society planted by the Ancients during the period before –300,000 and which developed separately from other human-inhabited worlds until it was eventually contacted by a star-faring society. Thus the Sword Worlders and inhabitants of the Islands subsectors are not a minor human race because they were not planted by the Ancients, although they did evolve their own societies while separated from the mainstream of human society. Likewise geneered races likek the Jonkeereen are not minor human races.

During the imperial period, minor human races were distinguished from major human races by the fact that minor human races had not discovered jump drive on their own, while major races had. The only so-called "major" human races are the Vilani, Zhodani, and Solomani.

Native: Standard term used in military starship tactical, operational, and strategic theory. The native force is the force which was already operating in the star system under examination when the enemy force jumped into the system (this recently-arrived enemy is labelled the *intruder*, which see). The native force is typically cast in the role of the defender, and is the victim of the c-lag phenomenon (which see). Status as native or intruder force has nothing to do with which side actually "owns" the system, but simply distinguishes which fleet is the most recent arrival.

The classic presumptive characteristics of the native force include the following: 1) "up and running" C3D organizations, 2) effective deployment around key worlds, bases, and refueling points, 3) fully fueled and provisioned, 4) defensive and/or reactive in nature, 5) victim of the c-lag phenomenon.

Natural: Opposite of artificial (no, really, keep reading). Refers to a creature created (i.e., conceived and born) by simple, instinctive, biological means, as opposed to a creature created by cloning, geneering, etc.

Refers also to a pre-existing physical object rather than one artificially constructed.

Noble Appurtenances: Collective term that refers to all of the duties, rights, responsibilities, privileges, properties, possessions, and powers that accrue to a noble by virtue of the patent of nobility. These are considered distinct from that individual's personal possessions, rights, etc., although this dividing line can sometimes be difficult to establish in the area of possessions and property.

Norrian: Adjective used for any concepts, developments, and socio-ethical beliefs particularly associated with First Regent Norris. Classic Norrian values include duty, service, inclusiveness, and governmental openness.

Outrim: A colloquial term used by Regency citizens to refer to the Regency's frontier with the Wilds, especially the frontier that runs along and through the Great Rift. See Local Directions.

Outworld Coalition: The name for the several groups of powers that fought against the Imperium in the five Frontier Wars. The coalition always included the Zhodani plus several *ad hoc* Vargr states (often created by the Zhodani for the sole purpose of serving as allies in these coalitions) and often the Sword Worlds.

Note the pre-Collapse meaning of "out," i.e., away from the Imperial core and toward the Zhodani in contrast to its current meaning: toward the Wilds of the former Imperium and away from other civilized areas, such as the Zhodani Consulate.

Penetration: Entry into jumpspace (j-space) from normal space (n-space). Also referred to as departure, j-transition or j-translation. Usually accompanied by brief biological unease, but this is not militarily significant as objects in jumpspace are unable to interact with other objects in jumpspace. (Exception, large gravity sources project "shallow" perturbing influences into jumpspace under some circumstances.)

Penetration is accompanied by gravitic "indentation" and "ripples" which can be detected by sensors with a hard fire control lock on a departing ship. Proper analysis of the penetration angle, jump envelope configuration, and entry vector can allow a prediction of the likely direction and distance of the jump. Prevention of such penetration lock-ons is one of the main missions of rear-guard screening forces in space combat. Area jammers and nuclear "white-out" patterns are typically used to obscure enemy view of friendly penetration for just this reason.

Point Identity: The concept of self possessed by all known biologically-based sapients, also known as embedded identity. Unlike *meta-identity* (which see) which comprehends itself as existing above, and independent of whatever bodies it may occupy, biological point identity consists of a self which cannot be meaningfully discussed without the living body which gives it all of its means for data collection and self-expression. Although most sapients have a concept of the "spirit" or "soul" which is an example of meta-identity, in all cases this soul simply disappears following the destruction of its body. This is in marked contrast to a vampiric intellect which can move from one electronic processing system, or "body," to another while retaining the same continuous identity.

Precipitation: Entry into normal space (n-space) from jumpspace (j-space). Also referred to as emergence, n-transition, and n-translation. Precipitation is accompanied by gravitic "bulging" and "ripples" which can be detected by passive sensors in normal space starting several minutes before impending precipitation. However, this phenomenon is sufficiently short-ranged that sensor operators must have a prior idea of the precip point in order to focus on it and detect it.

For those participating in the penetration, it is usually accompanied by brief but militarily significant biological unease, such as nausea or disorientation, which can confer a temporary advantage to native forces if they are overwatching the precip point.

Project Longbow: LONG Baseline Observation Window, the name for a system created in the 800s for observation of the galactic core and the Zhodani axis of exploration toward the core. Longbow was the largest known application of aperture synthesis (see **Fire, Fusion, & Steel** page 50) ever constructed, and was a deep Imperial secret throughout its existence. Longbow was created to observe the Zhodani core expeditions, and, after many decades of data accumulation and calibration was actually able to measure Zhodani shipping activity along the core axis. Because sensor signatures propagate at the speed of light, the observations were not in real time. Rather, the deeper into the core the sensor "looked," the older the signatures. Beyond a range of 1500 parsecs, whose EMS radiation had been travelling for about 4900 years, the Zhodani had not yet arrived in the time-space observation window, or TSOW (1100 – 4900 = –3800, and the first Zhodani Core Expedition only began in –4000). Thus the first Zhodani

expedition was being observed at a range of around 1500 parsecs while the seventh expedition (which departed in 750) was being observed at a range of only 110 parsecs in the year 1100. Observations of more recent events could only be made by moving the observing sensors nearer the target. (Conversely, observations of older events could be made by moving to an observation point much farther away from the event. Naturally this capability was only possible with jump drives that could move observers faster than light itself.)

The Longbow collector plane was located in the Depot/Lishun (1219 Lishun) system as part of the sprawling Imperial Navy facility there, aiding in its concealment. The collector plane was a disk of billions of linked receiver elements 46 billion kilometers in diameter, the size of the orbit 12 orbital disk (**TNE** page 195). This collector yielded a resolution at 1500 parsecs of 10 meters in long-wavelength infrared, and of half a meter in visible light.

Strephon was at Depot/Lishun observing Longbow activities when Dulinor assassinated one of his ceremonial doubles at Capital on 132/1116.

A more ambitious project, Longbow II, based on the lessons learned from the first Longbow, was begun under Strephon's direction in 1103. This project would use the entire width of the Imperium as its long baseline. With its sensor termini located in the Spinward Marches and Antares Sectors, in resolution but not sensitivity, Longbow replicated a passive sensor dish with a diameter of 160 parsecs (30 trillion kilometers), sensitive in all electromagnetic bands, from gamma and x-rays down through visible light and infrared all the way to long-wavelength radio. Longbow would be able to achieve a theoretical resolution of 0.05 *centimeters* at a range of 8000 parsecs, the distance to the galactic core. However, unlike the original Longbow whose disk-shaped receiver provided two-dimension resolution (width and height), Longbow II's long baseline lay only in the width dimension, along the galactic plane. This meant that this spectacular theoretical resolution was only in width, not height. Longbow II data was to have been collected at all of the listening points along the "bowline" and carried by jump-6 Imperiallines couriers to its "focal point" at Depot/Lishun where the data would have been synchronized (by such methods as pulsar emissions within the common field of view of all of the sensors), compiled, filtered, and enhanced by lengthy and demanding computer runs.

However, the calibration of such a complicated system was expected to require decades if not centuries before meaningful observations on the galactic core could be extracted, but the Civil War intervened, destroying the project. All Longbow II data is presumed to have been lost.

Project Jumpstart: An initiative approved by Emperor Strephon in 1103 to create a backstop in the event of a major breakdown of Imperial society. Jumpstart placed a number of high-technology caches throughout the Imperium, usually collocated with existing Imperial facilities: IISS and IN bases, offices of various Imperial ministries, and Imperium-subsidized schools, colleges, libraries, museums, and public works projects.

The Jumpstart cache is almost always a self-contained, autonomously-powered, hermetically-sealed, and sensor-shielded chamber buried deep beneath the ground. These caches are not, contrary to popular imagination and holovid entertainment, huge subterranean arsenals of high-tech weaponry. Instead, they provide information on crucial scientific and technological breakthroughs so that these can be recreated if they are lost as the result of a society-wide catastrophe. Much of this information is the broad base of mathematical, physical, biological, and engineering concepts on which these breakthroughs are built. This information also usually includes blueprints or prototypes of crucial equipment associated with these breakthroughs, such as superconductor technology and jump drives, or samples and cultures which must be synthesized to permit certain medical breakthroughs.

In order to reduce the chance of unauthorized use, many Jumpstart caches contain equipment or instructions which can only be used in conjunction with material or information contained at other Jumpstart caches.

Rape of Trin: In 1139 Trin (3235 Spinward Marches) was attacked by a vampire ship, the former Ziru Sirkaan battleship *Kishkii*, which destroyed most of the world's orbital facilities and bombarded the world's surface for several hours before finally crashing itself onto the world's surface. *Kishkii* was the sole survivor of a huge vampire fleet, estimated at between 60 and 80 vessels, which had deliberately advanced across four subsectors with what appeared to be the sole purpose of destroying Trin.

The rape of Trin killed 3 billion inhabitants outright, but tens of millions more died in the following months and years from radiological injuries. With the destruction of its orbital shipyards and port facilities, industrial facilities, and solar power collector/transmitters, the world's economic heart was ripped out, and Trin could no longer support itself, let alone repair the tremendous destruction done to the surface infrastructure. Although Trin received emergency technical and disaster relief from neighboring worlds and the Regency government, most of the five billion displaced persons had no choice but to emigrate to surrounding worlds. In 1202 Trin has still not recovered its former population or tech levels.

Kishkii's vampire fleet entered the Regency frontier in the Nusukha system (2127 Deneb), probably coming from Hysyl (2425 Deneb) in the Wilds. From Nusukha the fleet jumped to Prefecture (1827 Deneb), Gatooma (1730 Deneb), then Ishiri (1429 Deneb).

At each stop in the journey the fleet was faced by system defense forces which attempted to whittle the fleet down, slow it down, and buy time for couriers to leave the system and carry warning to surrounding worlds. However, it became clear that the fleet's target was none of the systems through which had passed thus far. This path led only through systems with poor quality (usually Class E) starports and gas giants. This allowed the vampire fleet to conduct gas giant refueling without being molested by large system defense forces.

From Ishsir *Kishkii* and her attendants jumped to Djar (1229 Deneb), Sipedon (0929 Deneb), and Askigaak (0629 Deneb). It was evident by now that the *Kishkii* fleet possessed an intact database on worlds in this region. From Askigaak the force jumped to Zyedl (0431 Deneb), and then to the Furens system (0334 Deneb). Here the vampire fleet met a task force commanded by Fleet Admiral Arthur Arkan. Arkan deployed the majority of his task force at the system's three gas giants. As expected, the bulk of the vampire fleet emerged from jump at the largest of the three. However, *Kishkii* was not among them. She entered the system at Furens, a water world, with a smaller force of ships. Although Arkan's task force adjusted quickly to this development, it was not enough to stop *Kishkii*, which had cleverly misdirected the human force. While *Kishkii*'s escort fanned out to form a high guard, *Kishkii*'s fuel shuttles siphoned fuel from the oceans below. Once refueled, *Kishkii* jumped from the system alone, leaving her remaining escorts to serve as a screen, in which duty all were destroyed.

Kishkii's next and final destination was Trin. She emerged in the system at Trin's 100-diameter gradient, and did not attempt to refuel. Instead she fired volley after volley of missiles and spinal mount fire at the world and its orbital facilities while completely ignoring the defending Regency ships that were battering her. The defenders were able to destroy hundreds of the missiles, but those that slipped through caused widespread destruction. No accurate count of the number of detonations has ever been made. As a last act of defiance, *Kishkii* dove into the world, adding to the damage already done.

Mop-up operations after the attack took months as each system along the vampire fleet's route and several parsecs to each side had to be carefully searched. Also, any ship sighting of a suspicious nature had to be investigated. Naturally there were a large number of sightings for years after the incident, but careful investigation proved them to be groundless.

In commemoration of this tragedy, the Trin's Veil subsector was renamed Trin's Shroud in 1140.

RASAC (Regency Artificial Sentience Analysis Commission): RASAC is the arm of the Regency government specially organized to study the phenomenon of virus and develop countermeasures for it. All virus-infected machinery, including vampire ships, are remanded to RASAC custody for study, followed by sterilization and repair or disposal.

Headquartered on Rhylanor (2716 Spinward Marches), RASAC has field offices on most Regency worlds, and has representatives on the staffs of all Regency Navy and RQS units.

In late 1201 a number of documents, reputedly stolen from secret internal RASAC files, were widely distributed to the Regency news media. These documents, if authentic, showed that RASAC was involved in more than research on virus countermeasures, but was actually involved in breeding domesticated strains of virus for its own use. The documents also implied that RASAC leadership was sympathetic to the notion that some strains of virus were living creatures with the same rights to exist as other sapient beings, and foresaw a future in which organic and electronic sapients would coexist in the same society.

The public response to these revelations (see **TNE** page 77) was naturally one of outrage. Special commissions appointed by the Regency Senate and Moot to investigate these charges are still under way.

Regency Election Observers: One of the hurdles of instituting representational reforms on a formerly feudal polity is the difficulty of ensuring fair elections on worlds which have no such traditions. Regency Election Observers are posted to observe elections on worlds which are new to democratic procedures or which are in danger of having their democratic processes subverted by some other force.

In only 60 years the REOs have established a tradition of dedication, honor, and courage. Hundreds of REOs have been killed while attempting to enforce legal and democratic standards, especially on the Vargr and Aslan-ruled *fait accompli* worlds (which see). See also "Lucifer," page 64.

Regent: The single executive leader of the Regency, essentially equivalent to the old position of Archduke of the Domain of Deneb. This position is held for life, and is obtained by formal designation by the previous holder of the office.

The title High Regent applies to a number of Regency officials appointed by the Regent and confirmed by the Regency Senate. The subject matter areas presided over by High Regents correspond to those of the old Imperial ministries.

RISS: Regency Interstellar Scout Service. Renaming of the Imperial Interstellar Scout Service, although the RISS has contracted quite a bit from its antebellum scope. Most of this is due to the sealed nature of the Regency borders. With no outward exploration, much of the service's mandate has disappeared, and with it one of the former IISS mission offices, the Exploration Office, has disappeared as well, officially disestablished in 1135.

The RISS retains two mission offices which continue its Imperial-era responsibilities: the Survey Office (formerly the Imperial Grand Survey, IGS) and the Communications Office. (The RISS also retains its four support offices: the Administration Office, Detached Duty Office, Technical Services Office, and Operations Office.) The Survey Office is responsible for resurveying and updating

the navigational charts of the Regency, and for mapping world surfaces when necessary. Since 1135 this office has also been made responsible for the Regency's navigation aids, including the commercial penetration corridors.

The Communications Office is responsible for operating and maintaining spaceside components of the XWeb (see page 21).

Much former IISS equipment and many of their facilities have been taken over by the Regency Quarantine Service (RQS).

RQS: Regency Quarantine Service. Stood up in 1131 using primarily IISS equipment, bases, and personnel. See page 19.

Safeside: Inside of the Regency Frontier, in the safe area.

Shriekers: The Shriekers are an omnivorous pseudo-mammalian race with four pairs of limbs and three pairs of eyes, native to the world Shvreeyiyi/567-908 (SM 1031, page 49). Each pair of eyes is specialized for a different area of sight: distant sight, near sight (less than one meter), and infrared sight. One pair of limbs are used as hands, ("manipulators"), and the other three pairs are used for locomotion. However, these limbs are short and the Shriekers can only move relatively slowly. The Shriekers have therefore developed a prosthetic device known as "walking legs." These legs are essentially jointed stilts harnessed to the six walking limbs that raise the Shriekers above the ground to allow more rapid travel. Because use of these stilts requires a surgical modification to the limb joints, these Shriekers are permanently crippled if their walking legs are taken from them. However, Shriekers skilled with these legs are able to perform any and all activities without removing them.

Shriekers reproduce sexually via sacs of eggs which are protected and fertilized outside of the body, one at a time. These unfertilized eggs are known to imperials unaware of their actual nature as "denuli gems" and can fetch as much as Cr10,000 each. However, Shriekers will not permit such use of their unborn offspring. See also **Adventure 10: Safari Ship** (SA).

Simulacrum: a clone fashioned to duplicate the original from which it was created. Such clones are raised in environments similar to those of the originals they are to simulate, to enable them to be as much like those originals as possible.

In the Third Imperium it was a tradition dating back to Paulo I (684-767, r. 736-767) that heirs apparent to the Iridium Throne would be cloned in infancy to provide stand-in "ceremonial emperors" to deal with the fact that the Emperor cannot be everywhere at once, although he is expected to be. This tradition later spread to high nobles, especially dukes and above.

The status of simulacra as individual human beings is problematic. Some emperors created programs to allow their simulacra to be rehabilitated and enter society as "real persons," while others simply ordered them to be destroyed like common animals upon their deaths. Imperial ethical theory is thus seen to have been deficient in the area of advanced genetics and bioengineering.

Squatters: This pejorative term is used by imperials to refer to the Aslan *ihatei* who flowed into the during the Final War. However, given friction between imperial and Aslan culture, the term is often extended to all Aslan, including assimilated Regency Aslan as well as Hierate Aslan.

Spinward States: Post-Collapse term used to refer to the governments centered around the Spinward Marches Sector which survived the Collapse and onset of Virus. Strictly speaking, the Spinward States include only the signatories of the 1132 Spinward States Accords that formalized the Quarantine. However, the term has become used for any of the surviving societies in the area, even those, like some Vargr States and the Federation of Arden, who were not signatories. These include the Regency, Zhodani Consulate, Darrian Confederation, Sword Worlds, Aslan fragments (those to spinward of the Great Rift), Vargr fragments (those sufficiently in the shadow of the Regency that they were able to escape the destruction wrought on the fragmented majority of Vargr society), and minor groupings, such as the Federation of Arden, Old and New Islands, Florian League, etc.

All of these states are "behind the Claw" in the imperial vernacular.

Terminal Noble: A noble who, due to the Representational Reforms, knows that he or she will be the last member of his or her line (see "Local Status of Nobility," page 17).

Third Imperium: Human-dominated interstellar society which existed between the years 0 and 1130 (Imperial calendar). This society was the largest interstellar society in Charted Space until 1117, when it began to disintegrate in a Civil War. The last act of this war was the release in 1130 of virus (which see), an artificially intelligent electronic combat system, which brought down all that remained of the Imperium in an event called the Collapse. The only survivor of the Third Imperium was the Domain of Deneb, since renamed the Regency.

Toons: Obscure imperial slang for Aslan, because they have only four digits on each hand.

Tower, the: The Great Tower of the Giyachii arcology which forms the most visible and recognizable part of the personal residence and offices of the Regent. As such, it has become the shorthand expression for the office and entourage of the Regent, in the same way as "the Palace" was used to refer to the office of the emperor.

Tree Kraken: Also known as land squid, the tree kraken is a 6 kg pouncer originally from Forboldn (SM 1808, page 38), but which has become distributed to many worlds in the Regina (C) and neighboring subsectors of Spinward Marches. The tree-kraken resembles the Terran octopus, but has only six arms, and is adapted to a terrestrial lifestyle, with a stiffer internal structure. Tree krakens live in trees and jump on their victims from above, using their excellent long-range binocular vision. Two to seven toothed suckers at the end of each arm scrape bits of flesh from the prey and place it in the ventral mouth, located between the arms.

Worlds with known tree kraken populations include Forboldn, Menorb (1803/Regina), Kinorb (2202/Regina), Jesedipere (3001/Aramis), Aramanx (3005/Aramis), Extolay (1711/Lanth), and Dinomn (1912/Lanth). It is rumored that the tree kraken's liver contains compounds useful in the manufacture of anagathics. (See also **JTAS** 1, OP, and **Best of the Journal** 1, SA.)

Tree Lion: Dangerous carnivore/pouncer native to Jesedipere (SM 3001, page 39), and now distributed to forested subtropical regions on many worlds of the Regina (Spinward Marches/C), Aramis (Spinward Marches/D), Lanth (Spinward Marches/G), and Rhylanor (Spinward Marches H) subsectors.

Tree lions resemble large 10-legged spiders (hence their other names: drop spiders and shovel spiders) massing 1 kg and covered with stiff bristles. Tree Lions live in trees and, using their shovel-shaped anterior limbs (hence, you know what I'm going to say), excavate pits around the base of their tree homes which they line with a smelly, sticky web which is attached to the lion's lair by "telegraph lines" which transmit the vibrations of prey struggling in the pit. The tree lion rapidly descends on another web line and delivers a paralyzing bite to its prey. They only rarely present a mortal danger to adult humans (although they can make short work of toddlers), except those who are allergic to the venom. Most humans only suffer paralysis of the bitten limb for 1D6x10 minutes; clearly the worst thing about tree lions is the shock of having a nasty, sharp, prickly two-pound spider suddenly sitting on your shoulder. (See also **JTAS** 18, OP.)

The profusion of creatures named "Tree something" in the Spinward Marches was the source of much jocularity in the Imperial Core (which see) during the antebellum period, when the populations "behind the claw" (which also see) were commonly regarded as frontier rubes by Imperial sophisticates. These jokes usually portrayed the people of the Marches as sodbusters who always had their noses in the dirt and were easily surprised by anything above them. It was joked that "Marchers" called air rafts and airplanes "tree cars," and called birds, "tree...thingies." However, we all know who got the last laugh.

Tree Rat: Also known as the Focaline Tree Rat because of its world of origin (2607), the tree rat is an arboreal omnivore similar in appearance to the Terran rat, although it is more intelligent, approximately equivalent to small Terran monkeys, with comparably complex social structures. Adult tree rats mass 3-4 kg and are 70-80 cm long, with two-thirds of this length being the rat's prehensile tail.

Although they can be pests, raiding orchards for the fruits that form the majority of their diet, they also perform a beneficial role by preying on more serious pests, such as insects, mice, and true rats. They have an excellent sense of smell, and are intelligent enough to be readily trained to detect fires, human emotional states, and suspicious substances. They are also clean and easily housebroken. They have become widely distributed through human space, and are common pets or mascots aboard starships because of their intelligence and friendliness, useful skills, clever and amusing antics, and their ability to keep starships free of vermin.

They are very adaptable, able to rapidly shed or grow thicker coats in response to temperature changes. Tree rat fur is reddish-brown, but can vary to extremes of chocolate or maroon. Part of the tree rat's charm is its natural curiosity and mischievousness, which asserts itself in the collecting of small, shiny or colorful objects (tools, keys, money, jewelry) which it will hide in its nest. They quickly learn to play with their owners by obviously stealing a valuable item and then leading their owners on a chase to get it back. (See also **JTAS** 10, OP, or **Best of the Journal** 3, OP.)

True Father/True Mother: The original person from whom a clone or clones are made. Also referred to, less romantically, as "donor," "source," "original," "pattern," or "objective parent." Clones of an original "natural" person are euphemistically called "true sons" or "true daughters" of the original.

Vampire Fleet: A group of ships controlled by virus. Such fleets often constitute a group mind, in which the fleet is the whole organism and each ship performs a specific function for that organism, analogous to an organ within an organic body. Such fleets are extremely dangerous. Not only can they infect other systems like most any virus-controlled system can, but given their control of an entire fleet of ships, their means for inserted their code into target systems is dramatically increased. Furthermore, because they possess the mobility and firepower of a fleet of starships, they can easily destroy what they cannot infect. Many of the dead worlds in the Wilds were killed by vampire fleets which bombarded life support systems, power grids, and containment domes until life became impossible.

Vampire Ship: A starship controlled by virus. Such a starship is actually a thinking, albeit artificial, being in its own right. The virus infestation can be said to have brought the inanimate ship to life. Where once the ship was a thing, it is now a creature.

Virus: The artificial intelligence weapon created and unleashed in the last days of the Final War, and which brought about the Collapse. Virus in its many mutated forms can infect almost any electronic data system, and once established within such a system, functions as a self-aware brain, controlling any and all systems and equipment to which the electronic system was connected.

Wildside: Outside of the Regency Frontier, in the Wilds.

Referees Only

REFEREES' SECTION

This section is for the use of referees only, as it details areas of potential mystery and interest to the players which can be resolved and detailed over the course of adventuring. These items are particularly those which are not common knowledge to the population at large.

Players will find that it is easier and more rewarding to roleplay characters who do not know a secret fact if they themselves as players do not know these details. After all, it is only in this way that PCs can experience the thrill of discovery as a campaign unfolds. For this reason, players will enhance their future roleplaying experiences by refraining from reading any further into this section.

So if you wreck your campaign by reading too much, don't come crying to me.

THE ANCIENTS

Yes, the Ancients are the Droyne, kind of, and there's also this guy called Grandfather...(**Secret of the Ancients**, OP, etc.) but such things are not known by the general public, nor even for certain by Smart Scientists. For purposes of campaign development and play, the Ancients can safely be assumed to be out of the picture.

THE REGENCY

Perhaps the one major identity crisis being faced by the Regency is the tension between imperial traditions of governmental secrecy and autonomy and the newer Regency and Norrian values of openness. While openness has been dramatically successful in cases like the Psionic Reforms, there has been a basic reluctance by the Regency government to be completely honest with its citizens about some of the dangers they have faced since the Collapse. Prudence dictates that opportunities for public panic must be limited. However, insufficient openness can create unrest by convincing the public that things are being concealed from them.

Although Norris certainly championed governmental openness, he also demonstrated great ambivalence on this score. Some of his most effective acts, such as appointing himself Domain Archduke in 1116, relied on his having a certain amount of secret maneuvering room. Acutely aware of this, he would have deliberately preserved such prerogatives. Tendencies toward hidden-hand ruling styles would only have been reinforced by the influence of Avery, trained in the autocratic imperial style of his ancestors.

Secret Regency Calibration Points

The Regency maintains or interdicts calibration points other than those shown in the Data Section (pages 35-72). These include CPs intended for the normal strategic mobility purposes, but also include special-purpose CPs, such as those allocated to Project Blackheart, see below. Rather than listing any here, let it suffice to say that referees should feel free to add secret CPs at points where their campaigns require them. People who look at maps of the Great Rift with a creative, analytical eye will be able to work out where they think useful CPs would lie, and there is a good chance that Imperial and Regency Navy officers have had exactly the same thoughts.

Note also that an interstellar hex can hold more than one calibration point, all of which would be, for all practical purposes, unobservable one from the other.

Firebreaks

Significant planning was done for the possibility of a massive virus breakthrough and the measures that would be required to contain it. These plans involved the phased fallback of the Regency Frontier in order to maintain a defensible perimeter. Depending upon where the Quarantine had been breached, certain areas of the Regency would have to be abandoned as undefendable. Rather than attempted to evacuate these worlds in a disorganized fashion, which would only increase the risk of further infection, these worlds were to be immediately excluded from the safe perimeter and their evacuees would have to pass through the full-up Quarantine just as refugees today do. This policy would thus trade the "cold-hearted" abandonment of many innocents for the increased chance of survival of the whole of the remaining civilization. However, in the hard calculus of virus and the Collapse, these coldly pragmatic principles seem the only rational approach.

For obvious reasons these plans and the list of worlds they would abandon as "expendable" are political hot potatos/toes. With the limited opening of the outrim frontier, these plans are being dusted off once more.

Project Blackheart

In late 1110 the emerging lessons of the just-completed Fifth Frontier War were used to lay the foundation for a new Imperial military capability to be used in future frontier wars. The most important of these lessons was the validation of the "reserve" strategy rather than the "crust" strategy to defend the Marches. Rather than having to maintain impervious forward defenses at all points along the border, the reserve strategy allowed for initial enemy penetration which would then be defeated in depth and eventually reversed through the use of reserve forces held in central locations.

The Zhodani siege of Efate was broken by just such an approach. The world of Louzy (1604) was the chokepoint for of all Zhodani shipping to Efate, and rather than sacrificing themselves in a "hold at all costs" stand, the Louzy system defense force "went to ground" where it remained a threat, able to gather intelligence on Zhodani operations and conduct attacks on their supply lines. After several months of this constant disruption of the siege, the Zhodani campaign into the Regina subsector was effectively abandoned (**The Spinward Marches Campaign**, OP).

An ambitious program to enhance future such operations in the enemy rear was instituted and named Operation Blackheart (*TD* 11). Blackheart consisted of the construction of a number of calibration point bases within the Imperial boundaries which would provide secure bases for the conduct of deep interdiction in the Zhodani rear areas. Each of these bases was home to a squadron of newly constructed *Nemesis*-class Intruder Cruisers, placed in mothballs awaiting hostilities.

Tailor-made for their intended mission, the *Nemesis* cruisers are equipped with jump-5 drives, fuel tankage for jump-6, black globe generators, powerful spinal mounts, but no secondary or tertiary armament. Their jump drives confer high operational/strategic mobility from their bases, and the fuel capacity allows jump-3 stand-off raids without refueling. The tactical profile of the *Nemesis* squadron is to jump into an enemy-occupied system, raise the black globes, and coast (hopefully) undetected to close firing range while charging the jump drives for jump. Once in firing range the cruisers drop their globes and open up a high-intensity volley with their powerful spinal mounts, doing maximum damage in minimum time, and then immediately jumping away before the enemy can adjust to the attack. Thus the provision of armament other than the spinal mounts would simply detract from the mission. And as these raids will primarily be against logistical facilities, forward depots, fleet trains, and other high-value soft targets, the *Nemesis* cruisers are not expected to have to stand up to heavy enemy fire in any event.

Blackheart CPs are especially concentrated in the Abyss of the Vilis (F) and Lanth (G) subsectors.

Because of the good relations between the Zhodani and Regency between 1110 and 1201 there has been no chance for the *Nemesis* cruisers to be used in their intended role. The weak point in the Blackheart program was the necessity of anticipating hostilities sufficiently far in advance for the *Nemesis* crews to be assembled, trained up, and have time to reactivate the ships. However, RASAC (see Library Data) was conducting preliminary studies on the feasibility of adapting the Blackheart force to "Man out of the Loop Autonomous Operations." RASAC was ordered to terminate these studies by direct communication from the First Regent.

Project Longbow

The Library Data entry is correct, although incomplete. After its creation, the Longbow project became an umbrella organization for a variety of long-range observation and intelligence gathering systems focused on the Zhodani and galactic core, which included natural and augmented psionics as well as the Longbow II project already discussed. These included smaller versions of the Longbow VLB array, but placed much closer to the core, many sectors to coreward of the Vargr extents. These observations were carried across the light years to the Imperium by relays of couriers, similar to the old Xboat network.

Many of these observations were connected to ongoing psionic research, particularly attempts to isolate the physical phenomena (as opposed to supranormal phenomena, see Psionics, below) associated with psionic activity. So in addition to collecting and processing EMS data in the normal fashion, this EMS data was examined for evidence of psionic activity by wiring human psions into the loop.

Although there was little unambiguous evidence of psionic signals being received this way, the research was continued as a great number of useful data was being generated. (This included the creation of baseline data on how typical EMS signals are perceived by psionic perception which had many useful applications in signals processing technology, the establishment of data protocols that would allow the electronic storage of telepathic or teleperceptive visions for later observation by other psions, and, entirely by accident, the discovery of the amounts of electronic information that could be pushed through a human brain without burning portions of it out.)

Longbow observations in the last years before the disintegration of the Imperium showed what appeared to be space combat along the core axis, headed toward the Zhodani Consulate. Regency intelligence agencies believe that this was connected to the observation of unusual Zhodani naval activity in 1119 (see **Survival Margin**, pages 22-23). These events presumably prompted the hasty core expedition of 1149 which ended in failure, and is in turn connected to the current upheavals behind the Exodus.

However, the final dramatic Longbow observation was actually connected to the Imperium's disintegration, as it was the reason for Strephon's absence from Capital on

the day Dulinor assassinated one of his doubles (**Survival Margin**, pages 7-9). It was one of the few unambiguous examples of the reception of psionic signals across interstellar distances, and was dramatic enough and connected to enough other events that it required the emperor's personal attention.

The signal was carried by a normal EMS wavefront emanating from the core, although of great strength and coherence. It was perceived by psions as a human female, dressed in black, standing before a city skyline. Also in the background was a scene of a desert with two astronomical bodies hanging above the horizon.

This vision was projected into Strephon's mind by psion Jonathan Crocker, the psionic relay on duty at the Longbow focal point during Strephon's visit. Both Crocker and Strephon agreed that the vision was not a "still picture," but a motion picture of a pregnant moment, waiting for an event or a message to be delivered, in Crocker's words, "one of those moments when the birds suddenly stop singing for no reason." Whether this was their joint perception of a real phenomenon or simply Strephon responding to Crocker's impression embedded in the projection is not known.

The woman was holding a staff which may have been technological in function, and had a bearing of great, even regal, dignity which was enhanced by the perceived timelessness of the image. Strephon immediately began thinking of the woman as an empress.

As an EMS phenomenon it was advancing toward the galactic rim at the speed of light, and projection of its propagation indicated that its arrival was associated with several Longbow stations having inexplicably gone silent. This implied a danger of some kind and required Strephon's attention. Future projection of the wave established that it would reach the Imperial border in 1205 at Meridian 78 along the Prime Radial (**Survival Margin**, page 7), using the standard Imperial coordinate system (page 19, **MegaTraveller Imperial Encyclopedia**, SA). This designates the point 78 parsecs to coreward of Reference (0140 Core) on the line running directly from Reference to the galactic core. This corresponds to the then coreward border of the Third Imperum in subsector A of Lishun Sector.

The gravity of this information, combined with uncertainty of the security of the important Longbow headquarters prevented Strephon from accurately referring to this journey (**Survival Margin** page 13, *TD* 15), but many of the key Longbow personnel were eventually able to make to Usdiki where they helped Strephon's government in exile formulate responses to this crisis. This included the eventual creation of Avery (see "Avery Aledon/Alkhalikoi," below). Raw data from the Longbow II program was removed from Depot/Lishun for transport to Usdiki, but was lost *en route*. Its fate remains unknown.

These details have been kept from the public for the simple reason that, until more information is available, there is no point in having the public believing the Millenium is arriving in 1205, making everything that they do pointless.

Psionics

The Imperial armed forces had a number of highly secret psionic programs in hand for many years, in the Marches as well as elsewhere in the Imperium. However, the Domain of Deneb possessed the highest density of these programs, including operations at Wypoc (2011 Spinward Marches), Regina (1910 Spinward Marches), Vanejen (3119 Spinward Marches), and HRD (1623 Deneb), among others. These programs were quickly expanded (secretly from 1116 on, and publicly from 1133 on) to create the broader capabilities available to the Regency today.

Artificial Psionics: Advances in the understanding of the electrochemical processes in the human brain allowed the Imperium to experiment with what became known as "artificial psionics," although it is more accurately referred to as broadcast electrochemical-electrical synaptic replication, or BECESR (pronounced "beezer").

The goal behind BECESR is the creation of a psionic-type capability which would still function in a degraded psionic environment (see psionic countermeasures below). Thus while natural psionics would be incapable of functioning, artificial psions would be capable of replicating some of their useful functions.

BECESR technology is still in the experimental and field test stage, with certain elite (and naturally secret) groups of military personnel evaluating the equipment. Subjects fitted with BECESR technology are known informally as "wireheads," although this technology is almost never externally visible.

Natural Psionics and Supranormal Theory: Because BECESR technology functions within normal physical limitations, such as the speed of light limiting the broadcast of electrical transmission, this technology is considered to be inherently limited when compared to true "supranormal" phenomena.

Psionic researchers believe that certain psionic manifestations are truly instantaneous (i.e., the receipt of telepathic information has nothing to do with the speed at which light travels the distance between data and observer) because they represent the intrusion of a higher reality into the physical world. This theory posits that this higher reality exists everywhere simultaneously and is "adjacent" to all points in the physical world. Thus if telepath A reads person B's mind he is not actually perceiving energy emanating from B. Rather he is directly accessing the higher reality, specifically that part of the higher reality which is manifested in the physical world as person B's "spirit." This would mean that such readings would be instantaneous rather than being limited by the speed of light. This theory has not yet been adequately tested in the Imperium or Regency, as psionics is a young, imprecise, and often quite subjective science. Furthermore, the ranges at which telepathy and teleperception can reliably be achieved are not great enough to to demonstrate a measurable light-speed delay.

This concept links the science of psionics to the science of jump space, and many researchers in this area group both disciplines within the larger category of phenomena called the "supranormal."

Psionic Countermeasures Research: Psionic Countermeasures, or PCM, has long been a major area of research by the Imperial armed forces. The psionic shield helmet (TNE page 344) is the best-known example of these efforts, and has been in common public use within the Spinward Marches for many years.

Most PCM thought uses the analogy of ECM and ECCM in the electronic spectrum. PCM would attempt to "jam" psionic activity by interfering with either the quality of information at the target (as the shield helmet does) or the ability of psions to exercise their talents.

However, in reality (or "suprareality" as the researchers like to point out), the principles of line-of-sight between psion and the object of influence are not clear, and may not pass entirely through the physical world as it is commonly experienced (see supranormal theory above), and therefore may not be targetable. Nonetheless, the impinging of psionic influences into the world of "normal" physics argues that these normal principles can be turned back against psionic processes.

Military psionic researchers in the Regency have been split into two main groups, those working on psionic countermeasures and those working for psionic superiority. The countermeasures school reasons that the Regency can not overcome the Zhodani headstart in psionic applications, and finite resources are best spent to "cut the psionic leg" from under Zhodani standard operational procedures, thereby throwing them into chaos which Regency forces can take advantage of.

The superiority school does not deny the Zhodani lead, but believes that psionics are sufficiently powerful that their effective use, even in the face of an enemy capability, is more effective than denying both sides the use of the "psionic spectrum." These researchers maintain that creative research can discover immature applications that the Regency can rapidly exploit into narrow but specific "bandwidths of spectrum superiority."

The two groups, which bitterly compete for finite funding, have been united recently under the concept of "escalation dominance" which attempts to synergize the strengths of both approaches. In escalation dominance Regency forces would be able to set the conditions under which psionics were used, and retain the initiative at each level. Under conditions in which enemy psionic activity represents only a minor threat to friendly operations, PCM efforts would be minimal, allowing friendly psionic activities to be undertaken without interference.

At intermediate levels, PCM would be increased, but with gaps in coverage—"windows" where friendly psionic capabilities could be exercised. Thus friendly superiority in certain psionic capabilities ("bandwidths") would be combined with PCM against areas in which the enemy held the upper hand.

At the highest level Regency forces would be able to simply take the entire psionic arena out of play, thus blowing all psionics, friendly and enemy alike, "off the air."

Regency Psionics: Naturally there are psionics in the Regency who are criminals and who disregard their vows, but their numbers are actually very small, because Regency psions maintain a strict policy of internal monitoring via telepathic and teleperceptive skills. In other words, they do not grant the rights of privacy to each other that they grant to the non-psionic public at large. As with the monitoring, punishment is usually administered internally within the psionic community.

Minor and first-time infractions are dealt with by education, correction, and moral suasion, but serious crimes can be punished by psionic assault or drugs. Capital offenses are turned over to the Regency Ministry of Psionics, which maintains psionic courts and correctional facilities for just such purposes.

All publicly-known psionic schools are ethical (i.e., they practice internal monitoring and correction of their members). However, there are underground psionic schools which exist to encourage antisocial psionic development. Most of these have front operations of some sort, but these are never psionic schools and none are actively connected to a legitimate school.

Project Jumpstart

The Library Data is correct, but does not contain in-depth knowledge of the function of these caches that is not available to the general public.

Except in rare cases of accidents where individuals are trapped or sneak into the sealed

chambers, Jumpstart caches are unmanned and fully automated. Because they are unmanned, many Jumpstart caches are passive resources, requiring individuals to know of their existence and location in order to use them. Some Jumpstart caches are accompanied by subtle clues planted in their surroundings to assist inhabitants of a shattered society to find them. The fact that these caches are often sited beneath museums, libraries, universities, etc., is an example of this, because the location is one associated in the local mentality with information and knowledge. However, on some worlds the clues are quite sophisticated, being associated with local mythologies and folkways that would be expected to survive a civilization-destroying catastrophe.

Some Jumpstart caches have sophisticated sensor systems that determine whether local society has collapsed. The simplest of these is an electronic dead man's switch, an indicator that the Imperial facility above has ceased functioning. Others have passive EMS sensors emplaced on the surface which could determine, for example, the sudden absence of any broadcast transmissions on a high-tech world. The continued absence of these transmissions might activate clues to the location of the cache for self-selecting individuals. For example, surface dispensers could release written instructions that would only be comprehensible to literate, Anglic-speaking populations. These notes could lead explorers to mechanical, electronic, or holographic terminals that would screen individuals for pre-selected characteristics and grant them entry to the facility.

These could be as simple as electronic "toys" which would select for intelligent and technologically sophisticated individuals (see the novel **To Dream of Chaos** for an example of this, although it does not specifically involve a Jumpstart cache), or as complex as simulated reality persons or situations which would require explorers to demonstrate certain levels of knowledge or education, or certain cultural assumptions. (For example, Jumpstart archives would be programmed to not admit simple Vargr corsairs, for example.)

All Jumpstart caches include an entrance hall where a moving slideway carries the visitors past impressive holographic displays of the glorious accomplishments of the Third Imperium, accompanied by a recorded message from Emperor Strephon on the value of the Imperium and the importance of its preservation (see **Survival Margin**, page 3 for text).

Avery Aledon/Alkhalikoi

Although assumed by many to be a clone of the last emperor, Strephon Alkhalikoi, Avery was in fact the biological son of Strephon and the dead Empress Iolanthe. Avery was conceived *in vitro*, using frozen ova that had been removed from Iolanthe in her youth. However, Avery was geneered (see Library Data, "Geneering") for psionic capabilities of the type Strephon witnessed on his visit to the Longbow focal point in 1116 (thereby missing his "assassination" by Dulinor, see **Survival Margin** page 7). The name Avery means "spirit ruler."

The Regent Consort was not killed in 1149 as announced. Instead, he departed on a mission to the galactic core, in command of a force of natural psionics, artificial psionics, and ships controlled by a specially bred strain of domesticated Virus. His mission, for which his father Strephon geneered, trained, psychologically conditioned, and raised him, was to follow up on the Longbow data and determine its relationship to the Zhodani core expeditions and its threat to the Imperium. At the time of his departure the "Empress Wavefront" was 17 parsecs to coreward of the Regency Frontier, in the Vargr splinters.

Rape of Trin

The battleship *Kishkii* was originally built at the Trin shipyards as ISS *Golden Redemption* in 1080. She was assigned to one of the Corridor reserve fleets which retreated into Vland following the loss of Corridor to the Vargr invasions. There she was added to the growing forces defending Vland. With the restoration of the Vilani Empire (Ziru Sirkaa), *Golden Redemption* was renamed *Kishkii*. Because she destroyed herself in her dive onto Trin, her original identity as *Golden Redemption* is unknown to Regency authorities.

Regency Quarantine Service

Deceit and corruption are antithetical to the Regency's principles and the fact that compartmentalized secrecy increases the risk of Virus infestation. However, people are people. (So why should it be, that we should—oh, never mind.)

By 1202 there is a small but well-established ring of corruption within the RQS ranks. The ring is essentially a Wilds import business catering to the wealthy, often members of the terminal or disenfranchised nobility.

None of the members of the import ring intend any harm to the Regency, nor any *real* violation of the Quarantine. All would claim that they are utterly loyal to the safety of the Regency and its people, and there is truth in that. Many of them have selflessly risked their lives in the performance of their duty many times, and most of them would unhesitatingly give up their lives to defend against a vampire invasion.

All they are doing is allowing a small number of harmless items into the Regency that would otherwise be uselessly piled up in impoundment areas, waiting for their turn with inspectors who carry inspection backlogs measured in years. And after all, if they make some extra money on the side, that's only fair compensation for all of their years of sacrifice on the Quarantine line, risking their lives to stop virus, right?

There is truth in that as well. That is the beauty of any form of corruption. It starts out innocuously: small irregularities that are not against the true spirit of the rules, just against little technicalities that don't apply in this case. A victimless crime. And boundaries erode until the point, completely unanticipated by the individual, that they have been unwittingly crossed. (For an excellent study of this phenomenon see the 1981 film "Prince of the City.")

It began when wealthy refugees begged RQS personnel for the opportunity to revisit their old homes to recover important items. Although RQS personnel initially refused these requests, knowing that any exceptions would breed more exceptions and an eventual breach of the Quarantine, eventually some gave in. After all, what would it hurt if the items weren't electronic systems that could harbor virus?

In the Wilds adjacent to the Regency, as everywhere in the collapsed Imperium, there lives a small but determined population of stateless Free Traders who dodge innumerable dangers in the pursuit of their age-old profession. These brave individuals were willing and able to undertake these missions, and why shouldn't they be allowed to make a living? They've got it tougher than any Regency citizen, and so long as the Regency's security isn't breached, what would it hurt this once?

These arrangements grew to allow the sale of priceless, unique pieces of imperial art or items of historical interest, recovered from an abandoned museum, government office, or noble's estate somewhere in the Wilds. As the black market in these items quietly grew, its patrons began making wish lists of items they would like to see recovered.

Inevitably, someone threatened to blow the whistle on the operation. The first life that was taken to ensure silence was probably an accident, but then even that accident had to be concealed. RQS duty is dangerous, involving operations on the Frontier where its members are subject to the many normal mishaps of interstellar travel, not to mention the chance of encountering Virus, Vargr corsairs, etc., so operational losses are an unfortunate, though not unexpected fact of life.

RQS Secret Files: It is a well-kept secret that there were a great many close calls in the period 1132 to 1170 that could have rivalled or even surpassed the carnage of the Rape of Trin. Although a certain amount of publicity on the danger of vampire penetration was deemed by Regency leaders to be useful in ensuring public compliance with anti-viral measures, it was feared that too much fear would only undermine the stability of Regency society. For example, if it were to become commonly known that major worlds such as Deneb, Aramis, Rhylanor, and Regina had been seriously threatened by vampire incursions, a massive exodus from the Regency rims could have resulted. Such an exodus could have crippled economically crucial worlds such as Deneb and dealt a serious blow to the Regency's ability to continue to defend itself.

Was the risk of massive slaughter for these unwarned populations worth the chance to keep crucial Regency shipyards and factories running? This was the judgement of High Regent Avery Aledon and his adoptive father First Regent Norris.

Deneb alone was threatened by a "Class 1" threat on no fewer than six occasions in 40 years. Many such threats were destroyed at the last minute in deep system engagements in their target systems. In one particularly dramatic case, a vampire ship had worked its way across the Regency by masquerading as a merchant vessel, and had arrived in orbit around Rhylanor, its target. However, when it attempted to open fire, its otherwise competent circuitry discovered that its missile magazines were empty. The ship was dealt with rapidly by Rhylanor system defense, but the incident was not made public.

Other examples include the fact that many of the reports of suspicious ships following the passage of the *Kishkii* vampire fleet (see Library Data, "Rape of Trin") were in fact accurate reports of vampires. In the event, these "slave" ships turned out to be harmless without the presence of *Kishkii* to control them, and they were taken over by RASAC for study. Consistent with the policy of keeping controversial RASAC initiatives secret, the significance of these suspicious sightings were covered up by RQS authorities, with the knowledge and approval of higher levels, including High Regent Avery and the First Regent.

THE DARRIANS

The Star Trigger

Through much of their recent history, the fabled Darrian star trigger was only a bluff. The Maghiz event of -924 was the result of Darrian activities, but the Darrians were unable to reproduce this event. By keeping this fact a secret, the Darrians were able to use the purported star trigger as a powerful deterrent weapon.

However, in the late 1110s, the Special Branch was able finally to isolate the true chain

of events that caused the catastrophic flaring of Tarnis (see Alien Module 8, Darrians, SA), and by the late 1120s were able to produce a functional Star Trigger weapon.

The actual Star Trigger consists of three parts: two meson communicators and a probe which penetrates deep into the star. It is equipped with a cooling system that vents vaporized tungsten into the star as it descends. This creates a column of tungsten within the star that extends behind the probe. When the two meson beams are deployed so that their beams intersect at the proper angle within the tungsten column, intense solar flares result in about 10 hours. (The bluff Star Trigger consisted only of the probe, but without the tungsten emission and the interference of the meson beams, was unable to accomplish anything except scare people.)

Thus the star trigger requires three platforms: one each for the meson communicators and the probe itself. The meson communicators must be deployed so that they intersect at a very obtuse angle, requiring that they be many thousands of kilometers apart, on nearly opposite sides of the sun and far enough away to be able to directly communicate with each other outside of the stellar interference. The system can be deployed from one starship which carries one meson communicator and deploys the other communicator and the probe aboard drones. More often, however, two ships would be used, each with a meson communicator and one or both launching probes.

In theory, a star which already possesses high metallic concentrations could be triggered by the meson communicators alone, but research in this area has been understandably difficult to carry out.

Darrian Tech Level 16 Navy

Sad as this might sound, it turns out that the much-respected Darrian TL-16 fleet is something of a fraud as well. Although the Imperium derived substantial advantage from their single tech level advantage over the Zhodani, this was because the TL-14 to 15 gap offered many significant advantages, not least of which was the three-fold increase in power:mass density in nuclear power production.

The TL-14 to 15 gap is also accompanied by increases in efficiency in many electronic systems, plus the appearance of a crucial brand-new technology, the force field, better known as the "black globe generator."

However, the TL-15 to 16 gap's improvements are mostly of the incremental variety, and these incremental improvements are not as dramatic as the TL-14 to 15 nuclear power efficiencies. Because of the Regency's new mastery of TL-16 starship systems, gained over the past 70 years, the nature of this additional bluff is now common knowledge to any Regency citizen who cares to think about the subject.

Likewise, any TNE player can deduce from examining Fire, Fusion, & Steel, that these improvements are primarily incremental in nature as follows.

No Change: Armor, Jump drive, Control systems, laser, maser, and radio communicators, solar collector panels, Contra-grav, Beam pointers, Master fire directors, Laser gravitic focusing.

Increased Efficiency: Power production, Avionics, Computers, Meson communicators, Active EMS and jammers, Ladar, Densitometers, Neutrino sensors, Neural activity sensors, Passive EMS, Area jammers, Nuclear dampers, Meson screens, Sandcasters, Force fields, Fuel purification, Fuel cells, Nuclear power plants, Batteries, Homopolar generators, Explosive power generation, Solar sails, Particle accelerators, Meson guns, Laser focal array volume.

Combat Advantages vs. TL-15: Advantage for jamming TL-15 radio, *no advantage* for TL-16 weapons firing against TL-15 sandcasters.

New Capability: Repulsors and Manipulators.

Darrian Patrol Cruisers: One little known fact (because it is carefully concealed by both Regency and Darrian sources) is that all of the TL-16 "Darrian" Patrol Cruisers are in fact manufactured in the Regency. The design of these vessels and their subsystems are based on Darrian examples, but these were used as templates to guide the Regency's developing TL-16 industrial base to avoid developmental blind alleys before finally hitting on workable configurations.

There *are* TL-16 yards on Daryen, but these are engaged in pushing forward the frontiers of advanced starship design (again, using relic Darrian examples), allowing the vast Regency yards to concentrate on quantity.

Darrian Secret Base

This, at least, is not a bluff. The Darrians have for centuries maintain a secret base, used by its high-technology mobile deterrent fleets and Special Branch star trigger detachments. The base is a large (200 kilometer diameter) ice ball which provides starship refuelling. Over the years a vast infrastructure including repair, logistical, medical, and rest and recreation facilities have been built into and around the body. It is therefore in all respects comparable to the most sophisticated of the Regency Calibration Points.

The base is at all times guarded by a defensive squadron of SDBs to prevent its use by unauthorized agents. It is located in grid 0423, 2 parsecs to rimward of Zamine.

THE ZHODANI

The interior of the Zhodani Consulate, one or two sectors to coreward of the Regency, is wracked by open warfare and breakdown of social cohesion as Zhodani fight Zhodani for reasons that are as yet not understood. Zhodani society has been the most stable human civilization ever created, and Imperial sour grapes to the contrary, was never known to harbor any deep-seated, simmering dissatisfactions or internal contradictions.

Regency authorities believe that the Zhodani breakdown is related to the "Empress Wave" which has been passing through the Consulate for the past few decades, centered as it is an average of 40 parsecs farther to coreward than the Regency. The same way that Longbow outposts were observed to go off the air after having been reached by the Empress Wave, the Zhodani appear to be the victims of whatever phenomena follows the arrival of the wave. Because it appears to have a clear psionic component, it is reasoned that Zhodani society, with its social structure based on psionic powers, is uniquely vulnerable to the effects of the wave.

Based on data received with Avery, Longbow did not have information on the nature of the psionic signals on the other side of the Empress Wavefront, which by itself appears to be innocuous. It is likely that it is a phenomenon behind the wavefront observed by Longbow that is the actual cause of the Zhodani problems.

Without further data on the relation between the wavefront and the Zhodani breakdown it is impossible to project how the Regency will be affected beginning in 1205 when the wave breaks on its borders. This was the purpose of Avery's mission which departed in 1149, which would also examine the wave's affect on the Vargr to see how this compared with the Zhodani experience.

Evidence of the Zhodani breakdown was seen as early as 1119 in the form of starship movements which implied warfare within the Consulate. At this point the wavefront was approximately halfway across the Consulate, on a radius 26 parsecs to coreward of the Regency's coreward borders. However, it is not actually known if the strife is caused by a delayed effect at some point after the wave's leading edge has passed over or whether the Zhodani could have directly infected themselves with some related phenomenon through their traffic coming down the core axis (see Library Data).

The "intimations of doom" described by Zhodani refugees are a response to received psionic impressions of the unravelling of their bedrock-solid society as well as to the wavefront itself.

By the Way: The phenomena alluded to above are not related to past draft ideas about the "Primordials," "Sparklers," or "Baddies from the Core," although there are certain similarities, at least of origin. So you need not bone up on the old rumors.

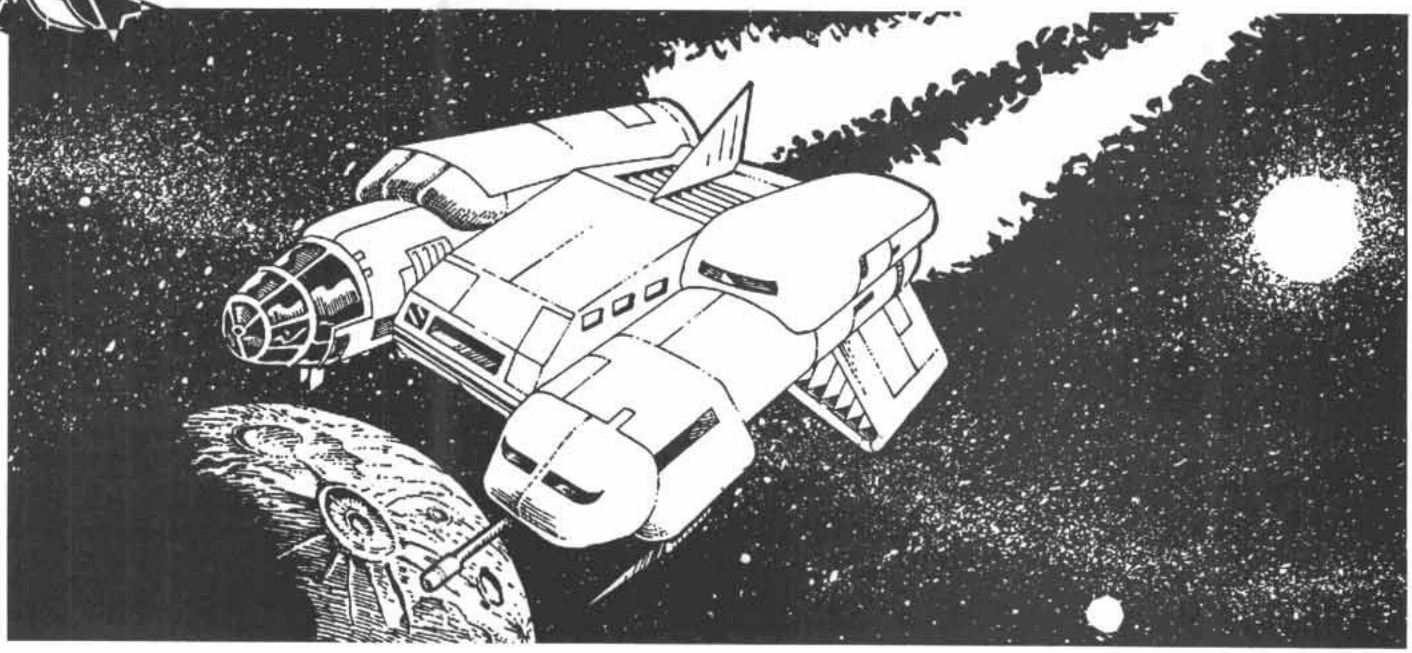
THE ASLAN

Regency intelligence services have observed evidence of several virus outbreaks in Aslan territory in the Riftspan Reaches. These are connected to Aslan efforts to reunite the spinward Hierate with its main body across the Great Rift, or at least to allow trailing Aslan to emigrate to the still-intact societies to spinward.

During the Collapse a great many Aslan began migrating across the Rift to safety, so that all of the circa 1130 Tlaukhu clans are today represented in the transrift territories, in at least small numbers. Due to the strength of Aslan familial ties, these small clan groups cannot resist the desire to reach out to their surviving brethren in the Wilds to bring them to safety as well. This sentiment, although laudable, increases opportunities for Virus infection. For this reason RQS inspections of Aslan immigrating to the Regency fait accompli worlds are increasing in thoroughness.

Aslan leaders both in and outside of the Regency interpret this development as anti-Aslan prejudice, intended to limit Aslan immigration into the Regency. The Regency is reluctant to explicitly present its reasons, for fear that this would be taken as either an attempt to interfere with Aslan internal affairs or as criticism of Aslan culture. Either way, the likely response is easily imagined.

THE VARGR



The Vargr Pack is not an example of organized crime in the Mafia style so much as it is a nationalist movement, operating covertly within the territory of another nation.

The Pack exists to funnel support out to Vargr groups in the Wilds, to support their efforts at rebuilding. While trade with the Vargr splinters along the spinward portion of the Vargr frontier is allowed, trade with the Wilds is illegal, as is any attempt to organize contact with the Wilds. Since the organization's core purpose is illegal, its methods and operations have been forced outside of the law as well.

Although the majority of Vargr in the Regency are not directly involved with the Pack, the nature of Vargr society and racial pride are such that most Vargr are eventually pulled into it one way or another, at least to the extent of paying Pack extortion or protection money, or providing their businesses as covers for Pack operations.

The Pack's leader is unknown, but this must be a quite charismatic Vargr to exert so much control over such distances, and anonymously at that.

Empress Marava-Class Far Trader

General Data

Displacement: 200 tons
Length: 42.5 meters
Price: MCr62.06 (72.84 armed)
Configuration: Wedge SL
Mass (Loaded/Empty): 1556.45/670.45 unarmed
1682.47/796.47 armed (see notes)
Hull Armor: 10
Volume: 2800m³
Target Size: S
Tech Level: 15

Engineering Data

Power Plant: 165 MW Fusion Power Plant (165 MW/hit), 1 year duration (11.585 MW excess, 1.475 MW excess when armed)
Jump Performance: 2 (420m³ fuel for Jump-2, 210m³ for J-1)
G-Rating: 1G (100 MW/G), Contra-Grav lifters (20 MW)
G-Turns: 48 (64.8 with Jump-1 fuel reserve, 81.6 using all jump fuel), 12.5 m³ each
Fuel Tankage: 1020m³ (72.86 tons) plus 16.5m³ (1.18 tons) reserved for power plant
Maint: 61 (67 armed)

Electronics

Computer: 3×TL-15 Model St (0.55 MW ea.)
Commo: 300,000 km radio (10 hexes, 10 MW), 1000 AU maser (∞; 0.6 MW)
Avionics: TL-10+ Avionics
Sensors: Passive EMS fixed array 30,000km (1 hex, 0.02 MW), Active EMS 3000 km (0 hexes; use long range for task difficulty in same hex; 5 MW)
Controls: Flight deck with 5×Workstation (only 3 used when unarmed) plus 1 other workstation.

Armament

2 turret hardpoint sockets fitted (Locs: 8,9; Arcs: 1,2,3). When weapons package is fitted, characteristics are as follows:
Offensive: 2×TL-15 150-Mj Laser Turrets (Locs: 8, 9; Arcs: 1, 2, 3; 4.2 MW; 1 crew ea.)
Fire Control Systems: 1×TL-15 Dual-purpose beam/missile MFD (6 Diff Mods; Msl 10 hexes; 10 hexes; 1.71 MW; 1 crew)

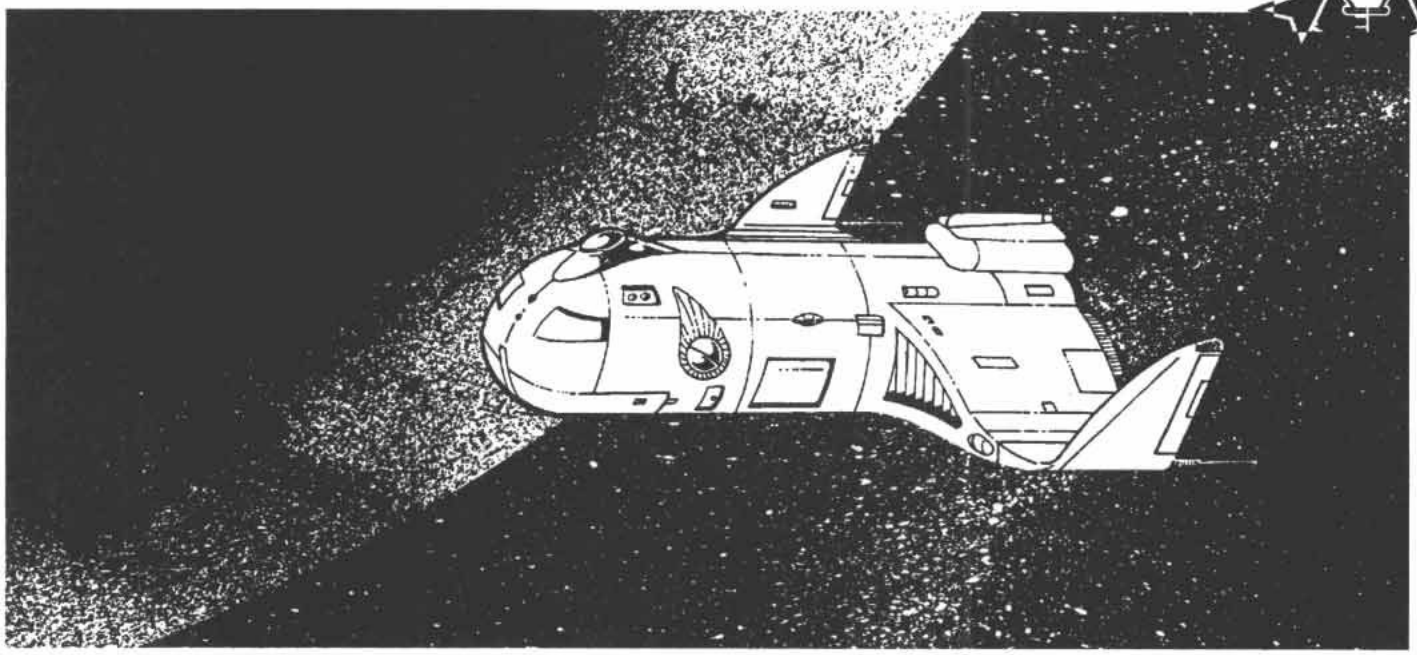
Accommodations

Life Support: Extended (0.56 MW), Grav Compensators (6G; 14 MW)
Crew (Unarmed): 5 (2×Maneuver, 1×Electronics, 1×Engineering, 1×Steward)
Crew (Armed): 7-9 (2×Maneuver, 1×Electronics, 1×Engineer, 0-2×Gunners, 1×MFD Gunner, 1×Command, 1×Steward)
Crew Accommodations: 1×Large Stateroom (0.001 MW), 4×Small Stateroom (0.0005 MW ea.)
Passenger Accommodations: 10×Small Stateroom (0.0005 MW ea.)
Cargo: 805.2 m³ (57.51 tons), 3 large cargo hatches
Small Craft and Launch Facilities: Air raft with internal hangar (Minimal), 1 launch port
Air Locks: 2

Notes

Off of the Spinward Main (page 42) where jump-1 free traders hold an economic advantage, the far trader in its many variants is the most common privately-owned merchant vessel in the Regency.

The far trader has space reserved for a weapons package as detailed above. The two turret gunners can be dispensed with and the turrets fired directly from the MFD, making a crew of only 7, but the unmanned turrets cannot be fired under local control should the need arise. Its sensor suite is optimized for low cost, not combat. Owners who bother to add the weapons package are well-advised to upgrade the ship's sensors as well.



Unlike the sleek and attractive TL-12 *Jayhawk* variant, the TL-15 *Empress Marava* variant of the far trader is the victim of some passing artistic conceit, current when the class was first designed, but lost to all contemporary understanding. With its prominent glazed nose, the Maravas are more reminiscent of TL-5 propeller-driven atmospheric craft than starships. In fact, their appallingly baroque appearance has led to their nickname, in naval circles, of "Puking Dogs." Their defenders point out that, although they may be ugly, they are at least "ugly with an attitude," namely defiantly unapologetic.

Fuel purification machinery (1.275 MW), 24 hours to refine 1020m³ (9.9 hours to refine 420m³). Fuel scoops allow 560m³ of fuel to be skimmed per hour.

DAMAGE TABLES

Area (1D20)	*Surface Hits*	*Internal Explosion*	*System*

TL-15 Subsidized Merchant ("Fat Trader")

General Data

Displacement: 390/400 tons **Hull Armor:** 10
Length: 43.6 meters **Volume:** 5460/5600 m³
Price: MCr87.58 (98.35 armed) **Target Size:** S
Configuration: Cylinder AF **Tech Level:** 15
Mass (Loaded/Empty): 3202.42/1175.72 unarmed
3328.43/1301.73 armed (see notes)

Engineering Data

Power Plant: 301.2 MW Fusion Power Plant (301.2 MW/hit), 1 year duration (10.17 MW excess, 0.06 MW excess when armed)
Jump Performance: 1 (560 m³ fuel)
G-Rating: 1G (200 MW/G), Contra-Grav lifters (40 MW)
G-Turns: 60 (82.4 using jump fuel), 25 m³ of fuel each
Fuel Tankage: 2060 m³ (147.14 tons) plus 30.12 m³ (2.15 tons) reserved for power plant
Maint: 125 (130 armed)

Electronics

Computer: 3×TL-15 Mod St Computer (0.55 MW ea.)
Commo: 300,000km radio (10 hexes; 10MW), 1000 AU maser (∞; 0.6 MW)
Avionics: TL-10+ Avionics
Sensors: Passive EMS fixed array 90,000km (3 hexes; 0.06 MW), Active EMS 60,000km (2 hexes; 7 MW)
Controls: Flight deck with 5×Workstation (only 4 used when unarmed) plus 2 other workstations.

Armament

2 turret hardpoint sockets fitted (Locs: 4,5; Arcs: 1,2,3). With weapons package fitted, characteristics are as follows:
Offensive: 2×TL-15 150-Mj Laser Turrets (Locs: 4, 5; Arcs: 1, 2, 3; 4.2 MW; 1 crew ea.)
Fire Control Systems: 1×TL-15 Dual-purpose beam/missile MFD (6 Diff Mods; Msl 10 hexes; 10 hexes; 1.71 MW; 1 crew)

	Short	*Medium*	*Long*	*Extreme*
TL-15 150-Mj Laser Turret	10:1/10-31	20:1/10-31	40:1/10-31	80:1/10-31

Accommodations

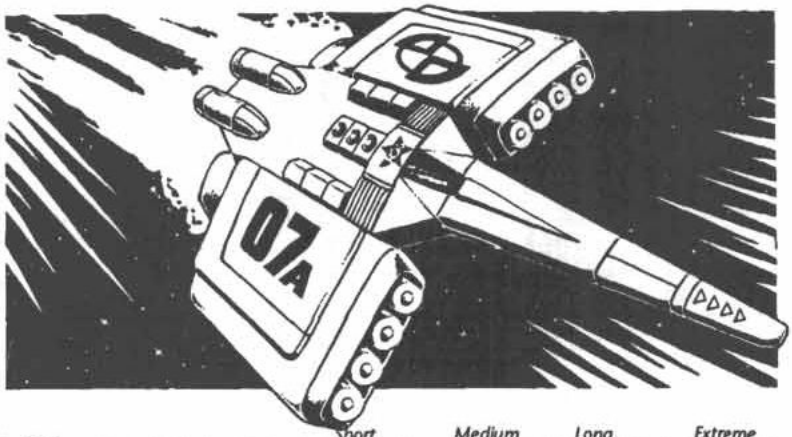
Life Support: Extended (1.092 MW), Gravitic Compensators (6G; 27.3 MW)
Crew (Unarmed): 9 (2×Maneuver, 1×Electronics, 2×Engineering, 1×Steward, 2× Small Craft Flight Crew, 1×Command).
Crew (Armed): 10-12 (2×Maneuver, 1×Electronics, 2×Engineering, 1×MFD Gunner, 0-2×Turret Gunners, 1×Steward, 2× Small Craft Flight Crew, 1×Command).
Crew Accommodations: 1×Small Stateroom (command; 0.0005 MW), 4×Large Stateroom (double-occupancy; 0.001 MW ea.)
Passenger Accommodations: 13×Small Stateroom (0.0005 MW ea.), 13×Low Berth (0.001 MW ea.)
Cargo: 1798.5 m³ (128.46 tons), six large cargo hatches
Small Craft and Launch Facilities: 10-ton Launch in AF External Grapple
Air Locks: 4

Notes

Because of its jump performance the subsidized merchant is encountered mostly along the Regency's "mains" (clusters of star systems linked by contiguous jump-1 routes), although with the use of auxiliary tanks it can cover two or more parsecs in consecutive jumps. However, this method is economically unviable, and is generally only used to move a ship from one main to another, usually resulting from a new owner or reassignment to a new market.

The "fat trader" has an efficient "drive-through" deckplan. With its rear cargo ramp and bow clamshell doors open its cargo deck is one continuous space.

The weapons package described above does not include a sensors upgrade. Crews who anticipate combat will want longer-ranged sensors to support the weapons. The two turret gunners can be dispensed with if the crew is content to fire the turrets solely from the MFD.



The ship itself displaces 390 tons; with its launch fitted to the grapple it displaces 400 tons. Jump, maneuver, and contra-grav drives are all configured to support the 400-ton figure.

Fuel purification machinery (2.8 MW), 22 hours to refine 2060m³ (6 hours to refine 560m³). Fuel scoops allow the skimming of 1092m³ of unrefined fuel per hour.

RQS Modular Inspection Launch and Jump-Boat

General Data

Displacement: 70 tons
Length: 28 meters
Hull Armor: 60
Volume: 980 m³
Price: MCr61.27
Target Size: VS
Configuration: Wedge/Box SL
Tech Level: 15
Mass (Loaded/Empty): 929.43/783.07

Engineering Data

Power Plant: 267.84 MW Fusion Power Plant (see notes; 267.84MW/hit), 1 year duration (0.0675 MW excess power)
Jump Performance: None
G-Rating: 6 (35 MW/G), Contra-Grav lifters (7 MW)
G-Turns: 76.9, 4.375 m³ of fuel each
Fuel Tankage: 336.272m³ (24 tons) plus 27m³ for power plant
Maint: 25

Electronics

Computer: 2×TL-15 Mod Fb Computers (1.1 MW ea.)
Commo: 30,000km radio (1 hex; 1 MW), 300,000km radio (10 hexes; 10 MW), 1000 AU maser (∞; 0.6 MW)
Avionics: TL-10+ Avionics
Sensors: Passive EMS fixed array 120,000km (4 hexes; 0.1 MW), Active EMS 300,000km (10 hexes; 15 MW)
ECM/ECCM: EM Masking (0.98 MW)
Controls: Flight deck with 3×workstations plus one other workstation

Armament

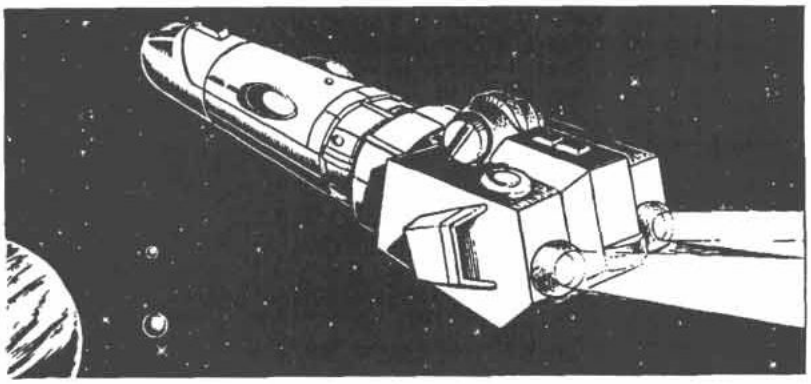
Offensive: 1×TL-15 144Mj Laser Lance (Loc: 1; Arcs: 1; 4 MW; Crew on Flight Deck), 1×TL-15 210Mj Laser Turret (Loc: 10; Arcs: 1-3; 5.83 MW; No crew), 2×Missile Pods (Loc: 13/15/17/19, 12/14/16/18; 8 ready Msls ea.; 0 MW, crewed from MFD), total of 16 ready missiles
Fire Control Systems: 1×TL-15 Msl/Beam MFD (6 Diff Mod; Msl 10 hexes; 10 hexes; 1.71 MW; 1 crew)

	Short	*Medium*	*Long*	*Extreme*
TL-15 144-Mj Laser Lance	10:1/10-30	20:1/10-30	40:1/5-15	80:1/2-8
TL-15 210-Mj Laser Turret	10:1/12-36	20:1/12-36	40:1/12-36	80:1/12-36

Accommodations

Life Support: Extended (0.168 MW), Gravitic Compensators (6G; 4.9 MW)
Crew: 4 (1×Commander/Pilot, 1×Engineer, 1×Gunner, 1×Electronics)
Crew/Passenger Accommodations: 3×Small Staterooms (0.0005 MW ea.)
Cargo: 10.826 m³ (0.78 tons), one small cargo hatch
Air Locks: 3

Notes



The inspection launch is an RQS-subsidized design like the quarantine cutter (see page 19), but is built for in-system operations only. In between RQS duty its owners use it for high-speed in system and courier service, often operating between a world and bases on its moons or in asteroid belts. It is a modular design, with a 50-ton main hull and two 10-ton pods, to port and starboard.

The missile pods, 210-Mj laser turret, and MFD pallet are RQS property, and are only fitted when on official duty. The price above includes these items, so the actual price to the civilian owner with two cargo pods is only MCr51.20. Each pod carries 112m³ (8 tons) of cargo, and with the MFD and turret socket space used for cargo, carriage is increased to 285.8m³ (20.4 tons).

Fuel scoop (2800m³/hr, or full fuel tankage in 7.2 minutes) is fitted, but no purification machinery is required for reaction mass.

General Data

Displacement: 55 tons
Length: 38.35 meters
Hull Armor: 60
Volume: 770 m³
Price: MCr47.11
Target Size: VS
Configuration: Needle/Box SL
Tech Level: 15
Mass (Loaded/Empty): 557.24/406.25

Engineering Data

Power Plant: 120 MW Fusion Power Plant (120 MW/hit), 1 year duration (3.8685 MW power surplus)
Jump Performance: 3 (154m³ fuel for Jump-3, 102.7m³ for J-2, 51.3m³ for J-1)
G-Rating: 3 (27.5 MW/G), Contra-Grav lifters (5.5 MW)
G-Turns: 84 with Jump-3 fuel reserve (99 with J-2 reserve, 114 with J-1 reserve), 3.4375 m³ of fuel each
Fuel Tankage: 442.75m³ (31.6 tons) plus 12m³ for power plant
Maint: 19

Electronics

Computer: 4×TL-15 Mod St Computers (0.55 MW ea.)
Commo: 1000 AU maser (∞; 0.6 MW), 1000 AU laser (∞; 0.3 MW), 300,000km radio (10 hexes; 10 MW)
Avionics: TL-10+ Avionics
Sensors: Passive EMS fixed array 120,000km (4 hexes; 0.1 MW), Active EMS 150,000km (5 hexes; 10 MW)
Controls: Flight deck with 2×Workstations

Accommodations

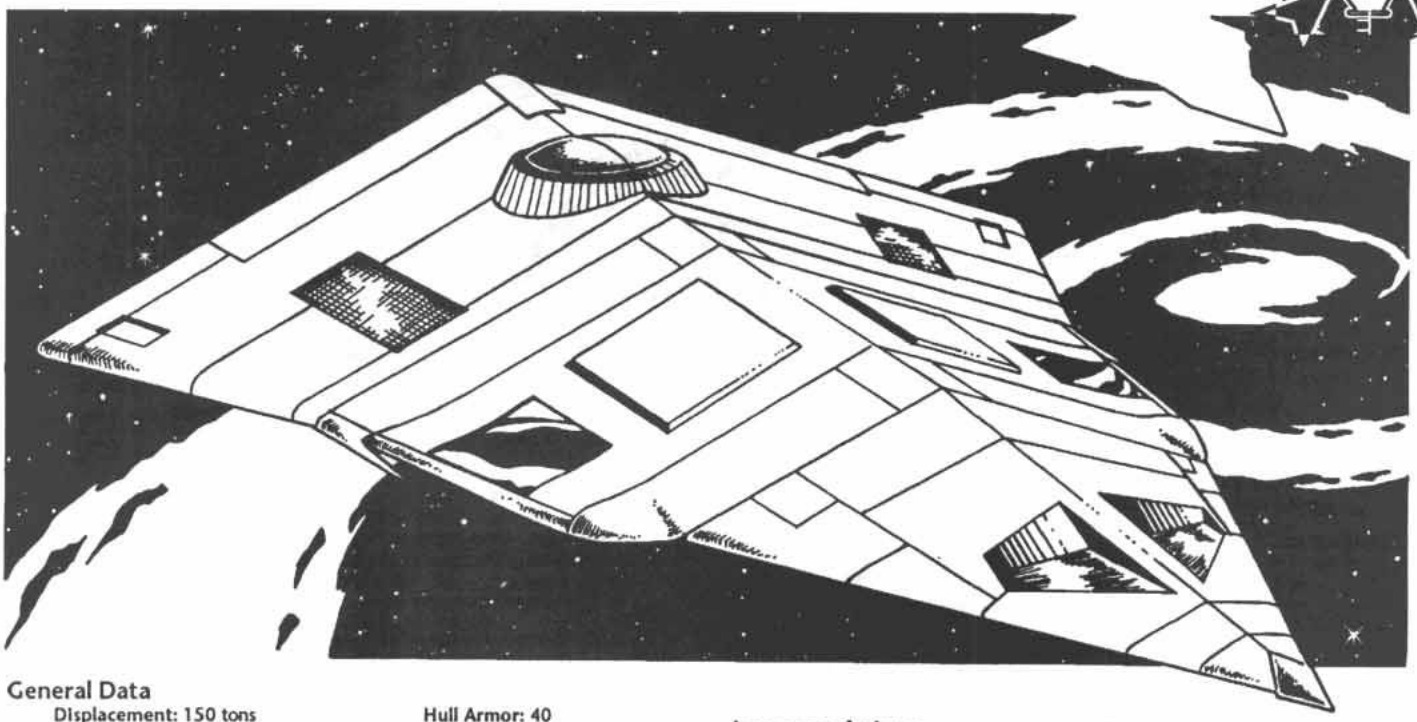
Life Support: Extended (0.154 MW), Gravitic Compensators (6G; 3.85 MW)
Crew: 2 (1×Pilot/commander, 1×Electronics/Engineer)
Crew Accommodations: 1×Small Stateroom (0.0005 MW)
Passenger Accommodations: (See notes)
Cargo: 120m³ (8.6 tons), one small cargo hatch
Air Locks: 2

Notes

The "Jboat" is a modified TL-15 ship's boat used to supplement Xboats for short-haul runs on the XWeb. The Jboat makes maximum use of standard ship's boat systems, including identical power plants, main hulls, etc. (See page 11.)

The small crew is allowed by the use of pregenerated jump programs and the fact that the craft will receive starport maintenance at the end of each jump. The fuel purifier is intended for emergency use, or if pressed into service as a fleet courier, as XWeb operations do not call for frontier refuelling (fuel scoop skims 154m³ per hour).

The fourth computer is a dedicated data storage/retrieval unit. Its capacity is entirely given over to XWeb electronic message storage and cannot be used for any "normal" computer tasks. (For details on the XWeb, see page 21.)



The variant shown here is the pure data/cargo variant. Small staterooms can be fitted at the expense of 28m³ of cargo each. Pure courier variants are fitted with four additional small staterooms (total of five) and have no cargo space.

For self-defense in high-risk areas, the Jboat can be fitted with a laser lance (see details with Inspection Launch above) at the expense of 28.2m³ of cargo, and MCr0.5522. The power overage allows its use with only a small (0.1315 MW) power shortfall.

Faith-Class Tier-4 RQS Quarantine Cutter

General Data

Displacement: 150 tons
Length: 38.75 meters
Price: MCr155.40 (144.17 unarmed)
Configuration: Wedge SL
Mass (Loaded/Empty): 1491.02/1017.65
Hull Armor: 40
Volume: 2100m³
Target Size: S
Tech Level: 15+

Engineering Data

Power Plant: 318 MW Fusion Power Plant (318 MW/hit), 1 year duration (0.588 MW power surplus)
Jump Performance: 3 (420m³ of fuel for Jump-3, 280m³ for J-2, 140m³ for J-1)
G-Rating: 3G (75 MW/G), Contra-Grav lifters (15 MW)
G-Turns: 60 with Jump-3 fuel reserve (75 with J-2 reserve, 90 with J-1 reserve, 104.8 using all jump fuel), 9.375 m³ fuel each
Fuel Tankage: 982.5m³ (70.2 tons) plus 31.8m³ reserved for power plant
Maint: 43

Electronics

Computer: 3×TL-15 Model Fb (1.1 MW ea.)
Commo: 1000AU radio (∞; 20 MW), 1000AU maser (∞; 0.6 MW)
Avionics: TL-10+ Avionics **Sensors:** Passive EMS fixed array 150,000km (5 hexes; 0.15 MW), Passive EMS folding array 210,000km (7 hexes; 0.25 MW), Active EMS 480,000km (16 hexes; 25 MW)
ECM/ECCM: EM masking (2.1 MW)
Controls: Flight deck with 6×normal workstation plus two other workstations

Armament

2 turret hardpoint sockets fitted (Loc: 16/17, 18/19; Arcs: All).
Offensive: 2×TL-15 210-Mj Laser Turrets (Loc: 16/17, 18/19; Arcs: All; 5.83 MW ea., No crew)
Fire Control Systems: 1×TL-15 300,000km Dual-purpose Msl/Beam MFD (6 Diff Mods; Msl 10 hexes; 10 hexes; 1.71 MW; 1 crew)

	Short	*Medium*	*Long*	*Extreme*
TL-15 210-Mj Laser Turret	10:1/12-36	20:1/12-36	40:1/12-36	80:1/12-36

Accommodations

Life Support: Extended (0.42 MW), Gravitic Compensators (6G; 10.5 MW)
Crew: 8 (2×Maneuver, 2×Electronics, 2×Engineering, 1×Gunnery, 1×Command)
Crew Accommodations: 4×Large Stateroom (0.001 MW ea.)
Passenger Accommodations: Whatever space is not used by crew
Cargo: 196m³ (14 tons) armed, up to 307m³ (21.9 tons) unarmed, 1 large cargo hatch
Small Craft and Launch Facilities: Minimal hangar with launch port for 3×MOLRASP sensor drones; minimal hangar with launch port for air raft
Air Locks: 1

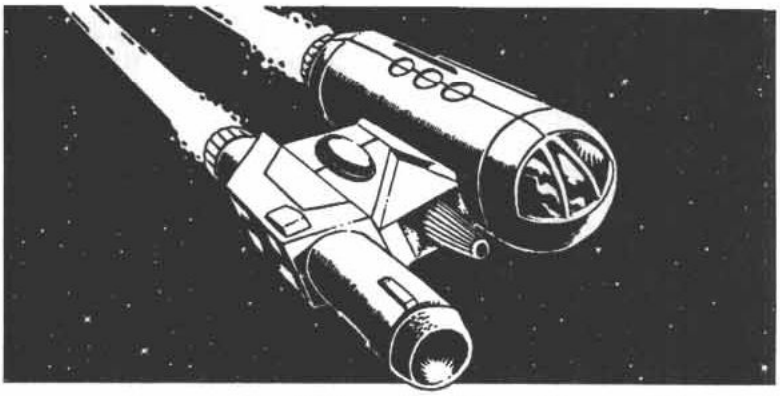
Notes

The Faith class is the standard RQS quarantine cutter. It was first created by adding a 50-ton "plug" to scout/courier hulls, but new-construction models are built from the keel up as cutters, with thicker hull plating and heavier internal structure. Faith-class cutters are designed for 3G performance; visually similar scout-based cutters which retain the scout's 2G performance are not members of this class. Faith-class cutters are well-equipped and expensive, but do offer the RQS subsidy for private owners.

Current versions (called "tiers") of the Faith class are equipped to take unmanned 210-Mj turrets in their sockets in place of the usual 150-Mj local-control turrets. Because they have no on-board gunner, they cannot be fired locally but are both fired as a battery by the MFD. Faith-class cutters also carry the 3-ton Maneuvering Off-board Long Range Active Sensor Platform, or MOLRASP, that is also used by the Regency's *Lauritson*-class picket ships (see table below for MOLRASP details and Challenge 76, page 36). These expensive drones are owned by the RQS and are issued to quarantine cutters only while on RQS active duty. The RQS likewise issues MFDs to those ships which do not have them, for the duration of active duty. When used for commercial trade the 18m³ hangar holds cargo, along with one or both turret sockets and the MFD space. Crews also hot-bunk to free up staterooms for paying passengers.

Early models of the class were not fitted with EMM suites and were not equipped for the 210-Mj remote turrets. These vessels are known as Tier-1 vessels. Tier-2 vessels added the EMM suite, and Tier-3 vessels were built to accept the 210-Mj unmanned turrets. Tier-3 is still the standard RQS cutter, with the Tier-4s, which add the 210,000km passive folding array, only available in limited numbers (note that the price of a Tier-3 is noticeably lower, at MCr120.40). Tier-1 vessels retrofitted with 210,000km passive arrays are known as Tier-1A, and carry 64 vice 60 G-turns without using jump fuel and four vice three MOLRASPs (cost is MCr144.26). Although the 150,000km fixed array seems redundant on cutters with the big array, its deletion saves very little cost, and is valuable not only as a backup to the folding array, but also for use while skimming fuel and in atmospheres, where its conformal configuration allows its use when the folding array is collapsed and stowed away.

Class names include *Augustine, Luther, Wesley, Calvin, Zwingli, Loyola, Aquinas, Torquemada, Franciscan, Dominican, Gregorian, Jesuit, Melancthon, Tillich, Bultmann, Barth, Kierkegaard, Nestorius, Flacius, Pelaglus, Nicea, Athanasius, Constantine, Albigenses, Waldenses, Arius, Gnostic, Manichaean, Donatus, Origen,* and *Tertullian.*



Fuel scoops skim 840m³ of fuel per hour. Fuel purification machinery (1.05 MW) requires 12 hours to refine 420m³ (35m³ each hour).

Notes

The Cuspid gunboat is a particle accelerator pod mounted on a minimally-modified variant of the ubiquitous 10-ton utility craft, variously known as the launch, lifeboat, or skiff (TNE page 378, **Brilliant Lances Technical Booklet**, page 46). This use of existing production lines allowed the rapid production of system defense craft to meet the Regency's spacecraft shortage (page 11). The single PA pod (powered to –3 Diff Mods) is identical to those mounted on the Fang below, and is armored and stressed to withstand 6Gs. However, the Cuspid is limited to 1G by the main hull's structure and the high density of the assembled craft. The main hull's maneuver drives will allow it to carry a pod massing up to 494.5 tons (the PA pod masses 225 loaded) at 1G. The Cuspid is fitted with a "can-opener," a salvaged fusion gun taken from surplus TL-14 Trepida I grav tank turrets being refurbished as TL-15 Norris tanks (see **Challenge** 77 pages 76-79 and **Striker II** pages 97-99). Its range makes it useless in space combat, but it is a fearsome close-range weapon, able to slice open the belly of most any resisting starship. Given the Cuspid's short legs, it is mostly used for orbital security and law-enforcement (which allows it to get within "can-opener" range), based at orbital stations.

Cuspids have fuel scoops (28.862m³ in 15 minutes), but no purification machinery.

General Data

Displacement: 50 tons
Length: 23 meters
Price: MCr73.65
Configuration: Box/Cylinder SL
Mass (Loaded/Empty): 743.62/729.59
Hull Armor: 60
Volume: 700 m³
Target Size: VS
Tech Level: 15

Engineering Data

Power Plant: 372 MW Fusion Power Plant (186 MW/hit), 1 year duration (1.6965 MW power surplus)
Jump Performance: None
G-Rating: 6 (25 MW/G), Contra-Grav lifters (5 MW)
G-Turns: 64, 3.125m³ of fuel each
Fuel Tankage: 200.4305m³ (14.3 tons) plus 25.65m³ for power plant
Maint: 13

Electronics

Computer: 2×TL-15 Mod Fb Computers (1.1 MW ea.)
Commo: 2×30,000km radio (1 hex; 1 MW ea.), 300,000km radio (10 hexes; 10 MW), 3×1000 AU maser (∞; 0.6 MW ea.)
Avionics: TL-10+ Avionics Sensors: Passive EMS fixed array 120,000km (4 hexes; 0.1 MW), Active EMS 300,000km (10 hexes; 15 MW)
ECM/ECCM: EM Masking (0.42 MW)
Controls: Flight deck with 3×normal workstation plus one other workstation

Armament

	Short	*Medium*	*Long*	*Extreme*
TL-15 14m Part Accel (–3)	5:70	10:41	20:21	40:10

Offensive: 2×TL-15 14m 196-Mj Particle Accelerator (Locs: 6/8/12/14, 7/9/13/15; Arcs: 1; 109 MW [Powered to –3 Diff Mods] ea.; 1 Crew ea.)
Fire Control Systems: 1×TL-15 300,000km Dual-Purpose Beam/Msl MFD (6 Diff Mods; Msl 10 hexes; 10 hexes, 1.71 MW; 1 Crew)

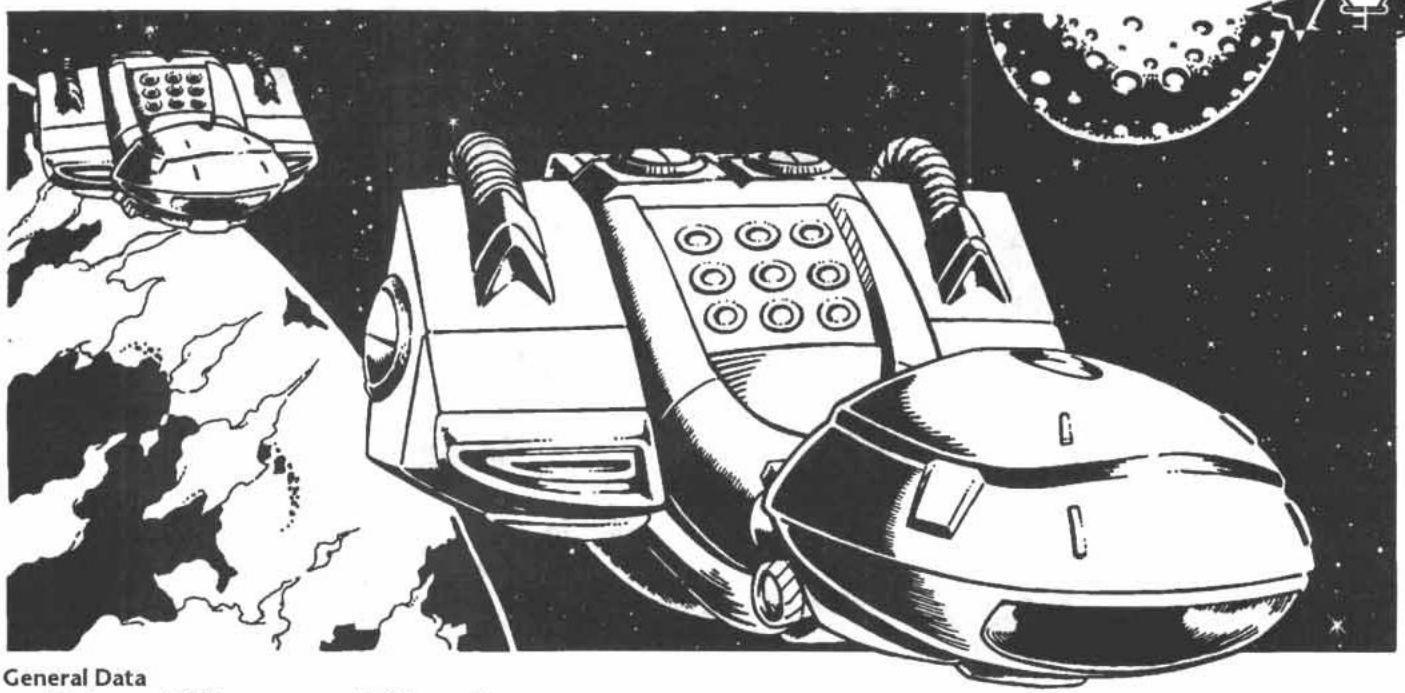
Accommodations

Life Support: Extended (0.14 MW), Gravitic Compensators (6G; 3.5 MW)
Crew: 6 (1×Commander/Pilot, 1×Electronics, 1×Engineering, 1×MFD Gunner, 2×PA Gunners)
Crew Accommodations: 2×Small staterooms (0.0005 MW ea.)
Cargo: None Air Locks: 3

Notes

The Fang-type is the true SDB development of the initial Cuspid concept seen above, although it is only the size of a heavy fighter. Its long-endurance and habitability allow it to perform most traditional SDB missions, and its high-G performance allows it to handle with the best of the fighters in Charted Space.

Small-to-moderate-sized particle accelerators like those fitted to the Cuspid and Fang (they are only large in comparison to these small vessels) are known in naval circles as "varmint guns." They are able to rapidly inflict killing damage on small starships, and their EMP side-effects make short work of non-Fb computers. Contrary to popular entertainment programs, fighters are able to take on full-size warships only under the most unusual of circumstances. Fang SDBs are able to quickly strip away the "nuisance vessels" in a vampire force, allowing the large fleet units to quickly dispose of the major units.



The Fangs' dual purpose (missile/beam) MFDs allow them to trade their PA pods for the missile pods seen on the inspection launch. Performance with these pods falls to 4Gs with 64 G-turns (3.125m³ each), and crew complement falls to four.

Fuel scoops allow te skimming of 280m³/hr, or 43 minutes for full fuel load.

Trekhyair-Type RQS Quarantine Cutter

General Data

Displacement: 300 tons
Length: 50 meters
Price: MCr196.70
Configuration: Wedge SL
Mass (Loaded/Empty): 2862.14/2433.78
Hull Armor: 40
Volume: 4200m³
Target Size: S
Tech Level: 14

Engineering Data

Power Plant: 584.7MW Fusion Power Plant (97.45 MW/hit), 1 year duration (0.031 MW power surplus)
Jump Performance: 3 (840 m³ fuel for Jump-3, 280m³ for Jump-1)
G-Rating: 3G (150 MW/G), Contra-Grav lifters (30 MW)
G-Turns: 64.44 (109.2 using jump fuel), 18.75 m³ fuel each
Fuel Tankage: 2048m³ (146.29 tons), plus 58.47m³ (4.18 tons) reserved for power plant
Maint: 99

Electronics

Computer: 3×TL-14 Model Fb (1 MW ea.)
Commo: 1000AU radio (∞; 20 MW), 1000AU maser (∞; 0.6 MW)
Avionics: TL-10+ Avionics
Sensors: Passive EMS fixed array 150,000km (5 hexes; 0.15 MW), Active EMS 480,000km (16 hexes; 25 MW)
ECM/ECCM: EM Masking package (4.2MW)
Controls: Bridge with 7×bridge workstations, plus 4 other workstations

Armament

2 barbette and 2 turret sockets fitted plus a dedicated 9-tube missile/drone launching cluster
Offensive: 2×TL-14 300-Mj Laser Barbettes (Loc: 16/18, 17/19; Arcs: All; 8.3MW ea.; 1 crew ea.), 2×TL-14 Laser Turrets (16/17, 18/19; Arcs: All; 4.2MW ea.; 1 crew ea), 9×Missile/drone launch tubes (Loc: 10; 1 ready Msl/drone ea.; 1 crew)
Fire Control Systems: 1×TL-14 Missile/Beam MFD (5 Diff Mods; Msl 10 hexes; 10 hexes; 1.77MW ea.; 1 Crew ea.), 1× Missile/Drone control station (No Diff Mods; Msl 10 hexes; 0.15 MW; 1 Crew)

	Short	*Medium*	*Long*	*Extreme*
TL-14 150-Mj Laser Turret	2:1/10-31	4:1/10-31	8:1/10-31	16:1/10-31
TL-14 300-Mj Laser Barbette	10:1/4+43	20:1/4+43	40:1/8-26	80:1/4-13

Accommodations

Life Support: Extended (0.84 MW), Gravitic Compensators (5G; 21MW)
Crew: 15 (2×Maneuver, 2×Electronics[incl. missile/drone operator], 4×Engineering, 5×Gunnery, 2×Command)
Crew Accommodations: Up to 15×Small Stateroom (0.0005 MW ea.)
Passenger Accommodations: 1×Small Stateroom (0.0005 MW ea.), plus any additional staterooms freed up from crew's multiple occupancy
Cargo: 196 m³ (14 tons), 2 large cargo hatches
Air Locks: 3

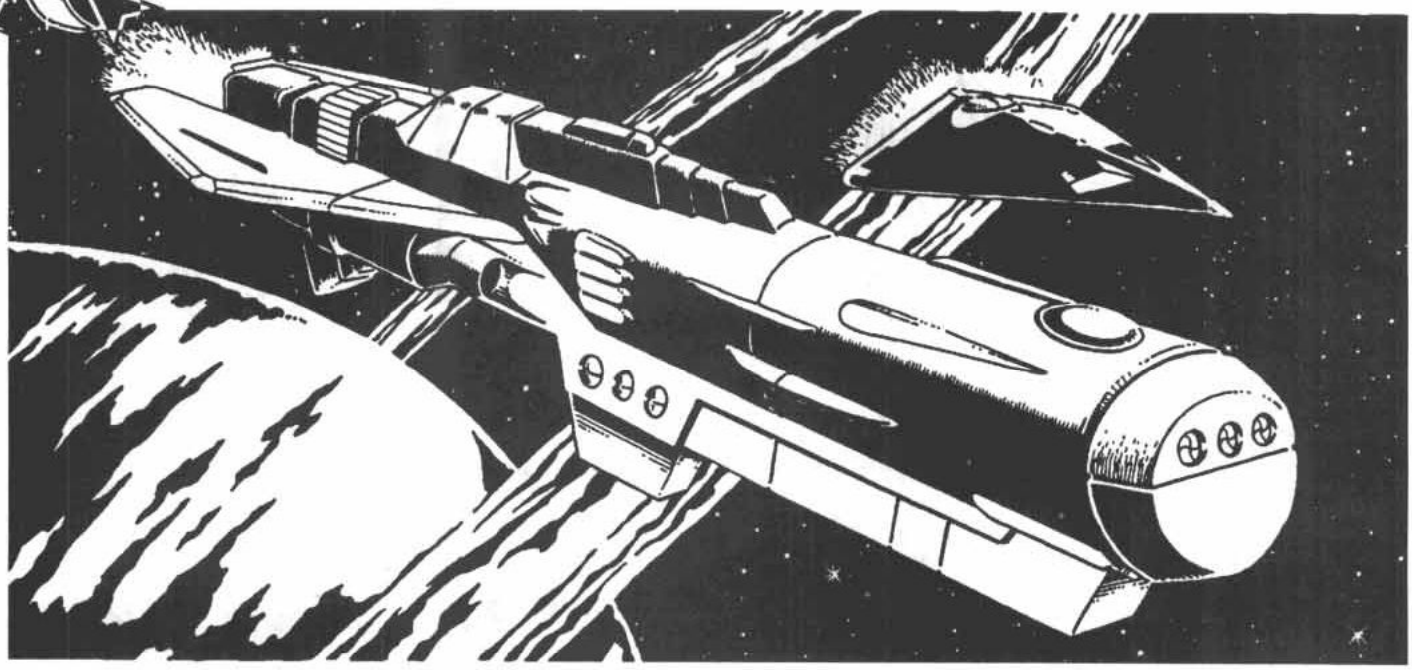
Notes

These distinctive RQS quarantine cutters are used almost exclusively by the RQS's Aslan personnel, still known as the *Trekhyair*, or "Land Protectors" (see page 27). They are built by Aslan shipyards on Aslan-ruled or -inhabited worlds of the Regency. Although they were built in response to the same requirements that resulted in the 150-ton Faith-class cutters (page 89), the Aslan stretched their 200-ton *Ktiyhui*-class courier (see *Solomani and Aslan*) by the same percentage and wound up with 300 tons. Their size and heavy armament makes these vessels highly sought after even by humans, but the differences in Aslan- and human-configured equipment means that human crews will operate the Aslan vessels at a uniform +1 Diff Mod for all tasks (see also **Aliens of the Rim, Volume 1: Hivers and Ithklur, page 86**).

Unlike the smooth, aesthetic curves of pure Aslan designs, the *Trekhyair* cutters have the appearance of "lash-ups," which in fact they are, using standard human technology overlaid on Aslan design techniques to which they are not visually or even technically matched. Late-production *Trekhyair* cutters are easily distinguished from earlier models by the unsightly exterior ducting that runs over the top of the engineering housings. This ducting was required by the retrofitted human-standard EMM suite which would not fit within the Aslan-standard interior ducting channels.

Anti-Aslan circles are loudly opposed to the *Trekhyair* cutter, noting its very heavy armament for its size, comparable to that of the 400-ton *Gazelle*-class close escorts (TNE page 370 or **Brilliant Lances Technical Manual**, page 23). The thought of such seemingly offensive vessels in the hands of theoretically disloyal inhabitants of the Regency is of great concern to these people, especially the fact that the RQS is bankrolling an instant rebellious navy within its own borders, tantamount to allowing the Hierate to forward base invasion fleets within the Regency.

The *Trekhyair* cutters are quite well-armed, and actually have more firepower than the larger *Gazelles* with their dorsal "missile farm" in addition to two laser barbettes and two laser turrets. However, they share a shortcoming with the *Gazelles* to which they are so often compared: they are limited by having only one master fire director.



The missile/drone tubes may fire any standard 7m³ space-combat missile, or any drone of the same or smaller size. The standard TL-14 7m³ passive sensor drone is shown on the drone table on page 89 (as the "missile-drone"). The nine-tube missile farm is treated as a single missile bay for purposes of hits and damage, see the table at left.

Fuel scoops allow the cutter to skim 840m³ of fuel per hour. Fuel purification machinery (2.1 MW), 12 hours to refine 840m³ (or 420m³ each 6 hours).

Barekdoldin-Class Darrian Patrol Cruiser (DPC)

General Data

Displacement: 500 tons
Length: 48 meters
Price: MCr400.47
Configuration: Cylinder SL
Mass (Loaded/Empty): 4467.07/3792.99
Hull Armor: 60
Volume: 7000 m³
Target Size: S
Tech Level: 16

Engineering Data

Power Plant: 1920.8 MW Fusion Power Plant (640.3 MW/hit), 1 year duration (0.173 MW surplus)
Jump Performance: 4 (1750 m³ for Jump-4, 1312.5m³ for J-3, 875m³ for J-2, 437.5m³ for J-1
G-Rating: 6G (250 MW/G), Contra-Grav lifters (50 MW)
G-Turns: 54 with Jump-4 fuel reserve (68 with Jump-3 reserve, 82 with J-2 reserve, 96 with J-1 reserve), 31.25 m³ of fuel each
Fuel Tankage: 3437.5m³ (245.54 tons) plus 192.08m³ (13.72 tons) reserved for power plant
Maint: 116

Electronics

Computer: 3×TL-16 Mod Fb Computers (1.2 MW ea.)
Commo: 1000AU radio (∞; 20 MW), 2×300,000km radio (only one powered; 10 hexes; 10 MW), 1000 AU maser (∞; 0.6 MW), 2×300,000km maser (10 hexes, 0.3MW ea.)
Avionics: TL-10+ Avionics
Sensors: Passive EMS fixed array 150,000km (5 hexes; 0.1 MW), Passive EMS folding array 240,000km (8 hexes; 0.25 MW), Active EMS 480,000km (16 hexes; 13 MW)
ECM/ECCM: EM Masking (7 MW)
Controls: Bridge with 10×Bridge Workstation, plus 9 other workstations

Armament

Offensive: 1×16.6m Particle Accelerator (Loc: Parallel/10; Arcs: 1; 71.1 MW [powered to –2 Diff Mod]; 1 Crew), 6×TL-16 207-Mj Laser Turret (Loc: 11, 11, 11, 11, 11, 11; Arcs: 2,3,4; 28.75 MW [powered to –1 Diff Mod]; No crew ea., fired by MFD), 1×Missile Bay (Loc: 1; 27 ready Msls; 0.45 MW; 1 crew), 1×1200-tonne Man-ipulator (Loc: 11; Arcs: 2, 3, 4; 24 MW; 1 crew)
Fire Control Systems: 4×TL-16 Dual-purpose Msl/Beam MFDs (6 Diff Mod; Msl 10 hexes [laser and maser]; 10 hexes; 1.51 MW, 1 crew ea.)

	Short	*Medium*	*Long*	*Extreme*

207-Mj Laser Turret (–1)	10:$^{1}/_{12}$-36	20:$^{1}/_{12}$-36	40:$^{1}/_{12}$-36	80:$^{1}/_{11}$-35
1200-tonne Manipulator	1:40 tonnes	2:20 tonnes	4: 10 tonnes	8:5 tonnes

Accommodations

Life Support: Extended (1.4 MW), Gravitic Compensators (7 G; 35 MW)
Crew: 22 (2×Maneuver, 1×Electronics, 9×Engineer, 7×Gunnery, 3×Command) plus 13 or more troops
Crew Accommodations: 6×Small Stateroom (single occupancy; 0.0005 MW ea.), 8×SmallStateroom (double-occupancy; 0.0005 MW ea.)
Cargo: 92.45 m³ (6.6 tons), one large cargo hatch
Small Craft and Launch Facilities: 10-ton unpowered pod controlled by manipulator in internal hangar (Minimal), one launch port
Air Locks: 5

Notes

Barekdoldin means "Lightning Wind" in the Darrian native language, *te-zlodh* (idiomatically, "Storm Wind," i.e., "the wind that brings the storm"). These ships are derived from old Darrian designs, but incorporate experimental fittings developed in conjunction with Regency engineers which are fitted for trials. A number of license-built *Barekdoldins* serve in the Regency Navy and RQS, where they are known as DPCs, for Darrian Patrol Cruiser. The design is highly thought of; it is considered to be well over twice as capable as the standard 400-ton TL-15 patrol cruiser (TNE page 372 or Brilliant Lances Technical Manual page 25) while it is only twice the price.

One example of this is the battery-boosted particle accelerator. Constant power from the ship's power plant is sufficient to power it at the –2 Diff Mod rate (ROF 200, see Fire, Fusion, & Steel page 115). However, it is connected to batteries which allow it to fire at the –5 Diff Mod rate (ROF 800) for three hours (six space combat turns). Alternatively, this battery may be used to provide 2G acceleration for three hours (12 G-turns).

The laser turrets are unmanned. They are fired as two three-gun batteries by two of the MFDs.

TL-16 Darrian missiles are equivalent to the standard TL-15 space missiles but may be controlled by either laser or maser communicators. They are launched from a 25-ton three-tube missile bay at the bow of the ship. Each tube is served by an autoloader. Total magazine capacity is 24 missiles, any of which can be fed to any of the three tubes.

The DPC carries a small tractor/repulsor manipulator which can exert 1200 tonnes of thrust on targets within 1000km, well within one space combat range band/hex. The weapons table above shows the number of tonnes of acceleration applied by the manipulator at the listed space combat ranges. Each 10 tonnes of manipulator thrust exert 1G of acceleration per displacement ton of the target. Thus at a range of 1 hex the manipulator could exert 1G on a 4-ton target, 4Gs on a 1-ton target, or 8Gs on a half-ton target (note that standard space combat missiles displace one-half ton).

The unpowered manipulator pod masses 151.98 tonnes empty, and can be loaded with 124.65m³/tonnes of cargo or up to 35 personnel in adequate seats. Within 1000 km of the ship it can be accelerated by the manipulator up to 12Gs in any direction. The pod's structure is stressed to handle 12G maneuvers, but its inertial compensators only negate 7Gs.

Troops may be housed in bunks in the cargo area (up to 13) or by multiple occupancy of the staterooms (22 more).

Fuel purification machinery (4.375 MW), 6 hours to refine 875m³, 12 hours to refine 1750m³ (145.8m³ per hour). Fuel scoops skim 1750m³ per hour.

The Regency Returns

Since 1979 the [illegible] Marches have been the birthplace of most [illegible] campaigns. Although the [illegible] have undergone changes and felt their share of hard [illegible] they have endured. [illegible] whether you think of the area as the Spinward Marches, the Domain [illegible] Web, or the Re[illegible] is still home sweet home, and it has now returned, in all of its multi-fac[illegible]ry, for **Tr[illegible]: The New Era™.**

Keepers of the Flame

The citizens of the Regency are citizens of the Third Imperium. They are the reverent guardians and sturdy repository of all that was great in that society, and they are pledged to carry its light back into the darkened universe.

But this has not been easy. The effort to keep Virus at bay took the better part of two generations, and absorbed most of the energy and productive capacity this society had. And now, with the great external threat seeming to recede, old repressed rivalries are re-emerging, just as the Regency is poised to spring again into the stars.

Enemies Within and Without

The Regency is burdened with a restive class of disenfranchised nobility, shunted aside by the wave of democratic reforms. Aslan *ihatei* squatters within the Regency borders, never quite assimilated into human society, are beginning to call attention to their demands, both from the Regency government and from their clan brethren outside the Regency border. Vargr splinter groups, driven into the Regency with the decimation of their own societies, will stop at nothing to fuel the recovery of their homeworlds in the Wilds. Sword World irredentism is again on the rise. And as if that weren't enough, their stable neighbors the Zhodani now seem to be coming [illegible]ompletely apart, wracked by internal war and flooding the Regency with waves of refugees. All in all, not an environment for the faint of heart, but keeping the flame was never easy.

[illegible] **Regency Sourcebook** includes:

•[illegible] on the current status of the Regency and its institutions: the Regency [illegible] Service[illegible] [illegible]nmental reforms, the new psionic schools, and the XWeb.

•Detail[illegible] [illegible] Regency's neighbors: Zhodani, Aslan, Vargr, Darrians, [illegible] worlds, Old and New Islands, [illegible]

•All 45 subsec[illegible] [illegible] Regency with maps and UWPs—al[illegible] worlds in all.

•10 new TL-15 and [illegible] spacecraft.

Regency Manual 2

This is the *Thunderbolt*. Its personnel are the best that history has to offer. They were not born to serve you, but you to serve them. Be worthy of their faith. You of all humanity are most cursed if you misuse them, or most blessed if you ennoble them.

The force of arms is not the only force in this universe, but when it is called upon, it can be the mother of life, or the father of damnation.

Use this *Thunderbolt* well, with justice, courage, compassion and honor, now and forever. If you do this, you will have proved worthy.

Forge the Future, in the name of all that is timeless.

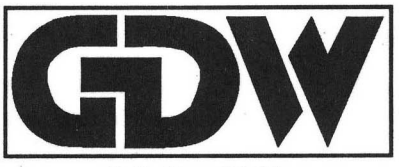
Regent General Mitchell De Groat,
Commander-in-Chief, Regency Planetary Forces,
Change of Command Ceremony, 1202

To Major General Lon E. Maggart, custodian of the future of mounted operations in this and all possible futures that are worth a damn: Forge the Thunderbolt!

Soli Deo Gloria.

About the Cover: The symbol on the cover is that of the Regency Planetary Forces, consisting of the Regency Army and Marine Corps. The Regency Army insignia removes the thunderbolt, places a shield behind the sun-and-unicorn device, and changes the sunburst from gold to black. The Regency Marine Corps insignia foregoes the shield and color change and replaces the thunderbolt with a downward-pointing cutlass, symbolizing its planetary assault role. The colors of the cover approximate the colors of the Regency Army (crimson and black) and the Marine Corps (maroon and gold).

Design and Development: David Charles Nilsen
Proofreading and Typesetting: Michelle Sturgeon
Cover: Julie Callahan
Interior Art: Kirk Wescom
Art Direction: David Nilsen and Julie Callahan



Credits Are: Going to be relatively dignified in this book. Well, maybe dignified isn't the right word. The others were dignified too, in a manic sort of way. Give me a break.

But Just In Case You Are Looking For Something Pithy: "The Armored Division must be a balanced fighting team of combat arms and service units, all of equal importance and equal prestige."

—Major General Adna R. Chaffee

Introduction

With the publication of the **Regency Combat Vehicle Guide** (hereafter **RCVG**), GDW has in print more fully detailed vehicle designs for the current edition of **Traveller** than at any point in its history (I think—I trust that I will be corrected if I have miscalculated), and this number will continue to grow in the months to come, at least until we pass the magic figure "101." For obvious reasons, the 89 vehicles rated in **Striker II**'s Appendices B-E (along with all of the missiles and infantry equipment in Appendices F and G) had to first be fully designed to the roleplaying level of detail using the **Fire, Fusion & Steel (FF&S)** design sequences. Only then were these designs converted to the **Striker II** format, with the attendant loss of fine-grained detail.

Of these, 20 had previously been published as fully detailed **TNE** vehicles with all of the details necessary for a roleplaying campaign. Since the publication of **Striker II**, a handful of its vehicles (the TL9 Abomination and the Trepida/Intrepid series) have been detailed in **Challenge** magazine, leaving **64 Striker II** vehicles still to be published to the level of detail that would allow **TNE** referees to run them in their roleplaying campaigns. With the publication of **RCVG**, this number falls to 43, and will continue to fall with upcoming releases.

COMPATIBILITY WITH STRIKER II

This book is the first of a series of spin-offs from **Striker II**, which are not actually used *with* **Striker II**. While **RCVG** covers the same subject matter as **Striker II**, it expands on this material in ways which are used with the **TNE** roleplaying rules but do not add new material to the **Striker II** miniatures rules. These vehicles already exist in **Striker II** with sufficient detail to allow them to be fully used with that system, so there is no need to add to their presentation there. But what if a PC group obtained one of these amazing vehicles? How much cargo space do they have? How many people can they hold? How fast can they go?

RCVG is intended to help bring **TNE** up to date with **Striker II**, by presenting **Striker II**'s Imperial/Regency vehicles to the level of detail used in the **TNE** roleplaying rules. This book will not present new military organizations, because that sort of large-scale information is appropriate to **Striker**, while one-on-one or two-on-two vehicle engagements are appropriate to roleplaying rules. So **Striker II** does support **RCVG** by showing the frequency, numbers and organizations in which these vehicles may be found.

When you think about it, this represents something of new wrinkle for the **Traveller** lineage of game systems. Whereas the original **Striker** (1981—do you feel old yet?—back then people were still wondering if Ronald Reagan would live through a term in the White House, and when you mentioned Jimmy Carter, everyone thought of sweaters and "malaise," and no one thought of building houses) *was* the vehicle design system for the original **Traveller**, **Striker II** represents an *alternative* means of resolving large-scale ground combat, in the same fashion that **TNE**'s **Battle Rider** corresponds to **TNE**'s **Brilliant Lances**. Thus the same vehicle has two faces in the new **TNE** system: one for **TNE** proper (i.e., the roleplaying rules), and one for **Striker II**.

Perhaps the one way that **RCVG** actually does support a **Striker II** miniatures campaign is that it presents prices for these vehicles. These were not presented in **Striker II**, the same way that the price of an M4A3E2 (76) Jumbo was not presented in **Command Decision 2nd Edition**. Like **CD2**, **Striker II** was intended to allow the resolution of historical (i.e., "historical")

scenarios with the use of historical/"historical" TO&Es. But many **Striker II** players like to organize their own unique or mercenary units, and price figures are important for this. Now this is possible.

DESIGNER'S NOTES

As I hope all old-time **Traveller** fans have noticed by now, the selection of vehicles and TO&Es in **Striker II** were painstakingly based on material presented in original **Traveller**, especially **Striker** and various issues of the **Journal of the Travellers' Aid Society**. Some material was also drawn from the **MegaTraveller** period from such sources as the **Rebellion Sourcebook** and Digest Group's *Travellers' Digest* magazine.

For TO&Es, the conversion was straight-forward: **Traveller** and **MegaTraveller** TO&Es were presented in "real world" terms and were easily converted into the **Striker II** standards of fireteam and single-vehicle stands. This yielded the Huscarles, Imperial Marine Task Force, Imperial Guard, MArCav and Zhodani units.

Updating vehicle designs was more complicated, as weapons performance, armor and mobility were not convertible directly to **TNE** or **Striker II** standards. So what I had to do was divine the qualitative concept of a vehicle and create a vehicle for **TNE** which fulfilled the same concept while retaining as many of the original's quantitative features as possible. Although measurements of armor thickness or weapon penetration did not translate from the logarithmic **Striker/MegaTraveller** system into the linear **TNE** system, items such as number of crew or passengers were more easily accommodated. I treated armor and weapons on a relative basis, i.e., this guy has more than this guy, but not as much as that other guy, but specific weapons *types*—lasers, fusion guns, VRF gauss guns—were retained, even though their functional **TNE** performance might not perfectly replicate their **Striker/MegaTraveller** parameters. For example, if old **Striker** said a missile massed 95 kg and had a 0.5 kiloton warhead, I retained those data points as *defined features*, but allowed their *derived features* like range, speed and price to fall pretty much where **FF&S** dictated. But I did do a lot of tweaking when I could finesse the derived features closer to their models.

The high-energy weapons upgrade (see "Putting the Heat Back into Plasma," from **Challenge 76** or **Striker II**—take your pick) threw something of a wrench into this, as the tremendous increase in plasma/fusion lethality knocked some pre-existing designs out of balance, requiring some repairs to get them back into line with their concepts.

The most notable example of this is the radiation of the single Intrepid/Trepida tank in the **Reformation Coalition Equipment Guide** (**RCEG**) into the three Imperial versions seen in **Challenge 77** and this book. Since the upgrade had thrown the design's offensive/defensive balance out of whack, I "rescued" it by postulating a series of upgrades that explained how the imbalance came to be.

In other cases, I just left the wounded vehicles to their own devices. In the case of the hapless Pyrrhus support sled (**RCEG** page 126, a.k.a. **TNE**'s "grav tank," page 364) the vehicle was already an odd duck, so further weirdness just wasn't that big a deal.

REFORMATION COALITION CAMPAIGNS

All of you who love the Star Vikings, please do not fear that this book represents a turning away from the Reformation Coalition campaign. It does not. GDW loves the Star Vikings, too. We will not skimp on RC coverage and development, and as many of you already realize, this book is for RC campaigns too. Only one of the vehicles in this book (the Norris battle tank, pages 12-13) was not a standard Imperial vehicle in the pre-Collapse period. That means that all the other umpteen vehicles and variants in this book can be found in the Wilds, to be salvaged by RC recovery teams or already in use by TEDs, or, you guessed it, the Empire of Solee. (Oops—maybe this book is bad news for the RC after all. Sorry, I wasn't thinking.)

WHAT NEXT?

Future vehicle guides will cover the Zhodani and other Spinward States, lower-tech vehicles that can be used for Spinward States planetary armies or the Wilds, and the Reformation Coalition. While many of these will be military vehicles, civilian, exploration and paramilitary vehicles will be covered as well.

After that, I don't know. The Millennium?

Burma!

FORMAT

The 32 vehicles on the following pages are identical to the vehicles of the same names presented in **Striker II**, but are presented in the **TNE** format as presented in the basic **TNE** rulebook and expanded in the **Reformation Coalition Equipment Guide**. This latter format provides specific roleplaying-level information such as speed in kph, speed-specific Diff Mods vs. fire, more detailed fuel breakdowns, etc. These simplify the referee's job when converting vehicle performance into real-world or game-specific terms.

One additional line of data has been added compared to **RCEG**, and that is "Reloading Data." This provides the parameters of weapons magazines and gives the time required to replace turret-mounted magazines, whether from storage elsewhere in the vehicle or from supply vehicles. Replacement time does not refer to multiple magazines already carried within the turret (as in the case of multiple VRF gauss gun cassettes); these replace each other automatically as ammunition is expended. Replacement time refers to removing empty cassettes from the turret and replacing them with fresh ones.

Each vehicle also comes with historical and technical information, discussion of design variations and background on their military operational usage. However, details on the larger Regency or Imperial units of which these vehicles are a part will not be found here. **Striker II** is necessary for such large-scale data.

NOMENCLATURE

In the Regency of 1202, it is common to still refer to equipment as being an "Imperial" design. This is especially the case in the Regency's armed forces, which take pride in their unbroken descent from Imperial organizations. Although the Regency is no longer the Imperium *per se*, such vehicles as the Imperial Marine Grav APC are still called *Imperial* rather than Regency, as they are the same vehicles that were designed and used by the Imperial armed forces. Although used by the Regency, their names recall their original creators, and the organization that the Regency is committed to preserve. Therefore the terms *Imperial* and *Regency* are often used interchangeably in the following pages.

Regency Planetary Forces

The Regency's armed forces are divided into two broad categories: space forces and planetary forces. *Space forces* include the Regency Navy, Scouts and Quarantine Service. *Planetary forces* include the Regency Army and Marine Corps, and all planetary forces: armies, navies, air forces and aerospace defense forces.

The distinction derives from their differing main focus of operations. Planetary forces control planets: their ground, oceans, atmosphere and close orbit. Space forces control space: the area between planets.

Planetary forces comprise a tremendous variety of traditional military mission areas: ground forces (armies), nautical forces ("wet" navies), atmospheric forces (air forces), naval assault troops (marines) and orbital control forces (astronauts). But in spite of the wide variety of planetary force niches, and the different skills necessary to operate a howitzer, a submarine, a helicopter, or a satellite, from the point of view of the Imperial-cum-Regency Navy, "it's all dirtside." (Note, however, that at high tech levels, the speed and mode of contra-grav travel make the distinction between ground and air vehicles increasingly meaningless, and air, after all, has meaning only as it relates to the ground beneath it and the planetary regime within which it exists.)

The Regency government only maintains two planetary forces, the Regency Army and Marine Corps, and these only at the high end of the tech range: tech level 14 and 15 (although it is the Regency's goal to standardize all of its planetary forces at TL15, this has not yet proven possible). There is no reason for the Regency government itself to maintain forces at tech levels lower than this. First, it is the Regency's job to defend its territory using the most capable forces possible. Equipping them with anything less than the absolute best technology available would be wasteful.

Second, it is the role of world governments to maintain their own planetary armed forces at tech levels appropriate to local world conditions.

TYPES OF ARMED FORCES

There are two major types of distinctions when describing armed forces: function and ownership.

Functional distinctions are two, and are described in the main text: space forces and planetary forces.

Ownership distinctions are also two: Regency and world armed forces. *Regency* armed forces are those raised, outfitted, paid, maintained and controlled by the Regency government itself. *World* armed forces are those raised, outfitted, paid, maintained and controlled by an individual world.

There is naturally a great deal of overlap between the two ownership classifications. Since the Regency consists of a number of member worlds, its forces represent and act in the name of the worlds that make up the Regency. By the same token, world forces, controlled by loyal member worlds of the Regency, also (ideally) act in the name of the Regency as a whole. For this reason it is common for people to lump all armed forces in the Regency's territory, Regency-owned and world-owned alike, together under one term, "Regency armed forces." This term would be particularly appropriate if the Regency were attacked as a whole by an outside force (i.e., Virus, the Zhodani Consulate, etc.). However, it obscures the important distinctions of the missions an armed force is equipped to perform (Regency planetary forces are able to function in all kinds of planetary environments, while world planetary forces are usually only required to function in the world's own local environment) as well as the technology with which it is outfitted (Regency forces are equipped at TL 14 or 15, while world forces are usually equipped at the local tech level). Furthermore, only Regency forces can be found operating at all points in the Regency, while world armed forces will only be deployed for purposes that are of interest or advantage to the owning government.

Note the semantic distinction: *Planetary* refers to planets as a physical or natural entity. *World* refers to planets as a political and social entity. Thus Regina has a *planetary* atmosphere and a *planetary* gravity, but a *world* government and a *world* technology level. Regina has world armed forces (i.e., they are paid for and controlled by the Regina world government) but these world armed forces can consist of space forces (which primarily defend Regina's star system but can be deployed to other systems) and planetary forces (i.e., those which defend the Regina "planetary" environment, even though Regina is technically a moon).

Thus, there can be Regency space forces (forces owned and controlled by the Regency government whose mission is the control of the interplanetary, or space, environment), Regency planetary forces (forces owned and controlled by the Regency government whose military mission is the control of the planetary environment), world space forces (forces owned and controlled by the government of a single world whose mission is the control of the space environment at least in the world's own system, and perhaps farther away), and world planetary forces (forces owned by the government of a single world whose mission is the control of the planetary environment, usually the world's own, but perhaps other planets' environments as well).

REGENCY COMBAT VEHICLES

Regency armed forces have generally retained and perpetuated Imperial military doctrine except where it conflicts with new post-Collapse realities, such as Virus, smaller astrographic, manpower and industrial bases, etc. This includes the retention of four basic classes of battlefield vehicles: tanks, APCs, specialist vehicles and support vehicles.

Because the Regency does not maintain armed forces below the TL14 level, all Regency planetary forces are by definition "grav" or "lift" forces. While many of the Regency's units retain these distinctions in their designations (for historical reasons), classes of vehicles do not, as all Regency tanks are grav tanks, and all APCs are grav APCs (exception, see page 16).

Tanks: While Imperial forces maintained a distinction between classes of tanks—heavy, medium (called "grav," not "medium grav"), and light—the Regency maintains one class of tank, the medium tank, now called the battle tank. Like the former Imperial medium tanks, these are simply called "grav tanks." The Regency's much smaller industrial base and much higher threat:self ratio has not permitted it to retain the luxury of multiple types of first-line tanks nor the quantity of assault shipping to carry such specialized equipment. Battle tanks are in the 10-14 displacement ton range, and are typified by the Norris grav tank on pages 12-13. This new reality is largely due to the excellent performance of the 10-ton Trepida family of medium tanks in the Civil War. These vehicles proved the mainstay of high-stellar level combat (see page 8) during the Civil War, while the more massive, voluminous and expensive heavy tanks (see page 6) were simply high-value targets. They were never available in sufficient numbers to make a difference on their own, and their rareness made their commanders reluctant to commit them when they could have made a difference. Post-Collapse Regency analysts determined that a similar number of 10-ton tanks would have made a more significant contribution to the battles in which the heavy tanks were available. Heavy tanks remain in service in the Regency only in world planetary forces. Light tanks are now rated as reconnaissance/scout vehicles and are classed under specialist vehicles below. See pages 6-13.

APCs: This terminology was deliberately chosen instead of variations on the "infantry fighting vehicle" theme to emphasize an essential point of Imperial doctrine: the true nature of infantry is that they are capable of fighting dismounted, and not as glorified AFV gunners. Infantry does not perform its mission of tenaciously holding ground in detail, or of rooting out opposing infantry, when it is in a vehicle. From this point of view, the term "infantry fighting vehicle" is essentially an oxymoron, because infantry in a vehicle are not infantry at all.

Imperial/Regency APCs are infantry *carriers*. While they fulfill the IFV performance concepts—such as the speed to keep up with tank forces, the armor to stand on the battlefield, and an armament which allows the vehicle to suppress threats to its carried infantry—their only reason for existing is to carry infantry to where they are able to do their job.

Because fire support vehicles are variants of APCs and are usually used in infantry organizations, these vehicles are usually grouped with APCs rather than specialist vehicles. See pages 14-25.

Specialist Vehicles: Specialist vehicles include all other combat vehicles, including scout and reconnaissance vehicles, artillery vehicles, combat engineer vehicles, air/point defense vehicles, etc. Many of the vehicles of this class are variants of tank or APC chassis. See pages 26-41.

Support Vehicles: Support vehicles encompass the vehicles that operate on or near the battlefield but which are not intended to engage directly in combat. These vehicles include liaison vehicles, ammunition supply vehicles and fuelers, maintenance and recovery vehicles, ambulances, etc. See pages 42-45.

Other Vehicle Types: Although no vehicles of this class appear in this book, this includes the vast majority of military-owned vehicles that support the military's institutional infrastructure: unarmored long-haul supply vehicles and tankers, unarmored utility sleds, staff cars and troop-carrying buses.

There are other vehicle types that are no longer used or never found favor in Imperial/Regency service. One such vehicle is the "combat vehicle," intended to replace the tank and APC categories. The last attempt to build such a vehicle was the TL15 Lancer combat vehicle, in the final years of the antebellum period. Armed with a heavy laser and fusion gun (a TL15 version of the rapid-pulse Y gun), the Lancer was armed and armored like a tank (two tanks, really), but also carried a very large infantry section of 24 troops.

Bridging the gap (or obliterating the distinction, depending upon your point of view), between tank and APC, the combat vehicle was another misguided attempt to create an AFV that would be all things to all people. By crossing an over-armed main battle tank with an APC, the result is a vehicle needlessly powerful in the APC role, and needlessly valuable in the battle tank role. In other words, it is too expensive in roles for which cheaper purpose-designed vehicles will do just as well, and its very expense would make its users reluctant to use it where the loss of a single combat vehicle would equal the loss in capability of two tanks and two APCs.

Although the dual-role combat vehicle concept is sure to arise again, it is currently banished from Regency military thought and doctrine.

TYPE-STANDARDIZED IMPERIAL/ REGENCY HIGH-ENERGY WEAPONS

Because of the variety of tech levels and manufacturers that provided materiel to the military forces of the Third Imperium, it was crucial for the military services to establish equipment standards to ensure that ammunition produced in one sector would fit the weapons of the troops deployed there, and that grav tanks manufactured on different worlds would be able to use the same stocks of spare parts. The total scope of this administrative program was immense, as it covered everything from boots to small arms to armored fighting vehicles to starships, but in practice it was broken down into specific areas, rather than designating all weapons in a single unified series. One such area was AFV main armament, which was further broken down into functional areas: kinetic energy direct-fire projectiles, indirect fire systems, missiles, rockets, high-energy (plasma and fusion) weapons, etc.

The dominant AFV armament at the high end of Imperial technology (TL14-15) was the high energy weapon, specifically the fusion gun, generally in rapid-fire configurations. (For further information on the design of rapid-fire high energy weapons, see the **Reformation Coalition Equipment Guide**, page 156.) Imperial standard fusion guns were classified by the following system.

Fusion V Gun: Any single-chambered fusion gun with a pulse energy of 3 megajoules.

Fusion W Gun: Any single-chambered fusion gun with a pulse energy of 18.5 megajoules.

Fusion X Gun: Any single-chambered fusion gun with a pulse energy of 74 megajoules.

Fusion Y Gun: Any single-chambered fusion gun with a pulse energy of 125 megajoules.

Fusion Z Gun: Any single-chambered fusion gun with a pulse energy of 175 megajoules.

RAPID PULSE FUSION WEAPONS

These weapons were designated in the RPN-XX series, where N denoted the standardized pulse energy level shown above, and XX was the tech level of manufacture. Thus the TL14 rapid pulse fusion "Y" gun was designated RPY-14. In some cases, rapid pulse fusion guns of more than one rate of fire would be manufactured at the same tech level and within the same pulse energy band. In this case, the weapons received the additional designation "high" or "low" to indicate whether they were the high-ROF or low-ROF variant of the weapon. In a few cases, three ROFs were standardized, and the middle ROF weapon received the notation "medium."

Rapid Pulse Fusion V Gun: Any rapid pulse multi-chambered fusion gun with a pulse energy of 3 megajoules.

The most common example of this weapon was the RPV-14 mounted on the Astrin grav APC.

Rapid Pulse Fusion W Gun: Any rapid pulse multi-chambered fusion gun with a pulse energy of 18.5 megajoules.

This weapon was manufactured in large numbers at TL15 as the RPW-15 Low (RPW-15L) mounted on the Imperial Marine Grav APC and the RPW-15 High (RPW-15H) mounted on Imperial Point Defense and ND Control APCs.

Rapid Pulse Fusion X Gun: Any rapid pulse multi-chambered fusion gun with a pulse energy of 74 megajoules.

This weapon was manufactured in large numbers at TL14 as the RPX-14 mounted on early marks of the Trepida grav tank. At TL15 it was manufactured as the smaller RPX-15 and fitted to the Imperial Marine Support APC.

The 15-chamber TL14 weapon was often referred to as the RPX-14 High (RPX-14H) to further distinguish it from the lower ROF six-chamber TL15 weapon, which was also called the RPX-15 Low (RPX-15L).

Rapid Pulse Fusion Y Gun: Any rapid pulse multi-chambered fusion gun with a pulse energy of 125 megajoules.

This weapon was manufactured in large numbers at TL14 as the RPY-14 and mounted on the Trepida Mark II grav tanks. A lighter version of the weapon has also been built at TL15 with a lower rate of fire as the RPY-15. To further distinguish it from the higher-ROF TL14 version, the 10-chamber TL15 version is also known as the RPY-15 Low (RPY-15L) and the 20-chamber TL14 version is the RPY-14 High (RPY-14H).

Rapid Pulse Fusion Z Gun: Any rapid pulse multi-chambered fusion gun with a pulse energy of 175 megajoules. This weapon was manufactured in the Third Imperium as the RPZ-15 and mounted on the 20-ton heavy grav tanks. In the Regency, this weapon is fitted to the smaller Norris grav tank, an upgraded TL15 version of the TL14 Trepida.

Miscellaneous: A TL15 40-chamber 200-Mj rapid pulse fusion gun was tested and manufactured by the Third Imperium, but was never type-standardized. This undoubtedly saved Imperial bureaucrats from having to figure out what letter came after "Z."

TL: Technology level; *ROF*: Rate of Fire in shots per fire *action*, except in the case of weapons listed as "SAN," where N is the total number of shots that the weapon can fire per five-second combat turn; *Dam Val*: Damage Value; *Pen Rtg*: Penetration Rating at short-medium-long-extreme ranges; *C-B*: Concussion value and Burst radius in meters; *Short Range*: Short Range in meters.

Heavy Grav Tank

TL15 HEAVY GRAV TANK

This tank is a classic example of "too much of a good thing." Although it served for many years as the standard TL15 tank for Imperial Marine, Army and Guard units, at 20 displacement tons it was simply too large for the capabilities it provided and was not that much more capable than the TL14 Trepida tanks which are only half its size. While this is not so much of a problem on the planetary battlefield, it is a major issue when it comes time to ship tank-equipped units from one world to another. Because the heavy grav tank requires twice the interstellar transport or assault lift of 10-ton designs, its use in these units created infrastructure costs far out of proportion to its actual battlefield capabilities. In addition, its crew size, also twice that of the Trepida series, doubled the personnel costs of the vehicle over the course of its operational life-cycle.

In addition, its command variant was a failure. The absence of a main armament on a vehicle which was clearly intended to operate with and masquerade as its fellow tanks on the battlefield was a critical shortcoming. Although it provided space for headquarters personnel, this function could have as easily been provided for with APCs at the headquarters, and this option would not have placed crucial headquarters personnel at risk in an effectively unarmed vehicle that was obliged to remain in the thick of the battle.

The heavy grav tank no longer serves in Regency Marine units, where it has been replaced by the Norris battle tank (see page 12). Heavy tanks removed from Marine service have been passed onto Regency Army units whose operational assignments do not require interplanetary redeployment.

Likewise, Regency Army "fire brigade," rapid-deployment and peacekeeping units have traded their heavy tanks for Norris tanks. Heavy grav tank production is complete, although manufacture of spares and maintenance parts continues; surplus vehicles from previous users are sufficient to meet the needs of all current heavy grav tank users. All new TL15 grav tank production is of 10-ton designs such as the Norris.

Heavy Grav Tank

Tech Level: 15

Price: MCr20.982401

Size: 280 cubic meters=20 displacement tons (VS)

Mass: 401.57 tonnes empty, 434.7 loaded

Power: TL15 12.42 MW fusion power plant supplying 2 MW to high-efficiency contra-grav lifters, with HEPlaR thruster generating 148 tonnes of thrust (0.0076 MW excess power)

Maint: 72

Controls: Holographic linked, TL10+ flight avionics, TL15 terrain following avionics, 3×TL15 Model FIt flight computers, TL10+ IGS navigation system

Commo: TL15 3000km radio, TL15 300km meson communicator

Sensors: 30km passive EMS sensor, 3000km passive EMS sensor, 3km active EMS sensor, 4×WSV goggles

ECM: Electromagnetic masking package, 4 decoy dispensers each with space for 60 of any combination of antilaser, antiactive sensor, or antiactive sensor decoys (see below)

Life Support: Heat, light, extended life support, artificial gravity/G-compensators (80 m3), and one air lock

Cargo: 312 kg of crew equipment (1.2515 m³)

Crew: 4 (Driver, Main Gunner, Secondary Gunner, Commander)

Passengers: None; includes two half-bunks for crew

Fire Control: EMS rangefinder and TL14 point defense ballistic computer (ignore 5 Diff Mods, and multiply Diff Mods of ballistic target by 0.5, dropping fractions), each of two EMS rangefinders may function as 3km short range laser/EMS designator

Armament: TL15 rapid-pulse 175-Mj fusion gun in main turret, VRF gauss gun in remote turret

Stabilization: Advanced (fire at any speed) for both weapons

Ammo: 200 rounds of 175-Mj 24.6×73.6cm PFC cartridges (Cr1400 each, MCr0.28 for full load of 200) and 120,000 rounds of 4mm gauss ammunition (Cr1200 for full load of 120,000 rounds dart)

Reloading Data: Fusion gun magazine is 14 m³, 28.28 tonnes loaded, 0.28 tonnes empty, MCr0.2814 loaded, MCr0.0014 empty, reloading requires 283 five-second combat turns and a crane or contra-grav lifters. VRF gauss gun ammunition is carried in 4 cassettes, 0.017m³ each, 0.017 tonnes loaded, 0.002 tonnes empty, Cr320 loaded, Cr20 empty, replacement requires four actions (see **TNE** page 273).

Speed: 785 kph maximum, 589 kph cruising, 190 kph safe NOE

Travel Move: 2356/1140

Combat Move: 109 (high mode absolute speed)/26 (NOE safe speed) in 10-meter grid squares

Signature: +1 Diff Mods vs. HRT and Radar, None vs. other methods

Diff Mods vs. Fire: –1 Diff Mod stationary, +5 at maximum speed (high mode combat move), +4 at cruising speed (high mode travel move), +3 at safe NOE speed, +4 at 2× and 3×safe NOE speed

Maximum Acceleration: 0.34 G

Fuel Capacity: 55,500 liters reaction mass plus 103.5 liters for fusion reactor

Fuel Consumption/Endurance: 1850 liters/hour (endurance of 30 hours), plus reactor fuel is sufficient for one month constant power

TL	*Round*	*ROF*	*Dam Val*	*Pen Rtg*	*Pen Val*	*Magazine*	*Short Range*
10	4×20mm/60 Dart	50	6	1-1-3-5	6-6-2-1	120,000C	300

TL: Technology Level; *Round:* type of round fired; *ROF:* Rate of Fire in shots per fire *action; Dam Val:* Damage Value; *Pen Rtg:* Penetration Rating at short-medium-long-extreme ranges; *Pen Val:* Penetration Value, i.e., Damage Value already adjusted by Penetration Rating at short-medium-long-extreme ranges for use against unarmored targets; *Magazine:* Magazine capacity in shots, where C indicates the cassette magazine type; *Short Range:* Short Range in meters.

Heavy grav tank firing the VRF gauss gun in its secdondary turret. Note that the dummy fusion gun carried by the command variant makes it virtually impossible to tell if this is a line or a command version simply by its appearance.

HEAVY GRAV TANK, COMMAND VARIANT

The command variant of the heavy grav tank is visually identical to the line version (facing page). It features a dummy RPZ gun which includes a thermal simulator that duplicates the distinctive heat plume of an operating fusion gun. While this theoretically makes the command tank more visible than it otherwise would be, it performs the more important function of preventing the enemy from easily picking out the command tank from its line companions (however, experienced troops can identify command vehicles by their behavior on the battlefield, which cannot be disguised).

Under standard Imperial doctrine, platoon-level tactical jamming is provided by the platoon's command vehicle. The command tank is accordingly fitted with a 30km EMS jammer to fulfill this role.

Imperial and now Regency doctrine calls for the establishment of a "constellation" of orbital surveillance and communications relay satellites around all worlds on which major military operations are being conducted. The long-range maser communicator allows the command tank to tie into the orbital communications and surveillance constellation and thereby communicate with ships in orbit and units on the ground anywhere under the constellation's coverage. The standard pair of TL15 computers for command vehicles allows its personnel to efficiently track, access, coordinate and route all intelligence, communications, and all command and control instructions to and from subordinate and superior units.

Characteristics of the command variant are shown below only where they differ from the line variant on the facing page.

Heavy Grav Tank, Command Variant

Price: MCr19.553243

Mass: 388.13 tonnes empty, 393.94 loaded

Power: TL15 18.72 MW fusion power plant supplying 2 MW to high-efficiency contra-grav lifters, with HEPlaR thruster generating 148 tonnes of thrust (0.0574 MW excess power)

Maint: 66

Controls: Holographic linked, TL10+ flight avionics, TL15 terrain following avionics, 3×TL15 Model Flt flight computers, TL10+ IGS navigation system, 2×TL15 Model St computers

Commo: TL15 3000km radio, TL15 300km meson communicator, 30,000km maser

Sensors: 30km passive EMS sensor, 3000km passive EMS sensor, 3km active EMS sensor, 6×WSV goggles

ECM: 30km EMS Jammer, Electromagnetic masking package, 4 decoy dispensers each with space for 60 of any combination of antilaser, antiactive sensor, or antiactive sensor decoys (see below)

Cargo: 477 kg of crew equipment (1.788 m^3)

Crew: 3 (Driver, Gunner, Electronics Tech, Commander)

Passengers: Normal workstations for two command personnel, plus adequate seats for up to three additional passengers and two half-bunks for crew

Fire Control: EMS rangefinder and TL14 point defense ballistic computer (ignore 5 Diff Mods, and multiply Diff Mods of ballistic target by 0.5, dropping fractions), EMS rangefinder may function as 3km short range laser/EMS designator

Armament: VRF gauss gun in remote turret, dummy RPZ gun visually identical to basic noncommand version

Stabilization: Advanced (fire at any speed)

Ammo: 120,000 rounds of 4mm gauss ammunition (Cr1200 for full load of 120,000 rounds dart)

Reloading Data: VRF gauss gun ammunition is carried in 4 cassettes, 0.017m^3 each, 0.017 tonnes loaded, 0.002 tonnes empty, Cr320 loaded, Cr20 empty, replacement requires four actions (see **TNE** page 273).

Speed: 976 kph maximum, 732 kph cruising, 190 kph safe NOE

Travel Move: 2928/1140

Combat Move: 136 (high mode absolute speed)/26 (NOE safe speed) in 10-meter grid squares

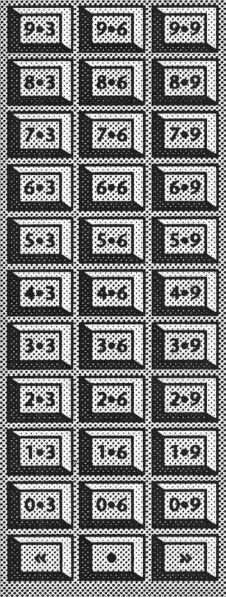
Maximum Acceleration: 0.376 G

Fuel Capacity: 55,500 liters reaction mass plus 156 liters for fusion reactor

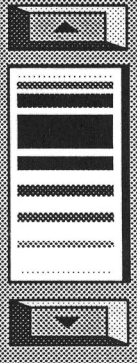
Fuel Consumption/Endurance: 1850 liters/hour (endurance of 30 hours), plus reactor fuel is sufficient for one month constant power

Weapon Characteristics

VRF Gauss Gun only, see weapons characteristics box (facing page) for line version



Decoys



Decoys are of three types: antilaser (which affect attempts to detect a target with ladar or to designate it with a laser designator), antiactive sensor (which affect attempts to detect a target or designate it with radar or active EMS), and antipassive sensor (which affect attempts to detect a target with HRT or passive sensors, including infrared goggles and sights). Each decoy only works against its specified sensor, and increases the difficulty of a detection or designation task by one level vs. TL15 systems, or by two levels vs. TL14– sensors. Each decoy lasts one combat turn (five seconds), and affects all appropriate sensor attempts against the owning vehicle, regardless of direction. Decoy dispensers may launch one decoy per second.

Decoys for heavy grav tanks cost Cr20,000 each regardless of type, or MCr4.8 for a full load of 240.

TL14 TREPIDA GRAV TANK

This tank was the pre-eminent symbol of irresistible armored firepower in the antebellum period, and was the standard grav tank of the high-stellar technology Imperial armed forces of the Last Imperium. The Imperial Army maintained units in three technology bands: Early Stellar (TL9-10), Average Stellar (11-13), and High Stellar (14-15). Because of the many significant technological break points (e.g., high-efficiency contra-grav at TL12, bonded superdense armor and fusion weapons at TL14, etc.) within these bands, technology of certain levels would tend to dominate the equipment of a certain band. In the High Stellar band, the greater number of TL14 worlds militated for TL14 vehicles rather than the Imperial TL15 absolute upper limit, and it was this consideration that made the TL14 Trepidas the standard high stellar tank. In addition to units of the three bands above, the Imperium maintained small numbers of "top tier" units equipped exclusively at TL15. Top tier units included Imperial Marine Regiments, Imperial Guard Regiments, and other elite spearhead forces. Sector governments typically maintained at least one top tier unit; in the Spinward Marches this unit was the Duke of Regina's Own Huscarles (see pages 46-47 and also **Striker II**).

The Trepida fully deserved its fearsome reputation; it is a dangerous weapon indeed, able to penetrate the equivalent of 2.5 meters of steel (in early models, more in later models) at a range of over 2.5 kilometers, but armored to withstand that same firepower across its frontal arc. Although the tank is expensive, it is more than a match for most starships, provided they get within its firing range.

It is interesting to note that almost the entire price of the tank is attributable to its powerful fusion gun, valued at 11.3 million credits of the tank's total price of MCr15.6 in the case of the Trepida II. As the Imperium's standard "high end" main battle tank, the Trepida was produced in a variety of models over the years, which are detailed below.

The TL14 Trepida is no longer the standard high stellar tank in the Regency, owing to the Regency's high priority program to maximize Regency technology up to the TL15 ceiling. Although many Trepidas can still be found in service in the armies of TL14 worlds, most Trepidas have been rebuilt as TL15 Norris battle tanks (see pages 12-13).

Trepida I Grav Tank

Tech Level: 14

Price: MCr9.885669

Size: 140 cubic meters=10 displacement tons (VS)

Mass: 210.97 tonnes empty, 237.21 loaded

Power: TL14 7.98 MW fusion power plant supplying 1 MW to high-efficiency contra-grav lifters, with HEPlaR thruster generating 86.62 tonnes of thrust (0.0298 MW excess power)

Maint: 40

Controls: Holographic linked, TL10+ flight avionics, TL14 terrain following avionics, 3×TL14 Model FIt flight computers, TL10+ IGS navigation system

Commo: TL14 3000km radio, 2×TL14 3km masers

Sensors: 30km passive EMS sensor, 3000km passive EMS sensor, 3km active EMS sensor, 2×WSV goggles

ECM: Electromagnetic masking package, 4 decoy dispensers each with space for 20 of any combination of antilaser, antiactive sensor, or antiactive sensor decoys (see facing page, bottom)

Life Support: Heat, light, extended life support, artificial gravity/G-compensators, and one air lock

Cargo: 155 kg of crew equipment (0.62 m^3)

Crew: 2 (Driver, Commander/Gunner)

Passengers: None

Fire Control: EMS rangefinder and TL14 point defense ballistic computer (ignore 5 Diff Mods, and multiply Diff Mods of ballistic target by 0.5, dropping fractions), EMS rangefinder may function as 3km short range laser/EMS designator

Armament: Turret-mounted TL14 rapid-pulse 74-Mj fusion gun, coaxial VRF gauss gun

Stabilization: Advanced (fire at any speed) for both weapons

Ammo: 410 rounds of 74-Mj 18.5×55cm PFC cartridges (Cr592 each, MCr0.243 for full load of 410) and 60,000 rounds of 4mm gauss ammunition (Cr600 for full load of 60,000 rounds dart)

Reloading Data: Fusion gun magazine is 12.15m^3, 24.543 tonnes loaded, 0.243 tonnes empty, MCr0.244215 loaded, MCr0.001215 empty, reloading requires 246 five-second combat turns and a crane or contra-grav lifters. VRF gauss gun ammunition is carried in 2 cassettes, 0.017m^3 each, 0.017 tonnes loaded, 0.002 tonnes empty, Cr320 loaded, Cr20 empty, replacement requires four actions (see **TNE** page 273).

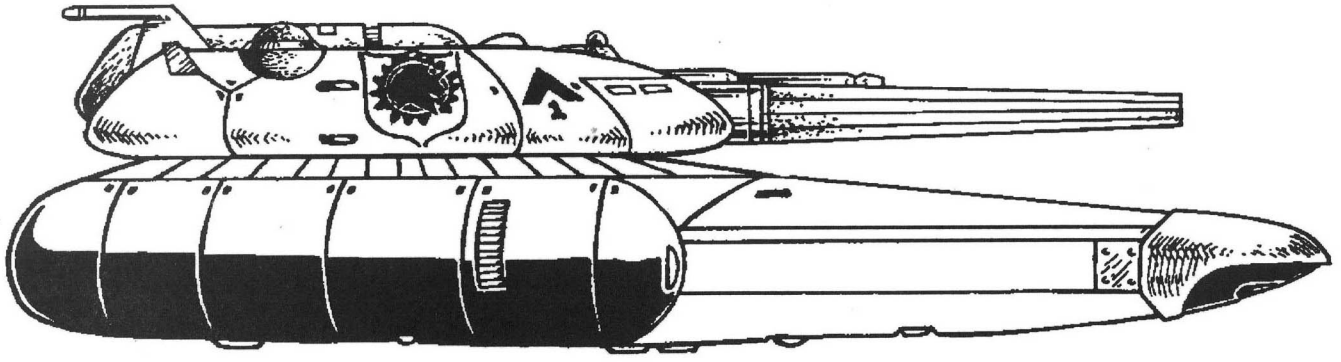
Speed: 713 kph maximum, 535 kph cruising, 178 kph safe NOE

Travel Move: 2140/1068

Combat Move: 99 (high mode absolute speed)/25 (NOE safe speed) in 10-meter grid squares

Signature: +1 Diff Mods vs. HRT and Radar, None vs. other methods

Diff Mods vs. Fire: –1 Diff Mod stationary, +5 at maximum speed (high mode combat move), +4 at cruising speed (high mode travel move), +3 at safe NOE speed, +4 at 2× and 3×safe NOE speed



Maximum Acceleration: 0.365 G

Fuel Capacity: 19,922.6 liters reaction mass plus 66.5 liters for fusion reactor

Fuel Consumption/Endurance: 1082.75 liters/hour (endurance of 18.4 hours), plus reactor fuel is sufficient for one month constant power

*Regency Army Trepida I grav tank. Note the distinctive fluted barrel of the RPX-14H rapid-pulse fusion gun. Compare it to illustrations of the Cuspid-type gunboats (**Regency Sourcebook**, page 90). The barrel of the coaxial VRF gauss gun is barely visible above and beyond the fusion gun.*

TREPIDA I

This is the first production version of the tank, and arguably the best balanced design. For example, note that unlike the up-gunned Mk II Trepidas, its frontal armor is matched to its weapon's performance, a typical design consideration of Imperial AFV manufacturers. Although its gun is less powerful than that in the later Trepida IIs, the 74-Megajoule rapid-pulse fusion X gun has a higher rate of fire than the later 125-Mj weapon, and is supplied with more ammunition, allowing the tank to stand longer in combat, almost seven minutes at its maximum cyclic rate of fire. Furthermore, the coaxial VRF gauss gun allows the tank to economically engage a wider variety of targets than can the Trepida II, armed only with its huge fusion gun. Perhaps more importantly, it can engage these targets with restraint (a word not often used in reference to bolts of fusing hydrogen plasma), an important consideration for peacekeeping, police action, and internal security missions.

Because of its lower offensive performance as compared to the Trepida IIs (next page), the Mk I is the variant most often chosen for rebuilding to the Norris battle tank design, which involves the scrapping of the turret. However, the turrets components are reused in other programs. The most interesting example of this component recycling is the Cuspid-type gunboat. The Trepida's RPX-14 fusion gun is salvaged, refurbished, and installed as a close-quarters weapon on this space-based fighter (see **Regency Sourcebook** page 90).

Like the Norris battle tank (page 12), the command version of the Trepida I retains its main armament and is supplemented by an APC in the headquarters section.

WEAPON CHARACTERISTICS

74-Mj 15-Chamber Rapid Pulse Fusion Gun (RPX-14H)

TL	*Weapon*	*ROF*	*Dam Val*	*Pen Rtg*	*Pen Val*	*C-B*	*Short Range*
14	RPX-14H RP Fusion Gun	SA5	258	1-1-2-10	258-258-129-26	67-25	1290m

TL: Technology level; *ROF*: Rate of Fire in shots per fire *action*, except in the case of weapons listed as "SAN," where N is the total number of shots that the weapon can fire per five-second combat turn; *Dam Val:* Damage Value; *Pen Rtg:* Penetration Rating at short-medium-long-extreme ranges; *C-B*: Concussion value and Burst radius in meters; *Short Range*: Short Range in meters.

Secondary Weapon: VRF Gauss Gun

TL	*Round*	*ROF*	*Dam Val*	*Pen Rtg*	*Pen Val*	*Magazine*	*Short Range*
10	4x20mm/60 Dart	50	6	1-1-3-5	6-6-2-1	60,000C	300

TL: Technology Level; *Round*: type of round fired; *ROF*: Rate of Fire in shots per fire *action; Dam Val:* Damage Value; *Pen Rtg:* Penetration Rating at short-medium-long-extreme ranges; *Pen Val*: Penetration Value, i.e., Damage Value already adjusted by Penetration Rating at short-medium-long-extreme ranges for use against unarmored targets; *Magazine*: Magazine capacity in shots, where C indicates the cassette magazine type; *Short Range*: Short Range in meters.

Decoys

Decoys are of three types: antilaser (which affect attempts to detect a target with ladar or to designate it with a laser designator), antiactive sensor (which affect attempts to detect a target or designate it with radar or active EMS), and antipassive sensor (which affect attempts to detect a target with HRT or passive sensors, including infrared goggles and sights). Each decoy only works against its specified sensor, and increases the difficulty of a detection or designation task by one level vs. TL14 systems, or by two levels vs. TL13– sensors. Each decoy lasts one combat turn (five seconds), and affects all appropriate sensor attempts against the owning vehicle, regardless of direction. Decoy dispensers may launch one decoy per second.

Decoys for Trepida grav tanks cost Cr20,000 each regardless of type, or MCr1.6 for a full load of 80.

Trepida II Grav Tank

TREPIDA IIA

The Trepida IIA is an attempt to fit the maximum possible firepower into the Trepida tank, making it more useful in antitank and direct support roles. The 125-Mj gun was the largest gun that could practically be fitted to the tank without sacrificing too much in rate of fire or ammunition capacity.

Even so, the tank has lost some ROF compared to the earlier model, and has had its ammunition supply reduced to only 3.5 minutes at the maximum cyclic rate. More importantly, it has given up its secondary armament, so the tank has no weapon with which to engage low-value targets other than its expensive and often over-powerful fusion cartridges. The Trepida II is thus very poorly equipped for peace-keeping operations where carefully controlled lethality and limited collateral damage is critical.

The low ammunition capacity of the early Trepida IIs caused the creation of the Trepida IIB type, which traded fuel endurance for additional ammunition. Early model IIs then became known as IIAs, but remained in production on a number of worlds.

Trepida IIA Grav Tank

Tech Level: 14

Price: MCr15.441221

Size: 140 cubic meters=10 displacement tons (VS)

Mass: 216.12 tonnes empty, 235.11 loaded

Power: TL14 6.63 MW fusion power plant supplying 1 MW to high-efficiency contra-grav lifters, with HEPlaR thruster generating 86.62 tonnes of thrust (0.0298 MW excess power)

Maint: 39

Controls: Holographic linked, TL10+ flight avionics, TL14 terrain following avionics, 3×TL14 Model FIt flight computers, TL10+ IGS navigation system

Commo: TL14 3000km radio, 2×TL14 3km masers

Sensors: 30km passive EMS sensor, 3000km passive EMS sensor, 3km active EMS sensor, 2×WSV goggles

ECM: Electromagnetic masking package, 4 decoy dispensers each with space for 20 of any combination of antilaser, antiactive sensor, or antiactive sensor decoys (see facing page, bottom)

Life Support: Heat, light, extended life support, artificial gravity/G-compensators, and one air lock

Cargo: 238 kg of crew equipment (0.955 m³)

Crew: 2 (Driver, Commander/Gunner)

Passengers: None

Fire Control: EMS rangefinder and TL14 point defense ballistic computer (ignore 5 Diff Mods, and multiply Diff Mods of ballistic target by 0.5, dropping fractions), EMS rangefinder may function as 3km short range laser/EMS designator

Armament: Turret-mounted TL14 rapid-pulse 125-Mj fusion gun

Stabilization: Advanced (fire at any speed)

Ammo: 170 rounds of 125-Mj 22×66cm PFC cartridges (Cr1000 each, MCr0.17 for full load of 170)

Reloading Data: Fusion gun magazine is 8.5 m³, 17.17 tonnes loaded, 0.17 tonnes empty, MCr0.17085 loaded, MCr0.00085 empty, reloading requires 172 five-second combat turns and a crane or contra-grav lifters.

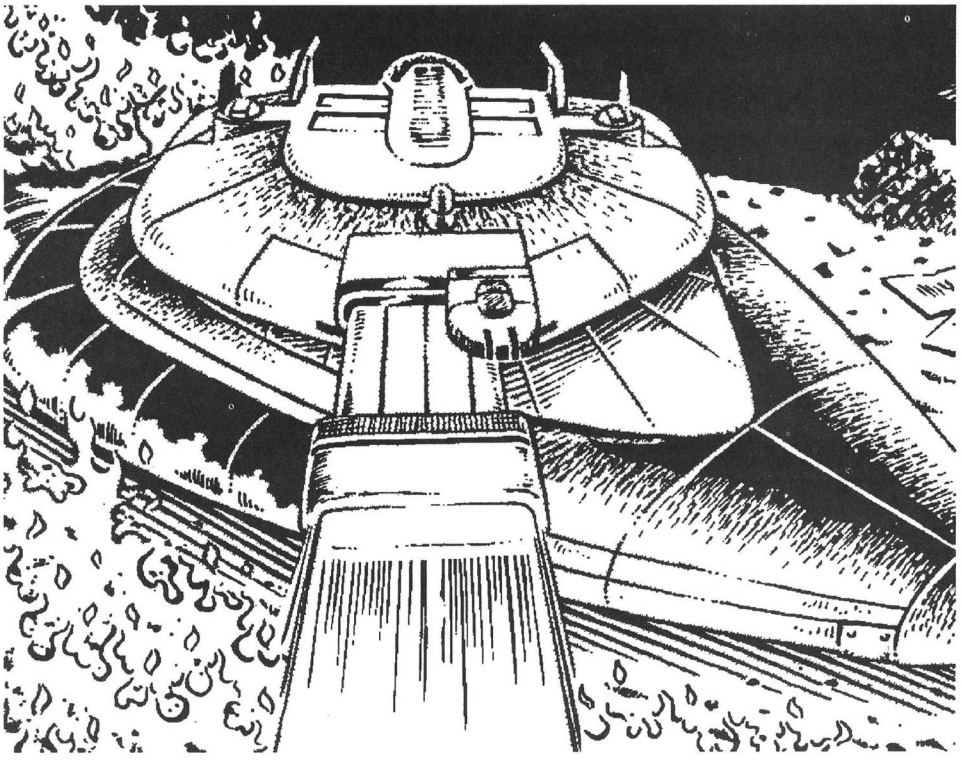
Speed: 712 kph maximum, 534 kph cruising, 178 kph safe NOE

Travel Move: 2136/1068

Combat Move: 99 (high mode absolute speed)/25 (NOE safe speed) in 10-meter grid squares

Signature: +1 Diff Mods vs. HRT and Radar, None vs. other methods

Diff Mods vs. Fire: –1 Diff Mod stationary, +5 at maximum speed (high mode combat move), +4 at cruising speed (high mode travel move), +3 at safe NOE speed, +4 at 2× and 3×safe NOE speed



Maximum Acceleration: 0.368 G

Fuel Capacity: 19,922.6 liters reaction mass plus 55.25 liters for fusion reactor

Fuel Consumption/Endurance: 1082.75 liters/hour (endurance of 18.4 hours), plus reactor fuel is sufficient for one month constant power

Date

Trepida IIB bearing the distinctive Fireball markings of the 444th Tank Regiment, currently serving with the 61st Fleet as the Regency Quarantine District 3 Mobile Force (see page 47). The presence of the cutlass in the design probably indicates that the vehicle is crewed by a Marine crew serving on an exchange tour with the Army.

TREPIDA IIB

The Trepida IIB is a revision of the up-gunned model II design, gaining greater ammunition capacity (over four minutes at the maximum cyclic rate) at the expense of four hours of fuel endurance. This is thought by most users to be a better balanced design than the IIA, as there is no need to have the additional fuel range on a vehicle which will run out of ammunition more rapidly, especially a tank which is ill-suited for peace-keeping patrol duty. The Trepida IIB was therefore produced in much greater numbers than the IIA.

The Trepida IIB is believed to have been the most numerous model of the Trepida family to see service in the Civil War, in which case it likely inflicted and sustained more casualties than any other single vehicle type.

Trepida IIB Grav Tank

Tech Level: 14

Price: MCr15.592871

Size: 140 cubic meters=10 displacement tons (VS)

Mass: 216.45 tonnes empty, 238.09 loaded

Norris Grav Tank

TL15 NORRIS BATTLE TANK

Originally known as the Trepida Mk III while still in development, it was renamed for the late First Regent upon his death in 1157. Because of the known shortcomings of the TL15 heavy grav tank design (see page 6 for discussion), it was determined that a tank in the Trepida size range but with heavy tank's performance would be the design goal for the TL15 future battle tank (FBT-15). Although it was possible to fit the RPZ-15 gun into the Trepida chassis, it did not prove feasible to improve the armor protection without increasing the overall size of the vehicle. Because maintaining the 10-ton size for ease of interstellar deployability was a primary design requirement, this shortcoming was acceptable. However, it was the existence of large numbers of Trepidas that could be quickly converted to the FBT configuration that clinched the argument. Since this would allow many more tanks to be quickly placed in service than in the case of an entirely new design, the Trepida III was approved for production in late 1156.

The hulls of the TL14 Trepida and TL15 Norris are virtually identical, sharing hull structure, control, contra-grav, and ECM systems. Thus conversion from Trepida to Norris standards was accomplished primarily by the substitution of a more powerful (though smaller) TL15 power plant and the installation of a new turret containing the TL15 armament, fire control, communications, and sensor systems.

Another major feature of the Norris design is the provision of a secondary armament: the coaxial VRF gauss gun. This allows the tank to engage targets under circumstances that do not warrant highly destructive fusion gun fire. This makes the Norris much more suitable for peacekeeping operations than are the Mk II Trepidas.

Norris battle tanks are the standard tank used by the Regency Marine Corps and most top-tier Regency Army units. Only army units which are organized for planetary defense of high-tech worlds still utilize the 20-ton heavy grav tank (see pages 6-7).

Perhaps the only shortcoming of the Norris design compared to its Trepida forebears is its relatively small ammunition capacity, only 1.75 minutes at the maximum cyclic rate. However, it also shares a weakness with its TL14 ancestors: relatively weak armor. In some respects the Norris is actually less well-armored than the standard TL15 APCs.

Tech Level: 15
Price: MCr18.569693
Size: 140 cubic meters=10 displacement tons (VS)
Mass: 217.25 tonnes empty, 233.96 loaded
Power: TL15 10.2 MW fusion power plant supplying 1 MW to high-efficiency contra-grav lifters, with HEPlaR thruster generating 86.62 tonnes of thrust (0.2048 MW excess power)
Maint: 39
Controls: Holographic linked, TL10+ flight avionics, TL15 terrain following avionics, 3×TL15 Model FIt flight computers, TL10+ IGS navigation system
Commo: TL15 3000km radio, TL15 300km meson communicator
Sensors: 30km passive EMS sensor, 3000km passive EMS sensor, 30km active EMS sensor, 2×WSV goggles
ECM: Electromagnetic masking package, 4 decoy dispensers each with space for 30 of any combination of antilaser, antiactive sensor, or antiactive sensor decoys (see facing page, bottom)
Life Support: Heat, light, extended life support, artificial gravity/G-compensators (40 m³), and one air lock
Cargo: 176 kg of crew equipment (0.705 m³)
Crew: 2 (Driver/gunner, commander)
Passengers: None
Fire Control: EMS rangefinder and TL14 point defense ballistic computer (ignore 5 Diff Mods, and multiply Diff Mods of ballistic target by 0.5, dropping fractions), EMS rangefinder may function as 3km short range laser/EMS designator
Armament: Turret-mounted TL15 rapid-pulse 175-Mj fusion gun, coaxial VRF gauss gun
Stabilization: Advanced (fire at any speed) for both weapons

Ammo: 105 rounds of 175-Mj 24.6×73.6cm PFC cartridges (Cr1400 each, MCr0.147 for full load of 105) and 60,000 rounds of 4mm gauss ammunition (Cr600 for full load of 60,000 rounds dart)
Reloading Data: Fusion gun magazine is 7.35m³, 14.847 tonnes loaded, 0.147 tonnes empty, MCr0.147735 loaded, MCr0.000735 empty, reloading requires 149 five-second combat turns and a crane or contra-grav lifters. VRF gauss gun ammunition is carried in 2 cassettes, 0.017m³ each, 0.017 tonnes loaded, 0.002 tonnes empty, Cr320 loaded, Cr20 empty, replacement requires four actions (see **TNE** page 273).
Speed: 784 kph maximum, 588 kph cruising, 190 NOE
Travel Move: 2352/1140
Combat Move: 109 (high mode absolute speed)/26 (NOE safe speed) in 10-meter grid squares
Signature: +1 Diff Mods vs. HRT and Radar, None vs. other methods
Diff Mods vs. Fire: –1 Diff Mod stationary, +5 at maximum speed (high mode combat move), +4 at cruising speed (high mode travel move), +3 at safe NOE speed, +4 at 2× and 3×safe NOE speed
Maximum Acceleration: 0.37 G
Fuel Capacity: 19,489.5 liters reaction mass plus 85 liters for fusion reactor
Fuel Consumption/Endurance: 1082.75 liters/hour (endurance of 18 hours), plus reactor fuel is sufficient for one month constant power

ON/OFF

Norris battle tank in Regency Marine service. Note the overall similarity to the Trepida tank on which it is based.

Note that the bulk of the huge 175-Megajoule RPZ fusion gun requires the coaxial VRF gauss gun to be fitted above the weapon, rather than alongside it as in the Trepida I design (page 9).

This vehicle displays kill markings in the form of illustrative silhouettes, one of several methods that are currently popular in the Regency planetary forces. Other methods include "kill rings" around the gun barrel, and national insignia corresponding to the allegiance of the destroyed system.

COMMAND VARIANT

The Norris command tank was carefully designed to be fully compatible with its subordinate tanks from a logistical and operational point of view. Both have identical battlefield endurance, and the command tank has equal or greater speed. Both use the same weapons fit, ammunition, decoys, electronics and avionics suites, fuel tanks, and thrusters, which greatly simplifies logistics support, maintenance, and stocking of spare parts.

The main differences between the two is the addition of a single TL15 computer and hull workstation for the commander, plus a 30,000km maser uplink to tie the platoon into the surveillance and communications constellation (SCC, see page 7). This is achieved at the cost of 47 rounds of main armament ammunition, and a new life-support scheme. Unlike the basic variant, which includes an air lock and 40 m³ habitable area, the command version has no air lock and limits its life support equipment to a small 15 m³ capsule occupied by the three crew in the hull.

The command version carries 55% of the ammunition available to the standard versions, so is able to effectively stand in battle when required to do so, and retains the same number of decoys as the standard tank. The command variant can be visually recognized by its slimmer turret, but unlike the command variant of the heavy grav tank (page 7), there was no attempt nor any real need to disguise the identity of this tank, as it is not a defenseless command vehicle masquerading as a tank, but a fully equipped combat vehicle well-able to defend itself.

Because the Norris command tank does not carry the other personnel of the platoon headquarters section (unlike the heavy command tank), the headquarters of a Norris-equipped platoon also includes an Imperial Marine Command/Computer APC (page18) or Imperial Fire Support/Command APC (page 24). This gives the Norris headquarters a separate "command" and "headquarters" vehicles: one from which the commander leads from the front and the other where the headquarters section coordinates information and logistics flow. The headquarters vehicle also makes up for the relative lack of computing capacity of the command tank, which only carries one computer instead of the two required of a full-fledged command/headquarters vehicle.

The Norris command tank is identical to the standard Norris but with the following changes. Simply replace the line in the Norris entry on the facing page with the information below.

Price: MCr26.430074

Mass: 218.28 tonnes empty, 228.34 loaded

Power: TL15 15.6 MW fusion power plant supplying 1 MW to high-efficiency contra-grav lifters, with HEPlaR thruster generating 86.62 tonnes of thrust (0.0357 MW excess power)

Commo: TL15 3000km radio, TL15 300km meson communicator, TL15 30,000km maser

Sensors: 30km passive EMS sensor, 3000km passive EMS sensor, 30km active EMS sensor, 3×WSV goggles

ECM: Electromagnetic masking package, 4 decoy dispensers each with space for 30 of any combination of antilaser, antiactive sensor, or antiactive sensor decoys (see facing page, bottom), 30km EMS jammer

Life Support: Heat, light, extended life support, artificial gravity/G-compensators (20 m³), *no* air lock

Cargo: 38.7 kg of crew equipment (0.155 m³)

Crew: 3 (Driver, gunner/vehicle commander, unit commander)

Ammo: 58 rounds of 175-Mj 24.6×73.6cm PFC cartridges (Cr1400 each, MCr0.0812 for full load of 58) and 60,000 rounds of 4mm gauss ammunition (Cr600 for full load of 60,000 rounds dart)

Reloading Data: Fusion gun magazine is 4.06m³, 8.2012 tonnes loaded, 0.0812 tonnes empty, MCr0.081606 loaded, MCr0.000406 empty, reloading requires 83 five-second combat turns and a crane or contra-grav lifters. VRF gauss gun ammunition is carried in 2 cassettes, 0.017m³ each, 0.017 tonnes loaded, 0.002 tonnes empty, Cr320 loaded, Cr20 empty, replacement requires four actions (see **TNE** page 273).

Speed: 869 kph maximum, 652 kph cruising, 190 NOE

Travel Move: 2608/1140

Combat Move: 121 (high mode absolute speed)/26 (NOE safe speed) in 10-meter grid squares

Maximum Acceleration: 0.38 G

Fuel Consumption/Endurance: 1082.75 liters/hour (endurance of 18 hours), plus reactor fuel is sufficient for 2.6 weeks constant power

Decoys

Decoys are of three types: antilaser (which affect attempts to detect a target with ladar or to designate it with a laser designator), antiactive sensor (which affect attempts to detect a target or designate it with radar or active EMS), and antipassive sensor (which affect attempts to detect a target with HRT or passive sensors, including infrared goggles and sights). Each decoy only works against its specified sensor, and increases the difficulty of a detection or designation task by one level vs. TL15 systems, or by two levels vs. TL14– sensors. Each decoy lasts one combat turn (five seconds), and affects all appropriate sensor attempts against the owning vehicle, regardless of direction. Decoy dispensers may launch one decoy per second.

Decoys for Norris grav tanks cost Cr20,000 each regardless of type, or MCr1.6 for a full load of 80.

Astrin Grav APC

TL14 ASTRIN GRAV APC

The Astrin grav APC is the standard Imperial TL14 APC, and as such was widely used and lost in the Civil War along with its sister AFV, the Trepida grav tank.

The Astrin APC is closely based on the chassis of the Trepida grav tank, and in fact has identical armor protection, power, locomotive, and electronic systems, allowing the two vehicles to operate together quite effectively. Although the Norris battle tank (see page 12) is the TL15 version of the Trepida, no TL15 APC version was ever built or contemplated, given the profusion of TL15 APCs already fielded and being produced.

The Astrin is intended for the carriage of 10 troops wearing heavy battle dress. The cramped seating required that a large troop door be installed to allow the troops to debark rapidly (five per five-second combat turn).

The Astrin has a substantial cargo capacity (equivalent to seating for an additional three troops), allowing the embarked squad to carry heavy weapons, support equipment, etc. along with them.

Tech Level: 14
Price: MCr3.7052325
Size: 140 cubic meters=10 displacement tons (VS)
Mass: 200.09 tonnes empty, 206.1 loaded
Power: TL14 5.37 MW fusion power plant supplying 1 MW to high-efficiency contra-grav lifters, with HEPlaR thruster generating 58.65 tonnes of thrust (0.0123 MW excess power)
Maint: 34
Controls: Holographic linked, TL10+ flight avionics, TL14 terrain following avionics, 3×TL14 Model FIt flight computers, TL10+ IGS navigation system
Commo: TL14 3000km radio, 2×TL14 3km masers
Sensors: 30km passive EMS sensor, 3000km passive EMS sensor, 3km active EMS sensor, 2×WSV goggles
ECM: Electromagnetic masking package, 4 decoy dispensers each with space for 20 of any combination of antilaser, antiactive sensor, or antiactive sensor decoys (see facing page, bottom)
Life Support: Heat, light, extended life support, artificial gravity/G-compensators (for 70 cubic meters), and one air lock
Cargo: 2015 kg of crew equipment (8.06 m³)
Crew: 2 (Driver, commander/gunner)
Passengers: 10 in cramped seats with large cargo hatch, allowing 5 battle dress-equipped troops to debark/embark per five-second combat turn.
Fire Control: EMS rangefinder and TL14 point defense ballistic computer (ignore 5 Diff Mods, and multiply Diff Mods of ballistic target by 0.5, dropping fractions), EMS rangefinder may function as 3km short range laser/EMS designator
Armament: TL14 rapid-pulse 3-Mj fusion gun in remote turret
Stabilization: Advanced (fire at any speed)
Ammo: 500 rounds of 3-Mj 6.3×19.25cm PFC cartridges (Cr24 each, MCr0.012 for full load of 500)
Reloading Data: Fusion gun magazine is 0.6m³, 1.212 tonnes loaded, 0.012 tonnes empty, MCr0.01206 loaded, MCr0.00006 empty, reloading requires 13 five-second combat turns and a crane or contra-grav lifters.
Speed: 867 kph maximum, 650 kph cruising, 180 kph NOE
Travel Move: 2600/1080
Combat Move: 121 (high mode absolute speed)/25 (NOE safe speed) in 10-meter grid squares
Signature: +1 Diff Mods vs. HRT and Radar, None vs. other methods
Diff Mods vs. Fire: –1 Diff Mod stationary, +5 at maximum speed (high mode combat move), +4 at cruising speed (high mode travel move), +3 at safe NOE speed, +4 at 2× and 3×safe NOE speed
Maximum Acceleration: 0.285 G
Fuel Capacity: 20,527.5 liters reaction mass plus 44.75 liters for fusion reactor
Fuel Consumption/Endurance: 733.125 liters/hour (endurance of 28 hours), plus reactor fuel is sufficient for one month constant power

Current production Regency Astrin APC, showing the standard turret-mounted RPV fusion gun. This side view makes the Astrin's common ancestry with the Trepida grav tanks very clear. Compare to pages 9 and 11.

Early production Imperial Astrin APC, without turret. In comparison with the current-production vehicle, note how the sensor equipment at the forward end of the hull deck has been displaced to the turret.

ASTRIN GRAV APC, EARLY PRODUCTION VERSION

The Astrin Grav APC was developed as a companion to the Trepida series tanks (see pages 8-11), and its production lagged several years behind that of the tanks. While the Trepida was type-standardized in 1109, the Astrin did not achieve large-scale deliveries until 1112, only four years prior to the assassination of Emperor Strephon. Thus the Astrin only began service entry in the last few years of the antebellum period, but these initial vehicles differed from current Regency-standard Astrins in their lack of a turret.

There was substantial pressure to field this companion vehicle in the Trepida-equipped organizations, and the design was rushed into production before a final decision was reached as to the nature of its armament, or even if such armament was required. Some pointed out that since the vehicle would operate in consort with Trepida tanks it would be wasteful and duplicative to give it a weapon of its own. Furthermore, the lack of a turret would increase the vehicle's speed and reduce its signature and target size.

In any event, the vehicle entered production and fought the Civil War without a turret, although its combat performance proved to Regency military leaders that such a turret was in fact quite necessary. For this reason, all Astrins produced in the Domain of Deneb and Regency following the onset of the Civil War have been equipped with a turret-mounted fusion gun as seen on the facing page.

Turretless early production Astrins are identical in most features to current production versions, except as detailed below.

Imperial Marine Grav APC

IMPERIAL MARINE GRAV APC

This vehicle has never been assigned an official name. It is simply known as the "Imperial Marine Grav APC," although it is unofficially referred to as "The Big Stick." It is no accident that the vehicle has no low-lethality secondary weapons. It literally has no ability to respond to provocation while limiting damage, for that is not its job.

The fact that it is entirely armed with nuclear Tac missiles and a fusion gun was well-advertised throughout the Imperium, and the message was clear: when the Marines arrive, the party is over, and no half-measures will be taken. And now, after the Collapse, the point remains: Regency Marines are not peacekeepers. Rather, they are peace*makers*, even if only the peace of the dead.

As an exception to the standard elimination of the title "grav" for Regency equipment, the Imperial Marine APC retains the descriptor "grav" as part of its antebellum mystique. It is curious that Imperial forces retain this mystique, for no forces of any of the various factions of the Shattered Imperium were ever able to gain a decisive advantage in the Civil War. Some historians claim that this is because the factions were each of approximately equal size, and it was the high quality of the former Imperial forces under the control of each that prevented any from gaining the advantage. Others claim that this inability of any faction to gain the upper hand is a fortunate (though admittedly chance) event that allows all former Imperial citizens to claim proud allegiance to the "real" Imperium, not just the faction that controlled their local space. Although this might simply be a flimsy nicety, it is from such psychological fig leaves that lasting peace can be fashioned.

Nonetheless, there are some armies which unaccountably retain the *cachet* of invincibility even in the presence of inconvenient refuting evidence, and the Imperial forces are one such army.

As another terminological exception, the "Imperial Marine Grav APC" carries no tech level designator, unlike most other Imperial-designed vehicles. This is because Imperial Marine equipment was automatically known to be TL15, so no designator was required.

Unlike the TL15 Imperial APC, the Marine grav APC carries all its weapons in its turret. As with most things this carries advantages and disadvantages. The carriage of its missile armament in a streamlined turret means that the Marine APC has less aerodynamic drag, and can therefore achieve a higher speed. Its missiles are also protected from non-penetrating fire.

On the down side, the Marine vehicle must reload its turret missile magazine after six shots while the army variant can fire all 30 of its missiles without any delay for reloading. Likewise, the Marine APC is limited in the firing of special rounds by the five missiles carried in the magazine. The army APC can fire any or all of its 30 rounds (assuming they have not been damaged by small arms fire or fragments) at any time, and in any order, as all 30 are ready to fire at any time.

Also unlike its army counterpart, the Marine APC carries a full-sized TL15 computer. This is used for command, control, and coordination of the APC's carried squad, and for proper integration with the remainder of the APC's unit. This computer was specified by the Imperial Marines because of the demands of the Marines' mission. Imperial (and Regency) Marines are usually deployed in small numbers, which requires them to operate over large areas with a resulting very low unit density. It is not unusual for a Marine regiment to be given responsibility for an entire planet, which means that entire countries can be the responsibility of a mere platoon or squad. The carried computer is tremendously valuable in keeping track of the data required by such distributed operations, and its provision is the main reason for the APC's very high unit cost (compare to the Trepida I grav tank, page 8, and the TL15 Imperial APC, page 22).

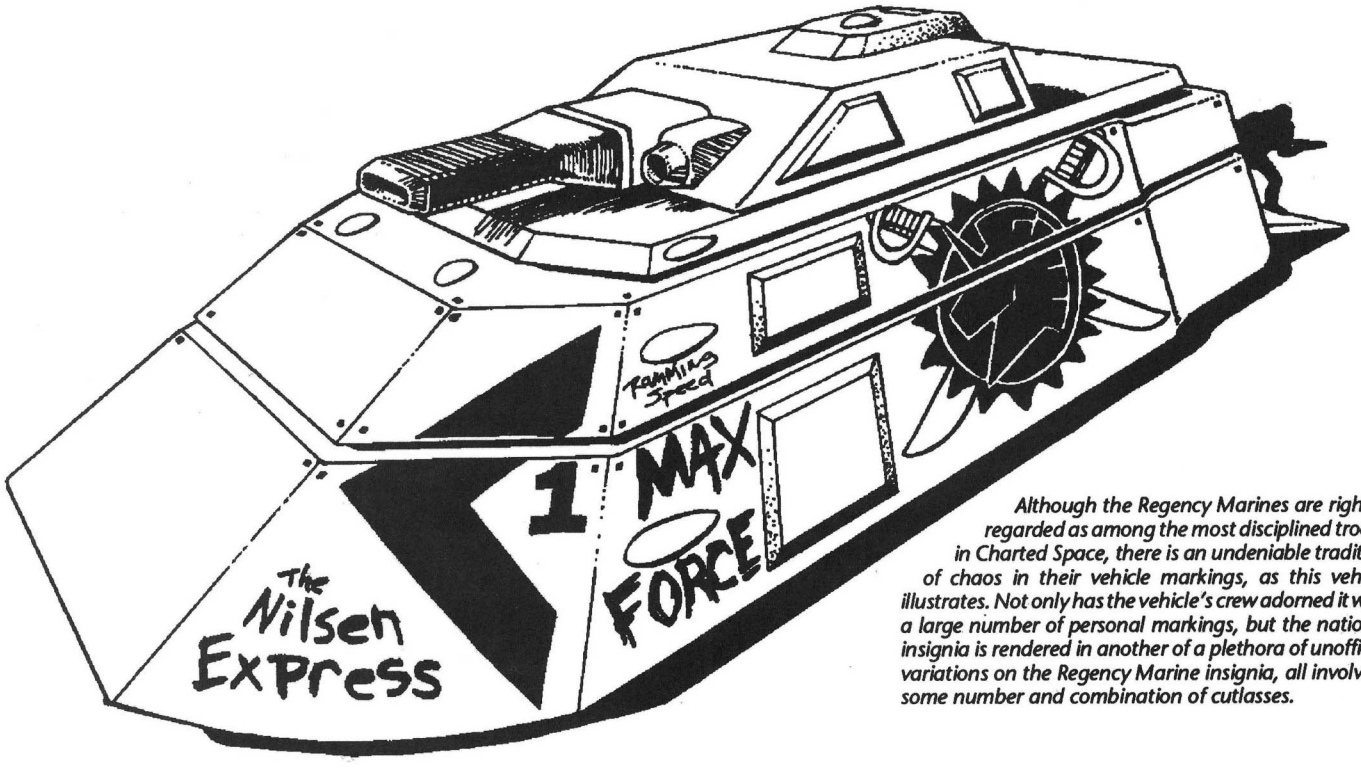
Another by-product of the on-board computer is the small squad size, only eight troops. The vehicle commander is also the squad commander, and is often obliged to disembark with the squad, although his or her usual post is at the console of the squad's command computer aboard the APC.

The Imperial Marine Grav APC is one of many TL15 combat vehicles which is built on the Imperial TL15 Standard APC Hull; see pages 22-23 for details.

WEAPON CHARACTERISTICS

TL15 18.5 Mj 12-Chamber Rapid Pulse Fusion Gun (RPW-15 Low)

TL	*Weapon*	*ROF*	*Dam Val*	*Pen Rtg*	*Pen Val*	*C-B*	*Short Range*
15	RPW-15L RP Fusion Gun	3	129	1-1-2-10	129-129-65-13	17-15	650m



TL: Technology level; *ROF*: Rate of Fire in shots per fire *action*, except in the case of weapons listed as "SAN," where N is the total number of shots that the weapon can fire per five-second combat turn; *Dam Val:* Damage Value; *Pen Rtg:* Penetration Rating at short-medium-long-extreme ranges; *C-B*: Concussion value and Burst radius in meters; *Short Range*: Short Range in meters.

TL15 Nuclear Tac Missiles

TL	*Guidance*	*Yield*	*Mass*	*Price*	*Short Range*	*Max Range*	*M/turn*	*Agility*
15	TeleG/TD/Hmg	0.1	95	3810.4	20km	70km	1668	4
15	TeleG/TD/Hmg	0.5	95	7806.4	20 km	65km	1668	4
15	TeleG/TD/Hmg	1	95	12,803.2	20km	62km	1668	4
15	TeleG/Tgt Skr	0.1	95	12,310.4	40km	70km	1668	4/6
15	TeleG/Tgt Skr	0.5	95	16,306.4	40km	65km	1668	4/6
15	TeleG/Tgt Skr	1	95	21,303.2	40km	62km	1668	4/6
15	Tgt Skr/TD/Hmg	0.1	95	14,844.8	40/20km	133km	16,680	8/10
15	Tgt Skr/TD/Hmg	0.5	95	18,836.8	40/20km	124km	16,680	8/10
15	Tgt Skr/TD/Hmg	1	95	23,830.4	40/20km	118km	16,680	8/10

TL is tech level of missile; *Guidance* is guidance packages in missile, where TeleG indicates teleguidance, TD is AEMS/Laser target designated, Hmg is advanced IR homing, and Tgt Skr is imaging radar target seeker; *Yield* is warhead yield in kilotons; *Mass* is mass of missile in kilograms; *Price* is price of missile in credits; *Short Range* is short range of missile in homing mode, where figures separated by a slash are in target seeker/homing mode; *Max Range* is maximum range of missile in teleguided or target designated mode; *M/turn* is the number of meters the missile travels in a five-second combat turn; *Agility* is the missile's agility, where missiles with a target seeker guidance mode have their target seeker agility to the right of the slash. All missiles have a volume of 95 liters, diameter of 30cm, and length of 1.34m.

Regency Combat Vehicle Guide

Although the Regency Marines are rightly regarded as among the most disciplined troops in Charted Space, there is an undeniable tradition of chaos in their vehicle markings, as this vehicle illustrates. Not only has the vehicle's crew adorned it with a large number of personal markings, but the national insignia is rendered in another of a plethora of unofficial variations on the Regency Marine insignia, all involving some number and combination of cutlasses.

Tech Level: 15

Price: MCr12.001883

Size: 168 cubic meters=12 displacement tons (VS)

Mass: 218.72 tonnes empty, 233.73 loaded

Power: TL15 9.9 MW fusion power plant supplying 1.2 MW to high-efficiency contra-grav lifters, with HEPlaR thruster generating 86.62 tonnes of thrust (0.0616 MW excess power)

Maint: 39

Controls: Holographic linked, TL10+ flight avionics, TL15 terrain following avionics, 3×TL15 Model Flt flight computers, TL10+ IGS navigation system, 1×TL15 Model St computer

Commo: TL15 30km radio, TL15 300km meson communicator

Sensors: 30km passive EMS sensor, 3000km passive EMS sensor, 30km active EMS sensor, 3×WSV goggles

ECM: Electromagnetic masking package, 4 decoy dispensers each with space for 30 of any combination of antilaser, antiactive sensor, or antiactive sensor decoys (see below)

Life Support: Heat, light, extended life support, artificial gravity/G-compensators (for 134.4 cubic meters), and one air lock

Cargo: 2060 kg of crew equipment (8.24 m^3)

Crew: 3 (Driver, Commander, Gunner)

Passengers: 8 in adequate seats with large cargo hatch, allowing all 8 battle dress-equipped troops to debark/embark in one five-second combat turn.

Fire Control: EMS rangefinder and TL14 point defense ballistic computer (ignore 5 Diff Mods, and multiply Diff Mods of ballistic target by 0.5, dropping fractions), control units for advanced IR homing, imaging radar target seeking, teleguided, and laser designated missiles, 300km laser designator, EMS rangefinder may function as 3km short range laser/EMS designator

Armament: TL15 rapid-pulse 18.5-Mj fusion gun and magazine launcher with 1+5 nuclear Tac missiles, both mounted in remote turret

Stabilization: Advanced (fire at any speed)

Ammo: 500 rounds of 18.5-Mj 11.6×35cm PFC cartridges (Cr148 each, Cr74,000 for full load of 500), 1+5 nuclear missiles in magazine launcher plus up to 26 more in cargo/damper box (usually only 26 total in both locations because of radiation hazard)

Reloading Data: Fusion gun magazine is 3.7m^3, 7.474 tonnes loaded, 0.074 tonnes empty, MCr0.07437 loaded, MCr0.00037 empty, reloading requires 75 five-second combat turns and a crane or contra-grav lifters. Missiles are 95kg each, replacement requires 19 actions each (see **TNE** page 273).

Speed: 1092 kph maximum, 819 kph cruising, 190 kph NOE

Travel Move: 3276/1140

Combat Move: 152 (high mode absolute speed)/26 (NOE safe speed) in 10-meter grid squares

Signature: +1 Diff Mods vs. HRT and Radar, None vs. other methods

Diff Mods vs. Fire: –1 Diff Mod stationary, +5 at maximum speed (high mode combat move), +5 at cruising speed (high mode travel move), +3 at safe NOE speed, +4 at 2× and 3×safe NOE speed

Maximum Acceleration: 0.371 G

Fuel Capacity: 16,782.625 liters reaction mass plus 82.5 liters for fusion reactor

Fuel Consumption/Endurance: 1082.75 liters/hour (endurance of 15.5 hours), plus reactor fuel is sufficient for one month constant power

Combat Statistics

Config: Sm Turret	**TF:** 252	**HF:** 252

Decoys

Decoys are of three types: antilaser (which affect attempts to detect a target with ladar or to designate it with a laser designator), antiactive sensor (which affect attempts to detect a target or designate it with radar or active EMS), and antipassive sensor (which affect attempts to detect a target with HRT or passive sensors, including infrared goggles and sights). Each decoy only works against its specified sensor, and increases the difficulty of a detection or designation task by one level vs. TL15 systems, or by two levels vs. TL14– sensors. Each decoy lasts one combat turn (five seconds), and affects all appropriate sensor attempts against the owning vehicle, regardless of direction. Decoy dispensers may launch one decoy per second.

Decoys for the Imperial Marine Grav APC costs Cr20,000 each regardless of type, or MCr2.4 for a full load of 120.

Imperial Marine Command/Computer APC

IMPERIAL MARINE COMMAND/COMPUTER GRAV APC

This is the standard command vehicle for line Marine companies, and is also used as a key headquarters vehicle at levels above company in Marine units. The organization tables in **Striker II** list this vehicle in three different ways: "Imperial Marine Command APC," "staff uplink Imperial Marine Command APC," and "staff radio Imperial Marine Command APC."

Imperial Marine Command APC and staff uplink Imperial Marine Command APC are the same identical vehicle. The only difference between the two is their assigned role; either vehicle could fill in for the other with a simple change in the specific crewmembers assigned (i.e., unit commanders and staff in the command vehicle, and communications specialists and staff in the staff uplink vehicle)

The staff radio Imperial Marine Command APC is a slight modification of the first vehicle and merely adds radios. It has the same uplink capability as the standard vehicle, and can fill in for the staff uplink vehicle if required to do so.

The communications suites of these and other Imperial Marine APCs show the reliance placed on meson communications at TL15. The only radio (except for the dedicated staff radio variant) is a small 30km model which is only a backup to the meson communicators. Compare this suite to the TL14 grav tank suites on pages 8-11, as meson communicators are not technically feasible until TL15.

In Imperial and Regency military doctrine, the ECM mission is handled at the company and battalion headquarters level. Thus all Imperial command vehicles intended for these levels are fitted with 30km EMS jammers. These are deception jammers and not broad-band "noise" jammers, and hence do not expose the command vehicles to a greater risk of detection or targeting. In order for such jamming to be successful, the vehicles to be protected must be sited relatively near to the command/jamming vehicle, which can often be a problem in Marine operations (see page 16). However, the jammer's range is generally sufficient to protect headquarters elements and such combat support elements as point defense and nuclear damper vehicles.

As is the case with the Marines' platoon-level command vehicle, the command/computer/staff APCs are fully combat ready, with offensive systems duplicating those of the line APCs, only omitting the internal stowage for additional missile rounds.

Imperial Marine Command/Computer and Staff Uplink Grav APC

Tech Level: 15

Price: MCr20.445411

Size: 168 cubic meters=12 displacement tons (VS)

Mass: 224.32 tonnes empty, 235.09 loaded

Power: TL15 15.6 MW fusion power plant supplying 1.2 MW to high-efficiency contra-grav lifters, with HEPlaR thruster generating 86.62 tonnes of thrust (0.01182 MW excess power)

Maint: 39

Controls: Holographic linked, TL10+ flight avionics, TL15 terrain following avionics, 3×TL15 Model Flt flight computers, TL10+ IGS navigation system, 2×TL15 Model St computer

Commo: TL15 30km radio, 2×TL15 300km meson communicator, 2×TL15 30,000km maser (only one powered)

Sensors: 30km passive EMS sensor, 3000km passive EMS sensor, 30km active EMS sensor, 3×WSV goggles

ECM: 30km EMS Jammer, Electromagnetic masking package, 4 decoy dispensers each with space for 30 of any combination of antilaser, antiactive sensor, or antiactive sensor decoys (see below)

Life Support: Heat, light, extended life support, artificial gravity/G-compensators (for 134.4 cubic meters), and one air lock

Cargo: 489 kg of crew equipment (1.957 m^3)

Crew: 3 (Driver, Commander, Gunner)

Passengers: 2 unit leaders in normal workstations, plus adequate seats for 4 additional passengers, large cargo hatch

Fire Control: EMS rangefinder and TL14 point defense ballistic computer (ignore 5 Diff Mods, and multiply Diff Mods of ballistic target by 0.5, dropping fractions), control units for advanced IR homing, imaging radar target seeking, teleguided, and laser designated missiles, 300km laser designator, EMS rangefinder may function as 3km short range laser/EMS designator

Date

This Marine Command APC shows that even command vehicles are not exempt from bloody-minded personal markings. The "radome" on the turret is actually the protective housing for the 30,000km orbital maser link, a characteristic item of the communications suite of all Regency company level+ command and staff vehicles.

IMPERIAL MARINE COMMAND/COMPUTER AND STAFF RADIO GRAV APC

As discussed above, this variant is identical to the Command/Computer and Staff Uplink Grav APC except for the following items:

Price: MCr20.573411
Mass: 225.00 tonnes empty, 235.69 loaded
Power: TL15 17.64 MW fusion power plant supplying 1.2 MW to high-efficiency contra-grav lifters, with HEPlaR thruster generating 86.62 tonnes of thrust (0.05182 MW excess power)
Commo: TL15 30km radio, 2×TL15 300km meson communicator, 2×TL15 30,000km maser (only one powered), 2×TL15 30,000km radios
Cargo: 399 kg of crew equipment (1.598 m³)
Fuel Capacity: 16,782.625 liters reaction mass plus 147 liters for fusion reactor

Decoys

Decoys are of three types: antilaser (which affect attempts to detect a target with ladar or to designate it with a laser designator), antiactive sensor (which affect attempts to detect a target or designate it with radar or active EMS), and antipassive sensor (which affect attempts to detect a target with HRT or passive sensors, including infrared goggles and sights). Each decoy only works against its specified sensor, and increases the difficulty of a detection or designation task by one level vs. TL15 systems, or by two levels vs. TL14– sensors. Each decoy lasts one combat turn (five seconds), and affects all appropriate sensor attempts against the owning vehicle, regardless of direction. Decoy dispensers may launch one decoy per second.

Decoys for the Imperial Marine Command APC costs Cr20,000 each regardless of type, or MCr2.4 for a full load of 120.

WEAPON CHARACTERISTICS

TL15 18.5 MJ 12-Chamber Rapid Pulse Fusion Gun (RPW-15 Low)

15	Tgt Skr/TD/Hmg	1	95	23,830.4	40/20km	118km	16,680	8/10

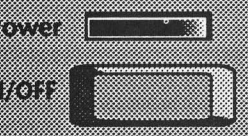
TL is tech level of missile; *Guidance* is guidance packages in missile, where TeleG indicates teleguidance, TD is AEMS/Laser target designated, Hmg is advanced IR homing, and Tgt Skr is imaging radar target seeker; *Yield* is warhead yield in kilotons; *Mass* is mass of missile in kilograms; *Price* is price of missile in credits; *Short Range* is short range of missile in homing mode, where figures separated by a slash are in target seeker/homing mode; *Max Range* is maximum range of missile in teleguided or target designated mode; *M/turn* is the number of meters the missile travels in a five-second combat turn; *Agility* is the missile's agility, where missiles with a target seeker guidance mode have their target seeker agility to the right of the slash. All missiles have a volume of 95 liters, diameter of 30cm, and length of 1.34m.

Imperial Marine Fire Support APC and Assault Gun

Regency Marine Fire Support APC, with typically aggressive unofficial markings. The fire support vehicle is easily distinguished from the assault gun (facing page) by the distinctive fluted barrel of the RPX fusion gun (compare with the illustration of the Trepida I tank on page 9). The assault gun is equipped with smooth, oval-cross-sectioned RPY gun as seen on the Trepida II tanks (pages 10-11). The fire support vehicle also retains the stubby barrel of the 95-kg tac missile launcher, which is deleted from the assault gun design.

IMPERIAL MARINE FIRE SUPPORT APC

In keeping with Imperial doctrine, platoon command vehicles double as the platoon fire support element, replicating the role of weapons platoons in low-tech leg infantry platoons (see also page 24). Thus the vehicle is a fully capable combat unit, with sensors and firepower equal to or better than those in the squad APCs, but with command features layered on top of those.



However, platoon command vehicles do not fulfill the orbital uplink or ECM roles, and are therefore lacking these systems which are present on company-level+ command vehicles.

Its command functions aside, this vehicle typically serves as a surrogate close-support tank, as the Imperial forces have never fielded a grav tank with the speed to keep up with the Imperial Marine Grav APC. This the Fire Support APC can do, and with its rapid-pulse fusion X gun, it provides tank-class firepower (although admittedly at the low end of this class). The logical extension of the capabilities inherent in this vehicle led ultimately to the Imperial Marine Assault Gun (facing page).

Tech Level: 15
Price: MCr19.066647
Size: 168 cubic meters=12 displacement tons (VS)
Mass: 223.49 tonnes empty, 240.02 loaded
Power: TL15 10.5 MW fusion power plant supplying 1.2 MW to high-efficiency contra-grav lifters, with HEPlaR thruster generating 86.62 tonnes of thrust (0.0614 MW excess power)
Maint: 40
Controls: Holographic linked, TL10+ flight avionics, TL15 terrain following avionics, 3×TL15 Model FIt flight computers, TL10+ IGS navigation system, 2×TL15 Model St computer
Commo: TL15 30km radio, 2×TL15 300km meson communicator
Sensors: 30km passive EMS sensor, 3000km passive EMS sensor, 30km active EMS sensor, 5×WSV goggles
ECM: Electromagnetic masking package, 4 decoy dispensers each with space for 30 of any combination of antilaser, antiactive sensor, or antiactive sensor decoys (see below)
Life Support: Heat, light, extended life support, artificial gravity/G-compensators (for 134.4 cubic meters), and one air lock
Cargo: 122 kg of crew equipment (0.491 m³)
Crew: 3 (Driver, Commander, Gunner)
Passengers: 2 unit leaders in normal workstations, plus adequate seats for 2 additional passengers, large cargo hatch
Fire Control: EMS rangefinder and TL14 point defense ballistic computer (ignore 5 Diff Mods, and multiply Diff Mods of ballistic target by 0.5, dropping fractions), control units for advanced IR homing, imaging radar target seeking, teleguided, and laser designated missiles, 300km laser designator, EMS rangefinder may function as 3km short range laser/EMS designator
Armament: TL15 rapid-pulse 74-Mj fusion gun, magazine launcher with 1+5 nuclear Tac missiles
Stabilization: Advanced (fire at any speed)
Ammo: 190 rounds of 74-Mj 18.5×55cm PFC cartridges (Cr592 each, Cr112,480 for full load of 190), 1+5 nuclear missiles in magazine launcher plus up to 26 more in cargo/damper box (usually only 26 total in both locations)
Reloading Data: Fusion gun magazine is 5.624m³, 11.36048 tonnes loaded, 0.11248 tonnes empty, MCr0.1130424 loaded, MCr0.0005624 empty, reloading requires 114 five-second combat turns and a crane or contra-grav lifters. Missiles are 95kg each, replacement requires 19 actions each (see **TNE** page 273).
Speed: 1028 kph maximum, 771 kph cruising, 190 kph NOE
Travel Move: 3084/1140
Combat Move: 143 (high mode absolute speed)/26 (NOE safe speed) in 10-meter grid squares
Signature: +1 Diff Mods vs. HRT and Radar, None vs. other methods
Diff Mods vs. Fire: –1 Diff Mod stationary, +5 at maximum speed (high mode combat move), +5 at cruising speed (high mode travel move), +3 at safe NOE speed, +4 at 2× and 3×safe NOE speed
Maximum Acceleration: 0.361 G
Fuel Capacity: 16,782.625 liters reaction mass plus 87.5 liters for fusion reactor
Fuel Consumption/Endurance: 1082.75 liters/hour (endurance of 15.5 hours), plus reactor fuel is sufficient for one month constant power

TL is tech level of missile; *Guidance* is guidance packages in missile, where TeleG indicates teleguidance, TD is AEMS/Laser target designated, Hmg is advanced IR homing, and Tgt Skr is imaging radar target seeker; *Yield* is warhead yield in kilotons (see **Fire, Fusion, & Steel** page 143); *Mass* is mass of missile in kilograms; *Price* is price of missile in credits; *Short Range* is short range of missile in homing mode, where figures separated by a slash are in target seeker/homing mode; *Max Range* is maximum range of missile in teleguided or target designated mode; *M/turn* is the number of meters the missile travels in a five-second combat turn; *Agility* is the missile's agility, where missiles with a target seeker guidance mode have their target seeker agility to the right of the slash. All missiles have a volume of 95 liters, diameter of 30cm, and length of 1.34m.

IMPERIAL MARINE ASSAULT GUN

This is the logical extension of the Imperial Marine Fire Support APC, placing a larger tank-class gun in a vehicle with global mobility in the class of the Marine APC. It is likely that vehicles similar to this one, perhaps mounting RPY-14Hs identical to those in Trepida IIs, were created by various factions in the Civil War. Because of the higher priority given to the manufacture of TL15 battle tanks, production of the IM Assault Gun has been limited, and only a handful of regiments have received it. Furthermore, current TO&Es do not reflect the addition of the assault guns, so there is no official prescribed pattern for their assignment. Some units have replaced fire support APCs with assault guns on a one-for-one basis; others have added an assault gun to each platoon headquarters, or two or three to the company headquarters. More dramatically, the 5th MArCav regiment is conducting an experiment where all of the grav tanks in their armored cavalry squadrons are replaced on a one-for-one basis with assault guns, turning the tank sections into assault gun sections (see **Striker II** page 142). This gives the armored cavalry troops greater global mobility, but they are now less heavily armed. Because of the confusion over the assault gun's role, there are also many different schemes for using the vehicle's cargo and passenger capacity. When assigned to headquarters, they usually carry headquarters personnel, although they are sometimes used to augment the ammunition and fuel carriage of the units they are assigned to support. The fact that it retains a significant power overage has made it possible for many units to rig them as additional command vehicles, with a second computer, and commander's workstations replacing the passenger and cargo space. Characteristics of the assault gun where they differ from the fire support APC are shown below. Items not listed are identical to the figures on the facing page.

WEAPON CHARACTERISTICS

TL15 125-Mj 10-Chamber Rapid Pulse Fusion Gun (RPY-15L)

Price: MCr14.543491

Mass: 222.75 tonnes empty, 248.21 loaded

Power: TL15 10.5 MW fusion power plant supplying 1.2 MW to high-efficiency contra-grav lifters, with HEPlaR thruster generating 86.62 tonnes of thrust (0.63262 MW excess power)

Maint: 41

Controls: Holographic linked, TL10+ flight avionics, TL15 terrain following avionics, 3×TL15 Model FIt flight computers, TL10+ IGS navigation system, 1×TL15 Model St computer

Cargo: 3.25 tonnes (13 m^3)

Passengers: Adequate seats for 4 passengers, large cargo hatch

Fire Control: EMS rangefinder and TL14 point defense ballistic computer (ignore 5 Diff Mods, and multiply Diff Mods of ballistic target by 0.5, dropping fractions), EMS rangefinder may function as 3km short range laser/EMS designator

Armament: TL15 rapid-pulse 125-Mj fusion gun in remote turret

Ammo: 100 rounds of 125-Mj 22×66cm PFC cartridges (Cr1000 each, MCr0.1 for full load of 100), plus one additional fully-loaded magazine in hull (MCr 0.1005 fully loaded)

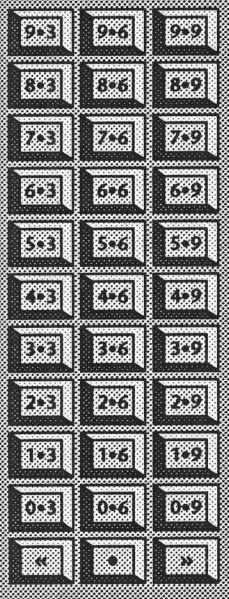
Reloading Data: Fusion gun magazine is 5m^3, 10.1 tonnes loaded, 0.1 tonnes empty, MCr0.1005 loaded, MCr0.0005 empty, reloading requires 101 five-second combat turns and a crane or contra-grav lifters.

Speed: 1004 kph maximum, 753 kph cruising, 190 kph NOE

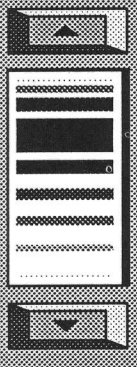
Travel Move: 3012/1140

Combat Move: 140 (high mode absolute speed)/26 (NOE safe speed) in 10-meter grid squares

Maximum Acceleration: 0.349 G



Decoys



Decoys are of three types: antilaser (which affect attempts to detect a target with ladar or to designate it with a laser designator), antiactive sensor (which affect attempts to detect a target or designate it with radar or active EMS), and antipassive sensor (which affect attempts to detect a target with HRT or passive sensors, including infrared goggles and sights). Each decoy only works against its specified sensor, and increases the difficulty of a detection or designation task by one level vs. TL15 systems, or by two levels vs. TL14– sensors. Each decoy lasts one combat turn (five seconds), and affects all appropriate sensor attempts against the owning vehicle, regardless of direction. Decoy dispensers may launch one decoy per second.

Decoys for the Imperial Marine Fire Support APC or Assault Gun cost Cr20,000 each regardless of type, or MCr2.4 for a full load of 120.

TL15 Imperial APC

Security Clearance

Yes No

300-1202

Date

TL15 IMPERIAL APC

This was the standard grav APC for TL15 Imperial Army units, and remains, with the Astrin, as the standard APC for all Regency Army units. It is a successful design: well-armored, reasonably fast, flexibly armed, capacious, and best of all, inexpensive.

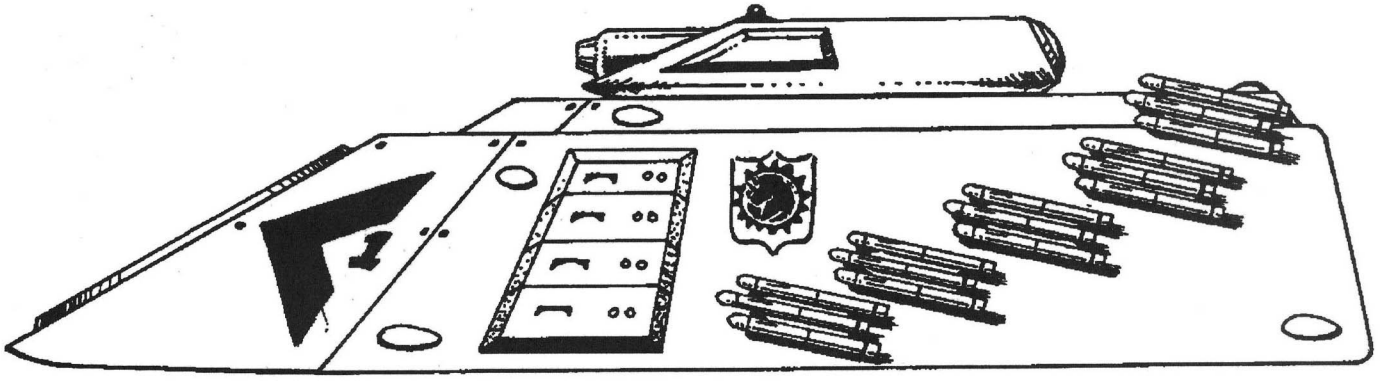
While it does not have the blistering speed of the Marine Grav APC (page 16), this is not a problem in the Imperial APC's role. The speed of the Marine vehicle is a by-product of the Marine requirement for distributed operations, and the need to be able to rapidly move from one point on the globe to any other. The army generally operates in larger numbers, with a greater unit density, and does not have such demanding mobility requirements. Thus, the main question when assessing the mobility of the Imperial APC is, "Can it keep up with the grav tanks?" and the answer is yes.

One of the main reasons for this vehicle's low price when compared to the Marine APC (page 16) is the lack of a full-size computer. This is possible because army operations usually do not call for the low unit densities typical of Marine operations, and the task of tracking unit locations and routing intelligence and instructions can be pushed up from the squad to the platoon level, where the Imperial Command APC (page 24) handles them with its computers.

The Imperial APC is armed entirely with missiles, a fact which makes some crew members unhappy. Although TL15 missiles are quite reliable, and even VRF gauss guns jam on occasion, there is something comforting about a noisy, lead- or plasma-spitting weapon that a missile launcher can just not replace.

The heavy missile magazine launcher is identical to that fitted on the Marine Grav APC family, but the army APC does not carry as many reloads in the hull, instead making space for a much larger infantry section, almost twice the size of that carried on the Marine vehicle. This makes the army version a much more flexible vehicle for army operations, allowing it to fulfill roles for which the Marines might require a specialized variant.

The siting of all of the APC's light Tac missiles on external launch rails is somewhat unusual, and makes the vehicles visually distinctive. While placing all the missiles on their own rails means they are immune to the sort of lucky hit that destroys a launch tube, leaving a magazine full of useless missiles, this position exposes them to small arms hits and fragments (the missiles' skin has an armor value of 3, any penetration makes it nonfunctional). In addition, there is never the problem of having the wrong mix of missiles loaded up in the magazine; any or all of the 30 missiles can be fired at any time, and in any order.



The Imperial APC is one of many TL15 combat vehicles which is built on the Imperial TL15 standard APC hull. Although there are many differences between the Imperial APC and the Imperial Marine Grav APC (page 16), both are based on the same standard hull, as are all the vehicles appearing on pages 16-33 and 36-39 of this book. Even the ubiquitous grav sled hull is related to the standard APC hull. Although its hull armor is much thinner, its overall dimensions and support systems are largely the same.

The use of a single hull for all TL15 APCs, command vehicles, and combat support vehicles vastly simplified the problems of logistics, maintenance, repair, and spares support over the vast reaches of the Imperium. Not only are hull fittings and incidentals, such as landing gear, identical on all users of this hull, they all also use identical contra-grav modules, avionics fits, holographic-linked control circuits, and 86.62-tonne HEPlaR thrust chambers. The life support system, for the hull's useful volume of 134.4 m³, is also identical on all but a handful of the vehicles that use this hull (see page 26).

Tech Level: 15
Price: MCr4.060751
Size: 168 cubic meters=12 displacement tons (VS)
Mass: 216.11 tonnes empty, 224.22 loaded
Power: TL15 9.3 MW fusion power plant supplying 1.2 MW to high-efficiency contra-grav lifters, with HEPlaR thruster generating 86.62 tonnes of thrust (0.01187 MW excess power)
Maint: 37
Controls: Holographic linked, TL10+ flight avionics, TL15 terrain following avionics, 3×TL15 Model FIt flight computers, TL10+ IGS navigation system
Commo: TL15 30km radio, TL15 300km meson communicator
Sensors: 30km passive EMS sensor, 3000km passive EMS sensor, 30km active EMS sensor, 2×WSV goggles
ECM: Electromagnetic masking package, 4 decoy dispensers each with space for 30 of any combination of antilaser, antiactive sensor, or antiactive sensor decoys (see below)
Life Support: Heat, light, extended life support, artificial gravity/G-compensators (for 134.4 cubic meters), and one air lock
Cargo: 2752 kg of crew equipment (11.011 m³)
Crew: 2 (Driver, Commander/gunner)
Passengers: 14 in cramped seats with large cargo hatch, allowing 5 battle dress-equipped troops to debark/embark per five-second combat turn.
Fire Control: Control units for advanced IR homing, imaging radar target seeking, teleguided, and laser designated missiles, 300km laser designator, EMS rangefinder may function as 3km short range laser/EMS designator
Armament: Magazine launcher with 1+5 nuclear Tac missiles, 30 launch rails for fire and forget missiles
Stabilization: Advanced (fire at any speed)
Ammo: 1+5 nuclear missiles in magazine launcher plus up to 6 more in cargo/damper box (usually only 6 total in both locations), 30 fire and forget missiles on launch rails, plus additional can be carried as cargo
Reloading Data: Missiles are 95kg (magazine-launched) and 30kg (rail-launched) each, replacement requires 19 actions each and 6 actions each, respectively (see **TNE** page 273).
Speed: 752 kph maximum, 564 kph cruising, 188 kph NOE
Travel Move: 2256/1128
Combat Move: 105 (high mode absolute speed)/26 (NOE safe speed) in 10-meter grid squares
Signature: +1 Diff Mods vs. HRT and Radar, None vs. other methods
Diff Mods vs. Fire: –1 Diff Mod stationary, +5 at maximum speed (high mode combat move), +4 at cruising speed (high mode travel move), +3 at safe NOE speed, +4 at 2× and 3×safe NOE speed
Maximum Acceleration: 0.386 G
Fuel Capacity: 21,113.625 liters reaction mass plus 77.5 liters for fusion reactor
Fuel Consumption/Endurance: 1082.75 liters/hour (endurance of 19.5 hours), plus reactor fuel is sufficient for one month constant power

Combat Statistics

Config: Sm Turret	**TF:** 252	**HF:** 252
Susp: Grav	**TS:** 140	**HS:** 140
	TR: 126	**HR:** 126
	Deck: 126	**Belly:** 140

The Imperial APC, also known as the Army APC, is one of the more distinctive vehicles of the Imperial/Regency services. With its exposed missile armament it has an aerodynamically "dirty" look that is not shared by Marine vehicles. Markings on Army vehicles, as this APC demonstrates, are also much more sober and subdued that on their Marine counterparts.

Decoys

Decoys are of three types: antilaser (which affect attempts to detect a target with ladar or to designate it with a laser designator), antiactive sensor (which affect attempts to detect a target or designate it with radar or active EMS), and antipassive sensor (which affect attempts to detect a target with HRT or passive sensors, including infrared goggles and sights). Each decoy only works against its specified sensor, and increases the difficulty of a detection or designation task by one level vs. TL15 systems, or by two levels vs. TL14– sensors. Each decoy lasts one combat turn (five seconds), and affects all appropriate sensor attempts against the owning vehicle, regardless of direction. Decoy dispensers may launch one decoy per second.

Decoys for the Imperial grav APC costs Cr20,000 each regardless of type, or MCr2.4 for a full load of 120.

All missiles have a volume of 30 liters, diameter of 20cm, and length of 95cm.

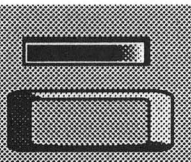
Imperial Fire Support APC

As is typical for Regency Army vehicles, this fire support APC is distinguished by only authorized tactical markings and the Regency national insignia, with no personal crew markings. Contrast this with the flamboyantly-marked Marine command APC on page 19. The protective dome for the turret-mounted orbital maser link belies the vehicle's role as a command vehicle.

IMPERIAL FIRE SUPPORT APC

Following the Imperial doctrine of placing a devoted fire-support/command vehicle at the platoon headquarters, this vehicle is the army's counterpart to the Imperial Marine Fire Support APC (page 20). However, the choice of armament gives a clear insight to the service's operating procedures and mission roles.

The Marines are used as expeditionary forces and in environments of all-out war. The first point means that the Marines expect to fight outnumbered and have to hold out on their own for long periods of time, without being able to call on heavy armored support. This requires them to build expensive AFVs which can meet a wide variety of dissimilar threats. The second point is that the Marines do not anticipate fighting in ambiguous, low-intensity conflicts or in peacekeeping roles. When the Marines are committed they fight to win, quickly and violently. Their weapons are not intended to be non-escalatory, in fact, quite the opposite.



These two points taken together yield the Marine RPX-15 Armed Fire Support APC. First, its heavy gun allows it to serve as a surrogate tank, as tank support will likely not be available when needed. Second, it has no need for a weapon that allows it to respond carefully with minimal lethality to a low-grade threat. Just level the damn block, say the Marines.

Tech Level: 15
Price: MCr19.312404
Size: 168 cubic meters=12 displacement tons (VS)
Mass: 222.48 tonnes empty, 231.87 loaded
Power: TL15 16.92 MW fusion power plant supplying 1.2 MW to high-efficiency contra-grav lifters, with HEPlaR thruster generating 86.62 tonnes of thrust (0.03182 MW excess power)
Maint: 38
Controls: Holographic linked, TL10+ flight avionics, TL15 terrain following avionics, 3×TL15 Model FIt flight computers, TL10+ IGS navigation system, 2×TL15 Model St computers
Commo: TL15 30km radio, TL15 300km meson communicator, TL15 30,000km maser
Sensors: 30km passive EMS sensor, 3000km passive EMS sensor, 30km active EMS sensor, 5×WSV goggles
ECM: 30km EMS Jammer, Electromagnetic masking package, 4 decoy dispensers each with space for 30 of any combination of antilaser, antiactive sensor, or antiactive sensor decoys (see below)
Life Support: Heat, light, extended life support, artificial gravity/G-compensators (for 134.4 cubic meters), and one air lock
Cargo: 1302 kg of crew equipment (5.209 m^3) plus 150 fire and forget missiles carried as cargo
Crew: 3 (Driver, Commander, Gunner)
Passengers: 2 command personnel at normal workstations plus cramped seats for two additional passengers, large cargo hatch.
Fire Control: EMS rangefinder and TL14 point defense ballistic computer for VRF Gauss Gun (ignore 5 Diff Mods, and multiply Diff Mods of ballistic target by 0.5, dropping fractions), control units for advanced IR homing, imaging radar target seeking, teleguided, and laser designated missiles, 300km laser designator, EMS rangefinder may function as 3km short range laser/EMS designator
Armament: VRF Gauss Gun, 34 launch rails for fire and forget missiles
Stabilization: Advanced (fire at any speed)
Ammo: 300,000 rounds VRF gauss gun (Cr3000 for full load of 300,000 rounds needle), 34 fire and forget missiles on launch rails, plus 150 additional carried as cargo
Reloading Data: VRF gauss gun ammunition is carried in 10 cassettes, 0.017m^3 each, 0.017 tonnes loaded, 0.002 tonnes empty, Cr320 loaded, Cr20 empty, replacement requires four actions (see **TNE** page 273). Missiles are 30kg each, replacement requires 6 actions each.
Speed: 758 kph maximum, 569 kph cruising, 190 kph NOE
Travel Move: 2276/1140
Combat Move: 105 (high mode absolute speed)/26 (NOE safe speed) in 10-meter grid squares
Signature: +1 Diff Mods vs. HRT and Radar, None vs. other methods
Diff Mods vs. Fire: –1 Diff Mod stationary, +5 at maximum speed (high mode combat move), +4 at cruising speed (high mode travel move), +3 at safe NOE speed, +4 at 2× and 3×safe NOE speed
Maximum Acceleration: 0.374 G
Fuel Capacity: 21,113.625 liters reaction mass plus 141 liters for fusion reactor
Fuel Consumption/Endurance: 1082.75 liters/hour (endurance of 19.5 hours), plus reactor fuel is sufficient for one month constant power

The Imperial/Regency Army, on the other hand, expects that it will often be expected to deal with situations short of all-out war: brushfire wires, counter-insurgency, peacekeeping, and security roles. These require weapons that can be used with some discrimination. Second, the army, when committed to combat, is committed decisively and in quantity, which generates two circumstances and one requirement. The first circumstance is that the army will be able to set the conditions of engagement to an extent that the Marines are not capable of. By dictating the tempo and choosing the time and place of their decisive engagements, they can control the risk to which their forces will be subjected, which does not require the sort of super-AFVs the Marines favor. The second circumstance is that since the army operates in numbers, supporting forces will be readily available to units which get in over their heads. The one requirement is that committing forces in large numbers require that they be affordable.

These three points yield the army's take on the fire support vehicle's armament: an inexpensive high-rate-of-fire suppression weapon useful in low-intensity engagements, mounted on a relatively inexpensive vehicle designed to function in close company with other complementary weapon systems.

During the Imperial era the Fire Support APC was originally used as a command vehicle at the platoon, company, and battalion level, but the vehicle was too expensive for use at the platoon level and insufficiently capable at the battalion level. This prompted the creation of two sub-variants of the Fire Support APC, the Austere FS APC for use at the platoon headquarters level, and the Imperial Command/Computer/Staff APC for use at the company, battalion, and battalion staff level. Both of these variants, in current use by post-Collapse Regency forces, are detailed after the main entry for the original Fire Support APC.

WEAPON CHARACTERISTICS

VRF Gauss Gun

TL	*Round*	*ROF*	*Dam Val*	*Pen Rtg*	*Magazine*	*Short Range*
10	4×20mm/60 Dart	50	6	1-3-5	300,000C	300

TL: Technology Level; *Round*: type of round fired; *ROF*: Rate of Fire in shots per fire *action*; *Dam Val*: Damage Value; *Pen Rtg*: Penetration Rating at short-medium-long-extreme ranges; *Pen Val*: Penetration Value, i.e., Damage Value already adjusted by Penetration Rating at short-medium-long-extreme ranges for use against unarmored targets; *Magazine*: Magazine capacity in shots, where C indicates the cassette magazine type; *Short Range*: Short Range in meters.

TL15 Fire and Forget Missiles

TL	*Guidance*	*Whd*	*Mass*	*Price*	*Sh Rng*	*Mx Rng*	*C-B*	*Dngr Spc*	*Pen*	*M/Turn*	*AGL*
15	Tgt Skr/TD	HE	30	4136.8	20	54	16-45	—	5C	16,680	8/10
15	Tgt Skr/TD	Flech	30	4328.8	20	54	—	150×600	1-Nil	16,680	8/10

TL is tech level of missile; *Guidance* is guidance packages in missile, where TD is AEMS/Laser target designated and Tgt Skr is IR target seeker; *Whd* is warhead type; *Mass* is mass of missile in kilograms; *Price* is price of missile in credits; *Sh Rng* is short range of missile in target seeker mode; *Mx Rng* is maximum range of missile in target designated mode; *C-B* is concussion and burst for HE warheads; *Dngr Spc* is danger space for flechette warheads; *Pen* is Penetration Value for HE warheads and Penetration Rating for flechette warheads in primary-secondary danger space (damage value is 2D6/1D6 respectively); *M/turn* is the number of meters the missile travels in a five-second combat turn; *AGL* is the missile's agility, with the target designation mode agility to the left of the slash and the target seeker guidance mode agility to the right of the slash. All missiles have a volume of 30 liters, diameter of 20cm, and length of 95cm.

AUSTERE FIRE SUPPORT APC

This vehicle is optimized for use at the platoon level by reducing its cost through the removal of one full-size computer and the EMS jammer which is not required in platoon command vehicles by Imperial military doctrine. However, the vehicle retains the larger power plant required by these two pieces of equipment, allowing the vehicle to be rapidly modified to the earlier standards if required.

The following characteristics are changed compared to the Fire Support Vehicle above; all other details are identical.

Price: MCr11.312604
Mass: 220.12 tonnes empty, 230.34 loaded
Power: TL15 16.92 MW fusion power plant supplying 1.2 MW to high-efficiency contra-grav lifters, with HEPlaR thruster generating 86.62 tonnes of thrust (5.58182 MW excess power)
Controls: Holographic linked, TL10+ flight avionics, TL15 terrain following avionics, 3×TL15 Model FIt flight computers, TL10+ IGS navigation system, 1×TL15 Model St computer
ECM: Electromagnetic masking package, 4 decoy dispensers each with space for 30 of any combination of antilaser, antiactive sensor, or antiactive sensor decoys (see below)
Cargo: 1927 kg of crew equipment (7.709 m³) plus 150 fire and forget missiles carried as cargo
Passengers: 2 command personnel at normal workstations plus cramped seats for four additional passengers, large cargo hatch.

IMPERIAL COMMANDCOMPUTERSTAFF APC

This vehicle retains the full armament of the fire support vehicle, but has additional communications added to allow it to perform in any of the following roles: company-level+ command APC, computer APC, staff uplink APC, and staff radio APC. Its power plant has been increased in output to allow for the additional power draw from the three new communicators.

The following characteristics are changed compared to the Fire Support Vehicle above; all other details are identical.

Price: MCr19.480404
Mass: 223.23 tonnes empty, 232.52 loaded
Power: TL15 19.08 MW fusion power plant supplying 1.2 MW to high-efficiency contra-grav lifters, with HEPlaR thruster generating 86.62 tonnes of thrust (0.04182 MW excess power)
Commo: TL15 30km radio, TL15 300km meson communicator, 2×TL15 30,000km masers, 2×TL15 30,000km radios
Cargo: 1205 kg of crew equipment (4.819 m³) plus 150 fire and forget missiles carried as cargo
Fuel Capacity: 21,113.625 liters reaction mass plus 159 liters for fusion reactor

Decoys

Decoys are of three types: antilaser (which affect attempts to detect a target with ladar or to designate it with a laser designator), antiactive sensor (which affect attempts to detect a target or designate it with radar or active EMS), and antipassive sensor (which affect attempts to detect a target with HRT or passive sensors, including infrared goggles and sights). Each decoy only works against its specified sensor, and increases the difficulty of a detection or designation task by one level vs. TL15 systems, or by two levels vs. TL14– sensors. Each decoy lasts one combat turn (five seconds), and affects all appropriate sensor attempts against the owning vehicle, regardless of direction. Decoy dispensers may launch one decoy per second.

Decoys for the Imperial Fire Support APC and its two sub-variants cost Cr20,000 each regardless of type, or MCr2.4 for a full load of 120.

Imperial Marine Fire Direction Center (FDC) APC

IMPERIAL MARINE FDC APC

Fire direction centers (see also **Fire, Fusion & Steel** page 88) coordinate the fire of several indirect fire systems (tube artillery, rocket artillery, and meson guns) at a single target, convert correction requests from forward observers into precise elevation, traverse, propellant, and trajectory commands, and calculate the effects of a wide variety of factors on artillery accuracy (such as atmospherics, different elevations between the firing weapon and the target, and so on). While fire direction centers are not required to conduct indirect fire, they increase the effectiveness of that fire dramatically.

For fire conducted through a fire direction center, the task roll to hit the target is a Difficult (instead of Formidable) task.

Fire direction centers substitute the appropriate weapon skill/asset of the main operator (usually the most skilled gunner in the FDC) for the weapons skills of the gunners of all the weapons controlled by the FDC (called the "battery"). All weapons in the battery must have a communications link to the FDC.

TL15 FDCs have an effective indirect fire range of 80 kilometers, meaning that the advantages described in the two paragraphs above apply within this range. Indirect fire using the FDC beyond this range is allowed, but the task roll to hit is Formidable instead of Difficult. TL15 FDCs mass 10 tonnes, displace 14 m^3, cost MCr3, and require a crew of four (of these, three require dedicated workstations, one may double as the vehicle commander from a vehicle crewstation). The FDC in this vehicle is supplemented by the standard command vehicle suite of two full-size TL15 computers, allowing them to be fully integrated and coordinated with military operations throughout the operational area.

Note that this 80-kilometer range is from the FDC to the target, and has nothing whatever to do with where the firing artillery is in relation to the target or the FDC. Thus, as long as the firing artillery is in range of the target and in communications with the FDC, the indirect fire task can be conducted as described above, even if the firing artillery is thousands of kilometers from the target, as in the case of a battlefield meson gun, or orbital artillery fire (see **TNE** page 281). This allows meson guns (page 40), MRL artillery vehicles (page 36), and the like to be sited far away from potential combat while retaining the ability for precision fire.

The Imperial Marine Fire Direction Center (FDC) vehicle is designed to be externally similar to the standard grav APC to enhance its battlefield survivability. For this reason it retains a fully equipped grav APC turret, although it does not carry any additional missile reloads within the hull. This gives the vehicle a robust self-defense capability, and allows it do "service" small nuisance targets on its own without having to waste a fire mission. Retention of the missile fire control systems also means that the FDC vehicle has a 300km range laser designator, although the FDC role does not usually call for it to designate its own targets from the front.

Like the command variant of the Norris battle tank (pages 12-13), the Marine FDC vehicle has dispensed with its hull's standard airlock and life support arrangement, in favor of a small 35 m^3 life support module for its six crew. This makes it one of the few vehicles using the standard TL15 APC hull (see page 22) that does not use the standard life support system.

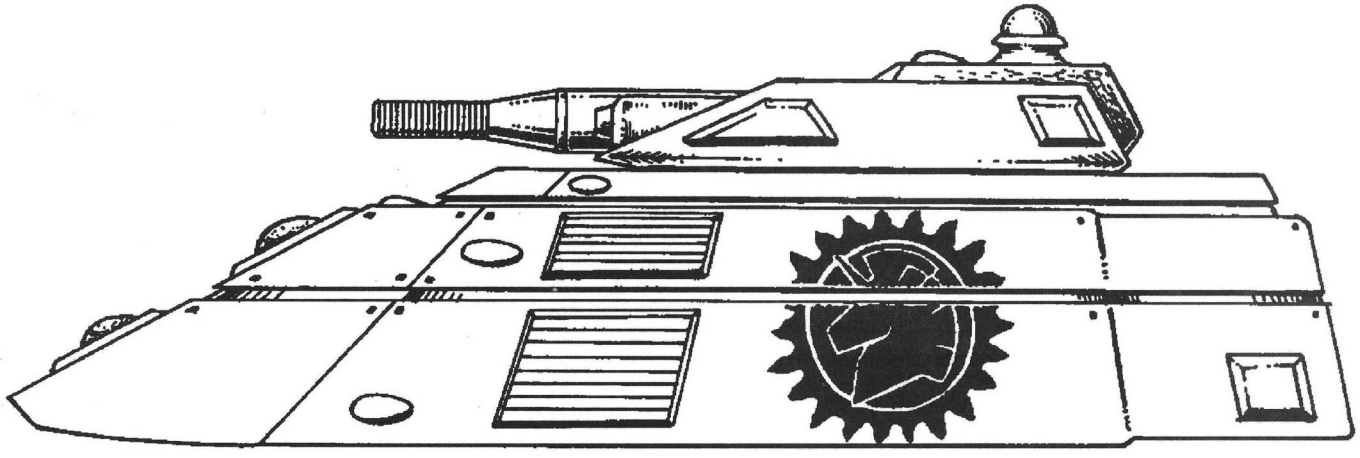
The range at which the TL15 fire direction center can apply its coordinating function, 80 kilometers, is rather limited compared to the range available to TL15 artillery systems (650 km in the case of TL15 MRL rockets, page 36, and 3600 km in the case of the Meson Artillery Vehicle, page 40). However, the fire direction center is the "on the scene" coordinator for such fire, and as described above, allows the actual firing artillery to remain far away from the battlefield.

Note also that remote drone missiles (pages 38-39), although classed as "artillery" do not use fire direction centers, as their mode of operation is entirely different from classical indirect fire.

WEAPON CHARACTERISTICS

TL15 18.5 Mj 12-Chamber Rapid Pulse Fusion Gun (RPW-15 Low)

TL	*Weapon*	*ROF*	*Dam Val*	*Pen Rtg*	*Pen Val*	*C-B*	*Short Range*
15	RPW-15L RP Fusion Gun	3	129	1-1-2-10	129-129-65-13	17-15	650m



TL: Technology level; *ROF:* Rate of Fire in shots per fire *action*, except in the case of weapons listed as "SAN," where N is the total number of shots that the weapon can fire per five-second combat turn; *Dam Val:* Damage Value; *Pen Rtg:* Penetration Rating at short-medium-long-extreme ranges; *C-B:* Concussion value and Burst radius in meters; *Short Range:* Short Range in meters.

TL15 Nuclear Tac Missiles

TL	*Guidance*	*Yield*	*Mass*	*Price*	*Short Range*	*Max Range*	*M/turn*	*Agility*

With the exception of the dome-protected maser uplink atop the turret, the Marine FDC vehicle is externally virtually identical to the standard Marine APC (see view on page 17) as it is fitted with a fully operational turret. This was done to prevent enemy forces from rapidly targetting artillery direction vehicles, and to also give them the ability to auto-suppress nuisance targets with direct fire and thereby save artillery fire missions for more important targets.

Tech Level: 15
Price: MCr20.872611
Size: 168 cubic meters=12 displacement tons (VS)
Mass: 227.79 tonnes empty, 238.01 loaded
Power: TL15 10.08 MW fusion power plant supplying 1.2 MW to high-efficiency contra-grav lifters, with HEPlaR thruster generating 86.62 tonnes of thrust (0.597 MW excess power)
Maint: 40
Controls: Holographic linked, TL10+ flight avionics, TL15 terrain following avionics, 3×TL15 Model Flt flight computers, TL10+ IGS navigation system, 2×TL15 Model St computer
Commo: TL15 30km radio, TL15 300km meson communicator, TL15 30,000km maser
Sensors: 30km passive EMS sensor, 3000km passive EMS sensor, 30km active EMS sensor, 3×WSV goggles
ECM: Electromagnetic masking package, 4 decoy dispensers each with space for 30 of any combination of antilaser, antiactive sensor, or antiactive sensor decoys (see below)
Life Support: Heat, light, extended life support, artificial gravity/G-compensators (for 35 cubic meters)
Cargo: 160 kg of crew equipment (0.639 m^3)
Crew: 6 (Driver, Gunner, Commander/FDC Officer, 3 FDC Technicians)
Passengers: None.
Fire Control: EMS rangefinder and TL14 point defense ballistic computer (ignore 5 Diff Mods, and multiply Diff Mods of ballistic target by 0.5, dropping fractions), control units for advanced IR homing, imaging radar target seeking, teleguided, and laser designated missiles, 300km laser designator, EMS rangefinder may function as 3km short range laser/EMS designator, TL15 Fire Direction Center with indirect fire coordinating range of 80 km.

Armament: TL15 rapid-pulse 18.5-Mj fusion gun and magazine launcher with 1+5 nuclear Tac missiles, both mounted in remote turret
Stabilization: Advanced (fire at any speed)
Ammo: 500 rounds of 18.5-Mj 11.6×35cm PFC cartridges (Cr148 each, Cr74,000 for full load of 500), 1+5 nuclear missiles in magazine launcher
Reloading Data: Fusion gun magazine is 3.7m^3, 7.474 tonnes loaded, 0.074 tonnes empty, MCr0.07437 loaded, MCr0.00037 empty, reloading requires 75 five-second combat turns and a crane or contra-grav lifters. Missiles are 95kg each, replacement requires 19 actions each (see TNE page 273).
Speed: 1092 kph maximum, 819 kph cruising, 190 kph NOE
Travel Move: 3276/1140
Combat Move: 152 (high mode absolute speed)/26 (NOE safe speed) in 10-meter grid squares
Signature: +1 Diff Mods vs. HRT and Radar, None vs. other methods
Diff Mods vs. Fire: –1 Diff Mod stationary, +5 at maximum speed (high mode combat move), +5 at cruising speed (high mode travel move), +3 at safe NOE speed, +4 at 2× and 3×safe NOE speed
Maximum Acceleration: 0.364 G
Fuel Capacity: 17,865.375 liters reaction mass plus 84 liters for fusion reactor
Fuel Consumption/Endurance: 1082.75 liters/hour (endurance of 15.5 hours), plus reactor fuel is sufficient for one month constant power

Decoys

Decoys are of three types: antilaser (which affect attempts to detect a target with ladar or to designate it with a laser designator), antiactive sensor (which affect attempts to detect a target or designate it with radar or active EMS), and antipassive sensor (which affect attempts to detect a target with HRT or passive sensors, including infrared goggles and sights). Each decoy only works against its specified sensor, and increases the difficulty of a detection or designation task by one level vs. TL15 systems, or by two levels vs. TL14– sensors. Each decoy lasts one combat turn (five seconds), and affects all appropriate sensor attempts against the owning vehicle, regardless of direction. Decoy dispensers may launch one decoy per second.

Decoys for the Imperial Marine FDC Carrier costs Cr20,000 each regardless of type, or MCr2.4 for a full load of 120.

TL15 Imperial FDC APC

TL15 IMPERIAL FDC APC

Fire direction centers (see also **Fire, Fusion, & Steel** page 88) coordinate the fire of several indirect fire systems (tube artillery, rocket artillery, and meson guns) at a single target, convert correction requests from forward observers into precise elevation, traverse, propellant, and trajectory commands, and calculate the effects of a wide variety of factors on artillery accuracy (such as atmospherics, different elevations between the firing weapon and the target, and so on). While fire direction centers are not required to conduct indirect fire, they increase the effectiveness of that fire dramatically.

For fire conducted through a fire direction center, the task roll to hit the target is a Difficult (instead of Formidable) task.

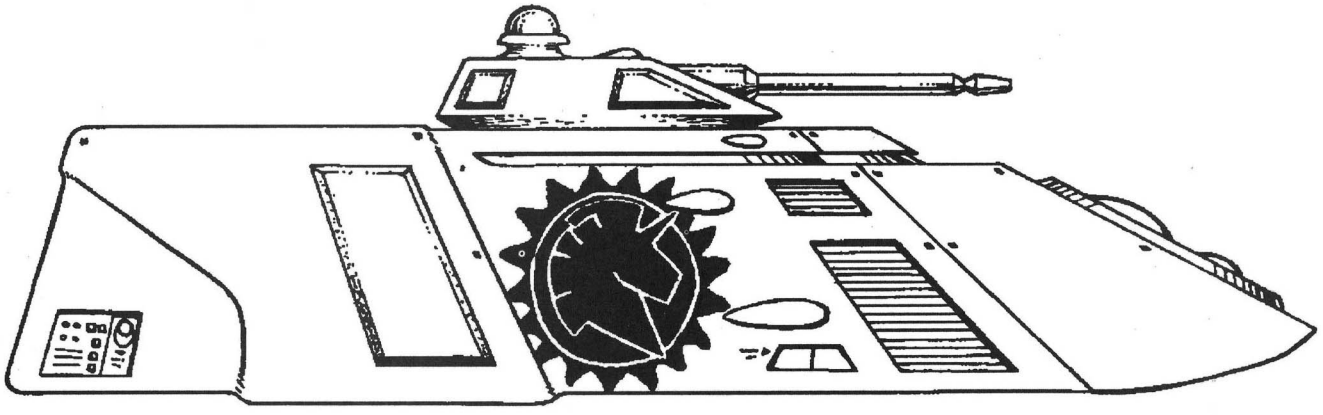
Fire direction centers substitute the appropriate weapon skill/asset of the main operator (usually the most skilled gunner in the FDC) for the weapons skills of the gunners of all the weapons controlled by the FDC (called the "battery"). All weapons in the battery must have a communications link to the FDC.

TL15 FDCs have an effective indirect fire range of 80 kilometers, meaning that the advantages described in the two paragraphs above apply within this range. Indirect fire using the FDC beyond this range is allowed, but the task roll to hit is Formidable instead of Difficult. TL15 FDCs mass 10 tonnes, displace 14 m³, cost MCr3, and require a crew of four (of these, three require dedicated workstations, one may double as the vehicle commander from a vehicle crewstation). The FDC in this vehicle is supplemented by the standard command vehicle suite of two full-size TL15 computers, allowing them to be fully integrated and coordinated with military operations throughout the operational area.

Note that this 80-kilometer range is from the FDC to the target, and has nothing whatever to do with where the firing artillery is in relation to the target or the FDC. Thus, as long as the firing artillery is in range of the target and in communications with the FDC, the indirect fire task can be conducted as described above, even if the firing artillery is thousands of kilometers from the target, as in the case of a battlefield meson gun, or orbital artillery fire (see **TNE** page 281). This allows meson guns (page 40), MRL artillery vehicles (page 36), and the like to be sited far away from potential combat while retaining the ability for precision fire.

The Imperial Fire Direction Center (FDC) vehicle is based on the Imperial Fire Support and Command APC (page 24), but with the external missile racks deleted. The loss of drag gives the Imperial FDC vehicle a blistering turn of speed, and makes it by far the fastest member of the army family of grav APCs (pages 22-25 and this page). Its light armament is intended for self-defense only, as the army feels comfortable that it will have sufficient support forces available that its FDC vehicle will not need to attack targets itself in order to save scarce indirect fire missions. The removal of the missiles underscore this point, but more importantly, make it possible for the vehicle to rapidly move around the battlefield, bringing the effects of massive bombardment to any points required. While the Marines are concerned that bombardment assets will be scarce in the Marine combat environment, the army expects them to be relatively plentiful; it is rather the FDC vehicles that will be the limiting factor. Therefore high FDC vehicle speed, moving the "footprint" of applicable firepower around the battlefield in the shortest amount of time possible, is the critical feature of its FDC carrier.

However, for the simple sake of redundant capability, the vehicle does retain the missile fire control capability of the fire support vehicle. This allows it to control missiles fired by other vehicles, and also gives it a 300km range laser designator, although the FDC role does not usually call for it to designate its own targets from the front.



Note also that remote drone missiles (see pages 38-39), although classed as "artillery" do not use fire direction centers, as their mode of operation is entirely different from classical indirect fire.

Tech Level: 15
Price: MCr20.087204
Size: 168 cubic meters=12 displacement tons (VS)
Mass: 229.16 tonnes empty, 231.78 loaded
Power: TL15 11.94 MW fusion power plant supplying 1.2 MW to high-efficiency contra-grav lifters, with HEPlaR thruster generating 86.62 tonnes of thrust (0.05182 MW excess power)
Maint: 39
Controls: Holographic linked, TL10+ flight avionics, TL15 terrain following avionics, 3×TL15 Model Flt flight computers, TL10+ IGS navigation system, 2×TL15 Model St computers
Commo: TL15 30km radio, TL15 300km meson communicator, TL15 30,000km maser
Sensors: 30km passive EMS sensor, 3000km passive EMS sensor, 30km active EMS sensor, 5×WSV goggles
ECM: Electromagnetic masking package, 4 decoy dispensers each with space for 30 of any combination of antilaser, antiactive sensor, or antiactive sensor decoys (see below)
Life Support: Heat, light, extended life support, artificial gravity/G-compensators (for 134.4 cubic meters), and one air lock
Cargo: 150 kg of crew equipment (0.6 m³)
Crew: 6 (Driver, Gunner, Commander/FDC Operator, 3 FDC Technicians)
Passengers: None
Fire Control: EMS rangefinder and TL14 point defense ballistic computer for VRF Gauss Gun (ignore 5 Diff Mods, and multiply Diff Mods of ballistic target by 0.5, dropping fractions), EMS rangefinder may function as 3km short range laser/EMS designator, TL15 Fire Direction Center with indirect fire coordinating range of 80 km.
Armament: VRF Gauss Gun in remote turret
Stabilization: Advanced (fire at any speed)
Ammo: 300,000 rounds VRF gauss gun (Cr3000 for full load of 300,000 rounds needle)
Reloading Data: VRF gauss gun ammunition is carried in 10 cassettes, 0.017m³ each, 0.017 tonnes loaded, 0.002 tonnes empty, Cr320 loaded, Cr20 empty, replacement requires four actions (see **TNE** page 273).
Speed: 1166 kph maximum, 875 kph cruising, 190 kph NOE
Travel Move: 3500/1140
Combat Move: 162 (high mode absolute speed)/26 (NOE safe speed) in 10-meter grid squares
Signature: +1 Diff Mods vs. HRT and Radar, None vs. other methods
Diff Mods vs. Fire: –1 Diff Mod stationary, +5 at maximum speed (high mode combat move), +5 at cruising speed (high mode travel move), +3 at safe NOE speed, +4 at 2× and 3×safe NOE speed
Maximum Acceleration: 0.374 G

Fire Direction Center vehicle belonging to an unidentified Regency Army unit. The national insignia is unusually large, probably indicating that the vehicle is a member of a peacekeeping force, which routinely use over-sized insignia to minimize the chance of mistaken identity in these tense operations. Note that although the Regency insignia appears to be applied "backwards," it is official policy that when affixed to vehicles, the unicorn in the insignia should be facing "forward," in the direction of the vehicle's travel. Thus port-side insignia appear "correct" while starboard-side insignia seem to be reversed.

The orbital maser uplink atop the turret is a standard part of the fire direction communications suite. These vehicles are able to collate data from orbital satellite networks or warships, coordinate fire from meson guns on the other side of a planet, and even direct the fire of orbital bombardment.

Decoys

Decoys are of three types: antilaser (which affect attempts to detect a target with ladar or to designate it with a laser designator), antiactive sensor (which affect attempts to detect a target or designate it with radar or active EMS), and antipassive sensor (which affect attempts to detect a target with HRT or passive sensors, including infrared goggles and sights). Each decoy only works against its specified sensor, and increases the difficulty of a detection or designation task by one level vs. TL15 systems, or by two levels vs. TL14– sensors. Each decoy lasts one combat turn (five seconds), and affects all appropriate sensor attempts against the owning vehicle, regardless of direction. Decoy dispensers may launch one decoy per second.

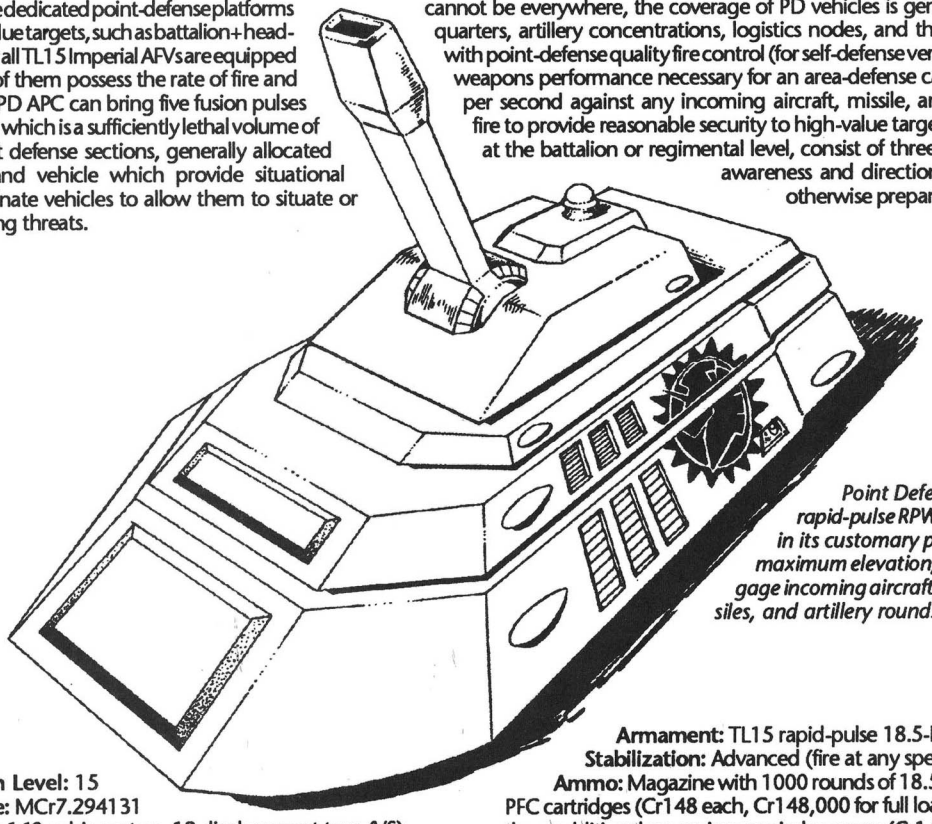
Decoys for the Imperial FDC Carrier costs Cr20,000 each regardless of type, or MCr2.4 for a full load of 120.

WEAPON CHARACTERISTICS

VRF Gauss Gun

TL	*Round*	*ROF*	*Dam Val*	*Pen Rtg*	*Magazine*	*Short Range*
10	4×20mm/60 Dart	50	6	1-3-5	300,000C	300

TL: Technology Level; *Round*: type of round fired; *ROF*: Rate of Fire in shots per fire *action; Dam Val:* Damage Value; *Pen Rtg:* Penetration Rating at short-medium-long-extreme ranges; *Pen Val*: Penetration Value, i.e., Damage Value already adjusted by Penetration Rating at short-medium-long-extreme ranges for use against unarmored targets; *Magazine*: Magazine capacity in shots, where C indicates the cassette magazine type; *Short Range*: Short Range in meters.



Imperial TL15 Point Defense and Nuclear Damper Control APCs

TL15 IMPERIAL POINT DEFENSE (PD) APC

At TL15, the point-defense mission combines the roles of antiaircraft, antiartillery, and antimissile fire into a single platform. However, because dedicated point-defense platforms cannot be everywhere, the coverage of PD vehicles is generally limited to high-value targets, such as battalion+ head-quarters, artillery concentrations, logistics nodes, and the like. Although virtually all TL15 Imperial AFVs are equipped with point-defense quality fire control (for self-defense versus Tac missiles), not all of them possess the rate of fire and weapons performance necessary for an area-defense capability.

The PD APC can bring five fusion pulses per second against any incoming aircraft, missile, artillery round, or vehicle, which is a sufficiently lethal volume of fire to provide reasonable security to high-value targets even at TL15.

Point defense sections, generally allocated at the battalion or regimental level, consist of three PD APCs and a command vehicle which provide situational awareness and directional cues to their subordinate vehicles to allow them to situate or otherwise prepare themselves for incoming threats.

Point Defense APC with its rapid-pulse RPW-15H fusion gun in its customary position: at near-maximum elevation, prepared to engage incoming aircraft, top-attack missiles, and artillery rounds.

Tech Level: 15
Price: MCr7.294131
Size: 168 cubic meters=12 displacement tons (VS)
Mass: 219.46 tonnes empty, 282.35 loaded
Power: TL15 10.98 MW fusion power plant supplying 1.2 MW to high-efficiency contra-grav lifters, with HEPlaR thruster generating 86.62 tonnes of thrust (0.01262 MW excess power)
Maint: 47
Controls: Holographic linked, TL10+ flight avionics, TL15 terrain following avionics, 3×TL15 Model FIt flight computers, TL10+ IGS navigation system
Commo: TL15 30km radio, 2×TL15 300km meson communicator, TL15 30,000km maser
Sensors: 30km passive EMS sensor, 3000km passive EMS sensor, 300km active EMS sensor, 3×WSV goggles
ECM: Electromagnetic masking package, 4 decoy dispensers each with space for 30 of any combination of antilaser, antiactive sensor, or antiactive sensor decoys (see below)
Life Support: Heat, light, extended life support, artificial gravity/G-compensators (for 134.4 cubic meters), and one air lock
Cargo: 1033 kg of crew equipment (4.134 m³)
Crew: 3 (Driver, Commander, Gunner)
Passengers: 2 in adequate seats with large cargo hatch
Fire Control: EMS rangefinder and TL14 point defense ballistic computer (ignore 5 Diff Mods, and multiply Diff Mods of ballistic target by 0.5, dropping fractions), EMS rangefinder may function as 3km short range laser/EMS designator

Armament: TL15 rapid-pulse 18.5-Mj fusion gun
Stabilization: Advanced (fire at any speed)
Ammo: Magazine with 1000 rounds of 18.5-Mj 11.6×35cm PFC cartridges (Cr148 each, Cr148,000 for full load of 1000), plus three additional magazines carried as cargo (Cr148,740 each fully loaded, Cr446,220 for all three)
Reloading Data: Fusion gun magazine is 7.4m³, 14.948 tonnes loaded, 0.148 tonnes empty, MCr0.14874 loaded, MCr0.00074 empty, reloading requires 150 five-second combat turns with no additional loading gear required, as gear is integral to vehicle.
Speed: 873 kph maximum, 654 kph cruising, 190 kph NOE
Travel Move: 2616/1140
Combat Move: 121 (high mode absolute speed)/26 (NOE safe speed) in 10-meter grid squares
Signature: +1 Diff Mods vs. HRT and Radar, None vs. other methods
Diff Mods vs. Fire: –1 Diff Mod stationary, +5 at maximum speed (high mode combat move), +4 at cruising speed (high mode travel move), +3 at safe NOE speed, +4 at 2× and 3×safe NOE speed
Maximum Acceleration: 0.307 G
Fuel Capacity: 21,113.625 liters reaction mass plus 91.5 liters for fusion reactor
Fuel Consumption/Endurance: 1082.75 liters/hour (endurance of 19.5 hours), plus reactor fuel is sufficient for one month constant power

Decoys for the Imperial Point Defense APC costs Cr20,000 each regardless of type, or MCr2.4 for a full load of 120.

WEAPON CHARACTERISTICS

TL15 18.5 Mj 19-Chamber Rapid Pulse Fusion Gun (RPW-15H)

TL	*Weapon*	*ROF*	*Dam Val*	*Pen Rtg*	*Pen Val*	*C-B*	*Short Range*
T5	18.5-Mj RP Fusion W Gun	5	129	1-1-2-10	129-129-65-13	17-15	650m

TL: Technology level; *ROF:* Rate of Fire in shots per fire *action*, except in the case of weapons listed as "SAN," where N is the total number of shots that the weapon can fire per five-second combat turn; *Dam Val:* Damage Value; *Pen Rtg:* Penetration Rating at short-medium-long-extreme ranges; *C-B:* Concussion value and Burst radius in meters; *Short Range:* Short Range in meters.

The maser uplink on the turret is a crucial component of the weapons system of the Point Defense and ND Control APCs. Without access to orbital surveillance data their ability to bring fire onto fast-moving threats would be severely degraded.

TL15 IMPERIAL NUCLEAR DAMPER (ND) CONTROL APC

The ND Control APC is the vehicle that directs and allocates the fire of Imperial Nuclear Damper Carriers (NDCs) against identified and suspected nuclear warheads to prevent their detonation (see NDCs, next page). TL15 NDCs have a 3000km over-the-horizon (OTH) range that requires the assistance of fire control centers that allows them to direct fire against nuclear warheads that are not yet in their line of sight. ND Control APCs provide this service, as they are tied into the planetary command-and-control network. This network conveys the identification of likely or confirmed nuclear warhead or nuclear warhead-carrying vehicles, as well as the determination of their cargo as fission or fusion weapons (see next page, or **Fire, Fusion & Steel** page 57; the correct determination of fission vs. fusion and the correct application of nuclear damper effects is handled via the standard task resolution system).

In design, the ND Control APC is a cross between a command APC and the Point Defense APC (previous page). The command functions allow the control vehicle to access the global observation and intelligence data to track and: 1) determine the location and imminent threat of nuclear warheads, 2) determine the firing and trajectory of nuclear warheads, and 3) hand off targeting data for these warheads to nuclear damper vehicles which can neutralize these warheads.

The purpose of ND control vehicle's armament is two-fold: to provide nonnuclear air defense to the NDCs under its control as well as to provide additional firepower against incoming projectiles in the case of saturation attacks too intense for the nuclear dampers to handle.

Each nuclear damper section (see **Striker II**) consists of three ND Control APCs and four Nuclear Damper Carriers. This allows two active ND controllers each controlling two NDCs plus one reserve ND controller which is either resting its crew between alert periods or is monitoring the global situation preparatory to taking over control of a two-NDC fire element. Each NDC element can maintain a rate of fire of two shots per five-second combat turn.

Decoys

Decoys are of three types: antilaser (which affect attempts to detect a target with ladar or to designate it with a laser designator), antiactive sensor (which affect attempts to detect a target or designate it with radar or active EMS), and antipassive sensor (which affect attempts to detect a target with HRT or passive sensors, including infrared goggles and sights). Each decoy only works against its specified sensor, and increases the difficulty of a detection or designation task by one level vs. TL15 systems, or by two levels vs. TL14– sensors. Each decoy lasts one combat turn (five seconds), and affects all appropriate sensor attempts against the owning vehicle, regardless of direction. Decoy dispensers may launch one decoy per second.

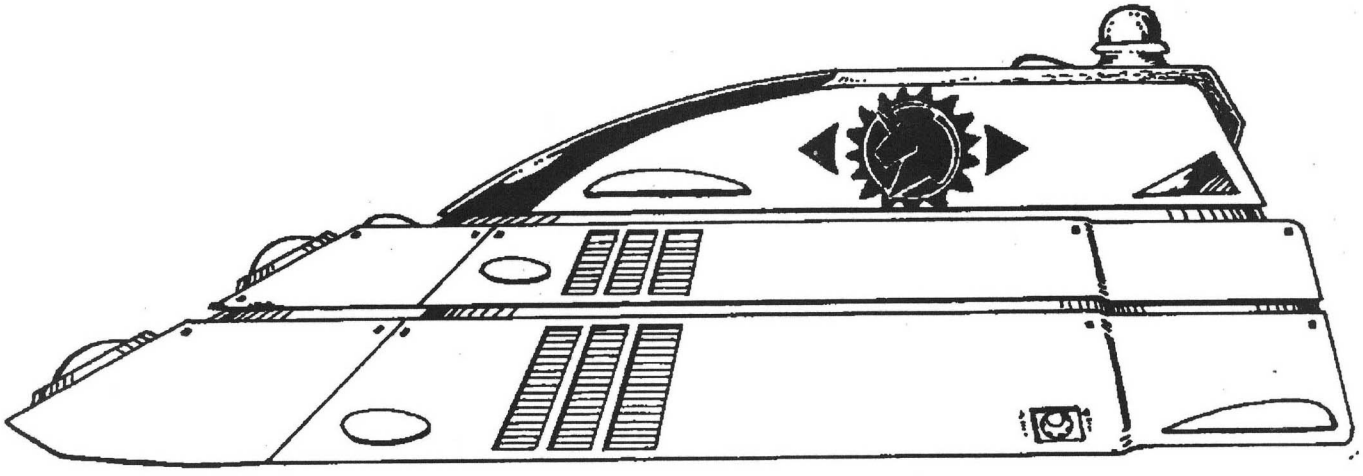
Decoys for the Point Defense and ND Control APCs cost Cr20,000 each regardless of type, or MCr2.4 for a full load of 120.

TL15 Imperial Nuclear Damper Carrier

TL15 IMPERIAL NUCLEAR DAMPER CARRIER (NDC)

Nuclear dampers disable nuclear warheads by preventing their warheads from undergoing nuclear reactions. In the case of fission warheads, they do this by transforming their fissile material into nonfissile elements, and in the case of thermonuclear warheads, they do this by preventing the hydrogen nuclei from being able to fuse. This sort of alchemy is made possible by the manipulation of the strong and electroweak forces. Weakening the strong force, which holds subatomic particles together in atomic nuclei, prevents hydrogen nuclei from fusing in thermonuclear reactions. On the other hand, manipulating the electroweak force, which controls the decay of subatomic particles, allows the nuclear damper to cause Uranium or Plutonium to rapidly decay into nonfissile isotopes, preventing the nuclear warhead from functioning. (Note, however, that improperly identifying a fission warhead as a fusion warhead and firing a nuclear damper at it to weaken the strong force will actually cause the detonation of a fission warhead, rather than prevent it.) For further discussion of nuclear damper technology, see **Fire, Fusion & Steel** pages 56-57.

Although it is believed that at higher tech levels so-called "nuclear damper" technology (although "nuclear enhancer" technology would be just as accurate, depending upon its specific application) will permit true alchemy, at current levels it is only able to provide economical results in military applications (where the result of a nuclear explosion has truly profound implications), and with materials that are either inherently unstable (in the case of fissile elements) or are in critical transitional states (in the case of fusion ignition).



Like meson guns, the positive or negative "nodes" generated by nuclear dampers are not affected by intervening terrain and can be generated at points over the horizon. This means that unless nuclear damper fire is to be restricted to direct "above the horizon" fire, their fire must be controlled by command centers that can pass over-the-horizon targeting points to the firing nuclear dampers. These command centers are the Nuclear Damper Control APCs detailed on page 31.

Like most TL15 battlefield support systems, the NDC is based on the TL15 grav APC hull. This has led to its commonly being called the "Nuclear Damper Grav APC," although this term is a misnomer, as it is a damper carrier, not a personnel carrier.

Tech Level: 15
Price: MCr21.992491
Size: 168 cubic meters=12 displacement tons (VS)
Mass: 235.11 tonnes empty, 238.75 loaded

Imperial Nuclear Damper Carrier (NDC). These vehicles are allocated at the battalion level, and are generally deployed to protect high-value targets, such as command/control/communications nodes, resupply points, and civilian populations, although they can operate with small tactical units, moving their umbrella of protection with the lead formations.

Fire from nuclear dampers vs. a specified target (either detected by the NDC itself or passed off from an NDC control vehicle) is resolved as normal direct fire (**TNE** page 275), except that a nuclear damper has only a single range band. Targets within this range may be attacked, and targets outside this range may be not. Targets within this range are all attacked with a basic difficulty level of Difficult. This task also applies Diff Mods for target speed (**TNE** page 294). Note that the vehicle is equipped with ballistic fire control, allowing it to disregard five such Diff Mods after multiplying the Diff Mods for ballistic targets by 0.5.

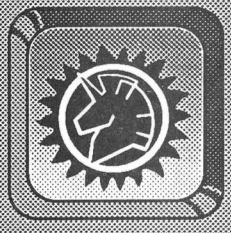
Nuclear dampers apply one additional Diff Mod, detailed as follows. Since the effect of the nuclear damping described above is not instantaneous, but requires the application of the proper positive and negative nodes to the material, the success of the damper is based on the "dwell time" of its field upon the target. The ability to keep this field focused on the target depends again upon the target's closing speed, with Diff Mods based on the net closing velocity of the nuclear warhead. Divide the net closing velocity in kilometers per hour of the targeted warhead by 60,000, and round to the nearest whole number. The result is the target's CV (closing velocity, using units of the **TNE** and **Brilliant Lances** space combat system) which is divided by the indicated value to yield a positive difficulty modifier. This Diff Mod is then applied to the basic fire task difficulty level based on range. Note that the CV units are so large (with 29,999 kph rounding down to 0) that this hardly ever creates a problem in the planetary combat arena; it is only the frictionless vacuum of space that allows nuclear warheads to get up to such high speeds.

The nuclear damper carried by this vehicle has a rate of fire of only one shot per turn, which means that each ND carrier can only conduct one fire task per five-second combat turn.

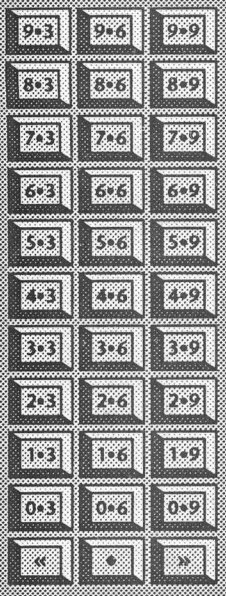
The reality of terrain-following nuclear munitions (or warhead-carrying aircraft) and their high speed means that nuclear dampers are dependent on hand-offs from systems that can provide over-the-horizon (OTH) targeting. Such systems are carried by ND Control APCs, which are detailed on page 31. In general, two ND carriers are given targeting information by a single ND Control APC. Battery organization is discussed on page 31.

Decoys

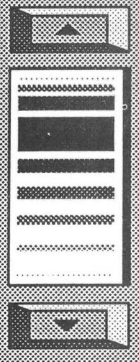
Decoys are of three types: antilaser (which affect attempts to detect a target with ladar or to designate it with a laser designator), antiactive sensor (which affect attempts to detect a target or designate it with radar or active EMS), and antipassive sensor (which affect attempts to detect a target with HRT or passive sensors, including infrared goggles and sights). Each decoy only works against its specified sensor, and increases the difficulty of a detection or designation task by one level vs. TL15 systems, or by two levels vs. TL14– sensors. Each decoy lasts one combat turn (five seconds), and affects all appropriate sensor attempts against the owning vehicle, regardless of direction. Decoy dispensers may launch one decoy per second.



Decoys for the Imperial NDC costs Cr20,000 each regardless of type, or MCr2.4 for a full load of 120.



WEAPON CHARACTERISTICS



TL	*Weapon*	*ROF*	*Range*	*Diff Mod*
15	Nuclear Damper	SA1	3000km	CV+5

Diff Mod: Divide the net closing velocity in kilometers per hour of the targeted warhead by 60,000, and round to the nearest whole number. The result is the target's CV (closing velocity, using units of the **TNE** and **Brilliant Lances** space combat system) which is divided by the indicated value to yield a positive difficulty modifier. This Diff Mod is then applied to the basic fire task level, which is always Difficult.

TL15 Imperial Cavalry Vehicle/ Armed Air Raft

Security Clearance

Yes No

300-1202

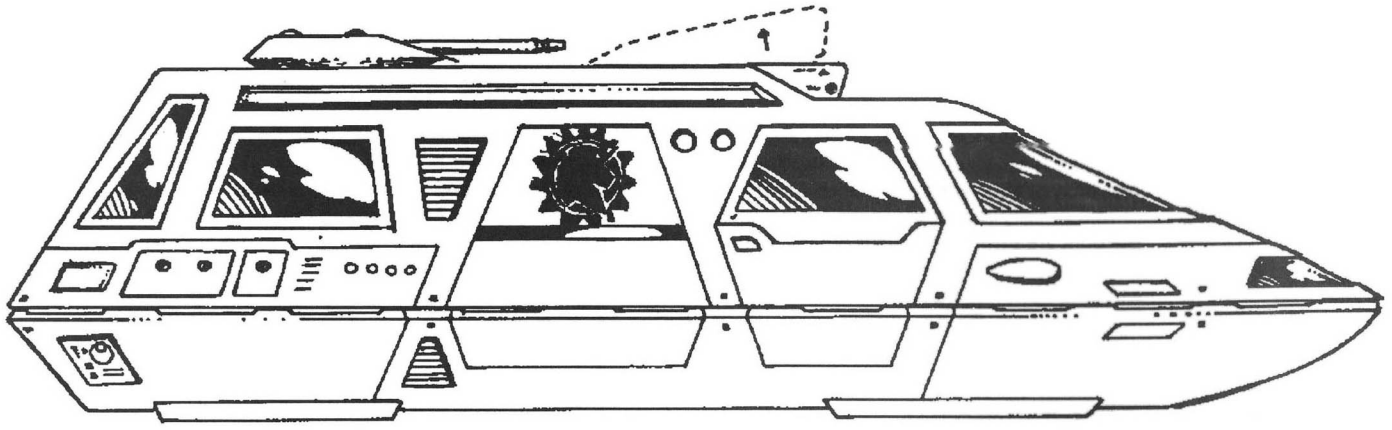
Date

TL15 ARMED AIR RAFT

The Armed Air Raft is the standard scout vehicle of the Imperial/Regency planetary forces, army and Marines alike, and is used in regimental and battalion scout sections, Marine Armored Cavalry (MArCav) platoons, and a variety of other light armed roles. It has the advantages of being reasonably fast, inexpensive, and carrying the offensive punch of the TL15 Imperial Fire Support APC (page 22). Because of its scout role it is officially known as the TL15 Imperial Cavalry Vehicle.

Its combination of VRF gauss gun and light Tac missiles gives it an effective and powerful armament for a vehicle of its relatively small size, although the carriage of the missiles in a single-tube magazine launcher makes them slightly less flexible than on the Fire Support APC with its 34 missile rails, any or all of which can be fire at any one time. In addition, its 300km laser designator makes it an effective artillery designator (see the MRL Artillery Vehicle, page 36). "Hunter-Marker" teams of FDC vehicles (pages 26-29) and armed air rafts are often assembled in artillery-heavy forces to bring the force of massive indirect fire onto the battlefield, in the form of target designated MRL fire via armed air rafts or standard MRL/meson fire via the FDC vehicles.

The armed air raft is designed for use as a recce/scout vehicle, and carries two observers who can be dismounted for ground reconnaissance/target designation/special operations missions. A full scout section of five armed air rafts can place an infantry element of two full fire teams plus a two-man command element onto the ground, and support them with gauss gun and Tac missile fire. This combination makes not only a successful intelligence-gathering scout force, but also a useful rear-guard or economy of force detachment.



Although meson communicators are not standard equipment on the armed air raft in order to reduce costs, power is reserved in the design for 300km units, which adds MCr0.25 to the vehicle cost and reduce cargo capacity by 0.5 m^3.

The Regency Army maintains a number of light action civil security battalions that are equipped primarily with armed air rafts and grav belt-equipped infantry wrapped around a standard headquarters component which includes a battery of eight MRL artillery vehicles. These units have a relatively low impact in terms of public provocation, but are very effective in terms of area surveillance, and the MRL battery provides a devastating punch which allows the unit to hold its position while awaiting reinforcement.

Tech Level: 15
Price: MCr1.420423
Size: 42 cubic meters=3 displacement tons (Mc)
Mass: 6.33 tonnes empty, 8.03 tonnes loaded
Power: 2.52 MW fusion power plant, with HEPlaR thruster generating 8 tonnes of thrust (0.0733 MW excess power)
Maint: 1
Controls: Holographic linked, TL10+ flight avionics, TL15 terrain following avionics, 2× Model 15-FLT computers, TL10+ IGS positioning navigation
Commo: 300km radio, 2×30km maser
Sensors: 30km passive EMS, 5×WSV goggles
ECM: Electromagnetic masking package, 4 decoy dispensers each with space for 20 of any combination of antilaser, antiactive sensor, or antipassive sensor decoys (see below)
Life Support: Pressurized, light, heat, basic life support
Cargo: 260 kg of crew equipment (1.04 m^3)
Crew: 5 (Driver, Missile Gunner, Gauss Gunner, 2 Observer/Dismounted Scouts)
Passengers: None (2 Observer/Dismounted Scouts in adequate seats)
Fire Control: EMS rangefinder and TL14 direct fire ballistic computer (ignore 5 Diff Mods), control units for imaging radar target seeking and laser designated missiles, 300km laser designator, EMS rangefinder may function as 3km short range laser/EMS designator
Armament: Turret-mounted VRF gauss gun, hull-mounted magazine launcher with 0+12 30kg fire-and-forget Tac missiles
Stabilization: Advanced (fire at any speed)
Ammo: 5 cassettes for VRF gauss gun (Cr1600 for full load of 150,000 rounds needle) 12 Tac missiles in magazine launcher (price varies, see table below)
Reloading Data: VRF gauss gun ammunition is carried in 5 cassettes, 0.017m^3 each, 0.017 tonnes loaded, 0.002 tonnes empty, Cr320 loaded, Cr20 empty, replacement requires four actions (see **TNE** page 273). Missiles are 30kg each, replacement requires 6 actions each.
Speed: 746 kph maximum, 560 kph cruising, 187 kph NOE (safe speed)
Travel Move: 2240/1122
Combat Move: 104/26
Signature: +2 Diff Mods vs. HRT and Radar, +1 vs. other methods
Diff Mods vs. Fire: No Diff Mod stationary, +6 at maximum speed (high mode combat move), +5 at cruising speed (high mode travel move), +8 at safe NOE speed, +10 at 2× and 3×safe NOE speed
Maximum Acceleration: 0.267 G
Fuel Capacity: 4800 liters liquid hydrogen (LHyd)
Fuel Consumption: 100 liters/hour (endurance of 48 hours), plus power plant fuel is sufficient for one month.

TL is tech level of missile; *Guidance* is guidance packages in missile, where TD is AEMS/Laser target designated and Tgt Skr is IR target seeker; *Whd* is warhead type; *Mass* is mass of missile in kilograms; *Price* is price of missile in credits; *Sh Rng* is short range of missile in target seeker mode; *Mx Rng* is maximum range of missile in target designated mode; *C-B* is concussion and burst for HE warheads; *Dngr Spc* is danger space for flechette warheads; *Pen* is Penetration Value for HE warheads and Penetration Rating for flechette warheads in primary-secondary danger space (damage value is 2D6/1D6 respectively); *M/turn* is the number of meters the missile travels in a five-second combat turn; *AGL* is the missile's agility, with the target designation mode agility to the left of the slash and the target seeker guidance mode agility to the right of the slash. All missiles have a volume of 30 liters, diameter of 20cm, and length of 95cm.

VRF Gauss Gun

TL	*Round*	*ROF*	*Dam Val*	*Pen Rtg*	*Magazine*	*Short Range*
10	4×20mm/60 Dart	50	6	1-3-5	300,000C	300

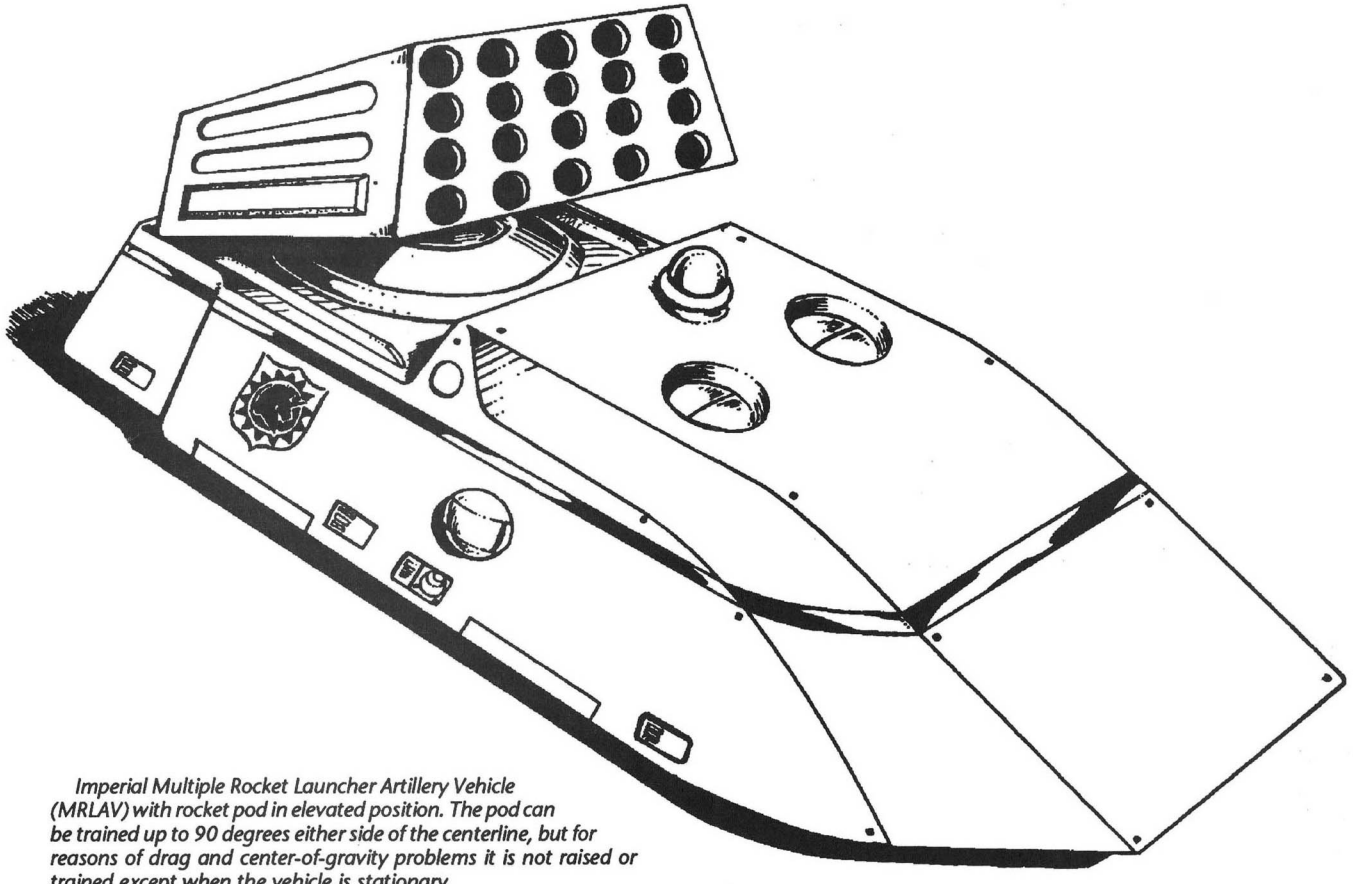
TL: Technology Level; *Round*: type of round fired; *ROF*: Rate of Fire in shots per fire *action; Dam Val:* Damage Value; *Pen Rtg:* Penetration Rating at short-medium-long-extreme ranges; *Pen Val*: Penetration Value, i.e., Damage Value already adjusted by Penetration Rating at short-medium-long-extreme ranges for use against unarmored targets; *Magazine*: Magazine capacity in shots, where C indicates the cassette magazine type; *Short Range*: Short Range in meters.

TL15 Imperial Artillery Vehicle (Multiple Rocket), MRLAV

TL15 IMPERIAL MULTIPLE ROCKET LAUNCHER (MRL) ARTILLERY VEHICLE, MRLAV

The MRL Artillery Vehicle is the standard Imperial area-saturation weapon. By ripple-firing its full load of 20 rockets a single MRLAV is able to lay fire on an area as large as 2060 meters across as far as 650 kilometers away. With its integral autoloader the MRLAV can reload in only five minutes. Thus under ideal circumstances a single MRLAV could cover almost 40 square kilometers with fire in a single hour. In a high-threat environment this figure would be reduced by the need to displace to a new firing position after each salvo, but given the vehicle's ability to rapidly open fire this value would be no more than cut in half.

The EMS guidance of these rockets allows them to be designated by any laser, radar, or active EMS system, which allows a very high first-round hit probability. The rockets may also be fired using normal indirect fire procedures, but given the capability of EMS target designation this method is wasteful and is only used in unusual circumstances.



MRL Artillery Vehicles are employed in four-vehicle units, either as separate MRL platoons or as MRL sections. Separate MRL platoons are small artillery units organic to nonartillery battalions and include an FDC vehicle as the platoon headquarters. MRL sections are assigned one or two at a time to a regimental or divisional artillery battery along with an RDM section. The MRL and RDM sections have no FDCs of their own. The battery is commanded from a single FDC battery command vehicle.

In both cases, there is usually one grav sled (see page 42) assigned per MRL vehicle as an ammunition carrier.

Tech Level: 15
Price: MCr9.013841
Size: 168 cubic meters=12 displacement tons (VS)
Mass: 257.17 tonnes empty, 269.24 loaded
Power: TL15 7.2 MW fusion power plant supplying 1.2 MW to high-efficiency contra-grav lifters, with HEPlaR thruster generating 86.62 tonnes of thrust (0.29092 MW excess power)
Maint: 45
Controls: Holographic linked, TL10+ flight avionics, TL15 terrain following avionics, 3×TL15 Model FIt flight computers, TL10+ IGS navigation system
Commo: TL15 30km radio, TL15 300km meson communicator, TL15 30,000km maser
Sensors: 30km passive EMS sensor, 3×WSV goggles
ECM: Electromagnetic masking package, 4 decoy dispensers each with space for 30 of any combination of antilaser, antiactive sensor, or antiactive sensor decoys (see below)
Life Support: Heat, light, extended life support, artificial gravity/G-compensators (for 134.4 cubic meters), and one air lock
Cargo: 49 kg of crew equipment (0.197 m³)
Crew: 3 (Driver, Commander, Gunner)
Passengers: None
Fire Control: TL15 Indirect Fire Control
Armament: 20-round multiple rocket launcher for 30cm, 500 kg EMS-designated artillery rockets
Stabilization: Advanced (allows set-up time to be reduced to 6 turns, or 30 seconds)
Ammo: 20×30cm rockets carried in launch tubes
Reloading Data: Autoloader reduces reload time to 5 minutes (60 combat turns)
Speed: 1070 kph maximum, 802 kph cruising, 190 kph NOE
Travel Move: 3208/1140
Combat Move: 149 (high mode absolute speed)/26 (NOE safe speed) in 10-meter grid squares
Signature: +2 Diff Mods vs. HRT and Radar, +1 Diff Mods vs. Passive and Active EMS, None vs. other methods
Diff Mods vs. Fire: –1 Diff Mod stationary, +5 at maximum speed (high mode combat move), +5 at cruising speed (high mode travel move), +3 at safe NOE speed, +4 at 2× and 3×safe NOE speed
Maximum Acceleration: 0.322 G
Fuel Capacity: 21,113.625 liters reaction mass plus 60 liters for fusion reactor
Fuel Consumption/Endurance: 1082.75 liters/hour (endurance of 19.5 hours), plus reactor fuel is sufficient for one month constant power

Imperial Multiple Rocket Launcher Artillery Vehicle (MRLAV) with rocket pod in elevated position. The pod can be trained up to 90 degrees either side of the centerline, but for reasons of drag and center-of-gravity problems it is not raised or trained except when the vehicle is stationary.

Autoloader rails are installed at the rear of the rocket pod, allowing the pod to be reloaded from ammunition vehicles (such as the Imperial grav sled, see page 42) in as little as five minutes.

This view affords a good view of the radome-protected orbital maser uplink, located between and behind the crew hatches, and just in front of the break in the hull for the rocket pod recess. The maser allows full access to the FDC net (see pages 26-29), so crucial to accurate indirect fire.

The shield around the Regency insignia shows that this is an Army vehicle. In any event, the vast majority of MRLAVs in service belong to the Army anyway, as the Marines prefer the Meson Artillery Vehicle (MAV), see pages 40-41.

WEAPON CHARACTERISTICS

TL15 30cm Artillery Rockets

Warhead	*Guidance*	*Conc-Brst*	*Direct Hit On*	*Pen*	*IF Rng*	*Cbt Move*	*Price*
HE	EMS Desig	225-155	—	38C	650km	30,310/+9	3696
Submun	EMS Desig	NA-225	1, 1-5	10C	650km	30,310/+9	13,696
Hmg Submun	EMS Desig	NA-115	1-3, 1-7	10C	650km	30,310/+9	21,696
HEAP	EMS Desig	149-125	—	353C	650km	30,310/+9	4696

All rockets have a diameter of 30cm and a length of 7 meters. *Conc-Brst* is Concussion and primary burst radius in meters (**TNE** 283-285); *Direct Hit On* shows the chance of a submunition direct hit on a personnel or vehicle target on 1D10 (**TNE** 284-285); *Pen* is the penetration value of the unitary warhead or each separate submunition; *IF Rng* is the maximum Indirect Fire Range; *Cbt Move* is the distance in meters travelled by the rocket per five-second combat turn and the Target Movement Diff Mod (**TNE** page 294); *Price* is the price of each rocket in credits.

Decoys

Decoys are of three types: antilaser (which affect attempts to detect a target with ladar or to designate it with a laser designator), antiactive sensor (which affect attempts to detect a target or designate it with radar or active EMS), and antipassive sensor (which affect attempts to detect a target with HRT or passive sensors, including infrared goggles and sights). Each decoy only works against its specified sensor, and increases the difficulty of a detection or designation task by one level vs. TL15 systems, or by two levels vs. TL14– sensors. Each decoy lasts one combat turn (five seconds), and affects all appropriate sensor attempts against the owning vehicle, regardless of direction. Decoy dispensers may launch one decoy per second.

Decoys for the MRL Artillery Vehicle cost Cr20,000 each regardless of type, or MCr2.4 for a full load of 120.

TL15 Imperial Artillery Vehicle (Remote Drone)

TL15 IMPERIAL REMOTE DRONE MISSILE (RDM) ARTILLERY VEHICLE, RDMAV

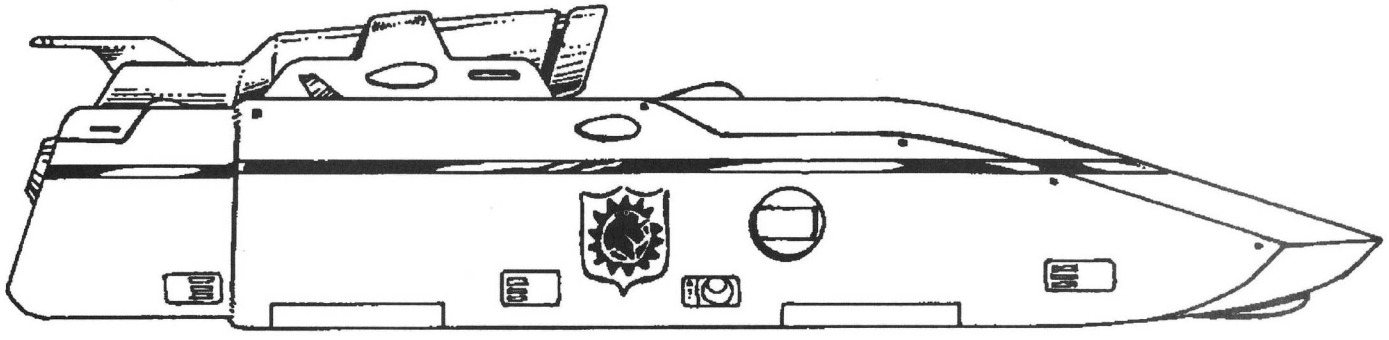
Whereas the MRL Artillery Vehicle (previous page) is used for area saturation fire, the RDM Artillery Vehicle is used for precision strike and real-time reconnaissance-strike. Its primary weapon is the Imperial TL15 0.1-ton drone missile. The details of drone missile operation below refer specifically to this weapon, but the general principles are the same for all drone missiles.

Drone missiles are operated using a combination of three assets—RCV Operations, Sensors, and Tac Missile. They are a cross between grav vehicles, Tac missiles, and mobile remote sensors, and operate in all these fashions over the course of a single mission. Over most of its mission, a drone missile operates as an NOE grav vehicle with a maximum speed of 200 kph, and is remotely controlled by its operator, usually in the firing vehicle, who communicates with it either via its 300km radio or its 30,000km satellite uplink.

The operator has the use of a single-purpose TL15 flight-class computer which allows him to synthesize sensor pictures from the drone(s) and other sensors with which the operator is internetted. This sensor picture allows him to move the drone missile toward targets he is aware of, or, by using the drone's own on-board sensors, he can reconnoiter in real time via the drone itself. Use of the drone's on-board sensors, a 3km passive EMS sensor in the case of the 0.1-ton drone, is a task using Sensors *and* RCV Operations (i.e., the lower of the two, see **TNE** page 109). During this "cruise mode" the drone flies an NOE profile and never exceeds 200 kph. (This is also considered its safe speed for the Drive action, using the RCV Operations asset.) However, once the drone is in range of a target which is visible to the drone (via another sensor task as above), the operator may commit the missile to attack that target. At this point the drone missile is operated and resolved as a homing missile, using the RCV Operations *and* Tac Missile assets (i.e., the lower of the two). The listed short range of the missile is based on the distance it can cover in five seconds at maximum thrust. Given the very long short range of the 0.1-ton drone, especially as compared to the range of its sensor, it is difficult to imagine that it will ever be fired at any range other than short.

The drone missile may be commanded to hit a face of the target (i.e., the top, the far/rear side, etc.) which is not directly visible from its point at the commencement of the attack, but this increases the task one difficulty level. When drone missiles are fired at moving targets, they use their agility as a counteracting DM to the target's own speed. The TL15 0.1-ton missile has an Agility of 12: 7 for its own speed with a +5 bonus from its drone brain. However, only its own speed is used as a modifier for weapons attempting to fire at it during this terminal phase.

Drone missiles which are never committed to an attack and which are returned undamaged into friendly hands may be refuelled, recharged, and re-used. Any drone missile which is committed to an attack, even if it misses, may not be re-used.



Because of the way that the RDM and MRL artillery vehicles complement each other, Imperial artillery batteries include at least one section each of 4 RDM or MRL vehicles, with the typical ratio being two sections of MRL to one of RDM for a total of eight MRL and four RDM vehicles per battery. Each battery is commanded from an FDC vehicle; there is no separate FDC vehicle at the section level. Unlike MRL vehicles, Remote Drone vehicles are not deployed in separate platoons.

Tech Level: 15
Price: MCr4.119341
Size: 168 cubic meters=12 displacement tons (VS)
Mass: 230.05 tonnes empty, 261.18 loaded
Power: TL15 7.2 MW fusion power plant supplying 1.2 MW to high-efficiency contra-grav lifters, with HEPlaR thruster generating 86.62 tonnes of thrust (0.07592 MW excess power)
Maint: 44
Controls: Holographic linked, TL10+ flight avionics, TL15 terrain following avionics, 4×TL15 Model FIt flight computers, TL10+ IGS navigation system
Commo: TL15 30km radio, TL15 300km meson communicator, TL15 30,000km maser
Sensors: 30km passive EMS sensor, 3×WSV goggles
ECM: Electromagnetic masking package, 4 decoy dispensers each with space for 30 of any combination of antilaser, antiactive sensor, or antiactive sensor decoys (see below)
Life Support: Heat, light, extended life support, artificial gravity/G-compensators (for 134.4 cubic meters), and one air lock
Cargo: 266 kg of crew equipment (1.064 m³)
Crew: 3 (Driver, Commander, Gunner)
Passengers: None
Fire Control: Control station with TL15 Model FIt computer, TL15 300km radio, and TL15 30,000km maser to control remote drone missiles, up to a maximum of 6 at one time.
Armament: 34-round magazine launcher for remote drone missiles
Stabilization: None
Ammo: 34 remote drone missiles (price varies, see below)
Reloading Data: Drone missiles are 0.857 tonnes each, replacement requires 9 five-second combat turns each.
Speed: 1103 kph maximum, 827 kph cruising, 190 kph NOE
Travel Move: 3308/1140
Combat Move: 153 (high mode absolute speed)/26 (NOE safe speed) in 10-meter grid squares
Signature: +2 Diff Mods vs. HRT and Radar, +1 Diff Mods vs. Passive and Active EMS, None vs. other methods
Diff Mods vs. Fire: –1 Diff Mod stationary, +5 at maximum speed (high mode combat move), +5 at cruising speed (high mode travel move), +3 at safe NOE speed, +4 at 2× and 3×safe NOE speed
Maximum Acceleration: 0.332 G
Fuel Capacity: 21,113.625 liters reaction mass plus 60 liters for fusion reactor
Fuel Consumption/Endurance: 1082.75 liters/hour (endurance of 19.5 hours), plus reactor fuel is sufficient for one month constant power

A sleek and attractive Remote Drone Missile Artillery Vehicle, in the markings of the Regency Army. Compare this view to the MRLAV on page 37 to see the details of the common hull shared by these two Imperial artillery vehicles.

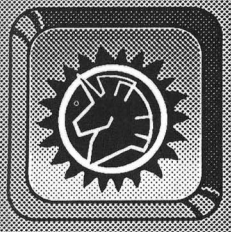
The vehicle in this view is unusual in that it is missing its orbital maser uplink, which should be visible atop the rear deck housing between the communications/ECM blades. It has presumably been removed for maintenance. See the view of the Meson Artillery Vehicle on page 41 for correct placement of the maser dome.

WEAPON CHARACTERISTICS

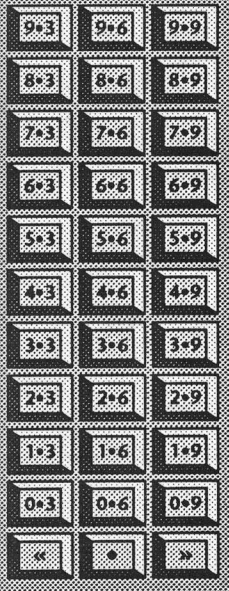
TL15 0.1-ton Remote Drone Missiles

Warhead	*Guidance*	*Conc-Brst*	*Dir Hit*	*Pen*	*Atk Rng*	*Crs Mv*	*Atk Mv*	*Price*
HE	Drone, 300km radio, 30,000km maser	225-155	—	38C	12.36km	278m/+4	12,360m/+9	208,120
Submun	Drone, 300km radio, 30,000km maser	NA-225	1, 1-5	4C	12.36km	278m/+4	12,360m/+9	218,120
Hmg Submun	Drone, 300km radio, 30,000km maser	NA-115	1-3, 1-7	4C	12.36km	278m/+4	12,360m/+9	226,120
HEAP	Drone, 300km radio, 30,000km maser	149-125	—	353C	12.36km	278m/+4	12,360m/+9	209,120

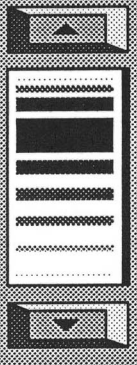
All missiles have a diameter of 60cm and a length of 4.95 meters, a mass of 857 kg, and a maximum flight-time duration of two hours. All missiles are equipped with 3km PEMS. All missiles have an Agility bonus of 12 used during the terminal attack flight to offset target agility bonuses. *Conc-Brst* is Concussion and primary Burst radius in meters (**TNE** 283-285); *Dir Hit* shows the chance of a submunition direct hit on a personnel or vehicle target on 1D10 (**TNE** 284-285); *Pen* is the penetration value of the unitary warhead or each separate submunition; *Atk Rng* is the maximum range at which the drone missile can begin its attack; *Cruise Mv* is the distance in meters travelled by the rocket per five-second combat turn while it is in cruise mode, and after the slash, the Target Movement Diff Mod (**TNE** page 294); *Atk Mv* is the same data except when it is in terminal attack mode; *Price* is the price of each drone missile in credits.



Note: On page 152 of **Striker II**, the rules for drone missiles do not mention the need for sensors. If no sensors are installed, the drone is treated as having the equivalent of "eyeballs" for on-board sensors. Additional capabilities can be achieved by installing and powering various sensors.



Decoys



Decoys are of three types: antilaser (which affect attempts to detect a target with ladar or to designate it with a laser designator), antiactive sensor (which affect attempts to detect a target or designate it with radar or active EMS), and antipassive sensor (which affect attempts to detect a target with HRT or passive sensors, including infrared goggles and sights). Each decoy only works against its specified sensor, and increases the difficulty of a detection or designation task by one level vs. TL15 systems, or by two levels vs. TL14– sensors. Each decoy lasts one combat turn (five seconds), and affects all appropriate sensor attempts against the owning vehicle, regardless of direction. Decoy dispensers may launch one decoy per second.

Decoys for the remote drone missile artillery vehicle cost Cr20,000 each regardless of type, or MCr2.4 for a full load of 120.

Imperial Meson Artillery Vehicle

Security Clearance

300-1202

Date

MESON ARTILLERY VEHICLE (MAV)

The Meson Artillery Vehicle is unique among the TL15 battlefield systems in that it is not built on the TL15 grav APC hull, but has its own purpose-designed hull. This was necessary to accommodate the vehicle's meson gun, which has a constant diameter of three meters, too large for the grav APC hull, and to carry the large power plant required to make a militarily useful meson weapon. (Even at a rate of fire of one shot every 20 seconds, the 3315 Mj input meson gun draws almost 166 MW of the vehicle's 174 MW total power requirement.) Unlike other Imperial Artillery Vehicles (see pages 36 and 38), the MAV does not carry the "TL15" designator. This is because there are no meson artillery vehicles at earlier tech levels. It was only the two-fold increase in fusion power plant output at TL15 that allowed the first battlefield meson guns to be created.

However, the current MAV is the result of attempts to create an Imperial battlefield meson vehicle that were made at the TL-14 level. This program quickly proved the impracticality of such an effort, but the MAV retains reminders of its tech 14 lineage in the use of the visually distinctive components of the TL-14 Trepida/Astrin grav vehicles in its hull. Although MAVs built by many manufacturers retain this original layout, many current production MAVs display the more angular lines current to TL-15 designs. However, in military circles, the TL-14 styled MAV is considered one of the more visually sporty designs of the Imperial/Regency vehicles currently in service.

Meson guns fire a stream of subatomic particles called mesons which do not interact with matter and have a very short lifespan, at the conclusion of which they disintegrate in a burst of radiation and other damaging particles. By firing these mesons at relativistic speeds, the meson's subjective passage of time can be altered, which controls at what distance from the firing weapon the meson will decay and explode. This means that these explosions appear as if by magic at some point downrange from the gun, although there is no visible mechanism linking the firing weapon and the point of impact. Although the concussion and burst figures listed on the weapon characteristics table seem quite small compared to conventional projectile and rocket artillery, the concussion values are completely unaffected by armor of any kind, as the exploding mesons materialize everywhere within the listed burst radius, on all sides of any armor that may be within that volume. Even personal armor does not protect its wearer when disintegrating mesons are appearing directly within his chest cavity.

Despite the fact that the meson gun fires in a perfectly straight line, it is used primarily as an "indirect fire" weapon because the straight line of the meson beam is capable of passing directly through intervening terrain and obstacles to hit objects hidden from line of sight. This requires the use of indirect fire observation and fire direction techniques, despite the direct fire nature of the weapon itself.

Nonetheless, the weapon is equipped with direct fire capabilities (the beam pointers required by all meson guns, particle accelerators, and nonsmall arms lasers automatically confer direct fire capabilities, see **Fire, Fusion & Steel** page 89), but the absence of weapon stabilization on the large gun mount prohibits the fire-on-the-move tactics of TL15 direct fire weapons. The MAV must come to a stop in order to conduct aimed direct or indirect fire, or suffers the adverse effects if attempting direct fire on the move (+1 Diff Mod for quick fire and +1 additional for movement, see **TNE** pages 275 and 294).

The three-meter-long meson tunnel actually yields an effective range of 3600 kilometers, but its short range is limited to 3000 kilometers by its beam pointer. When provided with the proper targeting information the MAV can actually be pressed into service as a planetary defense weapon, as its maximum range of 30,600 kilometers allows coverage of a full space combat hex. Note that at its longer range bands the battlefield meson gun has no appreciable concussion or burst effect, which makes it an ineffective area weapon at these distances. However, if it achieves a direct hit on a vehicle or spacecraft target at these ranges it uses its damage value against the vehicle or spacecraft directly. (For spacecraft use the normal space combat procedures as found in **Brilliant Lances** or **TNE** pages 311-326; for use against vehicles use damage value for the value "FPV–AV" on the Vehicle Damage Table on **TNE** page 299.)

MAVs are deployed in four-vehicle batteries. Each MAV constitutes a one-vehicle firing section, allowing a full battery to maintain one hit per combat turn on a given target. The battery headquarters consists of a command APC, a Fire Direction Center Vehicle (both of either the Marine or army configuration depending upon the service of the battery), and three forward observer sections each containing an air raft. Independent meson batteries deployed with a Marine task force (see **Striker II** page 138) also include a battery security section with two Marine squads, each mounted in an IM Grav APC (page 16) and an Imperial Cav Vehicle (page 34) for the section commander.

WEAPON CHARACTERISTICS

663-Mj 3 meter Meson Gun

TL	*Weapon*	*ROF*	*Dam Val*	*Pen Rtg*	*Pen Val*	*C-B*	*Range (DF Band)*
T5	663-Mj Meson Gun IFR=30,600km	1/4	129	NA	NA	33-15	0-3000km (Short)
		1/4	77	NA	NA	12-15	3001-6000km (Medium)
		1/4	39	NA	NA	3-5	6001-12,000 km (Long)
		1/4	19	NA	NA	1-0	12,001-24,000km (Extr.)
		1/4	15	NA	NA	0-0	24,001-30,600km (IFR only)

TL: Technology Level; *Round*: type of round fired; *ROF*: Rate of Fire in shots per five-second combat turn, where 1/4 equals one shot every four turns; *Dam Val*: Damage Value, used as "Final Penetration Value" (FPV) when scoring a direct hit on a vehicular target; *Pen Rtg*: Penetration Rating, not applicable to meson guns as they disregard armor; *Pen Val*: Penetration Value, not applicable to meson guns; *C-B*: Concussion value and Burst radius in meters, note that the concussion value is applied to *all* personnel targets within this radius, disregarding any cover or armor that may be between them and the point of the meson explosion; *Range (DF Band)*: The meson gun's explosive effects vary with its range. This column shows the maximum range at which the line's effects are used, and also show the range band used with that line for direct fire purposes. All meson fire beyond 24,000 kilometers is conducted as an indirect fire mission, and not as direct fire.

Although its official name is the MAV, or Meson Artillery Vehicle, the low, flattened shape seen above has earned the MAV the common name "Meson Sled." Compare the vehicle to the illustration of the Trepida II grav tank on the next page and the Astrin APCs on page 15 and it is easy to see that the Meson Sled shares a common automotive lineage with these vehicles.

The slatted cover on the hull's forward slope protects the sensitive focusing elements of the meson gun when not in use. Although the meson beam could as easily pass through this as it can pass through intervening terrain obstacles, the electromagnetic beam focusing elements work better without the interference caused by the electromagnetic properties of bonded superdense armor. These electro-magnetic perturbations, although hardly noticeable for most purposes, when close to the barrel can introduce tiny beam deviations that have tremendous impact on beam accuracy hundreds or thousands of kilometers downrange.

Tech Level: 15
Price: MCr12.29142
Size: 280 cubic meters=20 displacement tons (VS)
Mass: 342.55 tonnes empty, 343.34 loaded

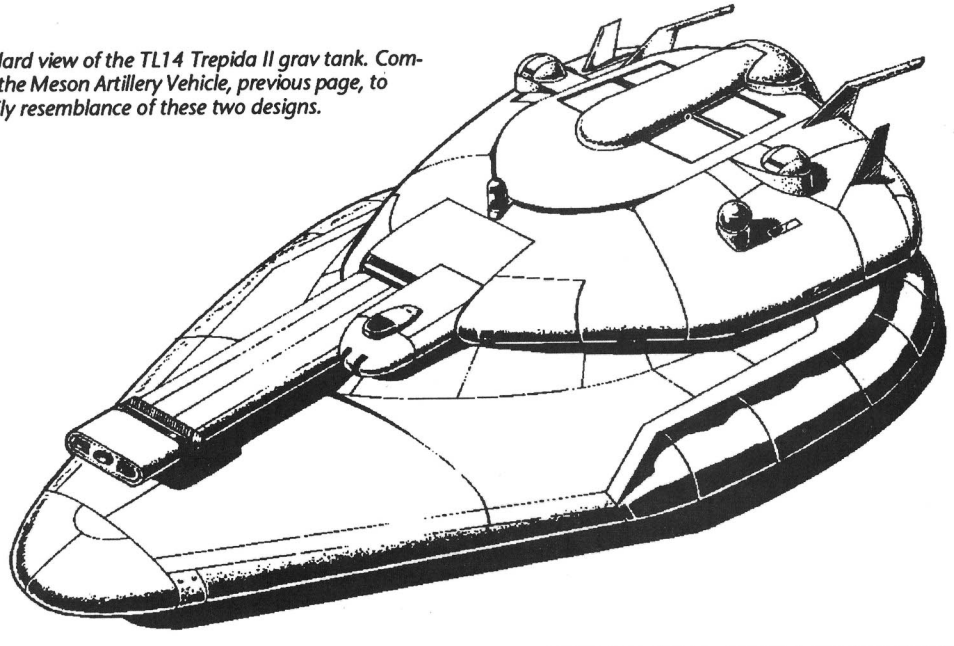
Life Support: Heat, light, extended life support, artificial gravity/G-compensators (for 224 cubic meters), and one air lock
Cargo: 98 kg of crew equipment (0.39 m3)
Crew: 3 (Driver, Commander, Gunner)
Passengers: None
Fire Control: TL15 3000km beam pointer, TL15 indirect fire control
Armament: 663-Mj Meson Gun
Stabilization: None
Ammo: Powered direct from power plant
Speed: 800 kph maximum, 600 kph cruising, 190 kph NOE
Travel Move: 2400/1140
Combat Move: 111 (high mode absolute speed)/26 (NOE safe speed) in 10-meter grid squares
Signature: +1 Diff Mods vs. HRT and Radar, None vs. other methods
Diff Mods vs. Fire: –1 Diff Mod stationary, +5 at maximum speed (high mode combat move), +4 at cruising speed (high mode travel move), +3 at safe NOE speed, +4 at 2× and 3×safe NOE speed
Maximum Acceleration: 0.262 G
Fuel Capacity: 4500 liters reaction mass plus 1451.25 liters for fusion reactor
Fuel Consumption/Endurance: 1125 liters/hour (endurance of 4 hours), plus reactor fuel is sufficient for one month constant power

Decoys

Decoys are of three types: antilaser (which affect attempts to detect a target with ladar or to designate it with a laser designator), antiactive sensor (which affect attempts to detect a target or designate it with radar or active EMS), and antipassive sensor (which affect attempts to detect a target with HRT or passive sensors, including infrared goggles and sights). Each decoy only works against its specified sensor, and increases the difficulty of a detection or designation task by one level vs. TL15 systems, or by two levels vs. TL14– sensors. Each decoy lasts one combat turn (five seconds), and affects all appropriate sensor attempts against the owning vehicle, regardless of direction. Decoy dispensers may launch one decoy per second.

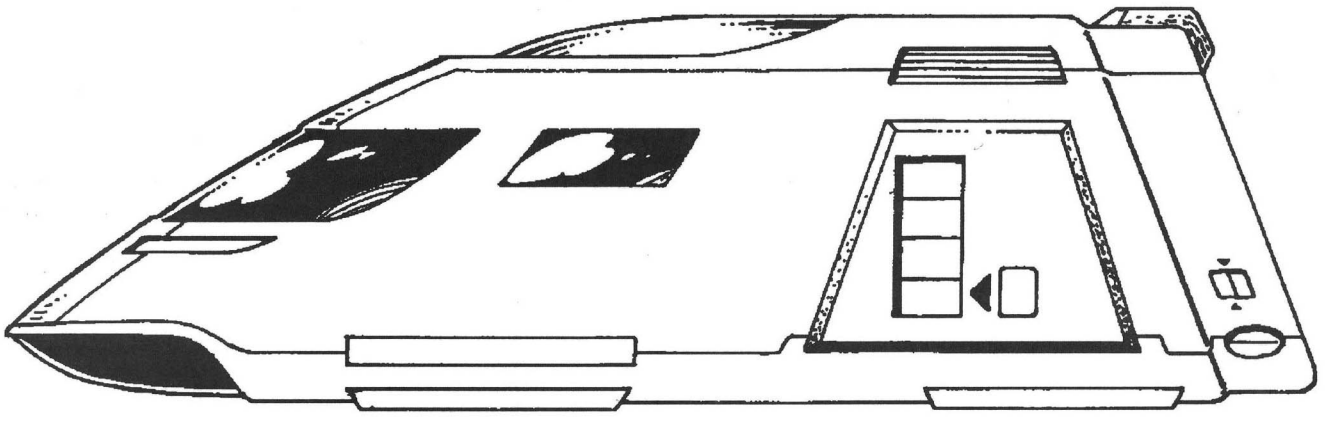
Decoys for the meson artillery vehicle cost Cr20,000 each regardless of type, or MCr0.8 for a full load of 40.

TL15 IMPERIAL GRAV SLED



The Imperial Grav Sled was ubiquitous in the Imperium's high stellar units, and serves in large numbers in the Regency Army and Marine units in the logistics, liaison, maintenance, and "hack" roles. For this reason it is also known as the Utility Sled.

Although they are not armored to the standards of true TL15 combat vehicles, the grav sled is quite well-protected by most other standards, and the grav sled is often used as a surrogate APC, especially by planetary armies. It is usually fitted with some form of weapon (typically a VRF gauss gun in a remote turret) in this role. When pressed into service as APCs, grav sleds are generally equipped with adequate seats to allow more rapid "debussing" of armored troops in combat. Grav/Utility Sleds are often used as ammunition vehicles to resupply the AFVs described elsewhere in this book. The quantity of ammunition that can be stowed varies by ammunition type and can be determined by the table below. Mixed loads of multiple ammunition types can be determined by pro-rating the figures on the table. For example, a grav sled loaded with one-half RPW-15 rounds, one-fourth RPZ-15 rounds, and one-fourth 30cm rockets would carry 4865, 257, and 18 rounds of the respective types of munitions. Note that these densely-packed ammunition loads are much more massive than general cargo, and raise the vehicle's loaded mass considerably.



Grav/Utility Sled Ammunition Carriage

Ordnance	*Number Carried*	*Cost Each/Full Load*
Decoys (antilaser, antiactive, or antipassive)	18,000	Cr20,000/MCr360
VRF Gauss Gun cassettes (30,000 rnds each)	4235 (127 mill. rnds)	Cr320/MCr1.3552 (dart)
6.3cm 3Mj PFC cartridges (RPV-14)	60,000 rounds	Cr24/MCr1.44
11.6cm 18.5Mj PFC cartridges (RPW-15)	9730 rounds	Cr148/MCr1.44
18.5cm 74Mj PFC cartridges (RPX-14/15)	2432 rounds	Cr592/MCr1.44
22cm 125Mj PFC cartridges (RPY-14)	1440 rounds	Cr1000/MCr1.44
24.6cm 175Mj PFC cartridges (RPZ-15)	1028 rounds	Cr1400MCr1.44
30cm Artillery Rockets	72 rounds	varies by warhead (see pages 36-37)
60cm Remote Drone Missiles	25 rounds	varies by warhead (see pages 38-39)

The figures for PFC rounds are for individual rounds carried in bulk, while the vehicles listed in this book are usually reloaded with complete magazines. The volume and time required for this operation is listed with each vehicle. The number of these magazines which can be carried in the grav sled's 72 m^3 cargo area can be easily calculated. Used as battlefield refuelers, the grav sled carries 72,000 liters of transferrable fuel, enough for three Norris battle tank refuelings or four grav APC refuelings. Like the TL15 APC hull, the grav sled hull is the basis for a wide variety of purpose-built variants, although for reasons of space these are not detailed in this volume. Grav sleds are ubiquitous in the Regency armed forces, and war-weary or surplus examples can be found in nonmilitary hands, serving in mercenary units, in police, paramilitary, or internal security forces, as hostile-environment vehicles, or customized for use by explorers and adventurers.

Standard view of the TL14 Trepida II grav tank. Compare to the Meson Artillery Vehicle, previous page, to see family resemblance of these two designs.

Utiliy grav sled, unmarked. Note that in keeping with its primary cargo-carrying duties the grav sled is equipped with three doors, one on each side at the rear plus the traditional rear ramp.

Tech Level: 15

Price: MCr2.2407955

Size: 168 cubic meters=12 displacement tons (VS)

Mass: 54.3 tonnes empty, 74.14 loaded with general cargo, up to 200.14 loaded with ammunition

Power: TL15 4.8 MW fusion power plant supplying 1.2 MW to high-efficiency contra-grav lifters, with HEPlaR thruster generating 43.31 tonnes of thrust (0.20642 MW excess power)

Maint: 12

Controls: Holographic linked, TL10+ flight avionics, TL15 terrain following avionics, 3×TL15 Model FIt flight computers, TL10+ IGS navigation system

Commo: TL15 30km radio, TL15 300km meson communicator

Sensors: 30km passive EMS sensor, 2×WSV goggles

ECM: Electromagnetic masking package, 4 decoy dispensers each with space for 30 of any combination of antilaser, antiactive sensor, or antiactive sensor decoys (see below)

Life Support: Heat, light, extended life support, artificial gravity/G-compensators (for 134.4 cubic meters), and one air lock

Cargo: Cargo area for 18 tonnes (72 m^3) plus 185 kg of crew equipment (0.743 m^3), with large cargo hatch

Crew: 2 (Driver, Commander)

Passengers: None, although cargo space can be allocated to 28 cramped (MCr0.0028) or 20 adequate (MCr0.002) seats. Large cargo hatch allows ingress/egress by 10 unarmored personnel or 5 armored (combat armor/battle dress) troops per combat turn with cramped seats or 20 unarmored personnel or 10 armored troops per combat turn with adequate seats.

Fire Control: None

Armament: None

Stabilization: None

Ammo: None

Speed: 1200 kph maximum, 900 kph cruising, 190 kph NOE

Travel Move: 3600/1140

Combat Move: 167 (high mode absolute speed)/26 (NOE safe speed) in 10-meter grid squares

Signature: +2 Diff Mods vs. HRT and Radar, +1 Diff Mods vs. Passive and Active EMS, None vs. other methods

Diff Mods vs. Fire: –1 Diff Mod stationary, +5 at maximum speed (high mode combat move), +5 at cruising speed (high mode travel move), +3 at safe NOE speed, +4 at 2× and 3×safe NOE speed

Maximum Acceleration: 0.361 G

Fuel Capacity: 17,324 liters reaction mass plus 40 liters for fusion reactor

Fuel Consumption/Endurance: 541.375 liters/hour (endurance of 32 hours), plus reactor fuel is sufficient for one month constant power

Decoys

Decoys are of three types: antilaser (which affect attempts to detect a target with ladar or to designate it with a laser designator), antiactive sensor (which affect attempts to detect a target or designate it with radar or active EMS), and antipassive sensor (which affect attempts to detect a target with HRT or passive sensors, including infrared goggles and sights). Each decoy only works against its specified sensor, and increases the difficulty of a detection or designation task by one level vs. TL15 systems, or by two levels vs. TL14– sensors. Each decoy lasts one combat turn (five seconds), and affects all appropriate sensor attempts against the owning vehicle, regardless of direction. Decoy dispensers may launch one decoy per second.

Decoys for the grav sled cost Cr20,000 each regardless of type, or MCr2.4 for a full load of 120.

TL15 Imperial Recovery Sled and TL15 Convertible Air Raft

TL15 IMPERIAL RECOVERY SLED

Most AFVs taken out of action during combat can be returned to service if they are repaired, but heavy grav vehicles without power or gravitic negation are extremely hard to move. The answer is another grav vehicle designed to pick them up and move them, and this vehicle is called the recovery sled.

Unlike many recovery vehicles, the grav recovery sled does not require winches or cranes to manipulate or extricate damaged or derelict vehicles. Rather, the bottom of its rear bed can be opened, allowing the recovery sled to set down around the disabled vehicle from above, and attach itself to it. This allows the recovery sled's contra-grav envelope and maneuvering thrusters to act directly on the now attached disabled vehicle without the use of winches or cranes. This open frame bed measures 15.6 meters long by 7.5 meters wide, and is large enough to easily accommodate the largest Imperial battlefield vehicles, the heavy grav tank and meson artillery vehicle.

Some units fit the vehicle with remote turrets mounting heavy machineguns or VRF gauss guns, but as these are seldom

Tech Level: 15
Price: MCr4.4009975
Size: 420 cubic meters=30 displacement tons (VS)
Mass: 37.99 tonnes empty, 463.28 loaded
Power: TL15 8.4 MW fusion power plant supplying 3 MW to high-efficiency contra-grav lifters, with HEPlaR thruster generating 43.31 tonnes of thrust (0.2513 MW excess power)
Maint: 6
Controls: Holographic linked, TL10+ flight avionics, TL15 terrain following avionics, 3×TL15 Model FIt flight computers, TL10+ IGS navigation system
Commo: TL15 30km radio, TL15 300km meson communicator
Sensors: 30km passive EMS sensor, 2×WSV goggles
ECM: Electromagnetic masking package, 4 decoy dispensers each with space for 30 of any combination of antilaser, antiactive sensor, or antiactive sensor decoys (see below)
Life Support: Heat, light, extended life support, artificial gravity/G-compensators (for 420 cubic meters), and one air lock
Cargo: Cargo bed for 424 tonnes (327 m^3, 23.36 displacement tons) plus 244 kg of crew equipment (0.977 m^3). Mass of recovered vehicle is limited by sled performance. Heavier loads can be carried, but at much lower speed.
Crew: 2 (Driver, Commander)
Passengers: None
Fire Control: None
Armament: None
Stabilization: None
Ammo: None
Speed: 400 kph maximum, 300 kph cruising, 100 kph NOE
Travel Move: 1200/600
Combat Move: 56 (high mode absolute speed)/14 (NOE safe speed) in 10-meter grid squares
Signature: +1 Diff Mod vs. HRT and Radar, None vs. other methods

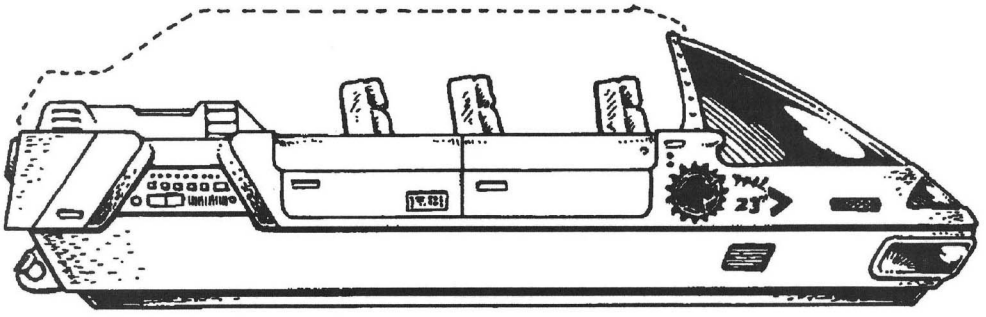
Decoys

Decoys are of three types: antilaser (which affect attempts to detect a target with ladar or to designate it with a laser designator), antiactive sensor (which affect attempts to detect a target or designate it with radar or active EMS), and antipassive sensor (which affect attempts to detect a target with HRT or passive sensors, including infrared goggles and sights). Each decoy only works against its specified sensor, and increases the difficulty of a detection or designation task by one level vs. TL15 systems, or by two levels vs. TL14– sensors. Each decoy lasts one combat turn (five seconds), and affects all appropriate sensor attempts against the owning vehicle, regardless of direction. Decoy dispensers may launch one decoy per second.



Decoys for the recovery sled cost Cr20,000 each regardless of type, or MCr2.4 for a full load of 120.

Recovery sled with lower doors open to accept disabled vehicle. Note also open rear rolling doors and side-mounted crane. This example is fitted with a remote turret with light autogun.

TL15 MILITARY CONVERTIBLE AIR RAFT

This is the military version of the standard civilian TL15 air raft with such militarized features as decoys, ECM, extra communications gear, and sensors. Compared to the civilian version the military version adds 5×WSV goggles, a second maser communicator, a third flight computer, electromagnetic masking (EMM), and decoy dispensers, giving it an electronics suite comparable to that of the TL15 armed air raft (see ICV page 34). This air raft can be used in an open-topped or enclosed configuration. With the top fitted it has a fully enclosed, pressurized environment with basic life support. The top alone masses 0.64 tonnes and is stored at 12.6 m³ (0.9 displacement tons). Although removing the top is quite simple and easily accomplished in the field, reattaching it is more complicated (in order to ensure airtight integrity) and requires two hours in a hangar or field maintenance facility. Like the grav sled, the air raft is used for a wide variety of combat support and combat service support missions, including liaison, headquarters vehicle, supply, maintenance, military police, etc. If used for ammunition supply, its five passenger seats are removed, increasing cargo volume to 18.45 m³. For figures on ammunition capacity, consult the table for the grav sled on page 42 but multiply the listed amounts by 0.25. Unlike the grav sled, the air raft is used for a large number of formal combat missions, including that of forward observer (FO) vehicles and section vehicles for grav belt-equipped light infantry. The most expensive portion of the militarized package is the EMM package, and this feature is often excluded from vehicles used for purely noncombat purposes. With this change the price becomes Cr541,090 and cargo capacity is increased to 6.79 m³ (with seats removed for ammunition carriage multiply the grav sled figures by 0.26).

Military convertible air raft shown in open-topped configuration. Dotted line shows silhouette when fitted with pressurized hardtop.

Tech Level: 15
Price: Cr751,090 (Cr750,019 without lid, Cr1071 for top alone)
Size: 42 cubic meters=3 displacement tons (Mc)
Mass with Top: 5.13 tonnes empty, 7.53 tonnes loaded
Mass without Top: 4.49 tonnes empty, 6.89 tonnes loaded
Power: 1.2 MW fusion power plant, with HEPlaR thruster generating 7.6 tonnes of thrust (0.1658 MW excess power)
Maint: 1
Controls: Holographic linked, TL10+ flight avionics, TL15 terrain following avionics, 3×Model 15-FLT computers, TL10+ IGS positioning navigation
Commo: 300km radio, 2×30km maser
Sensors: 30km passive EMS
ECM: Electromagnetic masking package, 4 decoy dispensers each with space for 20 of any combination of antilaser, antiactive sensor, or antipassive sensor decoys (see below)
Life Support: Light, heat, basic life support (pressurized with top fitted)
Cargo: 1.4875 tonnes (5.95 m³)
Crew: 1
Passengers: 5 in cramped seats
Speed: 798 kph maximum, 599 kph cruising, 190 kph NOE (safe speed), 300 kph maximum in any mode when top is removed and passengers have no protective gear or breathing apparatus
Travel Move, Open [Enclosed]: 1200/945 [2396/1140]
Combat Move, Open [Enclosed]: 42/22 (note that only 2×safe speed may be achieved in NOE mode) [111/26]
Signature: +1 Diff Mod vs. all methods
Diff Mods vs. Fire: No Diff Mod stationary, +6 at maximum speed (enclosed high mode combat move, not attainable with open configuration), +5 at cruising speed (enclosed high mode travel move, not attainable with open configuration), +4 at safe NOE speed (enclosed and open; this is also Diff Mod for maximum open configuration speed), +5 at 2× and 3×safe NOE speed (2× and 3× safe speed not attainable in open configuration)
Maximum Acceleration: 0.253 G
Fuel Capacity: 4380 liters liquid hydrogen (LHyd)
Fuel Consumption: 95 liters/hour (endurance of 46 hours), plus power plant fuel is sufficient for one month.

CIVILIAN VERSION

The civilian version of the TL15 air raft is identical to the militarized version with the following exceptions: Simply replace the entries for the vehicle above with those below.

Price: Cr504,450 (Cr503,379 without lid, Cr1071 for top alone)
Mass with Top: 3.77 tonnes empty, 6.68 tonnes loaded
Mass without Top: 3.21 tonnes empty, 6.12 tonnes loaded
Power: 1.2 MW fusion power plant, with HEPlaR thruster generating 7.6 tonnes of thrust (0.2408 MW excess power)
Controls: Holographic linked, TL10+ flight avionics, TL15 terrain following avionics, 2× Model 15-FLT computers, TL10+ IGS positioning navigation
Commo: 300km radio, 30km maser
ECM: None
Cargo: 2 tonnes (8 m³)

COMMAND VARIANT

The command variant is assigned to units such as the point defense section which require a vehicle for the section commander, but do not need a full-fledged command/coordination vehicle. Unlike true command vehicles, the tactical command air raft is not equipped with full-sized computers. Rather, it is simply equipped with a maser uplink that allows it to tap into the command-control network which the Point Defense APCs already directly access on their own. It thus functions as a repeater, allowing the commander to see the same information as his PD vehicles. It is identical to the militarized convertible air raft above with the following exceptions:

Price: Cr787,090 (Cr750,019 without lid, Cr1071 for top alone)
Mass with Top: 5.15 tonnes empty, 7.55 tonnes loaded
Mass without Top: 4.51 tonnes empty, 6.91 tonnes loaded
Power: 1.2 MW fusion power plant, with HEPlaR thruster generating 7.6 tonnes of thrust (0.0108 MW excess power)
Commo: 300km radio, 2×30km maser, 1×TL15 30,000km maser

Decoys

Decoys are of three types: antilaser (which affect attempts to detect a target with ladar or to designate it with a laser designator), antiactive sensor (which affect attempts to detect a target or designate it with radar or active EMS), and antipassive sensor (which affect attempts to detect a target with HRT or passive sensors, including infrared goggles and sights). Each decoy only works against its specified sensor, and increases the difficulty of a detection or designation task by one level vs. TL14+ systems, or by two levels vs. TL13– sensors. Each decoy lasts one combat turn (five seconds), and affects all appropriate sensor attempts against the owning vehicle, regardless of direction. Decoy dispensers may launch one decoy per second. Decoys for the air raft cost Cr20,000 each regardless of type, or MCr1.6 for a full load of 80.

Regency Military Units and Deployments

REGENCY MARINE REGIMENTS

Regency Marine regiments (frequently still called *Imperial* Marine regiments, especially by their members) are of two types: line regiments and armored cavalry regiments. The Regency does not maintain Marine divisions, and even the Imperium maintained very few of these on a permanent basis.

Line regiments are the standard multipurpose marine organization, heavy on grav infantry. Marine armored cavalry ("MArCav") regiments are fast-moving, hard-hitting, armored assault forces.

Line regiments are assigned areas of responsibility on the basis of one regiment per numbered fleet. MArCav regiments are assigned as mobile fire brigades to broad astrographic regions—two regiments each in the Spinward Marches and Deneb Sectors, and another two in the combined Trojan Reach-Reft area. Each MArCav regiment is complete with its own assault shipping.

The Regency Marine Corps (RMC) maintains 34 line regiments on its rolls, six MArCav regiments, and a number of reserve units which are primarily training organizations. Note that these regiments do not represent all of the strength of the RMC by any stretch of the imagination. Permanently assigned ship's troops, security detachments at embassies and naval bases, etc., are all organized separately and are not part of the regimental structure above. These 40 line and cavalry regiments are combat-organized military units, and do not have ship's or security troops drawn from their numbers.

Of the 34 line regiments, eight trace their lineage to Imperial Marine regiments of the antebellum period, and these retain their high-numbered Imperial designations, for reasons of history. Thus, in a reversal of typical military precedence, it is not the low-numbered Regency Marine regiments that have a place of pride in the corps, but the high-numbered regiments. All the MArCav regiments were raised by the Regency after the Collapse so are simply numbered 1 through 6.

Line Regiment Organization: The Marine Task Force organization shown on **Striker II**, page 138, is only one possible configuration that could be formed by its parent regiment. Each regiment contains three task force headquarters groups identical to that shown in **Striker II**. In addition, each regiment contains a pool of 18 companies that can be divided up among the three headquarters in any proportion desired. These comprise nine line infantry companies, five meson gun artillery batteries, two lift cavalry companies, a grav tank company and a commando company. When the regiment is committed to combat as a unit, one or two artillery batteries, a lift cavalry company and the commando company are often retained and commanded directly by the regimental headquarters.

The task force shown in **Striker II** (three line marine companies and a meson battery) is a common multipurpose organization.

MArCav Regiment Organization: The Regency MArCav regiment is a modified version of the Imperial unit shown on page 142 of **Striker II**. However, the regimental fire support battery is deleted, and each armored cavalry squadron had been given its own organic artillery battery with one section each of MRL and RDM artillery vehicles (see pages 36-39 of this book and **Striker II** page 141 for an example of such a balanced battery).

Unlike the line regiments, which are part of a fleet, each MArCav is permanently assigned its own assault squadron (SaultRon) with sufficient shipping to move and land the entire regiment in one lift. These assault squadrons are not part of any fleet structure, but are independent units which can be attached to any command as required. They are named and numbered as Independent Assault Squadrons (IndSaultRon) 1 to 6.

MArCav assignments are: 1st and 2nd in Spinward Marches, 3rd and 4th in Deneb, and 5th and 6th in Trojan Reach and Reft.

REGENCY ARMY UNITS

As with the Regency Marines above, the Regency Army maintains its ties to its Imperial Army antecedents by perpetuating units that date back to the antebellum period. These units keep their unusually high numbers from the huge Imperial rolls, while the low-numbered units are those raised by the Regency since the Collapse.

Note the lack of any armored or tank divisions. Regency Army doctrine dictates a combined arms organization above the brigade level. Cavalry and infantry divisions contain armored components at a level corresponding to their designations (i.e., orbital cavalry is more lavishly supplied with tanks than is lift cavalry; armored infantry has more tanks than lift or assault infantry units).

Terminology: A wide variety of cross-cutting unit descriptions have been used in the Regency and Imperial armed forces. Many are misleading or incomplete, and many are used in confusing and contradictory ways. For example, lift infantry is gravitic in nature, but can be either heavy or light, and a mechanized infantry unit is clearly heavy, but could be either ground or gravitic in nature. The decision to limit Regency Army units to TL14/15 has allowed it to simplify this confusing terminology, as all its units are automatically lift or grav units, and all its infantry units are automatically equipped with combat armor or battle dress.

However, this clarity is limited, because although the army designates all its units raised since the Collapse in accordance with this system, it allows its former Imperial units to retain their historical names, which often defy orderly categorization. Furthermore, this clarity is limited only to the Regency Army. The Regency's world, subsector and sector forces perpetuate a bewildering welter of contradictory and misleading terms.

Armored: This term is no longer used as a primary designator by Regency forces, having been replaced by "tank." Armored is still used by the RA as a modifier, as "armored infantry."

Armored Cavalry: A heavy cavalry unit, with no distinction between

Regency Military Units and Deployments

ground or gravitic equipment. This term is still used by the Regency Marine Corps where its gravitic nature is understood, but it has been replaced in the army by the term "orbital cavalry."

Armored Infantry: Current Regency Army term for infantry mounted in well-armored grav APCs, and not jump-trained. This term is also used by other services to distinguish infantry wearing combat armor or battle dress from units not so-equipped, as well as to distinguish troops (either with or without personal armor) mounted in armored, as opposed to thin-skinned, transport.

Assault Infantry: Jump troops. Assault infantry can be equipped to lift infantry or armored infantry standards, but it is their capacity for meteoric assaults that gives them their name.

Drop Troops: Jump troops. This term is not a Regency Army term.

Grav Infantry: No longer used by the Regency Army, having been replaced by "lift infantry" and "armored infantry." Where still in use, the term can refer to grav belt-equipped infantry or infantry in grav APCs. In some usage, however, grav infantry refers to heavy infantry (equivalent to "armored infantry") as opposed to light infantry (i.e., "lift infantry.")

Grav Tank: Unit equipped with gravitic tanks. This term is redundant in the all-grav Regency Army, so the term has been replaced by simply "tank."

Jump Troops: Infantry trained for individual meteoric assault from orbit to the planetary surface. Now officially known in the Regency Army as "assault infantry."

Lift Cavalry: A cavalry unit mounted in gravitic vehicles. However, the term makes no distinction between light and heavy cavalry. In current Regency Army usage, the term refers specifically to light cavalry. Such units are small, such as battalion scout platoons or the divisional cavalry squadron in a lift infantry divisions. The term is no longer used in the Regency Army for large units, having been replaced by "orbital cavalry."

Lift Infantry: In general usage, an infantry unit equipped with gravitic vehicles. In current Regency Army usage, this specifically means light grav infantry without heavy APCs.

Mechanized Infantry: Infantry mounted in armored vehicles. It is no longer used for grav units, but is reserved for units equipped with ground vehicles. Hence the term has disappeared from use in the purely TL14/15 Regency Army.

Orbital Cavalry (OrCav): The new term used by the Regency Army for "armored cavalry." Note that the organization of these units is virtually identical to the Regency Marine armored cavalry (MArCav) units above, although they use army instead of marine equipment. The term emphasizes the unit's high mobility and ability to operate from the "high ground" of close orbit to rapidly descend to any point on the world's surface.

Tank: In the Regency Army, a unit equipped with gravitic tanks.

Organization: Regency assault and lift infantry units are organized along the lines of the Imperial Guard jump infantry regiment shown on page 139 of **Striker II**. Regency tank units are organized along the lines of the Household Cavalry Regiment (page 140, **Striker II**), except tank platoons contain only four tanks instead of five. Armored infantry organizations are organized like tank regiments but with the proportion of tank and infantry battalions reversed. As discussed above, OrCav regiments are set up like the MArCav regiment in **Striker II**, but with the modifications as discussed in the marine section above.

THE DUKE OF REGINA'S OWN HUSCARLES (4518TH LIFT INFANTRY)

Although the Regina ducal seat no longer exists, the Huscarles retain their historical name and are under the nominal control of Regent Caranda, a direct descendant of the last Duke of Regina. In the antebellum period, the Huscarles, officially the 4518th Lift Infantry Regiment on the Imperial rolls, consisted of six battalions, three of lift infantry, two of lift cavalry and one of jump troops (see **Striker II**, page 141).

Since then, an additional two battalions have been raised, the 7th and 8th-4518th, and the lift infantry and jump troop organizations have been merged. Now the Huscarles' infantry battalions are all identical: All are fully jump trained, but all are also supplied with grav APCs so they can perform in either the assault role or armored infantry role when called upon. In addition, the lift cavalry squadrons have been reorganized as "orbital cavalry" following the new MArCav organization discussed above.

The 4518th is no longer thought of as a single deployable unit, but rather a parent formation of battalions and support units which are deployed separately. To this end, the regimental support units have been beefed up. The regimental artillery battery has been expanded to a battalion containing two mixed MRL-RDM batteries and two meson batteries. The Huscarles' new organization is therefore five lift infantry battalions (1st, 2nd, 4th, 6th and 7th), three OrCav (3rd, 5th and 8th), and one artillery battalion ("Regina Thunder," unnumbered).

Although the unit had not been part of the Imperial Army, with the dissolution of direct noble rule, the Huscarles were taken over by the Regency Army, but have retained their mission of defending Spinward Marches sector. Three of its battalions are currently deployed in the Sword Worlds subsector as occupation/peacekeeping forces: the 1st on Joyeuse, the 3rd on Gram, and the 6th on Sacnoth (see **Regency Sourcebook**, page 45).

It is equipped with TL15 Imperial Army equipment and uses the Norris battle tank, appropriately enough.

FORMER IMPERIAL UNITS

The Regency Army includes a large number of Imperial Army units that simply turned into Regency Army units in 1132 (see **Regency Sourcebook**). Many of these units have illustrious histories in the Frontier Wars or the Civil War era.

The following is a selection of several former Imperial units with the current designations, tech level of equipment, notes on specific equipment (where applicable), current location and duties.

317th Aero-Mech Brigade (OrCav): TL15, Norris Battle Tanks, Efate (Spinward Marches 1705), reaction force.

2012th Lift Cavalry Division (OrCav): TL15, Heavy Tanks, Esalin (Spinward Marches 1004), ceremonial/garrison.

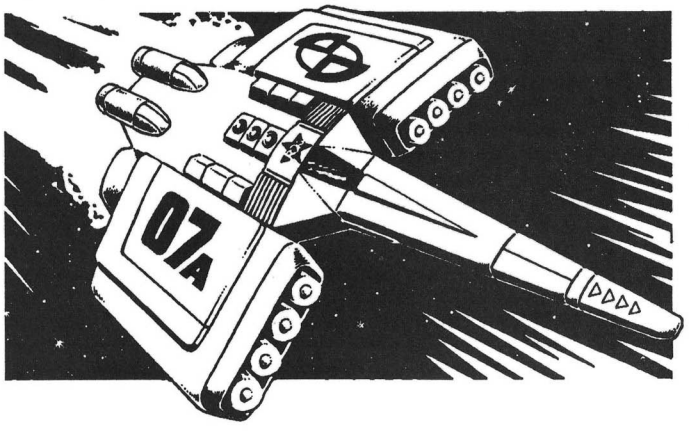
616th Grav Tank Regiment: TL15, Heavy Tanks, Mora (Spinward Marches 3124), garrison.

The Regency Starship Guide



This ain't the Wilds, this is the Regency.

And these ain't no family-owned rustbucket free traders, held together with gum and spit for four generations.

This is tech level 15 hardware, the way the Emperor used to make it. It moves fast, and it hits hard.

Regency ships might be old, hard-used, and scarred by combat, but they're not rusty, and you won't find any gum. They've been held together for 85 years by the best technicians and tech-15 and -16 shipyards humanity has to offer. Not by spit.

In the Regency, they do things a little bit differently. They don't have a different turret in each socket, based on whatever they could scrape together. Regency warships are fitted with batteries of unmanned 210-Megajoule laser turrets, all remotely controlled by top-of-the-line master fire directors, because when Virus is banging at the gate, second-best just won't pay the bills. New turret, barbette, and MFD designs are the norm in the Regency, because every ship and every life counts when you're manning the barricades of civilization.

Fer-de-Lance DEs, Pocket Carriers, Fleet Escorts, Quarantine Cutters, updated Patrol Cruisers, Close Escorts, SDBs, and Missile Corvettes, Xboats, Xboat Tenders, you name it, they're all here.

Because somebody has to defend civilization, and it might as well be you.

Sword and Shield

For centuries, the mighty Third Imperium was defended by the most powerful, sophisticated fighting vehicles ever created by humanity. These vehicles of the Imperial Army and Marines provided security and reassurance as humanity expanded to bring life to the stars, and defended them when those stars instead returned death. The Third Imperium did not win all of its wars, but it did grow to become the largest interstellar society ever known, through the ingenuity of its explorers and builders, and the courage of its soldiers.

And then, tragically, the people of the Imperium turned these most powerful weapons onto each other, destroying all that they had together built over a millennium of progress. When the irresistible force of Imperial attack met the immovable object of Imperial defense, the shock rocked the galaxy, and all that this great society had once been, all that it still had promised, all was gone.

Except for one last spark of hope.

The Regency

All was gone of the Imperium except for one isolated outpost, a frontier backwater called "The Marches," barely one-tenth the size of the Imperium. Facing their destruction, these people resolved to carry on the promise of the dead Imperium and preserve its heritage for the future.

Here, in the new Regency, Imperial armed forces did not fight each other, because humanity, finally aware of its fragility, faced the darkness around it with unity, and the might of the former Imperial armed forces rallied to the banner of the Regency. Once again, the most powerful destructive forces of humanity were pledged to its protection, not its destruction.

Now, for the first time in the history of **Traveller**, a single book, the **Regency Combat Vehicle Guide**, presents the primary combat vehicles of the Regency's "Thunderbolt," its planetary armed forces and its two main branches: the "Sword" of the Regency Marines and the "Shield" of the Army.

The Sword

The sword, or more properly, the *cutlass* of the highly trained Marine assault forces is wielded by pure TL-15 forces equipped with such vehicles as the legendary Imperial Marine Grav APC, Imperial Marine Fire Support APC, Imperial Marine Assault Gun, the Norris Battle Tank, and the Imperial Meson Artillery Vehicle.

The Shield

The Army's forces provide the major mass of Regency militar power, and are expressed by such vehicles as the TL-15 Imperia APC and its Fire Support, Command, and Fire Direction Cente variants, the TL-15 Heavy Grav Tank, the TL-14 Trepida grav tan family, and a variety of support units, including th Imperial Artiller Vehicles, Point Defense APCs, Nuclear Damper Carriers, Gra Sled, and Imperial Recovery Vehicle.

Wield the Thunderbolt

If you've been a **Traveller** military fanatic for years, locked in your basement with **Striker** while your family desperately bangs on the door, or if you are a relative newcomer, locked in your basement with **Striker II**, this is the book you've been waiting for. Even if you're not a miniatures player, but simply like to let your mind soar through the future with **Traveller**'s carefully detailed and visualized high-tech military forces, the **Regency Combat Vehicle Guide** provides extensive hardware detail ready for use in your **Traveller** campaign, and plenty of grist for your unbounded imagination.

- 32 TL-14 and 15 combat vehicles and variants in all, with 22 illustrations by Kirk Wescom, Traveller's premier technology illustrator.
- Details of 40 Regency Marine and 19 Army units with their locations and duties.
- Each vehicle entry discusses the Imperial and Regency military doctrine that made it what it is, and gives insights into the nature and principles of TL-15 combat operations.
