Finally, Ward makes a pretty good villain for a party of Chinese martial artists. Making him evil requires little more than a shift in emphasis. After all, he really was making a fortune out of China's most bloody civil war. Downplay his concern for the Chinese people and make his marriage to Chang-mei either a simple matter of political scheming, or else a temporary liason which Ward intends to abandon as soon as he can build up a fortune and return to America. For a completely over-the-top bad guy, make Ward a megalomaniac planning to take over China as the first step to conquering the world! Can a band of martial-arts masters beat the "Imitation Foreign Devils" of Ward's army and preserve China for the Mandate of Heaven?

Other GURPS Settings

operative.

Ward's background in Salem points to a possible connection with the Anglo-American "Insiders," Masons and their Bavarian Illuminati masters, or Gnomes of Zurich-style business interests -- any one of which would profit by keeping China unstable and ripe for plundering. On the other side, given Ward's opposition to both European colonialists and the corrupt Manchu rulers, he might be trying to liberate China on behalf of the benevolent masters of Shangri-La or the anarchist precursors of the Discordian Society.

Going into battle against the mystical Taiping rebels might serve the interests of a magical conspiracy group like the Cabal or the Adepts of Hermes. It might also serve the interests of the cult of Cthulhu: Salem is not far from Lovecraft's Innsmouth.

Finally, there's the matter of Ward's appearance. Small, unusually strong, almost emotionless, and with eyes of a color no one can describe -- is Ward an alien in disguise? Only the Secret UFO Masters know for sure.

The Ever-Victorious Army

Ward's force at its peak numbers 4,000 men, making it more of a brigade than a corps. The troops are all Chinese or Filipino, armed with Colt revolvers and Sharps rifles and trained in European-style drill and tactics. They wear green tunics and turbans. In game terms, they are Average TL5

GURPS Black Ops

The Taiping Rebellion has Grey plot written all over it. By the time the Company's Black Riders (see Ken Hite's "Shades of Black: Alternate Black Ops") learns the truth, it's too big to stop covertly. So instead they send in a top agent to fight fire with fire. Sure, Fred Ward's just one Black Op, but there's only one Taiping Rebellion, isn't there?

troops, which makes them a highly formidable unit when faced with the Green and Raw TL4 Taiping armies. The Ever-Victorious Army is supported by a large artillery battery equipped with a varied mix of field guns, howitzers, and cannon.

GURPS Castle Falkenstein

With hardly any changes other than letting him live into the 1870s, Frederick Townsend Ward would make an excellent member of the Second Compact. His tolerant nature and knowledge of the Far East nicely complement Sir Richard Burton's expertise on India and the Muslim world. For an interesting melodramatic twist, "Frederick Townsend Ward" might have been the nom de guerre of a well-known 1870s character -- Phileas Fogg, Auberon, Captain Nemo, or King Ludwig himself!

GURPS Traveller

Switch Ward's military skills for TL12 abilities like grav tank piloting, fusion gunner, or Battle Dress, and he could be a mercenary commander defending the Imperial starport on a planet torn by civil war. Or leave his skills as they are and make him a specialist in early-TL5 warfare operating on a low-tech world.

ST 13 [30], **DX** 12 [20], **IQ** 12 [20], **HT** 12 [20]. Move 6.

Advantages: Imperturbable [10], Military Rank 7 [30], Patron (Yang Fang, a Chinese banker) [10], Status 3 (free from Wealth and Military Rank) [0], Voice [5], Wealth (Wealthy) [20].

Disadvantages: Dependent (his wife Chang-mei) [-24], Reputation (headstrong foreign adventurer, among Chinese officials and Shanghai colonial leaders, -2 reaction, all the time) [-3], Sense of Duty (to his troops) [-5], Social Stigma (white devil barbarian) [-15].

Quirks: Broad-minded, Has no respect for authority, Leads from the front, Suspicious of British [-4].

Skills: Area Knowledge-13 (Yangtze delta region) [2], Area Knowledge-13 (World) [1], Black Powder Weapons-15 (Colt Dragoon revolver) [2], Boating-12 [2], Brawling-12 [1], Diplomacy-12 [4], First Aid-11 [1/2], Gunner-12 (Muzzle-loading cannon) [2], Leadership-14 [6], Merchant-12 [2], Navigation-12 [3 1/2], Riding-10 [1/2], Savoir-Faire-12 [1], Seamanship-14 [4], Strategy-14 (land) [8], Swimming-12 [1], Tactics-14 [8].

Languages: English (native), French-11 [1], Spanish-11 [1], Canton Chinese-9 [1/2]

Equipment: In battle, Ward typically carries nothing more formidable than a rattan cane as a mark of authority. If he did need a weapon, it would probably be a Colt revolver or Sharps rifle. He wears a plain blue military-style coat with no insignia. For his wedding, and at formal occasions among Chinese officials, Ward wears a mandarin's clothing including a peacock feather as badge of rank.

This is Ward shortly before his death. Before late 1861 he has no Dependent. His Wealth is Struggling in 1859, Average in 1860, and Comfortable in 1861. Ward's Military Rank starts out as 4 in 1860 when his mercenary force is established, increasing as the force grows in size. His social advantages and disadvantages reflect his position in Chinese society -- a barbarian outsider who has nevertheless achieved high position. Note that Ward does not have a Duty to China -- though technically under the orders of the provincial governor, in practice he makes his own strategy and ignores instructions.

Ward never did learn much Chinese. His skill level is the minimum possible, and he probably can't read the language at all. All his skills are TL5.

To make Ward even more cinematic than he was in real life, give him the Hard to Kill advantage (he was wounded in battle more than 15 times), Daredevil, or Toughness.

Point total: 165

A Plague of Diseases

for the *d20 System*

by Daniel Gent

With the advent of SARS, and all the precautions governments and medical personnel are putting into place to help prevent the spread of this flu-like virus, one can not help but wonder how would such a disease or virus plague your campaign world.

Both the *d20 System* and *d20 Modern* touch on the concept of diseases, how they spread, and the damage they can do. In this article we hope to introduce you to several new diseases you may or may not have heard of. The following describes the profile of a deadly disease.

Locales: Climate the location is commonly found in.

Incubation Period: Period of time in which the disease is in the body, the carrier is not infectious nor do they take damage from the disease. Incubation periods may actually vary depending on your constitution score.

Infectious Period: Period of time when the person can spread the disease by close contact or bodily secretions. This is always after the incubation period.

Transference: How the disease may end up infecting a group of people or your character.

Initial DC: Difficulty Class for the saving throw, the character must succeed the saving throw in order to avoid any effects of the disease.

Initial Damage: Damage taken after the Initial DC is failed.

Secondary DC: Difficulty Class for a repeated saving throw, the character must succeed in hopes of ever recovering from the deadly contagion. If the DC increases or decreases over time, it is indicated. This may be a daily check or a weekly check.

Secondary Damage: Damage taken after each failure of the Daily DC.

Symptoms: A list of those tell-tale signs that you have been infected.

Recuperation: The recuperation is how the body may heal all or some of the damage done by disease.

Chagas Disease

Locales: Warm climates

Incubation Period: Constitution less than 11, 7 to 14 days; Constitution equal to or greater than 11, 10 to 20 years

Infectious Period: After 7-14 days, regardless of Constitution score.

Transference: Initially passed from insect feces entering the body. Contact with infected blood.

Initial DC: 12

Initial Damage: The victim suffers 2 hit points of subdual damage from the swollen wound area.

Secondary DC: 10, increases by 2 points for every year of infliction; weekly until cured or the creature dies.

Secondary Damage: loss of 1 Con point, until cured or the victim dies.

Symptoms: Enlarged heart, cardiac problems, enlarged digestive tract, problems swallowing.

Recuperation: Once the disease is removed, the creature regains half of the constitution points lost, at the normal rate of recovery. The rest are permanently lost.

Dengue Fever

Locales: Tropical Climates

Incubation Period: 7 days

Infectious Period: Any point after 7 days

Transference: Bitten by an infected mosquito. Contact with infected blood.

Initial DC: 15

Initial Damage: After incubation the creature loses 2 points of Strength.

Secondary DC: 10; daily until cured or the creature dies.

Secondary Damage: After each failed save the creature loses 1 point of Constitution and Strength. One point of Intelligence is lost after 2 failed saves.

Symptoms: high fever, headache, nausea, vomiting, rash, weakness. External bleeding and internal bleeding is seen in some.

Recuperation: The creature regains 1 point of Strength and Constitution every week thereafter. The creature regains all Intelligence points lost at a normal rate of recovery, except has permanently lost 1 point of Intelligence.

Ebola

Locales: Tropical Climates

Incubation Period: 2 to 21 days

Infectious Period: Any point after 2 days.

Transference: Contact with infected blood.

Initial DC: 30

Initial Damage: loss of 1 Con, Str, and Cha

Secondary DC: 30; decreases daily by 1 point; a daily DC check is required to avoid the secondary damage

Secondary Damage: loss of 1 Con, Str, Wis, and Cha, plus 2d6 points of damage from bleeding wounds, until the Secondary DC is down to 10, or until the victim is dead; once the DC reaches 10 the disease is no longer active

Symptoms: Fever, headache, joint and muscle aches, weakness, diarrhea, vomiting, stomach pain. Internal and external bleeding is seen in some.

Recuperation: The body begins to recuperate normally after the disease has left the body. The initial damage is not recouped.

Leprosy

Locales: Warm and Tropical climates

Incubation Period: 7 to 14 days

Infectious Period: anytime after incubation

Transference: Close contact with infected person.

Initial DC: 20

Initial Damage: loss of 1 Str and 2 Cha points

Secondary DC: 14; daily until the creature is cured or dies.

Secondary Damage: loss of 1 Str and 1 Cha points; after 5 failed DC checks blindness or loss of member occurs

Symptoms: skin lesions, plaques, thickened skin, and nasal congestion; severe symptoms include blindness, loss of flesh and limbs (i.e., nose, ear, fingers, etc.)

Recuperation: Regain all lost abilities at a normal rate of recovery except initial damage. Loss limbs are not restored unless magical regeneration is performed.

Madcow Disease

Locales: Anywhere

Incubation Period: Constitution less than 11, 6 months to 5 years; Constitution equal to or greater than 11, 5 to 20 years

Infectious Period: None

Transference: Eating infected meat, often from a hooved animal (i.e. cow, deer, etc.)

Initial DC: 15

Initial Damage: 1 point loss of Wis

Secondary DC: 15; weekly check until the creature is cured or dies

Secondary Damage: loss of 1 point Wis, Int, Cha

Symptoms: Dementia

Recuperation: Regain all lost points, except for initial damage

Malaria

Locales: Tropical

Incubation Period: 7 to 9 days

Infectious Period: after incubation period

Transference: Bitten by infected mosquito; blood transference

Initial DC: 15

Initial Damage: 1 point loss of Con.

Secondary DC: 15; daily check until the creature is cured or dies

Secondary Damage: 1 point of Con, and Str; 4 points of subdual damage

Symptoms: vomiting, chills, headache, tiredness, nausea, seizures, confusion

Recuperation: Regain all lost ability points at a normal rate of recovery, except initial damage.

Spotted Fever

Locales: Temperate; Urban centres

Incubation Period: 5 to 7 days

Infectious Period: Non-infectious

Transference: Bitten by ticks

Initial DC: 15

Initial Damage: 1 point loss of Str

Secondary DC: 18/weekly; weekly decrease of 1 point until the creature dies or the DC reaches 10

Secondary Damage: 1 point of Str, Con and Cha

Symptoms: severe black rash, fever, headache

Recuperation: Regain all lost ability points at a normal rate of recovery, except 1 Charisma point.

Typhoid Fever

Locales: Developing urban centres

Incubation Period: 2 to 3 days

Infectious Period: after 3 days

Transference: contaminated drinking water and consuming food handled by an infected person

Initial DC: 20

Initial Damage: loss of 1 Con.

Secondary DC: 20/daily; decreases daily by 1 until the creature is dead or it reaches 10

Secondary Damage: loss of 1 Con and Str, 2 points subdual damage

Symptoms: Fever, chills, lose of appetite, spotted red skin rash, stomach pains

Recuperation: Regain all lost ability points at a normal rate of recovery

Disease Carriers

One way of introducing a new plague into any campaign world is through a disease carrier. Disease carriers are at times shunned by others they are lonely and seek to belong. They may be vengeful souls lashing out at the world the only way they know how, by infecting others with their burdens.

Some of your villains may be disease carriers and purposely attempt to infect others. These villains need not be powerful archetypes, but may be confused and angry people, commoners, people your characters come in contact with regularly, barmaids, teachers, equipment suppliers, retailers, fishmongers, etc.

One such famous disease carrier is Mary Mallon, better known as Typhoid Mary. Mary was born in 1870 in Ireland and later lived in New York City. She was notorious as she was a typhoid carrier and yet continued to work as a cook, by the time of her death she had infected 51 people, three of which died. Mary was shunned by many and it is believed that she was mentally unstable.

Typhoid Mary

Human Female 3rd level commoner; CR 1; Medium human; HD 3d4; 9 hp; Init +0; Speed 30ft.; AC 10; Attacks: by weapon -1 melee; Damage: by weapon -1; Face/Reach: 5 ft. by 5 ft./ 5 ft.; Special Qualities: Typhoid fever disease carrier; Saves: Fort +0, Ref +0, Will +0; Abilities: Str 8, Dex 10, Con 10, Int 10, Wis 11, Cha 10

Skills: Craft (cooking) +6, Knowledge (cooking) +2, Listen +2, Profession (cook) +4, Search +2, Spot +2,

Typhoid Fever Carrier (Ex): Mary is a carrier of typhoid fever. She is immune to the disease and anyone who comes in contact with her prepared meals must make a Fort save (DC 20) or suffer 1 loss of Constitution ability point, a daily save (DC 20) is required, which decreases by one point daily until the save reaches 10 or the creature is dead. Each day the save fails the creature loses an point in Strength and Constitution and takes 2 points of subdual damage.

Pyramid Review

Crimson Skies: Collectible Miniatures Game

Published by [WizKids](#)

Rules Pack: \$7.95

Aces Pack: \$15.95

Squadron Pack: \$15.95

As well as producing a trio of comics-based games using their Clix-based mechanics -- [Marvel HeroClix: Infinity Challenge](#), [DC HeroClix](#), and the forthcoming [Indy HeroClix](#) -- WizKids continues to delve into the magic box of old FASA developed intellectual properties. Having already advanced the **BattleTech** universe 50 years in [MechWarrior: Dark Age](#) and will be adding a customizable aspect to their forthcoming **Shadowrun: Duels** game, WizKids turn the clock back for their latest release, the **Crimson Skies: Collectible Miniatures Game**.

Based upon the [Crimson Skies](#) board game designed by Jordan Weisman and published in 1998, this is the game of dogfights and aerial dueling in the skies over the Shattered States, an alternate America of 1937. Weighed down by the effects of the Great Depression, the United States of America has splintered into some 20 rival and allied nations, such as the Confederation of Dixie, the pirate haven of Free Colorado, the political and economic powerhouse that is Empire State and her cultural rival, the Nation of Hollywood, the militant, stridently anti-bootlegging Lakota Territory, the fundamentalist Christian People's Collective, and (of course) the Republic of Texas. Torn by regionalist drives, both the intercontinental railways and the new highways were ripped up and disrupted, forcing both trade and travel into the air, ferried across the Shattered States by zeppelin. Of course, crime soon followed and aerial piracy became all too common, thus requiring the formation of state-sponsored aerial militias, privately funded security forces, and privateers operating under letters of marque! Always fascinated by the relatively new invention of the aeroplane, the media has made darlings of both pilots and their steeds, while the inventors and designers of 1937 continue building ever more exotic-looking machines in search of the perfect airborne thoroughbred. Of course, the media attention does nothing to cool the rivalries that form between pilots and militias, which in the hotheaded decade of the 1930s leads to some memorable dogfights.

Shot through with a pulp sensibility and peppered with a dash or two of Captain W. E. Johns' Squadron Leader James Bigglesworth, the **Crimson Skies: Collectible Miniatures Game** has the players take command of some of best air militias and most notorious aces to have them fly the unfriendly skies, go toe-to-toe and duke it to see who is top dog in the "Air Action Game." In addition, the **Crimson Skies: Collectible Miniatures Game** lets these aces face each other on the ground in a game of brawn, bullets, and brains in the "Aces Game."

The initial release for the **Crimson Skies** almost follows that of other click-base games in which a Starter Set is bought, followed by Booster Packs that add further figures. With **Crimson Skies**, the first purchase is the rules box, titled the "Blake Aviation Security Mission Briefing -- Rules for Air and Ground Engagement." This contains everything a player will need to play, except for both plane and figure models. The former come packaged in blister packs known as "Squadron Packs" containing four from a particular unit, which in the initial release are the rival militias the Broadway Bombers from Empire State and the Hollywood Knights of the Nation of Hollywood. Future Squadron Pack releases will include the piratical Fortune Hunters and the infamous Red Skull Legion. The figure models are similarly packaged, but are known as Aces Packs, with the first being "Aces Pack #1: East Meets West." This contains a figure each for Loyle "Show-Stopper" Crawford of the Broadway Bombers and Charlotte "Charlie" Steele of the Hollywood Knights, as well as their individual planes.

The rule box, which is designed to look like a leather satchel, contains the following:

- A 64-page double cover rulebook
- Two 30"-by-19.5" map sheets, together forming a large color map of an aerodrome on one side and blank on the other, all marked out in 1.5" squares
- A four-page full color Air Combat Quick Start Rules pamphlet
- An Aces Talents And Abilities Card for the Aces Game
- A Skills & Equipment Card for the Air Action Game
- A set of six six-sided dice
- Two envelopes, each containing a set of 12 Navigation Cards
- A large envelope containing 24 black-and-white Movement Markers for the Air Action Game and 48 Characters Tokens for Aces Game

The production values for all of this and the models are quite high. The modeling of the characters and the airplanes is nicely detailed, though the painting is perhaps a little splodgy in places, especially on the characters, which can make them look rather goggle-eyed. Another problem occurs with the gun barrels on the planes, some of which are bent. This is not helped by the difficulty of actually getting any of the planes out the packaging, which is a lot sturdier than in other Clix-based games and consequently holds the models in a lot more securely. A nice touch is that of the envelopes containing the Navigation Cards, the various tokens, and also the rule box itself, which are all fastened by string ties and help enhance the period feel of the game.

Both sides of the rulebook open with a full-color comic, one for the Aces Games and the other for the Air Action Game, the latter written by Michael Stackpole and both drawn by Ryan Benjamin. Combined with background culled from previous **Crimson Skies** games, they help the reader get a feel for the setting, both on the ground and in the air. Once past the comic though, the rest of the rulebook is done in black and white, which is a shame as much of the background material works much, much better in full color. This is particularly so with the photo-realistic depictions of the airplanes and much of their presence is lost by being in black and white. Fortunately the rules are very clearly written, with just seven pages detailing the Air Action Game and just less than that for the Aces Game.

Both decks of the Navigation Cards details eight different maneuvers -- Cruise (straight ahead), Glide (a gentle slip to the right or left), Turn, Tight Turn, Snap Roll, Side-Slip, Wingover and Half Loop (which brings the plane around to face in the opposite direction). Each maneuver has a Speed Rating, which is the minimum speed at which a plane must be traveling before it can be attempted. Some maneuvers can be performed at any speed -- a Tight Turn or Glide for example, while a Wingover requires a Speed of four or over, and a Snap Roll needs a minimum of three. Whenever an Ace's plane is in play, they can add an extra Navigation Card to the basic deck. For example, **Aces Pack #1** comes with Charlotte Steel's signature "Follow Me" move which enables her wingman to duplicate her maneuver exactly, while Loyle Crawford can perform a "Hammerhead Turn," which is a short, sharp turn to the left or right.

As with other Clix games, the statistics for each model are recorded on its base. For the aircraft they include the plane's name, its Collector's Number in the set, Squadron Symbol, Point Value (used to determine cost when creating a squadron up to an agreed Build Total), pilot's name, and seven combat values. Three of these do not change -- Silhouette (how difficult a target is to hit, the higher the better), plus the Front and Rear Gunnery Ranges -- while the other four do change. These are Maximum Speed plus the Front Gunnery, Rear Gunnery and Piloting Skills, all of which are read through the L-shaped window on the plane's base. Beside this window is a spindle much like the Heat Dial in **MechWarrior: Dark Age** on the various 'mech figures; here in **Crimson Skies** it is used to regulate a plane's speed and its effect upon gunnery skill. It is known as the Speed Dial.

The Air Action game begins with everyone creating a squadron and facing off against each other. In the initial release this consists of four planes per side, or five if the Aces are involved. The Broadway Bombers get two Grumman E-1C Avenger interceptors, and two Fairchild F6II attack aircraft, while the Hollywood Knights start with a pair of the under-armed but fast and nimble Hughes Aviation Bloodhawks and another of the multi-role, more heavily armed Ravenscroft Coyotes. The presence of Loyle Crawford adds another Avenger, while Charlotte Steele adds another Bloodhawk.

Each turn consists of players rolling for initiative to determine who will be the aggressor and get to act first. Speed is set for each plane, with pilots able to throttle up or down just a single click or turn of the Speed Dial. Speed

determines the maneuvers available for that aircraft, and while it is possible to fly faster than the current maximum speed allowed by redlining the engine, a piloting check is needed to prevent the plane from taking a click of damage. Likewise, a successful piloting check -- rolling equal to or greater than the pilot's skill on two dice -- can let them throttle up or down two clicks of the Speed Dial.

A Navigation Card is chosen and laid down beside each plane, to be revealed as the combatants move in order of their Speed, from fastest to slowest. The actual maneuver is plotted out using the Movement Markers as depicted on the Navigation Cards. Each Movement Marker is a piece of octagonal white card marked with a single black arrow. The plane then moves along the laid out cards, but only as far as their Speed Rating allows -- the black arrows of the Movement Markers shown on the Navigation Cards are marked with numbers. This indicates how far a plane can get into that maneuver at its current speed.

Once movement has been conducted (including resolving potential collisions), combat can occur. If a target is in range, measured out again by using the Movement Marks, then they can blast away! Some aircraft come with tail-mounted gun turrets, so they can shoot out of both their front and rear arcs. For each point of gunnery skill, a player rolls a single die, hoping to gain results equal to or greater than a target's silhouette, in which case a click of damage is inflicted. Once an aeroplane has been clicked down so that three bullet holes are visible in the L-shaped window, it is knocked out of the sky. The pilot still has the opportunity to bail out of their aircraft as it goes down.

The **Aces Game** centers on the character figures and the character Tokens, with the figures being like WizKids' other Clix-based figures in that they withstand no little punishment, while the Tokens can only take a single click of damage before being knocked out of the game. On the base of the characters -- such as Loyale Crawford and Charlotte Steele -- are marked their Point Value, Squadron Symbol, and Collector's Number, none of which change during the game, while those for their Speed, Attack, Defense, and Fate ratings do change as the characters take damage. Marked with the symbol of a four-leafed clover, Fate can be used to save a character's skin or improve their accuracy and damage, but either use comes at a cost -- a click's worth of damage. Like the other values Fate fluctuates as a character takes blows and bullets. Character Tokens do not possess Fate, but do have "Talents and Abilities" just as the characters do and are likewise keyed to their Speed, Attack, and Defense values. Once the players have recruited their team -- the character figures are more costly than the Tokens -- they are ready to go. The Aces Game plays fast and teams will find themselves going through the Tokens fairly quickly in comparison to the more durable figures.

The presence of the Aces also has an impact upon the Air Action Game. Once in their planes, they have as much Fate in the air as they do on the ground, and it works in exactly the same way as in the Aces Game -- in combat and also in avoiding collisions. If an Ace gets his aircraft close enough to an opponent, they can attempt a "Daring Feat," which can range from inflicting a click of damage through small arms fire through distracting an enemy pilot such that his next Navigation Card must be drawn at random, to the prestigious deed of stepping lively from wing to wing to force the bail out of the opposing pilot and thus commandeer their plane.

The **Air Action Game** can be played as a campaign, with pilots gaining experience for shooting down other planes, successfully bailing out, winning a game, and performing Daring Feats. The points go toward attaining ace status, though what effect this has on the game is never made absolutely clear (except that is, for increasing the cost of a plane or character during the purchase phase of both games). Someone will also need to note such changes down . . .

So what of the **Air Action Game** in play? It is easy to set up and play, and despite the lack of rules to regulate aircraft height (which would really only complicate the game), does capture the feel of the aerial dogfight. Maintaining and controlling a plane's Speed Rating through the Speed Dial is the key to the game as they make diving and sweeping passes, cannons and guns blazing, and rockets blasting. The effect of the Movement Markers is to make manoeuvring easy to plan and control, though it becomes more difficult as a plane takes damage.

One problem with the basic game is that with just eight planes in play, four from each squadron, the number of Movement Markers is perhaps a little tight. This gets more difficult when the other two planes from the **Aces Pack** are included in a game. This is only a relatively minor problem that can be rectified by the purchase of another Rules Pack.

The major problem with the **Crimson Skies: Collectible Miniatures Game** is the lack of support beyond the basic

game. Although scenarios and the like are promised from the publisher's website, there are currently none yet available and their omission from the **Rules Pack** is a disservice to the purchaser, who still has to pay for the comparatively more expensive miniatures. So at this stage, players can only set up the two squadrons or teams for the **Aces Games** and shoot each other down.

Another potential difficulty is the release of Squadron Packs that are very much tied into the **Crimson Skies** setting; with every pilot named, there is little room for the players to imprint their personalities and adventures upon the setting. In other words, the **Crimson Skies: Collectible Miniatures Game** leaves out one of the key attractions to FASA's versions of both **Crimson Skies** and **BattleTech** -- roleplaying. They did, however, retain it with **Mechwarrior: Dark Ages**. Perhaps WizKids will rectify this with some more generic miniatures and figures so that this can be addressed and also provide a wider range of opponents.

Just as it would have been nice to have had a book of scenarios in the Rules Pack for both the Aces and Air Action Games, it would have been pleasing if the rulebook had been done in full color throughout and on the same paper stock. It is also a shame that no map of a zeppelin is included for the **Aces Game**, or even a template for the **Air Action Game**.

These complaints aside, the **Crimson Skies: Collectible Miniatures Game** is a very nicely appointed, well-done and playable re-interpretation of FASA's original **Crimson Skies**. At this stage it does veer toward the beer 'n' pretzels type of game. This is not necessarily a bad thing, but hopefully WizKids will add some more generic miniatures that will help give their **Crimson Skies: Collectible Miniatures Game** the depth worthy of the setting.

--Matthew Pook

Pyramid Review

Dante's Inferno

Published by [Twilight Creations, Inc.](#)

Game concept & Design by Kerry Breitenstein and Todd A. Breitenstein

Art by Dave Aikins

Layout, design by Todd A. Breitenstein and Kerry Breitenstein

\$29.99; boxed set; 81 colored board tiles; 21 demon figures, including Lucifer; 36 player figures in 6 colors; two six-sided dice; 28 counter markers; 6 full-color resource tracks; 8-page full-color rulebook; for 2-6 players

Twilight Creations, Inc. is going back to the well for their latest board game, *Dante's Inferno*. Not only does it use that epic work of literature as the loose basis for the action in the game, there are parts that feel a bit like Twilight's other games and mechanics that were heavily inspired by the popular *Settlers of Catan* lines.

The object of the game is to be the first player to reach the ninth circle of Hell and defeat Lucifer. The board is made out of 81 tiles, each forming the circles of the underworld (technically, they're squares here). The board is nine tiles on a side on the outside, with two levels of hell per tile. The next tier is seven squares on a side, and they taper down to the single tile in the center where Lucifer rules.

Everyone starts with three of his playing pieces on the first circle. The tiles come in four colors (not counting the black corner squares), and they all have two numbers printed on them. Once a player dispatches any demons hanging about, he rolls for resources with the two six-sided dice. Resources are the sinners you liberate from hell. If either number on your tile(s) comes up on the dice, you get one point of the color-coded resource. Red squares, for example, give you one point of the red resource Violence. Rolling doubles gives you an added resource of your choice, and if you roll a 2 or 12 you can place the "good" or "bad" counter. "Bad" stops a tile from producing resources, while the "good" counter makes that tile pay off double for anyone standing on it.

While everyone receives resources on the die rolls, only the active player may trade Violence, Gluttony, Lust, and Hypocrisy points with the other travelers or spend them on actions. Different resource combinations allow you to bring more of your travelers onto the board; give extra movement to your playing pieces or move them to a deeper level of Hell; force an opponent's piece to move away; alter the roll of a die; flip a tile (preventing anyone from moving through it or getting resources from it); or buy a new tile. When the game begins, circles one and two are already built (corner spaces, where units move to the next level, cost nothing). But as you proceed, you must "build" your way toward Lucifer. Others can use the tiles you lay, so make sure you've got resources for movement or you may build it only to have opponents waltz in past you.

Going deeper has definite benefits aside from getting you closer to the winning conditions. You can only have one playing piece per tile per circle, so if all the choice spots are taken on circle one, you can go to the second circle and stand on those prime resource spots. If you go to the next layer of tiles (i.e., the tier with circles 3 and 4), the resource numbers tend to be a little more toward the extremes on the 2d6 curve, but when the number is rolled it's worth two of that resource. You get three of each on level 5/6, and four on level 7/8. Of course, the demons are tougher to fight as well.

A demon comes out every time someone gets a 7 on the resource roll. If you start a turn with a demon on your space, you have to fight it by rolling two dice and getting a 6 or better. Success sends it back to the aby . . . er, the box. Failure means the demon sets you back one circle, costing that counter some advancement. The demons get tougher the farther you get; on 3/4 it takes a 7+, and by the ninth circle you need a 10 or more to beat Lucifer.

The game components meet the usual high standards of Twilight Creations. The board tiles are keen little glimpses of Hell, like thumbnail sketches slightly reminiscent of a Hieronymus Bosch painting. The resource tracks and their counters are lightweights -- not that they're flimsy items, just that a good sneeze or a brush of the arm can easily sweep the information aside (which is bad since you're keeping track of four constantly changing resource totals . . .). Other than that, no problem. There are five different demon sculptures, each lovingly crafted to look sick and ugly, and an imposing Lucifer for your centerpiece. The playing pieces are also bold and look ready to dish out some demon beatings.

Only the first two steps of the turn sequence -- combat and resource rolls -- are set. Everything else can be performed in whatever order helps your strategy (for example, you can trade before you enter combat, or wait until afterwards to get back any critical vices you're low on). This makes it harder to remember the possibilities, and it's hard to be sure you've done all you want on your turn . . . and it's not all that clear to your opponent that you're finished, either.

Game play is a little more involved than Twilight Creations' ***Zombies!!!*** games; this one isn't as exciting, but then it's supposed to be more of a strategy game than a demon slaughter. The mechanics are simple enough, but there are twists aplenty that put a crimp in your plans . . . if you can remember to use them. The added resources as you progress through the circles is a good way to accelerate the game, and being able to change dice rolls with the right resource mix ensures the endgame won't get dragged out by a series of lousy dice results when you're up against the Author of All Lies. Even the demons are balanced well enough that they're a hindrance to your schemes and not a ruinous death knell.

A game takes about an hour, even with a full complement of players, and it's a nice combination of strategy, trading, and resource management. There are enough tactical considerations to keep play fresh and challenging, and to motivate repeat play. Although it freely borrows elements from both ***Settlers of Catan*** and some of Twilight Creations' own previous products, ***Dante's Inferno*** still has an enjoyable feel and style all its own.

--Andy Vetromile

A Game of Give and Take

I was talking with a friend last week about the best piece of writing advice I ever received while in college. This was a piece of advice I've found so useful, it's almost worth the \$20K albatross of student loans with which I shall no doubt go to that Great Con In The Sky. And, really, it applies to gaming as well, for both GMs and players. And it's advice I like so much, I spent a bunch of time in the archives trying to discern that, indeed, I haven't discussed it before. (And who knows . . . I may have. After 170+ columns anything is possible.) And the advice is:

No matter how close the tank is to the door, never shoplift lobsters in your pants.

Er, no . . . that's another column.

Anyway, the "five-years-of-college-in-a-nutshell" advice this:

Whenever two characters are interacting, each one wants something from the other. It is from this conflict and the interplay of these desires that the scene gets its tension.

Now, the interesting thing to note here is noting that "each wants something." We understand this on some level:

The hero is facing off against an orc in battle:

The hero thinks, "I want to kill this guy, and keep this guy from killing me."

The orc thinks, "I want to kill this guy, and keep this guy from killing me."

The hero is up against a merchant:

The hero thinks, "I've got to buy provisions from this guy, sell some old loot, and keep from getting ripped off."

The merchant thinks, "I'd like to make as much money off this guy as I can, keep from buying junk I won't be able to sell, and hopefully shoe him away so I can get to lunch."

Okay; so far, so good.

But "wants something" is a wide concept, and it flavors the entire context and atmosphere of the meeting. Let's take the scenario where the intrepid hero meets a beautiful princess . . . standard stuff. Consider the following scenarios:

The hero wants enough money from the princess to release his sister from indentured servitude.

The princess wants to improve her position in court, and having heroes run pointless errands for her will help her do so.

The hero wants to woo the beautiful princess.

The princess is looking for someone to cure her father's rare illness.

The hero is looking to uncover evidence of a shapeshifting imposter, and wants proof of the princess' guilt or innocence.

The princess wants to be left alone after a long day of dealing with minor courtly problems.

Despite the clichéd premise of the scene, each iteration will play out *very* differently from the others. And it's not just because of the individual desires, but the interplay between the two. Take the above three premises and mix-n-match each character's desires with a different opposing one; even assuming the same characters and personality types, the "hero seeks shapeshifter/princess wants solitude" scene would play out differently from "hero seeks shapeshifter/princess seeks cure."

Remember that "wants something" doesn't necessarily mean a selfish or materialistic desire. When a mother and son interact, the mother may want the child to be safe while the child may want the mother's love. Of course, the child may want candy instead, or to be left alone, while the mother may want the child to behave strictly, or to learn enough to

graduate the second grade. And it is possible - although rare - for desires to line up; usually there will be *some* incongruity between those desires, and it's possible for tension to arise from that difference. (Thus two lovers may wish to be with the other, but if they both want backrubs then it might be problematic . . . until they figure out to swap.)

So what does this mean? Well, for GMs, it's pretty straightforward. In the gaming world it's entirely common for characters to exist simply to serve the needs of the GM's plot and the desires of the PCs . . . but that shortchanges a living world. Instead, consider what the motivations of any NPCs the heroes encounter are. What do they want from the PCs? (In fact, it's entirely realistic for an NPC to want different things from different characters; he may want to be left alone by one, catch the eye of another, and learn more about the arcane pinky ring of the third.) Then, once you have a firm idea of what the NPC wants, figure out how he will try to get it out of the adventurers. (Again, not all NPCs need to be conniving backstabbing treacherous fiends; if a shopkeeper has the desire to "be left alone," one might accomplish this by giving the heroes exactly what they want, while another is as steadfastly uncooperative as possible, and a third is shopkeeper is entirely jovial but honest in telling the heroes to come back tomorrow.)

This advice is also good for players, especially in games of heavy PC-to-PC interaction or angsty campaigns. For example, I shared this theory with our two-player *Fading Suns* gaming group, and we realized something. One PC was committed to keeping my character safe (she had a duty as a bodyguard), while my PC saw her in a similar light as he saw everyone (including himself) -- as pawns that can be expended as need be for the greater good. Once we were aware of this, we were able to more fully play up the dramatic tension of those scenes; where her first inclination was to lock my character up at the first sign of dangerous evil, my character was equally tempted to push *her* into that first sign of dangerous evil (or myself . . . or both of us . . .). This realization allowed for greater tension, and more fun roleplaying within the group itself.

So in any game - even those with long-running PC interactions (or perhaps *especially* those long-running games) - take a step back and ponder those relationships with other player characters and important NPCs. What does your character want from his meeting with the emperor? What does he hope to get from his continuing relationship with his aged mentor?

Not every character needs to have novel-length documentation of their motivating forces behind them, but recognizing that the interplay of characters can boil down to competing desires goes a long way toward making even the most common interesting, dramatic, and unique.

For instance, I suspect that you want to stop reading this column soon, whereas I want you to give me a "5" in the ratings. Now, I'm sure we can work something out . . .

--Steven Marsh

Designer's Notes: *GURPS WWII Dogfaces*

by Shawn A. Fisher

"They wish to hell they were someplace else, and they wish to hell they would get relief. They wish to hell the mud was dry and they wish to hell their coffee was hot. They want to go home. But they stay in their wet holes and fight, and then they climb out and crawl through minefields and fight some more."

--Sergeant Bill Mauldin, *Up Front*

Introduction

Bill Mauldin's words could apply to virtually any American soldier, be they Continental, Billy Yank or Johnnie Reb, Doughboy, Dogface, or Grunt. Mauldin understood the American soldier. As a cartoonist, writer, and actor (starring alongside Audie Murphy in *The Red Badge of Courage*), his observations of the lowly footsoldier of WWII have often been hailed as an exceptionally revealing look at war. Mauldin, along with fellow Pulitzer Prize-winner and GI journalist Ernie Pyle, depicted the GIs as they really were: tired men far from home doing a brutal job.

Those weary GIs that returned after the war didn't seek thanks. They viewed their job in the war, almost to a man, as a necessary evil. There were parades and grandstands, and more valuable rewards like the GI College Bill. But there were few monuments. They didn't *need* a national monument to recognize what they had done; a nation still standing was thanks enough.

In our time, director Steven Spielberg paid homage to Mauldin's gritty version of the war with *Saving Private Ryan*, awaking America's curiosity in WWII yet again. And true to its forebears, that movie presented a fictitious situation that said more than any simple truth could convey.

Dogfaces was intended to portray the war in much the same way, to capture the gritty, sweaty, and terrified lives of citizen-soldiers some 60 years ago. There was much debate over the title of the book between myself and Gene Seabolt. As the ***GURPS WWII*** line editor, Gene insisted on "Dogfaces" all along. I had other ideas, but Gene did not relent, and I'm thankful for it. No title could have better captured the tone of the book.

Dogfaces was many years in the making, both in research and life experience. As an Army dogface myself, I marched through jungles in faraway places, worried about having enough toilet paper in the latrine, and treasured perfumed letters from home at mail call. As a historian and certified gun nut I fired many small arms from the war, climbed on various WWII tanks, rode in a DUKW, explored a WWII-era battleship and sub, and even parachuted from an airplane. I traveled the Ardennes in winter while studying in Europe, and trod hallowed ground among eternally sleeping GIs in Italy and France. Steve and Gene may claim this was all "reality testing," (and I confess that my wife may have been given that excuse a time or two . . .) but I can't blame it on them. I've been in love with WWII most of my life.

During my research I discovered that for many contemporary Americans, WWII is not just a fleeting time gone by. It's tangible. My grandfather stormed the beaches at Normandy, and later manned a half-track. Another relative was a Merchant Marine in the Pacific, and yet another an Army cook in occupied Japan. Thousands of Americans can recite the deeds of their forefathers (and mothers too!) during the war. The Internet is crawling with sons and grandsons begging for information about this unit or that battle. This thirst for knowledge is flattering to the quiet men whom seldom discuss their role in the world's greatest conflict.

Despite my research and background, I needed help. And lots of it. I received invaluable assistance while writing ***Dogfaces***, from friends that scoured old book stores for me while they were on vacation, to WWII veterans tolerating my pesky questions. Brandon Cope was the head engineer, contributing vehicle color text and designs. Hans-Christian Vortisch offered his usual fare of crunchy and tasty weapons data. *Pyramid* playtesters, among others, provided help on both content and style that added immeasurably to the strength of the project. Unfortunately, I neglected to credit

two of those foxhole buddies, Garrett "Whitestreak" Roberts for his aircraft carrier research, and accomplished **GURPS** writer Brian Underhill for support and advice.

Of course, the ramrod of the operation was Gene Seabolt, whose direction, encouragement, and hard-edged advice often found him in role of the crusty old sergeant while I played opposite as the naïve recruit. I don't feel like I've earned my stripes quite yet, but if I ever do, it'll be in part because of his guidance. Thanks, Gene.

Now, in fine Design Notes tradition, I offer you some juicy outtakes from **GURPS WWII: Dogfaces**.

A Setting By Any Other Name . . .

Roleplaying in a modern war may seem impossibly deadly. The lethality of the environment intimidates even the most talented GMs. In this, simulationists and storytellers alike seem united: how can a player enjoy a game where their character can be obliterated seemingly at random? Admittedly, this is a question that must be addressed, but thankfully the answer is simple: Treat war like any other setting.

First, GMs must forget about haphazard PC death. Most Game Masters would never kill off a party of subterranean adventurers in a tunnel collapse or gas explosion, yet both of these are dangers faced by real miners every day. Likewise, a modern campaign would rarely feature a character slain by a drunken driver, even though such occurrences claim thousands of lives every year.

Minefields, snipers, and artillery attacks should be viewed in the same way. They are plot devices, set dressing, tools for the GM. Though a common source of casualties for real-life soldiers, they have no more prominent a place in WWII setting than a capricious lightning strike killing a knight at a joust. This approach dovetails nicely with another misunderstanding, casualty rates.

Casualty rates in all wars are, to be indelicate, greatly overblown. Of the nearly 16 million men that served in the U.S. military in WWII, less than 10% were casualties. With rare exceptions, throughout history the death rate in battle has held steady at roughly 10% of the fighting forces engaged. Those wounded are normally two to three times the figure of those killed. A GM wishing to run a campaign based on front line troops would do well to remember that many troops survived multiple campaigns untouched, and many of those wounded suffered multiple light wounds in the course of a campaign. In terms of deadliness, the front lines should be no different than Huruk the Barbarian's next dungeon crawl.

So, how do you exploit the setting? Frontline campaigns have the capacity for intense combat, sure, but also for character interaction and conflict. The stereotypical WWII squad, with a soldier representative of every corner of the USA, may be straight out of Hollywood . . . but it was a real possibility in an army made up of exuberant volunteers, leery draftees, and hardened professionals. Perhaps nothing could be more frightening than to be saddled with an ambitious officer bent on promotion, willing to unnecessarily risk the troops lives, or sweat, for his gain (see James Cagney in *Mister Roberts*, or Eddie Albert in *Attack*.)

And of course, a modern war epic is not restricted to front-line fighting (though the TV series *Combat!* was). The troops may choose to rob a bank, as in *Kelly's Heroes*, or rescue horses -- on Patton's orders -- as depicted in Disney's *The Miracle of the White Stallions*. GMs may steal a riff from John Ford's *3 Godfathers* and saddle the unsuspecting GIs with a baby. There are hundreds of movies, books, and comics to mine for ideas. With ruthless adherence to plot and story over random violence, virtually any story can be set on the front lines.

Character Design

Names

According to the Social Security Administration and the Census Bureau, only half of the names listed as the top 100 most popular names of the 1940s are on that same list today. Although names such as James, John, and William were

popular then, as now, players and GMs should consider using some of the more popular names from the period. Names listed below include those of heroes and heroines, and entertainers.

Male: Archie, Audie, Belton, Benny, Bennett, Bing, Bud, Buster, Carwood, Cary, Chester, Clifford, Dee, Doyle, Elbert, Ellery, Elmer, Eugene, Herbert, Ira, Lyle, Orville, Otis, Marion, Milton, Norval, Sid, Slade, Uriah, Virgil.

Female: Betty, Clara, Dora, Dorothy, Dulcie, Edith, Edna, Eleanor, Esther, Gladys, Laverne, Lorna, Lucille, Mavis, Mildred, Myrtle, Ruth, Sadie, Violet.

Among pals, few men would call each other by their proper name; nicknames were the rule among GIs. These could be descriptive -- Red, Beanpole, Stumpy, etc. -- or just shortened forms of their given names (Bert for Herbert, Art for Arthur, and so on).

Movie Star

55 points

Hollywood answered America's call to war because it was both popular and profitable . . . and because it had to. The Army took over hundreds of motion picture backlots and soundstages to make training films, and then drafted actors and directors ruthlessly. By the end of 1942 about one-third of the movie industry was at war. For those that weren't, the Office of War Information closely scrutinized their products.

Some stars joined on their own, such as Jimmy Stewart, who became a squadron commander with the 8th Air Force, flying 20 missions into Germany (his pre-war pilot's license was put to good use). He was promoted to general after the war.

John Wayne tried half-heartedly, but never served. Clark Gable enlisted at the age of 41, became an officer, and flew combat missions in Europe. Douglas Fairbanks was a Captain in the Navy, leading commando missions to confuse the enemy about the location of Allied landings. Henry Fonda won a Bronze Star while serving in the Pacific.

Those that didn't serve visited the front in USO shows. Humphrey Bogart, himself a sailor during WWI, visited Italy and North Africa. A seemingly endless string of actresses wound their way through all the theaters; Marlene Dietrich, Ingrid Bergman, and Rita Hayworth all visited troops overseas.

Attributes: ST 10 [0]; DX 10 [0]; IQ 10 [0]; HT 10 [0].

zzAdvantages:xx Very Wealthy [30], Reputation +4 (Everyone, all the time) [20] and a total of 20 points chosen from Alcohol Tolerance [5]; Appearance [Varies]; Charisma [5/level]; Voice [10]; or National Advantages (see p. W68).

zzDisadvantages:xx A total of -30 points chosen from National Disadvantages (see p. W69) or Alcoholism [-10]; Compulsive Carousing [Varies]; Extravagance [-10]; Laziness [-10].

zzBasic Skills:xx Acting (M/A) IQ+1 [4]-12; Bard (M/A) IQ+1 [4]-12; Carousing (P/A - HT) HT+1 [4]-11; Performance (M/A) IQ+1 [4]-12.

zzSecondary Skills:xx Area Knowledge (any) (M/E) IQ-1 [1]-12; Sport (Golf, Polo, or Tennis) DX-1 [1]-9; Fast-Talk (M/A) IQ [2]-12.

zzOptional Skill:xx Spend 5 points on any of Motorcycle (P/E); Boating, Driving (Automobile), Powerboat, Riding (Horse), or Sport (any) (all P/A); Cooking or Savoir-Faire (all M/E); Gambling or Photography (all M/A); History or Literature (M/H).

zzCustomization Notes:xx This template represents the non-combatant but wildly popular movie star. If visiting the front, celebrities will likely wear a military uniform; during their acts the stars usually wore their trademark attire.

If the character is in the military, add Extremely Hazardous Duty [-20] and use the resulting points to buy the primary

skills appropriate for the template. While the character probably went through basic training, it's doubtful that the quality and frequency of training would be equal to that of other recruits. Generals, senators, and the press frequently intruded on the stars during their training. To represent a skilled star, buy the military template first, and then use the remaining points to purchase this template.

Businessman

80 points

Financiers and profiteers made a killing during the war, with most of the contracts going to less than 20 corporations. General Motors alone produced one-tenth of all American production, followed by Ford, DuPont, U.S. Steel, and General Electric. But the few contracts that did go to the little guys made those company owner's rich. One machine tool company with only 50 employees in 1939 had 1,500 in 1945, and increased its value from \$100,000 to \$5 million.

The businessmen worked hard to deliver the goods during the war, building more and larger facilities and opening second and third shifts. Sometimes it took more than elbow grease. Henry J. Kaiser (who had never built a ship before the war) applied mass production techniques to ship building. Henry Ford did the same with aircraft, which had been hand-built in years before. These advances required a leadership in constant motion to insure that raw materials, production, and transportation all ran smoothly. This took a monumental effort of cooperation. Competing companies, despite a few incidents of conflict, worked together to share time-saving ideas and improve efficiency.

This production increase was financed by the government's "cost plus" method of procurement. For both the companies and the government the "plus" was easy to deduce; it was plainly written on the contract. The problem was getting the "cost" right. Businessmen consistently underbid, then bumped the cost up until someone screamed. The Willow Run Facility, built by Ford outside of Detroit, was such an operation. Initial projections for the B-24 plant were just over \$10 million, but final cost was almost \$50 million. Ultimately it was successful, cranking out a B-24 every hour, but until 1944 it was "Will it Run?" to the critics.

In some cases the business community stalled, citing excessive taxes, unfair buying practices, or any number of other problems with government contract requirements (specifically the Fair Employment Act, one of the first labor laws to deal with discrimination). The response was seldom pleasant. In the worst cases the government simply bought the company, in others it took over the operation of the company during the war. The War Production Board was not above sending khaki-clad officers to replace balky managers.

Attributes: ST 10 [0]; DX 10 [0]; IQ 14 [45]; HT 10 [0].

zzAdvantages:xx Filthy Rich [50]; Status 1 [0]; and a total of 15 points chosen from National Advantages (see p. W68), or Lightning Calculator [5]; Single-Minded [5]; Voice [10].

zzDisadvantages:xx A total of -30 points chosen from National Disadvantages (see p. W69) or Age [-3 per year over 50]; Code of Honor (Merchant's) [-5]; Bad Sight [-10]; Overweight [-5].

zzBasic Skills:xx Administration (M/A) IQ+3 [8]-17; Area Knowledge (any) (M/E) IQ-1 [1/2]-13; Detect Lies (M/H) IQ-3 [1/2]-11; Fast-Talk (M/A) IQ [2]-14; Merchant (M/A) IQ+3 [8]-17; Psychology (M/H) IQ-1 [2]-13; Savoir-Faire (M/A) IQ [2]-14.

zzSecondary Skills:xx Accounting (M/H) IQ-2 [1]-12; Economics (M/H) IQ-2 [1]-12; Leadership (M/A) IQ [2]-14; Research (M/A) IQ [2]-14.

zzOptional Skill:xx Spend 2 points on any of Swimming (P/E); Boating, Driving (Automobile), Powerboat, Riding (Horse), or Sport (Golf, Polo, or Tennis) (all P/A); Cooking or Savoir-Faire (all M/E); Bard, Gambling, or Writing (all M/A).

zzCustomization Notes:xx This template illustrates the men that orchestrated what David M. Kennedy called the "War of Machines": the Fords, Kaisers, and other industry greats. It would be appropriate for union leaders, like John L.

Lewis of the United Mine Workers, or even Roosevelt's dollar-a-day men. In the latter case, add Administrative Rank 6, but since these men were appointed and removed at the president's whim, one could argue that the appointees had the rank only in name. Lower ranking governmental employees were much more stable, of course.

Businessmen served in unofficial but important governmental positions overseas. Business leaders negotiated for raw materials in Central and South America, Africa, and even India on behalf of the United States. These business meetings were often conducted aboard Navy ships, with grim-looking Marines prowling the docks as a show of force to sometimes fickle foreign companies and governments.

Odds and Ends

Artillery

More so than in the Pacific, the U.S. military relied on heavy artillery to kill the enemy in Europe. One of the techniques used was the time-on-target, or TOT (p. W43). For veteran and newbie alike, the TOT was a grisly experience. If executed correctly, the whole sheaf, or barrage, of shells would impact at precisely the same time. This impact would sound like a single large explosion to those far away. For those at the point of impact, it was hell on Earth.

A TOT barrage requires all guns involved to be in contact with an FDC and to have synchronized timepieces. Every gun must fire at the exact same instance. This combined all the advantages of the U.S. artillery system at once. For those in the strike zone, Fright Checks on the order of -4 or more are certainly in line with descriptions penned by German survivors even decades later. Even the most battle-hardened kraut shivered at the thought of a TOT courtesy of Uncle Sam.

As great as the American artillery system was, artillery shell production was reduced in 1942-43 to cut costs. Well-meaning but squirrely congressmen howled about wartime waste. As a result, US forces suffered a shortage of artillery shells in October 1944. Daily shell use was curtailed to only seven shots per gun in some divisions. By November new production had made up the shortfall and artillery units returned to firing shells in prodigious amounts.

D-Day: Mulberry and Pluto

The Allies' plans at D-Day relied on getting men and materiel on shore and in battle as soon as possible. Over-the-beach operations using DUKWs and landing craft would only suffice for a short time. Logistics needs for each of the divisions could exceed 700 tons per day, while the six U.S. amphibious truck companies (with 50 DUKWs each) could only unload 500 tons a day each. The armies would run out of supplies.

The Anglo-Americans planned to create artificial harbors, code-named Mulberries, by sinking more than 50 ships along with large concrete caissons to create a breakwater called a Gooseberry. With this in place, a floating pier was built that would allow trucks to drive from shore to ship. The plan worked, providing 15,000 tons of supplies daily at each of the two harbors. A violent storm June 19-20 destroyed one and damaged the other, but even with one operating, supply needs were met.

The Gooseberries proved a useful base for landing craft, since the superstructures of the ships were still above the waterline. These naval halfway houses were used as temporary barracks and kitchens in the first weeks after the invasion.

Also useful was PLUTO, the pipe line under the ocean. Several 3" lines were unreeled from giant drums across the channel. The pipeline transported 300 tons of gasoline daily. This was insufficient, however, since a single armored division could consume 200 tons of gas daily. Tanker ships were required to handle most of the fuel, pumping 600 tons of gas per hour through an off-shore mooring system once they reached the landing areas.

D-Day: Peppermint

Manhattan Project scientists had suggested back in 1942 that radioactive salts be used over Germany, killing the population by radioactive means. When concern began to rise about the Nazi atomic-bomb project, those involved knew that it was far more likely that their 1,200 tons of uranium ore might be used as poison, rather than in a bomb.

A team, Codenamed Peppermint, was assigned to search for signs of radiation poisoning among Allied troops at D-Day. The scientists and chemical-warfare officers used Geiger counters and unexposed photographic film to check the area. If the film became foggy or began to blacken, the team would be alerted.

Fortunately, no radiation was detected. The team spent much of their time after D-Day inspecting V-2 bomb craters near London for radiation, at the request of Roosevelt and Churchill.

When the Wizard's Away

Ways of Keeping Higher-Powered NPCs in the Background Where They Belong

by Stephen McKenzie

GM: *"You see a shadowy humanoid figure emerging from the opening in the burial dome. Its body is insubstantial, but its eyes are glowing, and it is moving towards you at great speed."*

Mortimer (Human Cleric): *"A shadow! Hey, I'm only 2nd level. Let's get out of here."*

Moseley (Dwarven Fighter): *"Yeah, agreed. We run for it. Hey, Morty, lets go and ask your overseer to come down here and turn it for us! He's supposed to do that for a living, right?"*

* * *

This situation is likely to crop up sooner or later if you are playing a low-level game and there are friendly NPCs of higher power level than the PCs in your scenario. Apprentice wizards and priests have their masters, as do many fighters, and even a thief may have contacts at the local guild. Part of the fantasy milieu is that the heroes are set apart from the mundane world by their skill and bravery and may attempt things normal folk could not. Despite this, it is common to find the character lists of pre-made adventures filled with powerful NPCs. There are times when logic dictates that these NPCs would want to become involved in what your party is doing . . . especially when it has something to do with money, powerful magic, or a great threat to the kingdom. As GM, you must be careful to ensure that these figures do not end up taking over the adventure.

In the example above, suppose Mortimer the Cleric is a member of a Church of Light whose main aim is to rid the world of undead. Suppose also that the GM has designed a few higher-powered church figures, the ones who taught the PC cleric his spells. And further, the GM has designed the scenario so that the cleric will get to encounter some undead creatures; after all, they are his forte. So, why wouldn't the more powerful cleric come down and turn the undead the party has found? If he does help out, the players become redundant, and the adventure becomes boring. If he does not help, the players may begin to ask questions. "Real nice church of light you're in there, Morty. They send underlings like you down to get killed, while they sit round eating roast snaarg-beast and watching the sunset."

Of course, the basic way to avoid this situation is by designing challenges for the PCs that are never so difficult that they might require help. This can be done in low-danger dungeon settings (part of the reason why dungeons are so popular), but becomes more difficult as they become more powerful. The ideas presented here are based on fantasy settings but could be applied to other rule systems and genres. They will help you to deal with this situation of "NPC interference" and design your scenarios so that your higher-powered NPCs stay in the background where they belong.

A Matter of Honor

Many players will instinctively want to avoid involving higher-powered characters, because the whole point is that they want to do things for themselves. You may wish to reinforce this, by making it part of the chivalric background of your clerical orders that it is considered dishonorable for them to seek help from others before they have attempted to do something themselves. Character classes such as barbarians will have a natural distrust of seeking the help of others, especially if magic might be involved. Try this technique with one of the characters in your party.

Honor can be a useful plot device, but in some situations it will not suffice on its own. What happens if the party uncovers evidence of a lost city, thought to be filled with artifacts that the local magic order is keen to get their hands on? Who gets sent on the mission to recover them? Not your humble party, if the members of the order have any sense

at all. You'll need to think of another strategy.

Quests, Tests and Training

A classic reason for NPCs to stay in the background is that one or more of the characters have been sent on a quest, or asked to perform a certain task in order to advance in the rankings of their order. You could use this idea a number of times; for example, you could invent magic initiation rites for various levels of magical knowledge, by which time your mage PC may be in the "inner circle" of the order.

Training quests are a neat device, and one that stands to reason. Many NPCs would not be willing to help their underlings simply because they want to make sure that they get adequate experience on their own. However, this device will wear thin after a while, especially if you employ it on more than one character. Your players may start to feel that they have no control over the story, and that their superiors allocate tasks to them on a random basis, with no continuity in the plot.

Scale and Balance

You are using a pre-made adventure setting in which the characters travel to a remote village, and are asked to by the villagers to defeat an evil monster that is terrorizing them. Look quickly to the list of NPCs provided, and think carefully about the implications. If you find, for example, that the local blacksmith is actually a high-powered dwarven fighter, is your fledgling party really the village's only hope? Think about knocking the smith back down a few levels, or alternately, giving him a gammy leg. After all, does he really need to be that powerful for the purposes of the scenario?

NPC power levels are a question of scale and balance. Simply put, the higher-powered of your really powerful NPCs, the more mid-powered PCs they will need to have underneath them for the hierarchy of the organization to make sense. Think about designing a local order of knighthood. To use *Dungeons & Dragons* terms, if you make the leader 18th level, you'll probably want to have one or two 12th-15th levels, more 7-10th levels, and then a whole host of 4th-6th levels, any one of which could treat your junior 1st-level PCs like hayseeds. So why not simply make the leader 9th level, and let the rest of the order sort itself out accordingly?

You can take this approach to your entire campaign. Rather than having hordes of hugely powerful NPCs, why not run a campaign in which NPCs over a middling power level are very uncommon, ones over 10th level are extraordinary, and any NPC over 15th level will be famous throughout the continent? Once your players have adjusted to this, it will seem very natural to them (and they will not ask you questions such as "how come there are no arch-mages in this city?") It will also mean that the PCs' own achievements will seem all the more noteworthy. One they reach 5th level, they will also be known throughout the region -- and most players just love it when their characters get a bit of fame.

Know Your NPCs (and give them something to do)

One of the most dangerous (and most common) things you can do in designing a kingdom, city, or other adventuring base is to simply jot down the names and levels of powerful local figures without giving any thought as to who they are and what they do. For example, in your capital city, you might place:

Order of St Christopher -- Sir Trimble, 15th level

Mage College -- Nimblor, 18th level

Church of Light -- Cassandra, 15th level

As we have seen, the existence of each of these figures suggests a host of other subordinate NPCs as well. The question is, are they necessary? If you don't know what an NPC does, that means they are not serving any function in the plot of your scenario. So why are they there? As a rule of thumb, do not use high-powered NPCs as window-dressing for your campaign. If you do position powerful figures in your local area, do so with some forethought as to

what role they might take in the long-term campaign. If you want NPCs as window dressing in a low-powered campaign, the dwarven fighter with the gammy leg will do just as well as the immensely powerful mage.

If you decide you absolutely have to have that arcane order with the all-knowing wizard (and his underlings) in your local area, it is important to flesh out the day-to-day workings of the order. It is much better to do this to begin with than to make it up on the spot as an excuse for why those NPCs cannot help your party. Doing this creates work for you as a GM, but it can certainly provide you with a ready-made excuse as to why Nimblor the Necromancer cannot help your party today, or any time soon -- "She's busy fighting the Illithid, I'm afraid."

Destabilize the Situation

"NPC interference" is most likely to happen when the party is located in a well-organized kingdom with no major internal or external threats. The "Grand Duchy of Yond Bezzle," peaceful and prosperous, may seem like an ideal starting place for fledgling PCs to begin exploring the wider world, but in practice it may cause you some real headaches, because there will be little activity for your NPCs to undertake. When the party comes back into town with tales of terrible monsters and untold wealth, folks will listen, because there is not a lot else going on.

A good local base for new PCs will be an area in which there are one or more serious threats to security, but which is still stable enough for the PCs to survive in the early phases. Perhaps Yond Bezzle is at war with a renegade kingdom on its northern border, or plagued by civil strife or orcs (or just plague, for that matter). Your NPCs will not help the party because they really do have better things to do than listen to treasure tales.

Hit them in the Hip Pocket

Players will be far more reluctant to reveal the secrets of their adventures if they have to buy assistance in return. Make sure the party is charged handsomely for any help provided to them and they will think twice about asking for it again.

This trick can even be used with organizations that the PCs belong to, such as benevolent clerical and magical orders, provided you do not make them *too* wealthy. If your cleric PC is a sworn servant of the Church of Light and seeks their aid to flush out those undead, surely it is not too much to ask that all the party's treasure be donated to help fix the temple roof? After all, the order has fallen on hard times lately. The cleric will probably want to do just that, but will have a hard time convincing the rest of the party that it's a good idea.

Hold Off on the Grand Epic

Grand epics are the essence of a many good roleplaying campaigns; when they are properly handled, they can make a series of one-off adventures pale in comparison. As a scenario designer you may want to involve your characters in your epic right from the word go, and if you do, you will probably also want to have some idea of where things are going to end up after the next 15 play-sessions have passed. Your the party have one piece of the hexagonal puzzle (that will prevent the Worm-God returning to plague the earth) and their overall mission is to find the other five, by which time they will be of a sufficient power level to take him on. Sounds neat . . . but why is it your party is looking for the pieces, and not someone with a little bit more clout? If they tell higher-powered NPCs their tale, it will be difficult to justify why no one listens -- after all, the fate of the world is at stake.

The trick here is to introduce elements of the quest slowly, so the PCs do not find out exactly what they are up against until they are ready to face it themselves. Perhaps they have a piece of the puzzle, but do not know what it is. The secret can only be uncovered by tracking down a sage who lives on the other side of the continent -- a voyage which can encapsulate a series of minor adventures along the way, gaining experience for the PCs as they draw closer to their ultimate goal. Reveal the facts one by one, to build up the player's knowledge over time, rather than handing the whole story to them all at once.

"Take This Job and Shove It"

Another way of avoiding NPC interference is to cut back on PC involvement with training orders or other institutions. For example, your cleric might be an itinerant monk, and your mage a hedge wizard. Your party is essentially an enclave, trying to establish itself as a force in the local area in competition with other organizations.

The difficulty here for many RPGs is with training. You may want to run a campaign in which the restrictions on training and power advancement are modified so that characters can train themselves, or each other, in some situations. You may also wish to arrange it so that your players' characters have a number of different options for training, and do not build up any allegiance to one particular organization.

An "enclave" party does not work for anyone else, and "tests" or "missions" laid down by higher-powered NPCs will be right out of the question. The party will be unlikely to ask for or receive assistance, either. The downside is that parties with no allegiances at all will end up becoming separated from your society. In some cases, you may end up with a situation where much of your campaign design work becomes wasted, because the party has no interest in anything that is going on outside their own small base of activity.

Getting Some Distance

One of the most obvious devices to avoid NPC interference is simply to remove the party from areas in which they could get support or suffer from NPC interference. Perhaps they are on a quest, and need to travel to an outlying wilderness area five days journey from the nearest town. Alternately, perhaps a local wizard is away on a quest, and the party has been asked to look after his holdings in his absence. Sounds like a piece of cake -- but what was that howling noise from the cellar?

One of the simplest and most effective ways of creating "distance" early in the campaign is to trap your PCs down in the dungeon (enemy adventurers lock them in, a cave wall collapses, or Something Lurking In The Dark decides to teleport them down to the 8th level). Snowstorms, shipwrecks, and other catastrophes can also leave them stranded and reliant on nothing but their own wits, hopefully for quite a few play-sessions.

Not So Friendly After All . . .

Suppose the heroes seek help from another local NPC who may have ideas about adventuring of his own. The party has run into trouble fighting some skeletons down in a crypt and their cleric is knocked out and reduced to near-death. They seek the help of a local high-level cleric of another faith, who is rather curious to know where they have been. "So, you *have* found the entrance to those fabled crypts, have you? I might pop down there and take a look myself!" Reason dictates that higher-level adventurers in the area would periodically bust in on the players territory, provided they knew about it. This can muck up your campaign but it can also work in your favor; sting your party with this trick once and they will be pretty careful about asking for help for a while to come.

Your players' secrecy about their adventures can be a great way of making sure that the higher-powered NPCs do not get involved too soon. Of course, this can preclude their involvement with any good organizations. If your ***Dungeons & Dragons*** paladin holds off on telling his superiors about what he's found because he wants to get the credit himself, an alignment check is probably in order.

The Unequal Fellowship

One of the greatest fantasy epics, *The Lord of the Rings*, features a party with wildly different power levels of ability; there is no reason why you cannot do so as well, provided you talk it over with your players first. Say you have a reasonably powerful priest sent out to do battle against a local nest of undead. Another priest assists him, and two local guards are hired as muscle, as well as a man of questionable morals to deal with the locks and traps. You now have a party that makes sense in the context of your setting; the local church is taking the undead seriously, rather than

leaving the problem to their underlings to deal with.

You can use this technique either at the start of the campaign, or introduce the more powerful PC character into the game in response to the players' request for NPC assistance (which will mean that someone will have to play two characters for a while). If you want to go the whole way, compose a party in which each player has one low-powered character and one mid-powered character, and the two different level groups take on related aspects of the same quest.

Some players will object to seeing their friend playing Mungo the Magnificent while they play Wetwipe the Wimpy. In this situation, you can make the higher-powered character a "Party Character." The other players each get a say in what this character does, coming down to a vote in case of conflict, with the GM having the final say. If you do decide to have a higher-powered character as a Party Character, it pays make them a bit slow-witted. Mungo might be Magnificent, but he's not the brightest fellow, and is easily told what to do by your more assertive and canny PCs.

The "Q" Character

In many situations it will make sense to have an NPC that the characters are directly responsible to -- a leader of the organization who is involved in deciding what missions they are given, or needs to know what they are up to for some other reason. However, there is no reason why this NPC should be more powerful than the PCs in terms of their ability level. Think of the character "Q" in the James Bond films, who was Bond's superior in the organization, but who would have been quite useless if called upon to come to Bond's assistance in the field.

You can use this trick in your campaign to provide a sense of realism in your NPC organizations without filling them with high-powered figures that could end up spoiling the fun. Think about your local clerical order. Is it possible to have a church leader who cannot cast any but the most basic spells, but is very charismatic, and excellent leader, and a wily politician? This tactic is another way of reducing the power of your NPCs, while still maintaining believable hierarchies in your organizations.

Lying Low

In this situation, the party cannot reveal too many of their secrets or ask for too much help because their behavior has been less than strictly legal. In the most obvious case, the heroes become outlaws, engaged in freedom fighting against an oppressive regime (or just plain old bandits if they choose). In other cases, the party live within your campaign society but there are a few aspects of their lives they are keen to keep secret.

You can also turn an incident in the ongoing campaign into a reason the party is keen to lie low. Try to engage one member of the party (thieves are a good target) in something unsavory, or in something that would offend a powerful local figure. You can also plan out this kind of campaign from the beginning, making the party's guilty secret the main focus of the game. Suppose that a certain kind of magic is illegal in your campaign world, and its practitioners are persecuted by the dominant religion. It will be easy enough to get your players interested in finding out how to use this kind of magic (everyone loves doing what they shouldn't), and soon they will be up to their necks in ancient magical lore, risking execution if they are discovered.

Put the Boot on the Other Foot

If your players have been put to one side by a powerful NPC, turning the tables can be an excellent way of restoring their morale. Suppose that Mungo the Magnificent thought that those skeletons would be easy work, and strode in ahead of your party. But unbeknownst to him, there is also Something Lurking In The Dark down there, who teleports the dimwitted fighter far down below, to fend for himself. Next time your party comes across him, he's suspended over a bottomless pit begging to be rescued. Of course, that encounter was not present in your original scenario . . . at least, not on the first level; you added it in to make sure Mungo did not end up running the show. Your players will enjoy rescuing him, and will love gloating afterwards as well.

The Hidden Enemy

You can set up one of your local organizations so that one member is actually an agent for a dark power. Imagine that one of the members of the magic order is secretly in league with the vampire that is the ultimate source of undead power in the area and wants his lair in the crypt to remain a secret. This NPC is eager -- a bit too eager -- to become involved in party affairs down in the crypt, and offers help (perhaps even killing a few zombies to prove his or her integrity), but then misleads the party so that they do not find the secret passageway down to the next level of the dungeon. After a while, the party may become suspicious of this NPC and seek to uncover the truth about him.

Alternately, it is known that somebody within an organization is a spy for an evil power, because it is clear that the enemy has been gaining information in advance; finding out who it is can be a challenge for your PCs at some later stage, but in the meantime, they have to be careful about revealing too much, because they might be unwittingly telling their enemy their plans.

Putting it all Together

Let's look at how you might design your next low-powered scenario around some of the principles above, looking at a standard beginning fantasy group -- a fighter, a cleric, a mage, and a thief -- in a standard crypt setting.

The party live in a in a kingdom that is beset by civil war; the northern part of the kingdom is attempting to secede from the main areas where the players live. There is also the persistent threat of subterranean elves who live in underground cave areas that abut onto several city dungeon areas, and the underground of several cities is currently a war zone. All this keeps high-powered NPCs rushed off their feet.

The party wishes to explore an ancient crypt, two days from the nearest town, and a full five days from the main city. The cleric PC has been sent to explore the crypt as part of a training exercise in order to be fully initiated in his order, and knows he will receive no further help than what has already been given him. The fighter, who is a bit more powerful, has been hired by the church to protect the priest (and might be a "Party Character"). The mage is hoping to recover lost magic artifacts that may help defeat the elves, but is reticent about saying too much too soon, as she knows that one of the members of the order is a spy. As to the thief, he doesn't want to go anywhere near the main city in case he ends up sleeping with the fishes.

With a bit of forethought in the initial design of your campaign, and the scenarios within it, you can rest assured that the adventurers will be the masters of their own actions and will thus have a great amount of input into the shape of the game. You will also end up with NPCs who have their own stories to tell, and who are fully involved in the plot. And finally, there will come the day when it is your PCs that are telling the NPCs what to do, and you will have a great campaign on your hands.

The Extraordinarily Classified Adventures of Troubleshooter Munch-O-SEN

by Matt Riggsby

The Extraordinary Adventures of Baron Munchausen is Hogshead Games's parlor/roleplaying game of conversation and storytelling among genteel 18th century aristocrats. *Paranoia* was West End Games's famous game of inept PCs, malfunctioning equipment, and confused bureaucracy in a darkly humorous future. One might think that the play styles of *Baron Munchausen* and *Paranoia* would be diametrically opposed, and yet here we are. Now you can bring the mechanics of Munchausen to a post-mission briefing of unruly Troubleshooters.

Munch-O-SEN can be regarded as a cutthroat version of the original Munchausen game. Rather than moving around the table in an orderly fashion, taking turns telling individual stories, a Munch-O-SEN game involves a single story: Troubleshooters recounting the events of their most recent mission. Players flatly contradict each other and interrupt their comrades, seizing control of the narrative. The object of the game is to survive both the judgment of the Computer and summary execution at the hands of the other characters. Play requires a copy of *The Extraordinary Adventures of Baron Munchausen*, or at least extensive familiarity with the rules, and a working knowledge of the world of *Paranoia*, if not the actual rules themselves. *Paranoia* is long out of print, but those unfamiliar with it can learn enough to play by asking about it on any discussion board where older gamers congregate or visiting some of the web sites listed at the end of the article.

(Stylistic note: In accordance with the Computer's views on equality of the sexes, pronouns of alternating genders will be used. Citizens who do not match the gender of any given pronoun will be surgically reassigned.)

Setting Up

Players may select names and service groups as they desire, although for convenience all players should be the same security clearance. They may also select roles in the Troubleshooter team, such as:

- Team Leader
- Mission Leader
- Assistant Leader
- Hygiene Officer
- Political Officer
- Weapons Officer
- Morale Officer
- Robotics Officer
- Vehicle Officer
- Experimental Equipment Officer
- Key Grip

These roles are entirely optional and are only for extra color.

Instead of gold coins, players should be issued tokens to use as treason vouchers. Pour a round of Bouncy Bubble Beverage, select a mission from the list below (or make one up), use any suitable method to pick someone to start, and begin the game.

Duration

The shared story told by the players here takes a bit more time than a story told by a single player in a conventional

game. Set a timer for about 15 minutes (the Computer has determined that the optimum time for debriefing is 14 minutes and 27 seconds). The game ends once time is up, even if the story isn't finished.

Contradiction and Stealing the Spotlight

Play begins as usual, with a player starting to tell a story. Other players may challenge his veracity by voicing an objection and putting forward one of their tokens, although the genteel challenges and wagers of 18th century noblemen may be replaced by flat contradiction.

Other players may also take control of the story by giving the player currently telling the story three treason tokens. Unlike regular contradictions, the interruption can't be avoided by anteing up one's own tokens; the attempt automatically succeeds as long as the interrupting player can cough up the three tokens. Taking control of the story also allows the player to flatly contradict a fact stated by the previous player, although it isn't mandatory.

Finally, unlike an orthodox *Munchausen* game, players *can* contradict the current storyteller by suggesting that he died. However, this can only happen up to five times during a given game (if the sixth clone died, he obviously wouldn't be around for debriefing), and the contradicting player must pay the three tokens to take control of the story at that point.

Example

The game begins with eight players: Alex, Beth, Chris, Denise, Eric, Georgia, Frank, and Holly. Denise made baklava for the evening's game, so she gets to go first.

Denise: After receiving our orders from our friend the Computer, we went down to the motor pool to get the vehicle we had been issued for the mission. It was a six-seat ground crawler, so . . .

Frank (pushing forward coin): No, it wasn't. It was seven.

Denise (pushes it back with one of her own): . . . you're kidding. You're challenging me about the number of seats?

Frank (adds another coin to the pile): Yup. I bet you're trying to make the Computer think there's something wrong with its resource allocation subroutines, you dirty Commie.

Denise (takes coins): Fine, fine, it was seven. The seats in the back were small so it *looked* like six. We didn't have enough room, so we had to put Alex in the trunk.

Alex: Hey!

Denise (ignoring Alex): I was the vehicular officer, so I got in the driver's seat, started it up, and . . .

Beth (shoving three coins towards Denise): . . . that's when the anti-theft system went off because she didn't put in a clearance code. There was a laser in the dashboard that shot her in the head. After we disposed of the body, I got in the driver's seat and leaned out the side so the laser wouldn't get me . . .

Experimental Equipment

The only companions Troubleshooters have are other Troubleshooters, who are not known for their remarkably useful abilities. Instead of companions, Troubleshooters have experimental equipment from R&D. Once per game, a player may cite a piece of experimental equipment which she can use to get herself out of a sticky situation.

Mutant Powers

Troubleshooters have deep, dark secrets, in the form of mutant powers. It is assumed that Troubleshooters will try to keep their mutations a secret, but will use them covertly if they have to. However, an observant citizen might ferret out their use.

Before the game begins, the names of mutant powers should be written down on slips of paper and put into a hat or other container (if your *Paranoia* books aren't at hand, write down as many as you can remember, or make some up if you want). Players should pass the hat, taking one slip each. If, while another player is narrating the story, a player can rationalize the character's actions as the use of the mutant power he holds the name of, he may reveal the name of the power, imply that the narrating character has a mutation, and take two of her tokens. Particularly bad rationalizations may be shouted down by a majority of players. The original game's convention of throwing bread rolls is in order here, although for a more *Paranoia* feel, [flavored kelp snacks](#) may be substituted. If this happens, the tokens are returned and the revealed power goes out of play. A character may only be stuck with one mutant power per game.

Example

Here, Eric holds a slip of paper with the Psychokinesis power and uses it well.

Alex: . . . the traitor dropped the memory chip into the sewer grating, so I had to reach down to get it.

Eric (waving the slip of paper and taking two of Alex's tokens): Gee, you'd have to have pretty long arms to reach that far. *Unless you were a mutant!*

And here, Eric uses the same power badly.

Alex: . . . we ran into some traitors coming around the corner, but I quick-drew my laser and blasted them.

Eric (waving the slip of paper and taking two of Alex's tokens): Gee, you'd have to be pretty fast to draw your laser that quickly. *Unless you were a mutant!*

Other players (hurling nori snacks): That's stupid!

Summary Execution

In "Munch-O-SEN," honorable duels are replaced by heavily-armed free-for-alls. At any time, one player may announce that another is a Commie mutant traitor and attempt to execute him forthwith. The target will, of course, fight back, using the same rock-paper-scissors procedure as dueling. Because life is cheap and weapons are exceptionally lethal in Alpha Complex, combat is resolved after a single round rather than best two out of three.

Also, once the attack is announced, other players can join in. They may choose to fire on either the original attacker or defender. The secondary combatants participate in the rock-paper-scissors contest, but aren't killed if they lose; the person they're shooting at is, after all, already firing on somebody else. However, if a secondary combatant *matches* the person he attacks, flip a coin. If it comes up tails, he suffers a severe weapons malfunction and is killed.

Unlike the original game, the player of a character killed in debriefing isn't out of it yet. She must give *half* of her tokens (as of the time fighting breaks out; round up) to the player she was shooting at. Being dead, she may no longer issue challenges or otherwise participate in the debriefing. However, she may participate in the voting at the end of the game; the players of dead characters represent the wise, even-handed justice of the Computer.

Example: Denise, taking exception to Frank's implication that she's a mutant, announces a summary execution attempt. Alex and Beth gleefully join in on Denise's side, while Holly decides to fire on Denise. Alex goes with rock, Holly and Denise with paper, and Frank and Beth with scissors. Frank kills Denise. Alex kills Frank. Beth matched Frank's scissors and flips a coin; it comes up heads and she lives. Holly matches Denise's paper; her coin comes up tails, so Holly is dead as well. Frank and Denise exchange half of their tokens, while Holly gives half of hers to Denise.

Ending the Game

The game ends when the time limit is up, all the characters die in a debriefing crossfire, or (as happens occasionally) the story comes to a logical end. Players should count up the number of treason voucher tokens they have. Instead of awarding them to other players en masse, players take turns, allocating tokens one at a time to the other players. Theoretically, this is to vote for which characters were the most traitorous during the mission, but in practice it allows the players one last opportunity for bickering and petty revenge. The player with the most tokens starts, handing them out one at a time until he's tied with the player with the second most tokens. They take turns until both are tied with the number three player, and so on.

Example

At the end of the story, Alex has 16 tokens, Beth has 7, Chris has 9, Denise has 12, Eric has 4, Georgia has 6, Frank has 1, and Holly has 8. Alex hands out four tokens, tying him with Denise. He and Denise alternate handing out tokens until they get down to 9, at which point Chris joins in, then Holly, and so on. Frank only participates in the last round.

The player who ends up with the most tokens is deemed to be a traitor and is taken away to be executed. The player with the least is given an official commendation. A well-played game may end up with all characters simultaneously being commended and executed. The Computer thanks any survivors for their cooperation.

Sample Missions

The Computer orders the Troubleshooters to do the following:

- Deliver a heavy box making ticking noises to an Indigo-level member of the CPU service group.
- Search for and apprehend a Sierra Club terrorist believed to have ties to renegade Outside organizations.
- Monitor levels of pharmaceuticals in a gruel vat facility and look for signs of sabotage.
- Quarantine all samples of Cold Fun concentrate with lot number Q843-AD8938E.
- Take over operation of a snack bar used as a meeting place for secret societies and take appropriate action against any traitors frequenting it.
- Review several new vid programs from HPD & Mind Control for treasonous content and fun value.
- Escort a traitor from a nearby detention facility to the interrogation center in far-off FAR sector.
- Disable several loudspeakers reprogrammed to broadcast Communist propaganda and apprehend or execute anyone who has listened to them.
- Engage in live-fire anti-traitor activities in order to test experimental new performance-enhancing pharmaceuticals.
- Perform cleanup of accidental spill of green paint in an Orange-clearance area.
- Direct traffic at several intersections where sabotage has disabled traffic signals and remote vehicular control.
- Investigate pilfering of gloves and helmets in a Red-clearance dormitory.
- Clear obstacles and saboteurs from a set of train tracks for inter-sector mass transit system.
- Provide security for a team of hydrological engineers repairing sewage tunnels.
- Pose as Armed Forces personnel to investigate possible treasonous behavior in a Vulture squadron.
- Collect the right boot of every citizen in a nearby Technical Services office block as part of an investigation of possible Corpore Metal activity.
- Hunt down and neutralize a rogue scrubbot accidentally fitted with a warbot brain.
- Infiltrate an Infrared barracks to investigate rumors of treasonous pagan rituals.
- Assist an IntSec officer in investigating a suspicious series of malfunctions at an important fusion power facility.
- Scout out OLD sector, a sector long sealed off from Alpha Complex, and report on any surviving residents' political orthodoxy.
- Stop a renegade band of PURGE fanatics who are attacking apparently random public hygiene centers in the sector.

Guard a warehouse containing classified Old Reckoning artifacts.

- Inspect a series of slidewalks for unauthorized monitoring equipment and booby traps.
- Assist R&D with a demonstration of genetic engineering experiments.
- Bring me the head of Alfred-O-GCA.

Analects Arcane

Mnemotheurgy for the d20 System

by Owen K.C. Stephens

Journal Entry: Forty-First Day of Summer

I am always a bit awed when I change journals. My old journal served me well, and is even now being copied by my senior apprentices to ensure my rambling thoughts and messages to the future are not lost in a tower fire or other local disaster. The first copies are already in the hands of many of my peers, and their compliments and reassurances warm my heart. But now I face a blank slate, a thick tome of creamy pages waiting but ink and effort to become another book for others to read. I am forced to wonder what I will find to fill so many pages, and worry if those eventual readers will receive this volume as well as the last.

In truth, I don't clearly remember the last time I began a new journal, though certainly I could look it up in the first pages of my old set. But these days, even rereading my own words doesn't always bring clear recollection of events back to me. Aerifel once jested the reason a mage's bond beast is commonly called a familiar is that it's the only thing an old mage is sure not to forget. Perhaps when she's older, I'll let her know how close to the truth she is.

Struggle as we might against the ravages of time, mages grow old. Our eyesight and hearing weaken, our muscles thin and our bones creak. Most arcanists my age are either thin as a rail or fat as a boar, and it's only because one of my apprentices is a skilled and observant cook that I manage to stay between those two extremes. But most worrisome of all our frailties is the loss of a mage's memory. Much of what sets us apart is what we know, and losing memory is very much losing power. In this case, even descending into hated undeath is no cure, as many of the ghoul lord wizards I know are just as forgetful as their living counterparts. So, how do aged sages deal with this slow degradation of our minds?

We cheat.

*The magic of memory is not as famous or alluring as flashier spells of fire and thunder, but all experienced archmages at least dabble in it. Generally younger mages don't bother, both because they have no need yet, and because they lack the experience to design a proper memory spell. Such arcana must be effective in a long-term way, able to assist the mage even when not active. It must be useful in specific situations when a mage is willing to prepare it. Though I have several works covering this subject, the best is without a doubt **Sera ves Unbres con Rarris**, which translates to *The Light Against the Mists of Thought*.*

*There aren't many original copies of **Sera ves Unbres con Rarris** left in good condition, and I require all my apprentices to make three copies in the first three years of their service with me. One I give them when they become masters, one I sell, and one I use to trade with other sages. There are many magics I feel should be kept secret, but I've seen far more good than evil come from doddering wizards being able to remember*

which staff heals and which summons demons.

*The reason I prefer the **Sera ves Unbres con Rarris** over other memory magics is that all its arcana is based on mundane memory techniques. The order that researched these spells long ago delved deeply into the philosophy of thought and memory, developing numerous mundane mnemonic techniques before they put any work in on the arcane versions. I am particularly impressed with their ability to use memory palaces, which most mages lack the time to construct and maintain through pure study and dedication. These spells allow even the most elderly of mages to use a few simple spells to remember things that would otherwise be forgotten.*

Of course, it's sometimes difficult to remember to remember.

*Arngrim Aignirson
Mage of the North*

Sera ves Unbres con Rarris

Original copies of *Sera ves Unbres con Rarris* are easily identified by their fine and heavy construction. The covers are slabs of thin, polished marble bound together by bronze rings. The body of the book is papyrus, though most also have linen front and back pages. The work is written in the draconic language in dark red ink, though, contrary to popular opinion, the ink has no blood content. These books are pretty, but weigh a hefty eight pounds and are vulnerable to breaking, mold, and fire. Many are missing one to three spells because of such wear.

In addition to several spells (all presented below), the book outlines the use of mnemonic tricks for remembering phrases and facts, and a method of memorizing long strings of numbers by associating each group of two or three to a well known date, collection, or possession involving that number. Neither method is given in enough detail to justify improved memory for a character, but they can serve as starting points for a character who wishes to research such methods more thoroughly.

Copies of the work done by apprentices of Arngrim Aignirson are actually more common than originals, and are often available in upscale magic shops (prices ranging from 2,500 to 10,000 gp). These are more typical-looking spellbooks, with tough leather covers and paper treated to resist moisture and heat (when closed, the books are not considered easily flammable). Of course copying errors do occasionally occur, and there is a 5% chance per spell that the information given is not complete, requiring a wizard wishing to learn the spell to pay an additional 25 gp per spell level in research and make a second Spellcraft check to fill in the gaps.

Though designed as wizard spells, most of the things in *Sera ves Unbres con Rarris* are usable by bards as well, who can select the spells normally after they have been exposed to them.

1st Level Sorcerer And Wizard Spells

Inertial Navigation. Get a mental map of how far you've gone and in what direction.

Refresher. Gain a bonus to skills you have ranks of.

2nd Level Sorcerer And Wizard Spells

Perfect Recall. Remember events with absolute clarity.

3rd Level Sorcerer And Wizard Spells

Akashic Access. Tap into a vast mystic storehouse of knowledge.

4th Level Sorcerer And Wizard Spells

False Recollection. Change your memories for a few days.

5th Level Sorcerer And Wizard Spells

Memory Palace. Gain a mental construct to store knowledge and memories.

7th Level Sorcerer And Wizard Spells

Memory Palace, Greater. Gain a mental construct to store knowledge and memories.

Akashic Access

Divination

Level: Brd 4, Sor/Wiz 3

Components: V, S

Casting Time: 10 minutes

Range: Personal

Effect: Information gained

Duration: 1 minute/level

Saving Throw: None

Spell Resistance: No

There exists a mystic imprint of all knowledge ever discovered by any living thing, known as the akashic record. This spell allows the caster to tap into this source of knowledge in search for a specific piece of information. Because the akashic record is so vast, only an experienced caster has a good chance to find what he's looking for, and more common information is far easier to find than rare knowledge. The caster rolls a d20 and adds his caster level and Wis modifier. The DC is set by the GM, based on the chart below.

DC	Type of Knowledge

15	Uncommon, known by a reasonably large group of educated people
25	Rare, known only by the most educated, or those who are specialists in the field.
30	Obscure, known by only the most well educated specialists.
35	Extremely obscure, known by very few, possibly forgotten by most who once knew it, possibly known only by those who don't understand the significance of the knowledge.

The effort to access the akashic record is a strain on the caster's mental faculties. Each time the caster uses this spell, he suffers a cumulative -5 penalty to further attempts for a week.

False Remembrance

Transmutation

Level: Brd 4, Sor/Wiz 4

Components: V, S

Casting Time: 1 action

Range: Personal

Effect: False memory

Duration: 1 day/level

Saving Throw: None

Spell Resistance: No

This spell allows the caster to rewrite his own memories in any way he wishes. He may forget events, edit when things occurred or what his own actions or motives were, or make any other change he desires. For the duration of the spell, the caster believes his false memories are real and accurate, not even remembering the casting of the false remembrance. Spells that reveal lies do not expose his altered recollections, so a caster who stole a staff could say in a *zone of truth* that he did not, if he had altered his memory to remove the knowledge he had. Other divinations are not affected, however, so the truth may still be discovered through other means.

The caster may, if he wishes, set a command word when the spell is cast that causes him to remember events accurately when he hears it. Many casters use this to entrust a close ally with the ability to restore the caster's original memories before the end of the spell.

Inertial Navigation

Divination

Level: Brd 0, Sor/Wiz 1

Components: V, S

Casting Time: 1 action

Range: Personal

Effect: Mental map

Duration: 1 hour/level

Saving Throw: None

Spell Resistance: No

All movement the caster takes during this spell's duration is recorded in a mental map. The caster knows exactly how far he's moved and in what directions. Thus the caster is always aware of his relative position compared to any other place he's been during the spell. This allows him to calculate how far apart and on what bearing any two points are. He can also perfectly retrace his route to go back to any place he's been.

Even after the spell's duration ends the caster has access to the mental map it created, though obviously it no longer keeps track of his position.

Memory Palace

Transmutation

Level: Brd 3, Sor/Wiz 4

Components: V, S

Casting Time: 1 minute

Range: Personal

Effect: Mental construct of a palace within caster's mind

Duration: 10 minutes/level

Saving Throw: None

Spell Resistance: No

The *memory palace* spell allows the caster to create an arcane mental construct within his own mind. The casting time of the spell represents the caster visualizing himself wandering through a palace, where everything he sees, smells, or hears within the palace acts as a reminder of some bit of information or text the caster has stored within the memory construct. The *memory palace* survives after the spell's duration ends, but the caster cannot add to it or retrieve information from it without casting the spell again. A caster can only have one *memory palace* at a time.

In game terms, the caster may store up to 10 pages' worth of information per level within his *memory palace*. The spell must be cast both to add and retrieve information to the mental construct. For the duration of the spell, anything the caster sees, reads, hears, smells, tastes, or touches can be stored in the *memory palace*, and anything already within the palace can be perfectly recalled. As a rule of thumb, one minute of input from one sense takes one page of space within the *memory palace*. Thus a caster who wanted to store the sounds and sights of a conversation he took part in during the spell uses two pages of the *memory palace's* storage for each minute of the conversation.

Recalling information takes the same amount of time the memory originally took, or that would be required to read

stored text from a book. It is possible for a caster to place his spellbook within his *memory palace*, but he must first have the spell in a real spellbook which he then reads to add to the *memory palace*. As a result, many casters take Spell Mastery with this spell and then place their entire spellbook within it, guaranteeing they can prepare spells in an emergency, or even recreate a lost spellbook.

The caster may eliminate anything stored in his *memory palace*, but once discarded it is permanently lost and cannot be regained.

The information in a *memory palace* is particularly resistant to the effects of a *modify memory* spell. Even if a character with a *memory palace* fails his save against a *modify memory* spell, he is allowed a second save at +4 to prevent any information within his *memory palace* from being altered. In no case does the caster of the *modify memory* spell become aware of the existence of the *memory palace*.

Memory Palace, Greater

Transmutation

Level: Sor/Wiz 7

Components: V, S

Casting Time: 1 minute

Range: Personal

Effect: Mental construct of a palace within caster's mind

Duration: 1 hour/level

Saving Throw: None

Spell Resistance: No

This spell functions as *memory palace*, except as noted above and in allowing the storage of 20 pages per caster level. A caster may have both a *memory palace* and *greater memory palace* at the same time.

Perfect Recall

Divination

Level: Sor/Wiz 2

Components: V, S

Casting Time: 1 action

Range: Personal

Effect: Recalls one memory

Duration: 1 minute/level

Saving Throw: None

Spell Resistance: No

Perfect recall allows the caster to perfectly remember any one event he experienced directly. This could be used to quote a riddle or book exactly, remember the name of someone met only once, or determine the seating arrangement of all 300 guests at a royal dinner. The memory must have occurred within one month per level for casters of 7th level or less, within one year per level for casters of 8th through 14th level, and within 10 years per level for casters 15th level or higher. The memory recalled can be no longer than one minute per level in length, and the perfect recollection of it lasts only one minute per level.

If engaged in a legal argument (a debate based on a specific set of rules, which may include some theological debate), or lengthy negotiations or similar verbal contention, using *perfect recall* to remember exactly the content of the previous debate or rules upon which the issue is to be settled (such as recalling reading a church's holy book), grants a +3 circumstance bonus to all Diplomacy checks made in regards to the argument.

Refresher

Divination

Level: Sor/Wiz 1

Components: V, S

Casting Time: 1 action
Range: Personal
Effect: Enhanced skills
Duration: 10 minutes /level
Saving Throw: None
Spell Resistance: No

The *refresher* spell causes the caster to recall all his training, education, and educational experiences with great clarity, as if they had just occurred. For the duration of the spell the caster gains a +1 circumstance bonus to all Str, Con, and Dex skills he has ranks of, a +2 bonus to all Wis and Chr skills he has ranks of, and a +4 bonus to all Int skills he has ranks of.

Friends & Familiars (for d20 System)

Designed by [Talisman Studios](#)

Published by [Bastion Press, Inc.](#)

Written by J. Darby Douglas and Kristen Schlight

Illustrated by Jason A. Engle and James Byrd

32-page color softcover; \$14.95

Friends & Familiars joins Bastion Press' "Legends Collection" as the sequel to *Allies & Adversaries*. Like *Allies & Adversaries*, *Friends & Familiars* is a very full-color collection of NPCs -- for use as sidekicks, companions, unique animal companions and even as rare familiars -- all suited for inclusion in any **d20 System** fantasy campaign. That color element comes from the brush of artist Jason Engle, with every page of the book done in tones of burnished gold and brown and each NPC given a full-length portrait. The style of each illustration possesses the slightest of ethereal qualities and any one of these pieces stands as among the best seen in any **d20 System** supplement released to date.

The format for *Friends & Familiars* is simplicity itself. Each NPC is given a two-page spread, with its illustration on the left-hand page, and the statistics and background given on the right. Also below the illustration is a simple two- or three-sentence thumbnail description of the character, followed by two or three hooks to help get each of them into a campaign. Only a contents page helps the reader find everything, but really *Friends & Familiars* is exceedingly simple to use. Unfortunately, the very high production values of this collection have been let down by a lack of proofreading. True, only the very occasional word is missing, but just one more read through would have negated this tarnishing of an otherwise beautiful book.

Friends & Familiars opens with an oddity -- a Chaotic Good but Undead Ranger. Abernath once served as an elite scout, part of an army led by a gallant and knightly paladin. His last assignment was to infiltrate the keep of a Necromancer Lord and retrieve a holy relic. Though the mission was successful, the victory came at great cost, as Abernath and his comrades were either killed or captured. The ranger's body was subject to necromantic experiments that corrupted his body, but his will was strong enough to survive and he was able to escape. Now he wanders the land fighting for the good of a society that he is unable to re-join.

Coglinus is a magical and mechanical construct created by the wizard and sea captain, Whestra. Both a scholar and an explorer, Whestra uses this self-aware, four-legged device as an aid to researching and analysing both legends and lore in preparation for expeditions to lands unknown. This is done by the use of spells such as *Analyze Dweomer* and *Legend Lore*, but Coglinus needs careful handling as he often interprets his instructions a little too literally.

More cunning and malevolent is Dusk the shadow mastiff, which also serves a master, though this one is an increasingly powerful shadow-mage. On the other hand, Infernus used to serve a master as his steed, but since the death of Lord Urroth in battle, this flame-maned and flame-hoofed horse has been wandering the land, terrorizing villages and setting light to both crops and houses. Also free to spread dissent and disruption is Necruss, a nasty little Imp with a fear of servitude and an extreme dislike of Elvenkind.

Fiondell is a Pixie Adept whose curiosity led to an interest in the arcane and in those from outside of the Great Forest. Unfortunately, this has grown too much for her father, who has banished her from his realm (which, of course, leaves

her free to attach to any player character willing to teach her more magic). Several of the other NPCs are likewise driven to particular purposes: Eriv the fighter wants to bring vengeance upon those who mistreat women after the murder of his mother, though woe betide anyone who gets him drunk, as he will rant at her needless death; Harenhorn wants to keep his upper class origins a secret while searching for his missing younger brother; Shae the cleric will quietly but firmly insist in her offer of help and aid to the player characters; and the young wizard, Terean is out in search of adventure.

Another interesting entry is that of Riak'khon, an albino tiger cast out of his clan and worshipped as the totem-god of a Goblin tribe. The tribal shaman's magic fused "soulstuff" into the tiger and granted him intelligence equal to that of any human, which enabled the formation of a long-lasting partnership with a lore master. Unfortunately, on their most recent delvings into ruins above and below ground they were cast apart and Riak'khon may be found looking for the Goblin, his old partner or even a new one.

Of the 15 NPCs in ***Friends & Familiars***, only two possess a Challenge Rating above 10, while the majority of the NPC humans have a level of six or below. Some of the entries are also connected by generic themes and names, so that they could be worked into the same plot if the DM so desired. There is also the inference from the writing that most are intended to be long-term additions to a campaign, though a few of the evilly-aligned entries -- such as Infernus -- could be used for single one-off encounters.

There are those who are going to look at ***Friends & Familiars*** and dismiss it as too expensive for what it provides; some 15 NPCs at a cost of a dollar each. This is not an entirely unfair assessment, as there is plenty of ***d20 System*** supplements available that offer more than the 15 on show here. Yet these 15 are shown very well indeed, with the portraits as often as not, saying as much about the characters as their write-ups do. Overall, what ***Friends & Familiars*** gives you is a selection of likeable, ready-to-use NPCs, some more interesting than others, but all of them beautifully presented.

Diceland: Space

Published by [Cheapass Games](#)

Designed by James Ernest & Falko Goettsch

Ships based on designs from Richard Carlson & Iikka Keranen

Art by phosphorous, Iikka Keranen, & James Ernest

25 full-color snap-together dice (glueless assembly required), full-color rules booklet, two cutout sets of 1-10 counters

***Garthans vs. Muktians Set:* 11 Garthans, 8 Muktians, 5 Tan Ru, 1 Kawangi Destroyer**

***Terrans vs. Urluquai set:* 11 Terrans, 8 Urluquai, 5 Zorg, 1 Klackar Outrider**

\$14.95 per set

It looks like Cheapass Games is finally following up on their promise to produce new genres and settings for their **Diceland** paper dice game. The first set, **Deep White Sea**, told the story of five different factions fighting for a lost ship on an icebound planet. Another version crossing into Steve Jackson Games' **Ogre** territory is also slated for release. With the current set, **Space**, the action goes -- surprise -- into outer space. More specifically, it puts the [Strange Adventures in Infinite Space](#) computer game onto its dice and sets them on the tabletop.

For those not familiar with the first release, **Diceland** sets come with 25 paper dice, colorful die-cut foldouts that easily snap into oversized eight-sided dice. (The packaging also has two sets of 1-10 counters that can be cut out for keeping track of commands.) The dice are your units in combat, with a single combatant in varying stages of health on each die face. Players press dots on the facets when the dice are damaged or moving; this rolls the unit onto another side, changing which enemies the die points at and what their current stats are. Based on the **Strange Adventures** computer game produced through the cooperation of Cheapass and their computer partners at Digital Eel, each die in Space represents a starship. The ships belong to one of the many bizarre alien races from that game.

The Garthans vs. Muktians set has 11 of the former's forces and eight dice for the latter. It also gives you five Tan Ru dice and a bonus die, the Kawangi Destroyer. The Terrans vs. Urluquai set has 11 Terrans, eight Urluquai, five Zorg, and a bonus Klackar Outrider die.

For those who haven't played the computer game (and some of this is meant to be discovered through play, so if you want to find it out on your own):

[SPOILER ALERT!]

The Garthans are warmongering lizards who attempt to enslave and destroy others. The Muktians are slug creatures who have come out of hibernation to explore the galaxy. The robotic Tan Ru are built to resemble chitinous animals, and they have little regard for biological life forms. The Urluquai are a combative jellyfish race whose watery home has prepared them for drifting through space. Not all races are as aggressive as these, though -- humans, relative

newcomers to space, can trade with the birdlike Klackar or ask the large-headed Zorg to use their mental abilities to fold space. Above all of this are (is?) the Kawangi -- no one knows what they want, but they blow up planets to get it.

[END SPOILER ALERT]

Most of the flavor from the computer version doesn't translate to **Diceland**, though each race has a different feel in play. A great many more units in this set can -- and will -- pull additional units onto the board with the Call ability. The Terrans excel at filling the table with their many fighters, but the Urluquai with whom they are paired have a more even spread of firepower, added abilities, and die faces with multiple special effects. The Zorg from this package have fewer ships in their standard mix, but they can field their whole force almost at once, and what their shields don't stop they can jump out of the way of. And the Klackar, well -- they don't need a lot of allies.

The Garthans are perhaps the most middle-of-the-road group of either set -- they haven't a great many special abilities, but they have several ships. Most of the ships are small, but they have two carriers to bring them in. Their packaged counterparts, the Mukhtians, have fewer ships, but they've concentrated more firepower among those smaller ranks. Some of their ships give up their firepower, but only because they get better Command of their fleet in return. The Tan Ru, as a machine intelligence, work together better than any other race (like the Zorg, they can practically Call every ship in all at once), and while they have few dice, they control them the best. As for the deadly Kawangi, they are terrible to behold -- easily the most devastating foe in the game.

Most of the special effects will be familiar to players of **Deep White Sea**, though a couple of effects have been removed (Poison doesn't affect ships much). A few new ones have been added -- Cloak and Dodge allow a ship to avoid being seen or hit by enemy fire, and Shield simply deflects any attack lower than its level. Additionally, Remove lets you force the removal of an opposing unit (though without scoring points for it), and Move and Shoot (and its opposite number Shoot and Move) give a ship two actions to the normal one action.

The rules haven't been altered significantly -- the only major change is that dice may act as they are brought into play instead of waiting for their next turn, and a few minor bits have been cleaned up. The order in which the rules have been presented has been shifted, and this seems to make a world of difference (for the better) in understanding the system.

Thematically there's little overlap between the two releases -- the first set had individual people on its dice duking it out in personal combat, while this is spaceborne dogfighting. Nevertheless there's nothing stopping players from using the sets together, and they should be able to do so without anything more hazardous than suspending some disbelief.

The graphics are nice, but it's hard to jazz up the artwork and make the units look different from any other ship counter from any other game. A few of the designs are a little dark and this sometimes makes the accompanying game stats dim, but most are pretty clear considering their small size. They duplicate the look of the ships from the PC version, so computer fans who want to see what their favorites can do on the board will get the visuals to match.

It's good to see the **Diceland** game finally getting a new release to spice things up, and **Space** is good fun and a worthwhile purchase whether you've played **Deep White Sea** or not. Still, the set is something of a holding pattern, adding functional new quirks but offering little in the way of real changes or innovations that demonstrate the full potential the game can -- and hopefully will - attain.

--Andy Vetromile

Passing Players and Painted Bellies

This past week has seen a number of events align within my life, some of them interrelated:

I have started rehearsals for my role in a local play here; my role as Joel Cairo in *The Maltese Falcon* marks my first return to the stage since high school (not counting the occasional improv work). Cairo is a role where I play an effeminate vaguely European criminal, and I find myself reaffirming my masculinity in the rest of my life - smashing beer cans into my forehead, leaving the toilet seat up, not asking for directions - and convincing myself that being told, "You're *great* in this role!" is a good thing. I've also learned that trying to keep an accent is difficult; what started out as a Russian accent turned into an Irish one by the end, to the point where I found myself saying afterwards, "The kids are after me Lucky Charms *and* me Maltese Falcon!" There is a wide variety of local theatre folks in the production; although we all seem to be having fun so far, I've already come to the conclusion that some of the performers take this *much* more seriously than others.

Last weekend I also had the opportunity to go to a beach house with some friends and join their smallish LARP for the evening. I got the opportunity to see the interactions of a bunch of different players and observe how their game went, as well as adopt a cheesy Italian accent.

Meanwhile my traditional weekly LARP - which I was absent from for a week because of the aforementioned beach house - had an incident last time, where, amid other conflict, one player got worked up and actually pushed another one . . . thus violating one of the sacrosanct rules of the *Mind's Eye Theatre* books. Afterward one player met a group of other players at a 1980's dance night at a local club, and found herself snubbed by them . . . seemingly for game-related reasons. As she put it, "I'm, like, 21, and they're all like 26 and older . . . and *I* need to be the mature one?!?"

Unrelated to the above incident, I've found myself putting in a sabbatical as a GM at my weekly LARP until my play runs in September. Yes, I found that even my seemingly infinite time commitments do have *some* limit, and I've decided that the "something that has to give" would be the LARP.

Oh, and I also have learned that, when the tanning parlor makes you sign a four-page waiver basically stating that pasty-skinned Irish red-heads with green eyes and an inability to tan - like, say, me - shouldn't use a tanning bed, they really, really mean it.

So what common thread (besides my Darwin-Award-nominated dalliance with pigmentation technology) ties all of these incidents together?

Well, I realize that gaming is a hobby that, like many, people have different levels of attachment to. Now, not too long ago I probably would have made the point that folks should remember that, no matter what happens or how exciting or angering it is, it's only a game; don't take it too seriously and you'll be okay.

But I'm not so sure I believe that anymore. Oh, sure, it *is* still just a game, and it's probably wise not to become obsessed with it; if you're going to fling yourself off a bridge because your wizard Zappo Zam failed his Getting Turned Into Hush Puppies saving throw, it's probably time to get some professional help. But I also recognize that much of life's experiences and pursuits strike us in different ways; just because you feel less strongly about something than many other people doesn't mean you're necessarily wrong, nor are other people wrong for having stronger ties to things. (Or vice versa . . . wow, that's a complicated sentence.)

I got choked up when my hamster died a few years ago. I have a hobby (habit?) of collecting copies of the comic *Marvel Team-Up* #137 from bargain bins. I don't care *anything* about sports, and keep up with them the bit I do solely for their ability to let me tap into the Guy Collective. Events hold different weights for different folks; I realize now that if, say, someone wants to devote themselves to the Detroit Lions, collect all Detroit-related merchandise, and dress up like a cheerleader for LionCon, more power to him . . . and hopefully he won't judge *me* too harshly for getting weepy during *Mulan*.

No, the point I would make nowadays is to take a step back to recognize and fully gauge *how much* this stuff means to you. That step alone can make all the difference, especially in games, which are a social pursuit and generally require having other folks hanging around. Having an obsession with your group's **Vampire** game means that you'll probably contribute seriously and in a positive manner to that campaign, but it also means that setbacks or disruptions - either in-game or out-of-game - may bother you. On the other hand, having a mere passing interest in that same game means you will probably be okay with troubles about the game, but may be a disruptive element yourself.

What can you do once you recognize your level of involvement with the game? Well, not counting the bridge-flinging mentioned earlier, that really only depends on the disposition of the *rest* of the gaming group. After all, if everyone you are hanging around with enjoys the same level of commitment - whether it's a bloodthirsty weekly poker game you all take deathly seriously, a group urge to paint the Detroit Lions logo on your bellies and go to the stadium in 10-degree weather, or playing in a **Shadowrun** game you play in 12-hour marathon sessions - it really isn't a problem. Likewise if everyone treats the monthly **d20 Modern** game as an entertaining diversion but nothing to get terribly excited about, everyone should have a pretty good time.

The problem only potentially comes when people with different outlooks intermingle in a gaming group; steely-eyed poker players will probably tear apart a chatty "in for fun" member of the group, a casual football fan will probably view belly-painters with horror, and a **Shadowrun** player who goofs around during those marathon sessions may well ruin the game for everyone else. (And, of course, the flip side is also true; a **d20 Modern** guru may be wildly dissatisfied by that casual beer-and-pretzels gaming group.)

So if there is the potential for conflict, then what? Well, determine if there actually *is* conflict, or try to assess how likely conflict is. It's entirely possible that the differing viewpoints and interest levels are *healthy* for the game; the less-interested players can help keep the more intense players grounded, while the enthusiastic players can provide an environment for those less extreme to more fully appreciate the game.

But that may be the Best Case Scenario. If so, try to consider, if there is disruption, how much there is likely to be. Life isn't perfect, and a bit of friction may be a small price to pay for a gaming group that everyone is happy with.

But if everyone isn't happy, then what? Well, a good possibility is to try to find a compromise of some sort. For example, I was once part of a **Shadowrun** game where two of the players were *really* into the game, and two others were only mildly interested; there was friction within the game almost immediately. After a few games where folks weren't having too much fun, we canceled that game and switched over to an **Advanced Dungeons & Dragons** game. This game was less of an obsession to the two diehard **Shadowrunners**, and was mildly *more* interesting to one of the other two gamers; as a result, the level of interest within the game was more balanced, and the game was more successful.

Or consider the possibility of separate games or sub-games. For example, many larger LARPs will often break into smaller groups based on the interest levels of the players; the "hardcore" players cluster together, the more casual attendees get in a group, and so on. If the **Shadowrun** game above was large enough, with roughly equal groups of diehard and casual gamers, it may have been possible to break the game into two separate games - one for each interest level.

And, that isn't possible, and any of the other Random Thought Table koans - be honest, talk to each other, etc. - don't work, then it may be better to leave a gaming group that isn't meeting your needs. Life is short, and there's a lot of world out there to limit yourself to a game that bothers you.

But, no matter what else you do, if the waiver says you shouldn't use a tanning booth, then for pity's sake don't.

--Steven Marsh

The Akashik Four!

for *GURPS*

by James L. Cambias

The Akashik Four are a group of superheroes based on the ideas of Theosophy as put forth by occultists like Madame Blavatsky, Rudolph Steiner, and Annie Besant (see the sidebar for a very incomplete summary). They are designed as low-end 300-point supers, suitable for a Theosophical *GURPS Cliffhangers* campaign or a four-color Golden Age *GURPS Supers* game.

History

The Akashik Four began their career battling crime and the forces of occult evil in 1926. The founder was the being known as "The Lord of the World," leader of the Great White Brotherhood of mystic Mahatmas, headquartered in the hidden city of Shambalah in the Gobi desert. Aware of the growing tide of both mundane and supernatural evil in the outside world, the Lord of the World selected four champions to fight for good. He appeared to each of them in a vision and gave them their instructions: they must gather in New York and join forces to battle the sinister minions of the Dark Face.

The Akashik Four responded to the challenge, and made their headquarters in Doc Toltec's laboratory high atop the Woolworth Building. Their first exploits were campaigns against the gangsters and bootleggers whose turf battles were making the city unsafe for decent folk. But in 1927 the evil Lords of the Dark Face made their first bid for world power with an army of ectoplasmic horrors. Only the devices of Doc Toltec, the mental and mystic powers of Nova and the Golden Lama, and the brute power of Thal the Lemurian kept civilization safe.

In subsequent years the Akashik Four battled occult perils in Egypt and Central America, while facing mundane evils in Chicago, China, Spain, and Ethiopia. As the 1930s went on, their efforts became focused on the rising menace of German fascism and Japanese militarism. By 1937 they and other occult heroes were already locked in a struggle with Nazi sorcerers. During the war they were affiliated with the OSS, conducting occult covert operations in Peru, Egypt, India, and Tibet.

Their final battle was in Antarctica in 1948, against the last remnants of the Third Reich. Thwarting a final plot to unleash worldwide destruction, Doc Toltec and Thal the Lemurian were killed. Heartbroken, Nova and the Golden Lama abandoned the active campaign against evil and devoted the rest of their lives to finding and training future champions.

Thar the Lemurian (300 points)

The last survivor of a forgotten Lemurian colony on a remote South Sea isle, Thar was discovered by a film crew in 1922 and brought to America as a circus attraction. In the summer of 1924 the big top caught fire, and Thar's heroism in saving audience members from the blaze won him widespread fame. Pressure

Headquarters

The Akashik Four make their headquarters in New York's Woolworth Building, a gleaming white spire in lower Manhattan overlooking Chinatown. Doc Toltec rents the entire 49th floor of the building, which is furnished with a complete laboratory and workshop, guest quarters for the other members, and an arsenal of fantastic devices and weaponry. There is a private elevator direct from the lobby. A basement garage holds Doc Toltec's powerful Studebaker cars, while a private hangar at Floyd Bennett Field contains his Ford trimotor plane and personal blimp.

Nova is the only member of the team who doesn't normally live in the building (although both Thar and the Golden Lama often spend nights elsewhere in their wanderings about the city). She has a comfortable apartment in Greenwich Village, linked to the laboratory via a radiotelephone device disguised as a piece of Mayan sculpture. Since many villains know about Doc Toltec's laboratory headquarters, Nova's apartment must sometimes

from newspapers and civic leaders freed him from his life in the circus, and he spent the next couple of years as a wanderer, doing odd jobs and picking up women across North America. When the Lord of the World appeared to him, he made his way to New York and joined Doc Toltec.

Thar has learned enough about the modern world not to suffer from the Primitive disadvantage, but still prefers not to use any technology more advanced than stone or wood. He is an incorrigible (and surprisingly successful) skirt-chaser, as his kind personality and good reputation nearly offset his alarming appearance. Despite his outlandish appearance, he probably has a better understanding of ordinary people than any other member of the Four. When not battling the minions of the Dark Face, Thar spends his time at simple pursuits -- fishing, watching baseball games, and introducing himself to every pretty girl he meets.

A hulking Lemurian, 12' 2" tall, 1,600 lbs., with four arms, brown fur, and three blue eyes spaced at intervals around his head. Age 34.

ST 28 [165]; **DX** 12 [20]; **IQ** 10; **HT** 16 [80]
Move 7.

Advantages: Charisma (+2) [10], Collected [5], Combat Reflexes [15], Damage Resistance (DR 4) [12], Extra Arms (two) [20], Night Vision [10], Reputation (as a protector of the innocent, +2 all the time, everywhere) [10], 360-degree Vision [25].

Disadvantages: Appearance: Monstrous [-25], Chummy [-5], Gullibility [-10], Inconvenient Size (12 feet tall) [-10], Lecherousness [-15], Pacifism: Cannot Kill [-10], Truthfulness [-5], Xenophilia [-5], Wealth: Poor [-15].

Quirks: Attracted to tall red-haired women, Distrusts all technology beyond TL1, Loves dinosaurs, Refuses to get a job, Speaks in a booming voice [-5]

Skills: Axe/Mace-13 [4], Brawling-15 [8], First Aid/TL1-11 [2], Occultism-10 [2], Riding (Triceratops)-11 [1], Stealth-12 [2], Streetwise-9 [1], Survival-11 (Jungle) [4], Swimming-12 [1], Throwing-12 [4], Tracking-10 [2].

Languages: English-9 [1], Lemurian-10 (native).

Equipment: Thar seldom carries any weapon other than a club or rocks for throwing. He normally wears a leopard-print circus strongman's leotard, modified to fit his immense body. For more formal occasions he has a single custom-tailored suit.

Doc Toltec (300 points)

Doc Toltec (his real name is Rlaveg Askac) was born three-quarters of a million years ago in one of the Atlantean colonies in what is now Central America. Like all the ancient Toltecs of Atlantis (not to be confused with their remote Mexican descendants), he had rock-hard coppery skin and a tremendous intellect. He was an up-and-coming scientist in a highly advanced civilization until an earthquake trapped him in an underground laboratory complex. With no way to escape, he placed himself in suspended animation until help could arrive. Sadly, the quake was the start of the catastrophes which destroyed

serve as a safe house for the team, and has a cache of medical supplies, some spare weapons and devices, and a convenient skylight for secret comings and goings.

What the Heck?

Theosophy is a school of occult thought (or mystical balderdash) invented by Madame Helena Blavatsky in the 1880s. It combined elements of Spiritualism with poorly-understood Buddhist and Hindu theology, a dash of garbled Darwinian evolution, and borrowings from just about every mystical or occult tradition. Madame Blavatsky presented all this in a series of books which she claimed were channeled from the "Akashik Records," a kind of supernatural archive maintained by the Great White Brotherhood of mystic Mahatmas.

A key element of Madame Blavatsky's history of life on Earth is the sequence of seven "Root Races," each of which goes through various sub-races in the progress of the species. In particular, the Third Root Race were the Lemurians, who discovered sexual reproduction and kept dinosaurs. The Fourth Root Race were the Atlanteans, which Madame Blavatsky identified with the Toltecs. They were wiped out when their continent sank 800,000 years ago (this Atlantis isn't to be confused with the later Atlantis which Plato wrote about, nor are the Toltecs to be confused with the Toltecs of

Atlantis, and rescue never came.

In 1915 a band of Mexican revolutionaries stumbled across the complex and tried to break in, triggering devices which awakened the sleeper. His mighty intellect quickly mastered English and Spanish, and equipped with super-scientific devices and a hoard of golden treasure, he moved to Manhattan to assist the people of his adopted eon. The newspapers quickly dubbed him "Doc Toltec," and when the Lord of the World contacted him in 1926, he was already battling New York's gangsters and various monsters in exotic parts of the world.

Doc Toltec's skills are all at TL6, since he has completely familiarized himself with modern science. He can also use ancient Atlantean equipment, which was approximately TL (5+4), but naturally there isn't much of that around after hundreds of thousands of years. Gadgets developed by Doc Toltec are either improved versions of existing TL6 equipment, some TL (5+1) "weirdtech," or TL7 gear decades early. "Weirdtech" devices appropriate for Doc Toltec are such things as the Magnetic Needler, Chloroform Grenade, Etheric Spiriphone, Eigenwellendetektor, or Etheric Mesh (all from **GURPS Steam-Tech**). Real-world TL7 equipment includes electric stunners or tasers, high-powered pistols, or compact submachineguns like the Uzi or MP-5. (A later-period Doc Toltec operating during WWII or the Cold War could even have 1990s firearms or prototype TL8 equipment, although computers and most of their applications are beyond his resources to create.)

Doc Toltec's personality is perhaps the most abrasive of any in the Four. He was a member of an elite group in a civilization more advanced than anything humanity has achieved. Consequently he considers himself naturally superior to humans, and takes a patronizing attitude toward them. Toltec seldom takes a break from work, and when he does he prefers to spend it contemplating the stars or meditating rather than socializing with humans.

Apparent age 30, 6'2" tall, 240 lbs. Copper-colored skin, black hair, dark eyes. A powerfully-built man in a gold-embroidered loincloth.

ST 14 [45]; **DX** 14 [45]; **IQ** 15 [60]; **HT** 13 [30]
Move 6.75.

Advantages: Appearance: Attractive [5], Charisma +1 [5], Combat Reflexes [15], Damage Resistance 7 [21], Gadgeteer [25], Gizmos (two) [10], Status 1 (free from Wealth), Versatile [5], Wealth (Filthy Rich) [50].

Disadvantages: Cannot Harm Innocents [-10], Code of Honor (Gentleman's) [-10], Curious [-5], Enemy: gangsters (large group, 9-) [-20], No Sense of Humor [-10], Overconfidence [-10], Secret (true origin) [-5], Sense of Duty (innocents) [-15], Stubbornness [-5], Unnatural Feature: shiny copper-colored skin [-5], Workaholic [-5].

Quirks: Alcohol Intolerance, Considers his own ethics more important than laws, Doesn't understand many modern ideas, Drinks warm animal blood, Wears very little.

Skills: Armoury-18 (guns) [8], Astronomy-15 [4], Beam Weapons-17 [2], Chemistry-16 [6], Electronics Operation-16 (sensors) [4], Electronics-16

precolonial Mexico, unless maybe they are -- consistency was not Madame Blavatsky's strong point). Modern humans (or at least the "Aryans" of Europe and India) are the Fifth Root Race, and soon the first members of the Sixth Root Race will appear.

Crossovers and Variations

Though the Akashik Four fit best in a pulp-era campaign, when Theosophy itself was at its height, GMs can use them for **GURPS Atomic Horror** adventures or four-color Golden Age supers games. They can be beefed up for higher-powered superheroics by increasing their attributes, especially DX and HT. Past about 1960, their brand of mysticism is a bit too old-fashioned, though they might serve as "elder statesmen" in the superhero community.

They can also be moved back to an earlier era, although Theosophy itself didn't exist before the 1870s. A Steampunk-era version of the Akashik Four would spend less time battling mundane evil and more time coping with weird menaces unleashed by the Lords of the Dark Face. In the **GURPS Castle Falkenstein** universe, they are certainly allies of the Second Compact, and the Golden Lama is a powerful sorcerer of the hidden Shambalah lodge.

In the **GURPS Cabal** setting, the Cabal are the Lords of the Dark Face the Akashik Four

(sensors) [6], Engineer-18 (electrical) [12], Guns-18 [4], History-14 [2], Karate-15 [8], Mathematics-15 [4], Mechanic-14 (electric motors) [1], Occultism-15 [2], Physician-14 [2], Physics-16 [6], Piloting-14 (dirigible) [2], Research-15 [2], Science!-15 [8], Stealth-14 [2], Swimming-14 [1], Weird Science-14 [4].

Languages: Ancient Toltec/Atlantean (native)-15, English-13 [1], German-13 [1], Mayan-13 [1], Spanish-13 [1].

Equipment: Doc Toltec usually wears nothing but a gold-embroidered loincloth, although in public he puts on trousers and occasionally a shirt. He never bothers with shoes. Toltec always has a couple of advanced gadgets with him, and in dangerous situations arms himself with a pair of powerful firearms equivalent to .44 Magnum automatics.

Nova (300 points)

The first of the Sixth Root Race, Nora Vance exhibited unusual mental and physical powers as a child in Ohio. In her teens, however, her uncontrollable "poltergeist" telekinesis made her an outcast, and she eventually fled her family home -- just in time, as the agents of the Lords of the Dark Face were on her trail. For a time she worked as a vaudeville showgirl, before her paintings attracted the attention of gallery owners in Los Angeles. She remained there until the Lord of the World contacted her in 1926, at which point she relocated to New York. Today Nova maintains a cover identity as Eve Newman, an artist and fixture in the Greenwich Village bohemian set.

Her psionic powers are an interesting mix. She has low-level powers which she can use all the time, but her higher power levels of ESP and Telepathy require her to enter a trance state. Meanwhile, her Telekinesis power can make small objects fly around like bullets when she's in danger. In fact, none of her powers are perfectly under her control -- strange things just happen whenever Nova's around.

Note that unlike the other members of the group, Nova has the Lords as a personal enemy. The Dark Face fight Doc Toltec when he interferes with their schemes, but are otherwise content to leave him alone. But Nova is a prize -- by capturing and corrupting her they can influence the evolution of the next human race.

Nova's personality is the most flashy of the group. In her secret identity she is a colorful bohemian artist, and her attitudes carry over to her heroic persona. Her artistic life has given her good exposure to some of New York's seamier side. She can often be frivolous and impulsive, which drives Doc Toltec frantic. One thing which can make her serious is the welfare of other members of the Sixth Root Race. As other children of the new race are born, she strives to protect them from the Lords of the Dark Face and help them control and understand their powers.

Age 26. 5'2" tall, 100 lbs. A slender fair-skinned woman with no hair and unusual silver eyes (in her secret identity she wears a frizzy blonde wig).

ST 10; **DX** 15 [60]; **IQ** 15 [30]; **HT** 13 [30]
Move 7.00.

spend so much time battling. The Golden Lama can switch his ritual magic abilities for a batch of standard **GURPS Magic** spells and a complete working knowledge of Hermetic modifiers to go one-on-one with Cabal sorcerers. Players can run the Four in their epic battles against the Cabal, or use them as potent if slightly clueless adversaries for a group of Cabal PCs. Note that it's quite likely that one of the Grand Masters is actually the "Lord of the World" who organized the Four, as a convenient "deniable asset" for internal battles. Cabal PCs may fight against them one week, then join forces the next.

Finally, Theosophical ideas found fertile soil in 1920s Germany, and some of Madame Blavatsky's concepts have uncomfortable echoes in Nazi ideology -- some writers specifically identified the Fifth Root Race as the Aryans, with all other humans merely the degenerate descendants of previous races. Maybe the Lord of the World isn't such a nice guy, and the Akashik Four are swastika-wearing bad guys for a **GURPS Weird War II** or **Hellboy RPG** campaign. In that case, Thar the Lemurian is a brutal, sex-crazed goon, Doc Toltec keeps alive ancient sacrificial rituals, Nova is impatiently waiting for humans to go extinct and make way for her super-race, and the Golden Lama is possessed by a hostile alien intelligence.

Advantages: Absolute Timing [5], Appearance (beautiful) [15], Autotrance [5], Eidetic Memory [30], Longevity [5], Metabolism Control-2 [10], Rapid Healing [5], Reduced Sleep [10].

Disadvantages: Enemy: The Lords of the Dark Face (medium superhuman group, 6-) [-15], Extravagance [-10], Impulsiveness [-10], Overconfidence [-10], Pacifism (self-defense only) [-15], Secret Identity [-10], Sense of Duty (the Sixth Root Race) [-10], Unnatural Feature (hairless) [-5], Weirdness Magnet [-15].

Quirks: Always wears trousers, Avoids alcohol and stimulants, Bisexual, Encodes occult wisdom in her paintings, Only eats fruit and nuts.

Skills: Area Knowledge-14 (New York) [1/2], Area Knowledge-14 (World)-1 [1/2], Artist-15 [4], Chess-14 [1], Dancing-15 [2], Disguise-13 [1], First Aid-14 [1], Guns-17 [1], Judo-17 [16], Literature-13 [1], Lucid Dreaming-13 [1], Occultism-14 [2], Performance-13 [1], Piloting-14 (dirigible) [1], Savoir-Faire-14 [1], Sex Appeal-13 [1], Stealth-16 [4], Streetwise-13 [1].

Languages: English-13 (native), Mayan-12 [1], Spanish-13 [1], Tibetan-12 [1].

Psi Powers: ESP-5 [15], ESP-20 (only in trance state, 1/3 cost) [20], Telekinesis-4 [16], Telekinesis-16 (uncontrolled, 1/2 cost) [32], Telepathy-3 [15], Telepathy-9 (only in trance state, 1/3 cost) [15].

Psi Skills: Clairvoyance-13 [4], Clairaudience-13 [4], Emotion Sense-13 [4], Mental Blow-12 [2], Mind Shield-13 [4], Precognition-12 [2], Psi Sense-13 [4], Psychometry-14 [6], Telekinesis-14 [6], Telesend-13 [4], Telereceive-13 [4].

Equipment: In her secret identity, she wears fashionably "arty" clothes and a blonde wig. As Nova she wears boots, white jodhpurs, a black tunic, and a domino mask, leaving her hairless head exposed. In combat situations she carries a 9mm Luger, but prefers not to use it.

The Golden Lama (300 points)

The Golden Lama is a 16-year-old Tibetan boy, the current bodily vessel for an ancient immaterial Venusian Lord of Fire. Consequently he has vast mystical abilities and can tap memories from dozens of previous lives. He was only 14 when the Lord of the World sent him from Shamballah to New York to join the Akashik Four.

The Lama's powers are considerable, but require some preparation. If he has time to perform a magic ritual, he can summon and command spirit beings and manifest them with his Ectoplasmic Projection ability. Caught in a sudden combat situation, he must rely on the martial arts he learned as a monk.

Because he has the mentality of an ancient otherworldly being, the Golden Lama seldom bothers with practical worldly details. Money and possessions are unimportant to him. He does regard all human life as precious, and whenever possible tries to convert foes rather than harm them. He often forgets that his current vessel is only a youth, and often surprises or amuses people with pronouncements of ancient wisdom and casual references to events of past centuries.

Age 16. 5'4" tall, 140 lbs. A wiry Tibetan boy with a shaved head and dark eyes, dressed as a Buddhist monk.

ST 10; **DX** 13 [30]; **IQ** 13 [30]; **HT** 12 [20]
Move 6.25.

Advantages: High Pain Threshold [10], Racial Memory [40], Sanctity [5], Strong Will +1 [4], Unfazeable [15].

Disadvantages: Absent-Mindedness [-15], Clueless [-10], Compulsive Generosity [-5], Devout Buddhist [-5], Pacifism (self-defense only) [-15], Poverty (poor) [-15], Selfless [-10], Sense of Duty (all humanity) [-15], Truthfulness [-5], Youth (age 16) [-4].

Quirks: Begs for food, Fanatically clean, Forgets he is only a boy, Prefers to sleep outdoors.

Skills: Autohypnosis-14 [6], Breath Control-12 [4], Fire Walking-13 [1], First Aid-13 [1], History: Esoteric-12 [2], Karate-16 [24], Meditation-12 [4], Occultism-17 [12], Panhandling-13 [1], Stealth-13 [2], Theology-14 (Buddhist) [6], Weird Magic-13 [6].

Languages: English-11 [1], Hindi-12 [1], Mandarin Chinese-12 [1], Sanskrit-13 [2], Tibetan-13 (native).

Magical Skills and Rituals: Ectoplasmic Projection-12 [2], Path of Health-17 [20], Path of Knowledge-16 [16], Path of Protection-17 [20], Path of Spirit-18 [24], Ritual Magic-18 [28].

Magical Advantages: Channelling [10], Ectoplasmic Projection-2 (Always Visible, -20%) [10], Medium [10], Ritual Adept-3 [30], Ritual Aptitude-5 [5].

Equipment: The Golden Lama wears saffron-colored wool robes and carries a string of beads and a begging bowl. He never uses a weapon.

Thanks to Jesse Lowe for inspiring this article, and Bill Stoddard for making me write it.

Franz Anton Mesmer

for *GURPS*

by James L. Cambias

History

Friederich (Franz) Anton Mesmer was born May 23, 1734, the son of a forester for the Prince-Bishop of Constance, in southwestern Germany. The young Mesmer must have showed signs of promise, for he was able to get a wide-ranging education despite his parents' lack of means. He attended the Jesuit university at Dillengen, then Ingolstadt university in Bavaria (where Adam Weishaupt later taught and the fictional Dr. Frankenstein was a student).

His first training was in theology to prepare him for the priesthood, but he abandoned that and began studying law in Vienna in 1759. After a year of that he switched again to the study of medicine. His dissertation was on the influence of tides on human health and behavior; much of it was plagiarized verbatim from the work of an English doctor named Mead, who was Isaac Newton's personal physician and wrote in the early part of the 18th century.

In 1768, Mesmer married Anna Maria von Posch, a wealthy widow 10 years his elder. For the next decade he practiced medicine out of her palatial house in Vienna. He was a friend and patron of Mozart's family, and a one-act opera by the 12-year-old composer was first performed in the gardens of Mesmer's house.

The Jesuit astronomer Maximilian Hell (who led an expedition to Lapland in 1769 and has a crater on the Moon named after him) first got Mesmer interested in magnetism. Hell had dabbled in treating ailments by applying metal magnets to the patient's body. (GMs looking for more High Weirdness can assume that Hell found the entrance to the Hollow Earth in Lapland, and learned the secrets of magnetic healing from the Hyperboreans.) Mesmer adopted Hell's ideas about magnetism, claiming (falsely) to have described them first in his (plagiarized) dissertation.

Mesmer soon found that the mysterious healing power of magnets could be transferred to other substances, including water and human beings. The patients responded just as well to "magnetized" objects as to actual magnets. Mesmer decided that there was such a thing as "animal magnetism," a force generated within the body which could be stored and used for healing. He augmented his personal magnetic power with an exciting-looking electrostatic generator which made sparks and gave mild shocks.

For the next few years Mesmer managed a series of heavily publicized "cures" alternating with bitter controversies with other doctors and scientists. His most famous case was of the young blind musician Maria Theresa Paradis. Mesmer supposedly restored her sight, but after a while she went blind again. He blamed her parents for undermining his treatments.

Mesmer went to Paris in 1778, establishing himself in the fashionable Place de Vendome. His wife remained behind in Vienna, and they never saw each other again. In his Paris home, Mesmer set up four rooms with large tubs of "magnetized" water, from which patients could absorb the healing power through iron rods or cords. (There was a fifth room where the poor could get treated for free, but that water was only magnetized by one of Mesmer's assistants.) His place became something of a social rendezvous -- ladies and gentlemen would sit around the tubs chatting, having tea, and listening to glass harmonica music. The establishment had two large doormen in matching livery, and a staff of assistants.

For acute cases, Mesmer would treat the sufferer personally, stroking or pressing the afflicted part while maintaining eye contact with the patient, sometimes for hours at a stretch. At times this treatment could induce fainting, vomiting, and even convulsions, so a padded room was added. Mesmer did accompany his magnetic treatments with more orthodox medical methods -- bleeding, purges, and a variety of drugs. His favorite prescriptions were lemonade and

cream of tartar. (Perhaps Mesmer's reputation as a miracle healer stemmed from the fact that his treatments were less harmful than other medical practices of the day.)

At first he was eager to have his methods tested and studied by the scientific authorities. Mesmer approached the Royal Academy of Sciences, the Royal Society of Medicine, and the Faculty of Medicine. The results were not good. Mesmer expected the doctors to accept his ideas without question, while they dismissed him as a quack.

In 1783, Mesmer established the Society of Universal Harmony with the help of his patient and secretary Nicolas Bergasse. Members paid up to 1,200 livres for Mesmer's instruction. Still, the organization grew, with more than 100 members in Paris, and daughter lodges in France, Belgium, and the West Indies. Lafayette was a member of the Society, and carried a letter from Mesmer to George Washington when he joined the American army. (Illuminated campaigns can assume the letter contained orders from Mesmer to his American mind-slaves.)

The following year King Louis XVI appointed a scientific commission to evaluate Mesmer's claims. The group included such luminaries as Benjamin Franklin, Dr. Joseph-Ignace Guillotin (who later reformed methods of capital punishment), Antoine Lavoisier, the astronomer Jean Bailly, and others. The scientists found no evidence that animal magnetism existed at all. (Interestingly, the commission also produced a *secret* report to the Prefect of Police about the possible risk to the virtue of ladies receiving Mesmeric treatment -- a valid concern given that some descriptions of the effects of magnetic treatment sound suspiciously like sexual arousal. In a conspiratorial game, the secret report contains the *real* facts on Mesmer's powers, and naturally resides somewhere in Warehouse 23 today.) The report was followed by a flurry of refutations, counter-refutations, denunciations, lampoons, and satires.

In 1793, with France still in the midst of revolution, Mesmer returned to Vienna. He was arrested on suspicion of being a political radical, released after a month, and remained under surveillance while in Austria. It is hardly surprising that he removed to Switzerland in 1796. Much of his fortune was in French government bonds, which became worthless with the Revolution, so he lived modestly. In 1798 he returned to Paris, where he published his autobiography and a summary of his discoveries. But with the rise of Napoleon he returned to Switzerland and lived there until his death in 1815.

Mesmer In the Campaign

As a patron, Mesmer has wealth, very good social connections, and whatever benefits his magnetic abilities can provide (10 points for a mundane Mesmer, 15 if he really does have healing powers, and 20 points for a cinematic Mesmer with mind-controlling hypnotic abilities). If he becomes the enemy of a PC, Mesmer's preferred tactics are lawsuits and vitriolic pamphlets, although a cinematic Mesmer could also make use of hypnotically programmed assassins and brainwashing.

Characters in Paris after 1778 may simply be patients of Mesmer's. His home is a good place to meet Contacts and gather information by listening to gossip. PCs can take "believes in Mesmer's healing powers" as a Quirk.

Mesmerism

Treatment by Animal Magnetism seems to be mostly a matter of suggestion combined with patients getting better on their own. In **GURPS** terms, Mesmer has the Hypnosis skill although he doesn't call it that. Like other hypnotists, he can use hypnosis to help patients control pain, relieve stress and stress-related ailments, and possibly cure ailments which are psychological in origin. He cannot cure organic diseases or injuries, although he can sometimes convince his patients that he has.

If the GM wants a Mesmer who really can heal people with his mind, give Mesmer either the Faith Healing advantage or the psionic power Healing at a fairly low power level (no more than 3), and replace his Hypnotism skill with Healing-10.

For a full-bore cinematic Mesmer with the power to cloud men's minds, use the "Hypno-Power" rules from **GURPS**

Warehouse 23 and increase his Hypnotism skill level to 20. That allows him to mesmerize opponents in combat, implant hidden commands, and edit memories -- perfect for adding *Manchurian Candidate*-style paranoia to a **GURPS Scarlet Pimpernel** or **GURPS Age of Napoleon** campaign. This version should also have Weird Science skill and probably some combat abilities.

Obviously, any version of Mesmer whose powers actually work should not have the Delusion disadvantage.

Crossovers

GURPS Scarlet Pimpernel

Mesmer's own politics were vaguely liberal, but he did flee Paris during the Terror. His disciple Bergasse was active in the first phase of the French Revolution. Given the shifting loyalties of the time, Mesmer could easily be on either side. A heroic Mesmer (with psionic healing) would be a good ally, a realistic Mesmer could need rescuing, and a villainous hypnotic mastermind Mesmer might actually be the hidden power behind the whole Reign of Terror.

GURPS Cabal

In the Cabal history, Mesmer is likely a psionic Adept, establishing his own Lodge in Paris after completing his training in Austria. Unlike other Adepts, Mesmer is unusually public in his activities. Is he simply "hiding in plain sight" using quack medicine as a cover, or is he playing a deeper game, pulling the strings of all the revolutionaries in Paris with the goal of transforming Europe?

Other GURPS Settings

By changing his name and the pseudoscientific buzzwords he uses, Mesmer can be a quack healer in just about any era. Obviously, this works best in settings without magical or psionic healing. In a **Cliffhangers** game, Mesmer's cultish Society for Universal Harmony might be the cover for an espionage ring, jewel-smuggling gang, or worse. In the **Atomic Horror** era, Mesmer's overconfident meddling in the very energies of life itself might backfire, leaving the PCs to confront the menace of the Magnetized Man!

A round-faced German gentleman with brown hair (usually hidden by a powdered wig), 5'9" tall, about 180 lbs.

ST 11 [10]; **DX** 10 [0]; **IQ** 13 [30]; **HT** 10 [0]
Move 5.

Advantages: Ally Group (Society for Universal Harmony, medium group, 9-) [20], Charisma +2 [10], Reputation (scientific-mystic healer, +1) [5], Status 2 [10], Voice [5], Wealth (very wealthy) [20]

Disadvantages: Delusion (magnetism works) [-10], Greed [-15], Overconfidence [-10], Reputation (quack, -2 among doctors and scientists) [-5].

Quirks: Freethinker, Loves music, Proud, Quarrelsome, Takes credit for others' work [-5]

Skills: Area Knowledge-14 (Paris) [1], Area Knowledge-14 (Vienna) [1], Astrology-11 [1], History-11 [1], Hypnotism-12 [2], Law-11 [1], Literature-11 [1], Mathematics-11 [1], Musical Instrument-12 (clavichord) [2], Musical Instrument-12 (glass harmonica) [2], Musical Instrument-11 (violin) [1], Naturalist-12 [2], Occultism-12 [1], Performance-13 [2], Pharmacy/TL4-12 [2], Philosophy-11 (Aristotelian) [1], Physician/TL4-14 [6], Physics/TL4-11 [1], Savoir-Faire-14 [2], Scene Design-11 [1], Theology-12 [2], Writing-13 [2].

Languages: French-13 [2], German-13 (native) [0], Latin-12 [2].

105 points

Equipment

Mesmer typically wears very fashionable clothing, often appearing in a lilac-colored coat. He does not carry a weapon, but he does have a complete TL4 doctor's kit, along with all sorts of impressive-looking medical devices: electrostatic generators, Leyden jars, magnets, and so forth. His wealth means that he can get almost any piece of equipment if it is available in Paris.

Class Action

The Jack-of-All-Trades

by Steve Honeywell

Everyone is good at something, be that cooking, painting pictures, or swinging a sword. But some people appear to be good at just about everything. They know at least a little about a lot, and know a lot about quite a bit as well. They have a variety of skills that make them not necessarily the best at any one thing, but at least competent at anything they try. These are Jacks- (or Jills-) of-all-trades, people capable of doing anything anyone else can do and more.

In **d20 System** terms, the Jack-of-all-trades, or joat, is someone who has concentrated his abilities on a variety of skills at the cost of combat abilities and spellcasting skill. Many have at least one craft skill and a professional skill to help them succeed in business, and some may have several of each. Joats are capable of possessing every skill available. While there's no guarantee that a joat will have ranks in a given skill, he probably does, and a powerful enough joat can even use skills he doesn't have ranks in. Their high number of skill points means that, given time, any joat will eventually have at least one rank in just about everything.

Because of the high skill point requirement for the joat prestige class, most of their ranks are filled by rogues or multi-classed rogues, and many of them are human. Highly intelligent characters of other classes may qualify for the joat class, but often find it unattractive. Lack of spellcasting progression and reduced bonuses to attacks make becoming a joat uninteresting for those who depend on spells or who find themselves on the front lines of combat. It's a possibility for a very smart human bard who doesn't rely on his spells and wishes to make himself able to do the work of several in a group context (or better take care of himself on the road alone).

NPC joats can be found doing almost anything, as the name of the class suggests. Some hire themselves out as trouble shooters or handymen while others use their various skills to run businesses or other enterprises. For an adventuring party, a joat easily takes the place of the rogue, and with his collection of esoteric skills, he can allow other characters to concentrate their skill points on just a few important ones.

Jack-of-All-Trades Class Details

Hit Die: d6

Jack-of-All-Trades Requirements

To qualify for this prestige class, a character must meet the following requirements:

- **Skills:** Any 8 skills: 10 ranks each, Any 15 skills (including the 8 mentioned previously): at least 1 rank
- **Special:** Must have access to at least one exclusive class skill

Class Skills

The Jack-of-all-trade's class skills are all skills except for exclusive class skills the character has never had access to (Scry and Animal Empathy for a rogue/joat, for example). These exclusive class skills are considered cross-class for Jacks-of-all-trades. Speak Language is still considered a cross-class skill, so a joat who wishes to add another language to his repertoire must spend two skill points to do so.

Skill Points at Each Level: 8 + Int modifier

Table 1-1: The Jack-of-All-Trades

Base Level	Attack Bonus	Fort Save	Ref Save	Will Save	Special
1	+0	+0	+2	+0	Insight
2	+1	+0	+3	+0	Bonus Feat (Skill Focus)
3	+1	+1	+3	+1	Quick Study
4	+2	+1	+4	+1	Calm Under Pressure
5	+2	+1	+4	+1	Bonus Feat (Skill Focus)
6	+3	+2	+5	+2	Lucky Guess
7	+3	+2	+5	+2	Quick Study
8	+4	+2	+6	+2	Bonus Feat (Skill Focus)
9	+4	+3	+6	+3	How'd He Do That?
10	+5	+3	+7	+3	Perfect Focus

Class Features

The following are features of the Jack-of-all-trades class.

Weapon and Armor Proficiency: A Jack-of-all-trades gains no additional armor or weapon proficiencies.

Insight: A Jack-of-all-trades may add his Intelligence modifier to any skill check three times per day. If the Jack-of-all-trades has no Int modifier or a negative modifier, he receives a bonus of +1 on uses of Insight. Insight may be not used with skills that have Intelligence as a key ability.

Bonus Feat: At 2nd level and every three levels after, the Jack-of-all-trades receives a bonus feat. This must be a Skill Focus feat for any skill in which the character has at least 1 rank.

Quick Study: At 2rd and 7th level, the Jack-of-all-trades receives a bonus 4 skill points. These must all be placed in the same skill, and must be placed in a skill in which the Jack-of-all-trades has had no previous training.

Calm Under Pressure: At 4th level, the Jack-of-all-trades may take 10 on any skill checks, even under adverse conditions. Calm Under Pressure can be used three times per day. The Insight ability may not be used in conjunction with Calm Under Pressure.

Lucky Guess: Starting at 6th level, the Jack-of-all-trades may reroll one failed skill check per day. The result of the re-roll must be accepted, even if it is worse than the original roll.

How'd He Do That?: At 9th level, the Jack-of-all-trades may use untrained any skill in which he has not trained, using the appropriate ability modifier once per day. For example, a ninth-level Jack-of-all-trades with no ranks in Alchemy may attempt to use the skill, adding his Intelligence modifier to a roll of a d20. The Insight and Calm Under Pressure abilities may not be used with How'd He Do That?

Perfect Focus: At 10th level, a Jack-of-all-trades is truly competent at performing under all conditions. He may take 20 on any skill check three times per day regardless of the situation. Perfect Focus may not be used in conjunction with Insight, Calm Under Pressure, or How'd He Do That?

HeroQuest

by Ron Edwards

Artwork by Ossi Hiekkala, copyright © 2003 Issaries, Inc.

In the back of *Cults of Terror*, a *RuneQuest* supplement published by Chaosium in 1981, I find the following "upcoming products" announcement:

HeroQuest. A new FRP game compatible with but distinct from *RuneQuest*. The mighty of Glorantha enter the lands of myth and legend, penetrating the immortal stories to fight in the Gods War, to crusade against Chaos, or to aid the Lightbringers. A revolutionary concept and approach to myth, magic, and gaming.

By Greg Stafford.

Cults of Terror was published 21 years ago, but this game never appeared. We see its realization only now.

The mythic world of Glorantha dates back to the 1960s, and in the 1970s was well-represented in wargames from Chaosium. When roleplaying appeared on the hobby scene, the Chaosium crew lost no time in publishing *RuneQuest*, a fantasy RPG set in Glorantha. *RuneQuest* has been through a few changes over the years, and that's worth a whole essay right there. It was one of the most single influential roleplaying game designs in history, and Glorantha gained a world-wide fan following.

Stafford now owns the Glorantha setting through his independent company, Issaries Inc., and he enlisted the immensely talented and thoughtful Robin D. Laws (*Feng Shui*,

Rune, The Dying Earth) to write the core rules system -- this new package was first released as **Hero Wars** and is now greatly modified and renamed **HeroQuest**. It represents the full spectrum of epic fantasy, from young heroes struggling to find their place in the world, to near demi-gods questing into myth itself and even changing it.

Egg of Erangalos Karastomabor

Floating a few meters above the surface of land or water, this immense indestructible egg has intrigued philosophers and mystics since Time began. Its purpose and origin are a mystery, although theories abound. The Egg's specific color depends on the race viewing it: pale blue to humans, medium red to elves, pale orange-yellow to dwarfs, and bright blue-purple to trolls.

What is Glorantha?

HeroQuest is set in the fantasy world of Glorantha, which is highly influenced by Scandinavian epics, mid-20th-century fantasy fiction, and classical myth from Greece and the Middle East. It is nothing like the pseudo-Tolkien faux

fantasy in many roleplaying games. Glorantha has a powerful, sweeping feel to it, including story after story full of inspiring heroes and dramatic moments. It is full of magic and wonder.

A character is magic. Everything on Glorantha is magical and mystical. No one is a grunting, surly, atheistic sword-dude. There's no getting around it; your character has a personal, cultural, sincere tie to the beings that Give Life Meaning. How has that tie failed you? What changes do you want to make to it? Answering these questions is the essence of **HeroQuest** roleplaying.

The most important detail is that the Hero Wars have begun. The Lunar Empire, in its quest for a coastline, has run into a rebellious tribe of barbarians in a geographically difficult area called Dragon Pass. At first, it's just another war between an empire and some die-hard rebels, but each side calls the gods into it -- and the wars explode into events that will eventually drive the gods out of existence and redefine the world. What the player characters choose to do, how they choose to fight in the Hero Wars, is going to become the new mythology.

A fair amount of Glorantha material is, if not tongue-in-cheek, at least funny. I can see a tendency on my part to emphasize the serious, mythic, blood-and-passion side of it all, but that short-changes the humor. Examples include those silly Ducks, the Ernalda's priestess' magic feats like "Think-of-the-children Cajole," some of the funkier cultures that are solid satires of other games or fiction, and a lot of the names. If your roleplaying bent is toward the humorous, Glorantha can provide it, but if it's not, then the setting won't force it either.

For the new reader, Glorantha is fascinating and original (in gaming terms; in literary terms its roots are highly recognizable), but it can also be overwhelming, especially since this massive background is implied and referred to in many places across the books. Questions abound: "What's a Lightbringer?" or "What's all this about broos?" or "Where's Dragon Pass, anyway?"

The good news is that Glorantha, unlike many fantasy RPG settings, works very well in small bites added on through play session after play session. There's a lot to learn, ever more rewarding, but very little you have to know at the outset. And **HeroQuest** has been designed to present Glorantha in small bites.

How Does The Game Work?

Characters are created using keywords, terms that carry with them baskets of skills, relationships, and flaws. The most important are Homeland, Occupation, and Magic, so that I might create a character as a Heortling Healer of Chalana Arroy. Just by saying this, the guy has 20-25 skills, magic, and starting scores popped right onto the sheet. Using either a list or narrative method, you (the player) just pile on a bunch more skills and attributes as you see fit. The character is highly "set" by his or her background, but you add whatever you want, making up what you'd like (there is no set skill list), up to and including followers, wealth, and nifty items. The numbers are added very simply later and are very easy -- one number to one term (attribute, skill, item, or anything). No points, no math, no rolls, no allocation.

So here you are in Glorantha. What do you do? Well, quite a lot. The setting is racked with war, and there's simply no way to avoid it. The neat part is that people conduct "heroquests" to the Otherworld, joining and even influencing the stuff of myth, in order to promote their own political and military goals. As I implied above, the game finally realizes Stafford's original intent to introduce the classic, mystic heroquest into roleplaying. It takes myth and literature very seriously and completely ignores the whole concept of adventuring just to improve for the next adventure. Rules and ideas for this mode of play are presented in some detail.

In order to conduct a heroquest, characters need to care about something enough to form their own solution. They form a Hero Band, a group of individuals and their followers who represent a unique solution to the controversies and battles that wrack the land, up to and including bringing an actual godling or god into reality. Again, this is so different from the usual run-around-kill-monsters model that it will leave traditional players baffled (which is good, frankly). If you're thinking in terms of old-style fantasy gaming, with "my guy" being "run through" a "dungeon," **HeroQuest** scenarios will be a big change for you. They occur within communities and are concerned with facing moral crises that arise from societal change. The most important raw material comes from the various relationships, communities, and social roles represented by each player character.

So much for the basic content; now for the system. I do not exaggerate to call it a Great Leap Forward for roleplaying. It uses dice, but utterly abandons building a moment-to-moment reality as the goal. The basics are deceptively familiar: roll d20; check against a target value; compare with the opponent's roll. There's no further rolling or checking, you and/or the opponent simply did really well, did OK, missed by an inch, or screwed up. Same-old thing? No -- because of four things.

#1: Everything on the character sheet is an ability. Skill? It's an ability. Physical descriptor? It's an ability. Character flaw? It's an ability. There are no "attributes" and no "skills" as separate game entities; they're mechanically all the same thing. The result is so much more sensible, and so much easier in play, than anyone might imagine. Hundreds of aggravating things about roleplaying systems and character creation just disappear.

Even relationships are abilities. This is a big deal in play -- one can use "Relationship: brother" or "Relationship: the town" just as one might use "Broadsword." Instead of a combat or spell arsenal with a few skills attached, **HeroQuest** characters are people first, with lives and hates and loves, who also happen to fight and to know some magic.

Just as anything about your character is an ability, all conflicts are conducted exactly the same way in **HeroQuest**. It can be a debate, a fight, a romantic interlude, or the clash of armies, and it's all the same mechanic.

#2: Contests come in two kinds: Simple and Extended. Simple Contests are resolved with a single die roll, while Extended Contests involve rolling dice over several rounds of bidding Advantage Points. However, the distinction isn't about how complex the conflict is in-world, but about how emotionally important it is to the real people at the table. If the conflict at the moment is a way-station to something else, or is "over quickly" in cinematic terms, it's Simple -- doesn't matter if it takes one in-game action, or 20, or a hundred. If it's a big dramatic moment, though, it's Extended, even if it only takes two seconds in "real time."

Therefore, use Extended Contests sparingly! The players, wanting to unload all their Advantage Point whup-ass at every turn, must be reined in. Gamemasters (called "narrators" in **HeroQuest**), used to the idea that in-world complexity sets actual-play complexity, may think they have to be used whenever something complicated is going on. I say, use Simple Contests for just about everything, and save that bidding stuff for the real battles and heart-breaking intrigues. I was reminded of the movie *Gladiator* while trying this out, and I think there are only two Extended Contests in that movie: the ongoing social intrigue between the emperor and his sister, and the big one-on-one duel at the end. Everything else was a Simple Contest, resolved with one or a few rolls.

#3: Every contest has two tremendous modifiers. The first one is Bumping: shifting one's success upward, either by spending Hero Points (experience points) or by having a high enough Mastery (ability rating). Bumping allows the resolution system to scale upward without the usual tail-ends of "hopeless" and "godlike" applied to the same tasks. If you have a great enough advantage over your opponent, you can even bump him down, making your victory even greater.

The second one is my favorite part of the game, called Augmenting: success on one roll (ability) leads to a positive bonus on the next. This is amazing during play. Want to intimidate someone? Roll your Grim ability, and if it does well, then add a bonus to your Intimidate ability. It applies to absolutely anything on the sheet, especially relationships. Thus, if you're chasing some guy, you roll your Running and that's fine, but if you're chasing the guy who's kidnapped your sister, Augment with your "Relationship: Sister," and you're better at Running. Because of Augmenting, every character and every scene in **HeroQuest** becomes unique.

You can even Augment without rolling a die! Any ability you have can provide an Automatic Augment to any other (appropriate) ability. The bonus might not be as great as if you rolled, but then again, you don't risk getting a penalty because you rolled badly. This way, you can automatically get a bonus for being Strong, Grim, and Tough in a sword fight, without having to make half a dozen rolls to figure out how much those abilities help you.

#4: The really shocking innovation is the defining feature of Extended Contests, called Advantage Points. They have no mechanical role during a contest at all. You bid them before acting, and that one roll's outcome might forfeit the bid, get you a big return, or even transfer them to the opponent. That is all the rolls do until the contest is over: just

subtract Advantage Points or move them around.

Some roleplayers, accustomed to constructing an imaginary reality step by sequential step, may very well be confused. What are these Advantage Point things? As long as they stay positive on both sides, they're just atmosphere; you basically "turn up the music" or "hog the camera" by bidding lots of points. Advantage during a contest ebbs, flows, and shifts, based on who's got more Advantage Points at the moment. But when one or both sides go below zero, now you know who wins and who loses. Then, and only then, are the events of the contest interpreted, in retrospect. If you end up on top, that big loss in Action Points two rounds back turns out to have been just a scratch. But if you lost out in the end, wow, that wound you took two rounds back really did you in. (So! No hit points, no fatigue, no endurance, no magic points; all these are subsumed in this retrospective definition of what happened over all the rolls of a contest.)

Now those confused players may howl with rage. Does winning mean you took no damage at all? How about movement modifiers? Pre-empting a faster opponent by a desperate move? Wearing down or annoying the opponent? Weapons and armor differences? Teaming up? And, and, and? Laws' system does in fact take all this into account, but by modifying Advantage Points, not by adding new steps and rules to the system.

Yet another innovation introduces the idea of followers, in that "extras" are treated basically as advantages to the "main guy's" rolls; they are not treated as characters in their own right, with actions and rolls of their own. Does your merchant guy travel about with three brawny helpers? You roll only for your merchant guy in a fight, but he sure gets some kick-butt Advantage Point add-ons when these guys are around, perhaps far better than the fighter dude all on his lonesome. Obviously, this technique cuts way down on play time in general, as a troll and his attendant horde of trollkin are rolled for as a single unit rather than as seven or eight individuals. It also creates kind of an interesting mini-GM effect for the players, as each may be controlling a band of people, rather than just one character.

The Isfalt

What Do *RuneQuest* Veterans Need To Know?

This game presents an amazing 180-degree turn in the basic philosophy of character design. In ***RuneQuest***, you knew everything physical about your character to the most painstaking, quantitative detail, but nothing about his personality or status as a protagonist. In ***HeroQuest***, you start with precisely those elements and let the other details simply spring from there. The best example of this is comparing the magic systems: in ***RuneQuest***, spells were intensely detailed and codified into list after list, god after god, rule after rule. You had so many Magic Points to cast spells, so much POW to match them against targets, so much INT to store them, and each was categorized according to two or three parameters. Here, Theistic magic (the stuff most familiar to most of us veterans) is largely improvisational. Given the Runes and a few examples for each god, the player must actually explain how the desired effect fits with the mythology of the presiding deity. The ***HeroQuest*** rules for magic match the themes of Glorantha far better than the mechanistic ***RuneQuest*** system could ever hope to. Of course, this gives the player much more control over his character, since he can take a single magical ability and use it in many different ways; all it takes is a little imagination.

The difference in actually playing combat is remarkable as well . . . imagine an old ***RuneQuest*** game in which our band

The Isfalt

Just when adventurers think they know what to expect, Glorantha throws another surprise in their way. Sometimes it is a delight or a wonder, but it is unlikely that the Isfalt counts as either of these.

other. Nearly all of this time is dedicated to resolving (1) the order of announced actions and (2) the effects of successful actions.

In **HeroQuest**, these very issues are resolved nearly instantly without being arbitrary. The entire combat might be handled by a single die roll in a Simple Contest! But even if you take it to the more detailed Extended Contest, there may be a bit of Advantage Point negotiation, but the action flows and resolves much faster. The same combat might take under half an hour, and given the player's freedom to define the character's commitment to this fight as it plays, it's far more satisfying to all concerned.

Also, the **RuneQuest** material kept player characters in the wastelands, hellholes, and outskirts of Glorantha, doing dungeon-style stuff like killing Chaos things, collecting Clacks, and building one's skills up to Rune level. This theme (or value-system) is utterly absent in **HeroQuest**. Instead, the "level" of play is up to you from the beginning, and the focus is strictly on resolving mythically and politically significant problems in and within communities. The general arena for suggested play has moved out of Prax and into Dragon Pass. Chaos per se is not presented as the central villain, as most of the violence around Glorantha is presented as arising from the conflict of interests in each place.

Where Do We Go From Here?

Given this focus, local and general cultures must be highly emphasized, and the books really deliver. The support material is astonishing, and far more oriented toward real decisions for players than the mainly descriptive older material. It also includes much new stuff, and at long last much is revealed about the Lunar Empire (the Red Goddess turns out to be a daughter of Yelm-yikes!) and the sorcerous cultures of western Genertela.

Getting a look at the religious panoply across the whole of Genertela yields some insights that never did get well expressed in the detail-heavy, pattern-light **RuneQuest** material. For instance, to the Orlanthi of Dragon Pass, Ernalda is the wife of Orlanth; to the Esrolians, she's the Great Goddess and Orlanth is one of her many paramours; and to the Tarshites, she's not only another daughter of Yelm but also one of the Seven Mothers of the Red Goddess! Another example is that the term "Gbaji" is applied to Nysalor by some peoples, but to his foe Arkat by others. Stafford has been especially clever in making each religious system use the same or similar bits and pieces, reflecting the historical contacts and re-castings of the old stories by the various cultures. **HeroQuest** recasts the world of Glorantha into a new game, using old favorites and new methods to allow and encourage truly mythic games.

Product Information

HeroQuest: Roleplaying in Glorantha is a July release, and will be sold by Steve Jackson Games. At the same time, a complete 64-page book called **HeroQuest Voices** will be available free for download as a PDF file. This book gives additional cultural background information on the 10 homelands detailed in **HeroQuest**, as well as seven additional peoples and races. Visit Issaries' website at <http://www.HeroQuest-rpg.com/products/3001.html> for more information on this item.

Hero's Book: Playing HeroQuest (an August release), **Dragon Pass: Land of Thunder** (an October release), and **Masters of Luck and Death** (a December release) will be the first supplements for the game. The

of heroes has finally tracked down a Thed shaman and his scungy broo crew, engaged in some hideous Chaos ritual. Can you imagine playing this out? Easily three hours of table-scanning, strike rank counting, movement-unit adjusting, chart-checking, and adding and subtracting. I just reviewed those rules, and to resolve one single weapon swipe or spell-cast requires rolling upwards of four times, plus cross-referencing many of the values to something or

first player's book for ***HeroQuest, Imperial Lunar Handbook: The Lunar Empire***, was released in March of this year. Two scenario books compatible with ***HeroQuest, Barbarian Adventures*** and ***Orlanth is Dead!***, are available as well.

Dragons of the Sixth World (for Shadowrun)

Published by [FanPro LLC](#)

Written by Lars Blumenstein, Elissa Carey, Dan Grendell, Tobias Hamelmann, Eleanor Holmes, Chad Huffman, Steve Kenson, Robyn King-Nitschke, James Maliszewski, Peter Millholand, Steve Ratkovich, Jon Szeto, Peter Taylor, Maliks Toms, & Tobias Wolter with Rob Boyle

Cover by Marc Sasso

Illustrated by Peter Bergting, Storn Cook, Eric Desideriu, Marko Djurdjevic, Steve Ellis, Kjell Eriksson, Chris Lewis, Matt Plog, Steve Prescott, Klaus Scherwinski and Charles Rouse

206-page b&w softcover; \$24.99

At the top of the Sixth World's evolutionary ladder -- and some would say also the food chain -- is the dragon. Since the rise of magic and the Awakening in 1212, a variety of these beasts have appeared and insinuated themselves into the ever-changing world of the 21st century. Some like Dunkelzahn have made themselves very much part of metahuman society; some remain hidden in the shadows from where they can manipulate events to their satisfaction; most have taken an interest in business affairs, with Lofwyr personifying this in taking control of the German-based Saeder-Krupp corporation; the majority renew millennia-old rivalries; and even some just want to party in the new and thoroughly modern age.

With *Dragons of the Sixth World*, the *Shadowrun* GM gets a thorough look at 10 of the Sixth World's Great Dragons -- their histories, assets, allies, enemies, and objectives, all given in the standard *Shadowrun* format. This is done in multiple voices accompanied by a cacophony of commentary -- some of it delivered by a dragon or three! -- all of which is suited to its subject, or rather its subjects, as it cannot be said that anyone individual knows everything there is to know about the 10 Great Dragons on show here. The format makes the book very easy to read and use, as does the writing. In addition, the supplement gives you the low-down on the biology, physiology, customs, and magic of the dragon, on the Draco Foundation, and on another 16 dragons -- both adult and great -- that have made their presence in the Sixth World.

That the Draco Foundation is included is important, because it is carrying out the execution of the last will and testament of Dunkelzahn, the Great Wyrms who ran for office and indeed was elected President of UCAS in 2057, before being assassinated. Despite his death, his influence is still felt -- as evidenced by FanPro's previous release for *Shadowrun*, the campaign book, [Survival of the Fittest](#). This detailed the competition known as the Rite of Succession between the Great Dragons to decide who would take possession of the Jewel of Memory and succeed to the role of Loremaster. The information in *Dragons of the Sixth World* is specifically set after the events of *Survival of the Fittest* (and also [Year of the Comet](#) and [Wake of the Comet](#)), being tied to February 2063, but this information would be still useful to have if the GM has yet to run *Survival of the Fittest* as part of their campaign.

In terms of production, *Dragons of the Sixth World* is up to FanPro's usual standard, though in places the artwork is

perhaps a little cartoon-like in style, which really does not work get across a sense of what a dragon is. To balance this, there are some truly excellent pieces done by Marko Djurdjevic, whose dark tones really imbue Ghostwalker with a sense of menace and Lofwyr with a sense of power.

The opening chapter of ***Dragons of the Sixth World*** deals with dragons in general, starting with their types: the Eastern Dragons of Asia, the legless Feathered Serpents of South and Central America and Africa, the little-known Sea Dragons or Leviathans, the Western Dragons of Europe, and the Great Dragons, essentially what each dragon will eventually mature into. Beyond their biology, physiology, customs, and magic (itself very different from that practiced by the awakened metahumanity), it examines their life cycle, culture, and customs, and having dragons as employers and the nature of their employees (or servants). All of this comes as a report from the Draco Foundation, so there is every possibility that the information it contains is as accurate as it can get in a ***Shadowrun*** sourcebook.

After exploring the Draco Foundation, the supplement presents a chapter-by-chapter examination for 10 of the most prominent Great Dragons of the Sixth World. This is done in alphabetical order from Aden (destroyer of Tehran) to Ryumyo, Japan's Great Eastern Dragon and enemy to Lung, the Chinese master geomancer, also a Great Eastern Dragon. Each chapter contains a box detailing that dragon: its type, gender, coloring, known metahuman forms, primary lair, and the translators they use (dragons cannot actually speak, but use telepathy instead), before giving a concise timeline of their activities since their awakening. Besides the three given above, the other seven are Celedyr, the Welsh dragon fascinated by the Matrix; Ghostwalker, the wyrm that appeared out of the astral rift left by the explosion that killed Dunkelzahn to reclaim Denver as own and upset the appcart on the Front Range Free Zone; Hestaby, who might be the one to take up Dunkelzahn's legacy as the most progressive of dragons; Hualpa, protector of the Awakened, founder of Amazonia, and enemy of Aztlan and Aztechnology; Lofwyr, who dominates Europe and seeks to do so in the dragon-hating Middle East, thus clashing with Aden; Masaru, who works to throw off Japanese (and Ryumyo's) influence in the Philippines and guide it to nation status once again; and Rhonabwy, the other Welsh Great Dragon with a dislike of Elvish power and an enemy off the coast. This last one is the Sea Dragon, a Leviathan who wants her clutch of eggs returned from Rhonabwy's possession.

In some cases a chapter provides a semi-update for a geographical area. For example, the chapter on Aden covers the Middle East and his links to the Kurds, Armenians, and Lebanese dissidents -- much of which is delivered in the form of a Mossad report. It also ties in with a last letter from an old enemy of Lofwyr's, which details some of his Saeder-Krupp operations within the same area, while a news report on the "New European Economic Community" will probably tie in with the forthcoming supplement, ***Shadows of Europe***. The chapters on Lung and Masaru do the same for China and the Philippines, which although giving useful information would have been helped by the addition of maps of the areas in question.

The penultimate chapter contains a brief write-up of some of the Sixth World's other remaining Great Dragons and also several noted Adults of the species. The 16 include one possibly dead dragon (Feuerschwinge, who fell into an irradiated area of Germany), and two new ones: Damon, an Adult Western Dragon that does not scheme and prefers to spend time in metahuman form visiting some of the best nightspots the 21st century has to offer; and Calozerca, who recently appeared to back Polish freedom fighters. One or two, like Schwartzkopf have been previously seen in the German-only ***Shadowrun*** sourcebooks and are new to the English language version of the game, while the Dragon of the Australian Outback previously mentioned in ***Target: Awakened Lands***, is finally given a name here -- Tjurjunga.

The last chapter of ***Dragons of the Sixth World*** is for the GM's eyes only, but really does not give away much in the way of secrets. The first part gives rules for running the beasts, providing the statistics for each species, along with their powers. All this updates and replaces information previously seen in the ***Shadowrun*** core book and the ***Critters*** source book. They also include rules for both types of Drake, first seen in ***Year of the Comet*** and ***Threats 2***: the True Drake and the Bred Drake. These are available as player characters, but given the strengths of such creatures and the fact that any dragon will be interested in having their former servant returned to draconic service, there is the danger that they will become the focus of a campaign. That said, they are suited for high-powered game built around the Draco Foundation.

Perhaps the best parts and also the most useful are those providing concise summaries of what it is like to work for each Great Dragon and what exactly their aims are. These tie back into the chapters on the Great Dragons and help the

GM get to the heart of each wyrm. This is necessary because of the wealth of information that ***Dragons of the Sixth World*** contains -- sometimes it is too much and sometimes it is too little, though this still leaves room for GM to develop and add their own suited to their campaigns.

Although many of these dragons have been mentioned and detailed in previous supplements, it is more than handy to have their updated information all in one place. This provides a lot of detail for the GM, enabling them to run each and every major dragon of the Awakened 21st century . . . which is a big sandbox to have the characters play. Of course if this is what they or their GM wants, ***Dragons of the Sixth World*** is the supplement to support it.

Pyramid Review

The Testimony of Jacob Hollow

Published by [Third World Games](#)

Game design by Frank Bustamante, Michael Nickoloff

Additional game design by Jason Jung, Randy Harrington, Eric Devlin, & Keith Kuntz

Graphic design by Dan Smith & Frank Bustamante

120 full-color cards (6 character cards, 15 Locations, 99 terror cards), 12 six-sided dice (6 each of two colors), rules sheet; requires (but does not include) one pawn per player and a way to track Investigation Points; \$19.95

Jacob Hollow is a man, not a place. The place is Castle Bay, and something horrible has happened to it and every person there save one. Jacob is that one person, the soul inhabitant who made it out past the disaster. Everyone wants to know what he knows and what happened there, but Hollow is most certainly mad now. Unfortunately, that doesn't mean the details of *The Testimony of Jacob Hollow*, as crazed as the tale is, aren't exactly and precisely right. The awful events in question are for two to six players to uncover in the new horror card game from Third World Games.

The object of the game is to be the first investigator to start his turn with 10 Investigation Points under his belt . . . or to be the only one left alive at the end of a turn. Each participant receives a character card to play; each of these personalities has a special ability that benefits them a special way over the others. The characters have a measure of Life and Mind -- the former keeps you alive while the latter keeps you sane. Both values can go up and down during play, and either one going to zero means you're finished as an investigator. The player may continue to vex his fellows with whatever cards remain in his hand, but that's all.

A deck of Location cards depicts the areas around (and under) the town of Castle Bay: the Sewer, the Library, the Asylum. If you can evade or defeat the horrors that lurk at each one (gaining Investigation Points for doing so), you may investigate the site for still more IP. This is why it's important to keep your Mind sharp -- the smarter and more together you are, the easier it is to uncover the town's secrets. Some locations also have other effects, making certain combats harder or easier, or costing you IP. You can bolster yourself with the cards in your hand, and opponents will try to do the same for themselves . . . or you may both attempt to hammer the Life and Mind out of the other with your Encounter cards.

Cards are one of four types. Actions are events made to happen, like Summoning something from the discard pile or Hiding from the horrors. Clues like Strange Chants and Research Files represent things you find out as you search Castle Bay, though they often come with beasties of their own that must be overcome for the reward. Items are the gear both magical and mundane you use in your quest, like Chainsaws, Maps, and Giant Larvae. Encounters, like Clues, are often populated by things that go bump in the night like the Killer Fungus, though they may also be run-ins with The Fortune Teller, the effects of which may be to your benefit or your detriment. Only cards classified as a React card may be played out of turn; the rest must be played after you've done your investigations.

All random action in the game is regulated by flips -- that is, turning cards over from the terror deck. Each card has a Horror Value, a number from 0-5 in the corner used to determine random outcomes when combating or evading

monsters, or chancing the use of certain cards. For evasion, a set of numbers is given -- if you can flip a card and get one of those numbers, you have given the monster the slip and may continue your search unmolested (the more powerful beings having the fewest or rarest evade numbers). If discretion doesn't work, you must combat the critter. Characters have a Combat score of 2; for foes, it varies. Your Combat score is how many cards you get to flip in battle. Total the Horror Values, and if you beat the monster's sum you win, often getting an IP reward for doing so. If you lose, you're subjected to damage, which is typically a loss of Life, Mind, or both, depending on how hideous your enemy is.

The pictures come from a number of artists, and while some of the illustrations look bloated or out of proportion when shrunk down, few of the pieces are outright terrible. The cards are hard-wearing items, smooth (though they still clump when you shuffle), and easily read. This is good, because any size group will run through the deck at least once in a game . . . with several players, you'll spend a lot of time shuffling.

To measure the characters' current statistics, the game includes 12 six-sided dice, six of two different colors. These are placed on the character card over the stat block; they fit nicely, but when you consider they'll be used as actual dice only once to decide who goes first, their inclusion in the set seems an unnecessary extravagance. (As an aside, once the package is open, getting the cards, dice, and rules neatly back into the box isn't easy.) The product's real Achilles' Heel is the rules -- not that they're badly written, but it's one of those games where there are still a dozen tiny unanswered questions or vaguely worded cards that will generate arguments aplenty (to say nothing of a FAQ at the website).

Play of the game is quick, and even a game with several players can take under an hour. With two ways to win (or lose -- this is horror, after all), sudden upsets can tilt the balance from one player to another within a single turn. The outcome is always in doubt, stretching a weakened character's potential demise out to knuckle-whitening interminability. Card flipping isn't the handiest method of arbitration, but your heart can sit in your throat as you make the crucial draw.

Although it's hard to be creeped out by a card game, ***The Testimony of Jacob Hollow*** has all the earmarks of horror, from its disquieting artwork to the on-target use of genre conventions. Even if the cards never tell an actual tale, it's an evocative work that proves the scariest thing is that which isn't seen.

--Andy Vetromile

Somewhere Old, Somewhere New

Although I love creating my own home-brew campaigns, I also have an affinity for published worlds. There's something freeing about not needing to come up with every detail of a setting, and I enjoy being surprised by other creators' ideas that force me to think outside the box.

Unfortunately, I run into a problem that many of my other gaming friends have as well. Things go great the first time we run a campaign in a game world, but we run into problems if we want to run a game in that world *again*. For some reason players and GMs feel constrained by what has gone before in the previous campaign, and can find themselves comparing adventures not on their own merits, but with the old series. This can be especially true with more "epic" games, where it is assumed that heroes are an integral part of the plot. (I've known at least eight groups who have played the **Torg** setting, and -- not counting my own campaign -- all of them ran the introductory adventure that came with the boxed set.) And, of course, it can be a common concern with campaigns based on television or movie settings.

What can be done about this difficulty, then? Are published settings only good for one adventure series, and that's it? Well, no. Fortunately there are some simple things that can be done to ensure the new campaign is more than a red-headed step-child of the previous campaign.

Resist the urge to incorporate the previous campaign into this one . . . in particular the old PCs. If the heroes became movers and shakers in the previous world, it's tempting to bring them in, either as integral plot elements or in cameos and as background dressing. Unfortunately, they can also become the Untouchable NPCs That Are Cooler Than The Heroes Can Hope To Be . . . y'know, the bane of many published settings and media-based campaigns alike. "If the Daught Plevince is such a world-shattering big deal, why aren't we calling Luke/Kirk/[Previous PCs]?" Yes, there are ways around this, but I have found that the effort necessary to keep this from being disruptive isn't worth it for what is, in essence, a "wink-and-a-nod" near in-joke. Keeping a clean slate will make sure the spotlight remains on the heroes and not on the past.

. . . Unless the setting is big enough to accommodate them all. The caveat to the above advice is if the setting is broad enough in scope to accommodate them all. In a setting like **Vampire**, for example, which emphasizes the insular nature of vampires and their urban cluster workings, it's easy to set a campaign in another city with another focus. Then, if the protagonists of Hoboken By Night happen to wander to their old PCs' haunting ground of Topeka, having the old characters play a part is a logical option; once the current PCs are done with their adventure, they'll go back to their city and the old characters will fade into the background again. (As a random aside, this is also the reason why I always had an easier time setting a supers game in the DC Universe over the Marvel Universe. In DC it's easy to stop by Gotham City for an adventure and meet the Batman, then wander back to their home city of Vanillavillanellaville and not worry about those characters crossing back over. In the Marvel setting, it's difficult to justify how you can wander down any New York City street and *not* run into members from eight different super-teams.)

In general, the more epic the setting is, the less trivial it is to have previous PCs running around, since those previous PCs were probably doing epic things themselves. Likewise the closer the setting is to the previous campaign's roots, the more difficult it is to differentiate them. Thus **Torg** campaigns were difficult to incorporate prior PCs because the general focus of "save the world" is more or less constant from one campaign to the next. However a **Fading Suns** game that focused more on interstellar trading and smuggling could coexist with a previous one that stuck more closely with scheming nobles.

The monkey wrench is your friend. But for the most part I resist even those temptations, and *really* shake up a campaign setting by altering some of its basic principles. Was **Fading Sun's** Emperor Alexius a noble, heroic leader in the old campaign? Well, then, he may be a conniving manipulative cad in the new game. Or he might be an obvious puppet to some *other* behind-the-scenes power. Or the PCs may watch him get horribly killed in the game's first session. If last time's **In Nomine** campaign was by-the-book, maybe this game is truly bizarre, with the heroes discovering a part of Earth where *no* Celestial abilities work, and its Celestial reality seems to be unraveling . . . it's not going away, and it's getting bigger. Or maybe the rules of this **Changeling** campaign are completely different, with the waking world relating to the Dreaming in a reciprocal manner, so that denizens of the Dreaming have unconscious ties

to our world in the same way we have ties to the Dreaming?

Anyway, the point is to establish, as early as possible, that This Is Not Your Father's Campaign. Although this may still cause grumbling from some who were in the old game -- "Well, these new developments are interesting, but it was more fun before . . ." -- I've personally found the benefits to outweigh the problems. (Long-time Marsh-fans -- of which I'm sure there are 16 quintillion reading this very column -- will remember that my first published work for *Shadis* was an article about alternate *Star Wars* campaign ideas. Luke failed to blow up the Death Star! Darth Vader is a good guy! Big laffs!)

For those who are reluctant to do this (since, really, monkey-wrenching a setting can result in a lot of work), consider the simple expedient of different power levels. Starting a ***Godlike*** game with the PCs as trebly strong heroes will result in a different campaign from a standard game, as will a ***Mage*** game where the heroes start as normal mortals (who will, of course, Awaken to the world of magic . . . eventually).

Pre-existing game worlds can be a lot of fun, and those that are heavily supported can provide a game shelf full of adventure possibilities. But just because you've had one rip-roaring good time with a game world once doesn't mean those possibilities are ever-closed. Even with the same group of players it's possible to create a campaign in the same game world without stepping on the toes of previous games' memories. All it takes is a bit of creativity and lateral thinking.

For example, consider another version of this column that is actually sentient and *evil* . . .

--*Steven Marsh*

Surface With A Smile: The Mona Lisa

"She is older than the rocks among which she sits; like the vampire, she has been dead many times, and learned the secrets of the grave; and has been a diver in deep seas, and keeps their fallen day about her; and trafficked for strange webs with Eastern merchants; and, as Leda, was the mother of Helen of Troy; and, as Saint Anne, the mother of Mary; and all this has been to her but as the sound of lyres and flutes, and lives only in the delicacy with which it has moulded the changing lineaments, and tinged the eyelids and the hands."

-- Walter Pater, *The Renaissance*

To the best of our estimation, she turns 500 this year, although true to her ladylike demeanor, she does not reveal her true age. That is only the least of the mysteries she conceals, gazing coolly out at us from above an unidentifiable landscape, with just a ghost of a smile playing around her lips. A ghost of a smile -- or perhaps, is it the smile of a ghost? She'll never tell, but she invites us to look deeper.

"All will acknowledge that the execution of this painting is enough to make the strongest artist tremble with fear. He also used an ingenious expedient: while he was painting Monna Lisa, who was a very beautiful woman, he had her constantly entertained by singers, musicians, and jesters, so that she would be merry and not look melancholic as portraits often do. As a result, in this painting of Leonardo's there was a smile so enchanting that it was more divine than human; and those who saw it marvelled to find it so similar to that of the living original."

-- Giorgio Vasari, *Lives of the Artists*

Monna (short for "madonna") Lisa Gherardini was born in 1479, and married the widowed Francesco del Giocondo, a Florentine noble, at the age of nineteen. (Hence *Mona Lisa*'s other title, *La Gioconda*.) At the age of 24, her husband hired Leonardo da Vinci to paint her portrait. He did so, in oils, over a period of four years or so, on a piece of poplar wood that has been cut down (losing two pillars framing the sitter) to 21 by 30.5 inches. Or so the consensus, fortified by Vasari, runs. There are a number of holes in it -- Gianpaolo Lomazzo, who knew Leonardo's executor, in 1584 described the *Mona Lisa* as "a Neapolitan woman." This leads some to identify the subject as Isabella Gualanda, a courtesan in the court of Giuliano de' Medici, Leonardo's patron from 1513 to 1515, as does a 1517 mention by the secretary of Cardinal Luigi d'Aragona of the portrait as a commission from Giuliano. The portrait followed Leonardo to the court of Francis I of France, to enter the royal collection after his death -- unless he willed her to his assistant (and adopted son) Andrea Salai, whose collection the French court also purchased after he was killed in Milan in 1524 by French soldiers. (Hmmm.) Either way, once firmly ensconced in Paris, she joins history, on her way to legend.

"He . . . kept Leonardo's Gioconda in Paris for two years, deceiving the French police, and then took her across the border back to Florence. Do you understand? Back to Florence where she was born, near the Palazzo Vecchio, by the sounds of the bells of Giotto's campanile, able to see the cypresses of San Miniato . . . Only a poet, a great poet, could dream such a dream."

-- Gabriele d'Annunzio, on Peruggia's theft of the Mona Lisa

According to Donald Sassoon's endlessly captivating book *Becoming Mona Lisa*, the key event in the ascension of the Mona Lisa to mythic status was a brief two-year vacation she took in 1911. An Italian painter-decorator working in the Louvre, Vincenzo Peruggia, lifted the *Mona Lisa* out of her frame and smuggled her out under his coat. Paris society was scandalized, and the newspapers played the theft for all it was worth. After two years, the hapless Peruggia tried to sell her to antique dealer Alfredo Geri, who promptly turned Peruggia over to the police. The motive for the theft remains murky -- some claimed it was a [Futurist](#) strike against Renaissance art, or an act of Italian nationalism (this was Peruggia's tactic at trial), or a case of obsessive love for Lisa. An Argentine con man calling himself the Marquis of Valfiero claimed to have hired Peruggia to steal the portrait so that he could sell forged copies to a number of secretive, gullible American millionaires. When she was returned, Valfiero assured each mark that the portrait in the Louvre was the forgery, and they had the original.

"The mirror conducts itself haughtily holding mirrored in itself the Queen. When she departs the mirror remains there ..."

-- Leonardo da Vinci, *Notebooks*

This would be all good fun were it not for the fact that Leonardo himself might have painted more than one *Mona Lisa*. The troublemaking Lomazzo mentions having seen two different paintings called *La Gioconda* and *Mona Lisa*. Vasari, that rock of historical fact, describes the *Mona Lisa* as having beautiful eyebrows -- eyebrows notably missing from the portrait in the Louvre. A painting that very much looks like a Leonardo study, the "Isleworth *Mona Lisa*," turned up in Somerset in 1914, and the St. Petersburg *Colombina* (a copy normally attributed to Melzi) received a surreptitious upgrade under the Soviets. William Henry Vernon, a friend of Benjamin Franklin, returned to America in 1797 with a 16th-century copy of the *Mona Lisa*. Still more annoyingly, Raphael's sketch "Young Woman in a Loggia," usually considered his study of Leonardo's unfinished portrait, changes the hands' position, adds a headband, and presents a different landscape in the window behind the sitter. In the various iterations of the *Mona Lisa*, one begins to see Leonardo's delight in, and fascination with, mirrors. In addition to optical experiments of recondite nature, he wrote in "mirror handwriting," referred to the mirror as "the master of painters," and introduced anomalous twins into his works.

"Might it not have been within the outlook of a Magus that a personality like Leonardo was able to co-ordinate his mathematical and mechanical studies with his work as an artist?"

-- Frances Yates, *Giordano Bruno and the Hermetic Tradition*

For instance, in his cartoon of "The Virgin and Child with St. Anne and John the Baptist," the Virgin Mary and St. Anne (her mother) appear to be twins, as (rather more heretically) do the infants Jesus and John the Baptist. (Some scholars identify the "St. Anne" as John's mother, St. Elizabeth, which only makes things worse for Leonardo.) One set of twins is noble and well-lit; the other is darkened with the *facia nigra* of sin. In *The Last Supper*, not only is the (very effeminate-looking) apostle John leaning away from Christ, he wears clothes mirroring those of Jesus. All of this indicates an attitude of dualism and darkness hidden beneath the sun of Leonardo's Renaissance -- and the landscape in the back of *Mona Lisa* is, many have noted, actually two different landscapes in divergent perspective. So what, precisely, was he up to? In *The Templar Revelation*, Lynn Picknett and Clive Prince recruit da Vinci as the core figure in a secret John the Baptist worshipping cult, while Dan Brown's turgid potboiler *The Da Vinci Code* paints da Vinci as a devotee of Mary Magdalene. The standard version splits the difference, following the lead of the *Dossiers secrets* in assigning Leonardo the Grand Mastership of the *Prieuré de Sion* itself.

"If [the Shroud of Turin] be the work of a forger, he must have been a super-genius as an anatomist, a physiologist and an artist, a genius of such unexcelled quality that he must have been made to order."

-- Pierre Barbet, *A Doctor at Calvary*

Perhaps a mission from one or more of his heretical cults led him to commit his own great act of forgery. In *Turin Shroud: In Whose Image?* Picknett and Prince finger Leonardo as the forger of the Shroud of Turin, dismissing earlier Shroud sightings as irrelevant. They further identify the image as Leonardo himself (just as Lillian Schwartz in 1987 identified the *Mona Lisa* as a mirror image of Leonardo), standing in for John the Baptist. Leonardo is known to have designed a camera obscura, which he called the *oculus artificialis*. Picknett and Prince argue that he impregnated a linen cloth with albumen and chromium salts (both easily available to Renaissance painters), focused sunlight into his camera obscura (containing either an actual crucified body or a suitably perfectionist model) with mirrors, and then scorched the cloth to "develop" the bizarre negative image. Their reconstruction of this method reproduced many of the Shroud's distinctive features, and it is interesting that the other use for the camera obscura in the Renaissance was for pretended necromancies, projecting ghostly images onto a wall. Leonardo was, as it happens, accused of necromancy in 1516, necessitating his departure for France -- with the *Mona Lisa*, apparently, in tow. Did Leonardo's necromancy raise [Pepper's Ghost](#) -- or something more sinister?

"La Joconde! The name makes me think immediately of this sphinx of beauty who smiles so mysteriously in Leonardo da Vinci's painting, and who seems to pose a yet unresolved riddle to the admiring centuries. It is dangerous to conjure up such a ghost."

-- Théophile Gautier, review of the play *La Joconde*

What if, in his experiments with mirrors -- and his discovery that mirror images "fill the surrounding air" everywhere -- Leonardo opened the doorway to the [mirror realm](#), the dimension of the [sphinxes between the frames](#) of our

persistent vision? Within it, he first viewed, and then perhaps communed with, the [Dark Lady](#), the [femme fatale](#) that Gautier, that intimate of Rosicrucians, intuitively identified with *La Gioconda*, which painting d'Annunzio called "Sphinx and Chimera." Leonardo, fortunately, was resistant to her blandishments (being gay may have helped him there), and knew, as he wrote in his mirror hand, "there are numberless people who, in order to gratify one of their appetites, would destroy God and the whole of the universe." Perhaps he trapped the Dark Lady within the *Mona Lisa*, suspended above and between two mirrored landscapes, frozen forever on the sacred wood of Hecate, black poplar. (The maiden Dryope and the sisters of Phaëthon were transformed to poplars by Apollo, god of artists, just as the Gioconda was.) But he knew that the Dark Lady always demands a sacrifice -- so he created an image of John the Baptist (the other painting he brought with him to France, complete with smile) with the same mirrored lenses that had almost released the Sphinx, as the ultimate image of blood sacrifice to this ultraterrestrial Salome.

Trapped forever between the images, he thought of only one thing -- immure her forever in the French royal collection, perhaps seeking the aid of the werewolf Cardinal d'Aragona (plagued by [his own Dark Lady](#)) to do so. But the Dark Lady drowned the throne of France in blood and found new lovers: Napoleon slept underneath her gaze, and heard her whispers as he planned world empire. In 1911, she escaped and tilted Europe into world war three years later. In 1963, she visited Washington and gazed into John Kennedy's doomed face. And this year, she will get her own chamber in the Louvre, the better to meet the eyes of five and a half million lovers every year. No wonder she's smiling.

The Flint Age

by [Chad Underkoffler](#)

Art by [Chris Cooper](#)

Genre: Caveman Supers

Style: Proactive Adventure

Fidelity: Low

Themes: Building & Defending; Trade

Campaign Setting and Background Information

Flint Age 1

In a primeval world, two intelligent races contend with wild beasts, the elements, the landscape, and each other for survival. Luckily, many of these sapients have strengths and abilities [far beyond](#) those of their, which helps them -- and their peoples -- prosper in the Flint Age.

What Everybody Knows

Geography & Climate

- *The North:* Scrubby grasslands rising into rocky ridges, and arid desert speckled with rare oases. Minimal precipitation and seasonal change; terrible wind- and sandstorms.
- *The West:* Warm, flat plains, eventually terminating at the Sea. Short, mild winters; long, muggy summers. Plenty of thunderstorms and the occasional hurricane.
- *The South:* Lush, forested foothills climbing into mountains; beyond lies tundra. Long winters with plenty of snowfall; warm, wet springs; short, mild summers; dry autumns.
- *The East:* Rolling hills, patchy forests, wide lakes, and deep valleys. Dry but cold winters; temperate spring and summers with adequate precipitation; chilly, windy autumns.

Fauna & Flora

Here are the names of some of the animals and plants of the Flint Age; note that this is not an exhaustive list. Fauna and flora particularly important to a group (as food, a source of useful products, or domesticated labor) are noted in the write-ups for each of the [Sapient Groups](#).

- *Dinosaurs:* Cutter Fish (ichthyosaurs), Giant Devil-Lizards (tyrannosaurs), Platy Grazers (stegosaurus), Three Spears (triceratops), and Walking Hills

When Are We, Again?

The world of the Flint Age is not Earth; it's Earth-like. The coexistence of dinosaurs and large mammals (like humans) did not occur here, according to current science. Neither have we found evidence of any saurian-descended humanoids, much less those contemporary with Stone Age humans. Then there's the [superpowers](#).

(brontosaurus).

- *Mammals*: Cave Guardians (bears), Giant Leapers (kangaroo), Horned Bounders (deer), Horned Thunders (bison), Knifefangs (sabertooth tigers), Leapers (hares), Nosehands (wooly mammoth), Runners (eohippus), Pack Warriors (wolves), Knife Hairs (porcupines), and Runner Birds (moas).
- *Other Animals*: [sea] Devil Fish (orca), Many Arms (octopus), Tide Barkers (seal), Sea Runner (tuna); [air] Devil-Lizard Bird (pterodactyl), Eye Bird (owls), Squeaker Bird (bats).
- *Common Plants*: Grain Grass (buckwheat), Pod Bean (soybean), Sweet Tuber (yam), Eye Tuber (potato), Red Bean (kidney bean), Yellow Tooth (maize), Gritty Fruit (pear), White Flesh Fruit (apple), Heart Fruit (tomato), Crying Tuber (onion), Furred Fruit (peach), Brain Nut (walnut), Spirit Plant (hemp), Yellow Gourd (squash), Orange Gourd (pumpkin), Sunrise Fruit (Orange), Puff Plant (cotton), Biting Fruit (chile pepper), Heart of Blue (indigo), Tart Plant (mustard), Pebble Grass (barley), Tiny Vine Fruit (grapes), Blue Flower Weaver Plant (flax), Sleepy Head Grain (oats), Leafy Ball (cabbage), White Tuber (parsnip), Happy Bean (lentil), Sprig Grain (rye), and many spices and herbs.

Flint Age 2

Superpowers

One out of every 250 sapient beings (and one out of every 10,000 animals or plants) has strange abilities that others do not: the power to generate spears of intense light (lasers) from their eyes; incredible strength or durability; weird transformations into liquid, gas, or rock; wingless flight; a "sixth sense" that warns of danger; vastly increased intelligence; etc.

With few exceptions, these potent capabilities allow superpowered beings to outperform enemies or rivals . . .

That's why the Fidelity is "Low."

OPTION: How Did Things Get This Way?

So, how did this [superpowered](#) world come about? Some options to consider:

- *Status Quo*: It just is, and has always been.
- *Near Miss*: No iridium meteor impact, and evolution took different paths on different continents. Ketsheeli are colonists/refugees from another continent who lost their ocean-going vessels and the know-how to reconstruct them, and have made the best of things (see also Harry Harrison's *West of Eden*).
- *Meddling*: The world is an elaborate experiment by (aliens/time-travellers/ultraterrestrials).
- *Slidegate*: Dimensional portals opened, bringing dinosaurs, prehistoric mammals, ketsheeli, and early man from four alternate Earths to this Fifth Earth.
- *Rocks From Sky*: Weird Meteors (see [Possible Superpower Origins](#)) have landed before, and their influence both protected, extended, and modified small pockets of the fauna of earlier eras.
- *Planet of the Apes + Jurassic Park + The Land of the Lost*: The Flint Age takes place in a post-apocalyptic earth, after cloning of dinosaurs and recombinant DNA techniques became widespread.

Trade, Commerce, & the Wamla Exchange

The majority of trade in the Flint Age happens in the form of barter: shells for pelts, meat for vegetables, shiny rocks for worked goods, food for services, that sort of thing. Of course,

unless they too are superpowered. Then, earth-shaking battles are joined.

Superpowered beings have allowed groups to survive catastrophes that would have destroyed a group lacking such blessings. Forest fires have been quenched, plagues have been countered; famines have been avoided; and the wise have guided and taught necessary crafts.

And the wonder of Weavertown has sprung into being almost overnight -- in less than 300 years, it has become a thriving metropolis of brick, wood, and stone, the center of the world's trade networks.

The world of the Flint Age is a young one, but growing quickly due to the combination of superpowers and the drive to create.

Sapient Groups

Each group of sapients is given a short write-up, following the template below. (Note that many of these terms are being used in a looser fashion than an anthropologist would, and that all categories are spectrums, and not exclusive choices -- e.g., a group could believe in a combination of Ancestor Worship and Shamanism).

Group Name

Group Species: Human, [Ketsheeli](#), or some mix.

Type of Group: For our purposes, a *Household* is a group of 2 to 20 related members. A *Band* is a group with 15 to 50 members, many of whom are related. A *Tribe* is a group with 75 to 500 members. A *Chieftdom* is a group with anywhere from 750 to 5000 members.

Subsistence Style: *Foraging* means "hunting & gathering." *Horticulture* is cultivation of plants through a mixture of basic gardening, gathering, and slash & burn cultivation. *Agriculture* is intensive food production through the use of the plow, irrigation, and terracing, often focusing on a few key staple plants. *Pastoralism* means herding animals for food and other products. *Transhumance* is seasonal pastoralism, usually involving only a small amount of the population herding the flocks at a distance from the settlement. *Nomadic* means the group moves their settlement often (usually after pasturage is eaten out by herds, fields lose fertility, as game migrates, or due to seasonal change).

Political Structure: *Egalitarian* means all members are equal, though individuals may take temporary leadership in specialized situations. A *Big Man* is a semi-permanent leader with notable prowess (in hunting, battle, diplomacy, wisdom, etc.) and who maintains his position through

sometimes folks won't want to trade their tame Bounder for your sack of tubers-- that's when the canny trader figures out what their target *does* want for their goods, and goes and tries to exchange that sack of tubers for whatever the desire item is.

In Weavertown, simple contracts -- written on clay tablets and fired into pottery -- have begun to be used. An example would be something like: "Og agrees to give Thark a pelt a week for a year to buy Og's mother's house." Each participant in the contract, as well as a disinterested third individual (paid by both named parties), gets a copy of the contract, so as to avoid forgery or accidental breakage. Indeed, a few enterprising Weavertownians have begun serving as general "contract holders" and gaining a supplementary income from it.

The last major form of exchange -- Wamla -- is not normally used for gaining material possessions (though this is not unheard of) so much as prestige. Whenever a deed of note is accomplished, a wamla will be created to commemorate it. "Day-dancer felled the Horned Thunder with one blow!" would be an example of a deed worthy of being immortalized, as would marriages, deaths, births, treaties, and so forth. (A very famous or prestigious person -- like one with superpowers -- could, in theory, produce a wamla that said "Yog the Mighty made this," and that would be a fairly interesting item . . . provided Yog didn't flood the market with them, get his butt kicked immediately afterward by Devilwing, or otherwise lose face.) Wamla can be a carved stone, an incised shell, a bone covered with scrimshaw, a pottery tablet, a string of beads, a belt of dyed quills, etc. The current holder of the wamla shares in the prestige of the deed while he owns the wamla; however, if one holds on to a wamla for too long, it begins to lose prestige -- and wamla exchange value. Thus, it's best to pass a wamla on after a season or two of ownership.

While there are at least a dozen minor wamla exchange rings (sometimes only involving two groups), there are 3 major ones:

- *Blue:* Nisalthu to Weavertown and back,

strength, prestige, and generosity. *Simple Chieftdom* indicates a permanent leadership, held until death; a Chief is higher status than everyone else. *Complex Chieftdom* differs from the Simple type by including a rank of "Advisor/Aristocrat" that has higher status than a "commoner," but lower than the Chief's status.

Degree of Gender Stratification: *Low* indicates there is little difference in status between men and women; *Some* points out that there is a discernable difference between the status of the sexes; *High* shows a great difference in status between the two.

Spouse Selection, Marriage Type, Marriage Residence, & Lineage Type: *Exogamous* indicates that spouses from outside the group are sought; *Endogamous* means that spouses are looked for within the group. *Polygamy* means having more than one spouse at a time is acceptable within that culture; *Monogamy* indicates that having one spouse is preferable. *Patrilocal* couples live near the husband's family after marriage; *Matrilocal* couples reside near the wife's family. *Patrilineal* groups trace descent through the father; *Matrilineal* groups through the mother; *Bilineal* from both.

Special [Technologies or Knowledge](#): Lists specific technologies or information known by the group, possibly unknown outside of it.

Trade Products & Participation: Lists products traded (*Supply*) and traded for (*Demand*) by the group, as well as if they participate in the [wamla](#) exchange ring.

Primary Religio-magical Beliefs: *Animism* means that the group believes that everything in the world possess individual spirits that should be venerated. *Totemism* is a variant of animism where a particular spirit is singled out for extra reverence, and often is seen to have a specific connection to the group. *Ancestor Worship* means that the pre-eminent spirits are those of the dead, who must be appeased. *Shamanism* is a form of animism with a special class of people (shamans) who serve as an intermediary between spirits and people. *Pantheism* is a belief that all phenomena are expressions of a single divine spirit.

Anthropomorphism places a pantheon of people-like gods in charge of phenomena, rather than focusing on the aspect of reality itself as divine. (While magical practices related to these religious types exists, it is unknown if they are effective. See [OPTIONS: Got Magic?](#) for ideas on functional magic in this setting.)

Superpowered Group Members: Lists notable, superpowered group members.

Further Information: Additional notes on the group's history or nature.

Nisalthu

Group Species: Human.

through several groups.

- *Green:* Weavertown to ZZarthka'ssss and back, through several groups.
- *White:* Broken for three generations, the White ring used to connect the Lost Tribe and Weavertown through several groups; unfortunately, after the Lost Tribe vanished, the entire exchange ring ground to a halt. Many of the communities closest to Weavertown ended up joining either the Blue or Green rings. The farthest groups were thus left isolated; they eventually relinked into a minor ring called the "Little White." While they usually trade only amongst themselves, some of the wamla object "trapped" here have managed to return to the major rings.

Most groups only participate in one ring, though a few participate in two. Note that Weavertown, as participant in all three rings, is the most common point for wamla to pass from one ring to another. For example, a shell detailing the birth of Arzurku Sea-Breather now resides in a Ketsheeli tribe that is completely off the three main rings (having passed from Nisalthu to Weavertown, from Weavertown to ZZarthka'ssss, and from ZZarthka'ssss along two minor rings).

Technologies & Knowledge

The presence of beings with incredible senses, increased capabilities, and super-intellecets has led to a strong understanding of some basics of science and technology in the Flint Age. Some have been fully adopted, while others are still "bleeding edge" (new, poorly understood, buggy). In addition to any specialized knowledge possessed by a group, they can know some, most, or none of the ideas listed below. (Note that Weavertown and ZZarthka'ssss are the only two groups that currently understand *all* of these concepts.)

See also [Future Tech](#).

Type of Group: Chiefdom.

Subsistence Style: Foraging (fishing) and aquatic horticulture.

Political Structure: Complex Chiefdom.

Degree of Gender Stratification: Some (after marriage, most women are not allowed to leave the island).

Spouse Selection, Marriage Type, Marriage Residence, & Lineage Type: Endogamous; Monogamy, Matrilocal; Patrilineal.

Special Technologies or Knowledge: Sailing and basic sea navigation.

Trade Products & Participation: *Supply:* Fish and sea-game (Cutter Fish, Many Arms, Sea Runners), shells, shellfish-based dyes, some sea-plants (Ocean Grass), tropical fruits. *Demand:* Grains, furs, meat, cloth. Participates in the Blue Wamla Ring.

Primary Religio-magical Beliefs: Pantheism -- all spirits are aspects of the Great Sea Spirit.

Superpowered Group Members: Many descendants through the male line of Rano Sea-Breather are amphibious, able to swim very fast, and breathe underwater (as well as the air). Their ruler, Arzurku Sea-Breather, also has additional powers.

Further Information: Nisalthu is the name of both the people and the island they inhabit. Their sailing ships come from the West, bearing goods to trade with the mainland peoples. Nisalthu dried, smoked, salted, and pickled fishes are sought after, as is Ocean Grass (kelp) that their amphibious members harvest from the sea floor.

Silpo Tem

Group Species: Human (99%).

Type of Group: Household.

Subsistence Style: Foraging; nomadic.

Political Structure: Egalitarian.

Degree of Gender Stratification: Low.

Spouse Selection, Marriage Type, Marriage Residence, & Lineage Type: Exogamous; Polygamy; Patrilocality; Bilineal (father first).

Special Technologies or Knowledge: None.

Trade Products & Participation: *Supply:* Hides and meat (usually Giant Leaper, Leaper, and Platy Grazer), bone, herbs. *Demand:* Cloth; metal goods; pottery. Participates (at one remove) in the Green wamla ring.

Primary Religio-magical Beliefs: Animism.

Superpowered Group Members: Yog the Mighty.

Further Information: Except for one random factor (Yog the Mighty), the Silpo Tem is an average hunter/gatherer household of the Flint Age. A decade ago, Mele the Childless discovered a black egg floating down the river. She retrieved it, and it hatched in her arms. She decided to raise the infant ketsheeli as her own, naming it Yog, after

Adopted

- Simple Machines (lever, inclined plane, wedge, wheel & axle, screw, pulley)
- The Germ Theory of Disease, Sanitation, and Antiseptics
- Fertilizer (use of mulch piles/compost heaps/middens)
- Herbology (medicinal, dyeing, spicing)
- Zero
- Writing
- Ciphering
- Domesticated plants or animals
- Fences
- Pottery (and adobe)
- Division of labor, Specialization, Assembly line
- Personal Property (moveable goods & residences)
- Communal ownership of fields and herds
- Contracts (see also [Trade, Commerce, & the Wamla Exchange](#)), including (Secured/Unsecured) loans with interest
- Various forms of non-loom weaving
- Brewing
- Winemaking
- Bread
- Cheese
- Tanning
- Food preservation (salting, drying, smoking)
- "Cold" metalwork (copper and tin, mostly)

Bleeding Edge

- Gears (simple, bevel, worm), rack & pinion, cam, crank & rod
- Focused animal and plant husbandry and Mendelian Genetics
- Crop rotation
- Personal ownership of moveable goods, fields, and herds
- Venture capital; joint ventures with shares
- Loom weaving
- Faience & glazes
- Copper and tin metallurgy/smelting
- Civic projects
- Surveying
- Geometry

her dead husband. Her incredible fervor in defending the hatchling forced her in-laws to permit her the eccentricity, though they watched askance, awaiting doom. Quickly, Yog grew, and became one of the band's best and strongest hunters. His superpowers have saved them all from danger or starvation numerous times, and he has finally been accepted as one of them.

The Lost Tribe: The Lost Tribe lived in the snowy south, and was known for its rich trade furs, strange gems, and delicate scrimshaw bonework. Unfortunately, a volcano erupted three centuries ago, burying the valley of the Lost Tribe (and the main pass from the highlands) under feet of ash. This catastrophe was followed by the Great Whiteness, a terrible blizzard that left packed snow in the foothills for three years. This broke the White [wamla exchange ring](#).

Most people of the Flint Age believe the Lost Tribe to have died in the eruption, or failing that, the ensuing Great Whiteness (see [The Lost Tribe](#) for more details).

Weavertown

Group Species: Predominantly human, a few families of [ketsheeli](#).

Type of Group: Chiefdom.

Subsistence Style: Mostly agriculture and transhumance (Three Spears), with mild foraging.

Political Structure: Complex Chiefdom; the three ranks of society are: 1) the Chief; 2) the Chief's family, along with the Spider Shaman and his apprentices; and 3) everybody else (but also see *Gender Stratification*).

Degree of Gender Stratification: Some (virgin women are virtually second-class citizens. However, after getting married or giving birth, they gain comparable status to men).

Spouse Selection, Marriage Type, Marriage Residence, & Lineage Type: Endogamous; Polygamy (including cases of polyandry); Patrilocal, Bilineal (mother first).

Special Technologies or Knowledge: In addition to all of the listed [Technologies or Knowledge](#), Weavertown residents have learned to harvest and work the silk of the Great Weavers (giant gray spiders).

Trade Products & Participation: Supply: Linen cloth, spider-silk, rope, hides, Sleepy Head Grain, Heart Fruit, Yellow Tooth, Pod Bean, Sweet Tuber, Three Spears meat.

Demand: Nosehand meat, furs, hides, all fruits, lumber, copper. Participates in the Blue and Green wamla rings.

Primary Religio-magical Beliefs: Totemism (the Spider) and Shamanism.

Superpowered Group Members: The most notable are Spider Shaman and Flame Shaper, but there are a handful of people in the city who possess some sort of

Contract-as-currency (using a contract as a unit of trade)

- Astronomy

The Ketsheeli

Humans share the world of the Flint Age with another sapient race much like themselves: the Ketsheeli. Humanoid saurians, ketsheeli have several differences in body and mind that set them apart from their mammalian neighbors:

- **Physiology:** Ketsheeli are usually five-foot-tall tailless humanoids covered with horny scales. They have three fingers and a fully-opposable thumb on each hand, and tend to be much stronger than the average man (but there *are* men that are stronger than the typical ketsheeli). While their eyes are large (with a slit pupil), they typically have worse vision than humans; however, their sense of smell is far more acute. Though warm-blooded, these saurians still retain sensitivity to extremes of temperature -- they are sluggish in cold weather, and jumpy in hot (see also *Psychology*). They are omnivores, and reach full physical maturity in five years, sexual maturity in eight. Male and female ketsheeli look almost exactly the same, except that males tend to have a single colorful skullcrest. Early spring begins the mating season, and females that decide to breed select their mates at this time. Near the beginning of summer, they lay eggs in clutches of six. Eggs are usually grayish-white and leathery. (However, some few eggs are black; these almost invariably produce extremely strong -- and extremely dumb -- hatchlings.) Females brood over the eggs until they hatch at midsummer while males guard the nest; both parents care for the surviving hatchlings until the next mating season, then leave the "younglings" to fend for themselves (see

superpowers.

Further Information: Centuries ago, on the advice of their Spider totem, a simple band settled in and around the caves of a large resource-rich canyon. They increasingly turned to horticulture, which eventually developed into full-blown agriculture, just as their hunting slowly changed into herding. Their safe and centrally-located village became the hub of several minor trade routes, many of which coalesced into the three major wamla rings. It grew and prospered under the rule of strong chiefs, advised by the line of wise Spider Shamans. Right at the time the White exchange ring was broken, Weavertown became a full-fledged city. Today, buildings of wood, adobe brick, and stone grow along the cliff walls of the canyon; there is a stone bridge crossing the river; an intricate irrigation system takes water to the fields; and a cobblestone street runs the length of the city. Atop the jutting promontory of the east canyon wall looms the Spider's Tower, sanctum of the Spider Shaman and his apprentices.

ZZarthka'sss

Group Species: Predominantly [ketsheeli](#), some few humans under the chief's protection.

Type of Group: Chiefdom.

Subsistence Style: Foraging, Horticulture, Pastoralism, Nomadic. (In essence, ZZarthka'sss is a mobile city, shifting seasonally, between four established sites.)

Political Structure: Simple Chiefdom.

Degree of Gender Stratification: Low.

Spouse Selection, Marriage Type, Marriage Residence, & Lineage Type: Exogamous; do not mate for life; Matrilocal (for first year); do not care about parental lineage, but identify with their brood-mates.

Special Technologies or Knowledge: In addition to all of the listed [Technologies or Knowledge](#), ZZarthka'sss residents are the pre-eminent miners and coppersmiths of the Flint Age, and have discovered smelting.

Trade Products & Participation: Supply: Copper goods, faience, pottery, Grain Grass, Eye Tuber, Gritty Fruit, Crying Tuber, Spirit Plant, Heart of Blue, Leafy Ball, Nosehands wool and meat, Giant Leapers meat and fur.

Demand: Linen, ore, dyes, fruits, dried fish, silk, Yellow Tooth.

Primary Religio-magical Beliefs: "Sauria-morphism." The folk of ZZarthka'sss believe in a small pantheon of gods much like ketsheeli in form and attitude, who are responsible for aspects of the world -- storms, night, mating, egg-laying, brooding, etc.

Superpowered Group Members: Chief Twocrest, Devilwing.

Further Information: The four "city-sites" of ZZarthka'sss are a solid day's journey apart. Winterhome is a deep cave

also *Psychology*). Ketsheeli have a lifespan slightly shorter than the average human.

- *Psychology:* Ketsheeli are much more driven by their emotions than humans: it is nearly impossible for a ketsheeli to set aside emotional reactions for rational reasons. They also have a physiological sensitivity to temperature extremes that strongly affects their thought processes, becoming depressed and introverted during colder times, and manic and extroverted during warmer times. Furthermore, because of their quick physical maturity, there is less bonding time between mother and hatchling; ketsheeli have stronger ties to their nest-mates than their parents, and tend to form age-related cliques. A ketsheeli's friends are usually close to their own age, and their enemies are almost always significantly older or younger. (Imagine ketsheeli as strong, scaly teenagers with Seasonal Affective Disorder.)
- *Typical Ketsheeli Stats:* Expert Strength, Expert Sense of Smell, Good Armor, Poor Vision, Poor Rapid Temperature Adjustment (Physiological & Psychological).

Future Tech

Here are a few of the technologies that are on the horizon; GMs can feel free to introduce them through NPCs or NPC groups, or allow PCs to discover them.

- Chains & belts, ratchets, pumps (the Archimedes screw).
- Bronze Alloy.
- Glass.
- Charcoal.
- Minted Currency.
- Commodities Markets.
- Taxation.
- Physics.
- Basic chemistry.

system. Springsite is situated on a wide grassy plain. Summerhome is on the shores of a wide, blue lake. Autumnfell lies in a sheltered valley along a river. Non-mobile technological infrastructure (giant ovens, huge smelters, astronomical observatories a la Stonehenge) remain at these locations; ketsheeli warriors will regularly patrol the sites throughout the year.

Generic [Ketsheeli](#) or Human Raiders

Group Species: [Ketsheeli](#) or Human.

Type of Group: Household or Band.

Subsistence Style: Foraging; nomadic.

Political Structure: Big Man.

Degree of Gender Stratification: Low.

Spouse Selection, Marriage Type, Marriage Residence, & Lineage Type: Various.

Special Technologies or Knowledge: None.

Trade Products & Participation: None.

Primary Religio-magical Beliefs: Various.

Superpowered Group Members: Numerous human bands, and at least two ketsheeli bands, are led by superpowered individuals.

Further Information: Nomadic Raider groups are usually made up of between 10 and 30 members, and are thus generally Households or Bands.

Languages

The main languages of the Flint Age are Weaverspeak, Nisalthuan, and ZZarthka'sssian. There are also two pidgin languages used on the major [wamla](#) rings (called "Bluetalk" and "Greentalk") and a host of human and ketsheeli dialects. Southern groups on the Little White ring have their own language ("Whitetalk"), stemming from the trade pidgin incorporating words and grammar from the Lost Tribe's tongue, but it has changed considerably since then.

What Everybody Doesn't Know

Possible Superpower Origins

So, where do superpowers come from? The GM must decide if multiple types of origin are permitted, or if all superpowers must stem from a single source. Options include:

- *Weird Meteors:* The coruscating rays of these sky-rocks warp the animals, plants, and sapients that come too close, granting strange powers.
- *Chosen by the Spirits:* The spirits of the world -- rock, sky, water, stars, plants, animals, the dead --

- Ironworking.

How Super Is Super?

Some superpowered individuals are more powerful than others; this is reflected in the difference between the ranks of a superpower. Take, for example, Superstrength. A character with a Superstrength of Poor is still far stronger than a human with Master (mundane) Strength, but is weaker than a character with a Superstrength of Average or Good. Everything is relative.

Looking at old *Action Comics* comics, Superman is "invulnerable." That means that he normally doesn't take damage from anything ordinary. Extraordinary circumstances -- like being hit in the head with a meteor, getting zapped with a million volts of electricity, being targeted by fifteen howitzers, or being blindsided by a giant robot -- muss him up a little, but generally don't really hurt him. However, being punched by another superstrong individual hurts him as much as a normal punch would hurt a normal man. Obviously, invulnerability is relative to superstrength: they counter each other. GMs should keep this sort of balancing act in mind when determining how superpowers interact or interfere with each other.

Additionally, the Flint Age GM must decide what the "benchmark" capability of an Average ranked superpower is. Is Average Superstrength "the strength of ten men"? A hundred? Two? Adjusting the Average benchmark allows the fine-tuning of the setting: if low, the setting is a bit more realistic; if high, it's much more four-color.

have blessed the being with power for reasons known only to them (see also [OPTION: How Did Things Get This Way?](#), *Meddling*, and [OPTIONS: Got Magic?](#)).

- *Mutation*: While most mutations are negative, a few are beneficial; perhaps Flint Age mutants are just the lucky ones.
- *Mutation 2: Genetic Boogaloo*: If mutations can be passed to offspring (as a recessive trait) and can recombine with other recessive mutations, new and different superpowers could spring up from these hidden potentials.
- *(Contagious) Super-Lysenkoism*: A lifeform's acquired characteristics can be passed to its offspring in superpower form. So, if a character is mauled by a dinosaur and doesn't just live, but recovers fully, any offspring he fathers may have advanced regenerative abilities (and, possibly, saurian characteristics); a woman struck by lightning has a chance of giving birth to a child with electrical powers, and so forth.

The Lost Tribe

They were mighty hunters who called themselves "Esidarra." Possibly due to their endogamy, they had few male children born to them: this engendered a strongly matriarchal culture, where women had more status than men. Each Esidarrian possessed supernatural longevity, unbelievable endurance, and remarkable senses. These advantages didn't help when the volcano blew -- awakened by a superpowered foe -- and the mountain fell upon them.

Options for the Lost Tribe:

- *Dead*: They really are all gone.
- *Handful*: A dozen survivors (11 women and one man) escaped the lava, carrying all they could, and took shelter from the Great Whiteness in a meteor-heated crater in the mountains. They and have recovered their numbers somewhat (25 women), but the last male has just died. Without men, the Esidarra will die out. They have finally found an open pass to the north, and have decided to come down out of the mountains. But first, they plan on exterminating all of the bloodline of that long ago volcano-waker . . .
- *Sole Survivor*: As for "Handful," only by now, a single woman lives. Dyolikeen the Huntress (see below) is the last of the Esidarra. Perhaps it was the blood she inherited from a long line of chieftainesses, maybe the meteor changed her while in the womb of her mother, or possibly the spirits have written her a grand destiny. She has come forth

The Weblines of the Spider

When the Spider Shaman dies, grows infirm, or is otherwise lost, all his (or her -- there have been female holders of the office) apprentices gather inside the Spider's Tower. They then descend into the caves beneath, where the holy indigo-furred Weavers live, and light the sacred fires of aromatic woods. As pungent smoke fills the caves, the Blue Weavers swarm and crawl over the faithful. One of the elect receives the spirit venom of hundreds of holy spiders, granting him their power. When he awakes from the coma of ecstasy, he will be changed, and will take up the Weaver Mask and Cloak of Webs as the new Spider Shaman. (Twice in recorded history, more than one apprentice has received the Weaver's Kiss and been so blessed; however, no apprentice with pre-existing superpowers has ever been selected.)

The Spider totem grants its Shaman several powers through its divine children. He will gain the ability to climb even the most sheer walls (Good), superhuman agility (Master), and mild superhuman strength (Poor). Also, the venom supercharges intelligence, allowing the Shaman to string together facts, theories, fancies, and observations into a web of understanding; this ability, more than any other, is probably most responsible for Weavertown's relative high technology and science. Unlike the other changes, this one is based on the recipient's starting intelligence -- a smarter apprentice becomes a smarter Shaman; thus, apprentices are chosen for their keen minds as well as their purity of soul. Lastly, each Shaman gains a distinct power related to their personality or talents: some examples from past Shamans (and their core trait) include Paralysis Venom (sarcastic repartee), Claws (knife fighter), Sixth Sense (mild paranoia), Webspinning (talented weaver), etc.

OPTION: Got Magic?

to seek her fortune, her mate, and a future for her lost people.

NPC Backgrounds

Chief Arzurku Sea-Breather aka the Sea-Chief: An Expert leader, Arzurku commands the respect and awe of his subjects. Like most of the Sea-Breather line, he is Amphibious, but is by far the strongest and fastest swimmer amongst them (Master) and a cunning Warrior (Expert). Additionally, he is blessed with the ability to communicate telepathically with any form of animal life, including sapients, at Average ability. All of these blessings, however, have made him Arrogant and Stubborn (Poor interaction with anyone other than his subjects).

Devilwing: One of Chief Twocrest's right-hand saurians, Devilwing is a fearsome (Expert) Warrior, on land and in the air. Wings sprout from her back, giving her Expert Flight -- she can even hover in place. She does not possess the temperature sensitivity of her kin. Her sight is also of Expert level, giving her an edge in hunting, scouting, and war.

Oyorda Uzanason Skotson aka Flame Shaper: Born to a potter's family, Oyorda grew up like any normal Weavertown child -- playing in the streets, helping his family at the kiln, trembling in awe at the wisdom of the Spider Shaman. One day, just as he was entering manhood, he was tending the kiln and suddenly found himself aflame -- but unhurt. Not only that, he could make the fire dance and shift by thought alone, mold them into shapes, and even cause them to spring from his hands. His gift increases in power as he ages. While more adept (Expert) at shaping and controlling extant fires, he can generate fire out of thin air at Good rank. He's even learned to fly on fiery wings at Poor rank. He's saved the city from two catastrophic fires since his power has been active. With his help, his family turns out pottery faster than any other. After a discussion with Spider Shaman, he's begun to get interested in applying his powers to metallurgy.

Dyolikeen aka the Huntress: A stranger in a strange land, Dyolikeen is the last of the Esidarra. She seeks a worthy mate (or mates), in order to rejuvenate and restore her people. She will be mother to a new tribe, stronger than the soft-bellied lowlanders. And she will take revenge on the bloodline of her ancestral enemy. She has Good Superstrength, Good Invulnerability, Expert Superspeed, and Expert Supersenses. Additionally, she is a Master Hunter, and believes women are superior in all ways to men -- except in the male ability to father a child.

Betwyr Mayason Samohtson aka Spider Shaman: The current wearer of the Weaver Mask and the Cloak of Webs is an orphan, raised by a kindly uncle, who was one of the few hunters supplying Weavertown with wild game. On these rambles, Betwyr learned to hunt, stalk, and trap as well as any grown man, and was woodwise and worldwise beyond his years from these travels. Blessed with a surprisingly sharp intellect, Betwyr became the youngest apprentice shaman in memory. He learned the ways of the spirit world as quickly as he had learned the ways of the forest. After ten years, the reigning Shaman died, and Betwyr was chosen by the Spider totem to carry on the mantle. He possesses Poor Superstrength, Good Wallcrawling, Master Superagility, Master Superintelligence, and the ability to walk unseen and unheard in shadow at Good rank.

As written, the Flint Age does not include magic. However, some GMs and players may wish to give their PCs magic powers, or superpowers with a magic origin. Feel free to, but note that if magic is a learnable skill, as opposed to something that must be inborn or acquired (like superpowers), there will probably be a many who will make the effort to learn magi, if only to defend against the superpowered.

Also, the determination on whether magic energies and superpowers affect each other, and how, must be resolved by the GM. Would a "sense invisible" spell allow the magician to see the Spider Shaman skulking through the shadows? Will a magic bolt pierce Yog the Mighty's invulnerability? Could Flame Shaper burn a shaman who has cast Resist Fire?

OPTION: Everybody's Got Superpowers

Maybe *everybody* in the setting has superpowers. On the whole, this would probably accelerate technology and scientific discoveries even faster, while making the world a more dangerous place. PCs with superpowers will be less special, the prestige of super-person created wamla would bottom out, and threats and enemies will be significantly more powerful.

Chief Twocrest (of the Sunrise-Over-Oak Brood): The extra green crest on his head is unusual for a ketsheeli, but this is not the only strange thing about Chief Twocrest. He has Average Superstrength, Master Sense of Smell, Good Invulnerability, Good Vision, Master Superintelligence, and is not affected by rapid changes in temperature in the slightest. He is a superior ketsheeli, and makes no bones about letting anyone know that. While somewhat jealous of the grand culture of Weavertown, he respects them as a worthy opponent in trade and war. In addition to his vast Pride, his other main failing is his unnatural -- for a ketsheeli -- Affection for his progeny and his people. He really wants Yog to join the ZZarthka'sss community (and secretly wishes to breed the Mighty One with his daughters).

Yog Yogson Meleson aka The Mighty: Yog is an Expert Hunter, and possesses a few potent superpowers: he is the strongest sapient in the Flint Age (Master Superstrength), tougher than many dinosaurs (Expert Invulnerability), and can even fly without wings (Poor Flight) -- though he generally launches himself with his superstrong leg muscles, only using Flight to control direction and altitude. He shares the Expert Sense of Smell and Poor Rapid Temperature Adjustment (Physiological & Psychological) of ketsheeli, but has Average Vision. He is also somewhat shy and lonely (Poor in interacting with strangers and females) -- he entered sexual maturity two years ago, and has yet to meet a suitable mate. His scales are a deep coppery color; his crest is red; his eyes are gold.

Group Interaction Matrix

This chart indicates current relations between groups, both the public position (and the secret feelings behind them, in parentheses). Only one treaty of note currently exists (see below, [Treaty Belt](#)), between Weavertown and ZZarthka'sss.

Group	Nisalthu	Silpo Tem	Weavertown	ZZarthka'sss
Nisalthu	X	No contact.	Friendly (mild jealousy)	Cordial (curiosity)
Silpo Tem	No contact	X	Unimpressed (afraid)	Friendly (mild jealousy)
Weavertown	Friendly (curiosity)	Dismissive (provincial)	X	Cordial (watchful distrust)
ZZarthka'sss	Cordial (unconcerned)	Cordial (annoyance, except for Yog)	Friendly (seeking weakness)	X

Events & Possible Story Arcs

- Giant Laser Devil-Lizard:* A huge, battle-scarred Tyrannosaur is on a fiery rampage, setting the landscape ablaze with jets from its eyes. It's up to the PCs to stop the power-maddened creature, before their (hunting grounds/cultivated fields/villages) are destroyed!
- Find the Treaty Belt:* After a disastrous sequence of raids and counter-raids a generation ago, the chiefs of Weavertown and ZZarthka'sss agreed their people would never again wage war against the other, and they re-emphasized the ties of trade between them (the Green wamla ring). For the most part, this treaty has held. In commemoration, three treaty belts were woven of silk and decorated with faience beads. Each chief holds one of these belts, and the other is supposed to circulate eternally on the Green ring. However, it seems to have vanished, and tensions are growing high. The chief of one of these groups asks the PCs to trace its path, track it down, and take it to his opposite number.
- The Call Goes Forth:* Something big -- an alien invasion, a natural

disaster, an epidemic, a herd of meteor-maddened animals, war between groups, etc. -- threatens everything the characters hold dear. A call is sent along the wamla rings, pleading that the blessed (those with superpowers) band together to repel this terrifying threat. Will the PCs respond, and join this new avenging league?

Advice, PC Opportunities, & Pitfalls

Proactive Adventure: The Flint Age setting is ripe for development by characters in a building frame of mind. Those with superpowers can change the course of mighty rivers, build fantastic cities, found kingdoms, defend their kith and kin from the dangers and ills of a harsh, prehistoric world. The possibilities are limitless . . . provided that the characters *do something*.

Since the Flint Age is off the beaten-track of supers games, some players may feel at a loss for knowing what to do -- after all, many supers games focus on *reacting* to the plots and crimes of villains and masterminds. The Flint Age could support that style of play in a pinch: just cast one of the NPC group leaders in the Thulsa Doom role.

But it can be more interesting to encourage players to think proactively, on what *they* can do to help their people(s) survive, build, and grow; on forging connections with other cultures; on seeking out new discoveries in the world, in the crafts, and in the sciences; and on protecting their people from natural and unnatural catastrophes.

If all that fails, send in a stampeding herd of radioactive, flame-breathing ankylosaurs.

The PCs' Group: If all the PCs do not possess superpowers, some players may feel a bit excluded; GMs may consider making some form of superpower mandatory. Perhaps the Spider Shaman has been missing for a year, and all of the PCs are apprentices newly-blessed with the Weaver's Kiss: an unprecedented number of new Spider Shamans! (What coming danger is so extreme that the Spider Totem has done this?)

Group-Level Play: An interesting take would be for players to each control the fate of an entire group: their subsistence, trading, building, research, and warfare activities. A superpowered individual character could serve as the leader of that group, and be the player's viewpoint character. While Group-Level Play isn't for everybody, it could lend a more thoughtful, diplomacy-and-trade based gaming experience.

Adapting the Flint Age

Fantasy: In a fantasy campaign, the peoples of the Flint Age may be barbarian tribes whose strangely-powered heroes make them hard to disregard, even to warriors with the best arms, armor, and magic.

Standard Supers: The Flint Age easily could be an "alternate dimension" of a standard supers campaign world -- simply replace the NPCs offered above with modified versions of the supers of the extant world.

Science Fiction: The world of the Flint Age could be an alien's terrarium experiment. Maybe its heroes are the only thing standing in the way of the Galactic Exploiters' Guild from conquering a rich biosphere. The Flint Age could have grown up on Earth after an apocalypse involving vast amounts of radiation, genetic engineering, or nanotechnology. Then again, it could all be just an engrossing, ahistorical VR game.

Gaudeamus Igitur: Age and Society in Roleplaying

Part I -- Childhood

by Michele Armellini

*"Let's rejoice, therefore,
While we are young.
After a pleasant youth,
After a troublesome old age,
The earth will have us."*

--*Gaudeamus Igitur*, translation from the C.W. Kindeleben 1781 version

The way in which any society works is heavily influenced by assumptions concerning age. Most roleplaying games make little use of this key defining element. Yet, given that many of the social settings of common RPGs are fictional (fantasy, science-fiction, or alternate-history), it would certainly be possible to use age groups and conventions both to make the setting more interesting and peculiar, and as adventure hooks. Also, historical settings would benefit from a realistic representation of the attitudes and expectations that society actually displayed at the time of the campaign.

It is easy to take for granted concepts like youth or old age and hand-wave them from current society to any Fantasy medieval gameworld. It's easy and wrong; a given age is a constant in mathematics, but not in social sciences. **GURPS** does offer a few specific rules, but they could well be tailored to the gameworld's cultural conventions, and other game mechanics could be used, too.

The ideas herein should be useful to everybody, but reference is made to the **GURPS** rules dealing with age. Adventure seeds are provided, too.

Childhood

Today, children in affluent societies are treated in a rather different way than they have been throughout most of history. Children's rights are a very recent concept, and to this day not widespread all over the world. In the past, even the child of a free man might be considered as something of a miniature slave. The father often had a right of life or death over the children, either sanctioned by law (as in classical societies) or informally accepted. The idea that physical punishment might not be good for the child is similarly recent, and harsh disciplinary measures are still used in many countries. Even the most loathsome form of abuses, the sexual ones, were at times considered bad taste rather than crimes, although powerful primitive taboos had taken the form of religious prohibitions against incest. Religion also played an important role in forbidding abortion and infanticide; when it didn't, these were choices a pragmatic, ruthless woman or a family in dire straits could feel forced to take.

A child over five or six years of age might be put to work. While this sometimes requires tools (such as looms) to be specially built, conversely the child's small size is very convenient for certain job descriptions (such as chimney-sweepers and acrobatic thieves). Until the mechanization of agriculture, a farmer having many children was wealthier than a childless one, everything else being equal, because the latter had to hire workers. In the early industrial age, children were paid much less than men, but for that very reason they were less likely to be unemployed. Infamous children's sweatshops are open for business, today, in many third-world countries.

The children of the powerful and wealthy were somewhat an exception to these rules . . . even though one could say they were still exploited, in different ways. Royal offsprings were crucial for their potential role, and often the focus of ruthless power games for the regency; young nobles had to be trained for the role they would play when grown up, and they could be betrothed, even when ridiculously young, as pawns in dynastic alliances. In recent times, a working child could be a fighting child; today, auto-firing, light-weight firearms take away much of the requisites (strength, skill)

only an adult could provide. Children often lack a proper sense of mortality, or this can be reduced by brain-washing, religion, and/or superstition. As such they can become ideally fearless soldiers; they can't be expected to carry out complex tasks, but they are often exploited for suicidal ones that an adult would refuse (such as clearing minefields by charging through them, which happened in the Iran-Iraq war). To this day, children are kidnapped from rival tribes in Africa and trained as little soldiers, as the Ottomans did for their Janissaries.

In wealthy countries -- today and in the foreseeable future -- children are treated much better, they have rights, and they are even decision makers (as anybody can see by watching TV ads aimed at them). They still have a job, though: learning . . . and a tough job it often is. Schooling can easily range from allowing each pupil to develop his own potential to forcing all of them into a mold. From five years up, children can be taught competition.

Children In *GURPS*

In *GURPS*, children as characters basically get lower Attribute scores as per p. B14. They have low IQ levels because *GURPS* IQ is not just raw intelligence but also general experience. Finally, when creating a child character, it's important to remember his Skill selection will be realistically limited, since he cannot have more than $(2 \times \text{age})$ points in Skills.

This treatment is openly intended to create realistic non-player characters more than playing characters. Low attributes and limited skills are already quite penalizing for the poor tykes. Children, however, are usually part of a family and society. Why not using the mechanics *GURPS* offers us to portray this network? For instance, if the parents take the child as a Dependent, then he should have them as Patron(s). If he has got no parents, but a huge extended family, maybe he has a Claim to Hospitality.

Also, the social standing of the children could well be considered, especially if they are meant as PCs, and especially if these are unusual children. For instance, adults will not expect much from an IQ-8 10-year-old brat as to his intellectual capabilities. The GM will simply take this for granted, and it's enough if that's a NPC. But if he's a PC, and a little genius with IQ 14, then the GM should probably thumb through his *Basic Set* and come up with a compulsory Disadvantage: Social Stigma -10 (Valuable property) -- "it usually takes the form of limited freedom and/or lack of intellectual respect"! That's exactly the way adults will treat the PC, at least until they understand how smart he is.

Similarly, all other social advantages and disadvantages might be taken into account. By applying any of them to children, the GM can better define them as characters; are they Literate? Are they Uneducated? Disowned?

Also, Advantages and Disadvantages applied to children will give a peculiar, specific flavor to the fictional or historical society they grow in, or portray their special position within it. For example, Spartan children wouldn't have parents as Patrons, and they'd probably have a Duty even when very young. The children in a dying race might have a very special social standing and careful Patrons. A kid working for a tyrannical master thief (a Fagin) would have Involuntary Duty, low Status, Poor, Uneducated. Of course there are several Disadvantages that seem tailored for a light-hearted campaign with child PCs: Clueless, Distractible, Evil Twin, Insatiably Curious, Klutz, and Short Attention Span (a must!).

Metahuman, Godlike, and Alien Children

The assumption behind the relatively numerous super beings existing in many supers gameworlds (including *GURPS I.S.T.*) is that super powers are inborn. They may be latent and activated by accidents, stress or physical training; but they may also be "operational" from birth, just as it happens with *X-Files* babies. What happens when a powerful five-year-old PK psi wants his lollipop? What happens when he's really annoyed with someone, and he's a pyrokinetic, too? (Stephen King answered this one with *Firestarter*.) Raising, training, and keeping in check these children may be a daunting task, especially if the parents *aren't* metahumans.

The story-telling potential of this situation was already appreciated by ancient Greek authors, who toyed with stories about gods in their childhood. The juxtaposition of super-human strength and a childish mentality may make for

interesting and funny situations.

In a science-fiction setting, of course, aliens may replace gods and demigods. If an adult specimen is overwhelmingly powerful, its young can be a sizable challenge -- especially since they may lack the adult's restraint and self-control.

Are These The Same Species?

Often SF aliens and their offsprings are assumed to deal with childhood as we do. However, sentient aliens may well not be mammals. Several life forms on earth undergo major, sometimes astounding, developments while they grow (these changes are called metamorphoses). The same may happen with extraterrestrials, and the *Alien* trilogy is a remarkable example. However, if the members of an intelligent alien race grow from egg to larva to pupa to adult, it is possible, even likely, that their attitude towards the young is different from ours. For instance, if eggs are laid in the hundreds of thousands because the race originally came from a hostile environment, an adult would probably protect them for the species' sake, but he wouldn't develop a personal attachment to all of them -- indeed, he might also regard someone else's eggs as a source of protein. Moreover, if the race no longer faces natural limiting factors, it would probably need to find ways to restrict reproduction.

Adults might let their young fend for themselves in their immature stages, because they realize that otherwise, they'd be meddling with evolutionary forces they prefer not to interfere with. Or, once they develop intelligence, they might become overprotective, with long-term consequences. Larvae may be amazingly different from adults (such as caterpillars versus butterflies), which might sparkle interesting situations when outsiders barge in.

Adventure Seeds

At School

There are a few games in which the gameworld is a defined space where adults have little or no place. *All* characters are children, and the main thrust of the game is their interaction. These are "school games" -- and here are a few school adventure ideas.

- *Schoolyard Wars*. We all remember: The bully. The joke butt. The fatty. The teacher's pet. And more often than not, there were the schoolyard gangs, too. Face down the enemies by mocking them or fighting them; be merciless and cruel, as only children can be. Just remember it's a dead serious thing for all involved, "child's play" is something only the adults believe in.
- *Microcosm*. Building on the Schoolyard Wars theme, above, why not creating a full gameworld -- contained in a school? Time at home is just something of a dream. The teachers are distant demi-gods, whose desultory interventions are usually more harmful than useful. Children have Social Status, Wealth, Reputation, Stigmas, Favors; all scaled to their life at school. Other children may be Allies, Dependents, Patrons, Contacts -- and Enemies . . .
- *Rat Race*. This is a scientific space colony. There are two castes: scientists and everybody else (from cooks to mechanics). It's a very long-term project, so there are families, and a school for the children. How they perform at school will define what they'll become: revered scientists or despised menial workers. The children of the former, of course, have much better chances, even though, officially, nothing bars a cook's daughter from qualifying for the better courses reserved to smarter pupils. Tests, examinations, repressed social-class rivalry, and challenges are routine.
- *Hate on the Field*. Football is just a game. This year, however, the teachers and parents want to organize a four-team tournament involving two schools. Each team has an unofficial name, too: Serbians, Croatians, Nothing, and Parenthesis (from the symbol on their shirts -- some say it's a half moon, actually). Some teachers are worried, and they seem to expect difficult refereeing and tough play. The place is Bosnia, the time is just before the war, and the story is, sadly, true.
- *The Dare*. The team carrying out the most outrageous, daring and crazy trick wins. The victim must be a teacher.

Ordinary Children

These are ordinary children, but the situation is extraordinary. For "everyday adventuring" with children, see "At School," above, under "At school".

- *Exploitation*. A simple adventure idea can be based on the villain exploiting children. This can take any of the forms mentioned above under "Childhood". Such a villain automatically comes through as loathsome and deserving the kind of retribution the righteous heroes can offer him. This is rather straightforward . . . maybe too much so. What if these working kids' wages are the only income for their families? Or, what if the children really believe their warlord is a mage whose amulets will protect them from mines and bullets? What if the warlord, well, is a mage?
- *From their mouth*. A horrific crime. A couple of witnesses. But . . . they are children. Do they need protection? Where are their parents, what role do they play? Will they be admissible, believable witnesses? Will they stand cross-exam? By reliving the events, will they break, or will they suddenly remember something more? And above all, are they reliable? What if they hated the victim, or the perp? What if one of them changes his version?
- *The innocents*. This isolated Fantasy community desperately needs help, so that they can stop the unseen enemy that kidnaps their children in the night. The children show up again months later, unharmed but very pallid, and they remember nothing. The families want them back, no matter what. The secret is that a wizard is stalemating a dreadful demon he himself has summoned; for doing that he needs *pure* persons, the only ones the demon can't harm, tempt, or control. In the cave beneath the mountain, the wizard and a number of young boys and girls live in a grim routine, with somebody always on guard over the demon's hole. Every few months, the wizard wipes the recent memory of one of the kids and sends him back to his family, but he's finding it increasingly difficult to kidnap replacements. Of course, the children realize that without them, the demon would be unleashed against their own families.
- *Lord of the Flies, II*. Civilized children abandoned on a desert island. Will they replicate the society they come from? Or will they revert to barbarism? What if this is a social engineering experiment, and adults are secretly monitoring them? What if this is actually a cruel media show? What if the Lord of the Flies *exists*, and not only in the children's souls?

Other Children

- *Mutant Kids' Chronicles*. These children look normal, but they have powers; maybe they are supers, psis, weres, or knack mages. This will lead to all sorts of intriguing situations, as they initially have little control, or none at all, over their own capabilities. There will be all sorts of enemies very interested in them, too. The heroes may be the concerned, harried parents and relatives; bodyguards and scientists working for a benevolent (or less malevolent) agency, tasked with protecting and studying the little wonders; or the children themselves!
- *Upside down*. It maybe the devil's, an impish deity's, the fairy's, or an unknown being's work. The fact is, now children rule in this place. Something embarrassing, or inconvenient, or outright harmful happens to anybody over 10 who refuses to obey a child's bidding. The heroes must discover what's going on and try to restore normality; possibly they will have to explain the brats that it's in their own interest. Or, maybe the PCs are children, and very happy with the way things work now.
- *The all-powerful brats*. A couple of spoiled alien children are on the run from their parents -- and they can easily cause planet-sized disasters! The much-less-powerful heroes must: first, open a dialog with the brats (who'll initially think they are little more than obnoxious flies); second, cajole, distract, fool or entertain them so that they won't destroy anything for the fun of it; third, call in the parents!
- *Take us to your leaders, er, parents*. The first contact with this planet's unknown civilization. The explorers land and meet the aliens. They are huge beings, but they seem friendly. Negotiations begin. However, it seems the aliens have a short attention span, and that at times they behave, well, in a childish way. How strange.
- *Intelligent larvae*. On this planet, the explorers, interlopers, or scientists seem to discover two intelligent species, very different from each other. The "superior" beings cull and *eat* sizable numbers of the "inferior," yet sentient, ones. The outsiders take issue with that -- and will be horrified and/or incredulous when the adults explain that those are their own larvae! The problem is that the one and only dominant species on the planet extinguished all natural predators, and they haven't found a better way to control reproduction. What will the off-worlders do?

Do the larvae realize what will happen after the cocoon, or do they think that's death? Do they know what the "butterflies" actually are? Won't they fight against their elders, if given half a chance by some well-meaning but uninformed third party?

Roleplaying Tips

Roleplaying children is not easy, but it can be very interesting, at least for a change. The ideal age bracket is between 10 and 13. Children of that age have a sometimes surprisingly clear (if narrow and slanted) perception of what's going on around them.

The GM and the players should be aware of the limitations the PCs will be subject to. The players should take great care to avoid acting on the basis of their adult knowledge. Every time there's a doubt, they should roll against relevant skills or their IQ rather than simply going along with what they want to do; if there's an infant prodigy, his IQ rolls might well be penalized. This will limit the players' options. On the other hand, there is a special joy in being allowed to act childish!

In traditional fiction, the adult adversaries of children protagonists routinely underestimate them at first, then become very angry at being fooled by the brats, and often resort to brute strength. The children, however, defeat brawn with brains, and the bad guys will discover that if they are evil, a brat can be wicked. This might be the way to go with a playing group.

There is also some disturbing fiction, bordering on horror, where dark events are seen through the eyes of children. This is very difficult to roleplay well, but some players might find it an enjoyable challenge. The GM should keep in mind that Fright Checks can be requested more often if the night-prowling heroes are under 12!

Working for THEM

Adventures of the Trilateral Headquarters on Energy Management in the Firestorm-Effect 1950s

by Brian Rogers

All About THEM

The Trilateral Headquarters on Energy Management was formed in the cautious days of 1945, shortly after the Nagasaki detonation. The Navy had encountered inexplicable problems in the Pacific, having lost three ships to things-not-easily-placed-in-a-report, and [Secretary Forrestal](#) pressed the Truman administration to do something. Truman's response was to place Forrestal as part of a three-man commission (with Army and Air Force representatives) to investigate what Los Alamos scientists quietly called *Firestorm Effects*: biological and environmental changes wrought by A-Bomb detonations.

Forrestal got the Trilateral Headquarters shuffled off his plate in 1947 when he was named Secretary of Defense. This shifted the "first among equals" within THEM to Army General Eugene Stanehurst, who kept that position until his death in 1963. Stanehurst's longevity in the post surprised many; he was named the Army representative as his last post before his retirement, despite his age (59) and poor health. The Army wanted a respected name to balance Forrestal. In 1946, sad events at home caused Stanehurst to throw himself mind and soul into THEM: if his body suffered, well, that wasn't what he had been picked for, was it? Frail even at the start, Stanehurst was quickly wheelchair-bound and using hothouses for offices. By 1963 there were rumors that he was as much a Firestorm Effect as the things his agents hunted.

Stanehurst became affectionately known as The Old Man among his people, from whom he demanded results but gave incredible loyalty. He amassed sufficient clout in Washington to run his agency any damn way he pleased -- despite Army attempts to replace him or adversarial representatives from the Navy or Air Force -- especially once his personal friend Eisenhower became president. This clout would have meant little if he hadn't also been very good at a sticky job.

During the 1950s he forged THEM into a small, efficient agency that knew the exact boundaries of its authority and had few qualms about exercising it. The mandates of the Trilateral Headquarters were as follows:

1. Maintain up to date awareness of advanced energy theory, engineering, and usage worldwide.
2. Insure primacy in such matters for the United States and its allies.
3. Investigate, contain and, if necessary, eliminate Firestorm Effects, with a degree of response dictated by the FE's immediate threat to public safety as determined by THEM personnel.

Under Stanehurst, THEM had a fourth, unofficial mandate: resolving the murder of James Forrestal. Stanehurst was adamant that his fellow THEM founder did not commit suicide, and while politics precluded an aggressive probing, the agency under his command kept a quiet vigil on the subject.

THEM's first and second mandates required close contact with Western scientists to track advances in physics and other sciences. General Stanehurst interpreted the second mandate to include THEM acting as a clearing house for scientists, including those with unusual theories: for any breakthroughs in energy sciences, THEM was either involved at the outset or had agents on the scene shortly thereafter. Aware of the threat of Communist infiltration in this scientific hothouse, THEM maintained tight internal security against espionage.

Naturally, the first two mandates also required THEM to perform similar espionage. Much of THEM's international division was dedicated to this task: infiltrating labs, tracking scientists, and stealing advances from Communist

countries (and, in some contentious cases, from US allies). Occasionally THEM would use sabotage to protect American primacy, though always with deniability. In this way, THEM was very similar to other cold war intelligence agencies.

Their third mandate was more unusual: Firestorm Effects were an unfortunate side-effect of atomic power, and THEM was America's primary defense. THEM focused on having a cadre of highly trained field agents, relying on their ability to call on traditional armed forces if required. Agents would be present to oversee energy research or investigate possible Firestorm Effects across the country. If things went awry, they'd coordinate the response to contain the situation.

Of course, nothing was ever that simple. The armed forces chafed at being commanded by THEM agents, disagreeing with agent decisions concerning proper degrees of force -- THEM forced the destruction of Firestorm Effects that the military would rather have used as weapons, while protecting FE's that posed no immediate threat to public safety from military or public destruction. Rumors persisted that these shielded FE's were recruited, and THEM agents were often called 'the freakshow' by the traditional armed forces.

THEM can be a potent agency within the Atomic Horror setting. With the administration backing and armed forces support, THEM agents wield considerable authority within the Headquarters mandate. They're given comfortable leeway on assignment but are expected to deliver: the Old Man accepts the occasional failure, but not if it includes stupidity, overconfidence, agency embarrassment or civilian casualties. THEM agents make great PCs, adversaries, patrons, allies, or deus ex machina if the scientist, teenagers and retired marine/gas station mechanic prove unable to contain the giant louse infestation on their own. The Headquarters can provide a government counterpoint to TSF from *GURPS Atomic Horror*, but it has other uses as well . . .

Using Firestorm Effects

Firestorm Effects are the Atomic Horror-esque results of mutagenic: inhuman strength or intellect, unusual hybrids (iron-skinned animals lusting after red blood cells, men with insect heads, etc.), telepathy/mind control, energy projection, and the classic uncontrolled growth or shrinking. These can be applied to anything, even whole environments, such as areas where everyone within it become telepathic, or where lightning discharges from the ground . . . though humans and animals are more susceptible. In short, Firestorm Effects are carte blanche to play with the world's rules to create the story.

What causes Firestorm Effects? Atomic power is the most common culprit, either by being exposed to normal radiation or to strange elements such as Brobdignagium, and if the GM wants to keep the world focused, he could run with Atomic effects for some time. Other culprits include chemical spills, biological modification, alien contact/abduction, Orgone, etc. Enterprising GMs can develop hyper-tech: secret weapons such as ray guns or jet packs whose power sources qualify them as THEM's problem when in the wrong (i.e., foreign) hands.

There are other common terms for Firestorm Effects: Monster is one. Super is another. Supers as a genre had fallen out of vogue during the Atomic Horror era, a time when two-fisted heroes battled the personifications of Middle-American fears with a little pseudo-science to get them over the top. All powers were, by definition, "things man was not meant to know", dooming their possessor to social exile, madness, and death (often at the hands of those two-fisted heroes). Heroics were not seen as an option for those touched by the atom.

Change the angle slightly and the Atomic Horror world takes on a different view; rather than condemned a priori, Firestorm Effects might be the ultimate heroes, valiantly suppressing their inevitable madness to help their fellow man. Given that the 1950's public response to supers would be calling the army, such heroes would have to maintain anonymity. With the growing Federal power to track people, they'd have to have some sort of government patron to avoid a Richard Kimball existence. If they acknowledged that their final fate was unavoidable, they may ask someone to be in the position to put them down when the time came.

Enter the Trilateral Headquarters on Energy Management. THEM -- with its secrecy, government connections, and position in the thick of things -- makes a perfect patron for Atomic Horror supers. Stanek believes that you can take

normal people and make them superior soldiers through training, support and a worthwhile adversary. His agents keep an eye out for recruitable FEs, offering them a way to use their curses to protect other innocents from the same fate (and to keep the Reds in check, of course). Some Firestorm Effects, the ones not already driven mad by their powers, gratefully agree. They're trained as field agents and given partners to help them deal with the normal world. In addition to standard THEM training, such partners are armed not only with psychological training to detect warning signs, but sufficient armament to eliminate their FE charges if or when they start the descent into madness. (This can mean some fairly extreme armament!)

The Freakshow

If the GM decides to use THEM as the setting for Atomic Horror Supers game, he should keep some things in mind.

First is the tone. While it is possible to just slot THEM as a super-agents game into the common "supers timeline dead period" between 1945 and 1955, that doesn't take advantage of the joys of Atomic Horror. If they become known, Firestorm Effects will be hunted by the army and press (if not snagged by the Reds or Grays). With the world on the brink from unseen threats, FEs are more terrors than saviors. This is an ideal setting for playing heroes who protect a world that hates and fears them -- even if you strip away the harsher aspects of self destruction, FE heroes are still a doomed patrol that is more tolerated than celebrated, even by the agency that supports them.

Second is balancing the characters. On one hand, you can simply not bother. FE agents are much tougher than their minders; play up the sheer power of FEs compared to normal people and make the inevitable final confrontation that much more ominous. Tragedians can wallow in knowing that when he flips he may kill his best friend, while tacticians may relish the Dark Knight challenge of taking down his apparently-unstoppable charge when the time comes. If you aren't comfortable with disparate power levels, build the PCs on even points but different strengths: a FE with 50 base points + 100 points in powers will certainly be powerful, but no more potent in any session than his 150 points-of-skills-and gear minder. Building the FEs on minimal base points will emphasize their "Cursed Normal People" condition in contrast to the hand-picked and trained THEM regulars.

Third is system. The encroaching madness and death facing FE PCs can be hard to handle, especially in a system designed to handle supers. **Aberrant** already focuses on the inevitable struggle against one's destiny, making it a good engine once you replaced the 21st century aspects with some 1950s chrome, but expect the FE PCs to be quite powerful. **GURPS Horror** has guidelines for handling slow descents into madness, and the baseline reality of the **GURPS** mechanics makes a great foundation for both agents and supers games. **Silver Age Sentinels** emphasizes the heroic ideal, and FE's struggling to fight the good fight in the face of personal tragedy make a ready canvas for heroism: just keep an eye towards slowly assigning more Defects to indicate the hero's fight against time. Likewise, **HERO System** games will readily handle a THEM game's Supers aspects, but will require some tweaking to deal with the Atomic Horror aspects.

Sample THEM Agents in *Silver Age Sentinels*

The original incarnation of THEM occurred in the Silver Age Sentinels playtest, so the sample character stats are given for that game. (This has the advantage of demonstrating how to build cursed FE characters in a sanity-free system.) The Characters are presented as 100 pt THEM agents. GMs should add bolded stats for Atomic Horror Supers, making them 140 pt FEs with their Minder. My Thanks to Stephen Shipman and Tom Ladegard for these Men in Black.

Lt. Col Reed Crawford USMC ret (callsign X-Ray)

Body 10, **Mind** 10, **Soul** 7, **ACV** 12, **DCV** 9, **Health** 125

Reed Crawford was an electrician's apprentice when Pearl Harbor was bombed, and joined the Marine Corps the next day. Trained as a pilot, he racked up an impressive kill record before being shot down over a South Pacific island, surviving there for weeks before being rescued, though the events surrounding that still haunt his dreams. At the end of the war he used the GI Bill to study physics and engineering before being recruited to THEM.

THEM was attracted by his development of an awesome personal weapon system -- his accelerator belt (and its ring-mounted projector unit) and broad spectrum goggles -- and his incredibly high natural resistance to radiation. Reed takes his job with THEM very seriously, and is prepared for the day when he has to use his advanced weapons against his friend and partner.

Dr. William Stanford

Body 8 (14), **Mind** 12, **Soul** 7, **ACV** 10 (12), **DCV** 7 (9), **Health** 155 (225)

Characteristics: Attack Combat Mastery (1), Combat Mastery -- ACV Knockback, Leap Attack (tackle) (2), Extra Attacks (1) Gadgets (2), Highly Skilled (7), Massive Damage -- Football Moves (1), Organization Ties: THEM (4 3), Wealth (1)

Powers: Armor (3), Immovable (3), Enhanced Body (6), Regeneration -- restricted to healing every 10 minutes (3), Speed (1), Super-Strength (1) Defects *Cursed -- In constant pain from muscle growth (1), Maximum Force -- Super-strength (1) Marked -- extremely over-muscled(1)* Red Tape (1)

Skills: Biological Sciences -- Biology (3), Driving -- Car & Motorcycle (2), Management -- Government (2), Gun Combat --Pistol & Rifle (1), Medical -- Surgery & Pharmacy (5) Physical Sciences -- Chemistry (3), Police Science - Forensics (3), Sports -- Football (3), Unarmed Attacks -- Strike & Grapple (2), Unarmed Defense -- Strike & Grapple (1)

A short, stocky block of a man, William Stanford tore up the Yale Football field during his collegiate days before getting his medical degree. During the war he distinguished himself as field surgeon, but upon his return moved into the field of sports medicine, still knitting together bodies torn apart on the field of battle. He began looking for more in life when THEM recruited him.

Recruited is a polite term - Stanford had become obsessed with fixing the "inherent frailty of the human form", to the point of breaking the second rule of medicine: don't experiment on yourself. Initially thinking the project successful, Stanford found himself growing stronger and losing control. When he accidentally knocked over a truck and held off gunfire from a panicked cop, the government was called. Luckily the THEM agents who responded were willing to quietly take him into custody. Stanford feels himself growing stronger every day, and has done the math: he's growing stronger faster than he's growing tougher, and eventually will be so strong that any muscle movement will break his bones. Even with his advanced healing, he'll still be in constant agony and no doubt quite mad. Until that point, he's fighting the good fight and searching for a way to reduce what he's done to himself. He doesn't know that Reed is there to both help him succeed and to stop him if he fails.

Analects Arcane: Dramaturgy

The Play's The Thing! for d20 System

by Owen K.C. Stephens

Journal entry: Sixtieth Day of Summer

I have been long away from my journals, as I have engaged in my least favorite pastime . . . arguing with my patron goddess. Her current avatar is young and foolish, over-sure of herself and her divine power. She still enjoys sowing her wild oats and watching the effect her favors have on handsome young wizards. I know She times her new avatars to be young when the Mage of the North is old, and I understand She depends on me to resist her charms (often literally) and temper her passion for changing the world. But I far preferred dealing with Amara than this young whelp who hasn't even taken a name for her self yet.

Unfortunately, I don't really have a choice in the matter.

As Mage of the North, I am perforce a devotee to the Dark Lady, and one of Her most obvious agents. Most who do not live in Brak Karral assume that the Mage of the North is automatically made a priest of Her Eternal Cult, and thus gain the powers all Her clerics possess. Contrary to this belief, the matter is not that simple. When I passed the gauntlet perilous and took up the staff of this office, the avatar Amara gave me a choice. The mystic powers and skills of any other vocation of spellcasters could be mine. Most of my predecessors leapt at the opportunity to gain the powers of clerics. A few chose to master the magics of nature as druids or feel innate power flowing through their veins as sorcerers. Maragin the Pure even chose to gain the holy spells of a paladin.

I however, had always wanted to learn to play the harp. Young as I was, I asked for the arts of the bards. Amara, trickster she was, didn't even try to talk me out of it. I do miss her.

Of course, from an arcane perspective, bards and wizards are remarkably similar. Though there are a few spells only available to me as the Minstrel of Night (you must forgive me . . . were that mages were forbidden to name themselves until they're older), when it comes to spells mostly the gift has simply given me a greater endurance of lower level arcana. That said, I have never regretted the bardic gift of lore, or the affect I can bring on allies by bellowing out the war odes of my forefathers. Sadly, I have yet to master the harp. As a side benefit, because I have chosen to learn some healing as a bard, most of my enemies and allies alike have never realized where my true talents lie as the Dark Lady's most beloved.

What I have learned in my dual studies of magic as wizard and minstrel is that there is, or can be, magic in all things. While wizards rush to create things that cannot exist without magic, bards learn to call forth the magic to be found in art, beauty, passion and dedication. While this is often a less powerful form of arcana, it is also much more

subtle, and often more versatile. I learned this most forcefully after coming across the Sets of Mirth and Sorrow, a thick tome of dramaturgy, in my tenth year as Mage of the North.

*Amusingly, the volume was not brought to me by one of my dozens of agents I have scouring the globe for books of arcana. Instead, I found it in the tower's own library, nestled among the many mundane books of Brak Karral. Some previous Mage of the North had acquired it as a reference to famous plays. I suppose as a mere wizard I might have similarly dismissed it. But as a bard, I instantly recognized the great power contained within those plays, rough and unformed as it was. It took me months to assume even one dramarcana as a bardic power, but within a few years I not only knew every such magic play within the **Sets**, I had unlocked the secret of using such power as a wizard.*

Which brings me full circle to my argument with Yivenia, current avatar of Her will. With access to all Her knowledge, Yivenia is well aware I am a master dramaturge, and that I have worked hard to keep this fact well concealed. My Winter Masque is a famous festival of plays and opera, but none suspect that I am anything other than an eccentric old wizard who enjoys forcing my social peers to trek into the frozen north or risk snubbing me. Yivenia, wroth as the Red Duke for outlawing unapproved wizards within his lands, would have me dress a version of the Sacrificial King's Tale or him at my next Masque. And I know full well that should I do so, my secret would be revealed, and my Masques never attended again.

Thankfully, of all the members of the Eternal Cult, the Mage of the North alone is free to ignore the orders of the Dark Lady's avatar. So as long as She does not make such a command to me directly, I can keep my secret safe. Of course it is never wise to anger a divine avatar, no matter how young, and thus I must take some steps to appease her. Certainly the Red Duke needs to be put down, and possibly even replaced, and the Sacrificial King might be the tool for the task. But not by my hand and certainly not at my Masque. I do know a rover band who can perform dramaturgy, however, who have also suffered under the Red Duke's new rule. Sending them a version of that dramarcana adapted for the Red Duke and his capitol won't be simple, but I have established many false identities as playwrights over the years . . .

I believe Yivenia shall have the performance she wishes, if not the venue and director she preferred.

*--Arngrim Aignirson
Mage of the North*

Dramaturgy

Dramaturgy is a form of spellcasting that is normally accessible only to bards, though any spellcaster can gain access to it with the proper feats (see Dramaturgist in the New Feats section, below). Dramaturgy works much like other spellcasting except it requires a new component with three elements, the dramarcana (DA).

A dramarcana is a play that has been designed to tap into the magic energy dramaturgy requires. Each dramarcana is geared toward one dramaturgy spell, though it must be adapted for each performance before a dramaturgy spell can be cast. A dramarcana is listed as having a running time (rt), minimum number of performers (mp), and an acting threshold (at).

The running time of a dramarcana is not how long the whole play is, but how long it must run, uninterrupted, before the dramaturgy spell can be cast. The minimum number of performers is how many characters with at least 1 rank of Perform (acting) must be involved in performing in the play, though only the caster need to be able to cast the dramaturgy spell. (In fact, other actors need not even know a spell is to be cast). The acting threshold is the minimum DC at least one actor must make just before the dramaturgy spell is cast. Characters can take 10 on this check, but only if they have practiced the play for at least six weeks. Otherwise they must make a d20 check.

For example, the *sacrificial king* dramaturgy spell is listed as having DA (rt 2 hours, mp7, at 25). This means the dramarcana required to cast this spell must run or at least two hours before it is cast, must have at least 7 characters with 1 rank of Perform (acting), and at least one performer must make a DC 25 Perform check. If any of these elements is not fulfilled, the spell cannot be cast. Any attempt to do so automatically fails, and the sell slot used is lost.

Adapting the Dramarcana

One of the drawbacks of dramaturgy is that each dramarcana must be fine tuned to work under a given set of circumstances. Even if a dramaturgist knows the *great victory* dramaturgy spell, he can't use the associated dramarcana to spur on the troops of the city-state of Gitterdamn to overcome their foes without changing the words, setting, and even some of the characters of the play, and altering the spell elements to match. A pre-written dramarcana is a framework on which the dramaturgist can build real magic.

Adapting a dramarcana requires both a Spellcraft and Perform (acting) check, and may only be done by a character who is capable of casting the dramaturgy spell the dramarcana is being adapted for. The lay must be adapted for performance in a particular venue and against a particular target or area. The base time to do this is one week, and the DCs of both checks are the same as the spell's acting threshold. If a month is taken, these DCs drop by 8. A character may take 20 on these checks, but doing so requires 20 weeks.

Encoded Spells

Though bardic and sorcerous dramaturges have little need for such tricks, wizardly dramaturges often encode regular spells into their written plays. Such works are not automatically dramarcanas, though there is nothing to stop a wizard from encoding a spell into a play that is already a dramarcana.

Encoding the spell takes the same amount of time and money as scribing a spell into a spellbook, but requires a successful Perform (acting) check with a DC equal to the level of the spell encoded +5. Characters who cannot cast dramaturgy spells have no chance of recognizing a spell has been encoded into a play, while those who can cast dramaturgies must make Spellcraft check (DC 5 + level of spell encoded) to notice it. Once noticed, the spell still must be deciphered.

Like learning typical spells deciphering an encoded spell requires a Spellcraft check, but with a limitation. The caster trying to unlock a spell from a play must have the Perform skill with acting as a chosen performance type. The bonus to his Spellcraft check to decipher the encoded spell can not exceed his Performance bonus. For example, Sonja Green has a Spellcraft bonus of +14 and a Perform (acting) bonus of +7. When attempting to learn a spell encoded into a play, she makes a Spellcraft check, but is limited to a +7 bonus, as that's her Perform bonus. If her Perform check were +18, she would be able to use her full Spellcraft bonus of +14.

Dramaturgy Spells

Catharsis

Conjuration (Healing)

Level: Drama 3

Components: V, S, DA (rt 2 hours, mp 5, at 18)

Casting Time: 1 action

Range: Touch

Area: 1 mile/level emanation from point touched

Duration: 1 day/level

Saving Throw: No

Spell Resistance: Yes (harmless)

This dramaturgy spell creates an invisible, immobile field of magic that retards and weakens a specific disease. This gives creatures within its area a +4 dramaturgy bonus to saving throws against a specific disease. The dramarcana for this spell must be adapted for a specific venue, and a specific disease. This spell is normally used to slow or end the spread of plague.

Comedy

Enchantment (Mind-Affecting)

Level: Drama 2

Components: V, S, DA (rt 3 hours, mp 12, at 15)

Casting Time: 1 action

Range: Touch

Area: 1 mile emanation from point touched

Duration: Instantaneous

Saving Throw: Will negates

Spell Resistance: Yes

This spell shifts the attitude of all creatures within the area one step better in regards to a specific group, race, or location. Once shifted, the attitude changes in response to the normal interaction with the group, race, or location. The dramarcana must be adapted for venue, group, race or location the attitude s to be shifted regarding, and season the play is performed.

Drama

Enchantment (Mind-Affecting)

Level: Drama 1

Components: V, S, DA (rt 4 hours, mp 12, at 15)

Casting Time: 1 action

Range: Touch

Area: 1 mile emanation from point touched

Duration: Instantaneous

Saving Throw: Will negates

Spell Resistance: Yes

This spell shifts the attitude of all creatures within the area one step worse in regards to a specific group, race, or location. Once shifted, the attitude changes in response to the normal interaction with the group, race, or location. The dramarcana must be adapted for venue, group, race or location the attitudes to be shifted regarding, and season the play is performed.

Enlightenment

Enchantment (Mind-Affecting)

Level: Drama 1

Components: V, S, DA (rt 4 hours, mp 2, at 13)

Casting Time: 1 action

Range: Touch

Area: 1 mile/level emanation from point touched

Duration: 1 day/level

Saving Throw: Will negates (harmless)

Spell Resistance: Yes (harmless)

This spell grants all creatures within its area a +1 dramaturgy bonus to all checks made with a particular Knowledge skill. The dramarcana must be adapted for venue, Knowledge skill the bonuses are granted to, and time of day the play is to be performed.

Great Victory

Enchantment (Mind-Affecting)

Level: Drama 1

Components: V, DA (rt 4 hours, mp 20, at 13)

Casting Time: 1 full round

Range: Touch

Area: 1 mile/level emanation from point touched

Duration: 1 day/level (see text)

Saving Throw: Will negates (harmless)

Spell Resistance: Yes (harmless)

This spell grants all creatures within its area a single reroll of an attack or damage roll made within the spell's duration. If the second roll produces a worse result the first roll may be retained. (If using some form of mass combat resolution, simply allow one reroll for the side affected by the dramaturgy, and ignore giving individual characters rerolls).

The dramarcana must be adapted for venue and major opponent most disliked by the general population of that venue.

Horror

Enchantment (Mind-Affecting)

Level: Drama 1

Components: V, S, DA (rt 30 minutes, mp 6, at 18)

Casting Time: 1 action

Range: Touch

Area: 1 mile emanation from point touched

Duration: 1 day/level (see text)

Saving Throw: Will negates (harmless)

Spell Resistance: Yes (harmless)

This spell grants all creatures within its area a +4 dramaturgy bonus to the next fear-based Will save they make within the duration of the spell. The dramarcana must be adapted for venue, and the number of times the play has already been played in that venue.

Midsummer's Night

Enchantment (Mind-Affecting)

Level: Drama 4

Components: V, S, DA (rt 2 hours, mp 15, at 25)

Casting Time: 1 action

Range: Touch

Area: 1 mile/level emanation from point touched

Duration: Instantaneous

Saving Throw: Will negates

Spell Resistance: Yes

This spell shifts the attitude of all creatures within the area involved in a relationship that at least one of them considers romantic. This shift moves the attitude closer to love (which can be treated as a step better than friendly). Once shifted, the attitude changes in response to normal interaction. Of course, since some creatures are involved in more than one potentially romantic relationship, much emotional trauma and confusion can result from this dramaturgy. The dramarcana must be adapted for venue, group, race or location the attitude s to be shifted regarding, and season the play is performed.

Sacrificial King

Enchantment (Mind-Affecting)

Level: Drama 4

Components: V, S, DA (rt 2 hours, mp7, at 25)

Casting Time: 1 action

Range: 1 mile/level

Target: 1 acknowledged ruler

Duration: 1 day/level

Saving Throw: Will negates

Spell Resistance: Yes

This spell forces a selected ruler within its area to make a will save, or suffer a -4 dramaturgy penalty to all Int and Cha based skills for the duration of the spell. If the ruler is present for the performance, he suffers a -2 penalty to his Will save. Anyone who is acknowledged to be head of a area, organization, town, guild, or council may be targeted by this spell. The dramaturgy must be adapted for venue and target.

Tragedy

Necromancy

Level: Drama 4

Components: V, S, DA (rt 3 hours, mp 12, at 23)

Casting Time: 1 action

Range: Touch

Area: 1 mile/level emanation from point touched

Duration: 1day/level

Saving Throw: Fort negates

Spell Resistance: Yes

This dramaturgy spell creates an invisible, immobile field of magic that strengthens and speeds a specific disease. This gives creatures within its area a -4 dramaturgy penalty to saving throws against a specific disease. The dramarcana for this spell must be adapted for a specific venue, and a specific disease. This spell is normally used to create and epidemic or hasten the spread of plague.

New Feats

Dramaturgical Spell [Metamagic]

You can work a spell into a play performance.

Prerequisites: Must be able to cast three or more dramaturgy spells.

Benefit: A spell cast as a dramaturgical spell must be performed as part of a play, and must have one or more targets (not an area or effect) who are among the audience. If the Perform (acting) skill check of the director is greater than 10 + the level of the spell, the spell has no outward visual effects. The spell still requires all its normal components, but these are worked into the play and do not seem magical.

Additionally, if the Perform (acting) check of the caster is higher than the hit dice of a target, that target suffers a -2 dramaturgy penalty to any saving throw allowed by the spell.

A dramaturgical spell uses a spell slot two levels higher than normal.

Dramaturgist [General]

You have learned to perform a few forms of dramaturgy.

Prerequisites: Able to cast 4th-level spells.

Benefit: Choose a number of dramaturgy spells equal to your Cha modifier (minimum 1). You may now choose these dramaturgy spells as you normally select spells. If you are a cleric or druid, they become part of your divine spell list. If a sorcerer, you must select them as spells known. If a wizard, you must scribe them into your spellbook.

Normal: Only bards have access to dramaturgy without taking this feat.

Special: This feat may be selected more than once. each time you take it, you gain access to additional dramaturgy spells equal to your Cha modifier (minimum of 1).

Pyramid Review

Time of Crisis (for Mutants & Masterminds)

Designed by [Super Unicorn](#)

Published by [Green Ronin Publishing](#)

Written by Christopher McGlothlin, M.Ed.

Cover by Keron Grant & Cully Hamner

Illustrated by Greg Kirkpatrick, Tom Fowler and Craig A. Taillefer

Colored by Scott Case and David Self

Cartography by Rick Achbeger and Sean Glenn

64-page full-color perfect bound softback; \$16.95

Time of Crisis is the first scenario to be released for Steve Kenson's Origins Award nominated [Mutants & Masterminds](#) superhero game, which reworked the d20 system to get a slimmed down version of the rules more suited to the genre. Designed for six characters of Power Level 10, it means that the adventure is aimed at beginning level characters -- for whatever system the GM wants to use. The simplicity of how statistics are presented in *Mutants & Masterminds* means that they can be converted with relative ease to most other superhero RPGs.

Physically, *Time of Crisis* is up to the standards set by both *Mutants & Masterminds* and *Freedom City*, the game's default city and setting book. It is printed on decent paper stock, and with a lot of full-color superhero comic-like illustrations it all looks very professional. In particular, the center spread of the "Primate Patrol" superhero team is a great image and certainly one to show the players when they are encountered. The adventure is also well-written and a pleasure to read, but its heading titles do occasionally become a little more tongue-in-cheek, and perhaps a little too adult than they really should be.

One of the joys of reading through the *Freedom City* supplement was the spotting and identifying its many, many "Easter Eggs" or little bonus references to comics, their creators, and various people within the industry. To some extent this is true of *Time of Crisis* -- there are at least four, and those are the easy ones to spot.

[SPOILER ALERT!]

The plot to *Time of Crisis* ties in with the *Freedom City* setting, though if the GM uses another for his own campaign, it would be just as easy to substitute other names to suit. A decade after his attack on Freedom City, Omega -- Lord of Terminus and master of entropy -- has decided to change his method to destroy the universe and thus expand his domain. Until recently he has been doing this dimension by dimension, but now he plans to detonate devices at the weakest points of the omniverse and thus shatter the universe through several precise blows. Unfortunately -- or fortunately for the universe as we know it -- all of those lie within Freedom City or versions of it in other parallels.

Enter the player heroes just after foiling a raid on a downtown casino -- a task the police were reluctant to let them do, except for the fact that all of Freedom City's premier superhero teams are busy elsewhere . . . A flash of white light and

they find themselves standing on a chunk of rock, fortunately one with an atmosphere, amidst a dark void. They find out what is going on from the Norn, the Guardian of Life who explains Omega's plans and how they can be prevented from happening by sending the heroes back in time to four dimensions and stopping the cosmic bombs from exploding . . .

Aided by the Norn, the heroes are first sent to a world in which the Nazis won, and they perhaps have the chance to help a legend from their own world; then onto a world of primates in which the heroes are mistaken for agents of Omega; from there to their own world, but "Through A Glass, Darkly"; before finally coming back to their own world. There is plenty of opportunity for battle and roleplaying along the way, and the GM is provided with lots of good advice, especially on handling the various NPCs that the heroes have to fight.

At the end of it, the characters will have saved the universe, and perhaps earned enough Power Points to have risen to the next Power Level. The GM will have basic descriptions of three new dimensions that they may have the player characters revisit sometime in the future, as well as a fine range of NPCs, some of whom are sure to want to exact their revenge. Once saved, the GM can always do a "Post-Crisis Reboot," if he wants to make changes to the team's home dimension or the others that they have visited during the course of ***Time of Crisis***. Several suggestions are given for this option.

[END SPOILER ALERT]

Let us not kid ourselves here; ***Time of Crisis*** is one big fat cliché drawn in glorious Technicolor. This is no bad thing in all honesty, and doing the superhero cliché is to some extent the point of ***Mutants & Masterminds***, and even more so Freedom City. Think of ***Time of Crisis*** as the setting's *Crisis on Infinite Earths* and you would not be far off the mark . . . This is a highly enjoyable affair that should provide several good sessions of play -- for whatever superhero RPG the GM wants to use.

Pyramid Review

Night of the Ill Tempered Squirrel

Published [by Alien Menace](#)

Game design by Tyler Sigman

Squirrel logo by Lynn Cook

Graphic Design by Marc Davis

Additional contributions by Edward Evans

100 cards, six playmats, rules (all black and white), in an envelope within a ziplock bag; \$7.95

Gone are the days of terrible movies made by talentless directors with half-applicable titles -- but on the plus side, now there's a game about them. Behold, *Night of the Ill Tempered Squirrel* from Alien Menace, the game of making bad flicks you'd be embarrassed to see on late-night TV for free.

The object of the game is to produce the worst film possible. Art is a subjective thing, so the only way to keep track of whose movie is the most repugnant is to award them stars just like reviewers do. If you come out with the fewest stars in your film at the end, you win the game and not one Oscar.

Each player (three to six budding writer/producer/directors, but they really want to act) has a playmat with spaces for keeping track of their Movie Elements. Elements are all the things you can't afford for your flick -- the actor, the plot/script, the monster, a title, the set location, your special effects, and of course a big finale. The game is played in two stages: Filming and Release.

During Filming, players take turns playing a card and drawing back up to five from the Filming deck. You only get to play one card per turn, and once cards are played no one may look at them unless another card allows it -- you're all essentially working blind, which confirms a few theories about some directors in Hollywood. For this round to end, every slot on every player's playmat must be occupied by at least one card, thus completing all the movies. The Movie Element cards you get will be rated from one to five stars -- if you get a low-star card, you'll want to play that on your own slots. On the other hand, you can play cards to fill other players' slots as well, so if someone fills your actor slot with a bad card (and even without looking, you know it's not going to be a good one), you may be forced to put the one-star loser you wanted for your picture in someone else's film. Fill your own slots, or someone else's? Play the three-star plot now, or hold off and hope to draw a one- or two-star plot?

Movie Event cards can change a number of these things about play. Some cruel competitor may see to it your flick gets extra funding -- now you can afford an additional Element, curse the luck. If industry spies get the low-down on your production, they may hire away your actor. On the other hand, an actor might quit in a fit of pique -- good if your opponents saddled you with big-name teen idol Bradley Pits, bad if they play it when the best actor you could score was Hank the Dog. Every event you play is one more slot on a playmat you don't get to fill, but it may be better than being forced to play the right card on the wrong person . . . and passing isn't an option.

Once all the movies have finished filming, it's time for the Release phase. Hollywood is abuzz about the big new releases and, God willing, yours isn't one of them. This phase plays the same, but it's much shorter: Each player gets two cards (from a smaller Release deck), the play-and-draw format remains the same, you still don't get to look at your

cards, and now you're trying to fill everyone's Review slot. There are a few Release Events as well, like big openings that draw unfortunate attention to your turkey, or idiot reviewers who might confuse your picture with another.

Once everyone's Review is in place, everybody flips their cards over and, in order, reads out their story with as much gusto as one can manage for such low-budget schlock. You total up how many stars you got from all your Movie Elements and your Review, and the player with the fewest stars wins and never works in this town again.

The game package claims the game takes half an hour, but it doesn't actually take that long if you know what you're doing. Play is rapid, and for a game that doesn't let you see what's going on, it's amazingly engaging. And if you think you're laughing hard while trying to put together a film blindfolded, wait until players get to let loose on their descriptions.

As far as components go, the cards and playmats are good, stacking together nicely. This is a surprise because they feel like they were made from the poster board kids use for school projects -- it's smooth and almost glossy on the back, and dry on the face. This friction also makes them difficult to shuffle, and the ink may not last. At the very least, it seems a little of it comes off on your hands, though the art doesn't seem to smudge or smear.

The art is a mix of clip-art elements, lazy cartoons, and the occasional bit of decent (if uninspired) line art. The cards are clear and easy to read (though both Filming and Release decks have the same Squirrel logo backing), which isn't hard to do when you dedicate card text to large, simple, legible language and not endless rules verbiage. The mats hold all the Elements -- well, one end of each kind of card anyway -- though they could have been laid out to mirror the order in which the cards are read at the end of the game. It all comes in an envelope, and this in turn is stuck -- tightly and without explanation -- inside a ziplock bag. Replay value may be limited since there are only so many Elements in the deck, but Alien Menace could also conceivably release new and inexpensive additions ala Cheapass Games' ***Deadwood***.

Though the game plays like an enormous round of ***Concentration***, there are still understated strategies that form in your head as you play. If someone is eagerly playing cards on himself, he's probably got some decent stuff that requires interference. Similarly, someone who gets pounded early in the game by opponents is obviously less of a threat in later rounds. With the exception of the Movies on Parade! card (which forces all players to rotate movies to the left - it has its uses and may solve some internal design problems, but it's disappointing since it's a deadly upset in a game already tightly focused on a single, difficult strategy), ***Night of the Ill Tempered Squirrel*** is a well-woven, creative game with genuine laughs. Like the movie culture on which it's based, the game is cheap and fast entertainment.

--Andy Vetromile

Heroes On The Sidelines

I had a few minutes last night to peruse some comic books (my first chance in over a month). One of the stories was a two-parter from *Peter Parker: Spider-Man*, which I will indulgently describe now.

[SPOILER ALERT!]

This Spider-Man story centers on the return of the Sandman, long-time Spider-Man villain and general bad hombre composed of sand. He had been broken down into his component sand particles (don't ask), and was reforming . . . only this time he had been split into multiple beings, with each being representing some facet of his personality (child, criminal, would-be do-gooder, caregiver). The rest of the story -- this was a two-parter, remember -- revolves around Sandman gathering up these alternating aspects and incorporating them into himself.

[END SPOILER ALERT]

Those of you playing at home may note that there was a considerable dearth of Spider-Man within this two-part Spider-Man story. Oh, to be sure, he was around, tagging along with Sandman, getting squished into tight taxis, and generally scratching his head quizzically at appropriate times. But for the most part I got the impression that ol' Spidy could've been replaced with a plush [Kitty Kitty Kitten](#) and the story wouldn't have suffered much.

The lesson of this? Never get broken down into your component sand particles.

Er, wait. There's something a bit deeper here . . . think think think . . . Ah! Got it.

There's a natural tendency in many kinds of adventures to have the heroes along for the ride, reacting to strange events, odd locations, or wild and powerful NPCs. This is an ancient and noble tradition, stretching all the way back to *Wizard of Oz*.

Unfortunately, done incorrectly this can be a wholly unsatisfying type of tale; the players quickly realize that their interactions have little effect on the events . . . the best they can hope for is to stay out of the way and try to survive. This can be especially true in adventures involving a metaplot for an established game universe; there is often one predetermined outcome, and that result will happen, by gum. In terms of arcade games, these are often like "track shooters" -- arcade shoot-'em-ups where you move automatically along a predetermined path (like the quarter-pumping equivalent of a roller coaster), with only minor variances depending on whether certain goals are met.

Now, again, that's not to say this type of adventure should be verboten. Rather, there are a few tips -- dare say I, "random thoughts" -- that can be used to make it work better.

The focus is the heroes. Now, I've harped on this one before, but it bears repeating. Even in a big epic struggle -- say, World War II -- it's possible to have a personally involving story . . . such as *Saving Private Ryan*.

Avoid utter powerlessness. I suspect one of the big reasons these kinds of adventures can be distasteful to many players is because, at their core, they are pretty realistic. We're constantly presented with situations where we cannot hope to affect the outcome, from day-to-day interactions with people who hold power over us, to macro events of governmental decisions and policies. Given the general unpopularity of playing characters who are [weaker](#) than the rest of the world, it's no surprise that many players enjoy RPGs because it gives them a chance to play characters who *can* make a difference in the world.

Although I'm guessing there are many ways of keeping the players from feeling powerless, the one I'm personally most fond of is always making sure there's one obvious way out . . . then working to make sure the players have incentive to stick around and not use that escape. For example, I ran an adventure where the heroes got tied up in a power game in a foreign kingdom. Its hook and tie to the heroes was a murder, which one of the PCs' allies was accused of. They had little chance to affect the outcome of the greater struggle, but they knew that they could pack up and leave for their

own kingdom at any time, without too many terrible consequences (especially after they resolved the ally's involvement with the murder). Their own curiosity to unravel the events that led to the murder kept them involved; they eventually learned enough to satisfy that thirst for knowledge, came to the conclusion that they were in over their heads, and pulled the emergency cable to end the adventure train.

In other adventures I've used similar techniques, ranging from the ability to shunt away those involved or flee themselves to the heroes having the power of life and death over *all* the powers involved (albeit only in an "all-or-nothing" kind of way). While this emergency switch is never presented as the best option -- or even a *good* option -- it is at least a viable choice, and goes a long way toward dispelling any feelings that nothing they do matters.

Make sure the heroes seem like they have an effect. Of course, ideally the players *would* feel like they could do something. Even in an adventure that was originally designed where the heroes aren't expected to affect the outcome, this can usually be mitigated by including a secondary goal they *can* influence. For example, in the *Quantum Leap* episode "Lee Harvey Oswald," where the protagonist Sam Beckett leaps into . . . well, Lee Harvey Oswald shortly before the Kennedy assassination. *[SPOILER ALERT!]* In that episode, Sam finds himself unable to prevent the assassination of the president, but it's revealed that, in the original timeline, Jackie Kennedy also died in the shooting; Sam prevented the secondary tragedy. *[END SPOILER ALERT]* Of course, it takes a fair bit of finesse on the part of the GM to make that secondary goal seem like something worthwhile, and not merely tacked on:

"GREETINGS, MORTALS. YOU SHALL WITNESS THIS DAY AN EPIC BATTLE BETWEEN INCARNATIONS OF CHAOS AND LAW. OH, AND A PUPPY MIGHT GET HURT, TOO."

Provide roleplaying opportunities. This is a no-brainer, but it's easy to forget. If the whole point of an adventure is to have the heroes witness the interactions of powerful NPCs or events they can't influence, then make sure they have the opportunity to actually interact! If rival CEOs are determining the fate of Urbapolis, make sure the heroes get that private dinner with one CEO and the cyberspace encounter with the other *before* the climactic interaction between the two on the private cruise ship.

Just because an adventure involves characters removed from the PCs doesn't mean the PCs should be removed from the adventure. With a bit of work, you can make this type of adventures work even when the outcome is strongly plotted. And hopefully the players will feel the exhilaration of being on a roller coaster, instead of the horror of being stuck on the "It's A Small World" ride.

--Steven Marsh

Designer's Notes: GURPS Age of Napoleon

A Gazetteer of Napoleon's World

by Nicholas HM Caldwell

This gazetteer of the nation-states of the Napoleonic era was omitted from the final version of *GURPS Age of Napoleon* for space reasons. It supplements the book's chapters dealing with the history, personalities, and everyday life of the era, by providing more in-depth detail on the human geography, society and politics of the individual nations.

Europe

Great Britain

England was beginning an agricultural and industrial revolution. Agricultural experiments with new crops and crop rotations, enclosure of common lands, and animal breeding on private estates had increased yields tenfold. Other landowners followed suit, promoting Enclosure Acts through Parliament to acquire village common lands. The poorest peasants had to choose between becoming permanent laborers or emigration to the industrial towns.

By 1800, there were over 50 towns with more than 10,000 residents -- Birmingham had reached 45,000, Liverpool 78,000, and Manchester 84,000. The industries which encouraged this urban explosion varied considerably: textile mills (Lancashire), pottery (Staffordshire), iron and steel foundries (Sheffield), mining (Durham and Newcastle), shoemaking (Northampton), and hosiery (Leicester and Nottingham). Mechanization entered manufacturing in fits and starts: the water-powered spinning machine was adopted in 1769, but it was 30 years later before the arrival of the powered weaving loom left another group of semi-skilled workers jobless.

The factory workers were poorly paid, employed in unhealthy and dangerous conditions, and housed in slums. However for the prosperous, the growing towns became ever more pleasant, with better water supplies and fire prevention measures, elegant architecture, and cultural diversions such as theatres, libraries, and coffeehouses.

A burgeoning canal system and an improving road network provided England with an effective inland transport system. Meanwhile the great ports of London, Bristol, Hull, and Liverpool continued to attract more of the world's maritime commerce, thanks to British naval supremacy and an expanding colonial and trading empire. By 1790, there were more than 9,000 British merchant ships at sea.

Daily newspapers had existed in London since 1702. By 1780, there were 158 newspapers and periodicals being published throughout England. The newspapers were usually single large sheets, printed on both sides and folded once to make four pages. The content of the provincial publications drew heavily on the popular London newspapers. Popular periodicals such as *The Spectator* sold 20,000 copies per issue, but circulation remained low for most newspapers until the invention of the stream-press in 1814. As these ephemeral publications were relatively expensive, copies were normally shared or rented in coffeehouses. Press freedom, controversial journalists, and cruel caricaturists ensured that political and military news as well as society scandal and gossip propagated beyond the ruling elite, producing an informed -- albeit frequently by biased sources -- reading public.

Scotland

The immediate effects of the Act of Union between England and Scotland had been to worsen conditions for Scotland, lending encouragement to the Jacobite Rebellions of 1715 ("the Fifteen") and 1745 ("the Forty-five"). The power of the clan system had been broken after the Forty-five, with severe penalties being levied on any Scots who bore arms or

wore clan plaid or kilts. These laws were finally repealed in 1782.

As the Highlander nobles became mere proprietors and large-scale sheep farmers, clansmen drifted into crofting, fishing, and the army. Thousands emigrated to America. (Later many took the "high road" -- emigrated -- to England.) The vain hopes of a Jacobite restoration continued to stir the clans even into the 1770s, though the self-styled James III of England (and VIII of Scotland) had died in 1766. His elder son, Charles Edward Stuart ("Bonnie Prince Charlie" or Charles III), died in 1788. His younger son (the *soi-disant* Henry IX) became Cardinal York, dying in 1807, and ending the legitimate Stuart bloodline.

The later 18th century saw "North Britain" (as the English styled Scotland) benefit from better roads and increasing industrialization. Until American independence, the tobacco trade created many fortunes in Glasgow. After a brief slump, the linen and cotton industries became the Clyde Valley's largest employers.

Scotland's 1,600,000 people were represented by a mere 45 Members of Parliament (30 county MPs and 15 representing its 65 royal burghs) and 16 peers in the House of Lords. However, as there were only 3,000 actual voters (1788), manipulating the Scottish elections was easy and the Scottish bloc vote in the House of Commons could be relied on to support the incumbent government. The Scots were sympathetic to the American Revolution and advocated a widening of the electoral franchise after the French Revolution.

Wales

Wales remained stolidly rural with a population of 600,000 (1800) and no towns larger than 7,000 inhabitants. Wales elected 32 Members of Parliament; local government was dominated by the gentry who served as Justices of the Peace and county sheriffs. The richest aristocrats in Wales were actually English peers whose main estates were in England. The Welsh nobility and gentry were not as rich as their English counterparts, but the social gulf between them and their tenants was much wider. Owing to absenteeism among the landlords, estate stewards became powerful intermediaries. Successful stewards eventually became lesser gentry themselves.

Enclosure of land in the 1790s led to gradual agricultural improvements and local unrest. This coincided with extensive canal building by private entrepreneurs who recouped their investments through tolls. Previously the poor Welsh roads had made sea trade important. The new canals boosted the Welsh wool, leather, and mining industries, increasing exports of coal, copper, iron, lead, and tin.

Ireland

"John Bull's other island," as Ireland was sometimes styled, was treated by England as another unruly colony rather than as part of Britain proper. It had been finally conquered by the English following the "Glorious Revolution" of 1688 and William III's defeat of James II at the Boyne (1690). As the Catholicized Norman and native nobility emigrated to Europe with their retainers, they were replaced with a Protestant Ascendancy subscribing to the established Church of Ireland, ruling over the 85% Catholic majority and the dissenting Presbyterians in Ulster.

Ireland's population rose from 2,700,000 (1771) to 4,200,000 (1791). Most lived in the countryside, farming potatoes or flax and weaving linen. Despite the efforts of English merchants to exert Parliamentary influence at Westminster to break Irish commerce, trade with America flourished from the western ports of Cork, Galway, Limerick and Londonderry, and smugglers exported Cork silver and Waterford glass to Europe.

Though some Ascendancy nobles were absentee landlords financing a life in England through Irish rents, the rest had become Anglo-Irish and sought a more equal relationship with England. Though hopelessly corrupt (two-thirds of the seats were "rotten boroughs" where the electors' votes were for sale to the highest bidder), Grattan's short-lived Parliament achieved some commercial concessions. Ireland was still governed from Dublin Castle by the Viceroy and his ministers. Irish legislation required the assent of both viceroy and King.

Dublin itself was the second largest city in Britain, with Ascendancy wealth rejuvenating its architecture. Parklands such as St Stephen's Green and Phoenix Park remained intact. Dublin was home to Ireland's sole university, Trinity

College, established by Queen Elizabeth I for the education of Anglicans, and matched in quality only by Edinburgh. Philosophical, agricultural improvement, and cultural societies flourished. The popularity of the faked *Ossian* poems and authentic translations from the Gaelic led to harps appearing in Ascendancy homes. Nevertheless, poets such as Oliver Goldsmith sought fame and fortune in England.

Irish cities and towns were mostly populated by workers and beggars, leavened by a small middle class. In the countryside, most farmers leased their land under the "conacre" system, growing potatoes for themselves and managing grain and cattle for the landlord. Dwelling in mud cottages with their livestock, these Gaelic-speaking tenants subsisted on potatoes and skimmed milk. Short leases denied the peasantry any security of land tenure, making them subject to the arbitrary whims of landlords and their agents. Secret societies such as the Whiteboys committed acts of sabotage and occasional violence against landlords, their agents, and their property in retaliation for landowner brutality. Taxes and tithes (to the Church of Ireland) were ruthlessly levied. Beneath the conacre farmers was a large itinerant class of beggars, gypsies, tinkers, and *gombeen* men. The last sold clothing and salt to isolated communities, offering credit at usurious rates of interest.

Ulster and the Penal Laws

Ulster was Ireland's most prosperous province. The great landowners enjoyed a lavish lifestyle. Longer land leases had created a yeoman farmer class while the linen industry provided employment for thousands. Whaling, salmon fishing, and illegal whisky distilling supported coastal and isolated communities.

Western Ulster was predominantly Catholic; eastern Ulster was Presbyterian. Both Belfast and Londonderry had religiously mixed communities. Belfast had expanded to 18,000 thanks to the linen, cotton and ship-building industries, though many of the new inhabitants lived in cramped slums. Barred (like Catholics) from attending Trinity College, Presbyterians acquired Enlightenment ideas at Edinburgh and Glasgow universities and from American traders, so that Belfast's Presbyterian middle class became the most radical segment of Irish society. Land hunger kept sectarian hatred alive in the country with rivalry between the Presbyterian "Peep o' Day Boys" and Catholic "Defenders" flaring into frequent violence.

Throughout Ireland, the Penal Laws were enforced to ensure Catholics and Catholicism was unable to threaten the Ascendancy. No Catholic could vote or hold parliamentary office, or seek legal redress. They were excluded from careers in law, the judiciary, and the navy, and forbidden from attending any British university. (Medicine was their only permitted profession.) Catholics were educated by priests and at foreign universities. No Catholic was allowed to bear weapons or own a horse worth more than five pounds. They were required to divide all land equally among any sons. (An eldest son who converted to Protestantism inherited everything.) The equal land division was often foiled by sham conversions or transferring the property to a Protestant friend prior to death who then returned it to the intended heir. Bishops were banned from Ireland on pain of death by hanging, drawing, and quartering. Only 1,000 priests were legally permitted and they were forbidden to teach the Catholic faith. Nevertheless more were trained in continental seminaries and returned to work in secret. Many educated Protestants found the Penal Laws distasteful and assisted Catholics in evading them.

France

His Most Christian Majesty, Louis XVI, ruled over a nation of some 26 million inhabitants, exercising his authority through the same administrative machinery created a century earlier by Cardinals Richelieu and Mazarin and the Sun King himself, Louis XIV. The royal palace at Versailles outside Paris was both the seat of the royal court and of the French government. The purchase of noble titles had elevated higher officials into the aristocracy while marriages between the *noblesse d'épée* and *de robe* gradually reduced the effective social distinctions and enabled the ancient families to recover some measure of political power.

The King's government was undertaken by a small number of ministers, responsible for law, finance, home and foreign affairs, the army, and the navy, and some 34 *intendants* appointed as regional administrators. Originally created as the monarch's agents to control the aspirations of local nobles and enforce the royal will, the *intendants* had become

aristocrats themselves and in the ensuing conflicts of interest, they frequently acted on behalf of their region (or its most vocal and powerful political factions). Subordinate to ministers and *intendants* was a large and unwieldy bureaucracy.

Various institutions in France such as the guilds and the Church enjoyed special privileges which mitigated the supposed absolutism of the regime. Provincial nobles agitated for further powers to be restored to their regional Estates from the central government. The 13 *parlements*, particularly the *parlement* of Paris, were attempting to acquire veto authority over new laws (rather than simply registration) in addition to their status as appeal courts.

Agriculture was the main-stay of most French families. The larger farms of northern France yielded comfortable incomes for their tenants; the west, south, and southwest were dominated by struggling sharecroppers with small plots.

Some 15% of the population lived in cities or towns, where municipal charters shielded the residents from rural feudal obligations and some taxes. With the exception of Paris and Lyons, the urban centers witnessing the greatest growth in prosperity were the coastal ports, such as Bordeaux, Le Havre, Marseilles and Toulon, thriving on overseas and colonial trade. The wealth of Nantes was derived from the linked commerce of sugar and slaves. Bordeaux spent its riches in its new theaters, shops, and fine buildings. Lyons, the second city of France (with 150,000 people) was the center of the silk industry, though workshops and small factories rather than steam-powered "dark satanic mills" predominated.

Switzerland

The Swiss Confederation and its allied communities of Geneva, the nominally Prussian fief of Neuchâtel, and the republic of Valais formed an extremely loose and disunited federation, lacking any central administration, legislature or constitution. Rent by internal religious divisions, the Swiss avoided foreign intervention, relying on their military reputation and difficult Alpine passes for their defense. More than 40,000 Swiss served as mercenaries abroad, though recruitment grew steadily more difficult as agriculture and manufacturing became more lucrative. Cotton, silk and lace-making became key industries in Zurich and St. Gall, while Geneva and Neuchâtel became renowned for watch-making.

The Forest Cantons of Schwyz, Unterwalden, Uri, and Zug remained dominated by Catholic nobles and clergy. Other rural cantons functioned as corrupt, popular "democracies" where the peasants sold prestigious offices to wealthy families and appropriated foreign pensions.

The urban cantons were ruled by town councils. In Zurich, the guilds ruled, regulating every aspect of life from dress to pastimes. Though half of Basel's inhabitants were citizens, the merchants' guild monopolized all high posts. Bern was governed by an exclusive patrician class of 68 families whose occasional six-year tenure of one of 60 bailiff posts enabled them to rebuild or enlarge their fortunes. Rural areas were neglected by the urban cantons. The common bailiwicks (under multiple cantonal jurisdiction) were misruled by bailiffs who recouped the office's purchase through levying fines.

Geneva's 25,000 people were stratified into four classes: office-holding citizens, voting burghers, *natifs* and newly arrived *habitants* who could neither vote nor hold office. A revolt in 1781 led to the temporary elevation of some *natifs* but was repudiated by the patricians supported by French intervention in 1782. Thereafter Geneva was ruled by its Small Council, and became a major financial center.

Though lightly taxed, the sharp social distinctions, censorship and legalism encouraged an attitude of seeking advantages from the States without doing anything in return. Swiss neutrality was quickly sacrificed by Napoleon. His Helvetic Republic (1798-1803) gave Switzerland a single government. Its treasuries were looted by France, while foreign armies and internal revolts led to anarchy and Napoleon's formation of a Helvetic Confederation under the Act of Mediation (1803). Switzerland languished as a satellite state until Napoleon's downfall, when an enlarged independent and neutral confederation was established.

Spain

Since the accession of Philip V, Duke of Anjou, as His Catholic Majesty, Spain had been ruled by a Bourbon dynasty descended from Louis XIV of France. He had abolished the constitution of Aragon, placing the entire nation under the laws of Castile and requiring all public business to be conducted in Castilian Spanish. From the Treaty of Utrecht (1713) onward which assigned Gibraltar to Britain, the British were seen as the enemy and the French as natural allies. Though Spain lost control of the western Mediterranean, the Spanish Navy expanded throughout the 18th century, defending the far-flung colonies and undertaking voyages of exploration.

Spain's population rose to 10 million (1800) with a hundred thousand living in Madrid. Half a million Spaniards claimed noble status; of these, only the 700 *grandees* and *titulos de Castile* enjoyed great wealth and influence. Links between the Spanish aristocracy and other European noble castes grew, with many Spaniards proving receptive to the writings of French and English thinkers. While the Inquisition remained active, its unwillingness to prosecute powerful *grandees* weakened its ability to halt the spread of subversive ideas

Population and prosperity migrated from the center to the Peninsula's periphery. The provincial nobility sponsored the foundation of regional economic societies between 1765 and 1789 to encourage investment and promote technical knowledge. Catalan and Basque merchants benefited from the opening of colonial trade to all ports by 1778. (Previously Cadiz and Seville had monopolized all commerce with the Americas.) Shipbuilding, coastal fishing, iron, and steel production expanded in the Basque region. The cotton and domestic industries enriched Catalonia. Valencia became a center of medicine and culture as well as the hub of the Spanish silk industry.

Agricultural improvements remained few; the great landowners were satisfied with the revenues from their estates while the peasants eked out a living on tiny plots and the common land. The landless laborers of southern Spain suffered most from increasing prices and rents.

The preference of many noblemen for French styles and fashions was equaled by the favor shown to native styles and customs by other sections of society and many noblewomen. Bullfighting, formerly popular only in Andalucia, became a national entertainment. Similarly flamenco singing and dancing spread throughout Spain.

A substantial French presence in Spain's commercial cities and a later flood of French émigrés propagated Revolutionary ideas and news of events north of the Pyrennees to ordinary Spaniards despite the best efforts of government censorship. Initial enthusiasm for the French Revolution collapsed with the execution of Louis XVI and the Terror. Basque and Catalan regional patriotism redirected itself against republicans, and the Spanish people united against the perceived Jacobin threat. The later loss of colonial trade and crippling military costs combined with disease epidemics caused severe hardship to many Spaniards, enflaming the discontent which erupted in violence against Godoy's ministry and during the War of Liberation.

Portugal

The discovery of gold and diamonds in Brazil had ushered in a Golden Age for Portugal during the first half of the 18th century. Bullion paid for the construction of new palaces, churches, and noble residences. Portugal's economy was linked to Britain's by the enduring Methuen Treaties which ensured preferential treatment for Portuguese wines (in British territories) in return for unhindered sales of English textiles in Portugal. Fish and corn were also imported from British North America. All problems were (temporarily) solved by judicious gold payments; meanwhile English expatriates consolidated their hold on commerce.

The Lisbon earthquake of 1755 shattered the easy complacency of the House of Braganza, and caused many intellectuals at home and abroad to doubt the merciful nature of God. The city center was destroyed and the English Quarter was badly damaged. Directed by the Marquis of Pombal, chief minister of His Faithful Majesty Joseph I, Lisbon was rebuilt to a grid pattern. Though the homes of the nobility and the rich were quickly restored, housing for the poor took the form of huge shanty towns which grew in the areas around Lisbon's seven hills. Under Queen Maria, a royal police force preserved law and order in Lisbon aided by the introduction of street lighting. Little was done to improve the road infrastructure of the nation.

Maria's reign witnessed Portugal's population rise to three million with the bourgeois expanding to include some 80,000 traders. Over 100,000 craftsmen supplied Portuguese needs. The armed forces recovered their professionalism after the long stagnation under previous rulers. The Catholic Church regained its influence in society. Both the monasteries and the rural squires retained their feudal dues and medieval rights (e.g. in blacksmithing and milling). Though Portugal possessed thousands of lesser nobles and impoverished knights, the grandees numbered a mere 50 titled families. Emigration to Brazil provided a safety-valve for the disaffected youth of the smaller towns.

Portuguese merchants felt increasingly patronized and exploited by the heretical English who lived in fine fashionable homes in the suburbs of Lisbon and Oporto. Strenuous efforts were thus made by Portuguese traders to develop new industries and markets.

As Brazil became more self-reliant, Lisbon's merchants exported low-quality goods to Angola and created a triangular trade in slaves to Brazil. Careful only to sell cargo space to slavers rather than purchasing the slaves outright, the shipowners profited regardless of whether the slaves lived or died en route. Payment was accepted in gold, cotton, Peruvian silver, and sugar -- the colonial estates were always in debt to the home merchants. The silver was re-exported to India while the sugar was sold to Mediterranean customers. The cotton supplied the flourishing textile industry around Lisbon itself. The capital became noted for its numerous goldsmiths and booksellers.

Portugal's other city, Oporto, was the center of the wine trade to Britain, with shipments being sent to London, Hull and Bristol. Portuguese wine was sufficiently coarse to induce English merchants to fortify it with French brandy before selling it in England. Low prices induced landowners in many wine-growing regions to return to the cultivation of cabbages, cereals, olives, and the newly introduced potato. Thousands of artisans near Oporto became involved in the flax industry, performing piecework at home rather than in factories. The center of Oporto remained the city's commercial heart. Colonial returnees flaunted their wealth in miniature palaces in the eastern suburbs, while the English community gravitated to the western districts.

Portugal's bourgeois magnates briefly hoped that the French invasion would permit them to escape from British competition. The behavior of Napoleon's marshals swiftly disillusioned them. Selling supplies to the British forces provided a new source of income. Nevertheless, they were greatly aggrieved by the Anglo-Portuguese Treaty of 1810 which allowed the British direct access to the Brazilian markets.

The Italian States

Despite a population rising to 18 million, Italy remained a mosaic of small states ruled by powerless dynasties. Victories and defeats in the diplomatic conflicts of the continental European powers were translated into transfers of Italian states and duchies from one hegemony to another. New rulers invigorated their kingdoms, reintegrating Italy with Europe. New roads connected northern Italy through the Alps to European markets, while sea trade boomed in the free ports of Ancona, Leghorn, Trieste, and Venice. Northern Italy exported silk especially to France; oil, corn, and wine remained the principal exports of the south.

The luxurious Renaissance villas of the nobility and classical monuments contrasted with the hovels of a mostly illiterate peasantry. The warm climate encouraged most to spend their waking lives outdoors. The wealthy had their sons schooled by private tutors or in the Jesuit academies; their daughters prepared for eventual marriage with a convent education. Though attached to Catholicism, popular and aristocratic morality was little influenced by its tenets. Despite the censors, printers published Enlightenment works in French and in translation; the native thinkers responded by emphasizing Italian (rather than classical) history and urging the use of Italian (rather than Latin) for cultural thought. Following the French invasion (1796), careers in the universities, academies, schools, the military and journalism became attractive alternatives to law and the Church for intellectuals. As Italy suffocated under Napoleon's Continental Systems, Jacobins channeled desires for an independent united Italy through numerous and popular secret societies such as the northern *Adelfi*, central *Guelfia* and Neapolitan *Carboneria*.

The House of Savoy ruled Piedmont and Sardinia as an absolute monarchy, reorganizing both territories to ensure the preeminence of the ruler and stifling enlightenment thought. Although Sardinia was a rural backwater, Turin and Nice enjoyed significant expansion. Determined to expand territorially, Savoy's Victor Amadeus III exploited the balance of

power between France and Austria.

Mantua and Milan (population 131,000) combined to form Austrian-ruled Lombardy. Divisions between town and country had been reduced by a reorganization of the Lombard provinces to ensure urban and rural participation in each administrative unit, while church influence was curbed. Agricultural innovations improved the standard of living and increased the wealth of the great landowners. With the extinction of the Medicis, Florence (population 72,000) and the Grand Duchy of Tuscany were ruled by Austrian Habsburg princes. Peter Leopold's reforms abolished torture and the death penalty and instituted free trade policies. Despite this "Enlightened" despotism, most peasants were sharecroppers or heavily indebted, the bourgeois were politically weak, and the landholders supported only the changes which were in their interests. The Este Duchy of Modena was an Austrian satellite.

The Bourbons governed the joint Kingdoms of Naples and Sicily. The Neapolitan barons were ill-versed in trade, preferring the extravagance of the court at Naples (population: 400,000), and allowing commoner parvenus to lease or purchase their estates to pay off debts. Heavy business taxes on commoners limited commercial and industrial growth. Agriculture concentrated on cultivating fruit, vegetables, grapes, and cereals. Seizures of monastic lands, the suppression of the Inquisition, and elimination of the right of sanctuary shifted power away from the Church. Sicily was ruled by a viceroy from its capital of Palermo (population: 140,000) -- however, the baronial parliament ensured the retention of aristocratic economic and social privileges. Another branch of the Bourbons ruled the duchy of Parma.

Reduced after the loss of Corsica to a city-state, the Republic of Genoa was still under the absolute control of the oligarchy of the Bank of St. George. The impoverished nobility and gentry subsisted on the salaries obtained from filling the minor posts of the army, administration and diplomatic service.

The Most Serene Republic of Venice was a shadow of its former glory. Its ruling oligarchy had declined to a mere 50 families. The city population had stabilized at 137,000. New walls were erected to protect Venice from flooding. The mainland territories were completely subordinated to the needs of the city and willfully neglected, lacking even a network of roads. The country towns emulated the city in lording it over their rural neighborhoods. Increasingly isolated from the outside world, Venetian foreign policy was to hide from all attention; its people and its rulers were gripped by a "terror of the future."

The Papacy was at its nadir of prestige. The Papal States and the Church were run by a ruling class of courtiers, "nephews" of cardinals and popes, and feudal nobles, for their own benefit. Divided by the Apennines, the southern papal domains consisted of large fiefs (worked by sharecroppers) and unhealthy marshes, while the northern regions exported hemp and silk, and enjoyed a measure of commercial prosperity. The University of Bologna sufficed as the center for Enlightenment thought. Rome itself (population 162,000) was filled with beggars and priests -- fully a third of the inhabitants of the States were in holy orders. The reforming ambitions of Pius VI (pontiff 1775-99) foundered; his successor Pius VII (1800-1823) had more urgent concerns.

The Dutch Netherlands

The Dutch Netherlands, then called the United Provinces, had declined from their peak in the 17th century, becoming a second-class power. Holland still dominated the federation. Although officially a Calvinist state, the two million inhabitants of the United Provinces included 700,000 Catholics and 200,000 Jews and Protestant Dissenters, who were excluded from all military posts and commercial office.

Political tensions in the United Provinces included the House of Orange's desire to convert their hereditary title of *Stadtholder* into an effective ruling monarchy, the rivalries between the nobility of the landward provinces and the merchant patricians of Holland, and the desires of the burghers (the self-styled Patriot factions) to obtain some share in the States-General which constituted the government. The aristocratic families, known as Regents, monopolized all positions of power and influence, even forming cabals to ensure vacant offices were transferred to appropriate holders. Though society became more stratified, wealth was a passport into the regent families.

The decay in the fortunes of the Netherlands was most visible in the cities and towns. By the 1790s, Amsterdam's inhabitants numbered less than 200,000; elsewhere towns steadily depopulated. Urban areas became filthier, dead

animals were common sights in the canals, and outbreaks of typhus, cholera and fever increased in frequency. Gin drinking became a widespread vice as the traditional meat, bread and dairy diet was eschewed in favor of gins, adulterated brandy, and low-quality tobacco. Begging increased in the towns, while robber bands prowled the countryside.

Devastating cattle plagues forced Dutch farmers to diversify more, raising sheep and cultivating asparagus, clover, chicory, flax, madder, potatoes, and tobacco. Fishing and whaling declined owing to a lack of qualified native sailors and supporting crafts. Dutch ships remained small and traditionally designed, while other nations constructed larger, faster ships, dredged their harbors effectively, and avoided the need for Dutch middlemen. The Dutch remained the premier smugglers in the New World -- this led to Dutch bankers supporting the rebellious American colonies with substantial loans and the importation of American revolutionary ideas into the Patriot cause. Manufacturing of textiles and ceramics collapsed from foreign competition, causing skilled workers to emigrate. High taxes (for the maintenance of the Barrier Forts guarding the borders) and guild restrictions (which increased prices) added to Dutch misery. The rise of Amsterdam as a world banking center did little to reassure the elite, who continued to fret about whether the United Provinces had exceeded their resources or reached the maximum extent of their wealth.

The Austrian Netherlands

The Austrian Netherlands (sometimes called Belgium and including modern Luxembourg) was granted by the Treaty of Utrecht (1713) to the Austrian throne. The Habsburg emperors modernized the previously Spanish governmental institutions, making appointment to public office depend more on merit than influence or status. The three million Flemings and Walloons came to be ruled by a combination of Viennese officials, Belgian administrators, native nobles with a French outlook, and Catholic prelates. The cities of Antwerp, Bruges and Ghent were governed by their leading burghers. The subordination of Flemish to French as the language of officialdom and the upper classes caused some resentment among lower-class Flemings who neither spoke nor understood French.

Under Maria Theresa, the Austrian Netherlands enjoyed an era of increasing prosperity with agricultural progress being matched with growth in manufacturing (such as cotton and woolen goods) and mining activities. Wages remained low and the ongoing blockade of the Schelde estuary by the Dutch prevented Antwerp's recovery as a port. For the well-to-do, it was a time of revelry, dancing and feasting. Enlightenment ideas percolated into employment, education, health and religious affairs.

Emperor Joseph II's attempt to lift the Schelde blockade failed; his administrative and religious reforms threatened the political autonomy of the Austrian Netherlands and the powers of the native aristocracy. The latter triggered an unlikely alliance between conservatives and progressives, culminating in a middle-class revolt (the Brabant Revolution) in 1789. The coalition fractured and Austrian control was reasserted by Leopold II in 1790.

The fall of the Austrian Netherlands to French Revolutionary armies brought annexation to France. Revolutionary and Directorial France abolished all traditional privileges, suppressed the Catholic Church, and eliminated all vestiges of autonomy. Extensive military conscription led to rural revolts (1798-99) and savage repression. The Consulate and the Empire introduced the Code Napoleon and restored religious worship under the Concordat. As an integrated part of France, the economy, especially in the coal, metal, and increasingly mechanized textile industries actually grew, unlike the other satellite states. Napoleonic control of Holland effected the removal of the Schelde blockade, restoring Antwerp as a port and staging ground for a French invasion into the unprotected eastern counties of England.

The German States

Germany was not a single nation; instead there were hundreds of mostly small states forming the Holy Roman Empire -- which was neither holy, nor Roman, nor an empire. The German rulers were ostensibly vassals of the Emperor in Vienna. In their own territories, these nobles could behave as absolute rulers.

The states had varying characteristics. There were about a thousand imperial barons and knights, mostly in the south-west and in the Rhineland, who held small fiefs as direct vassals of the emperor. Hereditary castes of senators governed the imperial free cities of Frankfurt-on-Main, Hamburg, Nuremberg, and some 50 lesser municipalities.

Unusually, Hamburg prohibited nobles from owning property within its confines; however this bourgeois bastion had nine levels of citizenship. The larger principalities in the west, numbering some 250 states, were endowed with landed nobility and bureaucracies, with small farmers working the land. Feudal obligations were frequently "bought off." Only Baden, Bavaria, Hanover, Hesse-Darmstadt, and Württemberg were of significant size. In eastern Germany, serfs and near-serfs grew cereals on the large estates of the *Junker* nobles of the major kingdoms of Brandenburg-Prussia, Mecklenburg, and Saxony. Serf revolts were frequent.

The state's religion normally mirrored its ruler's, though the conversion of a ruler did not necessitate mass conversions among his subjects. Each state was represented at the "Perpetual Diet" in Regensburg (which met until the empire's dissolution in 1806), providing a forum for diplomacy and dispute resolution without recourse to war among the minor powers. Citizens and nobles had recourse to two imperial courts (one in Regensburg which had a huge case backlog; the other in Vienna). To simplify administration, the tiny states were grouped into imperial districts which functioned as regional federations.

The nobility constituted about 1% of the total population. Imperial aristocrats married within their own class in order to preserve their votes in the Diet. Ruling nobles created elaborate courts (in proportion to their wealth) with entourages of secular and religious advisors, entertainers, and servants. The upper classes' demand for luxury goods adversely effected the economic development of the states.

The clergy remained a privileged order. Many Catholic bishops enjoyed opulent lifestyles, delegating their pastoral duties to assistant bishops who were usually of commoner and burgess stock. The Protestant clergy recognized the local prince as governor of their church.

Everywhere in Germany, from the secular courts of Munich and Dresden, the cathedral cities of Cologne and Mainz, to the university town of Göttingen, beggars formed up to a quarter of the population. Some indigents were bourgeoisie citizens who had been bankrupted, former officers, even nobles fallen on hard times. Hygiene was nonexistent, with filth even to the very walls of palaces; the absence of plagues was miraculous.

Prussia

Six million Prussians acknowledged the rule of Frederick the Great in 1769. His scattered domains were reflected in his multiplicity of titles -- Margrave of Brandenburg, Grand Duke of Silesia, King *in* Prussia (as its territories were not part of the Empire), and Duke of Ansbach, Bayreuth, Cleves, East Frisia, Mark, Minden-Ravensburg, and far-off Swiss Neuchâtel.

Though the Prussian territories embraced multiple faiths, royal decrees granting religious freedom forestalled any sectarian violence. Prussia was the most tolerant of German states in this respect, but for pragmatic rather than liberal reasons.

Likewise, pragmatic requirements for aristocratic support during his wars forced Frederick the Great to concede greater powers over their serfs to the *Junker* nobility. Military and civil appointments were monopolized by the Junkers. Contemptuous of mere trade, the haughty Junkers were frequently in debt -- though Frederick bailed many out, increasing their loyalty. They quickly became a disciplined and obedient elite, performing their tasks efficiently in the bureaucracy and the army. On their own estates, they were paternalistic overlords.

To ensure an officer corps, Junkers' sons were required to attend cadet school in Berlin from age 12. Armed "escorts" were used to prevent parental feelings interfering with a punctual departure for school. The ordinary soldiers were recruited from each canton. The exclusion of urban burgesses and property-owners ensured that this burden fell on the peasants.

Prussia's healthy economy was based on a combination of agriculture, commerce, and manufacturing. Many bourgeoisie became rich; some astute property developers even received leases to royal lands. However, wealth could not purchase a noble title in the fixed Prussian social hierarchy.

The Austrian Empire

The Habsburg dynasty had held the title of Holy Roman Emperor since the election of Albert II in 1438, and it remained their preferred title. It was not, however, a hereditary title -- each new Habsburg monarch had to seek election from the electoral college consisting of the Electors of Bavaria, Bohemia, Brandenburg, Hanover, and Saxony, as well as the Archbishops of Cologne, Mainz, and Trier. The end of each reign and the beginning of the next presented opportunities for the electors to extract concessions from weak monarchs in order to assent to their election. The true power of the Habsburgs lay in their own "crownlands" of Austria, Bohemia, and Hungary, rather than in their tenuous hold over the German States (see above).

Even in the crownlands, Habsburg monarchs were required to rule through consensus with the regional elites. The crownlands had been united by "personal unions" of Habsburg princes with the previous ruling dynasties rather than by conquest; hence the existing governmental structures had been preserved and each local nobility resisted the establishment of a homogenous constitution. The discontinuous territories and the central European location of the crownlands ensured that some part of the empire was always threatened by foreign intervention, denying the monarchy any opportunity for forcing internal reform. As the regional Diets would support defensive wars, Habsburg foreign policy emphasized coalitions maintaining the balance of power.

Unlike their fellow monarchs, Their Apostolic Majesties (as the Habsburgs were styled) were relatively well-informed upon conditions of their ordinary subjects. This was due to Joseph II's predilection for travelling incognito at home and abroad as "Count Falkenstein," both as prince and co-Emperor. Joseph's fact-finding trips inspired many of his reforms.

With a total population of 27 million, the crownlands had the usual high proportion of nobility and Catholic clergy, but most were peasants on noble estates and proprietors of small farms. The gradual reduction of the hated *robot* (compulsory feudal labor services) and an increase in rural manufacturing led to better conditions for the peasantry. Towns remained small.

Vienna was the empire's capital owing to its central location between Prague, Graz, Innsbruck, and Pressburg. Its population had grown to 300,000, with a third living in the suburbs. Vienna supported a substantial bourgeoisie class as well as many urban poor. Court and royal life centered on the Schönbrunn Palace.

German was instituted as the official language of the crownlands in 1784, replacing Latin and displacing national tongues such as Magyar. Public education was widespread. In rural areas, children received moral, religious, and vocational training. In urban areas, children learned reading, writing, and arithmetic. Burghers' children proceeded to a "middle school," focusing on either academic or vocational skills. The brightest and the wealthiest were finally sent to the regional gymnasium in preparation for university.

Road building and river dredging initiatives, an internal free trade zone, and the elimination of guild privileges led to a commercial boom. There was even a thriving sea trade with the Ottoman Empire and the East Indies.

The Revolutionary Wars forced a monarchic reaction against Enlightenment. The secret police expanded and censorship was enforced. The wartime inflation enriched many farmers.

The Habsburg Dominions

In addition to Austria, the Habsburgs ruled the kingdom of Bohemia (including Moravia), the kingdom of Hungary, the former Ottoman territories of Croatia, Slavonia, Banat, and Transylvania (much of which were still classified as the Military Border regions, home to scattered military colonies providing a permanent defense against the Ottoman Empire), Polish Galicia (see Poland), Lombardy (see The Italian States), and the Austrian Netherlands.

The Slavic lands, i.e. Bohemia, Moravia, Slavonia, Croatia, and Polish Galicia, had both the wealthiest landowners and the poorest peasants in Europe. In Bohemia, the *robot* for bondsmen was several days of labor per week; many nobles exploited their serfs even more. Three-quarters of a million Bohemians and Moravians were employed in manufacture,

particularly in the textile industry. Brno became known as the Moravian Manchester in this era -- although its Castle Spilberk became infamous as a prison for revolutionaries and radicals. Czech nobles continued to govern Greater Bohemia from the Hradcany Palace in Prague, which with a population of 80,000 was the second-largest city of the crownlands.

Hungary was controlled by the numerous belligerent Magyar nobility. Only a few (such as the Esterházy family) were great magnates; the rest drew their wealth from horse breeding and cereal farming. Hungary exported livestock, grain and wine to the other crownlands. Hungarian peasants had a better standard of living than their Polish or Czech contemporaries owing to a much lower *urbarium* (equivalent to the *robot*). Decades of peace had encouraged a rise in population and re-established an artisan class. Colonists and Balkan immigrants had repopulated the southern and eastern regions. Pressburg had reached 30,000 inhabitants; the twin cities of Buda and Pest on opposite banks of the River Danube housed 50,000.

In urban areas of Hungary, the arts were flourishing. The great nobles constructed new palaces, while the wealthier towns founded theatres and orchestras. Newspapers, reading clubs, and Masonic lodges multiplied. In more rural areas, converted mosques reminded the traveler that while Hungary had been detached from the Ottoman Empire for decades, it had yet to be fully absorbed into the European mainstream.

Denmark

During the 18th century, Denmark possessed the Germanic duchies of Schleswig and Holstein, the kingdom of Norway, and the ancient Norwegian territories of the Faeroes, Iceland, and Greenland, as well as three Caribbean islands (St. Thomas, St John, and St Croix) and trading posts in India and Ghana.

Denmark proper had a population of one million, of whom a tenth lived in semi-autonomous Copenhagen, where nobles and a large garrison mixed with merchants, craftsmen, sailors, and fishermen. With the decline of the Dutch, commerce had flourished, though Denmark was limited in its exports to meat and oxen, with its inferior grain being shipped to the captive Norwegian market.

Denmark was temporarily governed in 1770-71 by Johann Struensee, physician and Queen Caroline's lover. A conservative coup then reversed the Germanization of the court, leading to the restoration of Danish as the official language of the military and the government. Foreigners were prohibited from serving the Crown from 1776 onward. These "Danish" policies invigorated the national literature while Denmark's neutrality during the American War boosted maritime trade. A special treaty with England protected the vital Norwegian timber exports.

Nine-tenths of Denmark was divided into some 1,000 estates owned by several hundred landowners. From the 1780s, the magnates introduced various reforms, commuting seigniorial dues into money rents and increasing the process of enclosure. The lot of the peasantry, who were also taxed and tithed, improved, through an underclass of day laborers and cottagers appeared due to the shortage of available land.

Crown Prince Frederick's military and foreign policy of merchant convoys and neutrality in the 1790s served Denmark well until 1801. After the forced dissolution of the Baltic armed neutrality pact, it was only a matter of time before the Danes were compelled to choose sides. Vacillation led to the second British assault on Copenhagen and Danish incorporation into a Napoleonic alliance and the Continental System. Its overseas holdings were seized while British squadrons prevented communication with Norway and the Atlantic possessions. Though half the Danish merchant fleet was lost, Danish privateers enjoyed some success against British Baltic shipping. Widespread smuggling through British-held Heligoland ameliorated the impact of this unpopular war in the German Duchies.

Though Denmark forfeited Norway at the conclusion of the Napoleonic Wars, it recovered its Caribbean possessions and retained control of Iceland, Greenland, and the Faeroes.

Norway

United from 1536 with Denmark, Norway remained a distinct realm. During the 18th century, its fiefdoms were

replaced by a system of shires and bailiwicks, administered by governors and bailiffs appointed by the Danish crown. Norwegians could appeal the decisions of these officials to the king.

The 800,000 Norwegians were thinly scattered in coastal communities. Three-fifths of Norway's farmers owned their own land; in the north of the realm, the great landowners preferred to offer limited tenancies to preserve their own hunting and fishing rights. Farming, timber, mining, fishing, and shipping formed the sole Norwegian "industries," with merchants and burghers garnering fortunes during the wars of the 18th century. Taxation was lighter than in Denmark, owing to successful Norwegian defenses against Swedish incursions. Nationalism began to appear in the upper classes at the close of the century.

Inclusion in the Continental System brought bankruptcy, hardship, and isolation from Denmark. Ruled by a commission and threatened by Sweden, Norway was granted a temporary dispensation in 1809 from the System to renew trade with England, but suffered famine in 1812. Despite short-lived resistance, Norway was severed from Denmark and united with Sweden in 1815.

Sweden

Sweden had been in decline since its 17th-century apex of power, though it retained title to much of Finland and the Caribbean island of St Bartholomew. Gustav III's coup had ended the "Age of Freedom" which had degenerated into factional political strife between the "Hats" (supporting the nobility and bureaucracy) and the "Caps" (espousing the "people" and lower Estates). Rule was returned to the monarchy and the powers of the four Estates (nobles, clergy, burgesses, and peasantry) were reduced.

Three-quarters of Sweden's two million people depended on agriculture for their living. In response to the ever-present threat of famine, the Swedish farmers adapted English agronomic theories, introduced potatoes and turnips, and accelerated the process of enclosure of common lands. Insufficient work existed for the growing lower-class population; alcohol, especially gin, became the preeminent vice, especially as the government was unable to stop illegal distilleries.

Gustav III's reign witnessed an upsurge in cultural activity, especially in the theatre, opera, and belles-lettres. His policies led to the restoration of a healthy currency, a reorganization of Finland's administration, naval strengthening, and the abolition of torture. Enclosure of common lands in Finland led to discontent among the rural population and defenses against potential Russian encroachment were limited. In foreign policy, Sweden gradually became opposed to Denmark and Russia, as Gustav made little secret of his interests in detaching Norway and Russian-ruled Finnish provinces from his Baltic neighbors.

After Gustav III's assassination, Sweden had little direct contact with the rest of Europe between 1792 and 1804. Gustav IV concentrated on balancing Swedish finances and seeking a rapprochement with Denmark. An inability to form any alliances with Directorial France led Sweden to join the League of Armed Neutrality. After the collapse of this pact, friendly relations were restored with England, not least because Sweden exported half of its iron and steel output to Britain in return for commercial goods. Understandably fiscal policies were generous toward the minor industries of manufacturing and mining.

Napoleon's execution of the Duc d'Enghien drove Gustav IV into the Third Coalition and this personal animosity kept Sweden in the alliance despite Russia's defection after Tilsit, Denmark's alliance with Napoleon, and Russia's conquest of Finland. Turned into the scapegoat for all Sweden's ills, Gustav was deposed and a new constitution instituted which reduced the privileges and tax exemptions of the upper classes.

Bernadotte (as Charles John) gave Sweden its first secret police and espionage system as well as encouraging a resurgence of "Scandinavianism," the desire for a union of the Baltic states.

The Partitions of Poland

The "Royal Republic" of Poland ended in tragedy. At the beginning of the era, its population of nine million included

some 750,000 gentry and nobility, mostly landless lords with excessive privileges. The peasantry were defenseless, the bourgeoisie had dwindled, and even the clergy were demoralized. Catherine II of Russia had arranged the election of her ex-lover Stanislas Poniatowski as King of Poland in 1764. Though his affection for Catherine influenced his foreign policy, Stanislas nevertheless sought diplomatic alliances with Austria and France. Internally he balanced Polish finances and limited the *liberum veto*, the principle which required decisions of the governing Diet to be unanimous.

Worried by these reforms, Austria, Prussia and Russia acted in concert, forcing Poland to surrender huge territories under threat of invasion. The First Partition gave Galicia as far as the Vistula river to Austria, all lands between the Dvina and Dneiper rivers to Russia, and West Prussia and the northern portions of Great Poland to Prussia (though they temporarily returned Danzig and Torun). Having shorn Poland of defensible borders, they imposed a Permanent Council on Stanislas, hoping to hamstring his rule. Instead he turned it to his advantage, increasing his popularity by being seen to seek consensus.

Russian preoccupation with the Ottoman Empire enabled Stanislas to convene the Great Diet from 1788-1792. By its constitution, the nobility renounced many traditional privileges. Polish citizenship was defined, with burghers of chartered towns being entitled to send delegates to the Diet, and the peasantry was placed under government protection. The *liberum veto* was abolished and the monarchy henceforth was to be hereditary in the House of Saxony.

Dissatisfied aristocrats "invited" Russian intervention, which took the form of armed invasion (1792) while Prussia repudiated its neutrality. Stanislas surrendered and the Second Partition was enacted (1793), whereby Prussia gained Great Poland, Masovia, Danzig, and Torun, and Russia acquired the eastern parts of the former Grand Duchy of Lithuania and the Polish Ukraine. The brief revolt in 1794 led to the final Third Partition (1795): Austria gained Polish Galicia between the Pilica and Bug rivers; Prussia secured Warsaw and environs; and Russia the rest of Lithuania and the Duchy of Courland.

The Poles endured systematic Germanization by Austria and Prussia and repression under Catherine. Her successors were more conciliatory -- the Polish Prince Adam Czartoryski became a trusted minister of Alexander. Ineffectual conspiracies proliferated. The valor of Polish exiles who had enlisted in Napoleon's armies led to the temporary Grand Duchy of Warsaw (1807), a bureaucratic state modeled on France. After the Congress of Vienna, Poland was divided into five portions: the diminutive Republic of Krakow, Austrian-held Poland, Prussian-held Poland, the Kingdom of Poland, and the Lithuanian-Ruthenian territories.

Russia

Under Catherine the Great and her successors, Russia supported a population of 25 million people. Half a million were "nobles," entitled to own land and serfs. Courtiers, magnates, civil service officials, military officers, and provincial gentry alike were classified and pigeonholed according to the "Table of Ranks." Dedication to the nation through service was rewarded with elevation in the Table of Ranks, with the highest levels granting hereditary titles. Service demands and the attractions of the court prevented any close ties developing between absentee landowners and their estates. This divorce from rural and commoner concerns was exacerbated by many young nobles spending their formative years at the Land Cadet Corps College, where they studied languages, literature, mathematics, geography, and history as well as military and genteel skills. (Russian noblewomen were well educated in foreign languages at the expense of their native Russian.)

Free from direct taxation, the nobility could develop or dispose of their estates at their discretion. The richest nobles lived as independent princes on their estates, with scores or even hundreds of serf-servants. Armies of serfs could be raised to perform the slightest whim of a noble who had the power of life and death over them. Disobedient serfs could be beaten, exiled to Siberia, or sent to the navy. Three-quarters of the "nobility" owned fewer than 100 serfs; half owned fewer than 20. Many of these poorest nobles sank back into the peasantry.

Between the nobility and the huge peasantry were the clergy and the merchant classes. Though reduced to salaried officials of the state, the Russian Orthodox clergy, from ignorant village priests to the educated celibate "black" monks who formed the hierarchy, remained influential in the lives of ordinary Russians. The merchants were frequently

conservative "Old Believers" harking back to the traditions of old Muscovy. Ennobled merchants were encouraged to engage in industry, using serfs as an involuntary work-force. Separated from home and village life, housed in barracks, brutally punished and ill-paid, the unwilling serfs proved too unproductive and were gradually replaced with free laborers. With the connivance of nobles, even serfs rose to become the *de facto* owners of the factories and merchants.

Rural serfs lived in wooden huts with tiny windows (closed with dried animal bladders or shutters), and no chimneys. Inside, a large stove served as cooker and heat source. Furniture was minimal and crudely made. An effigy of Christ or the Virgin Mary was usually the sole decoration. Clothed in skins, linen or wool garments, and a full-length frock fastened by a girdle at the waist, devout serfs wore a crucifix around their necks. They lived on a diet of black bread, cabbage, cucumber, garlic, mead, and fruit liquors. Entertainment consisted of visits to the local bathing house, taverns, and occasional fairs. Obligations for the local noble ranged from three to six days' work per week, grudgingly performed, as well as incidental services such as carting or building. The village council regularly redistributed the common land among the serf families, dissuading anyone from making improvement measures. House serfs were trained as artists, craftsmen, and professionals, or formed into ballet troupes and orchestras to entertain their masters. Quotas of conscripted serfs formed the rank and file of the Russian armies.

Imperial Ambitions

Starting in the reign of Tsar Peter the Great, the ruling classes of Russia had been compelled to shift customs and behavior from Asiatic Mongol to Enlightenment Europe. French was the official court language. French cuisine and Western dress were common among the nobility. The imported culture formed a veneer of civilization which did not reach the lower classes.

The capital was St. Petersburg on the River Neva, where a population of 270,000 endured a dreadful climate and sickly marsh mists, and an elite enjoyed the magnificence of the royal court. The annual freeze of the Neva from November to March dissuaded most merchants from residing in St. Petersburg, preferring accessible Moscow. The lower classes ebbed and flowed through the city according to the season. The cost of living was high owing to the necessity of importing all goods.

The Tsars ruled from the luxurious Winter Palace and the Hermitages. Among the thousands of rooms in these vast complexes were the sovereign's private libraries, galleries and theatres. The nobility spent their winters in fine townhouses situated in the broad, straight squares or overlooking the canals and spacious squares of the city. During the summer months, they resided in their huge palaces south of the city. Occasionally they opened their gardens to the public. The mornings saw the wealthy tour the city in carriages or sledges; the afternoons were spent taking naps or playing cards; the evenings concluded with parties, balls, or theatre outings. Immigrants, British merchants, sailors, and naval officers, foreign doctors, and language tutors swarmed in St. Petersburg, with swindlers and adventurers fleecing the more naive Russians.

The old capital, Moscow, was larger still, with 300,000 inhabitants. Overflowing with priests, monasteries, convents, and churches, Moscow remained the heart of the Orthodox Church as the "Third Rome."

The empire itself was divided into provinces ruled by royal governors, and further subdivided into districts whose administration was elected by the local nobility.

The Ottoman Empire

The Ottoman Empire was slowly shrinking in size, with only diplomacy and "Great Power" rivalry forestalling a much swifter collapse. Its population of 25 million was spread over three continents: 11 million lived in Europe, 11 million in Asia and 3 million in North Africa. Constantinople itself was home to over 300,000.

At the apex of Ottoman society was the Sultan and his family. The eldest male now succeeded automatically to the throne; the remaining princes lived in the "gilded cage" of the Topkapi Palace, awaiting their turn or death. The Topkapi Palace was a "forbidden city" constructed as a series of diminishing concentric circles. The public were only

permitted into the first courtyard; the second courtyard was reserved for those with official business to present to the Divan (royal council), while officials were allowed into the third courtyard. The remaining sections were the preserve of the Sultan, the royal family and their retainers. The Sultans associated themselves with the *ulemas* (Muslim religious) and spent their wealth on building mosques, fountains and other public works.

The real power had shifted to the viziers and provincial pashas, whose families and households supplied subordinate administrators. Political marriages cemented alliances, so divorce and polygamy were rare among the upper classes, though the former was common among the ordinary people.

Ottoman society was divided into the *askeri* (the ruling class) who included the *ulemas*, the *kadis* (judges), the *muftis* (law interpreters), and the military, and the *reaya* who were the empire's merchants, craftsmen, and peasants. The military were mostly trained in obsolescent weapons and tactics. The once famed Janissary warriors, formerly children of Christian subjects trained as elite troops, had become a Muslim caste. The Janissaries were now garrison troops, who found additional employment as artisans and enforcers offering "protection" for businesses.

Religious *shariat* law applied to Muslim subjects, while the Sultan devised laws for those of other faiths and circumstances not covered by the *shariat*. The Orthodox faith was protected by the Sultans as a bastion against Catholicism and pro-Western sympathies. Though Orthodox clergy were exempt from taxation, each new Patriarch paid the Sultan 20,000 *piastres* (\$15,000) for the privilege of succeeding to the office.

Some foreigners enjoying special status ("capitulations") were subject to their own nation's laws while in the Empire, and exempt from taxes and customs, (Other foreigners had no protection.) Non-Muslims dominated trade. The Empire imported coffee, dyes, and coffee, and exported cereals, hides, tobacco, and wool. Its subsistence farmers also grew olives, fruit and vegetables.

In the towns, homes were partitioned by gender into *selamlık* and *haremlık* spaces for men and women respectively, and furnished with raised platforms covered with cushions. Men frequented coffee houses while both sexes enjoyed the markets with their storytellers and puppet theatres. The Sufi brotherhoods and lodges provided a focus to the religious and social lives of many. The larger lodges included living quarters, classrooms, libraries, hospices and even tombs.

The cities were primitive, congested, and filthy. Epidemics even of bubonic plague occurred often. Strangulation of rivals, beheadings and the staking out of felons' bodies reminded westerners that the Ottoman rulers remained capricious and ferocious.

The Lands of the Sublime Porte

The Sublime Porte, as the court-government of the Ottoman Empire was styled, had limited control over its provinces. The city of Dubrovnik sent cash payments to the Sultan, but in all other respects behaved as an Italian city-state. Noble families such as Suleiman's descendants ruled Baghdad, Ali Bey ruled Egypt, and Ali Pasha held Epirus.

In the Balkans, Albania, Bosnia, and Montenegro paid nominal tribute to Constantinople. Villages elected their own notables, some of whom abused the tax-raising powers for self-aggrandizement. The *armatoles* (or Christian militia) frequently doubled as bandits. The Balkan peninsula suffered from increasing depopulation during the second half of the 18th century; peasants who wearied of Ottoman rule simply left to live in its hills, mountains and vast forests. The Turkish population was concentrated in the towns and cities as administrators, troops, craftsmen and merchants.

Moldavia and Wallachia retained their native boyar nobles, but the Sultan selected their princes from leading Greek families who intrigued and paid huge sums for the positions. The princes could expect to earn much more, even during short tenures, from tax-farming and serf labor.

Ottoman Greece supported an elite of native scholars and clergymen. These families, known as the *Phanariots*, became wealthy through their services as interpreters, agents and diplomats for the Empire. They secured control over the Orthodox Patriarchy and looked forward to the overthrow of the Turks and the restoration of a Greek Empire as a second Byzantium. Greek mainland villages were governed by their own notables and granted relative autonomy in

return for prompt tax payments. The communities of the Peloponnesus archipelago elected delegates to their own senate.

The Arab provinces, especially Egypt, were dominated by the Mamelukes. Initially purchased as slaves, the best of these soldiers were educated in the households of their generals, manumitted, and gradually rose to positions of power. Egypt became effectively autonomous from Constantinople during the period. In Arabia itself, the Wahhabi movement (led by Abdul Wahhab and later Muhammad ibn Saud) denounced the "degenerate" rule of the Sultans and demanded a return to the strict teachings of the Prophet. They menaced Ottoman control of the holy cities of Mecca and Medina.

In North Africa, ostensible vassals such as the Dey of Algiers continued their piracy and slave raids. (The Sultanate of Morocco was never part of the Ottoman Empire.)

The New World

The United States of America

Prior to the Revolution, the 13 American colonies had each been administered by a royal governor, an appointed colony council, and an elected assembly. The franchise to vote and hold office in the assembly was limited to white males. Both council and assembly could propose legislation, which was then subject to the governor's veto. If he approved, the new law required ratification by the English government. After the Revolution and the Philadelphia Convention of 1787, each state admitted to the union was entitled to elect two members of the Senate and one member of the House of Representatives per 30,000 franchised voters. The frontier lands beyond the borders of the states were administered as territories under appointed governors, being allowed to petition for elevation to statehood on surpassing 60,000 inhabitants.

By the mid-1760s, the population of the American colonies reached two million, doubling to four million by 1790 and to eight million by 1814. The slave population rose from half to three-quarters of a million.

The New England colonies of Connecticut, Massachusetts, New Hampshire and Rhode Island supported flourishing timber and maritime industries. Boston (16,000 residents) in Massachusetts and Newport (11,000 inhabitants) in Rhode Island thrived as shipping, fishing and whaling ports.

The "Middle Atlantic" colonies of New Jersey, New York, and Pennsylvania were better suited for agriculture than New England. The Hudson and Delaware rivers were critical trade arteries. The cities of New York (25,000 residents) and Philadelphia (45,000 inhabitants) dominated this region.

The "South Atlantic" colonies of Georgia, Maryland, North and South Carolinas, and Virginia harbored half the American population. The Chesapeake region continued its cultivation of tobacco, while wheat and corn plantations increased in the interior of Maryland and Virginia. North Carolina added timber and naval stores to its tobacco exports. Baltimore was the principal town and port for these three states. Rice and indigo were the mainstays of Georgia and South Carolina with Savannah and Charleston (properly Charles Town) being the only significant urban centers in the south.

Wealth rather than noble lineage determined status and influence in America, before and after the Revolution. In the rural areas, planters with large estates controlled political power; in the cities, financiers and merchants formed the colonial and post-revolutionary elite.

The Western Frontier

Despite the Royal Proclamation of 1765 forbidding further settlement in Native American territories, American land speculators and pioneers continued to covet the western territories. After the Revolution, expansion into the frontier territories (Ohio, Indiana, Tennessee and Kentucky) gathered momentum, leading to confrontation with the indigenous Native American tribes.

The territories which later became the states of Ohio and Indiana were home to a number of settled tribes such as the Delaware, Iroquois, and Shawnee. Strife between settlers and tribesmen led to pitched battles. American victory at Fallen Timbers (1794) broke Indian power in Ohio, requiring them to concede substantial lands. Ohio became a state in 1803. Continued immigration produced renewed hostilities in Indiana. The Shawnee chief Tecumseh and his brother, the Prophet, attempted to raise a native coalition against the entirety of the American border in conjunction with British military support in 1811. The Prophet was defeated that year by Governor Harrison at Tippecanoe. Tecumseh died at the Battle of the Thames in 1813. The British defeat at New Orleans weakened their negotiating stance, preventing them from realizing their demand of an independent Native American nation in the northwest. Indiana became a state in 1816.

In Tennessee, American pioneers were largely independent of royal authority, prior to the Revolution. Early cordial relations with the Cherokee tribesmen degenerated to intermittent violence as permanent settlers superseded trappers and traders. Volunteers from Tennessee fought in both the Revolution and the War of 1812, and their territory was the first to receive statehood (1796).

Daniel Boone was the first successful American explorer of Kentucky. He was followed by waves of settlers in the 1770s, despite the belligerence of Shawnee and Cherokee tribes, who were encouraged to attack by the British during the Revolution. Immigration increased after independence and Kentucky was detached from Virginia's jurisdiction and recognized as a separate state in 1792.

Canada

Britain's original intentions were to assimilate Canada by encouraging Anglo-American immigration and reorganizing its administration on American colonial patterns. Territorial changes to New France added coastal Labrador to Newfoundland and mainland Acadia to Nova Scotia. Though several hundred English-speaking families arrived and quickly assumed economic control, British governors preferred the French seigniors, clergy and professionals to the pushy merchants, and sought their loyalty. Under the Quebec Act of 1774, Catholics were allowed to hold office while French law and the seigniorial system were upheld. The newly established Catholic clergy persuaded their congregations against rebellion; the English-speaking Nova Scotians' reliance on military-naval subsidies and English trade kept them loyal.

After the American revolution, the United Empire Loyalists buttressed Canadian allegiance to Britain, mostly settling in Cape Breton Island and New Brunswick, and on the frontier in western Quebec.

Though French Quebec rejected the rationalist ideals of France's Revolution, tension continued to rise between the English and French communities. The British response was the 1791 Canada Act, which partitioned Quebec into Upper Canada (west of the Ottawa river) where English law and land tenure held sway, and Lower Canada where the French system prevailed. The English-speaking merchants of Montreal were again disappointed in their attempts to obtain an elective assembly and the jurisdiction of English common law which would have aided them in ousting the French citizens from office.

Newfoundland became a crown colony. Prince Edward Island, Nova Scotia and New Brunswick were provinces administered by elective assemblies. Cape Breton Island had an appointed council, while Rupert's Land was run by the Hudson Bay Company. The unknown lands beyond were merely claimed.

The Maritime Provinces grew slowly, reaching a population of 100,000 by 1812. Prosperity came from fishing and trading local timber and foodstuffs with Britain and the West Indies. By 1812, land speculation and immigration of Scots, Irish, and Americans into Upper Canada created a loyalist landed oligarchy.

Lower Canada's population expanded to 300,000. Montreal itself was home to 30,000, and the city's merchants continued to control the fur trade. The "Chateau clique" of French ecclesiastics and seigniors, and English merchants dominated Lower Canada's government, though commoners and professionals successfully manipulated the assembly on key issues.

French Canadians' fear of assimilation into an American superstate, British Canadian loyalism, the presence of regular British troops, and American failure to attack Montreal decisively all preserved Canada in the War of 1812.

Louisiana

The Louisiana Territory, ranging from the "Stony" Mountains (later renamed the Rockies) in the west to the Mississippi River in the east, and from Canada in the north to the Gulf of Mexico in the south, was originally part of France's vast North American empire. Ceded to Spain as compensation for the Spanish loss of the Floridas in the Seven Years' War, the 50,000 French settlers remained sentimentally attached to France despite their abandonment. A brief revolt in 1768 was swiftly suppressed by the Irish-Spanish governor, Alejandro O'Reilly, who instituted and adapted conventional Spanish colonial government to Louisiana.

The new governor and *cabildo* (council) of New Orleans took over every aspect of civic and regional administration, fixing prices for essential commodities, maintaining the streets which became dustbowls in dry weather and quagmires in wet weather, licensing all medical practitioners, and so forth. The French practices of licensing traders and sending gifts to important Native American chiefs were continued and the tribes remained mostly peaceful. From Louisiana, Spanish forces harassed the British during the American Revolution, capturing West Florida.

Despite being almost totally destroyed by fire in 1788 and 1794, New Orleans rebuilt itself twice as a flourishing port of 10,000 residents. A gay city of high living and loose morals, New Orleans was the quintessential blend of wealth and poverty. The rich enjoyed masked balls, the theatres and the opera; the poor preferred the abundant taverns. All classes enjoyed the legal dances and the illegal gambling.

The 1780s saw a resurgence of tobacco cultivation in Louisiana in addition to its strong indigo industry. The tobacco expansion was too sudden; the produce was badly packed, spoiling quickly, and the export market simply collapsed. Cotton replaced tobacco during the next decade.

Louisiana failed to develop into a typical Spanish colony. Trade concessions made it a popular smuggling route to Spain's other possessions. A failure to attract sufficient Spanish and European Catholic immigrants meant it was unable to halt Anglo-American expansion, requiring Spain to grant American settlers navigation rights on the Mississippi and trading privileges in New Orleans. Hence from 1795, Spanish policy aimed at returning Louisiana to France, so that the latter could shield the Viceroyalty of New Spain from American continentalism. Unfortunately for Spain, Napoleon repudiated his word.

The Spanish Americas

Spain's American empire included most of Central and South America as well as portions of western North America. South America was governed as three viceregal dominions. The Viceroyalty of La Plata was the newest with 350,000 residents and its capital at Buenos Aires. From Lima, the Viceroyalty of Peru ruled one and a half million inhabitants. Two and a half million people lived in the Viceroyalty of New Granada which stretched from the Brazilian to the Mexican border. The seven million people of Mexico and beyond to California belonged to the populous Viceroyalty of New Spain.

Below the ruling viceroys, presidents, and captain-generals, the territories were subdivided into provinces administered by *intendants* responsible for all branches of government. Spanish towns were run by elected councils and appointed *subdelegados*. The officials were generously paid, efficient, and disliked by the colonials. Defeats in the Seven Years' War encouraged increasing militarization, with peace-time conscripted militias being reinforced with professional regiments from Spain.

New Spain became the empire's major silver producer. Despite the assistance of foreign experts, mismanagement and conservative techniques limited effective production to a few rich mines.

Salt beef and leather exports from the La Plata plantations and native settlements flowed through the thriving port of Buenos Aires. European goods destined for Upper Peru went overland from Buenos Aires; cargoes for coastal Chile

sailed round Cape Horn.

Catalan merchants established permanent bases for their fishing fleets in Chile. The sea bream and conger catches were salted for sale in Upper Peru. The Patagonian whalers exported whale oil directly to Barcelona.

The South American Indians forgot their own agricultural expertise and were slow to adopt European techniques. The Spanish *haciendas* (plantations) employed thousands of natives cultivating native crops such as potatoes and maize, as well as introduced crops such as rice and bananas. These inefficient and overextended estates strove to be self-supporting but largely failed.

Zealous missionaries led Spanish settlement and Native American conversion northward through California after 1768. The Jesuits were followed by ranchers and prospectors, leading to the creation of new towns at San Diego and San Francisco in California, as well as San Antonio and Albuquerque. This countered the expansionistic tendencies of Russian traders operating from Alaska and British claims to the Pacific shores of Canada.

Elsewhere an uneasy truce existed between the Spanish and the British logging settlements in Honduras. The settler population in the Dutch Guyana colonies of Berbice and Demerara-Essequibo became predominantly of British extraction, and surrendered to the British rather than join the French Empire. Disease-ridden French Guyana served as a penal colony for Revolutionary France.

Spanish American Society

Economically, Spain's colonies were bound to European markets, particularly England with its insatiable demand for raw materials and agricultural products. Mercantilist policies protected Spanish manufacturers, inhibiting industrial organization in the New World, though many independent master craftsmen serviced colonial needs. A preference for land and trade reduced the available capital for industrial investments. The removal of trading restrictions between the provinces from the 1760s onward encouraged legal commerce and colonial road-building, though the mountains still required mule and llama trains. Despite the risk of privateers, smuggling remained common, especially in war years. By 1797, Spain permitted its colonies to trade with neutral powers.

Spanish American (or Creole) society seemed ordered and prosperous, exuding self-confidence in civic splendor and lavish townhouses. Officials, senior clergy, and owners of plantations and mines spent most of their time away from their stoutly-built haciendas, which were used more for storage than as residences.

Creole society was highly stratified into castes. At the apex were the *gente distinguida* who included senior officials and clergy, professionals, wealthy landowners and mine-owners, and merchants. Some *mestizo* (mixed-race) families who could trace their ancestry back to the original conquest were accepted in high society. Mixed-race shopkeepers and artisans formed the colonial middle-class, with impoverished white immigrants determined to avoid manual labor and the natives making up a discontented proletariat.

Creole social life focused on the provincial courts and the local cathedral or church. Salon society as practiced in continental Europe was unknown. The theatre and bull-fights were equally popular pastimes. Though censorship was enforced, it was too slow and haphazard to prevent Enlightenment and revolutionary ideas circulating. However, the Creole learned societies concentrated on practical matters and periodical publishing.

Hostility grew between Creoles and Peninsular Spaniards, with the former styling themselves *Americanos* to differentiate themselves from the Peninsular immigrants and the *mestizos*. Though Creoles did become viceroys, competition for the lesser posts and well-paid sinecures in government and church was much greater. Catalan merchants disrupted cozy monopolies and preferential treatment received by low-born immigrants offended the sensibilities of Creole patricians. Gradually Creole loyalty to Spain eroded.

The Portuguese Americas

Discoveries of gold in the 1690s created Brazil's mining industry. By the mid-18th century, the economy had

diversified to include cattle ranching, whaling, sugar, and tobacco cultivation. Interior provinces such as Minas Gerais became self-sufficient, while the coastal plantations adhered to mercantilist policies. By 1801, Brazil's population stood at three million, with a steady influx of immigrants from Portugal and the Azores ensuring the colony remained Portuguese. A shortage of white women meant that the sons of mixed marriages were educated and allowed to hold minor offices. However, the military and religious orders were much stricter on race.

Brazil was organized into 14 regional "Captaincies." The towns were administered by municipal councils consisting of up to six aldermen, two magistrates, and one attorney. These councilors were selected from patrician families or elected by complex annual ballots. European and Brazilian-born Portuguese had equal opportunities to enter the councils, except in the largest cities. These bodies enjoyed the right to correspond with the monarch, a privilege frequently exercised by those of Rio de Janeiro and Bahia.

Portugal had various rights, privileges and duties with regard to missionary work. In return for bearing the cost of proselytizing, the monarchy had the right to collect tithes and appoint bishops in its colonial territories. Papal desires to rescind these concessions (so that Rome could more effectively organize the missionaries) led to conflict with the monarchy. As in Portugal, leading Brazilians joined lay confraternities (*misericórdia*) which focused on charitable works. Membership in these associations was considered an honor.

Brazil's rural aristocracy came from humble origins. Their practice of endogamy -- cousins marrying cousins and uncles marrying nieces -- kept their estates undivided. Many families owned vast lands in the interior. Commissions in the militia were sought as status symbols but the regular army and navy were avoided. (The rank and file of these services were recruited from ordinary citizens and mulattos.) The Crown sold all offices which even potentially generated revenue, and was unable to prevent its officials from making fortunes during their tenure. Merchants became rich from crown monopolies -- this also encouraged smuggling by the less fortunate traders.

The American struggle for independence encouraged some of the Brazilian elite to consider the desirability of ousting the Portuguese leadership so that they could form the new apex of society, even to the extent of forming conspiracies with American collaborators. The rebellion of 1789 in the mining province of Minas Gerais demanded economic freedoms, subsidies to attract white women to emigrate from Portugal, and the establishment of a militia. It was vigorously suppressed by the authorities. The deteriorating situation and eventual massacres of settlers in Haiti (former Hispaniola) reminded the Brazilians of their own discontented underclass. Though it was crushed, the 1798 rebellion of *mestizos* and blacks indicated how quickly Jacobin ideas had propagated through Brazilian society.

West Indies

Spain's major Caribbean possession was Cuba, a center of naval shipbuilding and already a tobacco exporter to North America and Europe. After the Seven Years' War, Cuba's fortresses were reinforced and slaves were introduced to establish sugar plantations. Spain also owned Santo Domingo (the eastern half of Hispaniola), Puerto Rica and Trinidad, though settler numbers remained in the low thousands.

French holdings included Martinique, Guadeloupe, Saint-Domingue (western Hispaniola) as well as St. Lucia, Tobago and islets such as Les Saintes. Martinique was the seat of government for the French Windward Islands. Both Martinique and Guadeloupe were prosperous sugar producers, but easily eclipsed by Saint-Domingue, which was responsible for two-thirds of French overseas trade. Annually 1,500 ships carried sugar, coffee, cotton, and indigo from the colony's 8,000 plantations to Europe and to British North America in return for cash, grain, fish, timber, and horses. Merchant houses in Bordeaux, Marseilles, and Nantes reaped vast profits, while racial and class tensions seethed among the 40,000 white settlers, the 40,000 mixed-race "mulattos" and freed slaves, and the half-million slaves. (Slaves who married French subjects were immediately freed.)

The Dutch islands of Curaçao and St. Eustatius used their free port status to prosper as clearing houses for manufactured goods and colonial products.

The British West Indies included Antigua, Barbados, Dominica, Granada, Jamaica, Montserrat, Nevis, St Kitts, St. Vincent, and the Virgin Islands. The older colonies were worn out from overcultivation of sugar. The West Indian

group in Parliament lobbied for lower sugar duties, cheaper slaves, and restrictions on trade with other sugar producers. The home merchants simply wanted cheap sugar and molasses, plus captive markets for slaves and manufactured goods.

The West Indian interests failed to avert war with the American colonies, but resisted overtures to join the rebellion, recognizing their reliance on the Royal Navy for defense. During the war, all the British islands save Antigua, Barbados, and Jamaica were (temporarily) captured by Franco-Spanish attacks, but the status quo was restored by treaty. Afterward price increases in timber and food imports from Canada, devastating hurricanes and rising sugar duties led to attempts to find new crop plants to replace the sugar monoculture.

The ambition of most white planters was to manage (and then own) an estate, retiring to Europe on the proceeds. The unhealthy climate, the absence of cultural pursuits and educational facilities for children, the lack of society, and the ever-present fear of slave revolt encouraged absenteeism. Attorneys and resident planters supervised the plantations of absentee neighbors, and became the leaders of island society, deputizing for officials, who preferred not to leave the mother country, and serving on elected assemblies and appointed councils.

The Rest of The World

India

India had perhaps 200 million inhabitants by 1800, mostly Hindus and Muslims. The Mughal Empire had contracted to an impotent city-state -- the old emperor Shah Alem was blinded by Afghan invaders in 1788 and eked out his life in Delhi's Red Fort. Agra, Jaipur and Delhi were administered by a protege of his former Maratha vassals. Sikh power was concentrated at Amritsar in the Punjab, while Muslim emirs and chieftains ruled Sind and frontier territories. Former vassals such as the pro-French Nizam of Hyderabad acquired legitimate titles from the emperor and acted as kings in their own domains. By avoiding dynastic proclamations and never striking coinage in their own name, they became independent without ever challenging the current emperor. By 1800, India had fragmented into 562 states.

The Marathas Confederacy had received permission to tax central India in the early 18th century. By mid-century, their interpretation of this as a license to raid, conquer, and *then* tax, had made them the greatest Indian power. The Confederacy was divided into five states ruled by distinct clans -- the Rao rajahs of Satara, the Gaekwar in Baroda, the Holkars in Indore, the Sindhia in Gwalior, and the Bhonsle in Nagpur. Though the Rao clan nominally headed this pentarchy, the Sindhia clan was the most powerful.

Mysore under the usurpers Hyder Ali and Tipu Sultan contended for supremacy in southern India. Like the Marathas, imported Arabian horses gave Mysore better cavalry forces than their lesser rivals. Only Hyder Ali was sufficiently prescient to urge a Hindu-Muslim alliance to expel the British while this was still possible in the 1780s.

Although the French had been reduced to defenseless trading posts at Pondicherry, Mahé, Karikal, Yanaon, and Chandernagore, all of which were quickly captured by the British in the Revolutionary Wars, French mercenaries commanded and trained Indian armies, and manned their artillery units.

The British spread outward from their outposts and presidencies of Surat, Bombay, Madras, and Calcutta, preferring to support puppet rulers than attempt outright conquest initially. The Company gained tax rights over Bengal, Bihar, and Orissa. Under Cornwallis' Code of 1793, private ownership of land in return for fixed rents replaced the Indian system of lifetime land grants for local law and order. British provincial courts replaced Indian courts with Company officials serving as both police and magistrates. Internal duties were suppressed while the Company obtained monopolies over salt import and sales as well as opium production and sale. The latter provided it with a non-specie export for the Chinese market. Methodical and fair rule, annual rather than multiple taxation, and land settlements bound India's peasantry to the British Empire. Subsidiary alliances (where Company troops replaced the ruler's own military) and systematic force reduced the power of native princes and brought peace to the continent. By 1820, Calcutta was a capital of a quarter of a million inhabitants.

The East Indies

Ceylon

Until 1796, the Dutch East India Company controlled most of Ceylon from Colombo and protected the interior kingdom of Kandy. Large profits were made from cinnamon, pearls, and elephant sales (the last to India). The Dutch respected the existing structures of Ceylon society, including the local nobility who helped them administer the island. The British East India Company ousted their Dutch rivals in 1796, and Ceylon became a crown colony in 1802. An attempt to conquer Kandy failed in 1803, but succeeded with the aid of local chiefs in 1815. After a rebellion in 1818, Kandy was integrated fully into the colony. British rule led to agricultural progress, abolition of slavery, and a replacement of land grants with salaries for service.

Malaysia

Malaysia remained dominated by shifting sultanates whose subordinate chiefdoms were prone to waging civil and foreign war with their neighbors. The Dutch held the trading post of Malacca. The British East India Company purchased Penang Island in 1786 to assist in supplying the Chinese markets. In 1819, Sir Stamford Raffles purchased Singapore on behalf of the Company, eventually transforming it into the region's greatest port.

Indonesia

Indonesia was styled the Dutch East Indies. Dutch assistance in a series of succession wars in Java and elsewhere in the archipelago during the early to mid-18th century had established the Dutch East India Company as the preeminent power in the region from its bases in Batavia (now Jakarta). The native nobles remained in place as tribute collectors (of produce) for the company within its directly held territories. Elsewhere company trading posts became (through intimidation) the sole export routes for the semi-independent territories. Smuggling, corruption, and administrative expense led to the dissolution of the company in 1799, with the Dutch government taking direct control. French control of Holland brought eventual French rule in Java by 1806. Despite impressive fortifications, Java was conquered by the British East India Company in 1811, and Stamford Raffles was appointed governor. His attempts at centralizing the Javanese regencies and integrating the island into the British trading bloc were undone by its return to Holland in 1815.

The Philippines

The Philippines were ruled by a Spanish governor-general from the capital of Manila. As the natives were at least nominally Catholic, the archbishop wielded great political power and Church institutions became wealthy through the accretion of estates. Priests and friars, fluent in the indigenous languages, spread in the provinces, assisting the colonial administrators, educating the Filipinos in European agricultural techniques, and attempting to eliminate animistic religious survivals among their congregations. Lay Spaniards enriched themselves, trading Chinese silk for Mexican silver.

Other Lands

Africa

European knowledge and direct intercourse with Africa was confined to its coasts. North Africa was ruled by Ottoman pashas and independent Muslim princes. The Barbary States were infamous for piracy and slave raiding. East Africa was a patchwork of urbanized Somali peoples and Swahili-speaking nations, culturally influenced by the Arabian slave traders.

Scattered European trading posts and coastal colonies were established on the west coast of Africa. The French outposts were at Gorée and in Senegal. The British, Danish, Dutch and Spanish founded sturdy forts to protect their

slaving interests on the Gold Coast, though they could easily have been overrun by neighboring native townships. The British created Sierra Leone, a colony for emancipated slaves, though settlement was limited to Freetown. From here, European influences seeped into West Africa. Meanwhile native nations and tribes such as the Ashanti, Dahomey, Oyo, and the Fulani (of Sudan) were all expanding toward the slaving coasts. Further south, the Portuguese dominated Angola, inciting war among its tribes, undertaking sporadic missionary work, and introducing New World crops such as cassava, maize, and sweet potato.

Owing to the milder South African climate, the Dutch base at the Cape of Good Hope blossomed from a mere port-of-call for ships en route to India and New South Wales to a colony of 20,000 settlers.

Australia

Britain decided to settle the New South Wales territory in 1786, ostensibly as a penal colony. The First Fleet (under Arthur Phillip) arrived with 1,000 marines, convicts, and free settlers in 1788, founding Sydney. Despite disease, hostile aborigines, and the lack of farming skills among the convicts, the colony survived with its population augmented by new batches of convicts, expanding the settled region around Sydney and in Tasmania. Australian whalers traded with the Maoris of New Zealand, introducing firearms to the tribal struggles.

The colony's governors were all military officers. This did not prevent clashes with the New South Wales Corps, whose leader, at the urging of a civilian coalition, deposed Governor William "Bounty" Bligh in 1808. The coup leaders were summoned to Britain for trial. Bligh's successor, Lachlan Macquarie, spent his term in office balancing the contending "exclusive" (former officers and free immigrants) and "emancipist" (former convicts) factions.

China

China, ancient, arrogant, and vast, was home to 300 million people. The Manchu emperors, like previous dynasties, considered China to be superior to all other nations. The Ch'ien-lung emperor (reigning 1735-96) patronized the arts (but censored any literature criticizing the Manchus) and funded military expeditions to secure and expand the frontiers. During his son's reign as the Chia-ch'ing emperor (1796-1820), piracy, localized revolts, and increasing opium addiction afflicted China.

While Shanghai became the principal port for Chinese traders, European merchants were restricted to Canton from 1759 and required to transact business in tea and silk with the association of firms forming the *cohong* monopoly. The favored Portuguese held a trading outpost at Macao near Canton. The East India Company convinced Admiral Drury in 1808 to seize it for Britain, officially to preserve it from the French. Macao seized, Drury was persuaded to continue to Canton. Civilians hurled projectiles from the banks at his barge while Chinese navy junks barred the river. Drury withdrew, receiving a letter later from Chia-ch'ing ordering him to quit Macao, which was restored to the Portuguese.

Japan

Japan was ruled by the Tokugawa shoguns on behalf of the emperors. Natural disasters combined with peasant revolts throughout the 1780s to unsettle the nation, with unrest reaching the cities in 1787. Attempts at reform to reconcile the monetary economy of the cities with the idealized and desired rice-based economy of the countryside failed. The samurai suffered poverty while the despised merchants enjoyed great wealth and richer farmers exploited their poorer neighbors, reducing them to mere tenants.

As part of the shogunate's isolationist policies, only the Chinese and the Dutch were allowed to trade with Japan, and only at Nagasaki. By the 1800s, Russian merchants were requesting and being denied commercial access to Japan. The Russians retaliated with sporadic attacks on outlying northern islands between 1804 and 1807. During a hunt for Dutch merchant vessels, *HMS Phaeton* entered Nagasaki harbor unopposed in 1808. This dishonor led to the ritual suicide of the port's governor and generals. Thereafter Japan was left alone.

Blight Of The Silvery Moon

by Alice Turov

Introduction

"Blight Of The Silvery Moon" is designed for a wide variety of Space campaigns with slight variations. It presumes the existence of interstellar travel, and is much better suited for "space opera"-style games (such as *Star Trek*, *Star Wars*, and *Fading Suns*) than more hard science universes. It assumes the adventurers have some degree of autonomy while being part of a larger organization; it also assumes the heroes have access to their own spaceship. (These last assumptions can be tweaked, if necessary.) The existence and importance of Earth is assumed, but that world can easily be replaced with another planet of import, should that world be unavailable or the adventure's McGuffin prove to be too great.

Pop Goes The World

The adventure begins when the heroes are called on to investigate an anomaly in a poorly charted area of space. The exploratory scoutship *Allegretto* missed a scheduled contact appointment while surveying an Earth-like planet, currently named Robin's Egg. The vessel was charged with investigating the solar system, determining the viability of colonizing that planet (and determining if sentient life already occupied it), and discerning if there were any obvious threats.

The solar system in question originally had six planets, of which the habitable one was the second from the star. (The closest is an *incredibly* small inferno; the other four are all large outer planets.) Unfortunately, the solar system has undergone . . . renovations.

When the explorers arrive, they will probably note that their scientific readings seem off. The gravitational mass expected from Robin's Egg is there, but there is no actual sign of the planet. Upon moving further into the system -- and within closer range of the sensors -- they realize that the planet is there, but it has been reduced to rubble through some cataclysmic force. Any standard attempts to contact the *Allegretto* will meet with failure.

This scene will obviously play out differently depending to the limitations of the faster-than-light travel within the game universe. In a world with hyperspace, where ships appear close to the target world in question, it's entirely possible to appear *within* the rubble of the planet (thus enabling a reenactment of the similar scene from *Star Wars*). In a world where ships appear at the edge of the solar system and glide in from there, the mystery and uncertainty of the situation can be played up much more (again, depending on the speed of the ship).

Scientific investigations should reveal that the planetary destruction is a recent event; it happened some time after the *Allegretto* arrived but before they were to report. Savvy explorers may well conclude that the exploded planet might have something to do with their failure to give an account, and they would be correct. (Especially skilled or lucky scientists will note that the mass of material remaining is greater than can be expected from a planet as described by the initial survey results.)

Assuming they are near or within the rubble of the planet, just as the heroes are preparing to give up investigation (or declare their efforts useless) they will receive a faint signal bearing the *Allegretto's* signature.

Tracking it down will prove a difficult and daunting task, pushing the skills of the entire crew. The signal is coming from the *Allegretto's* "black box," a beacon designed to survive and protect the final pieces of information accumulated from the research vessel. (Alternatively -- especially if there is a PC doctor -- it can emanate from a lifepod containing a disoriented and dying member of the team who personally knows the same information as the beacon.) The beacon is -- or is in danger of becoming -- lost in the rubble of Robin's Egg. Some possibilities include:

- The beacon has crashed on a large meteor and requires skillful reconnoitering by an away team.
- It is floating amid a busy patch of rubble, its trajectory being so unpredictable that it requires skillful piloting and a risky space walk to recover.
- It has floated amid a large number of similarly-massed objects and requires scientific know-how to reconfigure the tractor beam, robotic arm, or similar device to recover.

This scene should be spiced up according to the game world in question. Space pirates may have descended on the world to snatch up valuable free-floating minerals, interplanetary creatures might be lurking within the rubble, looking for more sources of energy to feed upon, or the like. It should be difficult but not impossible to acquire the beacon; the adventure cannot progress well without it. If the heroes get discouraged and plan to leave, make sure they realize that this is probably their only chance to get the beacon.

If they acquire the beacon (or rescue the team member), they can learn the following:

Unknown to initial cursory surveying efforts, Robin's Egg was a normal planet, devoid of any signs of sentient life. It *did* have a moon, and that moon had some unusual properties that the captain of the *Allegretto* was curious about. At a casual glance it strongly resembled Earth's moon; careful scientific analysis indicated that it was *very* similar to Earth's moon, with sensors indicating nigh-identical masses, measurements, and elemental composition. The external markings on the moon were different in many ways, but since those are primarily caused by meteors and other external phenomena, that's not unusual.

The crew of the *Allegretto* also noted something else unusual about the moon: a chasm several kilometers wide, seemingly the result of a meteor strike. The beacon (or crewmember) is uncertain what happened after that; there are intermittent reports -- interrupted by static -- of a series of underground caverns, intelligently designed and complete with lighting and incomprehensible seeming machinery. The final broadcast was from the away team head saying, "I think I've figured it out . . ." Within minutes energy signatures from the moon were off the charts; shortly thereafter the moon had exploded, in a force designed and controlled enough to obliterate its neighboring planet as well. The *Allegretto* was also obliterated itself, save for the beacon or lifepod.

Back At Headquarters . . .

Assuming the heroes report this information back, their superiors will have some troublesome news: Almost two years ago interplanetary researchers discovered *another* near-identical moon, also orbiting an Earth-like planet, complete with a revolution and rotation pattern seemingly identical to Earth's moon. The organization has kept this information secret since it leads to concerns about the nature of the galaxy; learning that the Earth's most significant satellite is, in fact, seemingly an artificial construct is troublesome in a number of ways.

Now the higher-ups of the organization are even *more* concerned about keeping a secret; learning that the moon is a construct is difficult philosophically, but learning that it's also a planet-destroying bomb is likely to cause planet-wide riots.

In short, they need to know more. So far the research team investigating this other similar moon has not reported any abnormalities or concerns. But efforts to contact them upon the party's return using FTL radio communications (if such exist in the game world) have so far proven unsuccessful. Communication scientists suspect that the subspace relay for that sector of space has been damaged; regardless, they need someone to go in person. The organization needs the heroes to investigate . . . quickly.

Secrets Of Another Luna

The planet in question is also on the outskirts of explored space, although in a different direction than the sector Robin's Egg was in. The planet is called Geodesa, and the research investigation is lead by Captain Askimoto Hoyu and Dr. Agnes Rolsh.

Captain Hoyu is an astrophysicist and the captain of the starship *Vanishing Point*. He is ostensibly in charge, but those

in the know -- or those who do research and/or contact gossip contacts within the organization -- agree that this is only the case on paper. Captain Hoyu has a fairly low-key leadership style, and Dr. Rolsh's more dominant personality has permitted her to make all the *real* decisions.

The trip to the solar system with Geodesa will be uneventful, although sadistic GMs may make inquiries as to who is at the science station, request bogus piloting rolls, and the like. However, it *will* be quickly apparent that there does seem to be some kind of communications problem; although sensor readings on the planet will be normal (as well as the *Vanishing Point*, when it's within sensor range), attempts to contact the ship, planet, landing crew, or anyone else associated with the research effort will be met with silence.

Once the investigators' ship gets close, they will note a shuttlecraft from the *Vanishing Point* coming toward them. Again, there is no standard communication from it, although as it gets closer it will use a Morse code transmission with its lights (or comparable system): "GREETINGS. I AM CAPTAIN HOYU OF THE VANISHING POINT. OUR COMMUNICATIONS HAVE FAILED. I COME IN PEACE."

The shuttlecraft will take no aggressive action, nor will it be insistent on boarding. (In honesty, the crew would like it if the investigators just went away . . .) The shuttlecraft will continue communicating via Morse code, should the heroes be suspicious, although the GM should point out that it's a fairly slow and frustrating communication method.

Assuming some kind of amiable contact, Captain Hoyu will be friendly but distracted. (Those who researched him ahead of time will know this is normal.) He will give a report of the *Vanishing Point's* progress to date:

They are a larger secondary research team sent after an earlier exploratory effort revealed the anomaly of a moon near-identical to Earth's. They have been doing research, but so far they have found nothing unusual or noteworthy (certainly nothing of the sort the heroes describe, should they reveal what they know). The *Vanishing Point's* communications went out a while ago after some unexpected solar flare activity knocked out the relevant systems. They had planned on reporting their findings in person when they had completed their initial scheduled tour, but so far there has been nothing interesting enough to report more immediately.

Captain Hoyu will seem to be forthright and immediate in his responses (if a bit scatter-brained). However, almost everything he tells the heroes will be a lie.

In fact, the *Vanishing Point* discovered the oddities of the similar moon some time ago. Dr. Rolsh pressured Hoyu into keeping it a secret; she convinced Hoyu (correctly) that the organization would probably try to suppress the moon's significance, especially if it tied into Earth's own moon. She played on Hoyu's desire for a scientific legacy -- as well as her own dominant nature -- to keep him silent.

Captain Hoyu will allow the investigators to board the *Vanishing Point*, should they be so inclined. If they wish to speak with Dr. Rolsh, he will explain that she is on the moon's surface doing more research, and is not expected to return for several days. (This is partially true; she is *not* expecting to return for a few days, but she is currently exploring the moon's tunnel system.)

Although all is not as it seems aboard the ship (or with its research), it will be up to the players and the GM to pace how this is revealed. Suspicious investigators will probably demand to speak with Dr. Rolsh immediately, and set out to look for her. Any scientific characters may note that few of the pieces of their story withstand close scrutiny; there is no evidence of a solar flare, nor do the *Vanishing Point's* own records indicate any such activity. In fact, their communications equipment is all working perfectly, except for a feeble software lock placed to keep it from activating. (Of course, getting close enough to those parts of the ship to discover this may require maneuvering, diplomacy, or stealth.) More personable investigators may interact with the crew and note that they are under orders to maintain radio silence; none of them will have heard about the solar flare.

Regardless, the next course of action is probably an attempt to track down Dr. Rolsh. Depending on the attitudes and actions of the heroes, this shouldn't be too difficult; Hoyu will not volunteer the information himself, but will not fight terribly strong to keep them from learning her location from the rest of the crew. (Hoyu will actually be supportive if they convince him that she is in danger.) If the adventurers are more belligerent or forceful, they may need to take

legal action, as permitted by their patron organization; the commanding officer of the *Vanishing Point* is obstructing an investigation that may be vital.

The coordinates given for Dr. Rolsh's lunar excursion will be fairly accurate; they will indicate a surface locale, which is where Rolsh has a camp, but she is currently underground, exploring the secret of this moon.

Geodesa's moon, like those of Robin's Egg and Earth, is actually a gargantuan bomb, seemingly like some kind of "reset button" for the habitable world it orbits. These moons are definitely a technology of the precursor civilization (however that is defined in the universe in question), complete with elaborate shielding devices that cloak its inner secrets from most sensing devices. Worse, these moons are on a long-term countdown that began in time immemorial . . . *and* they have elaborate tamper-resistant countermeasures to keep them from being easily comprehended, let alone disarmed.

In her extensive research on the moon orbiting Geodesa, Dr. Rolsh found a sequence of microwave frequencies that opened up an entranceway into the hidden chambers underground. She has since posted a sentry on the entranceway to guard it and the return shuttlecraft, and has taken the other three members of her team to explore.

Dr. Rolsh has found the inner chamber of Geodesa's moon; she is in the process of decoding some (but not all) of its inner workings, and is about to press the proverbial Big Button. This is not good; she believes this will disarm the humongous bomb, but will in fact set it off.

How this scene proceeds from here depends on the pacing of the adventure. If the heroes use stealth or subterfuge, they may intercept a transmission from Dr. Rolsh to the sentry, where she indicates that she is close to unlocking the artifact's power. Otherwise they may be able to force or cajole the sentry into revealing information; he knows most of what's going on, although like the rest of the crew on the *Vanishing Point* he does not know that his superiors are actually doing anything wrong.

The heroes will have their work cut out for them; the corridors are enormous, and it will take a considerable amount of time to get to Dr. Rolsh. If the heroes don't have any suitable transport, there is one other four-person hovercraft in the return shuttle. (This may be a good opportunity for any scientific miracle workers in the party to rig it to go faster.) They may find themselves struggling to convince Dr. Rolsh to cease her activities via communicators, trying to cause a distraction at the entrance (so she stops and investigates), or barreling through at break-neck speed trying to get to her first. Any diplomatic attempts will be difficult, since she will likely believe the heroes are attempting to stop her; unknown to all, she hopes to harness the power of this artifact for her own selfish needs. This scene will depend on the ingenuity of the heroes and the whims of the GM.

There are two obvious outcomes; either Dr. Rolsh is stopped (either by convincing her or getting to her in time), or they fail and she succeeds in tripping the moon's defenses. If they fail, they will experience first-hand the energy reading spikes that were present on Robin's Egg; at that point they have a few minutes to escape and (hopefully) get clear of the inevitable blast. Of course, if the heroes don't investigate the moon or otherwise learn what's going on, Dr. Rolsh will also trigger the moon's explosion. (Ironically they may have an easier time in this case, since they won't be within the moon's chambers.)

Again, this scene can be spiced up with any dramatic trappings of the universe in question. Any other sinister sources who might be seeking the secret of the moon may infiltrate the corridor, resulting in a low-gravity battle with space-suited heroes.

Regardless of the outcome, the heroes will probably have to deal with the improprieties of the *Vanishing Point* and its crew (assuming they survive). Should the heroes report in to their patron organization, it will send them to explore one last piece of the puzzle: Earth's moon.

The Moon Next Door

Ever since the heroes first learned about the incident at Robin's Egg, the organization has sent increased patrols to

protect the Moon; it has taken no other measures because it didn't know enough. If the heroes learned enough from Geodesa, they will have more pieces of the puzzle, including the location of the entranceway chamber (its coordinates are the same) and the electromagnetic key sequence necessary to open it.

If the heroes have been reasonably successful to date, the heroes will be asked to see this mystery through to conclusion.

The frequency key will, indeed, open the hidden corridors of the moon, and (after a long exploration) the heroes will make it to the inner chamber. And here they will encounter the truth . . . and a decision.

In the final chamber the heroes will encounter a dizzying display of precursor technology, with a holographic display depicting the moon in its position around the Earth. (The similar display in Geodesa's moon was destroyed by a botched effort of Dr. Rolsh.) Assuming the heroes have a skilled scientist, he will be able to discern two things (after a fair bit of investigation). First, the Moon is on a countdown to explode in 37 years, five months, and less than 21 days. (Geodesa's moon is on an identical timer.) Second, he will -- if at the previous sites or permitted to view the research - understand that a failed attempt to disarm the bomb will set it off.

The scientist will also believe he can disarm the bomb . . . and he will be mistaken. The bomb is deceptively complex, and one of its hypnotic effects is to convince those deciphering it that they can disarm it. (If the heroes seem likely to accidentally set off the bomb, lucky or perceptive characters may recall that the investigators of the *previous* two moons believed they could harness the moon's power as well.) Regardless, the heroes will now face a difficult decision with two obvious choices. They can attempt to disarm the moon's trap (and they will fail), or they can leave it alone (putting it in the organization's hands). If the heroes do nothing, there is no immediate danger; the world has over three decades to sort out the problem and come up with a *real* solution . . . although the consequences of failure would be catastrophic.

This portion of the adventure is designed to be quieter than the rest of the adventure, although it can be certainly spiced up with any space operatic stormtrooping adversaries that cling on to the periphery of such tales.

Conclusion

The adventure will resolve (for the time being) if the heroes explain the situation to the organization, leaving it to come up with a solution. Unfortunately, like so many problems that affect the world on a global scale, this one is complicated. There will be many who believe they can resolve the issue immediately, the best solution will take a long-term approach to arrive at (although it will take at least two decades of research to solve it for real), and the easiest solution is to ignore it and hope the problem goes away.

Extra Spice

As mentioned before, there are any number of complications that can be added to this adventure. All it takes is someone else to learn the secret (or pieces of the secret) to attempt to intercept or thwart the heroes; these agents could be as subtle or overt as desired.

As it stands there are many opportunities for different character types. Pilots, scientists, diplomats, fighters, and bureaucrats can all have elements tailored to them.

It may be entirely possible for the heroes to want to investigate Earth's moon directly after the Robin's Egg part of the adventure. Although the organization would discourage this, they won't forbid it. However, the heroes will have a *very* difficult time; they will have neither the location nor the means of gaining entry on Earth's moon. Given enough time they should be able to duplicate Dr. Rolsh's efforts on Geodesa's moon, but in that time Dr. Rolsh will have destroyed Geodesa and the heroes will be devoid of a vital clue they need to keep them from making the wrong choice.

Alternate Recipes

GMs may be understandably reluctant to place a planet-smashing bomb in Earth's back yard. Fortunately the adventure can work just as well with another planet substituting; the basic core of the tale -- a long-term bomb in a planet's moon -- will work with any world. All that is truly necessary is for the world to be significant . . . either an important hub of activity, another alien race's home world, or the like. The players are more likely to be experimental if they don't care about the endangered planet.

Alternatively (especially for darker campaigns), this entire affair may be a colossal conspiratorial hoax. In this case, not much is required to stage the adventure: a solar system with significant asteroid activity (to represent the destroyed remains of a fictitious Robin's Egg), and a corridor system constructed on another planet's moon (ideally one that's similar to Earth's), along with an accomplice Dr. Rolsh. In this scenario the heroes would *not* be permitted to visit the Earth's moon in the final scene; instead the organization would use this opportunity to do whatever it likes. Anything -- from sequestering the best scientists of the universe to the evacuation of the Earth -- would be possible if the organization is successful in its deception . . . which they may well be, if they have the heroes discuss their findings in front of an important meeting of eminent leaders.

Side Salads

If knowledge of the Moon's secret were to get into the hands of the wrong person, it could be disastrous . . . especially if he's willing to throw his life away to set off the bomb.

This adventure can work well with delays and additional adventures between the three parts; simply make it so that the patron organization doesn't learn of Dr. Rolsh's progress until later, and it takes longer to analyze data and permit the heroes to investigate the Earth's moon.

And, of course, there may well be *other* moons out there, ready to be discovered by unwitting explorers. And is there a pattern to these random, deadly satellites?

The Whisperer

for *d20 System*

by Darren Miguez

Art by Brendon & Brian Fraim

Copyright 2003 Trident, Inc. d/b/a Atlas Games

"The Whisperer" is an out-take from the *Penumbra Fantasy Bestiary* from Atlas Games. The more than 220 entries that fill this weighty volume's pages go beyond the atmospheric description, evocative illustration, and solid stats for which Penumbra is known, providing adventure seeds designed to inspire GMs and players alike, and extras like new gods, spells, and magic items. Springing from history, myth, and imagination, these creatures are suitable for any fantasy *d20 System* campaign. For those looking for more meat in their monsters, and more creativity in their creatures, comes the *Penumbra Fantasy Bestiary*.

The Whisperer

The whisperer is an insubstantial air elemental that requires sound to survive. Though these creatures can live forever on the crashing roar of a waterfall, or the treacherous screaming winds of a vast canyon, after a time these sounds, while filling, lose their flavor. New sounds, on the other hand, are intoxicating, and prompt the whisperer to rash acts; the sound of combat -- the clash of metal on metal occasionally punctuated by the scorching blast of a fireball or the ear-shattering thunder of a lightning bolt -- is like a drug to the whisperer. Once it has experienced the thrill of a violent combat, the whisperer will go to great lengths to repeat the experience.

The invisible whisperer will follow a group of adventurers, and if they seem to not be soon to battle, the whisperer will take matters into its own hands, and attempt to provoke a confrontation using its ability to create sound. It will lure dangerous subterranean beasts to the party as they camp, whisper insults into the ear of drunken tavern patron in the

Whisperer

hopes of starting a tavern brawl, or amplify the sound of a band of monsters so that the opposing spellcasters use more dangerous and flashy spells.

Normally, the whisperer is little more than a nuisance, though. A rare few groups of adventurers, especially those led by bards, have even managed to work out agreements with whisperers, wherein the creature scouts out underground areas or other dangerous locales, in return for the promise of a particularly violent battle. While such groups are highly effective in exploring ruins and caverns, they are generally not appreciated when the whisperer continues to cause mischief in civilized areas.

A rising and falling of wind, a series of echoes, or the bubbling of a hidden underground stream, all of which sound a little too regular to be naturally occurring: these are signs that the unseen whisperer is present. It usually communicates by repeating sounds it has heard, and often imitates voices that a listener will find shocking, such as his own or the voice of an enemy. If observed by someone who can see invisible creatures, the whisperer appears as a rapidly whirling tangle of vapor that constantly throws out and absorbs tendrils of cloudy mist.

Adventure Seeds

- The PCs meet a proud and beautiful minstrel traveling through the wilderness. She tells them her sad tale: at a local festival dedicated to a god of music, her music disappeared and her lute became almost silent. This not only embarrassed her, but made the high priest think her a bad omen, so that she was banished from the god's temple. The minstrel offers a reward if the party can cure her of her affliction. While the party tries to determine what ails the minstrel, the whisperer that is secretly feeding on the bard's music understands that it might be in

danger, and begins to lure in dangerous wildlife to harass the party. It confuses bats with high-pitched sounds and sends a horde of them to plague the party's campsite. It creates the howling of a she-wolf in heat close to the campsite to attract these predators. Finally, it insults bandits throughout the forest, heckling them from the treetops and daring them to attack the PCs, while making mention of the possessions they carry. Each attack grows more dangerous, but the minstrel follows the party if they manage to acquit themselves well in any combat that occurs. Can the PCs figure out how to rid the minstrel of her new admirer?

- The PCs are part of a military force that goes to fight for the good of the kingdom against barbarian invaders. If their force is lost, the kingdom may fall. On the way, however, a whisperer that has had some past experience feeding off of the sounds of combat sees the small army as a possible food source. It begins to lure monsters and beasts to attack the band of warriors, slowly diminishing their number as it consumes the clamor of battle. Can the PCs stop the efforts of the whisperer to embroil the force in meaningless battle? Can they explain to the whisperer that a grander meal awaits at the end of this trek, or even turn the whisperer against their enemy, the more warlike, loud, and rowdy barbarian force? Will they preserve the army, or will it be too weakened to fend off the barbarians?

Whisperer

Medium-size Elemental (Air)

Hit Dice: 3d8 (13 hp)

Initiative: +4 (Dex)

Speed: Fly 100 ft. (perfect)

AC: 18 (+4 Dex, +4 natural)

Attacks: Slam +6 melee

Damage: Slam 1d6

Face/Reach: 5 ft. x 5 ft./ 5 ft.

Special Attacks: Spell-like Abilities

Special Qualities: Audiophagy, Body of Air, Darkvision 60 ft., Death Burst, Immunities, Natural Invisibility, Spell-like Abilities, Vulnerabilities

Saves: Fort +1, Ref +7, Will +5

Abilities: Str 10, Dex 18, Con 10, Int 12, Wis 18, Cha 14

Skills: Concentration +4, Listen +12, Knowledge (nature) +4, Perform (song) +8, Perform (mimicry) +8, Spot +7

Feats: Alertness, Weapon Finesse (slam)

Climate/Terrain: Any land

Organization: Solitary

Challenge Rating: 4

Treasure: None

Alignment: Usually neutral

Advancement: 4-8 (Large), 9-14 (Huge)

Whisperers speak Auran, and can understand Common.

If a character is within 20 feet of a whisperer, he can make a Listen check (DC 18) to determine that the natural sounds that the whisperer cloaks its presence with are not natural at all; the source of the sounds is known to be unnatural and its location is known, though the true nature of them is not immediately apparent.

Audiophagy (Ex): If near a combat or other phenomenon above the volume of a normal conversation, the whisperer will absorb the sound around it, making muting sounds as if they were heard through earmuffs. This causes a -6 circumstance penalty to all Listen and musical or choral Perform checks within a 20-foot radius of the whisperer, and makes understanding speech conducted in or through this area very difficult. It takes a Listen check (DC 13) to understand more than one-word sentences.

Body of Air (Ex): Because its body is made of air, all corporeal attacks against the whisperer have a 50% miss chance. The whisperer can manipulate physical objects when it chooses to focus on such things, but generally tries to manipulate the world around it with sound. A whisperer can pass through objects that have some kind of opening, such as bars or nets, though it cannot pass completely through solid objects such as a wall unless there is at least some small aperture it can seep through, such as a keyhole or under a door. The whisperer leaves no trail that can allow it to be tracked.

Death Burst (Ex): When a whisperer dies, unless it is in an area affected by a *silence* spell, it expires in one last burst of deafening sound. All within a 20-foot radius of the whisperer must make a Fortitude save (DC 11) or else be rendered deaf for 1d4 days; deaf characters suffer a -4 penalty to Initiative checks, cannot make Listen skill checks, and suffer a 20% chance of spell failure when casting spells with verbal components. A *cure blindness/deafness* spell will remove this condition.

Elemental: An elemental is immune to poison, sleep, paralysis, and stunning. Elementals are not subject to critical hits or flanking and have Darkvision with a range of 60 feet. A slain elemental cannot be *raised* or *resurrected*, although a *wish* or *miracle* spell can restore it to life.

Feats: Whisperers receive Alertness free as a racial bonus.

Natural Invisibility (Su): This ability is constant, allowing the whisperer to remain invisible even when attacking. This ability is inherent and not subject to the *invisibility purge* spell.

Spell-like Abilities: This creature can use the following spells as if cast by a 8th-level sorcerer (or a bard of 8th level, in the case of *sculpt sound*). The DC to resist these abilities is 12 + the spell level. The range of the *ventriloquism* spell is measured as if it were a long-range spell (640 feet). The whisperer can use its Perform skill to attempt to mimic the voices of people it has heard with its *sculpt sound* ability. The whisperer can only use *locate creature* to locate a bard or other performer it is currently infatuated with; see Vulnerabilities, below.

3/day -- *gust of wind*, *shatter*, *shout*

At Will -- *ghost sound*, *ventriloquism*, *sculpt sound*, *locate creature*

Vulnerabilities (Ex): The whisperer lives on sound. If it is targeted with a *silence* spell and fails its saving throw, it is immediately slain. The whisperer is also intoxicated by the music of bards or other performers, and if it hears such music it must make a Will save (DC equal to the performer's Perform check total) or else be affected as if by a *charm monster* spell, with a duration of one day per level of the performer. If separated from its minstrel companion, the whisperer can seek out its performing friend with its *locate creature* spell-like ability.

Pyramid Review

CORE Command Player's Handbook

Published by [Dream Pod 9](#)

Written by Marc A. Vezina with Paul Lippincott

Illustrated by Patrick Boutin-Gagne

160-page b&w softcover; \$24.95

The Canadian publisher Dream Pod 9 has recently re-presented the Silhouette mechanics it uses for all of its games from *Tribe 8* to [Gear Krieg: The Roleplaying Game](#) into a single CORE book. The aim with the **Silhouette CORE Rules** is to present them as a basic set of rules for any game (and not just those published by Dream Pod 9), but by also including a set of **d20 System** conversion rules, making them compatible with the terms of the Open Gaming License. Beyond the basic rules of the **Silhouette CORE Rules**, any of DP9's games can be played with the addition of a "Player's Handbook" for that setting, each of which will include rules adjustments and additions as well as setting material for that game. The first of these Player's Handbook turns out to be not for one DP9's previous lines, but for a whole new one, launched with the release of the **CORE Command Player's Handbook**.

CORE Command falls into the space opera genre, and as an RPG it is a space opera drawn on a grand scale, with a reach that spans five galaxies, where spaceships are big (a star fighter is the size of a 20th-century battleship), and the technological level is high, very high. For **CORE Command** takes to heart the Arthur C. Clarke adage: "Any sufficiently advanced technology is indistinguishable from magic." This is an adage that takes on a particularly interesting aspect when the designers start applying the mechanics and magic of *Dungeons & Dragons Third Edition* to a very far future space opera background.

Physically, the **CORE Command Player's Handbook** is decently done for DP9. The layout is pleasing on the eye and the artwork has a softer, more rounded feel than in their other games, although it still retains an anime-like touch . . . Unfortunately, the writing is once again let down by a lack of proofreading, a trait all too common to DP9's releases. Fortunately it is not as bad in this book as it has been in others. A nice touch is the organization of the statistics for both games into boxes and tables, with the majority of the Open Gaming License content dropped into OGL Stat Blocks, as was done with DP9's first **d20 System** book, the **d20 Mecha Compendium**. Silhouette GMs wanting more detail for their gear would be well-advised to check out the OGL Stat Blocks.

The setting for this game is that of five neighboring galaxies: the Andromeda and Spiral galaxies, plus the smaller Tucanae, Trianguli, and Doradis galaxies. It is possible to cross between them via FTL travel that takes weeks, though faster methods such as the Hyper Tunnel Network and the Galactic Express are available; this latter method is a massive accelerator that is fueled by a single star each time it is used. Though there remain plenty of pockets of unknown space to be explored, several races have spread out from their home world across the galaxies to explore and colonize. On their travels they have encountered a race known as the D'vor, which travel in huge artifact fleets of ships and work to disrupt subspace with the aim of recreating the universe to their own satisfaction. In the setting of **CORE Command**, they are the default bad guys, though others -- some of which operate alongside the fleets -- are also present.

Many races have formed an alliance against this threat: Humanity; the highly intelligent and jellyfish-like Orb-Shakra (which use robotic servo-shells to get around) that can form direct mind links; the secretive-though-ever-alert Murans, with their arrogant and condescending manner; the diminutive, happy-go-lucky, space-wandering Dimni; the aquatic humanoid Cyran; the Sanrok, with their rock-like skin that needs an acidic chemical bath or particle shower to get

clean; the semi-shape changing Proteans; and strangest of all, the Mi-Compilers. They are the interpreters for the huge planet-sized computer known as Fractal that sits at the center of Alliance Space. While they may be of any racial stock, implants within their skin help them interpret Fractal's data.

Fractal serves as the alliance's data core, compiler, and central bureaucracy and the planet it orbits is home to, and known as the Academy. This is where those wishing to join CORE Command train before entering service. Though the exact meaning of the term "CORE" has been lost to time -- the Alliance is millennia old -- CORE Command is the Alliance's fleet, working as both its military and its exploratory service, tasked to make contact with civilizations, explore the unknown (inside and outside of Alliance territory), and defend against the danger of D'vor Star Devourer Fleets.

Within this setting, the player characters are members of CORE Command; though other roles are perfectly possible, they are outside of the scope of the **CORE Command Player's Handbook**. As members of CORE Command, characters are diplomats, Mi-Compilers, soldiers, scouts, spies, and Quantek Users. What are the latter? Basically, they have strips of Quantum Hypertechnology implanted within their bodies and these strips draw upon subspace to power a range of effects -- tractor beams, force fields, and weaponry. They require the use of Quantek Interface skill and each has a limited number of uses per day, between which they need to recharge.

Under the Silhouette rules, characters receive 50 Character Points for attributes and another 70 for skills, along with perks and flaws to create a member of CORE Command. Under the **d20 System**, characters are rolled up as normal and a class selected that equates to one of the roles given above -- Fighter for soldier, Bard for diplomat, Rangers for scout, Rogue for spy, Cleric for Mi-Compiler, and Wizard for Quantek User. In equating the Wizard for the Quantek User, the cleverness of the game design becomes apparent. Simply, each sliver of Quantek implanted within a character lets them take another spell-like effect that is perfectly modeled by one of the spells from the **d20 System**, which also works for the divine spells of the Cleric or Mi-Compiler.

This is exceedingly clever in terms of design, but the Open Gaming License content of **CORE Command Player's Handbook** can only take a referee so far. Because it is not **d20 System** compliant, the book lacks the kind of material you would expect from the core book of a new setting -- classes, feats, skills, and so on. Yet this should not hamper the experienced GM or DM, who can happily plunder the **d20 System** books on their gaming shelf with abandon to get what they want. The neophyte on the other hand may be in need of some help; this the book's biggest weakness is perhaps this inability to convert from system to setting . . . That said, the best resource for running a **CORE Command** game -- after the **Dungeons & Dragons Player's Handbook** -- will be another pair of core books for differing game lines. The feats, skills, and character generation rules from [Traveller T20](#) may prove useful, but [Dragonstar: Starfarer's Handbook](#) will probably be a better choice as it does include magic as part of its setting (or is that Quantek implants?). Both might be useful for creating characters and campaigns set outside of CORE Command's aegis, but still within the setting.

Unlike the **Dragonstar Galaxy** setting the outlook of **CORE Command** is entirely optimistic and upbeat. There is no conspiracy within CORE Command itself, or really within any of the setting's background, and the threat of the D'vor presented within the game is entirely external. This is interesting, as the D'vor or "Dvor" previously appeared in the "Outworld Changlings" setting published by DP9 in the **d20 Mecha Compendium**. A far bleaker setting, "Outworld Changlings" suggests that the "D'vor" and "Dvor" are not the same, and the name is purely coincidence . . .

CORE Command also introduces robots: not just simple servo shells, loading drones, and combat drones, but also the Recorder Hero. Available in three models -- the standard agile and fast Type I, the electronics specialist Type II, and the monstrous Type III -- they are as much cyborgs as they are robots, and designed as playable vehicles with a crew of one. That "one" is the personality and memories of a player character or deceased agent of CORE Command who has reached Grade 20 and above. (Members of CORE Command are ranked by Grades that equate to the **d20 system's** levels.)

There is a fair amount of new technology and gear for players to get to grips with. Perhaps the most interesting is the "Staze Node," a micro bubble of nothingness implanted in the neck of agents of Grade 5 and above. When an agent is about to die, the node is automatically activated and it expands automatically to encase them in an ovoid of

nothingness wherein they are impervious to the effects of time and everything else. The galaxies are littered with agents still held and protected within these nodes, waiting until someone -- say, a team of player characters -- can recover them.

Other "Tools of the Trade" include Memeware, cloned from the donor's tissue and implanted back into them to provide extra space to store and access knowledge. This is equal to 10 Skill Ranks or Character Points worth of knowledge. Unfortunately, it is not unknown for a head injury or access malfunction to result in the hard locking of some of this data, so that it cannot be erased and the Memeware reprogrammed. Characters can be accompanied by an Orb (a floating, automated information storage and retrieval device that holds an encyclopedia's worth of data), or by a Defense Drone, which can provide a very personal force field when the character needs protecting.

There is also a range of futuristic weapons: vibrating Cutter Blades, Gaussian and Beam weapons, Quantek-powered Buster Guns that provide anti-vehicular firepower in a handy package, Sliver Blades (with a force screen along the cutting edge), Firesheet Blades (which emit plasma close to the blade for melee combat or can fire it at range), and Wizard Gloves. The latter can be worn singularly or as a pair, and project a force field as either a shield, piston, or blade. The pinnacle of personal protection are the suits of Mercury and Lightning Armor, each allow the wearer to shift the degree of protection to where it is needed; the first suit is made of liquid nano-metal, while the second is constructed from force fields.

The spaceships of CORE Command are big, with even the smallest two-man star fighter being the size of the *USS Missouri*. This is because the engines necessary to get a vessel across interstellar distances have to be very big. The **CORE Command Player's Handbook** does cover rules for space combat within this setting, though only for the Silhouette rules and not for the *d20 System*. These scale up the rules -- there is a fair bit of this in the **CORE Command Player's Handbook** when dealing with technology and spaceships -- in the Silhouette CORE Rules, such as increasing the size of basic hex from 5km to 500km and providing rules for handling squadron to squadron engagements. These are necessary, as no single ship could deal with a D'vor Star Devourer Fleet. Also included are guidelines on just how damage much it takes to destroy anything from small asteroids and mountains, right up to large stars!

For the GM there are full write-ups of D'vor Bioships, including the Star Devourer, as well as the forces they use on the ground, and the two races that co-exist with their fleets. The reptilian Kabayans follow the D'vor, since they are entranced by the song that emanates from the bioships (actually a system of modulated waves used as ship-to-ship communication). The Grob are much smaller than the Kabayans, but live alongside and occasionally work for them. They will also trade with members of the Alliance, but they are far from easy to deal with. Another species are the insectoid Kom'Sov, which are four-legged and very aggressive; despite a herd-like mentality they established a sizeable empire in the Trianguli galaxy. It is the Kom'Sov that represent a threat suited to more advanced games of **CORE Command**.

The chapter on "Gamemastering CORE Command" presents solid but not spectacular advice, while the bulk is given over to a set of tables for creating random adventure outlines. These are actually adapted from the tables designed by James Maliszewski for the same purpose in **Gear Krieg: The Roleplaying Game**; the fact that they are included here is indicative of their status as one of the few good things to be found in that game. The use of the tables is fully illustrated with an example waiting for the referee to expand upon. More interesting are the final three pages of **CORE Command Player's Handbook**, which explains the setting's background, what is really going on, and what has happened to the Earth -- a question that arose while reading through the book. That the planet Earth does not appear to be within Alliance space is really a minor issue, but the reason *why* is interesting in itself . . .

The aim of **CORE Command** is to take the themes of the tried and tested classic fantasy genre and then map them onto the science fiction genre. Thus the Paladin becomes a CORE agent, the Wizard in his tall tower is a scientist at a remote research station, and that magic item a piece of Quantum Hypertechnology. In this the designer has been successful, because although the actual elements and objects so mapped are obvious from the one genre to the other, they sit equally well in both.

As a setting book for the **Silhouette CORE Rules**, the **CORE Command Player's Handbook** works well enough, and

its optimistic outlook is a pleasing change from DP9's other pessimistic games. Yet because it essentially draws from all of the elements of ***Dungeons & Dragons Third Edition*** and then sheaths them with a new outer cover and a new name, ***CORE Command*** works better as a ***d20 System*** game. This is despite the fact that it is only Open Gaming License compliant; this content actually supports the Silhouette system, as the statistics in the OGL Stat Blocks are more detailed than those given for the Silhouette rules.

Although there is plenty of detail in the ***CORE Command*** setting, its scope leaves plenty of room for the GM to add their aliens and sectors, as well as throwing in anything they want to take from other ***d20 System*** supplements. Further, a GM need not use either set of mechanics to run a ***CORE Command*** game, as the OGL Stat Blocks, together with their descriptions, are enough for the GM to use whatever other system he prefers. Both ***GURPS*** and the ***HERO*** system could work very well in this regard.

Whatever the mechanics a GM decides to use, he will find that the ***CORE Command Player's Handbook*** will give him a space opera setting that has epic proportions in scope, damage, and age. The latter is because the ***CORE Command*** setting really does feel ancient or at the very least millennia old. Curious GMs will also enjoy the successful re-sheathing of one genre and the themes of one game -- ***Dungeons & Dragons Third Edition*** -- into another game and genre: that of space opera and ***CORE Command***.

Urban Arcana (for *d20 Modern*)

Published by [Wizards of the Coast](#)

Designed by Eric Cagle, Jeff Grubb, David Noonan, & Stan!

Cover by Dave Johnson

Interior art by Jason Alexander, Kalman Andrasofszky, Lee Ballard, Justin Hampton, Kagan McLeod, Ken Meyer, Jr., Dean Ormston, Jake Parker, Puddnhead, Christopher Shy, Chad Michael Ward, Jonathan Wayshak, & Sam Wood

Cartography by Robert Lazzaretti

320-page color hardcover; \$39.95

What goes well with a fantasy-meets-modernity RPG like *d20 Modern*? A setting, of course. But then, that's just what you were expecting Wizards of the Coast to do. Using some of the fantastic elements found in the *d20 Modern* book, *Urban Arcana* presents a somewhat more fully realized world setting.

Between the world of the mundane and the fantasy world next door lies a gulf called the Shadow. For reasons not fully explained or understood, the tides of Shadow periodically reach a critical mass and begin dropping the hapless fantastic creatures and races of some unknown world of magic into our considerably more ordinary cities. Those who make the trip find that not only can they not get back, they cannot remember much of what the previous world was like. They may retain certain skills -- magic included -- but they must now make their way in a modern setting.

Ordinarily an orc pumping gas at the local filling station would draw a good deal of attention, but the Shadow (or one of its aftereffects) keeps most people in this world from piercing through to see what Shadowkind are really like. Bugbears seem to most to be nothing more than big, ugly, hairy men. A town engulfed in flames isn't the result of a dragon strafing but an unfortunate gas main explosion. People see what they want to see, but a few -- like the heroes -- penetrate the veil and adjust accordingly.

Player characters may be the lost souls who came across the Shadow, or they may be regular natives of this world who discover the new creatures inhabiting their lands (a revelation that usually follows a harrowing encounter with the Shadowkind). They may also make use of some of the strange transgressions of physical laws that these visitors bring with them (a.k.a., magic). Once the two sides have started intermixing, there's no going back. They'll find common friends in The Displaced, a kind of missionary effort for new arrivals; common enemies in the Fraternal Order of Vigilance, a group of racist (specist?) purebloods who want the Shadowkind dead; and those who just want to know what the hell is going on in the Paranormal Science and Investigation Society. (And Department-7 once again rears its nosy head here.)

The new advanced classes are the Arcane Arranger, a sort of "go-to" guy who gets what you need; the Archaic Weaponsmaster, whose abilities with stereotypical fantasy weapons is without peer; the determined Shadow Hunter, seeker of secrets; the Internet-savvy Shadowjack mage; and the Tarzanesque Wildlord, tossed into a new kind of

jungle. Fully seven more are provided. Once you're ready for a prestige class, you can be the Archmage, master of magic; the Artificer, creator of the oh-so-rare-here magic items; the Ecclesiarch, a cleric whose turning abilities aren't limited to the undead; and the Holy/Unholy Knight, defender of the faith.

There's nothing new about mixing the modern and the magical, and in truth there's nothing new about **Urban Arcana's** take on the subject. That said, the book is a full-thrust engine for bringing such a world to life. There's a bestiary with old favorites like the beholders and standbys like big cats and vermin, but they're given a new take and a new place in the reformed hierarchy. These sit side-by-side with new additions like cockroaches that steal your skin, violent dumpsters that take your life, and breathsnatchers that . . . well, you get the idea. There's not a lot of overlap, should buyers be worried about paying too much for rehashed material.

The authors took particularly evil delight in developing the goodies lists. Magic items as they appear in **Dungeons & Dragons** aren't all that common -- magic takes a heavy hit in this land -- but the gear they provide is as much satire as it is clever crossover treasure. (Indeed, this restriction on the rarity of magic items is liable to take a hit -- or maybe the GM who isn't forthcoming with the goods will *get* hit . . .) Tattoos are imbued with mystic protections. Chainsaws drip blood before you ever get to your victim, and you'd better be a psycho (or at least not of good alignment) if you want to use it. Cameras really *do* steal souls, magic coveralls allow you to turn to gas and drift through the villain's air ducts. And if you pick up a magic cell phone, there's no telling *who* will answer. Vehicles have similar perks, enhancing everything from the "armor" to the tires. But if that's not enough to trick out your wheels . . .

Spells. Most of the new magics offered to spell casters deal with technology, in keeping with the book's setting. These can beef up your car; bags of holding give way to back seats of holding. They can even *create* a car, or weapons, or bullets. "Rogues" can suppress security systems, and Internet users can teleport themselves almost anywhere you can send E-mail.

To bring the two worlds closer together, there are chapters that deal with running a crossworld game. It may sound elementary to the experienced GM, but they've done a good job dropping one setting in with the other (though no details whatsoever are given about the fantasy world -- GMs must provide their own), and this extends to the refereeing sections. It builds an adventure from the ground up, gives the GM an idea of the PCs' place in the world, and debates how much magic to put in your games.

There's material for bringing characters over from a pure **Dungeons & Dragons** campaign (along with their foes), and to make the modern world that much more real they describe it all. The locations chapter gives you plenty of places to work your voodoo, along with useful maps of several choice spots. The part played by locations isn't limited to the site itself; the book talks about the importance of the location to the city at large, and several real-world example are given. The equipment section not only lists weapons and armor, it describes what you can expect to find in squad cars or fire trucks (among others), and this all sits next to weapons with a decidedly exotic flair (water pistols and dwarven axes, for example).

The book is rounded out with some basic but effective adventures to introduce PCs to their new digs, in which:

[SPOILER SPACE!]

The heroes pick sides when a fight breaks out in a fast-food restaurant run by Shadowkind. Having gained the trust of some of the players in that drama, they're recruited for a rescue operation that will hopefully lead to the only man who knows how to return home across the Shadow.

[END SPOILER SPACE]

The spattered paintings, slick characterizations, gangly elves, and stumpy dwarves give a favorable graphic insight to the game; combined with an unpretentious writing style (with the occasional in-joke: the Swiss Juncture of Gnomes?), **Urban Arcana** is a good starting point for a classic magic-meets-technology campaign. Whether intentional or not, the game leaves much to the GM, but gives him the tools to realize that best game of games: the one that ultimately transcends its own source material.

*Note: **Urban Arcana** contains no Open Game Content.*

Pyramid Review

UNTIL Superpowers Database (for HERO System)

Published by [Hero Games](#)

Written by Steven S. Long

Interior Artwork by Nate Barnes, Storn Cook, Andrew Cremeans, Keith Curtis, Jonathan Davenport, Nick Ingeneri, Eric Lofgren, Bryce Nakawaga, Scott Ruggles, Greg Smith, and Chris Stevens

272-page b&w softcover; \$24.99

The **HERO System** has arguably the most detailed and involved power creation system of any superheroic RPG. As discussed in the review of the [5th Edition](#), powers are not categorized into real-world classifications that have defined abilities -- such as a Gravity Blast power -- but instead broken down into the component effects of the power. Thus in the **HERO System** our Gravity Blast power may cause some damage, make the victim lose some Strength, and/or keep him immobile.

This system is great if you are creative around a set of rules and know how to come up with cool powers. But if you *don't*, it can be a royal pain; there isn't as much of a "shopping list" of interesting abilities that can spark your imagination. Thus many first-time **HERO System** characters are some variation of Flyingenergyblastingforcefieldman, covering the triad of basic offense, defense, and movement.

The **5th Edition** book went a fairly long way in addressing this concern with large numbers of sidebars detailing specific applications of powers and power groupings. But there are still those wanting *more* . . . those who would benefit from a superpower supermarket approach. For those people, the **UNTIL Superpowers Database** may be the answer they've been looking for.

This book is a hefty collection of powers, with chapters grouped around special effects (which are an important concept in the **Hero System**). In turn, each chapter is subdivided into Offensive, Defensive, Movement, Sensory, and Miscellaneous Powers. These aren't new "powers" in the **HERO System** sense, but new applications of existing powers and power modifiers. Each power is given a description at the beginning that details what it does, how it fits in with the special effect, and how it works in simple terms.

For example, the power Let's Wrap This Up, under the Speedster Powers chapter, is the stereotypical speedster ability to pick up ropes, chains, or other nearby restraints and run around a target really, really fast until they are tied up. In game terms it's described as an Entangling attack that has a "focus" (appropriate materials of opportunity), no range, takes extra time (however long it takes to get the materials), and Cannot Form Barriers (which the normal Entangle attack can do).

Each power is then given a number of tweaks to affect its cost and abilities. For example, "Let's Wrap This Up" offers options for stronger or weaker wrapping, and a ranged wrap-up (he's so fast that he can just run over to the target and back). Each chapter offers between three and 10 pages of powers, with most pages containing three to five powers each. In a book weighing in at 272 pages thick, that's a *lot* of powers.

The most impressive aspect of its book is the depth and breadth of material here. Writer Steven S. Long has taken a number of special effects that are usually overused, seemingly limited, or otherwise lacking in possibilities and

expended their potentials. For example, an ability that is normally seen as a one-trick pony -- Precognition -- is expanded to include power examples that can let the character dodge ("Saw it coming!"), sense danger (Permonitions), or have extraordinary fortune (Precognitive's Luck). He can even take Looks Like I Win Again, which turns the Gambling skill into a power . . . don't play Poker with a precognitive!

The special effects covered range from the obvious (such as Fire And Heat, Water, or Animal powers) and some less-obvious ones (such as Cyberkinesis, Luck, or Sleep And Dream powers). Although the categories aren't exhaustive, they should still do a good job of sparking ideas to help create an incredible number of super-powered characters. In addition, new rules or guidelines are provided to help GMs and players use some of these powers. For example, the Emotion Control chapter gives rules for game effects for many kinds of emotions, while the Weather Control section offers rules for changing the weather and the effects that causes. The last chapter is also noteworthy, since it details some "Miscellaneous Powers," a collection of 11 comic-book powers that readers may be curious about how to replicate in the **HERO System**. (For example, the Darkseid-esque "Nega-Beam" -- a blast of energy which follows the victim around until it connects -- is treated as a Summon!) Wrapping up the **UNTIL Superpowers Database** is an Appendix, with a couple of examples of how to use this book. There is also a brilliant new rule called the "Power Skill," which allows players to use other abilities in-game at a *greatly* reduced power level, thus permitting for flashier or creative use of powers. For example, a water-based character may need to make a bridge of water to get some innocents to safety from a sinking yacht; but he doesn't have an appropriate power; through some finagling of his abilities, he manages to create a *very* weak, exhausting bridge that does the trick . . . barely. This one rule alone goes a long way in combating much of the genericness of **HERO System** powers.

Also scattered throughout the book are various sidebars detailing intelligence that UNTIL has gathered on various superpowered individuals; the powers of these individuals tie in with the chapter in question, so we get a discussion of "Thunderbolt I" in the section on Electricity Powers. These sections are, for the most part, forgettable; fortunately, they do not take up much room, and help the book from feeling *too* much like a collection of random powers.

Physically, the **UNTIL Superpowers Database** is up to the standards of the latest series of **HERO System** books. The artwork ranges from adequate to quite impressive (although, again, many pieces look like they *really* want to be in color). The layout, writing, and editing are clean (although the binding on the copy reviewed has shown some signs of wear), and there is a massive three-page index of all the powers in the book.

The **Advanced Marvel Super-Hero RPG** from the mid-1980s had the **Ultimate Powers Book**, considered by many to be the best book from that series. Now the **HERO System** has its own answer to that classic with the **UNTIL Superpowers Database**. Its greatest flaw is that it isn't of much use to anyone who *isn't* using the **HERO System**. Its next greatest flaw is probably that it, technically, isn't an essential book, since everything within can be replicated with the basic **HERO System 5th Edition** core rulebook. But for those who love the system and need to get creative juices flowing (or who just need to create interesting characters at the spur of the moment), this will be a great addition to your library.

--Steven Marsh

Time Enough To Run Out Of Time

Ordinarily when I'm pressed for a column idea I mercilessly rip off whatever movie I've seen most recently, file off the serial numbers, and go from there. Unfortunately I find myself stuck with *Charlie's Angels: Full Throttle* as my skull-etched source film for this week; I have little to say about it, except that I was proud with myself for having gestured wildly and yelled at the screen only *once*.

So now I find myself looking for another topic, and running out of time. And at present I find myself torn between a number of obligations, all pulling for my attention. There's nothing too unusual about that; I've found that burning the candle at both ends is good for amateurs, but for those looking to *really* save time, there's nothing like taking a blowtorch to the center of that wax stick.

Anyway, thinking of my personal time crunches, I found myself remembering days I've been in the player's seat, saying things like:

"So we have two days before our ship sets sail? Okay; during that time I go into town, get my equipment repaired, go shopping for a gift for the Queen, meet with the council elders, give the Queen her present, and check in with my underworld contacts. Oh, and in my spare time I'm trying to learn archery."

In short, our games generally assumed that downtime was this nigh-infinite cache of time, disrupted only by the occasional would-be cataclysmic event that needs to be dealt with ASAP before getting back to shopping for horses and flirting with royalty.

Of course, this isn't very realistic. For one thing, if you get the two confused you may wind up checking a princess' teeth and marrying a palomino. But more importantly, the world tends to move on, regardless of the PCs' actions. . . and quickly.

So how do you represent this in an RPG? Well, first off you don't want to be *too* obsessive; after all, [downtime](#) is often one of the most fun parts of a campaign. On the other hand, keeping the relentless pressure of time constant as a reminder will make the heroes appreciative both of truly quiet times, *and* make them enjoy the stress of the busier times more (since they'll be accustomed to a more hectic pace).

There are two easy ways to keep track of time in a game, allowing for more stressful normal interactions; one is a bit more abstract than others.

The first method is to keep track of the actual downtime available; in the same way that you might keep track of gold pieces or megacredz. Each day assign the number of available "points" to players (perhaps in the form of chips or glass counters . . . gamers love glass counters); thus they may get 15 counters to represent the 15 available waking hours to them. Have a list of available activities with their relative "costs" in time, then have players spend time appropriately; you can probably round to the nearest hour or half-hour:

Buying Stuff	1 hour (per type)
Dealing with City Bureaucracy	1 hour for simple tasks 3 hours for difficult tasks more?
Traveling from one quadrant of city to another	1/2 hour
Visit organization (religious, professional, etc.)	1 hour for brief visit 2 hours for thorough visit

etc.

Many RPGs -- such as **GURPS** or **Dungeons & Dragons** -- assign a cost in hours to training, spell memorization, or the like. Those tasks can be represented easily with this system; simply deduct the number of hours spent at those tasks from the available points per day; thus if you need 100 hours to get the Basket-Weaving skill, you can deduct them 10 hours a day for 10 days, or one hour a day for almost four months.

This system, although fairly complex, allows for a fair bit of tinkering, as desired by the gaming group. For example, players may gain extra "points" to spend each day by giving up sleep, only to be at (for example) -1 to skill rolls for each hour or two gained in this way. Various advantages and disadvantages become more workable, too, like "light sleeper" or "needs less sleep"; simply adjust available points per day.

GMs can also allow players more leeway in their point-spending per day. For example, the GM may allow a player to get a +1 to skill rolls per extra point (hour) spent at shopping, bureaucracy, or similar attempts; if you're willing to browse the bazaar all day, you should have a better shot at finding what you want and getting a good price.

The second method sacrifices realism somewhat, but it's simpler, more fast-paced, and places more effort on the players to be creative. Simply reduce the number of tokens the players get per day (to, say, five or six), dispense with the list of stuff, and have the *players* decide their value and how they spend them. This method is good for games that assume characters have lots of daily activities they usually accomplish (such as **Vampire's** daily feedings, contact maintenance, court attendance, and so on), with a limited amount of time left over. These tokens are more nebulous in nature, but should be enough to accomplish one easy-to-moderate task; their exact value is left to the players:

Player 1: I spend one token hiding that body from last adventure, one token researching that artifact I found, two tokens trying to improve my animal-control powers, and one patrolling the city looking for signs of that mysterious illness.

Player 2: I'm spending one token to buy a new car, one token training with these so-called 'computers,' and I'll spend one token trying to track down my sire. Oh, and I want to check out that illness, too, but I want to spend more time doing it; I'll use my last two tokens for that.

Player 3: I'm still *persona non grata* in court after the Sewer Incident, but I'm trying to rebuild my reputation. I'm spending all five tokens to hang around in court; if I can do any favors to improve my standing with anyone influential, I will.

And so on. Some gaming groups may find this method too nebulous, but others may find it a good bridge between meticulous record keeping and free-form "do what thou wilt" methods of handling downtime.

Either way, players generally love spending points on stuff, and points they get back every day can be even snazzier. They can actually make downtime more special and active -- since some players will *hate* to let those daily points go to waste -- while allowing for more interesting conundrums when time is tight; how do the heroes react when they are injured, their equipment is trashed, they have a dozen scrolls to decode, two of their loved ones are missing, and the Agent of Inky Darkness is due in town in two days? (And watch them sweat when you only give them a few of their normal tokens and tell them, "Let me know where you are when you use that last one . . .")

Of course, before you can *use* this system, all you need to do is find the time to make a list of activities for your game, maybe make a travel map for the city, find tokens, instruct your players . . .

Wanna borrow my blowtorch? You might find a use for it . . . especially if you've seen **Charlie's Angels: Full Throttle** lately.

--Steven Marsh

In Her Majesty's Service

Weapons And Equipment Of The Late Victorian British Soldier

by Hans-Christian Vortisch

*"We're marchin' on relief over Inja's coral strand,
Eight 'undred fightin' Englishmen, the Colonel, and the Band;
Ho! Get away, bullock man, you've 'eard the bugle blowed;
There's a regiment a comin' down the Grand Trunk Road."
--Rudyard Kipling, Route Marching*

This article details the armaments and equipment of the British Army and Navy for use in both historical campaigns ([GURPS China](#) and [GURPS Old West](#)) in the late 19th century, as well as a number of popular fictional settings, including [GURPS Castle Falkenstein](#), [GURPS Deadlands](#), and [GURPS Steampunk](#). The information will also prove valuable for *Cthulhu By Gaslight* and especially *Space: 1889*, although no game stats are provided for these systems.

A very short but useful introduction to warfare in the Victorian era can be found in *GURPS Steampunk* (pp. ST54-60); the sidebar on p. ST55 gives British Army ranks and unit organization.

Personal Equipment

During the Victorian era, most line infantry and Highlander units stationed in the British Isles still wore their famous redcoat dress: a scarlet jacket, blue trousers with red stripes down the legs, and white helmet and load-bearing equipment. Scottish troops from the Highlands substituted a kilt (or trews, tartan-patterned trousers). The white helmet and load-bearing gear were often stained with tea to reduce the highly visible contrast. Those units stationed in India wore more suitable khaki uniforms from 1885, and similar subdued dress was issued in limited numbers and on special campaigns from 1884; it was not until 1896 that khaki field dress started to fully replace the old colored types in all British Army combat units.

Each infantry soldier carried a greatcoat, spare shirt, trousers, socks and drawers, towel, and soap wrapped into a blanket and waterproof cape. This pack weighed 14 lbs. Together with the mess tin (1 lb.), a two-pint canteen (3 lbs.), boots and clothing (12 lbs.), Pattern 1884 combination entrenching tool (3 lbs., could be used as pick or shovel, p. HT95), and two days' rations of biscuits (2 lbs.), each man carried 33 lbs. apart from his weapons and ammunition (and not very comfortably -- the load-bearing arrangements were ill-designed, increasing Fatigue when on the march or in combat). Tents or other bivouac gear was seldom available; if it was, it was stowed on the pack animals.

In 1888 the Slade-Wallace valise (load-bearing) equipment was adopted, which had two belt pouches for .450 Martini-Henry ammunition; one held 40 rounds (3 lbs. for the ammo alone), the other 30 (2.25 lbs.). In 1889 pouches for .303 SAA ammo were introduced, which held 50 rounds (2.8 lbs.) and 40 rounds (2.25 lbs.). These were replaced in 1890 with new pouches holding 50 rounds each. For a short time, a separate pouch for a single magazine for the Lee-Metford Mk I was carried as well. From 1882, Cavalry and Mounted Infantry wore a cartridge bandolier holding 50 rounds over the left shoulder instead of the valise equipment.

Instead of the rifle and associated equipment, officers carried a sword, revolver, ammunition pouch with 20 rounds (1 lbs.), and field glasses or a telescope (pp. HT102, ST90). Many also chose to carry a small flask of whisky, pipe and tobacco, matches, and notebook and pencil.

Swords

The Cavalry, Horse Artillery, Foot Artillery, Engineers, Bandmen, and Hospital Corpsmen were issued a slightly curved, single-edged broadsword for all ranks, and officers of all services also carried one. Infantry types included the Sword

Pattern 1864, Pattern 1882, and Pattern 1885, which proved too light and bent or broke too easily. They were therefore replaced by the slightly heavier Sword Pattern 1890. Although the latter was intended for both cutting and thrusting, it was not optimally designed for either.

All had a 34.5-inch *Average* blade and a bowl hilt (treat as basket hilt, p. CII23). The weight given in the table excludes the scabbard (+1.6 lbs.).

Cavalry swords included the Pattern 1885 and the Pattern 1890; these had the same blade lengths, but were lighter than the infantry types, as were their scabbards (+0.6 lbs.).

The shortsword issued to Foot Artillery was shorter, with a 23.5-inch *Average* blade and a bowl hilt (treat as basket hilt, p. CII23). The weight excludes the scabbard (+0.4 lbs.).

Lances

The Cavalry used lances until 1903. The standard weapon was the Lance Pattern 1868, a nine-foot long bamboo shaft with a small point and a ball butt. Bamboo had the advantage that it did not warp in tropical climates. However, it was replaced by an ash shaft when the Pattern 1885 was introduced (which was otherwise identical).

Revolvers

All senior NCOs (Military Rank 2), trumpeters, and team drivers were issued a revolver. Officers had to acquire their own sidearm (see BOX).

Adams Mk II, 11.5×18mmR (.450 Adams), Great Britain, 1872 (Holdout -1)
A double-action revolver of hinged-frame design, based on the earlier .450 Adams Mk I. That was a converted percussion-fired .442 Beaumont-Adams (p. HT109). The Adams Mk II fired a blackpowder cartridge. Also see p. HT109.

The *Mk III* (1872-1880) was practically identical.

Enfield Mk I, 11×18mmR (.442 Enfield), Great Britain, 1880-1882 (Holdout -1)
This double-action revolver was a classic English hinged-frame design. It replaced the *Adams Mk II* and *Mk III*. Those for service in India were nickel-plated to protect them against corrosion. It fired a blackpowder cartridge.

Enfield Mk II, 11.7×22mmR (.476 Enfield), Great Britain, 1882-1887 (Holdout -1)

This weapon replaced the *Enfield Mk I*. The chief difference was the larger caliber. The soft lead bullet of the blackpowder-loaded .476 Enfield had a clay wedge in the tip, which caused it to expand massively (not unlike a Hollow-Point, pp. HT7, MF4-5). This made it effective, but also led to its ban under the 1899 Hague Convention.

Webley Mk I, 11×18mmR (.442 Enfield), Great Britain, 1887-1894 (Holdout -1)

The successor to the *Enfield* designs, the Webley Mk I was also a hinged-frame, double-action design, but based on the commercial Webley-Green weapon. It featured a self-ejector. While chambered for the 11×18mmR (.442 Enfield), it was also able to fire the 11.5×20mmR (.455 SAA) and 11.7×22mmR (.476 Enfield). The grip's shape was of the so-called bird's head design and featured a lanyard ring. Most went to the Navy. Also see p. HT110.

Webley Mk II, 11.5×20mmR (.455 SAA), Great Britain, 1894-1897 (Holdout -1)
Slightly modified *Webley Mk I*, chambered for the new standard ammunition and also featuring a new hammer with larger spur and reconfigured grip shape.

Privately Purchased Handguns

British officers were expected to furnish their sidearms at their own expense, typically bought at Richard-Westley's of London, or the famous Army & Navy Co-operative Society outlets. While many chose the regulation revolvers, some opted for other weapons, especially customized and longer-barreled high-end revolvers such as the Webley-Kaufmann or Webley-Wilkinson (p. HT110), the latter being sold together with a sword produced by the famous maker of cutlery.

Some officers selected less obvious choices, including so-called "howdah" pistols and early automatic pistols. Winston Churchill himself, then a lieutenant and war correspondent, used a Mauser C96 (pp. HT108, W94) instead of a revolver in the 1898 Omdurman campaign.

Lancaster Pistol, 12×22mmR (.476 Enfield), UK, 1885-1900 (Holdout -2)
This "howdah"-type handgun

The *Mk I** (1894-1897), *Mk III* (1897-1899), and *Mk IV* (1899-1904) were functionally identical.

Rifles

*"When 'arf of your bullets fly wide in the dirch,
Don't call your Martini a cross-eyed old bitch.
She's human as your are -- you treat her as sich
An' she'll fight for the young British soldier."
--Rudyard Kipling, The Young British Soldier*

Martini-Henry Mk III, 11.43×59mmR (.450 Martini-Henry), Great Britain, 1879-1889 (Holdout -7)

The perfected version of the Martini-Henry single-shot breechloading rifle that had started to replace the Snider-modified Enfield Pattern 1853 (p. HT113) in 1874. It continued in service for a long time, into the 20th century with some units. The cartridge was loaded with blackpowder. Also see p. HT113.

Martini-Metford Mk VI, 7.7×56mmR (.303 SAA), Great Britain, 1889-1890 (Holdout -7)

Originally known as the Martini-Henry Mk VI, this was converted from the Martini-Henry Mk II by replacing the barrel, breech block, extractor, sights and other smaller components, in order to fire the newly adopted small-bore blackpowder cartridge. All conversions were made by the Birmingham Small Arms & Metal Co. Most were directly sent to the colonies, including to Australia, Canada, and South Africa.

Martini-Metford Mk I Carbine, 7.7×56mmR (.303 SAA), Great Britain, 1892-1894 (Holdout -6)

This was a converted Martini-Henry Mk I cavalry carbine rechambered to the new small-bore caliber by the Henry Rifled Barrel Co.

The *Mk I**, *Mk II*, *Mk II**, *Mk III*, and *Mk III** were very similar.

Lee-Metford Mk I, 7.7×56mmR (.303 SAA), Great Britain, 1889-1892 (Holdout -7)

Adopted in December 1888 and first issued in 1889 (but not widely seen until 1895), this weapon slowly superseded the Martini-Henry designs with the British Army. It combined the turnbolt action and magazine of James Lee and the rifled barrel designed by William Metford into a quick-firing, accurate weapon. The magazine was fitted with a cut-off, to allow use as a single-shot weapon (conserving ammunition). The shooter would reload after every shot, but could use the full magazine when necessary. Furthermore, the magazine was removable, which allowed it to be quickly replaced in an emergency (for a time, each soldier was issued two magazines, one in the weapon and one as spare on the belt). Also see p. HT114.

A cleaning rod was carried below the barrel, inserted into the forestock. An oil-bottle and jag were stored in the buttstock. When fitted with the 12-inch *Average* bayonet (+0.9 lbs.), use Spear -1 skill (Dam thr+3, Reach 1, 2).

The rifle was made at the Royal Small Arms Factory, Enfield (RSAF), as well as the Birmingham Small Arms & Metal Co. Ltd. (BSA) and the London Small Arms Co. (LSA).

had four barrels bored into one rectangular barrel block. It had a unique and fast double-action trigger, which allowed very rapid fire. The usual chambering was the contemporary British service caliber, but it was also made in .380 Webley (Dam 1d+1), .450 Adams (Dam 1d+2+), and .500 Webley (Dam 2d+). Lancaster pistols were popular with British officers, as the gun was more reliable than revolvers. Hunters used it as close-in defense weapon against tigers and other predators. Also see p. HT111.

Borchardt Mod. 1893, 7.63×25mm Borchardt, Germany, 1894-1897 (Holdout -3)

The first successful self-loading pistol, developed by Hugo Borchardt and made by Loewe & Co. of Berlin. It had a toggle-lock action similar to the later Luger pistol (Georg Luger was assistant to Borchardt at the time), and fed from a detachable magazine in the grip. However, it was a bulky and clumsy weapon, and difficult to shoot single-handed (-2 to Guns (Pistol) skill). Most people used it as a take-down carbine, as it was delivered with a detachable shoulder stock. This featured a leather holster and allowed the weapon to be carried on the belt or saddle ring. It was sold in a presentation case with matching stock, four magazines, and accessories; it was apparently popular with British officers (even though regulations required a weapon able to chamber the .455 SAA). The round was interchangeable with the 7.63×25mm Mauser, but slightly weaker.

In 1892, it was improved to the *Mk I** configuration. The chief modification was the introduction of cordite ammunition (smokeless propellant, pp. HT27-28) instead of blackpowder, which necessitated different sights.

Lee-Metford Mk II, 7.7×56mmR (.303 SAA), Great Britain, 1892-1895
(Holdout -7)

This weapon was, like the *Mk I**, intended to fire smokeless ammunition. In addition, it introduced a double-row 10-round magazine in place of the old single-row 8-round magazine.

The *Mk II** of 1895 differed in minor details such as a slightly longer bolt and a new safety.

Lee-Metford Mk I Carbine, 7.7×56mmR (.303 SAA), Great Britain, 1894-1895
(Holdout -6)

This cavalry carbine was based on the *Mk II* rifle, but differed in the shorter barrel, smaller magazine, and various minor details. Issued from 1897.

Lee-Enfield Mk I, 7.7×56mmR (.303 SAA), Great Britain, 1895-1902 (Holdout -7)

Much the same as the *Lee-Metford Mk II**, differing only in the rifling, since the Metford rifling was eroded by the hotter cordite. Issued from 1900.

Machine Guns

Machine guns were originally only used by the Royal Artillery and Royal Navy; most campaigns of the era were fought with naval weapons crewed by sailors detached to regular Army units. In 1891 machine guns (especially the Maxim patterns) first became available to Infantry, Mounted Infantry, and Cavalry units as well. However, the full potential of the machine gun was never appreciated in the entire period, it being seen as an auxiliary weapon, an inferior version of the artillery.

Machine guns were nominally attached at brigade level (some 3,000 men), but often assigned to smaller units in colonial warfare. They were grouped in two-gun sections, each with one officer and 17 enlisted in the Cavalry or Mounted Infantry, or 12 enlisted in the Infantry. Seven respectively four of the enlisted were team drivers. In addition, two two-horse carts with ammunition and one with foray for the horses were included.

Gatling Mk I, 11.43×63mmR (.450 Gardner-Gatling), Great Britain, 1874-1880s

*"The sand of the desert is sodden red,
Red with the wreck of the square that broke.
And the Gatling's jammed and the Colonel dead
And the regiment blind with dust and smoke."*

--Henry Newbolt, *Vitai Lampada*

The Gatling gun was an icon of its era. It was patented by Dr. Richard Gatling of Indiana in 1862, and originally had four barrels. The prototype used percussion-

Ammo Supply

Ammunition for the Martini-Henry, Gatling, and Nordenfelt came in sturdy 0.54-cf wooden boxes holding 600 rounds and massing 80 lbs. They were tin-lined and tightly closed with screws to protect the contents against the elements. This proved to be a very unfortunate arrangement, when in 1879 at Isandhlanwa the troops became hardpressed for ammo, and not enough screwdrivers (not to speak of quartermasters) were at hand to open the boxes -- the soldiers desparately hacked at the copper bands with axes and bayonets . . . and suffered a sound defeat at the hands of the Zulus.

A crate of .450 Martini-Henry ammunition was \$15.

Notes on Mechanical Machine Guns

The tactical use of early machine guns was ill-understood at first. They were almost invariably mounted on heavy artillery carriages, and some of the early guns couldn't even be traversed, which means the whole carriage had to be moved to aim the gun, just like an artillery piece. Many early guns therefore fired multiple projectile rounds like Shot (pp. HT18-19, MF8) to give at least some spread of fire. Consequently, they weren't used very effectively, proving their worth only on the defensive and in fortified positions. With time, however, the mounts lightened (until eventually the tripod appeared in the 1870s), and generally allowed a 180-degree arc of fire. At the same time,

fired 14.7mm paper cartridges which were inserted into steel cylinders and fed from a gravity hopper (pp. HT117, OW87). The feed system was copied from the earlier Coffee Mill Gun: the cylinders were dropped into the hopper, a crank on the right side of the breech was turned, firing a round and ejecting the cylinder. At the same time, the next barrel was brought with a new round into position. Six of these were made by Greenwood & Co., but they were destroyed in a fire before any could be sold.

Later that year, Gatling offered an improved 6-barreled pattern chambered for the then modern 14.7×44mmR (.58 Berdan) rimfire cartridge. It was mounted on a wooden artillery carriage, which was pulled by a limber and horse team. The weapons were made on his behalf by McWhinny, Rindge & Co. Twelve M1862 guns were bought by General Butler of the Union Army and used during the American Civil War. The *New York Times* acquired three which were manned by staff in June 1863 against rioters in New York City (but never fired).

The M1866 in 12.7×53mmR (.50-70 Government), made by Colt, was the original series production model, the first 50 being taken into U.S. Army service in 1867. It was mounted on an artillery carriage, pulled by a limber and four horses.

Armstrong & Co. of England made a similar model under license, known as the Gatling Mk I, which was adopted in 1870 by the British military and chambered for the 11.43×63mmR (.450 Gardner-Gatling) blackpowder cartridge. The guns were not delivered until 1874, and most went to the British Navy; consequently, many colonial operations included a detachment of Naval gunners. The Mk I had ten barrels and used Broadwell drum magazines, which consisted of a circular cluster of several gravity magazines. The 352-round Broadwell drum had 16 vertical cells, each holding 22 rounds, while the 250-round drum (AWt 50) had 16 vertical cells, each holding 15 rounds. After all rounds of a vertical cell had been fired, the gunner (or preferably, a loader) had to manually rotate the drum so that the next cell was aligned with the feeder (2 seconds). Installing a new drum took 10 seconds. The weapon was mounted on a wooden artillery carriage and required a limber (387 lbs.) and four horses for movement. It was less reliable than other Gatling variants because of the British Boxer-type cartridges, whose rims were ripped apart by the extractors, causing a jam.

See p. ST52 for illustration (note Broadwell drum). ***GURPS High-Tech, First Edition***, p. 62 shows a Colt-made Gatling M1877, which was similar.

Gatling Mk I, 16.5×97mmR (.650 Gatling), Great Britain, 1875-1878

The Royal Navy used the Armstrong-made Gatling Mk I in a larger caliber as deck-mounted gun from 1875. It had ten barrels and fed from a 60-round Broadwell drum, with 10 cells each holding 6 rounds.

It was also mounted on a carriage for land-use; the limber was 888 lbs.

These weapons were first used in the 1877 clash with the Peruvian gunboat *Huàscar* and then in land warfare against the Zulus.

Hotchkiss Q.F. 1-pr Mk I, 37×94mmR Hotchkiss (1-pounder), Great Britain, 1884-1889

Benjamin Hotchkiss, an American living in France, invented a machine cannon externally similar to the Gatling weapons in 1871 (pp. HT117, OW87). In 1875, he built a factory in St. Denis near Paris, and started producing the weapon for

rates of fire, ammunition feeds, and the ammunition itself were improved.

As detailed on pp. HT73 and VE107, rate of fire of mechanical machine guns depends on the gunner, calculated from a formula depending on gun type (note that the formula given here differs from what those books say; it is based on the actual rates quoted for the weapons):

Gardner/Gatling/Nordenfelt -- maximum RoF is (skill+ST)/2.

Hotchkiss -- maximum RoF is (skill+ST)/5.

All guns have a mechanical upper limit, which cannot be increased regardless of skill (noted as $RoF = n$ in this article, where n is the maximum number of shots possible). For example, early Gatlings couldn't fire faster than RoF 5, even if skill and ST would allow for more. Also, the faster the gunner cranks, the higher the chance of a jam or other malfunction -- Malf will get worse by one level if RoF exceeds 5 or 66% of the listed maximum RoF, whichever is higher.

Alternative Machine Guns for Fictional Adventures

Although these specific weapons -- fictional in these chamberings and configurations -- were never adopted by the British military, the guns (and the technical principles underlying them) are real, and all dates of appearance are historical. They are well-suited to small group campaigns, since they are lighter and more easily transportable

the world market. The basic gun had five revolving barrels and was designed to fire a 1-lbs. blackpowder shell (SAPLE), the smallest exploding round allowed under the 1868 St. Petersburg Declaration. Its intended use was the defense against the torpedo boats then gaining popularity (the contemporary torpedoes had a range of 400 yards, while the guns typically opened fire at 1,000 yards). Other, less commonly used ammo was Solid (Dam 10d++), Canister (Dam 1d++, 1/2D 150, Max 500, WPS 1.6), APLE (available from the late 1880s, Dam 6d×2(2) plus 1d-4 [2d], WPS 1.5), and from around the turn of the century, SAPHE (Dam 10d(0.5) plus 1d [3d], WPS 1.5). It fed from an open 10-round gravity-feed hopper. A loader could top up the hopper with 10-round charger clips or loose rounds while the gun was firing. A shipboard installation weighed 1,181 lbs. (a traversing pintle mount, including gun), the weight in the table is for the gun and an artillery carriage. The limber stored 200 loose rounds and 100 rounds in clips.

Armstrong & Co. in England made it as the *Ordnance, Quick-Firing, 1-pr Mk I* for both the Royal Navy and export from 1884.

Gardner Mk I, 11.43×63mmR (.450 Gardner-Gatling), Great Britain, 1884-1889

This weapon was invented in 1874 by William Gardner of Ohio. The Gardner had two fixed barrels side-by-side, both sheathed in a common brass jacket for protection. Upon turning the crank on the right side, the barrels fired alternately. Each barrel fed from a top-mounted Parkhurst feeding rail, which could be topped up during firing by a loader. The Gardner was considered to be more reliable than the Gatling. It was also cheaper and lighter. From 1875, small numbers of guns were made by Pratt & Whitney of Connecticut. However, main production of the Gardner took place at the Royal Small Arms Factory, Enfield. The Mk I detailed in the table and adopted as standard weapon by the Royal Navy was a deck weapon mounted on a pedestal mount with gun shield (PD 4, DR 10). It used 30-round Parkhurst feeders.

In 1889, the Gardner Mk I was adopted by the British Army in 11.43×59mmR (.450 Martini-Henry), superseding the earlier *Gatling Mk I*. It used 20-round Parkhurst feeders and was mounted on a light folding tripod; Malf Crit, Dam 5d+, Ewt 138+40, AWt 4, RoF =10*, Shots 2×20, Cost \$300.

Nordenfelt Mk I, 11.43×63mmR (.450 Gardner-Gatling), Great Britain, 1884-1890s

This weapon was invented in 1873 by Helge Palmcranz of Sweden (p. HT117). The businessman Thorsten Nordenfelt took out patents under his name, set up factories in Sweden, Spain, and England, and the gun was soon adopted by most European navies. The weapon consisted of a number of barrels side-by-side, which were fired in sequence by working a lever on the right side of the gun back-and-forth. It fed from a hopper magazine.

The Nordenfelt Mk I of 1884 was made in England by the Nordenfelt Guns & Munitions Co. As a standard shipboard anti-personnel weapon in service with the Royal Navy, it was chambered for the .450 Gardner-Gatling cartridge. The gun had five barrels and a closed 100-round hopper magazine. The parapet mount was 168 lbs.

The *Nordenfelt Mk II* of 1886 was used by Army and Navy, and slightly lighter at Ewt 133, but otherwise identical.

Nordenfelt Mk I, 25×94mmR (1-inch), Great Britain, 1878-1890s

than the contemporary issue weapons, and more readily embody the modern picture of the machine gun.

Gatling Mk I Camel Gun, 11.43×63mmR (.450 Gardner-Gatling), Great Britain, 1875

The U.S. Army acquired the M1874 Camel Gun in .45-70 Springfield, so named because it was proposed to be mounted on a camel saddle and fired from the back of the animal (lying down -- *not* on the move). While this was almost certainly nothing but a selling ploy (and the U.S. Army did not regularly employ camels anyway), it could also be fitted to the howdah of an elephant (or Martian *ruumet breehr* . . .). Even without such an animal, it was very useful because of its much lighter weight than other Gatlings.

The (fictional) Gatling Mk I Camel Gun was made in England, chambered for the standard British machine gun cartridge, and issued to colonial troops. It had shorter barrels than the standard *Gatling Mk I*, encased in a bronze sleeve. It was also much lighter. Apart from the saddle mount (\$110), it could be fixed on a tripod (45 lbs., \$125), or small cavalry cart (925 lbs. including gun and ammo, \$300), which required only one horse on good roads (two on bad ones) and stored four loaded 250-round Broadwell drum magazines and 2,000 loose rounds in ammo chests.

Electric Gatling Machine Gun Mk I, 7.7×56mmR (.303 SAA), Great Britain, 1893

In 1893, Dr. Gatling patented a fully electric weapon based on his earlier designs, chambered

The Royal Navy made much use of the four-barreled Nordenfelt Mk I, adopted in 1878 to replace the .650 *Gatling Mk I*. It was the first gun in history to fire AP ammunition (pp. HT7, MF6, VE101), another answer to the threat of torpedo boats.

See **GURPS High-Tech, First Edition**, p. 119 for illustration (note closed hopper magazine).

Nordenfelt Mk I, 11.43×59mmR (.450 Martini-Henry), Great Britain, 1887-1880s

In 1887, the British Army adopted the three-barreled Nordenfelt Mk I in 11.43×59mmR (.450 Martini-Henry). It was mounted on a light wheeled carriage.

Technically, the Nordenfelt guns were made obsolete by the *Maxim*, but they continued to see service for years. During the 1900 Boxer Rebellion in China (pp. CH98-99 and MA8-9), the Royal Marines used one of these defending the Legation Quarters in Peking.

From 1898, many British Nordenfelts were converted to the 7.7×56mmR (.303 SAA) cartridge (Dam 6d+2, Ewt 110), and used for fortress defense.

Vickers-Maxim Mk I, 11.43×59mmR (.450 Martini-Henry), Great Britain, 1889-1897

Vickers-Maxim Mk I, 7.7×56mmR (.303 SAA), Great Britain, 1889-1912

*"He stood upon a little mound
Cast his lethargic eyes around
And said beneath his breath:
'Whatever happens we have got
The Maxim gun, and they have not.'"*
-- Hilaire Belloc, *The Modern Traveller*

Invented by Hiram Maxim in 1883 in a small shop in London, this was the first truly automatic firearm, and a milestone in the history of machine guns (pp. HT117-118). It introduced the self-loading action and made popular the ammunition belt. It was water-cooled (the sleeve around the barrel was filled with 7.5 pints of water). By 1887, after years of improving his design, Maxim had a few pre-production guns made for him at Vickers of Crayford, Kent, chambered for the 11.43×59mmR (.450 Martini-Henry) blackpowder round; Dam 5d+, 1/2D 700, Max 2,500, Ewt 60+100, AWt 32, RoF 10, Shots 333, Rcl -1. Three were ordered by the British Government for testing.

In 1889, it was adopted in slightly modified form by the British Army in both 11.43×59mmR (.450 Martini-Henry) and the new smokeless 7.7×56mmR (.303 SAA). Both variants were originally mounted on an artillery carriage (1,456 lbs. including gun and limber), but from 1897 also on a tripod (48 lbs. without gun). The carriage was pulled by one horse in Infantry units, and by two horses in Cavalry and Mounted Infantry units. The tripod allowed the mount and gun to be carried by a single mule. The belts were stored in heavy wooden chests; because of their excessive weight, a 150-round belt was introduced for the .450-variant in 1893 (AWt 20).

They were made by the Maxim-Nordenfelt Guns & Ammunition Co., whose board included Maxim, Thorsten Nordenfelt, and Albert Vickers.

for the 7.62×59mmR (.30-40 Krag) round. It was a 10-barreled weapon, water-cooled and with the motor included *inside* its bronze housing. (Already in 1890 the Crocker-Wheeler Motor Co. had experimentally attached an external motor to an M1889-pattern gun, but this less satisfying arrangement never caught on.) The cyclic rate attainable was a marvelous 3,000 rounds per minute (a RoF of 50 that would not be reached again until the General Electric M61 Vulcan cannon was introduced in 1953; see "[Autocannons in GURPS](#)"). The Electric Gatling Gun was designed for naval use, where the ship's generators could provide electrical power. It was never made in production quantities.

The (fictional) Electric Gatling Gun Mk I, made at Enfield, was instantly adopted by the British authorities, who insisted on the weapon being chambered for their new smokeless .303 cartridge (it being thus the TL(5+1) equivalent of the General Electric M134 minigun introduced in 1963, pp. HT119-120). The gun fed from the side using 20-round metal feed strips.

The Electric Gatling Gun Mk I is a perfect weapon for steam-powered automata or battlesuits (pp. ST76-77), and would be especially deadly against airships (pp. ST80-81), light liftwood vessels, and other aerial vehicles. Note that it is a different weapon from the entirely fictional *Electrical Gatling* on p. ST88.

Nordenfelt Mk I Single-Barrel Machine Gun, 11.43×59mmR (.450 Martini-Henry), Great

The weapons reached the troops in 1891 in batteries of two, and were first used in Rhodesia in 1893, then Afghanistan in 1895, and from then on, everywhere the British fought. In 1912, it was replaced in production by the Vickers Mk I (pp. HT118, W96), which was an improved version.

(In 1889, the British Navy also adopted the *Maxim Q.F. 1-pr Mk I*, which was an enlarged version firing the same 37×94mmR shells as the *Hotchkiss Q.F. 1-pr Mk I*. See "[Autocannons in GURPS](#)" for a description and stats.)

Cannons

*"They sends us along where the roads are, but mostly we goes where they ain't
We'd climb up the side of a sign-board an' trust to the stick o' the paint
We've chivied the Naga an' Looshai, we've give the Afreedee-man fits,
For we fancies ourselves at two thousand, we guns that are built in two bits --
'Tss! 'Tss!*

For you all love the screw-guns . . ."

-- Rudyard Kipling, *Screw-guns*

Royal Gun Factory 2.5-inch R.M.L. Mk II, 63.5mm (7-pounder), Great Britain, 1879-1880s

The 2.5-inch Rifle, Muzzle-Loaded, Mark I was adopted in 1879 by the Royal Artillery for service as a light mountain gun. It had been proposed two years earlier by Colonel Le Mesurier, who envisioned a steel gun made in two parts (to allow transportation on pack animals) which screwed together. The breech portion was 201 lbs., the muzzle portion 199 lbs. Thus it received its famous nickname, the "Screw-gun." The Elswick Ordnance Co. made 12 Mk I guns in 1879, and after successful service in Afghanistan that year, a much larger number were made as the *Mk II* by the Royal Gun Factory. Gun and carriage were carried by five mules or four camels (alternatively by four Martian *gashants* or Venusian *pacyosauri*), with additional animals required for the ammunition. (Note that occasionally, stampeding animals could and did rob entire units of their only artillery support.) A battery had six guns, but typical deployment was in sections of two, one always on the move, covered by the second. The Screw Gun could be assembled and loaded in 20 seconds by a trained crew. Apart from LE, it also fired Shrapnel (Dam 10d+, Max 3,300, WPS 10), Canister (Dam 10d+, 1/2D 130, Max 650), and Starshell. Even though it was actually one of the heaviest weapons of its type, and a blackpowder muzzleloader when many countries adopted modern breechloaders, it was considered the finest mountain gun of its day. It became obsolete with the widespread introduction of smokeless powder -- each time it was fired, it created large amounts of smoke, thus announcing its position to the enemy. This became painfully clear during the Boer War, and it was removed from service in 1903.

Rockets

Hale 9-pr War Rocket Mk I, 63.5mm, Great Britain, 1867-1899

The Hale gunpowder rocket was invented by William Hale in 1844, introducing spinning propulsion to dispense with the guidance stick of earlier designs like the Congreve pattern (p. ST89), which made it both more accurate and lighter. It was fired from a *rocket machine*, a trough on a light tripod. Some 2,000 57mm (6-pounder) rockets were available to the U.S. Army Rocket Brigade in the Mexican War (1846-1848). Hale rockets were also adopted by several European forces, notably the Austrian Rocket Corps, the Dutch colonial troops, and the Russian

Britain, 1882

This (non-fictional) weapon was a single barrel light machine gun version of the Nordenfelt designs, which was not officially adopted by any military, but offered unheard of mobility and firepower for a small section (the first light machine gun in history!). Fewer than ten were purchased by the Royal Navy for trials; it doesn't stretch credibility for the British Army to adopt it in larger numbers in a fictional campaign. It functions like the multi-barrel Nordenfelt guns above and feeds from a gravity hopper magazine.

It was mounted on a small folding tripod (15 lbs) and featured a wire shoulder stock.

Basil Zaharoff Maxim's "Merchant Of Death"

Basil Zaharoff (1849-1936) was one of the most important arms dealers in the early 20th century, supplying and spying for the Allies during WWI. Also known as "the mystery man of Europe," he was highly decorated by the French and knighted for his efforts by the British (and immortalized as Basil Bazarov of Korrupt Arms GmbH in the comic series *Tintin* . . .).

Born Basileios Zacharias in Mugla, Turkey, he spent his youth in Russia, before working for his uncle in the cloth trade in Istanbul. In 1866, he was sent to London for education, and in 1870 became his uncle's London representative. Two years later he was accused of

Artillery.

Although Hale rockets were used experimentally in the Crimean War, the Royal Artillery was late to see their advantage (even though the British had used rockets of earlier designs extensively during the early 19th century). The pattern detailed here was finally adopted in 1867. However, from then on, it was widely used in the various colonial wars, showing its age first in the 1890s, when modern breech-loading artillery made it obsolete. The last were bought in 1899, and the British Army disbanded the Rocket Artillery in 1901. From 1870, the British military used only 9-pr and 24-pr sizes, and the latter was only used from ships and for sieges. The 9-pr was popular since it was light enough to be carried on pack animals, and could be used in areas like swamps, where even light mountain guns were of no use. It was launched from a trough in land service, or from tubes in naval service. A mule could carry two packs of six rockets each (a load of 202 lbs.); the disassembled trough and its associated carrying equipment added 32 lbs.

embezzlement, but acquitted of the charge. He left London for Greece under the assumed name of Z.B. Gortzacoff.

Soon, he was made sales agent of Nordenfelt for the Balkans. In 1888, Maxim and Nordenfelt joined forces in the Maxim-Nordenfelt Gun & Ammunition Co., which broadened Zaharoff's range of wares *and* his area of operations, extending to all of Eastern Europe, including Russia. When Vickers Co. purchased the company in 1895, he found he had still more weapons to offer and more markets to serve. Later he was made director of Vickers-Armstrong Co. Zaharoff became a millionaire from arms sales, and was reputed to hold shares in the German Krupp and Czech Skoda armament firms.

Zaharoff was fluent in several languages, and personally knew many important European statesmen. In the 1920s, he was accused of fomenting warfare and of secret political intrigue (in some German circles he was called the *Dämon* of Europe). He would be a valuable Contact to acquire for any PCs in need of heavy armaments as early as the 1880s, or could play a shadowy background figure in a Victorian *Espionage* adventure.

Ewt: Empty weight of the gun, in pounds.

Mwt: Weight of the usual mount, in pounds.

AWt: Weight of the standard ammunition container, in pounds.

WPS: Weight of a single round, or of a single projectile and loose powder, in pounds.

Cost: Cost with mount and limber, as applicable. Given in U.S. dollars; for most of the period, \$5 roughly equal 1 pound sterling.

Bibliography

- Barthorp, Michael. *The British Army On Campaign 1882-1902* (Osprey, 1988). Pictures and describes the British soldier in the many small wars of that time.
- Chadwick, Frank. ***Space: 1889*** (GDW, 1988/Heliograph, 2000). The basic rulebook of this fictional Victorian history game (with ether flyers and colonies on Mars) covers both the British military and contemporary weaponry. Great for flavor, and with good illustrations of the weapons and equipment. However, many specifications for the weapons are somewhat off. There are some **GURPS** conversions on the net: Christopher Beiting has rules for Martian races at <http://gurpsnet.sjgames.com/Archive/Conversions/1889/1889races>, and Ken Walton offers character generation rules at <http://gurpsnet.sjgames.com/Archive/Conversions/1889/1889.txt>.
- Chadwick, Frank. ***Space: 1889 -- Soldier's Companion*** (GDW, 1989/Heliograph, 2000). Not quite as nice as the core book, this is mainly useful for tabletop and miniature gamers. However, it has extensive lists of British military units.
- Chappell, Mike. *British Infantry Equipments 1808-1908*, 2nd edition (Osprey, 1999). Depicts and describes uniform and load-bearing equipment.
- Chinn, George. *The Machine Gun (U.S. Navy Bureau of Ordnance, 1951-1955)*. A four-volume tome which also covers all the TL5 designs. Out of print for ages, but definitely worth hunting down in a library.
- Cordery, Robert. *Colonial Wargaming* (n/a). A gem of a website. Although primarily aimed at tabletop players, it has a wealth of information, including color photos of many of the weapons described here. There are also many steampunk vehicles and a fully commented filmography at www.users.dircon.co.uk/~warden/colonial.htm (seems to

no longer be available).

- Featherstone, Donald. *Weapons and Equipment of the Victorian Soldier* (Blandford, 1978). Very nice overview, with good illustrations and detail drawings.
- Hamilton, William. "American Machine Cannon and Dynamite Guns" (1889). Web reprint of a vintage article in *The Century Illustrated Monthly Magazine* about the Gatling, Gardner, Hotchkiss, and Maxim, with a number of illustrations -- http://www.shsu.edu/~his_ncp/mgs.html
- Hogg, Ian. *The Greenhill Military Small Arms Data Book 1870-1999* (Greenhill/Stackpole, 1999). Bare data and some illustrations for most of the small arms treated here.
- Jacobsen, Jaques. *The 1886 Machine Gun Manual* (Pioneer, 1969). An edited reprint of a vintage U.S. Army Artillery School manual, detailing the Gatling, Gardner, and Hotchkiss, as well as their use. Cheaply available, and worth it, although most of the models described are not the ones used by the British.
- Markham, George. *Guns of the Empire -- Firearms of the British Soldier 1837-1987* (Arms and Armour, 1990). Detailed and well-illustrated coverage of British infantry weapons, including machine guns, with a useful historical introduction on operational use.
- Smith, Walther/Smith, Joseph. *Small Arms of the World*, 10th ed. (Stackpole, 1973). Good historical account of the development of the majority of the weapons described, with most items illustrated.
- Spiers, Edward. *The Late Victorian Army, 1868-1902* (Manchester University Press, 1992). Examines organization, training, equipment, and social composition.
- Sünkel, Werner. *The Hotchkiss Cartridge in 37mm* (Privately printed, 1990). Detailed treatise on that ammunition.
- Toppel, Donald/Wahl, Paul. *The Gatling Gun* (Jenkins, 1966). A very complete book about all U.S.-made Gatling gun models, also with information on its competitors, including the Gardner, Hotchkiss, and Nordenfelt. A detailed summary and some pictures can be found at the U.S. Army site: *The Gatling Gun* -- <http://www-aca1.ria.army.mil/LC/cs/csa/aagatlin.htm>
- Various. *Weapons* (Diagram, 1990). A starting point. Depicts most of the designs above (including the cavalry lance and Hale rocket), although not always the exact models described.
- Williams, Anthony. *Rapid Fire* (Airlife, 2000). Although concentrating on 20th-century machine weapons, this book also includes good info on some earlier weapons, especially on the ammunition, and has color photographs of a few rare pieces. Also see <http://www.quarry.nildram.co.uk/rfweb.htm>
- Zhuk, Aleksandr. *The Illustrated Encyclopedia of Handguns* (Greenhill, 1997). Depicts and describes all the handguns.

* * *

Special thanks go out to Volker Bach (for the quotes and photos), Nigel McCarty-Eigenmann (info on blades), andi jones (edits and illustration), Tony Williams (material on the Hotchkiss revolver cannon), and the Hellions for the usual support.

Lean Gaming

Tips for Trimming the Fat from Your Sluggish Adventure

by Aaron Webb

If your GM style tends to be gravity challenged, chances are your players are suffering from the effects of adventure obesity. Take heart! There are many ways to trim that unwanted fat and whip your gaming sessions into shape.

Level of Detail

Start by committing to memory the phrase "I will not take myself too seriously." It's true. One of the main reasons for unnecessary bulk in an adventure is cramming in too much detail, oftentimes caused by the GM's own infatuation with his world. While not enough detail leaves quests lifeless and bland, too much can bog down the entire evening. And while realism helps players to relate their fictitious escapades to their actual lives, too much can make them rue the day they decided to join the party. The trick is to find a good balance and apply that balance consistently.

Here are a few suggestions for trimming down the level of detail:

- **Avoid long-windedness.** Watch out for lengthy introductions, filibuster speeches by NPCs, unrelated background information, and puzzles or items that require extensive reading. The players came to play, not to be an audience for the GM's performance.
- **Keep it real, but not too real.** When Reco the Bullheaded lowers his shoulder to smash through the dungeon door, he shouldn't have to worry about getting splinters. Some things are better left to real life. Most hiccups in this department stem from the GM's desire to inflict damage or consequences for non-plot-related actions. Before assigning penalties for character actions, ask: "Does this penalty relate to the plot or the environment?" If not, maybe the foolish actions of the PCs can be overlooked this time. Give them a warning or clever remark, then move on.
- **Too much stuff!** While it seems hardly possible to have too much money or too much equipment, at times having to keep track of all those copper pieces and the daily conversion rates to electrum can really put a damper on things. Consider using a single coin currency system or making general entries in equipment lists such as "clothes" instead of "underwear, socks, boots, belt, breeches, etc."
- **Less min-maxing and fewer specializations.** Min-maxing is the not-so-subtle art that many players practice of taking advantage of discrete groupings of ability scores and skills. A classic example is a warrior who consults the Intelligence table in the rulebook to see how low a score he can have before suffering a penalty. And many players get sucked into the bottomless pit of specialized options. While not always the case, a frequent result is that players become enamored with statistics and numbers instead of the soul or personality of their character. There's nothing wrong with wanting a character to be interesting or powerful, but if the focus is too much on the minutia, the game may grind to a halt as players consult the rules for their one-armed, min-maxed, dragon/elf half-breed during the middle of combat. Sometimes a good old warrior with an axe goes just as far. Fans of exceedingly complex characters may be surprised by just how refreshing it is to revisit classic simplicity.
- **Downsize it.** If you find that storming the castle or the police depot has become a loathsome and time-consuming task, try reducing the number of people or places the characters will encounter. Focus on the essential, and remove unimportant personalities or rooms.
- **No mazes.** Players who actually appreciate and enjoy navigating mazes are extremely rare. Most detest the thought of playing lab rat for the GM. Use the time that you save by not creating sprawling, complicated complexes, by putting it back into fewer but more interesting engagements or a richer plotline.
- **Use random events wisely.** Sometimes GMs add random or unusual encounters to their adventures in an attempt to simulate real life. These things have no bearing on the plot, but the players can't tell the difference. They treat the bunny that stumbles into the forest path as a dangerous adversary because they don't know that the GM just threw it in there for realism. A mere 20 minutes later, after scouring the bushes for hidden traps and

sketching out a detailed plan of attack, the bunny hops away. It's okay to throw in colorful or humorous events here and there, but make sure that they aren't accounting for more than their fair share of game time.

- **The Rule of Three.** Maybe great minds can handle all the intricacies of 10 sub-plots going on at the same time, or 20 different possible murder suspects, but most people prefer to have their options limited to a manageable number. Having too many plotlines or important characters to remember can leave players feeling lost or disinterested. If possible, avoid having more than three major options or developmental plotlines at any given time. This way, things remain interesting and uncertain but well within the average player's ability to grasp the situation fully and enjoy it.

Time Management

A good GM manages his time effectively and respects his players enough to see them off by a reasonable hour. There are few hardcore gamers who haven't had their share of all-night adventures lasting well into the morning, but typically those kinds of gaming sessions involve players who know what they're getting into. For weeknight get-togethers or for people who can't afford to go all night like they did in their youth, the responsibility falls upon the GM to set the pace and determine when the game will conclude. The GM is the only person with all the answers, the one who knows how many monsters and rooms are between the PCs and their final goal.

While no GM can perfectly predict the actions of the players or estimate exactly how long any encounter will take, most develop the aptitude for budgeting time into reasonable portions defined by phases of the storyline. It's usually a good idea to have an outline of the adventure, even if it's rough, with an estimation of how long each section of the adventure will last. Good GMs learn to pad their estimations to account for bathroom breaks, food, and general messing around. It's typically not a good idea for a GM to wall himself in by packing the allotted time with too much to do. In those cases, the adventure will usually run over the allotted time. By the end of the evening, the faithful players will be stifling yawns and watching the clock as they think about work or school the next day. Sure, it's always possible to cut off any adventure right in the middle and pick it up later, but it's even better when players are rewarded with a measure of plot resolution.

Here are some strategies for managing time effectively:

- **Mark the halfway point.** Even if a GM doesn't make a rigid schedule, sometimes it helps to identify the halfway point of the adventure. When that point is reached, a rough estimate can be made of when the adventure will conclude. If it becomes necessary, the GM can cut out portions or speed play to stay on track during the second half.
- **Give players a mental compass.** If players dawdle or slow down at a particular point in the adventure, consider helping them out by having them review out loud all of the facts that they already know. Sometimes an act as simple as this is enough to get them going again.
- **Have various speeds of game play.** Just like a VCR, GMs can fast forward the dull parts of the story. Cross-country journeys, ocean voyages, lengthy skill research, hunting, and many other time consuming tasks need not always be roleplayed, nor must they be completely devoid of character decision making. Consider using "condensed decisions" whereby the GM offers two or three options of varying danger, difficulty, time, and cost. For example, if an adventure requires that the characters travel by starship to the Moon of Solitude, allow them to select from a direct route that may take them through pirate space, or a safer route that will take longer but will avoid the dangers. A simple roll of dice can determine what ill effects, if any, befall the characters along the way.
- **Bypass planned portions of the adventure.** If things are lagging, sometimes the easiest way to conserve time is to simply bypass planned portions. Certainly, skipping an encounter is preferable to forcing the PCs to press through an adventure that the GM miscalculated. It's not the players' fault that the GM couldn't budget adventure time. Why should they suffer? In most cases, the GM won't lose the hard work that went into planning the skipped rooms or encounters; they can be incorporated into other adventures in the future.
- **Remove distractions.** Players can be easily distracted by real life. Whenever possible, make sure the players are well fed and ready to participate in the adventure. If a GM finds that players are more interested in bouncing a squishy ball off a sci-fi movie poster, consider getting rid of the ball (or the poster).

Being a great GM isn't only about having fantastic ideas or incredible plotlines. It's also about managing time and serving appropriately sized portions for the adventure-hungry players. The next time that work of genius fails to deliver the expected smiles and cheers, don't scrap the idea completely. Maybe all it needs is a little adjustment in the waistline keep it lean and mean.

Designer's Notes: GURPS WWII: Weird War II

by Kenneth Hite with William H. Stoddard

"Train them! Excite them! Arm them! . . . Then turn them loose on the Nazis!"

-- tagline, *The Dirty Dozen* (dir. Robert Aldrich, 1967)

And that, pretty much, is what I did. Captain Kinder calls the original Dirty Dozen "the most twisted, anti-social bunch of psychopathic deformities I have ever run into!" to which Lee Marvin responds, "Well, I can't think of a better way to fight a war." And with "cadre of professional writers" being the understood modern polite term for "twisted, anti-social bunch of psychopathic deformities," I can't think of a better way to write a game book.

This was, in fact, the approach I had decided on ever since Gene Seabolt first proposed **GURPS World War II** as a separate line. I wanted to see a book covering everything from Operation Sealion to the Hollow Earth, from Projekt Saucer to Superman, in one swell foop. But I didn't want to write the whole thing -- I didn't have the time then, and I still don't have the hard smarts now, needed to boil Goering's heroin dreams down to **GURPS'** brass tacks. So I proposed an "anthology book" like **GURPS Y2K**. I'd assemble a crack team of ragtag heroes -- er, top game writers -- to put the weirdness boot into the Axis. Then I'd write the outline, cherry-pick the easy stuff (the campaigning chapter and the four sample settings, including One With Everything), and set everyone loose with a chapter. Once they'd finished, I'd edit the thing together, insert box text and page references where necessary, and index the whole megillah from "Abwehr" to "Zombies." (As it turned out, I indexed it from "A-bomb, German" to "Zuse, Konrad.") Gene liked the idea, put me in touch with the only slightly less maniacal "Wild Bill" Stoddard (see "The Stoddard Narrative" box), and sold the package to Steve.

For the Alternate History chapter, I knew I could count on my collaborators on **GURPS Alternate Earths** and **GURPS Alternate Earths 2**, Mike Schiffer and Craig Neumeier. I knew this because I'd already talked them into helping write the outline for that chapter. Bill Stoddard justly demanded the Weird Science chapter, and knowing a good thing when I saw it, I made him take the Monsters, Aliens, and Supermen chapter as well. (Those of you who follow Bill's campaigns vicariously on the message boards know that he's run some dandy 1930s-era games featuring superheroes and alien contact. That should teach you not to talk about your campaigns where developers can hear you, Bill.) For the Conspiracy chapter, I tapped Mark Cenczyk, an old hand from the twisty backstory of White Wolf -- if he could make sense of **Wraith** cosmology, he could track down the Fourth Reich's bank statements. And Patrick Sweeney, creator of Monster Island and San Angelo alike, was a natural for the Weird Places chapter. During the assignment process, I came up with a brilliant mechanism (if I do say so myself) for Cargo cult magic, so I snaffled the Magic chapter for myself, and my work was done.

The only hard part left was coming up with the name. By the time this book could be proposed, Shane Hensley had already used **Weird War II** (my original working title) for his **d20 System** line of wartime horror books. I knew there was no way Shane would let that perfect title out of his

The Stoddard Narrative

In somewhat the same way that the United States and Germany both came up with the idea of an atomic bomb during World War II, Ken Hite and I both came up with the idea of a "weird science" supplement to **GURPS WWII** at about the same time. I submitted a proposal for an entire book on WWII alternative technology; Ken submitted a proposal for a book on all the weird aspects of WWII, with alternative technology as one section. Gene Seabolt, the line editor, asked us to talk with each other -- and happily we managed a more peaceful settlement than Germany and the United States! *[Plus, Bill is way smarter than Hitler. -- K.H.]*

Originally I was just going to do weird science and alternative technology. But knowing my enthusiasm for superheroes and aliens, Ken offered me the chapter on monsters, supers, and aliens as well . . . and found me unable to resist. *[I also made him write mechanics for the Philadelphia Experiment. Sucker!! -- K.H.]*

In fact, I ended up doing that chapter first; it didn't

grasp, so I suggested **World War Weirdness** and **World Weird II** and other horrible ideas until Gene suggested I stop pestering him and just ask Shane's permission to use his title for our book. By a stroke of amazing good fortune (and Shane's amazing good fellowship) he gave it, and **GURPS WWII: Weird War II** was officially christened, launched, and under weigh.

Of course, like any other wartime project, plans changed once we met the enemy -- in this case, tight word count. Even "Slasher" Seabolt couldn't pound the whole book into its allotted VSPs; between Armanic Rune Magic, a "greatest hits" list of mysterious wartime assassinations, and psionic Power to electrical power conversion notes for Kirlian motors, cargo space was at a premium. (I also had to give topics like Japanese revanchism, military folklore, and German anti-gravity research short shrift. Plus, in the time since I finished the manuscript I discovered, among other things, an experimental WWII stealth technology called Project Yehudi, and a German expedition to Brazil in 1940 that can't have been up to any good. Perhaps for **GURPS WWII: Weird War II 2**. Or **Weirder War II**. Or . . .) These two Stoddard-built vehicles, suitable for inhuman invasions, got cut from the Weird Places chapter, and Motor Pool 18 was already too full to take them, thanks to my giddy delight with experimental Luftwaffe aircraft. So here they are, in all their para-historical glory, left behind on the developer's beach:

Atlantean Crawler TL(6+n)

The crawler is the Atlantean equivalent of a tank: a war vessel designed to walk across the rugged floor of the deep ocean. The standard models are designed for warfare between Atlantean city-states; this model is adapted to warfare with air-breathers by adding some experimental technologies. The standard crew is a driver and two gunners, but there is sufficient life support for an additional passenger.

Subassemblies: Body +4, eight Legs [U:Body] +1.
P&P: Radium batteries, 45 kW, with 40-kW legged transmission.

Occupancy: 3 CS. **Cargo:** 0.

Armor

Body: 4/30

Leg: 3/15

Weaponry

2×Slow Autoloading Torpedo Launcher, 44mm [Body:F]
(57 rounds each)
1×Extra-Heavy Water Cannon [Body:F].

involve designing **GURPS** vehicles, which made it go a lot faster. It did involve some new mechanics, some monster template design, and some interpretation of cultural themes. The new mechanics was mainly the Giant Monster Design System, intended to produce **GURPS WWII-compatible** stats for everything from the Giant Rat of Sumatra to Mothra; to produce it I started with the **GURPS Robots** design rules, tweaked them to so that a 150-lb. human being would have exactly standard human stats, and then provided rules for creatures with odd numbers of heads and limbs. Templates came from a variety of sources, but the most important were the German horror films of the 1920s, many of which I saw for the first time. Finally, I tried my hand at Hite-style interpretation of themes, with monsters as embodiments of natural disasters (or, for the Japanese, the atomic bomb), supers as idealized images of military men, and aliens as symbols of foreign invaders (as they have been since H.G. Wells).

The technology chapter involved a lot more research, variously conducted at the nearby university library, over the Web, and by sending frantic e-mails to Ken and Gene asking for sources. [*Mwah-ha-ha-ha!* -- K.H.] The creativity of the German aviation industry gave me most of my designs, usually with barely suitable statistics. Probably the most perplexing was the Triebflügel, a bizarre German VTOL experiment that I could only approximate by combining the **Vehicles Expansion 1** rules for two or three different nonstandard designs. By contrast, Willy Ley alone gave me more material than the book could hold (and in some cases, more than **GURPS Vehicles** designs require!) on German rockets and spacecraft designs. Ken's draft outline for this chapter covered very nearly all the topics I had on my list [*This is Bill's polite way of saying "Ken is stark staring mad, and there was no way to fit it all in."* -- K.H.]; the only thing I added to the outline was a short overview of the real role of science, technology, and industry in the war. Looking into this further turned up any number of strange things, from the Pingfan Institute's biological warfare program in Manchuria to Vannevar Bush's differential analyzer, an analog computer so sophisticated that it blocked any effort to develop digital computers for solving mathematical equations.

World War II is remembered in the United States as both "the golden age of comics" and "the golden

Equipment

Body: 5×Ink discharger; life support, water-breathing, 4 man-days; limited rotation unit for body, 11° per second; sealed body.

Statistics

Size: 12'×8'×7' *Payload:* 1,067 lbs. *Lwt.:* 38,475 lbs.

Volume: 120 VSPs *Maint.:* 70 hours. *Price:* \$6,500,000.

HT: 7.

HP: 405 *Leg:* 75.

gSpeed: 18 *gAccel:* 1 *gDecel:* 20 *gMR:* 0.75 *gSR:* 3

Low Pressure. Off-Road Speed 14.

Design Notes

The maintenance interval for the crawler is based on the cost of the vehicle *excluding the radium batteries*, which comes to only \$8,000. The radium batteries are a sealed system that is maintained only by Atlantean scientist/priests. They weigh 13,000 lbs. and occupy 23 VSPs; only the nuclear programs of the major surface powers would be able to reverse-engineer them.

The listed statistics are for performance underwater; the crawler's body is filled with water, but the weight of the water does not affect its performance, being at neutral buoyancy. For performance on land, add 18,750 lbs., which reduces HT to 6, gSpeed to 14, off-road speed to 11, and rotational speed for the body to 8° per minute.

The torpedoes have speed 20 yards/second, endurance 2.5 seconds, and range 50 yards. Damage is 20d and is purely concussive, since fragmentation is largely ineffective underwater. A set of 6 torpedoes occupies 0.1 VSP, weighs 25 lbs., and costs \$45. The water cannon normally causes 4d damage as knockback only (a human target is knocked back 1 hex for each 8 points of rolled damage), with SS 5, Acc 8, 1/2D 90, and Max 120; it can also be set to produce a narrow stream, which causes 1d cutting damage and has 1/2D 180 and Max 240. Either use requires 25 kW and sprays out 0.11 VSPs of water per second (34 lbs./second); spraying for 550 seconds will empty the vehicle of water.

Martian Tripod TL(6+n)

The tripod is a variation on the mecha concept, designed to represent the vehicles used by the Martian invaders in Orson Welles' *The War of the Worlds* radio broadcast (and in the H. G. Wells novel it was based on). This version is modified from the version in **GURPS Mars** (p. MAR97) by using more primitive technologies that would have made more sense to World War II engineers. As a result, its capabilities are impressive but not beyond any hope of Earthmen fighting back. It provides space for a driver/gunner, a loader, and an observer.

Subassemblies: Body +4, three Legs [U:Body] +2.

P&P: Atomic pile with 600-kW power tap and 600-kW legged drivetrain. 20,000-kWs batteries for auxiliary systems.

Occupancy: 3 CS. **Cargo:** 37.5 cf.

Armor

Body: 4/200

Leg: 4/100

Weaponry

Heat Beam [Body:F] (18 chemical power slugs) with stabilization.

1×81mm Mortar [Body:T] (64 dispersal shells with Black Smoke).

Equipment

Body: Life support for three Martian-days; minicomputer with Compact and Genius options (Complexity 2); navigation instruments; radio transmitter (30 miles) and receiver (×3). *Body and Legs:* Chameleon system (-3 to be seen or hit if still, -1 if moving); sealed.

Statistics

Size: 12'×12'×40' *Payload:* 2,840 lbs. *Lwt.:* 71,685 lbs.

Volume: 170 VSPs *Maint.:* 10 hours. *Price:* \$734,000.

HT: 6. *HP:* 525 *Leg:* 90.

gSpeed: 41 *gAccel:* 3 *gDecel:* 20 *gMR:* 0.75 *gSR:* 2

Moderate Pressure. Off-Road Speed 27.

Design Notes

The tripod is designed using three pairs of legs for a Very Heavy Walker, but each nominal "pair" is actually a single leg. Cutting the weight, cost, HP, and size by 20% exactly covered the change in design.

Two systems are especially designed for the tripod: the chemical infrared laser and the chameleon exterior. The atomic pile is a TL(6+n) spacecraft design to minimize weight. The armor is made of advanced materials that multiply weight by 2/3 and cost by 6.67. The body is roughly cylindrical, 12' in diameter and averaging 4' high, though it rises to nearly 6' in the center; this suits the relatively squat Martian body plan.

The heat ray inflicts 6d×7 burning damage on its targets. It has SS 20, Accuracy 20, 1/2D range 4,200 yards, and maximum range 12,600 yards. It fires one shot every other second, using chemical fuel cartridges that must be reloaded; if one of these is forcibly opened, it inflicts half damage on anyone in the same hex in the form of corrosive chemical burns.

Black Smoke

The deadly Martian Black Smoke can be represented as a dispersal weapon (p. W:WW77); since its particles are extremely finely divided, it has 10 times the standard range. Black Smoke is a respiratory poison that coats the lungs. A HT roll is required each turn while breathing the smoke; failure does 2d damage to the victim. Survivors who have inhaled Black Smoke may suffer crippling respiratory injury (see p. B129). The smoke is totally opaque and vision is effectively zero while in the cloud (-10 to combat and orientation).

A wet, finely woven cloth covering the nose and mouth provides some protection against its effects; halve all damage results, rounding down, and treat critical failures as normal failures. A TL6-7 gas mask grants a +3 to the HT roll, plus the above protection. An airtight room, vehicle, or garment, or a TL8 or better gas mask, offers total protection from the smoke. GMs may wish to have Black Smoke inflict radiation damage as well; as for giant monster attacks (p. W:WW104), 10 rads is a suitable dosage, but multiply dosage by 1d if the smoke is inhaled.

Cost of Black Smoke is \$1.00 per dose.

Appendix Z: What Happened Today?

by Matt Riggsby

The PCs are waiting for something. Maybe they've got an enemy's house staked out. Maybe they've gotten to town before the contact they're hooking up with. Maybe the kidnapper will be calling again in three days. If the players aren't going to make their own fun, you'll have to say "the time passes uneventfully." Or you can roll 2d6 and consult this table.

Many of these events may be "under the radar" in a modern metropolis, but are appropriate to a historical or pseudo-historical fantasy city or relatively modern small town. PCs may just be witnesses, or they may be drawn into events (the runaway slave happens to barrel into them, the itinerant preacher points them out as examples of immorality . . .). The significance of any event in the greater scheme of things is, of course, up to the GM.

Roll	Event

1, 1	Game/sport: Many societies lacked dedicated sporting arenas, and those were usually used only by professional athletes. This might be a horse race through the streets, a ball game, or some other game.

1, 2	Construction: Characters witness construction on a nearby street or building site.

1, 3	Fight: Dueling rakes, brawling thugs, relationship ending badly, or religious or political argument taken to the next level.

1, 4	Beating: A fight, but very one-sided.

1, 5	Fire: Fires are a major threat in wood-heavy premodern cities. A small fire is a distraction and a moderate threat. A large fire is a danger to everybody.

1, 6	Public punishment: Many criminal punishments involve public display or humiliation: public flogging, exposure in stocks, or being paraded through the streets in an embarrassing fashion (naked, wearing a silly hat, backwards on a donkey, etc.).

2, 1	Fugitive: Someone running away from authority, such as an escaped criminal, heretic on the lam, or escaped slave.

2, 2	Runaway animal: For example, a mad dog, spooked horse, greased pig, herd of sheep, or angry bulls.

2, 3	Religious procession: For example, a procession displaying an idol or relics or a party of pilgrims setting out or arriving.

2, 4	Troop column: These may be soldiers on their way to or from battle or simply a show of force by the city guard.

2, 5	Funeral: A dead body (possibly on display) and a party of mourners. If the deceased was particularly notable, this could turn into a major public event.

2, 6	Official procession: A nobleman or official on his way somewhere with a party of retainers.

3, 1	Unseasonable weather: Heat in winter, a downpour in the dry season, etc.

3, 2	Unpleasant weather: Strong wind, heat, or precipitation. Most people will get out of it while it lasts; characters remaining outside will be uncomfortable and conspicuous.

3, 3	Controversial speaker: A street corner speaker advocates dangerous or

unpopular views, possibly provoking the authorities

- 3, 4 **Crime:** Pickpocketing, mugging, or smash-and-grab theft from a shop. Characters may, of course, be either witnesses or victims.
- 3, 5 **Persistent salesman:** Someone tries to sell the characters something they don't want and won't take no for an answer.
- 3, 6 **Friendly stranger:** Characters encounter someone who is interested in them. It may be casual curiosity, or he may have an agenda.
- 4, 1 **Interesting stranger:** Someone out of the ordinary and interesting. For example, an obvious foreigner, someone wearing unusual clothes, a person distributing small gifts to everyone he sees.
- 4, 2 **Mysterious visitor:** Characters see someone loudly mysterious: cloaked, hooded, or wearing a mask, clearly trying to conceal his identity.
- 4, 3 **Routine announcement:** Public notice is made of something of little immediate interest. For example, a noble wedding, a trivial new tax, the arrival of a merchant vessel, or the death of a minor official.
- 4, 4 **Notable announcement:** A public notice stirs up comment: a war starts or ends, a major public figure dies, a major new tax is being imposed.
- 4, 5 **Political demonstration:** A group of people agitating for or against something (a politician or official, taxes, blue laws, etc.)
- 4, 6 **Unusual meal:** At their next meal, the characters are presented with [unfamiliar dishes](#).
- 5, 1 **Public entertainment:** An individual entertainer starts performing, such as a juggler, solo musician, or man with a trained animal, or a troupe of performers (theater group, impromptu circus, etc.) sets up.
- 5, 2 **Arrival:** A large body of new people comes to town, such as a caravan or band of refugees. Characters will start seeing a lot of new people in town.
- 5, 3 **Unusual merchandise:** Characters notice peculiar merchandise for sale. This might include arms or expensive jewelry in a poor neighborhood, out-of-season produce or spices from a distant land.
- 5, 4 **Nosy Official:** An official (constable, goods inspector, religious orthodoxy enforcer) takes an interest in the characters. He may be near-hostile, or simply friendly and curious.
- 5, 5 **Investigation:** Police or other officials make a thorough search of the area and question bystanders.
- 5, 6 **Celebration:** Public celebration of a wedding or holiday. This may involve dancing in the streets or free food and drink.
- 6, 1 **Public ceremony:** Public prayer or sacrifice, creation of a nobleman or holy man, christening or naming ceremony, etc.
- 6, 2 **Personal accident:** Something bad happens to an individual. For example, someone falls out of a window or off of a roof, a porter drops his burden, which breaks and scatters all over.
- 6, 3 **Vehicular accident:** A vehicle or animal runs over a slow pedestrian, two vehicles collide, a wheel breaks and falls off a cart, goods roll from the back of a wagon.
- 6, 4 **Other accident or disaster:** A building collapses, a water line breaks and floods

a street, an earthquake strikes.

6, 5 **Omen:** Lights in the sky, a dozen birds roosting the shape of a character's first initial, goat speaks with human voice, or some other event of superstitious or ominous importance.

6, 6 **Roll twice, ignoring further 6, 6 rolls.**

Analects Arcane: The Tome Sound and Fury

Sonic And Speech Spells for the d20 System

by Owen K.C. Stephens

Workbook Entry The First

I never know how to start these passages. Who am I writing to? Is this supposed to be a record for my own use, that I may go back and remind myself of something forgotten? Or is it a missive to those who come after me, or even a scholarly work for my contemporaries? Whenever I ask my master, he tells me only that it will be what I make it. Of course it is he who controls access to the library vaults, and so I have little say over who sees my older workbooks. Certainly, I have avoided placing thoughts too private down in these pages. "Never write what you would not say aloud in an open market."

In any case, this is my first entry in my fifth book. I have recorded these rambling thoughts, as my master commands, for seven years of apprenticeship. I am far from being the senior of his servants, though I am no longer the most junior. As in most things -- appearance, bravery, talent -- I fall somewhere in the middle. Once this realization would have brought me a blue mood for days, but I have long since realized there are far worse things than to be merely average in my selected vocation.

There are, of course, areas in which I am a cut above average, and in these I take great pride. Of the 20 of us here under Master Vuterung's protection, I am within the top three in matters of penmanship, memory, research, logic, and diplomacy. Certainly these are not the flashiest of a mage's skills, but neither are they inconsequential to his success. It is largely due to my diligence searching the older vaults for snippets of arcana and compiling them that our collection of spells rivals that of the Mage of the North. We may lack his resources to beg, borrow and steal new books of lore, but the post of Master of Rings has been held many generations longer. In my lifetime I shall not clear out the vaults of forgotten scrolls, gathered by 20 of my master's predecessors.

In principal, all my collections of spells, culled from old and incomplete works, should follow a logical, methodical categorization method. In practice, there isn't a good, accepted, universal method for codifying spells by anything other than school and rank. I suppose it's hubris on my part to rail against this ancient tradition, but often it's only of use to specialists and beginners. Once a wizard can manage spells of most difficulties, and if he is free to use spells of all schools, is not utility, or at the very least theme, the more important measure of a spell's type?

So I sort my collected works by these criteria. There is often great overlap of course -- divination spells tend to be informative and necromancy tends to deal with undead, but this is not always the case. My works on fire spells alone include divination, conjuration, evocation, and abjuration magics. Of course this means I often have a dozen or more collections in progress at a time, as I wait to find

enough spells of a matching theme to fill a particular compilation.

Today, for example, I have just finished sewing the pages of my **Tome of Sound and Fury** into a single signature, and tomorrow I shall bind it into its cover. Once that gains my master's approval, it will take little more than a week to make a dozen copies. Some shall take their place among the other arcane analects in the Study of Rings, while others shall be sold, given as gifts, returned to the vaults, and even hidden in caches in case of disaster. I believe I shall keep a copy for myself as well, for these spells are of a bend that matches well my own temperament.

Within the **Tome** I have gathered 14 spells all dealing with sound, thunder, and speech. The most powerful of these are, to my mind, those that allow communication over large areas, with only select groups, or with any speaking creature, though these are certainly not all of high arcane rank. For my own needs, communication is more useful than weapons or even scrying; my ability to reason and negotiate has pulled me through far more difficulties than my ability to kill or strike terror into my foes.

Even in violent arenas, however, my **Tome** can be of use. Not only does it contain spells that damage through sound, an attack form often overlooked when foes prepare their defenses, it also provides some magics that hinder foes without harming them. A few defenses against thunder spells, means of secret communication and more traditional defenses round out the collection nicely. By focusing on one element rarely used by others a mage could gain great diversity and benefit from the synergy themed spells often provide. As an added bonus, the spells all have bardic forms, giving the book a wider, and thus more profitable, audience. Try making those claims with a book that focuses merely on ranks and schools!

Enough self-congratulations for now, however. I am charged with producing no fewer than 20 collections each year, and have fewer than nine fully finished so far this year. While my stitching settles and glue dries, I need to go back down to the vaults to seek the final touches of open works, and look for inspiration for new ones. My plans for the future depend on a strong recommendation from my master, and I shan't gain it by lounging about.

Rowan Armage

Journeyman of the Blue Sash

Third Day, of the First Week, of the Seventh Month, of the Seven Hundred and Forty-Fifth year since the Fall of the Iron Citadel.

The Tome of Sound and Fury

These slim spellbooks were compiled by Rowan Armage during his years as an apprentice of The Master of Rings. Like all Rowan's works from this period they are commonly found in older academies and extensive private libraries. Rowan is known to have made thirty of these books himself, though numerous copies have been produced using cheaper materials.

Rowan's original tomes are all bound in heavy red leather covers, with runes for Thunder and Voice engraved on the front and spine in gold, and a heavy iron rung running through the top of the spine (allowing the tomb to be hung from a hook, though the ring is simply an identifying mark of the Master of Ring's library). The pages are high quality parchment, with the letters inked in a dark blue color.

In addition to 14 new spells (detailed below), the book's 60 pages over uses for more common sonic-based spells. The most space is given to the use of the *silence* spell to foil enemy mages by casting it on a swift combatant (often a ranger or monk) at the beginning of a fight and have the silenced combatant move close enough to have the enemy spellcaster in the area. While within the area of the *silence*, the opposing spellcaster cannot complete spells with a verbal component, often severely limiting his options.

New Spells

1st Level Sorcerer And Wizard Spells

- **Inner Voice.** Hear yourself even if deafened.

Evoc

- **Shriek.** Targets in a cone deafened for 1d4 rounds.

Trans

- **Booming Voice.** Make yourself heard over a large area.

2nd Level Sorcerer And Wizard Spells

Conj

- **White Noise.** Sphere garbles all sound that passes through it.

Illusion

- **Dopplespeaker.** Sound like another speaker or creature.

Trans

- **Singing Sword.** Enhance a piercing or slashing melee weapon to do an additional 1d6 sonic damage.

3rd Level Sorcerer And Wizard Spells

Conj

- **Sea Shell.** Sounds travel from one shell to another.

Div

- **Group Voice.** Create a secret language for up to six creatures.

Evoc

- **Sharp Note.** Create a pulsing sphere of sonic damage you can direct.

4th Level Sorcerer And Wizard Spells

Abjur

- **Protection From Words.** Creature touched gains immunity to language-dependent spells.

Ench

- **Howl.** Loud howl causes targets to be shaken.

Evoc

- **Wall of Thunder.** Flexible curtain of sound blocks sound and damages those who passthrough it.

Trans

- **Soliloquy.** Targets in a cone hear a long speech instantaneously.

5th Level Sorcerer And Wizard Spells

Div

- **Interpreter.** Understand all spoken languages, and be understood by all creatures who can speak.

Booming Voice

Transmutation [Sonic]

Level: Brd 0, Sor/Wiz 1

Components: V, S

Casting Time: 1 action

Range: Long (400 ft. + 40 ft./level)

Area: Cone

Duration: One minute/level

Saving Throw: None

Spell Resistance: No

The *booming voice* spell allows things shouted by the caster to be heard over a large area. Only things spoken by the caster are affected, words said in a normal tone or whispered are no more easily heard than normal. Shouted words are carried throughout the area, and are clearly audible even over shouting, roaring, and the cacophony of combat.

Dopplespeaker

Illusion (Figment)

Level: Brd 1, Sor/Wiz 2

Components: V, S

Casting Time: 1 action

Range: Personal

Target: Caster

Duration: 10 minutes/level (D)

Saving Throw: None

Spell Resistance: Yes (harmless)

Under the effects of this spell the caster's voice can duplicate the sound of any creature, allowing him to sound like a specific speaker or creature. The caster must be familiar with the sound of the speaker or creature to be imitated, which is chosen at the time of casting and cannot be changed for the duration of the spell. The caster ceases to sound like himself during the spell.

Thus a caster with this spell could duplicate the sound of a wolf howling, or make himself sound like the local town mayor or an orc shaman. This grants the caster a +5 bonus to a Disguise check to emulate a specific person (+10 if the caster is only heard and not seen). This spell does not allow the caster to speak or understand additional languages, however.

Group Voice

Divination

Level: Brd 3, Sor/Wiz 4

Components: V, S

Casting Time: 1 action

Range: Touch

Target: Up to six willing creatures touched

Duration: One hour/level

Saving Throw: Will negates (harmless)

Spell Resistance: Yes (harmless)

This spell allows the targets to speak in meaningless gibberish, but still communicate with one another. It does not create an actual language, thus spells designed to translate languages (such as *comprehend languages* and *interpreter*) cannot decipher it. The magic of the spell allows the targets to babble incomprehensible when speaking (if they desire), and understand the meaning of the babbling of others targeted by the spell make. This in effect allows them to communicate in a private language that cannot be translated by others. Only spoken gibberish can be used this way -- the spell has no effect on written words. The spell also does not make the targets better able to hear each other in adverse conditions.

Howl

Enchantment [Fear, Mind-Affecting, Sonic]

Level: Brd 3, Sor/Wiz 4

Components: V, S

Casting Time: 1 action

Range: Medium (100 ft. + 10 ft./level)

Area: Cone

Duration: One minute/level

Saving Throw: Will negates

Spell Resistance: Yes

This spell causes a horrid, spectral howl to issue forth from the caster's mouth. The howl can be heard for up to a mile per level of the caster, but its real power is limited to a medium cone. Creatures within this area who fail Will saves are shaken for the duration of the spell. A shaken creature suffers a -2 morale penalty on attack rolls weapon damage rolls and saving throws.

Inner Voice

Divination

Level: Brd 0, Sor/Wiz 1

Components: V, S

Casting Time: 1 action

Range: Personal

Target: Caster

Duration: One hour/level

Saving Throw: None

Spell Resistance: Yes (harmless)

This spell causes the caster to hear in his head everything he tries to say, regardless of whether he can actually speak or not. Though the caster must still speak to fulfill verbal spell components, and thus cannot cast while in the area of a *silence* spell, he can hear himself even if deafened, and thus has no chance of mis-casting a spell due to deafness.

Interpreter

Divination

Level: Brd 4, Sor/Wiz 6

Components: V, S

Casting Time: 1 action

Range: Touch
Target: One creature
Duration: One hour/level
Saving Throw: Will negates (harmless)
Spell Resistance: Yes (harmless)

The *interpreter* spell grants its target the ability to understand all spoken languages, and be understood by any creature that uses a spoken language. Even secret languages and ciphers are clearly understood by the target, though not magically protected speech (such as that created by the *group voice* spell).

This spell does not grant the target any special ability with written languages. Creatures that know more than one language hear the target speak in their native tongue.

Protection From Words

Abjuration
Level: Brd 2, Sor/Wiz 4
Components: V, S
Casting Time: 1 action
Range: Touch
Target: One creature
Duration: 10 minutes/level or until discharged
Saving Throw: Will negates (harmless)
Spell Resistance: Yes (harmless)

While under the effects of this spell, the target cannot be affected by any language-dependent spell. A total of one level of spells per caster level are negated for the target, as the spell simply prevents him from hearing the words of language-dependent spells. This has no impact on his ability to hear or understand other kinds of speech or noise. If a language-dependent spell uses more levels than the spell has left, the spell ends and the target is given a +2 circumstance bonus to any save required by the language-dependent spell.

As a side effect, the target is treated as having 30 extra hit points for purposes of determining what power word spells effect him. The target does not actually gain any bonus hit points, nor do these spells count against the total number of spell levels the *protection from words* defends him from.

Sea Shell

Conjuration
Level: Brd 2, Sor/Wiz 3
Components: V, S
Casting Time: 1 action
Range: Touch
Target: Two seashells
Duration: 10 minutes/level
Saving Throw: None
Spell Resistance: Yes (harmless)

This spell can only be cast on two sea shells, each larger than two inches across and no larger than six inches. It causes all sounds that reach the first shell touched to be transferred to the second shell touched. It does not matter how far away the two shells are, as long as they remain on the same plane. Thus, for the duration of the spell, anyone listening to the second shell hears things as if he were at the location of the first shell.

Sharp Note

Evocation [Sonic]
Level: Brd 3, Sor/Wiz 3
Components: V, S
Casting Time: 1 action

Range: Medium (100 ft. + 10 ft./level)

Area: 5-ft.-diameter sphere

Duration: 1 minute/level

Saving Throw: Reflex half

Spell Resistance: Yes

This spell creates a pulsing mote of concentrated sound, which appears as a sphere of ripples in the air. It flies at 80 ft. a round as the caster directs, and can move through openings as small as one foot in diameter. If it enters a space with a creature it stops for the round, doing 5d4 points of sonic damage, though a successful Reflex save halves this damage. The caster may also have it sit next to an inanimate object or even a wall for a round, in which case it deals 5d4 at the end of every round it sits still.

The sphere has no strength or physical form, and cannot be used to push or pull anything. It does not operate underwater, and if the sphere is fully submerged the spell ends.

Shriek

Evocation [Sonic]

Level: Brd 0, Sor/Wiz 1

Components: V, S

Casting Time: 1 action

Range: 20 ft.

Area: Cone-shaped burst

Duration: Instantaneous

Saving Throw: Fort negates

Spell Resistance: Yes

This spell creates a sudden, ear-piercing shriek. Creatures in the area must make a Fort save or be deafened for 1d4 rounds.

Singing Sword

Transmutation [Sonic]

Level: Brd 1, Sor/Wiz 2

Components: V, S

Casting Time: 1 action

Range: Touch

Target: Piercing or slashing melee weapon touched

Duration: One minute/level

Saving Throw: Will negates (harmless, object)

Spell Resistance: Yes (harmless, object)

Despite this spell's name, it can be used on any piercing or slashing melee weapon. The spell gives this weapon an enhancement that deals an additional +1d6 sonic damage on each successful strike. A weapon so enhanced hums loudly, making a sound similar to a vibrating crystal and causing the bearer to suffer a -10 circumstance penalty to all Move Silently checks. This spell fails if cast upon a weapon that already deals additional sonic damage.

Soliloquy

Transmutation [Sonic, Language-Dependent]

Level: Brd 2, Sor/Wiz 4

Components: V, S

Casting Time: 1 action

Range: Medium (100 ft. + 10 ft./level)

Area: Cone

Duration: Instantaneous

Saving Throw: None

Spell Resistance: No

Soliloquy allows the caster to make a lengthy speech without risking interruption or debate. Everyone within the area hears the words spoken by the caster, which may take as long as a minute per level of the caster, in a single moment of time. The caster may not use this accelerated speech to do anything but talk -- it is not possible to cast additional spells or even use multiple command words with this spell -- nor does it allow those who do not understand the caster's language to comprehend his speech. The spell does guarantee everyone in the area hears one speech of the casters without interruption, even if the area is quite noisy or others are currently speaking. Creatures outside the area hear only a burst of unintelligible noise.

Wall of Thunder

Evocation [Sonic]

Level: Brd 3, Sor/Wiz 4

Components: V, S

Casting Time: 1 action

Range: Medium (100 ft. + 10 ft./level)

Effect: Translucent sheet of sound up to 10 ft. long/level

Duration: Concentration +1 round/level (D)

Saving Throw: None

Spell Resistance: Yes

A *wall of thunder* appears as a shimmering vertical sheet of rippling, roaring air. It is not opaque, although Spot checks made past it suffer a -4 circumstance penalty. No sound or sonic affect can penetrate it, and any Listen check made within 20 feet of it suffers a -10 circumstance penalty. Listen checks mad within 40 feet suffer a -5 circumstance penalty.

The wall may be straight, curved, or made into a series of complex overlapping shapes, as long as it remains vertical and the total length does not exceed 10 feet per caster level. The wall forms around any obstacle when first forming, making it impossible to catch creatures in the wall or cut apart objects with it. Once cast, the wall is immobile.

Any creature or object passing through the wall takes 2d6 points of sonic damage, +1 per 2 levels of the caster (maximum +10).

White Noise

Conjuration

Level: Brd 1, Sor/Wiz 2

Components: V, S

Casting Time: 1 action

Range: Touch

Area: Up to a 20-ft.-radius

Duration: 10 minutes/level (D)

Saving Throw: None

Spell Resistance: No

This spell creates an immobile spherical area, the size of which is set by the caster and cannot be changed once the spell is cast. Those within the area can hear and understand noises that originate within the area, but sounds from outside are garbled to a degree that makes them unrecognizable. Similarly, those outside the area cannot identify or understand any sound or speech originating within the sphere. The volume of sound is unchanged, but the garbling makes it impossible to eavesdrop through the barrier of the spell.

This spell is generally used under very specific circumstances, when a group wishes to have a private conversation without increasing the chances they can be snuck up on. This spell provides protection from language-based spells, but not other forms of sonic attack.

Pyramid Review

When The Sky Falls (for d20 System)

Published by [Malhavoc Press](#)

Written by Bruce R. Cordell

Illustrated by Kieran Yanner

Cover by Alan Pollack

64-page b&w softcover; \$13.95

Should a meteor of a particularly destructive size ever hit this planet again, our options and reactions will be somewhat limited: (a) scream, cry and panic; (b) call Bruce Willis and Steve Buscemi to see if they can save us; and (c) see (a) above. Actually, in game terms, the impact of a planet killer will be the subject of Eden's *Odyssey Prime RPG* setting, published under their Odyssey imprint. This will be for a modern or near future set game, but the question remains, "What happens if a meteorite hits the average *Dungeons & Dragons* fantasy world?" Such a question is addressed in *When the Sky Falls*, authored by Bruce A. Cordell, whose previous noted *d20 System* titles include the Origins Award-winning *Return to the Tomb of Horrors* and the *Epic Level Handbook*. This is the second "Event Book" to be published by Monte Cook's Malhavoc Press, the first being Cook's own *Requiem for a God*, an excellent sourcebook that explored the possibilities wrought by the death of a god!

The aim of an Event Book is to shake up a campaign, in this instance by having a meteor strike a world . . . and do so hard. The effect is at least to make the ground tremble and leave behind an impact crater, but in the Afterfall, there could be firestorms, a tsunami, showers of acid rain, changes in weather or climate -- and all this from simple meteorite. The author takes the DM through the step-by-step process that has him consider where it should hit, whether the fall can be foreshadowed, the immediate effect of the impact, and the long-term changes to both the physical world and nearby civilizations. There are plenty of ideas included in addition to various adventure hooks, from which the DM can select to work into his campaign. The rules for all of the impacts assume an object some 30-feet in diameter, but a set of guidelines are given so that the DM can scale this up or down as desired.

Beyond the basic chunk of ferrous metal or rock, *When the Sky Falls* explores the effects of two other types of impacts. The first of these is the "Thaumaturgic Meteorite" or Thaumeteorite Fall, essentially a meteoroid that is charged with magic, such that when it strikes, it does so with a singularly interesting effect, something akin to that of a detonated nuclear device. Where such an explosion sets off an EMP or "Electro Magnetic Pulse," the impact of a Thaumaturgic Meteorite also has its own EMP effect, the cleverly named "Ethereal-Material Pulse." This does not blank electronics, but rather subjects every magical item or creature within a 30-mile radius to a targeted *dispel magic* spell!

The second type is the "Engram Ark," the last psychic remnants and memories of the inhabitants of a world conquered and torn apart by a darkly malign psychic force known as the "Dark Plea." The impact of each of these two types will be accompanied by the additional impacts of the lesser meteorite types -- a Thaumeteorite will be accompanied by ordinary meteorites, and the Engram Ark by both ordinary types and Thaumeteorites.

The after effect of either impact or Afterfall is where this supplement begins to get really interesting. Besides the EMP, a Thaumeteorite leaves behind globes of thaumeteorite iron or Starmilk that can be used to forge weapons that also inflict *dispel magic* upon a struck opponent and it also infuses the "Arcanosphere," the "theoretical" medium that

underlies all magic and propagates its effect, with magic of its own. This can alter each of the various schools to the advantage or disadvantage of the player character spellcaster (as decided upon by the DM), as well as introducing Astromancy to the world. Available as a feat of the same name, this is a new category of magic rather than a new school, which the Astromancer has access to in addition to his normal arcane or divine spells. These spells are derived from the power of a meteor hitting a world, and the Astromancer's power and abilities can be enhanced if the celestial bodies are in the correct alignment and over the horizon; this harkens back to the birth aspects that could enhance magic in SPI's *DragonQuest* RPG. Psionic characters can also take advantage of thaumeteorite strikes and become Astromancers, though their powers will be just slightly different.

Where a Thaumeteorite benefits the spellcaster, the contents of an Engram Ark will be of potential benefit to all character types. Falling to the surface and protected by self-released Ark Guardians or Plasma Dragons, within the ark itself is a pocket of space containing a rune sea, rich with Engram. Each of these is the runic remnant of an individual from the alien world of Kure, torn asunder by the Dark Plea. Coming in a range of colors, a character can wear a single Engram as a tattoo, the type determined randomly by immersion in the rune sea. Further immersions will randomly change the Engram. White Engrams grant skill boosts; blue benefits arcane spellcasters and green divine spellcasters; red give psionic boosts; and black bestow a random effect that could be either good or bad.

Two organizations detailed in *When the Sky Falls* might arise in the Afterfall, or already have existed, predicting the impact itself. Sky Callers are a cult that sees meteorites as destruction untapped, which they call the Vengeful Sky. They believe that they can guide the course of meteoroids to cause further destruction, hold impact sites to be holy, and are led by clergy known as Ruin Priests, who embody pure chaos and evil. More benign are the League of Astronomers, who explore the threat and the potential inherent within each type of impact. Four Prestige Classes tie into these two organizations -- the aforementioned Ruin Priest, as well as the Astrogineer, who study Astromancy; the Engram Adept, able to wear more than one Engram and even pluck it from their skin to throw as weapon; and the Lord of Silence, who take strength from both the soundless void between worlds and the demiplane of silence, the Soundless.

Several new feats are introduced in addition to that of Astromancy, most related to the four Prestige Classes, plus over 30 new spells, also related. The chapter on Afterfall magic items introduces the weapon qualities of voidwrought -- the weapon appears to suck in light and lets the user to see in complete darkness; and starshine, which inflicts plasma damage whenever a critical hit is made. Both of these qualities can only be added to a weapon if they are constructed from the pure metals that evaporate and condense from a meteorite. Besides describing actual weapons with these qualities, several items are included, such as the Engram Wallet, which allows an extra Engram to be stored away from the Rune Sea ready for use or exchange; and the Bag of Night Terrors, from which can be drawn random nightmares or meteors to be thrown at an opponent.

When the Sky Falls is rounded out with five more fleshed-out ideas ready for the DM to use. One involves the literal fall of an angel to earth, a second the fall of a war machine deployed in the war against the Dark Plea, and another the arrival of a clot of demon's blood. All five are built around the idea that a meteorite impact need not be that of a hunk of rock. Indeed, one could even be that of a lump of Godsflesh, as detailed in the previous Event Book, *Requiem for a God*.

Like the first Event Book, the layout and presentation of *When the Sky Falls* appears to be without error, a pleasing professional touch. It retains the same format, utilizing sidebars to provide a very handy explanation of each chapter's key terms and also a checklist of points for the DM to consider in using said chapter's contents. The book's artwork is sparse, but Kieran Yanner's dark pencils are eminently suited to the subject. Unlike *Requiem for a God*, this book is more capable of standing on its own and does not require quite so many other sourcebooks.

Although the contents of *When the Sky Falls* are designed to affect a fantasy world, there is the feeling that they would work much, much better upon a more technologically advanced setting as opposed to that of the atypical fantasy world. They would even work well with a Victorian steampunk setting or perhaps in conjunction with the recently released *Urban Arcana* sourcebook for *d20 Modern*. The aim is not much to destroy a world, but to help build a story around an event and in addition to introduce what is, essentially, star-aspected magic. However a DM decides to use its contents, *When the Sky Falls* is another fascinating sourcebook from Malhavoc Press, presenting an intriguing set

of tools with which to change a campaign.

Pyramid Review

HârnQuest 4 (for the HârnWorld Campaign Setting)

Published by [Columbia Games Inc.](#)

Written by Peter Leith, Kerry Mould, Patrick Nilsson, Jonathan Davidson, Jerry Holland-Hibbert, & John Sgammato

Illustrated by Richard Luschek

Cartography by Patrick Nilsson, Jonathan Davidson, Jerry Holland-Hibbert Edited by Tom Dalglish, Grant Dalglish, John Sgammato, & Cal Stengel

50 loose-leaf b&w pages, two color maps; \$24.98

HârnQuest #4 is the latest issue of Columbia Game's quarterly supplement to their excellent *HârnWorld* campaign setting. *HârnWorld* has been in print since 1983, but there have been several dry spells with little new material getting published. Old fans will be glad to see new material flowing regularly again, and new players will find this a great time to explore this dynamic setting.

HârnWorld is a medieval fantasy setting that emphasizes realism, consistency, and detail. On the surface *HârnWorld* appears relatively mundane, and is much like Europe of the 10th-13th centuries. However, behind this veil are all the fantasy elements popular in most games: elves, dragons, wizards, mythical beasts; there is even a god residing on the main island. This subtle blending of fantasy and realism allows individual GMs to fine-tune the setting to their personal taste, from gritty historical realism, to multidimensional high-powered fantasy. The fantastic is never too intrusive to spoil the fun of historically minded gamers, but is easily at hand in interesting and creative forms to be added at will. There are no rules, so the setting is easily adaptable to your favorite roleplaying system, and numerous rules guidelines are available on-line, including the *d20 System* and *GURPS*. Alternatively, Columbia Games also publishes an RPG called *HârnMaster* tailored to the setting.

One quality that makes *HârnQuest #4* so unique and enjoyable is the manner of its publication, which may take a bit of explanation to those who are not already familiar with *HârnWorld* products in general. All material for *HârnWorld* is published as a series of individually numbered articles, collectively referred to as the *Encyclopedia Hârnica*. Each article details a particular aspect of the overall campaign setting such as a location (a kingdom, or castle), an organization (a craft guild, a religion, a tribe), a bestiary, or general background (heraldry, tournaments), to name a few. The articles are loose-leaf and are designed to be placed in three-ring binder in any order you choose to create your own personal version of the Encyclopedia.

The *HârnQuest* series follows in this tradition with each issue containing about three to five articles, totaling around 48 pages of material. The articles may be purchased separately after they are released (generally at \$3-\$10 each), or by a subscription, which gives you all the articles in the issue at a slight price break as well as free shipping.

HârnQuest #4 contains four articles with a maritime theme. Two articles are detailed descriptions of coastal locations in the Kingdom of Mælderyn: Kârvéth Castle and Glenoth Keep (20 pages plus color map, each. Glenoth is a small keep in a fishing village located on a remote island and is home to a chantry of the Shèk-Pvâr (Mages Guild). Kârvéth

is a seaside castle surrounded by a market town that serves as home to a large fishing fleet. The third article, *Aquatics* (six pages), is a bestiary describing four mythic and mundane creatures encountered in marine environments, one of which is unique to Hârn. The last article (four pages) contains general background information about fishing practices in *HârnWorld*, and is probably only of interest to dedicated Hârn fans.

HarnQuest #4 is full of well-researched, richly detailed material. Each of the location articles gives you the sense of a working, living, medieval town. The major members of the community are described in a few sentences each, including the cost and quality of any services they offer, making it easily accessible in the heat of a gaming session. Several buildings are depicted in each location, including beautifully rendered and precise maps. As with every aspect of the articles the maps give an authentic and accurate medieval feel (right down to the bathrooms!), and are some of the best in the industry. Neither location contains pre-set adventures, however plot hooks abound on every page. Each description-whether it is of castle, village, or individual character-inspires numerous ideas for working them into a larger story.

All of the articles are enriched with numerous naturalistic black and white illustrations of characters and environments, as well as medieval-style woodcuts, which contribute to the historic sense of the product. The artwork is all of exceptional quality and makes an excellent complement to the product.

The creatures and several major characters are given statistics for *HârnMaster*, Columbia Games' roleplaying system. The information is minimal and is contained in sidebars so as not to be intrusive to readers using other systems. *HârnMaster*'s human attributes are based on a 3d6 range, and the skill system is percentage based. Therefore they are easily converted to many other popular roleplaying systems.

Either location article would make a good jumping off point for GMs looking to begin a new campaign in *HârnWorld*. The only materials required to make use of these supplements are the *HârnWorld Box Set* and your favorite rules system. The single drawback for a new player is the unavailability of the *Melderyn Kingdom* adventure, which is currently out of print. Though the information in the Kingdom module is not absolutely required to use and enjoy these articles, some of the richness and detail of their place in the larger setting will be lost. However, it is still possible to glean a workable understanding of them from the context of the article.

All in all, the quality of production shown in these articles is some of the best in the fantasy gaming industry. They make an excellent contribution to the development of the *HârnWorld* setting, yet are generic enough that they may be of use to GMs looking for developed places to add to their campaign. The ability to purchase each article separately creates a wonderful opportunity for a curious gamer to get a sample of the *Hârn* setting for a small price. All of these qualities combine to create a product that is likely to thrill both old fans and those experiencing *Hârn* for the first time.

--B. N. Pasinella

Death Be Not Deadly

I tend to take a "different strokes for different folks" approach to this column, and to my gaming in general. Really, it's not very often that I make a strong recommendation. So, for once, I'm using my lofty post to tell you . . . don't do it.

It's tempting . . . heaven knows it is.

I mean, you're looking for a plot . . . some new means of challenging or surprising players and characters. Or maybe a PC got squicked unjustly, and you wanted to right the scales just a bit. Or maybe the game world has it as a "feature."

Regardless, you've done it, or you're tempted by it:

You want to thwart the grim reaper. Whether through pseudo-scientific trickery, magical malarkey, or just plain "I got better" hand-waving, you intend to bring a character back from the dead.

If so, consider the consequences *very* carefully.

In the real world, death is generally considered to be about as bad as it gets. It is almost universally regarded that murder is the worst crime one can commit, and the death penalty is considered the worst punishment possible in a civilized society (ever since "covered with honey and left hog-tied in the desert" was struck down by the Supreme Court in 1997).

This finality is also reflected in almost all great stories and serious literature; when Bambi's mother [*SPOILER ALERT!*] gets shot and killed, [*END SPOILER ALERT*] she doesn't come bursting back through the forest at the end of the story to save Bambi's life as Thumper tosses her a blaster and exclaims, "You! I thought you were dead!!!"

But in popular media the finality of death gets tossed out the window, and folks seem to come back from that undiscovered country with surprising ease. *Star Trek* wrecked it with a movie, wherein Spock was resurrected after almost a week of death; Buffy came back around 87 times or so; Gandalf recovered; and even the thoroughly mortal and quasi-realistic Sherlock Holmes cheated the scythe.

Sometimes it's bad enough just even to *lessen* death's grasp; for example, in a series like *Star Wars*, the emotional impact of Obi Wan's death is reduced by the fact that he becomes Luke's personal voice and snow globe. Like they say, "It's hard to miss you if you won't go away."

And, of course, comics and soap operas have stretched the futility of death beyond any rational ability to suspend disbelief. Almost without exception, any time a significant character dies, the audience nods and goes, "Okay; so when's he coming back?" (Or, to quote a *Radioactive Man* comic, "Who killed Sergeant Fluffy *this* time?")

So why is this a problem? Because by lessening the power of death, you get rid of quite probably the only -- *only* -- certain means of finality in a story. In any kind of cinematic world -- and, let's face it, if death isn't the Big Enchilada then we're probably talking a cinematic world -- the fact that death can be thwarted means that everything else is probably fair game as well. Friend has severed limbs? Cast that *regeneration* spell and dance the Macarena! Family member's soul been devoured by demons? Go check Wal-Mart; there's a sale this week. Loved one lost in the Himalayans? Leave the porch light on; he'll turn up.

Even if the angel of death isn't kept at bay in every case, that fact that it's thwarted at all can affect players' reaction to all deaths. Unfortunately, in many games (and other media) the only characters who come back from the dead are important ones . . . meaning if the character dies and doesn't come back, no one cared about the death in the first place. It's similar in many ***Dungeons & Dragons*** games, especially in earlier editions; the only characters with access to high-level resurrection abilities -- or enough money to pay for it -- are higher-level characters. In other words, those characters with the *most* ability to have a meaningful and fulfilling death are those most likely to come back!

"I died while trying to keep a dracolich from harnessing the eldritch energies of the Stone of Fate's Judgment for his world-ending schemes. Fortunately my chums were able to recover most of my body, so here I am, right as rain!"
"Really? Huh. I died when I critically failed kicking opening a door; my leg broke and I bled to death. <pause> Still dead."

So, my recommendation is this:

If you're a GM, consider -- *strongly* consider -- a mandate that says, simply, "Dead is Dead."

Now does this mean that I recommend never dealing with the afterlife, cheating death, and all that other good stuff? Not at all; but do it *smart*.

See, the "Dead is Dead" edict is, in essence, a line in the sand. You are drawing it for your players so they know that, if the line is crossed, it cannot be uncrossed. And then *don't uncross it*.

So for example, you say you like undead, and "Dead is Dead" interferes with that? No problem; simply phrase the mantra:

"If someone dies, it cannot return with its former mind and/or mental state."

So while you *could* reanimate, say, your deceased wife, she'd be a shambling bloodthirsty zombie with no memory of her former life and a hunger for brains. . . which will probably put a strain on the relationship.

Likewise you can have characters knockin' on death's door, slip into and out of comas, and so on. But if there's a body and a funeral, and you've given the players and the NPCs a chance to roleplay the emotional effects of an honest-to-goodness death, then resist the urge to bring that character back. You may or may not explicitly state a "deadly death" policy to your players, depending on your preference. Players can learn the hard way that there are no second chances, or you can tell them your reasoning. Depending on the game world you may need to tell them: "Sorry; *resurrection* isn't an available spell, brainbank downloading isn't possible, it's unclear if the dead are *really* communicating through mediums, and as far as you know there are no modern reports of people coming back from the dead."

If you don't have a Death is Dead policy, your game may run into problems . . . especially if you ever decide you *do* want a genuine affecting death. I know of what I speak; about a year ago in our recent LARP the narrating staff brought back a master villain from death. And it was a big surprise, all the players love it, and everyone had a great time. About six months later, struggling for plot, we had a famous hero in the LARP come back from the grave; there was a fair bit of interest, but the reactions seemed a bit off from some of the players. Just over a month ago another character came back from the grave . . . and his return -- his escape from the clutches of the inky void of the afterlife, which in our world would be viewed as nothing less than miraculous -- was greeted largely with indifference. "Aren't you surprised?!? I came back . . . from the *dead*!" "Yeah; there's been a lot of that lately. Oh, hey! We saved your stuff!" In short, it didn't quite have the emotional impact we'd hoped for.

Consider this a warning: If you gave the players a chance to react to a character's death, and it comes back, you've in essence tricked them. If that character dies again, there's no way that reaction will be as strong. If you give the players the idea that death can be undone, they will seek to undo it at some point. And if escaping death's clutches becomes less taxing and takes less time than paying off student loans, you're depriving the campaign of one of the most basic and universal of human responses and shared experiences; regardless of our lives, regardless of our backgrounds and history, we *all* understand death on some level, and fail to understand it on another. And we all also confront our own mortality . . . and will do so, ultimately, one final time.

"But wait!" I hear you cry. "My campaign already . . ." or, "But can't I . . .?" or, "Wow . . . there are a lot of ellipses in this week's column . . ." Fear not, gentle reader; I already have a sequel in mind to this installment, and I should be able to prepare it for your perusal within a few weeks.

Unless I die in the interim; then you may need to wait a bit longer.

--*Steven Marsh*

Dungeons: The New Frontier in Eco-Tourism

by Stephen McKenzie

It grew out of a touring freak show called "Moseley Woods' Freaks and Monsters," which toured in four states and was eventually seen by the emperor himself. Mr. Moseley, an ageing dwarven adventurer whose career and reputation were on the wane, decided to take one last trip into the hinterlands -- but this time, he was going to bring those monsters back alive. The first show featured a live white dragon, which the dwarf had patiently subdued. It was the first time most people had ever seen one in the flesh, and many paid big money to come back and see it again the next night. Moseley was set for life -- as were a host of other showmen who copied the trend.

That was a generation ago. More recently, a bright spark called Spender had the idea of taking paying customers to see the legendary creatures of the Underdark in their natural habitat. "Rather than kill that purple worm," he thought, "why not charge the curious town-folk for a glimpse of it -- from a safe distance, of course . . ."

* * *

Adventuring and tourism may sound a strange mix at first, but when you think about it, it's a pretty logical connection. People often want to be guided through unusual and dangerous parts of the world, either on sightseeing expeditions, or because they need to travel for some more important reason. By setting up your party as "guides" or "tour operators," you will give your characters an inherent shared rationale and a mode of operation that is often lacking in parties composed on individuals thrown together just for the sake of adventure. The would-be tour operators are trying to set up a business -- they know what they are doing, and why, as we shall see.

This article gives players and GMs tips on how to include an element of "adventure tourism" in their campaigns. It is focused on a standard "dungeon exploration" campaign, although the ideas could be expanded to include wilderness or even space exploration. The first section, "A Player's Guide to Dungeon Tourism," is for both players and GMs. If you want to use this material in your campaign, then the "A GM's Guide To Setting Up A "Dungeon Tourism" Game" and "Broadening the Tourism Idea" sections are for your GM only!

A Players' Guide to Dungeon Tourism

So, you're interested in trying your hand as an adventure tour operator? Good luck! It may be possible for you to start up a tourism operation in your campaign without any prompting from your GM, but may also be wise to discuss the idea first, as it will give the campaign a particular flavor; the emphasis will almost always be on humor and low fantasy rather than on serious quests, and at the end of the day, what you'll end up with is money, experience, and a few good memories, rather than any truly noble accomplishment. If your GM is agreeable, here's how you might proceed:

Identifying your Target Market

First, you'll need to find out whether or not there are actually people interested in dungeon tourism, and who they are. It's best to be based in a city with a fairly large and wealthy upper-class sector. A streak of decadence and entropy in the dominant culture will help; your target market should be rich, bored, and jaded, rather than noble and upstanding. Visit the local racetracks, gladiatorial arenas, and the more prestigious gambling dens and find out who your first clients are likely to be. Next, find out about any "Hellraiser" or "Thrillseeker" clubs in your local area; rich gentlemen's establishments are certainly your best option here. You can even make some preliminary inquiries: "How much would you pay us if we showed you a dragon incubating her eggs . . . without her knowing you were there?"

Once you have ascertained that there are enough rich fops or would-be heroes in your local area to make your efforts worthwhile, you can start thinking about who is actually going to man the show, and how you are going to fund it.

Manpower and Capital

Let's get this straight right from the outset: There is no way you can manage an adventure tour operation on your own. If you don't already have people to play the following roles, you'll need to advertise; traveler's inns are a good place to start.

- **A Showman.** You'll need someone with a gift of the gab, a flair for advertising, and an ability to spot a potential client. Part of the appeal of going on a tour is to listen to the spiel of the tour guide. If you just keep your mouth shut and point to the monsters, your customers won't come back.
- **A Scout or Ranger.** You'll need someone with good animal and monster lore skills, tracking, and any other skills that are useful in finding large creatures and predicting their behaviors.
- **A Healer.** It's vital to have someone along who can quickly repair any damage done to any of your guests as they undergo their adventure experience. The presence of this person will make them feel a lot safer, and your reputation will survive the odd mishap (an escaping monster, etc.) if your guests always leave your premises essentially unharmed.
- **A Handyman.** In order to make your dungeon tourist friendly, and to keep the monsters where you want them, you'll probably need to alter it quite a bit. Hire someone with a good knowledge of masonry, woodwork, mining, and in a particular, skills in constructing and maintaining doors and barricades.
- **Hired Muscle.** These people always have their uses: calming unruly monsters, persuading guests who are not keen to pay, or keeping out intruders or competitors. Hire at least one.

You'll also need cash. If you haven't already got it, you'll need to get enough to set up the dungeon (see "Making A Base") and to pay at least four weeks' wages (not a problem if your staff are prepared to work for free until profit starts coming in). Financiers for such an operation will expect their funds remunerated with a healthy profit, or even a stake in your company, so be careful about what you agree to. In terms of finding financiers, the kind of folk interested in going on a dungeon tour are the kind of folk with enough cash to fund one; see "Identifying your Target Market," above, and think about asking your first prospective customers for money in advance.

Finding a Product

Third, you'll need a product -- something to pull the punters in. Monsters are best, but spectacular ancient architecture or even interesting cave formations will do at a pinch (you can always build your customers up to wanting more next time). It may well be the case that you have already explored part of a nearby dungeon or cave system and found some monsters. If not, seek out a dungeon or unexplored ruins in or near your local city (or alternately, try your hand at a wilderness tourism operation). Explore the first two or three levels as best as you can; but if you *do* come across any monsters, flee, leaving large amounts of food behind. Well-fed monsters are less likely to attack guests.

What kind of monsters are best? To start with, find creatures that behave instinctively rather than intelligently; those that have predictable movement and behavior are safest. You don't want anything that can fly or otherwise move around in unpredictable ways, or anything with a ranged attack. You also don't want anything that is too intelligent or well-organized. Eliminate all monsters that do not fit with your plans. Obviously when you've gotten a bit more advanced these guidelines can be ignored.

Making a Base

Once you have found your monsters, you'll need to make a base for yourself. See about getting legal rights to the entrance, so that other adventures can't come in and spoil your show. This can be tricky if the entrance is out in the country or wilderness, but if you can find a city with a cellar/dungeon network that abuts onto the cavernous underworld, you can try to seal off an underworld entrance so that it is exclusively yours. If you can't get legal land ownership rights to the area, you may need to hire extra muscle to guard against intruders.

Establish yourself on the first few levels, making them safe for visitors. Seal all the entrances with doors and barricades, especially the ones leading to where the monsters are (you don't want the stars of the show escaping or

wandering about too much). Build ramps, steps, ladders, and railings to make the dungeon easier to navigate, especially if it is a cave (you may be intrepid, but your guests are almost certainly not). Investigate the behavior of the monsters in the area to build up a profile of what they are likely to do and when, so you can determine the best time to run your tours. If possible, find or create a viewing gallery; a place high up in natural cave overlooking somewhere where the monsters congregate is perfect. From there, you can lecture your guests on the behavior they see below them, and possibly even rig up a plaque or some other kind of interpretive display.

Trial Runs, Advertising, and the Big Launch

A trial run is highly advisable. Scout out the dungeon area to make sure those monsters are still where they should be according to your profile. Then send in a tour party composed of your guide and a couple of your team members, who must pretend to be uninitiated and require help to navigate the dungeon. A trial run will iron out problems you might not have thought of in a purely theoretical run-through.

Next, advertise. If you've already got a first client, you might want to wait for the testimony of that client, and let word of mouth do the work for you. Alternately, revisit those gentlemen's clubs and gambling dens and spread the news of your opening with broadsheets and posters, if they exist in your world. Resist the temptation to get the town crier involved. You will want your clients to think they are entering into an elite and prestigious world, and if your tours are advertised at the local marketplace, you will damage the image you are trying to create.

Finally, the big day will arrive. You may want to make sure your guests know they are your first ones, if that will give them prestige in their social circles. Alternately, you can pretend or suggest that of *course* you have run the tours many times before without mishap, and that they are completely safe. With appropriate pomp and ceremony, lead your guests down through the known portions of your dungeon, and into the greatest adventure of their lives . . .

Tips to Keep the Operation Going

- **Get more lackeys.** Once you have established your dungeon base and underworld entrance, you can lease out time in the unexplored sections of your dungeon to would-be adventurers. This works particularly well in areas where all the dungeon entrances are explored or taken. Doing this has a two-fold advantage; first, you're getting paid to do nothing; second, the adventurers are facing the dangers in the lower levels, and exploring new areas for your customers. Spin the new adventurers along with the idea that one day you'll let them join the firm.
- **Keep your monsters well fed.** You might make this part of the daily show; watching those giant ants devour the food you bring them might entertain your guests. If they are a particularly bloodthirsty group, try throwing a lesser monster into the clutches of a greater monster and explaining the combat to your guests blow by blow.
- **Invent your own mythology.** Most people will have heard of dragons, but you may find coaxing people in to see your gooey black slime monster a difficult prospect. If you find a way of inserting your monsters into local folklore (by hiring a bard to write songs about heroes who were slain by them, for example), your guests will enjoy their experience all the more. No one will check the validity or provenance of the folklore, either. People just don't care that much.
- **Get more monsters.** The public may get tired of your initial display, and if you want to attract guests back for more you will need to make sure you have a steady supply of monsters. Breed the ones you do have, if possible, and import them from other dungeons or wilderness areas if you are running low. If worst comes to the worst, make temporary monsters by collecting small creatures (rats, spiders) and magically enlarging them for the benefit of your guests. Alternately, use illusions.
- **Charge as much as you think the market will bear.** You are providing a unique luxury entertainment service and should price yourself accordingly -- think about how much equivalent tours might cost on Earth (a dive in a deep-sea submarine, a mountain-climbing excursion, or the like).
- **Make secondary merchandise.** After your guests have witnessed the main show they may want to buy souvenirs. Mock swords and armor are popular; guests like to buy these so they can pretend to be valorous. You may also want to sell food and drink, or perhaps even provide theme-based musical entertainment while they relax after their dungeon crawl. Once you've got 'em in, their money is yours! The possibilities are endless.

"There she is," said Spender, holding up the spot-lantern so that Lord Roader could see the enormous beast below. "She hasn't eaten in days. Watch closely as her keeper flies over and drops the sheep down for her. She'll have it as quick as a flash . . . if you blink, you'll miss it."

*"I see," said Lord Roader, sipping his port and leaning up against the balcony. "In Wren and Malone's Dungeon, you can actually throw the sheep down yourself. And they've got a **real** dragon, not just an overgrown lizard. I think I want to see something else . . ."*

A GM's Guide To Setting Up A "Dungeon Tourism" Game

There are a number of ways of including an element of dungeon tourism in your campaign. Here are four of the most obvious:

- You include an existing dungeon tourism establishment in one of your cities.
- One of your NPCs approaches the party with a "one-off" dungeon tour proposal. This NPC -- a rich eccentric -- wants to come down into the dungeon the party are exploring and see the sights. After that, the idea goes no further (or alternately, the players realize its potential).
- You set up a campaign in which dungeon tourism is a theme and introduce the ideas to your players.
- Your players want to set up a tourism operation in your ongoing campaign.

Of course, the players' guide above makes the process of setting up a business sound pretty straightforward, whereas you'll want to make it complex enough to be a real challenge. But don't put up so many challenges that you squish the operation too soon.

Having your party set up and run a business within your campaign world can provide an excellent structure for party stability and cohesiveness, as well as being the backdrop for adventures. All the activities and issues of the business world -- product and marketing, cash flow and competition -- must be undertaken and dealt with so that the enterprise may be successful. There's no need for you to make this process any more difficult than it already is until after the first few tours have been completed.

Dungeon tourism will work best in a campaign setting in which the following features exist. Think about including most or all of these features in a tourism game, whether you are starting from scratch, or inserting the idea into an existing series of adventures.

- Create a large underworld, filled with various kinds of monsters which is joined in a number of places to a cellar and dungeon complex beneath an inhabited area.
- Create an ethos in which a fascination for the monstrous and bizarre is prevalent in the population.
- Allow the PCs to find a previously undiscovered entrance leading to an area in which there are powerful but non-intelligent monsters dwelling.
- Set up the structure of the initial underground areas so that tourism is possible; provide a viewing gallery if you like, and don't include too many perilous descents or flooded river tunnels. Plain old cave floors will do nicely in the upper levels.
- Let the first tourism operations go smoothly (so long as the party have prepared adequately). Allow the players to build up momentum so that when they do encounter challenges, they have something to protect, rather than simply giving up after the first attempt because it all looks too hard.

So, you let the first few tours pass by successfully and uneventfully. The guests have "oohed" and "aahed" at the monsters and other dungeon features from the safe distance of the viewing platform and have left suitably impressed. Word of mouth is picking up and the players are feeling optimistic. Now, its time to add some spice! Throw any or all of the following challenges at your party.

Unhealthy Competition

Your players aren't the only ones who have thought about running a tourism operation! Either your party is getting in on an established trend, or else they are the trendsetters and will soon find others getting in on the act. This could simply mean that your party must work harder to keep their business going. Alternately, you might decide that competition in the tourism industry is less than friendly, and use the following ideas to liven things up:

- A valued customer pulls out of a tour and the party is keen to find out why. After much probing, they find out that there is a rumor circulating which discredits them; they are cheats, drug runners, or nefarious in some other way. Someone has been bad-mouthing the party's operation in order to draw business away. The party may be able to save their reputations . . . but perhaps it might be easier to discredit, or even frame, the competition?
- The party hears a rumor that another tourism operation is showcasing a dragon! All of a sudden, business drops away. Then the party hears from another source that the dragon is just an illusion. How do they prove it, thereby winning back their old customers? Looks like a sneak trip into their competitor's dungeon might be in order.
- On the party's latest touring operation, they find that someone has set a nasty trap aimed to kill or injure guests or party members. Alternately, some of those prized monsters appear to have been killed. Someone has been getting into the party's precious dungeon and mucking things up!

In the long term, the party should eventually triumph over the competition, and establish themselves as the premier tourism company in the area. Using some of the tricks described above on their competition is a good way of going about this. Alternately, members of one of the rival companies may be involved in something far more sinister, leading into a new and more heroic phase of the campaign.

The Unimpressed Guests

Not all the guests are quite as easy to please as the first few groups. In this scenario twist, the party runs into a group of guests who are less than amused by what they have seen. This might simply mean that the party's reputation suffers. Alternately, it may be more complicated . . .

- The guests are unimpressed, and demand to be taken deeper into the dungeon, threatening to ruin the party's credibility if they don't get their money's worth. This calls for a bit of off-the-cuff dungeon exploration, with some drunken guests in tow, making belligerent comments all the while.
- One of the guests is injured (by a fall or by a minor monster attack) and threatens to sue the party (or otherwise cause them grief if you have no litigious legal system in your campaign). In the worst-case scenario, the person is badly injured or killed, and the family initiates a death feud with the party.
- One of the guests mysteriously vanishes while down in the dungeon. This could be the act of a monster, or perhaps a rival touring company has done it to discredit the party. In any case, the person's friends demand that the party perform a thorough search of all the areas in the dungeon until the person is found.

Remember that any of the guests could easily be agents or spies for a competing tour company, who want to get an insight into how the party does things, and also want a chance to mess things up. In this case, the guests will be unimpressed no matter *what* the PCs show them; will be seen by one of the party deliberately tripping over in an attempt to fake an injury; or alternately, will arrange to magically remove themselves from the dungeon so it will appear that a monster has taken them.

Escape from the Under Dark

Of course, there are tunnels beneath the players' nice safe "touring dungeon" that are home to all sorts of creatures, some of them intelligent and highly mobile; sooner or later one of these is going to get curious about all the activity going on upstairs. In the final twist to the scenario, unexpected monsters get into the dungeon during a tour, or even break through to the surface areas where the party is based. Here are some suggestions for monster types that might make tourism a tricky proposition.

- Slime Monsters (such as *Dungeons & Dragons'* Green Slime) drop from the ceiling onto one of the guests, hideously disfiguring him. Slime monsters are useful because it is feasible to have them drop on anyone in a group, meaning that the guests will be difficult to guard. Alternately, one of the guests contracts a disfiguring

disease. Either way, the heroes have got their work cut out for them in order to preserve their reputation.

- An undead or spirit creature enters the body of one of the guests and takes him over. This does not immediately become apparent; it is only when the serial killings begin in the neighborhood that folks begin to ask questions. The truth comes out when the man's wife finally realizes he has been possessed, and seeks the party's help to restore him. Alternately, the creature must revisit its underground lair every few days to regenerate its power.
- Well-organized evil humanoid creatures ambush a tour group and attempt to kidnap several guests (demanding large sums of money for their return if they succeed). The party will discover that a network of tunnels beneath their dungeon leads to a large humanoid kingdom that has also been discovered by other adventurers. The focus of the campaign shifts away from dungeon tourism and on to exploring the underworld civilization.

Broadening the Tourism Idea

Dungeon Ownership

If you are going to run a tourism game you will need to think about property ownership in your legal system. In the scenario described above, it is assumed that people would have legal ownership of entrances to the underworld (i.e. cellars, vaults, shafts, etc) and would then stake out claims in areas beneath their entrance that will be legally recognized. You may decide that there is in fact no backing for an underground claim in your legal system, and that anyone can go wherever they like underground (although they still cannot use other people's entrances if that would involve trespassing on their above-ground property).

If you decide that the whole notion of property ownership over dungeon entrances is not for you, consider a scenario in which the dungeon entrance is in a wilderness area, and part of the tour is a three-day trek just to get to the entrance. If the location is secret, your party will have to be alert that your trek is not being spied upon by others keen to know where your entrance is. Alternately, there may be other adventurers or tour guides at the location, and staking a claim will be a matter of defending in with all the muscle you can find.

Finally, consider a scenario in which your newly formed adventuring party is trying to find the way down into the underworld, but all the entrances have been taken. Until they move up in rank, power, and prestige, they are going to have to bite the bullet and do what all the other beginners have done before them: Lease a dungeon entrance from an established dungeoneering company at a daily rate!

The Traveling Freaks and Monsters Show

Setting up a traveling show might be an easier (and more realistic) option for your party. In this scenario, the party travels to dungeons or outlying wilderness areas in search of monsters that can be drugged, subdued, or imprisoned, and then bring them back to civilization to put on a show. Perhaps your party will need to team up with a traveling circus troupe in order to make a name for themselves. Or perhaps the industry is already so large that there is money to be made simply by procuring monsters and animals for the exhibitions of other people. In any case, the scenario has a built-in inbuilt rationale as to why your NPCs would want to go traipsing through the wilderness, as well as providing the additional challenge of capturing rather than killing the monsters that they encounter.

The Genuine Wilderness Guide

Of course, there are other situations in which your party could function as tour operators or travel organizers that would involve them in far more noble causes than the ones that have been mentioned in this article. Imagine any of the following scenarios as good "party set-ups":

- A peaceful kingdom is being overrun by goblins and many citizens have become refugees. The party moves back and forth across a dangerous mountain range, taking refugees one way and taking back supplies to the resistance movement.
- A kingdom has been entirely occupied by an evil power and a resistance movement has sprung up. Resistance

fighters need places to lie low or even escape, and the party is well suited to leading people through the underworld out of the kingdom into safety.

- Clerics need to visit a holy place in the mountains in order to perform rituals, but the mountain range has become overrun by monsters. The party guides groups of devotees from the city up to the sacred site and back down again.
- A team of archaeologists is interested in exploring the ruins of an ancient site out in the desert. Who better than the local people (the party) to guide them safely to and from the place and guard them from danger?

Whatever the scenario, your party should ideally have a shared common goal from the outset, rather than simply being a group of strangers who get together in an inn. Guides and touring operations are just of many interesting and amusing "party rationales" you may wish to consider in your campaign.

Final Word

*Spender looked at the payments ledger and sighed disconsolately. "This is harder than I thought," he said. "First Wren and Malone open up and take half our business away with their phony dragon. It's just a giant lizard, same as ours, but with illusionary fire! Then someone poisons our giant beetles while they are still on the transport ship. It's too cutthroat around here. I know . . . how about we write a book called **How to Survive in the Tourism Business**. Writing about it has got to be easier than actually working in it . . ."*

Designer's Notes: *Transhuman Space: Deep Beyond*

Into the Deep Beyond

by David L. Pulver

"These bodies which now wear belong to the lower animals; our minds have already outgrown them; already we look upon them with contempt. A time will come when Science will transform them by means which we cannot conjecture, and which, even if explained to us, we could not now understand, just as the savage cannot understand electricity, magnetism, steam. Disease will be extirpated; the causes of decay will be removed; immortality will be invented. And then, the earth being small, mankind will migrate into space, and will cross the airless Saharas which separate planet from planet, and sun from sun. The earth will become a Holy Land which will be visited by pilgrims from all the quarters of the universe. Finally, men will master the forces of Nature; they will become themselves architects of systems, manufacturers of worlds."

-- Winwood Reade, *The Martyrdom of Man* (1872)

One of the last things I did for ***Deep Beyond*** was coming up with a suitable set of quotes for the book. I wanted to use the above passage, but it would not quite fit anywhere -- but I think Reade's words from over a century ago nicely sums up some transhumanist ideologies, and in a rather prescient fashion.

Deep Beyond is the ***Transhuman Space*** worldbook for the outer solar system -- that vast region that encompass the asteroid belt, the giant planets and their moons, and the icy bodies of the Kuiper Belt and Oort Cloud. This is the final frontier, the actual and symbolic promised land for adventurous pilgrims willing to push the envelope of science, society, and humanity. It's a place for transhumanists, criminals, corporate visionaries, and folks who just want to be left alone. And since America gets most of its vital energy from Saturn, there's also plenty of soldiers.

I also wanted to see if I could convey a sense of the wonder of the outer solar system -- not just cratered rocks, but worlds with erupting volcanoes and subsurface oceans, with continent-sized storms and geysers of ice. It seemed a shame not to make some use out of all that scenery, so I spent some time coming up with reasons why it might be economically feasible to put people there. Fortunately, a lot of much cleverer people had already thought up many of them, and I drew ideas from dozens of different books and articles on asteroid mining, Helium-3 extraction, and space colonization. Even though you won't find the standard trope of an asteroid belt full of hardy miners, there's plenty of things for people to see, do, and get in trouble with.

One of the biggest resources the belt and outer system offers is freedom -- places where people can get away, to escape the rules, memes, and regulations of Earth and Mars. That makes the belt and beyond home to everyone from experimental research labs of transnational corporations to bizarre posthuman societies. The inhabitants of the Deep Beyond are small in number and their profitable activities represent only a tiny fraction of the 2100 economy (aside from the huge He-3 mining operation). However, as a harbinger of a posthuman future, they can be seen as either the canary in the memetic mineshaft whose excesses serve as a warning to Earth, or as brave pioneers of mankind's expansion into the cosmos. Or both.

Deep Beyond was the second *Transhuman Space* book that I wrote, but it was the first one I began. In fact, it was originally intended to be the opening book in the line, until Steve Jackson and Sean Punch rightly pointed out that an introductory core book was needed to set the scene. So ***Deep Beyond*** ended up coming out later in the series. (Fortunately, it still beat the Cassini space probe, which will hopefully change our understanding of some of the places visited.) A lot of material that was intended for it had already appeared in the core book -- such as the outlines of the Exogenesis struggle -- but of course, this gave me more room to add new things . . . not all of which ended up being used.

Welcome to the Deep Beyond

"Imagine what it's like to risk death every time you go to work. You walk unshielded through an environment filled with bacteria and cancer-causing radiation. You navigate to work down a narrow channel, dodging a stream of multi-ton projectiles moving at ever-varying speeds. A single slip on a patch of ice or slippery vegetation, and gravity will suck you down with a force that can wrench ligaments or break bones.

"That was life on Earth. For many in the Third Wave, that's what it's like today.

"Luckily, you're growing up in space, where the laws of physics behave the way your physics text says they should. You can see someone coming a million miles away. You live in a clean, sterile environment, and if anything's wrong, you've always got your suit. If your craft's engine fails, it's not like you'll fall from the sky and die, like you would on Earth or Mars! If you don't panic, you can even live a minute in hard vacuum!

"Sure, microgravity, vacc and radiation kill a few careless groundhogs -- if you grew up on Earth, stay focused and learn quick. But not you kids -- space is in your blood.

"So stay away from planets -- they're not safe! And remember: it's not the environment you have to worry about. It's the competition. We got here first, but we're no longer alone."

-- Karen Pfil, Green Duncanite

The Duncanites are the libertarian pantropist group that initiated the illegal terraforming of Mars and chose exile to the asteroid belt over punishment. Much of **Deep Beyond** is concerned with their viewpoint, and working out some of the details of how they might live and work on Ceres and their other colonies. I wrote that section from a Duncanite viewpoint in reaction to all those books and RPGs that portrayed life in space as a never-ending struggle where one wrong move meant death, and so ended up as neurotic obsessive-compulsives. I figured the people who actually live there might have other ideas, at least after a generation or two.

Of course, that's if fairly stable, smart, well adjusted people get into deep space. One of the other assumptions of **Deep Beyond** is that after the orbital, Lagrange and Mars colonies have been around for a couple of decades, these societies will produce various misfits, dreamers, misanthropes, and the like, and being already in space, they'll find it easier to head out into the frontier than go back to Earth. This led to the creation of a number of religious and other isolate colonies. But a few were too odd to include.

Space Nazis Must Die

"The End Times are coming, and the Kingdom of Yahweh is at hand! We must purify ourselves before the final battle. Just as the 10 Lost Tribes separated themselves from the spawn of Cain to walk in the untainted north, we shall leave the muck of Earth behind us, embarking on a new Folk Wandering. We seek a new eyrie in which we may purge the taint of the serpent from our genes, and restore the line of Adam: fair of skin, long-limbed and long-lived, with straw-colored hair and clear blue eyes. Our Nordic ancestors grew strong in ice and snow; to dwell among the Cosmic Ice is the natural heritage of Nordic Man."

-- Richard Armstrong, 2074

I was originally thinking of including a fairly sizable bunch of space nazis in the Kuiper Belt, mostly to give the Duncanites something to worry about besides the Chinese and each other. My thought was that some suitably obsessed neo-Nazi racists would latch onto the semi-mystical ideas of Hanns Hoerbiger's "cosmic ice theory" and Nordic "folk wandering," and somehow fit that into a mythology that led them to head out to the icy Kuiper Belt or Oort Cloud and settle a comet or whatever . . . except their own ineptitude and racism would get into all sorts of unfortunate situations, which their leader would try to spin into some sort of epic tale, with pseudo-scientific ramblings of this sort:

"I knew we were in trouble when I saw the shape of the pilot's skull. Unlike a true Nordic, he was brachycephalic. Aderic, my trusty VI, performed a quick laser scan and confirmed my instinctive judgement. The greatest breadth of the pilot's heads divided by the greatest length and multiplied by 100 gave a cephalic index of 85. From that moment on, I

was certain he could not be trusted, and would try to cheat us during our passage."
-- *Our Folkwandering, Book VI: Columbia Station to Lagrange 5* by Richard Armstrong

I read a bunch of racist tracts as research to try and get the style right, but in the end, I decided they didn't really fit (if I kept getting the urge to make fun of them, they couldn't be taken that seriously as bad guys) so I reduced the Space Nazi Menace from the Kupier Belt to a single asteroid colony inhabited by a more media-savvy if no less toxic group, one that exported "eidelon" mind-clones of famous icons of the politically incorrect.

Dragons in Space

A more whimsical fringe group I had thought of including was inspired by reading a news account of the "Otherkin," a real-life movement of individuals who believe themselves to be spiritually or physically other than human -- incarnations of centaurs, dragons, sylphs, and so on. I figured that sort of meme could continue in more literal form:

Fafnir and Tien Lung

Fafnir is a group of immortal xenokin transhumanists attempting to transform themselves into celestial dragons. Most were heavily influenced by the dracofantasy infodreams of Shiina Aki, such as the award-winning "King with Wings" (2073) and the needlebrain past lives movement of the 2080s. The needlebrains attempted to use early psychosurgery and mind emulation technology to recover (critics said "manufacture") supposed past lives as dragons during the age of dinosaurs, which they envisioned (following Shiina Aki) as a Jurassic-age civilization ruled by Leviathan, king of the Tien Lung, which survived until destroyed by cosmic catastrophe. The group split in the 2080s, one segment being content to live in virtual reality on Earth, the other, a small faction led by millionaire guru Shinji "Tien Lung" Yamamoto, preferring a physical realization of their destiny. The means the group have finally achieved is their own deliberate transformation into the modern incarnation of draconism: enormous draconic cybershell spacecraft.

Alas, I got hung up on how they would actually pay for this sort of thing (the big spaceships, I mean), and in the end, decided it was all a bit much -- it never even hit the first draft. Perhaps turning themselves into cybershell dragons and flitting about Titan would have been more practical, and better for the tourist trade as well!

An element I did hope to explore was xoxing, and I wrote this short section:

Xox Populi

A xox is a replicated sapient infomorph. On Earth, sapient xoxes are feared by the authorities, as they represent the potential for a non-human population explosion. In the Deep Beyond, humans are in short supply, and there's plenty of room. Xoxing appears to offer a way to increase productivity without worrying about population. The situation in regard to xoxes is quite similar to many old attitudes toward illegal migrant labor -- it's not suppose to exist, but the economy often depends on it.

I then had a weird idea that perhaps there was a group in Earth orbit that ran some "amateur radio astronomy" dishes that were actually used to beam ghosts out from Earth to receivers secretly installed in the Belt or whatever -- they'd offer passage for dissidents, criminals, xoxes, etc. These folks would be reconstructed by the Trojan Mafia or another criminal group. But it sounded a bit far-fetched, and there probably weren't enough people who would need such a service -- actually it would work better as a way to illegal emigrate to, say, Mars.

I plan to explore xoxing in more detail, but decided to leave that to a hoped-for ***TS: America*** or ***TS: Pacific Rim Alliance*** sourcebook that could it look at the rising influence of ghosts in Japan and the United States.

Deep Beyond is available now. I'd like to thank everyone who made it possible, especially those Pyramidians who selflessly contributed ideas, material, and reality checking during the playtest. Bon voyage!

Give Your Heroes A Home with Cardstock Cutouts

by Mike Colcord

Not too long ago, roleplayers used just their imaginations to see where their characters were in a dungeon or in a town. Then some companies made flat "generic" maps for showing what was where, (like the "Dungeon Design Kit" in *Dragon Magazine* #45) and on occasion someone even made a 3-D cutout for this purpose. Of course, you still had to buy the set and were limited to what the company chose to make available, but being able to see where the characters were usually made it worthwhile. Then came the Internet, and downloadable files that allow you to print out as many of whatever you need. In addition to being generally cheaper than actually buying the sets, as graphic files they are usually modifiable to what you need. (For example, by setting your printer to print at a smaller scale, you can print 25mm sets for 15mm games.) Then came 3-D cutouts of buildings, dungeons, and just about anything else the intrepid DM needs to show the players what is going on. There are many places you can get these sets, with prices ranging from free to \$20.00 or so each.

This article will compare and contrast the downloads made specifically for roleplaying games, with attention to cost and ease of assembly.

The first is **Billy's Shed** at <http://homepage.ntlworld.com/johnny.kid/index.htm>, which has 15 or so buildings for the **Warhammer** game. These are medieval village buildings and are very well done. The set includes an armory, a bridge and watchtower, several basic buildings, ruins, and a magic shop. The detail is very good, the construction is easy, and these are all available free.

Next we have miniature buildings created for Wizards of the Coast's **Chainmail** miniatures game, at <http://www.wizards.com/dnd/article.asp?x=minis/ch20030123pmx>. This includes 15 downloads, including several with both whole and ruined versions. (The ruined version is designed to be put under the whole one so when a wizard's fireball hits it, you just pull off the whole piece.) The set includes a stone bridge, towers, city walls, a church, an inn, a blacksmith shop, and even a crypt and a graveyard. Most of these are very easy to assemble, and all are available for free.

Worldworks -- at <http://www.worldworksgames.com/> -- is the third location for medieval buildings. He has three sets available for download. Its first, **Castleworks**, is a castle. It includes two lengths of walls, a stone tower, a gatehouse, and a two-story building. The detail is excellent, and for the most part, construction is easy. The second set, **Dungeonworks**, is somewhat more complex, but for the standard dungeon crawl is definitely worth checking out. The third, **Villageworks**, includes various modular buildings that allow you to pick and choose the look of your village. All three sets are available at <http://www.rpgnow.com/> for a price of \$7.00 to \$15.00 and are well worth the investment. (Future releases include an interior set of buildings, and several sets of standup characters.) There is also a free samples section with several free selections.

S. John Ross' Cumberland Games -- at <http://www222.pair.com/sjohn/cumberland.htm> -- has two cardstock creations available: **Dungeon Interiors** and **Space Station Interiors**. Each set includes walls, floor pieces, and "wall hangings" suitable for the setting. At \$5.00 each they are a fine, cheap investment. (You might also want to check out his fine line of **Sparks Miniatures**. These are scalable miniatures designed as True

Color vs. Black & White

While color sets are nice and look better in a lot of ways, there is an advantage to getting the files uncolored. By printing several versions of the building in question and coloring them differently, you avoid having all the buildings look identical.

Coloring can be done prior to printing with several programs. As one option, Photoshop Elements allows the user to select a single page from an Adobe Acrobat document. (All the offerings are in Adobe format.) alternately, they can be printed and then colored with felt tip pens.

Assembly

When it comes to putting the models together, some equipment can make a difference. Most of the modules

Type Fonts, enabling easy scaling and mass-printing.) Assembly is very easy but are not colored. They are available at his site or through

<http://www.hyperbooks.com/catalog/index.html>

Microtactics -- at <http://microtactix.com/> -- is probably the most prolific of the electronic miniature sites around. In addition to three different modular undergrounds -- **Dirt Cheap Dungeons, Caverns, and Sewers** -- they have a medieval village set (**Vyllage-On-The-Cheep**), an interior village set, ruins, and Dirt Cheap Keeps. They are also almost the only place where you can get settings other than medieval. Locations include a modern town, a rural modern town, a futuristic setting, a western town, skyscrapers, vehicles, and tons of other things. Assembly is generally easy, and some of the sets are available in color or black & white. Prices generally run \$5.00 to \$20.00 per set, depending on complexity. There are several sample sets available for free as well.

can be cut out with scissors, but the small expense of a self-healing cutting board, a steel ruler, and an Exacto knife can make a big difference. White glue works very well, although Elmer's School Glue Gel sets quicker than the White glue.

For those interested in western towns, another option is **Whitewash City** by Eric Hotz, available at <http://www.erichotz.com/whitewash.html>. Each building comes in color and monochrome sets, and includes both a floor plan of the building and a blank floor plan (which is something that would be nice to see in some of the other sets). Buildings are available for \$3.00 each, and there are various package deals. For those playing **GURPS Old West, Deadlands**, or **Boot Hill**, the set is well worth the investment, and includes most of the places your characters are likely to go (such as a bank, a bakery, a hardware store, a bar, a hotel, and -- of course -- the sheriff's office and jail). All are very easy to assemble. Other items available include a flat set for a stone keep, a wooden palisade, and three sets for flat furniture (bedding, tables, and chairs). There are also various "add ons" (such as wanted posters, additional doors and windows, and tons of other stuff). Done in 30 mm, all sets are easily adjusted to whatever size you use. Both Eric's love of the old west and incredible artistic abilities show in these buildings.

Fantasy Cutouts <http://www.fantasycutouts.com/>) has one item available. The Guard tower is definitely the most complex model constructed here. A three-story watchtower on a small hill, this set is also the most amazing of them all. Each floor has a removable section to allow looking inside, and each floor is removable. Under the tower, inside the hill is a basement as well. At \$6.00 for a 14-page download, this is almost a "Must Have" item. *[Editor's Note: At press time this URL does not seem to be working.]*

Germ's World at <http://www.germy.co.uk/> has a modular space station, and a dungeon set, both of which are free and highly adaptive. In addition, he has a collection of buildings for a contemporary or near-future setting that not only includes interior walls, but removable roofs for interior access. It would be nice if there was some furniture as well, but it's a minor deficiency. The sets are very easy to assemble, resembling small shoe boxes.

One final option for those who play an unusual game is at http://members.tripod.com/~into_the_shadows/models/index.html. Available for free download is a Tardis (both exterior and interior, with standup figures) and a set of "Scooby Doo" figures with a Mystery Machine, and some simple-to-assemble cutouts.

A Nyamban Herbal

for *d20 System*

by Chris Dolunt

Atlas Games' upcoming **Ancestral Vault** sourcebook explores the heart of African adventure with 96 pages of mundane **d20 System** equipment, special and superior items, and magical objects of all degrees of power. Though designed for use with the **Nyambe: African Adventures** setting, these items can find their way into any campaign as exotic treasures from faraway lands. The following outtakes are just a sample of the wealth of **d20 System** material found in **Ancestral Vault**.

Introduction to Herbalism

Natural medicine makes extensive use of plants, animals, and stones to generate a variety of effects. Some of these effects are mundane in nature, while others are magical. The following herbs are used extensively in Nyamban natural medicine. This bonus material gives descriptions of new herbs not included in **Ancestral Vault**, along with the mundane and magical concoctions that a character trained in the ways of plants can create with the Herbalism skill.

Description & Climate/Terrain

The opening section of each entry gives a description of the plant in question, a discussion of its general uses and natural habitat, a glimpse into its history of use by sentient races, and other relevant information. Below it is a header giving the plant's common habitat. Many plants are adaptable enough that they can grow in other climates, but not without difficulty or some detrimental consequences.

Availability

This entry gives the plant's rarity and market price per pound. The raw herb's market price is determined by its habitat and rarity, and the more difficult an herb is to acquire, the higher the probability is that the herb market vendors won't have it, as well. To determine whether an herb is in stock, roll 1d20 and compare the result to the DC for that plant's rarity: Common DC 5, Uncommon DC 10, Rare DC 15, Very Rare DC 18, and Unique DC 20.

Bindings

This heading lists the magic schools with which the plant shares an affinity. A rating indicating the maximum spell level that can be bound to a verdex made of the plant using the Plantbind feat follows each school name; bindings allow an herbalist to "store" spells. For example, Anise's bindings are: Conjuration 2, Transmutation 3. This means that anise has an affinity for the schools Conjuration and Transmutation, with spell level maximums of 2 and 3, respectively. As such, a spellcaster may only bind a 1st- or 2nd-level Conjuration spell or a 1st-, a 2nd-, or a 3rd-level Transmutation spell to an anise verdex.

Traits

This heading lists the plant's medicinal traits, which describe the natural properties that can be harnessed by using the Herbalism skill. The number following each trait name is its rating, which is added to an herbalist's base DC 15 when she makes a skill check to create either a mundane or a magical concoction. It also determines the amount of time she must spend working on the material, with the amount of time being measured in hours for mundane concoctions, or days for magical ones, and equal to her Herbalism skill modifier subtracted from the trait rating. For example, Umeiko

the Sorceress has the Herbalism skill at +16, and wants to turn berries from the henna plant into a type of enchanted ink for creating magic-storing tattoos. The plant's pigment trait rating is 20, giving her a DC of 35 to effect the change over the course of 4 days.

Mundane Concoctions

Below the list of the plant's traits is a more in-depth discussion of a few of the natural effects inherent in the plant, and mundane concoctions that can be produced from each trait by using the Herbalism skill. Again, making a dose of one of these medicines requires an Herbalism check, DC 15 plus the trait's rating. At the end of each trait's information section is a brief note on which magical concoctions can also be made by awakening that trait; these are described more fully in the Magical Concoctions section immediately following.

Magical Concoctions

Also included in each plant entry are numerous magical concoctions created from the plant by awakening its natural attributes. Each is the result of laborious experimentation and research performed over centuries, codified, and subsequently handed down as a standard recipe. The magical concoction's information block contains its type, the trait from which it is made, as well as the base Herbalism DC to make one dose, and its market price. Also, unless otherwise noted, a concoction's bonuses do not stack with consecutive uses. In most cases, one must wait for the effects from previous uses to wear off for it work again.

Borage

Borage is not unique to Nyambe; it is also found in the lands to the North and parts of the Near East. Borage plants stand about two feet in height, and are covered with stiff white "hairs." The leaves, which are of primary interest to the herbalist, are pointed ovals approximately three inches long, and also covered with hairs. Its flowers, also useful in herbalism, are bright blue with black anthers. Finally, its seeds are black and grow in clusters of four.

Climate/Terrain: Temperate and warm plain and hill. In Nyambe, borage is grown mostly in the empire of *Mabwe* (MAH-bweh).

Availability: Common (22 cp per lb.)

Bindings: Abjuration 1, Evocation 3, Transmutation 4

Traits: Brokelung 3, Blightpurge 4, Coldsweat 12, Feverthaw 10, Readheal 2, Spinewrack 14

Mundane Concoctions

Brokelung: Sometimes nursing mothers eat borage nuts to induce milk production, but they can also cause difficulty breathing. An herbalist can grind borage nuts into a paste that help expel contaminants from the lungs.

Ingesting borage nut paste causes violent coughing that expels dust, sand, or other contaminants from the lungs. Where applicable, it adds a +2 bonus to Fortitude saves against such effects for 10 minutes.

Blightpurge: Dried borage leaves boiled in water can have a diuretic effect, helping rid the body of foreign substances.

Drinking such a concoction reduces the duration of any ingested potions or other substances currently in the body by 25%.

Coldsweat: Eating borage leaves can induce cold sweats to aid in purging toxins from the body.

A healer using this concoction to treat a poisoned patient gains a +8 circumstance bonus to Heal checks made to counteract the poison, but the borage also inflicts 1d4 points of temporary Strength score damage on the patient. This bonus lasts one hour.

Feverthaw: When boiled in honey and water, the extract of borage leaves can be drunk to reduce fever.

Drinking this infusion provides a +4 bonus to Fortitude saves made to avoid heat exhaustion for 8 hours.

When magically awakened, this trait can be used to produce a body-cooling substance known as *sunbane*.

Readheal: The juice from borage leaves can be used to reduce inflammation.

A healer who uses compresses soaked in this juice on her patient gains a +1 circumstance bonus to any Heal checks made to treat that patient against diseases that cause inflammation. This bonus lasts for 24 hours.

Spinewrack: Eating candied borage flowers stimulates a "flight or flight" response.

Eating these flowers provides a +4 circumstance bonus to Initiative checks for 1 hour.

When magically awakened, this trait can be used to produce *flowers of haste*.

New Magical Concoction: Sunbane

Type: Potable

Trait: Feverthaw DC 25

Market Price: 150 gp

When ingested, this honey-colored liquid provides the imbiber with complete resistance to the debilitating effects of heat, making the user totally immune to heat exhaustion for 24 hours. It has no effect on burns or other heat-related damage.

New Magical Concoction: Flowers of Haste

Type: Comestible

Trait: Spinewrack DC 29

Market Price: 400 gp

This concoction is in the form of borage flowers candied in crystallized honey. When eaten, they provide the user with a burst of energy. This has the effect of a *haste* spell, lasting 10 rounds. In addition, the flowers provide a +4 circumstance bonus to Initiative checks for 8 hours.

Cayenne

Cayenne is not unique to Nyambe; it is found in the Far East as well, but the Nyamban strains have a unique color and taste. Cayenne is a shrub that grows up to 6 feet in height. It has slightly purple branches, and produces a red, oval fruit, commonly known as a "hot pepper." The fruit is harvested and dried, and oftentimes the seeds are extracted and powdered into a flavoring simply called "pepper." Nyamban pepper is usually a pale brownish-yellow, as compared to the black or red pepper of other lands. To keep the cost of pepper down amongst the lower classes, it is sometimes "cut" with colored sawdust.

Climate/Terrain: Any warm. In Nyambe it is cultivated mostly in the kingdom of *Bashar'ka* (BAH-shar KAH).

Availability: Common (14 cp per lb.)

Bindings: Evocation 7

Traits: Allheal 2, Birr 10, Brokelung 8, Exapir 3, Readfah 6

Mundane Concoctions

Allheal: Cayenne has a mild ability to boost the immune system.

If a healer has a patient eat this cayenne concoction, he gains a +1 circumstance bonus to Heal checks made to treat the patient for any sort of disease. The effect wears off after 1 hour.

Birr: Simply eating cayenne peppers produces a sensation of heat, but in the hands of an herbalist, a concoction of cayenne can provide a great deal of energy.

Those eating a specially prepared concoction of cayenne peppers gain a +1 circumstance bonus to Initiative checks for 10 minutes.

When this trait is awakened, it can create a magical paste known as *dragon's breath*, which allows the person eating it to breathe fire.

Brokelung: An herbal concoction of ground cayenne pepper seeds can cause a heavy build-up of saliva, sometimes helping wash foreign substances out of the mouth.

Inhaling a concoction of pepper the round after eating an ingested poison allows a second saving throw against its effects. If the second save succeeds, then any damage caused by the poison is immediately negated, and the user spits out the poisonous substance. No secondary save against the poison is required, since the substance was not fully consumed.

Exapir: Eating cayenne can cause violent diarrhea or stomach upset.

After eating this concoction, the victim must make a DC 10 Fortitude save or suffer 1 point of temporary Strength score damage. There is no secondary effect.

When awakened, this trait can be used to create an irritating poison called *cayenne dust*.

Readfah: When ground and mixed with oil, cayenne can be used topically to treat arthritis pains, as well as other sorts of aches.

Cayenne oil provides a +2 circumstance bonus to Concentration checks to ignore pain. It does not help ignore distractions. The effect lasts for 4 hours.

New Magical Concoction: Dragon's Breath

Type: Comestible

Trait: Birr DC 25

Market Price: 375 gp

Dragon's breath is a magical paste made from cayenne pepper. After eating it, the user gains the ability to breathe out a single 30-foot cone of fire. Anyone caught in the cone suffers 6d6 points of fire damage, with a DC 15 Reflex save reducing the damage by half.

New Poison: Cayenne Dust

Type: Powder DC 15

Trait: Exapir DC 18
Primary Damage: Irritation
Secondary Damage: None
Market Price: 25 gp

Cayenne dust is a yellow-brown powder that is thrown into the air, and must be inhaled to take effect. A single packet is enough to affect a 5-foot-radius area. Those who miss their saving throw suffer irritation. This applies a -2 penalty to attack rolls and a -4 penalty to effective Dexterity. The character can move at half speed, but cannot run or charge. If an irritated character attempts to cast a spell, she must make a DC 15 Concentration check or lose the spell. The irritation effect ends after 1 minute.

Myrrh

Myrrh is not unique to Nyambe; it is also found in the Near East. Myrrh bushes have branches that grow at right angles to each other and end in sharp thorns. The leaves are trefoil ovals, and cover the bush sparsely. When the bark is damaged, cavities within the bark release a yellow resin. The resin eventually hardens to a dark red color, and is prized for use in incenses and perfumes, making it as or more valuable than gold. Herbalists also prize it for the various effects it has on the respiratory and digestive systems.

Climate/Terrain: Warm desert. In Nyambe it is found most often in the *D'okan* (d-OH-khan) Desert.

Availability: Very Rare (4,800 gp per lb.)

Bindings: Abjuration 5, Conjunction 3, Necromancy 9, Transmutation 7

Traits: Allheal 12, Apir 8, Ebbwith 4, Exapir 8, Hellac 4, Lungwort 12

Mundane Concoctions

Allheal: When dissolved in alcohol, myrrh makes an excellent mouthwash for sore or infected gums.

This solution provides a +4 bonus to initial Fortitude saving throws against poisons or diseases transmitted through ingestion for 4 hours. It provides no bonus against secondary saving throws.

Apir: When powdered and boiled in water, myrrh can be used for the treatment of stomach ulcers and similar problems.

This concoction can be used to lessen the effects of ingested poisons. It grants a +4 bonus to secondary Fortitude saves to avoid the effects of poison for 4 hours. It provides no bonus to the initial Fortitude save.

Ebbwith: When dissolved in alcohol and soaked into bandages, myrrh makes an astringent for use in treating cuts and abrasions.

Myrrh compresses provide a +2 circumstance bonus when making Heal checks to stop someone from bleeding to death.

Exapir: When powdered, mixed with hot peppers, and eaten, myrrh can stimulate the stomach and digestive system. This is especially useful in the treatment of those who have developed stomach problems due to excessive alcohol consumption.

This concoction can be used to expel all poisons from the body, not just alcohol. Eating myrrh and hot peppers inflicts 1d6 points of subdual damage, but allows the subject to regain an additional point of temporary ability score damage per day, provided the damage was caused by an ingested poison.

Hellac: Powdered myrrh can be worked into a wound to prevent infection.

It provides a +2 bonus to initial Fortitude saving throws against diseases transmitted by injury, if applied before the end of the disease's incubation period. It provides no bonus to secondary Fortitude saves.

Lungwort: Inhaling myrrh powder causes build-up of mucus in the respiratory system.

This provides a +6 bonus to initial Fortitude saves to avoid the effects of inhaled poisons or diseases. It provides no bonus to secondary Fortitude saves.

When this trait is awakened, it can create magical perfumes such as *scent of the dead*, or enchanted incense such as *king's smoke*.

New Magical Concoction: Scent of the Dead

Type: Ointment

Trait: Lungwort DC 27

Market Price: 75 gp

This oil contains powdered myrrh as well as less-savory substances such as fat rendered from human corpses. It is applied to the skin, and gives off a faint, rotting odor. Anyone anointed with this oil is effectively protected by *invisibility to undead*. One dose of *scent of the dead* is enough to treat up to three humanoids, and provides protection for up to 30 minutes.

New Magical Concoction: King's Smoke

Type: Inhalant

Trait: Lungwort DC 27

Market Price: 600 gp

When burned, this incense releases a reddish-orange smoke that fills a 30-foot radius around its point of origin. Anyone who breathes the smoke for at least one round gains a 1d4+1 enhancement bonus to Charisma for 10 minutes.

Pyramid Review

Chaos Rising (for d20 System)

Published by [Necromancer Games](#)

Written by James Collura

Cover by Llyn Hunter

Interior art by Brian LeBlanc

Cartography by Christopher Boll

64-page b&w softcover; \$13.95

You'd think the most confusing parts of an RPG adventure that deals with time travel would be trying to keep all the weird causality loops straight in your head and making sure the rubber physics don't bounce too far. In ***Chaos Rising*** from Necromancer Games, the time travel may be the *easiest* thing for the group to work with.

The party is called upon to find an amulet, an artifact that is the soul of a demon lord. Such an item doesn't come along often, and other interests have discovered its existence. Rather than let it fall into their (the wrong) hands, the adventurers are asked to soldier to the Devil's Finger, an impossibly tall promontory. Atop this sits a dwarven citadel, the final resting place of . . . well, all the elements of the adventure.

It's not as simple as going to the old dwarven fortress and collecting the amulet, of course. A small army of men led by the scurrilous Lord Raob Blackenheart work at the site, seeking to clear tons of rubble from a bygone disaster that cover the old outpost. So with all this going on, how are the heroes to get in and get the amulet? They need to travel back to a time before the halls collapsed, find a key to the vault wherein the demon lord is imprisoned, navigate the extradimensional paths that protect the vault from casual (or even determined) intrusion, and do it all by the blood moon two weeks hence (another good reason for time travel). The trials don't end there. Once the key allows entrance, Jubilex the Faceless Lord (from the Necromancer volume ***Tome of Horrors***) must still be confronted in a deadly and rather gooey finale.

If this sounds simple, it isn't. The players don't really have to understand the order of things to complete the module, but their characters shift back and forth a few times through the citadel's history. Throughout the timeline there are great battles and invasions, and demons stalk certain eras. But the full effect of the temporal fun is dulled by the confusion, and unless the GM takes pains to convey the history to his players in a meaningful way, it's hard to get excited about the party's impromptu visit and the changes they may make to something with which they're almost completely unfamiliar.

Keeping all the elements straight is a task; keys that open vaults that sit in demiplanes that occupy citadels that house creatures . . . time isn't the only thing the story twists. Too much of it boils down to killing things while taking the right thing to the right place and time, like an old Infocom adventure gone mad. There are some pleasant problems for the party to puzzle out, but the need for creativity is outweighed by the need to go through the motions in what is essentially a linear adventure.

For those who just want the crunchy bits, there's a prestige class called Brother of the Ooze. These lowly weirdoes are devoted to chaos and heed the call of Jubilex (whether he's even interested in followers is another question), and have

at their disposal spells and feats of a glutinous nature. They're hard to get a grip on -- with spells, fists, psionics, anything really -- and they can alter things in their environment to be just as gummy as they are. There are also the Corrupted (dwarves taken by chaos) and demon oozes (enough said).

The artwork is one of the better features of the book. The pencil drawings are done in a loving hand, each face etched with emotion, each figure conveying action. Even the cover lives up to the company's promise of 3rd edition rules with a 1st edition feel, with heroes surrounding a freakish and overbearing foe. The graphics and layout are equally impressive, with good maps (even inside the covers) and little wasted space. The text is a bit small -- usually good, since it means a whole mess of adventure stuck in the package, but some sections suffer from typesetting that lets words mash together into single, unbroken lines of gibberish. Worse, many pieces of information are repeated throughout the adventure. Normally this would be a good thing, covering all the bases, but when you get to where you're repeating information to be found later on the same page . . .

The module should be easy to drop into most ongoing games (and since it's built for four to six characters 12th level and up, the participants had better have some experience under their belts). Most of the important bits can be tailored to your existing story -- where the citadel is located, who hires the characters, and what happens to the world after the adventure concludes.

Although ***Chaos Rising*** contains a number of neat features (a couple of cute ways to alter the future to show the effects of heroic intervention, for example, and some NPCs that break out of their traditional molds), the material is terribly hard to absorb or get riled up about. In trying to prevent the sorts of horrors that spring from the wackiness of time travel, Necromancer Games has shackled their own adventure and its buyers with a story that, if not by the numbers, still leads the players too much by the nose.

Most of the module is designated open gaming content. The company's logo and graphic creations are product identity, of course, as are the plotlines and the motivations of the characters (though most of the people and critter write-ups can be freely reused).

Pyramid Review

Victoriana -- A Roleplaying Game of Vile Villainy & Glorious Adventure

Published by [Heresy Gaming](#)

Written by John Tuckey with Richard Nunn and Scott Rhymer

Illustrated by Tara K Labus, Kelly Hamilton, Svetlana Chmakova, Ursula Vernon, Matteo Lolli, Samuel Araya, Ed Davis, Shawn Brack, Fufu Frauenwahl, & The Illustrated London News Archive

304-page perfect bound softback; \$29.99

As the surviving British RPGs of the 1990s -- primarily *Warhammer Fantasy Roleplay* and *SLA Industries* with an honorable mention to *Dark Continent* -- are all relegated to the status of an uncertain future, the actual state of the British roleplaying industry looks surprising rosy and could be said to be undergoing something of a resurgence. At the head of the charge is surely Mongoose Publishing, the UK's most prolific of publishers with *d20 System* adaptations of 2000AD's [Judge Dredd](#) and [Sláine](#) (as well as forthcoming adaptations of *Babylon 5*, *Lone Wolf*, and *Conan*) and the self-developed and recently released *Armageddon 2089 RPG* all to its name, but alongside Mongoose have appeared several new independent publishers. These include Bottled Imp Games, with its *d20 System* vampire sourcebook [The Lords of the Night: Vampires](#) and self-published *Crimson Empire*, but perhaps the game that will have the broadest of appeal is *Victoriana -- A Roleplaying Game of Vile Villainy & Glorious Adventure*.

Originally self-published in 1997 with a limited print run of 20 copies, *Victoriana* joins a growing number set in an alternate Victorian era, best typified by *Space 1889*, [Castle Falkenstein](#), [Forgotten Futures](#), *For Faerie, Queen & Country*, and more recently [Victorian Age: Vampire](#). *Victoriana* shares much in common with *Castle Falkenstein* in that it brings the fantasy genre to the reign of Queen Victoria: magic, Dwarves, Halflings, Gnomes, Ogres, Beastmen, and Eldren (or Elves). Although the book uses a cog motif on both its cover and throughout its pages, which might suggest that it is also a steampunk RPG, *Victoriana* is very far from this. True, there are steampunk elements mentioned in the book -- such as aerial steamships and Babbage's successful completion of his computing machine -- they are barely touched upon, and those wanting more of them in their game are directed to other games and supplements (*Castle Falkenstein* and *GURPS Steampunk* in particular).

One result of suggesting that *Victoriana* is a steampunk game comes as a result of its default set-up. This casts the characters as rebels against the corseted confines of Victorian society and its hypocrisies, which in combination with the game's magic and supposed steampunk elements might lead one to describe *Victoriana* as a 19th century *Shadowrun*. Even the authors do draw this comparison themselves, substituting the term "Gutter Runner" for "Edgerunner" to describe the player characters. Also, it should be pointed out, that since *Victoriana* is "Fuzion Powered," it is currently the leading Fuzion RPG.

The nominal year for the game is 1867 with the British Empire approaching its height. Her current and primary concern is leading the Anglo-French-Turkish alliance against Imperial Russia in the Crimea, where despite poor leadership and logistics, the discipline of the Redcoat continues to hold off the mass attacks of ill-trained peasantry thrown at their thin red lines. It is hoped that the arrival of British artillery will be enough to stem the successes gained by the Eldren Czarina Pyetra or Imperial Death Guard (lead by Stephanie, daughter of Kathryn Romanov, the Steel Czarina).

Elsewhere, Russia continues to play the Great Game in the hope of wresting India from under British rule and influence, while the French Republic is in decline at home and abroad. She is ruled by Louis Napoleon, nephew of the great Napoleon the Despoiler, who dreams of Imperial gains abroad, while at home he is remodeling Paris to further splendor and Communists provoke revolutionary fervor through her broad boulevards. On her borders, the wily Prussian Chancellor Otto von Bismarck schemes to unite the German nations into greatness. Italy also still consists of several nations, and while its politicians and statesmen work slowly towards reunification, it may not be fast enough for the fervor of the revolutionaries under Garibaldi, against whom the French have stationed troops in Rome to protect both the Vatican and its recently established liberal government.

Although not historically accurate, the major factors that make **Victoriana** an alternate setting are magic and religion. Magic is itself rare but not unknown, and is "strictly" governed by the Guild, the Geneva-based body that regulates the study of the arcane, such that it is possible to obtain a degree in Thaumaturgy. This is **Victoriana's** major college of magic, but it is also possible to learn magic outside of the aegis of the Guild. Primarily, this type of magic being Petty Magic, which involves enchantments that require hours of time and concentration, and resulting in the creation of foci which keep their enchantment and magic. Petty Magic is mostly the province of the shaman and the native magic wielder. Other colleges -- such as Demonology and Necromancy -- are outlawed, with reports of their use usually bringing Guild thaumaturges to investigate.

The status of magic in 1867 is very much down to the influence of the Aluminat Church, which lead an inquisition or persecution of magic practitioners that culminated in the Thirty Years War. In doing so it lifted Europe out of a "Dark Age" or "Age of Magic," during which time great deeds were wrought through magic. The Aluminat Church sees magic as the essence of Entropy and would prefer to stamp its order upon what it sees as a untrustworthy and chaotic. As more recent Aluminat sects, the Anglican and Evangelical Puritans are more trusting, and less tolerant of magic respectively. Other religions also exist at the extremes of Europe: the Celtic faith in the West, and the Asgardian in the North. Though the Aluminat church sees these old Gods as dark and dangerous, the Followers of Entropy are more dangerous to all faiths; their best face is that of Paline, Lady of Subversion, and patron goddess magic, who is worshipped by a pleasure cult throughout the artistic circles of European society.

Characters in **Victoriana** can come from all walks and levels of Victorian society. Humans can be Lower, Middle, or Upper class; Eldren Middle or Upper class; Dwarves and Gnomes Lower or Middle class; and Beastmen, Halflings, and Ogres of Lower class origins only. What they have in common is that they are all desirous of change -- change because they feel that the nature and structure of Victorian society is wrong, if not corrupt. They be a simple social reformer, or hold to something radical such as Bolshevism, Communism, Chartist ideals, nationalism, Nihilism, Anarchism, or even Free Trade. Though some of these are extreme movements, they can at least account for the 21st century attitudes of the players in coming to the ideals of Victorian society -- arranged marriages, sweatshop exploitation, sexism, racism and slavery, and so on . . .

Victoriana uses a slightly cut down version of the Fuzion rules, with characters possessing a set of six characteristics (Dexterity, Body, Intellect, Presence, Resolution and Luck) rather than Fuzion's more standard 10 (INT, PRE, WILL, TECH, MOVE, REF, DEX, STR, CON and BODY). Social class determines how many points are available to spend on these six characteristics -- 28 for Upper class, 32 for Middle and 36 for Lower, as well as a Gutter Runner's starting money and the skills they have access to. All characters receive 30 points to spend on skills gained during their prior experience, which are divided between two packages, one for their "Childhood Experience" and another for their "Past Career." A fair range is available, but players are also free to design their own. A further 25 Option Points can buy increased skills and derived characteristics, Talents (advantages), and Perks (both social and asset based), while Complications (disadvantages) can be taken to provide more Option Points. Among the Talents available are Medium, Petty Conjuror, and Thaumaturge for players who want their Gutter Runner to wield magic. The process is relatively easy, but not helped by a lack of character generation examples, though there are several completed characters at the end of the section. All six are actually write-ups of characters that appeared in the color fiction at the beginning of the book.

Most of the races in **Victoriana** are self-explanatory, but Beastmen are not. The rules lump them into a single race, but they can actually be of any species -- Goat and Dog Beastmen being common in England. Illustrations under the descriptions of India and China suggest, for example, that they may be home to Tiger and Panda Beastmen

respectively. Unfortunately, a player is expected to define their Beastman Gutter Runner that they want themselves, favoring for example Dexterity over Body and adding the Talent "Acute Sense of Taste and Smell" if they wanted a Rat Beastman. It would have been nice had the authors included a number of Beastmen packages for players to choose from, further easing character generation.

The mechanics employed by **Victoriana** differ little from those of Fuzion, but where they do, it is with the aim of emulating both period and genre. The opposed dodge roll found in ranged combat has been replaced by having a target number against which players must roll. Combat is deadlier because there is little armor available and characters have less health. They also feel the effects of their wounds, suffering modifiers to their action rolls to simulate their pain and discomfort. Like character generation, both mechanics and combat are well-explained, and although the various different aspects of combat are each given their own examples, one large one that combined brawling, the clash of swords, the discharge of firearms and sorcery being used in one big fight, would have also helped.

For the GM, there is plenty of advice and support -- a plethora of NPCs, monsters and threats; a guide to running fights in particular London or British locations -- the Rooftop Chase, the kitchen of a great house, a Pea-Souper or London fog, in a water mill, a bar room, aboard and on top of a train -- moving of course, and through the maze-like streets of the Rookery-Warrens; plus the scenario, "A White Wedding." Described as "An Introductory Penny Dreadful," this revolves around an Upper class character becoming involved in an arranged marriage from which the bride is less than happy to remain within its confines.

Also discussed in the chapter on GM support is how to run **Victoriana**. The suggestions look at both atmosphere and campaign ideas. The former includes Ghost Stories, the Golden Age of Empire, Farce, Grim Reality, Dickensian, Moorcockian, and Turning the Tables, while the latter suggests the Consulting Detective, A Fellowship of Interest, Guild Investigators, Long Live the Revolution, and Suffrage as potential campaigns. It is in these last two, and also in Turning the Tables, that the authors explore the Gutter Runner set-up presented in **Victoriana's** opening pages. It is however, not enough for either GM or player, especially when the game makes so much of it throughout the book. And even though the game might be set in an *alternate* 19th century, to even to attempt to alter -- let alone overthrow -- society feels so much like the act of micturition into a gust, considering the strength of society's inertia that they would have to overcome . . .

Of the several game atmospheres given, it is very clear from the various elements of **Victoriana** that the default playing style is definitely that of Moorcockian, seen of course in the previous RPGs, **Stormbringer** (or **Elric!**) and **Warhammer Fantasy Roleplay**. If you consider that both the Moorcockian and Grim Reality atmospheres are the authors' favored style of play, then it is all too easy to draw a comparison and ask a question. It is tempting to compare **Victoriana** and **Warhammer Fantasy Roleplay**, with perhaps **Victoriana** being seen as an update to the 19th century in terms of the background and feel of the world of ". . . Grim and Perilous Adventure." If these are the authors' favored style of play, this begs the question of why they are not made more of throughout the rest of the book?

Certainly, the cosmology of the setting, with its Planes of Order and Entropy, and their manifestations upon the Earth - the Aluminat Church representing order, and sorcery representing the various degrees of chaos -- all lend themselves to the Moorcockian feel. Likewise, the blurb on the back cover hints again at this set-up, and of great change, that the planes will soon align and revolution is coming . . . Yet as to the nature of all this, the author leaves it little explored . . .

In terms of production, **Victoriana -- A Roleplaying Game of Vile Villainy & Glorious Adventure** is very much a hit and miss affair. Though overall well done, the look of the game is sometimes too cartoon-like to match the grit of its subject. As to the writing, it is basically sound, but what the game very much needs a thorough re-edit and proofreading, particularly towards its end, where it grows increasingly slipshod and feels very, very rushed. The contents could also be re-arranged to make them far more accessible, which an index -- so unfortunately absent in a book this length -- would also have helped with.

The real problem with **Victoriana** is that it is a medley of elements needing to be worked into a cohesive work. The background as a whole is never explained, leaving the reader to wonder at the setting's deeply untold history -- which

had it been explained, would have provided a foundation for said medley, as would a timeline. Also, some of the elements are unwisely handled and perhaps may give cause to offend. These include having the Zulus of South Africa actually being a tribe of Orcs, and the renaming of what is so exceedingly obviously the Catholic church something else.

Although **Victoriana** is not intended to be a wholly historically accurate game, the history that is given, jars jaggedly with the game's default date of 1867. It can perhaps get away with having the Crimean War take place a decade and a half later than it did in our history, but talking about how a great calamity may beset India next year on the centenary of the Battle of Plessey, fought in 1758, is one such example. Other little things, such as having a language called Swiss, making the Portuguese speak Spanish, and denying the Ottoman Turks the Turkish tongue, are just as irksome.

Ultimately, **Victoriana -- A Roleplaying Game of Vile Villainy & Glorious Adventure** is a game in search of a direction, which is such a shame considering that its pages contain one all ready to use. And if said direction does make it feel like an update of **Warhammer Fantasy Roleplay**, it is at least a stronger hook for both players and GM than the one provided. Of course, this is only one direction in which an experienced GM could take the game, whereas the novice will very much be lost in one of London's pea soupers. As a potential toolkit to run a fantasy game set within the Victorian milieu **Victoriana -- A Roleplaying Game of Vile Villainy & Glorious Adventure** has its uses, but as a coherent whole, it just does not pass muster.

--Matthew Pook

Crisis On Alternate Apes!

"When in doubt, add monkeys!"

-- the First Rule of Drama, attributed to Lee Unkrich

Carmine Infantino knew this wisdom well, as did the producers of *Friends*. Anything that encompasses both Iris Allen and Jennifer Aniston has to be sound advice, right? So we'll take it, and present four highly miscellaneous **GURPS** campaign frames (although the latter three might also make good **Terra Primate** campaigns) unified only by the simian element. Four classic tropes of apes among us; four worlds where history -- went ape.

"And we -- my partners and I -- have brought back the living proof of our adventure, an adventure in which twelve of our party met horrible death. And now, ladies and gentlemen, before I tell you any more, I'm going to show you the greatest thing your eyes have ever beheld. He was a king and a god in the world he knew, but now he comes to civilization merely a captive -- a show to gratify your curiosity. Ladies and gentlemen, look at Kong, the Eighth Wonder of the World!"

-- Carl Denham (Robert Armstrong), in *King Kong* (dir. Merian C. Cooper, 1933)

With the raising of the final mirrors to the top of the Lighthouse of Alexandria in 280 B.C., the world had its Seven Wonders -- Kardenam of Carthage wanted to find the Eighth. Following the path blazed by his countryman Hanno two hundred years earlier, he traveled between the Pillars of Melkart around the great island of Libya and up the Black River to the deep jungles where the "forest men" lived. Here, he found lizards and insects grown to enormous size, as if left untouched from the Golden Age when the gods and monsters had left their spawn on Earth. But the mightiest of these giants was the one the natives called Kong, a "forest man" of tremendous size. Only the alchemistic vapors brewed by the sages of the Library allowed him to defeat the beast, sending it into an enchanted slumber. But when Kardenam returned his captive to Alexandria, Kong awoke and rampaged through the city, climbing the Pharos and howling defiance to the gods!

Perhaps the magics the Librarians used to subdue Kong had some effect, or perhaps Kong himself carried the curse of Kronos after being removed from his Golden Age kingdom. Suddenly, the seas were alive with giant monsters -- Ketos the dragon-whale (called "Gog 'sileos" -- "king of Gog" -- by the illiterate rabble) who breathed fire, the three-headed Chimera from Gadarea, the Hydra from 50,000 fathoms down, and giant turtles, moths, and so forth all attacking the cities of the East from Alexandria to Athens. Each enchantment used to defeat one monster calls up others in its wake, until the Librarians fear that Kong himself will return in glory to claim his new kingdom of the monsters from Ketos. Players in this **GURPS Greece-Atomic Horror** game can be Librarian magician-sages, bold Roman monster-killing heroes (whose lips oddly match their speech, unlike the Easterners), or plucky youths who befriend a giant turtle for some unfathomable reason.

"Flash, for countless years our special race of gorillas has thrived behind these mountains! But we're so few -- we know we'd be wiped out in any contest with humans!"

-- Solovar, in "Menace of the Super-Gorilla" by John Broome, in *Flash* #106 (April-May, 1959)

On October 17, 1902, Captain Friedrich Robert von Beringe led Dr. Oscar Engeland, a sergeant, and 20 askaris into the Virunga Highlands of German East Africa. What he found was a city built by intelligent mountain gorillas, hidden behind a vibratory screen that bespoke a deep understanding of electro-magnetism and a deep desire for peace. Von Beringe responded to both in the finest traditions of his First Hussar Regiment -- the *Totenkopffhusaren* -- and opened up with his machine gun on the silverback who approached him cautiously. This bold stroke of troop dominance cowed the gorillas; they surrendered their city and promised to teach Dr. Engeland (and many later German scientists) the secrets of their technology. But one or two young gorillas escaped, making their way across country to the British outposts in Buganda. Now the Kaiser deploys his electro-fliers and magno-dreadnoughts to humble Europe just as von Beringe overawed Gorilla-stadt -- the only hope lies with "Lord Greystoke's Men" -- a few British adventurers equally at home in the African jungles and the jungle of European diplomacy. Players in this **GURPS Steampunk** game might be hunters, spies, engineers, or explorers sent out by his Lordship to liberate Gorilla-stadt -- or by his rival Sir Allan of the Foreign Office to destroy it!

"In here, you can see these chimps are capable of many of the same tasks as men. And they are much more cooperative. They are being put through every phase of the astronaut training."

-- Wernher von Braun (Scott Beach), in *The Right Stuff* (dir. Philip Kaufman, 1983)

In 1959, scientists working at Holloman AFB assembled a colony of 65 wild African chimpanzees to train for space travel as part of Project Mercury. In January of 1961, after a lengthy dispute with von Braun and his design team (who favored a single-chimp capsule), the first four-chimp mission rocketed into space. But what neither the trainers at Holloman nor von Braun's technical team had counted on were the freakish effects of cosmic rays. Ham, Enos, Minnie, and Ben were changed by the radiation -- given not only intelligence but also astonishing powers. Surviving gun-camera photos from the splashdown show Ham stretching his arms for hundreds of yards to batter sailors while Ben smashed the hull of the *U.S.S. Donner*. Pilots saw Enos flying in a cloud of fire -- and no witness or camera ever saw Minnie. Ham was not content with his four fantastic chimps; he freed the Holloman colony, and began a series of ape-nappings from zoos and laboratories across the country. J. Edgar Hoover and the FBI fear the worst -- could Ham be assembling an army of super-apes for an undeclared war on the Air Force? RFK saw a different option -- could Ham and his friends be conciliated -- and recruited for the secret war against Communism around the globe?

This particular campaign frame might be **GURPS Atomic Horror** -- jut-jawed heroes against Inhuman Menaces From Beyond -- or the ultimate in "hunted mutant" **GURPS Supers** action, with the players taking the roles of the super-chimps, trying to help people while avoiding the Air Force and FBI. Perhaps you might split the difference; a mixed team of super-chimps, science-heroes, and grizzled Marine veterans could infiltrate Communist Latveria, thwart an invasion by Mole Men, and desperately try to defeat the Air Force-FBI conspiracy that wants the Kennedys -- "soft on monkeys and on Mao" -- dead! Impossible Monkey Force X -- ask not what your country can do for you, but ask rather what you can do for a banana.

"You are right, I have always known about man. From the evidence, I believe his wisdom must walk hand and hand with his idiocy. His emotions must rule his brain. He must be a warlike creature who gives battle to everything around him, even himself."

-- Dr. Zaius (Maurice Evans), in *Planet of the Apes* (dir. Franklin J. Schaffner, 1968)

Was it a secret KGB or CIA biowarfare station, in the heartland of Ebola? Or was it a corporate gene-research lab, looting the jungle ahead of mercenaries out for conflict diamonds? Nobody knows, but something escaped from somewhere in 2001, during the chaos of the Congo War. To the millions of dead in chaotic fighting, refugee massacres, ethnic cleansing, and famine were added those killed by the virus later known as "Zaius-B." But some victims survived, often gifted with uncanny apelike senses and reactions. And when Zaius-B hit the apes -- well, they got smarter. Smarter than anyone who had run the Congo in the last century, because they managed to team up and put down the rebellions, drive out the predatory foreign armies (and their mining-company partners), and get the planes flying on time. Of course, if you're human, life in the Ape Republic isn't great -- ducking your head to every chimp, baboon, and gorilla and never, ever showing your teeth hurts your pride. But it is life, of a sort, and more importantly, it gives order where there was once only chaos and death. The Belgians were more cruel, and they were far less efficient. Humans work in the fields and uranium mines -- "wild" humans are hunted down by helicopter gunships and by Zaius-B survivors more ape than man. The Ape Republic has expanded its order -- and the etiology of Zaius-B -- throughout the civil war-torn belly of the continent, from Brazzaville to Luanda and from Harare to the Nile. Seven African countries have fallen -- and the apes press hard against Uganda, Tanzania, and Gabon.

This setting can host anything from the gritty commandos of **GURPS Special Ops** to **GURPS Black Ops** modern pulp heroism as Strike Force Charlton liberates key men, mines, and UFO crash sites from the aggressive empire of the apes. Campaigns can explore high politics (Does the UN recognize nonhuman governments?) and dark horror (What if the apes are brewing a new, improved plague?) alike -- or the PCs can be the brave new apes trying to balance the evolutionary scales and endanger some other species for a change. Whichever side you take, both know that a battle for a planet of the apes has begun.

Consequential Drift

I've received a few emails and a comment or two on the message board about my somewhat uncharacteristically emphatic advice in [last week's column](#), wherein I recommended that GM's strongly consider a "dead folks remain dead" policy. For some folks it seemed an odd position to take a strong stand on.

(I also promised a sequel to that column. This ain't it. Our apologies for those of you who waited all night in line for tickets for that installment; Elvis has left the column.)

Anyway, I mulled it over a bit and tried to figure out *why* that was a hot button for me. And I came to a conclusion that, even if it isn't right, is good for at least 1,000 words of contractually obligated columny goodness.

I realized that the decision to bring a character back to life - no matter the circumstances or intentions - can have unforeseen consequences on the rest of the campaign, which can be *very* difficult to undo. Like all unforeseen consequences, they're insidious; they aren't something that can come to light or be overcome by simple contemplation (since, by definition, they're unforeseen).

For example, in my first **GURPS Supers** game I ran (and, really, it was the first roleplaying game I ran for more than a one-shot) one of the players wanted to play a character called "Alter-Ego." It was a character with three personalities: a "normal" one, who was a scientist; one called "Ego," who had various mentalist powers; and one called "Alter," who could absorb matter and turn it into other things that he had memorized.

Now, long-time GMs may realize that this character might pose some problems. **GURPS** aficionados may believe the difficulty came from the half of the character who used **GURPS Psionics**, whose point structure always seemed fairly distant from **GURPS Supers** (as witnessed by the PC who could only toss around one mountain at a time, mostly because I refused to put more than one in any background description). But no; the difficulty came from the "Alter" side.

Yes, I knew the character would be powerful. Matter manipulation is like that. But it was a reasonably powerful campaign, and there were a number of limitations I thought would keep him in control: multiple personalities, limitation of a couple pounds of matter, limitation of a minute or so of keeping the matter absorbed . . . no big deal, right?

Yeah.

It was my first real exposure to the adventurer maxim of, "If it's not nailed down, take it. If it *is* nailed down, use a crowbar. If you can pry it up, it wasn't nailed down well enough; take it."

There were no nouns in my campaign that were not assimilated into this character. Keys? Absorb. Guns? Absorb. Rope? Absorb. Gadgets? Radios? Chemical concoctions? Absorb absorb absorb.

And each adventure Alter-Ego would find new ways for me to remove my hair before maternal genetics had a chance. And each adventure I would sheepishly make requests of additional limitations to be placed on the character's powers: It costs more energy, you only have a limited number of slots, it takes longer than it did previously. And nothing helped. It's not that he was *trying* to be a munchkin . . . not in the slightest. But the way the power worked and the logic behind it made *not* using that power seem like a dumb decision in most circumstances.

Finally we resolved the situation (more or less) by having a chat; he used his powers in a somewhat more restrained fashion, making sure to take an appropriate amount of "screen time" but not upstaging anyone. And things were okay from then on. (Of course, whether or not this was an *appropriate* solution is open to debate . . . and may be the subject for another column. In the short term I'll note that it's difficult to envision Superman saying, "Well, I *could* save the world with my heat vision . . . but I'll give Aquaman a chance and see if he stop Darkseid with his <snicker> fish . . .")

In short, the game was a victim of unforeseen consequences. Oh, sure, in hindsight I could have predicted some of what happened with the inclusion of that character and his powers . . . but when a character can transform matter without much effort, that means:

- He need not be imprisoned, so long as he can make explosives, lockpicks, chisels, sledgehammers, and the like.
- He need never be poor, so long as he can make diamonds.
- Practically *any* adventure revolving around limited resources of any type no longer applies.
- If you give any NPCs specialized or interesting equipment and the heroes capture it, you've given them not only their neat loot, but an *infinite supply* of their neat loot.
- And so on.

Anyway, the point of this anecdote is that I suspect much of the reason gamers are often so social outside of a gaming environment is because they're trying to keep others from making the same mistakes they did. Some of these mistakes are easily taken care of, like when I made the *perfect* scholarly priest character for one campaign, only to realize halfway through the first adventure I'd neglected to make him literate. Others can have far-reaching and unexpected effects that can be difficult to untangle, like introducing time travel, clones, alternate universes, or Ultimate Evil to a campaign. Or bringing back characters from the dead.

Parents often say, "I don't want my kids to make the same mistakes I did." (Of course, this always begs the question, "So it's better to take my chances with mistakes you *didn't* make, so that none of us have any idea how to fix them?") So if I was emphatic in last week's installment, it's only because I know all too well the dangers of unforeseen consequences, and how difficult it can be to unravel them otherwise. For me personally, the best way to fix a mistake is to keep it from happening in the first place.

Playing to the Crowd

Influencing Groups and Societies in *GURPS*

by Matt Riggsby

Competent social characters influence people. Truly ambitious social characters influence societies. Attempting to influence public opinion and make changes within a society, though, is both difficult and complex. No group of people is a unified whole. There is always a range of opinion and ideas, and even a consummate master of public opinion can be surprised by sudden shifts in public perceptions and the appearance of new opposition. Nevertheless, true power can come from influence over hearts and minds.

This system presents rules for influencing groups of people, from church congregations and departmental committees to entire societies, and conducting conflicts between groups within a society. This works on two levels. At a low level, a character can influence groups of people fairly directly with public speaking, distributing propaganda, and winning the support of key leaders. This may be sufficient for gaining the support of groups of moderate size, but any society of any appreciable size will be too large for any one person or small group of people to win over entirely. At a higher level, groups will struggle against one another. This article includes rules for determining the outcome of those conflicts, which may be led or influenced by PCs.

This article draws on concepts from a number of other sources, including [mass combat](#), [power and faction](#), and extended rules for [Memetics](#) skill and [social skills](#). Although not absolutely necessary, you may wish to review them before using these rules.

Procedure

The basic procedure for influencing a group consists of four steps:

1. GM identifies groups and any component factions, determines Social Strength values and range of opinions
2. Character decides which group to influence and what skill to use.
3. GM determines modifiers and appropriate skill roll is made.
4. Social Strength changes are applied and GM determines other consequences.

Social Strength

Social Strength is a measure of a group's ability to bring about or prevent changes. SS is a combination of wealth, social standing, legal and moral authority, popularity, and the size of the group. First, figure the average Wealth, Status, and total Reaction modifiers for group members and combine the modifiers for each as given in the table below.

Wealth	Status	Total Reaction	SS Modifier
Dead Broke	-4 or less	-4 or less	+.1
Poor	-3	-3	+.2
Struggling	-2	-2	+.25
	-1	-1	+.5
Average	0	+0	+1
Comfortable	1	+1	+2
	2	+2	+3
Wealthy	3	+3	+5
Very Wealthy	4	+4	+7
	5	+5	+10

Filthy Rich	6	+6	+14
Multimillionaire or more	7	+7	+18
	8 or more	+8 or more	+25

For example, a member of the modern middle class would have a SS of 3 (+1 for Average wealth, +1 for Status 0, and +1 for an average reaction modifier of +0). A moderately wealthy Medieval noblewoman of low rank might have an SS of 7.5 (+2 for Comfortable wealth, + 5 for Status 3, and +.5 for a small Social Stigma). The GM may derive other modifiers if an average level is between two entries on the table. For example, a group of craftsmen might have as many Wealthy members as Comfortable members, for a Wealth modifier of +3.5. Once you have determined the average SS, determine the group's SS by multiplying average SS by the number of people who are in it. For example, a group of a hundred wealthy Roman freedmen might have a SS of 525 (+5 for being Wealthy, +.25 for Status -2).

For matters purely internal to a group, the Rank advantage provides an additional +1 to SS per level. For example, if a government minister wanted to convince his colleagues to adopt a new method of bookkeeping, the Administrative Rank of bureaucrats would add to their Social Strength. If he wanted to convert them to a new religion, it would not.

The GM must determine the SS of any group a character attempts to influence. While it's possible to determine the SS of an entire society, from beggars and peasants up to presidents and emperors, the GM can often get away with only determining the SS of some segment of that society. Any group is likely to be divided into [factions](#). The GM must also determine the composition of those factions and how SS is distributed between them.

Example: An ambassador from the city of Gelano to the city of Venezepoli is trying to gain a reduction in import duties on raw silk, Gelano's major export. Although Venezepoli has nearly 90,000 residents, he only needs to win the support of the law-making bodies, the Senate and High Council. The Senate is made up of 240 people, including heads of important households, guild leaders, and other men of some wealth and importance. The GM decides that they are mostly Wealthy (+5 SS) and have Status 3 (+5 SS), but no particular reaction bonus or penalty (+1 SS). The Senate as a whole has $(11 \times 240) = 2,640$. The High Council is a body of 20 very rich and powerful men with special religious responsibilities and the wealthy Duke. The GM decides that the average wealth of the councilors is between Very Wealthy and Filthy Rich for +10 SS per member. They're Status 4 (+7 SS) and have a +1 reaction bonus for Clerical Investment (+2 SS). The council has a SS of $(19 \times 20) = 380$. The Duke himself is Status 5, Filthy Rich, and is personally charming (total reaction bonus +3) for a total SS of 29. The total SS of Venezepoli's ruling class is 3049.

Opinions held by members of a group are represented by portions of its Social Strength being committed to different propositions or ideas. On any given issue, a group's Social Strength may be neutral or committed to a specific position. On many issues, opinion may be divided between "for" and "against" (for or against a war, for or against a particular religious reform, etc.). However, other situations may call for multiple options. For example, an election might have neutral and committed to various candidates. The task for characters is to change that distribution in favor of their own positions.

Social Strength is divided between positions on the basis of points, not individuals. SS allocation is a measure of how much power the group as a whole will bring to bear on the issue. Some individuals will be enthusiastic; others will be half-hearted and provide only nominal support. Having, say, 200 out of 400 SS in favor of a proposition may mean that half of the people involved are fully committed to the position and the rest are entirely neutral, or it may mean that some are fully committed while a rather larger number are moderately in favor.

Example: The GM initially decides that the Senate has a faction of about 90 people in favor of a more aggressive stance against Venezepoli's traditional enemy, Miloma. As such, they aren't in favor of reducing any taxes. They represent 990 SS, with 450 SS against and 460 SS neutral. A small group of cloth merchants and related tradesmen, about 25 in all, are in favor of reduced costs: 275 SS, with 150 SS in favor and 125 SS neutral. The remainder of the Senate is largely unconcerned (100 SS for, 75 against, 1,200 neutral). The High Council is divided but more against than for (140 against, 100 for, 140 neutral). The duke himself has no position. Totals are 665 against, 350 for, and 1,954 neutral. Initial conditions are not good for the Gelanoese ambassador, but there's a lot of uncommitted opinion left.

In practical terms, distribution of SS can be used to gauge public opinion and popularly held belief. Anything with more than 20% of a society's SS behind it is a reasonably well-accepted idea, if not a particularly tightly held view. Controversial ideas will have at least 20% of the society's SS on either side. Most traditional beliefs and practices will have at least 75% of their society's SS in favor of them and very little SS actually against them. However, large, complex ideas and practices can be subdivided into more and less popular aspects. For example, the earliest Protestants were very much against the Catholic church, but remained very much in favor of Christianity, the Commandments, church-going, and so on. Likewise, most revolutions have been aimed at removing specific unpopular leaders (who have a great deal of SS against them), not at reworking an entire political system (which have more SS for than against). Some ideas and practices may have a surface acceptance but are rarely practiced (for example, some historical Muslim nations, which have a nominal prohibition against alcohol, saw regular wine-drinking, at least among the upper classes). "Lip-service" ideas will have perhaps 10% of the society's SS behind them, perhaps a similar amount of SS against them, but opinion will be largely neutral.

It's also worth keeping in mind that traditionally held views and officially-endorsed opinions are in many ways self-maintaining. Government propaganda, church sermons, and traditional observances can all be regarded as ongoing, almost automatic, attempts to maintain public opinion. Even if no one decides to take action to directly counteract the work of activist PCs, many aspects of the status quo will serve to lure people back to traditional ideas. Nevertheless, if PCs start to have a visible impact, there certainly will be some kind of backlash. In the example of the Gelanoese ambassador, if he became too successful in arguing in favor of dropping the tariff, the GM would eventually decide that a member of the opposition decided to campaign against the tariff proposal. At that point, both the ambassador and the opposed senator would hold their own meetings, write letters to key senators, wine and dine the high council, and otherwise make a series of persuasion attempts until the matter was voted on by the senate.

Persuasion Attempts

Once the GM has established the relevant factions and their opinions, characters may attempt to persuade them to their own positions. This persuasion is usually performed by either speaking to groups or distributing written propaganda. For public speaking, a character uses Bard skill; the same skill is used for radio and TV broadcasts, public telepathic transmission, and other forms of verbal communication. Bard can be used on any audience the speaker can gather (or broadcast to) so long as he speaks their language. Most orators would be hard-pressed to effectively reach a live audience of over 1,000, but can reach more with artificial amplification or by using broadcasting. Once such technology becomes available at TL 6, larger audiences can be reached by amplification or through paid broadcasts or advertisements at a cost of \$.015 per person. Characters may attempt to drum up audiences with public criers, advertising posters, offers of free food and drinks, or by inserting their own speaker into other public events likely to draw a crowd (religious ceremonies, sporting events, etc.), but ultimately the size and composition of the audience is up to the GM.

Writing skill can be used to persuade any literate audience using pamphlets, broadsheets, printed advertisements, newspaper editorials, and so on. Typically, it takes time and money to produce and distribute written propaganda. Written propaganda is particularly expensive at low TLs, where each copy must be hand-written, but the invention of the printing press speeds things considerably. Initial composition takes skill - 30 hours of work, minimum six hours. It takes \$.5 and 30 minutes of preparation time per person in the intended audience at TL 3 or lower, \$.20 and five minutes of preparation time (maximum eight hours) per person at TL 4, \$.01 and 30 seconds of preparation time (maximum eight hours) per person at TL 5 or higher. This only covers the time to prepare letters, print pamphlets, and so on; actual distribution may take a few additional days. Moreover, not all people who are exposed to written propaganda will pay attention to it. Only $10 + (3d6 \times 5) \%$ of the intended audience will read written propaganda and be subject to the persuasion roll.

Example: If the Gelanoese ambassador were to write letters to every member of the Senate (pre-printing press, TL 3), it would cost \$120 and take 120 hours to copy them out by hand. Since the letters are going to people living in the same city, he could probably have runners distribute them in an hour or two.

The GM may allow other social, artistic, and professional skills as well. For example, a minstrel could use his Singing skill to influence his listeners with a partisan ballad. In a preliterate or semi-literate society, Artist skill might be used

to produce satirical cartoons. With the advent of mass communications around TL 5, the GM should allow a Professional Skill (Advertising) to take the place of Bard and Writing.

Other skills may be used to persuade smaller, more focused groups of people. Carousing, Savoir-Faire, and Streetwise skill may be used exert personal charm in favor of the character's position at social events. A character may attempt to use those skills at events including no more than $(\text{skill} \times 2)$ people. Savoir-Faire may only be used among gatherings of high-status individuals. Streetwise may only be used among criminals and other rough company. Carousing can be used at just about any social event.

Diplomacy and Politics may likewise be used to influence groups, but through quiet negotiation, personal networking, and building consensus. They may be used to influence any number of people but, unlike the other skills, they can take a great deal of time. The time is spent in polite small talk and round-robin negotiation rather than direct persuasion. Attempts to use Diplomacy and Politics require 4 hours per person to be influenced. Individuals who are strongly opposed to the persuading character's position may also make themselves unavailable and not subject to the results of the skill roll. However, they can still take up time; a particularly ornery official may keep a petitioner waiting in his vestibule for hours without seeing him or play phone tag for days.

Example: Influencing the High Council and the duke with Diplomacy would take 84 hours. Assuming the high officials make themselves available in one way or another 10 hours a day, it would take the ambassador over a week to get to them all.

Persuasion Rolls

After each speech, pamphlet distribution, or other attempt to persuade an audience, roll against the appropriate skill, modified by total reaction modifiers (from Charisma, Reputation, etc.) and other modifiers detailed below. Persuasion attempts using Bard are modified by the speaker's Appearance (if the audience can see him) and Voice. Persuasion attempts using Writing do not gain bonuses from Charisma, Appearance, and similar personal advantages. If the roll succeeds, $(\text{margin of success} \times 2)\%$ of the SS of the audience (the people who heard the speech, read the pamphlet, etc.), rounded up, shifts one step in the persuading character's favor. That is, opposing SS becomes neutral and neutral SS becomes positive. Players may designate how the SS they influence is distributed. If the roll fails, there is no effect. On a critical failure, 2d6% of opinion shifts away from the character's opinion.

Example: The ambassador makes an address to a committee of the Senate with 40 members. The GM decides that it includes members of neither the pro-tariff or anti-tariff factions. However, many of them are members of the Montalet family, who have a long-standing if seldom expressed dislike of the Capugues, a prominent cloth trading clan. The committee has a SS of 440; the GM decides that it has 100 SS against the reduction, 120 for, and 220 neutral. The ambassador has a Bard skill of 14, and the GM rules that he suffers a -2 modifier (to approve the tariff reduction, the bulk of the committee would have to make a vote advantageous to a rival). It's a good speech, and the ambassador rolls a 7, making his skill by 5. He moves total of 10% of the committee's opinion, 44 SS. The ambassador's player decides to split it evenly, making 22 of the SS against his position neutral and 22 neutral opinion positive. After the speech, the committee's opinion is 78 SS against, 142 for, and 220 neutral. The total opinion of the ruling class is 643 SS against, 372 SS for, and 1954 SS neutral.

For small groups, the GM may treat the audience members as a single group with a single total modifier. However, for persuasion attempts against large groups, the results of the persuasion roll should be applied separately against each faction it contains.

Example: The Geloanese ambassador has an opportunity to address the entire Senate and High Council. He makes his Bard skill by 1. This counts as a success by 3 against the anti-tariff faction (who derive a small benefit from it for a +2 bonus), a failure against the Montalet and pro-war factions (who have modifiers of at least -2), and a success by 1 against the remainder of the Senate and High Council.

Sample Modifiers

Position provides a small benefit (small tax relief, physical convenience)	+2
Position provides large benefit (total tax relief, physical luxury)	+4
Benefit to be realized immediately	+1
Position involves small risk (e.g., legal inconvenience, small tax increase)	-3
Position involves large risk (e.g., risk of war or imprisonment)	-5
Risk or benefit is long term rather than immediate	×1/2
Temporary alliance required with opposed group	-2
Temporary alliance required with traditional enemy	-5
Long-term alliance required	×2
Increase/decrease CR in one area of law (weapons, civil rights)	-1
Increase/decrease regulation on minority group	-2
Increase/decrease overall CR generally	-3
Increase/reduce power of central authority	-3
De-emphasize existing religion/ideology (introducing limited market reforms in Communist economy, moderate humanist reforms in theocracy)	-4
Introduce new religion/ideology	-6

The GM may, of course, apply other modifier as necessary. Proposals which have no clear benefit or harm may nevertheless meet considerable resistance if they are seen as immoral or otherwise inappropriate. For example, legalizing alcohol in a strict Mormon or Muslim community would have at least a -3 penalty.

The modifiers above also assume that the ideas being proposed make sense to the intended audience. Some ideas require considerable cultural preparation before they'll be accepted. For example, the average Medieval peasant probably wouldn't understand idea of modern representative democracy (democratic time travelers might start slow with the idea of landowners electing a king). Likewise, Rastafarian theology would sound like incoherent gibberish to a Byzantine clergyman.

Charity and Entertainment

A character may gain temporary bonuses by buying the good will of a target group, giving alms to the poor, sponsoring religious festivities or sporting events, throwing lavish parties, and so on. This will provide a bonus to the character's next attempt to persuade the target group. For example, endowing a charity hostel would provide a bonus to an attempt to influence the urban poor, while sponsoring a grand ball would influence the aristocrats who attend. The cost of such an event is $(\text{monthly cost of living}/100) \times (\text{bonus}^2)$ per person to a maximum bonus of +3. The number of people to spend for is the intended size of the target group; individuals may choose not to show up at parties, go to the country instead of attending the games, etc. However, in most societies, only the very rich and powerful will pass up free food and entertainment, so that's rarely an issue. The cost to give a +2 bonus to a group of 100 middle-class peasants (Status 0) by sponsoring a feast on a holiday would be $(200/100) \times (2^2)$, or \$800. The bonus would apply only to those peasants who attended the feast. Sponsoring events also gives the sponsor an opportunity to distribute leaflets, make speeches, and otherwise interact with individuals who might not typically be available to him.

Example: The ambassador invites the High Council to a dinner, at which he'll try to subtly try to influence them with his Carousing skill (which he has at 11). Figuring he needs to really impress them, he goes all-out for the maximum bonus. Cost of living for status 4 is \$2500, and \$5000 for status 5. Therefore, he shells out $(2500/100) \times 3^2$ for each of the councilors and $(5000/100) \times 3^2$ for the duke, a total of \$4950. This money is spent whether or not they all show up.

Secondary Skills

Other skills may be used to support persuasion attempts.

Writing: A well-delivered speech is always enhanced by being well-written. A character with Writing skill (who does not have to be the one delivering the speech) can produce a speech to address a specific class of people. A speaker gains a bonus to Bard skill equal to the writer's margin of success for a small, homogenous group (a single union local, a military company) to a maximum of +5. Divide by two for a larger but fairly homogenous group (all farmers in a state or small nation) or by four for members of a large, diverse group (everybody in a large city or Medieval country).

Psychology: Psychology skill can provide useful insight into the thoughts and desires of a group. A psychological analysis can be used to tailor a message for a specific class of people, just as Writing skill can. However, it can be used to support any one skill roll (Bard, Writing, Diplomacy, etc.), and it only provides half the bonus (half of the margin of success for a small group, 1/4 for a large homogenous group, and 1/8 for a large, diverse group).

Memetics: A successful [Memetics](#) roll provides a bonus equal to the margin of success to all persuasion attempts intended to spread the meme in question. There is no adjustment for group size; group size is already accounted for in the Memetics skill roll.

Enthrallment: Enthrallment skills can be used in conjunction with persuasion attempts using Bard skill, providing additional benefits over and above those provided by the persuasion attempt itself. In attempts to accumulate Social Strength, the Persuade skill will move an additional (number of targets $\times$ average SS of audience) points of SS in the speaker's favor. Suggest and Captivate add the targeted number of people to demonstrations, riots, and strikes (see Other Uses of Public Opinion below). All Enthrallment skills can be used with fund-raising attempts, adding (number of targets $\times$ average SS of audience) to the effective favorable SS of the audience.

Other Uses of Public Opinion

Public opinion and persuasive skill can be put to other uses. Just as characters can talk people into helping them, they can also attempt to persuade groups of people to take direct action or to color their opinions of individuals. Here are some possibilities:

- *Endorse/Defame:* Rather than spreading a message, a character may work on the audience's opinion of other messengers. A persuading character may work in favor of or against an individual. If the persuasion roll succeeds, the audience will react to the target at (margin of success)/2 for the next 1d6+2 days to a maximum of +/-5 (the persuading character decides if it's a positive or negative modifier); this may be treated as a temporary Reputation.
- *Fund Raising:* A character may solicit donations for his cause. If successful, he receives \$(margin of success $\times$ SS of the audience in his favor $\times$ audience's average monthly cost of living $\times$.005).
- *Demonstrate:* Crowds can be convinced to make a public demonstration of their opinion by marching, gathering in one place and shouting slogans or singing, and so on, as appropriate to the society, for 1d6+1 hours. The number of people present at the demonstration is ((SS of the audience in his favor + (margin of success $\times$ 4%)) / average SS of the audience). The persuading character may delay the demonstration, but the number of people to appear will decrease by 1d6% per day.
- *Strike:* Strikes are a traditional weapon of the oppressed. Compute a number of people who will stop work as for a demonstration, but divide by two. 2d6% will return to work for each day the strike lasts.
- *Riot:* Rioters will break windows, set fire to things, and engage in fistfights. Compute the number of people as for a strike. 4d6% will stop rioting each hour the riot lasts.

Example: A union activist makes a firey speech before a thousand lower-class factory workers. Ranging from Poor to Average wealth with a range of Status going no higher than zero, the GM decides they have an average SS of 1.5 and monthly cost of living of \$300. They're not at all happy about their lot, so 60% of their SS, 900, is in favor of the proposition of increased pay for workers. The activist makes a Bard roll by 3. If he were speaking against a company boss, the boss would suffer a -2 reaction penalty for several days. If he wanted contributions, he'd get $$(3 \times 900 \times 300 \times .005) = \$4050$. If he wanted a demonstration, he'd lead a group of $(900 + (3 \times 4\%)/1.5 = 672$ people. 336 would be involved in a riot or a strike.

Personal Consequences

Attempts to change opinions often have some kind of fallout, and the more effective they are, the greater the chance something unexpected will happen. After any attempt to change opinions, the GM should roll 3d6. Add one to the roll if less than 50% of available SS remains neutral. Add two if less than 25% of available SS remains neutral. If the character succeeded at his skill roll, add the margin of success. On a 16+, roll on the personal consequence table and apply the results to the character.

Personal Consequences Table

Roll 2d6

- 2-3 Roll on Lasting Personal Consequences table
- 4 Character subject to a concerted physical attack. This may be anything from a random enraged citizen to a carefully planned assassination attempt.
- 5 Character suffers a -1 Reputation for 1d6 weeks
- 6 Character is subject to a civil lawsuit
- 7 No consequence
- 8 Character is subject to a criminal lawsuit with a threat of exile, or imprisonment
- 9 Character gains a +1 Reputation for 1d6 weeks
- 10 Character is given a donation "for the cause" of $1d6 \times$ campaign starting wealth
- 11- Roll on Lasting Personal Consequences table
- 12

Lasting Personal Consequences

Roll 3d6. Wealth cannot be increased beyond Filthy Rich or below Dead Broke.

- 3 Lose -10 points of Reputation permanently (either take a -10 Reputation or reduce the cost of an existing reputation by 10 points)
- 4 Lose one level of Wealth
- 5 Lose 10 points of Ally/Ally Group or gain an Enemy worth 10 points
- 6 Lose -5 points of Reputation (either take a -5 Reputation or reduce the cost of an existing reputation by 5 points)
- 7 Lose -5 points of Ally/Ally Group or gain an Enemy worth 5 points
- 8 Gain an Enemy worth -5 points
- 9 Lose one level of Status
- 10 Roll twice, ignoring further rolls of 10. Apply *both* results.
- 11 Gain one level of Status
- 12 Gain an Ally/Ally Group worth 5 points
- 13 Lose -5 points of Enemy disadvantages or gain an Ally/Ally Group worth 5 points
- 14 Gain 5 points of Reputation (either take a 5-point Reputation or increase the cost of an existing reputation by 5 points)
- 15 Gain an Ally/Ally Group worth 10 points
- 16 Lose -10 points of Enemy disadvantages or gain an Ally/Ally Group worth 10 points
- 17 Gain one level of Wealth
- 18 Gain 10 points of Reputation (either take a 10-point Reputation or increase the cost of an existing reputation by 10 points)

Individual Reaction and Subversion

It's also possible to work to persuade powerful individuals to use their SS for a cause using the usual rules for social skills. Any character can have a reaction to an idea as well as to a person. Someone with a Good reaction to an idea will lend 33% of his SS to a position. A Very Good reaction will get 66% of SS, and an Excellent reaction will get 100% of SS. If you're using [extended rules for changing individual reactions](#), the SS an individual will lend to a cause is equal to $(\text{Reaction Number} - 10) \times 10\%$. Working on a person-by-person basis is usually inefficient, but it can be

useful for extremely powerful rulers and leaders of opposed factions.

At the GM's option, individuals with enough influence over a body of followers to have them as an Ally Group will bring an equivalent amount of their SS with them. For example, a government minister has a batch of courtiers as an Ally Group. He is persuaded into a Very Good reaction to an idea. Not only does the position get 66% of his SS, it also gets 66% of the SS of his Ally Group. However, the GM will have to decide this on a case-by-case basis. A group of noble retainers will probably follow their master's political leanings out of loyalty and common interest; a street gang or pirate crew will more likely stick with their own opinions rather than follow their nominal chief.

Another use of social skills on individuals is to persuade them to work on your behalf. For example, a prominent official or popular hero might be talked into making a speech or writing letters supporting your cause. That persuasion attempt would use that character's skills and advantages, and might grant entry to groups the persuading character might not otherwise be able to reach.

Social "Mass Combat"

This is all well and good for gathering support for a proposition or spreading ideas (for example, popularizing a new religion). Some attempts at social change, though, will require some kind of confrontation. For example, passing a new law or electing a leader requires a distinct moment of decision. Such social confrontations are conducted using a process similar to the mass combat rules: when the conflict comes to a head, the strengths of each side are compared, other skill modifiers are selected, leaders roll a contest of skills, and consequences are applied. In social confrontations, though, battles may be a bit harder to start and Politics rather than Strategy is the applicable skill. The procedure for resolving social confrontations is as follows:

1. Force a confrontation
2. Resolve extraordinary strength use
3. Resolve catastrophes
4. Compute SS ratios
5. Roll contests of Politics skill
6. Resolve outcome and personal consequences

Forcing Confrontations

Confrontations don't necessarily happen on their own. For example, some governments may have regularly scheduled elections, which give a time frame for certain confrontations. However, other questions must be forced by their partisans. To pass new laws, for example, legislators must be convinced to consider the new legislation. If there is no preexisting timetable for a confrontation, at least 25% of relevant Social Strength must be committed (that is, not neutral) before one may even be attempted; otherwise, there's simply not enough interest. In order to make a confrontation take place, the leader of one of the interested parties must make a successful roll against his Politics skill. This roll may be resisted by the Politics skill of a leader of an opposed cause. If the character attempting to force the confrontation wins, the confrontation will take place in 1d6 weeks. All sides can spend the final weeks making last-minute speeches, trying to influence important figures, and so on.

Exceptional Strength

Magic, psi, and other exceptional powers have a place in social conflicts just as they do in mass combat, but they require powers with a somewhat different focus. ES points in social conflicts are computed as ES points in the [mass combat system](#), but instead of combat-related spells and abilities, they are earned for information-gathering and influencing abilities (telepathy powers, divination spells, etc.). Opposing leaders allocate points to the uses below:

- *Divination*: Using exceptional powers to look into the future to better plan actions. +1 to Politics skill per 3 ES points to a maximum of +3.

Catastrophes: +1 to another side's Catastrophe roll per ES point.

- *Confusion*: Sowing confusion at high levels of an enemy's organization. -1 to an enemy's Politics skill per 2 ES points to a maximum of -5.
- *Dischord*: Encouraging disagreement among the rank-and-file of an enemy. -50 to an enemy's SS per ES point.
- *Morale-building*: Enhancing coordination and positive attitudes on one's own side. +50 to own SS per ES point.
- *Defense*: Points may be allocated to defend against enemy attacks, each point negating a point of the enemy's ES.

Catastrophes

Things always go wrong at the last minute. For each group involved, roll 3d6 on the table below.

Roll Catastrophe

3-7	No catastrophe.
8-9	Poor communications hamper plans: -1 to Politics roll.
10-11	An enemy calls on unexpected resources (pick one randomly if there are multiple opposed groups). Increase that side's SS by 10%.
12-13	Last minute scandal. -2 to Politics roll.
14	Faction leader threatens to bolt. Make a roll against an appropriate social skill or suffer -1d6% SS.
15	Dissension among allies or top leaders weakens organization. -1 to Politics roll, -1d6% to SS.
16	In a last-minute schism, a faction leader bolts; 1d6% of SS defects to another side.
17	Major internal dissention. -2 to Politics roll, -2d6% to SS.
18+	Designated leader injured or detained. Base Politics roll cut in half or pick another leader at -5 to his Politics skill.

Social Strength Modifiers

As in the Mass Combat system, the strength of relevant groups is treated as a modifier to the leaders' skill roll. Compute the Social Strength ratings for each position. Find the ratio of SS of the stronger side to the weaker one on the Social Strength Ratio table below to get the modifier to Politics skill. If there are more than two positions, compute SS ratios relative to the weakest side.

Example: In a four-way election, candidate Bob has a total of 1490 SS in his favor, candidate Carol has 2909 SS, candidate Ted has 2998 SS, and candidate Alice has 5772 SS. Carol (about 1.95 to 1 over Bob) gets +5 to her Politics roll, Ted (a tiny fraction over 2 to 1 over Bob) gets +6, and Alice (at about 3.87 to 1) gets +7.

Social Strength Ratio

Odds	Politics skill bonus
1.1 or less	No bonus
1.1+ to 1.2	+1
1.2+ to 1.3	+2
1.3+ to 1.5	+3
1.5+ to 1.7	+4
1.7+ to 2	+5
2+ to 3	+6
3+ to 5	+7
5+ to 7	+8
7+ to 9	+9
greater than 9	+10

Other Modifiers

Social conflicts have their own kind of "superiority" modifiers. Either side of a conflict can have an advantage if they are seen as having moral or legal weight on their side, or at least the heavy guns. Any faction in a social confrontation gets a +2 to Politics skill for having clear support of each of these: legislators, judiciary, military, or spiritual and religious authorities. For example, in a confrontation between a popular uprising backed by a secular military against a theocratic government, both sides would get a +2. The popular uprising has the overwhelming support of the military, while the government has the overwhelming support of religious authorities. Assuming the opinions of the nation's legislators and judges are divided, they provide no bonus to either side.

Finally, public perception of the people involved in a struggle is important. As with persuasion attempts, a leader's total reaction modifiers are applied to the Politics roll.

Resolution

When catastrophes have been resolved, exceptional powers used, and Social Strengths computed, all leaders roll against their modified Politics skill to see how the confrontation comes out. Margins of victory are computed relative to the highest roller, who must get a definite victory over *all* other positions in order to win the confrontation. For a contest between multiple positions, it's very easy to come up with an inconclusive result and fight it out all over again in a few weeks.

Margin Result

0-2	Inconclusive. No laws are passed or candidates elected, but the side which caused the confrontation is at +3 to force another. Other sides lose 1d3% of their support.
3-5	Marginal victory. As with an inconclusive victory, no laws are passed or candidates elected, but 1d6% of support for losing positions becomes neutral and there is automatically another confrontation in 1d6 weeks.
6-9	Definite victory. The winning side's candidate or law is successfully established. 2d6% of losing positions' support becomes neutral.
10-12	Great victory. As above, but 3d6% of losers' support becomes neutral.
13+	Overwhelming victory: As above, but 4d6% of losers support becomes neutral and 1d6% switches to winning position.

This is sufficient for most legislation and many elections, where an unclear vote leads to another round of negotiation and move voting, but specific circumstances may provide exceptions. In most modern democracies, for example, the smallest victory is nevertheless a victory, although an actual tie will lead to a run-off election.

Example: After all modifiers are applied in the contest between Bob, Carol, Ted, and Alice, Bob makes his Politics roll by 3, Carol makes hers by 0, Ted makes his by 6, and Alice makes hers by 8. Alice comes out 2 ahead of Ted, 5 ahead of Bob, and 8 ahead of Carol. Alice's victory over Ted is inconclusive, so this battle will have to be fought again. Ted loses 1d3% of the SS behind him, Bob loses 1d6% of his support, and Carol loses 2d6% of her support.

Personal Consequences

As with individual attempts to influence society, leaders in social confrontations are subject to personal fallout, only more so. After every confrontation, every leader involved must roll on the Personal Consequences table. Leaders of each side must roll an additional 3d6 plus the margin by which they won. On a 16+, they must roll on the Personal Consequences table a second time. PCs lending their SS to a social struggle should make the same roll, also adding their side's margin of success.

Roleplaying Opportunities

This system outlines how to influence groups, but all of those attempts come down to individual action, which means

opportunities for roleplaying. Characters with good social skills may do most of the work influencing a society, but other characters will have their hands full supporting them. Here are some possibilities:

Getting An Audience: One of the big limiting factors on characters attempting to influence society is finding an audience that cares to listen to them. Here, the GM has a great deal of discretion, and the PCs may have to do a lot of work just to get their message out. The rules for entertainment provide one way of gathering a live audience. To gather specific individuals, characters might have to trade favors and talk their way into the good graces of difficult NPCs. Characters engaged in regional or nationwide political contests also have to deal with the problems of travel: coach, train, and plane schedules, bad roads, car or animal problems, bandits, making sure their entourage comes along, and so on. Characters attempting to use print or broadcast advertising might have to deal with partisan editors and station owners.

Security: For any topic which raises strong feelings, as any social conflict will, violence is always a possibility. Combat-oriented PCs are useful to scout out locations and keep an eye on the crowd.

Scandals: Because public perception of the people involved in a social conflict is a factor, a leader's reputation is even more vulnerable to attack than his person. Characters must be wary of enemies digging up unpleasant facts about their leader's background, or at least putting a negative spin on things that might seem innocuous.

Undue Influence: It might be dishonorable and underhanded to interfere directly in an opponent's campaign, but it's fun. Sneaky characters can misdirect important invitations to politically-motivated gatherings or simply let the air out of the tires of the most important individuals. Toughs can be employed to break up the other side's mass meetings. If there's nothing scandalous about an opponent's past, a scandal can be created.

GURPS Starbases

by Sandy Antunes

Starbases are a unique mix of ship and home, technology and politics. They span from from zero-gravity asteroid belt mining outposts to multi-racial "Babylon-5" O'Neil-style stations. Adventures in and around such bases cover the entire range of the science fiction genre.

Starbases and space stations face unique resource and technology issues, not just in construction but for allowing day to day life. Much of what we take for granted -- air, gravity, water, weather, living space -- are sharply controlled on a starbase. When someone is literally selling you the air you need to live, politics and economics become just as important as nifty tech or cool guns. And if said cool guns are the only way to get the air you need, well, starbase, we have a crisis.

Build It

For the gamemaster, creating a space station depends on your choice of rules. Since a station is just "a vehicle that doesn't move", use ***GURPS Vehicles 2nd Edition***, with a dose of the Vehicles outtakes (from *Pyramid* #21) for rules like habitation modules and spin gravity. Or, call it "a spaceship that doesn't move" and use ***GURPS Space***, with minimal thrusters (for station keeping).

Tech Level can range from modern-day earth (TL 7) through typical science fiction television usage (TL 9/10+) up to the Ringworld or Dyson sphere levels (TL14). Often the bases will be at the cutting edge of technology, since it's handy to have a Base before you launch your spanking new starship fleet. And hey, bases don't move -- they only need walls, power, air, and perhaps some gravity.

- **TL 6: Atomic:** Skylab-level short-term stations
- **TL 7: Nuclear:** MIR- and Freedom-sized non-self-sufficient stations
- **TL 8: Spacefaring:** Stations become self-sufficient and serve as starship ports
- **TL 9: Starfaring:** City-sized stations are ubiquitous and often independent entities
- **TL 10: Antimatter:** Stations can exist even in the absence of habitable worlds
- **TL 13: Worldbuilding:** The distinction between ship, starbase, and homeworld blurs
- **TL 14: Dysonian:** Bases so advanced, the locals may not realize they are constructs

Fund It

Within the game, space stations are more than just vehicles -- they are perhaps the most expensive and politically crucial elements of technological societies. Issues such as ownership, defensive potential, and multi-species involvement make for complex military, political and economic situations. The reasons for building such bases involve 3 aspects, in differing amounts. Where the motives lie on this pyramid define the role for a station.

Each of our three motives will affect how the base is designed. Clearly an all-military base is going to load up on firepower, armor, and sensors. Political bases will likely maximize living space as well as keeping tabs on affairs with good sensors. Economic bases will want lots of living space and easy ship access. Bases with multiple purposes are more likely to be funded by nations or worlds, but will have to then juggle these various factors.

Quick readers might note that 'Science' is not a motive here. Just as science is only part of science fiction, real-world science is likewise not a stand-alone goal, but something that requires a partner for support and funding. Thus a "Science Starbase" really has to have a supporting group. It can be funded by the Military, it can be designed for corporate research (Economic), or it can be there for pure research on behalf of a nation or world (Political). In all cases, the 'science' is part and parcel of the motive behind it. Consider 'science' just a wing in the base, just as 'goods' and 'trade' and 'meetings' and 'people living there' have their own sections.

Stepping back to the big picture, military bases tend to have the highest available technology, to best fulfill their defensive role. A purely military base may be spartan, providing simple barracks and serving as an advanced weapons platform. Or, it may be more behind the lines, providing recreation and relaxation facilities along with a modicum of defensive capability. As with real estate, their level of armament is a function of location, location, location.

A station set up as a peacekeeping effort, however, starts to encroach on political terrain as well. Indeed, a successful peacekeeper will participate in the local political scene more often than in battles. As most diplomats and negotiators prefer more comfortable housing than a barracks, such stations might lose some of their efficiency and trim in favor of comfortable quarters and decent guest facilities.

Or, the military station may be a form of bragging, showcasing advanced technology in a subtly threatening manner to impress other worlds. This can lead to overconfidence and an increase in appearance at the cost of military readiness. As time passes and conflicts become more removed, a military outpost can soon become an empire's figurehead, rather than a beachhead.

Purely political bases may simply provide consulate and ambassadorial stations or maintain a diplomatic presence. In such a case, the station's condition would be a direct measure of their importance in their government hierarchy. This spans the extremes from "jewel of the empire" to backwater outposts where only the out-of-favor are sent.

As politics rarely brings in money itself, though, even a base defined as purely diplomatic will end up engaging in at least some trade. The economic advantages of using an already-established port are many, low start-up cost being foremost.

Indeed, some starbases are purely economic in function, serving as trade ports and meeting houses. Poised in orbit around a planet, a base provides a very cost-effective way to transfer goods from inter-system ship to ground-hopper, and provides an effective Customs declaration for the planet as well. Indeed, the business of the port could be entirely

its utility in refueling, resupplying, and rebuilding ships, with no other goods necessary to sustain a viable income. But, it is more likely that there is trade as well, since an orbiting or free-floating base can provide ample warehouse space (ample, at least, compared with the fuel-eating spaceships).

Regardless of its economic utility, a base devoted to commerce will be characterized by surprisingly low technology, relative to a military unit. It is rarely cost-effective to spend huge quantities of your profit on your storefront and warehouse. If the base is devoted to the luxury trade, it might seem quite opulent -- but only in the surface details. Underneath, brute economy will rule.

Taking economy to an extreme, a nearly unmanned base can have great economic potential with little cost -- as a broadcasting station. This provides excellent (and unblockable) global coverage for the planet below, and requires very little space or comfort, especially if the only inhabitants are all staff.

Rounding out the triangle, an economic port may often find itself relying on military support, to keep open trade lanes and protect their interests. In such cases, the military is usually a separate entity, and indeed can frequently be at odds with the merchants over differing courses of action. The military presence must be robust enough to survive combat, but not get in the way often enough to cut into the profit margin. By the same token, an economic port is likely to provide quarters and facilities (at inflated rates) to its government's representatives. This provides both profit and some semblance of government sanction, and works to both parties benefit.

Use It

In reality, most bases have all three components to some degree, and that is what gives them their character. Each faction involved will generally consider itself the most crucial element of the station's community, and the inter-station politics will be a factor not easily ignored by visiting characters. A base with strong rivalries can provide endless adventure hooks without involving a single outside agency.

Characters working off a base will find things different from the usual cities in that access is more controlled and resources are more valuable. It's a lot easier to track which ships are arriving and leaving, than to monitor an earth-bound border. At the same time, tight controls on import/export means smuggling may be that much more lucrative.

Need to wheel a deal? Bases are just as filled with intrigue as any planet-bound setting. And just like a small town, everyone knows everyone, so secrets may be hard to keep.

Just passing through? Be prepared to deal with possibly corrupt customs, endless shakedowns for your meager credits, and blatant inquiries into your true motives. Nothing to worry about if you have nothing to hide, right?

Have a covert mission? If it's for the forces of order, you can hope the administration at least turns a blind eye, and maybe even provides a little help. But the locals might shut down if things on the base aren't as under control as the tourist brochures say.

Doing some private detective work? You might find the locals helpful -- or they might be part of the problem. Much like a wild west town, each base reacts differently to different visitors.

Overthrowing the establishment? A balkanized base, with zones belonging to different factions, is tremendously unstable. Whomever controls those resources necessary to survival will be dominant. And a 'scorched earth' policy by the losers can kill everyone. Either good diplomatic skills or 100% perfection in special ops can resolve such situations.

Starbases can be destinations, home, or simply a stop in transit. They're just like any other place, except for the ease of establishing totalitarian control and chance of catastrophic death of all aboard.

Know It

Our own Atomic and Nuclear era (TL 6/7) is marked by Skylab (36 by 7 meters in size), MIR (13 meters) and Space Station Freedom (108 meters). These structures are simultaneously primitive (rivaling a mobile home in terms of comfort and accommodations) and amazingly sophisticated, given that they allow life in the most hostile region nature provides. They are by no means self-sufficient, and require frequent and expensive resupplies of all basic commodities other than energy (which they receive via solar panels).

They are at their heart Political entities, and concerns like profitability and results take second place to the overall goal of asserting national pride. Fortunately, the pure science research is, in itself, genuinely useful and trickles down into earthbound society over time. Although not ostensibly military platforms, military funding and military science is engaged in on these platforms. Still, due to their small size and limited availability, these space stations are really more 'space platforms' than 'starbases'.

Those same restrictions mean such stations are more suited towards games where the characters are either part of the elite crew or involved in espionage. With typical staffing at a dozen or less, any adventure will be a short mission -- go in, do it, get out. Military or paramilitary operations, black ops research, or technology-driven investigation are naturals. Or perhaps these early steps towards space are also the only way for the daring heroes to stop the extra-planetary threat that has just manifested...

At the border of the Nuclear and Spacefaring ages (TL 7/8) is Space Station Five (from *2001: A Space Odyssey*, at 223 meters diameter). It clearly had Economic uses (given that there were regular civilian flights up to it), and may have had off-screen Political and Military purposes. Of the classic 'rotating ring to provide artificial gravity', it is a nice extrapolation of what we could, in theory, produce now. It also provides the best standard for what an entry-level starbase might be like. With staff, crew, and tourists, it can serve as a jumping off point as well as containing possible dens of political rebellion, secret research, or global terrorism. While perhaps too small to stage a campaign, such are ideal exotic locales for a jaded globe-spanning band of adventurers.

The fully-fledged self-sufficient Babylon-5 starbase (at 8454 meters, TL9) is a perfect example of "a world unto itself". Babylon-5 uses the "rotation as artificial gravity" model and a decent amount of real-world science, making it ideally suited for hard science fiction. Staffed with military crew under a diplomatic mission with the goal of being a trade nexus, it's smack dab in the middle of the 'triangle of interests' and thus a great place for trouble.

Those tending towards space opera can switch to Deep Space 9 (from *Star Trek*, at 772 meters, TL11). Complete with artificial gravity, photon torpedoes, shields, and other pseudo-science, the focus with DS9 is part military and all political. They must deal with a native planet population, several space wars, and a fair amount of internal corruption. Again, a plot-rich environment.

Past this, we get into Death Stars (800 km), Ringworlds (3 million earths), and beyond. Building moons and paving orbits is good for ultra high tech, and marks the end of the distinct terms 'starbase', 'ship', and 'planet'.

Starbases are a fascinating microcosm for the TL8 through TL 11 universe, a golden age where a starbase is a rich yet unique setting, balancing limited resources while remaining a bit tougher than any ship, a bit smaller than any nation. They have challenge and intrigue inside. And if you make a mistake, you can just leave -- to the hard vacuum outside.

What, Me Heal?

by Aaron Rosenberg

You and your friends are gaming. The party gets into a fight with some monster, and you step forward to lend a hand. "No, don't!" your friends all say. "We need you to hang back and heal us!" So you sit there and watch while they have fun, and then afterward you get to play Mommy and take care of their boo-boos.

Does this sound familiar?

It's a sad truth that people get certain expectations into their heads, and this is as true in games as it is anywhere else. People assume that fighters aren't too bright. They assume that wizards can cast fireball, or at least magic missile. They assume that rogues are untrustworthy liars.

And they assume that the best thing about a cleric is that he can heal.

Healing is useful, of course. Without healing spells, most fantasy adventuring parties wouldn't last beyond their second or third encounter -- they'd still be so wounded from that first pack of kobolds that a single wild boar would finish them off easily. So it is great to have a cleric in the party, and it's nice to know that your character is so important to everyone's welfare.

But that doesn't change the fact that being a known healer can limit your options. People start to expect healing from you, and after a while it becomes all you're allowed to do. And that's not a lot of fun.

So how do you get out of that and still manage to play a priest? Well, you have to be smart about it. Find ways to downplay your healing abilities and emphasize your other talents. But keep in mind that this isn't easy, and there isn't one perfect solution. Part of the problem is that you've actually got two separate things to worry about -- the players and the characters.

Players

It's sad but true that one of the first things anyone says when the group is creating new fantasy characters is "who's going to play the healer?" Your best option is to cut this off right from the start. Tell your friends that you want to play a cleric, but that you don't want to get stuck always healing everybody. Explain to them that you're interested in using the class's other spells and abilities. If you're lucky, they might say "that's cool -- we'll probably still beg you to heal us when we're on death's door, but we'll try to keep it to a minimum."

Even if you're already playing the character, if you have a good group that likes developing strong characters you should try the direct approach. Tell them you're sick of just being a sideline healer, and that your character wants to do other things. They may be fine with that. Maybe some of them are tired of what their own characters have been doing, and can appreciate the desire to change things around a bit. If that occurs, you're golden -- you'll want to ease out of the healer role, and still use healing when someone's seriously wounded, but if the other players know you don't want to focus on that they'll try not to emphasize it either.

But sometimes you'll say "I'm sick of healing" and someone else will respond with either "dude, we need you!" or "well, you shouldn't have played a priest, then." If you think either of those will occur in your group, don't bother talking to them about this. Just find other ways.

The best thing, in these situations, is to enlist the help of the gamemaster. A good GM wants everyone to have fun, and if you tell him you're not enjoying your character he'll work with you to change that. He's got the authority to say "suddenly healing spells don't seem to work" but that's a bit extreme. What's more effective, if a bit underhanded, is just to enlist him as an accomplice.

For example, you can create a new priestly prestige class, or modify an existing one. And the one drawback to this new class is that -- you guessed it -- your character can no longer use healing spells. Or very rarely. If the GM is willing to approve this, you've got a clear reason to tell the other players that your character can't heal them.

You can also get the GM to set up other reasons for your character not to heal. Perhaps another god has cursed this land, and whenever healing spells are employed they do cure the wounds but then inflict disease in their place. Or healing gives off a particular type of magical aura that can be honed in on by some particularly unpleasant monster. Or healing requires the trappings of your religion, and those are in scarce supply -- a water god's priest can't really be expected to function at full capacity in a desert.

Another option is to work with the GM to revamp how clerics work in his campaign. If healing is easy to do, and can be done on such a frequent basis, that cheapens the power. Here are a few ways to make healing more valuable, and at the same time less frequent:

Emphasize ritual. This is, after all, a direct entreaty to your god, and one you can reasonably expect to produce results. That's worth a bit of ceremony. Drop little comments about how healing is immensely powerful and so requires a long and elaborate process. Healing checks are quick things, basically combat medicine or first-aid. Healing spells should involve candles and censers and all sorts of other religious equipment, plus lengthy prayers. This is not something you rush over and demand because you fell out of a tree -- it's something that takes a day to prepare. After the first few times you make the entire party sit around for two days because you have to get ready to heal someone's cut, you'll find that they don't ask as often.

Emphasize fatigue. Healing is not something you can toss off whenever you like. Not only does it take time to prepare, it also requires substantial effort. Even though the god supplies the ultimate power, it has to go through your cleric, and that's exhausting. Emphasize that. "Yes, I can heal you. We'd better set up camp, though. It will take me a day to prepare, and after the process is complete I will be of no use for at least a day after that." Which means that you can't take a turn on guard, you can't help hunt, and you cannot cast any other spells. That should make them question how badly they need healing -- is it worth it to put one of their spellcasters out of commission for at least two days? Or should they just bandage that slash and deal with it?

Don't count on success. The god of healing is going to grant healing requests every time, obviously. But the god of war? Why would he? He'd probably rather see the character show some backbone by soldiering on while hurt. Think about your character's deity. Is healing one of his areas, or just something you can do because you're a priest? If it's the latter, emphasize the god's actual domains more. A god of fire is not really all that keen on healing, and so he may choose not to grant you that power whenever you ask. Lighting a fire he's happy to do, but healing is a different thing, and not his focus. The next time your character is asked to heal someone who isn't dying, agree to help. Go through the entire ritual, chant all the prayers -- and then look sad. Tell the others that your god has chosen not to grant your request at this time. Gods are unpredictable, and beyond reproach -- if he didn't give you the power, he must have a reason. And once you've established that you cannot heal on demand, the others will tap that more sparingly. They'll want you to save the healing spells for when they really need them.

You should also remember that the cleric-deity relationship is very personal, and can evolve over time. If in-game your god feels that you have been abusing the power to heal, he may revoke that ability to teach you a lesson. Stop using healing spells as often, as openly, and as easily. If any of the other characters ask, admit that you have been reprimanded, and are no longer able to tap that power as easily. It doesn't hurt to add a little guilt here. After all, if they didn't keep demanding that you heal them, you wouldn't have had your healing privileges revoked. You can also get together with the GM and actually roleplay this situation. Make it a real issue for the character, where he and his god are trying to come to terms with this new kink in their relationship.

Another option is for your character to choose a new path, one that takes him away from healing. This does not mean he has to give up being a priest -- if anything, it's a more focused approach to his clerical duties. For example, a priest of a fire god will concentrate on fire spells, while a priest of a war god will focus on war-related spells. If your god is not one of healing, you can easily shift your attention to your actual domains, and let the healing fall by the wayside. If anyone asks, just tell them that such powers are not truly an aspect of your god, and that as you have grown in

wisdom you have learned to more closely adhere to his interests and wishes. That's pretty tough to argue against.

Characters

If you've got a good group of players, they may be able to keep player-knowledge and character-knowledge separate. And if that happens, breaking out of the healer mold is a lot easier, because now you don't have to fool the players -- your character just has to fool the other characters. Here are a few suggestions:

Don't tell them you can heal. When characters ask if you can heal them, say something like, "Unfortunately, such gifts are beyond me." That not only tells them you can't do it, but reminds them just how valuable healing is. It's not something to be taken for granted, or bought on the cheap. You might also talk to the GM about establishing that, in his game world, not every cleric can heal. That way people won't automatically expect your character to have that gift.

Only reveal low-level healing. If the other characters have figured out that yours can heal, you can't really claim you can't heal at all. But you can minimize it. Only use the weakest healing spells, like Cure Minor Wounds. Never let on that you could access the more powerful ones.

Heal unobtrusively. This is a great way to not only downplay the healing, but also to develop your character. Find ways to heal people without their knowing what happened or who did it. For example, you could wait until everyone's asleep and then heal the wounded. When they wake up the next morning, they'll be amazed by how much better they feel after a good night's sleep. Comment on the strong divine energies in a particular glade, and the next morning they'll attribute their rapid recovery to the area rather than to you.

Demonstrate other abilities. If all you ever do is heal people, that's what everyone will expect from you. But priests are a lot more versatile than that. You just need to distract everyone else from healing by showing them what else you can do. Is the area crawling with undead? You're set -- once you've demonstrated that you can turn those liches and destroy those skeletons, the other characters will think of you as a take-charge, destroys-evil type of guy, rather than as the humble, religious healer. You do want to keep things varied, of course, to avoid being pigeonholed somewhere else, but definitely use some of your other abilities. If you want your character to be more physically involved in combats, use combat-oriented spells and jump into the fray. Whatever you do, though, don't focus on casting spells like Bless and Aid. Those are great boons to your party members, but they'll just put you back on the sidelines.

The important thing is to convince both the players and their characters that your cleric can do more than simply heal others. Either downplay his healing abilities altogether or play them up and make them more involved and more exhausting and more unlikely to succeed. Either way, as your character demonstrates other useful abilities and as the other party members get used to the idea that they may have to heal naturally, they'll learn to adjust. Your priest will stop being a Heal-o-Matic, and will become an active participant again. And that's worth a quick prayer of thanks.

Magical Scripts and Living In The City

Two Articles
by Larry D. Hols

* * *

Magical Scripts

The acquisition of new spells by magic-using characters in games is most often a matter of routine: the character finds a scroll containing a spell and copies it into a personal spellbook for study or is taught the spell by a more learned mage. Some games require the use of another spell -- some rendition of Read Magic -- to be able to read the spell for learning it, but the process is still essentially the same.

This method, while being quick and easy, lacks character. Tomes found in musty stacks are only of use if they provide an entire spell text in the generic language of magic. Scraps of spells are useless, as are scribbled notes about a spell. Research into variations is also flavorless, as a variation has to be found whole to be used.

It is possible to add flavor to the learning of new spells, and, at the same time, tie the use of magic strongly to the setting and provide use for otherwise rarely-used skills. Magic-using characters need not take deciphering magical writings for granted and Game Masters can add mystery and difficulty to the acquisition of new spells. The search for magical tomes and journals can prove of interest without whole spells being involved.

Magical Script

The first thing to do is to add the concept that magical writing exists separate from, and overlaid on, mundane writing when used to scribe spells. That is, the words that appear on the scroll or spell book page are not the whole of the spell. Those are the words that must be chanted or intoned, or explain what gestures must be made when, or how to manipulate any material components, or otherwise explain exterior behavior necessary for the spell to be worked.

The magical script, which is written over the mundane words, provides the instructions for the magical techniques, the internal behavior, the mage must use while casting the spell. These operations can include cadence, vocal pitch, mental operations (connecting with an elemental plane, for instance), or any other process necessary for casting the spell. The magical script is automatically obscured from normal vision as part of writing it down (whether via a Write Magic spell or using a basic magical technique).

For those games and campaigns where a version of Read Magic is used, the spell simply allows the caster to read the magical script. This script would be unreadable without use of the spell, as the writing of the spell involves setting a "twist" in the fabric of reality for the script. The spell allows the mage to learn that particular twist and thus read that script at will thereafter.

Breaking the writing of spells into two sections makes it possible to mix up how spells get discovered and learned in the campaign. A mage must find each section of a spell to be able to learn and use it, so chasing after journals and tomes can be fruitful.

The mundane text of a spell can be found, in whole or part, and by itself doesn't provide the mage with the entire spell. A PC can find the mundane portion of a spell and spend months searching for the corresponding magical script that accompanies it. The mage can even assemble the mundane script from notes found in a variety of places, if necessary, and put it all together when the magical script is located and learned.

The GM can use this to complicate things a bit, if desired. The magical script that is found may have been developed for a slightly different version of the spell than the mundane script, so either magical skill checks are necessary for joining the two or casting the spell is experimental -- leading to variation in effect -- and requiring the mage to adjust the spell to work out the glitches. The mage must tweak either the mundane or the magical script.

The split between mundane and magical script also means that other characters can read a spell because they can read the mundane script. They can't, however, read the magical script -- they may not even be able to see it. The magical script can only be seen using the Read Magic variant, if required, or by knowing the trick taught to all apprentices to see magical script where Read Magic is not required. That makes having non-mages help with searches for spell scraps of limited use when the magical script portion of a spell is required.

Example:

Archaeus, a mage, has sought out writings by the legendary mages Fallium and Pornaas because they reputedly used a spell that would throw large rocks with great accuracy and force. Archaeus has located notes later mages made about Fallium and Pornaas's versions, with approximately half of the mundane text each used scribbled in the margins. The GM can require that Archaeus's player makes checks to figure out if the two parts make for a whole, and possibly whether they work together for the same effect.

Archaeus is still in need of the magical script for the spell. His companions are of little help in finding it, though, because they aren't capable of even seeing if magical script accompanies the mundane script of a spell. He'll have to pore over the books all by himself.

End of Part One

* * *

Living In The City

Game Masters face the challenge of making each new part of a setting interesting to players. Presenting each new place so that it's memorable can prove difficult, particularly when dealing with places that are largely similar to one another. Players often seem determined to treat each new area as nothing more than an old area with new names . . . and can we please get on with the interesting stuff?

Each genre of game has types of places that often appear and are thus taken for granted by players. This article will discuss cities in fantasy campaigns, although the general principle can be used in other campaigns.

One method of helping to differentiate between cities in a campaign involves noting the day-to-day activities and habits of the people living in it. The GM can use knowledge of how the inhabitants live to provide nuance and depth to each city the characters visit for any length of time and perhaps etch specific memories of each city into the minds of players. It requires only a bit to show one city lives differently than another.

The key to providing the players with the feel or flavor of a specific city is to know the city well enough to have it affect the characters as they go about their business. If the PCs can act as if every city is the same, then all the stage dressing in the world is likely to be forgotten quickly by the players. Make the PCs adjust to the city and the players are more likely to remember it.

The cycle of daily living for a city's population can affect the characters in many fashions, and the characters will have

to adapt to those cycles as they pursue their interests in the city. Many areas actually touch on this, but a few can be used to great effect in making the city memorable. The manner in which the people conduct business is important. The meals they eat, how and when they are prepared, and how the food is procured can affect the PCs. The times when the varied residents appear and disappear as they go about their business can also have great effect.

Daily Business

As noted above, many GMs have already decided what areas use a given coinage system and the relative values of coins of different sizes and composition. Exchanging coins, however, becomes an exercise in bookkeeping only and an opportunity for defining a city more clearly is missed. Players can be kept on their toes when dealing with coinage issues, instead of simply having the characters ride into town, find a moneychanger, and change a few hundred florins for doubloons. Such a generic approach to handling foreign money can be changed with little trouble.

First, the GM can assume that in most instances, moneychangers do not buy coins from other realms to melt down and recast (and ignore the little matter of authorities taking a dim view of counterfeiting). Moneychangers change coins because they are able to use the coins in some fashion. They could change them with merchants doing business in the realm of origin. They could have a regular trade with moneychangers in the foreign country or occasionally trade coins with the local Royal Treasury (which could melt down the coins to mint new ones). The exact disposition can affect the value of the coins.

If the moneychangers typically trade coins with moneychangers across the border (or with moneychangers closer to the border), then anything that affects relations or travel between the two countries will affect the value of the coins. A border dust-up can shut off trade and make those foreign coins useless. Extensive flooding of the river that marks the border can make travel and trade sporadic, driving down the value of foreign coins. Long-standing hostilities can also decrease the value of coins.

How do the other inhabitants deal with foreign coins? Some, most, or all tradesfolk may accept foreign coins, setting their own rates, and force PCs to consider the worth of dealing with varied rates from vendor to vendor. Some may not accept foreign coins and force characters to trade at poor rates with a moneychanger. Some foreign coins may be welcome in most shops, pubs, and inns, while others aren't even acceptable to moneychangers as anything other than bullion. The city authorities may prohibit changing of coins anywhere other than with official moneychangers. A pouch full of coins can prove interesting for a character.

An example:

Coracon is a river port on the frontier. Because it is just upriver from a seaport and situated on the border marches with a neighboring land, lots of foreign coins flow through it. Most of the moneychanging is done by trading merchants who regularly do business downriver in the seaport or across the border. PCs can exchange coins with these merchants or try to find innkeepers and others who will change coins at worse rates.

A series of border conflicts, however, has slowed trade on land routes across the border, so coins from there have been devalued in exchange. A spice merchant, Dudric, offers a slightly better rate, however, expecting to be able to trade those coins for other foreign coins without much trouble downriver with the sea traders. He has a limited capacity for changing coins based on his store of local coins at hand. He will offer to trade for other foreign coins when pressed, although he'll keep a good portion of all his coins back until he can unload the coin from across the border.

Doing Business

Other aspects of how business is done in the city can also be important. Are prices by vendors firm or is bartering expected? Are all prices entirely negotiable? What are the protocols of negotiation? Is bartering done directly or indirectly? Is it a loud affair or a subdued scene? Do some markets require the use of an intermediary? Playing with these traits can allow for interesting variation in the experience of characters purchasing goods.

Example:

The bazaar in Coracon is noisy, with minor haggling on part of everybody involved. Dealing with luxury items such as spices, fine textiles, jewelry, and the like, requires each party to hire an intermediary and negotiations are done across a table while a bottle of wine is shared. The intermediaries belong to a guild and have some power in the city.

A character attempting to do business in a fashion other than that expected will engender feelings of hostility on part of the natives. This could result in the character being charged high prices or not being dealt with at all. The goods they get offered could all be second-rate. Few parties would want a lot of negative attention.

Where is business done? Do all of the merchants do business out of their storefronts, complete with a customer courtesy counter? Do all of the tradesmen send a journeyman and apprentice to a bazaar with the day's allotment of goods for sale? Do some trades do business from their shops and others show their wares in a bazaar? Are some trades required to restrict their business to a certain portion of the city? Is there a single bazaar, or many? What goods are shown where?

The heroes could be in need of gear that can only be purchased in the seedy section of town. Doing much business there will advertise their wealth relative to the inhabitants of the poor section, and likely set them up as targets for thieves. Conversely, they may need to trade in the ritzy section of town, and immediately come under suspicion because they aren't part of the normal crowd there. (The city watch is most likely very diligent about keeping the riff raff out of this section of town.)

Confessions of an Improvisational Game-master

by Gareth-Michael Skarka

I'll admit it. I am a lazy Game-master.

I can't stand to do tons of advance work, because I know full well that, more often than not, the player's actions will take the adventure in a direction that I did not anticipate, and a large chunk of that work will be wasted effort.

This pisses me off.

I know it shouldn't. The work that you put in to designing an adventure or a campaign setting is part of the role of the Game-master-and as we've all read in the GM section of every game we've ever played, Game-masters should be prepared for the players to pull the adventure off the tracks. It still gets on my nerves, though-I hate wasted effort.

Oddly enough, though, despite my lack of interest in massive amounts of preparatory work, I have the good fortune to have been considered, by the several dozen people who have played in my personal campaigns over the past 20 years, to be a pretty good GM.

This is largely because I have figured out one very important skill, and have worked hard to master it. That skill is improvisation.

You've heard it before, I'm sure-the adage that a role-playing group is similar to a band of musicians, each playing their own part, and creating a collective work. I've noticed that the similarity gets even more specific. A gaming group operates in almost identical fashion to a group of jazz musicians. Lacking any pre-defined structure or script, the individual players rely on impromptu combinations of their individual riffs, which combine to create a complex new composition on the fly.

So, I started to apply the lessons of improvisational jazz to my role-playing.

The first lesson: By careful combination of well-prepared riffs, one can improvise, and if it's pulled off well, the audience will never quite be able to tell what was rehearsed and what was thought up on the spot.

Apply this to the gaming table. Nothing is established until you commit to it. Until you divulge the information to the players, it is mutable . . . ever-changing. If this is done correctly, your players won't know the difference. It will all seem as if it had been planned by you from the beginning, part of a grand tapestry that you wove for their entertainment . . . when in reality, they did most of the work, and you merely reacted to them.

As such, I tend to keep a number of "riffs" in my game-mastering repertoire:

"Let's start at the very beginning . . . a very good place to start."

--The Sound of Music

If you'll forgive the show-tunes reference, the beginning actually is a good place to start . . . the beginning of a campaign, I mean.

Here is the first of my improvisational methods: I don't come up with ideas for campaigns. I come up with ideas for the beginning of a campaign. That's it. After that, I let the direction of the campaign be created by the characters. Let's face it-the average playing group has something like 4 players and a GM. It is simple numerical fact that the players have, in the average case, 4 times the imaginative power of the game master. There are simply more of them than there are of you . . . why should you do all the work?

They come up with character concepts . . . why not sit back and have them create the direction of the campaign as

well?

What I have done in past campaigns is to create the opening, and then sit back and observe what the players do with it. I then react to what they've done, and we're off and running.

Some examples:

"The King is dead"

I tend to use this opening in games where the player characters are fairly high-powered, both in ability and influence. I've used it in *GURPS Supers*, as well as *Vampire*.

The set up is this: The players are subordinate to a leader of some kind. You give them an overview of the situation to start play. Then, on the first night, you kill off the leader. You then sit back and watch the fallout.

The players will react to the event. Their reactions will give you a direction in which to take the campaign. One player might try to assert him or herself as the new leader . . . other players might try as well, leading to inter-party conflict. More astute players might start worrying about what the power vacuum will mean to the group's enemies . . . giving you an opening to throw those very enemies right at them.

The first VAMPIRE campaign that I ever ran, back in 1991, using this opening, and managed to run for over a year and half just on the seeds of stories planted by the actions of the players on that first night of play.

"Why are they after US?"

This is a fun one. I've tended to use it in games where the starting player-characters aren't supposed to know much about what's going on . . . it lends a bit of tension and action to the discovery that they undertake. I've used it in *Immortal*, *Justice, Inc.*, and *7th Sea*.

Here's the deal. You just come up with a group of bad guys, and have them attack the players. Have them make comments like "at last!" or "Turn it over, scum!" . . . something that indicates that they have a clear reason for the assault.

Do you need to have a reason?

Well, no, actually . . . just be vague. You'll come up with a reason later, and it will seem like you had it all planned from the beginning. I once had a supernaturally-skilled spearman confront the characters in a wuxia campaign set in a fantasy world based on medieval China. The spearman challenged a single character by name. The player decided "what the hell", and attacked-doing enough damage to kill a normal man in the first blow. It was then that I decided this was a supernatural NPC-because I found the situation too interesting to resolve so quickly. I gave him the ability to ignore damage from non-magical weapons. During the fight, I adlibbed a line from the NPC, where he referred to the character that he challenged as "Godslayer." I don't know where it came from-I pulled it out of the top of my head. It just sounded cool at the time.

When the other characters leapt to the defense of their comrade, I had the supernatural spearman retreat-mostly because I wanted to figure out what his deal was. He had intrigued me-and I had nominally created him!

It turned out, after a few more weeks of play, that the spearman was sent to assassinate the character, because the character IS a Godslayer-but in the future. The assassin was sent back to kill the character BEFORE he slays the god. Yes, I lifted this from The Terminator, adapted it to a Chinese fantasy setting, and let 'er rip. Not only did it give me a cool sub-plot involving that spearman, but it also gave me the impetus for a full-blown adventure at a later date, where the character actually got to fulfill his destiny, and slay a god.

Remember: Raymond Chandler once said that if a story was getting boring, you should just have two guys with guns

kick down the door and come in shooting. It becomes ten times more interesting if it seems like there is a reason for them to be there.

"The Blake's 7 Gambit"

For those of you who aren't familiar, Blake's 7 was a really kick-ass British sci-fi series of the early 80s. I blatantly lifted the set-up of the show for not one, not two, but three different SF campaigns: *Star Wars*, *Periphery* (a small press game that I wrote in 1993), and *GURPS Traveller*.

The campaign starts as follows: The players are prisoners, aboard a vessel of whatever wicked-and-nasty government has locked them up. The ship comes upon a derelict vessel, which the nasty government jailers want to salvage (salvage has historically been a great way for naval personnel to get rich/buy their way out of the service). The vessels link up, but the crews sent over by the prison vessel are never heard from again. The captain of the prison vessel, unwilling to let the salvage go, decides to send over a group of expendable prisoners to secure the vessel and find out what happened to the other crews . . . with no weapons, and wearing "dead-man collars" which will kill them if they attempt escape.

The players have to overcome whatever has been killing off the other salvage crews, figure out a way to take control of the vessel, and evade their captors. Of course, when they discover that the vessel is massively more advanced than anything they've ever seen . . . then the fun begins. What will they do with such a resource? Fight for the rights of their fellow oppressed citizens? Become the biggest, bad-ass space pirates the galaxy has ever seen? Don't worry . . . they'll show you.

This set-up doesn't necessarily need to be limited to a sci-fi setting, either-I'm planning on using it for the opening night of my forthcoming 18th century Caribbean pirates campaign (I'll be using *Skull & Bones*, the pirates-n-voodoo *d20 System* supplement that I helped design-which is coming out soon, I will note with a none-too-subtle plug). Take the archetypal Sabatini-esque set-up of the characters are prisoners being transported as slaves to the Caribbean (as was the case in the classic Captain Blood), make the derelict vessel a Spanish galleon (long thought lost in a storm), put some kind of supernatural threat aboard, and Bob's yer uncle, as the lads on the account say.

"The Inheritance"

This old chestnut started out as a standard *Call Of Cthulhu* cliché, and since then, I've used it in a number of other games and settings, including *GURPS Castle Falkenstein*, *Buffy The Vampire Slayer*, and *Deadlands*.

One or more of the characters are approached by a strange pair of solicitors, who claim to be the legal representatives of a recently deceased distant relative. The relative (the cliché dictates that this is almost always an uncle, for reasons which are lost in antiquity) has left the character as the sole inheritor of their estate.

At this point, the contents of the estate can vary-I've used everything from a single artifact (a wooden case with a pair of pearl-handled revolvers (*Deadlands*), to a strange country manor filled with the detritus of a lifetime of travel and occult experimentation (*GURPS Castle Falkenstein*).

The catalyst for adventure in this case is in how the characters deal with the inheritance. Have strange things happen surrounding it -- I usually dispose of the solicitors in some suitably grisly fashion. Have one or more groups of "interested parties" make their presence known, stating their belief that they, not the characters, should be the rightful owners of whatever-the-hell-the-thing-is. If you've got some inventive players, you might be lucky enough to spin this into a focus for the entire campaign: a throw-away comment by one of my players in the BUFFY game led to the entire campaign being focused on the fact that the inheritance, a small brownstone in New York City, was actually a "dimensional lynchpin"-a location that exists in the same space throughout all dimensions, holding the universe in place. Of course, occasionally there is some overlap, and the right door opens onto the wrong location . . . dimensionally speaking.

That's part of the secret, right there. Improvise from the actions of your players. As long as you don't let on that they're

shaping the world, and that you are merely arranging the details, you can make it appear as if you had detailed plans and a clear idea of where the campaign was going from the beginning. The things they do, the things they say-even out-of-character-can give you a foundation on which to build.

The key here is to make sure that you take copious notes during play, rather than before. Make sure you keep a record of everything that has been solidly established (so you don't violate those in-house "rules" later on), and quickly jot down any possibilities that occur to you as play progresses. Remember that the possibilities only become fact after you've presented them as such. You'll find that as play progresses, some possibilities will naturally grow more likely, as other options are eliminated through player actions. At that point, you can change a possibility to a fact by presenting it during play-or you can completely come up with something else, completely out of left field, that puts an entirely new interpretation on even the previously established facts.

How do you handle things like NPC write-ups? Have some published adventures or supplements standing by, and simply lift the stats from there. Since you won't know in advance who will turn out to be important, just use this method as a stop-gap measure initially-if the NPC turns out to be more important later on, go ahead and write them up as a unique character, using the initial "lifted" stats as a starting point. Again -- unless you let on, your players will never know that the recurring villain who has plagued their every step started out in your notes as "the guy they meet on the docks", whose stats were lifted from Bartholomew Roberts in *GURPS Who's Who 1*.

I keep a bunch of NPC write-ups ready to go, to be plugged in where needed. It's one of the riffs that I use -- like a 4-bar break-down from a jazz pianist, that he slips into the end of an improvised phrase to lend it some weight.

The point here is that your players are more than capable of dragging any carefully prepared story that you have off to hell and gone. Almost every "how to GM" article or section in a rulebook that I've read has contained the "be prepared to have your adventure completely screwed up" admonition.

So, if they're going to do it anyway, why not roll with it? It only takes a couple of things on your part: the ability to think on your feet, and the ability to keep a straight face when they assume that you'd planned it that way all along.

Nedeju, God of Wishes

by Andy Vetromile

You've been in that position before: You've found a ring that contains a wish spell, and you're all set to use it. You hold it up, open your mouth, and as you start "I wish . . ." you catch the gamemaster's eye. He's got that glint, that feral, mouthwatering hunger that tells you he's just waiting to pick apart the wording of your wish in oh-so-subtle fashion so that, instead of a +4 sword of giant-slaying, you end up with a baboon's head.

Why do such spells always go wrong? Why are even the simplest desires twisted into something that not only isn't what you wanted, but often ends up being more of a curse than a heart's desire?

Blame Nedeju.

Thinking Outside the Box

Gods are a jealous lot, carefully hoarding their power and guarding it covetously from those who would steal it given half the chance (which includes just about everyone). The only thing a god dislikes more than having his power usurped by another god is for an impudent mortal to do the same -- then deities present a united front. Witness the theft of fire by the Titan Prometheus. The gods sent Pandora, the first woman, to Prometheus and his brother, and followed this beautiful but curious woman with the gift of a box.

The box was part of an elaborate scheme of the gods to revenge themselves upon man for his quick acceptance of Prometheus' ill-gotten endowment. Into the casket, each god put a "gift" -- a plague, a vice, an ill -- and they sent it to Pandora and her mate. Her curiosity got the better of her, and she opened the container, releasing hardships upon mankind. When she slammed the lid shut, all that was left was hope.

Hope? Again, blame Nedeju.

Can't Keep a Good God Down

Or a demigod. Nedeju was one of those unremarkable and disenfranchised half-deities, a Johnny-Come-Lately in the firmament who had no sphere of influence, no dominion for interaction with mortals. He wanted badly to be part of the heavenly host, but gods do not share position so easily. No god truly disliked Nedeju, but none of them saw enough promise to ally themselves with him. They had trafficked with him before and, in spite of his cajoling and politicking, found the weight of him charm wanting. And so Nedeju could often be found sulking along the roadsides of the higher realms or puttering in the corners of the great halls, mumbling to himself about the inequitable division of power among those he wished were his peers.

Then came the box. Everyone was called upon to place something in the box, but few took notice of Nedeju, certain he had nothing to offer. When no one was looking, he slipped the only thing he had, hope, into the chest and quietly drifted away. The box was sealed and carried by Mercury to Epimetheus and his mate Pandora. She had released sorrow into the world, but now there was also hope, the gift of Nedeju.

Not that the fledgling god had any great love for mankind, but he knew the value of keeping the fish on the hook. To wipe out mankind would be the work of a moment for the pantheon, but it was unsporting and self-destructive (with no one to worship them, what would become of the gods?).

The gods' revenge was sweet, but it was also a miscalculation for two reasons. First, rampant ills were no longer attributed to the gods. Man lost a little of his fear of those beings; it was much harder for them to inspire awe in the jaded populace. The gods could still offer blessings, of course, but they could seldom protect followers outright, and

the devout in turn lost some of their faith. Second, and more importantly, in spite of the plagues he suffered man now had a small bit of essence from each of the gods and goddesses, and that was far better than fire.

The Rise of Magic

Man had been a quick study where fire was concerned. The only reason the gods were not completely supplanted by magic was it was a far more temperamental force with which to deal. Men spent lifetimes trying to master the power flooding the natural world, some without success. Others excelled at mysticism, and they became mighty indeed. The gods could only hope mankind would bite off more than it could chew. This was borne out with the creation of the wish spell.

It was, to coin a phrase, a mixed blessing for everyone. The wish spell was potent, and could work wonders even the gods could not reliably produce. Every time one was used, the pantheon felt a tug at its collective soul. Man, too, suffered. Without constraints or wisdom, the sheer power of a wish spell could wreak havoc on the world of man.

Again the gods stood to lose their fragile grip on their followers. Something had to be done. Someone had to regulate these wanton displays of power before existence self-destructed. The gods fell to arguing among themselves what should be done, who should be given sway over wishes. None dared trust his fellows with such authority. Then something happened that had never happened before: Someone noticed Nedeju watching the proceedings quietly from the corner.

The Ascension of Nedeju

Nedeju, they realized, had given man hope. Nedeju was not like the other gods. Nedeju wanted to be an active member of the pantheon, but had no real interest in the squabbles that characterized every assembly. He wanted to keep power where it belonged -- with the gods -- but he knew the value of careful dispensation of same. And so the congregation agreed to raise Nedeju. Into his vessel they each poured a small bit of their essence, and when it was done he was a god in full.

Nedeju was delighted. He had long sought this position, and now it was his. All his years of watching the other deities, studying their capricious whims and flights of fancy, were about to pay off. Anyone making a wish would answer to him.

Nedeju Almighty

Nedeju's symbol is the moth, flitting silently among men and drawn to the flame. As a god, he is somewhat green. He has spent his entire existence above mortals, and he has kept company with gods and goddesses, but he is neither ancient nor practiced. While these factors usually work to his advantage, maintaining the random nature of his work and defining his personality, he isn't the canniest member in the heavens. It's possible to "get one over on him," and Nedeju doesn't -- can't -- care about every use of every wish everywhere in the world.

He is somewhat self-absorbed and does not seek elevation by man or approbation by his fellows. The other gods, although they have given much power to Nedeju, are not always happy with the arrangement. He is often the target of schemes and sweet promises, and can be found at the center of many argument in which he holds no opinion. Manipulation seldom works, but that doesn't stop the gods from trying. Given Nedeju's close association with man, these plots often spill over and affect poor mortals.

Nedeju can do little outside the purview of wishes. If mortals aren't wishing for things, rarely can he intercede in their affairs. This is partly his nature and partly because this is how he nurtures his power and fosters pleasing behavior among mortals. On the other hand, a wish spell is a rare enough occurrence that there exists a very real chance Nedeju will take a personal interest in a being's execution of the power -- which is not to say he'll manifest, but he could be standing unseen nearby, and could show himself if the user proves interesting or clever enough.

If a mortal does get a decent wish past him, Nedeju is not a vengeful god. These oversights, if they offer him a valuable warning, are much more likely to be looked on with gratitude. Not such thankfulness as to provide added reward, mind, but then the person already got their wish . . .

Followers

There are those who know of and worship Nedeju, but they are few and far between. Nedeju prefers to work behind the scenes, and the more distance he keeps between himself and those who use his power, the easier it is to keep up that mien of arbitrariness. He knows he needs followers to maintain his power, but he doesn't need many -- a lot of his power comes from being linked to magics man already uses in ignorance. Rumor has it these followers have easy access to wishes, and this couldn't be farther from the truth. The trick is to make wishes a sort of grail, not to hand them out to anyone who asks.

More often, Nedeju calls upon his followers to work to keep his power active on the mortal planes. They are sent to ascertain the existence of rings and other items with wishes stored in them, and occasionally they are asked to place such items where they may, after great hardship, be found. There is another rumor that Nedeju may, without warning, destroy a cult that has discovered his existence, or that promotes knowledge of his existence too easily. This rumor is absolutely true. He feels he cannot afford widespread familiarity with his name and sphere.

The other major component of the Wish God's entourage is genies. He created these loyal beings and sent them to hide among artifacts and treasure, to ensure there would always be examples of his works among men if the undependable cults should prove too troublesome to retain. Genies are charged with offering men wishes, but most will attempt to warp the desires of their finders, hopefully teaching them an object lesson about the wanton use of power.

Using Nedeju in the Campaign

Nedeju prefers to remain behind the scenes, but like the wishes he oversees, there's no point having him in the game if the GM isn't going to make use of him. Some possible ways to put the Wish God to work:

- Fed up with the duplicity, a genie rebels against the wish god and begins dispensing wishes freely and accurately. The genie offers the party each a wish if they will first protect him from the followers of Nedeju sent to track him down. Alternately, Nedeju himself may approach the party and offer an unadulterated wish if they will discreetly find the offending being for him.
- Nedeju has been incapacitated and wishes suddenly have no limitations placed on them. Kings begin wishing for the destruction of their enemies, and entire armies are disappearing in impressive displays of raw power. The adventurers must track down Nedeju, find what has left him insensate, and put him back into power before the two most powerful warring states of the mortal planes eliminate all of realty with their desires.
- Someone has killed Nedeju and left a vacuum of power. Has Nedeju fallen prey to a clever paladin who took advantage of the deity's inexperience to do him in? Or have one of the other gods, still furious at having to give up so much to Nedeju to protect his own godhood, killed the Wish God in hopes of reclaiming his essence? If this is the case, it's unlikely the god stopped at taking back his own power, and now he holds something over all the other gods as well. The investigators must find who has perpetrated the crime, or may be called on by the pantheon as impartial observers to do the job. A dangerous task, given that anyone who can kill a god of wishes is a force to be reckoned with.
- Following the death of Nedeju, a successor must be found. One of the heroes may be chosen, and the other members of the group asked to serve as his avatars. The gods may instead send them into the world for a year and a day to find and present a successor to the position; the party could hold a contest to determine the fittest being. A heretofore unknown heir may be lost on the mortal plane and have to be tracked down. Most likely, the gods will decide one of their own is to ascend to the position, and the party will adjudicate. This is a perilous political game to play, of course, and it may be easier for some of the heroes to stall. The rest will seek a ring of wishes with which to resurrect the fallen Nedeju as reality storms continue wracking Heaven and Earth.
- The Apocalypse looms, and mankind attempts to delay it through the use of a wish. Nedeju has twisted these

desires, making some matters better and some worse, as is his wont. The kingdom's high mage takes the party aside and tells them to find a magical artifact, created before Nedeju ascended, that holds a wish with no limitations placed on it. Others claim this is a waste of time, that no such item exists, but the party knows there is always hope.

Pyramid Review

The Magic Box (for Buffy the Vampire Slayer)

Published by [Eden Studios, Inc.](#)

Written by John Snead with Timothy S. Brannan, Fiona Faria, Toos Holmes, Thom Marrion, Andy O'Hara, Andrew Peregrine, Justin VanKirk, and Jeremy Hunt

Illustrated by C. Brent Ferguson and Jon Hodgon

128-page color softcover; \$27.00

The Magic Box is not, as the title might suggest, a guide to the magical arts and occult emporium run by Giles and Anya as seen in the series, *Buffy the Vampire Slayer*. Rather it is a sourcebook for all things magical in the Buffyverse and more specifically for the [Buffy the Vampire Slayer Roleplaying Game](#). It is the fifth release for the game and the first fully-fledged supplement after the game's core triumvirate -- the *Buffy the Vampire Slayer Roleplaying Game* corebook, [Slayer's Handbook](#), and [Monster Smackdown](#). This means that its format changes from hard to softback, though without almost any loss in terms of production values. (What lose there is only extends as far as a not-so-fine a quality paper stock and the reproduction of one two stills from the series not being quite as crisply as they should be.)

Since this is the magic supplement for *Buffy the Vampire Slayer Roleplaying Game*, Eden Studios picked the right man to author *The Magic Box*. John Snead has a number of magic systems and supplements for various RPGs to his credit, including [The Dying Earth Roleplaying Game](#) by Pelgrane Press, as well as contributing to [Postmodern Magick](#) for Atlas Games' [Unknown Armies](#) and *The Book of Three Circles* for White Wolf Studio's [Exalted](#) RPG. In *The Magic Box*, he gives us an overview, history, and the nature of magic in the Buffyverse, new Qualities and Drawbacks, new archetypes and updated sheets for characters from the series, a look at magical organizations, psychics and Superscience, a grimoire of spells old and new, and -- of course -- a ready-to-run adventure.

The overview of magic provides a conjectured history of magic in the Buffyverse, drawn as tightly as possible from the series canon while also developing beyond it. This has it tied in with the fall from power of demons, once capable of great magics, but out-evolved by mere humans. Magic declined with their rise, but still tied to demons, some of who will teach the unwary a spell or more in return for favors and services rendered. One of the most interesting aspects of the book is its discussion of the differences between black and white magic, and the dangers of both of the former and that of magic addition. As seen from Willow's path in the series, this can come from casting too many spells as well as from casting spells too powerful for the witch or warlock to cast. Of course, it is quite possible to keep a balance between the black and the white, but not only is this difficult with all of the temptations available, it may also not be the most interesting option from a storytelling point of view. Besides providing rules for all of this, details are given for power boosting, whether from magic pushers like Rack, but from draining enchanted items and books as well as other magicians. There is expanded coverage of the virtual magic of the Technopagans like Jenny Calendar, and more detailed rules for Telekinesis, so that practitioners can toss bodies around and pull the triggers on guns from afar.

For characters, *The Magic Box* offers a wealth of new Qualities and Drawbacks. Of the latter, Demonic Tutor explains a dark way of learning magic while the Magical Family Quality gives a character an arcane heritage, access to an occult library, and might even please the Potter fan. It can also work as a drawback if the character's family have a less savory purpose in mind. Magic Group can also work as a Quality or a Drawback depending its status and demands upon a character -- and there are guidelines for both player and Director to design their own. This is in addition to the

several examples included: the demonic cult hiding behind the façade of the Delta Zeta Kappa fraternity; the key protecting and transforming into slayer's sister Order of Dagon and their mortal enemies, the Knights of Byzantium; the Technopagan Alliance and the High Council of Witches; and the all new Black Death, a magic practicing band.

For the player wanting a psychic rather magic-using character, there are the new Qualities of Empathy, Psychometry, Telekinesis, and Telepathy. The Enchanter and Superscientist Qualities work in similar ways, but where the first allows the design and construction of magical items and artifacts, the second does the same for technical gizmos and gadgets that simulate a spell-like effect. The rules for both are nicely -- but not overly -- detailed, with the process far from quick, though items known as "Assemblages" can be built in a pinch. They do not last long, though. The Sight Quality allows a character to see both traces and aspects of magic, while Spirit Medium enables easy communication with ghosts.

To reflect the various new Qualities and Drawbacks, several character sheets have been updated for the series cast. These include the magic-addicted Willow, the empathic Tara, the coven-boosted Giles and the post-rat witch, Amy Madison. All of these come from the show's sixth season, as does the sheet for the leader of the Geek Trio, Warren Mears (who possesses the Superscientist Quality), and also for the whacked-out, blacked-out, über-magic addicted and power-boosted (Darth) Willow. The four new archetypes include the Young Mystic, able to see the magic world, but not really affect it; the Young Inventor, who build amazing devices through Superscience; the demon-hunted and Demon-Trained Witch; and the AWOL Invisible Spy, who possesses the Invisible Quality and has fled government training and employment as a secret agent on a leash.

The selection of new spells is mostly drawn from the series, organized season by season. Each clearly indicates the episode that the spell appeared in, its Power Level and requirements, whether it can be cast quickly, its actual effect, and its Aspect Analysis. This last is an explanation of how each spell's Power Level is reached and ties into the rules for designing new spells. Some spells, such as Jonathon's Superstar formula, are not detailed here, as their purposes are really as plot devices. Of those spells drawn from the series, only a few were given proper names on-screen. These are clearly marked in this book, but for ease of use the author has named all of the other spells, both those new to the game and the previously unnamed one from the series. For all of the new spell types -- Quick Cast, Altruistic, Harmful and Summoning as well as for item creation -- there is an appropriate side-effect table to check against whenever a witch's, warlock's, or inventor's attempts go awry . . .

The adventure, "Orphan Child," is designed to focus upon the magic-using character and his family in a Director's series. It requires the use of magic to solve the problem at its heart, rather than the usual dose of slayage. Although it can be run as part of the ongoing series begun in the corebook -- and the author suggests adding in several NPCs seen in earlier episodes to tie it in closer if desired -- "Orphan Child" is not part of the series' ongoing story line. This episode is the most easily adapted to a Director's own created campaign.

Rounding out ***The Magic Box*** is an appendix that takes the reader beyond the Buffyverse. It begins with a four-page set of lists useful for rituals and the like. This includes the names and spheres of various gods -- Celtic, Egyptian, Roman and Greek (though no Sumerian or Babylonian, which would have been nice additions) -- plus the names and aspects of the Muses, the Graces, Voodoo Loa, candles, crystals, and herbs. Again, this very useful information, accessible with a little research time, but very welcome here all the same.

Beyond ***Buffy the Vampire Slayer Roleplaying Game***, there is ***CJ Carella's WitchCraft RPG***, and although the corebook gave a quick and dirty guide to converting the magic over to that of ***WitchCraft***, it is here that the game gets down to the nitty-gritty. In effect, this section goes both ways, with rules for adapting the ritualism of this game over to ***WitchCraft*** and the invocations of ***WitchCraft*** back over to the ***Buffy the Vampire Slayer Roleplaying Game***. A Director will need proper and fuller access to the various supplements for ***WitchCraft*** to get the most out of this appendix, but it is at least a good start and points the Director in the right direction.

Just as the show has its fans of Buffy herself, it also has more than its fair share of fans of Willow, resident Wiccan, computer hacker, fully-fledged witch, and more dangerously, vengeance-sworn threat to the world as we know it. This is what the book covers and is one reason why Willow appears on the cover. It does all this comprehensively and intelligently, particularly so where the content develops what is cannon or goes beyond it, such as the rules for

enchantment and item construction. There is a great deal in ***The Magic Box*** to add to any ***Buffy the Vampire Slayer*** campaign, especially if the gang includes a Wiccan, warlock, witch, or technopagan.

Pyramid Review

Dark Inheritance (for d20 Modern)

Published by [Mythic Dreams Studios](#)

Written by Sam Witt, Wil Upchurch, Chad Justice, Aaron Rosenberg, Jason Olansan, & Gareth Hanrahan

220-page b&w hardcover; \$34.99

Modern fantasy is a tough duck. You've got one of two ways to look at it. Type A is the *World of Darkness/Buffy the Vampire Slayer* philosophy: magic is all around, and most people just don't notice it. Type B is the *Shadowrun* philosophy: You wake up one day and there are dragons (creating a setting where Magic has always been all around is just right in the Alternate History field).

Dark Inheritance chooses to take both of them, weaving together an ancient hidden mystical history, with a sudden explosion of magic and mayhem.

The game is set now (it starts February, 2003), in the aftermath of an inter-dimensional tear that brought a demonic city to Earth in the space inhabited by Jerusalem. Now, the holiest city on Earth gets to share real estate with the least so.

Dark Inheritance is a setting for the **d20 Modern** system. The merge, called The Rip, acts as a good jumpstart point to transition from Type A to Type B. The difficulty of Modern Fantasy basically consists of pedantic players who desire nothing more than a good long game of "if that's the case, then why didn't . . .?", even if you're in the middle of a good game of something else. The rationale (hidden mysticism that explodes so as to be not-so-hidden) allows for both a "secret history"-type of game and a "brave new world" type of setting.

Players have the option of creating standard humans and Titans; Titans possess the "godgene," which allows them to channel energy in superpowers called birthrights. The system is a bit different from the standard magical abilities, and a bit more flexible than you see in the standard **d20 System**. Their abilities are outlined in the fourth chapter.

Titan's Birthright powers vary according to their bloodline. There are five bloodlines, each of which has a certain type of duty; for example, Crimson Lords lead, Hidden Suns are scholars, and Storm Crows are warriors. The birthrights are an interesting lot. Organized like feats, they have prerequisites in terms of abilities and other birthrights. The Fortitude of Tezcatlipoca birthright, for example, which allows you to ignore the massive damage save, requires you to have the Rest of Blessed birthright.

Birthrights are determined by bloodline; the Wild Bloods, shape shifters and skin-walkers, get birthrights from such categories such as Bestial Urge, Chimera, and Wild Flesh. The addition and use of birthrights is a pricey process; birthrights must be purchased by using Action points, which are a fairly rare commodity, and using them can cause a character to become physically transformed in a negative fashion. Characters must make a Strain check each time they use a birthright; failing by a certain margin (or rolling 1) will require the PC to make a transform check. Failing the strain check alters the character in accordance with the birthright they were trying to use. A character using Second Sight, for example, may be struck blind . . . permanently. PCs can buy off the effects of a transform by spending XP.

Standard magic is covered in a set of advanced classes (Initiates, Mystics, and Eldritch Monks). The remainder of the advanced classes include super soldiers, researchers and . . . well . . . Lara Croft for lack of a better term. There's an advanced class called the Stim Freak that's similar to the **Rifts** Juicer; it's fairly odd, but it does have the benefit of

having a class ability called "F'ing crazy".

There is also a pair of **d20 Modern** Prestige Classes, the Spec Ops and the Two Fisted God of Guns. In spite of everything else cool in this setting, the Two Fisted God of Guns is probably the neatest thing in the book. Sure, the Spec Ops is a neat class, but Two Fisted God of Guns is torn right from the screen of your favorite John Woo film. Some readers will, of course, balk at a character class that seems to be such a shallow cliché. "Where," they will ask, "is the 'guy with a katana and a raincoat' prestige class?" (One can only weep for their dry, empty souls.) Also included are 28 new feats, a selection of new occupations, and a few new uses for skills.

The setting is outlined in the first two chapters. Chapter one, and the book's introduction, develops the world through straight text and found information, outlining what happened in Jerusalem on February 9th, 2003 and what has happened around the world since.

The second chapter is an introduction to the seven factions that players will likely be members of. There's The Brotherhood of the Iron Rose, a secret organization of Catholic hit men; Project Titan, a secret government organization dedicated to exploring the genetic heritage that makes some people gods; and the Illuminati-esque Promethean Order; as well as an Eastern crime organization, a mercenary organization, and a secret group dedicated to breeding titans. The final chapter includes information on the various antagonists the setting will possess, from the demonically possessed to strange beasts.

There are a couple of quibbles with the book. The monsters section ends rather abruptly, in mid-monster. There's no index, which is a significant flaw in a book with as much information as this, and the table of contents is not terribly informative. In fact, there's no quick finds of any kind to help track down information in the book.

This is aggravated by the fact birthrights are organized by bloodline, so tracking down a birthright in mid-game is slightly annoying. Physically, there were some problems with the reviewed copy of the book. The binding fell apart, and the back cover now flaps loosely in the wind.

The book is filled with new information for use in **d20 Modern** games; even if you don't want to play in the **Dark Inheritance** setting, you'll find useful information for other games in here. The Prestige Classes, Advanced classes and Titans would all be useful for many games.

The Two Fisted God of Guns, of course, is perfect for any game.

--Justin Mohareb

Death Holds No Fear For MeeeeIIIEEEEEEE!!!!

Two weeks ago I encouraged folks to avoid bringing characters back from the dead, no matter how strong the temptation. But for many campaigns this advice comes too late; and so, to you, I promised some advice.

Okay; the cat's out of the bag, and death holds no fear for your players . . . but you're hoping to cram that genie back in the bottle. What to do?

Well, there are a myriad of techniques to use. (As an aside, notice how people who don't know what they're talking about use the word myriad: "Mrs. Finigan, your myriad of symptoms could be caused by a myriad of ailments. For example, you could be suffering from . . . uhhh . . . Myriadopia. I'm afraid we'll need to perform a cashectomy.")

Where was I?

(Babbling.) Oh, yes. Harnessing death.

What is required to reaffirm death is really dependant on the genre and campaign. In general, you need to present a situation where the players and characters understand the import of death in the campaign, ideally by letting them experience this newfound focus first-hand.

"There's a Mr. Reaper here to see you . . ." Let's face it; campaigns where death can be thwarted aren't exactly the most realistic in the first place. So perhaps the best course of action is to have a Big Epic Event where Death puts his foot down and shows that he means business. This can be any epic journey to the Underworld, a recovery of some grandiose artifact, or some mission for the gawds. In many campaigns -- especially supers -- there are actual personifications of Death running around for the characters to interact with or take to a Tori Amos concert. Anyway, the upshot should be that, at the end of that adventure, any means characters had of cheating death will be blocked to them. Resurrection spells stop working, and folks who can speak with the dead can offer reports from the afterlife: "Whoa! The rules are different now . . ."

For an interesting twist to get the player's involved, why not give them a "choice" or make them the holders of this newfound lock on the afterlife? (Choice is in quotes because it's not a *real* choice; consider the implications if Death says to the heroes, "Okay; you now hold the Key of the Afterlife. It needs to be kept on the mortal world because of its link between this world and the next. With it anyone can be brought back from the dead . . . but if it is used in this way, all life will end on this world. Oh, and all manner of unsavory characters will seek to take it from you. Have a nice day!")

(And what do you do if the players use the Key of the Afterlife? End all life on this world. Rule #2 of successful GMing: Never, ever bluff.)

"Hmm . . . are you *sure* your fiancée wasn't a zombie before?" As an alternate entrance to the Epic Plot above, you could just have the rules behave differently, for no apparent reason. Maybe those resurrection spells bring back the departed as mindless zombies. Maybe those who have come back from the beyond start suffering from some horrible wasting disease . . . and then they die. Regardless, the heroes can investigate the reasons behind this, culminating with some kind of revelation regarding the new nature of the universe, as above.

"He told you he came back from the *dead*? And you *believed him*?!" For more realistic campaigns, or those campaigns which haven't had many characters come back from the dead (maybe one or two), perhaps one of the most cruel things you can do is to reveal those characters who were believed to come back from the dead did not, in fact, do so. Rather, someone or something has impersonated that person and led others to believe he came back. Then work that fact into the plot.

How this comes to pass is up to you, depending on the campaign. As a general piece of advice, try using as little effort and energy as necessary to make it work with the pieces revealed to the players. For example, if a supers campaign

seemingly has the sinister masked Dr. Destructo-a-go-go return from the afterlife, you *could* concoct a storyline about it's really a cloned body with the transplanted memories from the previous incarnation . . . but it's *much* easier to simply say that someone else has adopted Dr. Destructo-a-go-go's identity and is now wearing his mask. The simpler the explanation, the more likely the players are to believe it -- and perhaps even consider that it was part of the storyline from the beginning -- instead of rolling their eyes and going, "What?!?"

Yes, this maneuver requires the players to swallow the existence of doppelgangers, convenient studyable journals of memories and mannerisms, and/or flawless duplicating plastic surgery . . . but at least, once the storyline is concluded, they *don't* need to believe that death is anything less than permanent.

("What do I do if it's a PC that was brought back?" I hear you ask. Simple; just come up with the same kind of solution, and have things start to unravel for the player. Energy beings able to scan brainwaves of the dying are useful here, as are magical constructs able to do the same thing. Once you have a solution, have a catalyst to start to reveal the truth to the player: "Why do I radiate as magical to detection spells?")

"Things like this only happen in comics! Bad comics!" Finally, perhaps the simplest thing you can do is to let the players know the rules have changed in-game by having a hip, edgy, self-referential character point out that, indeed, the rules have changed.

This kind of character has a number of counterparts; Rick Jones in the Marvel Universe often makes those kind of asides (especially as written by Peter David), various characters in recent hip horror movies *know* they're in a hip horror movie, and *Buffy the Vampire Slayer's* dialogue seems built around the premise.

Anyway, have this character have a situation to respond to -- ideally another death of some sort:

"Why did Plotpoint need to die? It's not like the old days; heroes came back all the time then. Villains too. They played by different rules, back then . . . they didn't kill. Do you think anyone will ever come back again?"

If the heroes still need the point driven home, you may want to have a red herring plot that the deceased character *might* be able to come back; run them through the gamut of the "back from the dead" storyline, only to have events conspire to thwart them . . . or have it be revealed as an unobtainable errand in the first place. (See the legend of Orpheus for more ideas.) Then have your hip character comment, again, that it just may not be possible to bring anyone back from the edge of death anymore.

And if the players *still* need to know that the rules have changed, then go ahead and kill your edgy, hip character . . . ideally dying with another lamentation that the rules were different now. (It takes the right kind of campaign, GM, and players to make this technique work . . . but it can also be one of the more effective and most realistic.)

If you use any of these methods, by far the most important thing to do is . . . *mean it*. Once you've put your foot down and said (in essence), "Death is meaningful again. From this point on, dead means dead," if you do *anything* to backpedal -- say bringing back some master villain from the dead because it's absolutely convenient -- then I almost guarantee you'll be stuck with a deathless campaign from then on. (Even worse, by crying wolf you've made it quite likely that anything else you present as "putting your foot down" may be seen as having wiggle room.) So if you believe you might be the kind of GM who will be tempted again to have characters shuffle back onto that mortal coil, it might be best not to employ any of these techniques.

* * *

Owing to the excitement of GenCon (and the raging jealousy I feel for not being able to attend), this week's Pyramid does not include a **d20 System** article. Sorry; we'll catch up next week.

--Steven Marsh

Big Brother is an Idling Bachlorette Survivor

Week 1

by Steven Marsh

Reality television is all the rage currently. Networks are scrambling to produce new programs that combine uncontrolled uncertainty with a level of interactivity and audience involvement previously unseen.

And we at *Pyramid*, never one to leave a bandwagon unjumped, have decided to put our own spin on the reality show.

We've locked five freelance gaming writers into the Big Pyramid, dividing the entire editorial content for the issue evenly among them to use as they will, submitting articles for your approval. Outside of minor style and formatting decisions, no other editing has been done with these articles.

Each week **YOU**, the readers, will vote out one of the writers.

The week after, the remaining contributors will again divide the entire editorial content among them.

And so on, for four weeks, until the last week when the two finalists each create something that fills half the magazine, and someone is crowned the BBiaIBS champion.

Voting for your favorite (or least favorite) articles is accomplished in the same way as normal voting -- by using the Rating system on the bottom of each page. The person who receives the lowest rating will be voted out of the Big Pyramid. Naturally, we need to give our contributors enough time to craft their masterpieces, so we will close off competition voting earlier than normal ratings. As such, only ratings received by Monday, 11:59PM Eastern Time, will count toward determining who is voted out. (Of course, even if you *don't* get a chance to vote in time for the competition, you can still rate articles within the normal two-week window to let the *Pyramid* Hidden Masters know your thoughts.)

And now, without further adieu, let us introduce the Big Pyramid challengers:

* * *

Sandy Antunes is a freelance writer, LARP designer, and astronomer. In addition to authoring several RPG books, numerous articles and adventures, and two years of RPG.net opinion columns, Sandy also has run live action games on both sides of the Pacific and published a professional live action magazine (*Metagame*) for two years. The oft-run tabletop-or-LARP "Priceless" is Sandy's favorite; "Miskatonic University" is perhaps the longest work; "ePublisher Guide" is a good sample of Sandy's love of this industry. Sandy currently runs a game with 10- and 14-year old players, and also has two children at pre-gamer age (two and four).

* * *

But What About . . .

"Where's my Suppressed Transmission?" we hear you ask. Well, one of the reasons we came up with this idea is the realization that, between GenCon and a European trip, Kenneth Hite wouldn't be available for a month. Given this fact we decided to do something different for that month.

We mention this just to try to curtail the pitchfork-wielding villagers who might accuse BBiaIBS of bumping Suppressed Transmission.

For the duration of this event there will still be reviews every week; in addition, you all are still stuck with Random Thought Table.

Chad Underkoffler's Campaign in a Box will next appear the

Larry D. Hols began gaming by becoming a DM on two days' notice. Since that trial by fire, he's played with and pattered with an unending stream of games and genres. He can be described as a ruthless GM, but prefers to be viewed as Just Plain Mean. He has shared his wisdom in a column on RPG.net and with a contribution to *Gamemastering Secrets Second Edition*.

* * *

Aaron Rosenberg recently won an Origins Award as the primary author on *Gamemastering Secrets Second Edition*, and was the creator of three Clockworks games: *Asylum*, *Spookshow*, and *Chosen*. He is one of the authors of Mythic Dreams' *Dark Inheritance* (reviewed this issue) and has written for such lines as *Lord of the Rings*, *EverQuest*, *Star Trek*, and *Vampire*.

* * *

Gareth-Michael Skarka has worked in the industry as a retailer, distributor, publisher, freelance writer/editor, and marketing consultant since 1988. He was the designer of *Hong Kong Action Theatre!* and *Underworld*, and has freelanced for dozens of publishers. His latest project, the *d20 System* Pirates-n-Voodoo book *Skull & Bones*, will be released by Green Ronin in August, with following support and adventures to be released by his own company, [Adamant Entertainment](http://AdamantEntertainment.com).

* * *

Andy Vetromile is a freelance writer, editor, and developer. He has worked for Steve Jackson Games, Nightshift Games, and interned for White Wolf Publishing, among others. He is the author of *The Complete Caveman's Club Book*, his first short story appears in *The Book of Final Flesh* from Eden Studios, and he has had articles in several magazines such as *Pyramid*, *Shadis*, and *Knights of the Dinner Table*.

* * *

If you have comments about the month-long "Big Brother is an Idling Bachlorette Survivor" event, or want to hype up your favorite BBiaIBS challenger, feel free to post over on the [Pyramid message boards](#), or send an email to [the editor](#).

week after this event, in August 22nd's issue.

Article Length

For those of you wondering how much room the competitors have each week, this is a breakdown of each week's maximum word length:

- *Week 1*: Five people -- 2,200 words each
- *Week 2*: Four people -- 2,750 words each
- *Week 3*: Three people -- 3,666 words each
- *Week 4*: Two people -- 5,500 words each

If an article is too long, the remainder of the article past the limit will be truncated.

Pyramid Review

Druids and Druidism (for d20 System)

Published by Bastion Press

Written by Thomas Knauss

Full color PDF; \$7.99

Druids and Druidism is a 70-page PDF druid class book. The book presents druids as caretakers of nature, a position that divorces them from civilization and its society. While the book contains many prestige classes, feats, spells, and items that druids can make, it is heavily slanted toward use for NPC druids, or druid characters in solo PC or all-druid campaigns.

This is because the picture of druids that the book promotes is one of an independent society that is dedicated to overseeing its own territory of natural wilderness. Their primary concern is protecting their area from the ravages of unnatural forces such as undead, exploitative sentient creatures, and the encroaching forces of civilization and "progress." This dual aspect of a tied-down protectorate and disconnect with normal society portrays druids as loners who only associate with those of their own society similarly dedicated to their wilderness charges. This makes them not quite a suitable position for a member of a diverse adventuring party that travels or deals with any issues of civilized societies.

In addition, many of the eight classes and 23 feats are tied to their wilderness niche, giving power only in their specialized terrain. This is fine for NPCs who guard an area but less attractive to generalist adventurers who encounter many different types of challenges and usually find themselves in different environments.

The prestige classes share many aspects in common, all being 10 levels, have two strong saves, d8 hit dice, moderate BAB, four skill points, and 1/1 spell advancement but no advancement in druid abilities such as wildshape. Most have some movement, combat, and extra spell or limited use supernatural abilities tied to their niche that fill out about 6/10 class levels.

The classes are:

Glacier Walker: Arctic lands protectors.

Guardian of the Oasis: Desert protectors.

Highlander: Mountain caretakers.

Lord of the Flies: Lawful insect aspected druids.

Packmaster: Druids who join a wolf pack as a beta.

Pridemaster: Large cat protectors.

Scourge of the Dead: Hunters of undead.

Waveriders: Protector of Waterways.

From the descriptions as written, only the Scourges are not tied down to one area with specific guardianship requirements. These classes can easily be made more PC friendly by changing the descriptions to be different paths of specialization in bonding with nature or animal spirits.

The section on nature's handiwork is a nice little discourse on items druids can make using natural materials. There are some great descriptions but the rules don't always come through in this section. For instance, a number of different wood qualities are described for real world lumber such as mahogany and alder trees. While the descriptions give a good flavor for the qualities of the wood, anything made out of them is automatically considered master work quality,

so double weapon quarterstaves of the various types all cost over 600 gp. In addition, although it mentions that druids use bone to craft many items, not one bone item is listed.

On the other hand, the leather armor with special qualities that can be created from the hides of monsters such as xorn and frost giants is both evocative and usefully stat'd. The idea of evil druids skinning sentient magical beings to craft items is a great little tidbit, complete with rules on how much can be harvested, prices, benefits of that type of leather or hide armor, etc. Similarly the new snake venoms, plant toxins, and herbal healing remedies give great details for nature lore and creating a natural apothecary feel. The remedies are even broken down into their application methods of whether they are decoctions or to be applied as ointments, etc. The benefits are modest, however, and as written they require a new feat in addition to skill rolls to find and prepare the right remedies. The feat seems an unnecessary cost for an adventuring PC and just using the appropriate skill sets should prove fine.

There are 26 new druid spells covering levels 1 to 9 with 11 crossover ranger ones. Particularly nice is the spell *bifurcate*, which gives the caster an extra identical body that he splits his spells and hit points with. Following this are 37 individual magic items with a natural flavor to them, notably including pseudo-Judeo-Christian Slings of Giant Slaying and a Crown of Thorns.

Druidic society is then examined a bit more in depth with the concept of druidic circles. According to this supplement, druids congregate in modest numbers to oversee a particular territory. At the center of the territory is a physical circle crafted and hallowed by the druids as a ceremonial center for their social and ritual life. There are plenty of different ways this physical circle can be set up with carved wooden totems, massive stones, ice sculptures, living tree arrangements, etc. Construction and price costs are examined in depth with various options for different terrain types. Oddly, a specific item creation feat is required to create a circle, although there seems to be no game mechanic tied to the physical circle besides a hallow spell. The circle is the site for ritual observances of natural events such as the yearly equinoxes and solstices as well as druidic funeral pyres, marriage ceremonies, and other significant rites.

The social druid circle is generally a loose organization that does not recognize the legitimacy of temporal powers. There are a number of different types of leadership styles that may be adopted from democratic to oligarchic to dictatorial. Different methods may also be used to allow membership into a circle or to gain leadership positions ranging from grueling physical tests of endurance in the wilderness to dealing with dangerous animals without the use of magic, or even trial by combat for leadership positions. When a circle gets too big, a charismatic druid will gather like-minded druids and set off to establish a new circle in another territory.

In addition to the circle, druids rely upon animal companions for society, and their choice of a companion is often seen as a reflection of the individual druid; some common animal personality stereotypes are defined, such as rodents and weasels being favorites of druids who are wily and antisocial while druids who choose bears are gluttonous and known for their strength.

Another nice little touch is the view of some druids that nature gods are actually druids who have advanced a step up the ladder of enlightenment and communion with nature.

Finally there is a little discussion of those who lose their connection to nature, through alignment straying or the call of civilization, and even a rumored society of ex-druids called the Black Thumb.

Overall, ***Druids and Druidism*** presents a lot of useable details and ideas for druids. This is more so for druids as NPC wilderness protectors apart from society than adventuring PCs as written, but the information can be easily modified to make it more PC friendly.

--John Henry Stam

Pyramid Review

Aliens (for the Star Trek Roleplaying Game)

Published by [Decipher, Inc.](#)

Written by Bill Bridges, Andrew Greenberg, Kenneth Hite, Ross A. Isaacs, & Doug Sun

178-page full-color hardcover; \$35.00

Much like the [Starships](#) before it, the latest supplement for Decipher's *Star Trek Roleplaying Game* focuses in on a particular aspect of the *Star Trek* setting. And just like *Starships*, this focus is entirely new to roleplaying in the *Star Trek* universe, as in previous incarnations of the game the treatment of aliens was to have them dotted here and there through all of a line's books. With *Aliens*, the fifth supplement for the *Star Trek Roleplaying Game*, there is nothing else but non-terrestrial sentient species to be found within the content of its pages (except for humans, making this a handy source of species put firmly into one single place).

Aliens is another hardback like the rest of the CODA line and the its layout is evidence that any of the niggles hampered the two core books -- [Player's Guide](#) and [Narrator's Guide](#) -- are gone. It is clean, tidy, and easy to read, though sparsely illustrated with photographs taken from all five series and the movies.

The volume opens with an overview of aliens and how they are used in *Star Trek*, which serves as a decent introduction. This includes a table that not only the races included, but also their attribute modifiers. Best of all, those that the authors consider the easiest to use as player characters with little or no adjustment are clearly marked with an asterisk. (And no, those so asterisked do not include the Borg, the Breen, the Founders, the Jem'Hadar, and members of the Q Continuum or Species 8472 -- thankfully.) Also included is a new to the CODA rules Personal Development Package -- "Alien Upbringing." This allows the creation of characters like Worf, born of one species but raised by another. *Aliens* is rounded out with several forms for creating an Alien Species Form.

The entry for each of the supplement's 58 races is organized in the same fashion. There are sections for Personality, Physiology And Appearance, Homeworld, History And Culture, Language And Names, Favoured Professions, Species Adjustments, Species Abilities, possible Encounters with members of the race along with a sample NPC and other suggested characters, before rounding out the entry with a look at the race's status during each of *Star Trek's* eras. These ties into the five television series -- *Enterprise*, *The Original Series*, *The Next Generation*, *Deep Space 9*, and *Voyager*. In fact, *Aliens* devotes more of its contents to the currently-in-production *Enterprise* than any of the supplements published so far by Decipher. Sections of boxed text describe new weapons, such as the Andorian Chaka (a punching blade used in dueling) or Capellan Kligat (a three-sided blade that can be thrown or used in melee); particular artifacts, such as the Bajoran Orbs and their locations or the various Betazoid relics; and cultural notes, detailing (for example) the Klingon Code of Honor and their Great Houses, or the Orion Syndicate; and also new traits particular to a race.

Such new traits are for the most part optional, but their use will add much to the game. For the Betazoid character there is "Bonus Skill: Empathy (Edge)" -- for players who want half-Human/half-Betazoid characters like Deanna Troi, while Deltans can take the Oath of Celibacy flaw. Vulcans will be able to undertake the Discipline of Kolinahr with the appropriate new edge (it has unsurprisingly high requirements) or even suffer the species Flaw: Psychodegenerative Disorder, such as Sarek's Bendii Syndrome. For those playing Trill the advanced rules for their symbiont detail it as a character in its own right and provide more detail for the skills it can pass onto its host.

The write-ups feel nicely complete, though in due course it is likely that such species as the Klingons and the

Cardassians will receive their own supplements, while the Andorians and the Vulcans already have. Those, however, were for the Last Unicorn Games' incarnation of the *Star Trek* RPG, which in comparison with this supplement often left its species write-ups frustratingly and irritatingly incomplete.

So what of the actual races in ***Aliens***? For minor species such as the Anticans, Lurians, Napeans, Pakled, and Vorgon there are only two pages of coverage for each, while others such as the Borg, the Trill, and the Klingons get five pages. Most of what would be regarded as either player character or major protagonist species receive four or so pages devoted to them. From the *Enterprise* series come treatment of the Suliban and their genetic enhancements and the Axanar, though no picture of them is given; while notable entries for *The Original Series* include the Gorn, the Horta, the Kelvans, the Medusans, and the Tholians. *The Next Generation* provides details for species such as the El-Aurians, Nausicaans, the Q Continuum, and the unique living ship Gomtuu. Those from *Deep Space 9* are a little more obvious -- the Bajorans and the Cardassians, plus the Jem'Hadar, the Founders, and the Breen (they *are* the major protagonists of the Dominion War after all), but also include the Flaxians and the Lurians, though there is no extended entry for the Ferengi as there are for other species found in the ***Player's Guide***. *Voyager* is represented by entries for the Hirogen, the Kazon, the Ocampa, Species 8472, the Talaxians, and the Vidiians, while from the 10 movies come just the two entries -- the Deltans and the Atrenoids. Of course, these are just the most notable of the races covered in ***Aliens***.

With so many different races within its covers, how useful the *Star Trek* GM will find this supplement to be will vary greatly. Much of this will depend upon their campaign and the species that they want to use within own series; for example, running an *Enterprise*-era game will severely limit what can and cannot be used. The same can be said for a *Voyager*-style game, but in either case, this is partly offset by the information given under the various Eras for every race. There are also entries that some may deem odd, most notably that for Humans, though since they serve as a benchmark by which all other species are measured and do play a prime role within the history of *Star Trek*, their inclusion here could be said to be warranted.

From a more objective point of view, many of the races in ***Aliens*** should prove themselves very welcome additions to the ***Star Trek Roleplaying Game***. These include older races such as the Tholians (here getting their first *full* write-up), and the Orions, who have been generally neglected since FASA's ***The Orions*** double supplement, much as they have in the various television series. Particularly welcome are the given notes on the Orion Syndicate. From the more recent series, most gamers and *Star Trek* fans will be happy to see the very first treatment -- within a supplement, that is -- of the Borg, though there are no rules for playing drones disconnected from the Collective. That said, such rules are outside the scope of this book and will probably be found in a future supplement. The treatment of the Hirogen and Species 8472 are also pleasing additions for narrators wanting stronger and more capable antagonists, while the expanded rules for Trills will be appreciated by some players. The Q Continuum entry is also well done, concentrating in the main on how to use them within a game.

Doubtless fans will also find that a favoured species is not given here -- I would have liked to have seen the inclusion of the Kaylari (from *The Original Series* episode "The Menagerie" and detailed in Last Unicorn Games' [Star Trek: The Original Series RPG](#)), while others might have wanted to have seen entries for the Son'ya and Remuns from the recent movies. Despite such opinions, ***Aliens*** is a very useful and handy resource for any *Star Trek* campaign and is probably the most useful of books so far released by Decipher.

--Matthew Pook

Yours For Four Hours

by Sandy Antunes

A good four-hour scenario depends on velocity. In contrast to the slow build of a campaign, the single night one-shot adventure or Convention game must be focused and quick. Within four hours, players are introduced, hooks are set, and a conclusion is rapidly reached.

A well-designed one-shot includes not just a sizzling good adventure, but interesting and capable characters able to solve anything this particular adventure will throw at them. The stakes (and mortality) level can be as high as you want, since no one will be coming back to their character. Above all, you must keep it interesting.

Character Is What They Are In The Dark

Everything starts with the characters. Technically, the players exist only as lonely voices calling out character actions, and thus characters serve as inner representations of the player's ego and id, or some such pseudo-psychological babble.

Let's get real -- one-shots are about *players* having fun, and characters are the thin candy shell that makes it all possible. So you need characters that work and that have a catchy hook for roleplaying.

Pre-generated characters are by far the best approach, as they will fit the scenario. There are horror stories about referees who neglect this little point, and create scenarios that require skills no one possesses. Fortunately, it is not the role of this article to address idiocy.

Good Redundancy Is Good

Characters should be created with redundancy in mind -- truly essential skills that you expect will be required must exist within several characters (though at varying levels of ability). If they simply must pilot the alien ship off the volcano island, for example, at least two characters must have some degree of piloting ability or something equivalent. Though skills should overlap, each character should be unique to encourage interaction and ensure each player gets to enjoy being needed at some point in the adventure.

Giving each character a unique identity means giving them a name and a role as well as statistics and skills. A character without a name is simply a tactical token, and much of the fun of roleplaying will be neglected. With a name and a role (even as simple as "Sergeant Lee the over-enthusiastic commando"), the player can instantly grasp the character's essential point of view.

Skills and abilities for characters should be concentrated, so that the character excels at a few certain things. This helps with identity, and lets the player distinguish their character from the others. They are, in part, what they do-- whether it be the Healer, the Scholar, the Leader, the Fighter, the Scientist, or any other archetype within the genre you are playing with. A mix of different character types is often best, since this will allow each player to have the spotlight on them for at least part of the game.

Flavor And Sex

To improve the richness of the characters, jotting down two or more sentences of background and detail that sets them apart will help players get into the role quicker, and does not take much of your time. Heck, this paragraph is only two sentences, and it says all it needs to say.

Character gender is an issue with several resolutions. With pre-gens, one easy solution is to give each character a gender-neutral name (like "Sandy" or "A.J.") and let the players choose for themselves. Or, you can be dictatorial and force them to play the gender you wrote; bear in mind that, in Convention games, some people are very uncomfortable playing cross-gender characters, and the purpose is to have fun. On the other hand, if it is your local gaming group and you want to toss them something new, gender-swapping is a fun way to explore role-playing, so go for it!

The Quick Choice

The actual act of players choosing characters for a one-shot can be handled in several different ways. Most common are either free choice (letting them read all the characters and choose whom they want), or random assignment.

Other methods include just listing the character names, or perhaps names plus occupations, and having them choose. Artistic types can lay out character sketches and let players choose, then surprise them with the actual details of who they are. Soft-hearted Referees can let players swap if they want. About the only poor method is having you choose what you think each player will like; people tend to resent being stereotyped or pigeonholed.

"Nametag" approaches are fine. If the character sheets have a little portrait, that can suffice for "prior info" when letting people pick. Just a catchy job handle (such as "Veteran Guncat") likewise can help guide the players. In such a case, don't let them choose from the entire character sheet. Just let them choose the Nametag and the rest follows.

Or, if you like a little randomness in your initial mix, you can use a Matrix Method to allow player-created characters. This is a quick system that balances your need for "can they do this" (plus your need for speed) with the natural player desire to actually, like, have a say in their very existence.

Matrix Methods Of Chargen

This method allows players to create their own characters, yet maintains balance and necessity within the scenario. It's the chinese menu system of creation, using 5 or so 'columns' to choose from.

First, you make little cards or slips with the skills or abilities that will be required within the scenario. Call these 'Column A', and make sure there are as many items as there are players.

Then, make a set of cards or slips with skills or abilities that would be handy to have, provide a back-up to an 'essential' skill, or allow for strong roleplaying. Scatter these randomly as Columns 'B' and 'C'. Each column should have more items than there are players, and duplicates are encouraged.

Make a set of interesting advantages or perks, that may or may not be directly relevant to the scenario, and call that 'Column D'. You can have more of these than there are players, but sometimes it is nice to have exactly as many 'goodies' as players-- let them fight over who gets what.

Finally, make a set of interesting disadvantages, and call that 'Column E'. Have more of these than there are players.

Players then create a character by taking 1 item from each column. Voila, a customized character, built with three skills, one advantage or perk, and one disadvantage. Players can easily remember their character's abilities, and they can craft the persona ("the roleplaying part of their character") around these iconic elements -- a process they usually will do while choosing their column items.

Rules Light Lite

You know those 1-page quickstart rules a lot of companies print? They're too long for a one-shot. Either your players love the system (and hence know it better than you) or they're newcomers (who don't care). Here's all you need.

- **GURPS:** Roll 3d6. Try to roll low. Let me know if you roll a 3 or 18. Compare against your skill for the attempt,

and tell me if you beat your skill or missed it (or missed it by more than 10). Or just tell me the roll and I'll figure it out. If you don't have a skill or advantage for it, roll anyway.

- **d20 System:** Roll a d20. Try to roll high. Let me know if you roll a 1 or a 20. Add your combat or skill bonus from your sheet if you have one, or just tell me the roll and I'll figure it out. If you don't have a skill or feat for it, roll anyway.
- **Call of Cthulhu:** Roll percentile dice. Try to roll low. Let me know if you roll under 05 or over 96. Compare against your skill for the attempt and tell me how much you made it (or missed) by in case it was harder or easier than usual. Or just tell me the roll and I'll figure it out. If you don't have the needed skill, roll anyway.
- **Other systems:** I'm sure you can figure this out from the above.

Kill A Friend

One keen trick you can pull to set a high tension level right from the beginning is to recruit a shill to start the game. This is not a person who is actually playing the game, but a friend recruited for fifteen minutes of work. Their job is simple -- to die. Privately go over the setup of your adventure with them, and tell them exactly what you want them to do at the first major crisis point. Have them be with the other players at the start, choose a character like the others, and appear totally innocent.

Start the adventure with the initial backdrop and setting, spring the first crisis, let the shill leap foolishly to deal with it, and kill them. This usually does not require much mechanics manipulation -- if need be, you can hide your die rolls/card draws/favorite resolution method from the characters. Look sad, but announce to the player that their character died. Walk with them away from the table to console them, and once out of earshot, thank them and return to your game.

You will return to a table full of very earnest players now. What have they learned from this? That you are not just playing around, that they should take things seriously indeed, that their characters' lives are really in peril, and that you are not going to give them any easy breaks. If this at all fits your genre, you have just set a wonderful tone for the adventure without any effort, and ultimately made the scenario more enjoyable for them.

Start It Off With A Bang

Even in the absence of a shill, a good one-shot should leap into action and tension. This means conflict -- in most RPGs, combat. Use an initial attack, ambush, or heck, hostile waiter with a minigun to let the players shake off the malaise of real life and get into their personae. By starting the game with action, you buy yourself valuable time to later tackle things like 'setting' and 'plot' without being too boring.

Then Set Off A Bomb

The plot you have constructed requires certain elements for a good four-hour game. Games include problem solving, combat, social interaction, player-to-player role-playing, and tactical decisions. If you are playing in a Convention setting, rather than with friends, you should allow for more flexibility in this mix based on what the players enjoy most during the run. In any case, your adventure will contain some or all of the above, to different degrees. This is what moves the plot along.

Pacing is important. It is useful to have a "ticking bomb" of some sort, a deadline the players face. It can be strong or subtle, but never weak. Strong is "the city will be destroyed at midnight", while subtle is "while you were debating, the villain got there first."

If there is not a time pressure, the players will have too much room to come up with truly wacky, inventive, and perhaps even cunning plans that unfortunately take the game off the map and bog it down. Far better that they be saying instead, "Gee, if only we could go to the Castle and recruit the King's troops, but this town will be destroyed by then."

After all, they are the hard-luck heroes, in the situation because either no one else knows, no one else cares, or no one else was around. This does not mean railroading players, but it does mean having events work for your benefit.

If the players favor social interaction and you had expected intense problem-solving to get past a certain point, invent an alternative that lets them try continue by the way they choose. Either their interaction will bypass the problem, if they do well, or quickly indicate to them that, fun as it is, they will not solve things that way and have to find a new approach.

It's Not A Railroad, It's Just A Good Idea

Deviations should be allowed to linger for only so long as they are viable for the plot. If the players are truly going along a wrong path, and can not get what they need no matter how good their actions, let them know.

One way is to just give them whatever they are pursuing (aide, items, NPC knowledge, troops) so they can realize it will not really help. Or, if it is something they clearly can not get no matter how clever they are, make it very clear to them (through an NPC or an appeal to common sense).

Finally, toss in a reminder of the main issue at hand -- a surprise appearance by the villain, a news report of happenings elsewhere, or whatever fits the setting they are in. Even if it seems mildly implausible, a timely coincidence can set the characters back in the right direction without giving them a ridiculous advantage.

This does not mean railroading the players is good. Just differentiate "clever ideas you had not expected" from "useless ideas you'd feared", and deal with them accordingly. If you always have that clock ticking down in the background and you keep throwing things at the players, the plot and the action should progress in at least a rough approximation of a path towards the finale.

The finale should always occur. This provides a resolution to the adventure, gives a sense of completion and closure to the players, and (hopefully) allows the players a sense of accomplishment. Depending on how successful the characters have been up to this point, they will enter the finale with a certain degree of preparation and understanding, which may range from Nearly Unstoppable to Doomed.

Similarly, their degree of personal risk and odds of survival are a result of how well-prepared they are. Like a chess End Game, their chances are a product of all they have done so far, but the final outcome is not yet determined.

Freedom To Die

Things could be bleak, and you should be prepared for the slight chance that the characters will fail completely. If the players have been generally clueless and ineffectual, the finale may be a crushing moment of despair as they watch, helpless, at what their failure has brought. This is okay-- this is part of roleplaying, the consequences of their actions. Hopefully they enjoyed the journey.

To keep it from being totally downbeat, you can add a second chance, a way for the characters to redeem themselves, a sort of 'sequel effect' where, though the game is over for this bunch, they know that somewhere, sometime, they or others might be able to reverse what has happened. Though this will not actually be played (unless you write it up later, thus creating a campaign), it does add a hopeful note to a dark, poignant end.

If all went well, though, the characters succeeded brilliantly in stopping the terrible things and in aiding the good things, and the finale is a brilliant triumph (though perhaps at great cost). Rewards are justly due, either as intangibles or in material objects (whatever is appropriate). Though it is a one-shot, slight moderation is recommended just to maintain realism; too many goodies and the players will feel cheapened, not heroic.

And now that the players have enjoyed role-playing your pre-generated characters cleverly through your brilliant plot twists to the final grand finale and stopped the ticking bomb, you can relax, until the urge to run another game

beckons.

The Central Psionic Directorate

by Andy Vetromile

I'm at the door. Is the target inside?

The voice came back, more irritated this time. Yes . . . as before, he's still in there. Still four in all.

Just wanted to be sure, I offered. The door's locked. I hear movement; any chance you can save me the trouble of picking the lock?

Elsbeth here. Focus on the deadbolt.

There was an audible click . . . too audible for my taste. I held my breath, but if anyone knew we were here, they didn't give themselves away. Do we know what's on the other side of the door? Booby traps?

A pause.

No contact with Galloway. Sorry, no.

I looked back at my team. Decked out in Kevlar and armed with M4s, they hovered just behind me waiting for a signal. I couldn't make anything out inside the darkened glass of Beery's helmet, but he gave a nod.

I turned the knob quietly and pushed the door. My team stepped from the porch into the entry hall, a formal but unfurnished room with a thick layer of dust. For a moment there was nothing but the sound of voices from another room. Then Beery stiffened as a young man in an old robe, munching a bowl of cereal, stepped around the corner. He wasn't the primary target, but he had to be neutralized.

"Compromise!" Beery yelled, the first words any of us had spoken aloud in 10 minutes. The man's cereal bowl wasn't halfway to the floor before Beery was on him, pushing him against the wall with his rifle stock. The unit piled into the foyer like a fraternity fresh from a homecoming victory.

I followed in time to see Keyes toss a flash-bang, blinding the occupants with smoke and light. Within seconds everyone was on the floor, and Billet, the pyrokinetic who had set fire to four government buildings, had a white noise generator clapped over his head.

"Clear," the other members said, one after another. I was about to say the same when a side door opened and a woman entered brandishing an Uzi. I had enough time to realize she must have been shielding her presence psionically as she leveled the barrel at my chest. There was an explosion of gunfire, but only because her finger was hooked on the weapon's trigger as it flew upward and out of her hands.

I was just about to think my thanks to Elspeth for this last-minute save when the woman reached out with her mind and thrust me backward through the wall.

* * *

Welcome to the Central Psionic Directorate, a government agency that uses psionic abilities to thwart criminals and terrorists. Don't worry if you don't have psychic abilities of your own. Nine times out of 10, the psis have got your back.

Fog of War

The Vietnam Conflict ended in 1968, thanks to the prolific use of chemical warfare. Sadly, the aftereffects of that

methodology are still being felt today.

The U.S. Government enjoyed several breakthroughs in biochemistry and saw no reason not to use them. Excusing themselves from a number of treaties by saying these drugs were in no way comparable to the mustard gases of yesteryear, the military made gratuitous use of the concoctions all over the country, even on their own troops. Great clouds of foul-smelling mist would pass over a battlefield, or concentrate on a single section and linger for days even in a stiff wind. Enemy troops would pass out or find themselves paralyzed by powerful hallucinations. Marines would then step in and collect weapons and prisoners, rendering huge contingents helpless without a shot fired. The United Nations continued to balk, but there was no arguing with the success of the American operations. In 1968, rather than spend the remainder of the 20th century unconscious, North Vietnam surrendered.

Home Front

The men and women of the Vietnam Conflict returned home as heroes. Even those who had protested the war were reluctant to vilify the participants, seeing an opportunity to use the struggle to further their own pro-drug agenda at home. Although it chafed them to do so, politicians bowed to pressure and legalized many mind-altering substances. That all changed by 1980.

During the 1970s, several servicemen and women showed side effects not obvious during the war. Everything from memory loss to epileptic seizures wracked combatants and front echelon support crews. Many died, and studies done in Vietnam showed the effects weren't limited to the States. By 1980, those children of the war not suffering symptoms similar to their parents' were displaying low-level psionic abilities - telekinesis, clairvoyance, and cryokinesis, among others.

Amends

Lawsuits threatened the country's economic stability, so politicians cut an ambitious deal to stave off disaster. Those with psionic abilities could work for the government, receiving several benefits - lower taxes, cheaper insurance, and job security among them - and the psionics would forego further legal action against the United States while helping lower the crime rate. Some refused the deal or had no powers to offer and so pursued their suits, but most took the offer, becoming part of the Central Psionic Directorate.

The CPD would be a federally managed agency charged with using psionics to foil crimes on local, state, and federal levels, and to protect the interests of the United States at home. Some cried this was an attempt to circumvent civil rights, but steps were taken to maintain the respectability of the organization. The government would be in charge, but subject to generous oversight by civilian agents. The chorus of protest was muffled, but did not cease.

How It Works

Psionics would continue to live life in their own communities, but when the need for their abilities arose, agents for the CPD could draw on the "pool." Since psis span the nation, there are usually a few no matter where police action occurs. Most agents use a device called a "tap" to access this pool (cruder wits call the pool the Brain Farm); it connects them with a selection of local psi users. Given various power levels and the synergistic nature of psionics, it's possible one will be in a location receiving aid from a psi in another county, or even another state.

The tap is the size of a pack of cigarettes (some disguise it as such, though few criminals would actually fall for such a ploy) that sits flat against the base of the skull. A smaller version exists, but it must be implanted within the skin using a simple surgery. Few CPD agents opt for this because a) the tap is no more likely to be taken from them than any other gear and b) it's kind of creepy.

A select few agents are psionic and have no need of a tap. Their ability is usually limited to "channeling": an improved ability to receive, use, and sometimes boost the psionic powers of others. (Few people in possession of full powers feel

the need to place themselves on the front lines.)

Structure

Although a federal agency, the CPD's employees work at all levels of government (another of the checks and balances worked into the system to assuage civilian concerns). Only the smallest police forces do not have a CPD officer on their payroll. Some larger cities like New York have entire units comprising only CPD agents, but for most teams it suffices to have one person with access to the pool.

Agents and psis answer to a local overseer whose job is to maintain lines of communication. If locals have a concern, he passes it up. If the higher-ups have a memo, he makes sure it gets passed down. He can take a more active role if he chooses, but most overseers are responsible for 100-500 psis over the space of a metropolitan area.

The overseer in turn reports to a state auditor, who is responsible for everyone in the state. Most states (and Washington) have only one auditor, though a heavy workload may demand more be assigned. If a problem arises or disciplinary action must be taken and it's not the sort of thing the overseer can take care of with a signature, the auditor will step in and handle it personally.

State auditors are a step beneath the directorate itself. The offices are located in Virginia, and are staffed by about 50 people, plus the Tribunal. The Tribunal is a group of three managers that creates the budget, manages problems, and passes out discipline in grave or contested situations (i.e., if a psi goes rogue or uses his abilities illegally).

To further prevent misuse of the system, all members of the CPD that do not work in the field are non-psis.

What the CPD Does

The CPD primarily concerns itself with high-profile criminal cases (murder, rape, arson), national security (antiterrorism), and psi crime (the misuse of psionic abilities). Sometimes there is overlap, but psi crime is the biggest concern since it is difficult for non-psionics to take on psionics on a level playing field.

There is plenty of mindpower to go around, so it is seldom thought amiss to ask for psionic assistance in even a local criminal case. It's fast and its use does not unduly tie up resources for any length of time. If a potential terrorist plot is uncovered, it is considered a priority for the CPD until it is resolved.

What the CPD Does Not Do

The Central Psionic Directorate, in spite of its imposing name, does not routinely pry into people's lives. There must be an indication of misdeeds beforehand, and the evidence must be presented to a judge in order for a psi-warrant to be issued. Once issued, these warrants typically come with several caveats attached, and failure to adhere to them is a serious oversight. In addition to the limitations placed on normal warrants (time, place, the person or item sought), agents may be limited in what powers they may access in order to carry the warrant out.

Psis are not required to work for the government, or even forego use of their powers (though a murder committed with telekinesis is still murder, and telepaths are not allowed to enter the minds of others without permission). The Directorate keeps tabs on unassociated psis (especially the powerful ones), and may investigate the suspected use of powers to determine if there's a new psi in town, but no actual action will be taken. This is for intelligence gathering only.

A psi accused of illegal use of his powers may be probed by telepaths in order that the CPD may learn the truth, though this is a rare occurrence overall. The ACLU and other organizations come down hard on abuses of psi power, and probing is far more likely to be okayed down the line (in a police interrogation it's almost unheard of; at trial, less so). In cases involving foreigners and threats to national security, these limitations are relaxed further still. In the field,

use of an ability may be overlooked - for example, a telepath who looks into a suspect's mind to find the code to defuse a bomb - but it's expected that it will go no further. To probe deeper and claim it was "for the case" will have to be proved to one's superiors.

The CPD in Action

How does all this come together?

Officer Perdue of the Los Angeles Police Department is attempting to uncover a chop-shop. Using the tap, he found Lisa Unger, a housewife and psychometrist from San Bernardino, ready and available for work. S/he touched the keys of a carjacking victim and tuned in to a warehouse on Bellway Avenue. Perdue followed up, calling for backup and a warrant with his radio. While waiting, Perdue sent more feelers out. By the time the warrant and his backup arrived, he was aching to move in. Dell, a psi with an affinity for electronics, offered to fill the system with static, but a local telekinetic named Perez stepped in and twisted the camera's view upward. Perdue wasn't too happy with this initiative, but what was done was done. He asked Dell to hang around.

When the team entered the building, most of the choppers gave up easily. One was shot by police, and Perdue channeled a healer out of Compton. Then he had Dell probe into the computer system and start poking through the files to see how much further the operation went . . .

Power Available

GMs should determine what powers are available and how rare certain abilities are to keep it from being all-psi-action. Some guidelines:

- Some abilities are almost universal, like telepathy and telekinesis. While their inclusion can short-circuit an adventure, limitations on range, depth of probing, or weight lifted can all make these abilities fun but less likely to overwhelm events.
- Pyrokinesis and mental blasts are mostly offensive powers, and illusions are defensive or diverting. Offensive powers (pyrokinesis, mental attacks) can do serious damage if not limited somehow, and even defensive illusions can cripple a character. This works both ways; you don't want your party wasting the bad guys with abandon any more than you want your villains to die before they can get their guns out of their holsters. Use lines of sight, durations, and technology to limit effectiveness.
- Exotic abilities like teleportation remove much of the danger, so such powers ought to account for only a small portion of the pool. Quirky occasional use, especially if it only works once, whisks someone out of the way only a few inches, or does more harm than good, is a good way to keep players from depending on such miracles.
- Time spent planning can make the difference. To keep things entertaining, players should be able to keep up a stream of conversation with members of the pool (it is happening at the speed of thought, after all). But if the game bogs down, put your foot down and push the idea that this is happening at a frantic pace, and they should keep up. And if their opponents are psis, the margins for action will shrink considerably.
- Power accessed before may no longer be available. If you call on a psi, it may be a moment before they can send to you - if they're deep in some mental activity like math or doing their bills, that will slow down the response time.
- The powers can be accessed even at night, when most psis are asleep - at this point, reaction time is slowed and the agent may not have the needed personal advice of the psychic in the use of the power.

Technology

As the human mind has expanded, so has man's understanding of it. Not only has man developed the tap, he has devised mechanical means of dampening psionic powers. White noise generators can create a loud mental "distraction" that inhibits concentration. These come in different sizes. The wearable version is the size and shape of a kneepad and is wrapped over the back of the head. Vehicle mounted models (the size of a car battery) can be used to debilitate

psionics within 50', and the largest is as big and heavy as a footlocker and is effective to 500'. Care must be taken that these devices don't interfere with psis on your own team, of course, and apparatuses have begun appearing that counteract the effects of white noise generators.

Alternate Settings

The CPD can be transplanted to other genres that use weird powers with a few alterations. For example, a fantasy campaign may have the Royal Chamber of Mentalism. With different dynamics in population, the group may be relegated to only the royal estate, as a member of the king's guard specially trained to use the system. Perhaps riders from the chamber go forth into the kingdom and use it against magical powers stemming from dark compacts made with demons (if your fantasy game has no psionics, substitute magic itself).

For futuristic games, it's even harder to keep track of the population (and thereby build up a decent pool). Psychics may be offered money to join the Galactic Psionics Directorate and settle in certain areas or on certain planets. The technological race becomes more important, and governments establish boosting stations on (and between) planets - this could in turn lead to truly magnificent displays of psionic power among the stars.

"Can I Be Allergic to Glass?"

by Aaron Rosenberg

No kidding, I once heard a player ask that question. We were creating characters for *Asylum*, and you can take various flaws to get extra points. One of those flaws is Allergy, and you specify the allergy, subject to GM approval. So he wanted to be allergic to glass. The GM asked, "What you mean like touching it?" and the player replied "no, swallowing it." "Uh," the GM said, "that's not really an allergy -- everyone has a bad reaction to swallowing glass."

So what are we talking about here? Limitations. These are fun ways to give your character more depth, more personality, and a more unique flavor.

Let's face it, if you've got two people in your game, each with fifth-level fighters, those two characters may be tough to tell apart. They have the same base attack bonus, the same number of hit dice, the same starting proficiencies and class skills. But if one of them refuses to carry a shield, and the other only uses axes and spears, now they're distinct. Because you, the player, gave your character a limitation.

Some limitations give you penalties to various rolls, like the classic Blind or Deaf. And maybe you don't want to take that severe a handicap. But you don't really have to. First off, lots of limitations are not so severe. Being unable to hear low-pitched tones, for example, doesn't mean your character is deaf, but he may have trouble listening to the instructions of that gravel-voiced army commander. So now your character has to ask someone else later what the commander said, or risk looking stupid by asking the commander to repeat himself. No real die penalties, but it makes the character more interesting. Second, even limitations that do cause penalties can wind up being more useful and entertaining than damaging. Here's an example: another *Asylum* game, and one of the players created a character named Lady Ellegance, who thought she was a butterfly -- she'd woven herself a pair of silk wings and everything. The only problem was, butterflies don't talk -- so she made her character incapable of speech. Not of sound, mind you, just of proper words. We all thought she was nuts -- the player, not the character (we knew the character was crazy). But the player forged on ahead with it, making little chirps and trills and other strange sounds. By the third session we could all understand her completely. She'd developed her own vocabulary, and given the character a tremendous amount of realism -- and all with something that would normally be seen as a weakness.

Does that mean all your characters should be deaf or mute? Of course not. But when you're creating your character, think about him. What is the character's history? Where did he come from? What were his parents like? Did he have an education? How and where did he get his training? Look at all of these elements, and see if any of them suggest some limitation that fits the character. If he had no formal education, perhaps he is illiterate -- or, even if he knows how to read and write, maybe he mispronounces everything because no one ever corrected him. If he grew up on a pig farm, maybe he is easily distracted by pigs and by farming activities in general. Or perhaps he despises pigs, and is actually afraid of them. The limitation should always fit the character, even if it stems from some aspect of his past or personality that most people don't know about.

If you know that you want to give your character a limitation, but you don't know which one, consider the character's history. Then think about what type of limitation you want your character to have. Most limitations can be broken down into the following categories:

Code: Your character has a personal code of honor or of behavior. Perhaps he cannot stab a man in the back, because his father was killed that way long ago. Or maybe he feels the need to answer any request for help, because his parents were saved by a passing stranger before he was even born, and so he feels he must honor that unknown benefactor by continuing such generous behavior. Codes can be extremely restrictive or very broad, and they can apply to everything or to a specific set of activities or individuals. For example, a knight has the code of chivalry, which dictates how he behaves toward worthy opponents (no backstabbing, no striking when the other is unarmed, automatic acceptance of any plea for mercy, etc.) and toward women (though only those of noble birth). It says nothing, however, about how a knight must act toward a cowardly robber or even toward a peasant. Make sure the code you pick fits the character,

and does not make his life completely impossible. Being an archer who has sworn never to fire a bow defeats the purpose of the character right from the start, whereas an archer who has sworn never to kill may have a difficult time but not an impossible one.

Feature: The character has a distinctive physical feature. Perhaps his hair is naturally striped like a skunk's or a tiger's, or his eyes are a unique shade of purple or a solid gray, or his tongue is literally silver. These may not seem limiting, but they mark the character, making it difficult for him to hide or be mistaken for another. Other physical features are more inherently limiting. Height is a big one. A character who is eight feet tall has just as many problems as one who is only four feet tall -- and in fantasy worlds with dwarves and other races, the tall human has a much harder time. Not only is it difficult for him to hide, but he has to get all of his clothes custom-made, while the short human can buy clothing meant for dwarves and hobbits and be fine. Other physical feature limitations include having too many fingers or too few, too many joints per finger or too few, missing a feature (like a nose) or having one that is so large it gets in the way. Physical features often provide more comical limitations, though they can certainly be serious -- the man with only one arm will have a tough time using a shield and a sword in combat. Be careful not to make the limitation too restrictive, however -- if you really want your character to be one-armed, talk to the GM about it. Perhaps you can trade that arm for something else, like extra experience or a bit of character-knowledge or even a few extra skill points.

Trait: While features are physical, traits are psychological. Your character always walks on the right side of the street. He never drinks from a dirty cup, and never uses another man's knife. He whistles whenever he enters combat, even if he is trying to surprise his opponent. Traits can be minor or major, and are usually not chosen by the character -- most traits are a matter of unconscious habit, and the character may not even be aware he does it. Why does he whistle when he gets ready to fight? Is it a way to calm his nerves? Did his old fight instructor use that particular melody to teach him rhythm? Some traits make sense once you know the character's history -- his grandfather died from a disease caught by sharing a pipe with several strangers, so the character simply cannot consider sharing utensils or cups with another person. Others are just quirks, and make no real sense -- the character wears only blue and has dyed every possession blue because he likes the color, and for no other reason. Most traits don't affect die rolls, just character.

Vow: Vows are similar to codes in that they affect the way your character behaves, but vows are more personal, and often more specific. The code of chivalry dictates that the knight must show proper respect for a noblewoman, and protect her from harm, but the knight has also vowed to defend a particular lady to the death and to see her restored to her kingdom. The code is often something the character was taught by another, but vows usually come from the character himself, and can actually take precedence over codes -- a character who swears to kill the man who murdered his family may be willing to stab that man in the back, even if normally such behavior would be unthinkable. Most vows are that specific, geared toward one person or event, but they can be more general -- for example, a warrior could vow to rid the world of orcs, or to slaughter every orc he sees, or even just to lend aid to anyone he sees battling the foul creatures.

Bias: Your character may have very set notions about particular people or things. For example, he may believe that all dwarves are drunkards, because the only dwarves he ever saw growing up were a part of drunken miners. Or he may insist that real men only eat meat and potatoes because that is all his father and brothers ever ate. Most biases are the result of a character's upbringing and education, and only come up when interacting with other characters. But a strong bias can be a major limitation, particularly when it prevents the character from relating well to another (like a character who thinks all dwarves are drunks, and his dwarven companion).

You can, of course, mix and match limitations. Perhaps your character has only four fingers on his left hand, because a bandit chopped off the fifth years ago. Now the character has sworn to find that bandit and get his revenge. Be careful about taking too many limitations, however. The character who has vowed to help any women in need, and who cannot tell a lie and cannot refuse a friend and insists upon walking everywhere (as opposed to riding a horse or taking a boat) will be a difficult companion because he'll slow the rest of the group to a crawl. Make sure that your character can still be effective -- stick to either one large limitation or several small ones. As an example, I'm currently playing a druid who not only cannot wear metal armor but who has vowed never to use manufactured or processed materials of any sort. His hide armor was made by hand and has no metal, his club is hardwood and his dagger bone, and his money is all in gems and gold coins (unrefined metal). It's a major limitation in that it influences everything the

character does, but it doesn't give him any penalties in terms of mechanics -- his weapons are made of wood and bone anyway, so they're fine, and his armor is just as effective as the normal version of hide. The limitation is simply a quirk of his personality. It does make him very distinctive, however, and creates a lot of fun roleplaying opportunities.

Before you add limitations, you should definitely talk them over with your GM. Tell him how you want to limit the character, and how that ties into his background or personality. This way, the GM can warn you if you're considering a limitation that's too restrictive or that goes against something he has planned -- for example, if he's about to run a campaign set on the high seas, a character who falls asleep every time he's on a boat won't fit in very well. He can help you find ways to make the limitation more integral to the character, so that it's not just a tacked-on trait but a real facet of his personality. And, by letting the GM know what your character's peculiarities are, you give him the chance to use them himself. If your character has a particular problem with black horses, one of those might be the only mount left when you need to chase someone down. Or perhaps your character is invited to a ceremony and offered the peace chalice as a mark of respect -- a great goblet that everyone drinks from in turn, and of course your character has that problem with sharing cups and silverware. Most GMs love the chance to play upon a character's unique details, because it makes the game more real for them just as much as for you.

Nor are you prevented from adding limitations if you're already playing a character. People change as they go, largely because of the things they experience. Was the character recently involved in a large battle with someone? Then perhaps he has developed a limitation as a result -- if his adversary had a forked tongue (literally), perhaps your character now insists on being able to see the mouth and tongue of any person he speaks with, just be sure they are not in league with his old foe. Or, if the character almost drowned because some sailor had not tied a knot properly, perhaps he must now compulsively check every knot he sees, and must always carry a coil of rope no matter where he is. Again, talk with the GM. Find some limitations that would make sense, given what the character has gone through recently. Then find ways to work in those new features -- in some cases the character may wake up one morning and suddenly have this new trait or code, but it might develop slowly instead. One of the advantages to adding limitations to existing characters is that others (both players and characters) already have their notions of what that character is like and how he acts. By adding something new, you'll make them stop and reassess the situation -- they'll have to look at everything anew, and that can be refreshing for everyone.

The biggest thing about limitations is to find something that's fun to play. Don't get bogged down in how many points a limitation is worth, or how much it penalizes you -- your GM will stop you if you select something too major, or too damning. Find a limitation that fits the character, that makes sense for where he's been and what he's been through, and that you think would be fun to play. Have you always wanted to play a straight-laced, honor-bound character? Then perhaps your extremely practical fighter starts realizing that life is more than mere survival, and that honor is the true measure of a man's worth. Or maybe you think it would be fun to have a character who stutters -- your halfling thief has just barely survived his encounter with a lich, and that fright is more than enough to make him have trouble speaking from then on. Keep in mind, too, that limitations are not absolute obstacles so much as challenging barriers. Having only one hand does not mean your character can't climb a ladder -- it just means he's got to be more creative about it than most. That gives both you and your character a chance to shine, by showing how you can overcome those restrictions. And it makes the character more interesting, more unique, and more three-dimensional because he has problems he has to work around. He's not perfect, just like we aren't, but he's got different limitations from yours, because you want someone that makes you stretch a bit as a player, and that means roleplaying traits and features and vows and codes that fit the character even if they wouldn't apply to you yourself. After all, everybody has a bad reaction to swallowing glass -- what's interesting is playing the man who feels compelled to swallow it anyway.

The Crux War

A d20 Modern Campaign Setting

by Sean Robson

"I am not speaking of randomness, but of the central principle of all history -- contingency. A historical explanation does not rest on direct deductions from laws of nature, but on an unpredictable sequence of antecedent states, where any major change in any step of the sequence would have altered the final result. This final result is therefore dependent, or contingent, upon everything that came before -- the un-erasable and determining signature of history."
-- Stephen Jay Gould, *Wonderful Life*.

If you could rewind the tape of life to any point in the past and let it run again, would it ever play out the same way twice? The late Professor Gould was referring to an innocuous little creature called *Pikaia* that swam in the seas of the Middle Cambrian, 500 million years ago. *Pikaia*, through sheer chance, survived a mass extinction that decimated many of Earth's early species; lucky for us, because *Pikaia* is the earliest known chordate -- the progenitor of the phylum to which we, ourselves, belong. What would the world be like today if *Pikaia* had gone extinct? What would the world be like if Archduke Ferdinand had never been assassinated, or if Nelson had lost the battle of Trafalgar? Imagine that for every significant historical event there is a divergent timeline for each alternate outcome. This would result in a nearly infinite number of alternate timelines, some only subtly different from our own, and others dramatically different. As a general rule, the farther in the past the divergence occurred, the greater the difference between that timeline and our own. Because each timeline can spawn its own divergences, the number of existing timelines is beyond count. Not every alternate outcome spawns a timeline, however; the event in question must be significant enough to overcome temporal inertia. If you had steak for supper last night, theoretically there should be an alternate timeline in which you ate chicken instead. But unless your choice of supper was a historically significant event such a timeline would only last a few milliseconds before remerging with the baseline. Think of a timeline as a fast flowing river with steep banks. In order to break free of this river, and create an alternate timeline, an event must have sufficient momentum; if it does, it forms a temporal "tributary," and the point at which this tributary diverges is called a crux. What if these cruxes were the battlegrounds of a temporal struggle to decide the ultimate fate of all time, and you were a soldier in what is known as the Crux War?

Campaign in Brief

The Crux War campaign allows you to take your players to any point in history and explore the myriad possibilities that might have resulted had events transpired differently. The heroes take the role of temporal agents from "our" timeline who make covert infiltrations into alternate timelines at critical crux points to prevent them from being conquered or subverted by the Akkadians, agents of an enemy timeline. Temporal agents are also tasked to influence the historical turning points of alternate timelines to ensure that they develop along paths that make them sympathetic to cause and to recruit them as allies.

Background

Our timeline first became aware of the Akkadians when a shadowy, enigmatic cover organization, known as the Disciples of Namtur, was linked to a variety of unrelated terrorist groups. The sudden geopolitical destabilization following the collapse of the Soviet Union resulted in flare up of long-simmering ethnic rivalries, increased terrorism, and widespread global conflict, and behind every incident were the Disciples. Intelligence agencies were at a loss to explain this new omnipresent organization until the leader of a Disciple cell was finally captured. Under interrogation, the leader revealed that he was an agent from another timeline and was sent to our timeline to soften up our defenses for an eventual invasion. The confession would have been regarded as the ravings of a madman were it not for the parachronic transmitter that he had been carrying when captured. Once our scientists had proof that time travel was

possible, creating a mathematical model for the "chronoverse" was relatively simple and the mechanics of cross-time travel were quickly discovered. In response to an unprecedented threat to our very existence, a secret agency known as the Chronoverse Operations Authority (COA) was established, an elite corps of Chron-Ops was created, and our exploration of the infinite worlds of the chronoverse was begun.

The Akkadians

Around 2360 BC, Sargon, ruler of the city-state of Akkad began a war to conquer neighboring city-states of Mesopotamia. By 2340 BC he had united Sumer-Akkad, and went on to subjugate the lands from the Persian Gulf to Cappadocia, creating the first great empire of the ancient world. Trade from across the empire made Akkad fabulously wealthy and transformed it into the center of world culture.

Facing external threats from the Hittites and other barbarian tribes pressing against every border, Akkadia was engaged in almost constant warfare. After the death of Sargon, the security of the empire was threatened by numerous rebellions. Sargon's grandson, Naram-Sin, quelled the rebellions in a series of military successes, and extended the realm created by Sargon. He declared himself "King of the Four Corners of the World" and had himself deified.

Under Naram-Sin's reign, the empire was invaded by the Gutians, a fierce mountain people and it is at this juncture that the Akkadian timeline diverged from our own. In our timeline, the Gutians overran Akkadia and northern Sumer, razed Akkad, and deposed Naram-Sin, ending his dynasty. With the Akkadians under Gutian rule, the Sumerians were able to regain control over many of their city-states, and in 2115 BC, the Sumerian city of Ur rose up in revolt against Akkadia and established an independent Sumerian empire that was extremely prosperous for over a century before becoming absorbed by the Babylonian empire. Events in the Akkadian timeline transpired differently, dramatically altering the future of the Mesopotamian region and of the entire world.

In the Akkadian timeline, as the Gutians were besieging Akkad, Naram-Sin appealed to the demon-god Namtur, the demon responsible for death, who dwelt in Kur, the underworld. When the Gutians were thrown back, Naram-Sin attributed their deliverance to the will of Namtur, and sacrificed Gutian captives to the death demon. He subsequently built a towering ziggurat in the center of Akkad to serve as the temple of Namtur, the city's new patron god. The narrow victory over the Gutians had a profound and lasting effect on the people of Akkadia, as the Gutian invasion was only the most recent attack in a long history of warfare. Naram-Sin concluded that the only way to ensure the security of Akkadia was to utterly defeat and subjugate all potential threats, and thus embarked upon a war of conquest that would last for centuries.

After Naram-Sin's death, he was venerated as the spirit of the Akkadian empire, and his successors continued the wars of conquest in his honor. As region after region fell under Akkadian domination, Akkad grew larger, richer and more powerful. Despite this, the Akkadians never felt secure, and xenophobic paranoia became a deeply ingrained feature of their culture. So too, did the worship of Namtur, and in each conquered city, a ziggurat built in his honor was baptized with the blood of its vanquished populace. All the while, Akkad's unprecedented prosperity allowed it to grow and develop rapidly, and its scholars unlocked the secrets of nature far quicker than such discoveries were made in our own timeline. By 1000 BC the Akkadian empire encompassed the known world, Akkadian astronomers had charted the heavens and celestial navigation made long ocean voyages a reality. The conquest of the New World began shortly thereafter.

Akkadian scientists discovered cross-time travel more than two hundred years ago, and began to explore alternate timelines. True to form, the Akkadians feared eventual invasion by alternate timelines, and set out to conquer all those they discovered. Since the Akkadians were far more technologically advanced than any other known timeline, it was not long before the ziggurats of Namtur were erected in a multitude of cities across many timelines. The Akkadians have explored far more timelines than they have resources to conquer at any one time, so they dispatch agents to crux points in timelines that are not on their immediate agenda for military conquest. The agents attempt to influence events and destabilize the world to make the timeline more susceptible to eventual domination when the time comes.

The Fundamentals of Cross-Time Travel

Agents travel between timelines by stepping through an Infinity Gate, which creates a bridge between the infinite worlds that might be. An immense amount of energy is required to power an Infinity Gate, so the process is extremely expensive. In general, the earlier an alternate timeline diverged from our own, the more power is required to establish a bridge. This means that travel to worlds greatly diverged from our own, such as the Akkadian timeline, is prohibitively expensive. Of course this means that the Akkadians don't often launch incursions into our timeline either, although with the resources of many vanquished worlds at their disposal, it is less of an issue for them than it is for us. Linear time travel within our own timeline is the most difficult and expensive type of all. To return to the analogy of the temporal "river," traveling into our past is like trying to swim up a waterfall and is not often attempted. Such a jaunt would deplete the Temporal Corps' entire budget for a year, so we have settled for seeding the crux points in our past with temporal flux sensors. Any attempt to open a gate in our past, say to alter the outcome of a key event in our history, will trigger an alarm allowing a rapid response team to be dispatched to protect the crux point. Forget what you've seen in the movies, though; it is not possible to change the course of our history, and thereby our present, by altering the outcome of historical events. Our past has already been written, and is immutable. Such tampering would only create a new timeline, although it is still worth defending our crux points because any timeline the Akkadians might wish to create is almost certainly one we would like to prevent.

Agents operating in alternate timelines have no way of communicating with headquarters in our own world, so they are issued with parachronic transmitters, which they can activate to send a temporal echo through the chronoverse that can be heard by special sensors that function like the temporal flux sensors that guard our own past. When a parachronic signal is received, the Infinity Gate is activated, and a bridge is reestablished allowing the agents to come home. Unfortunately the bridge is established only at the same geographical location that it was originally established, not at the agent's location so it is up to them to get to the rendezvous point for retrieval. If a signal is received and agents do not return, it is assumed that the transmitter was activated as an emergency signal and a rescue team is sent to find them.

The Role of Department-7 in the Crux War Campaign

- **Department-1: Administration**
- **Department-2: Training and Standards.** Responsible for recruiting personnel and training field-operatives.
- **Department-3: Archives.** Compiles and stores information about all known timelines, including the specific history of each and the location of its crux points. Also responsible for providing cover identities and appropriate costume for agents on assignment.
- **Department-4: R&D.** We face a technologically superior enemy and have a lot of catching up to do. Department-4 includes world-class physicists and engineers who not only built and maintain the Infinity Gate, but study captured Akkadian equipment in an attempt to reverse-engineer it and bridge the technological gap between us. Department-4 also maintains the armory, and supplies field agents with experimental equipment of beta-testing.
- **Department-5: Exploration.** Department-5 provides timeline scouts that make the first entry into newly discovered timelines. Reports from Department-5 agents are essential for building a reliable database of information on the known timelines.
- **Department-6: Intelligence.** As soon as Department-5 has explored and reported on a new timeline, Department-6 stations an agent on long-term assignment to monitor it. Such assignments can last for years, and many Department-6 agents spend their entire careers living in one timeline. They accumulate detailed information about their assigned timeline, and watch for signs of Akkadian activity on the world. They signal for pick-up once per year to file their updates with Department-3, and immediately upon the confirmation of Akkadian agents operating in the timeline. In the event that an annual parachronic signal is not received on its expected date, a team of Department-7 agents are dispatched to investigate. Intelligence agents also recruit indigenous agents and set up and handle intelligence networks on their assigned timeline. The Akkadians have a similar system; the Disciples of Namtur operate on many different timelines and always consist of natives of that world who do not know the true nature of their organization. Each Disciple of Namtur cell is recruited and directed by an Akkadian intelligence agent.

- **Department-7: Field Agents.** These are the "special forces" agents that fulfill a wide variety of roles, and include the elite Chron-Op agents. Field Agents are dispatched to counter any Akkadian operations reported by a Department-6 agent, to defend any incursions into one of our timeline's crux points, and serve as rescue teams that respond to any emergency parachronic transmitter signal made by a Time Scout, Intelligence Agent, or Field Agent team. They are also responsible for undertaking an investigation when an Intelligence Agent fails to signal for annual retrieval. Chron-Ops are the most highly trained of all COA agents, and are required to have a broad range of skills and combat abilities so as to complete their mission in any possible environment.
- **Department-8: Combat.** The combat department provides a rapid response military force that is prepared to repel an Akkadian military invasion, whether of our own timeline, or any allied timeline. They are the first line of defense and must hold the line until the world's military forces can be organized to respond.

Characters

Most Field Agents are recruited from our own time, and the COA looks for people who are able to handle themselves in a wide variety of circumstances. The agency will never pass up an exceptional candidate, however, and many agents have been recruited from other timelines. Thus it is possible to play an agent who originated from any period of time, such as a Roman legionnaire, a Victorian scientist, or a Renaissance era explorer. Sometimes, when a local discovers the truth about a temporal operation on their world, it is easier to tell them the whole story and recruit them than to cover it up.

New Advanced Class -- Chron-Op

Chron-Ops are the product of intense training, and are the elite of the Department-7 field agents. They are jacks-of-all-trades, and need to know a little bit about everything as they can be sent with no warning into nearly any possible alternate world. Since their training involves extensive education, most agents will have several levels of the Smart Hero basic class, but since they need to be able to fight ruthless and highly trained enemy agents, and survive in any conceivable environment, levels in the Strong, Fast, or Tough Hero classes are also recommended.

Requirements

Base Attack Bonus: +3

Skills: Diplomacy 2 ranks, Knowledge (History) 6 ranks, Speak Language (Modern), Speak Language (Ancient), Survival 2 ranks. **Feat:** Archaic Weapon Proficiency

Class Information

The following information pertains to the Chron-Op advanced class.

Hit Die: 1d8

Action Points: The Chron-Op gains 6 + one-half character level, rounded down, every time he attains a level in this class. **Class Skills:** Bluff, Craft (all), Decipher Script, Diplomacy, Disguise, Gather Information, Hide, Knowledge (all), Move Silently, Navigate, Read/Write Language, Repair, Research, Ride, Search, Sense Motive, Speak Language, Survival.

Skill Points at each Level: 7 + Int modifier.

Class Features

Best Effort

Chron-Ops are the best of the best, and are expected to succeed in even the most adverse conditions. Once per day they can focus all of their ability on the completion of a task and gain a competence bonus to any Skill Check. This

bonus is +2 at third level and increases by +1 every second level thereafter.

Bonus Feats

In order to gain the flexibility to meet the extraordinary demands placed upon them, Chron-Ops receive bonus feats every second level.

Operational Priority

Due to the high priority of their missions, Chron-Ops receive preferential logistical support. When requisitioning equipment from Department-4 or support from any other COA Department, Chron-Ops may add their class level to the roll (1d20 + character level + Chron-Op class level + Cha bonus).

Save the Day

The fate of entire worlds regularly rests on the shoulders of the Chron-Op and they are often required to do the impossible when the chips are down, and overcome overwhelming odds. Once per day, when spending an action point to improve a d20 roll, the Chron-Op can add his class level to the d6 improvement roll.

Level	BAB	Fort	Ref	Will	Special	Defense Bonus	Reputation			
1	+1		+1			+1	+0	Save the Day	+1	+1 Operational Priority
2	+2		+2			+2	+0	Bonus Feat	+2	+1
3	+3		+2			+2	+1	Best Effort	+2	+2
4	+4		+2			+2	+1	Bonus Feat	+3	+2
5	+5		+3			+3	+1	Best Effort	+3	+4
6	+6		+3			+3	+2	Bonus Feat	+4	+2
7	+7		+4			+4	+2	Best Effort	+4	+5
8	+8		+4			+4	+2	Bonus Feat	+6	+3
9	+9		+5			+5	+2	Best Effort	+5	+6
10	+10		+5			+5	+3	Bonus Feat	+7	+4

Adventure Ideas

The Dawn of Enlightenment

Situation: COA has received an unscheduled parachronic transmission from Marcus Quinn, a Department-6 Int-Op on station at a crux point in the year 1485 of the "Lancastrian" timeline, so named for the dominance and long-lived dynasty of the House of Lancaster in this world. The Lancastrian timeline diverged from our own in 1420 A.D., five years after Henry V defeated the French at Agincourt. The Treaty of Troyes was signed in 1420, which made Henry V the heir of the French king, Charles VI, instead of Charles' own son. In our own timeline Henry V died of dysentery in 1422, before ascending the French throne; most of France refused to recognize Henry V's son as the legitimate heir to the French throne, and by 1453 England had lost most of its territory in France. In the Lancastrian timeline the Treaty of Troyes was not refuted and Henry V did not contract dysentery, but was able to ascend the throne and cement English rule in France. The Lancaster kings went on to establish a powerful dynasty that has dominated Europe to this day. Henry V was succeeded by his son Henry VI, who continued to expand the empire his father had established in Europe and, in 1471 allied himself with Pope Sixtus IV to gain the support of the church, and subsequently gave royal consent to all papal decrees. Sixtus IV called for a crusade against the Turks, which Henry VI and his successor,

Edward IV, wholeheartedly supported. This was to be a long, bitter campaign that saw the eventual conquest of Turkey. The Spanish Inquisition was instituted in 1478 and was lead by Tomas de Torquemada, who became inquisitor-general of Spain in 1483. This inquisition has persisted to present day and its vigorous persecution of heretics, including all natural philosophers and free thinkers, has ensured that the Lancastrian timeline has never emerged from the "Middle Ages," and is firmly under the covert control of the Akkadians. Agent Quinn has been working with local revolutionaries to overthrow the iron grip of the church and usher in the Renaissance, in hopes of creating a new timeline that will eventually become our ally in the Crux War. Unfortunately, the leader of Quinn's Enlightenment Movement, a visionary artist and inventor named Leonardo da Vinci, has been accused of heresy and arrested, and is due to be put to the question by Torquemada, himself. Moreover, agent Quinn has discovered that Tomas de Torquemada is a member of new order of the church, the Order of Saint Namtur. This order is, of course the front for a cell led by an Akkadian agent.

Mission: Agents will insert into the Lancastrian timeline in 1485 A.D. There, they will contact agent Quinn, who is locally known as Antonio Bartolli, the abbot of a small monastery outside of Florence. During the first stage of the operation, Department-7 agents are to rescue da Vinci from prison, recover the confiscated Codex Atlanticus, his notebook of inventions, and assist him in constructing working prototypes of his military machines. The second stage of the operation will involve agents helping to train a cadre of revolutionaries recruited by Quinn, and lead them in battle against the Order of Saint Namtur. Agent Quinn is certain that once this militant sect is broken, Pope Sixtus will be able to regain control of the Inquisition, relaxing its strictures, which should, in turn, allow the Enlightenment Movement to gain momentum and herald a new age of science and philosophy.

Execution: Stage one of the operation will need to be conducted quickly, as Torquemada, and the Akkadian cell leader likely suspect that da Vinci is the leader of a COA resistance cell, and will be executed as soon as a confession, and Quinn's identity can be tortured out of him. The second stage must not delay too long, as the Order of Saint Namtur will use all of their resources to hunt down and destroy the revolutionary cell before it can act. Agents are responsible to evade the Order of Namtur long enough to prepare their forces to defeat them in battle.

Support: The Department-7 team will be issued with one parachronic transmitter. No other modern equipment will be allowed, as temporal contamination is to be avoided on this mission at all costs. The Lancastrian Renaissance must be allowed to make its own discoveries to generate the momentum to revolutionize the world. Agent Quinn can provide any other local logistical support required by the field team.

Command and Signals: The Department-7 field team is in tactical command of the operation. Agent Quinn is the officer in charge of the Lancastrian 1485 crux point, and is responsible for the strategic development of the Enlightenment Movement. Upon completion of the mission, or in the event of disaster, the parachronic transmitter can be activated to signal for retrieval.

Leonardo da Vinci and the Codex Atlanticus

Leonardo da Vinci (1452-1519) was an artist, inventor, and philosopher whose inventions were far ahead of their time. The Codex Atlanticus is the name that has been given to the notebook containing many of his inventions. The following are the inventions that will be of most use to the agents in the successful completion of their mission.

Armored Car

This is a tortoise-shaped cart reinforced with metal plates. The car is operated by 8 men who operated cranks to turn the wheels. The car has an inner turret armed with guns, with narrow slits to allow the gunners to aim through. Da Vinci described his armored car as a "covered chariot, which cannot be assaulted; behind it infantrymen shall follow without fearing injury or impediment." Construction: Purchase DC -- N/A, Quinn has gathered enough funds to purchase necessary materials; Craft (mechanical) DC 25; Time to build -- 24 hrs.

Automatic Igniting Device

This is the first rotating wheel lock for igniting firearms. Though da Vinci probably did not design this device until 1497, the GM may wish to allow it in Lancastrian 1485, because in this timeline, da Vinci devoted much less time to art than he did in our own, so his inventions could reasonably have been made earlier. All firearms of this age use matchlock ignition, whereby pulling the trigger lowers a slow burning fuse to a touchhole to ignite the powder. This fuse was very vulnerable to wind and rain, making matchlock weapons unreliable. The wheel lock ignited powder by striking a flint to create a spark, which results in a much more practical weapon that, unlike matchlocks, can be holstered or carried concealed. Construction: Purchase DC -- N/A; Craft (mechanical) DC 15; Time to build -- 1 hr.

Eight-barreled Organ

This is a machine-gun consisting of a set of eight small-caliber muzzles mounted in a fan-wise arrangement on a single wheeled carriage. Elevation of the muzzles can be adjusted by a turning a screw and the fan-shaped arrangement of the muzzles enables a wide field of fire. **d20 Modern** rules: The eight-barreled organ is a one-shot autofire attack. Due to the fan-shaped distribution of the barrels, the area affected is 20 ft. wide by 10 ft. deep rather than the usual 10 ft. by 10 ft. area covered by normal autofire weapons. Construction: Purchase DC -- N/A; Craft (mechanical) DC 20; Time to Build -- 12 hrs.

Thirty-Three-Barreled Organ

This is a scaled up version of the eight-barreled organ, which consists of thirty-three small guns lined up in rows of eleven, mounted on a rotating framework. After the first row of guns is fired, the gunner can successively rotate the second and third rows into place. The guns swing upward for muzzle-loading. **d20 Modern** rules: The thirty-three-barreled organ may make three autofire attacks before reloading. After firing, the gunner must take a full-round action to set up the next bank of eleven guns. The area of the autofire attack is 10 ft. by 10 ft. Construction: Purchase DC -- N/A; Craft (mechanical) DC 25; Time to build -- 24 hrs.

New Feats

Artillery Proficiency

You are proficient in loading, aiming, and firing all gun powder artillery weapons, such as cannons. The 8- and 33-barreled organs fall into this category.

Benefit: You take no penalty on attack rolls when using any kind of gun powder artillery

Normal: A character without this feat takes the -4 nonproficiency penalty when making artillery attacks.

Black Powder Weapon Proficiency

You are proficient in loading and firing black powder pistols and long-arms.

Benefit: You take no penalty on attack rolls when using black powder weapons.

Normal: A character without this feat or the Personal Firearms Proficiency feat takes the -4 nonproficiency penalty when making attacks. Characters with the Personal Firearms Proficiency feat but without the Black Powder Weapon Proficiency feat may make attacks without penalty, but reload times are doubled, and the weapon malfunctions on "to hit" rolls of 8 or less.

Designer's Notes: GURPS Vehicle Builder

by Thomas L Bont and Thomas Jones-Low

GURPS Vehicle Builder is a labor of love, one I have been working on for over four-and-a-half years (the oldest file I can find in any backup is dated January 1999). This article was originally 900 words of "How do I possibly tell you what the deal is for a project of this length?" Thomas Jones-Low said, "Reduce it to one paragraph." I have found that his opinion is usually right so you just read that paragraph. Besides, it would be impossible with my meager writing skills to tell you about the trials and tribulations of the development process. Suffice it to say nobody is happier than I am that it is finally shipping.

At one time I exclaimed in a public forum, "**GURPS Vehicles** defies logical expression!" To a certain extent I still feel that way. There are too many options, too many expansions, too many ways to tweak the rules to fit a particular application without devoting a substantial amount of time to learning the rules and all the ins and outs of the system. **GURPS Vehicle Builder**, when I first considered writing this ultimate gaming utility, was to fix this. I wanted something that was flexible enough to fit just about any genre the player wanted to design a toy in, while at the same time adhering to the rules in **Vehicles**. This was not an easy undertaking; there are only two other people I know of that could possibly understand it at the level of the developer: Thomas Jones-Low, my compatriot; and Mike Joseph, the writer of **GURPS Vehicles Designer** . . . and only because they have actually seen the fruits of their labor reach the market. In effect, I wanted a program that was generic enough to be worthy of the name **GURPS**.

So, why did I choose to do things the way I did in **GURPS Vehicle Builder**? Some things are completely user-defined (though they are defined by default by us) while some things are hard-coded. The simple answer is, "because it was easy." The not-so-simple answer is, "I still haven't figured out a way to make the entire program formula driven yet." This goes back to my previous exclamation about defying logical expression. Note I am steadily experimenting with ways to completely turn all performance statistics into user-defined formulas.

By its very nature, **GURPS Vehicles** scares off most would-be gearheads. It is math-intensive. The math isn't that hard, though. It is mostly just the four basic operations: addition, subtraction, multiplication, and division, with the occasional square root thrown in to keep you honest. However, even a simple vehicle has over 50 formulas that must be solved, with many of them depending on an answer from a previous one. Make a mistake earlier on and your entire design is toast. Post it to a public forum and you will get some feedback on the idea but it may be days before some hardy soul will actually try to reverse-engineer it and tell you if your calculations are wrong or not. This has actually happened to me a couple of times in the early days of **GURPS Vehicle Builder's** development (I was trying to get some free help to test my program <grin>). It was weeks before someone said, "Hey, your air speed is wrong!" Personally, I have probably only checked half a dozen myself. This isn't because we are lazy. It is time consuming!

GURPS Vehicle Builder reduces the amount of time it takes to design a vehicle by doing the math for you (and quite quickly, I might add, in real-time as you make changes to your vehicle). There are still a few different ways to toast your design, but **GURPS Vehicle Builder** does try to enforce the rules for you. If you want to step outside that sandbox known as **Vehicles**, you can. For instance, all motive subassemblies are not truly part of the Body. They are separate entities that only contribute to total vehicle statistics. By placing them in, say, the Body, **GURPS Vehicle Builder** will ignore their contribution to the vehicle as a whole but affect the Body. And they do not contribute to the final performance statistics.

You may think, "This is wrong; you should be able to place them anywhere." To a certain extent you may be right. However, by allowing **GURPS Vehicle Builder** to ignore situations such as this it opens the door to many other options. You can create armored sections of a ship much more easily -- put a superstructure in the Body and it is treated as a separate entity for structural and armoring purposes but not used for total vehicle surface area nor is that little rule about Body volume enforced. It has its advantages at times.

GURPS Vehicle Builder also takes care of the little nit-picky parts of the Vehicles design system. What is the

difference between a TL6 7.76mm Machine Gun and a TL7 model? I have no clue and neither do you unless you are a savant or happen to have **GURPS Vehicles** opened to the correct set of pages right now. **GURPS Vehicle Builder** knows.

In some ways, this program makes the vehicle design process worse by presenting you with too many options. Steve Jackson Games manages to put a new book out ever month or so with new rules, new additions, and new options that just contribute to the morass. However, before **GURPS Vehicle Builder** it was impossible to keep track of them all, which in a very strange way, made it easier on the designer. You only worry about the snake you know about (i.e., you only design with the options at hand). There are solutions to this problem, though.

The Steve Jackson Games solution is the Modular Design System (MDS). MDSs reduce the complexity of the vehicle design process by taking the most useful vehicle design options and wrapping them up into modules. For instance, a bridge module might consist of crew stations, computers, sensors, and communicators. This cuts down on the design complexity substantially. You find them in **GURPS Traveller**, **World War II**, **GURPS Space**, and **Transhuman Space**. **GURPS Vehicle Builder** fully supports the first three. **Transhuman Space** is coming in a later version though there is no definite time frame.

Thomas Jones-Low and I are steadily putting new items in as fast as we can get our hands on the books and type them in. As we do so, we continually find new ways to streamline the vehicle design process and implement them into the program, making the experience more pleasant for you, the user. And we do take every suggestion seriously, even if we don't use it. If you have an idea, send it to us. We'll look at it.

Fate's Worse; Then Death

This is the third week of our chipper, upbeat, happy-go-lucky series on death. If you didn't enjoy the first two, you almost certainly won't like this one.

Let's suppose for a moment that death has gotten out of control in your game. As a GM you stand on the table and proclaim, "Thus the king slumps over dead, dead I tell you, *dead!!!!*!" This prompts the players to breathe a sigh of relief and say, "Oh, whew; I thought it was something *serious*." And you realize that, no matter what you do, death will never be a force to be reckoned with in your campaign. Too many people have come back from the dead, too many tricks have been played, too often has death proven an inconvenience. The cat has gotten out of the bag, returned with kerosene, lit the bag on fire, and pushed powerful anti-bag legislation through Congress.

Okay; you now need something else to frighten players with.

Well, fortunately you're not out of luck. You have options. The trick is to understand *how* you have options.

But first, in the interest of completeness (and certainly not an attempt to pad the word count or provide tension), let me offer some advice of what *not* to do.

Avoid death escalation. A more spectacular "death" does not make it more powerful or emotionally tying to the players. Some GMs (and other creative types) mistakenly believe it does; thus if having a villain seemingly die in an exploding building is exciting but unbelievable, then maybe having him die on an exploding *planet* will be more believable . . . or an alternate universe that ***winks out of existence!*** "Surely no one could survive *that!*" the GM might think. In fact, usually the opposite is true; the more spectacular the demise, the more likely the players might be *not* to believe it. After all, if you can envision a force that can turn an entire alternate dimension into tapioca pudding, then imagining that there's an Tapioca-Activated Alternate Dimension Transportation Buoy really isn't a much bigger step.

At this point the players might well believe that you'll do *anything* to make the story work, no matter how unrealistic. (This may be true, but once they realize it, you've got a tougher road to travel.) No, perhaps the best thing to do is to have an *unspectacular* death. The heroes might not believe (or care) about a villain who dies in an exploding building, but there's a good chance they'll care if he's gunned down Jack Ruby-style on the courtroom steps right before his trial. The players still might not believe it -- this *is* a campaign where death has lost its teeth, after all -- but the emotional ties will still probably be stronger.

Avoid disappearances. This is fairly tied to death escalation; if a planet explodes, there usually isn't an identifiable body for the heroes to identify. But other times GMs try to convey a "wink-wink" sense of death by having someone disappear: "We just got a report that his ship sank in the Amazon; surely he must have drowned." Once this method is used, the players are pretty much waiting for the departed to return.

Okay; you have a couple pointers of what not to do; so what *should* you do, then?

Well, forget about killing anyone. It's not going to work. No, the trick is to find fates that are worse than death. And then there's one final piece to make this fate real:

The victim must remain in sight.

Not literally in sight, but certainly as part of the campaign. For example, let's say that you're trying to make the players emotionally invested in a villain's defeat; you might kill him, but the heroes will just wait for him to come back. But what if, after the climactic blow, he falls from a height . . . onto his head? He is obviously in bad shape, but the heroes don't know how bad. If the villain is carted off by MediCartel, the sinister villain convalescence unit, then once he's out of sight the heroes will probably assume he got better and will be back to plague them soon. But if the heroes are kept appraised of his condition through periodic updates, then they'll understand the gravity of the situation and the likelihood that he isn't coming back soon . . . and even if he *does* come back, he probably won't be the same antagonist

they faced before. ("Dr. Annihilatio is making considerable progress. He was able to drink broth through a straw unassisted for the first time today!")

Of course, the same applies to the good guys as well. If a sympathetic protagonist is killed, the players will just be waiting for him to come back. If he gets lost on an expedition to K2, the players will again just wait for him to come back. But if he's captured by a secretive paramilitary organization that periodically gives updates as to his status (in an effort to taunt the heroes), then they know he's not just going to "get better."

Perhaps the textbook example of this in the Silver Age of comics was Superman's Bottled City of Kandor. This piece of prime Kryptonian real estate became a bottled city -- along with its inhabitants -- when the villain Brainiac shrank it and stole it with his spaceship. (Did we sufficiently emphasize "Silver Age" here?) Superman was generally plagued with guilt at not being able to do anything for the Lilliputian Kryptonians . . . and since the bottled city was in Superman's Fortress of Solitude, he was forced to confront his frustration each time he went home. If the residents had merely died or otherwise been removed from the picture, neither Superman nor his comic readers would probably give them much thought (since this kind of thing happened all the time in the Silver Age anyway: "Golly; the residents of Shaggidog-4 sacrificed their lives so I could return to Earth. <choke> Hmm . . . I wonder if there's a softball game in Smallville today?").

Now, it should be pointed out that this method of reminding players should be used sparingly; after all, you don't want every aspect of the heroes' lives filled with drooling villains, mangled acquaintances, and oddly resized allies. Then again, these techniques are necessary in the campaign because death isn't feared anymore; as such, they shouldn't be used any more often than a meaningful story involving death would be employed in other campaigns.

Next time we continue this series (which may or may not be next week) we'll look at some specific things you can do to keep the living in the spotlight and out of the clutches of the grim reaper. But until then, consider that, using this technique sparingly, the players may view death as a kinder alternative in some instances . . . which leads to some very interesting story possibilities.

--*Steven Marsh*

Big Brother is an Idling Bachelorette Survivor

Week 2

by Steven Marsh

Last Monday at 11:59PM Eastern Time saw the closing of the first part of arguably the most controversial series that *Pyramid* has ever done. The readers spoke, and these are the numbers:

1. **Gareth-Michael Skarka** -- 3.9448 (634 votes)
2. **Sandy Antunes** -- 3.1675 (591 votes)
3. **Andy Vetromile** -- 3.0019 (530 votes)
4. **Aaron Rosenberg** -- 2.7686 (566 votes)
5. **Larry D. Hols** -- 2.5934 (519 votes)

Upon learning the results, we bid Larry farewell from our BBiaIBS experiment. It seems Larry's gambit of ending two articles midway did not pay off with the readers.

And so the groundwork was laid for an interesting and epic second week. Unfortunately, fortune did not smile upon this endeavor; late on Wednesday *Pyramid* learned that the frontrunner, Gareth-Michael Skarka, had personal issues that forced him to drop out of the contest.

Immediately the creative forces behind *Pyramid* debated how best to proceed. The editor's suggestion -- which involved flinging himself into oncoming traffic -- was discarded. Instead it was decided that the show must go on. And, with the former frontrunner now no longer in the competition, it is now possible for *any* of our contestants to win! (This is a textbook example of transmuting sow's ears into silk purses.)

The BBiaIBS experiment shall be shortened by one week,, with one person eliminated in this batch. Next week will be the climactic conclusion to this epic challenge!

(Or so we hope.)

Remember: You have until Monday, August 4th, 11:59 pm Eastern Time, to have your vote counted for this week's stage of the competition.

It's A Mad Mad Illuminated World

Three Articles by Sandy Antunes

* * *

Illumination

A conventional challenge features an opponent and a goal. Solving the challenge means either understanding the opponent or figuring out a way to stymie the goal. But that's tremendously linear. The best (game or movie or book) endings are ones that are obvious in retrospect yet not foreseen at the time.

This means there must be a twist. There must be elements that just don't initially make sense, secret purposes or motives that are a complete mystery. A simple lack of facts, hidden agendas, or even wildly incorrect world views can make a situation seem truly baffling.

The moment of illumination is when the light goes on in the player's minds and they suddenly see what really has been there all along. An illuminated plot involves a larger world than the one we assume we live in.

Shannon information theory lends different values to patterns or order, versus random information. The two can be distinguished. But what is random to one person is perhaps perfectly sensible to another. Any decent villainous goal should make perfect sense to its proponent.

So an illuminated game has a purpose beyond 'solve this problem'. It asks the characters (and players) to 'solve this universe', to figure out a new way to look at all the facts so that the situation makes sense, from the right point of view.

Everyone has ulterior motives. In an illuminated plot, though, those motives cannot be deduced until "the secret" is revealed. It's simply too non-linear. This means great care must be exercised by the GM in revealing clues. The GM controls the information flow that the players (and thus characters) receive.

The classic illuminated twist is the Lovecraftian universe. Only when you can accept self-destructive behavior as normal and non-Euclidian theory as accurate will your path to the final goal be clear. Of course, learning this will drive you insane.

If the Illuminati existed, they'd be a good source. After all, no matter how wacky or surreal things seem, once you hear "it's the Illuminati", you think "Oh . . . okay, that makes sense." Even if you don't understand it, you know why you don't understand it.

In their absence, we can invoke other sources of 'greater reality': alien gods, choral vortexes, pornomantic ascensions, and other "what the ?" influences can give any setting or plot a 90-degree shift.

We now apply the idea of greater secrets (illuminated reality, a new way to view apparently odd circumstances) as well as a healthy dose of old-fashion "there must be a secret, if we can just find it" to some classic cases. Specifically, let's use illumination theory to look at the 7 ancient wonders of the world.

* * *

The Seven Wonders of Any World

Grand illusions and monuments to magical might are often impressive, but ultimately an heroic campaign is rooted in the achievements of men and women, mortals who strive for greatness. A science fiction campaign is rooted in the iconic structures representing the future world. An alternative history is defined by the new power structures.

All of this is reflected in the setting, and drawing from history is an excellent way for GMs to develop magnificent creations of architectural and cultural impact for adventures and campaigns. The Seven Wonders of the Ancient World are excellent templates for such realms.

Scattered across geography and time, the Wonders' one common thread was the architectural beauty to which they arose. Which is utterly useless to gaming, at least until "**GURPS Architecture**" or "**Vampire: Gothic Arches**" is released. So let's examine and perhaps illuminate these. Where meaning doesn't exist, we'll invent it.

No mortal soul has lived long enough to see all seven of the wonders of the ancient world, but any traveler from 2700 BC to the present can explore one. Ergo, GMs creating campaigns can easily use a single Wonder as the focus for a campaign. Just one Wonder is rare enough; seven at once would be overkill.

It would be natural for a party of disparate adventurers to meet in the city near a Wonder, drawn by the tales and splendors told by travelers world over. Whether based in the fantasy D20 worlds or in a future or historical setting, Wonders of that world's past and present are centers for great adventure.

Ancient era games can explore the splendor of the Wonders at their peak; fantasy worlds can have thinly-disguised fantasy variants. In the earlier days, the Wonders are thriving constructs, humming with use. Later, more "civilized" era games may try and pierce the fog of history to find the true origins of the Wonders and their meanings. By these later epochs, characters must face the formidable task of discovering remnants of these long-lost marvels, or, far worse, face the insurmountable task of dealing with possible arcane threats that the Wonders had been built to guard against.

Least we get carried away, first, a list. As recorded by Antipater of Sidon, the Wonders were: (1) the Pyramids of Egypt, circa 2700 BC, (2) the Hanging Gardens of Babylon, circa 600 BC, (3) the Statue of Zeus, 430 BC, (4) the Temple of Artemis, 356 BC, (5) the Mausoleum of Halicarnassus, 353 BC, (6) the Colossus of Rhodes, 280 BC, and (7) the Pharos of Alexandria, also 280 BC. The wonders were dedicated to mortals or gods, designed for utility or worship; indeed, it is difficult to find a central theme connecting their existence. Built by different races in different centuries, the Wonders as a set are unique examples of ancient achievement.

Pyramids, Pyramids, Oh Clichéd Pyramids

Ironically, it is only the eldest of the works that still remains standing today. The Pyramids of Egypt, including the Great Pyramid of Giza, were built from about 2700 BC through to around 1000 BC. A pinnacle of Egyptian architectural skill, they lay scattered (some hidden) throughout Egypt and along the Sudan, centered at Giza, near Cairo.

Their design was an advancement on the 'step pyramid' design, with four triangular sides meeting at a point on top. The Great Pyramid, great Wonder of the World, was built as a tomb for the Pharaoh Khufu (or, in Greek, Cheops) to honor his reign of 2575 BC to 2465 BC.

For millennia it was the largest single structure ever erected, towering at 147 meters high, with the base square 230 meters on each side. There are many skeptics who do not believe such a construct could be made by a "primitive" ancient society. Those with a supernatural bent can spend a lifetime seeking the puzzle of their construction; indeed, riddled with hidden passageways, many times the architects themselves were killed to keep their secrets.

One of the best possibilities for the Pyramids is not Illuminated, but darkly mundane. Imagine you have nuclear power, with left over Plutonium (half life of 24,000 years). How would you keep people away? Perhaps a sign:

"Stay away! If you enter you will die! Your insides will rot! Invisible forces will eat away at you! Your descendents

will be deformed monsters! Go back now!"

Now translate that into pictures, and imagine an archeologist 10,000 years later. "Ha ha, look at the primitive warnings to keep away superstitious farmers. Let's enter and find riches! Hmm . . . nothing here but stacks of a strange metal." How many archeologists carry geiger counters?

So if you run SF, any 'ancient wonder' might be nothing but a toxic storage dump whose purpose has been lost in legend. Cruel, but useful to GMs seeking a more anticlimatic plot driver.

Now, for the actual pyramids, they were a thriving economic market akin to today's security business. As repositories for the royal dead, pyramids were a popular target for grave-robbing. An entire industry existed of two factions; those seeking to find and loot pyramids, and those who earned money protecting them. Guards would protect a tomb for as long as the family provided money; thus over time even the greatest became unprotected. Grave robbers during any Pyramid era would be a hunted class, but the lucrative market is encouraging enough for any thief to keep searching for that great find.

Fantasy games can easily expand these concept for any pyramid-building great race. Because of the high cost and the great skill in stonecraft and architecture required, only the greatest of civilizations can afford to create a Great Pyramid. Magic could help but little with the construction, unless someone could hire huge teams of mages to handle the lifting and placement of every block. Brute labor is and has always been cheaper than skilled workers, be they mage or engineer, and thus pyramid making could only be undertaken by large city/states.

Some have speculated that the pyramids found in South America are a legacy of Egyptian influence. This conveniently ignores the fact that these later pyramids (1200 BC to 1520 AD) had flat tops and were used as temples or palaces, not for burial. Alas, there is no universality to pyramidism.

If the supernatural were truly real, any matter involving the pyramids would be the focus of earth-bound Ka spirits and otherworldly forces vying in these borders between the living and the dead. Even lowly undead such as ghouls and mummies are a challenge for the low level visitor. To some, the pyramids are an innocent custom of an ancient race. To others, they are foci for forces that mortals are often wisest to avoid. In either case, profit-seeking humans provide a constant threat. As the most lasting of the Wonders, any setting involving pyramids can evoke these many possibilities.

Egyptian pyramids are overused as a plot device. Pop books on "pyramid power" were a bane in the 70s, and poor Thoth (ibis-headed moon deity) gets invoked by modern day pagans. As a deep, dark cosmic underlying secret, pyramids are a bit outdated. Fortunately, their influence survives in other wonders: that the Statue of Zeus may have had a Sphinx at its feet, and the Mausoleum was topped with a pyramid. But first, someone built a garden.

Garden Of Life

The Hanging Gardens, born during the New Babylonian period of 626 to 539 BC, was most likely a step-terraced garden near the city walls of the water-locked city of Babylon (south of Baghdad, in modern Iraq), surrounded by the Euphrates river. The Gardens were built by and for the king, Nebuchadrezzar II, who was busy consolidating the empire his father had recently restored to independence.

Following Nebuchadrezzar's death, internal struggles resulted in a usurper gaining the throne, and the usurper's son witnessed the fall of the Babylonian empire to Persia in 539 BC. Poor Nebuchadrezzar would later be best remembered as "that guy they named Morpheus' ship in 'The Matrix' after".

The terraced gardens appeared as if they were hanging, yet they contained paths within, and paths also led to the parks and gardens of the Akitu temple outside of the city walls. However, much of this picture is speculation; previous theories had suspected the Gardens as properly hanging from tall vaulted buildings in the center of the city.

Gardens of that time (judging by Assyrian examples) typically grew many trees, such as cedar, willow, fir and oak, and many fruit trees, including date-palm, olive, fig, and plum. And still more: almonds and pears, myrtle and accacia,

ebony and cypress box, quince and pomegranate. Not only does this make me hungry, but it is a useful list for anyone doing a period piece.

The same city contained the supposed Tower of Babel, a ziggurat dedicated to the city's patron deity of Marduk. The biblical tale of the fall of Babel and the significance of Babylon make them both far more interesting than the actual Garden. As a great city in both history and myth, Babylon's legacy in culture and custom has provided much of our Western culture (and, according to "Snow Crash", the breakdown of the bicameral mind and evolution of consciousness).

The possible lost lore of Babylon, information not recorded in history, would be a wonderful subject of study to sift out legends from truth; travelers in any era could partake of such wisdom, and the possible power it might bring.

Babylon as a city is a natural place for studies or employment of any sort. In non-Earth worlds, a city such as Babylon provides a natural center for mages and bards, scholars and travelers to congregate and mix. If a science fiction television series like *Babylon-5* can make a new Babylon, certainly an enterprising GM can too (hmm . . . you'd need something like '**GURPS** Starbases' for that . . .)

As time passed and the Gardens and Tower fell into ruins, adventurers would find opportunities for seeking lost knowledge or treasures. The gardens would be a particularly unusual above-ground "dungeon crawl", while the Tower might still be a focus of power for a local lord or mage who enjoyed the status such a unique relic brings. Indeed, it was several centuries after the fall of Babylon before another Wonder was created, this time in distant Greece.

The Short Wonder

The Statue of Zeus, a towering 13 meter sculpture in the Temple of Zeus at Olympia, Greece, was created by the sculptor Phidias around 430 BC. Well, okay, by modern standards 13 meters barely qualifies as "towering", given that every Bob's Big Boy fast food joint has a "Bob" about that height. But as a period piece, it's impressive.

[Interlude, fearsome thought: What if Zeus was that era's equivalent of Ronald MacDonald?]

This statue is richly made (something Bob can't claim), of of chryselephantine-- gold and ivory. Although Phidias also created the statue of Athena for the Parthenon (the temple on the Acropolis at Athens) it was the statue of Zeus which was truly called a Wonder. Perhaps this angered Athena-- in any event, time has erased all his works.

The statue of Zeus, sitting in a throne, was highly engraved with images of people and mythological beasts, drawing from the vast cultural heritages that existed before Greece. There is rumored to have been a Sphinx at the throne's arms, lions at the feet, an eagle on the staff in Zeus's left hand, an unknown winged figure on his right hand. What matter of creature it was, none say.

Mysterious creatures are an immediate hook for a GM, especially one who favors Lovecraftian tales. An exploration into such a mystery figure would well suit an adventurous party of explorers; depending on the magic level of the world, even an innocent question as to its identity could rouse Lovecraftian horrors, set an angry cult against them, or summon a magical beast most difficult to deal with. Although history does not record what occupied such an important place on such an important statue, it must have had good reason to be so honored. And perhaps, good reason to be so erased from the records of mankind.

The Universal Goddess

The next immortal to be honored with a Wonder was the goddess of the hunt, with the Temple of Artemis in the Greek city of Ephesus. Artemis, called Diana by the Romans and perhaps Cybele (the Great Mother of the Gods) by the Anatolians, was very popular with her people. Goddess of wild animals, the hunt, vegetation, chastity and childbirth, Artemis was often accompanied by nymphs (dryads).

Ephesus was believed to be Artemis' birthplace, and around 356 BC the colossal temple to honor her was built. Constructed of marble in a design similar to the Acropolis, this statue was merely one piece of the entire city devoted to the Goddess.

Considering the cross-race nature of this Goddess, holding different names and different aspects across the lands, strangers to this area might recognize her under still another name. Thus Ephesus may have served as a nexus for all who worshiped Artemis in her many forms.

Their yearly celebration of her birthday was notable in those times for not requiring a sacrifice. Celebrations included a variety of festivities, the center of which was the great procession across the city. Statues were carried, including one of Golden Artemis with her stags, and at least five others of Artemis in various poses-- Artemis at the hunt, Artemis at war, perhaps even Artemis defeating a team of adventurers.

Imagine coming across a statue of Artemis defeating your group . . . years before it actually happens. Ah, how wonderful.

Gold was reserved for immortals alone, and could only be used for statues of Gods, Goddesses, and Emperors. Stealing gold, then, was risky not just for thievery, but as a blasphemy as well. However, other nearby islands and countries did not have such a strong prohibition against gold for mortals, making temple robbery uniquely profitable.

Even a temple is not safe from destruction; the temple was destroyed first in 262 AD by the Ostrogoths. After being poorly restored by the Greek Tetrarchy, it was destroyed yet again by Patriarch Chrysostom in 401 AD, covered with silt over the ensuing years, and finally built over with houses and graves.

Amidst this constant battering, Saint John was rumored to have stopped by with a holy man to bath there (or so say 5th century tales). As the tales state, the remains were suspected to be haunted by a demon, a strangler by nature. Saint John devoutly drove out the demon, and was promptly attacked by the devotees of Artemis. The stones they threw were miraculously deflected, and John prayed against the building itself. When they later returned to the city, the idols and temples had fallen.

All that remains in modern times is a single standing pillar, but perhaps the power of Artemis remains so long as one stone stands. Whether there was a demon to face Saint John, and whether he truly defeated it, such choices are always possibilities that travelers after 400 AD might face. Or, the undercity might be a thriving culture of demons and creatures, the purging of Saint John still awaiting a successor.

The Mausoleum

The stone foundation of another wonder, the Mausoleum, is also among the few with remnants still standing in the modern era. An enormous yet derivative work, this huge white marble tomb stood 40 meters high, a broad plinth topped with an Ionic-style temple, itself topped with a pyramid (or perhaps a ziggurat), finally capped with a statue of a chariot and horses.

Bonus points for anyone who can differentiate Ionic from Doric. According to Google.com, Ionic is "cycles feature full suspension and hardtail mountain bikes handcrafted from titanium", while Doric is "manufacturers of top-sealed, lined-concrete burial vaults and distributor of cremation memorialization products." Doric columns, on the other hand, were basic, undecorated square 20-sided columns (the D20 of columns?) Ionic were slender, fluted, and convex. And Corinthian were more flowery Ionics. I actually have a point with this.

How words evolve is crucial to determining underlying mysteries. For a GM, the strongest way to put doubt and concern into a player's mind is to give an enemy organization a name rooted in ancient history. Whether it is Doric bikes or the Pyramid Society or the Golden Artemis Hunting Club, an ancient name is a quick and effective way to raise fear and interest within the setting.

Any decent Illuminated plot **has** to include clues for the players. And a name-based clue is ideal in helping clinch the

character's suspicions. Imagine searching a dictionary. "We're looking for which of the looted organizations is involved in this necromantic plot to bring about the Catastrophe. It's either Ned's Hardware Shop, or the Golden Artemis Hunting Society."

Names are powerful. Remember that.

As for the Mausoleum, it was built for, and named after, the Carian king Mausolus, who united six towns in what is now Turkey and named this region his capital, Halicarnassus, a generation before Alexander the Great would conquer much of the western world. Such synoecism (merging several smaller settlements into one city) was a common result of military affairs, and the city did prosper, adding fortifications, walls, and an elaborate harbor.

In honor of Mausolus, his widow/sister Artemisia II built the Tomb for his burial, a structure she would later join him in. Indeed, now "Mausoleum" is part of the English language, a synonym for "tomb". Statues of both of them likely stood at the corners of the roof-pyramid, and now rest in the British Museum (after excavation in 1857).

Much of the design was influenced by other cultures and the other Wonders. The upper structure was very Egyptian in design, while the statues included the Rhodian god Helios as the Sun God. As with the statue of Zeus, history is unclear over what other God-like representations were part of the structure.

Further, whether the carvings were merely symbolic, or were in fact required for mystical reasons, is a matter only known to the religions of the time, the architect, and anyone who was curious enough to pry. Rumors of this legendary place could draw many adventurous souls to pay a visit. An ironic GM could have an entire "tourist culture" spring up about the place, with greedy locals eagerly taking advantage of gullible adventurers who follow such rumors.

Giant Robots Aren't New

Although Helios was incorporated into the Mausoleum, he eventually gained center stage as the Colossus of Rhodes. This 30 meter bronze statue of Helios was erected in 280 BC to guard the entrance to the harbor at Rhodes, a Greek island off the coast of Turkey. Designed and built by Chares of Lindus, some reports suggest the towering statue straddled the entrance to the harbor, while others comment that it stood more casually to one side or the other. My belief-- were magic to exist, the status must have moved periodically. Yes, it's the advent of Fantasy Mecha.

It is known that Archimedes worked with mechanical designs, and certainly the Greeks were no slouches at architecture and engineering. While a bonafide mecha is perhaps a bit beyond their abilities, the idea of a moving statue is so sublimely beautiful that, were I able to force historical facts to allow it, it would be so.

The statue's appearance neatly coincided with the rise of Rhodian power, either through inspiration, coincidence, or divine province. Their original rise to power occurred in 304 BC, when Rhodes survived a siege by the island-state of Antigonos (aided no doubt by fantasy mecha).

Their survival was a combination of power (good defenses, strong will) and situation (Antigonos's son, Demetrius, lay the siege but failed to close off the harbor and cut their supplies), as well as minimal aid from Egypt. Rhodes' success led to their establishment as a peacemaker and a defender of autonomy, and thus bolstered they decided to build the Colossus (using money from the sale of Demetrius's now-useless siege engines and supplies).

Rhodes rose to be the strongest of the Hellenistic powers of their era. Thus times prior to and during the construction were bold, warlike times, where adventurous sorts could choose sides for fighting, for carrying messages, or merely for trading. Someone had to deliver Ptolemy's aid, for example; further possibilities at intrigue and politics abound for those interested in pursuing the rival politics of the different states.

The Colossus was finally toppled, not by man, but by the forces of nature, along with the island's walls, when a massive earthquake hit the island in 228 BC. As Rhodes was intimately intertwined with the economy of the other Greek states, contributions to rebuild flowed into their harbor, and they were able to maintain their imports and exports, and remain in power. Although their fortifications were rebuilt and improved, the Colossus was never

restored, and no trace of it remains now. Were it constructed to provide defense against a greater than mortal threat, its fall would provide a good start to a campaign to hold back the forces of darkness.

I've said my piece about what I wish the Colossus had been; I leave it to GMs to recreate this Wonder in their own eras.

The Lighthouse Of The Savior Gods

Roughly concurrent with the Colossus was another Wonder of a harbor, the Pharos lighthouse of Alexandria. An Egyptian city founded by Alexander the Great in 332 BC, the city was one of the finest ports of the ancient world, easily a peer of the strongest of the Hellenic powers. Indeed, the war that established Rhodian power was due to a debate between the Greek states over the wisdom of war with Egypt, with peace winning out.

The Lighthouse, on the island of Pharos in the harbor of Alexandria, was constructed in 279 BC by Sostratus of Cnidos. The island of Pharos was connected to the glorious mainland city by the Heptastadion, a 1.6 kilometer artificial breakwater for the harbor which also served as a causeway. The lighthouse itself was merely a sign that one was entering a wondrous city, Alexandria, famous for its Library, its cultural mix, and its robust mix of trade and learning.

The lighthouse construction spanned two rulers, starting during the reign of Ptolemy I and finishing early in the reign of Ptolemy II. Standing over 134 meters in height, it consisted of four stories of limestone blocks and granite (and marble) columns, with marble and bronze ornamental work along the lighthouse and pillared courtyard. The lantern itself consisted of a cupola on eight columns, above which a seven-meter statue of Poseidon (or perhaps another god) stood.

Resinous wood was burned to create the flame, and convex metal mirrors were used to extend the range of the light. Watchmen sitting in the tower had an amazing range of vision, and were able to see ships unperceived to the harbor below (due either to the height of the tower, the curvature of the Earth, or perhaps a telescope or lens of some sort). The lowest story sat over a freshwater cistern and provided living quarters, storage of wood for the flame, and primitive lifts to convey the wood to the top story.

The inscription, in letters of lead sunk into the stone, was a dedication to the Gods from the architect, appearing (translated) as "Sostratus son of Dexiphanes of Cnidos to the Savior Gods on behalf of sea-fares". Rumor has that the original dedication was a far more conservative statement given in the name of Ptolemy, the King; this surface dedication was written in a layer of plaster covering the architect's true inscription. Sostratus thus counted on the plaster remaining until after his (and Ptolemy's) death, eventually eroding to reveal his true words carved in lead.

Whether true or not, the inscription does remain ambiguous in mentioning "the Savior Gods", a title equally ascribed to Ptolemy and his Queen, and to the special gods of sailors, Castor and Pollux. Travelers of other mythologies might have a better knowledge of whom the "Savior Gods" truly were, and who they were saving; perhaps there was a specific threat warding by the Lighthouse.

The lighthouse survived even through Arab conquests of the region, finally falling in 700 AD. The Arabs repaired the lighthouse around 800 AD, and yet again in 980 AD, but earthquakes after 1000 AD and again in 1300 AD finally destroyed the structure completely. There now exists a fort (built in 1480) where the Lighthouse once stood. The Heptastadion still exists in the modern era, having gathered enough silt and material to hold a substantial section of town. Nevertheless, the Lighthouse, as with the other Wonders, has largely fallen from grace.

As for the inscription, in an Elrician sense, "Savior Gods" could be "chaos, coming to save us from law" or the inverse. Religion is flexible that way. The fact that the architect's beliefs differed from those of his patron suggests, at the very least, a conspiracy of one. It also neatly suggests a mechanism whereby any public or private work can be subverted by the architect.

Which raises the issue: what is written on the cornerstone of any particular building? Architects seem to hold a great

power in any society. It is not by accident that the Freemasons are feared as a great occult power; their work is the very bones of our civilization.

Earlier I stated that architecture was useless as a game plot. After presentation of these wonders, I offer an alternative: architecture is the one true secret influence for civilization.

Sleep well.

The effects of war, natural disaster, and time have obliterated most of the Wonders, leaving only the massive architectural tomb of the Pyramids to speak for ages long since dead. By their traces and histories we know of these elder glories, inspirations of architecture and expense. As a playground for characters, the possibilities surrounding each of these wonders is equal part trade, warfare, mysticism and magic. As an instant seed for a complex setting, the Wonders (or their parallels in non-Earth worlds) are natural drawing points for those who seek adventure, who seek knowledge, or who seek power. It is possible, for the ambitious referee, that there is a common link to the Wonders, a link that could take a long campaign to unravel. The power of history lies focused in the Seven Wonders of the Ancient World, which even now beckon to the adventurous.

Make Your Own Gaming Fiction!

Having trouble coming up with plot ideas? Use gaming fiction to inspire you! If your favorite RPG doesn't include any fiction vignettes designed to lure you into the setting and sell you on the cool character concepts, you can friend can just create your own.

Simply ask your friend to supply each blank item and fill in the hidden story (without actually telling them what the story is, yet). For example, the SF one asks first for a "noun", so just have them supply any noun, and so on. (Don't make me explain this further.) Once you get all blanks answered, reveal the fascinating and insightful fiction and feel particularly inspired. Apologies to MadLibs™.

Science Fiction

The huge _____ was _____ towards _____,
noun adverb verb a planet
where the _____ settlers lay helplessly in suspended animation.
adjective
Only the _____ captain, _____, and his _____

noble adj dog's name perky adj
 engineer, _____, could save the day! The engineer quickly
 female name
 leapt to the _____ to realign the _____ and
 piece of sf hardware technobabble noun
 reverse the polarity of the _____ flow, while the captain
 atomic particle
 _____ the _____. Just in time, they saved the
 adv verb noun
 _____!
 something valuable

Alternate History

In _____, everyone knows that _____ didn't _____.
 year famous person verb
 But what if _____ altered time to ensure that _____
 evil organization good org
 did not prevail in the _____? Imagine, _____
 contest or election adjective
 robots and _____ monkeys roaming the land, all due to _____
 adjective a number
 change(s) to the past. This, then, is our world.

Fantasy

As the _____ creatures _____ advanced

Why Don't We Do It in the Road?

by Andy Vetromile

It is said life is not a destination, but a journey. Taking this into account, the highways and byways of the average campaign setting probably ought to be better populated, and not just by more wandering monsters. Even the deserted ones aren't without charms, character, or perils. By who, then, or by what, are roads occupied? Why are they there, and are they really just the way to get to the dungeon/starport/infirmary? A few ideas to bring the roads to life and make getting there half the fun.

As I Was Going to St. Ives

When you travel a road, you're not the only one. You'll run across fewer of the folks going the same way as you, simply because you're all going one way at more or less the same pace. Most of the folks you see, therefore, will be those headed in the opposite direction. What are the people you meet like? This is a good chance for a GM to drop hints about the adventure to come.

If the GM includes travelers on his roads, PCs will often ask the oncoming traffic for news of the city. It usually boils down to something having to do with the king's family -- a tournament, a marriage, a need for champions to right some wrong. Then again, if the GM seeds something a little more insidious, it gives the players a sense of involvement rather than the feeling they're showing up to be lead by the nose.

Suppose the prevailing gossip is about a rash of thefts. The thieves' guild seems to be working overtime, but in spite of the attempts by the constabulary to root out those responsible, the usual suspects are protesting their innocence in no uncertain terms. On the other hand, maybe some folks are coming out of the city in search of new lands better fitted to their newfound status and wealth. How they came across this wealth they will not say. Each has a scroll they guard jealously. A contract, perhaps, made with demonic forces? Could the two adventure seeds be connected? What evil lies at the heart of the city, stealing from Peter to pay Paul? Finding it will require more than just showing up at the king's coronation and waiting for the evil cardinal to make his move.

Any similar character quirk can be played up; highlight one aspect of the travelers (refugees?) or one class of people - albinos, or Rosicrucians, or communists, the lame, or people lacking their own shadows -- and see where the commonality takes the party. A slow, zombielike stride is more easily noticed than a belief in angels, so make sure the team will have occasion to take note of or discover even internal similarities in passersby. The more subtle the clues, the harder the heroes have to work to find the hidden meanings. And if the road really is empty, well, that's a whole other problem.

Even today, hobos are known to leave signs as they travel. These alert other tramps (and anyone who knows how to read their signs) to conditions along the road, and to the viability of certain stops along the way. They will tell their fellows who lives where, who has dangerous animals or livestock, which towns will show charity vs. those that will toss vagrants out on their ear, and where one might find a quiet place to sleep for the night. These signs are everywhere, but they may seem innocuous to the untrained eye. Charcoal scratchings along roadside fence posts are typical, as are carvings in the bark of a tree and small arrangements of stones and pebbles ground into the dirt on the shoulder of the route.

The Shortest Distance Between Two Points is Under Construction

"It's a bypass. You've got to build bypasses."

-- Prosser, *The Hitchhikers' Guide to the Galaxy*

Back up a moment. How did the road get here? Who built it, and why? The obvious answer is "to get from point A to

point B." Not much fun there.

Roads and cities are both well established in many locations. The cities are built on the site of older towns and villages, and roads aren't much different. Modern blacktop may cover the site of a roadway established long ago. In anything but a mundane campaign, the road may take on many shades depending on its history. How many lonely spirits still wander the Trail of Tears from Georgia and Tennessee to Oklahoma? Do Roman soldiers still haunt what's left of the Appian Way? Every small town seems to have a lonely road and a ghost story associated with it.

Some roads are built with little or no concern for those people in the middle. The railroads began crossing the frontier, and almost immediately settlers and, again, Indians found themselves displaced, shifted, or an unwilling party to "progress." Even today, homeowners find themselves at the mercy of planning crews erecting passages near or through their neighborhood for the greater civic good. Players may not get far on these roads, but if they have a role as builders, they will become targets for the disaffected property owners. As victims, they'll have reasons to fight.

Even if you're not plowing right through someone's flower bed, building a road near them can be just as destructive. Economies change, traffic is redirected, and demographics shift throughout the area. And historically, if your friends across the border see roads being built or improved, they might think you were getting ready to move a lot of men and equipment . . . somewhere.

"We changed to the elevated at the South Station, and at about twelve o'clock had climbed down the steps at Battery Street and struck along the old waterfront past Constitution Wharf. I didn't keep track of the cross streets, and can't tell you yet which it was we turned up, but I know it wasn't Greenough Lane."
-- H.P. Lovecraft, *Pickman's Model*

A road may be constructed not to get people somewhere but to allow one person to get where they want. Fiction is littered with haunted houses, and they're invariably at the end of a long and hard-to-navigate road. Miles of thoroughfare may be built for the benefit of one mad scientist's lab, and not all of them rely solely on the isolation to keep unwanted visitors at bay. These roads may be dangerous, even deliberately booby trapped. It may be a built-in convenience or it may all be part of one man or group's efforts to ward off the inquisitive.

"And as you value your life do not go across the moor in any direction save along the straight path which leads from Merripit House to the Grimpen Road, and is your natural way home."
-- Sherlock Holmes, *The Hound of the Baskervilles*

Roads are man's attempts to bring a small amount of civility to the woods primeval (even if those woods only exist in the mind of the journeyer). The road is also the safest method of travel -- usually. It's faster than traveling overland, and one is far less likely to run into hungry wildlife on pavement. Dangers lurk behind every rock in the country. On the road, trekkers have the advantage of speed. The roadways are there to hasten one's journey and keep them safe from harm. If there's no road providing such passage, the king might be in the market for someone to protect his crews, or someone with a keen eye for potential ambush sites when deciding how the road will be laid out.

Of course, brigands lie in wait along the road because they know this is where the money is. The road then becomes a game of one-upmanship between the unsavory elements and the potential quarry. Lords and ladies will be accompanied by an entourage, and merchants will band together in great packs (travelers can tell a great deal about the road simply by seeing who travels it and who goes with them). Kings may decree that certain roads should be patrolled, or he may declare that anyone traveling after a certain time of night takes his life into his own hands.

For more examples of the curious abutting of safety and peril on the roads, see the *Mad Max* films; West End Games' *The World of Bloodshadows*; John Landis' *An American Werewolf in London*; and Steve Jackson Games' *Car Wars* and *GURPS Autoduel*.

"Once the flame appeared so near the road, that even in the darkness around us I could watch the driver's motions. He went rapidly to where the blue flame arose, it must have been very faint, for it did not seem to illumine the place around it at all, and gathering a few stones, formed them into some device."
-- Bram Stoker, *Dracula*

Once built, a road may conceal many secrets. Conquering nations write the rules once the dust clouds have settled, and they waste no time placing statuary and monuments to themselves. Here is an instance in which a new road may spring up, this one between the victor and the defeated (the winner will want a way to get to his subjugated lands from his capital, after all). Beneath that road lie the bodies of the fallen, the soldiers and their mourners both, and all that once belonged to them. A "scorched earth" policy in which the besieged nation hides its great treasures lest the invaders find them means the byways may cover a trove of valuable treasures, now hidden until such time as some enterprising soul hunts them down, or the next war happens along.

Man's secrets may not be the only ones lost to a covering of asphalt or cobblestone -- if, as they say, cities are laid out on an ancient grid of ley lines, these powerful magical elements may also be disguised, inaccessible, or (depending on the nature of events above) perhaps even poisoned. The color of the world's magic can change, given enough time and pounding by mankind's endless cycle of construction, war, and reconstruction. It may, in time, fracture altogether, or decide to snap back like an angry elastic band.

Life on the Road

"Red Hook is a maze of hybrid squalor near the ancient waterfront opposite Governor's Island, with dirty highways climbing the hill from the wharves to that higher ground where the decayed lengths of Clinton and Court Streets lead off toward the Borough Hall."

-- H.P. Lovecraft, *The Horror at Red Hook*

Evil never sits still for a moment. You may be sure that if Hill House is as haunted as they say, the roads leading there will also have tainted tendrils stretching further back down their length with every passing year. The embodiment of the road may not be the spirits of the dead but rather a life force imbued in the pavement itself. A road possessed of a supernatural intelligence may not be your everyday enemy, and it probably won't buckle just to throw off offending do-gooders, but it might produce simple misdirections, illusions, and other mystical effects to foil the efforts of ghost hunters whose prying can cost a road its precious hidden power just by making it ordinary.

"I have never seen another street as narrow and steep as the Rue d'Auseil."

--*The Music of Eric Zann*

Such fanciful notions won't hold up in a modern-day campaign, but superstition is a powerful thing, and a good GM will use the environment to its best effect. Jack the Ripper may be dead, but conjuring his name while the investigators search Berner and Hanbury Streets and Mitre Square can summon bad memories. You don't have to spot Resurrection Mary to feel a chill as you travel Archer Avenue in Chicago. Elm Street in Dealy Plaza, U.S. Route 80 in Alabama, and Broadway all have their famous links, good or bad, and can flavor a trip, mystery, or stopover effectively -- the ghosts they call up can be altogether real in their own right.

Come the future, the planning commission will attempt to do away with complaints about the condition of the roads by creating AI streets. These will constantly monitor themselves and alert the DOT when they need repair. Another generation come and gone and they may self-repair using nanotechnology. Car chases take on a whole new dimension when the road may fold itself up or demagnetize in hopes of foiling fleeing criminals (or PCs, unless they're one and the same). Excepting the possibility of AIs becoming sentient or going crazy, the AI may still have the capacity to develop a personality of its own, formulated by its relationships with the humans that reside there. The phrase "hitting the streets for information" undergoes a bizarre sea change when talking to a street with a Brooklyn accent.

Crossroads

"It was about nine o'clock on a moonlight August night when he neared the place. He was sitting forward, and looking out of the window at the fields and thickets -- there was little else to be seen -- racing past him. Suddenly he came to a cross-road. At the corner two figures were standing motionless; both were in dark cloaks; the taller one wore a hat, the shorter a hood. He had no time to see their faces, nor did they make any motion that he could discern. Yet the

horse shied violently and broke into a gallop, and Mr. Wraxall sank back into his seat in something like desperation. He had seen them before."

-- Count Magnus (M.R. James)

If one road is a font of great and secret power, where two or more roads converge must be a banquet for those who wish to suck the mystic marrow out of them. Crossroads have long stood for strange power. It has also been said if you sit in one spot long enough, the world will pass by you. The observation has been made about everything from Piccadilly Circus to Parisian cafes, but the best spot for such sightseeing has to be the well-traveled crossroads.

Mystic Meaning

"Before we go, we must ask the great spirit, Wematanya, to watch over us. So pee now because once we're on the road, we ain't stoppin'."

-- Hank Hill, *King of the Hill*

Since ancient times, crossroads were held to be important, magical places. Indians would place symbols, often phallic, of Siva in the Bhairava form (a much older incarnation) at these locations, a tradition also practiced by the Greeks, though they used Hermes as their template (and later still, the Romans would do so with Mercury). Hermes was the messenger god, and a guide for souls that have passed on -- perhaps that was the reasoning behind the phallic symbols. Travelers wished to cling to the idea that the life force was stronger at the intersection, and that the positive disposition of their gods would be well represented as they traveled across the land.

At their most basic meaning, crossroads have been seen as a physical manifestation of the otherworldly intersection between life and death. Legba, the voodoo spirit governing intersections, mirrors, and crossroads holds sway at any threshold. Few ceremonies are performed without a prayer to Legba for protection and favor when engaging in a voodoo ritual, especially at a crossroad. If you want to speak with your ancestors, revive the dead, or see that a friend doesn't end up in Hell by mistake, a crossroad is the place to start.

Papa Legba has mirrors of his own throughout the world. African tribes all have a version of this powerful spirit that opens the doorways. These passages aren't just the ones between life and death, though; they may be doorways into other worlds and dimensions. Which one, you can never be certain, for Legba is also a trickster god. The gate may lead to the Dreamtime, perhaps, or an alternate plane -- if our one world has many versions of Legba, the world on the other side of the gate will have them as well. Since Legba also teaches wisdom and serves as the go-between not just for life and death but as a liaison betwixt mankind and its gods, if he does not open the gate at your bequest, the dutiful student will realize there must be a lesson to be learned there.

Death Takes a Holiday

Superstitious villagers, fearful that someone recently dead might rise again as a vampire, would often bury the deceased at a crossroads. The theory was the vampire would crawl from its grave and, unsure in which direction the town lay, become lost trying to find it again. If an intersection has even one undead lurking beneath its soil, that's reason enough for cautious travelers to avoid prolonged stays.

Another method of destroying the vampire is to cut off the head, burn the body and head in separate funerary pyres, and scatter the ashes to the four winds at a crossroad. It is said that Bhairava, Siva's older and more fearsome countenance, is a black man with skin made darker still by ashes spread over his body. These ashes come from his administration of cremation grounds and his presence when one burns the dead in a pyre. Coincidence, or the dark and terrible god maintaining his status and jurisdiction under yet another new guise, reinvented for a new century and new lands?

Not all ethereal beings at a crossroads are necessarily the result of the nearby town's burial practices. Ghostly festivals are also said to occur at these spots, though whether this is a bacchanalian orgy or simply a gathering of the spirit folk is not clear. It most likely depends on the sorts of activities that transpired at the intersection in years past. Without

notable events to tint the character of these meetings, the crossroads may simply act as a sort of cultural congress, an assembly of the dead from all walks of life and all times past and present, who are taking advantage of the thinning walls between the worlds. If townsfolk and travelers alike have abused the junction, the specters may be destructive entities who, in the throes of their debauchery, plan or even execute plots against the living.

Depending on the disposition of ghosts in his world, the GM may decide player characters caught at the crossroads are invited to join the discussions, enticed to take part in the festivities, or implicated in their scheming. Then again, the group may be the first targets of the vengeful undead.

The Devil

*"I went to the crossroad
Fell down on my knees
I went to the crossroad
Fell down on my knees
Asked the Lord above 'Have mercy now,
Save poor Bob, if you please'"*
-- Robert Johnson, *Crossroad Blues*

Perhaps the best-known story about the crossroads is that of Robert Johnson, Tommy Johnson by some accounts. Johnson was a blues musician of no note and little talent. A poor black man, he was said to have wanted to play the blues but, possessing no skill at it, went down to the crossroads.

*"Early this mornin'
When you knocked upon my door
Early this mornin', ooh
When you knocked upon my door
And I said, 'Hello Satan,
I believe it's time to go.'"*
-- Robert Johnson, *Me and the Devil Blues*

Legend has it that if you want something, you go down to the crossroads three nights (or nine, in some versions), and on the last night you ask for what you want. Do this, and a tall, dapper black man will step forward and give you what you want. Black is used here to mean not the man's race or skin but his actual color, black as pitch, the same color as the black-faced Bhairava of Indian legend (see above). Robert Johnson did this, and the black man came forth and took Johnson's guitar. He strummed a few notes and handed the instrument back to the musician, who suddenly found himself able to play as never before.

The legend says Johnson went on to record several songs using his newfound talent, but that ultimately he had to pay the price. Rumors of everything from a heart attack to being poisoned by a rival have circulated, but most swear it was just time for the piper to pay his tutor.

Hoo-doo, an American version of hedge magic, claims anyone can do this. If you want to get better at something, you go down to the crossroads and practice. For most aspiring students, it sounds like good advice; if your players want to make use of this tactic, however, just trying to find enough privacy at the most public spot on the road can be a juggling act. Learning black arts or lovemaking can get you thrown in jail or run out of town on a rail, depending on the prevailing prurience.

Patron Saints

Religions are often characterized by acts of faith, and the pilgrimage is one of the most popular. The idea is that you travel (under what conditions varies) from one place to another, usually one that holds a great deal of significance to the faith. The most famous of these is the Moslem treks to Mecca, birthplace of Mohammed. St. Nicholas (yes, that St.

Nicholas) was said to have traveled to Egypt and the Holy Land as well, and so he has been made one of two patron saints of roads. The other, St. John Nepomucen, was supposedly dropped into the river to keep him quiet after he and others argued with King Wenceslas (yes, that King Wenceslas) over the funds of the Benedictine Abbey.

Today, the idea of a pilgrimage sounds to many people like a quaint notion. The underlying sentiments are still there, however. Even those who would not seriously consider undertaking such a journey still think nothing of placing wreaths and memorials by the roadside where a friend or loved one has died or been killed. Such locations often grow up beyond what one might expect, overflowing with gifts and flowers (all of them placed there by other people, one would assume). Somehow the idea that someone has passed away, usually too early, on a spot that parallels metaphysically the journey cut short in life, holds a special kind of energy.

The spot where John is said to have been plunged into the water, dropped off the bridge by his assassins, is also marked, by a metal plaque bearing seven stars. These are the stars that were said to have hung over the water the night he died. As Muslims still make pilgrimages today, and deaths on the road are still memorialized as were those of the saints before them, it could spell a new age (so to speak) of religious belief. The young souls that have passed may denote the beginning of a whole new crop of saints. Even if they are not canonized by the Catholic Church, the roadways of America may be littered with saints in disguise. The disappearing hitchhikers of modern urban legend could be, if not the Savior or Mormon Nephites, the restless spirits of the world's collective brood, forever secure in their innocence and seeking to bring that to other travelers who walk their paths. They now hitchhike in hopes of bringing blessings to other travelers, possibly under the watchful eyes of John, Nicholas, and Mohammed, and perhaps a host of others.

Magic

Countless magics have been associated with crossroads. A few superstitions that can be codified into spells or other rites:

- Crossroads are thought to be a good place to dispose of things unwanted. Lovers throw away the detritus of a failed relationship there. The sick and the weak imbue both skull and bone with their illnesses and infirmities, grind them together, and spew the results into the intersection. The unspoken danger of this, of course, is that these maladies may not go anywhere. The more negative energy mages and mystics dump into the crossroads, the more inhospitable that lay becomes. Sooner or later it will begin to spill out -- crops may die, travelers may take ill, and surrounding villages may fall under a curse.
- The roads aren't the only things that come together at a crossroad. It is said a lover may draw the object of their affection nearer to them if they seed each crossroad that lies between their houses with the right combination of mystic dusts or wondrous potions. Anyone sowing such magics into the soil should take care; this is an awfully public way to attract a lover, and failing to perform the rituals properly may draw the wrong man or even the wrong species.
- The powder of the road that sits beneath your footfalls is believed to hold power over you. A shaman need only collect the dust from where you've trodden and he can use it to inflict several spell effects on your feet and eventually the rest of your body. Given that one never knows what else has passed over that ground, it's not something to be undertaken lightly. A summoning spell that draws an animal can be a great boon. One that magnetizes pixies, undead, or sorcerers greater than oneself may be more troublesome.

The traveler should beware this power as well . . . an entire army, marching to make war on a small hamlet, may have given the hedge wizard just the ammunition he needs by all using the same intersection. Several scoops of dust and the right incantation later, and he could turn the army upon its master.

Run of the Mill, Middle of the Road

Not everything that happens at a crossroad is de facto evil or the beginning of some grand magical ritual. Crossroads were used for perfectly mundane activities throughout history. Great festivals are often held at the intersection, offering convenience, access, and an open feel to the occasion. Marketers would set up their stands and folks from all four

corners of the county would come to the gala. Feasts were celebrated this way, and business both public and private discussed.

Acting troupes would often erect their stages at the intersection, allowing them to draw in the greatest number of people and giving them the best "word of mouth" advertising as travelers to towns would carry news of the event.

Those on a journey would bivouac along the roadside, knowing that in plain sight on the shoulder they could count on some measure of safety from their exposure. Soldiers (the local ones forced to camp out on the way somewhere, anyway) would bunk down in this fashion because it gave them control of a valuable piece of territory while they slept. It was far harder for enemies to sneak up on them and take them unaware, or get their forces past the troops and into a key settlement.

Thus GMs can put most anyone out at a crossroads without it seeming too out of place or forced. Instead of inventing a reason for the party to seek a meeting with a particular guild or faction, the adventurers may stumble right into them at any intersection (and with proper clues dropped on the journey there, the atmosphere may already be set according to the referee's wishes).

A Left Turn at Albuquerque

"When a traveller in north central Massachusetts takes the wrong fork at the junction of Aylesbury pike just beyond Dean's Corners he comes upon a lonely and curious country."

--*The Dunwich Horror*

Fiction makes a lot of taking the wrong turn. You end up anywhere from the bullfighting ring to a deserted summer camp populated by rural whackos. A wrong turn is a good way to lead the party astray. It's terra incognita, and it's ripe with exploits. Role-players are well known for their habit of finding out in which direction the adventure lies and then turning to go the other way, so GMs will have plenty of opportunity to explore these unseen back roads (unless you just want to say the castle lies to the east, not the west).

And why does no one know what lies down this road or that? Do all travelers down that way all die? Do they become unwilling members of some dark power's army? The GM should give some consideration to this before making a blanket statement about how terrible it's thought to be.

For the improvisational GM, an empty road is a storehouse of possibilities. When was the last time your players got to name something? If they can journey into the unknown and clear the way for those who come after them, they will be hailed as heroes by anyone who passes this way, especially if they make sure their names are on every bend in the road and every stand of trees. If it's a haunted keep at the end of the road that has everyone cowering in fear, imagine the reputation that will build up around the men and women who emptied the structure of its foul inhabitants and now call it home.

I Meant to Do That

Not every wrong turn has to end in some evil hellhole. It may also lead to a glade of fairies, who have their own mischievous reasons for wanting to keep the big folk away from their glens. Perhaps it is only difficult terrain that makes the road so unfavorable -- if someone could cut through the last section of forest, or discover a hidden tunnel at the base of the mountains, it could become a whole new trade route. The heroes could make their camp a stop on the road, asking a toll for anyone wishing to use their bridge or be lead through the dark under.

The Path to Wisdom

"Enlightenment was not the jewel. Enlightenment was the choice."

-- The Fifth Doctor, *Enlightenment*

To bring this whole journey round-trip, sometimes an excursion isn't supposed to be about getting somewhere. Sometimes it's about going nowhere. Like the journey of life, sometimes the trip taken by a group of adventuring swordsmen and spell-slingers is about those stops they make along the way. Like Caine in Kung Fu, like Dorothy on her hallucinatory head-trip to see the Wizard, like pilgrimages to Mecca, the journey itself turns out to be the brass ring.

Some players show up to a game looking to kill stuff. Some want to amass enough treasure to bury a mountain troll. Still others want to achieve greatness. None of these things are to be gained by sitting at home and staring at the fire. They are the experiences gained over long months and years of hardship, and whether many of them realize it or not starting out, they'll get those during their time on the road.

GMs and their groups will spend a lot of time traveling; they may as well make sure there's something to look at along the way, and something worth talking about when they're done.

A Guide to the Saints, Kristin E. White

The List of Seven, Mark Frost

The Tale of Why John Hates Travel

by John W. Mangrum

Proposed Outline:

- Chapter One:** In Which the Protagonist Gets to the Indianapolis Airport a Little Early on Friday.
Chapter Two: In Which the Protagonist Takes the 5:35 PM Flight to Washington, D.C.
Chapter Three: In Which the Protagonist Takes the 9:20 PM Connecting Flight to Albany, NY.
Chapter Four: In Which the Protagonist Gets His Luggage, Takes a Cab, and is Home by Midnight.

The End

Actual Draft:

- Chapter One:** In Which the Protagonist Thinks Ahead and is Courteous to the Baggage Apes
Chapter Two: In Which a Dog is Sick
Chapter Three: In Which it Costs the Protagonist \$25 to be Considerate to the Check-In Lady
Chapter Four: In Which the Protagonist is at His Gate Two Hours Early
Chapter Five: In Which the Protagonist is Still at His Gate Three-and-a-Half Hours Later
Chapter Six: In Which the Protagonist Has a *Munchkin* Brainstorm En Route to Washington D.C.
Chapter Seven: In Which the Protagonist Arrives at Dulles Airport Five Minutes After His Connecting Flight Has Left and is Told to Come Back Tomorrow Afternoon
Chapter Eight: In Which United Airlines Hoses the Protagonist, Part I: No Hotel For You!
Chapter Nine: In Which United Airlines Hoses the Protagonist, Part II: A Tale of Two-and-a-Half Hours and the "You Want It, Come Get It" Baggage Pick-Up Philosophy
Chapter Ten: In Which the Protagonist Discovers That the Back of His Hands and Arms are Mysteriously Covered in Blood Blisters
Chapter Eleven: In Which United Airlines Hoses the Protagonist, Part III: The Mystery of the Ruined Suitcase
Chapter Twelve: In Which the Protagonist Finally Decides that United Airlines May Royally Screw Itself in the Ear
Chapter Thirteen: In Which the Protagonist's Flight from Indianapolis to Albany Includes a \$60 Midnight Cab Ride Through Washington D.C.
Chapter Fourteen: In Which the Protagonist is Hosed by Humanity but Saved by Technology, and Discovers that Eighty Pounds of Luggage Makes Sounds like a Locomotive
Chapter Fifteen: In Which the Protagonist Writes These Words at a Washington D.C. Train Station at 1:53 A.M.
Chapter Sixteen: In Which the Protagonist Gets to Plug His Computer In Again on the 3 A.M. Train to New York City, and Does Some Work, but Wisely Chooses to Sleep
Chapter Seventeen: In Which the Protagonist has Krispy Kreme Donuts in NYC at Dawn and Discovers that His Heart Makes Sounds Like a Locomotive
Chapter Eighteen: In Which the Protagonist Battles the Japanese Aboard the 7:15 AM Train to Albany -- and Loses
Chapter Nineteen: In Which the Protagonist Gets the Next-to-Last Seat on the Train -- and Loses It
Chapter Twenty: The Long March to Nowhere and Women with Purses
Chapter Twenty-One: In Which the Protagonist Damn Near Breaks His Finger While Stowing Himself with the Baggage
Chapter Twenty-Two: The Oblivious Frauline and the Suitcase
Chapter Twenty-Three: In Which the Protagonist Turns His Computer On Again and Types These Words at 8:30 AM While Stuffed in a Dark Space Behind a Seat
Chapter Twenty-Four: In Which the Protagonist Finally Arrives in Albany at 10:30 AM and Takes a Cab Home, Discovering in the Process that He Has Literally Ground the Wheels Off His 58 lb. Suitcase

Chapter Twenty-Five: In Which the Protagonist Greets his Cat

Chapter Twenty-Six: In Which the Protagonist Takes a Shower and Discovers that Almost Everything that Could Go Wrong with His Bathroom Plumbing, Has

Chapter Twenty-Seven: In Which the Protagonist Hops Online to Deliver This Tale

Chapter Twenty-Eight: In Which the Protagonist Tells Hackard that He's Behind on **[SECRET PROJECT 2.5]** and Will Talk to Him Later

Chapter Twenty-Nine: Epilogue: In Which the Protagonist Crawls into his Bed to Sleep and, Perhaps, to Drop Dead

The End

Pyramid Review

The Colonies RPG

Published by [Politically Incorrect Games](#)

Written by Brett M. Bernstein

Illustrated by Dennis J. McGarry

67-page PDF Document (3 megs); \$7.50

The Colonies is an RPG published by Politically Incorrect Games, and is a near future set game that can be seen to clearly wear its influences on its sleeve. In reading through its contents it was reminiscent of the BBC Television series *Blake's 7*; upon checking, there it was listed in the bibliography. The weapon illustrations looked vaguely like those from GDW's near future SF RPG, *2300AD*, and yes, there it is listed in the bibliography. Other relevant televisual references include *Earth: Final Conflict* and *V*, while movies like *Blade Runner* and *Total Recall* and the RPGs *Cyberpunk* and *Shadowrun* are also included in the source material appendix. This is not to suggest that the author has done anything untoward, but rather that in the case of the television series and films, *The Colonies* could be used to emulate them, at least in feel if not actuality.

[The Colonies](#) is available in two versions. The first requires the EABA rulebook (which supports several other games including a version of BTRC's *Timelords RPG*) and comes as a 15 MB PDF document for \$8. The second uses the PIG House Rules system, and it is this version being reviewed here.

The setting for *The Colonies* is roughly a hundred years in the future. By 2030 the fusion drive enabled tourism on Mars and it had replaced all fission plants. Every member of the United Nations had also signed and enacted a ban on nuclear weapons, which would be the cause of humanity's downfall. Without nuclear weapons, nothing could be done about the comet with a trajectory that would lead it directly into the Earth's path. Throughout 2037, hurried attempts were made to recreate the nuclear missiles dismantled years before, but it was all too late. Salvation came from space - a decoded alien signal from a species calling themselves the "Virimar," contained an offer to destroy the comet. The world leaders agreed and while the comet's destruction was assured, the explosion took out every orbital satellite, blanked many computer systems and prevented off-world communication. The Virimar were granted sanctuary in the central Australian outback, so that they could escape the orbital debris field. There they remained inside their ship, only meeting with the various government officials.

In 2081, as the debris field cleared, France initiated an aggressive annexation of cities across Europe, aided by Virimar technology. In response, the USA, China, the UK, Mexico and Canada formed a coalition army, but when this was sent to stop the French, sleeper agents in the home nations toppled governments and commanded the armies to oppress populations. Within a few years the Earth was been divided into provinces ruled by Virimar puppets; the Republic of France was the only surviving nation, with Eastern Europe given to it as a reward for its complicity. The collaborators live in comfort in tall skyscrapers, surrounded by desperate inner city neighborhoods and farmed suburbs beyond. Those charged with political crimes are sent to the labor camps . . .

With Earth suppressed, humanity's salvation lies off-world and beyond the solar system. Mars had survived and watched, learning from refugees what had happened at home and of a secret project put into practice in the few months before the comet's destruction; 20 vessels equipped with the revolutionary photon drive had been launched to colonize worlds in other systems. To date Mars has made contact with four worlds: Cassiopia, where perpetual darkness and savagely predatory wildlife forced some colonists to develop telepathy; Serpenti, a world with multiple rings that have caused mutations in the colonists; Reticuli, home to mysterious alien ruins which contained the secrets

to the science of biotech, but that have infected its colonists with nanotech -- and which has begun to infect those on Mars; and Orionis, split by a religious schism. Mars itself has become a democracy dominated by a variety of fairly benevolent corporations and the home to free humanity.

The Moon serves as a distribution and transit point for the Mars-run Off-World Militia, which is comprised of teams known as Liberation Cells, each of these have an established base near an Earth city, operating under orders via the Martian Defense Force liaison officers. In *The Colonies*, playing members of a Liberation Cell is the default set-up for the characters. Each cell requires one spacecraft pilot and one technician at least, but liaison officers, soldiers, mercenaries, hackers, scientists, refugees and even storytellers known as Pondsmiths.

Actually, Pondsmiths are a storytelling clan from the colony of Serpenti. Each world has a page devoted to it that contains a simple life path, much like that of R. Talsorian Inc.'s *Cyberpunk 2020 RPG*. These provide an origin, a little history, perhaps a reason for joining the Off-World Militia and possibly one or more special powers. The page also lists the costs of a character's traits (attributes) and skills. There is a page for each of the four known colonies, plus Earth and Mars.

Character generation begins by selecting a native world, rolling for background and then allocating some 150 points between traits and skills. There are six primary traits -- Strength, Dexterity, Perception, Willpower, Reasoning and Psionics, each rated from zero to six. Skills range from 0 to 12 and are divided into four categories: Fitness, Technical, Piloting, and Psionic. It is also possible to specialize within the various skills listed. The process is relatively simple, with character design being to some extent predetermined by the randomly rolled background (and its associated costs) and the desires of the player. An example of the creation process would have helped make it work.

While the game has a number of special abilities, including psionics, biotech, nanotech and cybernetic implants, each is balanced by a negative side effect. For example, the more a character uses his psionics, the more easy he is to detect, as measured by his Aura; likewise, Signature represents how easy the electromagnetic emissions from a character's implants are to detect; Contagion measures the degree to which a character's nanotech combine can be passed to another; and Aberration, how close a character's biotech chemical build-up is to causing negative side effects. These balances to the various special abilities do feel a little artificial, but at the same time, they nicely provide a means of curbing an over-reliance on them, and this should pressure a player to consider their use with care.

The Psionic powers are divided into Kinetics, (with the specialties of telekinetic Strike, Shield, Radiance -- speeding up the air to create plasma blasts and Sonics to manipulate sound), Passive (Empathy, Telepathy, and the meditative Quiet), Active (Trespass -- mind reading, Overload another's mind with a stream of confusing thought or block mind reading with Noise), and Intrusive (Implant false memories, implant and Trigger an action, and Extract whole memories or thoughts). Biotech or genetic enhancements tend to be metabolism, sensory, environment, or tissue growth-related, and are countered by aberrations such as radiation, spontaneous combustion, or reigning madness. Nanotech is divided between Biological Maintenance Units that improve the body's efficiency and Viral Units designed to infect others, such as the Disruptor Combine, which upsets the target's bioelectric system, whereas the Eater Combine attacks the body's organs, and the Poison Combine, the brain. Cybernetic implants include the usual range, but also devices known as limiters that can control a subject's ability to kill, commit violence, feel fear, emotion, and pain or even to speak. The Virimar use Limiters as punishment or as part of their super soldier experimentation program.

At its core, the dice mechanics in the PIG House Rules system are nicely simple. Roll 2d6, with low results bringing the desired outcome. Both penalty dice and bonus dice add to the number of dice rolled -- these are very clearly marked throughout the pages of *The Colonies* -- with one penalty die canceling out a bonus die, and so on. Where the number of bonus dice prevails, the two lowest dice rolled determine the outcome; where the penalty dice prevail, it is the two highest rolled that count. Roll under the skill total (the skill score plus its associated trait) to succeed.

It gets slightly more complex for advanced task rolls, where the result of the dice roll is compared with the character's skill total to get a difference called the margin. This is cross-referenced on a table with a difficulty determined by the GM to get a final outcome. Of course, the greater the margin, the greater the degree of success. As with the penalty and bonus dice added to action resolution, shifts in the difficulty of any attempt are clearly marked throughout the

game.

Again the complexity increases for combat, within the margin of success cross-referenced with the particular weapon being used to determine damage inflicted. Again the type is marked with symbols, lightning bolts for stress (non-lethal) damage, and Bugs Bunny-style lit bombs for lethal damage. The rules for combat cover most eventualities within its eight-page chapter, including all of the necessary charts. This includes underwater combat, fights within pressurized and zero-g environments, and using exotech (powered armor suits). Again, just as with character generation, there is no full example to aid the prospective player or even GM. Otherwise, combat is invariably short and brutal.

Exotechs and several other pieces of technology are covered over the seven different sections of the Technology Chapter. Besides the biotech, nanotech and implants, this includes weapons (explosive projectile or EP weapons, lasers, electro stun guns, and the mostly Virimar deployed particle streamers -- essentially gauss guns, and plasma firing pulse detonators), armor, exotech, miscellaneous items and drugs, the latter accompanied by side effect rules similar to those used for the psionics, biotech and nanotech. The rules for computers get a section to themselves and besides detailing the types and interfaces available, suggests several personalities that can be equipped. Two in particular, Oracle and Slave, are somewhere between a nod to and a swipe from *Blake's 7*.

All this technology is nicely, but simply done. Yet ***The Colonies*** gets even better when it covers Projects. This covers the design and invention of new items, similar to those already listed in the game so far, with the publisher encouraging the submission of such devices for use in further supplements. Of course, the appropriate skill and tools are required, but also actual experience points. The system seems simple and easy to use, but again let down by a lack of examples.

A sample cell and a description of the city of Philadelphia under the occupation of the Virimar collaborators support the default campaign set-up in ***The Colonies***. It includes a sample scenario within the one-page description, while the next two pages give another six mission ideas and several sample opponents. All of this could be adapted to the city of the referee's choice, as the real default setting has the game set in a gaming group's own town or city, with the player characters fighting for its liberation.

The Colonies comes as a 67-page PDF document, and bar the cover and the weapons, there are almost no illustrations. Likewise what color there is, is limited to the cover, and also to the pale gray-green wash given to the chapter and section headings. Where the lack of illustrations in a printed book would be seen as a downside, here it serves to keep the document size down. And while the artwork might serve to break up the text, this is not a real problem in ***The Colonies***, all due to its layout. Although it clearly shows its desktop publishing design, it is still done in a crisp, open style that is pleasing on the eye and easy to read.

What you get with ***The Colonies*** is really quite simple: a rebellion or resistance versus the authorities set-up, best typified by the [Star Wars RPG](#) from West End Games. While this game is very much in the vein of *V* meets *Total Recall* meets *Blake's 7*, it possesses a grittier tone than any of these influences. There is more breadth than depth to this game, as there are plenty of different elements, especially technical, around which to build scenarios and campaigns; helped of course that with this type of genre, ideas are two-a-penny. Beyond the basic game, the publishers have promised several supplements covering Mars, the other colonies, and the war against the Virimar. Politically Incorrect Games has already released two free supplements; one gives more details of the game's guns and the other provides background and life path pages for the newly discovered colonies of Oberon, dominated by technical castes, and Eridani, where the colonists have been reduced to primitive conditions after an exchange of low-yield dirty nuclear weapons.

The Colonies is a solid package that provides the GM with the necessary set-up to run a campaign within what is a familiar genre. It does this well, with a gritty feel to both the mechanics and to the various technological aspects of the game. Until the publishers provide more background, it still leaves plenty of space in which to run and develop a game. ***The Colonies*** is a well-presented, well-written game that comes in a credit-card-friendly package.

Pyramid Pick

Promised Sands RPG

Published by [BBRACK Productions](#)

Written by Benjamin Rogers, Mike Rennaker, Robert Anderson, & Kelly Slaughter

394-page b&w softcover; \$36.95

Asking gamers who are already familiar with half a dozen RPG systems to learn another one is an uphill battle. That's exactly the battle chosen by BBRACK Productions with their new title ***Promised Sands***. To make things a little more palatable for gamers who don't really want to have to learn a new mechanic, they've made sure of a few important things. First, the game mechanic is simple to learn and use, but offers a surprising amount of depth. Second, the game world of ***Promised Sands*** is rich and complex, providing incredible potential for adventures.

Promised Sands uses what its creators call the "Trinary System" for determining everything in game, with the exception of character creation. It works like this: roll 3d10. Two dice are a percentile roll, which must be under or equal to the success value (SV) of the task at hand. The third d10, called the Effect Die (ED), is used to determine how successful the character is at the selected task. The percentile roll can be modified by reducing the value of the ED. For instance, if you need a 35 to succeed at a task and roll a 49, with a 6 on the ED, you can still succeed. Reducing the value of the ED by 1 drops the percentile roll by 5. So, in the example above, if you drop the ED to a 3, the percentile drops to 34. Success, but at a much lower level of effectiveness.

The mechanic is perhaps a bit trickier than that, but that's the basic gist. After a dozen rolls, it becomes simple. The world of ***Promised Sands***, on the other hand, has an extremely steep learning curve. The default game world of T'nah is one of the most detailed game environments ever developed. In addition to a host of character races, there are dozens of cultures, each with their own customs for marriage, dealing with death, and more. Each race and culture is presented in great detail, providing a very real and consistent world in which to play.

It does take some time to get used to the world, and the book itself isn't a lot of help in places. Virtually everything has an unfamiliar name, from occupations to articles of clothing, and it takes a lot of flipping between the page you're reading and another page gleaned from the index to figure out that a bukhanq is a woman's scarf. Similarly, you can't meet up with folks at the tavern near the market. Instead, you'll have to find each other in the vahna near the souq. With more and more exposure to the game world, this becomes easier, but it can be a bit off-putting at first.

The world of T'nah itself is a unique one. The game takes place some 3,000 years after a massive worldwide catastrophe of some sort. The game's creators are quick to point out that this cataclysm is not the result of a nuclear war, but more a natural upheaval on the lines of an ice age or massive climatic change. T'nah is a desert land where water is scarce, and clean, pure water is almost unheard of. BBRACK calls it "Arabic renaissance," and that's as accurate a two-word description as can be devised. Magic of two types -- Ido and Qai -- exist, as do some items from pre-cataclysm. These items, called "otec," are highly prized and considered magical by most who encounter them. As for the magic, Ido is more arcane while Qai tends to deal with living creatures, either healing or harming them.

Much of the book concerns the creation of characters, since ***Promised Sands*** is a character- and story-driven game. On first pass, character generation can be politely described as opaque at best. Expect your first foray into developing a character to take a good two hours. It becomes easier with practice, since much of the confusion is spent determining which of the scads of races and cultures best suit your character concept. An example of character creation would be a boon here, but except for some small examples in places, there's nothing.

Each character has nine basic statistics divided into three main categories. The Flesh characteristic is subdivided into Strength, Dexterity, and Stamina. Intellect, Perception, and Sanity make up the three parts of Mind. Finally, Will is subcategorized into Charisma, Insight, and Resolve. The way scores are generated for each is unique and fascinating. Three dice are used for each, but the dice used are determined in character generation. The character's race, culture, and chosen apprenticeship grant a die from d4 to d10 to each statistic. Each is rolled, and the total is where the character's given Attribute starts. The maximum from the three dice is the character's eventual maximum in the given stat. For instance, a Human from the Renizant culture who apprentices as a Kril (warrior) rolls a d6, a d4, and a d8 for Strength respectively. The total of the three dice is the character's stat, while the maximum (18 in this case) is the character's maximum Strength.

Once a character has a race and a culture (and two-thirds of the dice needed to determine stats), the next step is the interesting crapshoot called "Qualities." Each race and culture provides a pool of dice and bonus points used to add specific features to the character. These can be positive, negative, or neutral and are determined partially randomly. Each Quality has a variety of possibilities. To determine one, roll up to three dice granted from race and culture and add the total. If it comes up with a bad result, bonus points can be used to boost the result. It's not necessary (or generally possible) to roll on all of the Qualities tables: characters are considered average in those areas. For example, a player may wish to determine the Nimbleness of his PC. He selects up to three dice he has in his pool and rolls the appropriate die, generating a result from 1 (clumsy, with an appropriate minus to certain skills) to 10 (natural grace, with a bonus to some physical skills). If the result isn't what the player wants, any bonus points in the pool can be used to boost the result. Players who don't choose to roll on this table have a character of about average grace.

Assets and Detriments can further define the character and are usually provided by race, culture, or fiat from the Bard (GM). Once done here, the character moves on to selecting an apprenticeship and determining skills. This also provides the final die needed for creating the Attributes of the character. Finally, the character is equipped, much of which is a starting package dependant on the character's occupation. It's all a fairly laborious process, but results in an extremely well-defined character with a large selection of skills and abilities.

Combat in ***Promised Sands*** uses the same basic mechanic of $d\% + d10$, with the d10 determining the amount of damage caused with a hit. Rules for shock, blood loss, bone and nerve damage make combat a brutal affair not to be taken lightly. Real, permanent damage or death is always a distinct possibility, and on T'nah, there's no such thing as resurrection. Despite this, combat is surprisingly easy to resolve, and isn't generally the focus of the game in the first place.

Evidence that it's all about the playing instead of the rolling is apparent in the section on character rewards. Earned experience, called Wisdom, can be used to improve Attributes or boost skills, but can also be used to buy Legend points. These points, when used successfully, allow the character to append titles to his name. G'rlan the Wanderer, with the judicious use of Legend Points, can become G'rlan the Wanderer, Slayer of Drachen, Tamer of Wild Beasts, Kin to the Ebon Syl. Players are encouraged to include these titles on the character's sheets, and to have the character use all his titles whenever introduced to new NPCs.

Perhaps the best invention in a game full of new ideas and possibilities is that of dissonance, or DIS. Each player is given the opportunity to, once per game session or scene depending on the Bard's ruling, interrupt the Bard and take the story in a new way, change the results of a die roll, gain a reroll, or somehow change the course of action in a real way. A player whose character is thrown off a high building can use DIS to allow the character to grab a ledge on the way down, preventing a fatal fall. This ability to avert fate puts a lot of power into the hands of the players, giving them a little more control over the fate of their personas beyond the vagaries of random dice rolling, once again increasing the level of roleplaying and not letting a bad die roll get in the way of a good story.

Overall, ***Promised Sands*** is impressive in a number of ways. T'nah -- designed down to funerary customs for multiple cultures -- is complex and engaging in a way that worlds based more on numbers can't be. The bestiary, for instance, contains creatures evolved through thousands of years of harsh environment and mutation. With a few exceptions, there aren't any magical beasts, undead, or creatures that feed off the spirit of dying. It would be possible to play ***Promised Sands*** without the inclusion of magic of any sort without losing much in the way of creatures to encounter. The backstory of the game is left purposefully cloudy, not so much because of a lack of attention, but because this history

really isn't known, and is left to the Bard to develop in his own way.

There are flaws here, and they are mostly flaws of omission. The lack of an example for character generation is serious, as is the lack of a sample adventure for new Bards (although one is available on the BBRACK website). It's hard to complain of incompleteness in a book of this size, but dropping a couple of the stories used to enhance the setting in favor of some concrete examples of play and character design would have been a good idea. On the positive side, if character generation is too difficult or arduous for a given player or Bard, there are a number of archetypes provided. The book, well-written and entertaining to read, is not always logical in the way it is laid out, and finding the information needed for a particular part of gameplay or character design can be frustrating. A glossary of terms would have helped a great deal.

Ultimately, ***Promised Sands*** is a great game for an experienced Bard who wishes to present an exquisitely designed and lovingly crafted world to his group. The mechanic is simple enough for new gamers to understand in a few minutes. It does require a lot of work on the part of the Bard, since the world itself is unique and perhaps a touch obscure, but those willing to explore this dense tome and really understand the workings of ***Promised Sands*** will find that work repaid a hundredfold.

Pyramid Review

Diceland: Ogre

Published by [James Ernest Games](#)

Created by James Ernest & Falko Goettsch

Illustrated by John Zeleznik, James Ernest and Elizabeth Marshall

\$15.95

Just as the exhaust blasts from the spaceships in [Diceland: Space](#) reaches the shelves of your local games emporium, Cheapass Games follows up that expansion for the excellent [Diceland: Deep White Sea](#) with a whole new set. Where *Diceland: Space* was based upon a title of their own, the computer game [Strange Adventures in Infinite Space](#), with *Diceland: Ogre* the designers have obtained a license from another company, Steve Jackson Games and it based upon their boardgame, *Ogre/G.E.V.*

First published almost 30 years ago and then just costing just \$3.00, *Ogre/G.E.V.* still remains a solid and inexpensive wargame in spite of the five-fold rise in the price since 1977. In this game of near-future tactical armored warfare, the most feared weapon on the battlefield is the cybernetic attack vehicle known as an Ogre. The ultimate in tank design, an Ogre could be up to 50 meters long, armed to the hilt and with an inhuman intelligence layered under three meters of armor. On the battlefield, an Ogre is near unstoppable, trundling on lengthy tracks towards its target, steamrolling over anything that gets in its way, while its opponents throw everything they can muster at the behemoth in an attempt to take it apart one component at a time, hoping that they can disable it. Since the original boardgame, the *Ogre* line of games has received a number of expansions, been transferred to the computer screen, received both a line of miniatures (including a conversion to the eldritch with the *Spawn of Ogrehulhu* expansion) and macro-miniatures, decorated T-shirts, and a roleplaying supplement with *GURPS Ogre*.

Of course, there are some differences between *Ogre/G.E.V.* and *Diceland*. Both are wargames, but the latter is more akin to a miniatures game, though with all of its combat details and values printed upon each face of the dice. These change as the die takes damage or moves, both simulated by pushing down on the corner of the octahedral shaped die so that a different side is face upwards and pointing in a new direction.

Diceland: Ogre comes with . . .

- 17 standard-sized dice, representing the Infantry (four dice), G.E.V.s -- Ground Effect Vehicles or advanced hovercraft (three dice), and two dice each of each of the following: Light Tanks, Missile Tanks and Heavy Tanks, Howitzers and Mobile Howitzers.
- A double-sided 13½ by 12-inch rules sheet.
- Two sets of ¾-inch diameter counters numbered from zero to nine -- their use is optional and only really necessary in larger, more complex games (they also have to be cut out from the packaging).
- Two 5 by 4¾-inch color cards, one Track Card for the Ogre and the other for the Command Post.
- . . . And finally, the Ogre itself.

All of this comes in the standard *Diceland* flat pack, with the dice needing some simple glueless construction before play. This does not take long, but is easier if the instructions are followed.

In comparison with the standard sized dice -- each two-inches to a side -- the Ogre die is huge. At four inches to a side, it is roughly some four times larger than the others. Each of the dice is illustrated with an image of the unit it

depicts taken from the **Ogre** line, though if truth were told, in comparison with the illustrations from **Diceland: Deep White Sea**, these illustrations are rather drab.

The Ogre Tracking Sheet can be used for either the basic Ogre Mark III or the tougher Mark V. Various boxes show the damage it can take to its missiles, main and secondary batteries, its antipersonnel defense system, and its treads. As it fires off missiles or takes damage, the various boxes are crossed using a dry-erase marker (which the player must supply).

The Command Post represents a unit all of its own and sits at the very edge of the table throughout a game. It is the target of the Ogre unit and can be destroyed by reducing all of its 60 armor points to scrap, or when the Ogre actually trundles over it. While this is the basic aim of the Ogre in **Ogre/G.E.V.**, in **Diceland: Ogre** the first player to score 50 points is the victor. The only effect of destroying the Command Post is to deny its player access to the Command Post's all-important "Command All" Special Ability. This enables every die in an army on the table to take an action, and is both a primary and vital action if the Ogre is to be stopped. Against an Ogre Mark III, the defending player constructs an army of just over 30 points, or just over 50 if facing an Ogre Mark V. The Command Post is placed at the table's edge, while the Ogre is put down 20 inches away in the center of the table.

Once the pieces are in place, the game begins with the army player going first. On his turn, he can throw a die onto the table and have it maneuver, fire a weapon, or use a Special Effect. An army needs to get its dice onto the table as quickly as possible so that the Command Post can activate its Command All Special Effect. This is helped by the Call Infantry Special Effect of the Infantry dice, and the Call Tank Special Effect found on the Light Tank and G.E.V. dice, the latter also able to Call G.E.V. Neither the Howitzer dice nor the Missile and Heavy Tanks have any Special Effects on their dice. By using the Call Special Effect, an army can field its dice against the Ogre all ready for a combined assault.

The Ogre possesses just the one Special Effect -- "Shoot and Move" -- which enables it to undertake two actions per turn, as opposed to the one of the various army dice. It can fire just a single weapon each turn, but one that will hamper an army's build up of units (using their Call . . . Special Effect) is its Antipersonnel guns, which fire in all directions and are deadly to all Infantry dice and dangerous to G.E.V.s. Unlike the other dice, the Ogre die is not thrown during the game (though airdropping an Ogre would be an amusing option), and its maneuverability is susceptible to damage to its treads. The movement dots marked on the Ogre die are with numbers that correspond with the tread boxes marked on the Tracking Sheet. Treads can be taking fire and by rolling over units, destroying them in the process. Since an Ogre is so big, an army can specifically target its components, including the tracks.

Unlike in **Ogre/G.E.V.**, units destroyed in **Diceland: Ogre** are not completely wiped out, but as in **Diceland: Deep White Sea**, go into reserve status from where they can be thrown back into the game after a turn's wait. This gives **Diceland: Ogre** a far more fluid playing style, already present because in **Diceland**, range is relative rather than absolute.

The rules also make several suggestions for playing different games and scenarios with **Diceland: Ogre**. These include pitting Ogre versus Ogre, and army against army, as well as mixing the two (although another **Diceland: Ogre** set will be needed to play with more than one Ogre). It is also possible to play this game solo, though nowhere near as fun. Even more possible is the sending of dice from other **Diceland** expansion sets against an Ogre; the rules suggest that three Terran Destroyers from **Diceland: Space** would be a worthy foe for an Ogre Mark III. Dice from **Diceland: Deep White Sea** will be less effective because both the Ogre and the Command Post are immune to a wide range of Special Effects that those dice possess.

Diceland: Ogre showcases the versatility of the **Diceland** mechanics in adapting **Ogre/G.E.V.** into this format, while still retaining much of the original war game's flavor. In some ways, **Diceland: Ogre** can be seen as "**Ogre/G.E.V.** - lite," being easier to set up and play, far less fiddly, and more tactile than the boardgame. The translation does lose some flexibility, as there is just the single Ogre in the pack. Such minor gripes aside, **Diceland: Ogre** is a pleasingly fun reinterpretation of an old classic that will be enjoyed by both **Diceland** and **Ogre** devotees.

And on a final note, cats like this **Diceland** expansion set as much as the last . . . while the size of the Ogre die doesn't scare them at all.

Hear Ye! Hear Ye!

One Million News Headlines and Rumors

by Jeff & Kristin Gaskill

The players in your game have defeated the dreaded Arch-Lich of Evil Incarnate, plundered his tower, carted away his mountain of riches, and are now relaxing in a nearby town after an orgy of spending, trading, leveling up, paying dues and tithes, and all of the other things adventurers do while loitering about in civilized areas. The characters are now hanging out in the local tavern, looking for something to do.

"So. What's happening in this burg?" the warrior inquires of the barkeep.

"Um . . . not much," replies the loquacious beer-flinger.

Sound dull? You bet. Wouldn't it be keen to have a handy way of coming up with news, rumors, and adventure hooks at the drop of a hat? Sure it would.

And here it is. Now you can instantly create any number of crazy things happening in your players' part of the multiverse with a few simple rolls of your favorite percentile dice.

How To Use the News Generator

Roll percentile dice from each of the first three lists -- Descriptions, People, and Events. For example, whipping out our handy bones and giving them a few shakes, we come up with 50, 22, and 42. Checking the tables we find that our first headline reads "Infected Diplomat Found."

With a little fast thinking, we can quickly come up with a possible scenario from this headline. He's infected with something (how about a nice magical malady, like Screaming Leaping Hives), he's a diplomat (he has to be from somewhere -- south is nice this time of year), and he's been found (from which one must assume that he was lost).

So now we've got a southern diplomat who's been missing and has just recently been found infected with the Screaming Leaping Hives. Why was he missing? How did he contract this horrible disease? If the characters are interested, you've got a new story subplot to follow and make your own. If they're not, just pop out a new headline -- Ravenous Old Coot Sucked Into Void, or Suicidal Prophet Kills Four in Tavern Brawl. If some of the results don't fit in with your world, go ahead and fudge those rolls' it wouldn't be the first time. Mix and match . . . that's the name of the game. Don't forget -- you can make any of the People selections plural. Why have just one Psychotic Halfling when you can have three or four for the same price?

Stop the presses!

No Means Yes and Yes Means No!

On many levels, RPGs provide a lot of wish fulfillment. You can be smarter than you normally are -- stronger, wittier, more attractive, richer, and more powerful. You can also encounter problems you generally couldn't in real life, but might enjoy exploring in a controlled environment. ("Oh, no! The Butterscotch Vixens have me chained in their dungeon!") And, of course, you get to explore worlds and encounter beings that simply don't exist elsewhere.

But there's one thrill that, at least for me personally, may top many other thrills provided by roleplaying. In a game, you're able to do things that are expressly forbidden in the real world; in fact, circumstances can warp in a game to allow you to do things that are not allowed within the game itself.

Generally these circumstances take the form of statements like, "Under any but the gravest circumstances we would not allow this. However . . ." Sometimes it's expressed more like, "Deeds such as yours would normally be punishable by death. However, given the service you have done for our people . . ."

In short, it's *fun* to do things you're not supposed to do. So how do you interject this bit of wish fulfillment into a game?

Well, first you must deny the players.

Minor digression: Isaac Asimov, in his robot series of stories, had three "immutable" laws that all robots had to follow. Then many of his plots came from a robot who seemingly violated one (or more) of those rules, and it fell to the protagonists to figure out what had happened. This technique, broadly applied, has innumerable applications to gaming; in this case I'll restate it as, "Tell the players that there are immutable rules, and then allow them to break those rules."

As such, in order to make this technique satisfying to the players, you first need to provide them with rules or restrictions.

These restrictions can be physical, and tied to the nature of the universe:

"No one can meet himself within the same timeline."

"A magician who learns of both Chaos and Order Magics will surely destroy his sanity."

"Don't cross the streams!"

They can also be social, mental, legal, or cultural:

"A woman cannot learn of the sciences; it's just not . . . *ladylike!*"

"Under penalty of death, none may directly address the Emperor nor lay a finger upon him."

"Only those sworn to the K'nall Triumvirate may access their Holy Library."

(There is also another type of rule, which will be explained below . . .)

Those tied to the physical nature of the game world are difficult to make convincing, since they rely on players suspending their disbelief to envision the one -- usually elaborate -- set of circumstances required to make the rule-breaking possible: "Well, *normally* you cannot cast more than one ritual a year. But . . . umm . . . today is the dawning of the Sign of Bullshidious, during which one may cast *two* rituals!" They are also often less satisfying because they almost all rely on the GM spoon-feeding the specific method of skirting the rules to allow his plot to progress. On the other hand, done correctly in the right story, violating the rules of the universe *can* be very powerful; after all, it's pretty neat to have a character that has explicitly done the impossible.

Rules tied to society are much easier to implement, and as such much easier to break. That's not to say it's *trivial* to break these rules; they are generally imposed by forces with enough clout to keep someone from violating the social

contract, and enough power to make the violator miserable for having done so. Again, this denied thing can be anything: a reclusive sage who hasn't spoken with anyone for decades, a warehouse full of mystic artifacts recovered in the 1930s, the crown jewels.

Regardless, both types of techniques work best if the GM lets the players know about the rules ahead of time. This lets them reflect about what is being denied, and possibly attempt to interact with the element *before* the GM intends within the story. For example, if the heroes learn that they have been given permission to kill a foozlebeast for its blood so they may save the Crown Prince, it's nowhere near as powerful to inform them that, by the way, the foozlebeast is sacred, and ordinarily it would be taboo to hunt one. Informing the players of the rules ahead of time gives them a chance to savor the "naughtiness" of breaking them.

There is an exception to this. There are rules that are intrinsic to the game world; these are generally obvious, and do not require explicit statement. For example, in a modern campaign the heroes might learn of an attempt by aliens to obliterate Washington D.C., and realize that, to keep the invaders from focusing their death ray, they must destroy the "antenna" -- the Washington Monument. In this circumstance it isn't required to state ahead of time, "Oh, by the way, it would be very, very bad to destroy the Washington Monument." Intrinsically, the players know this. (Of course, it can be interesting to have an NPC point out, "You know, it's a good thing you've got permission for this operation . . .")

Generally speaking these rules revolve around most of your obvious crimes: killing, destruction, theft, and the like. If the players learn that they must steal the Emperor's signet ring without his knowledge to fulfill a prophecy, then they don't need to be informed that what they are doing would be Very Bad under normal circumstances. (Even then, it might be good to inform the players ahead of time that the Emperor has such a signet ring . . . or even that the Emperor exists.)

So you've denied the players something. Now . . . you let them have it. Yes, the McGuffin introduced adventures earlier is now realized, and the heroes will be permitted an audience with the reclusive sage, given a chance to rummage around the government's ultrasecret warehouse, or allowed to use the experimental wall-phasing suit.

There isn't much to this part. If you've done your job in hyping up these forbidden possibilities, then getting to actually access the noun in question should be exciting for the players (assuming, of course, that what was denied is interesting; getting to access the government's secret warehouse and learning that it's full of nothing but wiener whistles and Alf puppets might result in irked gamers).

Afterwards, probably the best thing you can do is make sure the special encounter the players got to experience is still a big deal. After all, being told that the heroes could talk directly to the Boy-Emperor for this *one* instance makes it a perpetual big deal. Having the same Boy-Emperor decide that talking to the heroes has opened him up to society, and thus he'll talk to anyone from now on, makes the "rule-breaking" of the heroes less special. (This step isn't crucial, and in a lot of ways it's interesting to make the heroes merely the harbingers of some previously-impossible-but-now-possible deed. However, it's usually more special to punctuate the heroes' accomplishment by ensuring that others can't break the rule they did; in fact, it's often best to make sure the *heroes* can't break that rule again . . .)

The real world has a seemingly endless supply of forces telling us "no." Most game worlds have at least a comparable number of things denied the PCs. But letting the heroes break the rules every so often can be a great thrill that will make an adventure - and perhaps even a campaign - truly memorable.

--Steven Marsh

Big Brother is an Idling Bachelorette Survivor

Week 3

by Steven Marsh

Whereas [last week](#)'s "BBiaIBS" installment was punctuated by a startling development, this week was best defined when something dramatic and rivetting utterly failed to happen. Other networks might have sought to fix this and ensure high ratings by introducing, say, flesh-eating insects to the mix, but we at *Pyramid* know that there is no greater render of flesh than the author's own hands as a last-minute deadline looms.

The voting for the second week closed on Monday, 11:59PM Eastern Time. These were the results:

1. **Sandy Antunes** -- 3.5711 (443 votes)
2. **Andy Vetromile** -- 3.2457 (403 votes)
3. **Aaron Rosenberg** -- 2.8022 (450 votes)

By a considerable margin, Aaron Rosenberg escaped the claustrophobic challenge of composing a 5,500-word article in three days. This left Sandy and Andy faced with that task; both of them completed this with hours to spare.

And so the decision of who is the *ultimate* BBiaIBS champion rests in your hands. Voting for this installment will close at Thursday, 11:59PM Eastern Time. The winner will fail to have his life irrevocably changed, he shall not be presented with a multimillion-dollar contract, and plans to have a 20-foot-tall gold statue erected in his honor are unlikely to be realized given a preliminary round of communications with our bookkeeper. But we'll probably buy the winner a beverage of his choice at the next convention we encounter him at.

Who will rise to the challenge? **Who** will be the ultimate survivor of the Big Pyramid? **Who** will drink free?

Ye Olde Majik Shoppe

A Half-Dozen Odd, Strange and Just Plain Weird Magical Items

by K. David Ladage

In the dawning of the second age, the great mystic and sage, Kendalge, reigned as the land's premier magical talent. History paints a picture of a man that was a regal intellectual that brushed elbows with the movers and shakers of his day; some texts paint him as the *prime* mover and shaker, others see him as a tool of those that were truly in power.

He is said to have advised a dozen Kings over his lifetime, held a plethora of offices and titles, and was even dubbed Lord Protector of the Northern Regions at one point in his career. He was brilliant, powerful and wise. This much is not disputed.

However, owing to many of his memory-repressing spells, history does *not record* (save that which can still be found in mystic and guarded tomes) that he was eccentric to the point of insanity; some claim he had between three and six personalities running about in his head. Others claim he was actually possessed by a variety of otherworldly creatures over the course of his life. He would have conversations with people, and a few moments later act as though he had no recollection of having ever met them, let alone spoken to them. He was a wild-card in most of the conflicts that took place in his day.

No matter how you define the cause of his mental instability, one cannot deny the fact that over 60 of the most powerful and sought-after magical items in history are his creations (from Helicancile, the great shield that held off the armies of Lord Holstan for three days and nights; to Gemmomarmor, the mighty diamond golem that defeated the Hordes during the Northern Invasions).

Many a powerful and talented mage has spent their entire lifetime trying to emulate but one of his masterworks. Still . . . with that much going on in one's head, it should come as no surprise that Kendalge also created some of the oddest and just plain *weird* magical items history has ever known. Below we see but a half dozen examples of his unique perspective on the world.

Aaron's Sword

During the reign of King Frederick XIX, the King's eldest son, Aaron, commissioned Kendalge to construct him a mighty weapon. However, it was well-known that Kendalge was not fond of the King's son, since Kendalge had often openly complained that the boy was a danger to the throne; Kendalge claimed Aaron was a braggart that would kill his father for the power of the throne. Still, it was Kendalge's duty to comply with the Crown Prince. The result of six months of work was Aaron's Sword.

The weapon is a fine quality double-edged thrusting broadsword. The blade has some intricate watermarking that extends to within 1/64th of one inch from the edges. These markings seem to be in a state of continuous, fluid motion. The blade has a dull green glow to it that gets brighter as the moon wanes and dims as it waxes; the cutting edges, however, glow in a sickly yellow that gets somewhat brighter the more people are within 60 feet of the blade. When any form of detect magic is cast upon the blade, it will show as having many, sometimes conflicting magical properties of such intense power as to overwhelm the one doing the detection. All of this is for show -- several intricate and powerful illusions cast upon the blade to impress the young man that would wield it. The sword does have two "real" enchantments cast upon it, however. These, however, are all but undetectable.

The first is a simple charm that draws the wielder to the sword. Once you have the weapon on your person for more than an hour, the desire to maintain possession of the blade becomes ingrained. The wielder will refuse to use any other weapon in combat, they will cherish the blade above all others. Any attempt to point out the irrationality of such

a belief is useless. The second is that the wielder will grow more and more paranoid the longer he holds the weapon. This effect will not be noticeable for several weeks, as the initial changes are very subtle. After a few months, however, the wielder will trust absolutely no one. The strange thing about these enchantments is that they will only work if the wielder is a reigning Monarch . . . otherwise, they are dormant and do nothing.

It was less than six weeks after Aaron was presented with the sword that he assassinated his father and took the throne. Within another week, nobody would see King Aaron III lest he carried his favorite sword with him. After less than eight months on the throne, Aaron had killed all of his advisors, claiming they were plotting against him. His reign ended in a bit more than a year, with Aaron's younger sister, Chelsea, taking over. Aaron was buried with his prized weapon, although the grave was robbed a decade later. The fate of the blade was unknown.

Bauble of Time

Of the many areas of magic that Kendalge was obsessed with, none fascinated him quite the way that time did. He wrote in his journals that "Time is like invisible man building a wall of stone. You cannot see it, but its efforts result in effects that are obvious."

Although his most noteworthy artifact of time was his jewel-encrusted brooch (which, according to legend, often allowed him to react to events several seconds before they happened), most texts ignore or relegate the Bauble of Time to a footnote.

The Bauble is a small, spider-like piece. Eight four-inch-long thin spines of silver extend from the central bulb much like a compass. The bulb houses a glass sphere approximately two inches in diameter. The sphere is visible from the top and bottom and is half-filled with mercury. To activate the Bauble one must shatter the glass; thus it is obvious that the Bauble is a one-use item.

When the glass shatters, the closest sentient being to the bauble is removed from the time stream for, what appears to the outside observer to be, something between 10 seconds and one minute -- the exact time seems to be completely random. The affected individual will disappear completely, including all possessions, reappearing (from their point of view, instantly) in the same location they were in before they left. If anyone or anything is moved (or moves) into the location the affected creature was in, he will reappear in the closest, safe location available.

The first time the Bauble was used was by Kendalge's apprentice, Halvord. Halvord had been cleaning the study when he knocked over a large bookcase. The bulb hit the stone floor and shattered. He disappeared, and the books landed all over the floor where he had been; the nearest place for him to reappear was within the adjacent lab where Kendalge was working. He startled Kendalge, who dropped the elixir he had been working on, losing several weeks worth of work. Needless to say, Halvord had his duties severely increased for quite some time following the incident.

Chalice of Humility

If there was anything that could be said for Kendalge, it was that he was a humble man. He never spoke much of himself and was always polite and courteous. The same could not be said for many that he served. One such Monarch was King Beaufort VII. Once the King had a few servings of wine, his mouth would often get the better of him as he would begin spinning half-true tales of his own accomplishments. This often angered Kendalge who found such behavior assinine.

Kendalge crafted and enchanted a large set of chalices that would imbue magical power to any drink that was placed within them. These ornate drinking vessels were made of silver and platinum, engraved with an ornate maze-like pattern and a single one-carat diamond in each of the 64 chalices he made.

In addition to the humbling effect (see below), the diamond in the chalice will also change color to warn of poisons (yellow), spoiled drinks (orange), and even the presence of blood (red).

But the primary function of the chalices was humility. As the drinker continued to imbibe, he would grow more and more humble. The effect would last for as long as two hours after he finished drinking. According to the diaries of Queen Chelsea V (Kendalge's fourth wife and Great-Great-Granddaughter to Chelsea IV, the sister to Aaron), the effect was so subtle as to be nearly undetectable -- the drinker is simply incapable of bragging. He can still lie all he wishes, but not to save face, or to inflate his own perceived position. Chelsea's diaries go on to muse "had these wondrous vessels been made in the days of my Great-Great-Grandmother, perhaps King Aaron's fate would have been much more subdued."

Dream Catcher

Kendalge, aside from his obvious magical talents, was well-known for his superstitious nature. He collected four-leaf clovers (and is even said to have bred five-, six-, and eight-leaf varieties in his time); he would knock on wood after he said anything of any importance; he often prayed after seeing falling stars; he refused to do any magic on the nights of the new moon; and so on and so forth. He is said to have prayed to no less than 60 Gods, ensuring (in his mind) that he did not incur the wrath of any of them, and as a sign of respect. The man was, as it was written by Queen Chelsea V, "my sweet is a thoughtful and caring man that, to my eternal delight, has more quirks than one is capable of counting."

One of the many things he feared was that his next great idea would come to him in a dream and he would forget it when he awoke. He also believed strongly in the prophetic power of dreams (although no writing suggests that he ever had such a dream). As a result, however, he created his dream Catcher. The dream Catcher comes in two parts: a simple, nondescript sleeping cap and a specially enchanted crystal ball.

Whenever a sentient being places the cap upon their head, it will begin to induce sleep almost immediately. Most people will fall asleep within the first five minutes of wearing it. Additionally, they will get more rest than normal as the cap helps to induce a deep, REM sleep. One hour of sleep with the cap is said to be the equivalent of two and a half hours of normal sleep. In addition, in the fact that the dreams of the sleeper are stored within the cap. This cap can then be placed upon the crystal ball, much as it is on the wearer's head, and from there the dreams of the evening can be replayed. Simple verbal commands allow the viewer to speed through material, slow it down, stop it altogether to view a given scene more carefully, zoom in or out, rewind, and so on. The dreams are stored for as long as the cap is not placed upon the head of another sentient being.

In the time that Kendalge had these wondrous items, he is said to have played back no less than two dozen of his dreams -- each one revealing additional insights that he applied to his magical research. Within a few years of using the cap, he found he no longer needed it, as his memory of his dreams was crystal clear each morning. He was never able to determine if this was a side-effect of the magic, or if it was simply due to the fact that he had become more in tune with his dream-state.

Eye of the Storm

Legend tells that Kendalge was a promising enchanter even as a child. Most of these legends have been proven false over the years. One, however, seems to have continued to live on despite the 300 years since his death. The item keeps showing up for brief periods, and then fading away into the realm of myth and legend again. The actual existence of the item cannot be verified, nor can the "fact" that Kendalge supposedly enchanted it when he was only 11 years of age. The Eye of the Storm is, of all things, a small cats-eye style marble.

According to the most accepted version of the legend, Kendalge (in his youth) enjoyed playing marbles more than any other pastime. The Eye of the Storm was his prized possession in those days. The marble was a perfect sphere -- flawless in its creation. The marble, when placed between the thumb and forefinger in a marble "shooter" position and struck against any other object, will move the struck object up six inches to six feet in addition to any distance that it would move normally by being so struck. Regardless of mass, it will move. There is also a complication with this very powerful item; if it is ever dropped from a height of more than two feet, it will disappear upon striking the ground only to reappear sometime later (the legends waffle between weeks, months, and years) in some other, seemingly random

location. This disappearing act is not so limited in other writings of the tale. Some claim that it will disappear if it remains out of sight for more than a day, is placed in a bag containing any other marbles, is not used for more than a week, and so on.

The use of the marble in a game of marbles, where a circle is drawn in the soil and marbles are placed in the center for the players to strike out of the circle using their shooters, is obvious. However, through history, other uses have been found. Doors have been knocked open and walls moved; one castle siege is said to have begun with a wall shifted five feet, allowing the seizing army a new entrance. The many writings of Kendalge do little to verify (or place to rest) the legends surrounding this strange item.

Fly Paper

According to his second wife, Kendalge had a tendency to lose various scrolls and papers. He would work in his tower for hours scribing various formulae and a light breeze would blow his work into a state of disarray; he would place papers on his desk only to have his servants (or apprentices) move them without his knowledge; he would run out of room for filing on his desk and lose track of where some where in the piles upon piles of papers he was going through; and of course, people often attempted to steal his work. In order to correct all of this, he invented Fly Paper.

Fly Paper is exactly like any other parchment; it serves the same functions and is not different in any outward appearance. The only thing that makes it different is that, once placed somewhere, a command word of "stay" is uttered while hands are still in contact with the paper and the paper will form a mystic anchor and thus not move from that location; this location can even be in mid-air (hence the name) where it will remain airborne. By touching the paper and uttering the command word "come" the paper will release itself from its mystic anchor and behave as normal paper again. This second command word must be uttered by the same person that anchored it in the first place. This effect can be used repeatedly, although some tales indicate that it is limited (the legends disagree as to the exact number of "charges" but they range from six up to two-score).

It is possible, with significant effort, to move the paper (and break the anchor). Doing so would require care (so as to not rip the paper) and strength; it would take two to four average men to apply enough pressure. It is obviously harder to get the proper leverage on Fly Paper that rests on a surface than it is to do so with paper that is currently floating. However, if the paper is resting on a physical object, it is possible to move the surface the paper is on (thus "cheating" the enchantment). One of the more interesting characteristics is the fact that the paper can be bound to other sheets, thus increasing the strength needed to move the lot of them (see the book, below).

How Kendalge made this wondrous paper has never been discovered. Of the 24 reams of paper he enchanted this way, he is said to have used over 20 in his work -- indicating that there are still some four reams available for use. One ream is accounted for in the collection of books that make up his library. The 480 sheets were all bound to a book and collectively placed in a shelf in his tower. Since they are all locked into place together, and in contact with one another, none have ever been able to read the volume, since it would take the combined strength of approximately 1,500 men to move it.

Cornelius

by Joe Taylor

Cornelius is an ancient-looking African elephant, with a bulging forehead and dark eyes full of malignant intelligence.

Total Points: 616 points

Attributes: ST 240 [-]; DX 12 [-]; IQ 13 [100]; HT 17/50 [-]

Racial Package: Elephant [263], buy off Bestial [10], Chummy [10], Dull [1], Innumerate [5], Presentient [20], and Staid [1].

Advantages: Absolute Direction [5]; Acute Hearing +3* [-]; Alertness +3* [-]; Damage Resistance +4* [-]; Eidetic Memory [30]; Enhanced Move x1/5* [-]; Extra Flexibility (1 limb)* [-]; Extra Reach (1 limb)* [-]; Less Sleep x4* [-]; Passive defense +3* [-]; Penetrating Call* [-]; Peripheral Vision* [-]; Strong Will +4 [16]; Subsonic Speech* [-]; Striker (Long Tusk, thrust/imp, reach 1) x2 [100]; Telepathy Power 10 [50]; Unaging [15].

Disadvantages: Bad Grip* [-]; Bad Temper [-10]; Bully [-10]; Cannot Jump* [-]; Frightens Animals [-5]; Hidebound [-5]; Horizontal* [-]; Inconvenient Size* [-]; Increased Life Support x2* [-]; Loner [-5]; Mute* [-]; No Depth Perception* [-]; One Fine Manipulator* [-]; Poverty (Dead Broke)* [-]; reduced Dodge 7* [-]; Sadism [-15]; Secret (**) [-30]; Self-Centered [-10]; Semi-Literate [-5]; Slow Eater* [-]; Social Stigma (Valuable Property)* [-].

Quirks: Careful and patient; Considers killing animals to be murder (but not as much fun as killing people); Dislikes other elephants; Likes bananas; Refuses to be ridden by anyone [-5].

Skills: Area Knowledge (Congo)-18 [5]; Area Knowledge (Zooland)-15 [2]; Survival (Jungle)-16 [4]; Survival (Plains)-14* [-].

Psionic Skills: Mental Blow-15 [8]; Mindwipe-15 [8]; Sleep-12 [2]; Suggest-16 [10]; Telecontrol-16 [10]; Telerecieve-18 [14]; Telesend-18 [14].

Languages: Dutch-13 [1]; English-13 [1]; French-13 [1]; Munukutuba-13 [1].

* Paid for with Racial Package (BE109).

** Cornelius' Secret includes not only his sentience and mental abilities, but his history of sadism and murder as well. He knows that if anyone begins to suspect his true nature he is done for, and will stop at nothing to keep his secret safe. Because of this, he has managed to avoid gaining any sort of unusual Reputation.

*"Death is an Elephant,
Torch-eyed and horrible,
Foam-flanked and terrible."
-- Vachel Lindsay, Congo*

For thousands of years, there have been tales in Africa of places that are haunted, where men lose their minds and become possessed by murderous spirits. Some age-old stories speak of areas where even the animals act strangely, tearing at each other or themselves. There are legends of once-great cities located deep in the jungle that mysteriously vanished, with no trace of the inhabitants -- and whispered tales of lost villages which were later found with everyone murdered and horribly mutilated. And in the most remote corners of Africa, there are a small number of myths about a lone elephant who brings evil and madness with him.

Though he has lurked at the edge of human society for ages, none of the myths that grew up around Cornelius told the real truth -- that he was somehow born possessing intelligence, sentience, and psionic powers. Surrounded by witless

animals, Cornelius went mad with isolation long before he first encountered mankind. After years of taking out his frustrations on the beasts around him, he had developed a taste for sadism. When he finally did meet other creatures with real minds and real intelligence, he found it entertaining to manipulate them into doing each other in as well. Always careful to keep his true nature a secret, Cornelius preferred to prey upon isolated peoples or random travelers, and withdrew further into the jungle as humanity expanded.

In the 19th century, when ivory traders began to open up the heart of the Congo, they did not realize that they were invading the territory of an ancient, powerful force. Cornelius found puppets who were more than willing to slaughter other animals under his direction. With a little more manipulation, he had them carrying out acts of cruelty on their own kind as well. For the first time, Cornelius was in an environment where he could exercise his sadistic will on a grand scale. History only records a small part of the carnage he masterminded. When the ivory trade finally died down, he wandered randomly, hungry for more. Africa was boring him; he needed a place with more potential.

Two years ago, Cornelius allowed himself to be captured by wildlife preservationists. Giving subtle prods here and there, he has managed to get himself donated to Zooland, an animal theme park. Now Cornelius lives behind bars and gets gawked at by schoolchildren who call him "Mr. Peanuts." However, he also has access to new and interesting playthings, and has already begun to exert his influence on the keepers and animals of Zooland, slowly turning it to his own ends.

Methods and Motivation

Cornelius lives to cause death and suffering -- whether to animals or humans makes little difference to him. He rarely does so directly, preferring to use his psychic abilities to make others carry out his will. Therefore, most deaths he causes seem accidental or self-inflicted; if a keeper locks himself in with the lions, no one thinks that the elephant in the next cage over made him do it. He also uses his mental abilities to manipulate animals far more often than a human telepath would think to do so; anyone attacking Cornelius in the open is likely to be hit by a kamikaze pigeon. Currently, he is trying to gain control of Zooland and create an environment where he can satisfy his sadism free from interference or suspicion. Though quite intelligent, Cornelius is not human and doesn't think like one.

Cornelius in a Campaign

Cornelius is ideally suited for a *Supers* or *Horror* game, though he is not much of a monster in a campaign where psionic powers are frequently encountered. Any PC endowed with Telepathy could probably stand up against him, or at least expose him. In a campaign where psionic abilities are rare and unexpected, Cornelius is much more potent and surprising. The PCs might be able to guess that someone is using telepathic manipulation, but they're not likely to assume the villain is an animal! And since he likes to play puppetmaster and rely on his Telepathy, players may be in for a shock when they get reminded of just how physically powerful a fully-grown elephant can be.

Cornelius can also be inserted into almost any historical campaign. He could show up in ancient Rome, having crossed the Alps with Hannibal or been brought into the Circus Maximus as a spectacle. Cornelius would also give an interesting twist to a Victorian-era "Heart of Darkness" scenario. Where's Doctor Dolittle when you need him!

Zooland

Any scenario involving Zooland could instead be set in a specific zoo or an appropriate theme park. A GM can easily obtain a map of any zoo in his or her area. If the game is set in a different city, many zoos have maps available on their websites. The atmosphere of the place could range from apparent normality to an outright chamber of horrors, depending upon the mood the GM wants.

It's All Happening At The Zoo

- There have been a growing number of mysterious occurrences at Zooland recently. Over 10 animals have died in

the past two weeks and a child was killed when he squeezed through the bars of a normally docile gorilla's cage. When the PCs investigate, they find strange behavior among the staff: security personnel with holes in their memories, keepers who act like zombies, and owners who want to keep the whole thing covered up.

- The PCs apprehend a serial killer, but after he's locked up, the same pattern of murders continue. No matter how many suspects are caught, and no matter how sure the PCs are that they have the right man, the killings go on. And the only thing the various suspects have in common is that they all had been spending a lot of time at Zooland?
- The PCs have managed to find out the truth about Cornelius. Just before he can be destroyed, however, he manages to perform a mindswitch with a bystander. It may take a while for him to get used to operating his new body and function as a human, but Cornelius is still out there, contemplating revenge. And an elephant never forgets?

Analects Arcane: The Arcana of War

Warding Spells for the d20 System

by Owen K.C. Stephens

Workbook Entry The Forty-Seventh

*As I write this, an army surrounds my master's Citadel of Winds in siege. I am too far below ground to hear the **fireballs** hammer uselessly at gates warded with **iron air**, but I can feel the tension hanging in the air. I am told the red-helmed warlocks who make up such a frightening portion of our foe's army are warrior-wizards from the far west known as the Harrowers. They are mercenaries trained to overcome the mystic defenses of wizard's towers, and their presence fills me with dread.*

*This is the second time I have seen a major arcane-armed force attempt to take the Citadel of the Winds. My master is lord of a crucial port city and the mountain pass that connects it to the lands of the south, and his refusal to bow to any king or guild is bound to bring conflict. This time it is the Winter King who claims the port is rightfully his. Last time it was the Vernic League, attacking just three months into my training and still an initiate. Not that I cared who the enemy wizards were as I stood, shivering, a **wand of magic missiles** in my hand. The wand was far more powerful than I, but what little talent I had was enough to activate it. I was to target sergeants, lords, spotters and officers -- anyone who looked important and took cover. That was the first time I killed a man.*

*That first battle was terrifying for me, and I cannot say how thankful I am to now be too important to risk on the outer embankment. I suppose that may make me a coward, but if I was particularly brave I'd have become a warrior. As one of the Master of Rings' best archivists I rarely spend any time above ground during any fighting. My task is supposed to be suggesting wards and abjurations to counter the spells of our enemies, and to instruct younger mages in the use of spells we might not normally teach them yet. Five young initiates, not even officially apprentices, are even now pouring over the copies of **The Arcana of War** I have brought here. If the Harrowers do break our defenses, I shudder to think what they'll do to these young almost-wizards.*

*Thankfully, the Citadel is well-designed to repel such an assault. Unlike the castles and keeps built in lands where magic is rarely applied to sieges, it depends on not a square or circular outer wall. Instead, the Citadel is surrounded by a thick five-pointed embankment. The outer edge of the embankment is lined with good **tempered** stone, and the inner portion used for barracks, stables and work rooms. Solid towers sit at each of the inner five points, one a gatehouse. A killing ground is set between the embankment and the Star Keep, a smaller five-pointed keep tower.*

The star-shaped defenses allow our young initiates to cast spells from the outer points of the wall, while the more experienced apprentices of the Master of Rings protect them by casting defensive spells from the inner points. Thus our offensive strength has the greatest range and our defense is kept well back from the front

lines. When we have healing priests with us, as we thankfully do now, they too are kept on the inner points (healing those near the fighting with aid of the **rings of spell touch** my master is famous for inventing). A foe who seeks to move close to our defenders or healers must advance past the outer star points, finding himself in a crossfire.

The hollow walls are always manned during a conflict as well. Though Master Vuterung can blanket the entire stronghold with **mystic curtains**, there is no way to ensure no new method of teleportation is used against us. Every room has at least one guard, ready to ring an alarm bell if a burrowing monster or insubstantial foe should breach the embankment. The lower levels are similarly manned to defend against attacks from below. Though I am below the Star Keep, there are five levels of guards in rooms lower even than mine.

We have other defenses against arcane assaults of course. Thin sheets of lead were worked into all the outer walls long ago. The flat land around the embankment is criss-crossed with roads, placing a crossroads every 30 feet or so. Most of these roads have trenches beside them, allowing us to place running water nearly anywhere with just a few conjuring spells. A mithral net is hung over the center of our compound, supported by the six towers. It is fine enough to slow or entangle large foes such as chimeras without substantially interfering with offensive spells cast against airborne invaders.

Even with all this, the outcome of this siege is likely to be decided by the endurance of each sides' spell casters. The enemy cannot afford to use all his magic for attacks, as we might teleport behind his lines for a counter-attack. By the same token, we must husband our resources to guard against a particularly strong push. A foe well-equipped with wands and potions can expend quite a bit of force in a single assault. Wisely, Master Vuterung has always ensured our own supply of expendable magics was greater than any army could carry here. We rarely expend these magics, but if pressed could unload a decade's worth of arcane labor in an hour.

Ideally we will focus our defensive efforts on a few wards that each negate a wide range of offensive spells. A few **alchemical prohibitions** can neutralize a wide range of common attack spells, and setting up an **interdiction** or two (especially against elementals) is almost always worthwhile. A **wall of stone** is a good way to fill a breach, and when coupled with **antimagic field** can be difficult to remove quickly.

I'm having the initiates here with me learn **lesser alchemical prohibition** since I have the books and the time, but honestly I doubt I'll have them prepare more than one such spell each. Should our defenses fail the initiates will need personal protections, as I'll send them with one or two books each, to escape to one of our allies. I doubt more than one or two could make it past the Harrowers, but their presence as targets would improve my own chances. Should I not escape, it will be my duty to ensure none of the lore I carry, or know, falls into enemy hands.

Rowan Armage

Journeyman of the Blue Sash

Fifth Day, of the First Week, of the Eighth Month, of the Seven Hundred and Forty-Fifth year since the Fall of the Iron Citadel.

The Arcana of War

One of the oldest spellbooks that had wide distribution, *The Arcana of War* was written by the Ringlords of the Iron Citadel thousands of years ago. The Ringlords were an order of martial mages who fought in heavy armor, depending on magic devices, spells with long duration cast before battle, or Still Spell to overcome arcane spell failure.

The Ringlords built an empire with their combined sword and spell armies, and forced young wizards in conquered lands to join their forces. In time this was their downfall as the new members of their order often kept old loyalty, and eventually started a civil war that destroyed the Iron Citadel and the empire it ruled. Though many of their lorebooks were lost, enough copies of *The Arcana of War* had been carried by Ringlords to battles in far off lands that many survived.

Each copy of *The Arcana of War* is a thick tome with a heavy leather cover bound in iron. The books are 13 inches tall, 10 wide, and four thick, weighing six pounds. The title is etched in draconic on iron plates bolted to the front cover and spine. The pages are hardy vellum, inked in dull metallic letters. The solid construction of the books cause them to have a hardness of 5 and 30 hit points, and they are not considered easily flammable.

In addition to the new spells listed below, each volume of *The Arcana of War* includes several more common spells, including *detect scrying*, *dimensional anchor*, *fire shield*, *haste*, *heroism*, *mage armor*, *magic missile*, *message*, *mount*, *overland flight*, *protection from arrows*, *spectral hand*, *true strike*, and *wall of stone*. There are also several treatises on ancient wars, tactics and the building of strongholds designed to resist arcane armies (which was used to design the Citadel of Winds). Anyone able to look through a copy gains a +2 circumstance bonus on Knowledge (history) checks made regarding wars.

New Spells

1st Level Sorcerer And Wizard Spells

Scythes' Bane. Emanation prevents creatures from bleeding to death.

2nd Level Sorcerer And Wizard Spells

Alchemical Prohibition, Lesser. Grant 3 points of energy resistance in a 40-foot-burst.

3rd Level Sorcerer And Wizard Spells

Veil of Secrecy. Ward against mid-level scrying spells, and detect high level ones.

4th Level Sorcerer And Wizard Spells

Alchemical Prohibition. Grant 10 points of energy resistance in a 40-foot-burst.

5th Level Sorcerer And Wizard Spells

Mystic Curtain. Creates barriers in the astral and ethereal planes. **Temper Stone.** Harden one clay, earthen or stone object or structure.

6th Level Sorcerer And Wizard Spells

Alchemical Prohibition, Greater. Grant 20 points of energy resistance in a 60-foot-burst. **Interdiction.** Set up a barrier against one type of creature. **Scythes' Bane, Greater.** Emanation prevents creatures from dying due to injury.

7th Level Sorcerer And Wizard Spells

Iron Air. Create an invisible, floating wall of iron-hard air.

Alchemical Prohibition

Abjuration

Level: Sor/Wiz 4

Components: V, S

Casting Time: 1 standard action

Range: 40 ft.

Area: All creatures and objects within a 40-foot-burst centered on the caster

Duration: 1 min./level

Saving Throw: Fortitude negates (harmless)

Spell Resistance: Yes (harmless)

This spell grants all creatures and objects within its area limited protection from damage of whichever one of five energy types the caster selects: acid, cold, electricity, fire, or sonic. The subjects gain energy resistance 10 against the energy type chosen, meaning that each time the creature or object is subjected to such damage (whether from a natural or magical source), that damage is reduced by 10 points before being applied to its target's hit points.

Alchemical prohibition absorbs only damage. Objects and creatures could still suffer unfortunate side effects.

Note: This spell overlaps (and does not stack with) *resist energy* and *protection from energy*. If a character is warded by *protection from energy* and *alchemical prohibition*, the protection spell absorbs damage until its power is exhausted.

Alchemical Prohibition, Greater

Abjuration

Level: Sor/Wiz 6

Components: V, S

Casting Time: 1 standard action

Range: 60 ft.

Area: All creatures and objects within a 60-foot-burst centered on the caster

Duration: 10 min./level

Saving Throw: Fortitude negates (harmless)

Spell Resistance: Yes (harmless)

This spell works as *alchemical prohibition* except as noted above and in providing 20 points of energy resistance.

Alchemical Prohibition, Lesser

Abjuration

Level: Sor/Wiz 2

Components: V, S

Casting Time: 1 standard action

Range: 20 ft.

Area: All creatures and objects within a 20-foot-burst centered on the caster

Duration: 1 round./level

Saving Throw: Fortitude negates (harmless)

Spell Resistance: Yes (harmless)

This spell works as *alchemical prohibition* except as noted above and in providing only 3 points of energy resistance.

Interdiction

Abjuration

Level: Wiz/Sor 6

Components: V, S

Casting Time: 1 standard action

Range: Touch

Area: 10-ft.-radius

Duration: 10 min./level (D)

Saving Throw: None or Will negates; see text

Spell Resistance: Yes

This spell creates an invisible barrier that holds back creatures of one type. An interdiction can be erected against aberrations, animals, constructs, dragons, elementals, fey, giants, humanoids (one type: aquatic, dwarf, elf, goblinoid, gnoll, gnome, halfling, human, orc, or reptilian), magical beasts, monstrous humanoids, oozes, outsiders (one type: air, chaotic, earth, evil, fire, good, lawful, native, or water), plants, undead, or vermin. The type is determined when the spell is cast and cannot be changed.

A creature of the selected type with Hit Dice of less than one-third the caster's level cannot penetrate the barrier. A creature of the appropriate type with Hit Dice of one-third the caster's level or more can penetrate the barrier if it succeeds on a Will save. Even so, crossing the barrier deals the creature 2d6 points of damage.

Iron Air

Abjuration

Level: Sor/Wiz 7

Components: V, S

Casting Time: 1 standard action

Range: Medium (100 ft. + 10 ft./level)

Effect: Area of hardened air whose area is up to nine 5-foot squares/level (S)

Duration: 10 min./level (D)

Saving Throw: None

Spell Resistance: No

This spell creates a wall of iron-hard air that holds its position without any additional support. This wall has a hardness of 10 and 120 hit points per 5-foot square per level. The wall cannot be conjured so that it occupies the same space as a creature or another object. It is possible, but difficult, to trap mobile opponents within or under *iron air*, provided the wall is shaped so it can hold the creatures. Creatures can avoid entrapment with successful Reflex saves.

You can create the wall produced by *iron air* in almost any shape you desire. The wall created need not be vertical, nor rest upon any foundation. It can be used to bridge a chasm, form a barrier in mid-air, or as a ramp. The wall can be crudely shaped to allow crenellations, battlements, and so forth by reducing the area by half.

Like any other solid wall, this one can be destroyed by a disintegrate spell or by normal means such as breaking and chipping. A 5-foot section of wall whose hit points drop to 0 is breached. If a creature tries to break through the wall with a single attack, the DC for the Strength check is 28.

Mystic Curtain

Abjuration [Force]

Level: Sor/Wiz 5

Components: V, S

Casting Time: 1 standard action

Range: Medium (100 ft. + 10 ft./level)

Effect: Ethereal and astral barrier anywhere within range

Duration: 1 hour/level (D)

Saving Throw: None

Spell Resistance: No

This spell creates an invisible, immobile, impenetrable barrier on the ethereal and astral planes. This barrier may be of any shape or size desired as long as it does not exceed the maximum range of the spell. Once cast, its size and shape

cannot be changed.

This barrier functions like a *wall of force* on the ethereal and astral planes. The barrier has no effect on the material plane, but ethereal and astral creatures cannot pass through it. If it forms a closed shape (such as a cube or sphere), it is an effective barrier against teleportation, though once a creature passes through the barrier on the material plane, he may freely teleport to another point within the barrier.

Scythes' Bane

Abjuration

Level: Sor/Wiz 1

Components: V, S

Casting Time: 1 standard action

Range: Medium (100 ft. + 10 ft./level)

Area: Emanation, centered on caster, with a radius of 100 ft. plus 10 feet/level

Duration: Ten min./level (D)

Saving Throw: None

Spell Resistance: Yes (harmless)

This spell creates a pale nimbus, weaker than a single candle's light, that radiates softly from the caster. Creatures at -1 or fewer hit points within this emanation do not take damage when they fail to stabilize each round. The spell does not cause disabled creatures to be able to take actions or make them stable, it simply prevents them from taking bleeding damage or the duration of the spell.

Scythes' Bane, Greater

Abjuration

Level: Sor/Wiz 6

Components: V, S

Casting Time: 1 standard action

Range: Short (25 ft. + 5 ft./2 levels)

Area: Emanation, centered on caster, with a radius of 25 ft. + 5 ft./2 levels

Duration: 1 round/level (D)

Saving Throw: None

Spell Resistance: Yes (harmless)

This spell acts as a *scythes' bane* except as noted above. Additionally, a creature in the emanation that takes enough damage to be killed isn't, though it still suffers all damage dealt. Instead any creature at -10 or fewer hit points acts as if at -9 hit points or the duration of the spell. These creatures can still be damaged further, they simply do not die of such wounds. All damage dealt to a creature past -9 hit points must be kept track of, for it must all be healed if the creature is to live. If healed to -9 or more hit points before the spell ends or they are moved out of the emanation, these creatures remain alive, suffering none of the penalties for dying.

This spell has no effect on deaths caused by anything other than dropping to -10 or fewer hit points. For example, creatures killed by failing a Fort save against massive damage or from a *power word, kill* still die within the emanation of a *greater scythes' bane*.

Temper Stone

Transmutation

Level: Sor/Wiz 5

Components: V, S

Casting Time: 1 standard action

Range: Touch

Effect: Stone object or structure up to a 10 foot/level cube.

Duration: 1 day/level

Saving Throw: None

Spell Resistance: No

This magic hardens objects and structures made of clay, earth, stone, sand and rock. The hardness of objects and structures affected by this spell is increased by 1 per 2 levels of the caster (maximum +10 hardness).

Only a single object is affected with each casting of this spell, though a structure made of several different elements (such as a wall of cut stone blocks and clay mortar) is treated as a single object. If a structure is too big to fit within the spell's area, the part that does fit is effected.

You can use the *permanency* spell to render a *temper stone* spell cast on a structure permanent, with a minimum caster level of 12th and an exp cost of 2,000 XP.

Veil of Secrecy

Abjuration

Level: Sor/Wiz 3

Components: V, S

Casting Time: 1 standard action

Range: Personal

Area: 40-foot-burst

Duration: 10 min./level

Saving Throw: None

Spell Resistance: No

This spell has three effects. First it makes the area it covers invisible and inaudible to creatures on the ethereal plane. Second, it prevents divination spells of 5th level or lower and magic items that detect as divination with a caster level of 9th level or less from functioning within or divulging information about its area. Such spells and items are not negated, they simply do not function within the spells area and cannot reveal anything about what goes on within it. Third, if a more powerful divination spell or item does act within the area or is used to gain information about it, the *veil of secrecy* spell ends with an audible "pop," alerting its caster that scrying is occurring.

New Item

Ring of Spell Touch: These grayish silver rings allows their wearers to create ghostly, translucent hands that can deliver touch-based spells of 4th level or less at a range of 130 feet. This works as the *spectral hand* spell, except the ring does not use hit points from the caster, has but one hit point, and no bonus is given to touch attacks made with the hand. These rings are not necromantic in nature.

Faint transmutation; CL 3rd; Forge Ring, *mage hand*, creator must have the Enlarge Spell feat; Price 12,000.

Pyramid Review

Evernight (for Shane Lacy Hensley's Savage Worlds)

Published by [Pinnacle Entertainment Group](#)

Written by Shane Lacy Hensley

Cover by Zeke Sparkes

Illustrated by Cheyenne Wright with Kieran Yanner

Cartography by Aaron Acevedo

144-page b&w hardcover; \$29.95

Evernight is the first release from Pinnacle Entertainment Group to use its [Shane Lacy Hensley's Savage Worlds](#) mechanics and system. These are, at their core, a cut down version of those used in their [The Great Rail Wars Miniatures Battle Game](#), from its *Deadlands* game line. The purpose of these mechanics -- revolutionary or not, as *Savage Worlds* claims -- is to provide a system and game that handles both miniatures wargaming and roleplaying characters without leaving a seam between the two. The types of genres covered by *Savage Worlds* are invariably action orientated, leaning toward the pulp and the heroic styles, primarily the fantasy and classic 1930s pulp genre. It is the first of these genres, fantasy, along with the heroic style that *Evernight* falls into, being a heroic fantasy campaign.

The setting for *Evernight* is the happy, peaceful world of Tarth, a fact that both the book lays on (and the GM is encouraged to lay on) with a trowel, or even a dump truck. Tarth, and in particular the Kingdom of Valusia, are described as such nice places because, although *Evernight* starts off as a heroic fantasy, it very quickly becomes a dark fantasy after Valusia and its nearest neighbors are invaded and the land is covered in a thick sooty smog that blots out the glories of Solace, the sun god revered across the continent.

Evernight is what is described as a "Complete Scripted Campaign" (also known as a campaign to the likes of you or I -- never mind the fancy description), in which the player characters of beginning or Novice Rank must survive the invasion, the occupation by the world's would-be new masters and the resistance overthrow the literally growing darkness. Indeed the author describes *Evernight* as, "The darkest setting of all."

The book is split into three sections: one for the players, which gives details on Tarth and Valusia, both prior to and after the invasion; another for the GM that gives them the "real" information about Tarth's history and the invasion, as well as a bestiary; and the third, the campaign itself, entitled, "The Dying of the Light." This campaign is broken down into five acts, each of several scenes. Its title is, of course, not to be confused with the campaign of the same name that was the first new product published by Hogshead Publishing for *Warhammer Fantasy Roleplay*.

Evernight is generally well-written, clearly laid out, and illustrated in the same style as *Savage Worlds*. Indeed, some of the artwork from the *Savage Worlds* corebook is reused in this book, much of it going to support the heroic nature of the campaign, while the depictions of the bad guys, reminiscent of H.R. Geiger in places, work to enforce their black, black hearts. Aaron Acevedo's cartography is decent, though leaning more toward serviceable and basic rather than attractive.

It is heroes that the players take the role of at the beginning of the campaign, for in Valusia heroes are idolized, and

what every young girl or boy aspires to be, whether they be Dwarves, Elves, Half-Elves, half-Folk (Halflings), Humans, or even Half-Orcs. The setting requires few changes to either rules or character generation, though the Connections, Noble, and Rich Edges are not available, as their effects will be negated by the events of the campaign. Most of the new Edges become available once the characters rise in experience to Seasoned Rank, while the majority of those that are available to Novices fall into the Professional Edge category. These include the Musketeer, formally trained in the use of black powder weapons; and the Red Knight and Sun Priest. These last two are the equivalent of the Holy Warrior and Cleric found in the **Savage Worlds** corebook, and in the world of **Evernight** are the only way in which characters can obtain the Arcane Background (Miracles) Edge. Both are devout worshippers of Solace, the Sun God who marks their skin with the sun's red tint, and are greatly respected throughout Valusia. They can also both take the Avatar of Solace Professional Edge that enables them to infuse a weapon with Solace's power and cause it to burst into flame.

Although the rules for character generation from the corebook are reprinted in the 40-page player's section of **Evernight** (also available as the **Evernight Player's Guide**, on sale at RPGnow.com at a cost of \$5.95), the whole process can be sidestepped and the campaign jump started by having the players selecting one of the ready-to-run archetypes. These are simply copied onto the **Evernight** character sheet at the back of the book (which is actually easier to photocopy than the one given in the **Savage Worlds** corebook).

The second of the player sections actually provides updated information that becomes available to the characters once they have made contact with, and spent time, with the Resistance. This includes new prices for equipment, new (and sometimes *icky*) foodstuffs, several new Edges -- Dark Fighting, Tunnel Fighter, and the Scrounger and Slayer professional Edges -- plus two new archetypes. The first of these is the Dark Fighter, capable of fighting within the dark of the tunnels and caves that the Resistance has taken up home in; the second being the Light Finder, who searches for natural light sources with the gloom of the caves.

[SPOILER ALERT!]

The campaign, "The Dying of the Light," opens with our Novice, but potential, heroes tasked to take a message to an existing group of heroes currently investigating a cave of the ancients. Just as they locate the intended recipients, an almighty tremor reverberates through the walls of the cave system and buries everyone alive. By the time they get back to the surface and then to the Valusian capital of King's Port, the cause is clear. A gigantic spike has driven itself into the ground and is belching out the thickest, sootiest of fogs. King's Port is ruined and overrun with malicious Spider Beasts. The question is, who is behind these beasts?

The answer quickly becomes clear after the heroes are captured. They are revealed as being spider-like, but relying heavily on the use of psionics. The best description of them would be to combine the finer elements of **Dungeons & Dragons'** Mind Flayers, and the Xenomorphs from the *Aliens* series of films.

[END SPOILER ALERT]

While the characters begin at Novice Rank, if they are successful in vanquishing the villains of the piece, they will end "The Dying of the Light" as courageous heroes, perhaps even of great status. This does not mean that the campaign is itself over, only the current phase, as the author promises further volumes. Although played in heroic mode, the **Evernight** campaign offers a variety of other tasks for the characters to perform. This not only includes having to fight bad guys and monsters, but to also aid the survival of the Resistance, such as finding fresh fruit and sources of light. The campaign, on the whole, maintains a nice balance between the two types of tasks.

Yet **Evernight** is not entirely problem-free. One comes at the end of the campaign itself, after the defeat of the villains and liberation of the kingdom, when one hero is in line for a very, very large hike in their social status. The question is, what do the other characters get as their reward? Unfortunately, it is not covered in the pages of **Evernight**. The second problem lies at the beginning of this volume: There is no introduction. That there is no index is bad enough, but when the **Savage Worlds** GM wants to run **Evernight** and he is not aided by a description of how the book should be used, it is all very annoying. Actually, it is no problem to determine how to use the book -- but *only* after all of it has been read.

Finally there is a factor mentioned in the book called "Resistance," as well as a place to note it down as the heroes accumulate through their good deeds. Yet its use and purpose is only explained in the last two pages of the actual campaign. It is at the point where it is proactively used in "The Dying of the Light," but an explanation given for the GM earlier in the text would have been helpful. In fact, it is used to determine how many units the players will have their command in the final battle of the campaign using **Savage Worlds'** Mass Battle rules.

Despite these problems, **Evernight** is basically well-written and does a good job of showing off the roleplaying side of the **Savage World** mechanics. It is not, truth be told, in the same league with what are regarded as roleplaying's best campaigns -- **The Enemy Within** for **Warhammer Fantasy Roleplay**; or **Masks of Nyarlathotep**, **Walker in the Wastes**, and [Beyond the Mountains of Madness](#) for **Call of Cthulhu**, among others. Its heroic feel makes **Evernight** more akin to the original **Dragonlance Saga** published by TSR for **Advanced Dungeons & Dragons**, though with a much darker tone. And like that series of much-reprinted modules, **Evernight** is both very tightly scripted and linear, which will not be to the liking of all. *If* the purchaser can get around this -- and he is purchasing a "Complete Scripted Campaign," after all -- **Evernight** should give several long sessions of play. Hopefully, its sequels will maintain this quality, though perhaps at not quite so high a price tag.

Pyramid Review

Greek Gods (for d20 System)

by Steven Creech and Kevin Reusch

Published by Bastion Press

48-page color PDF; \$5.99

Greek Gods is the first of a three-part series of PDF **d20 System** sourcebooks adapting real world mythological pantheons to **d20 System** mechanics. This book focuses on presenting deific portfolios and full avatar stat blocks, as well as presenting some new domains, spells, monsters, and NPC heroes from Greek mythology.

The book does not provide an in-depth coverage of the stories about the gods or the Greek cosmology, but focuses on putting useable numbers to the major personalities of Greek myths. Myths and stories are referenced in individual god entries sufficiently to establish the authors are familiar with the legends, and to provide some flavor for a DM to use in roleplaying the gods or their followers.

Avatars are presented as thoughts the gods project onto the material world so that they can interact with it. These thought projections take the form of 20th-level characters with lots of powerful magic items, including weapons more powerful than mortals can craft, one unique artifact, starting abilities of all 18s, and usually with maximum hit points. They also have a number of divine immunities such as to all drains and mind-affecting abilities. If they have a class that casts spells, they automatically know every spell on their spell lists. However, despite these potent abilities they are all still listed as CR 20. Being the **d20 System**, these stat blocks take up a large amount of space, with most of the 17 gods taking up a page or two.

Each god also presents a minor boon to followers of certain favored classes, such as a bonus feat or ability boost. This is a neat flavor idea but unbalancing, and can be annoying in same games by favoring certain class choices. Most of the gods are depicted with full-color art, but the dimensions are a bit off making them look more like demihuman deities than classical divine icons. Unlike the next two books in the series, the artwork in *Greek Gods* is not Photoshop-altered pictures, but full-color drawings similar to other Bastion Press products such as *Minions: Rebirth* and *Druids and Druidism*.

Since the second book in the series, *Norse Gods*, is free, many will have picked that up before considering *Greek Gods*. *Norse Gods* was plagued with both poor layout editing and weird choices in matching gods to **d20 System** classes. *Greek Gods* is a far superior product in both respects. Apollo seems right as a paladin who focuses on archery, the portrayal of Ares as a raging barbarian is spot on, and Hades seems well suited as a cleric of the underworld. The only trend that seems a little off is that the mercurial Greek pantheon as a whole is slanted toward lawful alignments; in particular the philandering Zeus should at least be chaotic. The selection of magic items is also a little off in portraying the gods straight out of myth, but works fine in presenting them as **d20 System** equipped and adapted creations.

Each of the 12 original pre-Heraclean Olympians are presented as well as a number of lesser gods such as Thanatos and Eros. Noticeably missing is Hecate, the goddess of witchcraft. Nine new domains are listed as well as 35 new spells. Things that did not quite seem consonant in the *Norse Gods* milieu, such as the Sea Domain spells *dolphin companion* and *releasing the kraken*, make much more genre sense when found in the Greek mythology supplement. A few problems still hit some of the spells, such as weak static damage spells that are higher level for wizards than clerics. Also the lack of a short listing for the new spells is quite annoying and a hindrance to meaningfully using the spells.

The monster section of the supplement presents Boubo the clockwork owl from *Clash of the Titans*, a disappointingly weak 10HD (overrated to CR 20) portrayal of the three-headed underworld dog Cereberus, a decent Hephaestaen Cyclops, Zeus' white eagle, and a half god template. The template gives a +1 on saves, DR 5/-, high starting abilities, natural armor +1, and no aging penalties, resulting in a CR boost of +2. A 10-level prestige class Hunter of Hera is designed for NPCs who have been wronged by such demigods. The hunters devote themselves to Hera and wreaking vengeance against the half-gods. Since their abilities are so target specific and their prerequisites significantly limit the possible pool of applicants, it would be odd to see more than a handful of individuals who qualify and take the class on any given world. Still it might be used to make an interesting NPC.

Finally there are seven famous Greek heroes ranging from 15th level to 20th. Oddly, the half-god template is not applied to any of them, even though Heracles, Autolycus, and Perseus should qualify. Unfortunately, none of the heroes have descriptions or backgrounds, just **d20 System** stats. A few mechanical choices are odd as well, such as Homer and Hesiod as 20th-level bards whose only equipment are magic weapons and armor. Also, Heracles' strength is not as strong as a mortal being's could be before magic, and there is no representation of his great club, his invulnerable Nemean lion hide armor, or his hydra-poisoned arrows. Instead, he has a powerful vorpal sword (partially appropriate considering his Hydra fight) and a lot of protection items.

Overall, the strength of this product lies in the avatar concept, which closely tracks the established model of **Advanced Dungeons & Dragons 2nd Edition** deity avatars. This allows the actual gods to be safe but give them a powerful-but-character-based form to interact and meddle with the mortal world in a personal fashion. Given the Greek myths that have gods personally meddling in human affairs big and small, this is a good mechanical device to portray this aspect in a game without invoking the overwhelming epic monster power levels of deities and their avatars as presented in Wizards of the Coast's recent **Deities and Demigods** book.

--John Henry Stam

New Game, Old Characters

This week I had an idea that I haven't implemented, and is really in a weird proto-form. (So, really, instead of the half-baked thoughts you normally get, you're getting a quarter-baked column . . . chock full of yummy salmonella.)

Anyway, I was reading the first issue of J. Michael Straczynski's new Marvel comic series *Supreme Power*. If you're unfamiliar with the premise of this title (as I was until I started reading it), it seems to be a retelling of the tale of the Squadron Supreme, a benevolent super-team that exists in an alternate Marvel universe, and which was also an alternate version of the Squadron Sinister *evil* super-team, which started out, really, as an evil parallel knock-off of DC Comics' Justice League of America. (And who says comics don't make any sense?)

As I'm reading it, I considered one of the possibilities for a game, which might be an interesting way of revitalizing a long-running campaign.

I've talked in the past about ways to revitalize campaigns, ranging from [revisiting game worlds](#) to [blowing everything up](#). However, there's one possibility I hadn't considered until last night.

Restart a campaign, with the *same* characters. Replay the same adventures, if you'd like (updating them to a new campaign), or add new adventures. The campaign can branch out in new directions, or it can progress at a similar pace. Regardless, the core of those old characters (or some of them) would stay the same.

Think about it. On some level, many players like playing the same game over and over, perhaps with variations; this is one reason why the "dungeon crawl" is so satisfying. Unfortunately, many games are victims of their own success. A beloved character can grow too powerful to be enjoyed. A game world can become so crowded with its own continuity that further adventuring is impractical. Or there may have been a development with a character, plot, or background that makes the character (or the game) unplayable.

But if the players like the characters they have invested so much time with, why can't they keep playing them, or different versions of them? After all, many players do this subconsciously (or consciously) as it is; heaven knows I've played the witty-seemingly-sinister-andsecretive-but-really-a-good-guy-religious-paladin in a bunch of different games.

So what we're talking about here is a campaign "reboot," only the players (or some of them) will be playing the same characters (or new versions of them). "But wait!" I hear some of you cry. "How do these stories fit in with the other ones?" Well . . . they don't. All stories are imaginary, and playing the same characters in a new light doesn't distract from either set; 1966 and 1989 both had movies entitled *Batman*, complete with a version of the same character in both . . . but they exist independently. And, unlike [alternates](#), this is a "real" ongoing campaign instead of a diversion.

So, how do you go about doing this kind of campaign restart?

Again, stressing that I have not actually *used* this technique, it seems like it would be pretty easy, and -- unlike many campaign restarts -- the responsibilities can be divided more equitably between the GM and players.

Think about the campaign world, and if/how it will change. For example, a modern espionage game that is being rebooted might have begun as being set in modern times, only to learn that keeping up with the morass of modern events is a pain. So the GM might propose shifting the game to a different era -- perhaps the James Bond-esque 1960s, or the near-future Clancyverse of 2010 or so. Or maybe that *Star Trek* game will take place at a time when the battle of Wolf-359 went differently, and the heroes are now desperately fighting in a galaxy torn apart by war. Regardless, a change in scenery will enable even old, familiar characters to explore strange new options and seek out new life in old premises. (That's what we call an extended metaphor.)

Consider the core ideals of the campaign, and how they will change. If a game was optimistic at its core, then you might consider making the new version *more* optimistic . . . or it could be grittier. For example, in our espionage game,

we might decide that the government bosses of the heroes are completely trustworthy, noble, and good, and their missions are always just; we might also decide that the heroes will be asked to do many things that are morally gray. (Or the GM might throw the players for a curve and have them start out with a morally bankrupt agency, only to "defect" to an optimistic noble one in an early storyline . . .)

Consider adjusting the power levels of the characters. A great way to enjoy playing the same character but having a different experience is to adjust his power level. For example, when they restarted the Superman line of comics in the mid-1980s, they made him significantly less powerful than before. Contrariwise, when they revamped the Batman character shortly thereafter, they made him much tougher and smarter. Players should talk with the GM about what level of play they found most fun with their characters, then see if it's possible to start the character near that level. So if our espionage game above was most fun when the characters were inexperienced and able to make mistakes, lowering the power level will give them more room to explore that. Or if the players enjoyed being hyper-competent, consider starting them near there (with, of course, a higher degree of opposition!). It might even be possible to start a game at a completely different level of play, or even start characters out on *different* levels! (See the ["Power Level"](#) series I did last year.)

Think about how the Big Picture will fit together. One of the joys of a long-running game is its rich history. Unfortunately, from a storytelling standpoint these long sagas often don't make sense; seemingly important plotlines got dropped or bungled, while trivial bits assumed great importance through flukes. While this is fairly realistic, it can also be a fair bit unsatisfying. Say one character had a mentor who was never very interesting. Maybe that mentor could be killed early on, or be tied to another major plot.

Or say if one character had a significant love interest in the old game, but that interest was never integral to the plot or otherwise seem to "fit," now is a good chance to do so. The interest could be introduced earlier, or be tied to more plots, or tied more strongly to the origins of the other characters. Regardless, the player whose interest is introduced will know that the interest will (probably) be a love interest again . . . but he just doesn't know how or when, and in the interim that interest is more important than ever before.

Or, to pull another example from the world of comics, when they revised Superman they decided to have his parents, Ma and Pa Kent, still be alive. (In the old version they had died when he was a boy.) This opened up another avenue of story possibilities and gave Superman stronger roots to Earth.

Realize that not everyone needs to play along. In a reboot scenario like this, if not all players want to play a new version of their old character, that's fine. A lot of the fun of roleplaying comes from encountering different personalities, and interacting with changing characters. So if the campaign is being re-envisioned, it's entirely workable for some players to remake their old characters while other players make completely new ones; these "wild cards" will allow the old characters to branch out, or at least see new possibilities.

So let's look at a full example, pulled shamelessly from my own archives. I was in a long-running **Vampire: Dark Ages** game, where I played one of my patented secretive-seemingly-evil-but-really-not-paladins. If we were to try to recreate that game, I would put a vote in as a player for a relatively similar campaign world to start with; I might request that there be fewer supernaturals, to better focus on the unique nature of the PCs. It might also be interesting to push up the campaign by a few hundred years, so that instead of starting on the cusp of the Dark Ages we might start just shy of the Renaissance. I would want my old character to be more skilled in some ways and less skilled in others; he was never terribly intelligent, but I would want him to be more knowledgeable in the ways of war. The original version of the character had inhuman strength, vampiric mind control, and illusory powers; the ability to make illusions, although neat, always felt a bit incongruous with the rest of the character, so I would get rid of it. The religious aspect of the character was played up heavily in the old game, but it almost came too quickly; he never had a chance to fully "descend" before rising above his limitations. I would want this new version to be more "evil" for a time, before perhaps having some kind of revelation or (un)life-altering event that would make him see the error of his ways. In addition, I might make a request to have his old family be more important in this revision. The core of this revised character would focus initially on the struggle between a skill to do things subtly (which he would find distasteful) and a talent to do things bluntly (although not all problems can be solved with a sword). If he became more spiritual, he might consider his mind-controlling powers to be a sinister temptation. Regardless, I would

probably have, as a campaign-wide goal, the desire to become fully human again.

And in this fantasy campaign revisitation, who knows *how* the other players would reinterpret their own long-running characters, and what new direction they could go with them?

In a lot of ways, a lot of gaming is about reinventing the wheel -- over and over again. Players spend a lot of time creating interesting characters, making sure they work within the rules and support the team in an entertaining way. Then, when the characters get too old or die or the campaign is no longer interesting, those characters are scrapped in favor of *new* ones. If all are agreeable, there's no reason to reinvent the wheel; just give that old wheel a new paint job and you might find it can *still* take you fascinating places.

And if anyone tries this, why not drop me a line and let me know how it turned out?

--*Steven Marsh*

Planet Intoxica, Jewel of the Terran Hegemony

by [Chad Underkoffler](#)

Art by [Chris Cooper](#)

Genre: Space Opera with a dose of Noir

Style: Cinematic

Fidelity: Medium-Low

Themes: Intrigue and Crime

Campaign Setting and Background Information

(NOTE: This CiaB exists in the same setting as ["Planet Ugarte, Backwater of the Terran Hegemony."](#) and shares many of the same background elements.)

```
-- Start Transmission --
Galactic Archive Datafile
Sector: 2814.
System: Zigma Zebbin.
Star: Kurosawa, F3 V Type (yellow-white).
Planet Name: Intoxica (Kurosawa IV, 2 AU).
Planet Type: Earthlike, Medium-Iron.
Density: 5.2.
Diameter: 8,151 miles.
Gravity: 0.97 G.
Moons: 1 (Zeffirelli).
Year: 503 Terran Days.
Local Day: 50 standard hours.
Axial Tilt: 27 degrees.
Atmosphere: Oxygen-Nitrogen (1.11 standard pressures).
Climate: Tropical; Three seasons -- Wind, Summer, and Rainy.
Hydrographic Percentage: 85% surface water; two small continents (Fist and Sword), with extensive river systems; several archipelago systems and islands.
Terrain: Weathered hills, jungle, and swamps; volcanic islands of varying age and terrain.
Mineral Resources: Plentiful radioactives (including Volium) and organics (including crude petroleum).
Native Flora: Notable species include Naran-grapes, Bergamoids, and Hawlo-Hawlo seeds (see datafile Xenoflora-Intoxica for full catalog). [NOTE: Intoxican flora is often poisonous to Terran-stem lifeforms to a greater or lesser extent; check with your Medi-Professional for personal interdictions.]
Native Fauna: Notable species include the Deep Wasp (pelagic), the Locust-Roc (aerial), the Ant-Wolf (swamps), and the Lake Beetle (freshwater); all native fauna is insectoid (see datafile Xenofauna-Intoxica for full catalog). [NOTE: Intoxican fauna is often venomous, and may pose a danger to Terran-stem lifeforms; check with your Medi-Professional for personal interdictions.]
Transplanted Terran Flora:
    [Engineered] AvocadoPlus (various); ChicagoCorp Tropical Citrus species (orange, lemon, lime, grapefruit); Haruka Kelpy-Kelp (variant 17Q); Headley Luxi-LTD Cacao, Coffee, and Sugarcane; Paragon Rice, Aleph series; Quanta-7 GGd-Tobacco.
    [Natural] Grapes, Roses.
Transplanted Terran Fauna:
    [Engineered] Genetech Wetland Sheep; Milkfish (various); Paragon Silkspider (Alpha One through Beta Six species).
    [Natural] Little Brown Bats; Honeybees.
Population: 10 million.
Government: Corporate "City-States," Military Meritocracy.
Import Restrictions: See Hegemony Importation, Schedule C4.
Export Restrictions: See Hegemony Exportation, Schedule K12-Annex -
```

Intoxica. [NOTE: Many Intoxican compounds utilizing extractions or byproducts of native flora and/or fauna are classified as Schedule A pharmaceuticals or Schedules B through E narcotics. Export of any amount of these drugs is prohibited without appropriate Hegemony licensure.]
Starport(s): Port Paradise (northern tip of Fist) and Port Nexus (orbital station).
-- End Transmission --

Blasters & Swords

What Everybody Knows

Arms & Armor: We're talking rayguns and swords. Armor is limited to sturdy leather or leather equivalents. Star Guardsmen pack raygun carbines and cutlasses (officers carry a small sidearm); they wear ceremonial breastplates and small pot helms. The Intoxican Planetary Force (IPF) soldiers are armed with raygun pistols and rapiers, and wear sunglasses along with white spider-weave fatigues and field caps. These uniforms shed dirt and moisture, while protecting against UV rays.

Hyperspace, Hypergates, and Hyperdrives: Four hundred years ago, the discovery of *hyperspace* greatly enhanced the speed of interstellar travel. Provided that the realspace and hyperspace topographies were properly calculated, light years could be traversed in moments; if the topographies were not currently aligned or the calculations were off, then the same journey could take days, weeks, or months. While a few *hyperdrive*-equipped ships can leap into this new dimension on their own, most ships must enter through the ring of an orbital *hypergate*. The H-gate generates a *hyperfield*, much like the film of soap over a bubble-blowing ring. As a ship passes through the ring, receptors on the skin of the ship grab onto and hold the H-field, completely enveloping the vessel. So long as a charged H-field surrounds the ship, it is "lifted out of" normal space, and can skim across the dimensional interface at FTL speeds. Transition back to normal space can be achieved by passing through another H-gate, or by shutting down the H-field receptors (this latter choice is time-consuming and dangerous, though an H-drive-equipped ship is able to bleed the field off quickly). This opened the galaxy to . . .

Massive Human Colonization: Many worlds have been terraformed for human life. In a number of cases, the

planets have returned the favor, leading to . . .

Human Subraces: There are a number of human subraces, subtly changed as the different environments, circumstances, and gravities of the colony worlds worked upon the settlers. The heavy-worlders of Koschei and the water-breathing albinos of Thetis are but two examples. And then there are the . . .

Aliens: Sentient, sapient aliens have been discovered -- the Blob Men of Mogo, the Crystal Intelligences of Xarvaan, and the owl-like Huur of Xib' A' Teew are the most populous. No alien race is yet a part of . . .

The Terran Hegemony: In time, a number of strong colony worlds formed alliances with Mother Earth, creating the Terran Hegemony. However, over time, the colonies have become second-class citizens under the iron heel of Earth. The current Hegemon, Tsung Cain, is Emperor in all but name. The fanatically loyal Star Guard is responsible for carrying out his draconic whims and cruel fancies. This has led to the formation of . . .

The Freedom Legion: They fight against the forces of the Hegemon, trying to overthrow the tyrant and restore true liberty to the citizens of the Hegemony. The Star Guard hunts Legionnaires mercilessly throughout human space (and often, it is whispered, beyond). Suspected collaborators are punished severely -- as are their families and neighbors. This has led to many refugees fleeing to places like . . .

The Free Colonies: Outside the harsh rule of the Hegemony, the Free Colonies are a beacon to the hopeful. But the war-hungry Hegemon has dreams of expansion. The Free Colonies will never come together for mutual defense against the powerful Star Guard unless they can find a strong leader to rally around, like Raymond "Flash" Rogers, the man codenamed . . .

Centurion: The commander of the Freedom Legion, Rogers recently escaped the maximum security prison world of Tertius and vanished; his current whereabouts are unknown. But he could be anywhere, even . . .

Planet Intoxica: This lush, tropical world is one of the twelve "jewels" of the Hegemony -- a paradise known for wealth, beauty, and magnificence. While currently off the main trade routes, Intoxica is still a tremendous exporter of important resources -- especially the energy-mineral Volium -- and a vacation getaway for the rich and powerful.

However, even this Eden has its seamy underside: the native plants and animals are poisonous to Terran life to some degree, despite centuries of terraforming. Some act as nothing more than narcotics or hallucinogens on the human system, while others are deadly toxins. This quality -- along with its reputation as an "anything goes" party world -- gives Intoxica its nickname: "Planet Poison."

- *Governor Orlando Zirlaq & the IPF:* Governor Zirlaq is the local voice of the Hegemony. He commands the sizable IPF garrison, which provides necessary administrative, customs, educational, immigration, judicial, revenue, military, and emergency services planet-wide. However, chronic budget concerns hamper him, and he is increasingly beholden to the interests of the corporate-aristocrat Houses.
- *House Headley:* House Headley has been on Intoxica before the domes came down, and have their finger in nearly every corporate pie on the planet -- from genetic engineering to hotel & restaurant management. The current CEO of the House is Lady Kat Headley, an iron-willed businesswoman who has managed to parlay the Headley assets into virtual rule of the planet. Its House colors are blue.
- *House Tagliente:* House Tagliente is a comparative newcomer to Intoxica. Nearly a decade ago, during a particularly uncomfortable period of worker unionizing, this New Venice corporate House purchased a controlling share of Headley Planetary Mining. First, they changed the name of the concern to Tagliente Mines, Inc., and second, they ended all talk of unions and strikes with brutal and bloody tactics. Over the intervening years, they've gained control over other Intoxicant companies. House refugees from the recent New Venice Pacification have caused the Tagliente numbers -- and wealth -- to swell, and the "family" seems to have decided to make Intoxica its new homeworld. Its House colors are red.
- *Blobman:* Intoxica is one of the few Hegemony worlds to have a resident who is one of the enigmatic Blobmen of Mogo. It just appeared one day: no ships reported having carried a Blobman passenger for months, or even

having transshipped a package from Mogo. For its part, the Blobman either does not understand -- or refuses to answer -- the question. It answers to the name "Larry" and is fascinated with, well, everything. Like all its mysterious brethren, Larry is a humanoid pile of goop, known to be exceptionally strong, incredibly tough, insatiably curious, and flat-out *weird* (see also boxed text).

Larry

What Everybody Doesn't Know

The Hegemony's Secrets: The Hegemon has been hearing reports of a breakdown in public order on Planet Intoxica, in that corporate interests are threatening the ability of the IPF to exert government control. The last thing the Hegemon desires is for a single corporate House to get a hold on the resources of an entire planet. Thus, covert agents of the Star Guard are infiltrating the IPF and the local Houses, to investigate (and possibly exacerbate) the situation. If the IPF falters, the Star Guard will declare a "Crisis" and move in openly. (And it's only a short step from "Crisis" to "Pacification" and bringing the planet under the Hegemon's direct control, as demonstrated by recent events on New Venice and Arcadia . . .)

House Headley's Secrets: Unknown to most, House Headley *called in* House Tagliente to purchase their mining concern, "deal with" the unionization strike situation, sell it back to House Headley, and then get outta Dodge. It didn't work that way -- House Tagliente decided to stick around. Worse, they couldn't rely on their bought Governor and his IPF to kick the interlopers out: Duke Santiago had already gained his own hold on Zirlaq and key IPF officers. While initially Lady Kat intended to pull some Hegemony strings to resolve

The Blobmen of Mogo

Blobmen are amoeboid life-forms and their nature is not fully understood. Their cells are apparently undifferentiated and under conscious control, giving them a Good ability to Remold their shapes into whatever strikes their fancies. Among humans, they tend to take on roughly humanoid form, with sketchy facial features (since humans seem to be uncomfortable speaking to a blank head). Physically, they don't seem to need to eat, drink, or breathe, and are much stronger and tougher than a human (between Good and

this intolerable state of affairs, the recent Crises/Pacifications of New Venice and Arcadia have given her pause. If she calls in the Hegemon, she could lose everything. Better to fight the Duke on her own terms, on her own turf. She is driven to crush House Tagliente utterly.

House Tagliente's Secrets: Simply, House Tagliente wants more control over everything, and has been slowly applying "pressure" to Headley interests to secure that control. However, they view their dealings with House Headley as *just business* whereas they see their relations with Governor Zirlaq and the IPF as a *matter of survival*, given what happened to New Venice. They walk a fine line between trying to gain various grips (friendship, bribes, blackmail, threats, hostages) over Zirlaq and the IPF commanders, and keeping their noses clean (so as not to attract the attention of the despised Hegemony). Of course, as they are squeezed in their efforts to quietly gain this control over Intoxica by House Headley's resistance, *just business* is quickly changing into a *matter of survival*. The Duke wishes to cripple, but not destroy, House Headley, but that's starting to change as Lady Kat closes in.

Governor Zirlaq's Secrets: Governor Orland Zirlaq is trapped between the Scylla and Charybdis of the two warring Houses, with the Damoclean Sword of the Hegemon swinging about, ready to drop. Hamstrung, he's trying desperately to be a hardass in dealing with Lady Kat and Duke Santiago, despite their various holds on himself and his men. His primary goal is to stabilize the situation and keep it quiet -- that way, the Star Guards won't get called in.

Luckily, he's got a plan: get his son Hector (the commander of the IPF) to marry Lady Kat's daughter, Gemma, while simultaneously arranging for his son Herman (chum of Duke Santiago's son Ignatio) to become "adopted" into (a "made man" of) House Tagliente. Then, they'll all be one happy family, and Zirlaq will have information sources into and ways of placing pressure on the Houses that have been bullying him.

The Freedom Legion's Secrets: The Freedom Legion has a spy in House Headley -- codename Asp (see below). Their goal is to use Asp to glean information that can be useful in helping the Taglientes gain more influence on Intoxica. By proving invaluable to the Duke in his struggle against House Headley, they hope to enter his good graces (while they secretly encourage his hatred of the Terran Hegemony). Once they take full control, House Tagliente -- and thus, all of Planet Poison -- should be ready to ally with the Freedom Legion against the Hegemon himself when the Revolution comes.

Larry the Blobman's Secrets: First, Larry has split off two descendants: "Darryl-1" and "Darryl-2." Darryl-1 is currently stationed on the moon of Zeffirelli (absorbing enough energy to allow H-field generation and enter hyperspace), ready to courier information from Larry to Mogo in case of trouble. Darryl-2 is hidden within Larry's Intoxican residence and ready to bud, if necessary.

Second, Larry is on Intoxica to forestall the Hegemony moving in and taking over as they did on New Venice and Arcadia. If the Hegemony is "forced" to intervene in the internal politics of Planet Poison, they will gain a base of operations that -- while far away in realspace -- is nearly on Mogo's hyperspace doorstep. Larry is charged with destroying : 1) the planetary hypergate; and 2)

Master rank in Superstrong). They possess child-like curiosity and intellects comparable to an average educated adult human. They are whimsical, quiet, and have a surreal outlook on life (one wag described the typical Blobman personality as "Zen Buddhism by way of Monty Python.") They can speak by Remolding to create vocal cords and an internal air bellows.

They have a disconcerting habit of simply appearing on other worlds, then vanishing again, with no hints as to how this is accomplished. Galaxy-wide, the number of Blobmen who book passage on starships each month can be counted on the fingers of one (human) hand. They are suspected of possessing some form of teleportation technology or inherent power due to this habit. There are also unverified reports that they are a hive intelligence (sharing thoughts amongst themselves) and they could be photovores (they consume light).

The truth is quite different.

In short, Blobmen aren't individual beings, exactly. Nor are they a hive-mind, exactly. And they can't teleport.

Blobmen are the equivalent of white blood cells for a planetary organism: Mogo. They swarm its surface, proactively repairing injuries or repelling/neutralizing "germs." To that end, Blobmen have traveled to certain worlds who could pose a direct threat to Mogo's safety, ready to expunge any chance of danger if "infection" is detected.

as much Star Guard materiel and personnel possible, within two standard days of any Crisis-announcement .

Third, in support of keeping the Hegemony out, Larry is meddling in the conflict between House Headley and House Tagliente by providing tactical advice to both, to enhance their "quiet war" and turn them both against the Hegemony. He genuinely likes Ignatio Tagliente, who often asks the Blobman for personal advice and an outsider's perspective.

PC Backgrounds

Player characters might come from one of the following groups. All need not be from the same background, however, and a character can fit into multiple groups. Note that there may be tensions between PCs of different groups (say, one from Tagliente's Faction and one who's a Star Guard Spy) which may be the source of great in-game friction, or could utterly disrupt a game. Use caution.

Freedom Legionnaires: Secretly working towards the downfall of the Hegemon, PCs in the Freedom Legion have a codename; knowledge of simple ciphers, pass-phrases, and a few members of their local cell; and a zeal for freedom and liberty. To be a Legionnaire is a crime, so members should keep it close to their chest. Legionnaires may be asked to perform espionage, participate in sabotage, recruit new members, pass documents, harbor other Legionnaires, or go on other covert missions.

Headley's Faction: PCs could be part of House Headley, either a relation, employee, or client. Characters in this group are probably Intoxican born, and should possess a modicum of wealth and status. They fight and spy on the Taglientes and IPF, and support Headley interests.

Hired Guns & Mercenaries: PCs could be specialist operatives hired by House Headley -- mercenaries, spies, or private eyes -- brought in to help get rid of House Tagliente (or vice-versa).

Intoxican Planetary Forces (IPF) Garrison: Perhaps they're natives of Intoxica, old Star Guardsmen who've transferred their commission because they're close to retirement, or former smugglers who now get space-sick after that dogfight around Bohemia VII. An IPF soldier serves as both military defender and law enforcement officer: they are called out to patrol the streets, enforce the laws, make arrests, quell riots, oversee customs, and repel planetary invasions.

Jaded Jet-set: PCs could be wealthy dilettantes, offworld corporate nobility, or pleasure seekers caught up in the events on Planet Poison. "Look, Percy, they're dueling in the street again. How droll."

Refugees & Expatriates: On Intoxica by misadventure or choice after the Hegemony pacified their homeworlds, refugees and expatriates can serve as a grab bag of PC types. Nearly any profession, social status, or species can be represented, from University professor to wealthy plumber to dispossessed aristocrat. Depending upon their finances, refugees and expats could be scrabbling for a meal as a beggar or living it up in luxury hotels as characters of leisure.

Unknown to all others are the following secret abilities of the Blobmen:

1. They have Good skill at increasing, decreasing, nullifying, or reversing gravity's hold on themselves.
2. Their goopy bodies are natural hyperfield receptors (and detectors).
3. They can bud off two weaker Blobmen (this causes a reduction of their abilities by one rank; i.e., an Expert Superstrength Blobman becomes three Good Superstrength Blobmen, who can each become three Average Superstrength Blobmen, etc.).
4. All Blobmen may communicate telepathically to a range of 1 AU with its "ancestor" and its two "descendants," but not with its "sibling" or their "descendants."
5. They have a Good ability to sense and absorb energy (sunlight, hyperspace flux, raygun blast), and use it to heal their bodies, increase their abilities, or -- once out of planetary gravity - enter hyperspace.

Through coordinated use of these capabilities, Blobmen can exit a planetary gravity field, absorb solar radiation, generate an H-field, jump to H-space, navigate and travel through that dimension, sink back to realspace, and enter planetary gravity, all safely and without the need for a ship.

Spies (Star Guard or Alien): PCs could be agents placed there by the Hegemony or an alien government, set to observe (and possibly contribute to) the chaos of the inter-House conflict. Opportunities are already included in the write-ups for Tom Tildrum and Ignatio Tagliente (see below) for, respectively, Star Guard and Freedom Legion PC spies to take advantage of.

Tagliente's Faction: Whether born on Planet Poison or an escapee from New Venice, PCs might be part of House Tagliente. Such characters should definitely be skilled at taking care of themselves, mentally, physically, professionally, and socially; their greatest strength is their tightly-knit family connections. They build and strengthen Tagliente interests, and fight and spy on the Headleys, the IPF, and possibly the Hegemony.

NPC Backgrounds

(NOTE: The range of capability ranks -- from lowest to highest -- is Poor, Average, Good, Expert, Master.)

Freedom Legion

Nurse Kristyne Temple aka Asp: Hired to act as caregiver for the infant Gemma Headley twenty years ago, Nurse Temple has been in the service of House Headley since -- and in the Freedom Legion for five of them. Kristyne is Arcadian, originally, and once the Star Guard "Pacified" her world, she turned against the Hegemony. She fears history is about to repeat itself on Intoxica, and that this is in no small part due to Lady Kat's machinations. However, she is utterly loyal to Gemma, with a dedication surpassing her loyalty to the Legion or the House. She is an Expert Teacher and Caregiver, a Good Spy, and Poor at disobeying Gemma's commands.

IPF

Governor Orlando Zirlaq: The Governor's in a bit of a pickle: he's trapped between the machinations of House Headley, House Tagliente, and the Hegemony. He owes his position, power, or wealth to each of them in some regard, and all possess dirt on him. Like a man balancing spinning plates, he must divide his attention and care between each. However, self-preservation has shown him his path: keep everything quiet. If this can be done, he wins: the Star Guard won't swoop in, and two of his allies-cum-enemies will weaken the other. He's just got to keep the *appearance* of law, order, and public safety long enough for one faction to crumble. An Expert administrator, he has Good political acumen and wealth.

Commander Hector "the Handsome" Zirlaq: Hector is an Expert soldier, fencer, and athlete, and a Good leader of men. However, his real claim to fame is his Master rank appearance -- he's the finest-looking man in the entire sector. Unfortunately, this is his biggest failing, too: he is Poor at avoiding being narcissistic and vain. His father wants him to marry Gemma Headley, and he's actually become a bit smitten by the girl: she's nearly as lovely as he.

Herman Zirlaq aka Whimsy: Herman's not a soldier like his brother, but he is an Expert rank intellect and a Good fencer, shot, and socialite. Unfortunately, he's a bit of a wild-child, given to crazy acts and impulses (Poor self-control). "Whimsy" is Ignatio Tagliente's best friend, and would die for him without a second thought. His father wants him to join the business end of House Tagliente, and he's got no problem with that.

House Headley

Lady Kathryn "Kat" Headley: Once the ruler of Intoxica in all but name, Lady Kat used to be pro-Terran Hegemony -- that is, until the Arcadia Pacification. While previously, she had counted on House Headley's vast offworld network of commercial interests to insulate it from the Hegemon's reach, she hadn't counted on the bald-faced nationalization of businesses on Pacified worlds. If only she hadn't involved those grasping House Tagliente bastards in the mining problem, she'd be able to bolster Intoxica's defenses against the Star Guard. As it is, her attention is almost totally consumed by their quarrel. She is grooming her daughter to take over segments of House business, in order to turn her mind back to plots to maintain Intoxican sovereignty; she's already started machinating with certain (i.e., bribable) Star

Guard officers and Hegemony administrators. She is a Master of "high class culture" (dining, the fine arts, wines, luxuries); an Expert at scheming, willpower, and business, Good at public relations and social activities, and a Poor shot -- that's why she has bodyguards.

Gemma Headley aka The Ice Princess: Gemma inherited her mother's iron will, and her father's remarkable looks (Expert appearance and self-control). Her intellect is Good, and she's already started to learn how to run a few of the House concerns. She is Average at self-defense. She respects her mother, but is truly devoted to the woman who raised her: Nurse Temple. Despite her strength of character, she is Poor at dealing with her feelings of loneliness. (Note that Commander Zirlaq has begun to court her, but she hates his insufferable self-love.) If anyone ever manages to pierce the shell of her resolve, she will move heaven and Intoxica for them.

Thomas "Tom" Tildrum: Tom Tildrum is a nephew of Lady Kat's and holds the position of "special liquidations consultant" (i.e., assassin) in House Headley. An Expert duelist (with both sword and raygun) and intrusion specialist, he possesses a Good reputation as "a dangerous sort." His biggest flaw is his pride -- he has Poor self-control when insulted, and sees the entire farrago of dealings with House Tagliente as an insult. In short, he hates them with a burning intensity. He's very pro-Terran Hegemony, and one of his associates is -- unbeknownst to Tildrum -- a Star Guard spy.

House Tagliente

Duke Santiago Tagliente: Duke Santiago is just a simple businessman. If the ex-pat New Venetian sees an opportunity, he takes it. He buys low and sells high (and if sometimes you need to put a little English on the market, hey . . . it's what we call a "finesse"). He doesn't like Lady Kat because she's not doing half of what he could do with all her scratch. For example, he hates the Hegemony because of what they did to his homeworld. A man with the kind of money and resources that House Headley's got their mitts on could do some serious damage to Tsung Cain and his Starboys. That Flash Rogers character had the right idea, but the wrong conclusion. The point shouldn't be to overturn the Hegemon's dictatorship, but to make the right sort of guy the new Hegemon . . .

Ignatio "Iggy" Tagliente: The apple of his father's eye, Ignatio Tagliente is a hot-headed romantic, possibly more in love with the idea of being in love than he ever was with any of his paramours (Poor self-control in matters of the heart). An Expert duelist and charismatic type, he uses sword, fist, smile, and a Good head for business to administer much of House Tagliente's street-level concerns. He and his best friends Whimsy Zirlaq and William Jaeger also act as troubleshooters for the entire House, despite their youth. While even more loudly against the Hegemony than his father, he is unaware that one of his acquaintances is a Freedom Legion spy.

Consigliore-in-training **William Jaeger:** William Jaeger is the son of one of the Duke's advisors. He himself is being trained to serve in the same position for the Duke's son Ignatio, who also happens to be his best friend. William has a Master rank intelligence, an Expert grasp of House Tagliente business affairs, a Good grasp of House Headley's business affairs, and is a Good shot. Unfortunately, he's hopeless (Poor) at fencing, fisticuffs, or other physical activities.

Miscellaneous

TAT3 aka "Larry": Blobman of Mogo and mentor to Ignatio. Enjoys growing plants, especially those poisonous to humans. His hobby is attempting to replicate Terran bagpipe music himself. Energy Absorption (Good), No Need to Eat, Drink, or Breathe (Average); Personal Grav Control (Good), Remold (Good); Superstrong (Expert); Inability to control curiosity (Poor); Telepathy with ancestor & descendants (Average); Too weird to blend in (Poor).

Locations

There are a number of locations that can serve as the stage for action on Planet Poison. Here are the main divisions, in brief:

Faction Headquarters: All of these should be exceptionally secure (with a number of armed guards on duty and plenty of technological countermeasures) and safe. Direct assault is probably not an option, but sneaky reconnaissance or entry by stratagem is possible. Examples include the Headley estate, the Tagliente mansion, the Governor's compound, the IPF garrison, the hidden Star Guard outpost, and the secret Freedom Legion safehouse.

- *Faction Holdings:* These could be service businesses (casinos, hotels, amusement parks, clubs, etc.), industry installations (factories, plants, warehouses, mines, vineyards, commercial transport), or secondary residences (beach houses, cabin in the woods, houseboats, etc.). They are less secure than Headquarters, and more easily taken by force.
- *Public Areas:* The Public Square. Port Paradise Starport. Numerous parks and monuments. The Beach. The Hall of Hegemonic Justice. Public transport. These places are terribly insecure, and serve as the settings for most open conflict between factions.

Landing

Events & Possible Story Arcs

The Fix Is In!: At the Globe Casino, the biggest boxing match of the decade is about to happen: Junior Jambon vs. Claude King for the heavyweight title of the sector. But why has Junior's estranged mother Trudy shackled up with his opponent? It seems to be making Junior a little nuts. Worse still, disturbing rumors are starting to percolate that the match has been rigged by the Taglientes. Will Junior really take a dive in the fifth, or is it all just a bluff?

Serial Killer?: There's a serial killer stalking Intoxica's seedier districts, preying on average citizens. His *modus operandi* is an execution-style murder of a prominent member of a corporate House. "The Ghost Gangster" is also becoming known for the messages he's been sending to the newsfeeds, filled with crime scene details and taunts aimed at the Governor and the Commander. How long will his spree continue? (In actuality, there's no Ghost: it's a PR scheme cooked up by Orlando and Hector to cover isolated casualties in the inter-House gang war.)

Blobman Tourist: Larry (you remember, the enigmatic alien known to be weird, tough, and superstrong?), in a Hawaiian shirt, wandering around Intoxica, seeing the sights, humming bagpipe music to himself. Hilarity ensues. Any questions?

Signature Story Arc: "Starcrossed"

A Signature Story Arc (SSA) is a timeline for what happens if PCs *don't* get involved. An SSA can serve as a skeleton to create adventures -- even whole campaigns -- around, with various subplots and side-adventures weaving in and out. It can be altered, edited, speeded up, slowed down, or utterly warped to serve the current campaign.

An SSA is *not* intended as a way to railroad PCs. The real fun is to see how the PCs' actions disrupt and change "what would have normally happened," and follow up on the ramifications of those PC-inspired changes.

The following Episodes detail: 1) what will happen without PC involvement and 2) opportunities for PC involvement

at that point. GM-only information appears in [square brackets]; and a section on *SSA Advice* is offered below the Episode descriptions.

Episodes A1 through A3

A Trio of Inter-House Altercations

What Happens

After three altercations between House Headley and House Tagliente which meet two of three criteria (*public*, *costly* in terms of property or life, or *disruptive*), go to Episode B. A bloodless bar-brawl won't count, nor will an isolated execution, nor even a break-in at a Headquarters (unless it's really, really messy). Without PC involvement, the three altercations will be:

1. A Tagliente courier skimmer "accidentally" rams a Headley transport floater. This causes a massive wreck that rains burning debris into a non-Faction hotel resort and snarls air-traffic for hours.
2. Headley raygunmen open fire on Tagliente soldiers in a non-Faction commodities broker's office and vaporize a good chunk of the building in the crossfire.
3. Crews decked out in Headley and Tagliente colors mix-it up swashbuckler-style (swords and daggers) in Port Paradise Starport. In the confusion, a Tagliente starship explodes, ruining a pod of public ship-cradles. (Tom Tildrum was involved in this fracas, and is one of the few survivors.)

PC Involvement

PCs could be part of any one of these altercations for just about any background -- whether as part of a House Faction, as IPF soldiers responding to the chaos, or simply as observers. If fully involved with a House Faction, feel free to replace any of the above with any mayhem perpetuated by the PCs that meets the criteria.

Episode B

Gubernatorial Decree

What Happens

[The Governor holds a private meeting between Lady Kat, Duke Santiago, and their advisors to inform them that any further "loud" conflicts will result in harsh measures by the IPF. That means anyone who starts anything, dies. This decree is issued to forestall the Hegemony declaring that Intoxica is in Crisis.] The pair agree to Zirlaq's terms, and pass the word to their Factions.

PC Involvement

None really, unless they're high up in one of the three Factions represented here; if they're also a spy for the Freedom Legion or Star Guard, much mileage can be gotten out of this agreement.

Episode C

Masquerade

What Happens

House Headley throws a big costume party for Gemma's 21st birthday. Iggy, William, and Hector gatecrash, they have a dust-up with Tildrum, ruffled feathers are smoothed by Lady Kat. Then, Iggy sees Gemma and falls for her like a ton of bricks. [Later, Iggy sneaks into her chambers and puts the moves on her; she responds to the impetuous young man with a surprising (even to herself) ardor.]

PC Involvement

PCs can be guests at the party, and get involved with any element of the episode. Perhaps they tell Tom that Taglientes are in the house, help separate Iggy and Tom, bring the Lady to stop the duel, or point out Gemma to Iggy.

Episode D

Secret Marriage

What Happens

Iggy has a long talk with Larry about "human mating." Afterwards, Iggy scopes out the Headley estate and its workings. About the same time, Gemma starts studying Tagliente operations. [Iggy's trying to figure out a way to get in to see Gemma again. Gemma's trying to figure out a way to see Iggy again. Nurse Temple is eventually co-opted to deliver a message to Iggy.] Iggy acts very friendly towards distrusting Headley employees. [Temple passes a message to Iggy, setting up a rendezvous; Iggy and Gemma are wed secretly in Larry's rented bungalow.]

PC Involvement

PCs might overhear the discussions between Iggy and Larry, or Iggy and Temple, and decide to investigate. They might also notice the reconnaissance that both Iggy and Gemma are performing, and could possibly be tapped to help or hinder these efforts, without necessarily being clued into their true purpose.

Episode E

Duello

What Happens

In the public square, Tildrum attempts to provoke Iggy into a duel. Iggy refuses, Tildrum attacks anyway, and in the scuffle, Herman is seriously wounded. Iggy attacks, Tildrum flees.

PC Involvement

PCs can join into a general melee on either side, or attempt to stop the fighting (especially if they're IPF soldiers).

Episode F

Duello Redux

What Happens

While being med-evac'd, Herman dies. Iggy leaps from the ambulance skimmer, and starts tracking Tildrum. Eventually coming upon him in a tavern, they duel, and Iggy kills Tildrum.

PC Involvement

PCs could help Iggy locate Tildrum, hide and/or patch-up the wounded Tildrum, or trying to somehow hold back the tides of blood.

Episode G

Exile or Death

What Happens

When his son's murder is reported to the Governor, he summons the Lady and the Duke to attend him publicly. Orlando wants an explanation, *now*. The tragic death has stiffened his spine: the Governor will be ruthless in stopping the gang war [indeed, Star Guard spies may already be reporting that the Intoxican situation has moved to a Crisis point]. He orders the execution of Iggy at the urging of Lady Headley. However, when the facts of Episode G are brought to light [and a quiet threat from the Duke], he alters this to permanent exile upon pain of death. Lady Headley is not happy at all with this commutation of sentence, but the Governor is firm. [The Governor urges Hector to press his suit with Gemma and pursue alliance, in order to ameliorate the Lady's feelings over his decision.] Iggy flees the planet, and goes into hiding on the orbital station, Port Nexus.

PC Involvement

PCs could be recruited to (on the Tagliente or covert IPF sides) to spirit Iggy away or (on the Headley side) to hunt him down and assassinate him. PCs could help arrange or locate Iggy's hidey-hole on the orbital station.

Episode H

Poison Plot/Wedding Banns

What Happens

Lady Kat pushes her daughter to accept Hector's offer of marriage; Gemma refuses for a time [Temple and Gemma come up with an idea to fake her own death: once "dead," she can meet up with Iggy, and they can flee the sector; she sends a message to Iggy on Port Nexus], then relents. The wedding announcement is broadcast system-wide.

PC Involvement

PCs could be tasked with delivering Gemma's message to Iggy, or stopping the message from getting through. They might also be called upon to help with wedding preparations, if they are in House Headley or the IPF.

Episode I

The Return of Iggy

What Happens

[Iggy hears the wedding announcement, and decides to return, burst into the wedding, kill Hector, and steal Gemma away.] Gemma Headley dies under mysterious circumstances; her body is transported to the Port Paradise Hospital morgue. Lady Kat blames Tagliente assassins, and gears up for war. [Iggy hears of the death when he gets dirt-side, and runs to the morgue.] Duke Santiago, all the while protesting Tagliente involvement, nonetheless makes war-preparations as well. [The Duke attempts to contact Iggy, but cannot; this adds to his stress.] The IPF goes into full-riot-slapdown mode. Iggy is sighted making for the Port Paradise Hospital. Mass hysteria as all forces converge on the Hospital. [Iggy discovers Gemma dead and commits suicide; Gemma rouses herself, sees Iggy dead, and commits suicide.] The dead lovers are found, along with forged identi-cards and exit visas made out to "Mr. and Mrs. Shaxberd" (see *Now What?*).

PC Involvement

Even if the PCs have been assiduously avoiding the SSA, the Return of Iggy should demand their attention, because Intoxica is going to hell all around them. Every Faction is trying to get to the Hospital for one reason or another, under order or on their own initiative.

SSA Advice

First off, the SSA is intended to be a coat-rack for the PCs to hang their jackets on. If it's becoming too railroady (that is, the SSA is more important than what the PCs do), *throw it out!* Deviation from the "What Happens Next" is encouraged, if not mandatory. That being said, if one wishes to use the SSA, the following advice may come in handy:

Pacing: If a multi-session campaign, the first session could be totally unrelated to the SSA, allowing the players to get comfortable with Planet Intoxica and its denizens. An Event or PC-driven subplot would work well here to set the mood. If desired, there can be full non-SSA sessions between A1 through A3; almost no time between A3 and B; a half-session between B and C (gotta get ready for the party!); a session between C and D; a half- or whole session between D and E; almost no time between E, F, and G; one or two sessions between G and H; and a half-session between H and I. Non-SSA sessions can be used to weave in other Events, subplots, and missions into the campaign, so that the SSA is a background plot that occasionally moves to the front, rather than being stage-front every session. "The Fix is In!" works well if it happens at the same time as D, and "Blobman Tourist" is particularly good alongside A1, A2, A3, or C.

Now What?: In a more orderly universe, finding the corpses of Iggy and Gemma might make House Headley and House Tagliente realize the dangers of vendetta and allow them to bury the hatchet. However, it's more probable on Planet Poison that catharsis will involve stabbing, shooting, or explosions.

But wait, there's more: the city-wide panic caused by the Return of Iggy has an excellent chance of being the proverbial straw that breaks the Hegemonic camel's back. Obviously, the Governor cannot properly govern his unruly citizens; thus, the Hegemon will declare an "Intoxican Crisis" and send in the Star Guard to "restore order." In the face of planetary invasion, can this vendetta be set aside?

Monkeywrenches: Again, if the PCs get caught up in the SSA, they *will* perturb the plot. For example, if the PCs eliminate Nurse Temple before the Poison Plot (by murder, accident, blowing her cover, or simply delaying her too long), Gemma's subterfuge will probably be detected, and the SSA cannot proceed as written. *This is a good thing.* GMs just need to keep in mind the personalities, motivations, and goals of the NPCs, and evaluate what they would do as events change. The possibilities are -- and should be -- endless! Use the SSA as a jumping off point to allow your players to tell their own stories, be they interwoven with the SSA or completely divergent.

SPIN: Blob Harvest (aka Yoblobbo, A Pseudopod of Credits, or Last Blob Standing)

Here's an alternate take: Larry's not there to make sure the Hegemony stays out of Intoxica: he's there to make sure that it *does* intervene. He's goading both Houses and the Governor -- secretly serving as an agent for each -- to up the stakes and bring Planet Poison to a boil. Then, the Star Guard will swoop in, and all sides will take heavy losses. After that, Larry, Darryl-2, and Darryl-2's descendants will appear and neutralize the Intoxican threat to Mogo.

Gaudeamus Igitur: Age and Society in Roleplaying

Part II -- Youth

by Michele Armellini

*"Let's rejoice, therefore,
While we are young.
After a pleasant youth,
After a troublesome old age,
The earth will have us."*

--*Gaudeamus Igitur*, translation from the C.W. Kindeleben 1781 version

The [first article](#) of this series pointed out how age classes and conventions about age groups characterized different civilizations through the ages, and how these defining elements can be useful in roleplaying as background elements and adventure hooks. This article deals with what is possibly the most interesting age class, and the most useful for many promising adventurers: youth. The ideas and suggestions presented here should be useful to everyone; one section is **GURPS**-specific.

Rites Of Passage

Every reader went through it (with the exception of those who are undergoing it now!): awesome changes, raging hormones, the challenge of finding a proper place and a respected role in a more complicated world, new needs, new responsibilities.

This experience is so universal that it speaks to the heart of everyone, and it's so stressful, intense, and important that it has been the theme of countless fictional accounts; for Germans, it's even a literary genre on its own, the *Bildungsroman*. The well-known teenagers' angst has indeed existed in every human civilization -- but today it's only a shadow of what it was in the past.

In today's affluent societies, adolescence may be psychologically challenging, but it's a protracted, protected process. Typically, after having reached sexual maturity, teenagers still spend many years living with their parents and studying. At 18, they get full rights, but often they still have limited duties. As long as they have an insufficient income, or rely on their parents', they are not independent; conversely, if the parents are too generous, money that isn't earned the hard way can become a problem on its own. This prolonged dependence and cohabitation, of course, can cause conflicts (see also below).

But this is nothing compared to what happened in earlier times. Having to face a much shorter life span, our ancestors wasted no time, and youth was a moment of passage rather than many years of adolescence. Normally, biology defined that moment, and puberty meant one was no longer a child; he had become a man (she, a woman). The passage was often marked by impressive rituals (see below).

Once the youths had passed their initiation, in many civilizations they were considered as adults under every respect. This brought more responsibilities than any Western 15-years-old would gladly accept today; those youths had to grow fast. Nevertheless, they simply lacked the experience and perspective that only age can give, and one wonders how they coped: Joan of Arc arrived at court when she was 17 or 18, and there she met Charles VII, who had been king (though still uncrowned) since he was 19. Some inexplicably rash, impulsive, or naïve deeds by famous historical figures might well become more understandable if one just looks up their date of birth.

Less lofty people also had to quickly adapt to the demands of their careers and lives. In tribal societies, the youths were now expected to be skilled hunters and to contribute to the family needs. In war, they would still have secondary

roles for a while, as carriers, horse-holders, or skirmishers, but they could well have to face a foe bent on killing them. As to skirmishers, some military historians maintain that at low-tech levels this role wasn't very effective exactly because it had been devised to give the hot-blooded youths something to do. They'd advance in the no-man's-land, trade insults, rocks, and maybe a blow or two with their peers of the opposing tribe, without achieving much apart from testing their own bravery and warming up the battle; then they'd fall back to let real men do the real work. This point of view may be accurate, but a boy isn't less wounded just because the enemy skirmisher who hit him hasn't achieved anything else.

A craftsman's youth began early and lasted more than that; most crafts and trades required a long apprenticeship. An apprentice would begin to work (and learn) as young as 8, and his "youth," featuring lots of hard labor for virtually no retribution, ended when he became a full craftsman or a journeyman. Only at that time was his long ordeal paid back, because by then he knew his craft and had gained a chance of admission to the guild. Often, his initiation resembled what we'd call an examination today.

A farm boy's life would change with marriage; this might well happen real soon, often being the last thing his father decided for him. This was the turning point for girls, too, in virtually every civilization. In a poor countryside setting, at 20 a woman could already have three children, not to mention the babies who had already died; add to that the labor in the fields, and she would probably look like she was 30.

Indeed, youth as we know it in sociological terms is basically a by-product of learning. Complex societies, where a made man of the upper classes was expected to have a vast knowledge and many skills, simply needed to invest more time in training at least some of their manpower. Studying often leaves some free time, and above all the energy to try and exploit it. That's where the tune providing the title to this series was born. Medieval university students are the quintessential example of this philosophy: while we train for life, we'll have some good ol' fun.

Within this class, there is an interesting special case: the boys who trained to take monastic vows. Their discipline was no less strict than the full monks', and the final choice they were studying for was often taken for granted. But the novice's condition is interesting, since those final vows haven't been taken yet, but he still lives within the monastic community. And while he's there, he might have some access to all sorts of intriguing things (from manuscripts to reliquaries), while still being a boy.

Initiation

Up to today, "initiation" resonates with powerful social and psychological overtones. "Initiation" means access to a beginning, and it often implies entry into some kind of exclusive circle: a mystery cult, a lodge, or simply a guild, or even a frat. However, the first and most important exclusive circle one had to enter into was the grown-ups of his own tribe.

A primitive initiation could feature several different rituals; for starters, one or more tests, as to skill, bravery, and resistance to pain. The skill test would often regard hunting and survival, such as surviving far from the tribe for a month, hunting on one's own, and being treated by the tribe as an enemy. Pain could be self-inflicted, and involve ritual wounds, scarification, tattooing and even minor mutilation. Note that as long as the tribesman remains within his culture, *not* having the initiation tattoos makes him an Outcast (Social Stigma); but if he reaches civilized lands, they immediately qualify him as a Primitive (Social Stigma!) and may even be an Unnatural Feature.

Magical and/or religious rituals would take place, too; in certain cultures, mind-altering substances or procedures could be used (fungi, burning herbs, fasting, dancing to exhaustion) so that the initiate could attain a trance-like status. The shaman would then interpret his visions or dreams, giving the boy insights about his destiny or his relationship with the tribe's totem, or maybe his own personal totem animal. This might include acquiring one's true, adult (and possibly secret) name.

Before, during, or after these rites, the initiate would also be taught the adults' secrets: magical and/or religious precepts, sexual customs, secret knowledge, bywords or full languages, and more.

Boys are initiated by men, and, sometimes with lesser rituals, girls by women. Spying on the rituals by underage boys or by strangers is an abominable sacrilege, as is spying on the secrets of the other sex.

Initiation customs were diluted with the advancement of civilization, until they became just a harmless religious ritual, or maybe just the day one shaved for the first time and changed clothing style. Yet adolescence initiation elements still survived or resurfaced here and there, from the ritualized face-scarring duels in German universities a century ago, to the humorous challenges to join a frat and the bloody tests for a street gang. This whole concept makes for a wonderful RPG tool, of course. It is an ideal way of starting out with new characters. It may be the theme of an adventure in itself; even with preexisting adult characters (if they want to be accepted in the tribe they must be initiated as if they were boys!). It might also be an unforgettable way to characterize a primitive society.

Portrait Of The Character As A Youngster

GURPS makes quite a good job of portraying starting adventurers as teens; after all, **GURPS Basic** makes it clear that 100-point concepts are not heroes yet, and the sample character is 18. There are, however, a few things to remember if the youngster has to be realistic and balanced in **GURPS** terms.

At the borderline between youth and childhood, a 14-year-old character should take advantage of the free increase in ST and IQ (+1) when he turns 15 (see p. B14).

Second, from 15 to 17, the teens are subject to their mandatory Disadvantage: Youth (-2/-4/-6, p. B29). If the GM is going to have a group of underage PCs for a while, he'd do well to define what they cannot do, exactly. For instance, the description on p. B29 does not mention buying alcohol, voting, owning restricted items etc. Also note that if the "legal age" is higher (see "Voting Age", below), the value of this Disadvantage will change (if the legal age is 21, and the character is 16, it's a -10 Disadvantage). Youth also brings a -2 reaction modifier (lack of respect!) from adults. This may vary; in a transhuman society, those having a few centuries of experience might regard a 17-year-old as little more than a child.

When creating teen characters, other Social Advantages and Disadvantages should also be carefully considered. Can the boy's parents be considered Patrons? Does a group of close friends provide Claim to Hospitality, or even Ally Group?

Money and status can be tricky, because usually they are the family's, not under the direct control of the teens themselves. Independent Income might be a way to represent the lavish monthly allowance of a privileged daddy's boy, while conversely many students are less wealthy than their own family. If high Status is hereditary, the heir is considered one level lower in Status than his father (and his younger brothers, and sisters, may well be -2 Status). Attention should be paid to issues of actual power; the son of a Duke is Status 5 like an Earl, but the latter is the ruler within his domains, while the former's authority, if any, amounts to what his father decided to delegate.

Other interesting conditions that may come into play are Disowned, Heir, Uneducated.

Finally, there are a few Disadvantages that look so typical of teens that they would make a soap-teen-opera campaign really light-hearted: Compulsive Carousing, Impulsiveness, Overconfidence, Stubbornness, Shyness, and Klutz. As to Advantages, some wiry boys always seem to be Pitiable.

High School

Ordinary youths in ordinary times are the protagonists of successful fiction . . . so there must be something compelling about them! If these ideas just sound too old, a clever GM could still use them not so much as adventure themes in themselves, but as easily recognizable subplots or sideshows.

- **The Jock, the Nerd, the Belle.** These are the archetypes of countless High School movies. The secret for enjoying such a simple setting is to embrace simple objectives: have fun, gain status and respect, be popular, be

happy; avoid humiliations, bad marks, and your parents' wrath (they might ground you!). Then again, are these objectives really simple? If the players think so, a GM may always use High School life as a backdrop for more momentous events.

- **Why Jack?** A "jack" may be "any of various contrivances, originally one that took the place of a boy." Considering that jacks can also be used to lift vehicles, this tells a lot about the thankless jobs that unskilled apprentices had to face. Especially in low-tech settings, going to school isn't an option for everybody. The PCs toil through grueling routine in the fields, workshop, or factory. They survive building-yard accidents. They try not to be bullied by older workmen, who might be resentful because the boys are paid less to do the same work. They attempt to learn something from their master and to get all their wages from the embezzling foreman. When the players are tired of this, the GM may let the *real* adventure begin.
- **Dealing with Dad.** This is a theme as old as Oedipus. Youths need to affirm their own personality, and the quickest way is to question authority. It is already quite difficult to get a father to see his child's reasons under the best conditions; unfortunately some fathers are self-righteous moralists, or violent alcoholics, or just plain stubborn. While the most typical treatment deals with the father-son interaction, a GM can throw in a mother and/or a girl, too. This situation could be a good starting point for a new group of 17-year-old adventurers. They decide to leave their town to go treasure hunting in the Dark Hills . . . but first they'll have to ask for their fathers' permission! Or will they dare go without asking? Suggested soundtrack: Cat Stevens' *Father and Son*.
- **Peer Pressure.** As long as one is a child, his parents are his guides; but their importance will soon pale in comparison to the group of his own peers (what many parents call "bad company"). Most youths will go to great lengths not to disappoint their peers, from keeping secrets that would be better told to the headmaster (or the police), to committing crimes.

Bitter Apprenticeship

Perfectly ordinary youngsters can make for really interesting characters if the times they live in are extraordinary! Here are a few ideas:

- **They'll Talk to Us.** The aliens have arrived (or the Elves, or the demons). But there is a psychic incompatibility between them and the adults, or so they say . . . as they talk with teens. Do the intruders just want to deal with more pliable, less experienced minds? And what about the boys and girls they select as "interpreters"; are they brainwashed? Are they sincere when they try to explain what the newcomers want . . . and fail for lack of words? The visitors, of course, are feared by the adults, but they are becoming immensely popular with the teens. What do they really want?
- **The First Blood.** It's another initiation, the first kill. A trace of the ancient hunters' rituals sometimes survives in the barbaric gesture of smearing the quarry's blood on the face of a frightened boy. A young hunter's first buck can be a defining moment -- not to mention his first bear, or mammoth. But this is nothing compared to wartime, when the eager would-be warriors' prey is a human being. Will they be bloodthirsty or shocked? Will the prey be more difficult than the boys' trainers expect? Will the lesson go awry?
- **Voting Age.** The world has grown old, and the laws have adapted. After all, only the senior citizens cared to vote, right? So, the voting age is now 30, and until then, one is a "boy" (that's the way he'll be addressed) with limited rights. The state's budget caters to the voters, and robots do menial jobs; cheap drugs will keep the boys happy, and tough hi-tech cops will keep them in line. The PCs should cling to their low-paying job, risk a fine for going to that unlawful concert, and be polite with their elders: there's always a camera watching.
- **Dim Lights, Big City.** The big city is unforgiving, with seedy neighborhoods, gloomy shantytowns, abandoned industrial districts, and nightmarish sewers. Living there is hard for an adult with a home and a job, but it's much harder for the homeless and jobless. And the worst is to be, on top of that, boys; street urchins, *meninos da rua*. The PCs' friends beg, steal from the drunkards, run from the police, sniff glue and, from time to time, disappear. The heroes may try surviving in the street, in Yrth's Megalos, Medieval Paris, Victorian London, or modern Rio. If they reach 20, they'll be a statistical anomaly.
- **Lambs to the Slaughter.** In this disturbing setting, the boys only have vague remembrances of their sad, young mothers; at six, they were taken away to work in the fields around the Compound. Big men with hair on their faces, the Guards, punish them if they don't work hard enough. When they turn 14, the Teachers, harried, frightened youths that are just a few years older than the heroes, tell them about sex; if they make children they'll

live longer. Meanwhile, the weak, the rebellious, and the smart disappear in the night. The Masters take them away. Even the Guards fear the Masters, and they sometimes call them with a different name: Vampires. Can the heroes run away from the Compound, hide from the Guards during the day, and from the Masters at night?

Great Expectations

Here are a few adventure or campaign ideas for the truly extraordinary youths.

- **A Coming of Age.** This is the title of Timothy Zahn's SF novel. On that colonial planet, a mutation affected the settlers. Strong psychokinetic powers were bestowed on them . . . but they lose them shortly after puberty! Grown-ups have to rely on responsible boys and girls for help, and knowledge must be strictly guarded to prevent social unrest or outright chaos. This setting would be extremely interesting both for [children](#), as well as for adolescent PCs, who are losing the ability to fly and hurl things, and must cope with the change. What if some precocious genius starts a revolution? Or if somebody claims to be able to preserve the PK powers beyond puberty?
- **Changing Changelings.** Puberty may be the time one *acquires* his powers. It happens with werereatures in many fictional settings. Or it might be the time the X-Man begins to learn how to control and use those powers. In typical changeling stories, this might be the time the real parents or people come to fetch the strange boy. But what if this changeling refuses the change, or has somehow partially changed into a "normal?" What if he wants to stay where he grew up? Suppose a few potential X-Boys simply say "no thanks." Will their would-be mentors leave them alone? Will *their enemies* leave them alone? Will their normal friends, girlfriends, and relatives accept them as if nothing had changed?
- **Growing Pains.** In *GURPS Goblins*, childhood experiences (where "experiences" is usually pronounced "abuses") shape the characters' minds and bodies. In *GURPS Supers*, stress can activate mutagenes. In this strange low-power Supers setting, everybody has some small, trivial super capability, and they are both activated and shaped by the experiences, desires, fears and stressful situations of their adolescence. And there is a catch. Higher stress bestows greater powers, but this also makes adolescence longer, and it "locks in" adolescent personality traits. The most powerful persons on the planet, regardless of their real age, still behave like teenagers. And some of them are super-villains.
- **A Brave New Youth.** An epidemic condemns everyone who has already achieved puberty to a slow but sure death within a couple of years. The vaccine was found, but for the adults it's too late. Soon, the species' survival will be in the hands of those irresponsible boys and girls; desperate, dying parents and mentors strive to teach them the fundamentals, while hateful bands of adults are bent on taking Samson's stand. And the teens will soon have their despised little brothers to look after, too!

Roleplaying Tips

Behave as you did when you were a teen! Or, even better, think about the excessive, rebellious black sheep your mother warned you against, and behave like him. Or you might roleplay the mousy, shy girl who stays away from bullies -- but has a little secret of her own.

Most teenagers lack some typical balancing features one only develops over time: experience, balance, cautiousness, even common sense. On the other hand, they also often lack some less positive aspects of the middle-age mindset: cynicism, moral relativism, remissiveness. Adults are conservative and pragmatic, youths are revolutionary and idealistic (no shades of gray; it's either black or white!).

When roleplaying a teen, however, one should remember that nothing is cast in stone; it's a moment of transition and of hesitation. One day he might be bold, the next one he'll be shy. He may chafe under his parents' rule, then feel abandoned and insecure if suddenly freed. There will be, however, some turning point sooner or later, and/or a general trend of development. Disadvantages (both the typical ones listed above, and others) can give useful roleplaying guidelines. If the character is Impulsive, Overconfident and Curious, or Stubborn and Intolerant of authority figures, the player already knows what to do!

67 Words For "Damage," No Word For "Parlay"

This is another one of those columns where I point out something that's obvious to me, but might be worthwhile to repeat anyway. (And even if it isn't, it should at least buy me some breathing time before [Dragon*Con](#) draws me out of my secluded peninsula and into the wilds of Georgia next weekend.)

Anyway, there's a [common saying](#) (which may or [may not](#) be significant) posits that there are a bunch of different words for "snow" in the Inuit language. In the general sense this is usually brought up to drive home the idea that, when you've got a whole lot of something, it tends to figure more prominently in your linguistic choices. (For example, Kansans have 117 words for "flat.") Contrariwise, many times you'll hear that "such-and-such a language" doesn't have a word for some concept, such as "compromise" or "privacy" or "freedom," usually ascribed to a country whose citizens seem lacking in compromise, privacy, or freedom. (This is, of course, [malarkey](#).)

However, drifting from the realm of languages (and away from supportive links designed to limit the irate emails I get from various linguists), I note that the basic ideas behind these two concepts have implications to RPGs. Namely, a game has stats and rules for things it generally thinks are important, while a game that lacks certain concepts will make it more difficult to accomplish those activities.

I first noticed this in good ol' first edition *Advanced Dungeons & Dragons*, which didn't have a skill system per se, or even any means of determining success or failure at a task that *didn't* involve separating critters from their hit points. The closest it had was, in the *Dungeon Master's Guide*, the Secondary Skills Table, which randomly assigns useful secondary skills to PCs. (As an aside, according to that table, in the 1st Edition universe there are more professional gamblers than miners, armorers, shipwrights, or bowyer/fletchers, and 18% of the adventuring world has "No skill of measurable worth." For some reason I envision skill-lacking would-be adventurers lounging on the couch in their underwear, becoming inspired by a chainmail-clad former television star saying, "Do you want to make more money? Sure! We all do . . .") On this table, even if you *did* get a skill that would seem useful, there was no mechanic in place to allow use of it; it was up to the DM to determine whether or not, say, an armorer could make something with his skill. As a result, that system didn't really encourage anything that didn't involve knocking critters into the afterlife.

Contrariwise, games that have stats and abilities as an integral part will (probably) find players using those abilities more. For example, the Storyteller System has three categories of attributes -- Physical, Social, and Mental -- and requires players to prioritize those categories. When I saw that, I noted that it was the first system I had seen that placed social attributes on an equal footing with physical and mental ones. Mayfair's *DC Heroes*, on the other hand, had three categories of its own: Physical, Mental, and Mystical, while *Fading Suns* has a Faith attribute (which exists in direct opposition to the Ego attribute; the more you place focus and discipline within yourself, the less you can turn to a higher power . . . and vice versa).

What's the upshot of all this? Well, in games with detailed social rules you can expect to *use* them . . . presumably in a number of social settings. Likewise if a game decides that much of a person's makeup is Mystical in nature, then that aspect will probably fit into the game.

(Of course, it should be noted that the mere existence of a trait does not necessarily indicate it will be important; FASA's original *Star Trek* game, for example, had a Luck attribute, which seemed to have little game significance outside of giving humans something that they were good at that no one else was, and thus explain why they weren't turned into Romulan barnacle-scrappers centuries ago.)

So what's the point in mentioning all this (besides filler)? Well, namely that it's reasonable to expect players' actions to reflect what's possible in the game, and *not* reflect what isn't possible. For example, in most games I play in or GM, attempting to intimidate characters or otherwise persuade them through force of will is uncommon . . . unless a character doesn't have anything else to do. But in *Champions*, where "Presence" is an attribute and "Presence Attacks" are given extensive rules, it's entirely possible to craft a character with a powerful attack that consists of him saying, "Bow before me!"

So the upshot of this advice is two-fold. First, if there are actions the players will want to do, or activities the GM wants to encourage, then they need to make sure the game system supports it. For example, if it's important for the game that religious conviction (or lack thereof) plays an important part, then picking a system which intrinsically supports that element -- either with a "Faith" rating, a system with game effects for belief or nonbelief, or the like -- will do much to promote that element. (In my experience, it certainly works better than the GM merely standing on a table and saying, "C'mon, guys; I know there's no good reason, but in this game world you're supposed to do X!")

The second prong of that is to explore the game system you're using for activities and options you may not have been aware of. This can be trivial abilities; for example, I discovered in our ***Vampire: Dark Ages*** that, thanks to my character's inhuman strength, he was also good at jumping . . . very good. Shortly thereafter I was hopping around like Tigger on methamphetamines. ("How tall is the castle wall we're invading?" "Ummm . . . not more than 20 feet." "I jump it." "There are bad guys on the other side." "I jump them." "The mastermind is on the top floor of the central tower . . ." "I jump up to the top floor.") Although my exuberance of that new-found ability wore off quickly, I nevertheless always kept that jumping ability as part of my arsenal.

On a less whimsical side, I realized in our ***Fading Suns*** game that, owing to the wonky nature of the system, I was better off dumping most of my experience into the "Faith" ability and praying for things to work out (or at least not much worse off than in placing my trust in the standard task resolution system). In addition to getting a [Murphy's Rules](#) out of the experience, it also encouraged me to explore the religious aspect of that character and the universe more fully.

Of course, some games encourage the addition or inclusion of attributes that will be important to the campaign; some games, like ***Fudge***, can allow attributes that are unique to one *character*. And other game systems -- like ***GURPS*** -- have rules that can cover just about any situation. But some games have a core system, stat, or concept that it's enough to wrap an entire game around. (For example, immediately springing to mind are 1986's ***Marvel Super Heroes***, with its Karma system that enforces a moral code; ***Torg/Masterbook*** with its card system that gives players extensive control over the scene; and ***Aberrant***, with its elegant Super-Attribute system that easily yet evocatively simulates abilities beyond those of mortal men.) And other games have hidden gems that can bring new aspects or foci into a game (such as ***DC Heroes/MEGS*** system allowing Hero Points to be spent to modify the scene; ***Conspiracy X/GURPS Conspiracy X***'s system for pulling strings; or ***Exalted***'s combat system that directly rewards evocative and descriptive combat maneuvers).

And hopefully any games you play will have the vocabulary you need to play with snow problem.

'Gheliphrex

for *In Nomine*

by Loki Carbis

'GHELIPHREX

Demon of Unexplained Noises

Impudite Knight of Secrets

Corporeal Forces - 3	Strength 4	Agility 8
Ethereal Forces - 6	Intelligence 11	Precision 13
Celestial Forces - 5	Will 6	Perception 14

Charisma +3

Skills: Fast-Talk/6, Lying/6

Songs: Dreams (Celestial/3), Entropy (Ethereal/4), Thunder (6), Tongues (Corporeal/6)

Attunements: Demon of Unexplained Noises, Distraction, Djinn of Secrets, Habbalite of Dark Humor, Imbroglia, Impudite of Dark Humor, Impudite of Nightmares, Impudite of Secrets, Knight of Derision, Knight of Hidden Doors

Rites: 'Gheliphrex generates 1 point of Essence each time he manages to convince someone that the noise they just heard wasn't what they thought it was. He usually does this by quickly suggesting two or three additional explanations, and doing what he can to make it hard to figure out which one (if any) is the true explanation. If he can convince other people to do it for him, he gains 2 Essence.

It all went weird for Phrex the day he asked for his Word, about three centuries ago. Up until that time, he'd served Kobal, working fairly closely with the Prince. He'd attracted the jealousy of his fellow Servitors -- always a sign that a demon is doing a good job -- and was regarded as something of an up-and-comer to those in the know. His closeness to Kobal no doubt assisted him in this, but no one could deny that he was good at his work. And so, Kobal summoned Phrex one day, and told him that the time had come for him to petition Lucifer for a Word. Naturally, Phrex did so. He asked for a relatively minor Word -- Unexpected Noises. Phrex, like Kobal, greatly appreciated the comic value of a well-timed fart noise, but wanted to expand his repertoire.

Lucifer considered his request, dismissed it, and granted Phrex a different Word from the one he'd asked for. Gheliphrex was given the Word of Unexplained Noises. As an afterthought, Lucifer added an apostrophe at the start of Phrex's full name, and reassigned him to Alaemon, declaring that the explanation of any noise was a secret. Furthermore, he commanded Phrex not to enter his presence again until such time as Phrex had figured out how to pronounce his new name properly. Phrex is fond of joking that Lucifer's words were his first real experience of unexplained noises.

Since then, Phrex has served his new master well, largely out of terror, and risen in power. Alaemon's largely hands-off leadership style took him a while to get used to, especially after working with Kobal. In fact, centuries later, Phrex has still not met Alaemon. Somewhat tentatively, he has assumed that this is a good sign, and that his independence is a mark of Alaemon's trust in him. Certainly the several Attunements he has received from his new master would seem to be positive signs.

In the meantime, just in case they aren't, he's taken advantage of the Prince of Secret's blind eye to form good working relationships with several other Princes, notably Beleth (who appreciates the fright value of things that go bump in the night) and Malphas; it is rumored that the additional gun shots some people claim to have heard when Kennedy was assassinated were the work of Phrex, as a favor to Malphas, and Malphas is well satisfied with the results. More often than anything else, though, Phrex works with the Servitors of Media -- often in fairly minor ways, through his vessel

as a Producer for several alternative musical acts.

On the other hand, several other superiors take a dim view of him -- notably Fleurity (who thinks that drugs are all the explanation anyone needs) and Vapula (who has lost untold production hours trying to track down nonexistent but noisy mechanical faults). And relations between 'Gheliphrex and Kobal are a still precarious; each still suspects the other of having pulled a fast one on him.

Phrex is that *rara avis* in Hell: a demon who stays bought. Not that he doesn't lie and cheat . . . but he never breaks a deal if he can avoid it. There are those who whisper that he's aiming for redemption, but in truth, Phrex is just trying to establish a little insurance for himself. He's well aware that most Princes take a dim view of demons changing Superiors at all, let alone a second time, and he wants to make sure that his new boss trusts him (at least, as much as any demon ever trusts another).

His Word allows him to create all sorts of Unexplained Noises more or less at will. A Noise that is merely disquieting or beneath conscious notice costs him 1 Essence, while a Noise that is truly shocking or otherwise inexplicable could cost up to 3 points of Essence. For 5 points of Essence, he can create a noise that sounds to any Celestial like a Infernal disturbance of the Symphony. Furthermore, by linking his Word and his resonance, he can Steal Essence from anyone he has previously stolen Essence from in person, so long as they are actively puzzling over the explanation of the noise they heard at the time. This ability has no range modifier, although it will not work across Planes. Other than that, it is identical to the normal Impudite Resonance.

Encountered

As a general rule, 'Gheliphrex is still the merry prankster that he was when he worked for Kobal, but now his pranks have a nastier edge, and are more likely to cause fear and paranoia than humiliation (although that's still fun, too). In fact, Phrex is increasingly a mercenary; so many words find the occasional Unexplained Noise useful to their plans, and Phrex is the best in the business.

If players are Servitors of Secrets, Phrex most likely outranks them. There aren't a lot of Words under Secrets, after all. 'Gheliphrex is aware that his Word is considered basically dead-end by most other demons, but he thinks that he can prove them wrong -- and possibly change Superiors again. Beneath his playful exterior, Phrex is all ambition. Unlike most demons, though, he's prepared to bargain more or less fairly for what he wants.

Adventure Seeds

Does Unexplained Equal Ineffable? Phrex has been going all out lately, trying to develop another special rite. He wants to have the ability to make a noise that even a Malakite who have trouble distinguishing from the true ineffability of the Symphony -- think how many angels could fall to Hell then!

Right now, Phrex is busily trading favors and making deals with everyone he can. Anyone he can. He owes Lilith a lot of Geases (she'll be the only other one to get the rite when he's done -- and if he fails, he still has to pay, so she wins either way), and lately, he's been seen talking to an individual many think is the long-lost Eli.

Demons can be assigned to help or frustrate him in his quest, depending on how their Superiors feel. Angels will simply be asked to investigate the possibility that Eli is consorting with demons.

Honor and Offer -- Mammon has taken exception to the work of 'Gheliphrex for reasons he refuses to explain, as has Andrealphus. Together, the two Princes are scheming to bring down the Demon of Unexplained Noises before the paranoia and confusion that spread in his wake destabilize their Words any further. Their chosen method is simply to set up the Impudite -- if it looks like he's trying to redeem himself in Heaven's eyes, he'll soon be brought down by Asmodeus.

Unknown to them, several Archangels, including Yves himself, have assigned Angels to the job of helping Phrex

redeem. Whether or not Phrex actually wants to redeem himself is a question that only he knows the answer to. The answer is "yes"; it's just that he feels that he has to complete his current assignment first. This is likely to make an enemy of Nybbas, when it disrupts an important broadcast . . .

Demons may be Servitors of either Prince, Servitors of Secrets or the Game trying to find out what is going on, or just caught in the middle. Angels will be members of the team trying to get the Impudite to redeem.

Caladraland

Tribes of the Volcano Twins For *HeroQuest*, with *GURPS* Notes

by Jamie Revell

based on original material by Greg Stafford and Vesa Lehtinen

South of Dragon Pass lies Kethaela, more commonly known as the Holy Country, a region containing six nations, each traditionally associated with a particular element. Once united under the rule of the benign and immortal ruler Belintar the Stranger, in the four years since his mysterious disappearance, the individual nations have begun to revive their ancient rivalries. The southwestern nation is Caladraland, the land of fire.¹

The Land and the People

Caladraland is a rugged land with a subtropical climate. Geysers, hot springs and fumaroles abound throughout the region, which boasts three intermittently active volcanoes. Fire magic suffuses the area, even affecting the climate, which is drier and warmer than neighboring lands, with most of the rain falling in spring. Below the high peaks, the predominant vegetation is open evergreen hardwood forest and scrubland. Native wildlife includes brown bears, golden jackals, wild goats, yellow-face deer and saber-toothed cats.

The wild and forbidding landscape is for the most part sparsely settled. The natives are a barbarian people living in small clans based in individual villages. The clans are gathered together into loose tribal alliances on the basis of kinship or tradition, but there has been no central authority since Belintar's disappearance. Each clan practices slash-and-burn agriculture, and so must relocate to different areas as soils become depleted. While the presence of widespread agricultural magic specifically suited to volcanic soils means that such movements are less frequent than they would otherwise be, skirmishing between tribes over potential farmlands is frequent and sometimes bloody.

A moderately dark-skinned people, Caladrans wear light tunics and skirts of linen, or just simple loincloths in the height of summer. As with many Gloranthans, much of their life revolves around rituals in which the entire community comes together to cast magic to improve agriculture, ward off enemies or propitiate the gods. On such occasions, people daub themselves with ash and red pigments in patterns distinctive to their clan and their gods. Since the gods and spirits of Caladraland are believed to communicate through song, ceremonies are always musical, with singers accompanied by flutes and drums.

All adult male Caladrans, and some women, are trained to fight with bronze- or obsidian-tipped spears and can be mustered in defense or for large-scale raids. By comparison, professional warriors are relatively rare, because of the expense of maintaining them in times of peace. Nonetheless, every tribe will have a few, armed with spear, bronze axe and leather shield. Such tribal warriors sometimes wear leather armor, but generally prefer to rely on protective magic imbued in the patterns of ash they daub on their face and body before entering battle.

While the great majority of Caladrans live among the rural tribes, there are also a few large urban settlements within the nation. These are all important religious sites whose fixed nature has resulted in the creation of large temples and, with time, an urban infrastructure to serve the needs of the priesthood. It is only in the cities that specialist craftsmen can be found, along with other relatively civilized professions such as merchants and scribes. The cities trade for their food and other supplies with the neighboring tribes, but have only limited political power beyond their own boundaries.

Religion and Magic

In ancient times, before the dawn of recorded history, it is said that the goddess Caladra erupted from the earth here, creating the Vent volcano. Together with her twin brother Aurelion, born on an island far to the south, she is now the deity of the land that bears her name, and the principle object of worship of almost all of its inhabitants. The Twins share a single priesthood, whose members are the most respected members of their society. Together they represent the combined powers of earth and fire, including destruction, purification, mineral wealth and the fertility brought by volcanic ash.

Most Caladrans are initiated into the cult of the Volcano Twins when they reach adulthood. They are taught the basic magic of the gods, although only professional acolytes and priests can harness their full power. Alongside this divine magic, simple folk magic is also widespread, aiding even the most humble farmer or water-carrier in their day to day activities. A few people, mostly in the cities, worship other deities that support unusual professions such as scribe, merchant or healer, and some foreign warrior gods are also known. Finally, there is a small cult worshipping Heler, the god who brings the summer rains; his worshippers are considered strange by the common folk and tolerated only for their useful magic.

To the people of Caladraland, the world is alive with local spirits². Those associated with geysers, hot pools and fumaroles are particularly respected, and whenever a clan moves into a new region, the priests seek out these spirits to appease them and sometimes to share in their magic.

Things To Do

In past years, Belintar the Stranger kept Caladraland and its neighbors largely free from trouble through both powerful magic and political coordination. In the few years since his disappearance, however, foreign raiders have already begun to make their presence felt in increasingly daring and violent raids. The aggressive storm-worshipping Solanthi barbarians to the west of Caladraland are its most frequent foes, and both native Caladrans and foreign mercenaries might find themselves called to deal with that threat. Old rivalries between the six nations of the Holy Country are also being resurrected; in particular, the Pelaskan water-worshippers of the islands to the east raid the Caladran coastline, sometimes with the aid of their strange and sinister merman allies.

Threats exist within the country, too. Packs of saber-toothed cats and even magical lava creatures can be found wandering close to settlements. Hostile spirits may need to be propitiated, and the volcanic nature of the land leads to many natural hazards, such as clouds of smothering gas, earth tremors and, of course, actual eruptions. Foreign visitors might be in particular danger from such threats, if the priests decide that they have offended the gods. At the most extreme, human sacrifice is not unknown in Caladraland, with the bound victim thrown into a lava pit to meet the Volcano Twins in person. In a similar vein, volcanic fissures are seen as entrances to the Otherworld where the gods dwell, and suitably powerful magic might enable a raider to enter the realm and survive long enough to steal potent magical artifacts or powers. Player characters could take part in such a raid, or seek to prevent one.

Far to the north lies the expansionist Lunar Empire, devoted to a philosophy that tries to welcome all aspects of the world, even those that are evil and chaotic³. They have already captured the coastal Caladran city of Half-Town, but have made no inroads into the interior. None the less, their missionaries may be found anywhere, trying to break up established societies and overthrow ancient laws and traditions.

Some of the interesting places to visit in Caladraland include:

- **Ashmount** -- a horse trading center, sponsoring annual horsemanship competitions
- **Gemborg** -- a dwarven city built into the flanks of the Bluesmoke volcano. Although normal distrustful of humans, the dwarves here have long-standing trading deals with the Caladrans. As the name implies, the dwarves mine gems here, especially diamonds.
- **Half-Town** -- a city literally divided in half between Caladran and water-worshipping Pelaskan neighborhoods, this is now under foreign military occupation, much to the disgust of both communities.
- **The Howler** -- a particularly violent volcano, inhabited by a petty god who refuses to be propitiated as others are, and seems actively hostile to the Twins' priests. The ghosts of burning people haunt the surrounding land.

- **Lighthouse** -- a port city standing beneath an extinct volcano, on top of which stands a huge tower inhabited by an eternally glowing light spirit.
- **The Petrified Sea** -- Caladra once transformed this area of stormy sea into solid rock, where the shape of the waves can still be seen. Outlaws, cannibalistic ogres and dangerous chaos beasts are the only inhabitants.
- **The Vent** -- At 7000', Glorantha's highest volcano. On the higher slopes stands the High Temple, headquarters of the Twins' cult.

HeroQuest Keywords

Homeland Keyword

- **Occupations Available:** Entertainer (drummer, flautist, singer), Farmer, Healer, Hunter, Merchant, Priest, Scholar and Warrior (clan warrior, temple warrior; spear, axe and javelin)
- **Native Abilities:** Caladran Customs, Caladran Myths, Know Local Area, Singing. Men add Close Combat (spear), women add Foraging.
- **Typical Personality:** Energetic, Outgoing, Passionate
- **Typical Relationships:** To clan, to tribe, to chosen deity (usually the Volcano Twins)
- **Magic:** Common magic; initiated to Volcano Twins or other deity (Chalana Arroy, Ernalda, Heler, Humakt, Issaries, Lhankor Mhy, Maran Gor, Yelmadio)

Cult of the Volcano Twins Keyword

- **Mundane Abilities:** Devotee of Volcano Twins or Initiate of Volcano Twins, Mythology of Volcano Twins, Singing, Volcano Lore
- **Virtues:** Courageous, Pragmatic
- **Ash Affinity:** Armour of Ash, Choking Ash, Fertilize With Ash, Find Gems, Heal Burns, Sharpen Obsidian
- **Lava Affinity:** Burning Wind, Burning Spear, Direct Lava, Heat Ground, Ignite, Resist Heat
- **Twins Affinity:** Command Lava Daimone, Communicate Silently, Sense Volcanism
- **Secret:** Summon Eruption
- **Other Side:** The Pools of Liquid Light lie between the realms of fire and earth in the God World. In the center lie the Diamond Halls, from which a traveler may visit the Storm Age, Darkness or Underworld.

GURPS Information

Caladraland is a TL1 culture. Some iron weapons are known, but they are not produced locally, mostly being purchased from the dwarves of Gemborg. Literacy is a relatively rare advantage, being restricted mainly to the priests and some scribes in the cities. Sacred writings are carved onto copper plates, making them difficult to transport in bulk.

Typical Caladrans will have at least Singing HT-1 [1/2] and Survival (volcanic hills) IQ-1 [1]. Most men would also have Spear DX-1 [1]. Acolytes and priests of the Volcano Twins would have Singing and Geology/TL 1 at 12+ in addition to more standard professional skills.

Social Status

- 5 Chief Priest and Chief Priestess of the Vent
- 4 Senior Twin Priest
- 3 Clan chieftain, Twin Priest, highly renowned warrior
- 2 Twin acolyte, priest of minor god, renowned warrior
- 1 Wealthy farmer, specialist craftsman, healer, scribe, warrior
- 0 Farmer, hunter, craftsman, merchant, entertainer

- 1 Poor farmer, hunter or entertainer, freed slave
- 2 Slave (ash digger, water carrier)
- 3 Outcast

Magic

Gloranthan folk magic, such as that practiced by the Caladrans, is generally below the level of the magic described in **GURPS**. It can be assumed to be rolled into mundane skill levels, and requires no special rules.

Most Caladrans have some magic, but only acolytes and priests will typically have Power Investiture, reflecting their closer bond with their deity. Spells taught to worshippers of the Volcano Twins might include any of the following:

All spells of the Elemental Fire College

Earth Vision, Earthquake, Essential Earth, Seek Earth, Shape Earth, Volcano Armour, Repair

The GM might also wish to devise further spells, using those listed under the three Affinities in the Cult of the Volcano Twins keyword above as a guideline. Where possible, existing **GURPS** spells should be described so as to reflect the volcanic nature of the religion. For instance, Essential Earth would require sprinkling the ground with volcanic ash as part of the casting procedure.

* * *

¹ Information on Esrolia, the land of earth, and Heortland, the land of air, is provided in **HeroQuest**.

² Actually daimones in HeroQuest terms.

³ For more on the Lunar Empire, see **HeroQuest**, or the recently published **Imperial Lunar Handbook**.

Designer's Notes: GURPS Planet of Adventure

by James L. Cambias

I had a lot of fun writing *GURPS Planet of Adventure*. Even at the darkest times (when the manuscript was about 75 percent done and I began lying awake at night wondering if I was really cut out for game design) I was never reluctant to go back to work on it. Tschai is a fun place and I liked spending time there.

I did a close reading of the novels, taking careful notes which I then organized under the appropriate headings in the outline. Though in many places I expanded on what Jack Vance described (especially in matters like local government structure), my goal was to avoid actually contradicting anything in the text.

The book contains several adventure seeds and campaign outlines, but one idea which never made it even into the proposal was the notion of a random adventure generator. The concept fits Tschai's swashbuckling, peril-filled environment, but there just didn't seem to be enough room. So what follows isn't quite an outtake; call it a shard from a vanished reality in which *GURPS Planet of Adventure* was a 256-page tome.

The Random Tschai Adventure Generator

To create a Random Tschai Adventure, first roll to determine who the main adversaries will be. The table is biased in favor of Dirdir, Dirdirmen, Humans, and Blue Chasch, since those are the most active and numerous groups on Tschai. Wanek and Old Chasch are the least likely opponents. Since the aliens on Tschai are fairly territorial, the nature of the adversaries usually determines the location. If you're facing Dirdir, that probably means you're in Dirdir territory in Kislovan; Chasch as enemies indicates Kotan. Ordinary humans and Pnume can turn up anywhere, so the GM can pick a location that seems interesting, or simply use the current location of the party.

Example: Gamemaster Wilbur is creating an adventure for tonight's game. He rolls a 14 for the adversaries: Green Chasch. Since the Green Chasch spend all their time on the steppes of Kotan, that gives him the general location.

Next determine the goal of the adventure -- what the PCs are trying to accomplish. If the adventure is to be a long and elaborate one, roll multiple times. The first roll becomes the overall goal, with one or more subsidiary goals which must be accomplished first.

Example: Wilbur continues to create tonight's adventure. He rolls a single goal, number 12: Find an Object. He decides that the PCs will be searching for a Terran supply drop from space which was knocked off-course by hostile missile fire. It landed in Green Chasch territory, so the PCs will have to get it and avoid the alien nomads.

Another Example: Meanwhile, Gamemaster Jim wants to create an epic story arc for his Tschai campaign, which will span a month or more of gaming. He first rolls to determine the overall goal, and gets number 10: Rescue a Person. To perform that rescue, however, the PCs must first accomplish three subsidiary goals (one for each gaming session before the finale). Jim rolls three more times and gets 13, 15, and 9. So the party must defend a place, conquer a place, and reach a destination. Jim decides to rearrange them, so that the PCs have to help defend a way station against raiders, make a long trek by caravan, and finally recapture a fortress which has been seized by bandits. Only then can they proceed to rescue their lost comrade.

Once you have a goal, come up with problems. The adversaries are naturally the biggest problem, but there are others. Again, depending on how long a game session you want, roll once or several times on the Additional Perils table. For total randomness, roll a die to see how many times to roll on the table.

Additional Perils are difficulties, either serious or minor, which the characters must face in addition to the chief adversaries. Savage Beasts is pretty self-explanatory: the PCs encounter dangerous animals (or possibly carnivorous plants). In some cases the beasts may be connected to the primary adversary -- night-hounds and/or Phung if the party

is in conflict with the Pnume, for instance.

Hostile Tribes indicates that the party comes into conflict with a group of humans for reasons unrelated to the main adventure. The humans can be pirates, bandits, religious fanatics, or just xenophobic natives.

Lack of Funds may mean the party are faced with exorbitant prices beyond their means, or that they have come to a region in which sequins are not the common mode of exchange and they must find some way to get some local currency. Fraud or Sharp Practice is common on Tschai; in this case it means someone tries to cheat the party in the course of the adventure. Note that the PCs may not realize they have been cheated until it is too late to confront the crook.

Lack of Transport indicates some difficulty in getting to a particular destination -- either the party's vehicle malfunctions or is lost, commercial transport is unavailable, or there simply is no way to go to a specific place. Coping with a Lack of Transport may mean working passage, stealing a vehicle, or surviving an arduous cross-country trek.

Complications provide opportunities for roleplaying and intra-party conflict; some GMs may prefer not to roll on the Complications table. Most are self-explanatory. A Person in Distress asking for help gives the party the choice to get involved; if they do help, they may gain a useful ally -- or get suckered by a con artist. If they don't, the person may hold a grudge and take revenge later on.

A Conflict between two factions means that the PCs stumble into the middle of somebody else's battle. The battle need not be strictly physical combat, of course. Note that if one of the factions is the current adversary of the PCs, the party may be able to form an alliance of convenience with the other group. A crash, shipwreck, or mutiny is a problem with transportation that occurs in mid-voyage. Sometimes it can serve as an opportunity rather than a hazard -- PCs could join the mutineers and gain control of a vehicle as leaders.

Erotic Attachments between PCs and NPCs can lead to trouble when the relationship goes sour. In this case an NPC previously attracted to one of the party grows to dislike him; results may include awaile (suicide), simple desertion, petty revenge, betrayal, or assault.

Inadvertently offending local customs is all too easy to do on Tschai. Every group or village has its own peculiar traditions, and many of them seem designed to entrap strangers. This can be as serious as violating a taboo which carries the death penalty, or as (relatively) minor as wearing an orange sash without knowing it's the sign of prostitution.

A Traitor in the Group indicates that one of the party -- an NPC or even one of the player characters -- is working to oppose the aims of the others. This can mean the traitor is in league with their enemies, but could also indicate a personal vendetta (possibly the effect of an Erotic Attachment which has failed), or simply personal goals at odds with the group's.

Tables

Adversaries (roll 3d)

3-5:	Wanek
6:	Pnume
7:	Gzhindra
8:	Wanekmen
9:	Dirdirmen
10:	Dirdir
11:	Ordinary Men
12:	Blue Chasch
13:	Chaschmen

- 14: Green Chasch
- 15: Pnumekin
- 16-18: Old Chasch

Goal (roll 3d)

- 3-6: Escort one or more Individuals
- 7: Capture a certain Person
- 8: Steal an Item
- 9: Reach a Destination
- 10: Rescue a Person
- 11: Escape from Captivity
- 12: Find an Object
- 13: Defend a Location
- 14: Transport an Item safely
- 15-18: Conquer a Location

Additional Perils (roll 1d for the number of perils, then 1d for the nature of each)

- 1: Savage beasts (including Phung)
- 2: Hostile Tribes (ordinary Men unrelated to adversaries)
- 3: Additional Adversaries (roll again on table 1)
- 4: Lack of Funds
- 5: Fraud or Sharp Practice
- 6: Lack of Transport

Complications (roll 1d for the number of complications, then 1d for the nature of each)

- 1: Asked for Help by a person in distress
- 2: Caught up in a conflict between two factions (roll for both on Table 1)
- 3: Crash, Shipwreck or Mutiny
- 4: Erotic Attachment Sours
- 5: Inadvertently Offend Local Customs
- 6: Traitor In the Group

Spell Points

A New Arcane Magic System for the *d20 System*

by Scott Carter

The pack of winter wolves closed in on the three surviving adventurers, ragged and desperate after their fight through the ice caves.

"Quick, Serena!" yelled Keshra as she readied her flaming Kamas. "We need a fireball! Now!"

"I can't." Serena whimpered. "I forgot how."

How often in *The Lord of the Rings* do we see Gandalf sitting quietly going over his spell book? Or being unable to cast a spell at need if he had already used it that day? Or any wizard or spellcaster in any fantasy novel?

The answer is of course: never, or at least hardly ever. The peculiar habit of base ***d20 System*** wizards to be unable to cast a spell spontaneously they once knew has always bothered many people. So to has the limitation of the seemingly less-adaptable Sorcerer class. Then there is the problem of calculating spells known and spells per day when considering Ability bonuses. Once metamagic feats get involved the average spellcaster spends a great deal of time just figuring out what he can and cannot do, and with the Wizard that problem changes every "day."

To address some of these problems this article proposes the Spell Point System, a more straightforward method of choosing and casting spells in the ***d20 System***, while simultaneously being more suited to personalization and variety.

Spell Points

Spell points are a way of measuring how "in tune" a caster is with magic. Depending on your campaign world this might reflect their inherent ability to store and manipulate mana, or tap the Weave, or any other explanation you might have for the existence of magic and magical creatures.

Spells in this system cost a number of spell points (SP) equal to their spell level plus one. Therefore 0 level spells cost 1 SP, while 6th-level spells cost 7 SP. This is the cost to *both* learn and cast the spell.

When learning spells a spellcaster has a given number of SP. These can be spent to learn a lot of spells or a few spells, however the player chooses. This will mean that casters of the same level might know a widely different number of spells depending on how they have chosen to spend their SP; one PC might know a few really powerful spells while another might not know any "big" spells but be a lot more adaptable. For example, a spellcaster with 4 SP might learn four 0 level spells, two 1st level spells, one 3rd level spell, or two 0 level spells and one 1st level spell.

The number of spells per day is then equal to a number of spells whose SP is equal to or less than the total SP earned. A spellcaster who has earned 10 SP might know two 0 level spells, two 1st level spells, and one 3rd level spell. He might then cast in a day 10 0-level spells or five 1st-level spells or any other combination of spells whose SP adds up to 10 or less. At a higher level a spellcaster with 200 SP might cast two hundred 0 level spells (for some reason) or 20 9th level spells (perhaps if in combat with a dragon).

Unused SP saves but does not stack. No spellcaster can ever use more than the total SP he has earned in a day. If a spell caster has earned a total of 200 SP then he can only cast 200 SP worth of spells that day, even if in the previous day he only used 50 SP and had 150 SP "saved." Regardless of race or class, SP regenerates at the rate of 1/4 total earned SP per two hours of absolute rest, whether it is the sleep required by most races or the meditative state of elves. Therefore, casting spells whose sum cost is less than one's total possible SP in a day will not allow for more spells the

next day, but it does mean that less rest is required to once again be at the maximum SP for a day. Regular physical needs and penalties for lack of rest still apply.

Magecraft

Magecraft levels limit Spellcasters by putting a cap on how powerful a known spell can be. Magecraft 1 allows for a caster to know spells whose base cost (the cost before adding metamagic feats) is 4 SP or less and he cannot cast any one spell with an adjusted cost (cost after calculating any metamagic feats) more than 4 SP. Magecraft 2 increases the cost to 7 SP, while it increases to 10 SP with Magecraft 3.

Metamagic

In this system magic users never "prepare" spells, nor do they need a spell book; they simply cast the spells they know until their energy is so drained they can cast no more. They still requires any components the spells might need. The use of metamagic feats must be adjusted accordingly, since there is no preparation. To apply metamagic feats, calculate the SP for a spell based on the spell slot it would have used in the standard system. In most cases this simply means adding a number of SP equal to the spell slot adjustment given in the Feat description. For example, *magic missile* is a 1st-level spell and would cost 2 SP to know and cast. If Empowered using the metamagic feat it would be a treated as a 3rd-level spell and therefore cost 4 SP to cast. If it was Empowered, Maximized, and cast Still and Silent it would be considered an 8th-level spell and cost 9 SP to cast. Metamagic feats can be applied at any time. Players do not have to learn the improved version of a spell, as long as they know the base spell and have the appropriate Feats.

Spell related factors such as save DC or Spellcraft checks work as in the standard system.

Spell Points And World Variations

The Spell Point System can be used to alter the nature of magic in a campaign world. In the typical **d20 System** fantasy world, magic is equally common throughout and works much the same from one place to another. This does not have to be the case. The Spell Point System can be used to introduce Mana Levels, Ley Lines, and other magical variations into a campaign world. The SP costs to learn and cast spells would be typical of a Normal Mana area, but some areas might have different degrees of mana. A traveling spellcaster can encounter many in the course of his adventures. While mana differences do not affect the SP cost to learn spells, or the total spells known, it does affect the SP to cast. When entering an area with a different mana level, GMs should allow players a check against Knowledge (Arcana), Spellcraft, or another appropriate skill to become aware of the change. If the first check fails, a new check should be allowed every time an attempt at casting is made. Successful results might reveal only the fact that the mana level has changed, the direction of the change, or go into details as the game warrants. Alternately, in-game clues can be left to direct players to a better understanding of their environment. GMs who wish to hide the magical nature of the area should keep track of player's SP using the adjusted levels, ultimately revealing to the player that he has less SP left than he thought, or that he has suddenly discovered a new reserve of energy.

In a low-mana area indigenous spellcasters would be rare, as would creatures with spell like abilities. In such an area add 1 SP to the cost to cast any spell. Increasing DC for Use Magic Device, decreasing area effects, and increasing the number of rounds needed for a spell to take effect would heighten the sense that magic does not work as well in this area. SP regeneration takes twice as long. If using the idea of Ley Lines and Nodes (threads of power that carry magical energy) a low mana area would have few or no such lines. Spellcasters would rely on the minimal background mana for spells.

In a high-mana area, native magic users would be common. All local NPCs might have at least one level as a spellcaster and magical creatures would be more abundant than in the average campaign world. Spells in a high mana region would have cost to cast reduced by 1 SP. Spell effects have a greater duration and area. Magic items are easier to use and receive small bonuses to their abilities. SP regenerates at the rate of 1/4 total SP every hour of rest. Ley Lines would be thick in this region.

Very high mana regions should be scarce, and perhaps only exist for short periods of time. They might be sites of power for ancient gods, natural geysers of mana, or markers of extra-planar intrusion in the campaign world. Spells are easy to cast, costing 2 to 4 SP less than normal, and some spells might even be cast for free. Spells with varying effects would always yield the greatest possible result. Powerful magical creatures are likely to be drawn to such places, making them exceedingly more dangerous. Spellcasters resting in such an area would find their SP regenerated at the rate of 1/2 total SP for every hour of rest. Ley Lines converge into unnaturally dense nodes here, and using any magical device can be unpredictable.

On the opposite end of the spectrum, no-mana areas should be equally rare. Spellcasters who enter such an area would find that their spells are very difficult to cast, costing twice the SP. Once SP is used, it's gone, completely, no regeneration. Spellcasters would be wise to stay out of such regions. Unnatural and magical creatures would not exist at all, and might slowly revert to their more mundane counterparts if they happened to wander in and stay for an extended period of time. Magical items lose their puissance in such an area, and magical devices do not work. Optionally, GMs might choose to treat a no-mana area as an extended version of a beholder's anti-magic field, in which no spells work. Best reserved for extremely small areas, canny players might actually learn to use such pockets of anti-magic to their advantage.

Another variation GMs might introduce relates to kinds of mana. In some areas the type of Ley Lines might affect certain schools of magic or energy effects. Ley Lines that conduct elemental energies would allow some spells to be cast more easily, while others could only work at a greater cost. To add further color to a game world, a GM could allow spellcasters born in a particular region a benefit to learning certain kinds of spells and a penalty on others.

Below is a new spellcaster basic class that is designed to take the place of the Sorcerer and Wizard classes. The SP bonuses at each level are calculated to represent a spell per day capacity that falls roughly halfway between the Sorcerer's and the Wizard's. A modified version of school specialization and the Wizard's bonus feats has been retained to provide greater adaptability.

The Mage

Colloquially mages are referred to by different names depending on their governing attribute. Spellcasters who rely on Charisma are called Sorcerers; Wizards rely on Intelligence, while Warlocks and Witches rely on Wisdom. A mage may have come to his power through study, observation of nature, or through self-awareness. He is likely to have been guided by a book, mentor, or tradition, even one understood poorly at first. Since mages take different paths to their powers, it is difficult to generalize them. However, all mages are motivated by their dedication to the Art. Since they believe that magic touches every aspect of life they are often insightful, very aware of the world around them and quick to try and learn more about it.

Abilities: Mages cast spells dependent on their Charisma, Intelligence, or Wisdom, as chosen by the player at character creation. This Ability cannot be changed later. To cast a spell the Mage must have a governing Ability of 10 + the spell's level. At each level the Mage gets a certain number of Spell Points + bonus spell points at his Ability's Modifier in levels 1-10. Starting at the 11th level he gains further Insight into his craft and gets a bonus of $+ 2 \times$ his Ability Modifier.

Alignment: Any

HD: d4

Class Skills: Class skills are Alchemy (Int), Concentration (Con), Craft (Int), Gather Information (Wis), Knowledge (all skills, taken individually) (Int), Profession (Wis), Scry (Int, exclusive skill), Search (Wis), Sense Motive (Wis) and Spellcraft (Int)

Skill Points at Level 1: $(2 + \text{Intelligence modifier}) \times 4$

Skill Points at Each Addition Level: $2 + \text{Intelligence modifier}$.

Class Features

Weapons and Armor Proficiency: Mages are proficient with all simple weapons and are not proficient with any

armor or shield. Armor can interfere with somatic components of spells and can cause them to fail.

Spells: A Mage casts spells based on the Spell Point System. He starts with Magecraft 1 and the ability to learn spells whose base cost is 4 or less, likewise he may cast any spell he has learned whose adjusted cost is 4 or less. At the 7th level he progresses to Magecraft 2 and at 14th to Magecraft 3.

Bonus Languages: A Mage may substitute Draconic or any one Outsider language for one of the bonus languages available to the character because of his race. This ability reflects the variety of paths one may take to become a Mage.

Familiar: A mage may obtain a familiar as a sorcerer.

Bonus Feats: At the 1st, 5th, 10th, 15th, and 20th levels a Mage gains a bonus feat. This feat must be a metamagic feat revised for the Spell Point System or an item creation feat.

Specialization: A mage may choose to specialize in a magic school. Spells in the chosen school cost 1/2 (rounded up, never less than 1 SP) while forbidding access to spells in an opposing school or schools. This allows for quicker access and more frequent casting of powerful spells in the chosen school at the expense of variety. For opposing schools see the Wizard entry in the standard *d20 System*.

The Mage

Level	Base Attack Bonus	Fort Save	Ref Save	Will Save	Additional SP per level	Special
1	+0	+0	+0	+2	9	Familiar, Magecraft 1, Bonus Feat, + SP per level = Ability Modifier.
2	+1	+0	+0	+3	+3	
3	+1	+1	+1	+3	+3	
4	+2	+1	+1	+4	+6	
5	+2	+1	+1	+4	+6	Bonus Feat
6	+3	+2	+2	+5	+9	Magecraft 2
7	+3	+2	+2	+5	+9	
8	+4	+2	+2	+6	+12	
9	+4	+3	+3	+6	+12	
10	+5	+3	+3	+7	+15	Bonus Feat
11	+5	+3	+3	+7	+15	Insight (grants +SP per level = 2 × Ability Modifier)
12	+6/+1	+4	+4	+8	+18	Magecraft 3
13	+6/+1	+4	+4	+8	+18	
14	+7/+2	+4	+4	+9	+18	
15	+7/+2	+5	+5	+9	+21	
16	+8/+3	+5	+5	+10	+21	Bonus Feat
17	+8/+3	+5	+5	+10	+21	
18	+9/+4	+6	+6	+11	+24	
19	+9/+4	+6	+6	+11	+24	
20	+10/+5	+6	+6	+12	+24	Bonus Feat

Other Classes

Obviously, retooling the other arcane magic-using classes will take some additional effort. To keep the classes relatively balanced, calculate SP per level based on the number of spells that can be cast per day without bonuses due to Ability Modifiers. A bonus SP can then be given for Ability Modifiers at each level to reflect bonus spells gained. Magecraft 1 is given at first level, Magecraft 2 is given when the class would have access to 4th level spells, and Magecraft 3 is given when the class would have access to 7th level spells.

Pregenerated NPCs can be played with the original arcane spellcasting class as given if chosen. Simply take for granted that they would choose to use their SP in a way that would reflect the more traditional system. While there are some obvious differences in magic abilities between the standard versions and the mage, for short-term use NPCs they should not be too significant. Otherwise, the DM may choose to take the NPCs caster level and convert it to the mage

and select spells as closely as possible to the given spell list.

Divine magic users can be converted using a similar system to the one outlined here. However, in many ways it makes more sense for a divine spell caster to spend time in meditation or prayer each day, preparing spells then as needed. If you wish to totally adopt the Spell Point System, change Magecraft to Soulcraft and apply as given. Domain spells can either be bought for 1/2 SP, as with School Specialization, or at each level the Cleric can be given a designated number of SP that must be spent on spells within the chosen domains. The latter is probably more reflective the class description as given in the base ***d20 System***.

Ultimately, a full application of the Spell Point System in any game world would require a lot of time and playtesting. What has been presented here is just an attempt to add more variety and adaptability to your game play, while minimizing time spent on spell selection. Whether you want to play a "big gun" spellcaster who stands on the battlefield decimating armies or a quiet scholar poking around in ancient tombs for mystic secrets, the mage class can be adapted to your desires. The point is to have fun in a world of magic.

And don't forget your fireball.

Traveller's Aide #1: Personal Weapons of Charted Space

Published by [Quiklink Interactive/RPG Realms](#)

Written by Martin J. Dougherty with Fred Mars, Shane Mclean, Megan Robertson and Mark Urbin plus Frank G. Pitt

Art by Bryan Gibson, Chad Fidler and Steve Bryant

48-page b&w softcover; \$10.95

The first supplement to be released for RPG Realms' *d20 System* adaptation of the *Traveller* setting is *Personal Weapons of Charted Space*. Also the first in the *Traveller's Aide* series, it looks specifically at the type of melee weapons and firearms carried by "Travellers" (or adventurers) during a game, but not guns or other hardware of a military nature. Thus weapons such as the Advanced Combat Rifle, the Gauss Rifle, and all Fusion and Plasma Guns will be detailed in another supplement, as will armor and other defensive systems. Further, it provides statistics for not only [Traveller T20](#), but also *Classic Traveller*, drawing specifically from *Book 1*, *Book 4*, and *Supplement 4* of the *Classic Traveller* line, as well as *MegaTraveller* and later incarnations.

The layout of this slim supplement is clean and tidy, with just the occasional line drawing of a melee weapon or more frequently a firearm to break up the text. It could use more of these illustrations and the lack of them -- especially for some of *Traveller's* more esoteric weapons -- is perhaps the only real letdown to *Personal Weapons of Charted Space*. Two types of voice are employed throughout, one objective for the rules and associated subjects, while the other is subjective, used to present in-game thoughts and opinions upon the place of personal weapons within the Third Imperium.

Personal Weapons of Charted Space opens with a look at "Weapons Permits And Accreditation." Specifically, this is a look at how the Imperium regards its citizens holding, owning and using weapons of all types. For the most part, those characters that muster out of their career with a weapons benefit will also be granted an Imperial Weapon Permit. This may be General -- allowing ownership of any weapon within a category -- or Specific, restricting ownership of a single weapon within a category. The purpose of the permit system is to stop the trade by arms dealers to low-law worlds, but the Ministry of Justice will also intervene where its jurisdiction supersedes that of the local law. Of course, characters are really in trouble with the Imperial authorities if they lack permits for their weapons, but that will only happen if the characters bring such implements to the attention of said authorities. The referee is free to use these rules or not as he wants, but they could be used to form the basis of an adventure or two, as the characters go in search of a much wanted permit for say, an Advanced Combat Rifle.

Before presenting all of the weapon statistics in a series of tables for both game systems, the supplement examines every type one by one. Each is given a description that corresponds to the average model of that type, including some of the more esoteric categories, such the Discharger (Baton or Thud Gun, and Riot Gun) and also the Non-Lethal category (sprays, tranq guns, sonic Squealers, and electric stun guns). Also covered is a range of sights from the telescopic to the Heads-Up Display, plus various types of ammunition.

Where the tables so neatly organize and categorize average examples of each weapon, the next set examines those produced by some of the Gateway Region's leading arms manufacturers and suppliers. These are accompanied by descriptions of both the companies and their products, which makes for interesting reading as well as serving to add a dash of color to a character's particular weapon of choice. Although this information is particular to the Gateway

Region, there is nothing to stop the GM from adopting them for his own campaign, or using the information to as a model to create weapons for that campaign.

The few new rules in ***Personal Weapons of Charted Space*** are mainly aimed at the **T20** referee. They cover Weapons Detectors and Weapons Concealment for those times when characters do not want to advertize that they are armed, and of course, the penalties for when they are caught. The penalties listed are guidelines only, as on some worlds the law is more stringent than on others. Rules for burst and fully automatic fire, area and suppressive fire, and panic fire are included for both **T20** and **Classic Traveller**. Together with the rules for gun combat from either version of **Traveller**, the referee should be able to cover most situations that the characters land themselves in.

The supplement is rounded out with nine Patron Encounters presented in the standard format, plus a single Amber Zone. This last is by Frank G. Pitt, while the various Patron Encounters come from the book's other contributors as well as its author. All of them have a weapon orientated theme -- which isn't surprising given the nature of this book -- and all are generic enough that they could be set in almost any campaign or setting.

Not every **Traveller** campaign is necessarily going to need a book of guns, but in all likelihood, most will. Unless the GM is running a military or mercenary-orientated game, ***Personal Weapons of Charted Space*** is likely to be all that he needs in the way of a supplement on this subject. Of course, it will be useful for such military campaigns in addition to the future supplements planned by the publisher. Either way, ***Personal Weapons of Charted Space*** is well written, easy-to-use (despite the lack of an index), and reasonably priced for what it provides. Cleverly aimed at the owners of both the original and the latest incarnations of **Traveller**, referees of either should have a copy of this supplement on hand for their games.

Pyramid Review

Monster Manual v.3.5 (for Dungeons & Dragons)

Published by [Wizards of the Coast](#)

Written by Skip Williams

Revised by Rich Baker & Skip Williams

320-page color hardcover; \$29.95

This is the book that the third edition *Monster Manual* should have been.

First and foremost, it has more monsters in its 96 more pages, which increases the play value over the original right there, even if all are drawn from previous *Dungeons & Dragons* material. Some, like the gauth, are radically changed from their old *Advanced Dungeons & Dragons* appearances, but the vast majority of the creatures included are from the *Monster Manual Third Edition* or other third edition works like the *Psionics Handbook* and the *Manual of the Planes*.

This new edition takes the stat block format of the *Monster Manual II* (itself improved over the original version in *Monster Manual*) and refines it further. The improvements include separate lines for standard and full attack action, the clear marking of which feats are bonus feats, and the inclusion of the Level Adjustment for PC monsters. The only minor nuisance is that *Monster Manual v.3.5* uses the simplified 3.5 space statistic (which is only an issue if you preferred the third edition facing rules).

Where the new *Monster Manual* really shines is the tools it gives for customization. The system behind monster abilities was not made explicit in the third edition; you could do customization, but the book omitted details. That's changed. Now extensive guidance is given on improving monsters by adding hit dice, class levels, and templates. As mentioned above, the difference between bonus feats and merely typical feat choices are marked. Monster creation rules are now included, expanded and better explained than their previous publications in *Dragon Magazine* and the *Monster Manual II*. The monsters-as-characters sections are vastly expanded and improved (in most cases, at least -- some like locathah got shortchanged). This alone almost justifies the \$10 price differential between the first printing of the *Monster Manual Third Edition* and *Monster Manual v.3.5*.

The biggest defect of the new *Monster Manual* compared to the old is how the monsters are organized. The most glaring example is the dispersal of the animal subtype. In the move to the 3.5 version, all beasts were reclassified as either animals or magical beasts, but the newly-categorized animals were not moved into the Animal chapter, while those that were animals in the third edition were not moved to the main monster chapter. The vermin also remain in a separate section. But the entries that always made the most sense to keep separated -- the templates, which are functionally dissimilar to all the other entries -- are now entirely interspersed in the main monster chapter. This makes less sense than either the way the previous *Monster Manual* did it or a combined alphabetical listing interspersing the animals, vermin, and templates.

Yet the greatest overall defect of the new *Monster Manual* is inherited directly from the old -- lousy layout. We still have entries irregularly broken over two columns and page changes, wrapping around borderless images. This does mean more information per page, but is frustrating to read. Many argue that the original didn't deserve its Origins Award for graphic design, and this one is just as bad.

Then there are the relatively minor things, both good and bad. The new narrative descriptive text communicates the

appearance and feel of the monsters much more effectively than the old, irregularly placed descriptions. There are the inevitable mistakes, like the mismatch between the descriptive text of the kolyarut and its picture, of course. Some of the fixes from third seem a bit odd; for example, mechanically, the crossbow always made more sense for kobolds than the sling, but 3.5 changes the crossbow to a sling in the stat block instead of the slings to crossbows in the text. The round-by-round tactics on a few entries (like the mind flayers) are nice, but not very common. It's nice they've added an actual table of contents for the book above the alphabetical listing of monsters.

All-in-all, the ***Monster Manual v.3.5*** is a vast improvement over the third edition version. It is so much so, in fact, that even if you're planning to stick with the ***Third Edition*** of the ***Dungeons & Dragons*** rules, you should seriously considering buying it anyway. As said at the beginning of the review, this is the book that the ***Monster Manual Third Edition*** should have been. If you're playing ***Dungeons & Dragons***-style fantasy with a non-***d20 System*** game, this book may be useful for you, too. But this is labeled "Core Rulebook III" and means it -- if you aren't playing in the ***d20 System***, and aren't playing ***Dungeons & Dragons***-style fantasy, then there isn't much here for you.

Pyramid Review

Formula Dé Mini

Published by [Jeux Descartes/Eurogames](#)

Created by Eric Randall & Laurent Lavaur

Illustrated by Bernard Bittler

Graphic design by NEXUS/Guillaume Rohmer

Edited by Ron Magin

One double-sided mounted map board, one 20-sided die and five specialty dice, eight cars and eight spoilers in four colors, eight wooden gearshift pawns, eight "dashboards" with jig-cut ends, 200 Life Point tokens, 16-page full-color rulebook (German, French, Spanish, and English rules); \$24.95

It's not as though *Formula Dé* was all that tough a game to get into to begin with, but perhaps Euro Games needs a way to pull in more raw recruits. To introduce fledgling racers to the larger game, they now offer a slimmed down version called *Formula Dé Mini*.

The game runs, in most ways, identically to its parent system. Players take the role of a driver in charge of one or more little plastic racecars and run laps around a track. Dice are thrown to see how many spaces you move, and higher gears offer more spaces. When the flag waves, the driver must consider how best to strain his car to get into, and keep, the lead. Cars zip past each other from one lane to the next, taking dangerous hairpins by making sure their playing piece stops in each turn before entering the next straightaway. You can make a pit stop to repair the wear and tear suffered by your vehicle thus far, but you risk losing the lead as you do so. The first person to cross the finish line after the third lap is the winner.

Most of the differences between the old and new incarnations are small, but there are a number of them. For starters, one of the tracks provided has only two lanes instead of the usual three, which means less maneuvering room. The most noticeable change is wear points. Where you used to have to track several sets of points -- wear on your tires, fuel usage, brakes, etc. -- you now track only Life Points. These are represented by small plastic disks that look like gold coins. Each car gets 20 of these, and they are expended no matter what happens to your vehicle. If you run your engine too hot in a high gear, you lose an LP. If you bump into another racer, your bodywork stands to lose another LP. If you run out of LPs and suffer more damage, your car is destroyed.

There are still pit stops, though the addition of LPs changes how they are adjudicated. There are fewer rules: no weather effects and tire choices here. Once per game, you have the option of spending three LPs to advance one additional space (almost every game will have an occasion where you'll be glad you can do this).

Turns on the track used to be rated for the number of stops you had to make in them. The tighter the turn, the more stops you had to make, slowing your progress considerably. In the Mini version, you need only make one stop in every corner you take (then again, the straightaways aren't as long). Sixth gear (and its corresponding die) is gone, as are the little pads of sheets you use to score one-, two-, and three-lap races. In their place you're given eight cardboard tracks (called, alternately, "dashboards" or "cockpits"), two each of four colors. They list all six gears but the sixth gear is

graphically "faded" out. If you want to tell apart two cars of the same color, you can still switch the attachable colored fenders. The cardboard tracks come with jig-cut extensions so if you have a red car with a blue fender, you can affix a blue puzzle piece to the end of your red track. There are eight wooden pawns, also in the same color scheme as the tracks, for keeping track of your current gear.

The components are still first-rate. The board is heavy, mounted, double-sided (you get two tracks), and sports the same surreal artistic backdrop as the other maps in the series. The LPs are tough little chunks of plastic, the cars and their detachable spoilers are apparently cast from the same quality molds as the originals, and it's hard to argue with little wooden pawns. Given the premium components in the box, the price is a small miracle.

The big question about the game is really "Why do a simplified version?" Perhaps producing map after map supplement wasn't pulling in the cash. This design doesn't run much faster (nor, to be fair, any slower), and a lot of the new rules may rankle die-hard **Formula Dé** fans, but some of the changes actually play rather well. As such, it might have made more sense to provide the changes as an optional supplement to the full version, or even post them as extras to the company website.

If you already have the larger set, there's little point in buying **Formula Dé Mini**. The new components aren't hard to duplicate (just use pennies or beads instead of LPs), and once you've played a friend's copy of the smaller set, you can't help but remember any rules you want to swipe. **Formula Dé Mini** comes in a smaller box compared to its hefty papa, but the difference in play space required is negligible. Buying **Formula Dé Mini** first and then moving up to the full game seems like a waste of money, given that complexity doesn't change significantly either.

None of this is to say **Formula Dé Mini** isn't a worthwhile game -- it is, providing the same fast, challenging, and entertaining racing experience -- but buyers need to beware. Neither version is clearly better, they're just different. If you feel the need for speed, your decision should probably be based on comparing the price tags, because **Formula Dé Mini** sports no other advantages that put it in the lead over its predecessor.

Dork Tower!

Dork Tower!

Big Brother is an Idling Bachelorette Survivor

Conclusion

by Steven Marsh

The final confrontation between our two stalwart BBiaIBS competitors was a titanic . . .

Aw, heck; it's not like we're relying on the suspenseful conclusion to buoy our ratings for our sponsoring advertisement puppeteers. Let's just go right to the results, shall we?

1. **Andy Vetromile** -- 3.4594 (320 votes)
2. **Sandy Antunes** -- 3.2823 (333 votes)

And so the winner was Andy Vetromile, who -- even now -- has been whisked off to the lavish BBiaIBS corporate headquarters and awarded with a recording contract, a copy of the home game, and all the 100-siders he can stuff in his cheeks. Sandy Antunes, as the BBiaIBS runner-up, does not need to endure any of these fates.

We thank all our competitors for rising to the challenge, and our readers for indulging our little experiment.

And we now return you to your normal *Pyramid* Magazine, already in progress.

Eight Million Bayonets

Bayonet Fencing in GURPS WW2

by Marc Goldstein

"In my training as a young officer I had received much instruction in how to kill my enemy with a bayonet fixed to a rifle. I knew all about the various movements -- right parry, left parry, forward lunge. Indeed, I had been considered good on the bayonet-fighting course against sacks filled with straw, and had won prizes in man-to-man contests in the gymnasium."

-- General Bernard Montgomery

During the World War II all the major Allied and Axis nations issued bayonets to their troops and retained rifle-bayonet drills as a key component of basic training, even though bayonets had been derided as military weapons since the age of Napoleon. Actual casualties caused by bayonets diminished rapidly as the weapons of war grew more fearsome. During WW2, modern tanks, artillery and aircraft made daylight bayonet charges a preposterous anachronism. On the occasions that fixed bayonets did see use, it was often to murder unarmed prisoners and civilians without wasting ammo. Nevertheless, the bayonet retained a powerful mystique. It symbolized the military spirit and hearkened back to a more chivalrous age, when killing was done up close and personal. This article describes the bayonets used in WW2 and outlines a martial arts style -- Bayonet Fencing -- appropriate for use in a **GURPS WW2** campaign. To use the style templates, you will need **GURPS Compendium I**. Also highly recommend are **GURPS Martial Arts**, **GURPS Swashbucklers**, and the [errata](#) for **GURPS Japan, Second Edition** to make full use of the style templates.

The Fourth Form of Fencing

Like bayonets themselves, rifle-bayonet fighting techniques originated in France, where bayonet was considered the fourth form of fencing following foil, épée, and saber. The early styles derived their movements from French and Italian fencing and from spear fighting skills passed down by European armsmasters. George McClellan translated his 1852 Manual of Bayonet Exercise for the U.S. Army directly from French sources.

The armies of Britain and Japan took keen interest in improving their bayonet drills. Britain eventually instituted a fencing system derived from the Italian school. This style, unfortunately, emphasized presentation over purpose. During competitions, rifle-bayonet fencers were forbidden to grapple, emit battle-cries, or strike with anything save their rifle. The Japanese, finding the French program inadequate, drew on their own armed martial arts tradition. Techniques from spear and staff fighting were integrated into a unified bayonet fencing style, called Juken-Jutsu, in the late 19th century. In a 1904 rifle-bayonet fencing competition, a Royal Marine team was routed by a Japanese Army team that kicked, kneed, pushed, and screamed while attacking. After that, British instructors loosened the restrictions on vocalizing. Nonetheless, most European nations (and the U.S. Army) adopted versions of the British system around the time of the First World War.

Training & Tactics

In the 19th century, soldiers sparred with flexible, blunt-tipped training bayonets fixed to old surplus or dummy rifles. They practiced drills against cavalry and foot soldiers armed with lances, sabers, pikes, and bayonets. They also rehearsed executing mass bayonet charges in rigid formations. By the time World War II began, the goal of bayonet drilling had drifted from teaching a sophisticated fighting system toward simply instilling aggression and confidence. With live bayonets, soldiers trained by charging practice dummies. For sparring, they used sheathed bayonets or padded pugil sticks which began to replace training bayonets in the 1930s. Unfortunately, pugil sticks lent themselves more toward staff techniques, emphasizing swinging attacks at the expense of more efficient thrusts.

Many instructors, attempting to inure troops to the horrors of battle, went out of their way to make bayonet drills traumatic. U.S. drill instructors stuffed dummies with animal entrails, while the Japanese army took the next horrific step and ordered soldiers to execute bayonet attacks on bound, helpless prisoners.

The Russians learned a profound respect for the bayonet during the Russo-Japanese War, where the Japanese had successfully executed unnerving banzai charges at night. Unfortunately, this experience encouraged both sides to labor under badly out-dated tactics. The First World War caused other countries recognize that success in modern warfare depended more upon small-unit actions and individual close-combat rather than mass bayonet charges. Russian and Japanese drills, however, continued to teach soldiers how to perform bayonet charges in tight formations. Both nations would revise their tactics as the war progressed, but bayonets still played an important role. The Japanese became masters of night-time infiltrations, creeping through enemy lines to bayonet sleeping soldiers in their foxholes. The Soviets employed similar tactics, especially in urban combat zones like Stalingrad.

While mass bayonet charges were obsolete, rifle-bayonet fencing still held value for any unit that anticipated close-combat skirmishes with the enemy. For this reason paratroopers, marines, commandos, and units specializing in jungle or urban warfare received extensive bayonet training.

The simplest bayonet fencing programs taught footwork, weapon handling, parrying, thrusting, and striking with the butt of the rifle. More comprehensive programs added throw-point lunges, slashing attacks, feints, leg sweeps, and combination maneuvers. Some instructors also taught soldiers the proper way to use their rifle as a club when the bayonet was dismounted.

Few soldiers received sufficient training time to actually qualify for the Bayonet Fencing styles described below. In a realistic campaign, run-of-the-mill riflemen will not possess any special training beyond one or two points of Spear skill. Only elite troops, close-combat instructors, and other specialists should qualify to study Bayonet Fencing or Juken-Jutsu. On the other hand, the style is especially well suited for heroic and cinematic campaigns!

On Guard!

Rifles make clumsy hand weapons: they are covered with knobs, buttons, levers, and other protuberances; they are not specifically balanced for use as hand weapons; and after several rapid-fire shots, their barrels get too hot to handle safely. A fixed bayonet is used with Spear skill at a -1 penalty. With or without a bayonet, the rifle may also be used with Staff skill at -1 (see weapon table below). When grasped by the barrel and swung like a club, a rifle uses Two-Handed Axe/Mace skill at -1. When mounted, a bayonet disturbs the rifle's balance and alters the vibrations of the barrel, degrading accuracy. Apply a -1 penalty to Guns skill.

Many techniques for parrying attacks and striking with the rifle butt depended on stances taken from staff fighting, especially as pugil sticks supplanted training bayonets for sparring. It requires a Ready action to switch from spear to staff grip and vice-versa. Instructors taught soldiers to aim butt strikes at the head, abdomen, and groin; while bayonet thrusts were aimed at the abdomen, chest, or throat.

Weapon Table

Staff (Two hands, Parry at 2/3 skill)

Name	Type	Damage	Reach	Weight	ST	Cost	Notes
Rifle Butt	Cr	Sw	1	--	9	--	Staff skill -1
	Cr	Thr+2	C,1	--	9	--	Staff skill -1

Bayonet Fencing

This style template describes the European forms of Bayonet Fencing. It includes no complementary grappling or

brawling techniques; these were covered in other hand-to-hand combat drills, and were not holistically integrated into bayonet instruction. Similarly, use of the dismounted bayonet as a knife was taught elsewhere.

GMs should feel free to tinker with the template. During WW2, bayonet drills varied not only from nation to nation, but often from unit to unit! For example, the U.S. Army and Marine Corps adopted completing systems (see the Biddle style below). For realistic campaigns, it is certainly reasonable to limit players to watered-down versions of this style. Nations issuing spike bayonets would omit the Tip Slash. Programs that emphasized pugil stick sparring often lacked thrusting maneuvers like the Lunge. In general, bayonet instruction became more simplified in the later years of the war.

Soldiers picked to compete on fencing teams would emphasize the sport-oriented bayonet skills (some critics argue that pugil stick sparring only teaches the "Sport" version of these fighting skills).

Bayonet Fencing

7 points/-- points

Primary Skills: Spear, Staff.

Secondary Skills: Body Language.

Optional Skills: Fast-Draw (Bayonet), Spear Sport, Staff Sport, Tournament Law (Bayonet Fencing), Two-Handed Axe/Mace.

Maneuvers: Hit Location (Spear or Staff), Lunge [thrust] (Spear), Pass [thrust] (Spear), Retain Weapon (Spear or Staff), Tip Slash (Spear).

Cinematic Skills and Maneuvers: None.

Anthony Joseph Drexel Biddle (1874-1948) was a pioneer of hand-to-hand combat training in the U.S. Marine Corps during the First World War. In 1937, the Corps published Biddle's close-combat instruction manual, *Do or Die*. The Corps recalled him to active duty in 1942 at age 68 to serve as a close-combat instructor. Biddle's bayonet fencing style drew heavily from swordplay; Biddle insisted attacks be parried with the bayonet blade and restricted use of butt strikes. Some questioned the real combat effectiveness of Biddle's program; U.S. Army close-quarters combat expert Rex Applegate dismissed Biddle's "duelist approach." Nonetheless, the Marine Corps taught Biddle's system throughout the war.

Biddle Bayonet Fencing

9 points/-- points

Primary Skills: Spear, Staff.

Secondary Skills: Body Language.

Optional Skills: Fast-Draw (Bayonet), Spear Sport, Staff Sport, Tournament Law (Bayonet Fencing).

Maneuvers: Feint (Spear), Hit Location (Spear), Lunge [thrust] (Spear), Pass [thrust] (Spear), Retain Weapon (Spear), Sweep (Spear), Tip Slash (Spear).

Cinematic Skills and Maneuvers: None.

Juken-Jutsu

Like most nations, when Japan adopted the bayonet they also inherited the French bayonet fencing style. Finding the French program unsatisfactory, the Japanese army supplemented it with techniques from Sojutsu (spear fighting) and Bojutsu (staff fighting). The unified style, Juken-Jutsu, was formalized in the late 19th century. In addition to field training, most large Japanese bases had dojos dedicated to bayonet training, where various kata could be demonstrated and practiced.

While all Japanese riflemen studied Juken-Jutsu, few could dedicate enough time to qualify for the full style description below. GMs running realistic campaigns may restrict players to diluted versions of the style. Like most Asian martial arts, Juken-Jutsu was infused with mystical import and lends itself well to cinematic abilities.

Primary Skills: Brawling, Spear, Staff, Sumo Wrestling.

Secondary Skills: Body Language.

Optional Skills: Fast-Draw (Bayonet), Brawling Sport, Spear Sport, Staff Sport, Tournament Law (Bayonet Fencing).

Maneuvers: Hit Location (Spear or Staff), Kicking, Knee Strike, Lunge (Spear), Pass [thrust] (Spear), Retain Weapon (Spear or Staff), Spinning Strike (Spear or Staff), Sweep (Spear or Staff), Sweeping Kick, Tip Slash (Spear).

Cinematic Skills and Maneuvers: Kiai, Power Blow (Spear), Sweeping Counter Parry (Staff or Spear), Whirlwind Attack.

WW2 Bayonet Catalog

Australia

Owen Mk. 1 Knife Bayonet

254mm (10") single-edged blade with semi-spear point. Treat as a regular Bayonet.

Fits Owen submachineguns.

In 1943 Australia introduced this bayonet for its native Owen machine carbine. It was essentially a shortened version of the British Pattern 1907.

Finland

m/27 Sword Bayonet

420mm (16.54") single-edged blade with spear point. Treat as a Long Bayonet.

Fits VKT Kivääri malli 27, 28, and 28-30 rifles.

Among their improvements to the Mosin-Nagant M1891 rifle, the Finns replaced the Russian spike with a sword bayonet.

m/39 Knife Bayonet

300mm (11.81") single-edged blade with spear point. Treat as a regular Bayonet.

Fits SAKO Kivääri malli 39 rifles.

Believing its sword bayonets too cumbersome, Finland introduced the Kiv/39 rifle in 1941 with a shorter, handier knife bayonet.

France

Epée-Baionette Mle 86/35

335mm (13.19") cruciform spike. Treat as a regular Bayonet of Cheap quality with no cutting edge.

Fits Lebel Model 1886 rifles.

These old Lebel épée-style bayonets were retooled and shortened in 1935. The thin spikes still frequently bent or snapped under duress. The original Mle 86 bayonets boasted a 520mm (20.5") blade. Some could still be found in

service during WW2 (treat as a Cheap-quality Long Bayonet with no cutting edge).

MAS 36 Bayonet

330mm (13") cruciform spike. Treat as a regular Bayonet, with no cutting edge.
Fits the MAS 36 rifle.

Stored and mounted in a hole in the rifle's forearm, the MAS 36 bayonet was designed to never leave its rifle. No scabbard was issued, and it lacked a proper handle for use as a knife when dismounted (apply a -1 penalty to Knife skill).

Germany

S84/98 Knife Bayonet

250mm (9.84") single-edged blade with spear point. Treat as a regular Bayonet.
Fits Mauser 1898 carbines and rifles.

The standard bayonet issued to German riflemen during WW2.

Italy

Modello 91 Knife Bayonet

300mm (11.81") single-edged blade with spear point. Treat as a regular Bayonet. Fits Mannlicher-Carcano Fucile Modello 91 rifles and carbines.

The standard bayonet for older versions of the Modello 91 rifle.

Modello 91/38 Folding Knife Bayonet

175mm (6.87") single-edged blade with spear point. Treat as a Small Knife or as a regular Fixed Bayonet when mounted.
Fits Mannlicher-Carcano Fucile Modello 91/38 rifles and carbines.

This design folded like a pocket knife, allowing the blade to fold down below the barrel when the bayonet was fixed. The folding mechanism proved fragile and later designs deleted the feature altogether.

Japan

Type 30 Sword Bayonet

395mm (15.55") single-edged blade with clip point. Treat as a Long Bayonet.
Fits the Arisaka Type 38 and 99 rifles; Type 100 submachineguns; Type 11, 96, and 99 light machineguns.

This sword bayonet was issued to Japanese troops from 1897. Quality was Good until the final months of the war, when material shortages reduced production versions to Cheap quality.

United Kingdom

Pattern 1907 Sword Bayonet

432mm (17") single-edged blade with semi-spear point. Treat as a Long Bayonet.
Fits SMLE No. 3 rifles and Lanchester SMGs.

Leftovers from the First World War, the Pattern 1907 saw use in the Pacific and other secondary theaters where the old No. 3 rifles were still plentiful. The Australians and Indians were particularly fond of them. Factories in Britain, India and Australia continued to produce the Pattern 1907 through 1945.

No.4 Spike Bayonet

200mm (7.88") spike. Treat as a regular Bayonet of Cheap quality with no cutting edge.
Fits SMLE No. 4 rifles (and Sten SMGs from 1944).

Britain converted to this crude spike in the late 1930s primarily to conserve resources and ease manufacturing burdens. It was uniformly disliked by troops. It lacked a handle for use as a knife when not mounted, though Home Guards were issued a "broomstick" attachment that allowed it to be used as a close-combat thrusting weapon (use Knife skill at -1.)

No.5 Knife Bayonet

203mm (8") single-edged blade with bowie point. Treat as a regular Bayonet.
For the No. 5 "Jungle Carbine" version of the SMLE rifle, the British returned to a proper knife bayonet design. It was accepted for service with the No. 5 rifle in September 1944.

U.S.A.

Model 1905 Sword Bayonet

405mm (16") single-edged blade with spear point. Treat as a Long Bayonet.
Fits the Springfield M1903-A3 and M1 Garand.

The U.S. began the war with this vintage sword bayonet. U.S. arsenals manufactured a virtually identical copy, designated the Model 1942, in 1942 and 1943.

M1 Knife Bayonet

253mm (10") single-edged blade with spear point. Treat as a regular Bayonet.
Fits the Springfield M1903-A3 and M1 Garand.

Believing that the 1905 and 1942 bayonets were unwieldy and wasteful of resources, the U.S. military decided to shorten the blades of existing sword bayonets. This shortened design was dubbed the Model 1905E1. When the 1905E1 proved successful, manufacture of the new design was accepted in 1943 as the M1.

M4 Knife Bayonet

172mm (6.75") single-edged blade with spear point. Treat as a Small Knife or as a regular Fixed Bayonet when mounted.
Fits the M1 Carbine.

The army approved this bayonet for use with the M1 carbine in July 1944.

U.S.S.R.

Mosin-Nagant 1891 Socket Bayonet

500mm (19.69") cruciform spike with flat-head screwdriver point. Treat as a Long Bayonet with no cutting edge. Fits Mosin-Nagant M1891 rifles.

Fitting with Red Army doctrine, this bayonet was designed to always be fixed to the rifle. It had no handle for use as a knife when dismounted and was not issued with a scabbard.

SVT-40 Knife Bayonet

244mm (9.62") single-edged spear point. Treat as a regular Bayonet. Fits SVT-40 rifles.

In a break from Red Army policy, this bayonet came with a sheath and was mounted only when needed. The earlier SVT-38 rifle was originally issued with a 362mm (14.25") blade (treat as a Long Bayonet).

Class Action: Ability Focused Characters

Self-Improvement Classes for *d20 System* Games

by Owen K.C. Stephens

The class and level structure of *d20 System* games assumes characters spend most of their time pursuing a career or vocation of some kind. While a wide variety of life paths can be simulated with the vast number of classes now available and multiclass combinations mixing them, very little exists for characters who focus on improving themselves. A character who wishes to focus on improving his Strength or endurance outside the paltry one ability point improvement every four levels has few options.

In fantasy games, this is often overcome through the use of magic items. A player who wishes his barbarian to become known for his great Strength simply buys a pair of gloves that augment his physical power. While this works on a game-mechanical level, it's often unsatisfying for players who see their characters as more than a collection of possessions or numbers.

Since raising an ability score can have significantly more impact on a character than a single feat, it's not mechanically sound to allow feat gains to be spent on ability score increases. The only other mechanism for a character to improve is class levels. Thus presented below are six short prestige classes, each emulating a character's increase in physical or mental abilities after a period of training.

Though these are not traditional prestige classes, in that they do not represent a change in a character's vocation to some specialist or acceptance by a particular group or order, they do model a character spending considerable effort to improve one aspect of himself to the exclusion of advancement in his actual vocation. The prerequisites for these classes are simple, but do restrict the classes to characters who have already spent some effort to improve their ability score. This represents the amount of time and effort any self-improvement regimen requires before results become noticeable.

Strength Focused Character

The strength focused character spends a great deal of time exercising, eating high-protein foods, and testing his physical might by lifting, bending and breaking things he comes across. Most strength focused characters are warriors who wish to become even more dangerous with a great sword, who or engage in combat-sports such as wrestling or pugilism. A few, however, are more frail individuals who seek not herculean muscles, but just enough extra power to carry a few more books without being so weighed down they cannot move.

Prerequisites

- 8 or more ranks of a Str-based skill.
- Must have increased Str ability score by 1 or more points.

Table 1-1 Strength Focused Level Progression

Base Level	Attack Bonus	Fort. Save	Ref. Save	Will Save	Special
1	+1	+0	+0	+0	Great lift
2	+2	+0	+0	+0	Increased Strength
3	+3	+1	+1	+1	Mighty effort
4	+4	+1	+1	+1	Increased Strength
5	+5	+1	+1	+1	Constant effort

Class Rules

The game rules for playing a strength focused character are listed below.

Health: In games using hit points, strength focused characters receive 1d8 hit points plus their Con modifier at each level. In games using some other form of health points a strength focused character should receive fewer than a dedicated soldier, but more than scholars, rogues or technicians.

Skills: A strength focused character's class skills [and the key ability for each skill] are Climb (Str), Craft (Int), Jump (Str), Profession (Wis), and Swim (Str). In games using new or unusual skills, a GM should add any skill with a key ability of Str to the strength focused character's class skills.

A strength focused character receives a number of skill points equal to (2 + Int modifier) at each level.

Proficiencies: A strength focused character gains no armor or weapon proficiencies.

Great lift: The strength focused character has learned to apply his Strength more effectively for long periods of time. this increases the amount of weight the character can carry by 50%. All calculations based on the character's carry capacity (lift over head, lift off ground, push or drag) are calculated from this increased carrying capacity.

Mighty effort: The strength focused character is able to call upon a surge of strength when attempting brief, short-term acts of physical power. Whenever the strength focused character makes a Str check to break down a door or break an object, he gains a +4 circumstance bonus to the check. This also applies to grapple checks made to escape a grapple or pin, but not any other grapple checks.

Increased Strength: A strength focused character gain a +2 to his Str ability score at 2nd level. This increase is treated just as if the character had added Str points using his ability score increase gained every 4 levels, but is separate from that gain. The strength focused character's Strength increase by another 2 points at 4th level.

Constant effort: The bonus to Str checks the strength focused character gains from his mighty effort ability is now applied to all Str checks and Str based skills, as well as all grapple checks.

Dexterity Focused Character

Dexterity focused characters must train themselves to improve their speed, coordination, agility, and flexibility. His often involves throwing small blades, juggling, contortions, stretches, and sleight-of-hand tricks. Most dexterity focused characters are rogues or entertainers seeking to improve their numerous Dex-based skills. Archers and similar ranged combatants also sometimes become dexterity focused characters, though only those who wear light armor gain the full benefits over a straight fighting class.

Prerequisites

- 8 or more ranks of a Dex-based skill.
- Must have increased Dex ability score by 1 or more points.

Table 1-2 Dexterity Focused Level Progression

Base Level	Attack Bonus	Fort. Save	Ref. Save	Will Save	Special
1	+0	+0	+2	+0	Spry
2	+1	+0	+3	+0	Increased Dexterity
3	+2	+1	+3	+1	Great agility
4	+3	+1	+4	+1	Increased Dexterity
5	+3	+1	+4	+1	Great agility

Class Rules

The game rules for playing a dexterity focused character are listed below.

Health: In games using hit points, dexterity focused character s receive 1d6 hit points plus their Con modifier at each level. In games using some other form of health points a dexterity focused character should receive fewer than a typical adventurer or missionary, but more than a scholar or cloistered priest.

Skills: A dexterity focused character's class skills [and the key ability for each skill] are Balance (Dex), Craft (Int), Escape Artist (Dex), Hide (Dex), Move Silently (Dex), Open Lock (Dex), Profession (Wis), Ride (Dex), Sleight of Hand (Dex), Tumble (Dex) and Use Rope (Str). In games using new or unusual skills, a GM should add any skill with a key ability of Dex to the dexterity focused character's class skills.

A dexterity focused character receives a number of skill points equal to (4 + Int modifier) at each level.

Proficiencies: A dexterity focused character gains no armor or weapon proficiencies.

Spry: The dexterity focused character's training has paid off, increasing his agility, hand-eye coordination, and manual dexterity. The dexterity focused character gains a +2 bonus to all Dex checks and Dex-based skills.

Increased Dexterity: A dexterity focused character gain a +2 to his Dex ability score at 2nd level. This increase is treated just as if the character had added Dex points using his ability score increase gained every 4 levels, but is separate from that gain. The dexterity focused character's Dexterity increase by another 2 points at 4th level.

Great agility: The dexterity focused character is allowed to choose one of the following special abilities: +10 base move, evasion, skill mastery (3 Dex-based skills) or uncanny dodge. At 5th level the dexterity focused character may select a second special ability. If the uncanny dodge, took evasion at 3rd level he may take improved evasion at 5th, and if he took uncanny dodge at 3rd level he may take improved uncanny dodge at 5th.

Constitution Focused Character

Typical constitution focused characters are survivalists who have had a near-death (or return-from-death) experience, and wish to harden their bodies and minds against the dangers of the world. They expose themselves to the elements, eat diets full of special herbs, and push their bodies until they hurt, then learn to ignore the pain. Overtime they harden themselves to the ravages of diseases, poisons, exhaustion and wounds. Even so few characters take more than a few levels of constitution focused character, with only extremists pursuing the test of flesh to its outer boundaries.

Prerequisites

- Great Fortitude feat
- Must have increased Con ability score by 1 or more points.

Table 1-3 Constitution Focused Level Progression

Base Level	Attack Bonus	Fort. Save	Ref. Save	Will Save	Special
1	+0	+2	+0	+0	Hard to Kill
2	+1	+3	+0	+0	Increased Constitution
3	+2	+3	+1	+1	Endurance
4	+3	+4	+1	+1	Increased Constitution
5	+3	+4	+1	+1	Ascetic

Class Rules

The game rules for playing a constitution focused character are listed below.

Health: In games using hit points, constitution focused character s receive 1d12 hit points plus their Con modifier at each level. In games using some other form of health points a constitution focused character should receive more than any other class, even dedicated fighters.

Skills: A constitution focused character's class skills [and the key ability for each skill] are Concentration (Con), Craft (Int), and Profession (Wis). In games using new or unusual skills, a GM should add any skill with a key ability of Con to the constitution focused character's class skills.

A constitution focused character receives a number of skill points equal to (2 + Int modifier) at each level.

Proficiencies: A constitution focused character gains no armor or weapon proficiencies.

Hard to kill: The constitution focused character has toughened his body and honed it to stand up under massive punishment. He has also learned to push it beyond the boundaries of its normal limits. The constitution focused character has a 50% chance of not taking damage if he takes a standard action while disabled, a 50% chance of stabilizing when at negative hit points, and doesn't die until he reaches a number of negative hit points equal to his Con score or -15 (whichever gives him the most hit points to death).

Increased Constitution: A constitution focused character gain a +2 to his Con ability score at 2nd level. This increase is treated just as if the character had added Con points using his ability score increase gained every 4 levels, but is separate from that gain. The constitution focused character's Constitution increase by another 2 points at 4th level.

Endurance: At 3rd level the constitution focused character gains the endurance feat as a bonus feat. If the character already has this feat, he doubles all the bonuses to checks it provides.

Ascetic: The constitution focused character needs only half the sleep, food and water as a typical member of his species.

Intelligence Focused Character

Intelligence focused characters are generally scholars, researchers and spellcasters who find they spend too much time going to others to find answers to important questions. These characters are driven to know everything, and to learn how facts and ideas can be built off one another through creative thinking, logic, and rigorous testing of practical theories. They spend most of their spare time reading ancient texts, working logic puzzles and word games, and designing experiments to test the physical laws of their world. Only dedicated scientists, inventors and researchers take the full set of this class' levels, as spellcasters lose too much arcane power.

Prerequisites

- 8 or more ranks of an Int-based skill.
- Must have increased Int ability score by 1 or more points.

Table 1-4 Intelligence Focused Level Progression

Base Level	Attack Bonus	Fort. Save	Ref. Save	Will Save	Special
1	+0	+0	+0	+0	Knowledgeable
2	+1	+0	+0	+0	Increased Intelligence
3	+1	+1	+1	+1	Increased Intelligence

Class Rules

The game rules for playing an intelligence focused character are listed below.

Health: In games using hit points, intelligence focused character s receive 1d4 hit points plus their Int modifier at each level. In games using some other form of health points an intelligence focused character should receive the fewest of any other class, on par with research scientists, wizards and commoners.

Skills: An intelligence focused character's class skills [and the key ability for each skill] are Appraise (Int), Craft (Int), Decipher Script (Int), Disable Device (Int), Forgery(Int), Knowledge (all)(Int), Profession (Wis), Search (Int) and Spellcraft (Int). In games using new or unusual skills, a GM should add any skill with a key ability of Int to the intelligence focused character's class skills.

An intelligence focused character receives a number of skill points equal to (8 + Int modifier) at each level.

Proficiencies: An intelligence focused character gains no armor or weapon proficiencies.

Knowledgeable: An intelligence focused character gains a +2 bonus to all Knowledge checks, and may make Knowledge checks untrained. If the character has a special knowledge-based ability (such as bardic knowledge), the bonus applies to these checks as well.

Increased Intelligence: An intelligence focused character gain a +2 to his Int ability score at 2nd level. This increase is treated just as if the character had added Int points using his ability score increase gained every 4 levels, but is separate from that gain. The intelligence focused character's Intelligence increase by another 2 points at 3rd level.

Wisdom Focused Character

Wisdom focused characters are rare, most often coming from primitive or shamanistic cultures. Hey go on lengthy vision quests, meditate, contemplate their dreams, and practice perception games designed to increase their general awareness. Some philosophers, priests, and poets intentionally try to focus on their personal wisdom, while other characters find their way into this class after undergoing an enlightening experience, effectively stumbling into the class.

Prerequisites

- 8 or more ranks of a Wis-based skill.
- Must have increased Wis ability score by 1 or more points.

Table 1-5 Wisdom Focused Level Progression

Base Level	Attack Bonus	Fort. Save	Ref. Save	Will Save	Special
1	+0	+0	+0	+2	Intuition
2	+1	+0	+0	+3	Increased Wisdom
3	+2	+1	+1	+3	Increased Wisdom

Class Rules

The game rules for playing a wisdom focused character are listed below.

Health: In games using hit points, wisdom focused character s receive 1d6 hit points plus their Wis modifier at each level. In games using some other form of health points a wisdom focused character should receive more than scholars and wizards, but fewer than adventurers and scouts.

Skills: A wisdom focused character's class skills [and the key ability for each skill] are Craft (Int), Heal (Wis), Listen (Wis), Profession (Wis), Sense Motive (Wis), Spot (Wis) and Survival (Wis). In games using new or unusual skills, a

GM should add any skill with a key ability of Wis to the wisdom focused character's class skills.

A wisdom focused character receives a number of skill points equal to (4 + Int modifier) at each level.

Proficiencies: A wisdom focused character gains no armor or weapon proficiencies.

Intuition: A wisdom focused character has heightened his intuition to an extraordinary degree. He can often realize something, without knowing how or why he gained the knowledge. The character may avoid being surprised even if unaware of an impending attack by making a Wis check (DC 18), and move on the surprise round if successful. Additionally, the GM should instruct him to make Listen, Sense Motive and Spot checks anytime there is valuable information to be gained by such checks, even if the character's player doesn't think to seek such information. The DC for such checks is 5 higher than if a character was looking for something specific, but the checks are a free action.

Increased Wisdom: A wisdom focused character gain a +2 to his Wis ability score at 2nd level. This increase is treated just as if the character had added Wis points using his ability score increase gained every 4 levels, but is separate from that gain. The wisdom focused character's Wisdom increase by another 2 points at 3rd level.

Charisma Focused Character

Charisma focused characters are almost always performers, artist, writers or romantics. They study classic plays, practice painting, sculpting or music, and make an effort to understand and sympathize with everyone. Many charisma focused characters are schemers and con men, who ruthlessly use their good charms to take advantage of others and ain a lifestyle they have not earned. Others are truly kind souls, who are well liked because they are bright cheerful folk. Spies, performers, courtiers, courtesans and diplomats are most likely to undertake a regimen of mental exercises to increase their appeal, though some spellcasters who fuel their magics with force of personalty do so as well.

Prerequisites

- 8 or more ranks of a Cha-based skill.
- Must have increased Cha ability score by 1 or more points.

Table 1-6 Charisma Focused Level Progression

Base Level	Attack Bonus	Fort. Save	Ref. Save	Will Save	Special
1	+0	+0	+0	+0	Alluring
2	+1	+0	+0	+0	Increased Charisma
3	+1	+1	+1	+1	Increased Charisma

Class Rules

The game rules for playing a charisma focused character are listed below.

Health: In games using hit points, charisma focused character s receive 1d4 hit points plus their Int modifier at each level. In games using some other from of health points an charisma focused character should receive the fewest of any other class, on par with research scientists, wizards and commoners.

Skills: A charisma focused character's class skills [and the key ability for each skill] are Bluff (Cha), Craft (Int), Diplomacy (Cha), Disguise (Cha), Gather Information (Cha), Handle Animal (Cha), Intimidate (Cha), Perform (Cha) Profession (Cha), and Use Magic Device (Cha). In games using new or unusual skills, a GM should add any skill with a key ability of Cha to the charisma focused character's class skills.

A charisma focused character receives a number of skill points equal to (6 + Int modifier) at each level.

Proficiencies: A charisma focused character gains no armor or weapon proficiencies.

Alluring: A charisma focused character learns how to make friends and influence people. They can conceal their personal dislikes, compliment people they consider entirely unremarkable, and ingratiate themselves easily into a party. This Grants them +2 bonus to all Cha checks and Cha based skills.

Increased Charisma: A charisma focused character gain a +2 to his Cha ability score at 2nd level. This increase is treated just as if the character had added Cha points using his ability score increase gained every 4 levels, but is separate from that gain. The charisma focused character's Charisma increase by another 2 points at 3rd level.

Pyramid Review

Heart of the Machine (for Dragonstar)

Published by [Mystic Eye Games](#)

Written by Stefon Mears

Illustrated by Ed Bouelle, Brad McDevitt and Jeremy McHugh

Cartography by Ed Bouelle

64-page b&w softcover; \$13.99

Although there have been no adventures from Fantasy Flight Publishing for [Dragonstar](#), its *d20 System* campaign setting that really put *Dungeons & Dragons Third Edition* into space, the company granted Mystic Eye Games the licence to publish them instead. The first of these was *Raw Recruits*, an adventure designed to take the player characters from 1st to 4th level as the crew of the Starship Evarstanza, a vessel strangely shaped like a tin opener lying on its side . . .

The second and latest is *Heart of the Machine*, an adventure designed for 4th-level characters that takes place on a minor world beyond the Outlands of the Dragon Empire. Drelga has a small Imperial population, mostly living around the star port city of Drelandan; that city supports the mining and fishery industries that provides the planet's major exports. The player characters can start the scenario as natives of Drelga, but the adventure set-up works better if they are visiting during a stopover, perhaps while their ship could have its Starcaster (the *Dragonstar Campaign Setting's* equivalent of the FTL drive) recharged. If the DM has run the earlier *Raw Recruits*, then this ship could just as easily be the Evarstanza.

[BEGIN SPOILER ALERT!]

Heart of the Machine begins with a young man imploring the party for aid and telling them that he has witnessed a kidnapping, while the two men following him claim that he owes gambling debts. Of course, the young man's tale of kidnapping is true, tying into a rash of disappearances, and the others are members of a kidnapping gang known as Jack 23. Now that the player characters have some inkling of this, the gang will do its best to shut them up, and the party will have to investigate and act against Jack 23 to stop the assaults on them. The trail leads them to one of the gang's hideouts and hints of strange experimentation, and from there out into the wilderness to the alien source of these experiments.

[END SPOILER ALERT]

The adventure is decent enough, its plot being the *Dragonstar* equivalent of the necromancer wanting fresh bodies for his zombie horde, but it is rather linear and should neither challenge an experienced group, nor provide more than a long session or two. But where the *Heart of the Machine* really scores is in the support it adds to both the adventure and a campaign. For the adventure there are several well-mapped locations, including a motel, a bar, Drelga's First Unification Church, a Druidic Grove and a pair of gang hideouts. All of the NPC's are fully statted up, as are four ready-to-use player characters.

For the campaign, there are rules for handling vehicular chases by rolling on a chart of on-the-road encounters, while a separate table provides an example for use in the adventure, should the DM not want to roll himself. There are also

new spells and equipment, a new race (the villains of the plot), and a lot of new vehicles and robots. The vehicles range from ground cars, hover cars and bikes up to several economy starships. All of these are welcome additions to the **Dragonstar** setting, but they are let down by a lack of illustration, especially for the spaceships. Of the four new spells, the most interesting are *Analyse Lifeforce*, a 1st-level arcane spell that allows the caster to ascertain whether a target is dead or alive, its Hit Dice, and what creature Type/Subtype it is, while the zero level *Arcane Umbrella* protects the caster from the rain.

Although each of the several locations described in ***Heart of the Machine*** comes with several adventure hooks, no advice is included for continuing the main story thread of the adventure. Instead, the page that comprises "Appendix 4: Continuing The Adventure" just reprints the hooks already given. Not only does this waste a page, it also feels rather cheap when the time could have been taken to suggest possibilities beyond the adventure.

In terms of production, this book has its good points and its bad. The good includes the writing (which covers most of the actions that the characters might undertake during the adventure) and also the the nicely done maps. Just as nicely done are the "Theme Boxes," which clearly indicate to the DM how the adventure can be scaled to the abilities and the level of the player characters (whether they include either several fighters, rogues, or mechanists within the party or particularly capable members of these classes), and possibilities for if the players prefer to roleplay rather than roll-play. While the artwork can be said to be at best average, the really irritating problem with the layout are the boxes used to contain stats for minor NPCs. Placed at the edge of the text's two-column layout, they are unbordered, but done on a grey background with their contents poorly positioned within them. To be blunt, these are ugly as sin, and give the book a very amateur feature that stands out like a sore thumb. Also giving the book a very amateur look is the complete lack of apostrophe use throughout the book, and while a space between the word and the letter "s" is left, it does look rather odd and takes some getting used to.

These problems aside, what ***Heart of the Machine*** really provides is a reasonable interlude between the rest of a DM's own campaign. Its set up is perfect for this and once played does include plenty of items that can be added to a campaign. Had its really minor problems been addressed prior to publication, it would have been better described as decent rather than reasonable, but ***Heart of the Machine*** is still worthy of a **Dragonstar** DM's attention.

Pyramid Review

Lunar Rails

Published by [Mayfair Games](#)

Created by M. Robert Stribula

Boxed set; \$38.00

Some of Mayfair Games' earliest successes were the *Empire Builder* series of rail games. After the initial success of *Empire Builder* (since re-released as *North American Rails*) numerous games have followed that have adapted the same enjoyable game mechanics to other regions. Thus we have had *British Rails*, *Eurorails*, *Japan Rails*, *Australia Rails*, *India Rails*, and even *Iron Dragon*, an attempt to re-locate the system to a fantasy world. After all of these locations, I was left wondering what could conceivably be covered: South American Rails, maybe, or perhaps Africa Rails. Then the thought struck me: wouldn't an adaptation of the system to the moon be interesting?

Apparently someone else had the same idea . . .

After several years in development, *Lunar Rails* has finally been released. It is an excellent addition to the series, with enough novelty in its execution to challenge even the experienced player of the other Mayfair rails games. Players old and new will find something to enjoy in *Lunar Rails*.

First, the basics. For those unfamiliar with the system, the game itself is very simple. The map is a wax-coated board with a series of dots overlaid onto the terrain. The object of the game is to make money by first building and then shipping loads along a rail system. Crayons are provided to draw line right on the board, which can be wiped clean at the end of each game; no two games are the same, as players build competing lines of rail track. Each player is given a certain amount of money with which to build a few lines of initial track, and then dealt three demand cards, each of which gives three possible delivery runs for three different amounts of money. Players must manage the pickup of commodities, which are only available at certain locations on the boards, and their deliveries to various cities on the map. In the first portion of the game, profits are ploughed back into the frantic building of rail lines to service different cities and acquire different sources of commodities. Later in the game, players can upgrade to swifter or more capacious trains, as they concentrate on making money faster than their rivals. To complicate matters, every so often in the commodities deck there are hazard cards that cause various problems (rail strikes, excess profits tax, etc.) which cause problems, and throughout the game in the construction of rail lines there are terrain features to be reckoned with (mountain areas cost twice as much to build into as flat areas, and so on). The winner is the first player who comes up with \$250 million, and who has connected to a specified number of the major cities on the map.

Lunar Rails adds a few new wrinkles to the tried-and true Mayfair train game formula. This is, after all, the moon, so some of the commodities are different: in addition to familiar products like tourists, bauxite, and fruit, one has unusual things like scientists, KREEP ore, He³, and so on. In addition, the moon has a some unique terrain features. For instance, the larger craters are detailed on the board, and provide a special building challenge. Also, there are no rivers to flood and wreck track as in previous Mayfair train games; here the hazards are meteor strikes, which can hit randomly and destroy sections of track unpredictably. Furthermore, due to the scale of the game, there are a great many more mountains, particularly on the Far Side of the moon, which make rail-building tricky. There are other minor differences as well; since the moon's gravity is lighter, trains run a little faster than in other Mayfair train games. However, the biggest difference (and the most novel for experienced players) is the nature of the board itself: instead of being a rectangular projection of a section of territory, it is the two faces of the moon, Near Side and Far Side, with special connector points around the rim of each. What this means is that one can build track off the end of one face of the moon and on to the end of another, nicely simulating that although the map is flat, one is, in fact, playing on the

surface of a sphere. This adds an element of three-dimensionality to the game that is novel for new players and experienced players alike. One has to balance the fact that areas which don't necessarily look close to each other may in fact be so.

It is this three-dimensional element that adds the largest element of strategy to the game. My wife is an experienced Mayfair train games fiend, and we have discovered that despite her skill, she is very often beatable at ***Lunar Rails***, even by less-experienced players. Long-standing Mayfair fans might find the mental switch from a two-dimensional to a three-dimensional playing field to be a bit of an adjustment, though I like it just fine. Otherwise, there are very few design problems to the game. The only one we have noticed thus far is that in every game we have played to date, whoever built on the Far Side first and monopolized the profitable D'Alambert Crater robot or Tsiolkovsky Crater diamond commodity runs usually won. Whether this is a matter of strategy or an accident of the demand cards drawn for each game remains to be seen. Furthermore, Mayfair train games usually boast the minor benefit of an educational function, as they teach the player the geography of the areas in which game they're playing. While this is true (and in the case of geography-ignorant Americans, usually helpful), but somewhat less of a feature of ***Lunar Rails***, given that all of the settlements on it are fictitious. The craters are real, though, and the designers have thoughtfully labeled some of the major American and Russian 20th century landing sites of historical interest -- a nice touch that maintains some educational interest to the game. I did find that my prior knowledge of lunar geography gave me a definite edge over other new players, until they learn the terrain and it stops being confusing to them. Any other difficulties I had with the game are minor. As with all Mayfair products, graphics and production design are excellent overall. My only peeves were the designs of the trains on the train cards, which look like locomotives instead of the advanced rocket-propelled or maglev units that are described in the rules, though naming them after historical rocket types was a nice touch. Furthermore, in a nod to a Certain Movie, a commodity available only at Tyco Crater is alien Artifacts -- these are represented by a little squiggle design on the commodity cards when, darn it, they should have been little black rectangles . . .

Overall, ***Lunar Rails*** is a very enjoyable game. It offers much for the beginning player, while still remaining challenging for the experienced player. And the pedagogical value of learning the lunar geography is always useful. It is my hope that this one might be able to rope some of the science fiction fans into the enjoyable world of Mayfair train games. This may be the board game that fans of ***Transhuman Space: High Frontier*** or ***GURPS Terradyne*** have been waiting for. Who knows; maybe ***Mars Rails*** waits on the horizon . . .

--C.J. Beiting

The Shadow Under Dunwich

"[The Suffolk coast is] quite new to me except that I read of it in the Odyssey as the shore of Hades. Do you know it? It is unlike any other known to me. Fancy a cathedral city, which had its Bishop and members and six great Churches, one a minster, and an immense monastery and hospital for lepers -- and now the sea has slowly swallowed all but two shells of ruined masonry, and just twenty cottages, inn and school included. This is Dunwich -- literally built on the sand -- on and behind a high crumbling sea-bank, looking out to a sea where the nearest land is Denmark."

-- Algernon Charles Swinburne, letter to Edwin Harrison of Jan. 10, 1876

At once quotidian and mythical, the town of Dunwich is Suffolk's best known sacrifice to the sea. Its desolation inspired poets and horrorists, but sprang from nothing more mysterious than the wind and the waves. Slowly, however, the tides and storms built up a skerry of legend and lore running from the throne of Tristram to the land of the dead. With that in mind, let's go down to Dunwich.

"Her town of Dunwytche is by Rage and Surges of the Sea daylie wasted and devoured, And the Haven of her Highness' said Towne, by diverse Rages of Wyndes continually landed and barred, so as no Shippes or Boats can either enter in or oughte . . ."

-- from the royal records of Queen Elizabeth I (1578)

Although three Roman roads point resolutely to Dunwich, nobody has managed to find the slightest sign of Roman occupation, despite what must have been a tempting harbor. Hence, the history of Dunwich town begins rather abruptly with the Saxons, or rather the Angles, under whose King Sigeberht in the 7th century Dunewic was briefly the capital of East Anglia and seat of the bishopric of St. Felix. Dunwich went from strength to strength, repelling a rebel siege by Robert of Leicester in 1173 and gaining a Templar "temple" in 1185 and a charter in 1199 -- its population was probably over 3,000. By the mid-13th century, Dunwich's eighty galleys were fighting the king's wars, shipping golden Suffolk corn to Flanders, and raking in huge catches of herring from the North Sea. But the burghers of Dunwich had already been forced to build a sea wall (at their own expense) and continuously dredge the mouth of their harbor as the shores slowly crept south and west. And then the storms began.

On the night of the vernal equinox in 1286, "through the Vehemence of the Winds, and Violence of the Sea, several Churches were overthrown and destroyed," and Dunwich began to falter. Citizens turned to piracy and smuggling, gaining the town a bad reputation at court, which cost it dearly in lawsuits with the Bishop of Ely and with other towns along the coast. On January 14, 1328, another storm blocked the harbor entirely, and one in 1349 washed away 400 houses in Dunwich. Without their harbor, the people of Dunwich could not pay to rebuild; the relentless sea consumed building after building. Four churches drowned by 1385, two were demolished in 1540 before the sea could take them, and in 1608 the Temple went "over the cliff." Cemeteries slid down the cliffs, bones and coffins sticking out of the shingle on their way into the deeps. The Dunwich marketplace drowned in 1677, ending the town's economic existence. In December of 1739, a great storm leveled the remains of the village, and on November 12, 1919 the last church tower in Dunwich collapsed into the strand. Dunwich had ceased to be a place long before its last resident was buried in its last churchyard, in 1826. But like the all-consuming sea itself, the idea of Dunwich continued to erode and undermine the brittle, bright rationalism of post-Enlightenment Britain.

*"Tombs, with bare white piteous bones protruded,
Shroudless, down the loose collapsing banks,
Crumble, from their constant place detruded,
That the sea devours and gives not thanks.
Graves where hope and prayer and sorrow brooded
Gape and slide and perish, ranks on ranks.
Rows on rows and line by line they crumble....
Earth, and man, and all their gods wax humble
Here, where Time brings pasture to the sea."*

-- Algernon Charles Swinburne, "By the North Sea" (1880)

The printer John Daye, a resident of Dunwich, commissioned John Stowe to write a history of Dunwich in 1573, to capitalize on the Elizabethan taste for "ancient Britain." Although for some reason the history never wound up getting published, London antiquarians kept the memory of "sunken Dunwich" alive long enough for the ruins to become a picturesque spot for Gothic tourism. One such picturesque Goth, the poet Algernon Charles Swinburne, was powerfully affected by the Dunwich genius loci. His poem "By the North Sea" sets out a cosmology of human works -- including God and the gods -- drowned in the all-devouring sea of Time. It uses the "one hollow tower and hoary/Naked in the sea-wind" of Dunwich's All Saints Church as a central image, and alludes to the "displaced, devoured and desecrated" graves of Dunwich's cemeteries. Swinburne was an excellent and devoted swimmer, but the sea in his poetry is always both numinous and terrifying: "impelled of invisible tides, and fulfilled of unspeakable things/White-eyed and poisonous-finned, shark-toothed and serpentine-curved."

And in that respect, he resembles the other bard of Dunwich, whose works also speak of the transience of pitiful human gods and histories beneath the tread of Time -- and who also warns of the "unspeakable things" beneath the sea -- [H.P. Lovecraft](#). Lovecraft's Dunwich was inland, although intriguingly based in part on towns drowned by the construction of the Quabbin Reservoir in 1926. But his once-prosperous, now wracked shipping town of Innsmouth also echoes Dunwich's later history of murder and inanition. (The fen country around Dunwich still leads England in webbed feet and other deformities.) Lovecraft (like Swinburne) got ideas from dreams and visions; like Swinburne, he was occasionally subject to fainting spells or even fits. Lovecraft read Swinburne, and must have been affected by Swinburne's lines: "Ye are Gods, and behold, ye shall die, and the waves be upon you at last/In the darkness of time, in the deeps of the years, in the changes of things,/Ye shall sleep as a slain man sleeps, and the world shall forget you for kings." Lovecraft adopted a Swinburnian meter to some of his poetry (especially "Nemesis"), described Swinburne as "the only real poet either in England or America since the death of Mr. Poe," and eventually placed himself and Swinburne in the same "aesthete-pagan tradition."

Other writers were also seemingly trapped in the Dunwich undertow. H. Rider Haggard visited Dunwich often, and mentioned it in (intriguingly female-titled) novels like *Red Eve*, *Stella Fregelius*, and *The Witches Head*. Edward Fitzgerald, who translated the [Sufi mystic](#) Omar Khayyam, also seemed drawn to Dunwich, visiting it constantly between 1855 and 1878 despite describing it as "rough lodging." Even Jerome K. Jerome, whose hapless boaters seemed to symbolize Victorian innocence, found Dunwich irresistible, and was on his way there when he died of a sudden stroke in 1927.

"The coldest winter in memory was 1709

The sea froze off the coast of France all along the Neptune line

By the lost town of Dunwich the shore was washed away

They say you hear the church bells still as they toll beneath the waves."

-- Al Stewart, "The Coldest Winter in Memory" (1989)

But if Swinburne and Lovecraft are working to wash Dunwich out into the sea of myth, it seems that Dunwich itself is an outcropping of fact joined to the peculiarly British legend of the "sunken city." In Dunwich, they say, you can hear the church bells still ringing deep under the sea -- despite the decree of Queen Elizabeth that the bells of Dunwich churches be melted down to pay the town's increasing debts. But Britain is ringed round with submerged church bells -- lost Shipden in Norfolk, Selsey in Sussex, Kilgrimod in Lancashire, and Ravenser on the Humber for instance. Spectral bells also ring out from the famous Cantref y Gwaelod in Wales and Lyonesse in Cornwall. Both claim to be the original of the Breton legend of "Ker Ys," in which drunken lust leads a woman to open the bronze sea-gates and submerge the town, from which one single rider escapes. Dunwich, in Stowe's legendary history at least, had "brazen gates" in its "stone wall," and even today boasts a spectral horseman riding across the heath by the full moon -- although the offshore bells only ring on moonless nights.

One is inevitably, if only intuitively, reminded of Lovecraft's tossed-off allusion from "The Descendant": "In London there is a man who screams when the church bells ring." In this context, it's also interesting that Swinburne wrote an epic on "Tristram of Lyonesse." It ends with the lovers entombed, "and over them, while death and life shall be/The light and sound and darkness of the sea." Swinburne's Tristram, like King Arthur and the other heroes of Britain, has gone not just "over the water" but *under* it as well.

"On the opposite coast, in Frankish territory but exempt from taxation, dwell the mariners who, without catching sight of their passengers, carry the dead across the Channel. At midnight they are notified in a mysterious manner, and go to the shore. There they see empty boats, not their own, but strange ones. Upon setting out, they see the boat is laden choke-full, but see no one. Even with their heavily laden boats they succeed in reaching the island of Brittia in a single hour. Upon their arrival the souls are called out by name, and the ferrymen thereupon return with their empty boats so light that they only dip a keel in the waves."

-- Procopius, *History of the Wars* (ca. 555)

Scyld, Balder, Arthur, Sigmund, Iarlmagus, and the Maid of Ascolat all take boats to the land of the dead -- as do the nameless ghosts in Charon's barge and in Procopius' "heavily laden boats." And where, then, do they go, these heroes and ghosts? This land has many names, although Greeks, Gauls, and Egyptians all knew it to be an island to the West. For our purposes, though, it can be Tir fo Thuinn -- the "Land Under the Waves." The voyages of Maelduin and Ruadh both lead to an Otherworld beneath the ocean, a golden paradise and timeless shadowland alike. This may be somehow cyclically connected to the ancient notion of the sea (and the sea-goddess) as the home of all life -- for example, the Gothic *sáivala* -- "the soul" -- is cognate with *sáivs* -- "the sea." But "sea-born" Venus was also a goddess of the dead, and as such came in for special attention by (you know it) Swinburne, whose poem "Laus Veneris" recasts the Tannhäuser legend as a hymn to the [Queen of the Underworld](#). (Perhaps here lies yet another connection to Dunwich habitué H. Rider Haggard, who also wrote his greatest work in praise of a mysterious Queen of riches and eternal beauty, in an ancient cavern-temple.) Swinburne's "Hymn to Proserpine" (an even more explicit death-fertility goddess) goes even further out to sea: "Where beyond the extreme sea-wall, and between the remote sea-gates/Waste water washes, and tall ships founder, and deep death waits."

In this context, it's interesting to note that the historian Marcellus, commenting on the legends of the ineffable (and deadly) [Amazons](#), and on their foes in (the sunken land of) [Atlantis](#), claims that the British Isles are sacred to Proserpine -- and that Britain itself is sacred to Pluto. We seem to see above that Procopius identifies Britain explicitly as the Land of the Dead -- although he differentiates between "Britain" (the former Roman province, now settled by Angles) and "Brittia." The latter is divided in two by a great wall, with an earthly paradise on one side and snakes and poisonous fumes on the other -- and to that island, the dead are ferried from Europe. Essentially, Procopius' two-fold Brittia echoes a two-fold Britain -- one overlaying the other, with daylight history on top and a shadowland of death beneath. Where the two overlap, you hear the bells ring in sunken churchyards -- such as those in Dunwich.

Dunwich, which seems to have sprung full-grown from nothing in the sixth century -- just as Cantref y Gwaelod and Lyonesse sink under the waves. In legend, it even appropriates their stone sea-wall and "brazen gates" as the Dolorous Blow destroys Arthur's Logres and drives them into the Otherworld. Just then, too, the sober historian Procopius is testifying to the existence of two Britains, one a shadow realm of the dead. Is Dunwich upthrust by a great [reality quake](#)? Did its vibrations stir up a tidal wave of images, decanted by the Queen of the Dead, to pour into the unsuspecting mind of Swinburne, and from his poetry like a psychic virus into the neurasthenic H.P. Lovecraft? Does Swinburne's "woman in all tales" echo our half-hidden [Spider Goddess](#) Cybele, or the vampiric [Dark Lady](#) we see in Shakespeare's Cleopatra? Did Queen Elizabeth know of her submarine rival, and withhold the bells of Dunwich to secure her own throne from erosion? Does the Queen of Brittia yet wait beneath Dunwich to ["drench our steeples"](#) and "crack nature's moulds," feasting meanwhile on the ghosts of Templars and the flame of poets? The Dunwich horror waits on the dry salvages of Time, "white-eyed and poisonous-finned, shark-toothed and serpentine-curved." Don't hesitate to ring.

Odds & Ends: A New Beginning

It's been a while since I subjected you all to a column of odds & ends, so I thought I'd rectify this. I assure you, my motivations for presenting these snippets of columnloaf have *nothing* to do with the fact that I'm nowhere near a computer right now, but instead in Atlanta, enjoying myself in the comicy gothalicious scifilectable gamerly haven that is [Dragon*Con](#) after having assembled this issue a week early.

* * *

I love chachkas (Yiddish for bric-a-brac). In addition to the wall-to-wall bookshelves, my apartment is pretty much covered with odds and ends I've accumulated over the years - action figures, assembly toy kits, puzzles, odd toys, mock (and real) weapons, and the like. (Of special note is my stuffed Cthulhu doll, who is wearing a plastic chain taken from an old *Dungeons & Dragons* display, a bow tie, and a brown Australian "Trav'ler" hat. He's holding a tennis ball.)

The way my mind works, I think I *need* a certain amount of chaos in my life to keep my thoughts freely flowing. Tripping over, say, my mirror-illusion coin bank might trigger a thought on the nature of anti-gravity, illusions, magic tricks, and so on. Seeing a random padlock might inspire me to think of something ununlockable for my gaming players, or useful as a prop to show metaphorically how something might be "unlocked."

And having stuff lying around means I can do dumb stuff like substitute the pistol my character uses in the *Maltese Falcon* stage adaptation I'm in for a lightsaber during a rehearsal. (This lead to jokes on the *Pyramid* [chat room](#) like the *Maltese Millennium Falcon* and *Noir Wars*, a title so cool I'm bound to steal it for something someday. Thanks, **StevenEhrbar** and **Robert**.)

But there's a certain type of chachkas that holds a special place in my heart: stuff that exists as "real" world artifacts for a fictional universe. I have literally dozens of these things:

- T-shirts (Daily Planet staff shirt, Gotham City Athletics shirt, Mooby shirt)
- Jewelry (Green Lantern ring; Professor Xavier's School For Gifted Youngsters class pin; Enterprise-C communicator pin, complete with chirping board)
- Props (various *Star Wars* and *Star Trek* goodies, among other things)

And, of course, being the gaming geek that I am, I have a number of these items that tie into gaming worlds. I have things like the ***Mage: The Ascension*** tarot deck, a Arkham University diploma, and my ***Fading Suns*** Questing Knight medallion. (Sadly, I do *not* have my Origins ***Autoduel*** tool set . . . my parents didn't throw away my comics; they threw away my computer games.)

Anyway, the point I'm trying to make is <goes back and skims column> ah, yes! I remember. The point is that I love these "official" company props; they help spur my imagination ("Hmm . . . how would I smuggle this lightsaber aboard a ship?") and remind me of cool gaming stuff even when I don't get to sit around the table.

Perhaps more importantly, they serve as cool in-game props, prompting increased involvement and interaction with the world. For example, in my *Star Trek* game I ran several years ago I made a point of providing *Next Generation*-style communicator pins for the players; without any prompting they all wore them *and* tapped them when they wanted to use the communicator. So in another example of what I would do if I was Benevolent Dictator for Life of the Universe, I'd encourage gaming companies to make these props available, either as honest-to-goodness replicas or perhaps low-cost PDFs or even "do-it-yourself" creation ideas.

Of course, to do that game world makers need to create or evoke ideas that are prop-worthy . . . which may be a separate issue altogether.

* * *

I'm a big fan of the old *Dungeons & Dragons* cartoon. While not a masterpiece of Western civilization (or even Saturday morning kidvid), it nevertheless captured the spirit of what *Dungeons & Dragons* was for me back when I was a wee lad: exciting epic plots, a continuing story wrapped around episodic installments, snazzy magic items, and cool character classes.

Back when I only had a few of the *Classic Dungeons & Dragons* boxed sets, these kids all got to be characters I'd never even *heard* of.

But as I was recounting these memories in the *Pyramid* chat room last week, I noted that, y'know, the gal who got to be the Acrobat must have felt *really* ripped off. I mean, all the other classes were these interesting, powerful archetypes that were evocative of high adventure. All, that is, except the poor Acrobat, who immediately brought to mind a circus performer.

"Fear not: Ranger. Thief. Barbarian. Wizard. Cavalier . . . and Mime."

When I pointed this out in the chat room, **thomasm** noted that her magic item wasn't very interesting either:

"Oooh; I've got a magic *stick*."

Surprisingly, there *does* seem to be a gaming lesson here; namely, if you're before someone with the power to chart the course of your destiny - either an animated Dungeon Master or a real one - try not to be the last one named, created, or joining the team. Otherwise you run the risk of being the "also-ran" idea, where everyone earlier got the "cool" ideas. (This also explains Aquaman's membership to the Justice League.)

Now all I need is to warm up my ultradimensional transport so I can acquire a DVD set of the episodes . . . preferably with the fabled unrealized [final episode](#).

* * *

Yesterday and today I've needed to adjust to an increase in traffic in my fair city; the college students who have been mercifully absent for the blistering summer months have returned like swallows to Capistrano, only with slightly less resultant poop on my car.

As a minor gaming point I'd note that just about any game can benefit from a periodic scheduled, known event that will harm or help the game world. Any game set in New Orleans should have the specter of Mardi Gras looming down it annually, any campaign set in ancient Egypt would probably have the periodic flooding of the Nile as a big deal, and any game where the heroes are agents for the US government may well be curious as to the result of our presidential and congressional elections. ("Strikeforce Munchkin? You've been zero-funded.")

And even as I write this I realize the horror of our football weekends, which shall soon bring the city to its knees . . .

* * *

And speaking of braving increased traffic, I'm mere minutes from heading out of town to [Dragon*Con](#). Play nicely, folks, and try not to burn down the mag before I get back!

--Steven Marsh

Istanbul

by Matt Riggsby

Few cities become capitals of great empires. Fewer serve as capital for two, and even then one is usually just another phase of the one before. Born as Byzantium, rebuilt as Constantinople, and remade yet again, Istanbul is perhaps unique in that it ruled two empires which were essentially unrelated. Religiously, legally, culturally, and linguistically, the Byzantine and Ottoman empires were profoundly different, but the city on the Golden Horn was the lynchpin of both.

We'll be using Istanbul (mixed Greek and Turkish for "to the city", the most common in Turkish documents and used at least since the 13th century) to mean the city after the Turkish conquest and Constantinople to refer to it before, but in fact all the older names surfaced from time to time. In particular, Konstantiniye, a Turkish translation of Constantinople, was used through the Ottoman period. The name was *officially* changed to Istanbul only at the establishment of the republic in 1923, and even then it was slow to catch on in Europe (modern Greeks make it a point to call it Constantinople).

This article makes reference to previous articles on [Constantinople](#) and [Byzantine society](#). You may want to skim over those for background.

Geography and Land Use

The underlying geography of Istanbul is, of course, the same as that of Constantinople, and the land was used in about the same way: habitation is densest towards the eastern end of the Golden Horn, falling off toward the west. However, the Turks packed fewer people into the space. Istanbul's population probably didn't pass a half-million for most of the Ottoman period. The Turks took advantage of the difference in population density to leave more trees and green areas within the city than the Byzantines had.

History

The history of Ottoman Istanbul begins where the history of Byzantine Constantinople ends: the morning of May 29, 1453. When the Turkish sultan Mehmet II took the Byzantine capital, it was little more than the shell of a once-great city, inhabited by people of a different religion and ethnicity to boot. However, the site's ample natural advantages were good enough for Mehmet, who decided to use it as his capital. Like the early Byzantine emperors before them, the first Ottoman sultans in Istanbul rebuilt their capital. Istanbul was slowly transformed from a Christian Greek town to a Muslim and predominantly Turkish but nevertheless cosmopolitan city. People were brought in from the Ottomans' growing dominions. Aqueducts were constructed or repaired to bring water to the city. Old palaces were reoccupied and repaired, new homes were constructed, mosques and madrasas were built (sometimes using recycled churches), and new markets were laid out.

In 1453, the Ottomans controlled most of Anatolia and the southern Balkans. A century later, they controlled the Levant and Egypt, extended their empire into Persia, Libya, and the northern Balkans up to Austria and Hungary, annexed the Arabian peninsula, and together with their Crimean vassals controlled most of the Black Sea coast. The empire reached its height in the early-mid 16th century under Suleyman I. As treasure poured in from conquests in Europe, Africa, and western Asia, Suleyman undertook an immense number of building projects. Most of these buildings were designed by the brilliant and seemingly inexhaustible architect Sinan, a retired military engineer in the janissaries. Sinan lived into his nineties, building a reputed 400 works. Many were mosques and palaces, but he also oversaw the construction of tombs, hospitals, aqueducts, and other structures across the empire. Much of Istanbul's skyline was the product of his work.

Suleyman was regarded by Europeans as their greatest threat since the Mongols three centuries earlier. The feeling was

mutual. The Ottomans remembered centuries of Crusades (although the crusading movement was just as remote as the Mongol hordes by this time) and witnessed commercial powers such as Venice, Spain, and Portugal expanding their spheres of influence into the Islamic world. For their part, Europe had never fully recovered from the shock of the fall of Constantinople, and every report of another Turkish conquest in Europe was that much more ominous. In 1529, the armies of Suleyman, advancing into Habsburg-controlled Austria, reached the gates of Vienna, now Christendom's easternmost major city. Fortunately for the Europeans, "the Turk" was overextended and was unable to drive home the assault. Suleyman concluded a peace agreement with the Habsburgs and concentrated on expanding into Persia, eventually taking Baghdad. There would be another attack on Vienna years later, but the Ottomans had reached the limit of their westward expansion.

After Suleyman, the empire began a long, slow decline. The root of the problem is often identified as the sultans' response to the question of successors. Through Suleyman's reign, as in most monarchies, the ruler's close relatives served as generals and important officials, giving them a sort of on-the-job training that would qualify them for the crown. But someone who is qualified to take power is also qualified -- and far too often inclined -- to depose the current ruler. Suleyman's two oldest sons attempted to revolt and had to be executed. A despondent Suleyman all but retired from government in his later years, handing effective rule to his chief vizier, and excluding his youngest son, Selim, from power. When Selim reached the throne, he had neither the skills nor the desire to rule. Instead, he indulged in all the pleasures the wealth and influence of a supremely powerful monarch could obtain, leaving others to handle the day-to-day drudgery of administering the empire.

For self-preservation, future sultans followed the practice of excluding heirs from any position where they might get enough power to challenge the current ruler. In fact, they went to a terrible extreme. Sons were imprisoned in a building called the Cage, and no successor was named until the reigning sultan died. When one heir came to power, the others were quietly strangled. This did not improve the quality of the sultans who were to come. For decades, sultans assumed the throne having spent years in a single room (save for some very infrequent excursions), in fear of casual murder but supplied with all the luxuries which could be brought to them. At best, these sultans were lazy and hedonistic. Many, though, ranged from slightly unstable to downright insane.

Without the sultans exercising their authority, actual power fragmented as it moved a rung down the ladder. The palace was the scene of constant intrigues between viziers, janissaries, eunuchs, and the harem. The influence of sultans' mothers and consorts has led to this period sometimes being called "the sultanate of women." Occasionally, a competent favorite would arise and nudge the increasingly corrupt government in the right direction, but effective administration was the exception rather than the rule.

Constant infighting in the palace prevented the Ottoman empire from taking suitable steps against new challenges from the west. Much of the empire's wealth was based on its control of overland trade routes between Asia and Europe. European exploration and the precursors of the Industrial Revolution rendered that control moot. European sailors bypassed Turkish middlemen for Asian goods, and growing European factories, not duplicated in the east, could produce goods far more cheaply than Turkish craftsmen, further cutting down Ottoman exports. Westerners continued to visit Istanbul, but they were more frequently tourists with a taste for the exotic than merchants.

In the 19th century, a string of sultans realized how far the Ottoman empire had fallen behind Europe and attempted reforms, but it was too little, too late. Ethnic revolts and interference from European powers stripped away the empire's possessions until there was nothing left but the core territory of Anatolia and a toehold in Europe. Istanbul remained much as it was in earlier centuries, acquiring limited train and telegraph service, while Western Europe barreled forward into the age of steam and beyond. The Ottoman Empire saw its final importance as a minor player in the "Great Game." During the 19th century, Britain and Russia struggled for supremacy in central Asia, which led in turn to a number of subsidiary alliances and proxy conflicts as the two powers worked against one another. Though in decline, the Ottoman empire was still regionally important as a British ally, and Istanbul was an important location for diplomatic wrangling.

A coup in 1909 turned the last few sultans into mere figureheads and the monarchy was done away with in the 1923 when Kemal Attaturk's nationalists proclaimed a republic. There's a certain sadness at the passing of an ancient dynasty, and yet . . .

When the sultan Abd-al-Hamid was deposed in 1909, his concubines were freed. They were temporarily moved from the harem at Topkapi to another residence, and their well-attended procession was the first time ever that people outside the palace had seen the inmates of the harem. Announcements were circulated in the Circassian mountains, from which most of them had come. In what was by all accounts a moving episode, a crowd of rustic mountaineers came to reclaim their sisters and daughters. There were hundreds of tearfully happy reunions, although for those who had been in the harem longer, it took some wrangling to establish who was related to whom. It may have been the end of an era, but the captives of the harem could finally go home.

Government

The sultan was an absolute ruler. The Turks reasoned that if a ruler was dependent on the approval of others, he could be influenced by their interests and was therefore subject to corruption. A ruler subject to no one but Allah, therefore, was best suited to keep things honest.

And keeping things honest was the ruler's main function. He was expected to uphold justice for the common people and spend most of his time overseeing officials and stamping out corruption. In addition to personally reviewing decisions and occasionally observing officials at work, the sultan had a network of spies keeping an eye on officials throughout the empire. In the early years, this seemed to work fairly well. The system only began to collapse when the sultans began to lose interest in governing.

Although he held supreme power, the sultan didn't have time to do *everything*. He was supported by a cabinet of ministers called the Divan. The Divan consisted of the Grand Vizier, a chancellor, a pair of high qadis (judges), three ministers of finance, and a few other advisors. The Divan met at the palace several times each week to discuss business and hear petitions. The vizier served as a chairman, directing petitioners to the other members of the Divan for consideration. Originally, the sultan attended these meetings to oversee the work of his ministers (silently; he just watched while the vizier ran the proceedings). After Suleyman, sultans stopped attending regularly. However, there was a screened room adjacent to the council chamber where he could eavesdrop on the Divan without being seen.

Topkapi Palace

Westerners' most fevered, romantic dreams of decadent life in a harem are fueled by tales of the Topkapi palace, chief residence of the sultans for most of the Ottoman period. The hotly imagined picture of a bevy of beautiful, scantily clad women serving the pleasure of a single man, protected by an army of eunuchs and shielded from the eyes of outsiders, is far from complete, but it came closest to being real here.

The first sultans occupied existing Byzantine palaces, but they proved unsuitable. Therefore, they built a new one, called Topkapi by the Turks and the Grand Seraglio by westerners. This palace sits at the very end of the city's peninsula. Like the old Byzantine imperial palace, it was not a single building, but rather a palatial district, containing gardens, barracks, classrooms, offices, hospitals, mosques, baths, kitchens, and living quarters for the sultan and an army of servants and bodyguards. Topkapi was enormous: nearly a mile from north to south and about half a mile east to west. About three quarters of this area was open space, including orchards and parade grounds. Most of the buildings were concentrated into a roughly rectangular area that constituted the palace proper.

The entrance to the palace was the Ortakapi (central gate). Everyone, regardless of race or religion, was allowed into the first and second courtyards of the palace. The right to petition officials was an important one in the Ottoman empire, and this is where the common people could come to appeal to the Divan. However, silence was strictly observed. Anyone making noise was seized by guards and beaten. The second courtyard had, among other buildings, quarters where ambassadors waited for the sultan to receive them (sometimes for days).

Few, however, were allowed into the semi-public sections beyond the second courtyard; there were three more courtyards, private mosques, schools for the children of the sultan and his resident relatives and servants, more kitchens, treasuries, quarters, and so on. And at the very core of the palace was the most secret part of all: the harem. Outsiders, including diplomats, were not admitted. The only exceptions were craftsmen required for repairs and new

construction and a few women visiting relatives or selling goods to the harem's inmates.

The harem's most notable inhabitants were the sultan's concubines. The concubines were bought or given as tribute, selected for grace and appearance. However, the harem also included the sultan's close female relatives, as well as multiple ranks of servants for both the relatives and the favored concubines. At the harem's height, the women probably numbered well over a thousand.

But no matter how large the harem, a pleasure-loving sultan can indulge in only so much amusement, and none of the women, whether a relative or simply property, was allowed beyond the harem's well-protected walls unless she was married off, given as a gift, or retired to a lesser palace. Luxurious as it was, the harem was a prison. The day-in, day-out tedium was a serious problem, leading to depression and even suicide. There was considerable effort to find amusements for the harem inmates and develop useful skills. For example, the women might play games, learn and recite poetry, or play musical instruments. According to legend, belly dancing was developed as both recreation and exercise for the harem's inmates. They might also involve themselves in dangerous, covert affairs with eunuchs (some retained their original function), servants and janissaries from the outer palace (requiring considerable ingenuity just to communicate), and, no doubt, each other.

The most profitable use of their time, though, was in politics. Although the inmates of the harem were limited to a very narrow scope of action, that scope happened to include the sultan. Ambitious women who could attract and keep the attention of the jaded sultan could and did effectively rule the empire. The sultan's mother, while she lived, was usually the most important, followed by the *kaidins*, women who had borne sons. Factions would arise within the harem, supporting or opposing favorites and hopefuls, and anyone could be disgraced or even assassinated.

The palace hosted a large body of servants of all descriptions, with an emphasis on the unusual. Eunuchs, dwarves, and mutes were common in the palace. Eunuchs were employed for much the same reasons as they had been by the Byzantines. Moreover, they could reasonably be expected not to have improper relations with the sultan's women. The eunuchs, of whom there were anywhere from one to two thousand at any given time, were divided racially into black and white eunuchs. Each division was led by its own chief, the *kizlar agha* and *kapi agha* respectively. The white eunuchs mostly served in the outer parts of the palace, working as bureaucrats as well as servants, while the black eunuchs served in the harem itself. The *kapi agha* was initially master of ceremonies, gatekeeper, and receiver of correspondence from outside, while the *kizlar agha* administered internal communications. For example, he served as official messenger between the sultan and the grand vizier. Over time, the *kizlar agha* was given many of the *kapi agha*'s responsibilities and so became the most important official of the palace.

The grounds were maintained by a veritable army of 400 gardeners. All were foreigners, typically boys selected with an eye toward recruitment as janissaries. At times, they served as an auxiliary guard along with a separate group of 50 or so halberd-armed gatekeepers. The gardeners were directed by the *bostanji-bashi* (head gardener). The *bostanji-bashi*'s responsibilities went far beyond those implied by his title. He was also, for example, the palace's chief executioner, responsible for executing the highest condemned officials.

Military

The Ottoman military elite and de facto police force in Istanbul was the janissaries. The janissaries were the sultan's personal bodyguard. They were originally drawn from captives and the children of Christians, taken as tribute and raised as Muslims. The janissaries numbered about 20,000 by Suleyman's time, and they were probably the most formidable single fighting force in Europe. They initially used bows, swords and axes, trading bows for muskets when gunpowder weapons become current. Regardless of weapons, they were well-trained professionals through the age of Suleyman. In fact, they were the only standing army in Europe until the French established one in the 1600s.

When the sultanate declined, the janissaries went with it. They assumed civil powers and acquired a number of privileges, making it very desirable to be a janissary. Admission became open to their sons (janissaries were forbidden to marry until the 17th century) and even to people who were born Muslim. Although no janissary could become sultan, they nevertheless played an important role in palace politics and deposed several sultans who displeased them. As their importance and numbers increased (130,000 by 1800), their effectiveness as a fighting force evaporated. The

later sultans realized that the usefulness of the janissaries had passed, but it was not until 1826 that Mahmud III could organize a new army to replace them (and, incidentally, massacre them in their Istanbul barracks).

The janissary organization was expressed in terms of kitchens and cooking. Most officers had cooking-related names (head chef, bread-baker, soup-man), and a janissary orta (a unit of several hundred men) was commanded by its chief cook. Janissary helmets were decorated with spoons, and instead of a banner, the chief symbol of a janissary unit was its monumental soup cauldron, a vessel large enough to feed over a hundred men. Knocking over the cauldron (and thereby symbolically rejecting the food provided by the sultan) was a classic method for expressing displeasure with authorities.

Trade and Industry

The Islamic world had a long and honorable merchant tradition, and despite a brief interruption around Mehmet's conquest, trade in Istanbul remained as healthy as it had been in Constantinople. Knowing that a great deal of their revenue depended on it, the Turks encouraged international trade, granting broad access to foreigners wishing to trade there. When the Turks took Constantinople, they confirmed and continued the privileges that Italian merchants had enjoyed under the Byzantine emperors, and later merchants, including the French and English, were granted similar rights.

Although there were open-air markets, the Turks preferred to build large sheltered ones. The shelters are huge masonry vaults, pierced here and there by skylights and ventilation shafts. From within, they are a forest of pillars and archways inhabited by merchants selling anything one can imagine. In addition to imported goods, a number of locally produced products can be found. The Turks excelled at carpet-making, an art dating back to their days as nomads, and fine embroidery. The production of painted ceramic tiles is a major industry in this period as well. The famous Blue Mosque, a monumental mosque built by Suleyman, is encrusted in rich blue tiles made in Istanbul.

Scholarship

During the early years of the empire, and like so many other things reaching its height with Suleyman, Istanbul was a center of learning rivaling anything in the rest of Europe. Although there were no large universities, there were a great many small schools and a number of libraries. Suleyman actively encouraged a wide variety of scholarly activities, so one was as likely to find a map of the New World in Istanbul as in, say, Italy or France, and translations of important western works were available alongside original works in Turkish.

However, unlike western Europe, where the printing press was revolutionizing book production, books in Istanbul were hand-written through the period in question. Calligraphy remained an important art (a modified version of the Arabic alphabet was used), and books were still decorated with hand-painted miniatures and careful applications of metal leaf. The Turks were also pioneers in the art of marbling paper.

Buildings and Streets

After a major earthquake in 1509, which did tremendous damage to the predominantly Greek-style earthen buildings, buildings in Istanbul were largely made of wood. These buildings may have been more resistant to the earthquakes that plague the eastern Mediterranean, but they magnified another danger: fire. And, in fact, fire did become a major hazard in Istanbul, destroying large parts of the city every few decades. The exteriors of homes were plain, even shabby, and mostly windowless, but their interiors were often far more luxurious than their façade suggested.

Although Istanbul was less densely populated than Constantinople at its height, the areas that were inhabited were crowded. The streets were extremely narrow, and the buildings often leaned inwards to the point where residents of buildings on opposite sides of the street might be able to touch hands from the top floors. Many streets were paved, but apparently they were never cleaned and were frequented by stray dogs in large numbers. Wheeled vehicles were rarely used, probably owing to the narrowness of the streets, and in some periods women rarely ventured outside.

Accounts of visitors suggest that Turks liked having trees around. Rather than clearing all the trees off of a building site, they would try to maintain at least a few, perhaps building near or even around it so that the branches provided a nice finishing touch to the roof.

Religion and Ethnicity

After the first few decades of Turkish rule, Istanbul is predominantly Muslim and Turkish. However, Orthodox Christians remained a significant minority; the Patriarchate remained headquartered in Istanbul, albeit in reduced circumstances. Christians were prohibited from building new churches, so the Orthodox used increasingly decrepit Byzantine-period buildings. There was a sizable Jewish enclave as well.

The city was also ethnically mixed. In addition to the Turks, there were a great many ethnic Greeks in residence, as well as people from all over the Ottoman empire: Arabs, Persians, Egyptians, Syrians, various Balkan Slavs, even Gypsies and Russians. Most non-Muslims lived in Galata, but a number lived in the city proper.

Food

Turkish cuisine is closely related to the food of the Middle East, but there are influences from Greece, India, and the central Asian plains. Soups, pilavs, and slow-cooked vegetables are staples of the Turkish diet, and stuffed foods are common, from dolma (stuffed grape leaves) to stuffed gourds to kofte (small stuffed balls of ground meat). Visitors to Istanbul happily remarked that a wide variety of fruits and nuts are available year-round, and sweet pastries are popular; baklava is probably a Turkish invention. Most dishes are usually eaten by hand; as in similar cuisines, having clean hands is very important. Families take meals together where possible, but if guests are present, men and women eat at separate tables.

From the mid-16th century onward, coffee is popular. Turkish coffee is made from espresso-like powdered beans (the grounds may be used for divination like tea leaves), sweetened during brewing rather than at the table, and sometimes spiced. It is served in small cups and is very, very strong. Despite Islamic prohibitions on alcohol, Istanbul hosts a great many taverns, particularly in the "foreign" neighborhoods of Galata, serving all manner of alcoholic drinks. In the 17th century, a distilled beverage called raki appears, instantly becoming wildly popular. Raki, a close relative of Greek ouzo, is powerful, flavored with aniseed, and turns a cloudy white when water is added.

Clothing

Typical Turkish garb includes slippers or boots (janissaries in particular wear very high boots folded over at the top), baggy trousers, and layers of shirts, tight vests, long-sleeved jackets, and robes. The number of layers someone wears bears some relationship to their importance. Turkish clothing was often elaborately decorated with embroidery or, by those who could afford them, precious metals and stones. When women venture out, they were often completely covered, to the point where a man could pass his wife on the street and not know it, although old women enjoyed some exemptions.

Most men, particularly the wealthy and important, wear large turbans. A Turkish turban may be wrapped around a tall cap that protrudes through the top of the turban, and it may be ornamented with a decorative pin at the front. Many women also wear tall hats; fashionable hats have a high point in front, described by visitors as resembling a unicorn horn. The Turkish fez is more of a "common man's" hat.

Things to See and Do

An unfortunate theme in the accounts of visitors to Istanbul is that, with its narrow, dirty streets, it is much more attractive at a distance than close up. Nevertheless, it's an active, diverse city with a lot to do. Most of the Byzantine landmarks remain or have been replaced by Turkish equivalents, and the Hagia Sophia (with four minarets added)

serves as a model for other large mosques. Here are some other places to go:

- **Coffee houses:** Coffee houses are important centers of social activity in Istanbul, matching the importance of taverns in Europe. As with western taverns, people may meet friends there or hold meetings of brotherhoods and political groups. Coffee is often served with an array of snacks (*meze*) which can constitute a meal in their own right. The coffee houses are also home to a popular genre of puppet theater, which could be used for anything from light comedy to political commentary.
- **Baths:** One Turkish custom which visiting Europeans may find perplexing is public bathing. With separate hot, warm, and cold pools, Turkish baths are almost identical their Roman predecessors. It was common to meet friends there, eat snacks, gossip, and otherwise entertain oneself while getting clean. Although partial nudity is common (and, indeed, necessary), bathers may maintain minimal standards of modesty with a loincloth or a towel wrapped around the waist.

Istanbul in the Campaign

In a historic campaign, Istanbul makes a convenient exotic port of call for Western adventurers. It combines matchless grandeur and the appeal of the unfamiliar with surprising accessibility. It is, after all, a short sea voyage from many Western ports, not far from the familiar waters of Italy and southern France and Spain. Indeed, for a character from Italy, Istanbul is closer than regular trading partners in London and the Hanse towns. It's also a natural center for characters from the Muslim world. For almost all of the period in question, the Ottoman empire is the biggest Muslim power in the world, as well as the capital of most of the Muslim world west of the Persian Gulf. In a fantasy campaign, Istanbul can function much like the Baghdad of the *1001 Nights*, while its mad sultans make good rulers for a horror campaign.

An entire campaign could be set within the walls of the palace, with PCs playing eunuchs, concubines, ministers, and so on. It would afford little scope for swashbuckling adventure but considerable room for political intrigue. A somewhat more conventional campaign might be build around a group of Janissary PCs. In addition to participating in military campaigns, they might serve as police in Istanbul or guards at the Grand Seraglio.

Foreigners will find a lot to do in Istanbul as well. In addition to being a center for trade, Istanbul was often a center of political and diplomatic activity. For example, Suleyman recognized the Protestant threat to Catholicism, which in turn had the potential to destabilize the Catholic Habsburgs, so he apparently provided active support to Protestant countries. An adventure might involve Huguenots or German Lutherans appealing to Suleyman for aid. The French and the Habsburgs will want to stop them, of course, and the Catholic church will be no help to them either. By the 19th century, espionage is a serious possibility. The Great Game can be played out as a Victorian Cold War (perhaps with steampunk gadgets). Indeed, with the UK vs. the Russians, any number of James Bond-esque plots can be recycled without having to change names and nationalities. PC spies might try to subvert the Anglo-Ottoman alliance, waylay potentially hostile regional strongmen visiting the Divan, head off potential diplomatic disasters, and work to counter enemy agents.

A number of the adventure possibilities for [Constantinople](#) can be recycled in Istanbul, with Muslim Turkish elements laid over. Here are some more suggestions:

- **Abduction from the Seraglio:** If it was good enough for Mozart, it should be good enough for your PCs. The comic opera has its heroes rescuing their beloveds from the harem of a mercurial sultan, an eminently gameable scenario as either comedy or drama. Any PC can get involved in a plot to rescue a female friend or relative from the harem. Female PCs might *need* rescuing, or might decide to escape on their own. An interesting complication is that once would-be rescuers reach the intended inmate, she might not want to leave.
- **Yelling "Fire" in a Crowded Bath:** The PCs must apprehend or assassinate a well-protected rival. The one thing he leaves his fortress-like home for is regular visits to a popular bathhouse. He may be surrounded by bodyguards, but when he's at the baths, no one has any arms more formidable than a rolled-up towel.
- **At the Mosques of Madness:** The PCs (or someone they know) finds hideous evidence that the famous architect Sinan was, in fact, an evil djinn enslaved by Suleyman. As revenge, he arranged the mosques he built in a subtle but blasphemous form of sacred geometry, trapping the palace in a web of madness which will, in time, bring

down the empire. The PCs must figure out exactly how Sinan's plans work and how to dismantle the web. And once they do, they'll have to come up with an excuse for dismantling some of the greatest mosques in the Dar-al-Islam. Heroes of the 16th century might even go head-to-head with a demon Sinan.

Pyramid Review

Twilight of Atlantis (for d20 System)

Published by [Avalanche Press](#)

Written by Jim Lai, Jason Donovan, & John R. Phythyon Jr.

48-page b&w softcover; \$12.95

Twilight of Atlantis is a mythological campaign setting for the **d20 System**. The authors attempt to recreate the Atlantis of Plato's *Republic* (the Critias and Timaeus in particular) and present it as a setting for fantasy adventure. It is firmly set in a Greek Mythological prehistory, with the Olympian Gods being major players as well as a few defined cultural factions: the Atlanteans, the Egyptians, the Spartans, the Athenians, and everybody else, including a few non-humans.

Atlantis was created by the god Poseidon as a magical paradise garden island where he married a mortal and had septuplet sons who became kings of the land. Poseidon's bloodline spread throughout the island and combined with the magic of the island, creating a magically powerful and long lived race of men. The sons set out in antiquity, learning from other cultures and developing all that they learned to never before seen heights. Specifically they learned architecture from the reptilian Lemurians, and metallurgy from the bestial Mue; they developed magic on their own. They then built up an empire that conquered the known world, until they hit Greece where the other Olympian Gods protected the mythical prehistoric city-states of Athens and Sparta, the only entities to successfully repel and turn the tide on the Atlanteans. When the counter-invasion of the Athenian navy and the Spartan army reached Atlantis, there was a matricidal accident where one of the sons killed his mother; in his grief, Poseidon appeared and broke his trident, sinking Atlantis and dooming the empire forever.

This campaign is set at an unspecified time before this fall. It is sometime after the conquering of the world and the first contact with the Greek city states, but before the cataclysm.

Twilight of Atlantis details a number of new races, including three types of Atlanteans depending upon how much divine blood they have; and an uplifted humanoid cat race, the Bastai, that were made to ease in the conquest of Egypt. The Lemurians and Mue are presented as standard monsters, but have favored classes and ECL information.

It also gives four 10-level prestige classes detailed for Atlantean culture: Artificers, who gain mastery over all types of item creation; Orpheans, warrior who have died and had their spirits bound to their bodies by orichalcum and magic; Resonants, who gain a number of metamagical abilities; and Spellbanes, a Bastai monk class with antimagic strikes designed to counter Egyptian sorcerers.

Atlantis is a land of long lived people with an affinity for magic. Many become masters of wizardry and magic items are commonplace in the city. Atlanteans control their weather, shape the land, and even set up the permanent whirlpool Charybdis to block the Athenian navy from venturing towards Atlantis or some of the Atlantean colonies.

One of the real sources of Atlantis' magical power is the metal orichalcum, which is only abundant in the mines of Atlantis. This metal laces the imperial city, powering many effects and preventing teleportation into the city due to the high concentration of magic. It can be used as a raw material in magic items, each 5gp worth replacing 1 xp needed to create the item.

This book also presents 10 spells, mostly for arcane casters. Each has a nice Greek background flavor and go well with the setting. No mechanics for major power effects are given, but epic spells from the **Epic Level Handbook** or rituals from **Relics and Rituals** or **Spellbound** would fit well in the high magic Atlantean setting.

The magical feats were not terribly impressive; Resonance is nice granting a free second use of a spell once a day, but the Imbue Tattoo feat does not say what effects you can actually put into a tattoo, just that it costs extra because it is an unslotted item. The warrior polearm feats are quite nice, allowing reach weapons to strike close for an attack penalty, using a long spear in one hand, and reducing cover penalties from allied shield towers; these beat the Close Order Formation feat from ***Dragonlords of Melnibone*** by a lot.

Being a Bronze Age world there are rules for bronze weapons, including ancient equivalents of the long and greatsword. Bronze is just as effective in weapon attacks and damages but has less hardness and hit points, making it easier to sunder bronze weapons, an elegant technology adjustment. There is also a list of weapons, armor, and tools that would be anachronistic in the bronze age of Mythical Greece -- no crossbows, fancy pole-arms, or monk weapons. Generally the only armor types are leather, scale mail, breastplates, and small and large shields.

There is a brief overview of the Atlantean world and Atlantean society and culture, and a little bit about running campaigns in a classical world setting, along with three adventure seeds.

There are no developed NPCs of the setting or even an in-depth overview of the current island or imperial city. The only map is a rough one centered on the Mediterranean, showing Greece, Egypt, Crete, and Atlantis in the Atlantic. There is no ready-to-run developed base of operations but the society and cultural atmosphere is presented with good thematic mechanical additions and restrictions.

Despite the shortness of the book, ***Twilight of Atlantis*** presents a fun fantasy setting. The combination of omnipresent Greek mythology, high magic, and the struggles of an empire unrestrained by actual history make for a great playground to adventure in. The feel of the world is easily accessible and many standard monsters fit naturally into the setting, perhaps more so than in a medieval fantasy world.

Pyramid Review

The Most Dangerous Game (for When Darkness Comes)

Published by [Twilight Creations, Inc.](#)

Game Concept & Design by Kerry Breitenstein & Todd A. Breitenstein

Art by Dave Aikins

Written by Todd A. Breitenstein, David Carl, Steve Crow, Les Simpson

16-page rulebook, 64-page scenario book, 48 disks, 8 tiles; \$19.95

Twilight Creations, Inc., is finally getting some mileage out of the Variable Tile System. They've gotten the good folks at Alderac Entertainment Group to collaborate on a version based on their popular *Spycraft* espionage game for the **d20 System**. The odd thing is, in spite of being its first big crossover, *When Darkness Comes: The Most Dangerous Game* is not a standalone.

In this incarnation, instead of playing skulkers in the shadows investigating supernatural goings-on, the players create spies looking to stop world-shattering plots. Although the action is based on the *Spycraft* game, it's not heavily influenced by the *Shadowforce Archer* series of setting books. The general espionage attitude is there, so most of the plots are about tracking down high-tech scientific discoveries and taking out masterminds and their criminal henchmen.

The game has a few adventures to get buyers started. Like the entries in the original *When Darkness Comes* line, these amount to a few "quickie" modules and one story with a grander feel that will probably take all night or longer. Each escapade is prefaced with a brief bit of fiction that sets up the scene.

[SPOILER ALERT!]

"Something in the Air" has agents racing to stop a madman from releasing a virus; "Found and Lost" puts a wounded spy's life on the line as the rescue team tries to get him and his package before the enemy; investigators have to uncover a sleeper in "Don't Look Now," then an agency mole in "Misfire;" and "Turn of the Cards" is a mini-campaign that links four missions, all geared toward tracking and stopping a mastermind from unleashing a new pathogen on the nuclear disarmament talks.

[END SPOILER ALERT]

The adventures start to feel similar before too long (those that aren't "track down 'the package'" are attempts to stop betrayal from within), though the fiction manages a little more atmosphere here than in previous entries into the line. "Don't Look Now" is particularly unsettling. This supplement also deserves kudos for not always taking the predictable route -- in the campaign adventure the agents work for the Brazilian government, of all things.

The components meet the same high standard as the other sets, including some swell new artwork from other artists riding shotgun with Dave Aikins. New disks settle the game into an espionage groove. There's a mastermind and his henchmen, and some thugs, security guards, and civilians to get in your way. The unpredictable Foil (who's side is she on, anyway?) may trail and undermine your party. There are traps and other dangers players can mix in to sow confusion. A couple of "floppy disk" disks give agents something to chase after, and several vehicles give them

something with which to chase after them. Best of all, there are six agent disks that correspond to the six basic classes in the ***Spycraft RPG***: Wheelman, Faceman, Soldier, Fixer, Pointman, and Snoop. These are double-sided, showing a gray picture of the agent in disguise on the opposite side in case they want to make use of the disguise rules.

There are eight new tiles. Here you get the agency HQ and mastermind lair (of course), a market, a cathedral, a government building, a casino, and a pair of generic city street tiles (each unique) with some interior streets to make chases a little tougher.

The rulebook contains a variety of new rules. Each player class, for example, has special abilities that define their character; the Pointman can add to another agent's rolls, while the Fixer can create a kit from whatever he finds lying around in a house. There are guidelines for running chases, both on foot and behind the wheel of cars or cycles. These mostly boil down to comparing movements until losing sight of one another or meeting up on the same square (at which point combat occurs).

The Disguise skill allows you to "overcome" villains without engaging in combat; successfully beating the villain's TN gives you Victory Points. This set also introduces Investigation Leads, a way of measuring how much you've discovered about the plot. ILs have to be earned to learn things about the plot (according to each scenario's setup), and when you have 10 of them, you can add the mastermind to the disk pool. You're closing in on him . . . but you also have to worry about Failure Points. Get three of these and you get sent back to HQ to start over, sans your ILs. Troublesome plot elements may also be overcome with the judicious use of the Demolition or Computer Hacking skills.

The rulebook is rounded out with several useful tables of information, some optional rules for weapons, new Fate tables, some Quickstart rules, skills from other supplements that are carried into this one (you can't have espionage without the Sneak skill), and some tips on combining the horror and spy elements from both versions.

The game does come with its own set of problems. Thankfully, the poor editing that characterized many entries in WDC thus far isn't one of them; the product isn't perfect, but the impediment has gone from an open flaw to a minor point. There is no table of contents; you'll need to find things (like the Quickstart Rules, mentioned everywhere but the front of the rulebook) on your own. You need the basic ***The Awakening*** set because it has components not included here. The rules are only in that set, too; there is plenty of new material here, but it still depends on that first release, crossover audience notwithstanding. The chase rules are pretty easy to follow, and you can even play them solo (using dice rolls for movement). On the other hand, given the six-square confines of the tiles and the double-digit movement of cars, chases can be awkward. They also make generous allowances for travel -- run to a van using the last of your foot movement and you can still move almost the full rate for the vehicle.

When Darkness Comes: The Most Dangerous Game is a solid supplement that gives folks an idea what the system is capable of when the designers set their minds to it. They've included a lot of what it will take to make the change from horror to international intelligence work, most of it with smooth, simple mechanics that keep ***When Darkness Comes*** from becoming top-heavy. With AEG and Twilight Creations working hand in hand so well, hopefully other companies will sit up and take notice of the potential offered by the Variable Tile System.

--Andy Vetromile

Designers' Notes: Transhuman Space: Under Pressure

by David Morgan-Mar, Kenneth Peters, & Constantine Thomas

Conception

*"I was quite looking forward to [**Blue Shadow**], if (as Kenneth Peters suggests on his web site) a significant chunk of the book would concern Europa and its world ocean."*

-- Constantine Thomas, Yahoo! Groups **Transhuman Space** group, January 12, 2002

Transhuman Space: Under Pressure began as an idea named **Blue Shadow** on David Pulver's initial list of planned **Transhuman Space** titles. It was to deal with life on and under the oceans of 2100, building on the vast technological and social upheavals outlined in the core book. The name was changed to **Under Pressure** during production, to avoid confusion with **GURPS Blue Planet**, an excellent conversion of Fantasy Flight Games' aquatic campaign world.

When the core book was released in January, 2002, **Blue Shadow** had not yet been assigned an author. Constantine and I (DMM) were talking on the [Pyramid Chat](#) soon after, when David Pulver appeared. Knowing Constantine was a planetary scientist, he asked him if he would like to write **Blue Shadow**. Although keen on the idea, Constantine felt such a project would be too large for him to take on alone, and the conversation turned to other matters.

Afterward, I approached Constantine with the suggestion that we collaborate on a proposal for the book, since I felt I could handle the Earth-based material if he could do the extraterrestrial stuff. We sent a query to David Pulver, who suggested we add Kenneth Peters to our group, as a **GURPS Vehicles** expert qualified to write the Modular Vehicle Design System that was required. With that, our triumvirate was born.

Brainstorming

"Yes, you too can play a clam. No, not uplifted or mutated or psionic or magical or a refugee from another universe. Just an average, everyday clam. But! It can be given an Aerospace Piloting skill set and be uploaded as a Shadow and then downloaded into a toaster! Does the part where you stick the bread in count as a Flesh Pocket? Hey, stop looking at me!"

-- Kenneth Peters, e-mail to David Pulver, February 12, 2002

The easy part done, we had to come up with a proposal stuffed to the gills with so many cool ideas that The Powers That Be could hardly say "no." In this stage were born many of the concepts that made it into the book, such as aquacrete, cetanism, and squidpacks. We also discussed and rejected some ideas, such as introducing native macroscopic life to Europa, and bioships. Although submarine bioships -- vehicles grown as genemod organisms -- sounded cool, the difficulty of making them suitably pressurized to carry human passengers in the sea forced us to conclude that they would be too expensive and impractical to be realistic.

We developed the Calamarine, a gengineered squid bioshell, at this stage. It was originally envisioned to be based on the giant squid, some 80 feet long, with a biological blue-green laser weapon to complement its already awesome natural armament -- an idea that caused Kenneth to draw comparisons to Dr. Evil's "sharks with frickin' laser beams attached to their heads." The vulnerability of such a large creature to heavy weaponry made us rethink the concept, and we finally settled on the smaller Humboldt squid-based "shock troop" design seen in the book.

Execution

*"There are three planned books on Earth: **Fifth Wave**, **Broken Dreams**, and **Blue Shadow**. The three books form one of those 'balanced triangle' things like they use to promote healthy diet and stuff. If I were to summarize each in one*

word, I'd say **Fifth Wave** is 'Technology,' **Broken Dreams** is 'Society' -- and **Blue Shadow** is 'Environment.'
-- David Morgan-Mar, Pyramid chat, May 31, 2002

I said that before I had seen a copy of **Fifth Wave**. Jon F. Zeigler later said to me that he thought **Fifth Wave** was about society too, and I agree with him, though I would add that it is how society has reacted to technology. Nonetheless, the overlying theme of **Under Pressure** is the interaction of transhuman technology with the environment -- a theme only touched on by the other books.

We used this theme to drive much of the material in the book. The oceanic focus and the interaction of humanity with the environment, both on Earth and off it, provided background or inspiration for many of the technologies, organizations, and occurrences that we developed. Extrapolations from present-day trends led to sometimes frightening conclusions, that had to be tempered or avoided by technology.

An overriding constraint was fitting our material into the **Transhuman Space** canon. Four books had been released and another four had been through playtest by the time we finished writing, so there was a wealth of material to draw on, and to be consistent with!

The ecoterrorist organization Blue Shadow caused particular problems. From the core book we knew that it was "preservationist," yet it was dedicated to protecting and rescuing uplifted sea creatures -- a seeming inconsistency with the ideals of Preservationism. We solved this by mixing the pan-sapient rights meme into Blue Shadow's brand of Preservationism, providing justification for saving existing uplifts while at the same time campaigning against their creation. This also neatly explained Blue Shadow's aversion to inflicting casualties of any kind.

Writing underwater material to be consistent with existing **GURPS** rules was a real challenge. We caused more than our fair share of gray hairs on Dr. Kromm's head as we bounced rule interpretations, rewrites, reality checks, and new rules off him. We worked closely with Jon F. Zeigler and Bill Stoddard on these issues, so we could have a consistent set of underwater rules with **GURPS Blue Planet**. Anthony Jackson was a great help with many technical and rules issues.

The mechanics of writing the manuscript were complicated by the fact that we had three authors . . . on three different continents. Thankfully, the manuscript divided fairly neatly into parts that we could work on independently before integrating them into a whole. Despite being in widely separated time zones, we often had long private discussions on the Pyramid Chat about various ideas and passages of writing. This particular piece of 2002 technology proved invaluable in the assembling of the book, by allowing virtual meetings, without which our cooperative effort would have been almost impossible. The telepresence world of 2100 has its beginnings in the here and now.

Real life intruded on the writing process in interesting ways. I lost my job to the downturn in the I.T. industry. Constantine was busy writing and revising his Ph.D. thesis -- on the internal structure of the Jovian moons. His European ocean model was developed with state-of-the-art planetary modelling software created for his thesis, and will hopefully be the subject of a scientific paper! Kenneth, meanwhile, received involuntary recall orders for active duty with the USMC in Hawaii. Some of his emails from there got lost, and we were imagining his C.O. leafing through detailed technical statistics of military submersibles that had been intercepted being sent from Sergeant Peters' account . . . On the plus side he had better access to military periodicals and the knowledge of the logistics officers he works with (who as active duty and reserve Marine officers also had a great breadth of experience in other fields).

The Crunchy Bits

Even though our page count expanded from 128 to 144, and finally 160 pages, there was a good deal of material we couldn't squeeze in. And then there was some material we came up with that simply *shouldn't* have gone in . . .

"And today, a pod of environmentalist Pilot Whales beached themselves near a crowded human city in protest at the simians' continuing destruction of the oceans. As usual, the humans were too stupid to realize what they were doing and put them back in the water. A repeat protest to hammer the point home ended in tragedy when all 47 whales died after the humans couldn't be bothered with them any more."

Character Types

We cut the following two character types, suitable for many *Transhuman Space* campaigns, from the manuscript. The names are Russian.

Boyevik ("Mobster")

*"Yeah, I'm a Triad and an ethnic Russian, so what? Haven't you heard that crime went international over a century ago? Hey, don't look at me like that, we serve a useful function for society. There will always be losers and dropouts -- I don't care how long people live or what their bodies look like or even how much money they have in the bank -- we give these people a purpose and control them at the same time. Why do you think we're called **organized** crime? The only alternative is a bunch of independent rabble looting and pillaging like mad dogs."*

Whoever said, "crime doesn't pay" was never a criminal. You maintain "investments" around the world that make you more money than a small corporation. Hundreds of millions of dollars pass through your hands each month; you're not risking your life for nickel and dime racketeering and prostitution. You dabble in funding ecoterrorists in Nigeria so they disrupt a competitor's mining platforms and recently blackmailed a genetic engineer at VeldtKorp so you can sell their newest proteus nanovirus developments to your contacts in the Martian Triads. Just a few more lucrative operations and you'll move up and join the "old men" who pull your strings and really make things happen. In your mind there is very little difference between what you do and the CEO of a multinational corporation, although the CEO may have less assassins on the payroll.

Advantages: Allies and Contacts are important. Alternate Identities and Zeroed can be instrumental in evading arrest and your competitors. Wealth (including levels of Multimillionaire) are appropriate, but if it was just money you wanted it would have been easier becoming a corporate manager.

Disadvantages: Enemy, Greed, Involuntary Duty (to your cartel), Paranoia, Secret. Bloodlust and Code of Honor (stays bought) are common with some of the older gangsters.

Skills: Acting, Administration, Detect Lies, Law, Merchant, and Streetwise. Holdout, Guns, and Intimidation will be useful during the occasional cartel shakeup.

Volk ("Wolf")

"A lot of people have moved to the oceans to escape the stifling control of governments, corporations, their parents, the media, whatever. Many escaped the tyranny of nanny states like the United States and most of Europe. But they still have problems they need dealt with, justice still needs to be served at its most basic level -- an eye for an eye, a tooth for a tooth. The sheep of the world need to hire wolves like me to keep the other predators at a safe distance. It can get a bit messy, but that's why I charge a premium."

Problems have solutions, and that's where you come in. You're a professional contract enforcer, sometimes working for criminal syndicates but usually doing your best to keep your clients safe by force of reputation. Those who haven't lived a day outside their carefully managed arcologies call it extortion; to the inhabitants of a floating shantytown off the New Mumbai arcology you're the closest thing to the law they have. Communities occasionally hire you to keep the peace, and those are the jobs you like the best. At least then you can pretend you're not just a legbreaker working for the highest bidder. You make your living based on the fact that people trust you to complete your contract to the letter. Some people get the idea they can bribe you out of fulfilling your contract; those people usually end up dead.

Advantages: Alertness, Combat Reflexes, Danger Sense, Fit, Hard to Kill, Reputation.

Disadvantages: Bloodlust, Code of Honor (stays bought), Contacts. You may have a Higher Purpose.

Skills: Brawling, Guns, Interrogation, Intimidation, Law, Streetwise.

Hardware and Wetware

Transhuman Space is a mix of conservative and optimistic views of the future. The concepts behind almost all of the technology are either already being experimented with or there are programs underway to explore those possibilities. Much of the technology in Chapter 6: Aquatic Technology we'll probably see by 2020 in some form or another. Much of what looks like science fiction (like the shark repelling field generators) you can buy now!

I (Kenneth Peters) used **GURPS Vehicles** heavily in developing the hardware, partly because it gives a starting benchmark for performance at various Tech Levels, but mainly because it helps keep the technology consistent. I've listed some of the technical assumptions we used in Chapter 6 so you have an idea of what we were smoking to get the statistics.

Oceanic Energy: The OTEC generator was originally a vehicle module in the Appendix (based on the rules in **GURPS Vehicles Expansion 1**), but we decided that it was so massive and limited in application that it fit better in Chapter 5. The other generators are not designed with **GURPS Vehicles** -- because that book has no system to cover them.

Microgenerators: There were some questions as to what the point of these were compared to batteries. One reason is that they are solidly TL8 and thus readily available to Fourth Wave individuals. Weight tends to be higher overall, but the generators are built with a structure and armored -- they become more advantageous over longer periods.

Muscle Generators: This was built as an extra-light steel structure with a 0.4-kW muscle engine, cycle seat, and integral 0.4 kWh hour battery. Surface area was based on a volume of 0.5 cf (components volume is 0.2 cf). We bloated the cf listed as that's the minimum it takes to actually operate -- consider it an Exposed "Very Cramped" Standing Room requirement.

Lift Bags: Lift bags are "built" by multiplying their inflated surface area by 0.3 to get weight and 10 to get cost. Hardcore gearheads will note this is 100 times the gasbag weight and cost on p. VE20. This multiplier gives good results matching real lift bags at TL6 and TL7.

Personal Transport: The finpants and finsocks were built using **GURPS Vehicles**, albeit taking some liberties with determining what hydrodynamic lines they have.

Supercavitating Minitorpedoes: Pure **GURPS Vehicles** designs, with the *one* exception that underwater drag was *not* rounded. I based their volume on the weight of the standard missiles in **Transhuman Space** so they could be fired from standard launchers. I divided their weight by 50 to get volume in cubic feet, then consulted the surface area calculation on p. VE18 (the chart does not have enough detail for stuff this small).

- **15mm:** 0.002 cf body (0.1 sf) with advanced submarine lines. Structure is extra-light metal-matrix composite with the supercavitating option and is sealed. The warhead is a 15mm small warhead. It has two solid rockets, a 10 lb., 0.017 minute boost rocket to reach supercavitation speed and a 2 lb., 0.035 minute endurance sustainer rocket bought as a guided missile (×2 cost). Remember that the boost rocket has *halved* thrust underwater! Underwater drag is 0.0125.
- **30mm:** 0.016 cf body (0.38 sf) with advanced submarine lines. Structure is extra-light metal-matrix composite with the supercavitating option and is sealed. The warhead is a 30mm small warhead. It has two solid rockets, a 90 lb., 0.017 minute boost rocket to reach supercavitation speed and a 35 lb., 0.05 minute endurance sustainer rocket bought as a guided missile (×2 cost). Underwater drag is 0.0475.

Note: Hydrojet powered designs are problematic with straight **GURPS Vehicles** because of their minimum weight (even if that is ignored they have horrible performance at this size).

Lost Technology: Direct Blood Oxygenation

This was an interesting idea that simply didn't pass muster as far as feasibility and competitiveness with liquid breathing and rebreathers.

Direct Blood Oxygenation Unit: The blood oxygenator bypasses conventional respiration completely, and does not interfere with cetacean-analog diving reflexes. The unit consists of an invasive routing system that takes deoxygenated blood out of the body, a filtration and gas injection unit using the same electrolysis technology as artificial gills, and a return catheter to supply freshly oxygenated blood back to the body. Gas partial pressures are computer controlled, so there is no risk of oxygen toxicity or the bends. Does not interfere with the Oxygen Storage advantage, unlike other breathing systems. Purchase as an artificial gill with ×2 weight and ×10 cost.

Vehicles

Vehicles suitable for adventuring tend to be military or utility vessels, but we wanted to include (and there was considerable demand for) civilian cargo vessels. Unfortunately, the last minute cut to word count meant that the cargo container text was shortened considerably, and two cargo vehicle designs were dropped. These components and vehicles, plus an emergency submarine escape capsule design, are presented here.

Optional Rule: Larger and Smaller Hydrofoils

There is normally no allowance made for smaller hydrofoils and there is no advantage to using larger foils other than the increased volume and HPs. For additional depth to the design system, any size hydrofoil may be used as long as the size does not exceed that of the main hull.

Hydrofoil Variable: Divide the chosen assembly's surface area by that of the normal hydrofoil for that hull type. If the variable is less than 0.2 it is too small to function. Otherwise modify the following performance statistics.

Variable	Hydrofoiling	hMR	hSR
0.2-0.5	×1.5	-2	-2
0.51-0.8	×1.2	-1	-1
0.81-0.9	×1.1	--	-1
0.91-1.2	×1	--	--
1.21-1.5	×0.9	-1	+1
over 1.5	×0.8	-2	+2

Hydrofoiling is the multiplier to the required minimum speed to begin hydrofoiling.

The hMR and hSR modifiers are how many rows you move down (negative) or up (positive) if using the extra detail option for hydrofoil maneuverability.

New Hull Types

Type	VSP	Wt.	Cost	HP	Area	Top
Stupidly Large Arcoblock	45,000,000	1,080,000,000	M\$13,500	3,765,000	2,510,000	840,000
Superdimensional Fortress	90,000,000	2,160,000,000	M\$27,000	6,000,000	4,000,000	1,330,000

Transhuman Space Technical Appendix Additions

In addition to the basic setting modifications, the following rules were used to design vehicles:

Supercavitating Lines: The designer may ignore the ×1.05 weight multiplier.

Very Fine Lines: Not normally available (at least, not for free!).

Hull Shapes: A simplified hull shape system is to assign a ×1.2 volume multiplier for "cylindrical" hulls -- submersible hulls are already cylindrical and do get no benefit from this option. Multiply by ×2 if spherical.

Submersible Design Option: This is not required in **Transhuman Space** unless you wish to simplify the design process. Instead, purchase ballast tanks as storage tanks with a ×2 cost multiplier to cover vents and trim ducts.

Plastic Armor: This has an M of 0.1 and a C of 0.5. For every 10 points of damage it sustains (regardless of whether it protects or not) one point of DR is destroyed afterward.

Roll Stabilizers: Replace with Fin Stabilizers, multiply surface area by 0.01 to get weight, and 0.2 to get cost.

Periscopes: Build these as turrets but increase rotation space by 10% for every foot of length it can extend.

Snorkel Tubes: These are free if the vessel has submarine lines (either type).

These designs are *far* too large to mount realistic hydrofoils, but hey, you can always build some in **GURPS Vehicles** and see what happens.

Standard Containers

Cargo containers are built with old extra-light aluminum structures and DR 2 steel armor; the structure is waterproofed and will normally float even with a full load. All have a Complexity 2 computer and one or more short-range (10 mi.) radio transponders, forming a manifest tracking and emergency recovery system. The computer tracks everything in the storage area using v-tags and monitors access to the container (and broadcasts an alarm if there is an unauthorized entry). The computer can write new records but cannot delete or modify them. There are ports for inspection cyberswarms to gain access to the containers, even if they are sealed. When received, the contents are checked against the records from the originator, the shipping company, and the container manifest to look for discrepancies.

Large Container (Twenty-foot Equivalent Unit, or TEU): 20'×8'×8'. 250 VSP cargo.

Very Large Container (Forty-foot Equivalent Unit, or FEU): 40'×8'×8'. 510 VSP cargo.

Container Type	VSP	Weight	Cost	DR	HP	Size
Large (TEU)	256	2,000	\$10,000	3	262	+5
Very Large (FEU)	512	4,000	\$20,000	2	525	+5

Sealing: \$5,600 for large containers, \$11,200 for very large. *Reefers:* Containers with climate controls for cargo (-30°F to 230°F). This costs \$10,000 and requires 10 kW for a Large container, double for Very Large. This includes a D cell (5 kWh) incorporated into the frame, used during transfers. When on board a ship or in dock, reefers are plugged into external power.

Note that Container Cells can hold either two TEUs or one FEU container.

Vehicle Designs

Wright-Waterman C1200 LASH

The Wright-Waterman *C1200* is a mid-sized "lighters aboard ship" (LASH) vessel designed to operate without significant local port facilities or expensive fuel. It carries a small fleet of lighters to help offload cargo, and has

Sonar Communicators: Divide range by 100 rather than the 10 specified in **GURPS Vehicles Expansion I**.

Sonar: Sonars use conformal arrays and distributed transducer arrays for full coverage. Flat sonars that cover a single hemisphere are available at half weight, volume, cost and power. If range is over 1 mile then *square* the range before multiplying by the values below. New sonars multiply weight and volume by 0.5, but cost is multiplied by 4.

TL	Type	Weight	Volume	Cost	Power
Old	Active Sonar	40	0.8	\$4,000	2

The towed array and dipping sonar options are technically available but not recommended for use.

Passive Sonar Targeting: Passive sonar can be used for targeting.

Magnetic Anomaly Detectors (MAD): This technology was approaching obsolescence in regards to antisubmarine warfare by late TL7 and had hit a wall in the physical limits of their detection capability. In TL9 it is an interesting toy mainly useful for picking up emag signature spikes. It will not detect submarines (even if they are made of steel the signature reduction is such that it's a fool's game).

Sonar IFF: Can be used, but active sonar can work as a sonar IFF out to twice its normal range (this does not impede normal function).

Bilge Pumps: You don't get free bilge pumps.

Diving Controls: You get a free extra set if you purchase duplicate maneuver controls.

Planing: Multiply Ath by 1.2 to see if the vessel can plane if it has a lifting body hull.

Submerged Hydrodynamic Drag: Equal to (surface area ×2.5)/Ls.

Crush Pressure: As in **GURPS Atlantis** but the shape modifier is 6 for submersible lines and 3 otherwise. Spheres have a shape modifier of 24 and cylinders have a shape modifier of 6. Only watertight compartments need to calculate a crush pressure. Note that sonars must be in contact with the working fluid in order to function so they are usually placed in a flooded section of the hull.

375 lbs./VSP Flotation, are you mad!?

There's a method to this madness. In **Under Pressure**, flotation rating is hull volume in VSP

numerous cranes located around the hull, including an aft-mounted loading crane with 80-ton capacity used to load and unload lighters from their storage section. The payload assumes the lighters are unloaded, this vessel operates like a hybrid LASH or SEABEE (Sea Barge) ship, loading and unloading containers before taking them aboard. They can be loaded if necessary but the limit is the crane and possibly the limits of buoyancy.

The *C1200* requires the Shiphandling (Steamer) skill. It has computerized controls. Standard payload includes 48 empty lighters (see below) stored in an aft 115,200 VSP cargo hold and 2,000 loaded Very Large containers in the cells. The external cradles are usually empty, but can hold tugboats or a launch for the crew. A standard crew is 10 sailors.

Subassemblies: Medium Arcoblock Body +12, 2,400 VSP Superstructure +7.
P&P: 40,000-kW ducted screw, 40,000 kW fusion reactor, 10,000 kWh batteries.
Fuel: 200 years endurance from fusion reactor.
Occupancy: 4 RCS
Cargo: 4,500 cf (Superstructure)

Armor	F	RL	B	T	U
Hull:	3/5	3/5	3/5	3/5	3/5
Superstructure:	3/5	3/5	3/5	3/5	3/5

Equipment

Hull: Short-range sonarcomm; PESA array; sonar array; precision navigation instruments; 2 2.5-ton external cradles; 4 bilge pumps; 4 safety systems; 1 water filter; 80-ton crane; 3 40-ton cranes; 2 20-ton cranes; 1,200 container cells; 872.76 bilge space. *Superstructure:* Two duplicate maneuver controls; 12 cabins; 20-man environmental controls; Complexity 8 mainframe; 2 medium-range radios; radio IFF transponder; hall; 500 sf landing pad.

Statistics

Size: 800'×115'×35' *Payload:* 56,037.2 tons. *Lwt.:* 64,716.8 tons
Volume: 6,012,000 cf *Maint.:* 2 hours. *Price:* \$99,393,230.
HT: 5. *HP:* 150,000 [Hull] 6,000 [Superstructure]
wSpeed: 20 *wAccel:* 0.1 *wDecel:* 0.3 *wMR:* 0.05 *wSR:* 8
Draft: 43.8' *Flotation:* 187,500 tons

Design Notes

Superstructure is Large Cutter with no hydrodynamic lines. Structure is light steel on hull, medium aluminum on superstructure, surface is waterproofed.

Fine hydrodynamic lines with fin stabilizers. Armor is cheap steel on hull, steel on superstructure. Long-term access space for fusion reactor and batteries. Crew stations have bridge access. Ewt 17,359,400 lbs.

Komar MLV-3 Lighter

This is a boxy unmanned vehicle either carried aboard LASH ships for transporting cargo from ship to shore, or used

multiplied by 375 lbs. This is equal to 62.5 lbs. (base flotation in lbs./cf) times 5 (cf in one VSP) times 1.2 (volume multiplier for Average/Submarine Lines). This stays constant so that if your vessel changes to No Hydrodynamic Lines it has the right flotation rating and you don't recalculate based on your Lines. This simplifies a bit of *GURPS Vehicles* arcana and works in most situations. In my opinion, a 100-VSP ship is 100 VSP even if it has less volume usable because of hydrodynamic shaping -- it just has the equivalent of broken storage for internal components. This should answer puzzled gearheads scratching their heads over why that value was used rather than 312.5 lbs.

as a general cargo barge. Standard payload is 10 Very Large containers: 4 in the cargo hold and 6 on the top deck, stacked 3×2. Requires the Shiphandling (Steamer) skill. It has computerized controls. \$193,180.

Structure: Waterproofed Large Cutter (SM +7, 3,000 HP, HT 6, 375 tons flotation) with old light steel structure. No hydrodynamic lines. PD 3, DR 5 aluminum armor. 50' long. 12,000 cf total volume.

Equipment: 280-kW hydrojet; 2,800-kWh battery (10-hour endurance); Complexity 6 small computer with backup; medium-range radio; PESA array; radio transponder; bilge pump; 11,500 cf cargo hold.

Weights: Ewt 20.65 tons. Payload 275 tons. Lwt 295.65 tons. Performance: wSpeed 5; wAccel 0.2; wDecel 10; wMR 0.25; wSR 7; Draft 5.6'

SafetyONE ERS-5 Emergency Capsule

This is an emergency system deployed on some large submersibles. They became popular after a string of gruesome accidents with civilian and military submarines in the 2020s. They allow the crew to reach the surface from standard civil operating depths, at which point the emergency transponder activates and the radio can be used. More capable, but significantly more expensive, systems are used on deep-diving military and civilian submersibles.

A small cargo area holds minimal emergency supplies. It has no controls and simply drifts with the currents on the surface. Uses the extra detail armor volume rule. \$28,735.

Structure: Sealed Medium Boat (SM +3, 900 HP, HT 12, 3.75 tons flotation) with old extra-heavy aluminum structure. No hydrodynamic lines. PD 4, DR 100 titanium armor (3 VSP). 6' long. 120 cf total volume.

Equipment: 5 CS; 7-kWh battery; short-range radio; radio transponder; 1 man-day limited life system; 2.5 cf cargo hold.

Weights: Ewt. 5,910 lbs. Payload 2,050 lbs. Lwt. 6,960 lbs. Performance: Draft 1.27'; Crush Pressure 39.8 atm.

Appendix Out-Takes

The Aquatic Vehicle Modular Design Sequence (AVMDS) is the second modular system in *Transhuman Space* that is based directly on *GURPS Vehicles* -- the other being the Wheeled Vehicle Modular Design System (WVMDS) in *Transhuman Space: In The Well*. (The spacecraft design system in the core book is sufficiently different in scope and format that it's not included.) The systems are directly compatible, and some components were left out because they appear in *In The Well*.

Using the WVMDS and AVMDS Together: There's one issue that needs to be brought up immediately -- without using *GURPS Vehicles* there is no way to determine how big the wheel subassemblies are for the hull types! So your dreams of an off-road wheeled Large Arcoblock are dashed without a bit of work. But it's simple to use components back and forth.

Design: The bodies in the WVMDS can be used in AVMDS with no changes, just remember that the hulls in *Under Pressure* already include hydrodynamic lines -- WVMDS bodies are hulls with No Hydrodynamic Lines but they can be given lines (divide volume by 1.2 for Average lines). For hydrofoils, pick a set for a hull that is of comparable volume to the WVMDS body.

GLUB GLUB! Driving Underwater

Sealed vehicles can operate underwater by simply driving around on the sea floor, a few with ballast tanks can do this intentionally -- others just hope they sink in shallow water!

Some underwater areas are completely impassable by driving, and even the nice areas are quagmires -- *halve* off-road speed unless it has extremely-low ground pressure (note that current flotation rating will reduce the effective loaded weight for this) or has legs. A vehicle with high, very high or extremely high ground pressures will get stuck if the a Driving-4 roll is failed, roll every 10 minutes. Getting unstuck requires a Driving-5 roll, and a failure by more than 3 means it's *really* stuck and needs outside help.

Performance: The most obvious place to start using the AVMDS to calculate water performance for ground vehicles that can float (you've waterproofed their structure or sealed their hull). When determining water speed, legs and wheeled drivetrains with off-road wheels generate 2 lbs. of aquatic thrust for ever kW of motive power. Determine crush pressures normally.

The Last Word

"Scientists today were celebrating after seven years of genetic research produced the first whale that could talk. Humanity awaits what wisdom they could learn from the whales."

"The Whale Speech project was terminated after the subject rattled off an endless list of millions of atrocities perfectly recorded in Whalesong memory for the past 1,000 years. She was still talking when the voicebox was deactivated."

Building A MSTRE

by William Blake Smith & Andy Vetromile

They were close now. They ran past towering bins and rows of boxes and crates, the clack of distant boot heels resounding off the corrugated steel walls of the warehouse. Suddenly a flash of light, followed by the sound of a metal door being slammed -- then silence but for their own slowing footfalls. When they rounded the corner they found a dead end, and footprints in the dust trailing into a solid concrete wall. General Gorman had disappeared, and taken the Stone of Arimathaea with him.

Storing your stuff can be challenging, more so when the stock is leaking radiation, magic, or worse. The ever-cautious scientists and shamans at Warehouse 23 have come up with an ingenious method for storing inventory: the Multi-dimensional Storage, Transport and Recovery Engine (MSTRE) System.

A MSTRE in the Making

The MSTRE System was created by Dr. Anton Spiller, then the foremost authority on interspatial relations. He demonstrated a prototype that allowed him to retrieve anything he needed from a single desk drawer. Warehouse staff immediately set about establishing a full and workable version of the system on a facility-wide scale. Spiller's fate is unknown -- his folder was, ironically, lost -- but it has been suggested he fell victim to the labyrinthine permutations of his own creation. (The last any witnesses heard from him, he said something about "Version Two.")

The principle behind MSTRE is simple (although the actual parapsysics would make the average scientist froth at the mouth). By manipulating the time-space-reality continuum, it is possible to create doorways to locations where space isn't at a premium, and the temporary storage of magical, alien, and secret artifacts won't be noticed -- places like your grandmother's basement on the bottom shelf, behind the fertilizer. Sometimes the effects of such storage go unnoticed and nobody suffers. Sometimes the items have catastrophic effects on the surrounding environment. For example, the storage of the "real" Hope Diamond in a dusty filing cabinet under the New York Stock Exchange has had a deleterious effect on the world economy.

Amazingly, through the flexibility in time, space, and dimensions afforded by the MSTRE System, it is possible for Warehouse 23 to use the original resting places of artifacts as temporary storage nodes. This has confounded a few adventurers who sought a difficult-to-reach artifact, only to find men in coveralls gently placing the item on its pedestal before leaving through a solid wall.

The Nuts and Bolts

A single doorway connects warehouse workers to all of these distributed MSTRE locations. (The staff has been understandably hesitant to add another entrance -- or, indeed, make any kind of upgrade -- since Spiller's disappearance.) This doorway is disguised as a freight elevator. It has two large steel doors that must be opened by pulling down on a leather strap. Then the user must open a metal cage. Inside is the greasy, soda-stained interior of a cargo lift. The only difference between this elevator and any other in the warehouse is that the control pad has only the numbers 0-9 and a network jack. Warehouse personnel have small computers that they use to program the keypad controls. The 1-9 buttons allow the workers to store the last nine places to which they've traveled. Some locations see more portal traffic by a level of magnitude (like Stonehenge and San Francisco International), so shortcuts can be a real time saver. They also allow for a quick getaway if the team is compromised. The 0 button is always keyed to return the MSTRE transport to Warehouse 23.

The elevator itself works much like a "standard" dimensional door. It is a two-dimensional opening and would only be visible to someone outside if they were facing the open side and the elevator's built-in stealth system were disabled. Usually the users program the doorway to open on the backside of a shelving unit or storage area where they can add

and remove warehouse inventory without drawing attention to themselves. Occasionally, a doorway opens several feet from the destination node, with the gulf of dimensionless chaos in between. Falling into this netherworld would be bad for the user.

If the MSTRE unit is damaged or left open without its stealth system engaged for more than 30 minutes, it is set to return to Warehouse 23. (Damage to the portal can have disastrous consequences all by itself, as there is no way to predict if or how that damage might be translated to other locations.) Occasionally this "boomerang" function has led to unauthorized warehouse entry. Consequently, when the system is being utilized for scheduled operations, two security guards are placed on watch. Only a few workers have disappeared forever into the distributed storage network, making MSTRE duty one of the least lethal in the Warehouse system.

Navigating the warehouse and its abutting halls and storage areas can be tricky. Having a good sense of direction or an accurate internal clock is invaluable. Having both is a potent combination that will get you a job offer. Most who venture into the MSTRE have very specific instructions on where to go and what to do so they need not depend on their own senses to recover from misjudged system use.

The Darker Side of the System

There are rumors that some people get lost in the twisting, Escher-like halls and realities and live off what they find in the various areas they encounter. Some superstitious workers leave food and useful accessories lying about in the passageways and broom closets the system comprises. This is either to appease the ghostly figures reputed to wander the infinite spaces, or in hopes that, should they share the same fate, others will show similar kindness to them.

Another rumor holds that entire bands of these passage dwellers travel like nomadic tribes from one era or mystic site to the next. That their appearances explain everything from the Anasazi tribe to the crew of the Flying Dutchman is a tale that remains unconfirmed by the warehouse staff, like most illuminated gossip.

Building the Beast

Erecting portal nodes or extending the system can pose its own problems. Most of the time expansion just means adding another hallway in null space or bending Newtonian dynamics, some of which can be accomplished by remote manipulation of the system. Talented users can even make passages to new locations "on the fly."

Other times, though, setting up a hallway has to be done the old fashioned way: with nails, rivets, metal plating, and a self-contained environmental suit. Few people like hanging by a tethered lifeline over the gaping maw of null space; it takes a special breed that can stand the limitless gray. Some have been known to go mad looking at it for lengthy periods. These people are generally avoided at the canteen: They can't see the menu but they can see the taint in your aura.

Newtonian dynamics are stubborn and often refuse to shift without something else giving. This is usually no trouble; at someone's house somewhere in the suburbs, little Billy is suddenly unable, in violation of the laws of probability, to break one of the windows with a baseball. Other times, like when the Brisbane Police start bailing out more suspects than they had in custody, the problem is a little more noticeable and needs amending.

The subjective physics index is also troublesome. If a team needs to make an incursion into a specific area, local physics may not want to play along. The immediate mana level, sunspots, or the statistical likelihood of a refund check from the IRS can conspire to solidify against incursion a piece of real estate the warehouse staff wants for MSTRE. At that point, a construction team has to go to the location they want to use and start building a MSTRE node, chronospatially navigating their way back to the main system. Subtlety is the watchword, and when you bring a portable reality stabilizer and the contents of a home improvement superstore with you to a civilian's tool shed, you can watch the word subtlety pull a fast fade.

Adventure Seeds

Special Effects: One of the PCs inherits a piece of seemingly worthless property. While cleaning up the junk in the house they find a minute spent in the bedroom equals an hour anywhere else in the house. A scheduling error has targeted the bedroom as a MSTRE site, and the PCs could encounter guards, creatures, or fabulous gizmos while they try to figure out the chrono-anomaly.

Was That Door There?: While handling a museum security job the PCs are told to use the freight elevator on the loading dock to move their equipment. When they come out of the elevator they find themselves in the Hall of Mummies. In Egypt. In 5000 BC. Hopefully it will be the least interesting place they will be forced to visit.

Stairway to Newhaven: The heroes travel to the Beinecke Rare Book and Manuscript Library in Newhaven, Connecticut to deliver a mysterious volume to the collection, but to their chagrin the book is reported stolen before they can even leave town. Security cameras show a man stepping out of a solid wall and taking the book!

Four Guys and a Room: The party is told to put a rather large chunk of fallen satellite technology into storage. When they reach the storage location, that spot is clearly too small to hold the item in question. Their manual tells them in cases where the item is too big for the room, the room must be made to fit the item. The PCs must now use conflicting and abbreviated instructions from the manual to reconfigure the room. For clever, well-prepared, or insane GMs only.

Internal Affairs: A squad of well-armed and well-informed soldiers is loose in the shifting architecture, and the team must venture in to find them and neutralize the threat they pose. Running gunfights may break out in storage areas (some of which may contain weapons and vehicles and the space to use them).

Damage Control: Some fool had a running gunfight in the storage area, and now the MSTRE System is on the fritz. A technical crew has to go in, find the problem, and fix it. With meeps and gremlins running loose under the floorboards (not all of the creatures are escapees from the warehouse, and not all of the floorboards are on the floor), the repair may turn into a war of attrition.

What Does This Button Do?: When they load into the elevator, the workers discover the controls have changed. Did someone add controls? Where's the new manual? What do the new controls do? Is this the right lift, or has some outside force piggybacked its entry portal onto a portion of the system to help themselves to the warehouse's facilities?

Joy Ride: Your group has had a long week at the warehouse, and now they want to kick up their heels, maybe catch a movie. But the remoteness of the warehouse means they'll never get to the theater in time, certainly not before all the tickets for *VR Volkswagen and the Hippienauts* are sold out. Surely the brass wouldn't mind if someone borrowed a control pad, just for the weekend, just for a quick trip?

Well, yes, they would mind. Another team comes looking for you, armed with South American sap guns and restabilization nets. Bad enough you're cruising around with illuminated property without the proper forms, but you allowed an unattended babbling psychic to slip through a reality crack under her bed and scarper into the local mall.

Have We Got a Job for You: Your tribe led a peaceful existence until the strangers came, wearing their odd garb and offering everything your clan needs for its survival. They asked you to invade the wyvern's caves and retrieve an item known only in legends among your people -- but they were right. It was just where they said it would be. And when you presented it to them, they made you another offer, for another item.

Who are these people? How do they know so much of your lands and the tales surrounding them? Why are they so generous with their goods? And how do they appear and disappear at the canyon when there is but one way in or out?

Nice Work If You Can Get It: During a visit to a small island in the Philippines, a race of goblinoid creatures approaches you. They have what you want -- a small idol rich in jungle-aspected mana -- but they offer something else as well: their undying fealty to you, their new gods.

Do you dare perpetrate such a fraud? When will they get wise to the ruseâ?or do they know of your corporeal nature already? They always seem to have just the artifact you came to obtain, always just what it takes to bring you back again. Who's using whom?

Random Destination Generator

This table is designed to help the GM create quick random locations for the MSTRE device.

Roll 3d6

	1	2	3	4	5	6
Die 1	Barren	Dusty	Dark	Antiseptic	Glowing	Slime-Coated
Die 2	Alien	Toxic	Mystical	Abandoned	Temporally Warped	Experimental
Die 3	Warehouse	Cave	Shelving Unit	Cabinet	Field	Garage

Combine the results to form your description. Example: On a roll of 2,4,1 you would get a, "Dusty, Abandoned Warehouse." A 3,2,3 would get you an "Dark, Toxic Shelving Unit."

Plotting as Oral Storytelling for GMs

by Patrick Dunn

Oral story telling is as old as human civilization. Perhaps older. It's certainly older than writing; in fact, some scholars now think that when a culture develops writing, they forget how to tell oral stories. Of course, as gamers, we know that this isn't entirely true: oral stories continue as games, and the same tricks that make oral story telling possible must be reinvented by every GM. After all, GMs cannot plot as novelists or other writers can: we cannot plan, control our characters, or revise. Yet we can manage to tell coherent and interesting stories, if we have some tricks. We can borrow those tricks from the ancient story-tellers of prehistory, the scops and bards. Here are three ancient tricks that you can make new again in your storytelling:

Steal Your Story

Take Homer for instance. There is plenty of evidence in the text of Homer that it was originally an oral story, and that it was a story the audience was familiar with. The tale of Troy and the voyages of Odysseus was familiar to every Greek. (In summary: the Trojan War between the Achaeans and the Trojans drags on for years. Finally, Achilles, who refuses to fight because his commander stole his girlfriend, joins the fray and wins the war, but is killed shortly thereafter. Achilles' friend Odysseus tries to get back home, but meets with many obstacles; finally, he returns home to find out that his wife is being courted by a group of bandits, whom he kills.) This was an old story, borrowed by Homer for his song.

You can do the same thing, stealing a plot from another source and grafting it on your story. Fortunately, this is made easier by the fact that there are, essentially, very few possible plots; one critic names a total of 36. And everything in any given plot is reversible or otherwise changeable. Take the Trojan war: a valuable artifact is stolen by a powerful prince of a neighboring city-state. The king conscripts an army to retrieve the artifact. The characters are, because of their exceptional skills, placed in a special unit and given various missions. Or, you can reverse the story: the king's foolish son makes off with a rival city-state's prized gizmo, and now the rival city-state has invaded and carried off some valuable booty. The king can't avoid war, but . . . and here you can change the story to fit your players. Are they more diplomatic? In that case, he asks them to carry a secret message to the enemy camp for a meeting to negotiate peace. Are they backstabbers? The foolish son can enlist their aid to assassinate his father because the son wants to press the war against his dad's wishes. Are they beefy fighters who relish combat? Then they're wall defenders. It's all the same plot; you let the characters decide the switches you flip.

You don't have to steal from mythology, of course. You can also steal from movies or books that you've enjoyed. This might seem dangerous, and sometimes it is. For example, if you steal the plot of a popular fantasy novel only to discover that half the group had read the books and recognized the plot immediately, you're going to have problems. Fortunately, you can switch around details to make a plot unrecognizable. None of the plots above look much like the *Iliad*; just enough has been changed to make them seem different and original.

Here are some additional tips for creative stealing: Never use a character's name from the original story. If you call the foolish son "Paris," you'll have a few suspicious players on your hands. Use the plot only for the basic inspiration; don't be hidebound into the plot. That leads to bizarre games in which the GM tries to force the players to make the "right" choices. Finally, ask yourself with every detail, "what if I reversed this to its complete opposite?" You might end up with something entirely original, when all you intended to do was steal.

Use Formulas

One of the primary characteristics of an oral story -- and one of the ways that scholars can tell if a story was originally oral and not written -- is the use of formulas. In *Beowulf*, for example, there are certain phrases that fit the meter and form of the poem that are used over and over again, such as "unlocked his word-hoard" for "made a speech."

"Unlocked his word-hoard" doesn't always work in the poem, of course, so you have a list of formulas for "made a speech," including "spoke formally;" "stood and spoke;" "remembered his oath;" and, from a different poem, the "Battle of Maldon" -- "shook his spear."

Of course, you don't have to tell your story in verse (and probably wouldn't want to, unless you have a very odd gaming group!). But you might also have formulaic plot points that can be dropped in a story. The classic and overworn example: "you meet in an inn" and its science fiction twin, "You meet in a spaceport." But you can find a set of relatively original plot formulas that you can use when you can't think of anything else. Some possibilities:

- **A mysterious message arrives.** From whom? You as GM don't even have to know at this point. But it'll get the players moving. Particularly if it's something like a head in a box, or a lawyer with a summons.
- **An innocent is caught in the crossfire.** Perhaps a sleeper is caught in a mage battle, or perhaps a waif is discovered living in the orc camp. In any event, this plot device gives you an NPC to play with and a possible, but not necessary, future development. Again, you don't have to know the purpose or history of this person when you use it; you'll develop it as you go.
- **Someone powerful seems to have noticed the NPCs.** Possible employer? Enemy? Ally? Neutral but interested party? Let it depend on how well or poorly the PCs react.
- **The PCs are invited to a party or other large social event.** You can use this to introduce players, of course, but you can also use it wrap games up, or as an interlude in between dungeon crawls.

The use of such plot formulas can be used to spark major plot directions; at the party, for example, they could meet the main villain and embarrass him in public, thus causing him to swear vengeance. Or, they can be used to suggest possible plots to players who may or may not find them interesting. The waif might be returned to her parents, or one of the PCs might take her on as an apprentice, opening up new directions of roleplaying. Either way, it's the players' decision whether or not to accept that plot hook, and most players enjoy making an impact on the plot.

Build a Kernel, Don't Plan a Plot

Some GMs claim to have success planning out a plot in intricate detail, but many GMs find that exercise frustrating in the extreme. After all, you'll planned for your players to find the cursed dagger at the end of the first session, but they've spent time arguing with the blacksmith and challenged him to a duel, and never even got to the tomb by the end of the session.

You don't really need to plan out the plot exactly, though, especially if you have a compendium of plot formulas and stolen plots knocking about in your head (or in a box of notecards, if you prefer the organized approach). All you really need to build a plot are the following things:

First, you need a conflict. Decide what two things will be in conflict. In traditional plotting, there are only certain possibilities: Man against Nature, Man against Man, Man against God, and so on. Consider in terms of ideas, not in terms of Men and Gods. Your conflict might be Loyalty and Power: when your PCs become powerful, will they reject their old patrons? (You could steal from *Henry IV 1 & 2* for that plot, or make your own) Or Love and Death: what happens when the players begin to lose the things they love? Do they despair? Or do they find a way to fight even death? Any two ideas that can be set against each other can be the core of a plot idea.

Once you have a conflict, decide a set of possible complications. You won't use all of them, but jot them down just in case. Before each gaming session, decide which complication you'll use. If you're going with Loyalty and Power, for example, your complications might be:

1. Players are knighted, and patron (the thief guildmaster) elicits promise to be loyal and not betray him.
2. Patron calls in a favor in a public place, risking the players' position as knights.
3. Players are called in by the Chamberlain to explain the rumors of past criminal connections.
4. Players discover that the Chamberlain has hard proof of their prior criminal activities.

This approach isn't quite planning out a plot, because you know going in that you won't use all of these. If, for

example, the thief guildmaster asks for the promise of loyalty and the players, soon to be knights, say, "No, old man, we're going to betray you the minute we have that medallion of knighthood!", there goes your careful plot. But good! Because after the session, you sit down for ten minutes and draw up some new complications:

1. Guildmaster hires assassins to kill the new threat.
2. Players find out that the king's nephew is one of the assassins.
3. Players find out that the Chamberlain has been paid off to destroy the knights' reputation.
4. Players discover that the Chamberlain has hard proof of their activities, and intends to present it to the king.

Notice that the plot is brought back to approximately the same point. And that this point still enforces the basic plot conflict. Now, instead of deciding, "are we going to be loyal to our old patron and friend, or to our new powerful position?" they have to decide, "are we going to be loyal to the law we're sworn to uphold, or are we going to kill the chamberlain or steal his evidence?" You don't have to return to the same plot point as done above, if you prefer not to. In fact, you don't even have to know how you'll resolve the plot when you start out. Half the fun for some GMs is finding out what happens in the end.

Finally, you'll want to have a few NPCs. Give each NPC a conflict as well: Your thief could be Kind but Desperate. Your cleric could be Pious but Greedy. Only do this with important NPCs; people who drive carts and so forth should be given very little detail, other than local color. Also ask your PCs to sum up their characters' motivations in terms of these conflicting adjectives. Some gaming systems already do this, but it can be wise to ask them to come up with a specific conflict that drives their character. These conflicts, if you can trust your players to play them, making plotting much easier. You can predict with some accuracy what choices the players might make, and tailor individual complications to specific players.

These three tips won't make you into Homer, but they will help your plot move along without having to call time out long enough to figure out the next step. They also have the advantage of requiring less planning than writing out an entire plot. You can even come up with a plot in a matter of seconds for those surprise sessions. Just steal from a movie or book you enjoyed, change a few things around, decide a conflict and a handful of complications, and roll up some characters.

Once, scops sat beside the fire and sang the songs that made people laugh and cry. Today, we sit around a table of nachos and dice, and tell the stories that make us look forward all week to gaming night. To think that we continue an oral storytelling tradition that most people think died out in 700 CE is exciting. How much more exciting our games become, then, when we can consciously use those techniques of oral storytelling to enrich our plots.

Pass the root beer, Unferth. It is time to unlock the word-board.

Making the Most of Moves

Cinematic Combat in the *d20 System*

by Geoff Skellams

A common criticism of the *d20 System* system is that the combat system isn't cinematic enough. The rules seem to almost mandate the use of miniatures, turning a roleplaying game back into a tabletop war game. For some people, this "clunkiness" is enough to turn them off *d20 System* altogether. However, other roleplaying games -- such as *Feng Shui*, *Dragonfist*, and *Marvel SAGA* -- have wholeheartedly embraced the action paradigm and include mechanics that allow players to attempt the wild stunts seen in the movies. With some creative thinking and a little flexibility, the *d20 System* combat system can easily do the same cinematic style almost as easily as games created specifically for it.

The *d20 System* rules break combat into six-second rounds. If you read the more recent editions (for example *D20 Call of Cthulhu* or *D20 Modern*), a character has a variety of actions each round, with most of them involving a move action and an attack action. Whether the character attacks first and then moves, or moves then attacks is left to the player. The move action doesn't necessarily mean walking across a room, either. It can be as simple as standing up, or picking up an object.

Hong Kong action movies in particular make great use of movement before and after attacks. For example, in Jackie Chan's *Who Am I?* there's a fight scene where Chan slides backward across a table and then falls to the floor with the chair. As soon as he lands, he kicks out, sending the chair sliding underneath the table to knock the feet out from underneath the guy who was chasing him.

The key to cinematic *d20 System* combat is being as creative as possible, particularly with the move action. Make the move action's description as colorful as you possibly can and set yourself up for the attack. The clearer the description is, the more enjoyable it is for all those playing. In writing circles, the old adage is, "Show, don't tell." The same is true when describing the actions your character is doing. Don't just say he's trying to hit his opponent. Instead, use word pictures that show us exactly how he's going about that goal. To use the Jackie Chan example again, the move action would be the sliding across the table and onto the chair, while the attack action would be kicking the chair into the opponent's legs.

It's a good idea to look at your character's skills and feats (particularly the active ones like Balance, Jump, and Tumble) and work those elements into the your move actions descriptions. By concentrating on your character's strengths, you give yourself a much better chance at succeeding with the wild stunts. It also allows your character a chance to use those skills and feats that might not otherwise get used.

As a player, it's important to think not only about your opponent, but also the combat's location. Try to think of the sorts of objects that you would expect to find in a location like that, and then work those into your action descriptions. It doesn't matter if the GM hasn't explicitly said that the object isn't there. If he's playing along, you should be allowed to get away with it, provided that you don't try something too outlandish.

Don't try to do too much with your action descriptions, though. Basically, you should aim for one quick sentence for each part of your action, with perhaps no more than one "and" to join them together. If your idea is any more complicated than that, chances are you're trying to do too much in one round and will probably be stopped by your GM. By keeping the descriptions short, sweet, and colorful, combats will go much faster and be more fun for everyone.

Setting Things Up For A Fall

As a GM, it's vital that you encourage the players to experiment with their descriptions and not make it difficult for

them to achieve their actions. One of the easiest ways to do this is to actually have the NPCs work in the same way, and for you to describe the NPC's actions the way that you would like to see the players describe their characters actions. Most players should quickly follow suit.

The other way you can help make your combat sessions more cinematic is to stage the locations carefully. When running a combat, it's easy to fall into the trap of thinking of the combat taking place in a vacuum. The attention is focused almost entirely on the characters and little thought is given to what's actually around them. By thinking about the combat's location before the session, you can seed the combat with the sorts of things you want to happen. Things to include are some props for both the PCs and NPCs to use in the fight and some strange terrain or obstacles that will complicate the fight and make it more interesting for everyone concerned.

Don't be afraid to ask players to make additional skill checks if their movement descriptions are relatively complicated. To go back to the Jackie Chan example, the sliding backward across the table should require a Tumble check, say DC 15. If the Tumble check was successful, the attack should have a -2 penalty, because the chair is being used as an improvised weapon. However, don't make it impossible for the PCs to succeed with their stunts or they will give up trying them.

In the ***Feng Shui*** RPG, Robin Laws suggests that GMs work out a list of cool things that can happen during a fight scene. This is wonderful advice, as it really helps set the tone for the sorts of stunts that will happen during play. The list doesn't have to be very long or very detailed. A few dot points should be enough to jog your memory when you're actually running the game. It also helps focus your attention on the sorts of props that need to be included in your description of the scene itself when the PCs first encounter it.

The other thing that both ***Feng Shui*** and ***Dragonfist*** recommend is learning to say "yes." This style of cinematic play relies as much on the players thinking things up as it does on the GM. If the players think of a prop that should belong in the scene, then allow them to use it, even if it hasn't even been mentioned up until now. It takes a little getting used to, but the extra flexibility and creativity that it allows is a wonderful thing.

d20 System combat can be somewhat dull and mechanical, but it doesn't have to be. With a bit of thought and some colorful descriptions, the ***d20 System*** is just as capable of allowing cinematic action as other games that were written to specifically capture that feel. Bend the rules a little if you have to; remember, the idea is to have as much fun as possible.

Big Questions Answered; No One Notices

Many games revolve around search for -- and possibly finding -- "the truth." Unfortunately, I believe far too many games allow it to be found.

Consider the biggies: life, death, is there a higher power, how will the world end, is there free will, what's six times nine . . . all the unknowables.

Depending on the game world, many of these are, indeed, answered. Where do we go when we die? Well, to one of 16 planes, depending on your alignment and a couple other fiddly bits. Is there life after death; sure! Spock and Superman hung out in the hereafter a while, playing **Wiz-War**. How will the world end? Well, the scarf-clad Doctor knows how things turn out on Earth and at the edge of the universe.

In short, in most worlds the questions that most of us struggle with day in, day out -- questions that plague us on a macro and micro level -- are both answerable *and* answered.

Does she really love me? -- Easy to know in a world with mind-reading.

What will the future bring? -- Trivial with precognition or time-viewing.

Is this really a good person? -- Cast *detect good/evil/law/chaos*.

Have I done anything important with my life? -- Just wait for Clarence to talk you off the bridge on Christmas Eve; he'll set you straight.

Consider that questions which were near-unknowable in the not-too-distant past that we *can* now answer:

- Child paternity
- Definitive collaborative blood evidence
- Accurate time-dating of artifacts
- The mathematical understanding of heredity

It wasn't long ago in the human scale where the movements of stars and heavenly bodies were the deepest of mysteries. That's almost cliché to think about . . . but not when you realize that unlocking those mysteries led to radical changes in society and thought.

So what does this mean for your average gaming? Well . . . nothing. Which is part of the problem.

Most of the time ordinary folks in gaming universes act just like their counterparts in our world, despite any elements that *should* make them rethink things. How could someone *not* believe in the Force, when there are robe-clad mystics levitating objects, fogging minds, and hopping around like Grover on acid? Why didn't the world's religions react when there was an honest-to-goodness *angel* as part of the Justice League?

Consider *Star Trek*. They've established on the show that there are still religions in the 23rd and 24th centuries. If that's the case, then how can people encounter -- or hear about -- any the myriad Beings of Nigh-Infinite Power, and not be spiritually moved? Why hasn't a Cult of Q sprung up on the *Enterprise*? Q is able to do just about everything that major religious figures have been claimed to do, *and* he'll sign 8"×11" glossies for \$20 apiece! At the very least someone might corner Q and ask him for the truth about his own religion. (Then again, one should never ask any questions one does not want to know the answer to; Arthur C. Clarke's *Childhood's End* explores this area nicely.)

Quoth Hamlet:

*"For who would bear the whips and scorns of time,
The oppressor's wrong, the proud man's contumely,
The pangs of despised love, the law's delay,
The insolence of office and the spurns*

*That patient merit of the unworthy takes,
When he himself might his quietus make
With a bare bodkin? who would fardels bear,
To grunt and sweat under a weary life,
But that the dread of something after death,
The undiscover'd country from whose bourn
No traveler returns, puzzles the will
And makes us rather bear those ills we have
Than fly to others that we know not of?"*

In other words, the only reason your standard peasant doesn't fling himself into the thrasher is that he doesn't know what will happen in the hereafter if he does. How, then, does that sit with your average fantasy-setting peasant? His priest quite probably has a direct link to the divine, bestowing him with power and wisdom. He has probably heard tales of those who came back from the dead, and he probably has some solid proof as to where he will go when he dies.

There should be no agnostics in the Forgotten Realms.

How, then, does all this relate to gaming?

Well, I'm not entirely sure yet. (Hey, it's a column about the results of answering life's unanswerable questions . . . gimme a break!) But I have some proto-thoughts about the whole thing.

Consider carefully whether or not any of the Big Questions will be answerable in the game world. Sometimes the answers to some questions will be unavoidable; for example, if there's mind-reading in the game world, then secrets about what people are *really* thinking are probably going to be difficult to keep. (On the other hand, the classic Dick York *Twilight Zone* episode "A Penny For Your Thoughts" shows the fallibility of mind-reading . . . just because someone is thinking or fantasizing about something doesn't mean it has any actual bearing on reality.)

Other times, however, GMs will include the answer to a Big Question as a Darn Tantalizing Carrot with which to motivate PCs. Being able to meet an omnipotent being, travel through time to witness the truth about some point in history, or [cheat death](#) are all fascinating plot elements, but they may well also change the game world in ways everyone doesn't expect.

Consider making knowledge a zero-sum game. *In Nomine*, for example, neatly skirts a surprising number of metaphysical issues by noting that no one knows the whole truth . . . or if they do, they're not talking. Thus most of the basic religions are still equally valid, and no one belief system is more "right" than others (although, again, agnostics would have a hard time in the game universe if they knew the extent of the War).

You can also make knowledge zero-sum by having the "truth" revealed that there is no truth . . . or if there is, then it isn't revealed. For example, *Star Trek V* (in the tradition of many original series episodes) centers around the idea that Kirk and the gang find God, only it turns out it wasn't really Him. (Mind you, it would have been more satisfying if the *Enterprise* crew had learned that *Star Trek V* itself wasn't real . . . but you take what you can get.) This zero-sum truth is a good way of satisfying more "realistic" game campaigns, but it is also more unsatisfying for players . . . especially if used too often.

Consider the implications of game knowledge, especially on common people. Although heroes may be made of sterner stuff than your average street Schmoes, there are a *lot* more of them than there are heroes. In general consider that established religions and beliefs will try to incorporate or explain most phenomena. For example, one of the best things about ***Aberrant***, in my opinion, was its detailed accounting of what the various religions thought about the sudden appearance of these super-powered Novas; some were very supportive, others were more apprehensive, and still others viewed them as tools of the devil and acted accordingly.

To return to our fantasy campaign, then, let's consider the implications of knowing that there is a definitive afterlife. In that case, religions and philosophies probably focus more on the *whys* of that phenomenon; why are there various kinds

of afterlives for those who are pure of heart, and what are the implications of that? (In good ol' *Dungeons & Dragons* terms, if you are Chaotic Good and your wife is Lawful Good, then you both might be assured of having a pleasant afterlife . . . but it might be stressful to realize you won't be there together. As such, there may be fundamental philosophical differences based not on how good a life you live, but on how orderly or spontaneous an existence you lead.) In a world that knows of the existence of reincarnation for all, there might be those who act in seemingly unusual ways; for example, an organization may build around the idea of helping others through brutal and horrendous means, figuring that this current cycle of life is already ruined for them, but they might as well try to help others before they die and come back.

And, of course, if suicide is universally agreed to send you immediately to the Plane of Painful Sores and Unsweet Tea, then you'll probably keep your bodkin where it belongs.

Finally, reconsider recasting these Truths as not-so-universal. For example, if our fantasy world has some of its denizens being reincarnated, while others get to go to an afterlife, and there's no obvious discernable pattern as to what determines one over the other, then this can be the lynchpin of faith the campaign revolves around. One religion might say that those who adhere to its scriptures will go to their just rewards while those who still haven't learned will return. Another religion might say that those who are born under certain astronomical situations, or those who are part of certain castes, will be assured a place in the afterlife. And others might believe it's entirely random and unknowable, and there's no point in living life differently than you would otherwise . . . in other words, you *can* have agnostics in a world of mystery and wonder.

On many levels, games are often about wish fulfillment. But having too many wishes fulfilled can damage the integrity of the game world itself, especially if those wishes involve bringing knowledge back to the game world. Since the essence of faith is something improvable, then providing proof in-game may well destroy faith, or make it more difficult to explain why faith still exists in the world.

And, to quote *Wormy*, "Lotsa fokes got all the answers . . . and they don't seem to be the least bit concerned with the questions."

Dork Tower!

Dork Tower!

Pyramid Review

Vice Squad: Eighties Police Adventure

Published by [Politically Incorrect Games](#)

Written by Marc Bruno with Brett M. Bernstein

48-page downloadable PDF; \$4.00

It should take little or no difficulty to break down the TV cop genre into their respective decades, and all with a few generalizations. For example, the 1950s TV Cop needs no more than a decent suit, a belief in the law and a desire to get "Just the facts, Ma'am." The 1970s cop should have a sheepskin coat or woolly cardigan, a bull dog of a car, and an attitude to match -- white stripe optional, of course. The 1990s needs grit, strong language and shaky camera angles, while the current crop of cop shows brings the ultrachic high tech science of forensics to the art of criminal detection. In between are the 1980s, when all a cop needed were cool shades, an even cooler foreign car and a light linen ensemble in soft colors.

Barring Task Force Games' *Crimefighter RPG*, the genre of the TV cop show remains little explored and while we were promised the chance to "*Leef it oowwtt!!!!*" for the all 1970s buddy-cop game *Git Yer Trousers on, Yer Nicked!*, it is doubtful that this New Style game designed by James Wallis will ever get out of the squad room. In the meantime, and while we await the arrival of *Crime Scene: Police Investigation*, the *d20 System* game of forensic detection from the new Hogshead Publishing, Politically Incorrect Games lets you wander back to the 1980s with *Vice Squad: Eighties Police Adventure*. So slip into something sub-tropical and pastel, make sure your shades are black and shiny and the keys to your Maserati are in your pocket, and let's go get that alligator-pet keeping drug czar! Oh, and socks are entirely optional for this review.

Vice Squad: Eighties Police comes as a 1.54-meg 48-page PDF, with a full-color cover and a black-and-white, art-free interior. Designer Mark Bruno has some experience with this kind of game and format, having worked for Deep7 on their XPG title, [Mean Streets RPG](#) and also having created the self-published space opera [Armada-X](#).

This game comes divided into two sections. Both print the game's rules, but do so in different formats and to different ends. Laid out in landscape format, the first 13 pages are not meant to be printed out, but instead read from the computer screen. To this end, hyperlinks are built into the layout to facilitate ease of access, navigation and use. The second section reprints the rules, but in the traditional portrait format and without the hyperlinks. This section is also followed by the game's character stereotypes, vehicles and four scenarios, all of which is used with either version of the rules.

The game is the third title in PIG's "'genre Diversion' Quick Fix Games" each of which -- like those of Deep7's 1PG line of titles -- is designed to facilitate a single night's play in between a campaign or as a break from the current one. But there the comparison between a 1PG title and a "genre Diversion" one ends, as the latter are slightly more complex. Indeed in terms of complexity, the "genre Diversion" rules are on a par with Deep 7's XPG games, such as *Mean Streets*, if not slightly more so. Essentially, they are a cut down and simplified version of the mechanics used in PIG's *The Colonies RPG* -- and can be played in basic or advanced mode.

Basic mode has a player attempt to roll equal to or under a skill total to succeed using a pair of six-sided dice. From the same dice roll, the advanced mode requires the difference between the skill total and the total, this margin being compared against a difficulty set by the GM. For ease of play, the success table is printed on the character sheets. The number of dice thrown can be altered by a character's action or situation, and even by the equipment being employed. For example, if a character has been grievously knocked to the ground, he has a penalty of two dice on their roll; if he

was firing a shotgun at close range he would receive an extra bonus dice. Bonus and penalty dice cancel each other out, and whatever the roll, only a total of two dice count: the worst or highest two if there were more penalty dice applied, or the best or lowest two if the bonus dice held favor.

Character generation is a reasonably quick and simple affair. four primary traits -- Fitness, Empathy, Reasoning and Willpower -- are rated from zero to five, and have 11 points divided among them. Alternatively they can each be rolled for on a six-sided die. Another 25 points go on skills rated from zero to 10, which can be no higher than twice the associated trait under normal circumstances or higher than six at the end of character generation.

Characters also receive several clichés, one from each of the five categories. Each cliché is a special ability designed to simulate a particular aspect of a game -- obviously in this case, that of an eighties cop show. These categories are combat clichés, chase clichés, investigation clichés, contacts clichés and authority clichés. Some of the best and most fun include:

From the combat clichés, Fiery Wreck -- firing a gun at a parked or crashed car will always cause it to explode; Conversational Nod, in which our hero never needs to talk to communicate his intentions in a tight situation; and the ever-popular Magic Clip, from which bullets never run out.

From the Chase clichés, Super Star -- the hero owns a luxurious sports car that makes him more studly and thus gives a bonus on seduction rolls; Multi Tasking Driver, for when a hero needs to drive, shave, and let off a round or two; and the amusingly named Frogger, by which means the heaviest of traffic can be crossed in complete safety!

From the Contacts clichés comes Spec Ops, for the hero with a Special Forces military background and who still maintains his contacts; and Don't Go Against the Family, for heroes with mob ties. Other contact clichés cover sports, local politics, the police department, the underworld, and business and retail.

From authority clichés comes Squeaky Clean, which always keeps Internal Affairs away from the hero; Squad Lieutenant give them rank; Planted Evidence provides something extra with which to frame a suspect; and Vigilante Judge, where you're always guaranteed to get a warrant in a hurry.

Alternatively, players can select one of the ready-to-play police officer stereotypes. These include the Loner, the Maverick, the Grizzled Veteran, the Rookie, and the Dishonest Cop. These come with their own pregenerated clichés, but it would be easy enough to substitute these with those more to a players' liking. As such, there are no rules or guidelines for handling a cliché in play. This is a shame, as they are an integral aspect of the game and do serve to enforce the conventions of the game.

As well as combat and other actions, the rules cover vehicle chases, simply and succinctly in just a single page. They deal not only with highway pursuit and motorboat chases -- no surprise given the obvious inspiration for ***Vice Squad: Eighties Police Adventure*** -- but could in a pinch also handle light planes and possibly helicopters. Just as the characters have their stereotypes, the chase rules are backed up with a selection of high performance cars -- the Maserati Merak SS, the Corvette, the Lamborghini Countach, Ferrari 308 GTB, the Triumph TR8, and even the DeLorean are all included. The selection is rounded out with a typical automobile and motorcycle as well as the Plymouth Gran Fury Police Squad Car. The lack of a Porsche was surprising, however. Six pages of very expensive yachts, a fast cigarette boat, and a pair of police launches round out the vehicles section.

Villains and their incarnations as a 1980s cop show stereotype also get their own page. This discusses the types suitable to the game, from Gangster/Crime Boss and Drug Czar to Drug Smuggler and Rogue Cop, before suggesting a few clichés suitable for their use. There are only nine provided, including Immortal, always able to revive from fatal injuries; and Can't keep Him Locked Up, always able to escape prison within a year; but a GM may want to boost their bad guys with a cliché or two from the player's list.

Vice Squad: Eighties Police Adventure is rounded out with four scenarios, each of which is a little over two pages long and should each give a solid evening's worth of play or so.

[SPOILER ALERT!]

"Like Father Like Son" begins with an undercover operation to bust a drugs dealer gone tragically awry and the lucky apprehension of a Drug Czar's son, who perhaps will spill the beans on daddy's dealings. In "Hunting Season," the squad must investigate the kidnapping of the wives of local Colombian importers and the subsequent deaths of both husbands and spouses; this could be plain old gangland violence or something else. Another kidnapping is at the center of "Deliver Her From Evil," though not of the wives of Colombian drug dealers, but that of an up-and-coming fashion model. Finally the player characters need to provide protection to a visiting South American dissident in "Man on the Run."

[END SPOILER ALERT]

It should be noted that "Deliver Her From Evil" is actually an expansion and adaptation of the author's adventure previous "Vendetta," written for [Full Clip: Hong Kong Action RPG](#) published by Deep7. The expansion is nicely done, and suggests crossover potential between the source material for both games.

If ***Vice Squad: Eighties Police Adventure*** is lacking anything, it is in the little advice provided for the GM. That said, if the GM knows the genre, it should not be much of a problem. Unfortunately, no bibliography is given to that end. Thus ***Vice Squad: Eighties Police Adventure*** works better for the more experienced and older GM, as well as the players, who possibly need to be of a certain age to get the most out of the game. In addition, ***Vice Squad: Eighties Police Adventure*** does not have the immediacy of a 1PG title -- one cannot quite as simply pick up and start running this game. This owes as much to the traditional RPG design and format as anything else; even then, ***Vice Squad: Eighties Police Adventure*** is still pretty quick to get going. The genre is nicely handled and enforced through the use of the clichés and despite the lack of explanation of their use, it will be interesting to see their like employed in future "genre Diversion" titles. Indeed, without the presence of the clichés, ***Vice Squad: Eighties Police Adventure*** would not really stand out from the growing range of RPGs published in PDF format, but together with the very genre they help evoke, ***Vice Squad: Eighties Police Adventure*** is a diverting slice of fun.

--Matthew Pook

Characters for "Strange Bedfellows"

Pregenerated Characters for *In Nomine*

By Elizabeth McCoy

These are pregenerated PCs with both **GURPS** and ***In Nomine*** stats, designed for the "Strange Bedfellows Expanded" adventure that begins in this issue. Naturally, GMs may use any of these as NPCs or pregenerated characters for other adventures!

The Characters

These are all 9-Force angels, too new to modern Earth to have been given Roles yet. (They do have drivers' licenses, though, with sufficient backing to withstand a traffic ticket or two -- but not a higher-level investigation.) All have variable genders -- alter the default one as desired.

The **GURPS** translation has been altered from a straight conversion in some places, for elegance and to make them 100-point (plus racial template, Choir template, and Choir Attunement) characters. All have Literacy, Essence Control 9, and 5 points from Quirks (some left blank for players to define).

OZEM

Ofanite of War

Ozem is first in his age-set classes, a young prodigy of motion (if prone to daydreaming during Earth studies). He's quite unaware that his vessel is attractive -- he just thinks it's decently streamlined, and tends to view it as yet another vehicle to drive. He's on a fast-track to being a covert warrior, and thus has had a *little* training in restraining his natural Ofanite impulsiveness. A little. Ozem had never met Judgment Servitors before, but he's expecting them to be just as annoying, pedantic, hidebound, and supercilious as his fellow Michaelites seem to believe. (He's a good character for anyone who's already impulsive!)

GURPS Character Sheet

ST 12 [-15]; **DX** 16 [20]; **IQ** 12 [-15]; **HT** 13 [-10]

Advantages: Alertness +4 [20], Extra Hit Points +7 [35], Power Investiture (all 3), Vessel (Attractive Appearance) [35].

Disadvantage: Servitor of Michael [-8]

Quirk: Clueless about Earth - except cars.

Skills: Acrobatics-14 [1], Brawling-16 [1], Climbing-15 [1], Dancing-11 [0], Driving (Car)-15 [1], Escape-13 [0.5], Fast Draw (Knife-17 [1], Pistol-17 [1]), Fast-Talk-7 [0], Guns (Pistol)/TL7-19 [2], Holdout-10 [0.5], Knife-18 [4], Running-11 [1], Shadowing-11 [0.5], Tactics-10 [1]

Song: Numinous Corpus: Wings-9 [4]

In Nomine Character Sheet

Corporeal Forces - 3	Strength 5	Agility 7
Ethereal Forces - 6	Intelligence 5	Precision 7
Celestial Forces - 5	Will 5	Perception 7

Vessel: Human/2, Charisma +1 (Body Hits: 25)

Skills: Acrobatics/2 [9], Climbing/2 [9], Driving/2 [9], Escape/1 [8], Fighting/2 [10], Move Silently/2, [9], Ranged Weapon/3 (Pistol) [10], Running/2 [9], Small Weapon/4 (Knife) [11], Swimming/1 [8], Tactics/2 [7]

Songs: Wings/3 [6]

Attunement: Ofanite of War

KEHELAHATH

Kyriotate of War

Kehelahath -- "Kel" for short -- has been down to Earth a few times, to get used to the concept of . . . lying, to cover for one's host-body. Since her Will is so weak for one of the Dominations, she's not likely to do much possessing of animals unless she gets lucky or spends Essence to boost her Will. Still, Kel's happy enough in the vessel her Kyriotate of War attunement gives her -- so long as she has her Big Honkin' Axe around. Like Ozem, her opinions of Judgment are thoroughly steeped in Michaelite "bad attitude," though she's had little actual experience with triads. (Despite being a Kyriotate, her Will is low enough that she would be a good character for someone who doesn't want to worry about resonances or less-human Choir attitudes.)

GURPS Character Sheet

ST 18 [45]; **DX** 17 [30]; **IQ** 14; **HT** 14

Advantages: Combat Reflexes [15], Extra Hit Point +1 [5], Power Investiture (Corporeal 4, Ethereal 3, Celestial 2), Vessel [30].

Disadvantages: Servitor of War [-8], Reduced Alertness 2 [-10], Weak Will 4 [-32].

Skills: Acrobatics-14 [0.5], Acting-13 [1], Axe-17 [2], Brawling-17 [1], Climbing-15 [0.5], Driving (Car)-15 [0.5], Fast Draw (Pistol)-18 [1], Fast-Talk-14 [2], First Aid/TL7-9 [0], Guns (Pistol)/TL7-19 [1], Stealth-16 [1], Throwing-14 [0.5], Two-handed Axe-17 [2].

Songs: Healing (Corporeal-12 [6]), Motion (Corporeal-12 [6])

In Nomine Character Sheet

Corporeal Forces - 4	Strength 9	Agility 7

Celestial Forces - 2	Will 4	Perception 4

Vessel: Human/1 (Body Hits: 45)

Skills: Acrobatics/1 [8], Climbing/1 [8], Dodge/5 [12], Driving/1 [7], Emote/2 [6], Fast-Talk/3 [7], Fighting/2 [15], Large Weapon/3 (Battleaxe) [12], Lying/2 [8], Move Silently/2 [9], Ranged Weapon/2 (Pistol) [8], Throwing/1 [8]

Songs: Healing (Corporeal/4 [8]), Motion (Corporeal/4 [8]).]

Attunement: Kyriotate of War

SOPHEREETH

Seraph of Judgment

"Sophie" has been on exactly one Earth mission, and still takes her job very, very seriously. She leans slightly toward the "Mercy" faction in Judgment -- but is naively unaware that Judgment *has* factions. As Dominican Most Holy go, she can be reasoned with surprisingly well; she won't let people get away with things, but she will delay the lecture if it seems prudent. She's not thrilled to be working with Michaelites -- they're always so "disorganized and irrationally rude (sung in the strong opinion chord)" -- but she will do her duty and retrieve the AWOL Cherub before he Falls! From a more War-like point of view, she's nosy, ivory-tower, and can barely hold her own in a firefight -- a total civilian. (Her curiosity may well increase the friction between herself and Parnach . . .) Sophie's probably best for someone with previous roleplaying experience, being by turns soft-hearted, intellectual, or stern.

GURPS Character Sheet

ST 11 [-20]; **DX** 11 [-20]; **IQ** 16; **HT** 12 [-15]

Advantages: Charisma +1 [5], Servitor Attunement (Heavenly Judgment) [45], Vessel [30]

Disadvantages: Clueless [-10], Curious [-5], Servitor of Judgment [-10].

Quirk: Ivory Tower Naivete.

Skills: Artist-13 [0.5], Brawling-10 [0.5], Computer Operation/TL7-16 [1], Criminology/TL7-15 [1], Detect Lies-13 [0.5], Guns (Pistol)/TL7-13 [1], Interrogation*-16 [2], Law-15 [2], Leadership-16 [0.5], Research-15 [1], Singing-14 [4], Stealth-11 [0.5], Tactics-13 [0.5], Typing-15 [16], Writing*-16 [2].

Songs: Form (Ethereal-13 [6]), Motion (Celestial-13 [2]), Possession-13 [2], Shields (Celestial-14 [4])

* Sophie's Interrogation skill is geared toward effective use of the Seraph resonance and Detect Lies. Writing is technical writing, to take efficient notes and write up reports.

In Nomine Character Sheet

Corporeal Forces - 2	Strength 4	Agility 4
Ethereal Forces - 3	Intelligence 7	Precision 5
Celestial Forces - 4	Will 8	Perception 8

Vessel: Human/1, Charisma +1 (Body Hits: 10)

Songs: Form (Ethereal/4 [7]), Motion (Celestial/2 [6]), Possession/2 [6], Shields (Celestial/3 [7])

Attunements: Seraph of Judgment, Heavenly Judgment

CLEMENT

Cherub of Judgment

Clement is firmly in the "Mercy" camp of in Judgment. He's sweet, easy-going, and tries to explain to subjects that Judgment's only harassing them because they're all angels, and even Judges care about people. He's the sort to request that the Seraph ask if a subject has learned from his mistakes and is truly repentant, so they can avoid overworking the Celestial Tribunal. Nevertheless, even his laid-back temper gets strained by Michaelite hostility. (Parnach is likely to especially annoy him, since "we're both Cherubim together, so we should get along.") As soon as he summons his Big Honkin' Sword, he'll garner some envy from the Michaelites, though. Naturally, he's attuned to Sophie. His Earth experience is minimal -- two missions. Clement is a peace-maker character, suitable for players who avoid getting involved with in-character strife.

GURPS Character Sheet

ST 16 [20]; **DX** 17 [30]; **IQ** 10 [-30]; **HT** 16 [20]

Advantages: Alertness +2 [10], Artifact: (Corporeal 1, Bastard Sword, Summonable for 0 Essence, Immediately Recognizable as Artifact) [18], Extra Hit Points +2 [10], Power Investiture (Corporeal 4, Ethereal 2, Celestial 3), Strong Will +2 [8], Vessel [30].

Disadvantages: Chummy [-5], Honesty [-10], Overconfidence [-10], Servitor of Judgment [-10].

Skills: Acting-8 [0.5], Artist-7 [0.5], Broadsword-17 [2], Brawling-16 [0.5], Climbing-12 [0], Detect Lies-7 [0.5], Driving (Car)-15 [0.5], Fast Draw (Rifle)-16 [0.5], Guns (Rifle)/TL7-17 [0.5], Running-13 [0.5], Stealth-12 [0], Swimming-16 [0.5], Two-handed Sword-15 [0.5].

Corporeal Forces - 4	Strength 8	Agility 8
Ethereal Forces - 2	Intelligence 3	Precision 5
Celestial Forces - 3	Will 6	Perception 6

Vessel: Human/2 (Body Hits: 48)

Skills: Artistry/1 (Drawing) [7], Detect Lies/1 [7], Dodge/1 [9], Driving/3 [8], Fighting/2 [14], Large Weapon/3 (Broadsword) [11], Lying/1 [7], Ranged Weapon/1 (Rifle) [6], Running/1 [9], Swimming/1 [9].

Songs: Healing (Corporeal/2 [6], Ethereal/1 [3], Celestial/1 [4]), Shields (Corporeal/2 [6]), Claws/4 [8].

Attunement: Cherub of Judgment

Artifact: Broadsword/1, Summonable for 0 Essence, Obviously a Relic

EBED-DAN

Elohite of Judgment

As a direct counter to Clement, Ebed-dan is an old-school Elohite who believes the Symphony is well-served by a bit of inflexible, inexorable Justice. If he didn't also believe in advising -- rather than overruling -- the Seraph of the triad, he'd be horribly annoying at best. He was last on Earth in the days of horses and crossbows, with a Role as a seaport tavern owner, and is suffering a bit of culture shock. (Naturally, he doesn't express it overmuch, lest it unsettle his Seraph, but pretending that he's Perfectly Fine would only lead to grief as well, in his objective opinion.) He's encountered enough hostility from Servitors of War to return it -- though typically only as aloofness and the occasional snide remark. (He did get his crossbow, since the Michaelites have *their* weapons.) Like Sophie, Ebed-dan is better for players with previous roleplaying experience.

GURPS Character Sheet

ST 10 [-30]; **DX** 12 [-15]; **IQ** 19 [60]; **HT** 13 [-10]

Advantages: Common Sense [10], Combat Reflexes [15], Extra Hit Point +1 [5], Musical Ability +3 [3], Power Investiture (Corporeal 2, Ethereal 4, Celestial 3), Rapier Wit [5], Servitor Attunement (Incarnate Law) [15], Vessel [30].

Disadvantages: Reduced Alertness -1 [-5], Servitor of Judgment [-10], Weak Will -3 [-24].

Skills: Acting-20 [4], Animal Handling-17 [1], Area Knowledge (1400s Italy)-19 [1], Artist-16 [0.5], Beverage-Making-20 [2], Brawling-11 [0.5], Cartography/TL3-18 [1], Cooking/TL3-20 [2], Cooperage-20 [2], Crossbow-14 [4], Detect Lies-16 [0.5], Diplomacy-16 [0.5], Escape-12 [4], Fast Draw (Arrow)-12 [0.5], Fire-Making (Flint Sparking)-14 [4], First Aid/TL3-20 [2], Forensics/TL3-16 [0.5], Games (Chess)-20 [2], Holdout-17 [0.5], Interrogation-17 [0.5], Knife-14 [4], Knife Throwing-12 [1], Language (1400s Italian)-19 [2], Law*-18 [2], Lockpicking/TL3-17 [0.5], Psychology-16 [0.5], Research-17 [0.5], Riding (Horse)-14 [1], Savoir-Faire-18 [0.5], Singing-17 [2], Stealth-14 [1], Tactics-16 [0.5], Veterinary/TL3-16 [0.5].

Song: Shields (Ethereal-16 [2])

*Besides being out-dated, Ebed-dan's Law skill is now subsumed by his Incarnate Law attunement.

In Nomine Character Sheet

Corporeal Forces - 2	Strength 3	Agility 5
Ethereal Forces - 4	Intelligence 8	Precision 8
Celestial Forces - 3	Will 5	Perception 7

Vessel: Human/2 (Body Hits: 12)

Skills: Artistry/1 (Drawing) [8], Detect Lies/1 [8], Dodge/1 [6], Riding/1* (Horse) [6], Emote/2 [9], Escape/1 [9], Fighting/1 [6], Lockpicking/1 [9], Lying/1 [9], Medicine/1 [9], Move Silently/2 [7], Ranged Weapon/1 (Crossbow) [9], Savoir-Faire/1 [9], Small Weapon/1 (Knife) [9], Tactics/1 [9]

Songs: Shields (Ethereal/2 [6])

Attunements: EloHITE of Judgment, Incarnate Law

*Riding (Horse) is based on Agility.

VANIAH

Malakite of Stone

While not the brightest gem in the quarry, Vaniah's good-hearted and devoted to the concept of *unity*, *dammit*. (Though it wasn't all-capital or profanity-ed until three minutes after she met the group she was supposed to keep together -- Dominicans and War-angels . . .) Though strong and sturdy, she often lets her mind wander when matters aren't immediately interesting. She's also got a very simple fighting style -- wade in swinging. This makes her easier to dodge, but once she connects with something, it's going to be pretty well smote. (Vaniah's for players who like smiting -- in moderation, as Stone's dissonance conditions forbid hitting first.)

GURPS Character Sheet

ST 17 [30]; **DX** 15 [10]; **IQ** 10 [-30]; **HT** 16 [20]

Advantages: Alertness +1 [5], Choir Attunements (Malakite of Stone [0], Mercurian of Stone [30]), Power Investiture (Corporeal 4, Ethereal 2, Celestial 3), Strong Will +2 [8], Vessel (Attractive) [35].

Disadvantages: Absent-Mindedness [-15], Easy to Read [-10], Servitor of Stone [-18].

Skills: Acrobatics-12 [0.5], Acting-10 [2], Brawling-15 [1], Climbing-13 [0.5], First Aid/TL7-9 [0.5], Running-13 [0.5], Staff-15 [4], Stealth-14 [1].

Songs: Form (Corporeal-13 [20]), Tongues (Corporeal-7 [1]), Numinous Corpus (Wings)-9 [4].

Vessel: Human/1, Charisma +1 (Body Hits: 50)

Skills: Acrobatics/1 [7], Climbing/1 [7], Detect Lies/1 [6], Emote/3 [8], Fighting/2 [16], Large Weapon/4 (Staff) [14], Medicine/1 [5], Move Silently/2 [8], Running/1 [11]

Songs: Form (Corporeal/6 [10]), Tongues (Corporeal/1 [5]), Wings/3 [7]

Attunements: Malakite of Stone, Mercurian of Stone

MINNI

Mercurian of the Sword

Minni is pert, perky, cute, and not what one would expect of a demonbane Laurencian. She's barely even excellent (by Sword standards) with her saber. On the other hand, her ability to dodge is boggling, especially when she feels like being acrobatic about it. She's looking forward to more Earth experience, and a Role as a Bounty Hunter. Now, if only War and Judgment could settle their differences and work together as God's Plan asks of angels. Sheesh! (Minni's a good character for someone who wants to play up the religious and faith aspects of *In Nomine*, or simply be an acrobat.)

GURPS Character Sheet

ST 12 [-15]; **DX** 16 [20]; **IQ** 14; **HT** 14

Advantages: Combat Reflexes [15], Enhanced Dodge [15], Power Investiture (all 3), Sanctity [5], Servitor of Laurence

[1], Vessel (Attractive) [35].

Disadvantages: Broad-Minded [-1], Imaginative [-1].

Skills: Acrobatics-16 [4], Climbing-14 [0.5], Dancing-14 [0.5], Detect Lies-11 [0.5], Diplomacy-11 [0.5], Driving (Car)-14 [0.5], Fast Draw (Sword)-16 [0.5], Fast-Talk-12 [0.5], First Aid/TL7-13 [0.5], Fencing-17 [4], Guns (Pistol)/TL7-17 [0.5], Judo-14 [1], Stealth-14 [0.5].

Songs: Charm (Corporeal-12 [8]), Numinous Corpus (Wings)-11 [4].

***In Nomine* Character Sheet**

Songs: Charm (Corporeal/5 [8]), Wings/3 [6]

Attunement: Mercurian of the Sword

* Use Shortsword values (***In Nomine***, p. 65) for a saber.

Strange Bedfellows Expanded

An Adventure in Two Parts Part One: The Adventure Begins

By Elizabeth McCoy

*(While full of **In Nomine**-specific details, this adventure could be stripped to the bare bones for other settings: someone is missing. The PCs need to find him, starting by searching his apartment for clues to where he might have gone. Once they find him, they need to rescue him -- and the child he's babysitting -- from enemies who are willing to kill to acquire the child. Many of the complications will still apply.)*

Overview

This is an expansion of the adventure seed, "Strange Bedfellows," from **Superiors 1: War & Honor**, pp. 136-137. It supplies NPCs and pregenerated PCs with both **GURPS** and **In Nomine** stats, allowing a Game Master to run it as a quick one-shot. (Or, due to length, a two-shot.) This isn't the only way it could be fleshed out, of course!

Each stage of the adventure lists a Goal, some Possible Solutions, and Complications. If the GM desires, the urgency of the main goal can be toned down, and *all* the complications used to make a short campaign arc.

The premise -- for those without **Superiors 1** -- is that a Cherub Vassel of War, Ziba, has hidden his Heart and gone to Earth. A Dominican triad discovered that he was AWOL before it could be dealt with "internally," and the agreement is that a mixed team of Judgment and War angels will be sent to get Ziba back. Since Judgment and War mix together about as well as nitro and glycerin, one of the Judges has sensibly called in some favors to get other angels assigned to the team as well -- Servitors of Stone and/or the Sword. (Of course, the GM can allow other kinds in as well or instead, but the pregenerated characters are Servitors of the Archangels from **Superiors 1**.)

Designed to be "newbie" friendly, the [pregenerated PCs](#) are relatively new-to-Earth angels, assigned to this hunt for some "seasoning." The GM can explain things as the plot goes along. A quick overview of the group's Archangels, the Bands and Princes is in order, with the most attention being paid to Lilim, Lilith, and Baal. The other Princes can be given one-sentence overviews; e.g., "Haagenti is the Calabite Prince of Gluttony, and is not known to be a heavy thinker. He's allied with Kobal, Impudite Prince of Dark Humor, whose job is to make suffering Funny." For GMs who wish to disguise the relevant information, a good excuse is that Lilith is a human ("and no one knows how Lucifer made her a Princess"), while Baal is Michael's opposite number. The expansion on Lilim can be excused as a digression because of Lilith's unique nature.

The players should know that some of the "meat" of this adventure is roleplaying the hostility of Michaelites toward Dominicans, and the determined, annoyed neutrality-if-it-kills-us-(mostly) of the Judgment triad toward the War angels -- while the Stone and/or Sword Servitors work on keeping the peace.

The senior member of the team is Parnach, Cherub of War (see *NPC*, below). Technically, he's in charge of the mission, since he's got the most Forces and is a friend of Ziba's. Michaelite characters should (technically) follow his lead.

The Judgment team is Seraph, Cherub, and EloHITE. Naturally, the Seraph (Sophereth) is in charge, but can be overruled if both of her triad-partners vote against her. Any of them may be NPCs -- if Sophie is, the GM may have her and Parnach argue frequently, to force the PCs to work together. A player-character Sophie sets the tone while NPC partner(s) follow her lead. (They'd be a bit passive, to save the GM's sanity.)

There are two other angels, there to keep the peace. Vaniah is a Malakite of Stone while Minni (whose name means

"prepared"), is a Mercurian of the Sword.

(*GM Note:* Dominic is unlikely to send two angels on Ziba's trail; either it's a full triad, or Parnach could be dropped and Sophie made the theoretical leader of this mission (probably with more than 9 Forces in this role). There should be at least one Michaelite along, and things will work more smoothly with at least one of Vaniah or Minni as a buffer.)

Part One: Starting Out

The team is assembled, equipped, and may exchange opening shots. They're then sent to the site of Ziba's last known location on Earth: his apartment. Unfortunately, no one has a key . . .

Goal: Get into Ziba's third-story apartment to search it for something personal so that Parnach can use his Song of Affinity to locate Ziba. Avoiding both excessive Symphonic disturbance and being arrested is a plus.

Possible Solutions: Convince the next-door neighbor to relinquish the spare key -- or at least accompany someone in. Sneak in the window (Corporeal Healing *will* work on windows, if they're not totally smashed). Pick the lock and get away before a nosy neighbor calls the police. Go celestial and zip inside the room, despite the disturbance.

Complications

- The next-door neighbor, Chris McClough, is a mundane, an atheist, and a UFO nut. (He's perfectly functional and normal, save on that one topic.) He might be fooled by someone impersonating Ziba (e.g., Corporeal Song of Form), or successfully convincing him that they need to get something Ziba borrowed. However, he's sensitive to "lights from the sky," and would respond to supernatural phenomena by grabbing his camcorder and filming it all with as much stealth as possible (so the aliens won't turn their anti-tech rays against him!). Of course, he'd respond to a mere burglary by calling the cops.
- The apartment immediately below Ziba's is owned by a couple with marital problems. While Mr. George Smithsen is on a business trip, Mrs. Linda Smithsen is at home and frequently tipsy from drinking George's prized wine collection. If contacted by the PCs, she makes a reaction roll to each one. If she gets a Good reaction/check digit 4+ to one of the male-vesseled ones, she'll make a pass. If she gets an Excellent reaction/check digit 6 to one, she'll make a pass no matter the gender! (This is to get back at her husband for having an affair (she's right, he is). She would, afterward, be guilty that she broke her marriage vows.) If Linda sees someone breaking into the apartment above, make the reaction roll -- on a Very Good/check digit 5+, the GM should assume that she's tipsy-to-drunk and will invite the burglar in! (She might threaten to call the police if refused, or offer sanctuary if the police are already on the way.) Otherwise, she just calls the cops.

On the Trail

Once the PCs have acquired some hair from Ziba's hairbrush, Parnach can use his Song of Affinity (with extra time or extra Essence) to start tracking Ziba. Clever use of triangulation -- if the PCs think of it, because Parnach won't -- will have Ziba stationary. He's still a city or two over, though. Now they just have to get there. (This should take at least a full 24 hours, which will restore 1 Essence to everyone at dawn.)

If the GM wants to be kind, the group has two cars, and can separate the Dominicans and Michaelites. For more opportunities to snipe, they have a minivan.

Goal: Getting from point A to point B, staying together (if with two cars), and negotiating the hazards of pump-your-own gas stations and late night biker gangs. As usual, Symphonic disturbance is frowned upon.

Possible Solutions: Carefully read the car manual regarding gas tanks, and the instructions on the gas pumps. Combat or evade any hostile mundanes.

Possible Complications

- Running out of gas in the middle of the night, or other [car trouble](#). At the least, an annoyance as the group must decide whether push the van to a gas station, or divide the group to send someone (or two) for gas while the rest wait. If there are no all-night gas stations nearby, or the complication below shows up, it can be a major delay.
- A nastier breed of biker gang, looking for trouble. If the PCs are in their cars or van, ignoring the gang will work -- after a few attacks with crowbars or chains, which will dent cars or crack windshields. (Convincing Michaelites not to retaliate may be difficult; appealing to Parnach's sense of urgency about the mission will work.) If the group is pushing the van, or waiting at the side of the road for someone to get back (such as Parnach), the gang stops to offer "rides" to female PCs and/or be generally insulting. Careful diplomacy or fast-talk can clear them off without violence (if the PCs are determined to avoid fighting), and supernatural displays may convince the bikers that something was in their beer, but it's far more likely that there'll be a rumble.

Gang Members: Figure one biker thug per PC present. **GURPS** - ST 11, DX 11, IQ 10, HT 10. Motorcycle-14, Brawling-12 and one of Broadsword-12 (used with crowbars, not swords), Flail-10 (with chains), or Knife-12.

Advantages: Toughness +1 or High Pain Threshold. **Disadvantages:** Bad Temper, Bully. **In Nomine** - Corporeal Forces 2 (Strength 5, Agility 3), Ethereal Forces 2 (Intelligence 3, Precision 5), Celestial Forces 1 (Will 3, Perception 1). Advantages: Toughness/1. Body Hits: 15. **Disadvantage:** Angry/1. Skills: Driving/5 [10], Fighting/3 [8], and one of (Large Weapon/3 (Crowbar) [8], Small Weapon/2 (Chain) [7], or Small Weapon/3 (Knife) [8]).

- If the fight goes against the PCs too severely, a second biker group will show up -- and aid the PCs. At least one has a cell phone to call police. (Not all bikers are violent bullies -- just the NPCs when a combat is desired.)

Non-Player Character

The **GURPS** character sheet presumes the Basic Celestial Template, p. IN9, and is built according to the guidelines on p. IN16: it gets Choir, and Choir Attunement for free, and buys the Duty and Superior Invocation package (usually as a disadvantage). The **In Nomine** sheet has target numbers in square-brackets, for ease of reference.

PARNACH

Cherub of War

Parnach is an older Cherub, and a bit hidebound -- he's unlikely to investigate unusual happenings unless ordered to do so, figuring that it's "just life." (This is why Ziba is a Vassel of War, and Parnach isn't.) Still, he's steady, reliable, has decent leadership skills, and is a surprisingly gentle soul for a minion of War -- he goes out of his way to make sure that innocent bystanders aren't damaged, and becomes morose if they are. He's also a sucker for soulful canine eyes, despite being a winged bull in celestial form, and keeps dog biscuits in his coat pockets in case he runs across a stray. Parnach has been in Heaven for a while, but isn't totally out of date.

Parnach's role in this adventure is to provide focus -- his goal is to find Ziba, without spending a long time on the various distractions provided. (If using this as a short campaign arc, he'll be less impatient.) If he's not used, the GM should either give the Ethereal Song of Affinity to someone else, or provide a loaner-relic.

Resonance Information

Malakite: Within the last week: most noble -- agreed to this joint mission, despite considering Judgmenters somewhere on the level of pond scum. Most ignoble -- let some students off easy in training, because he didn't want them to look bad in front of a roving triad. Within the last year, his most noble actions were: this mission; patiently training a group of Mercurians of other Archangels in the most non-damaging self-defense methods possible (instead of pushing them "just in case they encounter a demon," as many Michaelites would); and sneaking into a hospital to heal some victims of a car-chase between him and a couple of Calabim of Belial. Ignoble are: letting students off easy; not thinking of

investigating some suspicious (in retrospect) fires that turned out to be caused by the Fire Calabim; allowing bystanders to be damaged during the Calabim's attack. Most noble: entered Trauma in a kamikaze strike against a hostage-holding demon (successfully eliminating the danger to the innocent bystanders). Most ignoble: not noticing when a mortal lover followed her (female vessel) and got himself killed attempting to protect her from the Baalite Parnach was chasing.

Mercurian: Parnach considers himself immensely superior to the Judgment Servitors, more experienced than the other Michaelites, equal to Vaniah, and slightly superior to the Mercurian of the Sword -- this is enhanced by being the nominal leader of the expedition. The name most people call him is "Parn"; his geographic origins are North American; his cultural origins read as somewhat dated British (a contradictory combination that hints at his celestial nature, though a suitably quirky home life could also result in such readings); his job is "Teacher and Lead Troubleshooter of a Troubleshooting Team," and his hobbies are watching motorcycle races and attending dog shows. His relationships are teacher-to-student (none currently present), leader of the current team, and subordinate to his Boss (whom he basically worships without question). The importance of these relationships is in inverse order: his Boss is most important, his role as leader is next, and his role as teacher is (currently) least important.

Lilim: Show up the Dominicans so that they understand who's the better angel (Geas/2); Find Ziba (Geas/3); Save Ziba's fuzzy butt from the Dominicans (for Michaelite justice) (Geas/4); Get a Role that permits him to have a dog (Geas/5).

GURPS Character Sheet

ST 15; DX 15; IQ 13; HT 14.

Advantages: Alertness +1, Essence Control 11, Power Investiture (Corporeal 4, Ethereal 3, Celestial 4), Servitor Attunement (Howl), Vessel (human male).

Disadvantages: Incurious, Pacifism: Cannot Harm Innocents, Servitor of War [-8; p. IN40].

Skills: Animal Handling-10, Axe-16, Brawling-16, Climbing-13, Diplomacy-10, Fast Draw (Pistol)-14, First Aid/TL7-12, Guns (Pistol)/TL7-16, Leadership-12, Motorcycle (Medium/Heavy)-14, Orienteering-12, Savoir-Faire (Military)-12, Scrounging-12, Sex Appeal-11, Stealth-15, Survival (Urban)-12, Tactics-12, Teaching-12, Tracking-14, Traps/TL7-11, Two-handed Axe-15.

Songs: Affinity (Ethereal)-10, Form (Corporeal)-11, Healing (Corporeal)-9, Light (Celestial)-11.

In Nomine Character Sheet

11 Forces

Corporeal Forces - 4	Strength 8	Agility 8
Ethereal Forces - 3	Intelligence 5	Precision 7
Celestial Forces - 4	Will 7	Perception 9

Vessel: Human/2 (Body Hits: 48)

Role: none

Skills: Climbing/1 [9], Driving/1 [8], Fighting/3 [15 Corporeal], Knowledge/1 (Animal Handling) [6], Large Weapon/5 (Axe), Medicine/1 [8], Move Silently/3 [11], Ranged Weapon/1 (Pistol) [8], Survival/2 (Urban) [11], Tactics/3 [8], Tracking/4 [13]

Songs: Affinity* (Ethereal/3 [6]), Form (Corporeal/3 [7]), Healing (Corporeal/1 [5]), Light (Celestial/3 [7])

Attunements: Cherub of War, Howl

* The Songs of Affinity are akin to the Corporeal Song of Attraction; Ethereal Affinity requires some hair or blood.

Designer's Notes: Strange Synergy

by Mark Ahlquist

Last century, in 1985, years before *Magic: The Gathering* shook the gaming world, we were dabbling with cards that combined their effects in unpredictable ways. I remember reading *Magic* cards and thinking to myself, "They should've worded that one differently." Then, more often than not, the next edition of the card would read very closely to my guess. This is not because I'm some sort of super genius, but because some of the same issues the inventors of *Magic* were grappling with were already explored by me and my partner Brian, in our own game, *Strange Synergy*.

I wanted a game that would continue to surprise me even after playing it a hundred times. The answer, I felt, was in combinations. Super-simple rules, lots of cards that modify the rules. Take any three cards and the modifications would likely be interesting. (Actually, I didn't really think it through like that. I just wrote.)

The first draft of the rules fit easily on a three-by-five-inch index card. My memory of them is vague now, but they went something like, "Move: 1, Attack: 50%, Damage: 1(hard), Life: 10. Two actions per turn, per warrior."

For power cards I tore index cards in half. The powers were things like "bottle" and "swing on light." It represented a fight in an old west saloon.

I persuaded my brother to play and he whooped me 15 straight games; still, it was fun. We both wrote up some more power cards and played some more. Then more cards, and more playing. The objective was to destroy your enemies, but the real objective was to write cards that were cool and/or made your brother laugh. The saloon scenario was long forgotten.

More friends played in the days that followed, and they all wrote new power cards. Everyone had different concepts about the game mechanics, the physics of the game world, and even what the hell was going on. Why are these guys fighting? I had no idea. One kid figured they were giant monsters so he wrote the card "rocket-powered turtle shell." Another guy imagined super heroes so we got "elastic body" and "retractable claws." Yet another produced cards from high fantasy; "talking sword" and "unicorn" were added. And of course there were the downright silly, like "biggest hat ever." In one game I battled the "vengeful ghost" of "giant Bullwinkle balloon," equipped with "machine-gun nipples." I succumbed to this worthy foe, but since I had the "Kansasizer," my warrior awoke from a dream and the game was a draw.

I eventually realized this game was a winner. Everyone who played it played it enthusiastically, and wanted to play again. Why not publish it? So the fun part ended and the hard work began. I accidentally used the phrase "hard work," and when I looked up, only my good friend Brian was still there.

Good thing he was, too, because the game was a killer. It was easy and fun to come up with crazy new powers, but now we had to make them all get along. Cards like "Fast" just add to a warrior's speed, no problem. But a card like Giant Magnet adds new physics to the game world. Are smoke bombs magnetic? Smoke Bombs create line-of-sight issues. But what about Stench? Stench is omni-directional! Surely nothing beats Stench. Hold on, Robot Body is immune to Stench, but makes the warrior magnetic . . .

I wasn't comfortable with cards that added new physics. As a purist, I felt that each card should be entirely self-contained, and resolve its own issues. But then I wrote "Bat Wings." I went nuts trying to write all the rules for flying on one card. They just wouldn't fit. And each other gadget or mutation that enabled flight had their own quirks that would have to be described on the card too. I gave up and wrote flight into the rules, but I didn't like it.

Flight turned out to be a can of worms of a different color. It seemed to screw up everything. Now, two warriors could occupy a single space. Was it a diagonal attack to strike at someone who was flying? How high could they fly? Where is this battle taking place anyway? We finally decided to remove the third dimension altogether, but keep it in reserve for a possible expansion. As it turned out, no one missed it.

The difference between magnetism and flight was that magnetism added some real interaction to play. Now you could move your enemies around if they didn't let go of the magnetic thing, and it really mattered when there were bottomless pits around. Flight just let you move over bottomless pits, and there were sneakier ways to do that.

So the game was written card by card, and rewritten many times. Finally we said, "Perfect enough!" We pitched it to Steve Jackson Games. He responded that he liked it, but since it was heavy on components, it would be on the back burner.

Then 10 years later he e-mailed us: "We're finally ready to move on ***Strange Synergy*** . . ." Oddly, it wasn't overcooked a bit. In fact, they suggested many small improvements of the kind where you say, "Now why didn't I think of that?"

Amusingly, the SJ Games development team had some questions about certain cards, but Brian and I hadn't really thought about them for years. It had been a while since we had played the game, and we were busy with other projects. Luckily Brian had many of our old drafts stored away. He pulled out the rules and cards and we looked them over. We realized that to answer their questions we needed to know which version of the game they had. Brian always insisted we keep meticulous track of version numbers, and I said it was a waste of time. Boy, was I proven wrong.

Our duty was clear. We had to play the game a bunch of times to refamiliarize ourselves with it. The old gang was called out of retirement, just like in the *Blues Brothers*. We played into the wee hours. Hilarity ensued, but in the end the verdict was unanimous. ***Strange Synergy*** is still a blast!

Cludge

Classless, Levelless, Universal d20 Gaming Environment

by Owen K.C. Stephens

There's no avoiding the fact that **d20 System** games are everywhere. For players who enjoy the basic **d20 System** engine, with its strong class and level mechanics, this is great. There are enough sourcebooks that even if your favorite genre isn't covered, it can be put together from elements of other **d20 System** games. Quality varies wildly, but a number of well-written supplements and adventures exist, giving the discerning gamer extensive support for his **d20 System** campaigns. But for players who don't like the basic premises of the **d20 System** engine, the flood of material compatible with it can be annoying.

Two of the biggest complaints against **d20 System** games are that they're strongly tied to classes and levels, and can't easily be adapted to ignore these concepts. The main drawback of class/level game systems are that certain common character concepts cannot be easily made, and characters achieve power in large blocks that soon propel them to dizzying heights of power. They can also be very difficult to adapt to new genres. Even if there are elements of **d20 System** games you could combine into a new campaign setting, the feel of the game is limited to an epic heroic progression by tiered power levels. Players are also limited to character concepts supported by an existing class unless the GM is willing to write whole new classes for his setting, and try to ensure they're all balanced against each other.

For groups who want the freedom to, for example, create a pulp-style Victorian game set in 1900, drawing from elements of old west, prehistoric, fantasy and even Asian games, setting the heroes at a single consistent power level well above that of normal mortals, it would be useful to have a system that ignored classes and levels, but was still compatible with standard **d20 System** games. This article presents a set of game sub-rules designed to be a Classless, Levelless, Universal d20 Gaming Environment (Cludge). By stripping away the class system and allowing character skills, feats and special abilities to be purchased à la carte, Cludge frees characters from the constraints of a few archetypes and allows games to be set at a consistent power level.

Cludge is most useful for gamers who enjoy most aspects of typical **d20 System** games, but want more freedom to create a specific gaming style within those rules. Of course the system isn't perfect, and lacks the strong game balance and organization mechanics most **d20 System** games promote as strengths. Put simply, Cludge is a kludge. But for gamers who are already familiar with **d20 System** game mechanics who want to explore new ideas and niche genres without writing their own sourcebooks, Cludge allows for quick and unfetter experimentation. Equipment, monsters, spell systems and stylistic rules can be taken from any number of different games, and easily Cludged together.

Basic Rules

Cludge does not replace any normal **d20 System** rules other than character creation and advancement systems. Rules for combat, social interaction, alignment, equipment, magic, and condition definitions are covered by whatever core **d20 System** rulebook you choose to take them from. It's best to pick a single **d20 System** rule set to answer these questions, though of course you may wish to add elements from other books.

Though Cludge characters may draw upon any rulebook the GM is comfortable allowing into his campaign, it's best to stick to one edition of each rules set. If taking rules from a series of **d20 System** books about star knights, make sure you draw all the rules from the same edition of that game. This avoids confusion and contradiction from two characters having skills or feats with the same name but different game effects.

It's important for GMs to remember Cludge is *not* self-balancing. Though the system is consistent, clever players can quickly find combinations of feats and powers that are more powerful than others. A GM must enforce his own best judgement both to prevent gross abuses of the system, and to ensure characters match his view of whatever genre the

Cludge campaign is emulating.

Power Rank

A campaign's Power Rank determine numerous things about the player characters in it. It is roughly equivalent to class level in a traditional **d20 System** game. When a GM sets the game's Power Rank he is determining the approximate power of the characters for the duration of the campaign. Whatever level of play the group most enjoys should be selected as the game's Power Rank. For example, a group of gamers who most enjoy playing 5th-7th level characters should set their Cludge game at a Power Rank of 6.

The Power Rank sets the number of Attribute and Character points characters get, as well as the maximum Attribute bonus and skill ranks. In most Cludge games character's Power Rank rarely if ever increases, though characters can grow and expand themselves within a set Rank.

It's important to note that just because all the player characters are set at a single Power Rank, that doesn't mean all NPCs are at the same rank. Mooks and thugs can and should be set at lower levels (often significantly lower), and major enemies and allies may well have a higher Power Ranks. As a general rule, characters have a CR equal to their Power Rank. A GM may decide to use the normal class and level system for minor NPCs, rather than taking the time to design them as Cludge characters.

Ability Scores

You can use any of the numerous methods for determining ability scores published in various **d20 System** core rulebooks. Characters may buy up ability scores using character points (see below). In many cases, groups that prefer Cludge to normal games also prefer point-buy ability score systems. A simple point-buy system for heroic characters is presented below, but a GM should feel free to modify any ability score system he likes for his own Cludge games.

For standard Cludge ability score generation characters start with 8s in all their scores, and have 24 ability points to buy up their ability scores. Games stating at a higher Power Rank should give characters an additional (Power Rank/2) ability points.

Ability Score	Ability Points
8	0
9	1
10-11	2
12-13	3
14	4
15	5
16	7
17	9
18	12

Knacks

A character's knacks are one-time bonuses that cannot be bought up. They may represent innate bent, childhood training, or just talents picked up as part of a character's background. All characters get two and only two knacks regardless of the campaign's Power Rank. Each knack may be selected only once.

Knacks

- +2 to Fort Saves
- +2 to Reflex Saves

- +2 to Will Saves
- +10 Class Skills
- +5 Proficiencies

Attributes

Characters receive a number of Attribute Points equal to the game's Power Rank $\times 4$. These are spent to determine things normally assigned by a character's class in other **d20 System** games. A character's Attributes can be bought up using experience, at a rate of 15 Experience Points per Attribute Point (see Experience Points, below). Attribute Points are assigned as bonuses to a character's Attributes, which have a base of 0 or 4 (in the case of Class Skills).

These numbers are assigned to your:

- Base Attack Bonus
- Fortitude Saves
- Reflex Saves
- Will Saves
- d10 Hit Dice
- Class Skills +4 (No Power rank limit)
- Bonus Feats
- Spellcasting Power

Base Attack Bonus: Attribute Points spent equal the character's base attack bonus. This works just like an attack bonus gained from class and level in typical **d20 System** games. A character who's base attack bonus is +6 or higher gains multiple attacks if he takes a full attack action. Additional attacks are at a bonus five lower than the previous attack. For example, a character with a +12 base attack bonus may make three attacks with a full attack action, at base attack values of +12/+7/+2.

Fortitude Saves: This is the character's base Fort save, to which is added his Con modifier, and any other modifier gained from racial abilities, feats or special effects, just as with normal **d20 System** games.

Reflex Saves: This is the character's base Reflex save, to which is added his Dex modifier, and any other modifier gained from racial abilities, feats or special effects, just as with normal **d20 System** games.

Will Saves: This is the character's base Will save, to which is added his Wis modifier, and any other modifier gained from racial abilities, feats or special effects, just as with normal **d20 System** games.

d10 Hit Dice: this is the number of 10-sided hit dice the character gets, adding his Con modifier to each. The first hit die is automatically considered to be a 10, and further hit dice are re-rolled if they produce a result of 5 or less. A character with no d10 hit dice gets 4 + Con modifier hit points, though this is replaced by his first d10 hit die.

In games using some other form of health, each rank of this Attribute should be as useful as a level of the warrior/soldier/fighter class common to the **d20 System** game the health rules are taken from.

Class Skills +4: This is the number of skills the character treats as class skills. This Attribute has a base of 4, which is added to the Attribute value assigned (for example, a character who assigns +1 to Class Skills has 5 class skills). The player decides what skills are class skills up to his maximum, with all other skills considered cross-class skills. Unlike other Attributes, a character's class skills may be assigned a value in excess of the campaign's Power Rank.

Bonus Feats: This is the number of bonus feats the character receives. The character must fulfill the prerequisites for these feats normally. A GM may wish to restrict bonus feats to a particular category (all combat feats, or all metamagic feats), depending on the style of the campaign.

Spellcasting Power: This is the casting level of any special effects the character gains access to (see below). When the

character uses magic items, their maximum casting level may also be restricted to the character's spellcasting power. This Attribute also replaces spellcaster level as a prerequisite or item creation feats.

Optional Attributes

The conventions of a particular genre or play style may call for Attributes other than those presented here. A GM could add a Defense Bonus (granting the character an innate Dodge bonus to AC/Defense), Max Skill Ranks (requiring characters to buy the right to have more than a few ranks in their skills), superpowers (if adapting a superhero genre's rules to Cludge). Similarly, a campaign might decide to do away with Special Effect Power or Hit Dice, setting those automatically at a campaign's Power Rank (or ½ Power Rank, or whatever the GM decides fits his game).

To maintain the power balance presented in Cludge, characters should receive a number of attribute points equal to the number of Attributes used /2 at each Power Rank. Of course a campaign can produce more powerful characters by handing out more Attribute Points, or weaker ones by offering less.

Character Points

Character points are used to buy feats, skills, special effects, innate abilities and additional wealth. Character start with 20 character points, +20 per Power Rank of the campaign. Thus characters in a PR 5 game begin with 120 character points. Additional character points may be bought with Experience Points, at the rate of one Character Point per Experience Point spent (see Experience Points, below).

Ability Scores

It takes 8 character points to buy one additional ability point, which is then used to buy ability scores using the ability score chart. A GM using a flat one-for-one ability score point-buy or random ability score determination should charge 10 character points per ability score.

Feats

Every character starts with one feat for free. Additional feats may be granted by your Attributes or race. Additional feats cost 5 character points, +1 character point for each feat prerequisite the feat taken has. You must qualify for the feat normally.

Proficiencies are considered half-feats (you get two weapon or armor proficiencies for each feat slot expended). A GM should select proficiency categories appropriate for his campaign, possibly taking them from a standard ***d20 System*** core rulebook. A proposed set of proficiencies is present below.

- Light Armor
- Medium Armor (requires light armor)
- Heavy Armor (requires medium armor)
- Simple Archaic Weapons (standard fantasy simple weapons and thrown, including grenades)
- Martial Archaic Weapons (standard fantasy martial weapons, requires archaic simple)
- Pistols
- Longarms
- Cannons
- Siege Gear (catapults and such)
- Eclectic (any 5 specific non-exotic weapons)
- Exotic (any 1 exotic weapon)

Skill Points

Characters receive a number of skill points equal to their Int mod $\times$ (Power Rank +3). Additional skill points cost one Character Point each.

A character may buy a maximum number of ranks of a class skill equal to the game's Power Rank +3, and half this number of ranks of cross-class skills. Class skills cost 1 skill point per rank, while cross-class skills cost 2 skill points per rank. If a character gains additional class skills (by buying up his class skills Attribute) his new maximum ranks and cost per rank improve, but the ranks he has already bought are unaffected.

Special Effects

For Cludge, special effects are any amazing powers, such as spellcasting, psionics, or mutant superpowers, granted to a normal **d20 System** class with an increase in access (level of ability and uses per day) at each level of that class. This includes the spellcasting ability of standard **d20 System** fantasy bards, clerics, druids, paladins, psionics, rangers, sorcerers, and wizards, and similar special effects from many other **d20 System** games. All special effects have a casting level (for level-dependent effects, such as range, duration and damage dice) equal to the character's Spellcasting Power Attribute.

To access special effects, a character must pay a "buy-in" cost. For a standard campaign, this is 15 points, allowing the character to use items as a member of the class. Each level of access to special effects of that class cost an additional 15 character points. Thus a Cludge character who wants to have access to spells as a 5th level wizard must spend 90 character points (15 to buy into the wizard, then an additional 75 for 5 levels of special effect access). Of course these spells are cast at the characters spellcasting power Attribute.

For games with low access to special effects, the buy-in and access cost for spells and similar abilities can be increased, though it shouldn't go higher than 25 unless special effects are extremely rare in a campaign. Lowering the cost makes special effects much more common, and costs shouldn't be lowered to less than 10.

In a campaign where low-level special effects are common, but more powerful ones rare, the cost changes from a flat cost to a graduated scale. The buy in costs maybe reduced, but most importantly access costs 5 points per level of access bought, with each rank bought separately. Thus 1st level access costs 5 character points, 2nd level an additional 10, and 3rd level an additional 15. This produces a game with lots of characters having low and mid level special effects, but very few with high level access.

Innate Abilities

Cludge characters can buy the special abilities of any normal **d20 System** character class as innate abilities by spending character points. All innate ability purchases must be approved by the game's GM. A GM may wish to double the cost of innate abilities taken from more than one standard **d20 System** character class ($\times 2$ cost for a second class, $\times 3$ for a third, and so on), depending on the style of the campaign.

Abilities that automatically increase in power as you go up in level (such as animal companions, familiars, a monk's armor class bonus and bardic knowledge) but are not special effects (see above) have a cost of 6 +1 per level of effect (to a maximum of the game's Power Rank). Thus a character who wanted the animal companion ability of a 6th-level druid would spend 12 character points.

A character may have a 0-level special effect as a special ability 3 times per day for 5 points. A 1st-level spell three times a day costs 10 points, and a 2nd level 20. These are cast at the character's spellcasting level. A character's spellcasting level for a single special effect bought as an innate ability may be increased for 2 character points per +1.

Other abilities from standard **d20 System** game classes not already covered by previous Cludge rules may be bought piecemeal. The cost is the level a class gains the ability $\times 2$. If the ability is an extension of a lower level ability, you must buy the lower level ability first. Normally a character may not buy an ability gained at a level higher than the

Cludge game's Power Rank, though a GM may make an exception. Characters are also limited to no more than one of these innate abilities per Power rank.

Racial Traits

It costs nothing to be a member of a standard **d20 System** race with no ECL adjustment. Most racial traits (special powers granted to a race) may be purchased by members of other races for 10 character points. Races with ECL shifts cost 15 character points per ECL value to play. A character cannot normally change his race after character creation, though such special effects as polymorph spells, shapeshifting, cybernetics, and nanites may allow for such a thing in some Cludge games.

Gear

Cludge doesn't have independent equipment rules. The GM of a Cludge game must select a base set of **d20 System** game rules and use them. Assuming the rules selected have equipment amounts defined by level, Cludge characters receive the starting equipment of a character the same level as the campaign's Power Rank. A character may increase his starting equipment by one level for 15 character points, and may increase it by 2 levels for 50. (If the GM wants money to be usually useful increase these costs; if it's less effective lower them).

Minor special items (things that could be bought at the character's normal equipment level, but are not commonly available) cost 5 character points each. Medium special items (things that could be bought with an equipment level one or two higher than the character's) cost 15 points each. Major special items (things the character couldn't possibly afford but the GM is willing to allow in his campaign, such as steam-punk submersibles with crews, and secret bases in the Alps) cost 20 character points.

Peerage/Memberships

Rather than spend character points to be a member of a group, a GM should set prerequisites required for membership. A GM may decide to restrict a character from buying the abilities of a prestige class unless the character meets prerequisites appropriate to the class.

Experience

Cludge uses a much smaller scale for experience, as it translates directly to Character Points, and can be used to increase a character's Attributes. As a basic rule, give characters 1 experience point for a typical four-hour game session. If a game is particularly long or particularly difficult, give 2 experience points. A game that is both long and difficult is worth 3 experience points. Additionally if players stay in character, do excellent roleplaying and come up with interesting and entertaining ideas, grant 1 (or rarely 2) bonus experience points.

A GM may want to increase a game's Power Rank after a long running campaign has gone on for an extensive period. As a rule of thumb, every 75 Experience Points you can increase the game's PR by 1. Characters gain an additional 4 Attribute points and 20 Character Points, and re-figure anything based on the campaign's PR (such as max ranks for skills and skill points from Int).

Some **d20 System** games have feats or spells that cost experience points to use. Rather than spend the much rarer Cludge experience directly, characters should be allowed to buy "pools" of experience for item creation and spellcasting. For each experience point spent, the character gains a pool of Power Rank $\times 2$ "experience points" to be spent on item creation and spells.

Cartography by Todd Gamble

240-page black & white perfect bound softback; \$32.95

The first release in Green Ronin Publishing's "Mythic Vistas" line has the potential to offend a large segment of the community, and unfortunately were they to become aware of it, quite possibly will. Yet having read through *Testament: Roleplaying In The Biblical Era*, there is relatively little here to cause such offense. One might be the chronological dating system it employs, another the proofreading errors that are really silly mistakes, but the first is to be found on the back cover of the book. The all too bold strap line, "You've Read The Book, Now Play The Game!" really is dreadfully awful in its triteness. Although that said, the publishers deserve something for having the chutzpah to use it.

Part of the real reason that *Testament* should not be cause for offense is that it is *not* just another Christian-themed roleplaying game, even arguably, a Christian-themed roleplaying game at all. This is because it is set firmly in the Mythic Ages described by the *Old Testament*, and it consciously strives to be religiously neutral. For example, the dating system is denoted as BCE and CE -- Before Common Era and Common Era -- rather than Western society's BC and AD, but even this is cause for offense to some. Yet religion is still important and central to *Testament*, not just that of the Israelites, but also that of the Canaanites, Egyptians, and Mesopotamians. Plus their geography, culture, history and culture receive equal treatment, though the bulk of this supplement is given over to the Israelites. This isn't a surprise, given their particular prominence within the source material.

Testament: Roleplaying In The Biblical Era is also set across 3,000 years of history, through many different eras, each slightly different from the last and all available to game within. They begin in the Antediluvian Era, approximately 3000 BCE; Pre-Egypt, approximately 2000 to 1800 BCE, the time of Abraham to Joseph and the founding of the Twelve Tribes; the Exodus from Egypt, 1274 to 1234 BCE; the Time of the Judges, 1234 to 1028 BCE when the tribes moved into Canaan; the Early Kingdom of Saul, David, and Solomon, 1028 to 924 BCE; the Two Kingdoms, 924 to 587 BCE; the Exile of Israel's elite throughout the Assyrian Empire, 587 to 539 BCE; the Return from Exile in Assyria, 539 to 323 BCE; and the time of the Maccabees and the threat of the Seleucid Empire, 323 to 135 BCE.

This wide range of eras also makes *Testament* both a Bronze and an Iron Age RPG . . . which isn't to say somewhere

in between, as the latter metal appears and supplants the former. The scope is equally wide for characters. There are not just Israelite Levite Priests, Psalmists, Judges, or Champions of Israel, but also Canaanite Idol-Makers, or Qedeshots; Babylonian Magi of the Starry Host and Royal Astrologers; and Egyptian Khery-Hebs, Master Charioteers, or Ren-Hakaus. Even though the focus of the Testament is upon the Israelites and their history, the inclusion of these other peoples and their classes makes this supplement something more akin to a Bronze/Iron Age RPG set within the Middle East.

As this is a game based on the *Old Testament*, it has both an epic and a mythic quality to it, for which the heroism of ***Dungeons & Dragons Third Edition*** -- sans Elves, Dwarves, *et al* -- is well-suited. Thus Samson has a Strength score of 20, Solomon is literally filled with the Wisdom of the Lord (possessing a Wisdom of 30 a Will save bonus of +25), and both Angels and Devils are powerful beings that -- for the most part -- remain hidden from the eyes of men. This is neither due to invisibility nor ethereality, but rather to a state of divine or infernal grace. This is a world, in which deities -- *all* deities -- are real, for ***Testament*** makes no claim that one or more are in fact false. Instead, each god is real to their faithful, and characters may interact with them and other great beings, and in doing so may forge the destiny of their nation and people.

Once a GM has decided upon the Era for his game, players create their characters as is normal for almost any ***d20 System*** game. Characters can only be Humans, and choice of race is limited to Egyptian; Israelite; and Canaanite, which may be native Canaanites, Phoenicians, or Philistines depending upon the Era; or Babylonian, which may be Sumerian, Akkadian, Babylonian or Assyrian, again depending upon Era. The choice of Era will also determine the range of languages known to the characters, while Race does the same for available classes. These can come from the ***Player's Handbook*** or be one of the 14 new classes given in ***Testament***.

For those wanting a more Biblical flavor to their game, the Levite Priest replaces the Cleric class for Israelites, and is a far less showy spellcaster. To refresh a cast spell, a Levite Priest must perform sacrifices to God and may find some spells difficult to cast anyway, including the *Summon Monster* series, *Find Traps*, and *Flame Strike*. At higher levels, they can speak with serpents, cause plagues with ease, and even Turn or Rebuke Dragons, which in this setting are Sin Dragons. The Psalmist replaces Bard, and sings inspiring and powerful songs praising the God of Israel, which is particularly useful on the battlefield. Judges help settle disputes, but times can also be military leaders and prophets, while the actual Prophet Prestige Class maintains close ties with the God of Israel, often warning the Israelites of their transgressions. Of course, the Champion of Israel Prestige Class has a far more martial bent.

Since the Israelites view the use of sorcery as blasphemous, they have no classes that use Arcane magic. Indeed, all of the Israelite spell casting classes are Divine in nature. Further, ***Testament*** suggests that the alignment system of ***D&D3e*** be replaced with a Piety score, which measures how attuned a character is with what a moral person is regarded as being by his culture. The more attuned that he is, and the higher his Piety score is, the better a character's chance of asking his deity for a boon. This might be a temporary increase of his hit points, the temporary improvement of Saving Throws and Skill Checks, the smiting of evil, and the seeking of divine inspiration. Piety can be gained by observing his faith's strictures, which the rules cover as any reduction in Piety from sins committed or becoming Unclean. Both loss of Piety and being Unclean can cause a character a loss of class abilities. Piety can also be given out as awards for completing missions for both a character's nation and his deity.

The other races also have their own classes. For Egyptians, the Khery-Heb or "Reader of Scrolls" replaces the Wizard class, but they also possess divine qualities as well. They can cast spells that fall within their god's domain read from scrolls that they write, can create charms *and* later on, can enhance their scrolls with metamagic feats. The Ren-Hakau is an Egyptian Prestige Class, a devout worshipper of Thoth, and masters of the magic of names, words and particularly, True Names. The Magus of the Starry Host is the Babylonian equivalent to the Khery-Heb, but draw their spells from the worship and study of the stars and the heavens, even having to go on pilgrimages to view particular stars in order to gain new spells. Though branded as prostitutes by Biblical Prophets, the Qedeshot is an important figure in Canaanite fertility religion, a cross between the Bard and Cleric classes with elements of the "Houri" class from *White Dwarf* magazine. Her powers come spells, dances and kisses, with her devotions ensuring the fertility of the Canaanite people and lands. ***Testament's*** only general class is the Spy, but there are several general Prestige Classes also. These include the Desert Hermit, the Idol-Maker of personnel idols and those intended for religious purposes; the Master Charioteer and the Royal Astrologer, this last a subset of the Cleric, the Magus of the Starry Host

and the Khery-Heb.

Characters must also take a Flaw as part of the creation process, which represents the struggle with weakness that every person has. These should be unacceptable to the native society of the character, thereby being a source of trouble for the character and roleplaying for the player. The long list includes Boaster, Bully, Deceitful, Drunkard, Proud, Profane, Tragic, and Vain. The many characters written up in the history section of **Testament** all include one or more of these flaws.

The many classes are backed up with a wide range of feats, the majority of which fall into the Divine, Battlefield, or General categories. Some of the General feats are even more particular, such as Mountain Born, which is innate to Canaanite or Israelite characters and improves their Climb and Wilderness Lore checks and eases their movement rates through hills and mountains. The feats move a step up in potency to tie in with the setting's mythic aspect with several Mythic Feats. **Testament** suggests that a character take just one of these, but even then, possession of any of the Mythic feats would indicate a great hero. They include Celestial Charioteer, able to drive the very vehicles of the gods; Friend of Beasts, whom no animal will attack; God Spell, enabling a spellcaster to interchange between Divine and Arcane spell slots; and Slaughter Ground Champion, which makes a warrior adept at fighting amidst a sea of foes.

This last feat falls into the Battlefield category and ties in with the rules provided to handle the Biblical Battlefield, which encompass three types of battle: the Realistic, the Heroic, and the Mythic. In some ways, the Biblical Battlefield Resolution System is quite simple; for example, the rules for terrain not unreasonably assume that battles of the age took place on relatively flat ground. Troops come in three qualities: Green, Veteran, or Legendary and are organized into wings that simply face their enemy across the battlefield, with battles run pretty much as personal combat would be, treating each wing or unit as a character. This is fairly standard to most mass combat systems for the **d20 System**, but the Biblical Battlefield Resolution System allows for a great deal of player input -- not just tactics, but taking the roles of captains who can command wings or fight their enemy counterparts to influence the outcome of the battle. Better still, the rules come with a very detailed example that makes learning the system very easy.

Testament: Roleplaying In The Biblical Era is similar to the **King Arthur Pendragon RPG** in that the players are encouraged to build and involve themselves in a community, taking wives, fathering a dynasty, and so on. Where **Pendragon** is set in the romantic feudalism of Arthurian Britain, **Testament** is of course set in the Bronze Age of the Middle East and is a far dryer milieu, both in terms of game and climate. The rules for Community Management cover the survival of a community and provide a variety of random events that can beset such community, around which a GM could easily build a campaign. They go hand in hand with the guidelines for goods, services and trade, which work not on the payment of gold or some other form of money, but through barter, which again could very easily be the source for an adventure.

A lengthy chapter contains all of the new spells for the setting and the many new classes, as well as the new domains of Desert, Heaven, Fertility, Pestilence, and Thunder. There are new special abilities for magical weapons and armor. Weapons can be consecrated and inflict extra damage on holy ground; be capable of multiplying criticals, requiring further attack rolls to increase the weapon's critical multipliers; and even be thorny to the touch. Armor can be Holy or Unholy, and with the Virtue quality can transfer its protection value to another person -- very useful to bodyguards. The actual magic items run from simple incenses and charms right up to major artifacts; yes, this does include the Ark of the Covenant and its contents!

The new creatures are organized much as the rest of the **Testament**, into their cultures, interpreting them as the Israelites, Canaanites, Egyptians, and Mesopotamians would have viewed them. Thus the Angels of the Israelites are not categorized into their Medieval Hierarchies of benign servants of the Lord, but come as four simple types: Cherubim or Storm Angels, Malachim or Messenger Angels, Mazzalim or Guardian Angels, and Seraphim or Fire Angels. Evil is represented by a number of demons and also by the new Sin Dragon and the Leviathan; and in games set in the Antediluvian Era, GMs will want to make use of the giant Nephilim, being the offspring of Angels and men, as well as the Half-Nephilim template.

Almost half of **Testament** is devoted to the history, geography, culture, religion, and magic of each society. And of this half itself, half of that is completely given over to the Israelites and their long history as chronicled in the *Old*

Testament. Proceeding Era by Era, the events of the period and an approximate timeline are given, along with notes and statistics for some of its major and important figures. Thus for the Exodus, there are write-ups for Moses and his brother Aaron, a note that the effects of the 10 plagues that beset Egypt are the province of God or gods and not the player characters, along with a discussion as to when the Exodus *might* have happened. At the end of every Era, there are notes on possible roleplaying campaigns set within the period. These only run to a few paragraphs, and therein lays the main problem with this supplement.

It is not that the advice is bad, nor is it useless; it is in fact worthy of the material it supports. Rather, it is that there is not enough of it, as it gets lost in the swathes of background detail that the author gives. A seasoned GM will have no problem in extracting ideas from said background, but playing a game or campaign of *Testament* is another matter. Of course, it is only the Israelites that would suffer from this problem, but then they are the main focus of this book.

The actual level of detail and information given in *Testament* is staggering, clearly having been most thoroughly researched by both the author and the book's editor and developer, Spike Y. Jones (also the editor of *GURPS Egypt*), which is backed up by an extensive bibliography of books, games and websites at the back of this book. In fact, there is so much information that Green Ronin has had to reduce the size of the body text to eight-point type so that they could get everything in. Even then, it feels as if there was still more that the author wanted and could have included much more material. The result of this is that the book has a very tight layout, with not a single space having gone to waste. Initially, the font size, laid out over a gray background, does make *Testament* a daunting prospect to read and is likely to put off quite a few potential purchasers, but this is countered by the author's direct and engaging style, and of course the information itself.

There are, however, one or two typographical errors that may raise the ire of some. Most notably are the misquotations of two of the Ten Commandments. The 9th Commandment is given as, "You shall bear false witness against your neighbor," while the 10th includes " . . . You shall not cover your neighbor's wife . . ." Well, these do twist the meanings of these strictures and really, this is a daft kind of error. So perhaps in a project as big as this book has been, it is also forgivable one.

Although not a Christian roleplaying game as such, there is nothing to prevent *Testament* from being run as a campaign that focuses upon the founding of the Judean-Christian faith. Given the Israelite focus within the book, *Testament* would very much support this kind of game, but perhaps this would be to miss out on the more Mythic aspects of the setting and of the four very different other cultures presented within its pages, as they clash with each other across the region. It would not negate their use as protagonists and the like, of course.

Testament: Roleplaying In The Biblical Era is a staggeringly ambitious project, one that very successfully presents a toolkit for running a game or campaign across three millennia of both history and mythology. It contains a very thorough treatment of Israelite culture, and a credible one for each of the Canaanites, Egyptians, and Mesopotamians as well. Certainly these are the best (and very probably the first) such treatments of the Canaanite and Mesopotamian civilizations, and indeed there is enough information here to run games based in their societies and that of the Egyptians using the *d20 System*. This supplement is a superb start to Green Ronin's Mythic Vistas line and if the rest are as good as *Testament: Roleplaying In The Biblical Era*, then they are well worth their weight and page count.

On a more personal note, as a nominal but non-practicing Christian and agnostic, I would never have considered playing in any of the previously published Christian-themed RPGs. That stance has changed after having read through *Testament*, and a Biblically set mythic game is far more enticing prospect.

Boxed Set Board Game for 3-6 Players; \$44.95

Students of board and card games recognize that nearly every new game they encounter falls into one of several rough categories defined by a particular game mechanic or type of player interaction. Even the most unique or revelatory of the European board games, for instance, will have discernible roots in a classic game or genre. The venerable ***Settlers of Catan*** owes at least a portion of its engaging gameplay to the classic trading game ***Pit***. Territorial wargames are frequently nothing more than souped-up ***Risk***. Numerous card games adapt trick-taking mechanics from Bridge and Hearts. Despite the pervasiveness of this gaming vocabulary even in the hobby's most distant and distinctive corners, it is still occasionally surprising to discover where today's game designers will garner their inspiration; it's even more surprising to see how the most talented designers expand on and improve the games we thought we'd tapped out long ago. ***Mystery of the Abbey*** takes its cues from a rarely emulated classic: ***Clue***. And for gamers who thought the mystery of ***Clue*** was done to death in their pre-adolescent years, ***Mystery of the Abbey*** proves that there's more than one way to commit this delicious kind of crime.

The abbey of the title is just the first, and most superficial, of the improvements the designers have made to ***Clue's*** universally recognized formula. It has the tone and atmosphere of Umberto Eco's *The Name of the Rose* -- perhaps a less familiar, but also less timeworn, setting for a tale of murder. The victim is Brother Adelmo, his body found dashed on the rocks at the bottom of the abbey's sea cliffs. The suspects: 24 monks, any of whom might have helped Adelmo to his grisly demise. Unlike ***Clue's*** "in the Kitchen with the Rope" solution, the only piece in this puzzle is the single monk card removed secretly from the Suspect Deck at the beginning of the game.

To track down the killer, players (traveling monks, the only residents that could be innocent of the crime) use a set of traits that define every monk -- each is fat or thin, bearded or clean-shaven, each has a title and belongs to one of three orders. A sheet showing all the suspects, with easy-to-read symbols and colors representing the traits, is given to each player for taking notes and marking off those proven innocent. That's assuming the players can stand to mar these beautifully drawn and printed pages; a pad of 50 is provided, but they're so colorful and appealing you'll feel a pang of guilt for using five or six for a game.

More lush illustrations grace the cards and the spectacularly attractive board. ***Clue's*** rectangular mansion is transformed into a circular -- but hardly symmetrical -- cluster of chambers, courtyards, and chapels. Besides being prettier, the environment is also more interactive and vital to play than ***Clue's***. Most rooms trigger special actions, providing extra suspect cards, library books (from a deck containing a plethora of entertaining effects), and even the opportunity to rummage through another player's room to take a card from their hand. Just don't get caught, or you're sent to the chapel for penance and lose a turn.

Moving around the board, interrogating monks in the Parlatorium -- that's the cafeteria, for those who don't speak Latin (all the room names are in the ecclesiastical language, a sparkling touch which braces the theme) -- and dusting

off old books is engaging in itself, especially on the first play. But the meat of the game, as in **Clue**, is questioning other players about their list of suspects. Here **Mystery of the Abbey** once again transcends the old classic, audaciously allowing nearly any question the player wishes to ask. "Have you eliminated Father Sergio as a suspect?" "How many Benedictines have you seen?" "Did you just receive Brother Cyrille from Joe?" You can even ask, "Are you going to the Scriptorium next turn?" All players have taken a vow of honesty; they must speak the truth (and stick to any future moves they have presaged). There is always the option, when asked a question, to take a vow of silence. But by answering the current player's question, you get to ask him one in return and he cannot take silence as an option.

Like **Clue**, paying close attention to both what has been requested and the subtext of those requests is the key to advanced play. Logic and deduction are the way to get ahead, which does mean that those who lack the skill or perspicacity required can lag behind. Still, this game does much to even the playing field. Cards are passed every few turns -- when mass is called in the Chapel -- meaning all players automatically get to see new cards as the game progresses. This card movement, also caused by certain book cards from the library, can stymie even the cleverest logician and most thorough note-taker. In addition, as players start narrowing in on the culprit, they can make "revelations," guessing, when the statistical odds are good, at one trait of the killer -- that he's a Franciscan, or fat, or a Novice. Correct revelations gain the gutsy player two points at the end of the game. Correctly identifying the murderer is worth four points. Incorrect revelations or accusations deduct points. Victory goes to the player with the most points, not always the shrewd detective who first identifies the killer himself.

If anything, the weakness of the game is that it is randomized enough to frustrate those who wish to play a pure match of wits and logic, while still disadvantaging those who don't have the clarity of mind -- or desire to expend the energy -- to discern the meaning behind every question and answer. Many gaming groups will discover in **Mystery of the Abbey** the perfect balance between these two styles of play, but approaching the game with expectations of finding purely one or the other could lead to disappointment. And speaking of disappointment, don't be fooled by the Days of Wonder "Web Card" in the game's box. Sure, you can use the access code on it to play free versions of the publisher's games, but **Mystery of the Abbey** isn't one of them.

Still, I'm not sure you'd want to play **Mystery of the Abbey** online, where the first-rate components (including a little metal bell for calling mass) and beautiful artwork would be reduced to flat and pixilated imitations. And it's not just the visuals that would suffer a disservice on a computer. The immersive atmosphere and delightful interaction between players would be the most mourned victim of moving the murder online. As it is, **Mystery of the Abbey** is a broadly appealing game: gorgeous, engaging, and, yes, derivative. In the best sense of the word.

Steven's Self-Indulgent And Easy-To-Write Dragon*Con Report

There was a demand and interest for a [Dragon*Con](#) report by thousands of *Pyramid* readers. Well, Bob Portnell, at any rate. So if you don't like this column, don't blame me; blame society . . . as embodied by Bob Portnell.

Anyway, although Dragon*Con didn't officially start until Friday, my trip actually began on Wednesday. I had firm plans to travel to Atlanta and crash at my friend Michael's place Wednesday, so that I wouldn't need to rush on Thursday and be stressed out. All I had to do first was finish up *Pyramid* and get on the road; my plans had me leaving no later than noon.

As I left my parking lot and began driving at 9:30 PM, I reflected that my sense of timing may not be what it could.

Anyway, I navigated the evening drive to Atlanta with nary a hitch; in addition, I was pleasantly surprised when I crossed the Florida/Georgia border, and gasoline prices dropped from \$918.67⁹ a nanoliter to more reasonable levels. I also realized that any fears I had about navigating complex downtown Atlanta traffic were mitigated somewhat by the fact that I was doing so at three in the morning.

Thursday we got our hotel rooms, and the rest of the seven-person gathering assembled. We went and signed in with the convention.

The previous day, about three hours into the drive to Atlanta, my mind wandered back to my refrigerator back home, and the vital "do not forget to take this registration postcard" postcard tucked safely under the 1999 FSU schedule pizza magnet. Filled with shame, I went to the Guest Registration area: "You know that vital postcard that we're not supposed to forget?"

"What's your name?" the stern-looking woman asked.

"Steven Marsh," I replied.

"Sign here," she said, smiling as she handing me the three-ring binder.

I signed in, collected my badge and special guest folder, and departed.

As I did so, I realized that there was absolutely no effort made to verify who I was. And I considered that, seeing as how the Guest Registration took about seven seconds versus the serpentine wrapped-to-infinity lines of the regular registration, there was room to be very evil here.

"Hello; I'm Steven Marsh, and I'm here to register as a guest. These three people are my friends, and they're also here to sign in; these are . . . umm . . . Andy Vetromile . . . errr, Jim Steranko . . . and the gal on the end is Lou Ferrigno. Uhhh . . . It's short for Louise."

Fortunately I resisted the siren's call of convenient evil, and the next morning the rest of us registered; it only took half an hour to do so. (When my friends asked why I bothered waiting with them, I said it was intriguing to watch how the little people experienced the convention. I was, justifiably, smacked for that comment.)

Sadly, I was not scheduled for any panels, meetings, or anything else interesting; should anyone have had any interest in finding me, they would have had little recourse save wandering aimlessly and hoping to bump into me. And, frankly, the odds of that are pretty slim.

Two days later, as I was wandering aimlessly, I bumped into the *real* Andy Vetromile. He, too, was not scheduled for any panels or discussions. For some reason I considered how many of us there were, signed up as guests but not

scheduled to *be* anywhere; I wondered if we could crash in vacant exhibit rooms and put up signs like, "Will Host Professional Game Editing Panel For Food." Friday also saw a [repeat](#) of my entry into the "Whose Line Is It, Anyway?" competition. And this shall be the first and last time I mention that fiasc^D^D^D^D^Devent.

Saturday I began my new con obsession in earnest - getting my sketchbook sketched. See, many years ago I started formulating a philosophy about buying stuff at conventions: Only buy things at a con that you can't get elsewhere. I figure, what's the point of buying, say, a normal game or standard in-print graphic novel at a convention when I can order them at home through my FLGS, save some money, *and* not worry about lugging it around a convention? So I generally only buy stuff at cons that is rare, cheap, or otherwise exclusive to the con.

I figured original art from artists whose work I appreciate - in the form of sketchbook sketches - was the pinnacle of my "can't get it elsewhere" philosophy, and it gave me a chance to chat with them, too. (As an added bonus, as I continue to add to it I'll eventually have a book I've dumped hundreds of dollars into . . . so that I can forget the book somewhere and lose it all in one fell swoop!) The sketchbook was a personal success, and I look forward to continuing it.

Saturday I also roamed around aimlessly some more (Dragon*Con is great for that), and found myself in the super-secret Guest Hospitality Suite. There where I mingled briefly with the super-nice George Takei, all the while struggling to keep from dipping into übergeek mode and asking him to sign something.

Saturday night I was wound up, and so I found myself reading a book in the hotel hallway, lest I disturb my slumbering roommates. I think I discovered an interesting phenomenon at science fiction-fantasy/gaming/comic conventions: Reading a book that is not part of one of those genres at such a con - for example, a normal novel like, say, Dan Brown's *The DaVinci Code* - will get you the *exact* same perplexed, bewildered, and mildly disapproving looks that reading something from one of those genres - such as a *Spycraft* supplement - will get you in the real world. (Of course, the hotel passersby may have merely been disapproving of the fact that I was in my boxers . . .)

Sunday was my last full day at the con, so I took the opportunity to introduce and reintroduce myself to various folks. I finally got to meet Ryan Dancey, after somehow missing him at last year's con; since he's one of the foremost thinkers on the subject of the business of gaming, it was great to finally place a face to the online presence. I got to meet some of the folks from [Green Ronin Publishing](#), and was doubly struck at 1) how much really interesting stuff they were producing that 2) my FLGS was utterly failing to stock. I can only imagine that the delight of possibilities open to *d20 System* gamers is offset by the agony of game shop managers who need to decide what to order. Anyway, I got to drool over about a dozen of their products, some of which I dumbly chatted about in conversations along the lines of, "Oh, sure; we ran a review of this about three weeks ago . . . not that I've ever *seen* a copy, mind you . . ."

I spent some time with the Looneys over at [Looney Labs](#); it's always nice to see companies at a convention that seem genuinely delighted to be there, and I got to learn a couple of new *Icehouse* game variants. And, finally, I got to meet Phil Brucato, whose new *Deliria* RPG from [Laughing Pan](#) is a beautiful-looking book that I hope to review within the next couple of weeks.

(Sadly, [White Wolf](#)'s Justin Achilli has eluded me for the second year in a row; I've yet to get a chance to thank him in person for joining our *Iron Ref* competition back in '01.)

Sunday night ended with me and a friend attending a secret party hosted by [Holistic Design, Inc.](#), makers of personal favorite RPG *Fading Suns*. I got to chat with the nice and cool Holistic folks, including Andrew Greenberg and Chris Wiese (with whom I joked that I didn't know whether to offer congratulations or condolences for his recently winning the GAMA presidency). It was a great party, involving tasty snacks, chocolate fondue, a full bar that made tasty margaritas, and . . . hmm . . . I'm not remembering much after the margaritas, except a vague memory of a gossamer angel and leather-clad demons, doing some kind of interpretive dance about the new *d20 System* edition of *Rapture: The Second Coming*. (Earlier on Saturday I'd asked Andrew Greenberg whether that would make it the third coming. Apparently I only missed being the one millionth person to make that joke by six people.)

Monday began with the logistics of sorting out seven people, mass transit, and three cars parked in three different places. I also learned that, hypothetically speaking, accidentally leaving one's dome light on in one's car - like, say,

when you're driving bleary-eyed while following strange directions to Atlanta at 3 AM - is an effective way to utterly kill your battery after a five-day vacation.

And that's about it. I didn't get to play in any games (although I was tempted to rejoin the continuing ***Vampire: Dark Ages*** LARP I was a part of in New Jersey last February, but evening plans with friends prevented me). I got to shop, hang out with cool people, and generally satisfy my short attention span at a con that successfully manages to meld three of my interests.

And I'm already making plans to attend next year; hopefully I'll actually get to meet Louise Ferrigno.

Fantasy Cosmology

When the Stars Are Just Lights

by David Morgan-Mar

In a previous article -- ["Fantasy Astrology: When the Stars Are Right"](#) -- the applications of astrology to fantasy gaming were discussed. Although possibilities such as additional moons and planets were covered, the basic assumption was that the physical universe was much the same as our own, with planets orbiting stars and the sun being a star. This article discusses possibilities for other, fantastical cosmologies, and their impacts on a fantasy campaign.

Why Do We Need To Know This Anyway?

Most fantasy campaigns don't concern themselves with what the stars are made of, so long as they are there at night as expected. This is fine, but thinking about such questions can bring about new possibilities for adventure.

A simple assumption used in many campaigns is that swords or armor forged from the iron in meteorites are either capable of holding vast enchantments or are innately capable of slaying powerful monsters. When we use this information in our campaign universe, the question arises: Why is meteoric iron different to earthly iron? Is it because it's purer, because it's descended from the heavens and has been touched by gods, or because it's actually a different substance not otherwise found on earth?

Is it possible, using magic or some other means, to travel into the sky and find meteoric iron? Where, exactly, might one find it?

In real life, medieval astronomers were convinced that comets were atmospheric phenomena, because the heavens were perfect and unchanging. What if this is true? Can a bird collide with a comet? What if people could reach a comet, and destroy it or change its course? The implications on astrology -- and potentially the fate of kingdoms -- might hang in the balance.

And finally, what happens if a mage levitates ever higher into the atmosphere, or if a ship is enchanted to do so, carrying a crew? What do they find beyond the earthly realm: the killing vacuum of space and planets millions of miles distant, or new territories to colonize and conquer?

With the right assumptions, a fantasy campaign can benefit from a unique cosmology, either simply by explaining a few salient facts about iron, or by opening up new locations for adventure.

New Physical Laws

The first thing to realize when designing a fantasy cosmology is that our familiar laws of physics will probably need to be bent, if not completely broken. In a world in which magic exists, this should not be any great conceptual problem, although it does help enormously if there are *new* "physical laws" that can be codified and work in a consistent manner. They don't need to be realistic, just consistently applied. If this is too difficult, some handwaving can always come to the rescue, though too many special exemptions and contradictions can make the setting feel chaotic.

New laws can be based on concepts familiar to the players, such as the laws of sympathy and contagion of magic, or the posited reality of the four Aristotelian elements. Or they might be something entirely original.

Elements that might be considered for changing include:

Gravity

In the real world, gravity dominates the structure of the universe on scales from asteroid-sized upward. If gravity works the way it does in our universe, then things will be pretty familiar to us -- huge stars orbited by planets, at vast distances from one another amidst the vacuum of space. If a fantasy campaign is to venture to the planets or the stars in such a universe, travel is likely to be either by teleportation or the use of gates that transfer matter from one place to another. Fantasy technology is unlikely to be up to building a vehicle in which people can venture into the void between worlds.

By changing the way gravity works, a GM can construct a universe where travel between the planets can be done physically, because planets can be much closer together. They can be smaller too; a campaign world might only be large enough to contain an area the size of medieval Europe, with no change in gravity.

To the medieval mind, gravity was not a force that fell off as the inverse square of the distance between masses. Things fell to earth because that was where they were meant to be. (Similarly, fire reached upward because its natural place was above the air.) With this form of logic we can construct a more convenient form of gravity for a fantasy world. Objects fall to, well, wherever they should be according to common sense, and at the familiar rate people are used to. Planets of any size have the same gravity, and ships that travel between them will probably have a convenient gravity too. For variety, the natural locations of the elements can be jumbled up. Imagine a world with a core of air, surrounded by a bubble of water, on which solid objects float. Fire might collect at the center of the bubble, or also float on the water.

The original game of fantasy space travel -- TSR's *Spelljammer* -- postulated that gravity is either present at its normal strength, or absent entirely. Ships traveling through space have a gravitational plane running through them, so that gravity works "as expected" on the upper decks. Below the plane, gravity is reversed. An arrangement like this is convenient, dramatically useful, and has an internal logic of its own.

Vacuum

Nature abhors a vacuum -- or so thought early scholars. In a fantasy game this could be true. The space between worlds may be full of air. This facilitates "space" travel, since there are no concerns about taking along an air supply. The air between worlds might be thin, like it is on high mountains, making exertion difficult, but otherwise not causing any harm.

Space might instead be full of a luminiferous ether, through which light travels. This is really an industrial revolution concept, but could be adapted to fantasy use with new jargon. Such an ether does not interact with physical matter at all, so may not be noticed. It may, however, be the basis of an alternate "ethereal plane" of existence, which can be penetrated by magical means and navigated by beings in ethereal form. This may be the method of traveling between the planets -- traversing the intervening vacuum in an ethereal state.

Spirits may inhabit the ether; the ethereal plane is a prime candidate for a spirit realm. These can include autonomous spirit entities, who may be able to travel between worlds across the void at will, and ghosts. The first spacefarers may find themselves besieged by spirits of the dead, turning a space jaunt into a horror adventure.

If space is full of air, why not have other things out there too? There might be rivers of water flowing between worlds, or bridges of earth that can be traveled simply by walking across them from one world to another.

Earth

"Earth" is the central world where people live; it might have a different name in your campaign. Our Earth is an enormous sphere of rock and metals. In a fantasy cosmology, the variant options are limitless.

Other solid shapes will produce interesting effects. An ellipsoidal earth will have varying horizon distances, depending on your location. If the atmosphere remains spherical, parts of the ellipsoid will have thin air or stick into the vacuum

of space. On a toroidal (donut-shaped) earth you can see parts of the world curving away up into the sky. A fantasy earth might even exist on a ringworld like that envisioned by author Larry Niven, or on the interior surface of a Dyson sphere.

Shapes with edges introduce another feature. A cubic earth will look like a flat world to its inhabitants, until one falls over the "edge" and finds gravity turned through 90 degrees and a whole new expanse of territory to explore. The faces might also be linked via underground cavern systems.

Earths might actually *be* flat too. Terry Pratchett's Discworld is an example -- a flat circular disc carried through space on the back of four great elephants, who stand astride a planet-sized turtle. What happens to objects that fall off the edge of such a world depends on the nature of gravity and the presence or absence of air in space. If objects are lost, some sort of magical or physical process will be needed to replenish any lost water, lest the world inevitably become a desert. The "bottom" side of a flat world may house similar terrain (and inhabitants) to the top side. Travel from one side to the other could be by simply stepping over the edge, through tunnels, or by magical means only.

A flat earth may be *infinite* -- stretching forever without end. This naturally creates an infinite amount of territory, but perhaps civilisation is restricted to an island continent in an endless sea. Using some tricks from modern geometry, it's possible that an apparently flat earth "wraps around" on itself, so that a traveler heading north eventually reaches his starting point, coming from the south. If nothing else, this makes creating a GM's map easy -- simply assume each edge wraps around to its opposite edge.

Planets

In our universe, planets are large spheres of rock and metals similar to Earth, or balls of gas or frozen volatiles. The non-earth planets in a fantasy cosmology may follow suit, or they might all be similar worlds to earth, at distances that make them look like bright spots in the night sky. This makes them ideal for visiting and colonizing, or conquering if they are already inhabited!

Or planets could be something different. They may be small discs or simply glowing lights -- not something on which you could walk around. They may be made of very different material. Europeans who believed in the four Aristotelian elements of earth, water, air, and fire also believed that objects in the heavens could not be made of these elements. They postulated the existence of a fifth element, or "quintessence," which made up everything in the heavens, and whose nature was to move in endless circles about the earth. If quintessence is real, it surely must be a powerful magical ingredient. Planets might be mined for it, or stolen in toto, if only they can be reached.

The Sun

Our sun is a huge sphere of hydrogen and helium, generating energy through nuclear fusion. Ancient theories of the sun ranged from a ball of fire, to the brilliant shield of a god, to a hole in the sky through which the radiance of heaven shone. Any of these possibilities might be literally true in a fantasy cosmology.

If the sun is a ball of fire, what is it burning? Perhaps it is the forge of the gods, stoked by a divine blacksmith (whose hammer blows presumably cause thunder and lightning). Maybe it burns the souls of sinners, giving people a glimpse of hell every day. Or it might be a life-giving hearth, tended by a benevolent creator god.

Another possibility, raised by the *Spelljammer* game, is that the sun is a ball of pure elemental essence of fire. As such, it needs no fuel or air to burn. Such a sun might be the location of the fabled City of Brass, the home of the djinn. Fire taken from the sun might retain its essential nature, burning indefinitely without fuel.

Visiting a ball of fire might be possible, if the campaign includes magic capable of protecting intrepid explorers. The sun might only be a few miles up in the atmosphere and easily reached, or it could involve a long expedition on a spaceworthy vessel. Once they get there, things might get hot in other ways! If the sun is controlled by the gods, they are unlikely to take kindly to sightseeing mortals. If it is purely a physical phenomenon there might be adventures to be had, collecting meteoric iron from molten pools on the surface, or dealing with the djinn or other creatures who live

there.

If the sun is actually a divine artifact or a gateway to heaven, then it is likely to be guarded. Supernaturally large and vicious monsters make good guardians. If adventurers can overcome such obstacles, they may be able to steal the sun! This could cause an extended night on earth, but may grant the wielder immense power -- for a touch of irony the valiant hero brazen enough to steal the sun might become the new sun god . . . and be removed from play to serve as an NPC. Finally, if the sun is a hole in the sky, it may be the pathway to recovering the soul of a departed loved one; a quest worthy of any fantasy Orpheus.

Stars and Celestial Spheres

We know that stars are other suns, extremely far away, each potentially with its own set of planets. This could be the case in a fantasy universe too, although if the sun is a ball of fire only a mile across then the stars will be fairly close by and perhaps easily visited.

A much more common theory in ancient times was that the stars were simply small lights fixed to the inside of a great sphere which enclosed the earth. This is appropriate if the sun is a unique object or a hole in the enclosing sphere. The nature of the lights depends on other factors: they may be smaller holes in the sphere, lanterns tended by gods to light their way across the heavens, shining souls of ascended heroes, or the glow of cities.

Spelljammer calls such enclosing spheres *crystal spheres*, and uses them to separate different planetary systems from one another. An infinite number of "crystal spheres," each containing a set of planets, drift in a void. This terminology is historically inaccurate (as explained in the next section) -- such spheres are better termed *celestial spheres*.

What is beyond a celestial sphere is a matter for speculation. There could be other celestial spheres as in **Spelljammer**, there might be nothing at all, there might be the realm of the gods, or there might be some enormous clockwork mechanisms that keep the universe turning as it is supposed to.

Crystal Spheres

The name "crystal spheres" derives from the work of Eudoxus and Aristotle, who believed that the sun and planets were each attached to a transparent sphere centered on earth and rotating about it. If this is true, then any space voyagers beyond the nearest planet will need to deal with the problem of penetrating the spheres -- hopefully without causing any damage that might disrupt the workings of the heavens! In medieval cosmology, the crystal spheres were the homes of different types of angels -- beings who might not take kindly to earthly intruders.

Comets and Novae

Depending how you have designed the rest of your fantasy cosmology, these objects may have a natural explanation, may require some thought, or may be totally inconsistent with your universe. Atmospheric comets should be possible in most campaigns; whether you want such objects in your world's atmosphere is another question. If they exist and adventurers can travel to them, they will need physical properties. They might simply be tricks of light, similar to rainbows. Or they could be giant flaming swords, placed in the sky by gods as an omen; retrieving such a sword could be a glorious adventure, and may bring untold power, or ill-fortune, to whomever steals it.

Novae are literally "new stars" -- stars that appear where none were before. In our universe, these are either faint stars that flare into visible brightness, or stars that explode. In a fantasy cosmology, there are almost certainly different explanations. Novae might be temporary lanterns placed by traveling gods, or the campfires of celestial nomads gathering in a festival. Or if stars are other suns, novae may really be newly formed stars, complete with new worlds to explore.

Ley Lines

If your fantasy world has ley lines along which mystical energy is concentrated or channeled, they need not end on earth. Ley lines might crisscross the void between the planets. This could produce regions of space where magic is easier to perform, or it might only be possible to perform magic on the ley lines. If space travel relies on magical propulsion or protection, then ley lines could demarcate the only passable "roads" through space.

Traveling to Other Worlds

Once you've established the overall structure of your campaign universe, it's time to think about how it can come into play. The most direct method is to use the universe as an extended location for adventure. There are various ways for bold adventurers to span the stars:

Teleportation

Magical teleportation may be able to send people to other worlds. If spells are not powerful enough, an enchanted item might be needed. Gates are permanently emplaced magic items or areas that allow a person to step through them and emerge elsewhere. These could be used to set up convenient pathways between worlds.

One problem with teleportation is that it bypasses all of the intervening space and other bodies between the departure and destination points. This is not conducive to establishing an atmosphere of traveling vast distances to places in the sky. Locations may as well be on opposite sides of an ocean or mountain chain for all the characters experience. This is, however, a good way to strand a group of heroes far from home. There is *no way* they can get home without finding a way to teleport back -- all the walking in the world or even building a ship won't help. For sweet irony, strand a group of characters on the celestial sphere, able to look up and see their homes above them, but unable to reach them.

Extraplanar Travel

If the void is suffused by an ethereal plane, and it is possible to phase one's body into it, then this may be usable as a method of transport between worlds. Spirit creatures such as djinn are probably adept at this, enabling them to traverse the distance between a solar City of Brass and the earth.

Other planes may also be passages to the stars. An astral plane is likely to reach beyond the confines of earth, and characters in astral form may be able to wander anywhere in the universe. Alternate physical planes may provide connections between worlds that can be traveled across by conventional means, making a trip to another planet into a sea voyage across an alternate plane for example. There may also be conduits between worlds through caverns via an elemental plane of earth, or from the heart of a volcano to the sun via a plane of elemental fire.

Magical Propulsion

One strong attraction of building a fantasy cosmology is designing methods of traveling between worlds. For a classic high fantasy feel, travel could be done in space vessels that are built along the lines of sailing ships. Some might actually *be* sailing ships, which can simply lift off and sail through space if adequately empowered. For a different feel, people may travel through space in wagons, houses built on loose foundations, or with no kind of vehicle at all.

In most cases enormous speeds are required to propel a ship between worlds. Some form of spell, ritual, or magical item might be required to achieve this. A spell can usually be taught to other mages, so this method produces the most freely available space travel. Any ship with a wizard who knows the spell of spaceflight can travel through space.

A ritual is more demanding. It may require the constant chanting of a group of monks while in space, or the sacrifice of animals (or humans), or any other esoteric ceremony imaginable. If extra speed is needed, perhaps spare crew could join in for a while, or more gemstones can be crushed.

Magical items are the rarest forms of space propulsion. There may only be a few such items in existence. An artifact that allows a ship to sail into space might be small and portable, tempting thieves at every port of call, or it might be

the entire ship. If such items cannot be created, they will be jealously guarded, whereas if they can, then enchanters will be trying to turn them out rapidly, perhaps producing items with subtle but dangerous flaws.

Physical Propulsion

An alternative to using magic to travel through space is to use the laws of physics. With different physics, all sorts of things become possible.

Getting off the ground is probably the hardest part of space travel. Hot air balloons can help, and can be constructed with ancient technology once the principle is understood. Perhaps in your universe objects get lighter as they ascend, so trekking to the top of a mountain is a natural start to a space journey -- get high enough and you might even drift off without help. On flat worlds, getting into space might be as simple as falling off the edge. People or ships can be carried aloft by giant birds or other creatures. Or maybe there is a special type of substance -- a wood that only grows deep in elven forests, or an ore that only dwarves can refine -- that floats in air. Build your ship out of such a material, weighed down with an appropriate amount of ballast, and you have a flying vessel.

Once in space, traversing the distances between worlds could be done in several ways. If there is air in space, there should be winds that can be caught by sails. Wind currents could blow ships around at great speeds, making interplanetary journeys tolerably short. If the winds don't take you where you want to go, airscrews, oars, or harnessed birds might do the trick. If rivers of water run through space, a ship might drift with the current or use oars to head "upstream."

Without air, other means of propulsion must be found. Currents in a pervading ether might be forced to interact with sails made of some special material. Ethereal spirits might be employed (or enslaved) to haul a ship around. Or, if Newton's laws still hold some relevance, simple rocket propulsion could be used by firing cannon from the rear of the ship.

Astrology

As discussed in "Fantasy Astrology: When the Stars Are Right," the appearances of stars and planets in the sky can be mapped out and interpreted to determine their possible influences on earthly life. If your fantasy cosmology results in a different appearance of the night sky, then your astrological symbology needs to be adjusted to suit.

If people can actually visit the planets and stars, that may change how astrology is perceived. Progressive types may denounce astrology as superstitious nonsense, while some will probably try to incorporate any new knowledge into the astrological correspondences. Or there may be no effect at all -- many people in our world believe astrology still works even after probes have visited every planet except Pluto.

For a weird campaign, not only does astrology work, but it is reactive. If people travel to the celestial sphere and move some stars around, the fates of people on earth will change! Who knows what will happen if someone manages to steal the sun or destroy a planet . . .

Legends

With a variant cosmology, the legends of your campaign world may be altered in subtle ways. If stars are the campfires of heavenly nomads, they may all move from night to night. The resulting changes in constellations are sure to be worked into myths. In many cultures there are legends of heroes ascending to the heavens and forming a constellation. This might be literally true, with great heroes traveling to the celestial sphere and setting up stars in patterns designed by themselves.

Then there are legends of beings from the sky coming to earth. Seen either as gods, angels, or demons, such beings may be actual visitors from other worlds. Once your campaign world attains the ability to travel through space, adventurers may be surprised to find that the old legends are true, and the celestial beings can be visited, traded with,

or conquered.

Campaign and Adventure Seeds

Pirates of Space

A swashbuckling campaign can be constructed by using small planets near one another, a "convenient" gravity, space full of air, and wind or water currents for space propulsion. Pirate ships built for the seas can take off with magical aid and sail into the sky. Asteroids serve as islands and brave adventurers make their fortunes by raiding commercial fleets carrying diamonds mined from jungle worlds or gold from the sun. When ships meet in space, they can fire broadsides before closing for boarding actions in best piratical style.

The Celestial Heresy

A traveler has returned from a long voyage. He claims to have reached the edge of the world and seen the sphere to which the stars are affixed. Furthermore, he says he found a cave that leads to the other side of the celestial sphere, but he's not telling what he found there. He's now trying to raise equipment and men for a return journey. Several different religious factions have taken an interest in the man's claims. Some want him burnt as a heretic, others are keen to send representatives to visit what they believe will be the home of the gods. More materialistic people think he's found some untold treasure and would kill for the man's map. Can the PCs join the man's quest, protect him from harm, and discover the secrets of the universe?

Army of the Comet

A great comet appears in the night sky, forewarning of disaster for a peaceful kingdom. Two nights later, it is gone. The next week, news reaches the capital of an army massing on the borders. Within days it lays waste to several villages and advances on the capital. Scouts report the army's leader is a giant of a man, wielding a flaming sword. The court astrologer declares the sword is the comet, stolen from the heavens, and that only a similarly divine protective device can prevent the fall of the kingdom. The king's new balloon sits in the courtyard, and everyone knows the moon is the glowing shield of the kingdom's patron goddess . . .

Hauling Iron

More meteoric iron is needed on earth to fight a war against the fae races. The only known deposit is on a world two weeks' travel across the ether. To get there, ships must be pulled by enslaved spirits, past other worlds populated by hostile races and monsters. Each mission must run a gauntlet of encounters, from warships and space creatures to passing groups of djinn who try to free the spirit slaves. The fae may have their own space vessels too, and fight running battles against the iron supply lines.

Further Reading

- Chadwick, Frank, *Space 1889* (GDW, 1988). Variant planetary geology in this classic game that defined "steampunk," currently available in rerelease by Heliograph Press. Not exactly the fantasy genre, but spaceflight concepts could be borrowed.
- Grubb, Jeff, *Spelljammer* (TSR, 1989). The seminal game of high fantasy space travel, Spelljammer contains extremely inventive and unique astrophysics. Highly recommended.
- Grubb, Jeff, Cordell, Bruce R., and Noonan, David, *Manual of the Planes* (Wizards of the Coast, 2001). About alternate planes of existence rather than space, but contains many novel concepts that could be adapted to the physical world.
- Pratchett, Terry and Masters, Phil, *Discworld Roleplaying Game* (Steve Jackson Games, 1998). A flat world carried through space on the back of a giant turtle, although this actually has little impact on most adventures.

- Stoddard, William, ***GURPS Steampunk*** (Steve Jackson Games, 2000). Steampunk concepts get an up-to-date treatment.

Mark English and Mrs. English

for Over the Edge

by Michael Anguiano

Thomasville, Alabama, appears on road maps mostly by default, simply because mapmakers don't like to have large blank areas. Despite its size, Thomasville is still the largest cluster of population in a rural, underdeveloped part of the state. A stone's throw northward along lightly paved roads is the unincorporated town of Constantinople, where joking questions about changing the name to Istanbul are met with blank stares. Rural postal delivery is handled mostly by the easygoing, friendly Mark English, practically a local landmark in his aged green truck. Life has changed little in Constantinople, despite Mark's rather spectacular achievements as an occult engineer of international merit.

Aside from having a social security number and an indifferent record of service with the U.S. Postal Service, Mark doesn't really have anything else of note in any national databases. He is caucasian, fifty-eight years old, married for forty-three years. He has no college, criminal, or military record. He has a valid driver's license, but has not had any points on it for eighteen years. He has traveled abroad on several occasions but not in the past ten years. Any investigation will find that he is well known and well regarded in Constantinople, with a reputation for being reliable, clever, neighborly, and damn good with his hands.

Of course, Mark English is all of those things, but the locals won't tell outsiders that he's also known as a bit of a nut. Mark has volunteered so many repairs for so many people that it would be unthinkable to speak poorly of him. In recent years, he's fixed the furnace for the local Baptist church, overhauled vehicles for emergency services, rewired the local market's freezer, repaired generators for the hospital down in Thomasville, ran wire to supply electricity to a dozen or so of the county's poorest families, and got the local AM station back on the air after a storm had knocked out its antenna. Aside from a few drinks of lemonade, sweet iced tea, or beer (depending on the time of day and who's offering), Mark refuses any payment but instead directs people to some worthy local cause that needs support.

Mrs. English has even less on file than her husband. Their marriage license lists the couple as being the same age. This detail constitutes the entire official record for Mrs. English. The license fails to even list her first name or maiden name. Mrs. English was born and raised in Constantinople, and her people have lived here since before the war. A few of the older folk might remember that she was born a Caskinette, but the rest of her family has long since passed on or moved away, so she's been known simply as Mrs. English for the last forty years. Of course, all of the local residents treasure Mrs. English for her friendship, her voluble cheerfulness, her seemingly indomitable good spirits, and her tireless devotion to community and church. Mark may be well regarded, but his wife is beloved.

Outsiders will hear nothing but good about Mark and Mrs. English. Mark may be considered eccentric, but the locals protect their own. Indeed, outsiders will be hard-pressed to even find where the couple lives. Directions will be consistently vague and contradictory, usually identifying landmarks only with "You'll know it when you see it" and "You can't miss it." Meantime, somebody or other will call up to the English place to let them know that someone's wandering around, looking for them.

The English place is a small, two-story pink house on a sizable piece of wooded land, where Mrs. English keeps a few livestock and grows vegetables. Mark has turned the garage into a workshop, since Mrs. English won't let him bring any of it into the house. His library occupies roughly half of the second floor, with the rest taken up by the master bedroom and a water closet. The first floor is a standard arrangement of living room, kitchen, etc. The cellar is mostly used for storage. A rusted length of barbed wire, nailed to half-rotted posts, marks the outlying edge of the property. Fourteen inches below the surface, the same route is followed by a braided cable of assorted metals, which forms a barrier ward against occult and mystical energies.

The front yard is littered with vehicles, a few of which Mark is repairing for neighbors and the rest are slowly being cannibalized for assorted parts. A small tree has grown through the rusted hulk of an ancient, formerly white Chevy

Impala, which serves as an anchor for a feline spirit. It was run over the Impala and caught in the engine, a grisly death that tied its spectral essence to the machine. Mrs. English says that Kitty is really a very sweet cat; it's just upset about being run over. If Kitty's former owner were still alive, however, he'd tell you that it was always like that and death hasn't done anything to change it. Kitty was one of Mark's early projects, found in a salvage yard over in Tuscaloosa. Mark tried to develop it into a powerful guardian spirit, but Kitty proved immune to any training, even when compelled by occult means. It adored Mrs. English, though, so she persuaded Mark to just power Kitty back down instead of destroying it entirely. Now Kitty mostly sleeps in the Impala's glove compartment, emerging occasionally to chase the ghosts of birds and squirrels. It will respond if Mrs. English calls it, but anyone else will be met with indifference or outright hostility.

Mark has mostly given up on guardian spirits, having more luck with barriers and wards which he can anchor with mechanical means. The perimeter barrier is one example. Another is the pentagrammatic array of stainless steel rods, driven into the earth in a seventy-eight foot range encompassing the house and front yard; each 20" rod is inscribed with a mix of Hebraic characters and Aztec hieroglyphs. The wiring of the house itself creates a third barrier, intended to absorb rather than deflect. This barrier is active only in the absence of electricity, draining mystical energies into a modified battery array in the cellar (next to the stack of empty mason jars). Since the house is hooked up to the local power grid, Mark figured that a cut in power would probably be accompanied by an attack of some sort. He later uses the absorbed power to run equipment for his experiments, so that he doesn't have to worry about causing power outages with an unexpected drain.

Thanks to his job with the Postal Service, Mark has managed to accumulate a surprising amount of occult paraphernalia without attracting undue attention. He has established mail drops in five other places, under assumed names, and has their contents forwarded to fictional addresses in and around Constantinople. Each of the fictional addresses is on his delivery route, so Mark simply collects that mail from the rest of his deliveries. He developed this system about 25 years ago, once he'd started work on his system of techno-occult transnotation and decided he needed to acquire significant research materials. He has since accumulated one of the more significant occult libraries on this continent.

The library contains a mix of occult materials and technical manuals. Mark's collection is notable not for its size but rather its focus on efficacy. For example, he sold his copy of the *Necronomicon* (Wormius edition) back in the 1970s, deciding that it was unsuitable for his purposes and generally overrated. He also has a filing cabinet with extensive notes on the various books, which he used to compile his manual on techno-occult transnotation. He keeps the manual itself in the back of one of the cabinets, behind a sheaf of letters from the Church of Latter Day Saints.

A small legion of undead spiders protects the library from minor threats like pests, fire, intruders, or excessive humidity. The spiders also serve to absorb ambient traces of evil, so that certain volumes with a radiant effect will not affect the rest of the library. Once a spider has reached saturation, it lays eggs and is subsequently devoured by the hatchlings. This works much better than Mark's previous system, which involved simply wedging Jack Chick comics between the particular volumes. If the spiders are overtaxed, Mark has left an illegible folio from the Revelations of Glaaki behind the filing cabinet, which serves as hatching grounds and fodder to nourish additional generations of spiders.

Mark has rigged a variety of other defenses for the house and grounds, but he is constantly modifying or replacing those as he fiddles with new projects. Only the more permanent systems have been mentioned here.

Mark is in regular correspondence with various occult organizations, using pseudonyms and his forwarding services to avoid becoming an obvious target. He has, on two occasions, hosted a small convocation for the purpose of demonstrating some of his results and developing useful applications. Only a small number of attendees were present, given Mark's then-lack of reputation, but he deeply impressed all of them. Word about Mark has only nominally filtered out to the occult community, since the attendees are reluctant to share the benefits of Mark's insights.

One of his principal correspondents has been *The Blue Line*, a Paris-based glossy fringe magazine that serves as a front for an occult research organization. *The Blue Line* is particularly interested in his transnotation studies but has worked to discredit him with other occult groups. Once Mark became aware of this, he began feeding them disinformation and

has pursued his more serious inquiries elsewhere. *The Blue Line* is currently contemplating more direct action to acquire Mark's findings.

Mark is also in regular contact with assorted extraplanar entities, but he knows to distrust most of their assertions. Although encouraged by the success of his various projects, he continues to proceed with extreme caution. Most recently, he has been able to establish a stable portal for direct regular communication with some of his contacts. He has refused to establish a transit point, instead limiting the portal to communication only.

While the depth of his occult studies would drive most men to the brink of sanity and beyond, Mark English has a philosophical view of life and a mechanistic perception of the universe(s). He has no illusions about the unlikely survival of humanity or the purposelessness of life. Mrs. English, conversely, is a deeply religious woman whose extraordinarily durable faith will see her through any crisis. She's been married to Mark for too long to unquestioningly accept scripture as concrete fact, but nevertheless believes in an Almighty God who has simply created more levels to reality than He let be said in the Bible. She continues to attend church every Sunday, to wear a crucifix next to her heart, and to live her life by the teachings of Christ. Mark, frankly, thinks she's nuts, but he loves her anyway. Mrs. English, of course, feels the same way.

Mark English, Technoccultist

Improvisational Engineer/Mechanic -- 4

If it's mechanical or electrical, Mark can fix it or maybe make a new one. He'll use improvised parts as necessary, sometimes sending someone to collect a bizarre list of needed items (sardine tins, a glow-in-the-dark yo-yo, two hardboiled duck eggs, the hubcap from a Ford truck, etc.). Sign: belt with assorted multi-tools and gadgets.

Techno-Occult Transnotation -- 4 (technical, narrow)

Mark has conjoined his occult knowledge with his technical expertise, distilling years of research into a handwritten manual on techno-occult transnotation. Using materials from Radio Shack, Home Depot, assorted electronics catalogs, and eBay, Mark can modify or even replace substantial elements from occult rituals. Just off the top of his head, he can safely substitute a technical simulacrum for a typical single element of any spell, but multiple elements or combinations of elements usually require him to consult his manual and work out the appropriate calculations for a (reasonably) safe reformulation. Sign: ink-stained fingers, library of occult books and technical manuals.

Robust -- 3

Despite smoking a pack a day, drinking regularly, and a lifelong diet of starches and fried food, Mark is hale and healthy. Sign: spring in his step, energetic.

Flaw -- Country. Very, very country. This is not a problem in Constantinople or any other small town in the Deep South, but elsewhere it elicits presumptions of ignorance and credulity. Sign: looks and sounds like extra from "Hee-Haw".

Hit Points -- 21 (health and vigor)

Motivation -- to explore and understand the universe(s), to map the nature of reality

Languages -- English, Latin, Greek; some French, German, Arabic; read-only Aramaic, Kanji

Mrs. English, Wife of Mark English

Country Wife -- 4

She can cook, clean, sew, and handle various parts of a small farm like she was born to it (which she was). Sign: always wears apron, sweet and friendly manner.

.45 Colt Revolver -- 4 (narrow)

She's a crack shot with the .45 Colt Peacemaker that she keeps in one of the front pockets of her apron. Sign: always has a .45 Colt Peacemaker in one of the front pockets of her apron.

Protective Charm -- 6

This is a small engraved steel disc that Mrs. English wears around her neck. This was Mark's gift to her on their 25th wedding anniversary. It took him several years of solid work and a significant outlay of resources, but the charm has proven to be well worth the effort. This charm protects Mrs. English from virtually anything, including the loss of the charm. Sign: the charm, on a thin silver chain.

Flaws -- none. She's an incredibly sweet woman, and anyone who says otherwise is a very bad person.

Hit Points -- 14 (clean living and good health)

Motivation -- to be a good wife and a good Christian

Languages -- English

Using English(es)

Mark and Mrs. English provide a stark contrast to the stereotypical trappings of the occult. The two of them are provided as background characters for ***Over The Edge***, but may be easily adapted to any contemporary game with supernatural elements (modern ***Call Of Cthulhu***, ***GURPS Horror***, etc.). Mark English may be used as a resource by the PCs or as a plot device by the GM. Mrs. English mostly serves as a foil to PCs who are overly aggressive or who might equate folksiness with stupidity.

Aside from his practical repair skills, Mark English can provide PCs with information, analysis, and advice on a wide variety of arcane objects, supernatural entities, mystical phenomena, occult organizations, etc., as well as where to look for further information. His techno-occult transnotation system also gives him a unique ability to analyze and possibly circumvent some of the practical limitations on the use of arcane objects or ritual magic.

A GM can use Mark and Mrs. English as a plot device to introduce the PCs to a particular object or organization. The PCs could be invited to one of Mark's convocations (possibly by accident), Mark might be one of the few known custodians of a particular book, or the PCs could be hired to purchase (or steal) some book or trinket from Mark. Alternately, Mark could hire the PCs to recover a manuscript which was stolen, to find a rare occult element that he can't circumvent with transnotation, or to safeguard a book in transit to (or from) a purchaser.

Urban Legends: The Rockhouse

A d20 Modern Campaign Resource

by Daniel Bronson

Hattori knew the teenagers were going to be a problem the instant they swaggered in, their loud laughs and horseplay invading the quiet sanctity of the store.

"Can I help you, young sirs?" he asked, resolved to see them out the door as quickly as possible.

This induced a fit of snickering among the boys. One stepped forward as the other two began to nonchalantly wander through the store. "Yeah, Pop. We were just, uh, wondering where the bathroom was."

"They are around the back," Hattori replied, his eyes on the pair. They had made their way to the beer cooler.

"Got a key for it or anything?"

"No, there is no key. They should be open." They were into the cooler now, rummaging through its contents.

"Well, it's locked right now, man," the boy said, tapping his fingers on the counter. "Could you go open it?"

Worry clouded Hattori's features. "I thought you did not know where they were," he said, then louder: "Excuse me, sirs, but unless you have valid ID showing that you are of age, I cannot sell you alcohol."

The two boys glanced back at Hattori, grabbed some beers, and ran for the door.

"Oh, no, no, no . . ."

"See ya, Pop!"

"No, come back! You do not know what you are doing!" Hattori cried out, watching the trio flee from the store, but as the wave of hatred coursed over him he knew it was too late . . .

* * *

Three hundred years ago, native tribes would stop here to make camp on their way to other lands. Two hundred years ago, pioneers would stop here to rest overnight on their way to the frontier. One hundred years ago, vacationers would stop here for a picnic on their way to their country homes. Today, travelers stop here for a couple of minutes on their way to the next city.

"Here," in this case, is a scenic pull-out where people can park, get out of their cars, and take a break from the road. Forest land surrounds the area, an open field of long green grass with a rushing stream that runs down one side of the forest-field border before vanishing back into the trees. A cool breeze is often felt that brings with it the clean smells of the earth and plants, reminding visitors of a world away from the hustle and bustle of the city. Should the travelers need something more than beautiful scenery and a quick walk around the parking lot, however, they can visit the Rockhouse.

There may have been a time when nomadic peoples left a pile of stones here as a make-shift shrine in hopes of having a safe journey. If so, that pile is long gone. In its place stands a small country store with walls built from rocks picked up around the area. It is a squat building, solidly constructed but definitely rustic in appearance. There are three thick wood doors, one in the front and two in the back, that -- judging by the numerous scratches and stains -- have been there for many, many years.

Inside, the Rockhouse is dimly lit. Some natural light manages to fight its way through the dirt, grime, and spider webs on the windows, but most of what illumination there is comes from three pairs of hanging fluorescent lights. Of these, at least one of the bulbs is always out and another flickers randomly. The quiet buzz of the lights mixes with the musty aroma of the store, much as the dust kicked up by prospective customers gently swirls into the air. The moth-eaten head of an eight-point buck is mounted in a place of honor above the front door, a tribute to the skills and luck of some long-forgotten hunter. Other smaller trophy heads decorate the top of the back wall: two deer, a very young bear, and something that might be a mountain lion.

Along the side walls are several black-and-white photographs of the surrounding area. One depicts some men widening the then-dirt road going by the Rockhouse, another shows the stream outside running over its banks and nearly reaching the building, and a third is of a pair of older men holding up a good-sized fish they presumably caught. Each one is framed with a glass cover, though most of the covers are cracked and all of them are filthy, and each has a little white label with faded handwriting on it. Most are unreadable but the labels for the three photographs mentioned above are "Road work -- 1942," "The big flood -- 1965," and "Mitch & Morry -- 1957," respectively.

Cold drinks and frozen treats are kept in glass-top coolers and a wide variety of cookies, pretzels, chips, candy, and other snacks hang from racks throughout the store. One of the short aisles also has a small selection of toiletries, groceries, and medications, presumably for the people who live in the area. For those willing to wait a few extra minutes, there is additionally a well-used gas stove back behind the counter that the owner, Katsutoshi Hattori, can put to good use cooking up an excellent burger.

It was nearly a decade ago that Hattori purchased the Rockhouse, leaving everything just the way it was. Some might claim this is because he is too lazy to clean the place out. Hattori's reply is that the store has done good business so far; why try to fix something that isn't broken? This is not, however, his real reason for leaving things alone. His real reason is that he does not wish to upset the Presence.

Hattori became aware of the Presence shortly after acquiring the Rockhouse. From time to time he felt as if there was another person in the room with him, someone watching and waiting, but no matter how hard he looked there was nothing to be seen. During the day, when people stop by and buy things, a different feeling emerges. It is one of being calmly pleased, a sense that all is right with the world. It only lightly brushes against the edge of the mind, never intruding and almost never being consciously recognized. Hattori is certain this is why people continue to stop at the Rockhouse. They may claim all sorts of reasons, but in the end they know, on some unconscious level, that it will make them feel good to do so.

Hattori also knows, though, that there is a dark side to the Presence. The first time he didn't even realize what happened, he simply felt a surge of caustic hatred wash over him as a family left the store. In retrospect, Hattori figures that the child of that family must have shoplifted something because the second time he felt that hatred was when a teenager held him at gun-point and emptied the register before taking off on a motorcycle. Hattori found out afterwards that the robber had an accident only a mile down the road where he hit some loose gravel and slid into the path of an oncoming car. The car swerved but it not only still hit the boy and motorcycle it also slammed into a tree. The robber and the two people in the car were all pronounced dead at the scene.

Dramatis Personae

Katsutoshi Hattori

"Thank you for your patronage. Please come again."

Charismatic Ordinary 2: CR 1; Medium-size humanoid; HD 2d6-2; hp 5; Mas 8; Init +1; Spd 30 ft; Defense 12, touch 12, flat-footed 11 (+1 Dex, +1 class); BAB +1; Grap +1; Atk +1 melee (1d3 nonlethal, unarmed strike); Full Atk +1 melee (1d3 nonlethal, unarmed strike) or +2 ranged; FS 5 ft. by 5 ft.; Reach 5 ft.; AL good, Billie Shantca, the Presence; SV Fort +1, Ref +3, Will +3; AP 0; Rep +2; Str 10, Dex 12, Con 8, Int 14, Wis 13, Cha 15.

Feats: Alertness, Iron Will, Simple Weapons Proficiency, Trustworthy.

Possessions: Personal possessions.

After a failed attempt in his late teens to be a country music star, Katsutoshi Hattori decided to leave Japan and travel to the United States. Once there he spent several years working in various restaurants as a line cook and putting himself through school, finally receiving his MBA. Then, following graduation, he found a job as the manager of a small chain of convenience stores. Being single and living cheaply he saved up enough to finally purchase a store of his own, one that was away from cities: the Rockhouse.

Despite his discovery of the Presence, Katsutoshi has remained at the Rockhouse for several reasons. First, he generally hasn't felt threatened by the Presence. The few disturbing episodes with thieves have left him somewhat shaken, but he realizes that he is not the target of the anger. If anything, the Presence reminds him of some of the fairy tales his mother used to tell him when he was younger, stories about good spirits that helped those close to them. Second, he really likes the area and it took most of his life's savings to buy the Rockhouse. He refuses to simply leave it all behind after working so hard to get here, even if there are some difficulties involved.

One of Katsutoshi's current difficulties is in dealing with a sheriff's deputy, Tommy Shoe. Tommy feels it is one of his perks as member of the local law enforcement to help himself to some snacks now and again, free of charge. Katsutoshi is pretty sure the Presence would react badly to that and has made it a strict policy that no one gets anything for free. In an attempt to find a compromise, Katsutoshi has tried offering Tommy a discount but the deputy still thinks Katsutoshi is deliberately holding out on him.

Deputy Tommy Shoe

"I think I'm gonna call that resisting arrest, boy."

Strong Ordinary 3/Dedicated Ordinary 1: CR 3; Medium-size humanoid; HD 3d8+9 plus 1d6+3; hp 29; Mas 16; Init +1; Spd 25 ft; Defense 16, touch 14, flat-footed 15 (+1 Dex, +3 class, +2 concealable vest); BAB +3; Grap +5; Atk +5 melee (1d3+2 nonlethal, unarmed strike); Full Atk +5 melee (1d3+2 nonlethal, unarmed strike), or +6 melee (1d6+2 bludgeoning, rifle butt), or +4 ranged (2d8, Mossberg); FS 5 ft. by 5 ft.; Reach 5 ft.; AL sheriff's department; SV Fort +6, Ref +2, Will +2; AP 0; Rep +1; Str 14, Dex 13, Con 16, Int 12, Wis 10, Cha 8.

* Includes -3 armor penalty for concealable vest.

Feats: Confident, Run, Personal Firearms Proficiency, Simple Weapons Proficiency, Vehicle Expert, Weapon Focus (rifle butt).

Possessions: Mossberg (12-gauge shotgun), 20 12-gauge shotgun rounds, Beretta 92F (9mm autoloader), 50 rounds of 9mm ammunition, tonfa, concealable vest, various other pieces of law enforcement gear, and personal possessions.

Contrary to popular belief, Tommy Shoe isn't a "dirty cop." He's just a petty, insensitive, and occasionally violent one. Under normal circumstances it is very likely that Tommy would have long since been removed from duty as a sheriff's deputy. Unfortunately, several factors -- including the intervention of his higher-ranking father and older brother and the department's status of being severely undermanned -- have conspired to keep Tommy behind the badge.

When he was younger, Tommy admired his father's dedication to law enforcement and knew that he wanted to be a sheriff's deputy as well, and maybe even the sheriff. His father was pleased by this and often complemented Tommy on his career goals. Then, as Tommy was finishing up high school, his older brother announced that instead of being a lawyer -- a choice his father never particularly cared for -- he was going to follow in his father's footsteps as well. Tommy's hopes of at long last excelling beyond his brother were crushed. He went ahead and followed through with his plan, becoming a deputy, but his heart was no longer in it.

Tommy realizes he isn't the world's greatest law enforcement agent. Point of fact, he knows he's not even a pretty good one . . . but he really doesn't care any more. He is certain that everyone is constantly comparing him to his father and brother, a mindset that makes him bitter. He consequently finds joy in making himself feel superior to anyone he can by belittling others and proving that he can make their lives a little more difficult if he so desires. This is particularly true when it comes to taking down suspects.

Billie Shantca / Jamie Kurt

"It's a reasonable plan, but there are three things you haven't considered . . . "

Smart Ordinary 2/Dedicated Ordinary 2: CR 3; Medium-size humanoid; HD 2d6+2 plus 2d6+2; hp 18; Mas 12; Init +1; Spd 30 ft; Defense 14, touch 14, flat-footed 13 (+1 Dex, +3 class); BAB +2; Grap +1; Atk +1 melee (1d3-1 nonlethal, unarmed strike); Full Atk +1 melee (1d3-1 nonlethal, unarmed strike) or +3 ranged; FS 5 ft. by 5 ft.; Reach 5 ft.; AL chaotic, good; SV Fort +3, Ref +1, Will +6; AP 0; Rep +2; Str 8, Dex 13, Con 12, Int 16, Wis 14, Cha 10.

Feats: Alertness, Attentive, Educated (Knowledge[behavioral sciences] and Knowledge [civics]), Meticulous, Nimble, Personal Firearms Proficiency, Simple Weapons Proficiency.

Possessions: pen, graph-paper notebook, a silver dollar, and personal possessions.

Billie Shantca has always been a planner. When she was 10 she came up with a way to get her brother and herself into R-rated movies. When she was 13 she came up with a way the gang she was in could take over more territory. When she was 15 she came up with a way that same gang could set up a chop-shop without getting caught. And when she was 18 she came up with a way to steal nearly \$3 million dollars worth of diamonds, sapphires, and other gems. It all worked, too, with the exception of one thing she had only partially planned for: betrayal by associates who fingered her as the brains behind the operation. It was thanks to that partial plan, however, that she went to prison knowing her so-called friends would never find the loot.

When Billie was 19 she came up with a way to escape from prison, a way to re-acquire the hidden gems, a way to fake her own death, and a way to live happily ever after far away from anyone who might recognize her. Now, 33 years later, she resides in a nice cabin in the woods near the Rockhouse. She has re-created herself as "Jamie Kurt," a mystery writer of some note. Much of her published work is on Internet literary sites; some of her better efforts are available in bookstores. She enjoys incorporating aspects of her "past life" into her stories but she is always careful to avoid being too obvious.

Billie, who always goes by Jamie these days, can often be found at the Rockhouse playing chess with Hattori. The game helps her take her mind off of whatever writing project might be giving her trouble, not to mention that over the years the two have become close friends. She has never revealed her true past to Hattori and feels a little guilty about that sometimes, but never enough to bring the topic up. When down at the Rockhouse Billie also has fun amusing the children that come by with a wide variety of coin tricks.

Creature Cast

The Presence

The Presence is the result of ages of belief that this place is a special one for travelers; belief made real by the forces of Shadow leaking into this world. For the past several decades the Presence has considered the Rockhouse to be its shrine, a place of worship for those who desire its blessing. Its take on humanity is quite simple. Anyone who

purchases an item in the store is viewed as paying homage and is rewarded. On the other hand, anyone who steals from the store has committed a most vile transgression and is punished. The Presence rewards and punishes these actions by placing its blessing or curse upon the person, respectively. Those who do neither are simply ignored. If at any time the two effects are in contention, the curse overrides the blessing.

To those who can detect the invisible, the Presence appears as a blanket of gray fog that stands about 20 feet tall and stretches nearly 100 yards out in every direction from the Rockhouse. The incorporeal fog is thinner at the edges and thickest in the store itself. It shifts slowly, passing right through anything within its boundaries, but cannot stray from its location.

Effectively attacking the Presence is pretty difficult, though anyone who manages to do so will discover that the only response they elicit is that they get hit with the Curse of the Presence. The Presence cannot fight back in any other way; the beliefs that brought it into existence didn't account for that. If push comes to shove, however, the Presence can try to communicate the problem to an individual it has chosen as its "keeper" in hopes that they can handle it. The current keeper is Katsutoshi Hattori.

Should anyone wish to eliminate the Presence, there are two options. The first requires a major incantation -- such as *cast into Shadow* -- focused on the Rockhouse. The second is to destroy the Rockhouse and prevent anyone from ever "worshipping" the Presence again. Under those conditions it should dissipate in a few decades.

Abilities:

The Presence has the following abilities:

- **Blindsight (Ex):** The Presence lacks eyes but it is aware of everything that happens within the area it covers.
- **Damage Reduction 20/+2 (Ex):** The Presence ignores the first 20 points of damage dealt by weapons of less than +2 enchantment.
- **Fast Healing 15 (Ex):** The Presence heals 15 points of damage each round so long as it has not been reduced to -10 or fewer hit points.
- **Immunities (Ex):** The Presence is immune to acid, disease, paralysis, petrification, poison, sleep, stunning, and mind-affecting effects. It is also not subject to critical hits, nonlethal damage, ability damage, ability drain, energy drain, or effects of massive damage.
- **Mindlink (Sp):** The Presence can cast forced mindlink three times per day as if a level 10 Telepath. It rarely uses this ability, but when it does it generally only targets its chosen keeper and it prefers to wait until the individual is falling asleep or just waking up. The messages it relays in this manner tend to be vague.
- **Natural Invisibility (Su):** The Presence is always invisible.
- **The Blessing of the Presence (Sp):** The Presence can place its Blessing at will as if a level 10 Acolyte; the blessing lasts 12 hours. The blessed individual critically succeeds their next travel-affiliated check** and gains a +1 luck bonus to all further travel-affiliated checks during the remainder of the blessing's duration. The target also unconsciously feels a degree of contentment for the duration of the blessing. A Will saving throw (DC 21) negates the Blessing and spell resistance applies.
- **The Curse of the Presence (Sp):** The Presence can place its Curse at will as if a level 10 Acolyte; the curse lasts 12 hours. The cursed individual critically fails their next travel-affiliated check** and suffers a -1 luck penalty to all further travel-affiliated checks during the remainder of the curse's duration. When the curse is placed, the keeper feels a brief surge of anger from the Presence. A Will saving throw (DC 21) negates the Curse and spell resistance applies.

** Travel-affiliated checks can involve several different skills, depending on the situation. Drive, Pilot, and Ride are the obvious ones, but checks such as Navigation or travel-affecting Survival checks could also qualify.

The Presence: CR 15; Colossal outsider; HD 60d8; hp 240; Mas -; Init -2; Spd fly 10 ft. (good); Defense 0, touch 0, flat-footed 0 (-8 size, -2 Dex); BAB -; Grap -; Atk -; Full Atk -; Reach 15 ft.; SQ blindsight, damage reduction 20/+2, fast healing 15, immunities, natural invisibility, spell-like abilities; AL itself, its shrine, its keeper; SV Fort +12, Ref -10, Will +15; AP 0; Rep +0; Str -, Dex 6, Con -, Int 12, Wis 12, Cha 15.

- **Skills:** None.
- **Feats:** None.

Adventure Seeds

- As the heroes are driving up to the Rockhouse, a man and a woman come running out of the store carrying cases of beer, jump in a car, and take off down the road. A very distraught Katsutoshi runs out of the store after them, yelling for them to stop, but this does no good. If the heroes ask him what happened he will explain that the two stole the beer, and consequently they have put themselves and those around them in grave danger. Katsutoshi will avoid saying too much about the Presence because he doesn't want the heroes to think he's crazy, but in his agitated state he will let some information slip . . . enough that the heroes should realize there are strange forces at work here and that if the thieves are not stopped then people may die.
- One of the trophy heads mounted on the wall looks like a mountain lion to most people, but to those who take a closer look it looks stranger than a normal mountain lion. And yet, if it is a creature of Shadow, why didn't its head vanish when the thing died? Is it actually a mountain lion but the taxidermist spiced it up a bit? Is it the head of a cross-breed, a mix of a normal mountain lion and something of Shadow? If so, how did the cross-breed come to be? Was it the creation of a magic wielder, the work of modern science, or simply the result of nature running its course? This head has been here a long time, but are there others of this species still around?
- When the heroes stop at the Rockhouse they find the front door locked, which is odd since a) the store hours shown on the door indicate the store should be open and b) the sign in the window is turned to read "OPEN." Interestingly, the sign just under it looks like it once said "HELP WANTED," but someone folded it so that now it just says "HELP."
 - The situation: a trio of young men have taken over the store. They are armed with guns and have Katsutoshi and Billie as hostages. They locked the doors to keep other people out, but they aren't the brightest of individuals so they didn't think to turn the sign to "CLOSED." They also didn't catch Billie quickly adjusting the "HELP WANTED" sign when they first walked in. While they have helped themselves to the cash register and some snacks, the men still want one more thing: Tommy Shoe. Tommy caught the three with drugs a while back, beat them up, and then helped send them to jail. Now they want revenge. They have already had Katsutoshi call the sheriff's station and ask them to send Tommy over, though without relaying what was really going on. Consequently, the deputy will be by after he finishes taking care of some reports. It will still be about 45 minutes before he arrives.
 - If they peer through the windows, the heroes will be able to get a pretty good idea of the situation inside the store. They can try to reach the authorities if they want, but a) most cell phones don't have very good reception out here and b) there is no 911 service. When Tommy arrives he will be set to walk right into the store. On his own he will probably get killed, though he'll manage to take out at least one of the men there, and the hostages will be in danger. If the heroes try to warn him or offer to help he will reject their assistance with threats of locking them up for obstructing an officer of the law. (He doesn't like people telling him how to do his job or suggesting he might need help.)
- Katsutoshi needs someone, or better yet a group, to transport an item of value for him. He asks the heroes to do this because the Presence told him they were right for the job.
 - The item in question is a fist-sized rock that carries within it the essence of the Presence, which needs to leave the Rockhouse because "something dangerous to it is coming." The implication is that the heroes will need to hide the Presence and keep it safe. In reality, however, once the Presence has chosen one of the heroes as its new keeper it will be passing along suggestions that actually lead the heroes toward the danger. After all, why hide when you have a group of bodyguards that can fight for you?
 - The "opposing force" is a motorcycle gang, the leader of which rides a Harley Davidson V-Rod that has been possessed by a demon that likes to feed on things like the Presence.

Map

Map of The Rockhouse

1. **Katsutoshi's bedroom:** A wood desk sits along the north wall with a matching stool. A bed is in the southwest corner and a dresser is against the east wall. A stereo and several CDs of old country music are on top of the dresser and a nice guitar rests on the bed. The various papers on the desk -- bills, letters, some musical scores, etc. -- are neatly stacked.
2. **Katsutoshi's living room:** A television sits in the northwest corner, facing a coffee table and a big, cushioned chair. The coffee table is covered by a cheesecake cookbook and some gardening magazines. Similar reading material can be found on the bookshelf along the north wall. A refrigerator and a sink are in the southeast corner of the room.
3. **Katsutoshi's bathroom:** A pot of water with five bamboo stalks growing out of it sits on the counter next to the sink. Next to the pot is a scented candle; it smells like chocolate chip cookies.
4. **Women's bathroom:** The bathroom is fairly typical and quite clean.
5. **Men's bathroom:** The bathroom is fairly typical and quite clean.
6. **Storage room:** Piles of goods fill most of the shelves in this room, with the exception of the shelves against the north wall. Lacking a closet for himself, Katsutoshi has used these shelves instead, filling them with boxes of out-of-season clothing, some pots and pans, and other items he doesn't need on a regular basis. He has also set up an old shower curtain rod across the north shelves so that he has a place to hang his clean shirts.
7. **Checkout counter / Kitchen:** Across the north wall of this area is a refrigerator, a stove, and some counter space. During business hours, Katsutoshi cooks up burgers here. After hours he uses it as his own kitchen. The checkout counter that sections this area off from the rest of the store is covered with a hodgepodge of pickle jars, jerky canisters, and racks of chip bags, as well as the cash register and a couple boxes of lottery tickets.
8. **The store:** The store shelves all kinds of goods, from magazines and canned sardines to aspirin and chocolate bars. Some animal heads are mounted across the west wall, and that of an impressive buck has been placed just over the entry door on the east wall. Old black-and-white photographs hang along the north and south walls.
9. **Coolers / Freezers:** Two freezers sit up against the west wall, filled with ice cream bars, popsicles, and other frozen treats. The west-most cooler on south wall holds beer and the other two carry a wide variety of carbonated beverages and other drinks.

Dork Tower!

Dork Tower!

A Singularity of Unicorns

*"Now I will believe
That there are unicorns, that in Arabia
There is one tree, the phoenix' throne, one phoenix
At this hour reigning there."
-- William Shakespeare, The Tempest, III:iii:25-28*

We see the unicorn so clearly. A horse with a spiraling horn, milky white, its head in the lap of its maidenly captor. But if we look closer, we see that the horse may be anything but, the whiteness the pallor of the sepulcher, and the horn a venomous fang. And the maiden? She may not be there at all. We hunt the unicorn even though we know it cannot be caught -- let's follow its trail, and discover if it can even be seen. Tally ho!

*"There are in India certain wild asses which are as large as horses, and larger. Their bodies are white, their heads dark red, and their eyes dark blue. They have a horn on the forehead that is about a foot and a half in length . . . The base of this horn, for some two hands'-breadth above the brow, is pure white; the upper part is sharp and of a vivid crimson; and the remainder, or middle portion, is black. Those who drink out of these horns, made into drinking vessels, are not subject, they say, to convulsions or to the holy disease. Indeed, they are immune even to poisons if, either before or after swallowing such, they drink wine, water, or anything else from these beakers. . . . The animal is exceedingly swift and powerful, so that no creature, neither the horse nor any other, can overtake it."
-- Ctesias of Cnidos, Indica (398 B.C.)*

And with those words, we get the first notice of the unicorn -- single-horned, poison-controlling, aloof, and impossible to hunt. Ctesias was followed by Megasthenes, and then by Aelian in the 3rd century A.D. This worthy adds spirals to the horn and notes that the unicorn becomes tame only when with a female, albeit still, at this early date, a female unicorn. (Roughly contemporaneously with the foregoing, we begin to hear about the qilin, the mystical unicorn of China, which appears only at times of utter peace, or for the coming of a great sage.) It is with the Christian bestiaries, starting with "Physiologus" in the 5th century, that we learn how to trap the unicorn by luring it into sleep with a maiden (or, as later, more Christian still, bestiaries insist, a virgin). The unicorn becomes smaller, less wild, and its horn becomes white rather than the solid black of Aelian.

Belief in the unicorn was buttressed by its uncompromising appearance in the Bible, especially in the Book of Job, in which God asks "Canst thou bind the unicorn with his band in the furrow?" The Biblical unicorn, the *re'em*, is a ferocious, mighty creature to be compared with mountains and even the Lord Himself ("God hath, as it were, the strength of a unicorn"); it also has the essential wildness that paradoxically defines (and hence tames) the unicorn. Pious witnesses from the Jesuit missionary Jeronimo Lobo (who saw a horse-like unicorn in Ethiopia in 1630 or so) to a Major Latter (who chased similar unicorns through Tibet in the 1820s) vouched for the unicorn's existence. Benard de la Harpe stumbled upon an Indian tribe roasting a unicorn over a fire in Louisiana in 1719, and there was a brief vogue of unicorn hunting in the South African forests in the early 19th century.

*"Similarly, there may have been a primitive unicorn, a unicorn almost divine, of which the rhinoceros and the oryx were only the unworthy avatars, so nobly conceived that every object and creature that called it to mind -- separate horns, single-horned sports, cattle with twisted horns, bas-reliefs that suggested one-horned animals -- aroused a kind of awe, so holy that it gave rise to a Persian myth."
-- Odell Shepard, The Lore of the Unicorn (1930)*

However, eventually even Biblical authority had to wane, as the various candidates from the orongo of Sinkiang, to the gemsbok of Namibia, all turned out to have two horns after all. The oryx, which often appeared in single-horned profile on Persian palaces, may have given the Biblical chroniclers ideas, or perhaps they always meant *re'em* to mean wild bison, or aurochs, or even rhinoceros. (Marco Polo quite pettishly describes the rhinoceros in his travels, saying it was "not in the least like that which our stories tell.") Ctesias' description of the unicorn does seem to match a confused jumble of the Indian onager and the Indian rhinoceros, and the superstitious Chinese belief in rhino horns' supernatural efficacy has nearly extirpated the poor animals even in our enlightened 21st century. The trade in narwhal

teeth, which was quite lucrative in medieval times (the fictive horns being worth 10 or even 20 times their weight in gold), didn't quite manage the same devastation. European relative poverty, and the difficulty of narwhal hunting without a compass, probably limited the supply even as suspicious rationalists like Ambrose Paré and Olaus Wormius were identifying magical "alicorn" as a mundane narwhal's tooth and doing their share to stanch the demand.

"To this day, it is said, malicious animals poison this water after sundown, so that none can therupon drink any longer from the stream. But early in the morning, as soon as the sun rises, a Unicorn comes out of the ocean, dips his horn into the stream and drives out the venom from it so that the other animals may drink thereof during the day. This, as I describe it, I saw with my own eyes."

-- Johann von Hesse, *Itinerarium ad Hierusalem* (1389)

The demand swelled as the legendary powers of the unicorn's horn (the "alicorn") expanded from Ctesias' beginnings. Not only did cups of unicorn horn cure poison and plague, touching anything with a unicorn horn decontaminated it. Eventually, merely placing a unicorn horn on the table purified the meal all around as the horn "sweated" in the presence of poison. Although most opinions held that the alicorn had a natural antipathy to poison, some (on the homeopathic model) believed that the unicorn horn drew all poisons into itself. Various savants from Albertus Magnus to Girolamo Cardan all recommended testing putative unicorn horns to ensure their authenticity, by poisoning animals and using the alicorn to cure them. Arabic scholars held that the true alicorn, split lengthwise, showed the "images of trees and beasts and birds," a veritable microcosm of the mundane. Enough of these tests must have come up trumps to keep the bishops, kings, and popes buying unicorn horns well into the 17th century. (Queen Elizabeth bought a unicorn horn brought back by one of John Dee's polar expeditions in 1577.) And none of these alchemists ever seemed to notice that the alicorns they had were ivory narwhal's teeth rather than unicorn horn -- bringers of lies, rather than truth, in the Homeric formula. Perhaps, then, they weren't. Ivory or horn; pure or poisonous? This bisociative uncertainty may have translated itself into the alchemical lexicon; the unicorn becomes a symbol for the hermaphrodite calcination, the albedo, the White Mercury. The famous "unicorn tapestries" of the La Rochefoucauld family (now in the Cloisters) may well reference this alchemical saga, as the unicorn is both wild and tamed, both alive and dead, by the end of it.

*"The Lion and the Unicorn
Were fighting for the crown;
The Lion beat the Unicorn
All about the town."*

-- anonymous rhyme first printed in *Tommy Thumb's Pretty Song-Book* (1744)

This ambiguity extends into the relations between unicorns and snakes. Although some bestiarists assured us that the unicorn, like the stag, could not suffer a snake to touch its hoof, the majority seemed to hold that the unicorn actually feasted on snakes, and on poisonous creatures of all kinds. (Phallic symbols have to stick together, I guess.) The legend of the cerastes, or "horned serpent," seems almost like an attempt to meld the two: its horns were reputed poison cures, it lived in the same countries as the unicorn, and both it and the unicorn could be caught by means of a [mirror](#). (The unicorn is trapped by its vanity; the cerastes frozen by its own gaze.) More straightforward is the rivalry between unicorns and lions -- in the letter of [Prester John](#) we hear that unicorns and lions are mortal enemies. The unicorn attempts to impale the lion; the lion, dodging, causes the unicorn's horn to be stuck fast in a tree trunk. Then, the lion turns and ravages the unicorn without mercy. This motif goes surprisingly far back; appearing on Babylonian cylinder-seals, Persian bas-reliefs, Egyptian papyri, and Scythian medallions, as well as in the famous Mother Goose rhyme. This latter is often taken to refer to the contest of Hanover and Stuart for the throne of Britain, lions being the Plantagenet (English) symbol, and unicorns that of the (Scottish) Stuarts. It's interesting in that context that Queen Elizabeth's unicorn horns (including the one John Dee procured from Hyperborea) vanished from the Tower of London during the English Civil War. Were those unicorn horns, which cured poison and upheld the lives of kings, somehow important, or at stake, in that struggle?

*"We caught the beast called Unicorn
That knows and loves a maiden best
And falls asleep upon her breast;
We took from beneath his horn*

*The splendid male carbuncle stone
Sparkling against the white skull-bone."*
-- Wolfram von Eschenbach, *Parzival*, IX:482-483

And what, if anything, does that tell us about the magical stone found in the unicorn's skull according to Wolfram's *Parzival*? If the unicorn's stone is the Grail, then the medieval parallel of Christ and the unicorn makes sense -- but if the unicorn is, rather, the forces of sin and chaos (which must be tamed by a pure Virgin, hint hint), then this [crystalline skull](#) stone might be a much darker thing. Perhaps, like Lucifer, this is the [Stone Fallen From Heaven](#), contained in the unicorn's uncatchable, indefinable, constantly shifting form. Magical stones show up in the skulls of other beasts as well: toads, serpents, dragons, basilisks, and so forth -- all of them poisonous creatures. In *Parzival*, Trevrizent applies the unicorn stone to the wound of the Fisher King without result, except to note that the wound seems "envenomed." Is the "male carbuncle stone" a kind of profane or sterile Grail, or perhaps an aborted Grail kept underneath the sharp Spear of the unicorn -- from whose dolorous blow no beast can recover. Perhaps the unknown horseman from Persia whose "poisoned spear engraved with the name of the Grail" struck down the Fisher King was, in fact, the unicorn.

*"Nobody sees much of unicorns anymore. . . . In an attempt to solve the problem, the American ecologist Lamont Cole . . . opened a book called **A Million Random Digits**, which used to be put out by the RAND Corporation, and picked an arbitrary place to begin. Then, counting from this point, he selected a series of 8,760 numbers at regular intervals. Let these, he said, represent the level of metabolic activity of a unicorn at the end of each hour in a normal year. There should, of course, be no relationship among the numbers and no cyclic pattern. But what Cole found, to his astonishment, was that unicorns were apparently most active at three o'clock in the morning! Which accounts for the lack of recent sightings . . . And we are left with some awkward questions about random tables."*
-- Lyall Watson, *The Dreams of Dragons* (1987)

The unicorn, after all, is the enemy of the royal lion in the West and of the royal elephant in the East. The Arabic unicorn, the karkadann, has a horn ten feet long, and is the only beast that will attack the elephant (another legendary serpent enemy). According to one of the Alexander Romances, Alexander the Great's horse Bucephalus ("ox-head") was a karkadann presented to him by Queen Candace of the South (either an [Amazon](#) or the [Queen of Sheba](#) -- and a maiden who can tame a unicorn). Alexander, of course, may have been poisoned, and his kingdom, like that of the Fisher King, fell into waste. The unicorns bear within them some form of poisonous chaos, a kind of panic insanity. As the Alexander Romance assures us: "No man yet of woman born Endures the terror of his horn." The karkadann is enormous, of unnatural size, recalling the giant bred on unicorn-milk in another Arthurian romance, *Le Chevalier du Papegau*. Again the Biblical *re'em* looms up, tameable only by God; Talmudic tradition holds that the unicorn was the size of Mount Tabor, and its horn "reached up to the sky." Mount Tabor, like Mount Sinai (where the monk Felix Fabri saw a unicorn in 1483) is one of the points where the mundane world touches the divine, the supermundane realm, and the unicorn's horn ends where reality and unreality touch. The unicorn is a chaotic pocket, containing images of a dark world (the reality of the Amazons? the [griffins](#)? the [sphinxes](#)?) held together by a singularity -- a point, at the end of its spiraling horn. There, the wave front collapses, there the worlds meet in poison and pain, opening a road for the energies of death to flow from a king's banquet or into the side of reality itself. Only by trapping the unicorn in the trunk of the world-tree, or in an insulated (pure? virgin?) mathematical space, can its poison be drawn, and the cosmos made safe -- until the next unicorn is sighted, over the hills and far away.

Pyramid Review

Burn Rate: The dot-com card game

Published by [Cool Studio, LLC](#)

Written by Rich Koehler

Illustrated by Jim Massey

156-card deck; \$15.95

Games with a business theme usually require the players to make the most money in order to win, like the classic *Monopoly*. Others focus on corporate culture, such as the Hip Pocket title [Cube Farm](#) or the Origins Award nominated [Management Material: General Office Edition](#) from Zipwhaa, Inc. Certainly, ***Burn Rate: The dot-com card game*** differs from *Monopoly* in that the aim is not to make the most money, but be the company that loses the least and survives with *any* money after all of the other companies have gone bankrupt. The reason for this is that ***Burn Rate*** is a card game about the dot-com boom, and more particularly, the dot-com crash. Either way, both *Monopoly* and ***Burn Rate*** are inspired by financial crashes . . .

Designed for two to four players aged 13 and over, each takes the role of a CEO, with a staff of overworked employees, the most incompetent vice-presidents imaginable, and a bundle of start-up capital all tied into one or more really, *really* bad ideas. In fact, ***Burn Rate*** includes 20 of the worst ideas that have brought dot-com start-ups to their knees, flat on their back, and finally six feet under! These range from "Make Postage Stamps Online" and "Free Music" to "Online Pet Store" and "Dot-Com Card Game." This all adds up to one big, bad thing -- your dot-com start-up is hemorrhaging money like there is no tomorrow. And actually, for most dot-com companies, there isn't . . .

Burn Rate: The dot-com card game comes as a 156-card deck, divided into 55 red-backed cards and 101 blue-backed cards; plus a 3½ by 5-inch ten-page foldout rules pamphlet. A notepad or piece of scrap paper is required to keep track of each company's funds as they lose round-by-round. The red-backed cards represent the various employee cards, further broken down into four departments, each denoted by border color on their fronts; these are tan for the Sales department, red for Development, blue for Human Resources (HR), and green for Finance. Each employee is marked with a skill factor from 0 to 3 -- the more numbers the better, so a skill factor of 0-1-2-3 is better than 0-1 or 0-1-2; a salary rating from 1 to 3 -- the lower the better; and individualized with a face and name. The Development personnel also include Engineers, which only possess a salary rating and not a skill factor . . . as do the Contractors (marked with gray-bordered fronts) whose salary ratings are triple that of any Engineer.

The blue-backed Play cards represent the actions that the players can take; they can be either Offensive, indicated by an arrowed top to the card's border, or Defensive, which have a square top to their border instead. In addition to describing whatever effects are particular to a card, Play cards are marked with a skill factor requirement, which must match one of the skill levels given on an employee card in order to be used.

At the beginning of the game, each player receives 100 units of funding as their start-up capital, or 80 if there are four players participating. The employee cards are separated into piles for each department, and the top one turned over ready for the process of First Hire. The players take turns to pick one of the face-up employees until they have hired a total of four, preferably one for each of the four departments: Sales, Development, Human Resources (HR), and Finance. This is not absolutely necessary, but having an employee in each department enables a player to use both Offensive and Defensive Play cards associated with *that* department.

Hired employees have to be arranged into their departments with the *best* employee -- possessing either the highest

skill rating or lowest salary -- placed on top. This employee becomes a company's department head. Some employee cards are marked with the letters "VP" for Vice President and they are always the head of department, are very difficult to poach or fire, and are invariably *bad* at their job!

In a turn a player can either play or discard up to four Play cards, but not both. To play a Defensive card, one of its skill numbers must match the skill level of a company's associated department head. Conversely, one of the skill numbers on an Offensive card must match that of a rival company's department head. If a department currently has no staff, a card marked with a skill level of zero can still be played on it.

Offensively, a player can play Bad Ideas on their opponents; force them to pick up a really bad employee with Bad Hire (they have no choice as to which employee); force them to fire a VP with Out To Pasture; force them to pay double their salary on their next turn with New Business Plan; and steal an employee from them with Poach. Defensively, Release allows a player to get rid of a Bad Idea; Hire lets you pick up a new employee of your choice from the labor pool, while Fire does the opposite; Funding adds a set amount to a company's current funds, and Layoffs lets a company get rid of any number of employees bar a pair of VPs.

Once all cards have been played or discarded, a CEO has to deal with any Bad Ideas that they accumulated since their last turn. A Bad idea can occupy the time and effort of up to four engineers, as marked on each Bad Idea card. If a CEO does not have enough engineers, they must hire Contractors until all of their Bad Ideas are being tended to. Unlike other employees, Contractors cannot be fired, but can be let go once a Release card has been played on a Bad Idea or enough Engineers have been hired.

A CEO must also pay all of their employee's salaries, and this is worked up by adding up all of the salary figures on their employee cards. The total is deducted from a company's current capital and is also known as a company's "Burn Rate," or the rate at which a new company spends its start-up capital before it begins generating positive cash flow from its operations. Simply put, a company's "Burn Rate" is a measure of negative cash flow! Should a company's current funds fall below zero, it has gone bankrupt, and the player is knocked out of the game. A company can even survive with a bank balance of zero, though not for long. A player's hand is then refreshed back up to six cards. Play continues until all but one company has been driven bankrupt!

The basic tactic to **Burn Rate** is to play cards: Play more cards to gain better effects and draw better cards for the next turn, and hit a company with as many Bad Ideas as possible, forcing them to get more Contractors in and drive up their Burn Rate. Given that up to four cards can be played each turn, it is also possible to play cards in combinations; for example, playing a Poach card to steal a company's engineers when they are dealing with Bad Ideas and thus force them to hire more Contractors. Another good time to play Bad Ideas is after having played a Poach on a company's only Sales employee, thus leaving them open to the new Bad Ideas!

As a game **Burn Rate** possesses both simple play and tactics that are easy to grasp, and the players are given plenty to do in their turns, being able to deal out attacks on rivals and with attacks made by those rivals. Yet despite this, it got a mixed response from our review test sessions. One player did not like having to keep track of the funds separate to the game, even though adding any form of money to the game would add to its costs and make it more fiddly. We also found the rules less than clear on the first read through, although the game's website does come with a decent FAQ. Further, the game feels very dry in its theme and there seems to be little room for the players to inject their own color, which would make it even more enjoyable.

Yet despite this, **Burn Rate: The dot-com card game** is both well-designed and appointed with good quality cards. Pleasingly, blank cards are also available for those players that want to design their own -- the publisher's website already includes several of these fan-created designs. **Burn Rate** also does a good job of emulating its theme, which is no surprise given that the creator, Rich Koehler, worked as a software engineer for a Seattle-area dot-com and survived two rounds of layoffs until he was finally let go in a third, in October of 2001.

Strange Bedfellows Expanded

An Adventure in Two Parts Part Two: The Adventure Concludes

by Elizabeth McCoy

When we left off [last week](#), the PCs were in transit in their van, heading for where Ziba holed up. If they thought of using the Song of Affinity and triangulation, they'll be on an Ofanite-straight course. If not, it will be more winding.

Ollie, Ollie, Oxenfree

Eventually, the group will get to the warehouse where Ziba has holed up. Here, the primary threat is Ziba himself, until the group can prove their identities! Unfortunately, Ziba has fortified the place . . .

Goal: Get to Ziba without getting caught by a deathtrap, nailed by friendly fire from Ziba (under the assumption that the group are demons), or causing too much Symphonic disturbance.

Possible Solutions: Send someone celestial and ignore the disturbance. Sneak through the deathtraps in a dungeon-crawl. Get a message to Ziba somehow.

Complications

Ziba's had over a week to fortify his position as only an attuned Cherub Vassal of War can. He started with a three-part warehouse in an L-shape, with the "I" of it 300×90 feet, and the "stem" of it 270×50 feet. (The division is at the corner, 90×50; and the stem has been rented out already.) The large doors to the dock for semi-trucks is in the inner part of the L, and are about five to six feet above the ground.

The first level of security includes locks on all the doors, with a burglar alarm that alerts the police. This is all that's in section A -- the bottom of the L -- which is rented out. (The GM may find amusement by having it full of pallets of gaming material, such as the group's favorite Most Notorious RPG. If so, the kid Ziba's babysitting (Erica) will likely have gotten some copies to read . . .) The security here is lax enough that Ziba's managed to rig the crates into defensive "lines of fire" and even has a deadfall or two that can be triggered with a good, ST 16/Strength 8 shove. So far, no one's noticed, and recently Ziba appropriated some crates to rig deadfalls in Section B.

The corner of the L, section B, is primarily offices on the second floor, with much less storage space than the other two wings of the building. Section C, the upper part of the L, has a loft on the near end with office-space there, and Section A has its offices in a loft, and on the bottom of the side nearest the corner.

Since it has more rooms, Section B is where Ziba initially set up shop. A bit of "surgery" to one of the walls added a "secret door" into the loft-office in Section C. The offices have windows to the outside -- which Ziba has covered with "mirrored glass" film. (This keeps it cooler inside, too.)

The second tier of trap is tripwires -- baling wire at ankle height on some doors, and head height at others. There are also a few tripwires at various heights, anchored in corners and around pillars, in the large, empty areas of the

A Different Approach

In a police campaign, such as **GURPS Cops**, humans could be involved when a report of a murder/kidnapping comes in. Anna Kelley's body was found on the scene; lots of blood from at least two other people was there as well, and there are reports of unmarked cars being driven off. The Kelley car is reported at a hotel on the outskirts of town, with a girl and a woman in it. In this version, celestial complications are one to three angels on Ziba's trail (probably Sophie, Minni, and Parnach), and two to four demons (mostly lower-powered ones) likewise.

warehouse. Many of these have metal scrap and/or paper cups tied to them at the anchor points (where it won't reveal their location too much), so that the rattling will alert Ziba. In Section B, some of the crates from Section A are stacked so that anyone who trips the wire will get a crate on the head. After that, extension cords have been taken, stripped at the ends, and the bare wires wrapped around doorknobs. There are small spy-holes cut in walls and floors at angles appropriate for rifle usage, too.

Unfortunately, Ziba has to keep a fairly close watch on things, so that he can disengage the deathtraps if someone shows up to rent Section B or C. Fortunately, his charge is relatively sensible and doesn't go wandering about in the death-trapped area.

The head-height wires will do no damage unless someone runs into one, at which point it does 1d6/2 Body hits of damage. The deadfalls will do (1d6 minus the check digit of a successful Dodge) × 10 Body hits! The electrocution doorknobs require a Strength roll from the person grasping the knob; a success does 7 - check digit Body hits, while a failure is 7 + check digit hits.

Ziba will likely detect the group if they approach from the front driveway, since he's watching the windows. (The inner part of the L has no windows or easily accessed walls for drilling, so he must trust in his tripwires.) Ziba has left waysigns (*Superiors 1*, p. 121) around the warehouse, indicating, "Attuned Cherub; fortified position." If the War-angels are alert for waysigns, they'll notice them and, hopefully, not walk into the deathtraps.

Crashing the Party

Once Ziba has been contacted, and the situation with the kid has been explained -- or at least dragged out of him -- things get more interesting from a combat point of view.

Whoever is standing guard (there are Michaelites in the group; *someone* should stand guard) should notice a car coming up the drive. (If it's night, the car will have its lights off, and require a Perception roll to notice, with penalties if there are lights on in the same room as the lookout.) It's moving fast, heading for the access road around the warehouse, to the truck dock. The sequence of events is as follows (until the PCs interfere, that is):

- The car drives up and screeches to a halt in front of the dock. The door opens and a woman falls out, power-crawling for the stairs up to the ramp. Clearly, one of her legs is broken and bloody, unusable. Also clearly, she's not human, from the way she's ignoring this. Ziba, if there, can identify her as "Lee," the Lilim who geased him. (Since there are no windows here, slow PCs may not get to see this part.) As soon as she gets to a door, she enters (if it's unlocked) or bangs on it frantically.
- Two SUVs enter the front parking lot, headlights on. One stops in the driveway, sideways to block it, while the other heads for the back lot.
- The stopped one disgorges two humanoids -- carrying rifles (Enoch and Gareb). The driver (Gether) remains at the wheel, and one other (Chidon) also stays inside.
- The second one stops, smashing into the woman's car. Two people (Eshek and Cabul) climb out of this one, too -- one is the driver -- while someone else (Bizjothjah) takes the wheel. Again, there are others (Elam and Gaal) left in the back seat. The two Calabim track the blood trail of the woman into the building.
- The goal of the Lilim's pursuers is to seize her and drag her back to Hell, and either kill or capture the child who calls her Daddy. (Kill, if they think the girl's a human. Capture, if they realize she's celestial.) They're perfectly willing to try to convince the angels to hand Leshem (and kid) over by telling them what crimes she's committed -- of which, only "treason to Hell" is likely to stick. If talking won't help, the battle will be joined. For the demons' stats, see *Characters* below. (Duplicate the Impudites or Habbalah as needed to challenge the characters sufficiently; an additional SUV of demons can arrive "belatedly" if the PCs aren't breaking a sweat, but such an obvious fudge should be avoided if possible.)
- Once the shooting starts, Chidon, Enoch, and Gareb may attack the front of the building, while the Calabim, Bizzy, Elam, and Gaal take the back. (Note that the Sword of Judgment can *definitely* be used on Eshek; Bizjothjah will be more than happy to order him to retreat, and he'll try to tell his troupes to fall back and regroup before he flees to Hell.)

Princess on Deck!

This element, though useful for "It Just Keeps Getting worse" effects, is purely optional. If the players show signs of wanting to wrap things up with a brawling bang, don't use this last scene. (Instead, try to let the Lilim escape, as a "The End(?)" or "I Thought *You* Were Watching Them!" finale.)

Either when the PCs are losing the battle, when they're in the middle of winning, or after they've mostly wrapped things up -- someone strolls through the middle of the battlefield. The someone is about five feet tall, dark-haired, medium-dark skinned, female . . . and a Superior, after one gets a clear look at her. Fortunately, Lilith is in a non-hostile mood; accidental and deliberate attacks will be deflected by a Corporeal Song of Shields, and otherwise coolly and elegantly ignored.

If there are any captive demons, Lilith asks them what their freedom is worth to them, then asks the angels if they'd like to make a counter-offer. (She'll go back and forth till someone stands pat -- sensible angels won't get involved in the bidding war in the first place.) If there are captive angels, Lilith simply frees them, smiling enigmatically while the demons mutter ineffectively. Now the PCs can worry about what they owe her.

What Lilith is really there for, though, is her Daughter, Leshem. The discussion will be entirely in Helltongue, permitting the GM to avoid "talking to himself," winding up with Leshem getting some Essence to heal herself (if still wounded). Depending on how obnoxious the angels have been to her, Leshem will explain a few details of the mission her Mother has just given her. (See her character sheet for details.)

By now, Lilith has slipped away -- only to be discovered curled up on some pillows on the floor, reading storybooks (in Helltongue) with Erica. Upon discovery, she looks up and asks, "What, haven't you ever seen someone reading to her granddaughter?"

And that's probably a good place for the GM to snap books closed and announce, "The end."

Non-Player Characters

(All **GURPS** characters have the Basic Celestial Template, p. IN9. ***In Nomine*** characters have target numbers in square-brackets, for ease of reference.)

ZIBA

Cherub of War

GURPS Character Sheet

ST 18; **DX** 17; **IQ** 12; **HT** 18

Advantages: Alertness +4, Combat Reflexes, Distinction: Vassal of War, Essence Control 12, Extra Hit Points 10, Role 4 (Zachary Barns, Martial Arts instructor), Power Investiture (Corporeal 5, Ethereal 3, Celestial 4), Servitor Attunement (Howl), Strong Will +3, Vessel.

Disadvantages: Dissonance 1, Edgy, Geased Extremely Hazardous Duty (protect Erica), Overconfidence, Reduced

Hi, Boss!

If Lilith shows up, the PCs may invoke one of their Superiors: Michael, David, Laurence, or with the Celestial Song of Tongues, Dominic. *Michael* will have a short discussion with Ziba, Parnach, or one of the War-PCs, getting up to date on the situation as quickly as possible. (This may include temporary granting of the powers of the Vassal of War Distinction!) Then he'll go off to discuss the matter with Lilith and Leshem, over a drink. *David* will, well, stonewall. Eventually, barring great efforts by the PCs, he'll let Lilith take Leshem and Erica; they are, after all, Lilim. (He's mildly approving of the pair; they have faced hardship and have a strong relationship with each other.) *Laurence* will immediately snarl a demand for Lilith to surrender herself, duel honorably, or flee; she'll pick the latter, using Celestial Motion to grab Leshem first. If Erica's not right next to her "Daddy," she'll be left behind, and be vastly upset by this, accusing the angels of scaring off Grandma and Daddy and being meanies. (Laurence will be taken aback by a Lilim who thinks she's human and has human levels of selfishness.) *Dominic* will tell Lilith that she is summoned for trial, which will get roughly the same result as Laurence's ultimatums. He, too, will be nonplussed by Erica.

Manual Dexterity -1, Servitor of War, Stubbornness.

Skills: Acrobatics-14, Acting-10, Axe-15, Broadsword-18, Detect Lies-11, Driving (Car)-15, Fast Draw (Knife, Pistol, Rifle, Sword)-15, Fight Choreography-10, First Aid/TL7-12, Guns (Pistol, Rifle)/TL7-18, Judo-16, Karate-16, Knife-17, Lockpicking/TL7-11*, Mechanic (Small Gadgets)/TL7-11*, Piloting (Hang Glider)/TL7-15, Piloting (Manned Kite)/TL4-17, Riding (Horse)-15, Savoir Faire (Dojo)-14, Spear-15, Staff-13, Stealth-16, Tactics-14, Teaching-12, Throwing-14, Traps/TL7-13.

Songs: Form (Corporeal-12), Healing (Corporeal-11), Light (Corporeal-11), Motion (Ethereal-8), Shields (Celestial-11), Numinous Corpus: Wings-14.

* Reduced Manual Dexterity has been subtracted from these skills

In Nomine Character Sheet

12 Forces, Vassal of War

Corporeal Forces - 5	Strength 10	Agility 10
Ethereal Forces - 3	Intelligence 5	Precision 7
Celestial Forces - 4	Will 8	Perception 8

Vessel: Human/4 (Body Hits: 90)

Role: Zachary Barns, Martial Arts instructor/4, Status/3

Skills: Acrobatics/1 [11], Detect Lies/1 [9], Dodge/2 [12], Driving/1 [8], Emote/1 [9], Fighting/6 [21], Knowledge/3 (Teaching) [8], Large Weapon (Sword/4 [14], Axe/1 [11], Spear/1 [11]), Lockpicking/3 [10], Medicine/2 [9], Move Silently/2 [12], Ranged Weapon (Pistol/1, Rifle/1) [8], Savoir-Faire/4 (Martial Arts) [11], Small Weapon/2 (Knife) [9], Tactics/6 [11], Throwing/1 [11]

Songs: Form (Corporeal/4 [9]), Healing (Corporeal/3 [8]), Light (Corporeal/3 [8]), Motion (Ethereal/2 [5]), Shields (Celestial/5 [9]), Wings/6 [11]

Attunements and Distinctions: Cherub of War, Howl, Vassal of War

When Ziba answered the phone and heard an old Lilim acquaintance, his first plan was to get close enough to separate her head from her body with as little fuss as possible. Then she explained that she needed a child protected, and negotiations went much more peacefully than Ziba had planned.

Now Ziba's working on protecting the "imp," Erica, while trying to convince her that she needs to redeem. As if this approach to demon-management weren't hard enough for an old War-horse like Ziba, Erica doesn't even know she's a demon. It's very perplexing. However, by now he's willing to accept some help -- and if he didn't go looking for it, he's not against the terms of the Geas. (He'll even resist the temptation to smack around Judgmenters and try claiming it was due to being geased -- though he'll think about it.)

He's honestly sorry that he was missed in Heaven, and holding a note of dissonance for not telling anyone where he was (betraying the trust of his Boss and fellow Servitors), but he's also as proud of Erica, the "redeemable imp," as if he'd hatched her himself. When Leshem shows up, he'll defend her -- if only to get her to let him take Erica to a Heaven-Tether for more protection. (Once she's given that permission -- which she quickly will -- he'll focus more on defending Erica, possibly to the extent of attempting to commandeer a car from the demons out front. They'll resist this.)

Since Ziba is a Vassal of War, he is very combat-capable, and is likely to overshadow PCs. The GM can moderate this by keeping him busy defending Erica and possibly Leshem, and by restricting his access to weaponry and/or ammunition. If necessary, a lucky shot to the leg or gut might even cripple him sufficiently to keep him from defending PCs. (Or the Habbalah could afflict him with depression -- his attunement to Erica would keep that defense up, but everything else would be Too Much Trouble.)

LESHEM

Free Lilim

GURPS Character Sheet

ST 17; DX 18; IQ 16; HT 16

Advantages: Band Attunement (Lilim of the War), Combat Reflexes, Essence Control 11, Patron (Lilith), Power Investiture (Corporeal 4, Ethereal 4, Celestial 3), Servitor Attunement (Passage), Vessel (Attractive, Role 4: Artist), Vessel (Beautiful, Zeroed).

Disadvantages: Disfavored (Renegade), Geas (2 years, to Lilith), Geas (various, other Lilim, -5), On the Edge, Reduced Alertness -2, Sense of Duty (Family), Stubbornness, Weak Will.

Skills: Acrobatics-15, Acting-17, Artist-16, Axe/Mace (Club)-16, Climbing-13, Computer Operation/TL7-16, Cooking-12, Detect Lies-14, Driving (Car)-16, Electronics (Security Systems)/TL7-13, Escape-15, Fast Draw (Knife)-18, Fast-Talk-15, First Aid/TL7-15, Guns (Pistol)/TL7-19, History-13, Hobby Skill (d20)-14, Holdout-14, Judo-15, Karate-20, Knife-19, Language: Japanese-14, Lockpicking/TL7-14, Merchant-14, Pickpocket-15, Riding (Horse)-16, Running-13, Savoir-Faire-15, Scrounging-15, Sex Appeal-15, Singing-15, Stealth-19, Streetwise-14.

In Nomine Character Sheet

11 Forces

Corporeal Forces - 4	Strength 8	Agility 8
Ethereal Forces - 4	Intelligence 7	Precision 9
Celestial Forces - 3	Will 6	Perception 6

Vessel: Human Male/1 (Sex Appeal +1, Body Hits 40; currently mortally wounded); Human Female/3 (Charisma +1, Sex Appeal +2, Body Hits 56; currently suffering from a broken leg, treat as a Crippled/4 Discord)

Role: Lee Shen, Artist/4, Status/3

Skills: Acrobatics/1 [9], Artistry/4 (Painting) [10], Computer Operation/2 [9], Detect Lies/2 [8], Dodge/3 [11], Driving/1 [10], Electronics/1 [10], Emote/2 [8], Escape/1 [10], Fast-Talk/2 [8], Fighting/6 [18], Language/1 (Japanese) [8], Large Weapon/1 (Club) [9], Lockpicking/1 [10], Lying/2 [9], Medicine/1 [10], Move Silently/4 [12], Ranged Weapon/1 (Pistol), Running/1 [9], Savoir-Faire/1 [10], Seduction/2 [8], Singing/1 [7], Small Weapon/3 (Knife) [12]

Songs: Affinity (Celestial/3 [6]), Attraction (Ethereal/2 [6]), Form (Ethereal/2 [6]), Healing (Corporeal/1 [5]), Light (Celestial/2 [5]), Shields (Celestial/3 [6]), Tongues (Corporeal/1 [5]), Acid/6 [10], Claws/1 [5]

Attunements: Lilim of the War, Passage (from Theft)

Leshem is an older Lilim, and quite powerful, with many Songs and attunements from Valefor and Baal. (She's unlikely to overshadow the PCs, though, because she's currently wounded and out of Essence.) Leshem "recently" settled down in his Role of Lee Shen Kelley (he took Anna's last name), Japanese-American artist. With mighty Geases to Lilith, he and Anna had a child: Erica.

Unfortunately, Leshem was suspected of treason -- selling Baalite secrets -- and evidence (circumstantial or otherwise) was sufficient that the Game and the War attempted to take him into custody. He dodged them, but they showed up at his house before he did. Anna was killed, and Leshem's male vessel seriously wounded, but he got Erica away and changed into his more powerful female vessel. Then she got in touch with Ziba, and ran off to talk to contacts and find out why the Game and War were after her, and if she could get any allies.

She's found out why they're after her, but wasn't able to find any affordable allies before they caught up with her again, crippling *this* vessel, too. She's not sure how much longer Ziba's going to be willing to babysit, and is on her way back to tell him to get Erica to safety -- even an angel-Tether. (Previously, she hadn't given permission for him to take Erica to one.) Then she's planning to use her last Essence to change to her mortally wounded male vessel and perish, entering Limbo. Leshem hopes that Ziba will send his friends back to ambush any demons lying in wait for her to get

out of Limbo. She is, alas, unarmed -- though she might use the Song of Acid with her last Essence instead, once she sees the PC reinforcements.

The Little Favor that Lilith is going to ask of Leshem involves breaking into a Tether (Leshem doesn't know whose it is, angelic or demonic) and retrieving an artifact sword with a pearl set into the hilt. Considering that Lilith's offered to exchange everything Leshem owes for Erica's creation for this relic, it's important and the Tether's going to be a tough nut to crack.

Leshem cared for Anna, and cares for Erica. Her current state is close to human averages of selfishness and selflessness, though there are a few atrocities in her past. (And she's not inclined to dwell upon those to the extent of repenting.) Her worst sin, though, was being unable to save Anna, and she's been relatively heroic, trying to protect Erica. She's not likely to drive Malakim nuts immediately, till her unwillingness to repent and consider redemption comes up. (She also believes the Hell party line that Lilim fry in Heaven, and will want to protect Erica from *that*, if not from mild "indoctrination in angel-think.")

ERICA

Lilim Child

GURPS Character Sheet

ST 6; DX 7; IQ 8; HT 7

Advantages: Alertness +8, Charisma +1, Essence Control 7, Extra Hit Points +5, Luck, Patron (Leshem; almost all the time), Power Investiture (Corporeal 1, Ethereal 2, Celestial 4), Secret Advantage: Patron (Lilith, very rarely), Strong Will +8, Vessel (Attractive, Role 6: Schoolgirl)

Disadvantages: Curious, Fear of Spiders (mild), Shyness (mild), Stubbornness, Youth (age 8).

Skills: Acting-6, Computer Operation/TL7-8, Bicycling-10, Fast-Talk-6, Games (Cards: Go Fish, Crazy Eights, etc.)-11, History-6, Hobby Skill (d20)-7, Kite Flying-8, Literature-6, Mathematics-6, Musical Composition-7, Musical Instrument (Violin)-8, Musical Notation-8, Needlecraft-6, Poetry-6, Scrounging-8, Singing-6, Stealth-6.

Songs: Light (Ethereal-5), Tongues (Celestial-6)

In Nomine Character Sheet

7 Forces

Corporeal Forces - 1	Strength 2	Agility 2
Ethereal Forces - 2	Intelligence 3	Precision 5
Celestial Forces - 4	Will 8	Perception 8

Vessel: Human/6, Charisma +2 (Body Hits: 14)

Role: Schoolkid/6, Status/1

Skills: Computer Operation/2 [5], Dodge/1 [3], Emote/1 [9], Fast-Talk/1 [9], Move Silently/4 [2], Singing/1 [9]

Songs: Light (Ethereal/2 [4]), Tongues (Celestial/1 [5])

Erica Kelley's origins are shrouded in mystery. Leshem doesn't want to talk about it much, and even Seraphim of Judgment are not likely to get much beyond the shrouding of Lilith's involvement. In essence, Erica is the celestial child of Leshem (as "Lee Shen") and Anna Kelley -- and Leshem believes Anna was human. (Indeed, there was disturbance at Anna's death.) Don't ask if Anna donated a Force to Erica, or darker components, because Leshem won't talk and Erica doesn't know. Erica herself is cute, half-Asian, half-Black, and -- even at only 7 Forces -- all Lilim. She doesn't know anything about Hell, or demons, or angels, save what's in popular culture. She has some rudimentary concept that there's an afterlife, and reincarnation, but calls her Songs "maaaaagic." She knows that mean people killed Mommy and hurt Daddy real bad and Daddy's now a girl, who said that Ziba would protect her. She misses her friends. She doesn't sleep. She displays -- and feels -- real grief about the recent tragedy, but is slightly more distractible than a human child might be, if presented with diversion. Since she's unaware of her Band and hasn't made

any comments about Ziba's needs, he's decided that she's an imp and he's trying to get the concept of "redemption" across despite Erica's ignorance of celestial matters.

(If Erica's life is put into serious danger, she might spontaneously go celestial to escape -- and is much tougher that way! If things go very badly for the PCs and/or Erica, the GM might have her call for her Grandmother, unwittingly Invoking Lilith.)

CABUL

Calabite of Fire

GURPS Character Sheet

ST 18; DX 17; IQ 8; HT 18

Advantages: Alertness +1, Band Attunements (Balseraph and Calabite of Fire), Combat Reflexes, Essence Control 9, Extra Hit Points +3, Power Investiture (Corporeal 4, Ethereal 2, Celestial 3), Strong Will +8, Vessel (Zeroed, Unattractive).

Disadvantages: Discord (Corporeal 4: Total Klutz)*, Servitor of Belial

Skills: Brawling-18, Driving (Car)-15, Guns (Rifle)/TL7-16, Throwing-17.

Songs: Numinous Corpus (Feet-11, Horns-12).

*Cabul has Klutz without the normal DX requirements; it's a Discord

In Nomine Character Sheet

9 Forces

Corporeal Forces - 4	Strength 9	Agility 7
Ethereal Forces - 2	Intelligence 3	Precision 5
Celestial Forces - 3	Will 8	Perception 4

Vessel: Human/3, Charisma -1 (Body Hits: 63)

Skills: Dodge/1 [8], Driving/4 [9], Fighting/3 [16], Ranged Weapon/2 (Rifle) [7], Throwing/4 [11]

Songs: Feet/4 [8], Horns/5 [9]

Discord: Twitchy/4

Attunements: Calabite of Fire, Balseraph of Fire

Cabul is on this mission because he was hanging around in the right place at the right time, and Bizjothjah and Eshek both believe in the theory of "expendable front-line troops." Cabul alternately admires Eshek for his brutality, and sneers at him for his "softness" regarding humans. Cabul himself would cheerfully pull the wings off flies, and otherwise torment other living beings, just to get reactions. He's not up on more subtle torments (Bizjothjah's the one for psychological torture), but vaguely understands that these are potent and would like to learn -- even from an annoyingly snooty Balseraph. He thinks of the lesser Baalites as cowardly and cannon fodder, while he is *obviously* showing them what true warrior spirit is! (In truth, his combat tactics are simplistic: find enemy, shoot rifle at enemy till out of bullets, throw anything available, use resonance on enemy till enemy resists, use Balseraph of Fire attunement to make enemy drop metal things, Sing Horns and Feet, close with enemy and pound enemy into dirt. Find another enemy. Repeat.)

Note that wooden weapons or hafts are immune to the Balseraph of Fire attunement. Note further that Parnach has a certain antipathy toward Calabim of Fire. (This is a way to get Parnach out of the brawl, if he overextends himself in an attack and gets severely injured, or just fixates on fighting with Cabul.)

GETHER

Djinn of the Game

GURPS Character Sheet

ST 16; DX 12; IQ 10; HT 15

Advantages: Alertness +1, Combat Reflexes, Essence Control 9, Power Investiture (Corporeal 3, Ethereal 2, Celestial 4), Servitor of the Game, Strong Will +10, Vessel (Role 6, Enforcer Thug).

Disadvantage: Laziness.

Quirk: Self-Defense Only, Unless Ordered (because he Can't Be Bothered).

Skills: Acting-9, Brawling-14, Detect Lies-10, Driving (Car)-12, Escape-12, Holdout-10, Intimidation-11, Lockpicking/TL7-10, Savoir-Faire (Servant)-10, Shadowing-10, Stealth-12, Tactics-10, Tracking-9, Traps/TL7-8.

Songs: Attraction (Corporeal-6, Ethereal-6, Celestial-8)

In Nomine Character Sheet

9 Forces

Corporeal Forces - 3	Strength 7	Agility 5
Ethereal Forces - 2	Intelligence 4	Precision 4
Celestial Forces - 4	Will 10	Perception 6

Vessel: Human/1 (Body Hits: 28)

Role: "Jeff," Thug Enforcer/6, Status/2

Skills: Detect Lies/2 [8], Dodge/3 [8], Driving/4 [8], Emote/1 [7], Escape/4 [9], Fighting/2 [12], Lockpicking/3 [7], Lying/1 [7], Move Silently/3 [8], Savoir-Faire/3 [7], Tactics/4 [8], Tracking/1 [7]

Songs: Attraction (Corporeal/2 [5], Ethereal/3 [5], Celestial/3 [7])

Attunement: Djinn of the Game

Gether attuned to Leshen during the fight where Leshen's human spouse was killed, and is still a bit battered from being unable to fight back when Leshen reacted violently. (Thus, it took a while for the Game to catch up -- Gether had to recover.) So long as it's only Leshen in danger, Gether's hoping to sit in the car. He'll be last into any brawl, considering it his job to keep Leshen from getting away again. Indeed, he'll quietly drive away if the angels take control of combat dramatically enough.

BIZJOTHJAH

Balseraph of the Game

GURPS Character Sheet

ST 16; DX 12; IQ 17; HT 14

Advantages: Essence Control 11, Extra Hit Points +3, Power Investiture (Corporeal 3, Ethereal 4, Celestial 4), Role 4 (PI), Servitor of the Game, Strong Will +2, Vessel (Handsome).

Disadvantages: Overconfidence, Reduced Alertness -4, Sadism.

Skills: Acting-16, Computer Operation/TL7-16, Criminology/TL7-15, Detect Lies-14, Disguise-15, Driving (Car)-12, Electronics Operation (Security System)/TL7-15, Escape-9, Fast-Talk-15, First Aid/TL7-16, Games (Chess)-16, Guns (Pistol)/TL7-13, Interrogation-15, Musical Instrument (Violin)-14, Psychology-14, Physiology/TL7-13, Research-15, Running-11, Savoir-Faire-16, Sex Appeal-12, Shadowing-16, Singing-13, Stealth-12, Streetwise-15, Tactics-14, Tracking-16, Traps/TL7-15.

Songs: Attraction (Ethereal-13), Harmony (Ethereal-13), Tongues (Corporeal-13), Numinous Corpus: Wings-15

In Nomine Character Sheet

11 Forces

Corporeal Forces - 3	Strength 7	Agility 5
Ethereal Forces - 4	Intelligence 9	Precision 7
Celestial Forces - 4	Will 10	Perception 6

Vessel: Human/1, Sex Appeal +2 (Body Hits: 28)

Role: "Benedict Joseph Jamesson," Private Investigator/4, Status/3

Skills: Computer Operation/1 [10], Detect Lies/1 [7], Dodge/1 [6], Driving/1 [8], Emote/2 [8], Escape/1 [8], Fast-Talk/1 [11], Knowledge/2 (Torture) [11], Lockpicking/1 [8], Medicine/1 [8], Move Silently/2 [7], Ranged Weapon/1 (Pistol) [8], Running/1 [8], Savoir-Faire/1 [10], Seduction/1 [11], Singing/1 [7], Tactics/1 [10], Tracking/3 [9]

Songs: Attraction (Ethereal/1 [5]), Harmony (Ethereal/1 [5]), Tongues (Corporeal/2 [5]), Wings/6 [9]

Attunements: Balseraph of the Game, Dissonance Binding

Known as "Bizzy," behind his back, Bizjothjah is technically in charge of the Asmodean-Baalite mission. Being a Balseraph, it's unclear how much *he* knows about why they're after Leshem, since he'll invent any number of plausible reasons why Baal and Asmodeus want Leshem captured. He has no orders about Erica, but will tie up loose ends by killing her in front of Leshem (if he thinks Erica's human) or capturing her as well (if he realizes she's celestial). All in all, he's a thoroughly sadistic specimen of Balseraph which any Malakite would delight in smiting.

He'll order nearby demons to capture the weakest-looking angel(s) (i.e., one or more of the PCs) so that he can exchange hostages for Leshem and Erica. He'll be happy to torture any hostages in front of Ziba to convince him to relinquish Leshem. (If he gets Leshem, he won't try too hard for Erica, unless he discovers she's not human.)

ESHEK

Calabite of the War

GURPS Character Sheet

ST 18; DX 18; IQ 14; HT 17

Advantages: Artifact (Fiery Sword)*, Essence Control 10, Extra Hit Points +5, Power Investiture (Corporeal 4, Ethereal 3, Celestial 3), Strong Will +2, Vessel (Unattractive).

Disadvantages: Bad Temper (Discord 3), Reduced Alertness -2, Reduced Manual Dexterity -2, Servitor of the War.

Skills: Brawling-18, Broadsword-21, Detect Lies-12, Driving (Car)-16, Fast Draw (Pistol, Sword)-17, Guns (Rifle)/TL7-19, Intimidation-16, Leadership-14, Tactics-14, Throwing-15.

Song: Numinous Corpus: Tail-12

In Nomine Character Sheet

10 Forces

Corporeal Forces - 4	Strength 8	Agility 8
Ethereal Forces - 3	Intelligence 6	Precision 6
Celestial Forces - 3	Will 7	Perception 5

Vessel: Human/4, Charisma -1 (Body Hits: 64)

Skills: Detect Lies/2 [7], Dodge/2 [10], Driving/1 [7], Emote/3 [8], Fighting/2 [14], Large Weapon/6 (Broadsword) [14], Tactics/4 [10], Throwing/1 [9]

Artifact: Fiery Sword/3*

Discord: Angry/3

* Eshek captured it from an angel, and uses it against angels at every opportunity

Eshek was placed under Bizjothjah's command by his immediate superior, and is somewhat grumpy about it -- but obedient. He's the one who killed Leshem's wife, and the only point in his favor is that he did it quickly because he

(unlike Cabul and Bizjothjah) doesn't hold with hostages and torture, thinking them decadent and unbecoming to demons. Further, aside from deeming torture to be beneath him -- "that's for Habbalite morons" -- Eshek fancies himself a "surgical strike" commander, and doesn't like the disturbance associated with damaging and killing humans. He's a violent commander with demons, though, prone to breaking bones for minor disobedience, and all his underlings are afraid of his wrath.

He'll quickly figure out that Ziba is focused on defending the child, and delegate the nearest demon or two to harry Ziba -- but stay out of range -- while Eshek himself heads for the target: Leshem. If Ziba is protecting both, he'll try a forked attack to focus Ziba on the child. (In the "heat of battle," he's likely to over-rule Bizzy in this matter -- though it'll be hard to communicate *his* will in the middle of a brawl.)

ENOCH and GAREB

Habbalah of the War

GURPS Character Sheet

ST 15; DX 12; IQ 10; HT 15

Advantages: Alertness +2, Combat Reflexes, Essence Control 8, Extra Hit Points +5, Power Investiture (Corporeal 3, Ethereal 2, Celestial 3), Strong Will +6, Vessel (Zeroed, Attractive).

Disadvantages: Overconfidence, Reduced Manual Dexterity -1, Servitors of the War.

Skills: Axe/Mace-14, Brawling-15, Climbing-11, Driving (Car)-11, Escape-9, First Aid/TL7-9, Guns (Rifle)/TL7-14, Intimidation-10, Running-13, Sex Appeal*-12, Stealth-11, Tactics-7, Theology-8, Throwing-10.

Songs: Healing (Corporeal-7), Numinous Corpus-10 (Tail for Enoch, Claws for Gareb).

*They are good at dramatic poses which show off their attractive vessels, thus default Sex Appeal

In Nomine Character Sheet

8 Forces

Corporeal Forces - 3	Strength 7	Agility 5
Ethereal Forces - 2	Intelligence 4	Precision 4
Celestial Forces - 3	Will 7	Perception 5

Vessel: Human/2, Sex Appeal +1 (Body Hits: 35)

Skills: Climbing/2 [7], Dodge/2 [7], Driving/1 [5], Escape/1 [6], Fighting/4 [14], Large Weapon/3 (Club) [10], Medicine/1 [5], Move Silently/2 [7], Ranged Weapon/3 (Rifle) [7], Running/1 [8], Tactics/1 [5], Throwing/2 [7]

Songs: Healing/2 [5], Numinous Corpus/4 [7] (Enoch has Tail; Gareb has Claws)

Enoch and Gareb are essentially Eshek's second in commands -- if only because they're able to beat up the Impudites and Leshan killed his previous one (a Balseraph) during the first attack. Somewhat surprisingly for Habbalah, they have matching explanations for why they're "angels doing God's work in Hell" and nominally working for Baal. (They're there to prove to demons that angels are better, so that Heaven will win Armageddon; they fight against "Heaven's wimps" to strengthen Heaven.) As the closest things to "friends" that Punishers have, they'll cooperate surprisingly well with each other, and even help each other out if they get ganged up on. ("Honestly overpowered" isn't "weak.") They're a bit overconfident, sure that they're the equal of "wimpy" Heavenly angels, but due to their delusion, they won't *soul*-kill a worthy angelic opponent (i.e., one who fights back), even if they get a chance in celestial combat, unless it's entirely self-defense. (Worthy ones should be vessel-killed and sent back to Heaven to train, you see . . .) They look down on the other demons, but respect the stronger ones' ability to pound on them, and don't intend to "break cover" by revealing they're *really* on Heaven's side in the end.

CHIDON, GAAL, and ELAM

Impudites of the War

GURPS Character Sheet

ST 14; DX 14; IQ 8; HT 14

Advantages: Combat Reflexes, Essence Control (7 Essence), Extra Hit Points +4, Power Investiture (Corporeal 3, Ethereal 2, Celestial 2), Strong Will +4, Vessel (Zeroed).

Disadvantage: Servitors of Baal.

Skills: Brawling-16, Guns (Rifle)/TL7-16, Running-11, Scrounging-7, Stealth-15, and one of Axe-15 or Shortsword-15.*

Songs: Form (Corporeal-7, Ethereal-6).

(Gaal uses Axe for his hatchet; Chidon uses Shortsword for his baseball bat.)

In Nomine Character Sheet

7 Forces

Corporeal Forces - 3	Strength 6	Agility 6
Ethereal Forces - 2	Intelligence 3	Precision 5
Celestial Forces - 2	Will 5	Perception 3

Vessel: Human/2 (Body Hits: 30)

Role: none

Skills: Dodge/3 [9], Fighting/3 [12], Small Weapon/3* [8], Move Silently/1 [7], Ranged Weapon/3 (Rifle) [7], Running/1 [7]

Songs: Form (Corporeal/4 [7], Ethereal/4 [6])

* Chidon uses a baseball bat (club); Gaal has a hatchet; Elam actually has a shortsword, and is envied by his fellows.

Chidon, Gaal, and Elam are a matched trio of junior Baalites. They get ordered around by everyone, yelled at because they're so bad at sucking Essence (to give to their superiors), beaten up in the guise of training, and generally have bad attitudes. They're afraid of Cabul, Eshek and the Habbalah, and are wary of the Gamesters. If any of them get an Excellent reaction/positive reaction roll with a check digit of 6, there is a chance they'll be so impressed by angelic teamwork that they'd be interested in defecting from Hell. Whether they're actual redemption potential, though, is problematic.

Being a Pirate Means Never Needing To Say You're Sorrrrrrrrr-y

Why do we like evil-doers, while at the same time finding evil distasteful?

I've been struggling with this recently because of today (Friday the 19th), which is the second annual "Talk Like a Pirate" day, as reported in [Daily Illuminators](#) everywhere. This, too, follows closely on the continued success of the *Pirates of the Caribbean* motion picture, itself based on a family-oriented ride that extols the virtues of being a pirate.

Mull that over for a minute. For those who know their history, pirates are generally not considered terribly savory; pillaging, plundering, looting, and burning are generally activities we try to ensure our kids *avoid*, yet most of us wouldn't bat an eye if our youngster wanted to dress up like a pirate for Halloween.

Likewise, having returned from Dragon*Con a few weeks ago, I note that there are an *awful* lot of folks dressing up like Darth Vaders, Boba Fetts, Stormtroopers, orcs, vampires, Borg, and insurance salesmen (although the latter may have been the result of an ill-timed concurrent convention).

In contrast, I'm pretty sure I've never seen someone dressed for fun as, say, an Aztec priest, a Nazi, a terrorist, a child molester, or anything like that.

And in thinking it over, I've come to the conclusion that people like the idea of "evil-doers" that don't actually do any evil.

Consider most of your *Star Wars* antagonists; outside of opposing the actions of the protagonists, they actually don't do much that's actually *evil* . . . certainly not on-camera. Darth Vader struts around, killing henchmen (who are, presumably, evil themselves), flies his cool advanced Imperial spaceship that *wasn't* made of papier-mâché, and acts directly against the Good Guys, which makes him by definition the Bad Guy. Boba Fett mutters something about Han Solo being no use to him dead, stands around, and eventually trips and falls into the Sarlacc Pit. And the poor Stormtroopers . . . well, they're generally no more menacing than your typical office temp.

Now, obviously a moment's thought shows this isn't the case; the countless worlds of the Empire didn't join because the Stormtroopers brought punch and pie. One does not become a bounty hunter like Boba Fett without . . . well, killing people for money. And Darth Vader, even if he wasn't directly responsible for the Death Star, certainly had culpability with its construction and deployment on Alderaan.

Which brings us back to pirates. My weathered Webster's Ninth New Collegiate Dictionary has a definition of "piracy" as "robbery on the high seas." Robbery is, of course, taking someone else's stuff through violence or threat of violence. Beyond the plundering, I understand that rape played an important part in many pirates' lives as well, and there was often a fair bit of incidental murder involved. Despite this, dressing up and pretending you're a pirate holds a much broader appeal than pretending you're a robber, rapist, or murderer.

Why is this, and what on Gaia's green earth does it have to do with gaming?

I suspect it's because there is an appeal to being a badass, not because of anything you've done, but because of some inherent quality that *makes* you a badass. This reaffirming loop enables you to think of yourself as bad, without doing anything evil. In fact, you can even pretend that you *aren't* evil; after all, other pirates may violate and murder, but not me. I just wear a cool hat and get to sail the high seas. Oh, and I'm bad.

In the gaming world, I've noticed a similar trend; people like to play characters that are bad, without actually *doing* anything wrong. For example, in *Vampire* LARPs I usually try to drive home what being a vampire means by trying to work with the player how they feed on human blood (which is a pretty big part of the whole vampire experience). Almost invariably, the players who are playing the most immoral, sinister characters are the ones who don't like

roleplaying what they're doing:

"I kill homeless people and drink their blood. If anyone sees me, I kill 'em."

"Okay; how do you find them? What do you do with the bodies? What if one starts screaming? How do you handle it if more than one person sees you and they run in different directions?"

"Uhhhh . . . I don't know. I just deal with it."

Now, if I insinuate that the players may not want to play such antisocial characters, they bluster and demand to be able to do so. And several of these same players were unable to handle it when I was graphic about their actions and consequences when they tried carrying out evil acts in the game.

Of course, I'm certain there are a bunch of players out there that do revel in being utter fiends. But I have a more grandiose theory as to why many people embrace playing "bad" characters, while at the same time finding being "bad" distasteful.

Because being "bad," by definition, obviates one from the obligations of being "good."

Consider that being bad is not a full-time calling; no one would ever say something like, "What's up with Vader? He didn't pimp-slap that Imperial technician for no good reason! Are you *sure* he's evil?" No, if you're bad, you can pretty much act however you'd like.

Being good, on the other hand, is a full-time mission; society just won't buy it if Luke Skywalker got liquored up and lopped off someone's arms for snoring too loud, and still claim to be "good."

But, paradoxically, you can be "evil" and *still do good*. In fact, a nigh-infinite number of stories have been written about characters defined as evil that have listened to their conscience, or done something that was good (or seemed to be good). Even discounting the power of the redemption story - a literary staple from Biblical tales all the way up to *VH-1's Behind the Music* - it's usually trivial to wave away any seemingly good acts as being selfish: "I saved that whelp from the slavers because she was making too much noise with her screams." It's much more difficult to justify a seemingly selfish act as serving good: "If I hadn'ta lopped off his arms, they prolly woulda fallen off eventually anyway <blaaarrgh> . . ." (In ***Dungeons & Dragons*** terms, I suspect most GMs would call for immediate alignment loss if a Lawful Good character burned down a village for fun, but I doubt they would call for the same alignment loss if a Chaotic Evil character saved someone from a burning village for no good reason.)

Which brings us back to pirates. By embracing the mindset of a pirate, I suspect that many of us like the freedom that entails, while finding the evil distasteful. And while it's trivial to envision a pirate who is noble and just - or could *become* noble and just some day - it's much more difficult to embrace that possibility with, say, terrorists, Aztec priests, or child molesters.

So to tie it all to gaming, I'd point out that in a game that presents characters with amoral or immoral choices, it's imperative for everyone to be on the same page in terms of how they are going to deal with that . . . *or* to agree that certain thresholds won't be crossed. It's entirely possible to play a reticent vampire who has so lost touch with humanity that he thinks nothing about slaughtering innocents, without the game descending into an hourly gorefest; simply agree that the camera fades to black when those actions take place. (I'm personally uncomfortable with that style of GMing, but I recognize it as a valid option.) Likewise it's possible to play a game - like, say, a *Star Wars* Dark Side game - where everyone is "bad," without anyone ever doing anything particularly bad (outside of attacking Good Guys, that is). It's even possible to dispense with those designations altogether, and simply have characters act however they want; good and evil is not an absolute, and characters muddle through their lives however they can.

Regardless, know what is acceptable and expected of the players before hand, and what will be shown and discussed. This will keep those awkward moments where one party envisioned "bad" to mean "graphic destroyer of lives," while another was more looking forward to being "a trash-talking pirate."

A pirate who, no doubt, would eagerly look forward to the annual "Talk Like an Insurance Salesmen" day.

Pyramid Review

The Dice of Wrath (A Knights of the Dinner Table Dice Game)

Published by [Flying Buffalo, Inc.](#)

Designed by Rick Loomis

Five Dice, pad of 40 score sheets, rule sheet; \$14.95

Dice are available singly for \$2.00 apiece

They've been comic book characters, as have their alter egos. They've been figurines, card games, and battle books, and their favored RPG system has gone from fictional to Game of the Year. That leaves clicky bases and dice, and Flying Buffalo, Inc. has the dice thing covered now that the *Knights of the Dinner Table* are featured on ***The Dice of Wrath***.

Jolly Blackburn's popular gamers' comic strip about the misadventures of B.A. and his motley cast of roleplayers pokes fun at the gaming hobby. In this tabletop incarnation, their in-game alter egos -- the Untouchable Trio plus One -- have finished another dungeon crawl, and the time has come for the group to divvy up the loot. Players (three to five of them) take on the role of one of the strip's characters: B.A. the GM, his cousin Sara, bloodthirsty Bob, dizzy Dave, or rules lawyer Brian. There are 11 items up for grabs, each worth a certain number of points.

The game provides a pad of 40 score sheets, which list the characters, the treasures, and the point values. Everyone gets a copy of the sheet. There are five six-sided dice, each with pictures of the five personalities on the die faces; the sixth side is the wild Hoody-Hoo side. If that comes up, it counts as any character you want it to.

On his turn a player rolls these dice, and ideally his character's picture comes up on a lot of them. If not, the player may pick up any unsatisfactory die results and reroll them, and do it once more after that. Those are the results he's stuck with. The record sheets show six boxes next to each of the 11 items, and each die result must be placed into one of those boxes.

If your die rolls don't net you a lot of your own character, all is not lost. Since who gets what at the end of the game depends on how everyone voted, smart players will make a deal with another player -- vote for them to get an item they'll like and ask that they do the same for you. If that person won't cut the deal you want, you can put your votes in a box next to a less valuable item -- or one that takes away points.

Some items are generic things like the Ring of Invisibility, worth points to anyone. Others are more valuable to certain characters -- if you're playing Brian, you would love to have the Ring of Fireballs, while Bob's player scores more points if he gains the Crossbow of Slaying. Still other artifacts depend on another item -- the Crossbow Bolts are worth points to anyone who ends up with the Crossbow of Slaying, but the bolts lose you points if you don't have the weapon, too -- strive to get those bolts at your peril, especially since Bob will be fighting you tooth and nail for both of them. Cursed items can lower your score, and there are a couple more curveball devices that can randomly change your point totals or alter your die rolling.

All but the last round of play is done openly -- your votes and any deals you want to make must be done publicly. When everyone's had three goes with the dice (yes, that's three rounds of three dice throws each), everyone adds up what they have in the boxes next to each item. Whoever got the most votes (no matter who cast them) gets the item (B.A. gets all tied-score artifacts). Add up the point values of these items to determine the winner.

The game is a portable item, good for pulling out most anywhere. The pictures (Urbanic renditions of the Knights,

apparently, whose version of the Knights is still as good as anyone's) are melded into the dice, so it doesn't look like they'll wear off any time soon. They range from face shots to full body poses, but in spite of the small size they're still nice. They also serve as regular dice. The score sheets make a good graphic presentation, though at least one of them ought to be saved for photocopying later.

What looks (and plays) like a simple variation on **Yahtzee** is actually a carefully interwoven series of counterbalancing tactics. Pushing here may mean something pulling loose there, and if you don't make and stick to a plan of attack you'd better be a good negotiator. The market has a lot of games that play fast these days, but that holds doubly true for **The Dice of Wrath**. With rules that are easy to absorb and play time as short as five minutes, it's a small miracle Flying Buffalo managed to jam as much strategy and player interaction into such a compact package.

--Andy Vetromile

The First Room

by Stephen McKenzie

Terror! Suspense! And a darn good reason to be as quiet as you can! Its all here in this Adventure Pizza, designed for characters as fresh and tasty as possible.

Ingredients: A Recipe for Suspense

1) Journey to Stonestrow Canyon

In the upper reaches of a remote mountain range are a series of limestone caves in ravine, known to the residents of the lowland valleys as Stonestrow Canyon. The canyon is five days travel by horse from the nearest settlement, and a full two weeks from any sizeable town. Giants once lived here, long ago, but the most recent residents were a band of renegade human clerics, members of an evil sect banned in the main cities of the realm. It was to these remote caves that they fled, 100 years ago, looking for a secret place to perform their despicable rites of blood sacrifice. Using the caves as a base, they raided the lower valleys looking for sacrifices. For 15 years they terrorized the countryside, until finally, the king's men located the secret cave base and killed every member of the cult they could find. Stonestrow Canyon was searched and cleansed, and then abandoned. No one has set foot in the area since.

A recent discovery has revealed that an important wizard named Fullbright may have been one of the sect's last victims. Fullbright disappeared about one year before the evil sect was flushed out (in other words, 86 years ago). He went missing while on a mission to hide an artifact of great value, in the most remote location he could find. Members of another magic sect, enemies of Fullbright's order, were trying to steal this item and it was considered too risky to hold on to it. Because his mission was a secret, no one except the head of the order (whose name was Burwick) knew where Fullbright was going. Burwick was killed in a battle with the enemy sect before he could tell anyone where Fullbright was planning to hide the artifact. (It does not mater what the artifact is. Use any one from your campaign).

The recent interest in Fullbright's fate has come about because of the exhumation of Burwick's body by some enterprising clerics who are allied with his order. When they realized that the danger from the rival sect was over, they used divination magic in order to speak with Burwick beyond the grave, and have found out the area that Fullbright was intending to hide the artifact: in the mountain wilderness near Stonestrow Canyon. The clerics quickly put two and two together and realize why Fullbright never came back. He was captured by the evil priests, and was probably made a sacrifice! A further search of Stonestrow Canyon is now desired, to locate Fullbright's body, speak with his spirit about the location of the artifact and recover it. It's a long shot, but it just might work.

There are a number of options for involving the PCs. It does not matter what the artifact is, what kind of order the wizards belong to, what the enemy magic sect was like, or why they ceased to be a threat. The most important ingredient is that a low-level party undertakes the quest for Fullbright's body. Additionally, one member of the party must have some mechanism that enables them to speak with dead people (noting that this must be done more than once).

Once you have provided your party with the background, start the action with the party entering a large limestone cave (the first in the system) and prepare to perform an extensive search. But the very first thing they see inside is the body of an enormous dragon asleep on the floor, in the middle of the chamber . . .

2) The Sleeping Dragon

Here are some sample lines to introduce the dragon to your players, in rough chronological order:

"You clamber down the slope on to the cave floor. It's a pretty large cave, you can't see the

other end and you can't see the ceiling. But you can hear a low, regular rumbling sound coming from somewhere deeper into the cave in front of you . . ."

"Now that you mention it, a very large creature breathing is exactly what it sounds like . . ."

"Now you've moved a bit closer, your torchlight shines off the part of the creature closest to you. Whatever it is, it's huge, and its covered in scales like a lizard . . ."

"No, it still hasn't moved, and its breathing is still the same . . ."

"Yes, it probably is asleep. Just as well, otherwise you'd all be dead by now."

"Yes, that's right; there's a huge dragon in the first room of the dungeon. So what are you gong to do about it?"

The dragon, whose name is Kos, reached maturity about 400 years ago and for a long time ruled over a wide swathe of the northern mountains that are his ancestral home. Other dragons in the area did his bidding or stayed out of his way, and the local inhabitants were suitably terrified of him, and paid whatever homage he required. For a while, everything was rosy. However, Kos is one of particular family of dragons (the Rodosi dragons) that are badly affected by senility. Once such a dragon reaches a particular age, his mind starts to go, and in most cases he is ejected from power by younger dragons. And that is what happened to Kos 50 years ago, when his younger brother Amorgos threw him out of his caves in the north and banished him from the kingdom.

Kos traveled south, looking for refuge. His magic abilities were now beyond him, having escaped his crumbling memory, and a deep depression came over him. He did not seek a new place to establish dominion over humans or other dragons. Instead, he sought a place far from anywhere, where he could hunt wild game and sleep out the rest of his days. And the main cave in Stonestrow Canyon was the best place he could find.

Kos can get in and out of the main cavern by two entrances (a third is too narrow for him). He cannot access any of the smaller caves that lie below the first chamber, and nor does he wish to (see section 3 and 4, below). He spends nearly all of his time asleep on the floor of the main cave, and wakes up about once every eight weeks to go hunting. His hunts last for several days, during which he dines on the wild goats and sheep that are plentiful on the mountainsides. Then he returns to his slumber. Such is the life of the ancient and senile dragon.

The players, of course, know none of this. All they know is that a large and powerful dragon is in the first room of the cave complex, and that the rest of the adventure will have to involve tiptoeing around his sleeping form. They do not know when he will wake up, how powerful he is, whether he has any treasure (which he does not) or if there are any other dragons in the area. Play on this fear, curiosity and doubt as much as possible. It does not matter what kind of dragon the GM chooses. Sketch out the basic statistics for a large powerful dragon with no spell-casting ability, and add in additional details according to what kind of dragon he is. If you decide that Kos is a normal fire-breathing dragon, you might want to describe the stench of sulfur and the blackened marks around the main cave, and so on.

Ideally, this is one of the heroes' first adventures, and they are hoping for a nice easy job to cut their teeth on. The presence of the dragon will terrify them, but he is not intended to be an actual monster to be faced during the adventure. If combat with him occurs, the PCs will be lucky to manage an escape, and will surely die if they try to confront him. Instead, Kos' function in the plot will be similar to an invisible timer for a very large bomb. The players never know when he might wake up, or what might awaken him, and every moment in the caves beneath his lair will be spent with half an ear out for his movements above.

Assume that Kos has only just begun one of his eight-week naps when he is discovered. In normal circumstances, Kos would sleep soundly for this period and would only have a small chance of awakening beforehand. However, his keen senses are still functioning in his sleep (even despite his senile condition), and noise, light or smells nearby will cumulatively increase his chance of waking up, as his subconscious slowly pieces together the fact that someone is in his cave. Work out Kos's normal awakening date, eight weeks from the day he is discovered. Then, begin with a very low chance (1%) that Kos will awaken prior to that date, of his own accord, on any given day. This roll can be made at

the start of each day, and should not increase cumulatively per day. Add 1% on to the chance every time an event occurs that might disturb him, such as:

- A loud noise occurs in the caves below
- Someone makes noise of any velocity in the main cave
- Someone carries a light within range of his head
- Someone carries a lit torch, food items, or anything else with a noticeable smell within 60 feet of him (this includes characters who have not washed themselves in the last two days, or washed their clothes in the last four days).

Roll to see if Kos wakes up when the disturbance occurs, as well as rolling against the newly adjusted total at the beginning of each day from then on. Particularly loud noises, or bright lights very close by him, should add +2 to the chance instead of +1. Once a modifier has been added onto the daily total, it cannot be removed, so that Kos will be increasingly likely to wake up as adventuring occurs in the cave nearby him. In any case, he will always awaken after eight weeks, so there is a definite limit on the time the party has to complete the rest of the scenario.

The players should see the GM making rolls every time the explorers go anywhere near Kos, and they will quickly get the idea that this will increase the likelihood of waking him up. The party should need no encouragement to use the "sneaking" game rules to their fullest potential. However, the GM shouldn't tell them too much about exactly what will trigger the dragon's senses. Most players will quickly realize that light and noise are to be avoided, but the GM might want to reward the player who realizes that taking a regular dip in the nearby stream is a good idea, while carrying that salted lamb under the dragon's nose is not.

3) The Main Cave

As you may have guessed, all movement in and out of the cave system must be done by going past the dragon. Sketch out a basic limestone cave system according to the following specifications:

The main cave is essentially a tube, 400 feet in length and about 80 feet wide in most places. There are three entrances from outside. The first two are holes at either end. One of these is an old river course, and a landslide caused the other one. Both main entrances are about 40 feet by 40 feet and both allow easy access to the floor of the cave. Kos can fit through both of them. The third entrance is a five-foot by five-foot hole in the ceiling immediately above where Kos sleeps, 80 feet in the air. His breath weapon is effective through this hole.

The ceiling is about 80 feet high on average (out of sight in most places). There is a noticeable depression (15 foot deep, 5-10 feet wide) running through the room where a river used to flow, but other than that the floor is generally even (with five-foot irregularities here and there, but no ravines or major slopes). The giants cleared obstructions and leveled parts of the floor to make access easier. In addition, Kos has barged flowstone and other formations out of the way in order to clear even more access, so limestone debris litters the floor. Bats, insects, lizards and other small creatures live in the cave, and there are tree roots dangling down from the ceiling.

The main cave was the area in which the giants lived, many hundreds of years ago. They did not penetrate to the lower levels, which are not on a gigantic scale. Remains of gigantic habitation found in the main cave can include:

- Huge statues (free carved), or 'Rushmore-style' heads in the cave wall (10-15 feet high).
- A huge stone slab acting as a bridge over the river depression
- A large pile of sharpened boulders (ammunition).
- A huge cooking fire surrounded by boulders, with whole dead trees nearby.
- Several giant skeletons (limed over and imbedded in the river depression).
- Piles of moldering furs and skins in various locations

Allow the gigantic remains to act as a distraction, encouraging the PCs to loiter in the main cave for longer than they should.

4) The Lower Levels

Use the following outline when designing the lower cave areas.

There are (at least) three lower areas. Position the entranceways to these lower areas according to how close you want the party to get to the dragon. In the most obvious scenario, the entrance leading to the area containing Fullbright's body is about 20 feet from Kos's head.

The lower levels are a combination of natural caves, together with small rooms and connecting passageways dug by the clerical sect. Access from the main cave is by quite narrow cave tunnels, which have been altered or extended by the clerical sect to allow for human movement. These are a sloping tunnel, a rough-hewn staircase, and a sinkhole where the river once descended. In the case of the sinkhole, the ladder used by the clerics is now gone and the party must climb down into the lower area.

The lower levels are only accessible from the main cave. The GM should think carefully before placing any secret entrances leading from the lower levels to the outside; any that might exist should be difficult to find or hard to access (a lengthy underwater swim might be in order). Further, each of the lower levels has only one entrance from the main cave, and they are not connected to each other. This will mean that the party is obliged to travel back and forth through the main cave in order to explore the dungeon.

The lower levels were the main areas in which the clerical sect lived. The clerics moved through the main cave in an unobtrusive fashion, and made secret entrances to hide the passageways down to the lower levels (so that anyone searching the main cave would not realize they were living down below). These doors were discovered when the place was raided 85 years ago. Remember that the sect had only been present for 15 years, so all their building accomplishments must have been feasible in that time span. There will be nothing of any value in the lower levels; it was all taken during the raid. Materials prone to decomposition (paper, bone, wood, cloth, etc.) will be in poor condition after 85 years but still essentially intact.

Give each one of the lower levels a particular function in the daily lives of the clerical sect and design them accordingly. Some suggestions for the three main lower areas are:

- **Area 1:** Sleeping and eating areas, a refuse pit, a cooking area (possibly underneath the sink hole or another entrance).
- **Area 2:** A military area, training area, weapons store, prison, and the chambers of some important clerics.
- **Area 3:** Religious area, temple, graveyard.

The important thing is that Fullbright's body could be in any of these lower areas. He could be one of the skeletons chained up and left to die in the prison. Or he could have been one of the bodies that were dumped unceremoniously into the garbage pit. Finally, perhaps he was buried in the pit grave in the temple graveyard. It doesn't matter which one you choose, so long as there are skeletons present in each of the lower sections, prompting the PCs to stop and search for Fullbright's body in a number of places.

Cooking Tips (with Extra Spice)

1) Finding Fullbright's Body

The GM might decide to give Fullbright's body an identifying feature (such as a helmet, or a weapon) so that it might be easier to trace him. Otherwise, the party will need to talk to a range of dead people until they find the body they are looking for. The GM should take on the personas of some of the following as the party begins talking to corpses:

- Another captive, who was sacrificed by the clerics years before and knows that sacrifices were performed in the temple (near the graveyard).
- A slave of the clerical sect, who knows that captives who were not sacrificed were simply thrown into the

- garbage pit (especially if they had been wounded in combat and were unworthy sacrifices).
- One of the clerics, who will lie to the PCs about where the body was buried.
- A young child, who died of an illness that apparently killed many people in the caves (the child does not know what year she died).
- One of the king's soldiers, who can remember the battle.
- Another cleric who tells the party (truthfully) that Fullbright was captured and interrogated in the prisons because he was thought to be a spy. The cleric does not know his eventual fate.

Once Fullbright's body is finally uncovered, he will immediately tell the party of his fate, as well as the location of the artifact (if they mention that the danger of it being stolen has passed). In the easiest case, Fullbright is still carrying the artifact (perhaps he swallowed it shortly before capture). GMs with a sadistic sense of humor might decide that it is actually back in the city the party came from, having been taken from Fullbright by the clerics and then captured by the king's soldiers, who did not know what it was. The most obvious answer is that he hid it somewhere in the mountains shortly before he was captured.

Extra Spice

- The party speaks to a particularly powerful cleric who curses them from beyond the grave.
- Fullbright buried the artifact in the main cave, near or under the dragon's resting place (and the clerics discovered him doing so). The PCs will have to lure the dragon out so they can get to it.
- The dragon wakes up shortly after the PCs find out where the artifact is buried. They must be alert to his presence in the skies as they dig it up.

2) Monsters, Traps and Treasure

Fitting other monsters into this scenario isn't difficult, provided they are not sentient, and would not smell like food to the dragon. If you decide that one of the lower areas has a river or other moisture in it, populate it with creatures made of slime or fungus. Giant spiders or other insects will also work well, as will any non-sentient creature that hides among rocks and normally preys on bats or other small cave creatures. Minor undead may also populate the graveyard area. Any traps made by the clerics would have been found and deactivated when the place was raided; likewise, all normal treasure would have been found.

Extra Spice

- Use any pain resistance, shock, or willpower rules in your game to see if the players can undergo the ordeal of combat while remaining quiet. A shout of horror as a slime monster falls from above will add +1 onto Kos's chances of awakening, and prompt a "wake up" roll.
- Add in a lower level that was not discovered in the raid (with the secret door from the main cave still intact). Now you can add in traps, guardian monsters such as golems, and some of the cleric's treasure. Be sure to put Fullbright's body (and perhaps the artifact) in here. Also be sure to make traps and monsters in this level as noisy as possible.
- In their final days the clerical sect attempted to dig a tunnel between two of the underground levels, thereby removing the need to visit the main cave. This tunnel might be completed by the PCs -- but is always at risk of collapsing, stranding them in one of the lower areas and leaving them with a lot of quite noisy digging to do.

3) When the Dragon Wakes

It would almost be anticlimactic not to have Kos regain consciousness by the end of the scenario. However, a successful awakening roll need not spell instant death for the party. Kos will be slow to wake up properly (about a minute before he will begin to move around in the cave), and this will give characters that are in the main cave enough time to flee from the immediate range of his breath weapon. Movement or even a change in his breathing will be immediately noticeable to all those in the main cave, and his movements will be heard by those in the lower levels who successfully manage to listen. If the heroes have any sense, they will keep an ear out for his movements at all times,

especially if they have made any noise below.

A likely occurrence is that the party becomes trapped in one of the lower levels. Kos will attempt to breathe down the tunnels leading into the lower area that the players are in, and any caught in the area of effect will suffer the consequences. The party may need to survive down there for several days, sending up scouts to see what the dragon's movements are, and trying to judge the best moment to flee.

Another likely occurrence is that the dragon will end up chasing the party through the mountains after they have fled from his cave. In this situation, Kos will forget that the PCs are human and think he is hunting them as though they were sheep or goats. Despite his senility, he is a keen hunter and knows the mountains well. He will attempt to skewer the PCs on his claws after diving out of the air, and can also use his breath weapon to burn out areas where the PCs may be hiding, but he will try to avoid incinerating or otherwise totally disintegrating them, as that would ruin the taste.

Extra Spice

- Rather than waking up, the dragon dies (of old age). It may take the players some while to realize that he is dead. His hide alone will be worth a small fortune. Clever characters may want to increase their prestige by plunging a sword into him and then claiming that his death was their handiwork.
- The dragon has lost his nerve in his old age. He wakes up and decides to flee rather than risking combat with the party (wrongly assuming that they must be extremely powerful).
- It turns out that Kos does have treasure, but such a pitiful amount that he completely obscures it when he's lying on top of it. Allow the PCs a glimpse of the traditional pile of coins with magic weapons jutting out here and there, and they might be back, trying to figure out ways to lure him out of the cave.

Side Salad: Information on Kos the Dragon and his Kin

1) Killing or Trapping the Dragon

The opportunity to kill or capture a large and ancient dragon will prove too tempting for some players, and the focus will shift from finding the artifact onto the dragon himself. However, killing or subduing Kos will be almost impossible unless the attack is carefully planned out. The GM may need to work with the PCs to make sure that their plan of attack is not a suicide mission. Here are two feasible ways of bringing the dragon down:

- **Poison.** Kos may be tricked into digesting large doses of lethal poison, if these are placed in sealed capsules and pout in or on the body of a sheep, which is left near the cave. The players will need to know that Kos eats sheep before attempting this. There may also be some doubt as to whether he would eat a dead one (in fact, he would). Other attempts to poison the dragon (such as firing poisoned arrows at him while he sleeps) will probably be less successful.
- **Landslides.** A bit of digging and some carefully placed explosives will cause landslides sufficient to block both of the cave entrances. This will require the input of a character with a considerable knowledge of geology, mining and explosives (who might be hired from the township). Of course, the party does not know that Kos has no spells with which to extract himself.

2) Dragon Lore

The players may want answers to any of the following questions, and probably more besides: How long is he likely to remain asleep? What is his breath weapon going to be like? Why does he have no treasure? Why hasn't he terrorized the area? How long has he been here? Does anyone else know he is here? What kind of dragon is he? Are there likely to be other dragons in the area? And so on.

The GM should decide on the standard lore relating to dragons, which adventurers in your campaign might know. It is

suggested that the following pieces of information are not common knowledge:

- "Rodosi" dragons are prone to senility.
- "Rodosi" dragons have a political structure based on families, in which the old are usually ostracized due to senility.

Clever and curious PCs will want to know something more about dragons than common knowledge allows, and may visit a library or seek the aid of a sage in the town. Here, it will be possible to find out about the nature of Rodosi dragons. It will also be discovered there that Kos is certainly not part of local lore (no one had any idea he was there). Information may also come out about the sleeping and eating habits of Rodosi dragons, although that information will come from a sage and be quite hard to acquire.

3) Proving It

Initially, it may be difficult to convince the townsfolk that the dragon is real and that the party are not simply trying to attract attention to themselves. The local magic order that the party works for may wish to send a more high-powered NPC back with the character to verify that the dragon is real, and help the party find the artifact. But a really spicy addition to the scenario might be if the party is equipped with an imaging device of some sort (a magical camera, or possibly even a device that makes moving images) so that they can get footage of the mighty beast and prove that their tale is true. "Pose for the trophy shot, guys, and then run like hell . . ."

Deacon Paul

Bioroid Rights Activist for *Transhuman Space*

by Royce Easton Day

Background

"Deacon Paul" (as he's popularly known) was born Paul Isiah Richards in his parents farmhouse outside of Macon, Georgia, July 4th, 1890. The first fifteen years of his life were bitter ones. His family were poor African-American sharecroppers, and they lived in the mocking shadow of segregation that was the Deep South in the period between the Civil War and the 1960s. Young Paul saw little difference between his family's life then and the tales of growing up a slave that his grandmother told him.

His grandmother died when he was ten, and five years later his family finally managed to save up enough money to move north to New York City, where they found freedom and acceptance in the thriving culture of Harlem. There Paul applied himself to his studies with vigor, determined to learn enough to support his family and never find himself again at the mercy of white plantation owners. He graduated with honors and a degree in chemistry from Howard University in 1922.

By the 1950s Paul was the head of his own company, a chemical firm making a tidy profit selling fertilizer nationwide (the irony of possibly taking money from the same white farmers who had oppressed his family wasn't lost on him.) He was an active member of his church, and with his commanding voice and natural charisma he quickly became a leading deacon. In the 1960s he was a local leader in New York's civil rights movement, fighting the hard fight against racial inequality that, while not as blatant as in the South, was as deeply entrenched.

Deacon Paul died in 1980, 90 years to the day after he was born. In his will he ordered his body be cryogenically frozen, and a trust fund set up to revive him whenever it was technologically possible. As he put it, "I have helped create a bright future for my children, and their grandchildren. I wish to see what they will accomplish in it." In 2095, after several decades of internal wrangling, the law firm overseeing Deacon Paul's trust fund ordered that his brain be scanned in order to create a ghost emulation, and the ghost be transferred to a bioshell based off of his DNA.

After his successful awakening and several months of therapy to deal with the typical amnesia from creating a ghost from a cryogenic patient, Deacon Paul began a closer examination of the United States of 2095, eager to see a world where the color of one's skin no longer mattered.

What he found horrified him. The status of bioroids in the United States, born to their jobs and programmed to look towards no farther horizon than their duties, struck at the center of Deacon Paul's soul. As he put it, "In my grandmother's day, at least a slave could *dream* of escaping their fate. Thanks to memetic programming, even that is beyond most of these children of technology."

Today Deacon Paul is one of the leading activists for bioroid rights in the United States. He has parlayed his initial status as one of the "Five Oldest Living Memories" (Euronews Profiles, September 15, 2096) into a platform advocating full legal status to bioroids. To popular audiences he uses his grandmother's tales of living in slavery to illustrate the inequity of bioroid status. On the political front he's used the considerable income of his trust fund to mount attacks in court against the "legal guardian" status of corporations and government agencies that use bioroid laborers and soldiers. To date he hasn't had much success, but he is at least succeeding in keeping bioroid rights issues in the public view.

Quotes

"The US Army decants bioroids and calls them minors. Then they put guns in the hands of these children and tell them to play war. Does no one see this as inherently *wrong*?"

"When a man holds another man in bondage, whether they were born or 'constructed,' whether it is legal or not, it is an *offense against God*. To deny that truth is to work the Devil's will."

"If they are children, young and naïve, you must treat them as children, with love and charity. If they are adults, able to work and fight, then you must treat them as adults, with respect and dignity."

"No, we are *not* going to move along, Officer."

Campaign Uses

Deacon Paul is an activist, but not a violent one. He still believes strongly in the use of passive resistance and peaceful confrontation to draw attention to inequities, rather than rioting and terrorism. Nevertheless, he is an annoying thorn in the side of the status quo, and he rarely lets himself be intimidated in a confrontation. If a GM wants to run a politically oriented campaign, Deacon Paul would make an excellent NPC for player characters to meet.

Player characters can be easily drawn into an adventure involving Deacon Paul, particularly if they're of a political bent. Memetic engineers might be hired by him to help promote his cause, or by his opposition to discredit him. Security personnel will have to keep him safe from retaliation by disgruntled corporations or anti-bioroid terrorist groups. And of course any free bioroid who finds himself living in the United States will certainly have sympathy for Deacon Paul's cause.

As a Patron, Deacon Paul will have limited utility. He's still developing his own network of contacts, and won't be able to provide much information or support to player characters. But if an unfortunate PC finds himself in jail after protesting for the bioroid cause, Deacon Paul won't hesitate to bail them out.

Description: 5'11", 200 lbs. A heavy-set African-American man with a shaved head and a commanding voice, appearing to be in his mid-thirties. Usually wears a conservative suit in public.

Statistics: ST 10 [0]; DX 10 [0]; IQ 13 [30]; HT 12 [20].

Advantages: Ghost Mind Emulation [17], Bioshell Template [64], Reputation [Bioroid rights activist] +2, large class of people [Bioroid supporters] [5], Charisma +3 [15], Common Sense [10], Empathy [15], Strong Will +3 [12], Voice [10], Wealth [Very Wealthy] [30], Independent Income [5].

Disadvantages: Custom Bioroid Body [no Mistaken Identity or Social Stigma] [-8], Honesty [-50% limitation] [-5]*, Pacifism [Self-Defense Only] [-15], Reputation 2, Bioroid Rights Activist, [among government officials and corporate executives, small class], recognized sometimes 10-, [-1]

* Deacon Paul's Honesty doesn't prevent him from breaking the law. In situations involving protest and passive resistance it is often difficult *not* to break the law. He recognizes, however, that his actions are often considered to be illegal, and is perfectly prepared to face the consequences when confronted.

Quirks: Prays before every meal [-1], Reads a chapter from the Bible every evening [-1], Equates bioroid "guardianship" with slavery [-1], Questions authority [-1]

Skills: Swimming-10 [1], Chess-13 [1], Performance/Ritual 13 [2], Spanish-13 [2], Agronomy/TL 7-12 [1], Chemistry/TL 7-14 [6], Economics-11 [1], Oral Literature-13 [4], Theology [Baptist]-18 [4], Administration-13 [2], Bard-18 [2], Diplomacy-14 [1], Leadership-18 [4], Memetics/TL9-10 [1], Merchant-14 [2], Politics-16 [2], Teaching-14 [2], Savoir-Faire-18 [2]

Dodge 5; Parry 5; Block 3; Will 16.

Point Total: 230

Spicing Up Animals

New Templates for the *d20 System*

by Owen K.C. Stephens

Fantasy games present numerous monsters for heroes to fight, tame, hunt, befriend, and fear. Most of these are truly fantastic creatures that cannot be explained away without resorting to magic. Creatures in the real world, however, have an amazing array of natural defenses and attacks that can easily be adapted to new animals, creating "monsters" that do not depend on mystic explanations.

Presented below are two "fantastic" creatures created by adding real-world attack mechanisms to creatures that don't normally have them. Templates for adding these attack types to other creatures are presented at the end of the article.

Cinder Wolf

Medium Animal

Hit Dice: 2d8+4 (17 hp)

Initiative: +2

Speed: 50 ft. (10 squares)

Armor Class: 16 (+2 Dex, +4 natural), touch 12, flat-footed 14

Base Attack/Grapple: +1/+2

Attack: Bite +4 melee (1d6+3 plus poison)

Full Attack: Bite +4 melee (1d6+3 plus poison)

Space/Reach: 5 ft./5 ft.

Special Attacks: Trip

Special Qualities: Low-light vision, scent

Saves: Fort +7, Ref +5, Will +1

Abilities: Str 15, Dex 15, Con 19, Int 2, Wis 12, Cha 8

Skills: Hide +2, Listen +3, Move Silently +3, Spot +3, Survival +1*

Feats: TrackB, Weapon Focus (bite)

Environment: Temperate forests

Organization: Solitary, pair, or pack (7-16)

Challenge Rating: 2

Advancement: 3 HD (Medium); 4-6 HD (Large)

Though at first glance this creature seems to be nothing more than a powerfully built wolf, a closer look reveals it is dark red in color rather than brown, and has even darker stripes of fur in tiger-like patterns. Its jaws glisten with saliva as it bares its fangs.

Cinder wolves are canine pack animals very similar to wolves, but with poisonous venom that is easily delivered by their powerful bite attacks. The red coloration and striped patterns common in cinder wolves serve as warning to other animals, which learn not to bother the poisonous predators. A slight difference exists in the patterns of males and females, allowing someone very familiar with the breed to distinguish them at a glance.

Cinder wolf packs are migratory, ranging after large herds of grazing animals, which are their preferred prey. A pack is run by the two or three largest females (generally 5 or 6 HD cinder wolves), which are often sisters. Males are slightly smaller than females but more aggressive. When hunting, the females select a point of ambush and allow the males to herd animals towards it. If bringing down a large prey that cannot be driven, it is the males who attack it from the front, while females move to attack from the flank or rear.

Young cinder wolves are born only in the early spring during which time the pack settles into a temporary den. By the time the cubs are 3 months old they must care for themselves, as the pack moves on. If the pack is low on member or food is plentiful cubs may be allowed to join, but more commonly they must strike out on their own to form new packs.

Cinder wolves stats are created by adding the venomous template to normal wolves. Related breeds could be created by adding it to dire wolves or worgs.

Combat

Cinder wolves often use traditional "wolf-pack" tactics, sending a few individuals against a foe's front while the rest of the pack circles and attacks from the flanks or rear. They also often employ hit-and-run attacks, where they bite a foe once or twice, then retreat to allow their poison time to work. A series of lightning attacks by a pack can easily bring down a creature much larger and more powerful than any two or three wolves could defeat in a stand-up fight.

Poison(Ex): A cinder wolf's poison causes a burning sensation that travels from the bite wound throughout the target's body. It deals primary damage of 1d12 hp and secondary damage of 1d6 Con, with a Fort save DC of 15.

Trip (Ex): A cinder wolf that hits with a bite attack can attempt to trip the opponent (+1 check modifier) as a free action without making a touch attack or provoking an attack of opportunity. If the attempt fails, the opponent cannot react to trip the cinder wolf.

Skills:* Cinder wolves have a +4 racial bonus on Survival checks when tracking by scent.

Vampire Ape

Large Animal

Hit Dice: 4d8+23 (41 hp)

Initiative: +2

Speed: 30 ft. (6 squares), climb 30 ft.

Armor Class: 15 (-1 size, +2 Dex, +4 natural), touch 11, flat-footed 13

Base Attack/Grapple: +3/+13

Attack: Bite +8 melee (1d8+9)

Full Attack: Bite +8 melee (1d8+9) and 2 claws +6 melee (1d6+6)

Space/Reach: 10 ft./10 ft.

Special Attacks: Attach

Special Qualities: Low-light vision, scent

Saves: Fort +9, Ref +6, Will +2

Abilities: Str 23, Dex 15, Con 20, Int 2, Wis 12, Cha 7

Skills: Climb +14, Listen +6, Spot +6

Feats: Alertness, MultiattackB, Toughness

Environment: Warm forests

Organization: Solitary, pair, or company (3-5)

Challenge Rating: 2

Advancement: 5-8 HD (Large)

This massive brute is an are-like creature, though it's head is unusually elongated, and full of sharp fangs. It's long arms are visibly corded with muscles and end in hands tipped with long talons.

Vampire apes resemble their common omnivore cousins but are dedicated predators. They prefer to hunt Medium and Small prey they can easily immobilize. Once a vampire ape has latched its teeth into a foe it drinks the blood that flows from the wound until it has gorged itself. A vampire ape will not willingly release a target, preferring to die while drinking than flee.

Vampire apes grow to be as much as 8 feet tall, and a bull male can weigh 700 pounds. Young apes are raised in a company, which is ruled by the largest and most powerful male. The ruling male is easily identified by the chevron-shaped pattern of silvery hair that grows in on his back and chest. The ruling male drives off all young males and some females when they hit puberty. These young adults may travel in pairs for a time, but eventually become loners or join another company. Vampire apes are extremely protective of very young members of the species, and respond to an infant ape's cry even if it is not part of their own company.

If a ruling male grows too old, he may be challenged and driven off by a younger male from outside the company. Such a male loses the chevrons on his chest, but not those on his back. Such a deposed ruler is known as a rogue male, and is extremely aggressive and fearless. A rogue male often tries to build a new company, but most times is unable to defend it from younger males.

Vampire apes stats are created by adding the bloodsucking template to apes. Similar creatures could be created by adding the template to baboons or monkeys.

Combat

Vampire apes hunting alone almost always restrict themselves to targets smaller than themselves, though a rogue male may attack anything. Companies are much more likely to attack bigger prey, with three or four apes able to bring down even an elephant. Younger members of a company often do not bite larger foes until they are dead, instead helping older apes by clawing at a particularly dangerous target until it falls.

Attach (Ex): If a vampire ape hits with a bite attack, it uses its powerful jaws to latch onto the opponent's body and automatically deals bite damage each round it remains attached. An attached vampire ape loses its Dexterity bonus to Armor Class and has an AC of 13. An attached vampire ape can be struck with a weapon or grappled itself. To remove an attached vampire ape through grappling, the opponent must achieve a pin against the creature.

Skills: Vampire apes have a +8 racial bonus on Climb checks and can always choose to take 10 on Climb checks, even if rushed or threatened.

Bloodsucking Template

Bloodsucking creatures feed by attaching themselves to a target and drawing out its blood. Some creatures were believed to be bloodsuckers when they simply had a tendency to attach themselves to a foe with a bite, and this template can be used for them as well. Weasels and leeches are common examples of these creatures, but the feeding mechanism could have developed in any predatory or verminous creature.

Creating A Bloodsucking Creature

"Bloodsucking" is a racial template designed to create sub-species, and can be added to any living, corporeal creature (referred to hereafter as the base creature).

A bloodsucking creature uses all the base creature's statistics and special abilities except as noted here.

Armor Class: Natural armor improves by +1.

Attacks: A bloodsucking creature retains all the special attacks of the base creature. Additionally it gains a bite attack if it didn't already have one, with damage based on the creature's size (See table below). (If the bite attack granted on the chart is better than the base creature's bite attack, use the attack from the chart.) The creature adds 1½ its Str modifier to its bite damage if its modifier is positive. A bloodsucking creature's bite attack is always its primary attack.

Size	Bite
Fine	1 pt.

<i>Diminutive</i>	1d2
<i>Tiny</i>	1d3
<i>Small</i>	1d4
<i>Medium</i>	1d6
<i>Large</i>	1d8
<i>Huge</i>	2d6
<i>Gargantuan</i>	3d6
<i>Colossal</i>	4d6

Special Attacks: A bloodsucking creature retains all the special attacks of the base creature. Additionally it gains the Attach special attack. If the creature successfully hits with a bite attack it automatically attaches to its foe and does bite damage automatically each round. The attached creature loses its Dex bonus to AC, and cannot be removed with being grappled and pinned.

Abilities: Increase from the base creature as follows: Str +2, Con +6.

Feats: If the bloodsucking creature's Dex modifier is greater than its Str modifier, the creature gains the Weapon Finesse feat as a bonus feat. If the base creature has non-bite attacks, the bloodsucking creature receives the Multiattack feat as a bonus feat.

Challenge Rating: Same as the base creature + 1.

Level Adjustment: Same as base creature +1.

Venomous Template

Many types of creatures have both venomous and non-venomous species. Though in our world this is most common with snakes, frogs and many bugs, there's no reason why other worlds could not have poisonous birds, wolves, or even humans.

Creating a Venomous Creature

"Venomous" is a racial template designed to create sub-species, and can be added to any living, corporeal creature (referred to hereafter as the base creature).

A venomous creature uses all the base creature's statistics and special abilities except as noted here.

Armor Class: Natural armor improves by +2.

Special Attacks: A venomous creature retains all the special attacks of the base creature. Additionally, one of its normal attack types has poison damage added to it. A creature may add poison damage to its grapple, representing a poisonous skin (in which case the poison is applied any time the venomous creature makes a grapple check, even if another creature started the grapple).

A venomous creature delivers one of the poison types outlined below, selected when the template is added. The poison does primary and secondary damage based on it's original CR, as defined in the table below. Successful Fort saves (DC 10 + $\frac{1}{2}$ creature's HD + creature's Con modifier) negate the primary and secondary poison damage. A particularly powerful venomous creature may deliver more than one kind of poison, though this increases the creature's CR.

Poison	Damage
<i>Fevered</i>	Primary 1d6 Int/3 CR; secondary 1d6 Int/3 CR
<i>Hallucinogenic</i>	Primary 1 pt Wis/4 CR; secondary 1d6 Wis/2 CR
<i>Lethal</i>	Primary 1d12 hp/2 CR; secondary 1d6 Con/3 CR
<i>Narcotic</i>	Primary 1d6 Str/4 CR; secondary unconsciousness (1d6 hours)

<i>Paralyzing</i>	Primary 1d6 Dex/4 CR; secondary paralysis (1d6 minutes/4 CR)
<i>Relaxant</i>	Primary 1d6 Str/3 CR; secondary 1d6 Str/2 CR

Special Qualities: A venomous creature may be immune to its own poison at the GM's option.

Abilities: Increase from the base creature as follows: Str +2, Con +4, Cha +2.

Challenge Rating: Same as the base creature + 1 (minimum 3); +1 per additional poison type.

Level Adjustment: Same as Challenge Rating adjustment +1.

Pyramid Review

The Book of Archetypes (for All Flesh Must Be Eaten)

Published by [Eden Studios, Inc.](#)

Written by Evin Ager, Colin Chapman, Set Danielson, Mark Kinney, Mauice Lefebure, Thom Marrion, John McMullen, Charlie Payne, Charles Plemons, Tom Redding, Robert Michael Russel, and Derek A. Stoelting

Cover by Carlos Samuel Araya

Interior Illustrations by Travis Ingram

48-page 7½ by 9½-inch saddle stitched softback; \$15.00

In comparison with recent releases for [All Flesh Must Be Eaten](#), the genre books [Enter the Zombie](#), [Pulp Zombies](#), and [Fistful o' Zombies](#), the very latest title is an exceedingly simple affair. *The Book of Archetypes* is literally just that, a collection of character types that can be used as a source of instantaneously ready-to-play player characters, NPCs or even as a potential source of ideas.

The Book of Archetypes contains some 40 or so entries, many of which have been written by fans of the game. Arranged in alphabetical order, the layout for each archetype is exactly the same as those found out in both the *All Flesh Must Be Eaten* core book and the three genre books. This includes statistics, Qualities and Drawbacks, skills, and gear on the left-hand side of the page, with the personality and a quote on the right, separated by a fetching illustration by Travis Ingram. Both his art and the layout give this book a nicely uniform look.

Breaking the archetypes down by power level, the 41 are made up of 25 Norms, 14 Survivors, and 2 Inspired. There is only one instance of duplication between the entries: the Survivor-level Fire Fighter and its Norm counterpart, the Fireman. The other Norms include the Archaeologist, the recently (zombie) Bitten Housewife, the Circus Knife Thrower, the Crazy Teen, the Distinguished Gentleman, the Ex-Goth Gal (complete with Neil Gaiman collection and Random Abandoned Animal -- "Oh look! A stray kitty!"), the Fatalistic Corp Executive, the Gamemaster, the Good Ol' Boy, the Government Agent, the Grizzled General, the Gun Store Owner, the Ham Radio Jammer, the Necrophiliac, the Obnoxious Lady and her dependant toddler, the Paramedic, the Paramilitary Geek, the Porn Producer, the Stripper, the Target Shooter, the Lebanese ex-racing Taxi Driver, the Tormented Grade School Student (the only child in this collection), the Vigilante, and -- for the post-post apocalypse game -- the Zombie Rights Activist (Zombies are people too, y'know!). The Survivors include the Bounty Hunter, the Courier, the Drill Sergeant, the Ex-Spy, the aforementioned Fire Fighter, the Great White Hunter, the High Class Thief, the Hispanic Gang Member, the Industrialite, the Kendo Master, the Porn Star, the Sanitation Specialist (who specializes in cleaning up the undead menace), the Survivalist College Student, and then comes up to date with the Terrorist. The two Inspired characters are the Crusading Preacher and the Ishtar priestess.

Including this last archetype, the collection does contain a rather unhealthy dose of sex in its designs. The Ishtar Priestess, gifted with the Blessing and Visions miracles, along with the Stripper are fairly benign in this regard, but the others are nothing short of vile. The Necrophiliac undertaker's son with the Bound Zombie Girl in his Gear and the quote, "WHOA! Don't shoot that one. I'll, uhm, take care of her." is fairly obvious in its vileness, while the Porn Producer and the Porn Star are not. The Porn Producer's illustration looks suspiciously like a certain overweight porn star and actor, and is peddling post-snuff flicks, his quote being, "This is a business that thrives on fresh meat. You

with me or not?" His Porn Star counterpart looks a little too much like Britney Spears, right down to the school uniform.

The book also has a dig at our own with the Gamemaster archetype, as overweight, balding, bearded and bespectacled (though oddly dressed in a featureless plain grey sweatshirt), sword in hand and clutching a manual of monsters! It also makes use of "Gamer," a new variable cost Quality/Drawback. For example, the "Burned Out" gamer has finally succumbed to years of caffeine abuse and sleep deprivation, and really needs his full eight hours. This is a one-point Drawback, while a gamer with the one-point Quality "Razor's Edge" can go for a whole day without the need for sleep; and "Godlike Endurance" Quality both doubles the cost and length the gamer can go without sleep.

Other new Drawbacks to be found in the final pages of ***The Book of Archetypes*** include Absent Minded, Flashbacks, Narcolepsy, and Physical Disability (Overweight); the last one is used particularly for the Obnoxious Lady archetype. The only new Quality in addition to Gamer is Quick Learner. This section also includes a selection of new gear -- a Briefcase Gun, the Fire Engine Hose (with rules for when it flails, though there is no whip included for use with the Archaeologist), the shovel, and the Hotfoot. The latter is an improvised weapon, an aluminum baseball bat with alcohol-soaked flaming rags tied around its tip. More deadly still is the "Boom Stick" Assault Rifle, an M-16 with its attached M-203 Grenade Launcher modified to fire 20mm cannon shells! Other new gear is tied into particular archetypes -- the fireman's protective equipment and fire engine, the Kendo Master's armor, and the Grizzled General's Command APC.

Although the contents of ***The Book of Archetypes*** are intended for use with ***All Flesh Must Be Eaten***, they could easily be used in other games. Not just those from Eden Studios -- [***Terra Primate RPG***](#), [***Buffy the Vampire Slayer Roleplaying Game***](#), and the forthcoming ***Angel RPG*** -- but also those from other publishers, such as Atlas Games' [***Over The Edge***](#) and ***Feng Shui RPG***, FanPro's ***Shadowrun RPG***, as well as almost any modern set RPG. Of course, some conversion work will be required to get these archetypes into other games.

The fact that the contents of ***The Book of Archetypes*** is suited to any modern or near-future-set RPG also acts as a slight limitation. Essentially none of these characters are suited for use with ***Fistful o' Zombies***, and only a few are suited for use with ***Pulp Zombies***. This is not so much of a problem with ***Enter the Zombie***. Some of the archetypes can also be used to inspire adventures in themselves, such as the filming of post-snuff movies by the Porn Producer could also be turned into a dark trip into the valleys of Los Angeles for an ***Angel RPG*** scenario.

If there is a downside to this supplement, it is in the cost, which is a little high for a book this size and of this length. Yet when you consider that there is a piece of art on almost every page, this cost is understandable. Putting that gripe aside, ***The Book of Archetypes*** does exactly what it sets out to do and it does so in a pleasingly simple, handy, fun but vile way.

Pyramid Review

Monsters of the Mind (for d20 System)

Published by [Green Ronin Publishing](#)

Designed by Kevin Brennan, James Maliszewski, Morgan Peer, Tracey Peer

Edited, developed by Penny Williams

Proofing, additional development by Chris Pramas

Cover by Todd Lockwood

Interior illustration by Toren "Macbin" Atkinson, Drew Baker, Kent Burles, Kevin Crossley, Dennis Detwiller, Todd Lockwood, James Ryman

64-page b&w softcover; \$14.95

If you're bold enough to let psionic characters into your *d20 System* game, you're probably going to need more psionic counterbalances for them than the *Monster Manual* offers. It's Green Ronin Publishing to the rescue with *Monsters of the Mind*, a bestiary full of mental menaces and psychic folk to populate your world.

The default setting for the things that go bump in this book is Naranjan, one of Green Ronin's Mythic Vistas books. Aside from a brief primer at the beginning designed to give those not in possession of the *Mindshadows* book an overview of that island nation, the book is entirely about monsters, beings, and humanoids with a hefty helping of psionic abilities. Those who don't have *Mindshadows* and don't want to use the setting can still get use out of the book. The monsters are given a place in the societies or ecology of the campaign island, but nothing is so married to the setting that it can't be lifted for another time and place.

There's no table of contents, but there is a listing of the entries by Challenge Rating and you can look them up alphabetically from there. The critters provided run the gamut. There are teeny-tiny ones and really enormous ones. Some walk, some fly, some swim. Some are pulsating with psionic potential, while others lack the intelligence to use their abilities as anything more than instinctual survival traits.

With some 50+ beasts to choose from, the GM should be able to find something that will suit his needs. There are angelic and demonic beings seeking man's salvation or damnation. Psionic plants use illusions to resemble the surrounding plant life while they absorb people, or they ward off humanoids who seek them out for their valuable, deadly, or hallucinogenic substances. Psis see their bodies split from their minds, and while each is deadly on its own, the rejoined demihusk is more monstrous still. Mental fey can plague your PCs, and if they wander near the shore it seems every waterway has some sort of fish, dragon, or soulless baby ready to drag you under the waves (it is an island, after all).

A large chunk of the book is given over to thoughtforms, creatures that embody the six psionic disciplines. The muscular ego thoughtform controls psychometabolism abilities, the boney savant possesses psychokinesis powers, and the telepath thoughtform has -- of course -- telepathy powers to the nth degree.

Thankfully, not everything here is looking to suck out our heroes' brains. There are mysterious strangers who have achieved great power and come back to assist others in making the transcendental journey. The couatl is a wise old bird who might lend a hand to adventurers of a decent stripe, and the young spotted naga is considered a boon protector to a village -- until it unwittingly sheds its old personality like a used skin. And some of these things simply want to be left alone, but the people of Naranjan just keep seeking them out to kill or enslave them.

The artists got some really good notes from the editors, because their illustrations are spot-on. The artwork is almost exclusively done in pencil, giving the book a "naturalist's sketchpad" feel. More than a few of the things listed are disturbing beings, and their depictions can be outright creepy. The type is small, but the real problem with the graphic presentation is the type font used for the creature names and subsection titles. Probably stylized to match the feel of the ethnic groups of Mindshadows, picking out the names (which are already hard to spell out or pronounce in many cases) often entails looking into the entry to see how it's (legibly) spelled there.

Monsters of the Mind presents several original creatures, though few are so original that GMs will find that moment of "wow" that has them building entire adventures around some cool tidbit from the descriptions. It seems to be hard coming up with really exciting uses for a psionic monster, and this is reflected in a number of the entries. Many creatures "eat" psionics or their psionic energies, for example, and a number of things are hunted to near extinction by the fearful islanders.

They are all sound concepts, and most have a believable ecological niche to fill so they don't come off sounding like DM punishment for psionic characters. The writing style is talented and colorful; while there's not as much to "ooo" and "ahh" at, at least the entries don't sound like the cookie-cutter critters some assembly-line monster compilations foist off on customers. While a little short on the juicy adventure ideas, this collection is still the result of a lot of thought, and GMs now have a full resource for finding the right **Monsters of the Mind**.

Monsters of the Mind Open Game Content: Proper names of people and places are exempted; everything else is open content. This means the monsters (save those Green Ronin borrowed from Wizards of the Coast) and their stats can be used freely, but details about Naranjan are off-limits.

--Andy Vetromile

Pyramid Review

H.P. Lovecraft's Arkham (for Call of Cthulhu & Call of Cthulhu d20)

Published by [Chaosium](#)

Written by Keith Herber, Mark Morrison, Richard Watts, & Mervyn Boyd

Illustrated by Louis Cortes Real

Cover by Lee Gibbons

248-page b&w softcover; \$28.95

It's easy to think of Chaosium as stuck in an "old-school" publishing regimen and its latest release, ***H.P. Lovecraft's Arkham***, at first appears to be only more evidence. In form, it's an anachronism, sporting the kind of low-level, detail-happy setting material that hasn't been seen in a major RPG supplement in years, plus four ready-to-run "scenarios" (as they were called back in the old days). On one hand, the outdated appearance isn't a surprise; a vast majority of the book's text could be found in ***Arkham Unveiled***, published in 1990. What is surprising, then, is that this material can serve a GM today as well as it did 13 years ago, something that certainly can't be said of many RPG supplements from those days before vampires started masquerading and a d20 was a piece of plastic, not a marketing phenomenon.

Chaosium hasn't been totally unaffected by the zeitgeist. It has littered ***H.P. Lovecraft's Arkham*** with ***d20 System*** conversions for every rules passage and NPC statistic listing. But the cursory (though adequate) nature of these conversions -- not to mention the puzzlingly out-of-place collection of ***d20 System*** character "backgrounds," including the modern-day "Hacker" and "Crime Scene Investigator" -- put to rest the idea that it is up-to-date rules systems that are keeping the material fresh and useful. A more telling clue to the book's secret of longevity can be found in another new addition: the 16-page short story, "The Dreams in the Witch House," a canonical Lovecraft tale set in Arkham, reprinted in its entirety.

Besides being more readable than the preponderance of RPG fiction, the story also serves a purpose for gamers, and it elucidates how Chaosium can get away with bringing 13-year-old gaming supplements back to market. Lovecraft's words set the tone of what's to follow, both on the page and in a gaming session that utilizes the Arkham supplement. While most game publishers would use these pages and the 110 later pages of scenarios for rules updates, new character classes, special powers, or equipment lists, ***Call of Cthulhu*** -- still running with essentially the same stripped-down rules they had 13 years ago -- focuses on narrative concerns. Customers of many game lines pay primarily for balanced and effective rule sets and for books that feed their appetite for new frontiers of character advancement. Chaosium has established a different pact with its fans. It provides stories and the components of story: character sketches, atmospherics, and story hooks, including entry points into Lovecraft's own works. Starting out with "Witch House" is a signal to the Cthulhu audience that Chaosium is about to hold up its end of the bargain in generous fashion.

The 100 pages of campaign setting material that follow the short story might, on first reading, appear to tarnish the promise of narrative focus. In this nearly house-by-house catalog of locations in Lovecraft's "legend-haunted city," players are given information about local politics, social clubs, geography, and day-to-day facts like when school starts each year, where the cheapest meal can be found, and what plays have been performed by the local theater company. An attentive GM, however, will notice that a healthy number of these locations are also miniature stories in

themselves. From gang battles to red-herring rituals of college fraternities to the unusual coffin-shaped clock on the wall at the watchmaker's shop, story threads are woven throughout the otherwise dry listings of facilities and residents. GMs needing inspiration for their next one-shot mystery will be just as pleased with the material as those looking for fertile ground to start their new 1920s campaign. Arkham, in these pages, feels both like a replica of Lovecraft's haunted township, seething with dark secrets, and also like a livable community of aristocrats, professionals, and rural folk, going about their daily lives. An impressive foldout map in the back binding (unfortunately scaled-down from previous editions to accommodate an illustrated frame of questionable quality) is the final stamp of authenticity.

If there's a weakness to these pages, it's that a few opportunities have been missed; the one-sentence school listings, for example, seem ripe for a story hook or two and the Miskatonic University listings get so hung up in telling you which professors appear in which Lovecraft stories that they fail to give you any current events for players to muck about in. There's also the organizational oversight that places the details for the Arkham Historical Society in the middle of one of the later scenarios, instead of here in the setting material where it belongs, without even so much as a "see page 174." And, of course, there's the pesky fact that if you've been collecting *Call of Cthulhu* supplements faithfully over the years, you already own every word in this setting section (excepting the *d20 System* rules conversions). Entries have been reordered, but never expanded or cut down. The only real perk for those who own *Arkham Unveiled* is seeing the old liney character portraits transformed into much more evocative computer-assisted versions at the hands of Louis Cortes Real. Real does an especially good job with the weathered faces of high society grand dames, grimy dockworkers, and undying cultists.

Four well-developed adventures follow the setting material, taking up the final half of the book.

[SPOILER ALERT!]

The first scenario is the only new addition, replacing a shallow Reanimator retread from *Arkham Unveiled*. "The Books of Uncle Silas" drops a motherlode of eldritch tomes into the players' hands after manufacturing an uncle's inheritance for any character who might (cross your fingers, GMs!) happen to be an orphan. *Call of Cthulhu* often depends on such contrivances to get an adventure going, but here the results don't justify it: another mad uncle arrives on the scene to retrieve the dread volumes and while the scenario gives lots of ideas for how he could pester the players, it fails to outline any kind of satisfying denouement for the story. Luckily, the scenarios get much better after this one.

"The Hills Rise Wild" is a vicious and tightly woven little vignette in which the search for a meteorite in Arkham's rural outskirts leads characters into the hands of a disarmingly helpful, but ultimately deceitful, serial killer named Levi Stone. Played effectively, characters should slowly get the unnerving feeling that they're being hunted by a predator on his own territory. The killer's wife and son, emotionally quashed and conflicted, provide a fascinating psychological element and can be flexible tools for GMs striving to maintain the perfect threat level. The supernatural has only a chance of making an appearance, depending on how the players proceed, although after seeing Real's fearsome rendering of Levi's carved idol, GMs may not be able to restrain themselves from unleashing the beast upon their parties. The only disappointment here is that the meteorite turns out to have nothing to do with anything. While it could become a story hook for a later investigation, it's a hook that, within these pages, has no barb.

Following this hillbilly fun is "The Condemned," a masterfully conceived race against time that brings Arkham's witch-haunted past to the streets, homes, and hideaways of Arkham's present. An immortal wizard, trapped for a century in a stone bridge support, escapes on a fluke and plots revenge on the descendants of his captors. Step one of his plan is the sparkling twist that makes the mystery so extraordinary: the wizard magically swaps bodies with an unsuspecting college student camping along the Miskatonic River. Digging up the wizard's shriveled but still-living body -- host to a shattered mind that doesn't belong -- buried along with the murdered corpse of the student's friend, makes for one of the more memorable opening scenes players are likely to experience. The rest of the story admirably fulfills the promise of this beginning, with a series of grisly murders, numerous intriguing historical handouts, and an appearance by Quachil Uttaus, one of the creepiest and most neglected Great Old Ones.

If "The Condemned" is the quintessential Mythos mystery story, "The Dead of Night" ratchets things down into a more personal mode, exchanging the serial murder of society's most esteemed members for the scattered miscreant actions

of three zombie children -- the product of a misguided father's love. While having all the components of a classic chilling campfire story, the scenario has its share of misfires. The unidentified body that sparks the investigation is quickly sidelined by the horrible truth about the undead children. Meanwhile an unnecessary NPC from out of town mucks about behind the scenes of the story where characters have little chance to encounter him or learn what he's up to. These two ill-fitting plot elements tie into a general voodoo theme that feels unsuited to Arkham and more appropriate for a New Orleans sourcebook. Still, a GM who maintains the focus on wrangling the vicious cannibal children from their individual dens will likely have more than a couple creeped out players by the end of the night.

[END SPOILER ALERT]

The final calculation of the worth of ***H.P. Lovecraft's Arkham*** hinges on how long you've been collecting Cthulhu supplements. If you have ***Arkham Unveiled***, \$28.95 is a steep price to pay for a short story published elsewhere, a lame scenario, and some snazzy new artwork. Anyone who is making his first visit to Arkham, on the other hand -- whether he's pulling into the station on the ***d20 System*** line or took the reliable old BRP connection -- will find that 13 years can't even begin to sully a bunch of great stories like these. Chaosium shouldn't be chided for bringing them back from the grave. It should be thanked.

Sugar-Coated Serial Characters

A few years ago I had an idea for a movie that I figured, once I was an internationally renowned scriptwriter, would make me a kajillion dollars. Sadly, it seems those dreams are a ways off in the future, and possibly an alternate universe or three over. But I figured I'd share it with you, on the theory that if one of you all turns it into a film, I can haul you to court. Oh, and then I'll tie it into gaming, I guess, since that seems to be what you kids are all into today.

Anyway, I'm a closet James Bond fan. (Actually, I'm a fan of the idea of James Bond, and don't care for many of the movies; I'm like that about a lot of things.) And I was trying to figure out some of the inconsistencies about the movies, ranging from the profound (how can he have so many adventures and not be a hundred years old?) to the nitpicky (why don't Bond and Blofeld recognize each other in *On Her Majesty's Secret Service*, despite the fact they met in *You Only Live Twice*?) But the question that boggled me most was, if you're an internationally known secret agent/spy named James Bond, and part of the definition of "secret agent" and "spy" incorporates some aspect of secrecy, then why on Gaia's green would you go around announcing yourself as "Bond, James Bond" to anyone who will listen?

That's when I realized: James Bond isn't a man . . . it's a *position*.

In this idea, Her Majesty's Secret Service realized long ago the power of symbolism and icons, and so they created this superspy who was omnipresent, all-competent, completely unafraid, and unkillable.

How could Bond have so many adventures yet remain roughly the same age? Once a Bond gets too old and retires (or gets killed), he's simply replaced with someone else in the position.

Why don't Bond and Blofeld recognize each other? This Bond isn't the same guy who met Blofeld before. (As an aside, I contemplated the possibility that Blofeld was a position, too.)

And why doesn't Bond remain secretive? Because he's not *supposed* to; he's worth more to the world if people know who he is, and if he seems to be an omnipresent, unstoppable agent.

Mind you, the whole point of this idea was to be able to bring back *other* Bonds (in other words, other actors who played Bond), in a *really* big adventure where one Bond wasn't enough, in a *Doctor Who* "[N>1] Doctors" kinda way.

Anyway, to tie it all back to RPGs, I realized that one of the great joys of a lot of gaming is to have a character that is one-of-a-kind: mankind's last, best hope; the Keeper of the Secrets of Ecivedtolp; the Angel of Atlanta. But one-of-a-kind characters are also fairly stressful; many times GMs are discouraged from making adventures too difficult, because the stakes are so high. After all, how can the campaign go on if the Keeper of the Sacred Isotope is eaten by geese?

So as a radical concept or a change of pace, why not have gamers play not a specific character, but a position? That way, the stakes can be as high as you'd like; if the person filling the position is killed, incapacitated, or wants to quit, the player can simply have a new character fill that position.

This concept is actually somewhat common in the comic world; some characters have gear - such as Green Lantern's power ring, or Starman's cosmic rod - that is passed from generation to generation. Others have a mantle or a title that is passed on, perhaps because of genetics or a similarly powered person reusing a name (such as the Flash).

But the concept can actually be applied to a number of games. For example, a Space Opera player could play the "Leader of Puce Squadron, the Rebellion's most vital group of maverick pilots." Then, if that character's Schwa-Wing Fighter gets blown to pieces, the player can still play the same concept.

Now, I'm sure many games are already done this way; it's not uncommon for someone to play, say, the child of a fallen hero, or someone else who has been tangentially tied to the game world. But if the game world is specifically

built around the possibility of roles instead of individuals, then a number of possibilities open. Games can be more lethal, as has been already mentioned. Alternatively, they can allow for games with quick turnover. For example, the Marvel Universe has a cosmic energy force that bestows random individuals with super-powers for a short period of time; in a gaming world, it's easy to envision the player "character" as this series of individuals. (And, of course, an idea of this sort can be translated to a number of genres; for example, a pulp character could be the possessor of the "Shade Force," which seeks out worthy persons to bestow with its power for one year at a time.)

And, in perhaps the best side effect of this arrangement, the period of "inexperience" and lower power level - which many people consider to be the most fun part of a character - can be extended almost indefinitely.

Should you decide to give this concept a shot, here are some ideas to make it work.

Figure out the limitations of the position. Perhaps the biggest obstacle is coming up with a justification why more than one of the characters can't be "on camera" at a time. If the Secret Service *does* have a half-dozen people with Bond-level training ready to fill his shoes, why don't they unleash them all at once? A little thought will usually make an answer apparent. In our Bond case, they *are* in the field already; when the time comes, someone is promoted to 007 status (with the resultant government-issued tuxedo and perhaps some plastic surgery). Likewise in our Puce Squadron example, the other pilots serve as the pool from which the new Puce Leader will arise.

The other thing to figure out is why the new character would continue adventuring with the party (or otherwise be tied to the other PCs). This is usually straightforward (if our superspy character is ordered by the government to do so, for example), but it can require some finagling if only a specific member of the position got involved with the PCs. If a player has created the position of the "High Priest of Mahna Mahna," and the first member of that position he plays joins the PCs, maybe that character has some unfinished business when he dies/leaves/whatever; then the next person in that position will have reason to fulfill his predecessor's goals even though he doesn't know the other heroes.

Figure out the limitations of memory. Since a character of this sort is a series of similarly powered characters, it can be useful to figure out how much he knows about the others in his line. To steal from White Wolf's five-point scale, here is a range of possibilities.

- 0 Each character iteration is a blank slate; he perhaps knows the name of the position, but that's about it. "I'm the Chosen Catchchild? Great! . . . What does *that* mean?"
- The character knows the broad outline of his position; he knows what his abilities and limitations are, and what is expected of him: "I'm the Keeper of the Word of Lovers, so I'm supposed to help anyone I see who's in love or falling in love; is that it?" Any specifics of past deeds, however, are unknown.
- • The character knows the specifics of himself and his post, and a number of specific past events that his predecessors have done: "Ah, yes; Mr. Gutman. I've heard about him . . . something involving a statue of a black bird in Istanbul, right?" He may have even met his immediate predecessor once or twice.
- • • The character knows a great deal about the position and his predecessors; he has read reports, studied journals, and perhaps gotten to know the previous position holder(s) personally. "Man; why didn't the Bloodefender *index* any of the stuff in this cave?"
- • • • The character knows almost as much as can be known by normal means; there is extensive paperwork, databases of actions, extensive meetings with others who have held and will hold the position, and so on. "Computer: Access Überdatabase for all previous references to 'Destiny Pathogen.'"
- • • • • The character knows everything about the previous iterations of the position-holder, down to deeds, private thoughts, and the like. It may even *be* the same character, albeit with, say, the thoughts of a new host or experience of an alternate body to differentiate him. "Curious; in this cycle I seem to have an appendage on my posterior that gyrates when I'm pleased."

Mind you, this hasn't been playtested, but it gives a nice range of possibilities that should hopefully give you all some ideas.

As a final tip, make sure you have a cache of replacement characters ready to go in the queue. Figure out what would be fun and different while remaining true to the position concept. Thus the original Corporate Field Manager for the Iron-y Enterprises might have field-tested his company's cyberwear out of a desire to produce the most efficient equipment, while the elderly man who replaced him does so to protect his predecessor's reputation and dealings, while the third hotheaded woman who replaced him is out there for the thrill of adventure.

In all, the idea of position-as-PC opens up a lot of possibilities, and should provide for some radically different adventures and campaigns, which are not rendered powerless by the fear of a character leaving, but instead invigorated by that happening.

Oh, and if I ever see a movie trailer that begins, "Bonds are back!," someone's gonna get sued.

Designer's Notes: GURPS Faerie

Once Upon A Time

by Graeme Davis

It was a mild Austin evening in March 1991.

I hadn't been a freelancer for very long. In fact, I was delivering the manuscript of my first freelance effort, **GURPS Vikings**. My fiancée and I were visiting her brother, who lived in Austin, and I took the opportunity to deliver the manuscript to SJ Games in person.

I met Steve, along with Loyd Blankenship, who was, if memory serves, the Managing Editor at the time. I handed over the first draft of **GURPS Vikings**, and we went for a meal.

Conversation naturally turned to future projects. We talked a little about the idea that would later become **GURPS Middle Ages 1**, and I asked if SJ Games had any interest in a folklore-based product. I had been using British and European faerie lore for years as a source for my own roleplaying campaigns, and I had even managed to sneak a few bits and pieces into my work for Games Workshop on **Warhammer Fantasy Roleplay**. Why invent something new when you can steal something that has already stood the test of time?

Steve mentioned that he had been considering a companion book to **GURPS Fantasy Folk**, with the working title of **Faerie Folk**. They had been talking to Steffan O'Sullivan, then a **GURPS** regular with Fudge years in the future, but he was not happy with giving faeries that kind of treatment. I said I'd think about it.

We went on to a couple of other places for beers, and that's all I will admit to remembering about that evening. Except that I came home with copies of **GURPS Fantasy Folk** and several other useful bits of swag.

GURPS Middle Ages came and went, along with a few projects for other folks. Freelancing wasn't working out too well for me financially, and I got a succession of jobs in the computer games industry. I was still doing little bits of freelancing here and there, but nothing major.

Then I ran into Sean Punch at GenCon a couple of years ago. We talked a little, and I got some freelance editing work. This led to second editions of **GURPS Vikings** and **GURPS Middle Ages 1**. One day, I was avoiding work by mooching around the SJ Games web site, and found that **GURPS Faeries** was still there on the wish list. So I put together an outline, and got the contract to write it.

I suppose I really should have known better. Now I'm not saying what caused it, but something got into my computer and messed with all my header formats. I had checked all the files and made sure they were good, but when they printed out at the SJ Games end, the headers were all over the place. Then my email crashed, obliterating my inbox just as I was looking for some emails I'd received about the correct way to credit playtesters and other such vital things. Sean kindly resent the emails, but the next day, there was my inbox, completely untouched. I started leaving small offerings of milk and cookies beside my computer at night. You can't be too careful.

Still, how else could I have taken time out to research faerie beliefs and folklore from around the world? There's something very satisfying about reading books on Inuit and Australian aboriginal traditions, alien abductions, 19th century Irish murders, classical Greek literature, and Scottish witchcraft trials, and calling it work. The people in the library began to whisper and point when they thought I wasn't looking.

Also very satisfying was the mountain of feedback I received from the playtest group. They had ideas and information that hadn't crossed my radar at all, and quite a few of them had insights into their own local traditions that I couldn't have found without going on a fieldtrip the size of Drake's circumnavigation. Thank you all, folks; even if your name

didn't make it into the book, you were an immense help. Many thanks, as well, to Gene Seabolt, Bill Stoddard, Phil Masters, and the other veteran **GURPS** writers who helped me out with faerie-related material from their own projects. There are so many books now, not to mention those in development, and trying to tie together all the faerie-related information in the **GURPS** canon is a job I could not even have attempted without a lot of help.

As with all **GURPS** books, there was more material that would fit. One particular campaign outline ran way overlength. I guess I just got so into the idea that I kept on writing and writing. It also came too close to a recent blockbuster movie for comfort, although I maintain that was just the convergence of ideas. Honestly.

Anyway, if you ever wondered what would happen if the faeries were cast as the forces of evil in a dark, future world that was sort of like cyberpunk but without so much emphasis on technology (and let's be honest, who hasn't?), here is one possibility. I call it:

Gaia In Darkness

What if the near future of humanity lay, not with technology, but with magic and the resurgence of the Old Ways? Or perhaps technology actually enabled the return of the Old Ways? After all, who hasn't looked up a horoscope or done an I Ching reading online?

While accepted as a useful tool, technology is not the be-all of human existence and striving. Therefore, while more advanced than it is today, it has not advanced at the same rate, or in the same directions, as it has in a conventional cyberpunk setting. In particular, implants of any kind are seen as a pollution of the human body, rather than an enhancement. The human body may not be perfect, but it was designed by Mother Nature, who is generally thought to be smarter than most human inventors.

Likewise, genetic engineering and other biotech endeavors have become socially unacceptable -- and indeed unnecessary. By working in harmony with nature -- and with the faeries -- crop yields can easily support the world's population, even in spite of (or perhaps because of) a global switch to organic farming practices.

Instead, technology focuses on communication and empathy. While a few humans have been born with telepathy and other psionic gifts, almost all the rest rely on some form of Mechanical Telepathy (p. CI27) which combines the functions of phone and internet. Scientists have begun to predict the formation of a human group mind: an organic internet which in time will fuse with the consciousness of Gaia to create a truly living planet. Some are looking forward to that day, but many fear that it will result in the annihilation of their individuality.

In some parts of the world, experimental communities -- dubbed "ant farms" by their detractors -- have already achieved perfect mind linking on a small scale. In others, madness and even death have been the result as the dark side of an individual's psyche spreads throughout the group.

Stringent mental health checks are now required before participating in such experiments, and despite the sworn goal of egalitarianism, a new hierarchy of society is forming, based upon natural psychic ability vs. psi-technology and mental health vs. mental illness. The Master Race of this new world is already beginning to emerge in the Gifted, an overclass of natural telepaths with "perfect" minds. Some have even begun to speak of the next phase of human evolution.

Where do the faeries fit into all this? They are Gaia's intermediaries and messengers, teaching her mortal children to live in harmony with each other and with the planet. At least, that is what they say -- but they could have several agendas of their own.

One might be the harnessing of human psychic potential to create mana so that the faeries can continue to survive and thrive. Another might be the reshaping of human society in the faeries' image -- or rather, in their self-image. Human history is full of instances where a technologically superior culture has taken it upon itself to "improve" a less technological one and remake it in its own image, and the result has nearly always benefited the colonial power much more than the natives. Perhaps the faeries are doing this to the humans, using a façade of communion with Gaia.

History teaches that colonialism is frequently accompanied by the rape of natural resources and the reduction of the colonized people to the status of second-class citizens. What might mortals have that faeries want? Many folklore sources would point to souls -- either literally, as in the case of the Teind (the tribute of souls traditionally paid by the faeries to Hell in exchange for their independence), or figuratively, as in stories of faerie abductions of mortals to care for (or replace) frail faerie newborns.

Perhaps the faeries are grooming the Gifted -- for a rigid class system is, in its own way, a form of selective breeding program -- to the point where they will be deemed fit to interbreed, revitalizing the faerie race without polluting its blood unduly. Or perhaps the Gifted are unwitting seed-beds for faerie or hybrid genetic material which will be transplanted back into sickly and dying faeries to keep them alive. Meanwhile, the rest of humanity labors to sustain both itself and the Gifted, being slowly reduced to a worker caste.

Of course, not all faeries in this setting are necessarily evil. However, it may well be the case that the more closely they fit the "noble faerie" stereotype, the less they can be trusted. Turning conventional faerie lore on its head, the ugly ones may be the honest ones.

Be that as it may, there will be some faeries who are opposed to this enslavement of mortals, and are fighting to change the situation. In such a seemingly idyllic world, it will be easy for the establishment to paint these dissenters as dangerous anarchists, sworn to drag both faeries and mortals down into the mire. They are frightened, establishment sources will say, of the potential of the next stage of human evolution, and wish to keep faerie power in the hands of faeries, and keep mortals in their place.

The scene is set, then, for a conflict where no one can be quite sure which side is good and which is evil. The oppression wrought by the "noble faeries" is so subtle, and so well-propagandized by emotion control in the developing web of human consciousness, that the vast majority see it as not only right but the fulfillment of human destiny. On the other hand, the work of the opposition in undermining and sabotaging the process is widely regarded as anti-human, faerie-supremacist aggression. Not even many faeries know (or believe) the truth about the Gifted.

Player Characters

The PCs may begin the campaign as humans who somehow become convinced that the faeries do not have their best interests -- or the best interests of the planet -- at heart. Or, they may begin as faeries who have realized what is really going on, and set out to save the mortals from the scheme, and from themselves.

For mortals, a necessary first step in joining the resistance is detaching themselves from the psychic and technopsychic communication web, so that they cannot be used to monitor resistance activities. This will be a traumatic experience for many -- they will be alone in their heads for the first time in their lives, and the sudden silence will be unnerving. This "deafness," as it has become known, is almost impossible to conceal from the "hearing," so the mortal rebel must drop out of society and disappear. The Deaf Who Will Not Hear are hunted down by the faerie elite and their mortal servants, because their minds are easier to probe, once they are captured, than those of their faerie counterparts.

While faeries have had the ability of psychic communication for millennia, they have mostly learned to compartmentalize their minds, screening some thoughts from general accessibility. They would say that this is similar to a mortal thinking something rather than saying it aloud. Therefore they are better able to conceal their true thoughts, and can operate within the mainstream of society even if their sympathies lie with the resistance. They are able to teach some simple mind-masking techniques to their human protégés, but these are not always effective.

Starting the Campaign

The campaign can start at any point along the story arc, and each stage has its advantages and disadvantages.

The story begins when mortals become aware of the faeries, and begin working with them to solve the world's

problems. The setting might be contemporary or near-future -- books on contact with faeries and working with them to save the environment are already on the shelves in our world -- or it might be a dark future-cyberpunk setting, where corporate greed has run its logical course.

In either case, faerie PCs could be ambassadors to the mortals, or they might be troubleshooters sent out to keep the mortals from completely destroying the world. They could also be renegades, ignoring faerie prohibitions on contact with mortals because they see that the only survivable future is one where the two races work together.

Mortal PCs can be any kind of character, since anyone could potentially be caught up in the tide of events. Environmental lobbyists and New Age mystics are logical first points of contact for faerie intermediaries, but corporate employees, construction and refinery workers, and other kinds of mortals have a good chance of being contacted -- or sabotaged -- drawing them into the story. Even private eyes and mercenaries might find that their objectives, and their clients, are not what they appear. Investigators might be hired to find evidence against a corporate executive whom the faeries want to remove, while mercenary groups might be hired to sabotage or destroy industrial installations or drive developers or prospectors away from an area.

Starting at the beginning of the story arc also gives players a world which is familiar, while starting in the middle, with human-faerie co-operation well established and radical changes in society as a result, give the players more work to do in becoming as familiar with the world as they would expect their characters to be.

However, starting in the middle of the story allows players to see the world as it has become, and to experience a world very different from the one they inhabit in real life.

When creating a mortal PC with ties to the resistance, the player and GM must pay particular attention to how the character broke from the communication web, or cover this in the first few sessions of play. The character's backstory - how he experienced the world before the campaign began, and what events set him outside the mainstream of the world to become a PC rather than an NPC -- is of critical importance.

For example, if he is one of the Gifted who has turned against the faeries, what happened to make him give up his favored life? Was it a developing social conscience, seeing the plight of lesser mortals growing steadily worse? Was it a bad psychic experience at an ant farm? Did he somehow discover that the faeries' goals and motives were not as altruistic as they claim? Another important question is how the hero is masking his rebel activities from the communications web -- has a sympathetic faerie mentor taught him to block his thoughts? Has he developed this ability spontaneously? Or has he not yet learned to do so -- meaning that he is on the run and must stay one step ahead of the faerie "Thought Police?"

Faerie characters are easier to create, but should also have a detailed personal backstory to explain how they came to be PCs rather than NPCs. If they are with the resistance, this needs to cover how and why they broke with the faerie establishment, and what events contributed to their present attitudes and goals. If they are with the establishment, their personal backstory needs to cover their career up until the start of the campaign, explaining how they came to be where they are today, and giving some context for their views and motivations.

How To Run A Mystery Adventure

by Matt B. Carter

Mystery has its place in every genre, from the sleek dark world of *Cyberpunk* to the grim period horror of *Call of Cthulhu*. Whether it is blue-collar crime or grisly murder, the disappearance of a politician or the poisoning of a village's water supply, behind every story is the potential for a mystery. This article explains the essential techniques involved in running a mystery adventure for your group, whatever the system or the setting.

Creating The Plot

To begin with, put yourself in the villain's shoes. Decide on your hook, your crime, or your mystery; the result that your perpetrator is looking to achieve; and then work backwards from that ending. Consider all the angles and plan the crime as though it was you who set out to commit the deed. It could be a robbery, a murder, a kidnapping, or any number of activities related to the particular game you are playing. Take into account any special abilities the villain might have and how they would be applied to the task.

Now work out what could go wrong. Something has to go awry in order for your players to be able to solve the mystery; there is no point in letting your villain pull off the perfect crime. There must be a hole in the plan somewhere, and a plausible one too. Don't make it too blatant; nothing screams "plot device" like a smoking gun (unless, of course, it's a red herring, and even then it can be too obvious). It must be something that your villain can conceivably have missed or that is outside of his or her capacity to prevent. The latter is usually the best option, as it does not rely on the villain's incompetence.

Perhaps an associate betrayed him? Clues could be left deliberately by somebody wishing to expose the villain, like an undercover agent or a double-crossing partner. Or perhaps there was an unknown entity involved in the crime, something about which the villain could not possibly have known that ended up leaving a mark behind. This is especially appropriate with games that use magic or other unpredictable fantasy elements. In any case, choose this first clue carefully, for this is what will draw your players into the adventure from the start and give the story a base from which to develop.

Once you've picked the hook, the rest of the plot should fall into place more easily. At this point you should start to work through a list of things that your players can discover and the sources from which they can do so. Mystery adventures are not often linear; usually they consist of a collection of characters and locations, each of which holds information. Your job is simply to provide enough of these that the players can follow the plot through to some kind of confrontation. If you've presented the hook properly then they should have some idea of where to start their investigation, and from there you can lead them through branches of plot as they discover more clues.

For example, your hook is that the players -- members of a law enforcement or investigation agency, for the sake of the example -- find the corpse of an immigrant from Hong Kong in a hotel room in New York. He was stabbed, but before he died he wrote "Freedom" in his own blood on the carpet. He has only been dead for a few hours. According to his identification he worked in a restaurant in Chinatown. From here you can place important information in two obvious places: with the clerk at the front desk of the hotel, and with the owner of the restaurant.

Let's say the players talk to the hotel clerk first. He tells them that the room was rented by a woman, a Miss Sayers. She mentioned that she worked for an antiques dealer in Manhattan whose name he can't recall, but it began with an "M." The clerk knows nothing about the murder victim, except that he was discovered exactly the way the players found him. Traveling to the restaurant, the players interview the manager and discover that the murdered man has not been into work for over a week and that he stole a framed photograph of the Statue of Liberty from the restaurant manager's office. He writes down the address of the murdered man for them. From here, the obvious avenues for the players to investigate are either the antiques dealer or the home of the murdered man.

This kind of branching system is elementary to the construction of a mystery adventure. You can introduce elements one at a time or simultaneously, depending on how complicated you wish to make the plot. Avoid using too many twists and turns, though. You need surprisingly few plot twists in order to make a good adventure story, and the overuse of red herrings and deception, unless handled expertly, will simply confuse the players and have an adverse effect on the pace of the game. The players' investigations and dialogue will, if all goes to plan, fill out the plot for you and make the story seem much more gripping and detailed than it did on paper. Don't try to make the mystery more complicated than it needs to be, or you'll end up introducing too many elements and losing control.

When writing the adventure, bear in mind that the driving goal should always be apparent to the players. In the above example, the goal is to find out who murdered the man in the hotel room. Once they've done so, if they haven't uncovered another, larger crime, then the adventure is over. If you want them to keep investigating after they've solved the murder and stopped the culprit, then give them a reason to investigate. Perhaps a key witness in the murder case disappears or turns up dead, leaving another clue behind. Always make sure the players have a clear goal ahead of them, and be careful about stringing a plot out for too long.

It is vitally important that before you start to play you should research everything and check every single one of your facts, however minor or irrelevant you might think it is. The reason for this is that if your plot relies on any kind of science or logistics it can be very embarrassing if one of your players should know of a scientific reason that it wouldn't work. This is even more embarrassing if more than one of your players should spot it, and crippling so if they all do. Also make sure that the proper research channels are in place for the players so that it does not seem like you are overly steering them. You should prepare NPC professionals who are experts in the relevant fields, libraries and other physical databases, and any other kind of media the players might require. It is not necessary to actually have statistics or information available for all of these, but if you do not then you should have a plausible reason for the information not to be available.

Running The Game

It's all very well having planned the adventure, but when it comes down to actually playing the game it can all go horribly wrong. Preparation is not the only science involved in running a good mystery scenario, and even the best referee can fall over if he or she doesn't keep in mind a few important principles while playing.

First, and perhaps most importantly, you must maintain a very careful pace. Moving the adventure along too fast by feeding the players too much information can throw them off the scent, and if they haven't yet caught up with the plot the way you planned then you can lose them entirely. This is very easy to do, and will ruin a mystery scenario faster than anything else. Conversely, if the adventure is too slow then the players will get bored and lose interest in the plot regardless of what else is going on. Pacing is the most important element of running a mystery adventure. Getting it right can take several attempts, and this is another good reason to keep your mysteries simple to begin with.

It can also be important to maintain a poker face when out of character. If you smile at the wrong moment, or look as though the players are on the right track when they're not certain, it can essentially amount to out-of-character information. This is not so important if your clues are relatively easy and are really little more than tools to advance the plot, but if the game is supposed to be a tightly-wound mystery that taxes the players' brains then it is vital that you do not give anything away.

Finally, as with all games, you must have at least a loose set of contingency plans prepared. If the players get stuck and can't work out what their next move should be, especially if they've overlooked a clue or are missing vital knowledge, then you need a way of dropping hints smoothly and subtly before they start to get frustrated. Have an NPC or two prepared who can turn up with an important piece of information, or maybe a news broadcast that contains the missing clue. Remember, it's much better to insert new information using events than it is to use characters. It's a lot smoother, and if it looks like a scripted event then the players will feel like they've figured it out for themselves. But, as long as it fits the story and happens logically, you should be able to get away with any kind of exposition even if the players realize you're feeding them clues. Just don't let an NPC solve the mystery for them.

Likewise it is possible that the players will figure out what's going on more quickly than you anticipated, or that you

accidentally give away a piece of information too early. You need to be prepared to insert the ending to your adventure sooner than you had planned to and yet maintain the consistency of the story. If the villain was supposed to have stolen the ruby and boarded the train by the time of the final confrontation, and the players have managed to uncover the plot and hide the ruby before the villain can get to it, then again you need a contingency plan. If you manage to seamlessly slip in a dramatic alternative to the ending you had planned, or if you manage to insert the ending you had planned while missing out the part of the plot that you have accidentally skipped, then the players will love it and you will have pulled off a major coup. They'll have outdone themselves, and so will you. They'll have solved the mystery before they even had all the clues, and you will have provided a dramatic climax despite them pulling the rug out from under you.

There are only two near-foolproof ways of doing this. The first is to have a climax that cannot easily be avoided. For example, the ending you have planned could be a showdown with the villain in his penthouse apartment. The only way this will come about is if the players find out that he was behind the whole thing and confront him. It doesn't really matter if they work out that he did it any earlier on in the game than you planned; just have him waiting there for them when they arrive. As long as the scene does not require excessive timing, or for the players to behave in a very specific way based on later plot elements, this can be done with relative ease. The other way is to have a set of endings prepared, a collection of "if/then" conditions based on the players' activities and successes. This is much harder but, if you pull it off, can make for a very memorable adventure.

And that's about it. Remember, start out with something simple. Place a clue, work out the branches of investigation, and have a few back-up plans prepared in case it doesn't go as planned. If you prepare carefully, and know your plot well enough, you have nothing to fear. Above all, remember the first rule of gaming: everybody is there to have fun.

Mog the Half Orc's Pit Fighting Circle

for *GURPS Fantasy*

by Royce E. Day

It's ugly, it's not talked about, but below a certain social level in the city of Megalos you can't deny it's there. Every once in a while a high-minded priest makes a demand of the Megalos Guard and burns the place down, but it always shows up again in a day or so in a new spot, and with crowds just as large as before. Mog himself hasn't been caught yet, though there's a fair reward (\$200) for his capture on the charge of "creating a public disturbance" (rioting is a regular event at the Circle).

The design of the place is pretty simple. The inner circle consists of a sand-lined pit nine feet deep and about 20 feet wide, surrounded by rough benches except for two wooden gates on opposite sides where the fighters enter. Outside this area are a couple small buildings (sheds, really) where combatants and their trainers/owners can have some privacy before the fight begins, and the usual array of itinerate merchants hawking souvenirs of questionable quality and food of even more questionable origins. There are also, inevitably, bookies in the area. Though none of them have a clear franchise from Mog, occasionally one manages to beat off his competitors and gain exclusive business for all bets on the Circle's fights. Chaotic systems being what they are, it's usually an open market again in 24 hours (or less, depending on how fast the bodies can be disposed of).

Events in the Circle occur every day (including Sundays, much to the aforementioned righteous priests' disgust) usually starting early in the afternoon, and proceeding until sunset. There's no particular set schedule otherwise, audiences for Circle fights appearing about five minutes after the crier Mog hired starts announcing the day's card. Once enough of a paying audience shows up to fill the seats (\$1.00 a head), the fights begin.

Events vary, sharing only in their utter brutality. Be it gladiators, cock fights, bear-baiting, or worse, every fight in the Circle sticks to a few very basic rules.

- **Rule 1:** Contestants enter from opposite sides of the Circle at the sound of the gong.
- **Rule 2:** No magic.
- **Rule 3:** Last one standing wins the purse.

The purse is generally 10% of Mog's take at the entry gate (\$50 to \$100, usually). Humanoid combatants are permitted to tap out during a fight, though the audience much prefers it if they're either crippled, unconscious, or dead. Animals generally fight to the death. If the audience isn't happy with the fight's outcome, they aren't afraid to show their disapproval by either flinging whatever they have at hand into the Circle, or sometimes physically entering it themselves to attack one of the fighters. Mog allows this, mostly because it makes for a better show, and encourages fighters to play to the crowd.

At the end of the fight the winner is helped out of the Circle to collect his purse, and the loser is pulled out and thrown into the street. Medical aid after the fight is the responsibility of the combatants.

There are generally four or five events a day. Mog pays out to the winning fighters/owners at the end of the day, and in that one respect is generally honest. The mix is generally one or two humanoid fights (there aren't *that* many wannabe gladiators in the city) and the rest animal events. If there's one odd thing about Mog's whole operation, it does seem like he somehow has unusually steady access to exotic animals to stick into his pit, like lions, tigers, and things locals have never heard of.

The most popular event is humanoid on humanoid combat, of course. Armor more substantial than heavy leather is frowned upon by Mog, though any sort of non-ranged weapon is welcome, the more exotic the better. Given the confined area of the Circle, it's usually one-on-one, though pairs also make an occasional appearance. Most of the

regular fighters that appear are human of course, though for some reason Mog offers a double purse to any half-elf vs. half-elf fights. Despite having kept his Circle operating for at least two years now, no regular fighters have made a name for themselves yet. For one reason or another they tend to drop out once they get a reputation going, probably because they sensibly figure once they've earned a good amount of coin, they can move on to a safer occupation.

Secrets

The biggest one behind this whole operation is that Mog the Half Orc isn't one.

Mog's name is really Cai Evertree, and he's no half-breed creature, he's a full-blooded Dark Elf. His family has been in the business of organizing bloodsports for almost a thousand years now, and he's just on a business holiday to help expand operations. He came over to Megalos about three years ago, on a mission to find new fighters and exotic animals to sate the jaded tastes of Dark Elf crowds. The family's extensive stable of slave warriors and animals were becoming a bit stale, and to pump up business some new bloodlines had to be found. So far he's been having the time of his life.

The simple fact is that he finds it absolutely hilarious that humans and other creatures brought by the Banestorm are so utterly desperate for a pittance of coin that they're willing to throw themselves into a grotty, pathetic excuse for an arena and risk their lives for a purse that would be spat on by even a novice Elven warrior. Even better, many of them are disgusting, mongrel half-elves, who die in the Circle and leave the world before they can produce any more perversions of nature.

But there is a practical side to the whole thing. Promising fighters in the Circle are sometimes kidnapped by Cai or his associates, to be transported back to the secret Dark Elf strongholds and finish their lives serving in arenas that will properly show off their talents. He takes care when he picks his target(usually someone who is new to the capitol and has no immediate family or friends nearby), and is careful to leave no evidence of his crime. Within an hour of catching his quarry, the person finds themselves in the cells underneath Cai's family's estates, ready to start his *real* training and become a slave warrior.

Mog/Cai carries only two magic items on his person: a pair of rings which supplement his spellcasting abilities, and a logbook of his operations which is carefully hidden in the house he owns in Megalos proper (getting into the city is relatively easy when he's in his Elven form). In the city he maintains the identity of an Elven sage researching the recreation of the Church's hierarchy during the chaos of humanity's initial appearance on Yrth.

The first ring has an Illusion Disguise spell, which permits him to maintain his Mog identity for up to 24-hours without draining his personal mana, or if he needs to quickly escape the attention of the authorities. The second has a Scryguard permanently enchanted on it to keep him clear of the magical eyes of prying mages.

If he is discovered, Cai would first attempt to cast a normal Teleport spell to a preset bolt hole well away from Megalos, and then Gate straight home. Given his origins, he knows he'd undoubtedly be executed for his activities in Megalos. The henchmen he hires under the guise of Mog to kidnap fighters know nothing of his true identity, and figure their employer just likes to occasionally have someone to casually torture/murder.

Adventure Seeds

- **The Old "NPC Goes Missing" Plot:** A friend of the heroes, one that is well known as a competent soldier and who was also a little down on his luck, has disappeared after participating in a fight in the Circle. Questioning Mog directly will lead to a wall of indifference. "What do I care where somebody goes once 'dey take 'dere purse?" he'll say. But there's a witness who swears he saw their friend enter one of the outbuildings to collect his winnings, and never came out again.
- **Backtracking:** The PC's find clues about Mog's operation from the other end, during a mission that takes them to a secret dark elf city hidden deep in the wastes of the Nomad Territories. The local arena appears to have an unusual number of foreign fighters, most of whom prove to have had their minds blanked when they entered

their life of slavery. Will they be willing to follow the leads all the way back to Megalos?

The Hand You're Dealt

New Hexes for *Deadlands d20*

by Michael Suileabhain-Wilson

During the playtest for ***GURPS Deadlands: Hexes***, several playtesters observed that, while the hexes created for the book were written up for ***GURPS Deadlands*** and original ***Deadlands***, there were no guidelines for using them in a ***Deadlands d20*** campaign. At the time, there was nothing to be done: the proposal for the book hadn't considered the possibility of ***d20 System*** conversions, and license issues would have made it difficult to add such a thing anyway.

Still, a good idea is a good idea, and so here we present eight of the hexes from ***GURPS Deadlands: Hexes***, adapted for ***Deadlands d20***. Not all the new hexes from *Hexes* were able to be converted, but the assortment that has been runs the full gamut from powerful divinations through enchantments to hexes that make your arm try to kill you. They may even be useful to groups running ***d20 System*** campaigns in other settings, though some hexes may be less appropriate - and less balanced -- outside the *Deadlands* setting.

The Rock Springs Society for Games of Chance and Skill

The Rock Springs Society for Games of Chance and Skill operated in Wyoming from 1867 to 1869. To the world at large, it was a prettied-up opportunity for the biggest scoundrels in six states to get together and hone their skills by trying to pull their best scams on one another. That's true as far as it goes, but like so many things in post-Reckoning America, there was more to the Society than met the eye. Four of the Society's seven members were hucksters, and damn good ones at that. Besides meeting to exchange their mundane innovations, they exchanged hexes and other occult lore at their get-togethers until that cold February day when the Agency adjourned the Society for the last time.

The Society's *Proceedings*, published in 1867 and 1868, are avidly searched after, by ordinary swindlers as much as by hucksters. Only a dozen copies of each volume were ever printed (and several of those have been captured by the Agency), but the demand for them is great enough to have inspired several unauthorized reprints. On the face of it, the book is merely a record of what games the Society played, how the games went, and who was there. If you look closely, however, the attentive reader will notice a variety of swindles and cheats leaving their traces on the record. Many readers hope to learn some new shenanigans by poring over its pages. For those with the eyes to look even closer, however, the *Proceedings* contains potent hexes committed to code by the members of the Society.

Some aficionados of the *Proceedings* claim that there existed a draft of the 1869 *Proceedings* which includes an extremely deadly hex by the legendary "Red" York; the search for that manuscript has become many a huckster's obsession. Skeptics note that if "York's Last Hex" did exist, it wasn't enough to keep the Agency from gunning him down in the bathtub.

Blink

Transmutation

Level: Hck 2

Components: S

Casting Time: 1 action

Range: Close (25 ft. + 5 ft./2 levels)

Target: You

Duration: Instantaneous

Saving Throw: None

Spell Resistance: No

Blink is the more common name for the hex that Jim Hannigan poetically termed the Adulterer's Best Friend. It

instantly transports the caster to any location within the hex's range, as long as no person or obstacle is occupying the space he wishes to "blink" into. Casting *blink* does not trigger an attack of opportunity for casting a spell.

Burning Death

Evocation [Fire]

Level: Hck 4

Components: S

Casting Time: 1 round

Range: Touch

Target: Creature touched

Duration: 1 round/level, to a maximum of 10 rounds

Saving Throw: Fortitude half (see text)

Spell Resistance: Yes

Burning death, the hex that made "Red" York's reputation, causes the target to burn from within with a supernaturally accelerated case of rock fever. Each round until the hex expires, the target takes 1d8 points of fire damage; a successful Fortitude save reduces this damage by half. If the target dies from this damage, his body explodes into flame and is rapidly reduced to a pile of ash with a fist-sized lump of ghost rock in it. While the hex is in effect, the target also suffers a -4 penalty to all attack rolls, skill checks, and ability checks from the unbearable pain; this penalty is reduced to -2 if the initial Fortitude save is successful.

Ecstasy

Enchantment (Compulsion) [Mind-Affecting]

Level: Hck 3

Components: S

Casting Time: 1 round

Range: Close (25 ft. + 5 ft./2 levels)

Target: One creature

Duration: 2 rounds

Saving Throw: Will negates

Spell Resistance: Yes

Ecstasy, York's least destructive creation, overwhelms its victim with pleasure. While under the hex's effects, the subject is so smitten with pure pleasure that he may take no action until the end of the hex. While under the hex's effects, the subject is overwhelmed with pleasure and may take no action until the end of the hex; he is not stunned, however, and keeps his Dexterity modifier to AC. This hex may be addictive (rumor has it that the Agency was able to get the drop on York because he was blissed out on his own hex). If *ecstasy* is successfully cast upon the subject three times within 10 days, he must make a Will save to resist becoming addicted to the hex. This addiction is equivalent to a *lesser geas* compelling him to seek out more opportunities to experience the hex's pleasures. If he manages to get *ecstasy* cast on him again, it ends the *lesser geas*, but he must also make another Will save to avoid becoming addicted afresh. The addiction may be lifted by any of the spells that will lift a *lesser geas*, as well as *remove disease*.

Hell's Arsenal

Transmutation

Level: Hck 2

Components: S

Casting Time: 1 round

Range: Touch

Target: One weapon

Duration: 1 minute/level

Saving Throw: Will negates (harmless, object)

Spell Resistance: Yes (harmless, object)

Bathes the target weapon in a halo of flame. This flame will not harm the weapon or its wielder, but anyone struck by

the weapon takes an additional 1d6 points of fire damage. A missile weapon under the effects of this hex will confer the flame bonus on its projectiles. A weapon under the effect of *hell's arsenal* can ignite normal combustible materials, and can harm any creature harmed by magical fire.

Hidey-Hole

Conjuration (Summoning)

Level: Hck 1

Components: S

Casting Time: 2 rounds

Range: Touch

Target: One object

Duration: One hour

Saving Throw: None

Spell Resistance: No

Removes a non-living object to the Hunting Grounds for the duration of the hex. While in the Hunting Grounds, the target cannot be detected by any means limited to the normal world. Jim Hannigan was fond of using this hex in support of his nasty pilferage habit. Some maintain that he knew a more lasting version of it, and caches of Hannigan's treasure are just waiting in the Hunting Grounds for some enterprising huckster to riddle out how to get at it.

I Want Answers!

Divination

Level: Hck 3-9

Components: S

Casting Time: 1 action

Range: Self

Duration: Instant

Saving Throw: None

Spell Resistance: No

Paul Montenev was known in his day as the best hand with a manitou in all the Weird West, largely due to his mastery of this hex, which permits a huckster to get up in a manitou's face in a fashion not usually permitted by the stylized game of hexslinging. *I want answers!* compels the manitou called to answer one question about the Reckoning and topics with which manitous and their allies are involved -- critters, hexes, mad science, abominations, black magic, etc. This spell may be cast at any level the caster has access to; casting at higher levels calls a more powerful manitou, with more knowledge about the details of the Reckoners' plans. The results are usually cryptic; the power of the hex compels the manitou to answer, but most manitous really don't know much, and they aren't forthcoming with what they do know. Hence, only a clearly worded and relatively simple question, like "What was that thing that just tried to eat us?" is likely to get a clear answer. Questions about a unique abomination, or about any specific project of the Reckoners', is far less likely to get a meaningful answer; only a greater manitou is likely to know, and they're rare and difficult to control.

When *I want answers!* is cast, the Marshal makes a Knowledge roll on behalf of the manitou. The manitou's Knowledge skill is based on the level at which the hex was cast (see sidebar). The sidebar gives the *total* bonus to the manitou's roll, including Intelligence bonus. A spectacular success on the spell roll adds one level to the effective spell level. The DC for the roll depends on the question asked (see sidebar). A manitou's Knowledge skill and Intelligence cannot be enhanced by spells or items; the bonus given in the table is the maximum bonus possible. If the roll succeeds, the manitou knows the answer and must tell it, but may be cryptic and misleading. The more powerful the manitou, the cleverer it is in its misdirection.

Even if a huckster manages to browbeat a manitou into telling the truth and nothing but, the knowledge may be a two-edged sword. If a huckster intimidates a manitou into telling him how to kill a glom, that's no big deal, and the manitou will want to keep to himself the fact that he got slapped around by a mortal. If that same huckster had his luckiest day ever and managed to extort the truth about Reverend Grimme, a manitou wouldn't dare to hush that up.

That huckster may find himself the object of a little attention from los diablos any day now.

This hex may be unbalancing, and GMs should feel free to disallow it if they prefer to keep secrets out of player hands.

Knowledge DCs

10	Names of common critters, names of hexes
13	Abilities of common critters, specific properties of hexes
17	Names of abominations
20	Abilities of abominations
23	Names of unique abominations
27	Story behind a minor completed plot (famine in Charleston)
30	Abilities of unique abominations
33	Story behind a major completed plot (the Great Quake)
37	Story behind a minor ongoing plot (Simone LaCroix's zombies)
40	Story behind a major ongoing plot (the Church of Lost Angels, ghost rock)
45	Major secrets of the Reckoning (who are the Reckoners, what do they want, etc.)

Manitou Knowledge Skill

Spell Level Skill Bonus

3rd	0
4th	+3
5th	+7
6th	+10
7th	+13
8th	+17
9th	+20
10th*	+25

*10th-level hexes are, of course, usually impossible. However, because a spectacular success produces results as if the hex were cast one level higher, a 9th-level casting of *I want answers!* will summon a manitou that would be summoned by a "normal" 10th-level casting.

Phantom Amputation

Enchantment (Compulsion)

Level: Hck 3

Components: S

Casting Time: 1 action

Range: Touch

Target: One limb

Duration: 5 minutes/level

Saving Throw: None

Spell Resistance: Yes

This spell causes a manitou to pass into the limb touched by the caster. For the duration of the hex, the target cannot use the affected limb. Furthermore, the resident manitou may, at moments of stress, attempt to turn the afflicted limb to acts of mischief. This attempt is resolved like a normal Dominion check for a Harrowed, except that the manitou can, at worst, take over the limb. If the manitou wins a Dominion check, it can control the limb for 2 rounds, during which time it will cause trouble any way it can -- hitting or kicking allies or innocents, throwing away equipment, or even attacking the target. If, through grave misfortune, the manitou succeeds in winning Total Dominion, it gains control over the arm for the duration of the hex. Note that the manitou will not necessarily act in the best interests of the caster. A character who has been the subject of Phantom Amputation gets a +1 bonus to the roll to become Harrowed.

Rabbit Foot

Transmutation

Level: Hck 3**Components:** S**Casting Time:** 1 action**Range:** 10 yards/ level**Target:** Self**Duration:** Instantaneous**Saving Throw:** No**Spell Resistance:** No

Rabbit foot was Lucky Sanderson's signature hex. It jiggers the odds at the last second, snatching victory from the jaws of defeat. An attempt that by all rights should have failed may be successful with the aid of this hex. This hex allows the caster to re-roll any one failed skill, attack, or save roll when cast immediately following the failed roll. The results of the second roll are binding. *Rabbit foot* can be cast with an instant gesture, as a free action; using it in this manner counts toward the normal limit of one quickened spell per round.

Shift Wounds

Conjuration (Healing)

Level: Hck 1**Components:** S**Casting Time:** 1 minute**Range:** Touch**Target:** Living creature touched**Duration:** Instantaneous**Saving Throw:** No**Spell Resistance:** No

Ordinarily, it's difficult persuading a manitou to do something constructive, like healing someone. In order to seal the deal, a huckster has to offer an incentive: in exchange for healing the subject, the manitou gets to inflict equally dire wounds on the caster. *Shift wounds* heals 2d8 points of damage, while doing an equal amount of damage to the caster.

Homeland: Kralori

Eternal Peace, Peerless Tranquility and Bounteous Prosperity be upon you, for even unwashed and brutish barbarians have their own mean and unrewarding place in the Great Order of the Cosmic Dragon!

by Mark Galeotti

Kralorela teems with inhabitants, crammed into tiny huts clustering upon the sides of the much-irrigated rivers or the stone, brick and rice-paper tenements of the teeming cities. Temples stand on sacred places, monasteries and dojos among them. Government towns link villages to huge cities that swarm with official business, internal trade and religious administration. Atop it all the Imperial Dragon oversees peace, safety and serenity, through his huge and ubiquitous bureaucracy, dominated by coteries of palace eunuchs and courtiers, the mighty lieutenants known as exarchs and the countless mandarins and aristocrats across this huge land.

Kralorela occupies the eastern portion of Genertela. Colonies of Kralori are often found in cities overseas in Melib, Teshnos and much of the Eastern Isles.

Kralorela Homeland Keyword

Occupations Available: Entertainer (Dancer, Musician, Shadow-Puppeteer, Singer), Farmer, Foot Soldier (Spearman, Swordsman, Crossbowman), Healer, Hunter, Merchant, Petty Noble, Sailor, Scholar, Thief, Warrior.

Native Abilities: Enduring, Geography of [Home Province], Know Place in Society, Kralori Customs, Peace with Dragons, Speak Kralorelan.

Typical Personality Traits: Conservative, Nationalist, Obsequious to higher authority, Pious, Polite.

Typical Relationships: to Ancestors; to Family.

Magic: Common magic, Kralori Pantheon (theism).

Native Flaws: All abilities relating to Outside World 6. This indicates the extreme isolationist attitude of the common Kralori people.

Common Names: Names are a very significant indicator of social status. Commoners will generally have a single name reflecting their birth, such as Hong ("Farmer") or Kao ("Soldier"), as well as a nickname to distinguish them from all the other people in their village with the same name. Two names denote someone born or appointed to a petty office, such as Hong Ba ("Farmer Elder-Brother," a village headman) or Hong Zhang ("Farmer Protector," the head of the village militia). Three names are the sign of an aristocrat or hero, and four of the mightiest mandarins and generals and their families -- such people typically use only their more esteemed names. Thus, Duzhe Shu Chuan Jian ("Reader Clerk Boat-Master"), the fabled designer of the Kralori turtle-

This homeland was originally written for **HeroQuest**, but was cut due to space constraints. It will be used as the basis for the final version that will eventually appear in the first of the Kralorela books. I will be following this article up in the next few weeks with at least two more, including "Kralori Navies" and "The Two-Times Unfortunate Encyclopedists of Barbaric Deviltry," a hero band that was cut from the forthcoming **Masters of Luck and Death** because the hero band was cut from **HeroQuest**.

Kralorela is very much Glorantha's equivalent to ancient China, albeit one where dragons really do manifest themselves and the emperor and his closest lieutenants (the exarchs) and bodyguards are dragons or can take their form. However, the packed and noisy cities, the rolling paddy fields and the huge and impressive public works (instead of a Great Wall, Kralorela has huge bridges between islands and iron forts), as well as the presumption of absolute superiority over all foreigners is strongly reminiscent of imperial China at the height of its power -- as strong as during the Han dynasty, albeit without the same level of social and technological change.

barges, is universally known only as Chuan Jian. Women will generally have one fewer name than equivalent menfolk (and it is not unknown for peasant women to be known purely by a nickname or as "Hong the Unfortunate's Second Daughter" until marriage confers the name "Hong the Drooplip's Second Wife" or the like), but exceptions, while a minority, are not rare.

Origin

Kralorela is the Kingdom of Splendor, and all Kralori know it is where all wisdom, virtue and enlightenment reside. Since the shattering of the original Divine Solar Empire of HeenMaroun in order to recreate the world, Kralorela has been progressive and unchanging in its virtue, notwithstanding brief and transitory emergencies such as the tyranny of Sekever and the 352-year reign of ShangHsa-may-his-name-be-cursed.

Common Religions

The Little Mandarins

The most widely-practiced common magic among the Kralori is centered around the so-called "Little Mandarins," local village totems and ancient ancestors. This is magic of the peasantry, and it would be inappropriate and undignified for anyone of higher rank to practice or even affect to notice it.

Charms -- Escape Foreman's Attention, Frighten Bandit, Know Way Home, Light Fire Quickly, Move Quickly Through Mud, Pacifying Kowtow.

Two-Jade Ring

The two-named Kralori represent a very varied social order, ranging from the most important peasants to lesser bureaucrats. They include many who are not following in their parents' footsteps so much as trying to exceed their ancestors' achievements, and their optimistic, aspirational and ambitious views are at once a useful engine of progress within Kralorela and at the same time viewed with mistrust by commoners and aristocrats alike. This is also reflected in their relative lack of ancestor magic: how can you revere a figure whose path you are no longer willing to tread? Many have turned to the Two-Jade Ring, a philosophical movement which uses as its symbol and focus a ring made of the very cheapest kind of jade (co-called "gray foreigners' jade") given a rim of the best variety the individual can afford (which is thus replaced if and when he has prospered and can buy better), representing the transition from base roots and constant reinvention. The increasing political militancy of several members of the Ring has begun to displease the authorities, especially since the Great Defenestration of Laonan Tao, but only in Puchai Province are members required to register on the Roll of Disharmonious Souls.

Charms -- Resist Tradition, Think Different Thoughts.

Feats -- I Know My Worth, Locate Own Property.

Six-Sixes-Passed-On

Noble houses pay strict attention to their lineages, and it is regarded as a matter of pride to be able to chart "six-sixes" (a doubly harmonious number) of mandarin ancestors. These are all carefully noted in gold leaf on the Ledgers of Passed-On Excellency in the house's inner sanctum. Many also carve these genealogies into stones which are then worked into ornamental gardens. Through contemplation in these gardens, Kralori may attain a near-mystic understanding of their ancestors' virtues, and from this understanding derive common magic.

Feats -- Beat the Rebellious, Elegant Gesture, Ignore Foreigner, Know Relative's Age, Remember Family History.

Spells -- Grow Nails, Harmonious Blossom, Locate Appropriate Stone, Shame Underling.

Specialized Religion-Kralori Pantheon

The dominant religion of Kralorela is founded upon the great dragons, from whom everything else flowed. The ultimate goal of Kralori mysteries is to become a dragon, but for most this is an abstract concept, and instead the center of their faith is Right Action and observance of their just and proper place in the world. The Kralori religion is inextricably tied to the political system. The Emperor is both just and enlightened despot and also himself a dragon, albeit in human form. All Kralori practice the Imperial Adorations, channeling their worship and reverence towards the Emperor, through the officials known as exarchs, who rule provinces, marshal armies and dispense justice in his name. They also worship powers appropriate to their rank and profession, whether peasants calling upon their ancestors for help and comfort or mandarins learning to emulate former Dragon-Emperors.

The dragons of Kralorela do not recognize distinctions in otherworlds, seeing a more fundamental and significant division between Right and Wrong Action. Kralori may mix magics freely without penalty, so long as it is appropriate to their social rank and role. Thus, a mandarin could practice common magic deriving from the Six-Sixes-Passed-On, including spells, even if a devotee of Vashanti. However, this would not apply if he also used spirits of the commoners' Little Mandarins tradition.

Kralori Pantheon Keyword

Abilities: Know Kralori Pantheon Myths, Talk to Dragons, Worship Kralori Pantheon.

Virtues: Philosophical, Revere Dragons.

Magic: Divine aid.

Other Side: Worshippers travel to the somber court of the Udam Bagur, Archexarch of Hell. There, they are judged: those who have practices Right Action travel to the Excellent Palace of Pleasant Reward to await the Passing On of His Supereminence the Dragon Emperor, at which time their souls will accompany him to the next stage of existence. The rest face appropriate and measured terms being tortured by devils to purify their souls until they are deemed worth of appointment to menial positions within the Excellent Place or, worse yet, rebirth as a barbarian or other animal.

Sample Deities of the Kralori Pantheon

Entertainer: Sav Hual, the Great Harmony

Affinity -- Dance.

Grimoire -- *Divine Movements Classified* (sample spells: Know The Next Step, Many Moving as One, One Moving Like Many, Perfect Tone).

Farmer: Ebe and Okerio Tradition

Spirits -- Ancestor, Farming, Rice.

Foot Soldier: Imolo Wen the Swordsman.

Affinities -- Discipline, Know Your Place, Soldierly.

Healer: Serelaloon.

Serelaloon is a total pacifist goddess.

Affinities -- Absolution, Compassion, Healing.

Hunter: Hunters will generally be members of the Ebe and Okerio ancestor worship tradition, although the particular ancestral spirits they contact will often be hunters themselves.

Merchant: Tun Dai, the Factor.

Affinities -- Merchant, Organize.

Petty Noble: Han Majang, the First Minister.

Affinities -- Administration, Authority, Politics.

Sailor: Thrunhin Da, the Blue Dragon of the Deep

Affinities -- Appease Sea Dragon, Shiphandling.

Scholar: Vashanti, Emperor of Sacred Nine

Affinities -- Administration, Literacy, Precedent.

Thief: Chuman Kalasak [Sedsaru]

Affinities -- Escape, Hide.

Warrior: Heseroon Marn, Faithful Dragon Fighting School

"Warrior" in Kralorela indicates a dojo-trained martial artist. Heseroon Marn is worshipped as a common religion, as well as a source of the skill of Dragon-Style unarmed combat (although he also encourages other schools).

Feats -- Block and Riposte, Bone-Shattering Kick, Soaring Sky Leap, Sudden Raking Blow, Twist and Strike.

Reasons to Have Left Home

Kralorela is rigidly caste oriented and anyone not content with their father's lot in life risks being branded a troublemaker and disgrace to the family. Such people are often driven out through violence or being ignored or leave voluntarily out of hope or desperation. Sometimes soldiers and others learn there is more to life and get wanderlust. Many people roam about as monks or seeking training in martial arts.

True Paths to Perfection: the Four Yesses and the Four Nos

Truly, it is written, that the Kralori are the finest of all people: respectful, virtuous, diligent and happy in our reverence for Godunya, our Divine Dragon Emperor, and his perfect and just rule. While immeasurably superior to the unfortunate souls not blessed by Kralori birth, we must nonetheless always heed the Four Yesses and Four Nos.

Yes to Reverence, No to Novelty. Reverence is a step backwards into our eternal future. We have much to revere. First and last are the dragons. Second and there are the Emperors, now dragons themselves. Third and everywhere are our ancestors, who lovingly scorn our failures that we may improve and defend us from spirits and devils who would steal our hearts and livers in the night. Fourth and ever are our traditions, which show us Right Action that we may serve the Emperor after our deaths in the Excellent Palace of Pleasant Reward. Bodkartu the Hidden Death protect us from forbidden lore, Bei Feng the Muter chastise the unruly mind!

Yes to Obedience, No to Disorder. Just as Ebe the Wild Man was tamed by Okerio, and from his lusts and passions came Aptanace the Sage, the father of the civilized arts, so too we must curb our disorderly natures and kowtow to the heavenly order of fate. Of course, there is impious novelty and there is an acceptance of our destiny -- if we appear to make something new that works for the good of Kralorela, then this must mean that we were guided by draconic inspiration, and all is as it should be.

Yes to Pride, No to Uncertainty. The humblest Kralori ox-driver is nonetheless greater than a king of the barbarian outsiders, for they are so corrupt that they have become devils, even if they do not know it. This is a blessed land, and it is not right or fitting for us to doubt that or be curious about the ways of the barbarians. Even our mariners prefer to sail the Harmonious Waves, the waters which wash our shores. That way they remain within ear-shot of the great brass Presence Bells which dot our coastline and can remind them of their homeland even when becalmed in the fogs of the Kahar Sea.

Yes to Manners, No to Impertinence. Know your place -- give appropriate respect to those placed above you in the

Eighty-Nine Rungs of Precedence, whether bowing to your local Block Warden or Village Elder or performing the Three-Heron Kowtow to an exarch. Even foreigners are to be pitied, not mocked for their stunted souls, false gods and distressing standards of personal hygiene. If they are possessed of the appropriate chop to travel in our blessed land, then do not call them "barbarian devils" or nail them up in the ox-sty without good reason.

Quest for the DragonLords

Published by [DragonLords Inc.](#)

Designed by Robert Johannessen

Graphic design by Jarmo Kaski

Illustrated by Sam Yip, Peter Wolf

boxed set, full-color mounted game board, 4 reference cards, 12 quest cards, 24 scroll cards, 9 dice of varying sizes plus a special crystal die, 60 gold and silver counters (kings, wizards, equipment, magic items, etc.), 24 pegs, plastic storage tray, 75 plastic disks in three colors (to represent stacks and denominations of units), 160 plastic figures for four armies, 4 DragonLord figures, 8 ships, 12 sails, cloth bag full of gold nuggets, CD-ROM with game rules; \$59.99

From the outset, the DragonLords Inc. game *Quest for the DragonLords* is an impressive and daunting-looking item. The box is a deep black with shiny, red-foil inlays, thick as a brick, and just begging for a coffee table upon which to show itself off. The quality extends to the pieces inside, but the proof is in the play.

The object of the game is to control the world, eliminating your opponents by capturing their Kingdoms or killing their kings.

Players begin by selecting one of four armies (Elves, Dwarves, Barbarians, or Orcs), some equipment for traveling in the Wastelands, a scroll card (a one-shot spell), a ship, and three counters for your King and Wizard (the third is a decoy to prevent players from knowing where your regent is).

In turn, players choose some land. There are six realms in the game (areas surrounded by a colored dotted line), each with a capital city space called a Kingdom. Once you claim a Kingdom, you take turns placing additional units until the other territories are filled. Choosing adjacent spaces makes reinforcement easier, but there are other valuable sites like the teleports (spaces from which Wizards can drag armies about the board), gold spaces, and mines.

A player starts by buying units to be placed at turn's end. The Orcs have the advantage here, being able to buy multiple units at a discount. Then comes movement: Units at sea claim island territories, armies reinforce or attack desirable property, and quest parties travel the Wastelands. Winning is easiest with a DragonLord, a powerful master of those beasts with devastating combat effectiveness, hence journeying into those areas that were laid low in a bygone age by those warriors.

You may have multiple parties in the Wastelands, but may only activate one in each of the two Wasteland sections on your turn. There you roll for movement along a simple track, traveling to villages for equipment (you only get one set at the start of the game), shrines for talismans and additional scrolls, and witches' dens for potions, elixirs, new spells, and DragonOrbs (useful when you stumble across a dragon in need of charming).

The Draw Quest Card spaces require you to follow the instructions on a Quest card. Some require specific equipment like a pickaxe just to attempt them. You must roll the crystal die to see if the gods bless, curse, or ignore you. These

results aren't always what you might think. Blessings usually net you something, but you may end up empty-handed. If the gods ignore you, it's not a neutral result -- you could still be attacked. And curses, typically bad, may let you break even or even offer a benefit.

Next comes combat, fought to take territory or waylay competing quest parties. Fights can happen when opposing units meet in the Wastelands, at sea, and on land. A standard combat involves the attacker rolling a die for each unit he has -- every 3 or less (4 or less for the Barbarians) is a hit. The races roll six-siders because they all have a Defense of 6. If you're fighting some of the weird creatures of the Wastelands, some of them have higher Defense scores like 8 or 10, requiring bigger dice and making it harder to roll a 3.

The defender rolls a counterattack the same way. Combat is usually simultaneous, so all casualties are removed at the end of a round. Some exceptions exist. Notably, the Elves have the ability to sneak attack their enemies: Success denies them a counterattack, but failing to remove all the units forces them to retreat without taking the land. Certain spells can also take out units precipitously.

Naval combat is similar, only once joined the attackers cannot choose to retreat (Wizards and DragonLords can still teleport out of combats). No DragonLords are allowed into the Wastelands, so they cannot take part in fights there. They can't remain in naval spaces either, so they must leave during the Transfer phase, but in the meantime they tear through fleets and units like cardboard with their fiery breath.

The chance to hit, called the Total Attack Strength (T.A.S.), can go up or down for the imposing presence of a King, an attack on the well-defended Kingdom itself, and various spells that bolster your troops or demoralize your enemies. Whoever is left after the battle may man any ships now lacking crews, and is in control of the territory in a land battle.

Transfer phase allows you to shift units to adjacent territories to account for losses, or to replace troops who have moved into other spaces. Once you know how much land you've taken, you get income. During the Income phase, you reap rewards for all the land you took, unless you've lost your Kingdom space somewhere along the line. If this happens, whoever took it takes all the money that was on that spot (if you possess multiple Kingdom territories, you can split up your coffers to be on the safe side), and you can't get income until you get back a Kingdom. It will also cost you in the Reinforcement phase. Ordinary territories are worth one gold, while gold-colored spaces are worth five. Those gold spaces with a mine are worth 10 if you're the Dwarves.

Finally, it's time to replace losses in the Reinforcement phase. You can pump new units into the territories in a realm where you hold the Kingdom (so you can't dump them into a realm where you just established a foothold unless you were good enough to take the capital).

Quest for the DragonLords is nothing if not ambitious, and with a price tag to prove it. Not that you don't get your money's worth; the components are a gamer's dream. The plastic troop figures are different for each race, and you could nick them for any of several other games. They aren't gorgeously sculpted -- they have a half-melted-at-the-edges look that befits only the Orcs and makes the DragonLords look like Deep Ones astride their mount -- but someone went to more than a little trouble to work them. The cloth bag full of little gold nuggets is a mixed . . . uhm . . . bag. A clever idea, you're supposed to use the bigger pieces as 5s and the smaller bits as 1s, but there's no standardization. These really are irregular bits of lumpy metal, and too many of the pieces are exceedingly small. Whatever the process used to render them, some are smaller than a sesame seed, which means a lot of them are going to get lost in short order (and given the coloration of the board spaces and the fact that funds are supposed to sit on the board itself, it's a recipe for aggravation).

The board, a six-section foldout, is gorgeous, and the thumbnail bits painted onto the Wastelands spaces can look positively medieval. It also has its troubles. The dotted lines (and occasional mountain ranges and rivers) that are supposed to delineate the different realms and territories use colors that hardly leap out at you. It's pretty clear what's supposed to be where, so you won't spend the whole game squinting, but be prepared to do double-takes throughout the game to ensure you're making legal moves.

The reference cards are thorough, listing available magic items and spells, action sequences, your race's costs and stats, a key to the Wasteland, and a spell track for up to three Wizards. These have holes in them into which you place

plastic pegs so you know which Wizard has which spell(s), but not all the pegs and holes are a good match.

The rulebook is a fancy thing, big, with big type and full-color illustrated examples of play. It's hard to say this was an unnecessary expense, but for all the bright and spacious pages you still have to consider the three pages of credits, needless back-cover designs, and, inexplicably, "Notes." Add to this that there are some big incidental pieces of art in the manual and you have a lot more rulebook than you have rules, which is worse when you read them and see just how quickly the rules lawyers will tear into it. Worse yet, the included CD-ROM has the rules on it -- not everyone will have a computer, but there's an enormous amount of redundancy. (There's also an animated sequence on the disc - fine work for a small press item.)

The counters are all pretty nice, but cards might have done the same job more simply. They're supposed to stack with the units in the game (this would take up less space, and now you know which quest party owns what stack of equipment counters), but they really only stack with other equipment counters. Units don't fit snugly with the small poker-chip style counters used to indicate multi-unit groups, and those don't fit with the counters, and . . .

Something of a cross between *Talisman* and *Risk*, the game is staggered between the game play in the Wastelands and the larger game of conquest. It seems awfully easy to get hold of a DragonLord and pretty darn hard to do away with one. The challenges of the Wastelands lie entirely in the Quest cards (of which there are only 12, detailing the strangely well-populated and green "barrens"), and some of them are brutal. There's not much chance for skill to carry the day. It all boils down to die rolls, the results of which don't always make sense. The larger, strategic game is the better part of the set, but there's not much here to make even the novice war gamer sit up and take notice. The attack and defense procedures and mix of forces do little to enhance rules that have been in use since *Axis & Allies* hit the shelves.

But you do have to take the game as a whole, and while the bits don't always come together as smoothly as you'd like them to, it's not a bad game. It's just not terribly original, borrowing as it seems to from several sources. It's faster than many, and the DragonLords -- plus the fact that the mystic elements of the game prevent it from degenerating into seeing who can break through the other man's heavily fortified borders first -- can put the kibosh on drawn-out military excursions into enemy territory.

Given the cost, problems, and lack of direction in *Quest for the DragonLords*, the value of the decent game underneath it all is, sadly, a dilemma most easily solved by putting your money elsewhere.

Ruins of Rathess (for Exalted)

Published by [White Wolf Publishing](#)

Written by James Maliszewski and John Snead

Illustrated by Ed Bouelle, Leanne Buckley, Ross Campbell, Shane Coppage & UDON

Cover by Kevin Lao & UDON

96-page b&w softcover; \$16.95

Ruins of Rathess is the newest supplement for White Wolf Publishing's RPG set before the World of Darkness and after the First Age, in the Age of Sorrows, [Exalted](#). It bears similarities with the previously released ***Time of Tumult***, but is not an anthology of adventures. Instead it terms itself, "A Deadly Adventure Locale," detailing as it does the crumbling city of Rathess, capital of the Dragon Kings and once prime city of the First Age, the capital of Creation. As an adventure locale, no plot or actual scenario is given in ***Ruins of Rathess***, but rather the authors give us a treatment of the city's history, its surroundings, important buildings and utilities, denizens and foes, plus its dangers and rewards. All of which can be used as a place to loot, a place to hide, a place to explore, or even as a place in which to find allies and restore . . . Which of course, will attract the attention of more Solar Exalted and the unwanted attention of the Terrestrial Exalted.

The book is up to White Wolf's usual production standards, and is both well written and engaging. It does open with several pages of history, which like the first few pages of the core book is not as interesting and easy to read as the rest of the supplement. That said, it at least serves to establish the place of the Dragon-Kings, their history and their capital within Creation. The supplement's artwork is a little variable in quality, with the anime style of Shane Coppage being the best of the illustrations. Conversely, the cartography is all uniformly good, though it is a shame that there is not more of it. It should also be pointed out that while the blurb on the back cover describes ***Ruins of Rathess*** as both, " . . . [A]n adventure reference for Storytellers and a setting resource for players," there is no way in which any player should be allowed near its contents. There are too many secrets contained within.

Located halfway between the Elemental Poles of Wood and Fire, Rathess lies deep in thick, perilous and hungry jungle. Before the foundation of Meru, the new home to the Solar Deliberative, Rathess was the capital of the Old Realm and bulwark in the war against the Primordials. It is also the capital of the Dragon-Kings, saurian worshippers of the Unconquered Sun and allies of the Solar Exalted. These long-lived beasts -- over three centuries -- turned inwards to dwell on their own affairs after the move of the Solar Deliberative, and less on the defense of the Realm. This involved gladiatorial events and festivals, then sectarian violence and dark sorcery, including the summoning of demons. Their attention wandered from the gods granted for worship by the Unconquered Sun as a reward in the war against the Primordials and more to local spirits and deities. This included Han-Tha, the Ghoulish King, whose cult preached the consumption of the flesh of the dead to gain their power, and who aimed to bring about such an orgy of violence, death and feasting that he could be raised up and recognized as a true god under Heaven.

The Dragon Kings declined further and shut themselves off from Creation, their intelligence dimming further as they did so. Without their attention of their granted gods, and their own inattention to their young, there were fewer and fewer Dragon Kings to spend the decades necessary to raise their young from their natural-born savage state. Until the

Great Contagion struck, Rathess was a protectorate of the Dragon-Blooded, but since, its reputation has been that of the treasure trove of the Southeast. Now it has been picked bare, but still contains secrets within its towers, to be explored and uncovered, not just by those brave enough to endure the dangers of the jungle around it, but by the servants of the Ghoul King, who still seeks to elevate his status.

Though mentioned in previous *Exalted* supplements, *Ruins of Rathess* provides the first real treatment of the Dragon Kings. The first of the Primordials' experiments at creating sentient, thinking beings, Dragon Kings are not Exalted, but upon death, their spirits are reborn into a new egg; eventually, the young Dragon King can be civilized enough to recall memories of their prior lives. Though they can channel Essence, they cannot employ charms like the Exalted can, and instead follow 10 ordered Paths that teach them to shape their essence in order to transmute themselves and affect their surroundings. The supplement only details six powers across three of the 10 Paths of Pre-Human Mastery, which some may find to be a limitation to *Ruins of Rathess*, as may be the lack of creation rules for the Dragon Kings themselves. This would be an unfair criticism, because it perfectly models the situation within the city itself. There are relatively few of these creatures within the city, and even less who are partly civilized, and certainly almost none who are fully civilized. Thus their knowledge of the Paths of Pre-Human Mastery is also limited.

Getting to the city is difficult enough, as it lies several hundred miles from the nearest town in the midst of thick jungle, home to both deadly diseases and hungry beasts; *Creatures of the Wyld* details many of these creatures. It will take weeks of travel deep under the canopy and less time along the river, with the quickest route probably being via air, whether across the treetops or above. Once there, adventurers will discover a circular metropolis in the Mesoamerican mould, with wide boulevards, great step-pyramids, soaring towers of apartments, ports for the aerial vessels of the First Age, an undercity that extends down several levels, and outer edges severely overgrown by the surrounding jungle.

These actual locations include the Tombs of the Exalted, the great Arena of Atlakki, the Great Observatory, the Pyramid of the Sun, the Living Towers where the Dragon Kings once dwelled, the Flying Towers, and the Underway. Both their history and current status are given; more interestingly, there is also a solid guide to repairing some of the devices found therein. Doing so will not be a step taken lightly, as it will take great strength, men, time, and resources to undertake and complete. In some cases, the reward cannot be taken away, such as the orrery with which the future can be divined, while some such as the crashed airship will provide a circle of Exalted with great means of travel. The orrery and other items that cannot be removed, as well as several Manses, are covered in the chapter on rewards.

There are also allies and enemies to deal with in the city. Potential allies are the remaining semi-civilized Dragon Kings, particularly if the characters are Solar Exalted. Probable enemies are the followers of Han-Tha, lead by a corrupted Exalted known as the Goblin King, who commands a horde of goblins and other creatures, and who works to restore some of the city himself. Beyond the city, the Wyld has crept close and the Fair Folk will have to be dealt with should the restoration of Rathess be an aim. Where necessary, all of these NPCs are fully detailed, as well as several new gods particular to Rathess.

In terms of artifacts as rewards, Rathess offers up plenty . . . if the players are prepared to work for it. There are plenty of samples detailed, of both Dragon King and human manufacture. The former includes vegetative technology such Green Eyes (tiny plants that turn the wearer's eyes jade green and improves his eyesight), Vine Klaves that impale themselves onto the user's arm; crystal technology that is primarily mundane in the form of lights, air ducts, and lift tubes, but does include several weapons; and other artifacts. There are relatively few human items, but they include an intact warbird, once used by the air cavalry of the Old Realm.

Although no scenarios or plots are given within its pages, if there is a core story to explore in *Ruins of Rathess*, it is in its restoration by the player character Solar Exalted. There are suggestions for handling other celestials, particularly how the various inhabitants of the city will react to them, but the sense is that the emphasis is firmly upon the Solar. In fact, using it for any other purpose -- perhaps as a place to just loot or hide -- may well be a waste of its contents. To that end, there are plenty of hooks and story ideas contained within the writing.

If the *Ruins of Rathess* has any antecedents, it is in the " . . . *By Night*" series of supplements published by White Wolf for their *World of Darkness*, and in the *Parlainth: The Forgotten City* campaign setting published for FASA's

Earthdawn RPG. In comparison with the " . . . *By Night*" series, the situation in Rathess is far more static, with far less going on. This is due to its ruined nature and also in the concept core to the **Exalted** RPG -- that the player characters really can affect the world around them. This is not to say that events in Rathess will not progress, as other Solar Exalted will be attracted to the city and have the chance to further its storylines. Also about a ruined city, the **Parlainth: The Forgotten City** boxed set contained far more detail than given here, but again this is not really the purpose of **Ruin of Rathess**, as the **Exalted** Storyteller should be adapting its contents to their Circle of Exalted characters.

Ruins of Rathess very much plays up to the stock elements of pulp fantasy -- pre-civilized giant lizardmen, thick jungle, an ancient and fallen civilization, and a crumbling ruin awaiting the recovery and re-use of its wonders. None of this may be suitable for some **Exalted** campaigns, but Rathess has the potential to become the center of a whole campaign in itself, particularly if the players are interested in its restoration. If this is the case, this "locale" book gives a plethora of story hooks within its pages to fuel such a campaign, though more so for one that focuses upon Solar Exalted characters, as the remaining Dragon Kings will be prepared to ally with them over other Celestials.

--Matthew Pook

Dork Tower!

Dork Tower!

Parts of the Plot Pig

I was watching the *CSI* Season Two DVD set the other day, and "enjoying" the alternate commentary track that was provided with a few episodes.

I'm a huge fan of DVDs; my video tape collection consisted of maybe a half-dozen tapes before the advent of DVD, but I jumped on the digital bandwagon after a stellar year at the movies (1999, for those of you playing the home game). Initially, one of the biggest appeals of this new format was the extra goodies that were only available on the DVD release: deleted or alternate scenes, featurettes, and alternate audio tracks with commentary from those who helped make the movie a reality.

Unfortunately, for the most part these commentary tracks have been disappointing for me; they usually aren't terribly insightful, interesting, or worthwhile. In fact, for we now present, for your reading pleasure, a do-it-yourself audio commentary track suitable for those DVDs that lack one:

Director: You know, you two were really great to work with.

Actor 1: Oh, it was easy; it was a dream to be on this shoot. A real dream.

Actor 2: Yeah.

Director: Now this shot was tough to get, but we got it.

Actor 1: Check out the look on that one guy's face! He's all like, "What?"

Actor 2: Yeah.

Director: What was your motivation in this scene?

Actor 1: I don't know. We got really wasted the night before; I don't remember that day at all. Man, that one gal was *hot*!

Actor 2: Yeah.

Actor 1: Really great to work with. Say, wasn't this shot the one where you had that really interesting story about the kerosene-soaked rattlesnake and the renegade cabbie?

Director: No, I don't think so . . . no, that wasn't this movie.

Actor 2: Yeah.

Just copy, cut, and paste as appropriate to make that transcript the proper length for *your* movie.

Anyway, I continue to endure commentary tracks every so often, for a few reasons. First, it lets me put in a DVD I've already watched too dang much already, and convince myself I've not yet descended into obsessive-compulsive disorder because this time the experience is *different*. More importantly, however, every so often I'll get a gem amid the mounds of refuse.

Such was the case with one of the commentaries on the *CSI* Season Two boxed set. (See? And I bet you thought I'd forgotten. Heck, in a minute I'll tie it into gaming, and then you'll *really* be impressed!) The episode in question had the crime scene investigators looking into the death of a woman, seemingly in a sauna, although she showed signs of asphyxiation. At one point the chief examiner is interrogating a hotel employee, and the examiner points out that the woman could have died elsewhere and been moved, perhaps by getting her hair caught in the hotel whirlpool. At this

point the writer comments that she regretted using that line because, at *CSI*, "They use all parts of the pig." In other words, just about any fact or piece of information can be turned into an episode, and so by using something like that as a throwaway line, it more or less excluded its immediate use as a plot (although she did confess that the audience shouldn't be surprised if an episode of *CSI*'s ninth season revolved around someone drowning by getting hair caught in a whirlpool).

Anyway, that statement sparked something in me that related to <ding!> gaming.

See, I realized that I have a tendency in my gaming to use throwaway ideas as "filler" to flesh out my *real* adventure. And each of those throwaway lines can contaminate other adventures, by making them impossible (or at least more difficult).

For example, let's say I have an adventure that revolves around the seeming assassination of the king. After some investigative leads, I have the heroes discover someone who can assume other peoples' forms, and the disappearance of the trusted vizier. I then lead the heroes into believing that the vizier was kidnapped, removed, or killed by the doppelganger, only it's a red herring; the vizier ran off for an entirely unrelated reason, the doppelganger was a benevolent observer sent by his people, and the king had faked his own death to root out a political rival. The heroes unravel everything, case closed.

And, frankly, I could turn this into a darn good adventure. The problem is, with this kind of story I've now "skimmed" the campaign pool of a lot of potentially useful plots. After the conclusion of this adventure, it's pretty much unacceptable for me to use a plot that involves:

- A royal assassination (or anything that resembles one)
- Someone running away
- Doppelgangers
- Someone faking their death

Any of those elements stand a real chance of immediately evoking the previous adventure.

Something similar often happens (at least for me) in established game worlds; I'll find myself dipping into as many pots as the books offer, revealing a dozen or so secrets or interesting plot pieces in an adventure. And, again, once you've revealed that the Emperor has an illegitimate son who might be a contender for the throne - and the PCs have *met* him - then that element can't be revealed again; if that story element was squandered, then it can inadvertently keep a number of different stories from being possible. And, depending on how long the campaign is going to be, you may find yourself in a bind looking for new possibilities.

Even as a player, I note that I have a tendency to create convoluted characters who tap into a lot of different elements: clergy pretending to be nobles, vampires that turn into mages, and the like. I'm not sure I would do anything differently - since I generally have a blast with my characters - but I think I've finally managed to put my finger on one reason why I have difficulties coming up with additional characters in a campaign once it's time to retire an old PC.

As I've GMed, I think I've realized that it can be useful to "keep it simple." Many of the greatest stories from literature and movies are pretty simple and straightforward. Players can be satisfied by all manner of adventures, and I've found that players tend to prefer simpler adventures that they fully "get" than more complicated ones they can't follow. And it is often possible to pare away the chaff, making an adventure tighter. (On the other hand, many tales are also richly complex and satisfying; don't be afraid to use story parts if it's useful and will make a riveting game.) So going back to our royal assassination plot, I note that we don't need to introduce actual shapeshifters; the same effect can be created by having someone in disguise, with him being a foreign diplomat with forged papers. And the vizier doesn't even need to run away; in fact, unless he's been established elsewhere, the vizier may not even be necessary for the plot at all.

Of course, it's often not too late to use every part of that plot pig. For example, if you decide later that you've found the perfect use for the Emperor's illegitimate son, then it's probably possible to reintroduce him (assuming he wasn't killed in his introductory adventure); in fact, that would be perhaps an ideal situation, since then the players know about it

beforehand, and it's [foreshadowing](#). The trick is not to do slash-and-burn plot development, so that elements can be reused in future stories.

After all, it only takes a few little things to make a pig adventure.

* * *

As an aside, I've gotten lots of e-mail and newsgroup posts over the past week about last week's column. In fact, I suspect more people have written to tell me about *Casino Royale* than have ever actually *seen* said movie.

Oh, well . . . at least I still have my can't-miss idea about the behind-the-scenes story of *Romeo & Juliet* with a romantic William Shakespeare as the lead; I *know* that hasn't been done.

--*Steven Marsh*

American Anabasis: Bisociating Lewis and Clark

"Of courage undaunted, possessing a firmness & perseverance of purpose which nothing but impossibilities could divert from its direction."

-- Thomas Jefferson on Meriwether Lewis, Aug. 18, 1813

Two centuries ago this month, Congress approved the Louisiana Purchase, more than doubling the size of the United States at the stroke of a pen. The voodoo capital of New Orleans, and the pyramids of Cahokia, fell into American hands with that ratification -- but what else? Thomas Jefferson, the contradictory, brooding spirit of the Revolution, was gripped with the desire to know. He commissioned his private secretary Meriwether Lewis, and Lewis' old commanding officer the frontiersman William Clark, to find out for him -- and 197 years ago this month they came back and told him what they found. On the way, they accomplished the impossible, and joined America to its second seacoast. "Nothing but impossibilities" would seem to be an apt summary of the obstacles facing Lewis and Clark. And deep in the unexplored blankness at the heart of the New World, nothing but impossibilities remained to be discovered.

"In a northerley derection from the Mouth of this Creek in an emence Plain a high Hill is Situated, and appears of a Conic form, and by the different nations of Indians in this quarter is Suppose to be the residence of Deavels."

-- journal of William Clark, Aug. 24, 1804

Once the Corps of Discovery vanished over the horizon from La Chouritte, Missouri Territory, on May 25, 1804, they entered a true "terra incognita." Although the Indian nations hunted and trapped across the expanse, many of them (such as the Sioux) were relative newcomers themselves, and in any case they felt solid definition of the earth to be unwholesome at best. Lewis and Clark's source maps ranged from the optimistic to the completely useless; entire rivers, mountain ranges, and lakes appeared and disappeared from them seemingly at random. Was there a "Great American Desert" that blocked further expansion? Was there an immense inland sea, a ghostly echo of [John Dee's](#) "Sea of Anian"? Even the fabulous cities of Cibola and Quivira -- North America's [El Dorado](#) -- clung in fugitive state to the margins of the charts.

Near Vermillion in modern South Dakota, Lewis and Clark encountered a conical mound, perhaps owing "its orrigin to the hand of man," or "the residence of some unusial Sperits" including a "large [assemblage of Birds](#)." Further upstream still, they encountered "white bears" (haltingly explained as grizzlies by modern writers) and a mysterious "tyger cat or fox" that still lacks identification. Lewis heard "unaccountable artillery" on July 4, 1805, near Great Falls -- where two great UFO flaps would later manifest, in 1950 and 1975. "I am at a loss to account for this phenomenon," Lewis recorded, but confidently added "I have no doubt but if I had leasure I could find from whence it issued." This spirit of the Enlightenment soon rode in harness with Indian "medicine," as the Freemasons Lewis and Clark began to brand and blazon trees "to prevent the Savages from disturbing" their boats and equipment. It seemed to work -- the Corps lost only one man (to appendicitis) and no boats, and fought no Indians on the entire voyage. Caches of priceless trade goods they left on the westward voyage they found undisturbed on their return. Lewis even traveled into the heart of the sacred Blackfoot "Badger-Two Medicine" district in early 1806, on a mysterious surveying mission seemingly unrelated to the return journey. Meanwhile, Clark named a sacred butte of the Crow people "Pompey's Pillar" on July 25, 1806 and carved his name into it where "the nativs have ingraved on the face of this rock the figures of animals." (A later voyager described the hieroglyphs as showing three horsemen and three warriors on foot -- our [mysterious triplicity](#) working again?) Perhaps it's only coincidence that the original Pompey's Pillar in Egypt (thought to contain a [magical head](#)) is the highest surviving point in Alexandria -- and that Clark named the butte on the Egyptian New Year.

"It is not improbable that this voyage of discovery will procure us further information of the Mammoth, & of the Megatherium also . . . There is surely space enough . . . for Mammoths and Megalonyxs that may exist there."

-- letter of Thomas Jefferson to Bernard, Comte de Lacépède, Feb. 24, 1803

Or perhaps it's more than that. Because Jefferson, the "American sphinx," sought all manner of signs and wonders in the "American Egypt," the territory he had conjured into the American West. In addition to old standards such as pillars of salt, "monuments" of antiquity, and so forth, Jefferson also asked Lewis to keep an eye out for Welsh Indians

--descendants of Prince Madoc's 12th century [expedition](#), as attested by none other than John Dee -- and "the remains or accounts of any [animals] which may be deemed rare or extinct." Jefferson had uncovered what he believed to be a huge lion, the "megalonyx," in his investigations of Virginia fossil beds, and was engaged in a bitter dispute with the French naturalist Buffon on the nature of American animals. Buffon believed that American animals were smaller and weaker than European ones -- Jefferson's megalonyx, and the increasing number of "incognitum" or "mammoth" bones he accumulated, proved different. Rather than a debased afterthought, America's enormous mammoths and megalonyxes rampaged through an ideal, even providential, landscape. Again, coincidentally or not, Lewis and Clark were sent in the direction of what Jefferson's best maps showed to be a pyramidal "height-of-land" at the center of the continent, where four rivers (the Rio Grande to the South, the Missouri to the East, the Columbia to the West, and the Saskatchewan to the North) flowed away in the four cardinal directions. This meshes scarily well with the Biblical description of the four-rivered Garden of Eden, even as its pyramidal center resonates backward to Egypt and forward to [Mount Shasta](#) or the [Big Rock Candy Mountain](#). Lewis and Clark, in other words, had been sent [up the River](#), into the [Waste Land](#) to discover the Axis Mundi -- the Mountain at the Center of the World, the Gateway to Heaven, surrounded by beasts untouched since primordial Creation.

"Nothing would be more useful than the apprehension of [Meriwether Lewis], and even though I realize it is not an easy undertaking, chance might proportion things in such a way that it might be successful . . ."

-- letter of Nemesio Salcedo, commander of the Provincia Internal, to Governor of New Mexico Fernando de Chacón, May 8, 1804

Is it any wonder, then, that the Spanish sent four successive Spanish expeditions to stop Lewis and Clark, by force if need be? Jefferson worked to mask their voyage with three other expeditions of "antiquarian research" in the Louisiana Territory, and he sent Zebulon Pike on a wild career through the Southwest that has never been satisfactorily explained. Either Pike was lost, he was dangerously aggressive (planting a fort deep in Spanish Texas on the Rio Grande River), or the still-undefined West simply kept moving around him. (Laurie Winn Carlson, however, postulates in her riveting book *Seduced by the West* that Jefferson intended both Pike's and Lewis' expeditions as sacrificial martyrs to spark a war with Spain that would bring Texas and Florida into the Union.) General of the Army (and Agent No. 13 of the Spanish secret service) James Wilkinson sent his own expedition out in 1805. Its goal was to travel up the Yellowstone River "called by the natives, [Unicorn](#) River . . . which my informants tell me is filled with wonders." Wilkinson was playing a triple game to grasp these chaotic world-bending wonders of America Incognita, manipulating the Spanish, Jefferson, and Vice-President Aaron Burr, who spent the Lewis and Clark years seemingly mounting his own quixotic coup attempt to detach the American Egypt as his treasonous empire.

"I received, my dear sir, with unspeakable joy your letter of Sep. 23 announcing the return of yourself, Captain Clarke, & your party in good health to St. Louis. The unknown scenes in which you were engaged & the length of time without hearing of you had begun to be felt awfully."

-- letter of Thomas Jefferson to Meriwether Lewis, Oct. 26, 1806

But Lewis and Clark soldiered on, taking their longitudes and writing down their observations, fixing America into Jeffersonian reality. Unless, of course, they didn't. Lewis skips 400 days of entries in his journals all told, and the journals themselves may not have been the day-books Jefferson claimed they were -- they were not published, after all, for a century after the expedition set out. The mysterious "red notebooks" that the editor Reuben Gold Thwaites used in 1904 (and upon which Nicholas Biddle supposedly based his 1814 *History of the Expedition*) show no signs of having been dragged across a continent, drowned in boating upsets, rained on through an Oregon winter, or rested on convenient tree stumps and rocks throughout. In short, aside from a few "elk skin books" of William Clark's (which somehow escaped a mysterious wave of destruction), we have practically no on-site documentation of the journey at all. Furthermore, an expedition of 33 members camped at some 600 sites during a 28-month journey to the Pacific -- but only one of those sites has ever been found. For all intents and purposes, Lewis and Clark's West remains as big a mystery to us now as it was to them in May of 1804. Such mysteries reverberate over the centuries: Why didn't their settlement in Oregon ever see a ship during the height of fur-trading season? Why did the ordinarily prolix Jefferson mute his reaction ("unspeakable joy" indeed) to Lewis' return? Who were the mysterious white men seen in the mountains by Indians of the time, who warned off the 1807 British Thompson expedition with peremptory letters by a mysterious "Captain Jeremy Pinch" (whose name appears in no official records) from a nonexistent "Fort Lewis"? The letters threatened "more powerful means of persuasion in our hands than we have hitherto used" -- had a secret force

of Jeffersonian geomancers moved into the True Pyramidal Eden to harness the power of the mammoth for Republican Democracy?

"It is with extreme pain that I have to inform you of the death of His Excellency, Meriwether Lewis, Governor of upper Louisiana who died on the morning of the 11th . . . and I am sorry to say by suicide. . . . Some days previous to the Governor's death he requested of me in case any accident happened to him, to send his trunks with the papers therein to the President, but I think it very probable he meant you . . ."

-- letter of James Neelly to Thomas Jefferson, Oct. 18, 1809

And if so -- perhaps Lewis became expendable. Or worse yet, dangerous. He had seen too much, out there in Sasquatch country; he had heard the "unaccountable artillery" from the invisible fortresses, and drawn the True Arch and Square across secret America. Rather than the high-profile position Lewis seemed to expect upon his return, Jefferson mired Lewis in distant St. Louis as Governor of the Missouri Territory, while Wilkinson undermined him from New Orleans. In a "state of derangement" at his ill-treatment, Lewis set out for Washington -- significantly while in possession of "the original papers relative to my voyage to the Pacific" -- in [1809](#) to make his case to the new president, James Madison. At Fort Pickering, Tennessee, Lewis suddenly changed his plans -- rather than continue south to Wilkinson's New Orleans base, he struck across country up the Natchez Trace, accompanied by his servant John Pernier and by the Chickasaw Indian Agent James Neelly. Neelly reported sending Lewis on to Grinder's Stand, and arriving too late to prevent Lewis' suicide. With single-shot pistols, Lewis had shot himself twice (once in the head and once in the stomach), then cut his throat, arms, and legs with a straight razor. Neelly was the only witness to the story; Ma Grinder had refused to come to Lewis' aid after hearing argument "like a lawyer" and the shots. (She much later -- after Jefferson was safely dead -- claimed to have seen [three men](#) on horseback ride up before the argument.) Lewis' money (\$120 -- no small sum in 1809) vanished; Neelly simply appropriated Lewis' dagger, horse, and pistols for himself. And sent Lewis' trunks and papers to Monticello, for Jefferson's eyes only. Whatever secret Lewis hoped he had kept from Jefferson was gone. Pernier also committed suicide (or was found conveniently dead, anyhow) in Washington in 1810. Neelly disappeared in 1812, the same year that Sacagawea died "of a putrid fever."

"Specimens of all such bones as I [thought] curious and worthy your inspection . . . were sent on from this Place the 11th of October to the Collector of the Port of New-Orleans with a request to forward them to you at the City of Washington; you will most probably receive them soon after this letter. The bones are divided into three boxes (see inclosed list) and sent in different Boats with directions not to be opened on any pretence whatever. I have taken the dementions of all such bones as I thought Material, which I have retained for fear of an accident, and have also deposited with My Brother at Clarksville such as were remaining Parts of Rib, back bones, leg bones, thigh, ham, hips, sholder blades, parts of the upper and lower Jaw, Teeth of the Mammoth and Elephant and parts of the Mammoth Tusk's which may hereafter be had if Necessary."

-- letter of William Clark to Thomas Jefferson, Nov. 10, 1807

Which left only William Clark. His final mission for Jefferson was to supervise the excavation of a massive mammoth-bone find near Big Bone Lick, Kentucky, in October of 1807. Two years to the day before Lewis' suicide, he sent three boxes of artifacts to Jefferson -- with a perhaps casual note that he had retained a few bones (and perhaps some other artifacts) in a safe place "for fear of an accident." Nothing happened to Clark. He never turned his eyes back to the blank spots on the map, to the pyramids and mammoths that Jefferson concealed in the Secret West. Only his name remained, carved into Pompey's Pillar as though to cement Clark himself into America's sacred geography. Content with his frontier obscurity in St. Louis, he lived a long, prosperous life as Superintendent of Indian Affairs. He adopted Sacagawea's surviving children and did what he could to mitigate the impact of white settlement on the Indian tribes. He died on the feast day of Osiris, 1838, in sight of the American Nile, and was buried with full Masonic honors, finally climbing the Mountain to Heaven that he had found in the heart of America 33 years before.

À Moi La Légion!

La Légion Étrangère in its Glory Days

by Volker Bach

Weapons by Hans-Christian Vortisch

Gary Cooper kissing Ingrid Bergman under a glorious sunset. Columns of exhausted men stoically marching on under the burning desert sun. Laurel and Hardy in the clutches of an evil bedouin prince. The words "Foreign Legion" conjure up romantic and adventurous images in our minds. No wonder it makes a great roleplaying background. But what was the reality behind the image? The Légion Étrangère has had a varied and fascinating history that can as easily be injected into a campaign as any Hollywood fantasy (which is not knocking "Beau Geste" -- you can do worse than to play the Légion cinematic).

Beginnings

On March 10th, 1831, the newly crowned king of France, Louis Philippe, ordered the creation of a legion of foreign volunteers to serve in the French army. The practice was hardly new -- "Legions" of foreigners had fought both for France and her enemies during the Napoleonic wars -- but his motivations were. Louis Philippe did not want for troops. He had a national military which supported him enthusiastically. The foreign legion of Louis Philippe was not intended to give him soldiers, it was meant to take an embarrassing number of refugees off his hands. After the revolution of 1830, France had become Europe's beacon of liberty and the failed revolutionaries of many less fortunate states took sanctuary within its borders. Paris in 1831 was full of Prussian, Austrian, Saxon, Polish, Spanish, and Italian political refugees all of which were more or less experienced fighters full of revolutionary fervor, but desperately poor and disappointed by the French unwillingness to support their causes. Creating a military unit to take in these men was a political masterstroke. Its military usefulness was widely considered questionable, though.

The army, not having asked for the Légion, wanted nothing to do with it. For the first months the unit did not even have barracks. French officers and NCOs were unwilling to serve there, which hampered transforming the motley assortment of men into soldiers. Eventually, the government decided to rid itself of this embarrassment by shipping it off to France's newest colonial possession, Algeria. There, the Légion found itself set to digging ditches and building roads, or sent to the least healthy garrisons to die in droves. Equipped for warfare in the traditional European fashion, they were unprepared for the guerilla war they found themselves in. After two years the Légion was presented, lock, stock, and barrel, to the Spanish queen Isabella to fight against rival pretender Carlos in 1834. It was only the continuous flow of refugees that prompted the decision to establish a "new Légion" for service in Algeria in 1837 and eventually take back the few survivors of the Spanish corps.

The Légion of the early days was probably the worst place in the French army. As it had not been intended as a "real" fighting force, its early recruitment standards were low. The biggest group of men was made up of foreign deserters (who brought vital military skills), university students with democratic leanings, and revolutionary proletarians. As they were allowed to enlist under assumed names (originally intended to protect those whose home governments still persecuted them), many of them may have taken the opportunity to escape prison or the workhouse. Often poorly supplied and scandalously badly paid (Légionnaires sometimes had to sell pieces of their uniform to buy food), they were subjected to brutal discipline, posted to the most dangerous garrisons, and put to hard, dirty work. Desertion was a permanent problem (between 1831 and 1845 it ran around 11% annually) and insubordination frequent.

The Algerian wars further molded the Légionnaires their image. The Foreign Legion was rarely used in traditional European warfare. It was a colonial unit in a war where quarter was neither asked nor given. The unofficial motto "March or Die" stems not least from the fact that anyone straggling behind the column in Algeria would suffer a slow, painful death at the hands of his native captors. Equipped as line infantry (and dressed in heavy wool jackets and coats

in the heat of North Africa), they often suffered heavily from sniping and ambushes. Unable to reply in kind, the Légionnaires took their accumulated frustration into battle, where they killed combatant and civilian alike without mercy. After a taste of this life, most men became thoroughly brutalized, slow to trust anyone outside their immediate circle of comrades, and skilled in the art of violence.

In the 1840s, the French strategy in Algeria changed from positional warfare carried out by large armies to long-range mobile warfare by light infantry columns. The Légion was a vital part of this new war of speed and endurance (although the theater commander, General Bugeaud, thought it unsuited to this kind of warfare and requested its abolition). During the arduous years of conquering the Algerian highlands, it adapted itself to the role it was to play for almost the next century: the Légion became France's finest colonial light infantry.

A Légion column in the Atlas or the Rif (the Sahara desert itself was not brought under French control until the 1900s) had to operate independent of supply wagons, with only a few baggage mules to the company. The soldiers themselves were expected to carry all their equipment and most of their rations on interminable marches at a killing pace. Food was always in short supply (new recruits sometimes finished eight days' rations in four, not accustomed to the Légion's frugal standards) and often of dubious quality and difficult to prepare adequately (Légionnaires occasionally ate ground coffee mixed with crumbled hardtack because they could not get enough drinking water). Soldiers quickly learned how to supplement their meager diet with local vegetables and fruit, and much of the looting reported on campaign had as its goal bread rather than gold. The men often returned from their expeditions looking more like starving refugees than victorious soldiers.

Tactics, too, changed shape. Instead of being drilled as line infantry, the Légion took part in raids, ambushes and night attacks. Without the support of heavy artillery they had to rely on their own ability to keep the enemy at bay with musketry or bayonet attacks. It was in this demanding school that the Légionnaires learned the skills that set them apart -- dealing with adverse terrain, withstanding hardship, and aggressively closing with the enemy wherever he showed himself.

The Légion of Fame

The Légion came into its own during the last years of the Second Empire, remaining one of France's most celebrated and active fighting forces until the 1960s. Its main battleground remained Africa, but it was also used in the Crimea, Italy, Mexico, Guinea, Indochina, Madagascar, and even in France itself during the Franco-Prussian War and in World War I. Wherever French troops went to carve out colonies, the Légion was used in the most dangerous missions.

A unit of foreigners proved a godsend to France's colonial policy. The French forces at the time were divided into the *Armée Métropolitaine*, consisting of conscript units, and the colonial forces, the largest of which was the *Armée d'Afrique*. This latter consisted mostly of natives, little trusted by the generals. The Légion was one of the few "white" units (along with *Zouaves* recruited mostly from local French settlers and the penal *Batallions d'Afrique*, where conscripts with criminal records served their time). As such, it was considered trustworthy while the fact that it was recruited from foreigners allowed its commanders to risk greater casualty rates than the public back home would have accepted in French units. In short, it was perfect for all unpleasant, difficult, and hazardous undertakings.

The men entering the Légion usually did not intend to fight heroically for France. Varying legends were built around their motives for enlistment, with detractors claiming that criminals and cutthroats used the *Anonymat* to escape prison sentences while romantics saw

Le Soldat Camèle

Along with his uniform and heavy greatcoat (an encumbrance during the day, but a necessity in cold desert nights), the Légionnaire's kit included a stiff leather pack containing rations of hardtack, rice, pasta, bacon, and dried onions (eight days' was the standard), spare boots, shirts and underwear, cutlery, sewing gear, weapon cleaning kit, 40 extra bullets (later increased to 144), soap, bootblack, usually a pipe, and whatever salt, sugar, or tobacco he needed. Fastened to the pack he carried a groundcloth and shelter half, a one-liter canteen (later two), a drinking cup and a small cooking pot. On his belt he had a cartridge case and bayonet. Firewood (hard to come by at times), extra food, smuggled alcohol and looted valuables were often added to this load and experienced men always carried a walking stick they used to support their pack during short rests (taking the weight off the shoulders without sitting

disinherited princes and dishonored gentlemen thronging its ranks. The truth was more prosaic. For many recruits, enlistment was a way of escaping poverty and despair. Passage to North Africa and the prospect of being given land to settle after their term ran out tempted some too poor to afford emigration to America or Australia. The French army also occasionally sent undesirables from other units to the Légion. Middle-class recruits, far rarer than legend made them out to be, usually tried to escape some insoluble predicament -- accountants who had been caught embezzling, officers dishonorably discharged, bankrupt craftsmen and professionals having lost their licenses. Among these, the occasional blueblood was found -- even a prince of the Danish royal family fought and died with the Légion -- but they were few and far between. About half of the Légionnaires were illiterate, and most of them dirt poor.

Many stories circulated of Légion recruiters getting likely recruits drunk or abducting them. In fact, the Légion never had to fall back on such dodgy tactics. Recruits came to its enlistment offices in France in sufficient numbers for it to be choosy (indeed, recruiters often told them to rethink their decision before signing on). Enlistment standards varied according to the need for men, but generally the requirement was for a man to be aged between 18 and 45, healthy, not visibly unfit, with no physical deformities or handicaps, and reasonably alert. In **GURPS** terms, assume Légion recruitment to require ST, DX and HT of 10+ and IQ 8+, with all serious physical Disadvantages being grounds for exclusion. No previous military training or even knowledge of French were required. Except between 1871 and 1880, when a fluke of history limited recruitment to men from Switzerland and Alsace-Lorraine, candidates from all European countries and the United States were accepted. The occasional non-white applicant succeeded, but on the whole the Légion remained a "white" unit into the 1970s and no Colonials were allowed to serve (though African-American recruits were generally welcome).

After enlistment, recruits were issued with rail tickets to Marseilles where they awaited shipment. From there they were sent to Oran, where they were divided up between the First and Second Regiments of the Légion. Training took place at the regiments' headquarters, Sidi-Bel-Abbès for the 1^{er} Régiment Étranger and Saida for the 2^{ème}. Both towns lay south of Oran in the Algerian highlands. The men were brought in by train, shepherded by NCOs, and received by a Légion band and detachment. Uniforms and gear were issued on arrival and the *bleus* (raw recruits) assigned quarters. Each man was handed over to a serving Légionnaire (preferably of his nationality) to be initiated into the practices of the service. Old soldiers often sought out new men from their home area to pump them for the latest news (or bum a drink off them). Here, they also had the chance to meet veterans passing through headquarters for reassignment -- though many of them were undesirables returned by field units and many officers complained that they were a bad influence on recruits.

Training could last anywhere from three to 15 weeks, depending on the need for reinforcements and the state of a given group of recruits. It began with basic drill and protocol. French commands were taught to

or lying down) and which served as a tentpole during the night.

Légionnaire Template [39 Points]

Légionnaire training did not end with being sent out to their field units. It was only after a year or so of Légion life that a soldier acquired the skills and fighting edge that made a Légionnaire. This template represents a realistic "good" Légionnaire with prospects of promotion. For a cinematic Légionnaire, both Attributes and Skill Levels should be higher.

Attributes: ST 11 [10]; DX 11 [10]; IQ 10 [0]; HT 12 [20]

Advantages: Fit [5] and a total of 15 points from higher ST, DX, IQ or HT [10], Alcohol Tolerance [5], Alertness [5/Level], Charisma [5/Level], Combat Reflexes [15], High Pain Threshold [10], Strong Will [4/Level], and Toughness I [10]

Disadvantages: Duty (to Légion, all the time, frequently hazardous) [-15]; Poor [-15] and -10 points from Addiction (tobacco) [-5], Alcoholism [-15], Bad Temper [-10], Illiteracy [-10], and, of course, Secret [varies]

(It is recommended to allow a Légionnaire character more than -40 points in Disadvantages, or not to count the Duty towards the limit)

Primary Skills: Brawling (P/E) DX [1]; Guns (Rifle) (P/E) DX+1 [2]; Soldier/TL (M/A) IQ [2]

Secondary Skills: Hiking (P/A) HT [2]; Spear (Bayonet) (P/A) DX [2] and two out of Survival (Desert) (M/A) IQ [2], Intimidation (M/A) IQ [2], Stealth (P/A) DX [2], or Wrestling (P/A) DX [2]

soldiers who understood little or nothing of the language, rifles cleaned and disassembled, kit washed and polished, and parade maneuvers trained. Légion training was light on theory, but placed high demands on the recruit's physical fitness. Running, gymnastics, and hard labor were near universal. By the third week, the soldiers began route marching. The troops were assembled before dawn and marched out, heading into the highlands or desert as far as their officers deemed fit (usually as far as they could be pushed at this stage -- occasionally farther). Sometimes marches took several days, with troops camping in the field. The army reckoned two liters (two quarts) of water sufficient per man and day, which the Légionnaire had to carry himself and from which enough had to be saved during the day to brew coffee and cook the ration of rice or noodles in camp. Rations were equally short. Once habit, pride and stubbornness made the men endure this without complaint they were considered Légionnaires.

Life in the Légion was dominated by poverty, hard labor, and violence. The unit had a reputation as "bad garrison troops" which led officers to keep them busy at all times lest they make trouble. Physical training, marches, and fatigues kept the schedule tight. Légionnaires were encouraged to volunteer for labor duties on farms and in workshops where they kept half their daily wages, the other half going into the Légion's coffers. Given their pitiful pay (5 centimes a day, which amounted to \$.01, a twenty-fifth of what a US or British soldier received), the chance of earning extra money was welcome. Few Légionnaires had other sources of money and army pay was just about enough to buy half a pint of cheap wine a day. When on guard duty in isolated outposts, they were put to work raising walls or digging ditches, sometimes to no purpose, and the colonial government frequently called on the Légion to build roads or railways in times of peace.

Légion NCOs were almost always promoted from the ranks of their own unit. As they were required to speak, read, and write French (which many Légionnaires never mastered), middle-class and French soldiers tended to be favored for promotion. Officers were exclusively French, usually graduates of the StCyr military academy, and often looking to make a name for themselves in action. They were, on the whole, of above-average quality. Communication was difficult and the men had to be led by example, or through fear. Most officers and NCOs were brave men, leading their men from the front, though many were also brutal and volatile. Légion discipline was fierce, with beatings commonplace and often administered ad hoc. Fighting among the men was equally endemic, and many soldiers (and occasionally NCOs) guilty of theft, bullying, or other infractions against the unwritten code of comradeship met with rough justice.

Formal discipline outside of basic training was lax by contemporary standards. Close-order battle evolutions, still favored in line units, were hardly taught at all. Training concentrated on the skills of the individual rifleman -- cover, marksmanship, and fieldcraft. Together with a largely informal education in hand-to-hand combat and the endurance and versatile skills gained on labor details and marches, this made the Légionnaire a formidable enemy. The absence of spit-and-polish also

Background Skills: A Total of 6 point chosen out of Animal Handling (M/H) IQ-2 [1], Fast Talk (M/A) IQ [2], First Aid/TL (M/E) IQ [1], Gunner (Light Field Gun or Machine Gun) (P/E) DX [1], Knife (P/E) DX+1 [2]; Masonry (P/E) DX [1], Packing (M/A) IQ [2], Riding (mule) (P/A) DX-1 [1], Teamster (mule team) (M/A) IQ-1 [1] or Woodworking (P/A) DX-1 [1]

Customization Notes: A Légionnaire may bring almost any Skill from an earlier civilian life.

Le Cafard

Légion troops in garrison quickly succumbed to a blend of boredom, melancholy, and hopelessness known as *cafard*. Some tried to combat it through alcoholic excess punctuated by maudlin singing, others through indiscipline or prankish horseplay, but the only thing that truly helped was the prospect of action. *Le cafard* may well have disguised (if that is the word) some true manic-depressive disorders, but on the whole it was a condition specific to the corps. This may go some way to explain why many Légionnaires were eager to go into battle, and more so why their officers were.

La Crapaudine and other Cruelties

Penalties in the Légion were harsh. Aside from blows by fist or cane, unruly men could find themselves put on fatigue duties or sentenced to carry sandbags or heavy logs for hours on end. More notorious still were such punishments as *le silo* or *la crapaudine*. The former meant burying the légionnaire to his neck in sand -- often

made them the worst garrison troops France had to offer -- Légionnaires took little pride in their uniform, conduct, or military bearing. Rather, they tended to indolence and drunkenness whenever they could get away with it, even selling parts of their uniform for alcohol. Punishment for such infractions was stoically accepted and, one suspects, administered without much enthusiasm or hope of lasting change.

The Légion of Legend

The Légion became legend even in its own time, ironically not least due to the efforts of its detractors. Particularly in Germany, traditionally a copious source of recruits, civic organizations orchestrated heavy-handed propaganda campaigns. Unfortunately, their pamphlets and novels added to exactly the image of adventure and ultimate challenge that drew desperate and bored men to the colors. By 1890, sensationalist accounts by ex- Légionnaires (real and fictitious) added to the stream of narrative that Hollywood was to immortalize.

As with most legends, that of the Légion was based on a sanitized and exaggerated reality. Where the real Légion occasionally served as a refuge for disgraced gentlemen, legend peoples the ranks with star-crossed Romeos, innocently sentenced escapees from the world's most notorious prisons, and the disowned denizens of Europe's royal houses. It is true that a number of such characters served -- among others, musician Cole Porter, writers Alan Seeger and Blaise Sendrars, future Soviet defense minister Malinowski, and Prince Aage of Denmark. Only in literature is a Légion unit filled with their ilk, however. Similarly, the legend of the Légion claims that a body of Légionnaires can do literally anything because someone will have the necessary skills. Commanders need but call out for circus artists to scale walls, sailors to man boats, miners to dig tunnels or classicists to translate inscriptions dug from the desert sands. Neither will the Légion ever want for competent leadership -- former officers from every army on earth are thick on the ground. This makes a Légion company a good place to start an adventure campaign -- PCs from all backgrounds can become firm friends here while acquiring necessary combat skills.

Similarly, the brutality of Légion discipline, savage enough in reality, takes on legendary proportions. Sadistic *sergeants* and *caporals* lash out for the slightest infraction, inflicting painful, humiliating, and often enough lethal punishments. The threat of the penal battalions, from which one man in four returns alive, always hangs over the heads of hapless soldiers. Officers, distant and bent on marching to glory over the corpses of Légionnaires, are little help, and frequently the only escape is to kill NCOs and disguise their deaths as enemy action. Brutality in the ranks -- fistfights, group beatings, extortion and personal feuds -- hardly need exaggerating, and the conflict with a bullying messmate is a staple of Légion fiction.

The most important feature of cinematic campaigning is combat, though. The colonial wars the Légion fought were often an interminable series of forced marches, brief, violent clashes, boredom,

for up to 72 hours. After such treatment all but the hardiest needed time in hospital to recover. *La crapaudine* (the toad) involved tying the victim's hands and feet together behind his back. After a few minutes, painful cramps would set in that could lead to unconsciousness (roll vs. HT every minute. On a failure, take 1d-2 Fatigue (on a critical failure, take it as damage). High Pain Threshold helps, but Toughness does not. Double-Jointed characters roll at +2). The worst offenders found themselves placed in the notorious penal battalion in Colomb-Béchar where such penalties were handed out even more liberally, and with less concern for the sufferer's permanent health.

Les Compagnies Montées

From 1881, the elite of the African Légionnaires were drafted into the mounted companies. In these units every two men shared a mule that they would ride taking turns. Each man spent one hour perched on the back of the pack animal while his comrade led it by the bridle, then changed places with him. Along with its rider, the mule carried the tent, blankets, rations, cooking gear, fodder, and an extra two liters of drinking water. Mounted companies could march for ten or fifteen hours a day, leaving the men to snatch what extra sleep they could in the saddle. They covered up to fifty miles a day through the most hostile stretches of desert. The toll in both mules and men was high, though, and few légionnaires lasted more than two years in these units.

Détachement Légère **Humping the Bush 1880s-style**

and disease. Its legendary battles usually involved only small units. A cinematic Légionnaire, on the other hand, will see action against barbaric and implacable foes almost continuously.

The Légion's Battlefields

North Africa -- Forge of a Legend

North Africa was the Légion's home and the permanent base of most of its men. It was also where most of its fighting took place as the French pushed the border of colonial rule south into the Sahara. Most conflict was local, pitting solitary garrisons and flying columns of the Légion and its native auxiliaries against Berber tribes of the coastal highlands, oasis dwellers of the El-Areg plain, or the nomads of the Hoggar and Sahara. Militarily, this was no contest, but the enemy refused battle, locking scattered garrisons into a circle of raid and counter-raid to bleed them to death by inches. Far from the precepts of civilized warfare, Légionnaires could expect little mercy from tribesmen who routinely tortured prisoners to death, and showed little in return. Ambushes and betrayals, looting, rape, and the indiscriminate slaughter of civilians were regular occurrences.

The true enemy of the Légion in north Africa was the land. While stereotypes of Légion warfare picture marching through interminable sand dunes, much of the actual fighting took place in the barren mountains of the Atlas and Hoggar where daytime temperatures in summer could reach 130° while at night they dropped below freezing. Especially in winter it could be bitterly cold (in February 1908, a mounted company of the 1ère Régiment Étranger was all but wiped out by a nine-day blizzard). Food and water were scarce, maps inaccurate, and most of the population hostile.

Indochina -- The Merciless Jungle

From 1884 onwards, Légion troops were embroiled in a war in Tonking. Nominally passing from Chinese to French control, the territory had to be wrested piecemeal from local warlords and Montagnard chiefs, among them the infamous "Black Flags" recruited from Chinese deserters, bandits, and headhunters. The Légionnaires were not to leave until the last French forces did. Indochina was a coveted posting since it earned extra colonial pay and, with favorable exchange rates and ridiculously low prices, allowed them to have servants care for their gear and keep native concubines. Disease was rife and the fighting dangerous, though.

As in North Africa, battles were rare. The conquest involved besieging and taking over fortified posts whose garrisons sometimes found themselves besieged in turn by Chinese or warlords troops (the siege of Tuyen Quang in early 1885 became especially famous). Much of the work "pacifying" the country rested on the shoulders of mobile columns. Accompanied by hundreds of native porters hauling their equipment and supplies, they snaked their way through jungle and mountains to accept the submission of Montagnard tribes, hunt down guerilla fighters, track robbers and warlords to their lairs, and collect tribute and taxes. A column would be led by native troops walking point, followed by the main force of légionnaires or Marines guiding the line of native porters hauling boxes and barrels, wounded on stretchers, camp furniture, and even light guns. Fighting, when it happened, was savage and merciless. The enemy often placed ambushes. Eventually, the French troops managed to end systematic resistance by capturing the strongholds of native leaders and placing their own garrisons there. Such posts, surrounded by hostile tribes and often engaged in raiding expeditions against Chinese troops only nominally at peace, then proceeded to break the native will to fight.

Indochina, away from the coast, was a country uncongenial to campaigning. Mountainous and covered in jungle, it had no roads worth speaking of and the climate was murderous for horses and men alike. The French military's solution to this dilemma was to recruit huge numbers of native porters and strip down the load of their soldiers to the absolute essentials.

A légionnaire on the march would carry a rolled-up tent half with a blanket, eating implements, rifle cleaning kit, 144 bullets, several days' rations and some personal possessions, a liter canteen, and his rifle and bayonet. This was considerably more than the native *tirailleurs* marching with them and a crushing load in tropical heat and humidity. On forced marches, soldiers collapsed from exhaustion and sometimes were shot by merciful comrades to spare them the horror of falling into enemy hands. Standing orders were not to leave any European weapons behind. No such concern was extended to légionnaires.

The Légion Armory

The Légion was armed like the French Metropolitan Army. These are some of the small arms used throughout the times.

Revolvers

MAS Chamelot-Delvigne Pistolet-Revolveur Modèle 1873 (1873): The standard double-action army revolver. The cases had to be ejected one-by-one through the loading gate (p. HT71). The Mle 1874 issued to officers had a fluted cylinder and other weight saving measures; Wt 2.6.

MAS Lebel Pistolet-Revolveur Modèle 1892 (1892): The first smokeless powder revolver, this popular double-action design would see service until the 1940s. It had a swing-out cylinder and hand-ejector (p. HT72). Also see p. W:RH38.

Rifles

All infantry rifles were issued with bayonets, which were typically 2 feet long and weighed 1.65 lbs. Treat as Spear (Dam thr+1, Reach 2).

MIS Fusil d'Infanterie Modèle 1857 (1857): This was a muzzle-loading black powder rifle firing a paper-and-linen cartridge with a Minié bullet (p. HT61). Some were still in use in the 1870s.

MIS Chassepot Fusil d'Infanterie Modèle 1866 (1867): A bolt-action, single-shot breechloader based on the Prussian Dreyse Zündnadelgewehr M.1841 needle-gun (p. HT63), firing a paper-and-brass cartridge.

MAS Lebel Fusil d'Infanterie Modèle 1886 (1886): This bolt-action magazine rifle was the first rifle to fire smokeless propellant rounds (p. HT27). Also see pp. HT114, W:RH38 for various versions used up until the 1940s.

Machine Guns

Hotchkiss Mitrailleur Modèle 1914 (1914): The standard medium machine gun, feeding from 30-round strips and mounted on a 60-lb. tripod. For more details, including its forerunners such as the Hotchkiss Mle 1900 and the MAS Mle 1907, see pp. HT118, W:RH38.

CSRG Chauchat Fusil-Mitrailleur Modèle 1915 (1915): A magazine-fed light machine gun, thoroughly despised by all who had to use it. Also see p. HT118.

Further Reading

Histories of the Légion are plentiful and often available in local libraries or second hand. The most insightful and even-handed book on the Légion in English is Douglas Porch's *The French Foreign Légion* which, while lengthy and harder to come by, is well worth the effort. The same author's "The Conquest of the Sahara" introduces the reader to the Légion's most celebrated battleground. Much recent scholarship and most primary sources are, unfortunately, in French.

The Légion of fiction is perhaps best encountered in P.C. Wren's classic "Beau Geste" (whose author served in the Légion himself) or its movie adaptations of 1939 (starring Gary Cooper) and 1966. A new (and far inferior) Légion movie called *The Legionary*, starring Jean-Claude Van Damme, might be more easily available. A brilliant early spoof on the legend, *Beau Hunks*, was made by Stan Laurel and Oliver Hardy in 1940, proving that you can play even this setting as comedy.

Comic goes here.

Just a Little Place in the Country

by Brian Rogers

Comics cartographers get to have a lot of fun: they get to add little countries whenever a back-story calls for it, then lavishly detail on these artificial places whenever heroes visit. In Gaming, it's the closest a supers GM gets to the fantasy GM's joy of mapping out new realms. Given that most supers games take place in a "fairly close to our world" environment, by the early 21st century much of the exploration has been done, especially if the country is the homeland of one of the PCs. If they're not going to be tromping it with compass and maps, how should the Players respond to the this new State?

Since locales [develop a personality](#) of their own over time, why not treat these small states as NPCs? Here's how the standard NPCs categories can fit your new, small independent states, with ready-to-use examples. (Plus, since they have a limited effect on world politics, there's no reason why they can't be exotic locales for action heroes, mythos investigators or anyone else to visit.)

Country as Dependant NPC: Ruritania

"If love were the only thing I could follow you -- in rags of need be -- to the world's end . . ."

Accessible by train from Munich, this lovely country lies on the invisible line dividing Eastern and Western Europe and contains the best of both worlds. The people are friendly, the countryside idyllic and when left to itself it is fair, kind, generous and non-violent. The people of Ruritania would never consider aggression and find even a standing army a distasteful necessity.

Which is a shame, because it lies right in the geographic middle of the 20th century's violence. Before the shift to a parliamentary monarchy at the end of the 19th century there was some unfortunate royal infighting that put the country's future in peril, and while it all worked out for the best (the scandalous books on the subject ultimately gave Ruritania a profitable tourist trade) more challenges arose. The country was threatened by the Great War, was easily conquered by the Nazis in World War II, spent the latter half of the 20th century a potential target of Soviet aggression and the end of the 20th century a potential staging ground for the Balkan ethnic wars.

Like many a Dependant NPC the people of Ruritania are likable but not heroic. They are unafraid to face challenges but often lack the ability to overcome them. They have strong moral fiber but inevitably need outsiders to lead or protect them. One such hero led their army in the Great War; another protected them from threats in the pulp era. A third led their resistance to the Nazi occupation, and so on. If PCs have Ruritania as a DNPC expect the country to face threat after threat, and the heroes will defend them as they would defend their sweet Aunt Mary from robbers or swindlers -- except that the robbers are conquerors and the swindlers are spies.

If you need a more direct connection, the Ruritanian royal family has an unfortunate habit of falling in love with unattainable outsiders. There is the well know affair of Queen Flavia and the Englishman, but her offspring carried on the tradition. It is generally believed that the reigning Queen Anne's "24 Hour Illness" in Rome in 1953 was actually a secret holiday, and the changes to her character afterwards were caused by a brief, passionate, unconsummated love affair. Observers of the Ruritanian court suspect that her children will approach the world in the same fashion. Such a true, passionate love blocked by duty is a great hook for an individual PC, and by loving the princess, one, by extension, loves her country.

Ruritania is a template for countries that the characters love but aren't tied to -- probably an outsider, they are at most a citizen abroad. They shouldn't be able to call on the country for resources or support outside of visiting its embassies. The Heroes should start with no particular reputation, social rank or other advantages. It is not a Patron -- it is both an ideal and a loved one. It is the thing that must be protected. It is the place on the map being threatened by aliens, invading troops or Doc Marauder's latest genocidal scheme, whose loss would be more than a change in the map: it

would me more than the heroes can bear.

Country as Enemy: Costa Pacifica

"This building is our Embassy. Our Soil. You have no authority here. You may leave now."

Taking its name from its location, Costa Pacifica is a small Central American country with some stunning beaches, a warm climate, and two major resorts (Santa Clara and Santa Lucia) built to cater to the world's tourist trade. With calm, tranquil seas and skies for most of the year and some spectacular storms during the summer months, tourist agencies refer to the resorts as "where Angels would stay on their vacation."

And assuming those angels were of the fallen variety, they'd be right. Derogatorily called "Costa Muerte" by sidelined members of State Department, the real country is very different from the one on the TV or resort center streets. Costa Pacifica's genius was one smuggling cartel's ability to secretly take and keep control of the whole government in the 1920s. While this puppet government speaks all the right words in the ever present war -- be it on communism, drugs, or terror -- the real rulers enjoy near total control of the country and its populace. Quiet terror keeps the streets safe and the upper echelons jealously guard their absolute power over the life and death of their people. Fear is the order of the day, but the trains run on time, street crime is incredibly low, and everyone has a job . . . a job working the hidden coca fields with an unspoken threat of punishment for the slightest infraction, but a job nonetheless. Those that do fight use whatever weapons they can, and are branded terrorists as a result.

Like any good long term enemy, Costa Pacifica is resilient, cunning, and hides its corrupt heart beneath a charming veneer. Its people are too terrified to act for themselves and its leaders are hidden deep in the shadows. The public government is a US Ally: it was strong against communism in the cold war, cunningly diverts blame for most of its drug trade to other countries (while asking for funds to help fight it) and quickly became one of the Coalition of the Willing, citing their own "terrorist" problems. They are a major player in the international drug trade, dabble in the occasional other smuggling or weapons deal (sometimes taking weapons given to them by the US, marking them as destroyed and selling them back to US criminal organizations for use against pesky heroic types . . .). They are easy to hate but must be given a grudging respect for their use of the system.

Still, players can get frustrated dealing with a faceless enemy whose visible upper edges are protected by diplomatic immunity. To prevent this, introduce the ruling cartel early as possessors of some secret -- there's a mythos temple in the deep jungle, they're descended from aliens or a eugenics program -- that makes their members willing and able to take on individual heroes. This brings the conflict from the abstract to the personal: the PC can equate the country with "The Cartel" without losing the sense of fighting a whole country. Alternately, give the Cartel an overall leader. Perhaps he's vain enough to have himself elected president, but more likely he has a significant position in the government or as a major businessman. While this gives the country a single face, it changes the scenario from having a country to having the man who rules a country as an enemy, which isn't exactly the same thing.

Costa Pacifica is the template for anything where the PCs would want to take on a whole country. While this version has the people ruled by terror, they could also be fanatical nationalists who will willingly take arms against any meddling outsiders (which would make the heroes' job that much harder). Still, if the heroes do manage to eventually win by reforming the country or ousting its leadership, the sense of personal satisfaction would be great. Naturally this is constructed within the logic of Comic Books; it's unlikely that a such country could pull off its deception as long or as successfully in real life, and if the players ever engineer a victory the aftermath might be just as dangerous. Fortunately, we're dealing with Comic Book Logic.

Country as Rival: Henn

"I have this crisis under control. Thanks for coming out to help anyway . . . "

The small Pacific rim island of Henn is a stable, hard working, moderately prosperous country. Elevated by the Asian economic bubble, it parlayed its resources in offshore oil into high technology and conventional manufacturing. The

island has one of the highest per capita education levels in the world, and survived the collapse of the Asian bubble better than its neighbors. The sudden collapse from the model country of the future to just another struggling Asian country hit the country's self image hard and they have reacted in a rather odd way. If they can't show the world how to thrive by being an economic example, they would do so by being a heroic example!

Strange as this sounds on the surface, it does make a certain degree of sense. There are few ways for the people of Henn to return to their perceived prominence on the world stage: The weak markets keep them from reclaiming an economic position; they have neither the desire or capacity for fame via conquest; mere goodwill is the stuff of back page articles when they appear at all. But *Heroes* -- powerful, stalwart international heroes -- make international news all the time. They stop tidal waves, hold off alien invasions, prevent earthquakes. It is the goal of every Henn to see their country's name tied to such glory, and they'll sacrifice to achieve it. A chunk of Henn's high tech industry is dedicated to power-armor prototypes; the public voted for a DNA database to isolate superhuman potential; international agents investigate super-humans for clues to their origins; the terminally ill volunteer for power-inducing treatments. All to prove that their heroes are the equal of, or superior to, the greatest heroes on the planet. Like, say, the PCs.

As Rivals go, the country of Henn is a good one. They don't *hate* the PCs. They respect them. Admire them. They just want to do what the PCs do better than the PCs do it. They're out there pursuing the same goals, but for ever so slightly the wrong reasons. Henn heroes won't ever create disasters, but there might be the temptation to wait until someone can see them solve the problem. They would never get in another hero's way, but there's still the strong urge to prove they could do it on their own. They have a deep pride and nationalism combined with a struggle against inferiority that might make them hard to deal with on a hero to hero basis. If a major planetary crisis comes up, you can bet that any Henn heroes will be right there, willing to sacrifice themselves in an instant to save the world for their glory of their country. They're good people to have around, but frustrating for the Player Characters.

It would be easy for the Players to see themselves as being rivals with an individual hero from the country, and their discovery that it goes deeper than that should be an amusing one. Henn can even become a place to explore morality, about how far a country should go while doing the right thing, and what the effects of such a nationalistic supers society would be in a generation or two. If you want to keep things light, just have a Henn hero or hero team turn up whenever there's a natural disaster and try to upstage the heroes. A team of international heroes might find themselves strangely hurt if every time they respond to a disaster call someone else is handling it and getting the credit. Or it might give them a chance to go out on the town and let the Islanders take care of the world for a night.

This country is not so much a template as a gimmick. The circumstances that generate a country whose national identity puts it in a friendly rivalry with a single person are rare to the extreme. Plus, this obviously only works in a high-powered supers game, as no action hero, spy, or mythos investigator will ever reach the degree of prominence required. You can use this as the template for a cover story, using this friendly rivalry as the reason why a single small country is developing advanced weapons technology and inducible superhuman powers. What sinister forces are really controlling such a country, and why?

Country as Subjects

Finally, there is the most common use for a fictional country in a supers game: one of the major characters in the game rules it. Unlike the above examples, this is more complicated and more easily modeled. Once the hero (or villain) is in charge of the country it becomes another asset or source of power. Supers games model sources of power very well -- allies, status, wealth, organizational ties, henchmen and all the other things a national leader can draw upon are fairly simple. They can be very powerful, but in game terms they're not hard to design.

The nature of such supers-governed countries will be highly dependant on the nature of the hero. Just as cities designed for [Troupe Style Supers](#) should mirror and support the character's idiom, so too should the country they rule. If the hero is a technological wonder, his homeland is probably very high tech. If she is a naturalistic mystic, it's probably a very spiritual place. Some heroes merge these things, leading to strange high tech naturalistic spiritual cultures, but that can be cool too. The mirroring of the hero-ruler and his nation makes manifest the symbology of the king being the people, opening things up for mythic resonance. (For a twist, the hero-ruler may be the exact opposite of his

homeland, which may lead to resentment, plotting and other things that make the sovereign's head hang uneasily.)

Small exotic countries should be more than just contortions on a map and collections of Slavic-sounding syllables. They should be as interesting and engaging as the people your heroes love, hate and compete with every day. With plenty of nice scenery to blow up when a big fight erupts on your vacation.

With Murderous Intent

by Michael Brown

The adventurers finally get some time off at a secluded mountain cabin, unaware that forces are gathering that could not only ruin their vacation, but also threaten their very lives.

The "base" year for this adventure is the mid-1940s (TL6, in **GURPS** terms). It would only take some minor tweaking to use it in a different era, however.

Ingredients

As a result of a past job, a favor cashed in, or just because they have the right friends, the adventurers have been granted temporary use of a secluded mountain cabin. Now that they have some time between jobs to take a real vacation, the offer of R&R in picturesque surroundings is just too good to resist. The cabin owner supplies them with the keys and directions to get there. The only things he asks are that the group clean up afterward and have fun.

The unpredictable winds surrounding the mountain renders a quick trip by air useless, but the roads into the mountains are well maintained and have many strategically placed scenic overlooks. The trip up is uneventful and the cabin proves easy to find. It occupies a quiet stretch of woods a half-mile from the main road and overlooking a clear mountain lake downhill and a commanding view of the sunset. Every so often, a glimpse of wildlife off in the distance promises superb hunting.

Upon entering the cabin, however, the party will immediately notice that something is amiss. The interior of the cabin stinks; a dead body occupies the living room sofa, and has apparently been there for some time. The man's hands and face are bandaged in what looks to be an amateurish attempt at first aid. The condition of the skin under the bandages, although decayed, indicates that he suffered some sort of burns to those areas. It cannot be clear without an autopsy whether the injuries led to his demise. In the pockets of the man's rumpled suit are only a .38 caliber revolver and a pack of name-brand cigarettes. The only identification is a silver ID bracelet etched with the word "Clench."

A quick check of the rest of the cabin indicates recent habitation, although an effort was made to quickly set things in order before the users left. Observant party members will notice several bullet holes in the ceiling above the body; they do not appear to have been made by the dead man's gun.

A search outside the cabin may reveal several sets of footprints and intermittent tire tracks, which disappear once they reach the road. No one else is in the area; the nearest habitation is another unoccupied cabin ten miles away.

Cooking Tips

Clench, the dead man, was a member of a gang of criminals that had previously pulled off a huge robbery and later happened upon the cabin while searching for a place to hole up. Clench was burned by a steam discharge during the robbery and was left behind when the gang leader decided to move on. As they left, the leader quietly ordered another member of the gang to go back and silence Clench. In a moment of sympathy, however, the would-be assassin fired several rounds into the ceiling to make it sound like he had shot Clench to death, then quietly promised to come back and help his colleague. Unfortunately, Clench died of his wounds before his friend could return.

The gang leader has recently learned what actually occurred, and has ordered the deaths of both men. The assassin escaped his former leader's clutches and is headed back to the cabin in a vain attempt to spirit Clench away. The rest of the gang is also proceeding toward the cabin.

The gang currently numbers six, including the leader and his girlfriend. All are armed with Thompson submachine

guns ("Tommy guns") or handguns except the girl, who is carrying discreet protection in the form of a concealed snub pistol. All of the gang members are murderous desperadoes; the leader in particular is a vicious tyrant who rules through fear. He is bloodthirsty and is to date responsible for seven deaths. The gunmen follow his orders without question. (Extra Spice: All is not well in the gang; the boss's leadership methods have fostered deep resentment. There may be a plot brewing by several members to kill the boss and take over.)

The would-be assassin is the only member of the gang with a conscience. He is armed with a Colt 1911 .45, but only has eight bullets left. His goal is to retrieve his friend Clench and disappear. He does not yet know Clench is dead. (Extra Spice: He blames the PCs for Clench's death and will try to kill them all from hiding in revenge.)

It is up to the GM to decide who arrives at the cabin first. If the assassin arrives first, he will object to the group's presence but will not initiate hostilities; he just wants to get Clench and disappear. On an exceptionally good reaction roll, however, he may be persuaded to help the group against the other gangsters. If the gang arrives first, they will waste no time looking for Clench and their wayward companion. The PCs will be assumed to know where the men are and will be taken hostage and tortured unless they divulge their whereabouts. The assassin, once he realizes that the rest of the gang beat him to the cabin, will immediately take off again, leaving everyone else to his or her fate.

It is possible that the cops have a handle on the whereabouts of the gang and is either tracking them down or knows where they are going. In either case, they will be on their way to the cabin, and are inclined to simply haul everyone away and sort it all out later. (Extra Spice: Any PCs with shady backgrounds or wanted by the authorities will be closely scrutinized and/or jailed.)

To heighten the tension during the inevitable climax, the GM could make sure that the players' group gets separated from one another, sparking a deadly cat-and-mouse game in the deep woods as the gangsters try to find them and pick them off one by one.

(Extra Spice: What if the gun moll is the actual brain behind the outfit, using her feminine charms, among other things, to control the gang through the boss and allow him to think he is in charge? If there is existing unrest in the gang, as mentioned above, she will make her move during the battle at the cabin, dispose of her brutal lover and take the gang to parts unknown.)

Side Salad

The GM should remember that their presence is unexpected and unwelcome. A reaction penalty of -3 is reasonable from anyone arriving at the cabin.

Why should Clench be dead at all? Perhaps the group arrives at the cabin soon after he is left behind and is still alive as a result. He will of course lie about his presence there and try to dupe them into helping him escape or carrying out his revenge against his former boss.

Dessert

If the PCs take any of the gang alive, they will discover that there is a substantial reward for their capture; the leader is particularly valuable. Each surviving gangster is worth \$5,000; the leader is worth \$20,000. Of course, the group will have to see the cops in order to get their money . . .

Albert Hawkshaw, Steampunk Explorer

for *GURPS*

by Mark Gellis

Biography

Albert Hawkshaw was born in 1850, in Manchester, the son of a bookseller. He was always interested in science, especially geology and geography, and he was fortunate enough to his talent noticed by Robert Nicholson, an industrialist who frequented his father's shop. When Hawkshaw turned sixteen, Nicholson arranged for the young man to join one of his expeditions to India as an assistant geologist and surveyor. He knew there was money to be made in Asia and in Africa. He only needed the right men to get the job done.

Nicholson was impressed by Hawkshaw's performance. The young man endured hardship without complaint, did his job better than men twice his age, and had a knack for managing things and people. As the years went on, and Nicholson sent Hawkshaw on different missions around the world, it became clear that the young man also had a knack for languages and, surprisingly, for warfare. Hawkshaw was almost as keen a student of tactics and strategy as he was of geology and geography, talking with the men who led expeditions about how to conduct battles in the wilderness and reading anything and everything he could find on the subject. More than once, he had a chance to put what he had learned into practice, helping defend expeditions from bandits or hostile natives. By the time he had turned 30, he had proved his worth again and again, even saving Nicholson's life from mutinous native guides on one occasion.

His preferred weapons are the Adams .450 revolver and the Martini-Henry rifle (see *GURPS: High Tech*, pp. 109, 113, 124-125 for details).

By the mid-1880s, Hawkshaw has been working for Nicholson for 20 years, handling geological and mining surveys for him around the world, along with an occasional special job, with a significant degree of success. 40 years earlier, Nicholson had inherited the mine his father started in a small town about 10 miles from Manchester. Now, he owns and operates more than twenty mines on three continents. He owes a good bit of his success to Hawkshaw.

In spite of all this, it would probably be too much to say that the two men are friends. They do, however, understand and respect each other. Hawkshaw considers Nicholson a fair and reasonable employer; Nicholson considers Hawkshaw a valuable asset, a man who is both smart and dependable, so much so that he is willing to provide an unusual degree of support to help him complete certain assignments, including using his wealth and connections to put pressure on colonial administrators or to arrange for "assistance" from the British military. If Hawkshaw says he needs a hundred rifles and a couple of small cannon to get a certain valley surveyed so a certain mine can be built, Nicholson knows he would not ask for such things lightly and will do what he can to see that his geologist gets what he needs.

Nicholson is not mistaken about his geologist. Hawkshaw is a good administrator, a sound scientist, and a skilled mapmaker, more than capable of organizing and leading surveying and prospecting operations. He is also a capable mercenary, able to organize and lead an armed group. He is not much of a brawler or a swordsman (in fact, he has never had any real training in melee combat and would be at a disadvantage against anyone who is), but he is a very good shot with a rifle and with a pistol, and a man of above average willpower and personal courage, so men are willing to follow him into battle. On two occasions, Nicholson has asked Hawkshaw to handle what were effectively corporate assassinations, leading a small group of armed men to kill the leaders of a village responsible for stalling one of his mining operation. In both cases, Hawkshaw was able to plan and conduct the mission quickly and secretly, leaving no evidence that would embarrass his employer.

Hawkshaw has virtually no training in the biological sciences. He is not interested in gaining any such training. He has little interest in flora or fauna, current or prehistoric; his passion is for the Earth itself and for the mineral wealth that it contains. He has also never learned engineering. He enjoys studying the land and figuring things out about it, which he refers to as "squeezing out her secrets," but once he has squeezed out the secret of a particular place, he is not really interested in the mechanics of getting the goods out of the ground. That he leaves to other men.

Hawkshaw's parents are both dead by the 1880s. His elder brother, Philip, owns and runs the bookshop. The two men write to each other (Philip is proud of his younger brother and is always glad to hear from him and about his adventures), but are not especially close. He also has two sisters, both married to Manchester shopkeepers.

Hawkshaw is generally content with his life. He has certainly gone further than he would have sharing the family bookselling business with his brother. He has seen things most white men have never seen and will never see. But most of his work, while interesting, is really quite tame, aside from the risks and annoyances of working for weeks at a time in the wilderness. Mostly, what he does is travel to foreign and often exotic places, studies the land and the soil and the rock formations, surveys the countryside, makes maps, and helps manage the efforts of the engineers and technicians who will build and run mines, ports, railroads, and so on. At the same time, he has lived through his share of real adventures and he has seen his share of enemies crushed under his heel.

He is a loner by nature. He is not unfriendly, but he prefers solitude and does not have any genuinely close friends. If anyone asked him, he would have to admit that he has probably never been in love.

If Hawkshaw has one serious flaw, it is jealousy. The simple fact is that he is a good explorer, but not a great one, and he knows it. He feels overshadowed by people like Dr. David Livingstone and Sir Richard Burton. He likes working for Nicholson, but he fears that he will never do anything that will put his name in the history books. As a result, he is quite likely to feel jealous of anyone who appears to be competition with him and he is willing to sabotage such people. In addition, he is vindictive; once someone has crossed him, he will hold a grudge for a very long time. This makes him a useful but not entirely reliable ally and a potentially dangerous rival or adversary.

Using Hawkshaw In A Campaign

Hawkshaw can be used as a player character (or the basis of one) if one is running a campaign at the 150-point level.

Hawkshaw is designed for a campaign set in the 1880s, the height of the Steampunk era, but he could be used in an *Age of Napoleon*, *Old West*, late *Steampunk* (Edwardian era), *Cliffhanger*, *World War II*, *Atomic Horror*, or any modern era campaign with only a few changes. He could also be adapted for campaigns in other locations without difficulty; in most cases, all one would have to do is modify his biography and substitute a few of his current languages and skills (Riding, Area Knowledges, etc.) for more appropriate ones.

As an NPC, Hawkshaw can appear as an ally or an adversary. In general, he will be working for Nicholson, so whether the player characters are allied or in competition with Nicholson will determine whether they are allied or in competition with Hawkshaw. If someone had the right connections, however, it is possible that he or she might be able to convince Nicholson to "loan" Hawkshaw to a team of player characters for a special mission. He would be a useful scientific consultant for any venture involving mining, surveying, or other projects where large quantities of rock and soil might be involved. His combination of scientific, administrative, and tactical skills make him a valuable addition to any party operating in poorly explored and possibly hostile territory. And Hawkshaw would be particularly interested in joining an expedition exploring uncharted territory; it is here, after all, that he might earn a place in the annals of history.

Anyone meeting Hawkshaw will see a fairly ordinary looking man, memorable only for looking like he would be equally comfortable in the wilderness or in an office. He does not talk much, but if one can engage him in a conversation, they will soon learn that he is an intelligent man, quite knowledgeable about a variety of topics, but mostly about such subjects as geology and cartography. Someone who has a university education might suspect that he is mostly self-taught, but would see that this does not appear to have harmed him much. Anyone asking about him will probably be able to learn that he is attached to the Nicholson Mining Company as a surveyor, but that he often does a

lot more than just survey; a particularly good investigation might uncover some rumors that Hawkshaw has been involved in some pretty tight situations and handled himself well.

It is possible that someone who is skilled in areas Hawkshaw considers his "territory" might make him jealous, but the only sign will be that he brings the conversation to a close as soon as he can do so without being rude. Any future meetings will be civil, but Hawkshaw will not be very willing to provide the player characters with assistance or information. If someone really manages to annoy him, a GM should remember that he does tend to hold a grudge; it would not be unreasonable for him to become a recurring "enemy," showing up on occasion, when an opportunity presented itself, to frustrate the plans of the player characters.

One could use him in an adventure similar to Conrad's *Heart of Darkness*, replacing Kurtz with Hawkshaw. The story would begin with him going insane for some reason ("This is how I will make my mark on history!") and turning one of Nicholson's mines into his own petty kingdom. The gradual loss of profits combined with the total lack of communication from the mine would alert his employer that something was amiss and the player characters would be dispatched to investigate, but they would know very little about what they were getting into. Or, it might be some other agent of Nicholson's who has gone mad, and Hawkshaw is guiding the team of investigators. A particularly cruel GM might even assume that Hawkshaw and the other agent are both mad and are working together, with Hawkshaw leading the player characters into a trap (or, if this is not true, the GM might still drop false clues that it is).

Nicholson might also ask Hawkshaw to operate as an agent provocateur, a saboteur, a spy, or an enforcer, either to further his own ends or on behalf of the British government. The 1880s are a busy time for the British Empire. Hawkshaw could show up in India or almost any part of Africa. Nicholson may have "loaned" him to the British government to handle a special job (or he might be doing it on his own, having arranged a leave of absence, hoping to win some kind of fame). He might be observing foreign forces under the guise of doing a survey for Nicholson. A man who knows land and how armies do battle can gather a lot of useful information simply by looking around and writing down his observations. Perhaps he has been captured by bandits and the player characters need to retrieve him, and the information he now carries in his head. Or he might be asked to eliminate some threat to one of Nicholson's mines or British settlers. His target might be anything from villages of hostile natives to mercenaries hired by one of Nicholson's competitors. No matter what Hawkshaw is up to, the player characters might be working with him or protecting someone else from him.

Finally, Hawkshaw might be used as a red herring. His current business might not have anything to do with the player characters. Because he tends to be quiet, however, he may look suspicious. If he is involved in anything covert or if someone has done something to annoy him, he will be especially quiet. If players jump to conclusions about him based on too little evidence, a GM should remember that it is always his or her prerogative to take advantage of such situations.

An Interview with Magus, Alister

Modern Magics for the *d20 System*

by Owen K.C. Stephens

The *Interview with Magus, Alister* is an unusual "spellbook" designed for modern urban fantasy games using the **d20 System** rules. Rather than a book at all, it is a video tape of the type used in security cameras. The tape is battered and worn, with odd stains on the outside of the cassette. A yellowed label reads "Interview with Magus, Alister," but has no date or location listed. The cassette is surprisingly resilient (hardness 20, resistance 20 to all energy types, 30 hit points, and immune to being blanked or recorded over).

If watched, the tape appears to show a police interrogation of a middle-aged man of eastern European descent. The man is identified as "Alister Magus," and is questioned by two American police (one tall and thin, the other older and overweight) regarding his involvement in a ritualistic killing. Alister is handcuffed and shows signs of having been beaten.

Throughout the first half hour of the interview Alister Magus tries to explain he tried to stop the cult, but arrived too late to prevent them from summoning a powerful demon. He urgently warns that the demon will come after him, and neither he nor the police are safe. At the 32 minute mark, a strange "pop" can be heard on the tape, which Alister and the police can clearly hear. The police look at each other, then tell Alister to wait while they "check that out."

Once the two police leave, Alister looks directly at the screen. If it is the first time the tape has been watched by a group, he calls the character with the highest Int score by name, and says he must explain something quickly. He states that he has little time left, and cannot allow everything he knows to be lost. Over the course of the next hour Alister outlines the method for casting numerous spells, including those presented later in this article and *detect magic* and *obscure object*. Periodically a scream or splattering noise can be heard in the background. Alister admits that some of these spells seem unimportant, but assures the viewer each one has saved his life at least once. A modern mage must be able to operate below the radar of society he claims, and pretend to be things he isn't.

Alister is still explaining spells at the end of the hour, when the two cops return. They are clearly suffering wounds incompatible with life, and are moving in a stilted fashion. Alister yells at the tape's viewers to be on the look-out for the forces of evil, and to make allies to watch their backs. He struggles briefly with the two dead police, who kill and begin to eat him. One looks at the screen, and repeats the viewer's name Alister used earlier. The tape then ends.

For more modern magics and urban fantasy spellbooks, check out the Analects Arcane articles ["The Arcane-ist's Cookbook,"](#) ["The Technonomicon,"](#) and [The Tooninomicon](#).

1st Level Modern Spells

Conj

Arcane Teller Machine. Perform banking without going to a bank.

Ench

Karaoke. Perform a song well.

Trans

Nuke. Transform ingredients into a meal.

Pick-Me-Up. Caster staves off fatigue or exhaustion temporarily.

2nd Level Modern Spells

Conj

Unseen Assistant. Conjures a invisible, semi-intelligent force able to perform complex tasks and make judgement calls.

Ill

Security Risk. Masks one object from detection by indirect means.

Trans

Wardrobe. Change clothes to any touched, regardless of size.

3rd Level Modern Spells

Conj

John Q's Cardboard Box. Create a shelter that looks like a cardboard box.

Phantom Scooter. Conjures a quasi-real motorbike.

Trans

Redirect. Allows changes to existing recorded visual media.

4th Level Modern Spells

Conj

John Q's Hole in the Wall. Create a shelter from any door.

5th Level Modern Spells

Trans

Noneday. Caster gains one additional day of work.

Arcane Teller Machine

Conjuration

Level: Modern 1

Components: V, S

Casting Time: 1 action

Range: Personal

Target: Caster

Duration: Instantaneous (see text)

Saving Throw: None

Spell Resistance: No

The *ATM* spell allows the caster to do banking without accessing a bank or electronic teller. The caster can do any of the things normally possible at a bank -- make a deposit or withdrawal, apply for a loan, check an account balance, or even make a payment to a third party. Up to one transaction per caster level can be made. If the caster makes a deposit or withdrawal, the money moves from his person to the bank's reserves or vice versa. All transactions made through the *ATM* spell leave normal banking records.

John Q's Cardboard Box

Evocation [Force]

Level: Modern 3

Components: V, S, M

Casting Time: 1 standard action

Range: Close (25 ft. + 5 ft./2 levels)

Effect: Box-shaped zone of force

Duration: 2 hours/level (D)

Saving Throw: None

Spell Resistance: No

With this spell, the caster creates an unmoving, opaque box of force that closely resembles a large cardboard box (though it lacks any specific writings or markings). The box may be as much as 10 feet on a side, and covers the ground. The box appears dark and empty from one side, which may be faced any direction (even down). As many as six Medium creatures can fit into the box, freely passing into and out of the box (even through the sides or top) without harming it.

The temperature inside the hut is 70°F if the exterior temperature is between 0° and 100°F. An exterior temperature below 0° or above 100° lowers or raises the interior temperature on a one-degree-for-one basis. The box also provides protection against the elements, such as rain, dust, and sandstorms. The box withstands any wind of less than hurricane force, but a hurricane (75+ mph wind speed) or greater force destroys it.

You can illuminate the interior of the box dimly upon command or extinguish the light as desired. Although the field of force is opaque from the outside, it is transparent from within. Missiles, weapons, and most spell effects can pass through the box without affecting it, although the occupants cannot be seen from outside the box (they have total concealment).

Material Component: A cardboard box of any size.

John Q's Hole in the Wall

Conjuration (Creation)

Level: Modern 4

Components: V, S, M, F; see text

Casting Time: 10 minutes

Range: Close (25 ft. + 5 ft./2 levels)

Effect: 20-ft.-square space

Duration: 2 hours/level (D)

Saving Throw: None

Spell Resistance: No

You conjure an extra-dimensional space anchored to an existing door. The space appears to be a low-rent apartment. In all respects the lodging resembles a one-room efficiency, with a sturdy door, two shuttered windows, a small fireplace, a tiny bathroom with a shower and a kitchenette. The floor is level, clean, and dry, though the walls are slightly cracked and the ceiling shows signs of water damage.

The shelter has no heating or cooling source, taking the temperature of an interior space appropriate to conditions outside. Therefore, it must be heated as a normal dwelling, and extreme heat adversely affects it and its occupants. The dwelling does, however, provide considerable security otherwise; it exists in a pocket dimension that can only be accessed through the door used in the casting. The door resists flames and fire as if it were stone and is impervious to normal missiles (but not high explosives, cannons, or rocks thrown by giants).

The *hole in the wall* contains crude furnishings -- a queen sized bed, two sleeper sofas, a card table and six folding chairs, a writing desk, and a television (which only receives local broadcast stations, not cable).

Material Component: A house, apartment, or hotel room key.

Focus: A working door in a doorway. The door must be opened to enter the *hole in the wall*.

Karaoke

Enchantment

Level: Modern 1

Components: V, S

Casting Time: 1 action

Range: Touch

Target: One creature

Duration: 10 minutes/level

Saving Throw: Will negates (harmless)

Spell Resistance: Yes (harmless)

The target of this spell can sing and play musical instruments as if it has Perform (keyboards, percussion instruments, sing, stringed instruments, and wind instruments) bonuses of +15. This has no effect on creatures who already have Perform checks better than those provided by the spell. the target can only perform music and lyrics it has on its person (even if in the form of a record or CD) or can see (such as those provided by karaoke machines).

Phantom Scooter

Conjuration (Creation)

Level: Modern 3

Components: V, S

Casting Time: 10 minutes

Range: Close (25 ft. + 5 ft./2 levels)

Effect: One quasi-real, scooter-like vehicle

Duration: 1 hour/level (D)

Saving Throw: None

Spell Resistance: No

You conjure a medium-sized, quasi-real, scooter-like vehicle. If a picture of a specific medium-size two-wheeled vehicle is used during the casting, the phantom scooter matches its appearance exactly. The vehicle operates only for you unless a key is used in the casting, in which case it operates for anyone holding the key.

The scooter has an AC of 18 (-1 size, +4 natural armor, +5 Dex) and 7 hit points +1 hit point per caster level. If it loses all its hit points, it disappears. A phantom scooter has a speed of 20 feet per caster level, to a maximum of 240 feet. It can bear its rider's weight plus up to 10 pounds per caster level. It requires the same amount of concentration and skill to operate as a normal two-wheeled vehicle.

These scooters gain certain powers according to caster level. A scooter's abilities include those of scooters of lower caster levels.

8th Level: The scooter can ride over sandy, muddy, or even swampy ground without difficulty or decrease in speed.

10th level: The scooter may be a size Large vehicle, and carry two passengers plus 20 pounds per caster level.

12th Level: The scooter can use *water walk* at will (as the spell, no action required to activate this ability).

14th Level: The scooter can be a size Huge vehicle with four wheels, carrying four creatures and 40 pounds per caster level.

16th Level: The scooter can use *air walk* at will (as the spell, no action required to activate this ability) for up to 1 round at a time, after which it falls to the ground.

Noneday

Transmutation

Level: Modern 5

Components: V, S, M

Casting Time: 10 minutes

Range: Personal

Target: Caster

Duration: 8 hours (see text)

Saving Throw: None

Spell Resistance: No

This spell grants the caster one additional workday which occurs outside of normal time. It can only be cast at a place

appropriate for working, such as a home, workshop, or office. This spell can be cast only once each week.

The extra eight hours can only be used to perform work on a Research, Craft, or Profession check, or spell research or magic item creation. The caster may use any of the resources available at the location the spell is cast, but cannot affect the condition of himself, other items, or other creatures. At the end of the spell the caster appears in exactly the same location as when the spell was cast, and no external time has passed. The caster cannot heal, rest, or even re-equip himself during the time of the *noneday*.

Material Component: A clock, calendar or watch worth no less than 200 gp (or with a purchase DC of at least 20).

ExP Cost: 25 experience points.

Nuke

Transmutation

Level: Modern 1

Components: V, S

Casting Time: 1 action

Range: Close (25 ft. + 5 ft./2 levels)

Target: 1 person/level worth of consumable materials

Duration: Instantaneous

Saving Throw: None

Spell Resistance: No
