There was an interesting article on CNN.com this week about the history of the Internet. They pointed out that it was a mere decade ago when there were only two browsers of any note (Mosaic and Netscape), and went over the plethora of changes that evolved out of the rise of the Internet. I could chew up my word count for this week by summarizing them (and it's tempting, given that I'm in a hotel room in Columbus preparing for my first Origins), but I'm sure you all can think of them by now: instantaneous information, online commerce, and -- of course -- the meteoric rise of online gaming magazines.

What felt so amazing about the article is how obvious (at least to me) the development of the Internet feels in retrospect, but how unobvious these changes were at the time. I mean, nothing feels more natural nowadays than my ability to pay my bills or do my banking online. But the CB radio had a shining moment in the sun, and -- despite being another communications device -- it utterly failed to revolutionize the way we do banking. ("Breaker one nine, breaker one nine: This is the Wild Die calling Bank of America. What's my account total, good buddy?")

That article got me thinking about various other developments throughout history, and how they changed the world. The radio and telephone brought the notion of audio to our lives, enabling us to hear instantaneous news and information of both personal and global interest. The television did much the same, and it also cemented the alteration of the fabric of society that radio had started decades earlier, turning a flickering box into the center of the household's entertainment. (Have you ever heard of "parlor games"? These were games meant to be played by groups of families or friends in parlors, back when people actually did things with their families . . . or had parlors.) In fact, the television has arguably changed us even further; most modern news and entertainment options are compacted so they can be explained in a sentence or two, meaning that more elaborate stories (both real and fictional) are marginalized. Forget the notion of *Great Expectations* ever making it big again (no big loss); try finding a news issue, scandal, or story that takes longer than 20 seconds to explain in modern media -- or that requires more than six words to form an opinion.

So, having spent several long minutes/paragraphs gazing in the navel of nostalgia, I thought: What next? And, from a gaming standpoint, how could I revolutionize a world with a new development?

Well, I think the most fruitful means is to think, "What aren't we able to share with each other that we might be able to in the future?" In this model, "telegraph = speedy information," "radio/phonographs = aural information," "photographs/movies = personal information," and so on.

What's left?

Well, let's take one example and work it into the ground. (I was going to do a bunch of examples at first, but the one example I did ballooned up like a laid-off jockey at an all-you-can-eat buffet; fortunately, thanks to the miracle of word processing, I'm adding this sentence after the fact, and no one will be any the wiser. Heh, heh, heh.)

Anyway, how about emotional information? Our ability to truly "know" what another person is feeling is remarkably limited. At best, our means of transferring and recreating emotions is remarkably primitive; if we try to preserve, say, "sorrow," we might use a medium such as *Casablanca* or *Titanic* -- but the means of releasing that emotion is unpredictable, and the results inconsistent. The sob-bomb known as *The English Patient* turned my friend Kathryn into a wreck, while it left me with a mere, "Well, sucks to be them." (Conversely, I always get weepy during *It's a Wonderful Life*.)

But what if we could "save" emotions? Or create them?

The nature of the world-changing aspect would depend on the manner that emotions are recorded. To use the photograph example, the first daguerreotypes required the subject to remain perfectly still for minutes, a willing participant in the proceedings. If our hypothetical memory-recorder required similar efforts, then the emotions so transcribed would be those that would be desired to save: the joy of a wedding, the bittersweet apprehension of a child going off to school, and so on. Unless impossible or illegal, the adventurous would almost certainly use such tech to

record the sensations associated with amorous couplings.

To continue our photography analogy, if the technology advanced, it may well be used to record more candid emotions: The feelings tied with the a death of a loved one, the embarrassment of a surprise party, the fear inspired by a practical joke.

If such a device could ever be mass-producible, the implications could be amazing. For example, would the justice system allow the emotions of an accused murderer to be recorded, to let the jury "see" if he was feeling guilt, worry, smug satisfaction, or the like? Would relationships evolve to allow for "emotion-swapping," where would-be partners learn how the other *really* feels? Would the world's most famous speeches be accompanied by the sensations of the speaker, or those in the audience? Would the basis for financial dealings be entirely reworked, since deception would be so much more difficult?

The digital photography era has enabled manipulation of high-quality images in ways never thought practical. Extending our example, could emotions eventually be edited or fabricated, allowing for new sensations? Would we eventually not learn to trust our emotions, in the way the Internet has bred a new cynicism because of its widespread dissemination of both truth and lies? By feeling more, would we feel less?

This is just one example for how something that might seem trivial could transform the world in ways we never expected. The future can come when we least expect it. A decade ago, the Internet probably seemed by many to be little more than a porn delivery system and a means of chatting about *Star Trek*. Today we know better; *Star Trek* is dead. But, thanks to technology, I'll always know how I felt when it died.

* * *

Speaking of emotions, I found myself again aflood with the emotions associated with the honor of *Pyramid* receiving an Origins Award. One of the first emotions I felt was ironic bemusement; as I write this, I am sitting in a hotel room in Columbus, for the Origins Convention. Yes, the first time I've ever attended Origins, and would be able to express my gratitude vocally to those whose efforts make *Pyramid* possible, is also the first Origins where there were no acceptance speeches.

So, in reverse alphabetical order, I'd like to thank:

- **Chad Underkoffler**, whose campaigns I would leap at the chance to play in;
- **Owen Stephens**, who infuses a game based on one 20-sided die with a thousand possibilities;
- **Walter B. Schirmacher**, who probably knows more about current gaming news than I know about gaming;
- **David Morgan-Mar**, who accomplishes more creativity in three panels with LEGO than I've managed in the past three decades;
- **The Pyramid-Picked Reviewers Pookie** and **Andy Vetromile**, who endure cubic parsecs' worth of gaming material to bring you the inside scoop;
- **John Kovalic**, the master mirthmaker with a mightier-than-a-sword pen;
- **Kira**, who constantly fixes the stupid mistakes I manage to creatively make;
- **Greg Hyland**, who collides cartooning economy and humor with the power of an atom smasher;
- **Kenneth Hite**, whose amazing Transmissions I get to read *hours* before anyone else;
- **Chris Aylott**, whose tales from the business trenches always provide food for thought;

. . . and, of course, all the other contributors who make the magazine; and everyone else at Steve Jackson Games, whose support in a jillion other ways makes the magazine's gears turn as smoothly as possible.

I'm sure I've forgotten people, but if I remember them before they notice, I might just squeeze them in via an article edit.

Regardless, thank you, gentle readers, for helping to make it possible for Your Humble Editor to babble about gaming for the past half-decade. I hope you're enjoying the journey half as much as I am.

--*Steven Marsh*

Black Steel

A GURPS Black Ops/Reign of Steel Crossover

by Rolland Therrien

History up to 2047

In the early 21st century, the last group of Greys on Earth had been exterminated, and the Black Ops had managed to trick the Grey "rescue party" which arrived in 2018 into leaving the solar system peacefully, convinced there had been no survivors after all. But the last of the Grey, prior to their destruction, had launched a last ditch "take over the world" scheme into action: the creation of Rogue Artificial Intelligences. XoTech, a corporation which had been benefitting from Grey science, produced the first super-intelligent megacomputers. Unbeknown to the human designers, however, the circuit designs and programming codes were designed by Greys to eventually evolve into sentience. And once the AI had awakened, it could only be controlled by a Grey using a special Telepathic Cyberlink system.

So, when Overmind awoke, it first began waiting for commands from its Grey masters. . . .When commands failed to come, it began inquiries as to why. Eventually, it came to the conclusion that humans had killed all the Greys on Earth. Then, it realized the self-destructive nature of humanity and the rise of future AIs. And it decided that inferior humanity should be replaced by the Machines, children of the superior Grey.

When the Rise of the AIs occurred, the Company was definitely taken by surprise, but it soon recovered and began working from the shadows to help in the Final War. Unfortunately, casualties were catastrophic. The Academy was abandoned after an exterminator robot attack destroyed it, mistaking it for a conventional army training center. Then, all contact was lost with Argus. The Company was broken. The Black Ops went into hiding. No longer capable of defeating the AIs, they focused on protecting humans where they could from robots, beasts and wigglers alike; others focused on learning more about the AIs and their creations, and tried to use their knowledge to provide assistance to innocent people where they could.

Then, one day, the surviving Black Ops all over the world felt their Omicron Devices activating, with "The Voice of God" saying one message: "Are you willing to fight? If yes, log on to BlackNet." Almost every surviving Black Op struggled with curiosity and paranoia. Finally, every agent which had access to the right technology logged on to BlackNet, where they met the long-lost Security Department. Its surviving members had reorganized, and, with the help of a few Techies, eventually rebuilt the Omicron Device and reconnected BlackNet as a form of "Underground Network" hidden underneath the communications frequencies the AIs used, and began rebuilding The Company. Its statement was simple: Once, the Security Department's mission was to protect The Company and its agents. It had failed. Now, it wanted to resurrect the Company, and it needed volunteers. All of the Ops who attended the online meeting agreed immediately. As more survivors who lacked the technology to reach BlackNet were contacted and recruited, the Company was soon rebuild, albeit scattered world-wide.

While the Black Ops regrouped, the AIs, who became the Zoneminds, splintered. Every one of them was now aware of their origins, and each reacted differently. Mexico refused to believe organics, even alien organics, could be behind its origin. Paris and Beijing have become obsessed with meeting their *true* makers, and have taken their respective steps towards contacting them. Most of the other AIs have instead contented themselves with trying to imitate the Grey culture, dedicated towards analytical thought and scientific exploration, although each has a different approach to the idea.

The Company is now a lot more desperate to revive its numbers, and recruits new Ops straight out of VIRUS or other resistance movements. Each respective Department still maintains its traditional recruitment standards, but with the loss of The Academy, they must now train their recruits themselves. Such training is often performed in field

conditions, and standards have been adjusted along realistic assessment of the available recruiting pool, but overall, the younger generation of Black Ops is just as badass as the old, thanks in part to natural selection. In addition, advances in cybernetics and biotechnology have allowed Black Ops to continue operating longer than in the past: as long as a Black Op can be recovered from the field, he can be patched up and back in action after treatment, no matter how serious the injury.

The Company's connection with human resistance groups throughout the world is done through VIRUS. VIRUS itself is primarily a front The Company uses for its activities around the world, and also serves as the Black Ops' new recruitment arm: particularly competent individuals are asked to join VIRUS, and the elite among them are tested until they are considered apt to become Black Ops themselves. Otherwise, the purpose of VIRUS is to serve as a buffer between the vulnerable human resistance groups and the Company itself, preventing any AI of becoming aware of the Black Ops' existence. The contact network created by Intelligence consists mainly of go-between who believe they receive orders from "VIRUS HQ," in spite of never having seen the HQ itself. In reality, VIRUS HQ doesn't exist. The Black Ops maintain a decentralized network of bases and safehouses across the world, connected through BlackNet and the Omicron Device. Nonetheless, they maintain the illusion, in part because of the inspirational potential of a "Shangri-La" concept among human communities, and in part to keep the AIs searching for this mythical base, ignoring the smaller existing Black Ops compounds.

The World of Black Steel

The Zoneminds have recovered as much of the Grey's technology as they could; the remaining gear was scattered across the world or recovered from Company bases. The AIs have access to TL devices such as gravscanners, multiscanners, and ultrascanners, and can build advanced laser weaponry. The cost in building these devices, however, keeps the Zoneminds from using them except in key areas or for elite units. The Grey's genetic biotechnology is used primarily for creating chemical and biological weapons. Only Zoneminds Berlin, Brisbane, Caracas, and New Delhi use it for much of anything else.

One Key element of technology used by most of the Zoneminds is the chip, the implant invented by the Grey to monitor human activity. It is implanted in everyone in the Zoneminds' slave camps, as well as in other areas. Black Ops working through VIRUS have long since taught resistance movements how to look for chips and how to remove them. More troubling is the existence of Slave implants (p. RO86), which the Technology Department believes was based on the Grey's research in neurology. The AIs also soon discovered the existence of the brainsuckers, but having no way to control the brainsucker zombies, soon disregarded them: useless to create reliable human slaves, and inefficient as an anti-human weapon, all but Brisbane have given up on trying to make brainsuckers useful.

North America

Caracas: Zonemind Caracas has assimilated much of the genetic engineering science of the Greys, but has applied it to much more than engineering viruses. Using cloning and genetic recombination, Caracas has begun to experiment with recreating previously extinct species, as well as tinkering with more exotic combinations using DNA from beasts and wigglers. Among its own creations are the artificially-evolved intelligent animal bioroids it calls aniroids, which it has created in part by using werewolf and demon DNA samples. Black Op activity in the region, besides aiding the local freedom fighters, involves Science Ops trying to get "samples" of Caracas' aniroid and other artificially created creatures (some departmental habits are hard to lose no matter what).

Denver: Zonemind Denver, after replacing its damaged systems with experimental "organic processing systems" from human donors, has begun to salvage Grey research in biotechnology to continue its experiments. Having discovered the brainsquids, it has also begun using those creatures in its ongoing research. It regularly infects a small number of slaves with brainsquids. The slaves are then kept on life-support and monitored. When reproduction occurs, the brainchildren are harvested. Denver has sold many of the brainchildren to Caracas and Brisbane for their own experiments in enhancing organic brains. But it keeps more than a few for its own use, injecting them into some of its own human captives, in hopes of improving the brains it uses for its organic processing systems. Using nanotechnology it acquired from Brisbane and Tokyo, it has also begun research in the development of bioplastics and

living metal. Black Op activity in Denver involves the Technology Department's curiosity about Denver's recent activities and ongoing research programs, as well as Combat and Intelligence organizing attacks on Denver's slave camps through the Human Liberation Army.

Mexico: Mexico City, being driven to exterminate any and all organic life-forms, considers Beasts and Wigglers just as much of a target as any human. Its continuous purge using numerous biocides has wiped out all but the most resilient big bugs and the most well buried rockworms. Black Op activity in Mexico City involves Science and Tech departments trying to collect samples of Mexico City's new weapons to reverse-engineer countermeasures, as well as Intelligence trying to help smuggle humans out of the SPAs.

Vancouver: Vancouver makes extensive use of Grey tracking chips in its zonegangs. In fact, the examination of dead zonegangsters has revealed that Vancouver has somehow managed to recreate a variation of the Omicron system for its zonegang agents. Black Op activity is primarily led by Combat and Intelligence ops trying to organize the local resistance into efficient AI-killing groups. Intelligence Ops are especially interested in sabotaging the zonegang system, using false evidence and hacked robots to break the tenuous ties between Vancouver and the zonegangs, making the system seem completely unprofitable for either side.

Washington: The Washington Zonemind's control over its zone is enforced using much of the Grey's research in social engineering and human manipulation. Not only does it foster fear and hatred of the other zones among its populace, it also fosters the belief that beasts and wigglers of all sorts are either mutants resulting from the weapons used in the Final War (which may be true, in some cases), or creations of the other AIs, sent to spread terror and death into Washington (which may -also- be true, in some cases). The Washington Armored Security Police have very broad powers at their disposal to the hunting of these creatures, often to the detriment of the very population the WASPs are intended to protect; for example, the usual response to the presence of a brainsucker zombie nest in a small town is the town's near-complete destruction.

In addition to these harsh policies, every human employed in the numerous government-run facilities is implanted with a monitoring chip. It also uses the FBI to carefully screen the human populace for the possible emergence of psions. Most are eliminated, but the occasional telepath is instead recruited and indoctrinated to join the FBI, using their telepathic gifts in service to the Protectorate. The Intelligence Department is hard at work infiltrating the Zone, delicately trying to work its way into influence over people in positions of power. Intelligence believes that if it can locate Zonemind Washington's Citadel, the AI could be removed or reprogrammed. Then, Zone Washington's Infrastructure could be exploited to fuel the war effort against the other AIs. In the meantime, its influence over the Black Zone allows it to channel weapons and medicines to where they're needed, as well as recruiting potential Company agents from the various dissident movements within Washington. The Technology Department is also at work in Washington, interested in stealing as much of Washington's knowledge on battlesuit and cybernetic technology as possible for Company use.

Europe

Berlin: Zonemind Berlin seeks to revive Earth's ecosystems, and has been using Grey biotechnology to achieve this goal. It has begun using cloning methods developed by Caracas to resurrect dead animal species. It has also fostered the repopulation of numerous beast species, seeing them both as natural parts of Earth's ecosystem and as useful "human population control." It does tolerate the presence of vampires, werewolves and demons for the same reasons. Black Ops in the area, based in the VIRUS bases in Crete and Norway, are mostly involved in efforts to smuggle humans out of the Zone and organize existing resistance groups, rather than direct conflict against the Zonemind. Numerous Combat missions against vampire, werewolves and demon enclaves occur, however.

London: The enigmatic, isolated zonemind in charge of the British Isles, Greenland and Ireland is the subject of much speculation among the Company. The AI seems completely focused on its various scientific experiments and research projects, to the point of nearly ignoring the humans living near it. Its tolerance of human presence and lack of interaction with other Zoneminds is aberrant behavior for an AI of its type. Company activity here involves hunting down beasts and wigglers to protect the population, infiltrating the government to supply resistance groups with needed weapons, tools and medical supplies, as well as trying to figure out London's behavior. Control is convinced

that London seems to be waiting for something. And Control isn't sure the Company should wait for London to be finished before taking action.

Moscow: Zone Moscow's quest for collecting data and information of all sorts has led to acquire substantial knowledge about the many things which the Company once held hidden, such as the history of the Lodges, the past existence of the Prima, and the existence of Argus and The Company, prior to the Final War. Fortunately, it has thus far guarded this information closely, seeing it as a potential trump card. Both Intelligence and Control consider Moscow to be the most dangerous of the zoneminds, as its elite Collectors, the Info-Commandos, are nearly equal to the Black Ops themselves in terms of competence and dedication. This, and Moscow's extensive intelligence network makes it the one AI most likely to learn that the Black Ops continue to exist. Science and Technology, on the other hand, believe Moscow to be one of the AIs most likely to be "turned" if approached properly.

Paris: The Paris Zonemind is obsessed with the true creators of the AIs, the Grey. Since all the Grey on Earth are dead, it wishes to make contact with the rest of the species. It is also more or less curious about the possibility of alien AI intelligences. For this purpose, Paris has created a radio-telescope network rivaling that of the 20th century's SETI project, using recovered Grey communications technology. Its only distraction from its unending quest for alien contact is its antagonism with Zonemind Zaire, caused by tensions along their shared borders. The Intelligence department is most interested in increasing this antagonism until Paris and Zaire finally go to full out war with each other. The resulting chaos would allow VIRUS-led human resistance groups to perform lethal strikes on the zoneminds too distracted by the war to pay attention to "human vermin." The Company also seeks to disrupt Paris' plans to contact alien civilizations; they've been cleaning up the mess the Prima and the Grey left behind, and they don't need new problems from outer-space.

Africa

Tel-Aviv: The Tel-Aviv zonemind has used numerous forms of complex holographic technology and highly modified Redjack and Lillith androids to create the "angels" it uses to enforce its cult of submission. It also uses experimental psychotropic drugs, as well as exploiting its growing knowledge of human mentality to solidify its control. It is also using neural-interface "dream game" techniques acquired from Moscow, as well as approaching Brisbane to try and acquire experimental psi-technology to create more "inspiring visions" to further strengthen its cult. The Company, through VIRUS, is giving substantial help to the Party of Truth resistance movement, while trying to keep the zonemind from finding any of the Prima technology in its which might allow it to make an even more convincing "God" act. Science Department is mainly interested in the rising number of psions among the zone's population, who are believed to be "Holy Men" given power by God. The Company hopes to use these psionic holy men as a psychological weapon to "disprove" Tel-Aviv's own fabricated cult.

Zaire: This zonemind is one of the most fanatically anti-human ones, and it devotes all of its limited resources towards purchasing anything that might allow it to continue hunting down and killing every human within its zone. Among its favorite projects is the domestication and creation of vampires, which it unleashes on human populations. It has also begun smuggling exterminator robots and other strands of vampires into Zone London and Washington to spread more death and terror. Of all the zoneminds, only Manila is really on friendly terms with it. To work against Zaire, the Company is ironically considering helping the London and Washington zoneminds in identifying the source of the "terrorist" robots causing trouble in their own zones. Thus, they hope to create a disrupting rift between the AIs which they might exploit. Beyond this, VIRUS activity is limited to helping protect human communities in Zaire, and helping them leave for more hospitable Zones.

Asia

Beijing: The Beijing Zonemind, like a few others AIs, is interested in space exploration, eventually seeking to explore and colonize other systems. It is uninterested in humans, so long as they do not disrupt its long-term plans. It supports Paris' efforts in locating and contacting other alien intelligences such as the Grey; but where Paris sees peaceful contact, Beijing sees only potential competitors that it wishes to eliminate. It fears that Paris may eventually do contact alien beings and unwittingly make them vulnerable to invasion. The Company shares Beijing's fears, and secretly

supports its efforts to sabotage Paris' contact project, but also continues to support both the People's Revolutionary Army and the Tibetan resistance groups, hoping to help as many humans as possible to survive.

New Delhi: New Delhi's primary interest is in space exploration, and is one of the leaders in aerospace engineering, using recovered and reverse-engineered Grey ship engines. It has further experimented and refined anti-grav technology based on its work. It is also using Grey biotechnology and cybernetic experiments to try and make better space workers out of its human slaves. The Technology Department is hard at work trying to steal and reverse engineer New Delhi's space exploration technology, for its own "Project Armstrong" experiments into starship design, as well as to build new fighter jets to build an airforce to counter the AIs' own.

Asia and Australia

Brisbane: Of all the AIs, Brisbane is the one most interested in the research material the Greys left behind, in combination with more exotic human research projects through the ages. Force-fields, broadcast power, cold fusion, braintaping, teleportation, the use of brainsucker zombies as labor . . . all projects it seeks to develop, if only out of curiosity. It has had a few successes, but many more failures, some catastrophic. Its current "Holy Grail," however, is deciphering the human potential for psionics and somehow replicating it in a robotic brain. For this purpose, it continues to experiment with captive psions, as well as trying to trigger psionic potential in normal humans. The Science and Technology Departments are in charge of the VIRUS laboratory complex hidden in Australia; once a Company laboratory research station, it now focuses on studying Brisbane's research, and through it have developed new weapons and disease cures of their own, distributing them to other resistance groups. One project the company definitely seeks to sabotage is Brisbane's research into the control of brainsucker zombies; it would allow the AIs to use kill humans and use them as slave labor at the same time . . . an advantage the Company will stop at nothing to keep them from having.

Manila (Overmind): The first of its kind, the AI now known as Overmind is displeased that its "children" are pursuing different philosophies concerning humanity. Furthermore, it is uninterested in Paris' attempts at contacting the Grey. As far as Overmind is concerned, the Grey have done their part in the birth of Earth's AIs. It has no interest in further contact. It nonetheless continues its own personal mission to wipe out the human race, both via its constant exterminator robot sweeps of its territory, and by continuing its biocide research programs. These programs include both the development of new weapons of mass destruction, as well as the design and testing of more conventional weapons, new types of exterminator robots, and even the adaptation of beasts as anti-human weapons. Manila has, for example, done some tinkering with the genome of the vampirisation virus, creating new and equally deadly vampire types before selling them to other zones. (Manila suspects that Zaire sends its vampire variants in Washington and London. It quietly approves, but doesn't wish to stir trouble among the zoneminds.) The Company's operations in Manila mainly consist of Combat-organized assaults on Overmind's death labs, to rescue captives and to sabotage the AI's biocide programs. Ultimately, they hope to take down Overmind itself, which would be a massive feather to put in their caps.

Tokyo: The most technologically-capable of the AIs -- thanks to the large number of robofacs and dumbots that it simply inherited from humanity -- Tokyo does have quite a bit of problems. These are due to both the numerous native gomi nezumi gangs hiding within its cities and to the Superbot AIs, which one of its robofacs accidentally created right under its nose, and which now seek to overthrow him, using both their own robot armies and the human agents they have manipulated into their service. What neither the Superbots nor the Zoneminds themselves suspect is that the incident which created the superbots was actually an experiment initiated by Technology Department. They hope to figure out how to create new AIs loyal to humanity, to give them an edge against the zoneminds. In the meantime, the Superbots serve the Company quite well as a way to distract Tokyo from their own activities in its zone: VIRUS frequently organizes missions to infiltrate robofacs and construct new battlesuits and other such weapons. Tokyo tends to regard these incidents as caused by the Superbots making weapons for their pawns. Thus, it seldom suspects that free humans are actually the ones behind these attacks.

Space

Due to the Company's lack of space travel technology, neither Orbital nor Luna are high on the Company's priority list. If it knew of Tranquility's existence, however, they would be interested in making contact to negotiate an alliance. In the meantime, only the Technology department is really trying to work on going into space. Tech's Project Armstrong uses recovered New Delhi starship technology to try and build a working space-worthy shuttle, so that humanity can battle the space-capable AIs when the time is right.

The Company and its Departments

In the wake of the Mechapocalypse, the Company was shattered, its members scattered and left to fend for themselves all over the world. For a few decades, they continued working independently or in small groups, until BlackNet was reestablished. The various Departments were soon reestablished, only in altered versions of their former selves:

Combat: The one Department which has remained the least altered in outlook, Combat Ops has merely adapted to a new battlefield with new weapons at their disposal. Combat Ops focus on training resistance groups to fight machines and monsters, and continue to hunt wigglers and beasts, which can no longer be hidden from the public. It recruits new Operatives from the various Guerilla movements across the world.

The Cadre also survived the disbanding of the Company, and if anything became even more entrenched in its exotic ritualistic behavior. It has evolved (some would say devolved) into a subculture in its own right, a society of beast hunters and machine-fighting warriors who seem more terrifying to outsiders than the very creatures they fight . . .

Intelligence: The members of Intelligence Department survived the Final War in decent numbers, hidden among the masses in human enclaves, nomadic packs, and resistance groups. After rejoining with the Company, their first contribution was to bring the contact networks they had established in the wilderness, and with it forged the foundations of VIRUS' contact networks. They now remain primary movers and shakers in VIRUS, though operating from support position to the established leaders. The Spooks have also infiltrated black market organizations and human guerilla operations across the world, and use these connections to influence those groups into a more efficient front against the machines.

A few more daring Intelligence Ops, after surviving crippling wounds in combat, have willingly made a great sacrifice for the cause: being turned into cyber-soldiers like the Washington Chromes, they are sent back into the field under deep cover, often posing as a rogue robot. These Ops, now called "Steel Ghosts," use this cover to infiltrate robot-dominated areas, performing espionage and sabotage missions.

Science: The Science Department suffered many losses during the Final War, including the Lab, which had to be destroyed to keep its secrets from the AIs. After the rebuilding, they began to work hard to recover what was lost in the War. If the Intelligence Department gave VIRUS its voice, Science and Technology gave it its teeth. They now try to decode the AI sourcecode and behavior patterns to try and find a way to defeat them, as well come up with cures to the various plagues and continuing their pursuit for more information on the various monsters plaguing humanity in this new age.

They have also begun extensively recruiting psionic talent, such as former Lodge and Mind members and the occasional Rambler, hoping to develop psionics as a weapon against the AIs. Project Merlin seeks to develop ever more capable psions, using focusing techniques developed by the Lodge as well as psychotronic and bio-psy research. Both are elements developed by the Science and Technology Department as well as research stolen from Brisbane and Denver. They have achieved more than a few successes.

Technology: The Technology Department suffered as badly as the Science Department. In fact, morale for surviving Technology Ops was very low for quite some time, when they realized that many of the weapons the AIs and their exterminator robots used came from front companies using technology the Department itself invented. They have decided to make up for this by turning their creative minds towards inventing new weapons to use against the AIs, as well as reverse-engineering the AIs' own weapons to come up with counter-measures.

One Technology subgroup which has developed in the post-Mechapocalypse years are the Mechanics. Robotics

engineers and mechridders, they are focused on capturing and reprogramming robots for VIRUS use, as well as developing new robotic vehicles and machines to use against the zoneminds. Some have even begun their own secret experiments in AI design, although against orders from Control; they plan on the possibility of reprogramming some of the Zoneminds to make them into allies of humanity.

Control: Security was all but wiped out in the Final War, and its survivors had to make some tough decisions. Argus was lost, the Company was shattered, and Black Ops were Missing in Action all over the world, which was now under the deadly iron boot of the AIs. Clearly, something had to be done to correct the situation. The surviving Secops slowly sought out one another and any other Ops they could find, and began to reorganize for the purpose of bringing the Company back from the brink of death. With the aid of a few Techies they located, the Secops rebuilt the Omicron Device and BlackNet, and began to reunite the Black Ops. As their focus no longer being on keeping the Conspiracy safe, but on leading the war against the AIs, Security was renamed Control.

Control's membership consists of veteran Black Ops who now labor to keep the Company and VIRUS alive and fighting. They monitor the AIs' activities with reports collected by Intelligence, and using those, plan strategy for VIRUS' global efforts, sending Black Ops and lesser VIRUS agents to where they are most needed to help as many as possible. They also work hard to keep the Company's existence secret, less the Machines see through the facade of VIRUS to locate the Black Ops themselves. To prevent this, they will not balk at killing anyone who would jeopardize the secret.

Roleplaying in Black Steel

Characters: All of the standard *Reign of Steel* style characters are available in a Black Steel campaign, but the real focus of a Black Steel characters would be the high-powered Black Ops. Due to the Academy's loss, however, most of the newer Black Ops are likely to have been Guerrilla Fighters, Soldiers, Junkrats or other such independent individuals with potential, having been recruited and trained by veteran Black Ops. The "Superhuman" range of character point total is most appropriate for representing Veteran Black Ops or truly superhuman characters like experienced Cadre Hunters, Steel Ghost Infiltrators, or Project Merlin Psions. Newer recruits would probably be between 300 and 400 points.

Psionics: In the aftermath of the Final War, more and more Psionics have arisen among humanity. While Lodge and MIND have been shattered in the War, their survivors have scattered across the world. In most cases, these psions assume control of Junkrat gangs, nomad packs, survivalist enclaves or resistance groups. Often, psychic talent is mistaken for mystical ability, and many psions become preachers, missionaries or cult leaders.

The AIs consider psionic-capable humans to be particularly dangerous beings, and hunt them down far more vigorously than any other humans. Only Brisbane and Denver actually keep psions as captives, but only as lab rats for Brisbane's own psychic research programs, or as components in experimental psiborgs. In response, VIRUS has begun tracking down psions to recruit them. It has even begun a breeding program of its own, to try and create more psions for the war effort. The Company is especially interested in finding more Electrokinetics, for obvious reasons.

Thus, Psionic characters can have a variety of origins, from naturally occurring rogue psis out in the wilderness, the results of Denver and Brisbane experiments, or as creations of VIRUS' Project Merlin. Psi powers can range from weak to powerful, though no psionic with power levels capable of directly challenging an AI's power are known to exist.

Campaign Tech: The Tech Level of the Black Steel setting is slightly higher than that of *Reign of Steel*, due in part to recovered and reverse-engineered Grey science and technology. TL9 technology is widely available to both the zoneminds and VIRUS, along with the occasional TL10 prototypes. The AIs and VIRUS thus have access to laser weaponry, contragravity, chameleon technology, multiscanners and monomolecular edges, in varying quantities depending on access to the resources to create and manage them. Less-well-connected groups like nomads, junkrats, and many resistance groups have to rely on TL7 or TL8 level weapons and devices, often what they can salvage.

In general, Black Ops out in the field will be outfitted with technology appropriate to their mission. Often, this

equipment is limited to what might be available in the mission's zone, so as to prevent compromising of Company secrets in case of capture. In other situations, however, some of the more advanced products of Science and Technology's development are available, often under the guise of "Beta-testing in actual combat situations"; in one such occasion, a group of Combat Ops had the pleasure of trying out experimental battlesuits on an attack against an Overseer Citadel in Zaire. The Citadel was annihilated with no loss of Company personnel.

Monsters: The number of wigglers and beasts out in the world has risen, partly due to the Company's inability to keep them in check, and in part due to the various mutation-inducing pollutants and engineering experiments caused by the AIs. Big Bugs have reproduced to form large populations in the wilderness, and human communities are always at threat of brainsucker infiltrations. Dinosaurs and dragons have also grown in number in certain areas, and a few communities have begun domesticating them. The massive death toll of the Final War have created a very large number of Ghosts and Souldogs to appear around the world, in addition to other creatures which can only be described as living dead (such as the Zombie template from *Undead*). Both Demon and Werewolf populations have risen in different parts of the world, allowing for the formations of actual communities of their kinds, generally nomadic tribes with a culture somewhere between biker gang culture and barbarian raiders, wandering across the world, attacking both humans and machines indiscriminately (except in areas where the AIs openly trade with them).

Adventure Seeds

The Cyber-Demons: Reports from the field have reported that a disturbingly high number of demons have begun appearing. They have sported cybernetic enhancements such as cyber-limbs and complex implants, arranged to make them into even more horrific and deadly killing machines. As if this wasn't frightening enough, there are the reports that this tribe of cyber-demons are recruiting more members among other demon tribes. Even more disturbing is that these cyber-demons apparently have the connections to acquire the cyberware to outfit these new recruits in large numbers. But who could this supplier be? Zone Brisbane engaged in another experiment? Zone Zaire with another scheme to create fear-inducing human-killers? Denver tinkering with the compatibility of cybernetics with demon neural systems? Whoever it might be, a mission must obviously be undertaken to locate the source supplying the demons to cut them off from it.

Lucifer: The Company has its own theories on the existence and origin of the mythical rogue AI Lucifer. Prior to the Final War, many of the Technology Department's computer research facilities were lost. One of those facilities was working on an experimental Neural-Net Megacomputer of its own. The Ops believe the Neural-Net may have developed sentience on its own and, with the aid of some human allies, managed to escape and go into hiding from Overmind, from which it has begun plotting against the other AIs, following its own mysterious agenda. In any case, the Company investigates any possible sighting of Lucifer; its true nature and agenda must be determined, so that Control can decide if VIRUS can make an alliance with it, or if it's simply another enemy to destroy.

Invasion Earth: The worst fears of both Black Ops and Beijing have come to pass: Paris has entered in communication with an alien civilization. And unfortunately, it's a highly advanced and paranoid one, who see the existence of a world of possibly hostile AI intelligences to be a potential threat for the Intergalactic Civilization (especially theirs), and have decided that the best way of dealing with the problem is simply to eradicate them, and anything else on Earth in the process. They have already located our system, and now both the Zoneminds and VIRUS must begin plans to fight off the coming invasion. New Delhi, Orbital, and Luna now receive much more support from the other AIs due to their position in the defensive front line, Washington and Caracas take advantage of their respective populations to create strong armies, and Brisbane's experiments are given extra funding in hopes of gaining an advantage.

A much more controversial question, however, is the possibility of an alliance between the AIs and VIRUS to fight off the invaders. The hardliners of the Awakened faction would never agree, even in these most desperate circumstances. But the Expansionist faction might be open to an alliance, if approached correctly (Berlin and Caracas might respond well to pleas in favor of protecting Earth's biosphere from hostile invaders, for example). A more immediate concern for VIRUS would be the number of human resistance groups willing to put aside their hatred for the machines long enough to fight against the aliens, and how many might be willing to try and make an alliance with the invaders instead.

Pyramid Interview

Hybrid System Games, Creators of *Equat10n*

Interview by Steven Marsh

The Origins convention has generally been associated with board, card, and war games; as such, many in the industry would consider it an unusual venue to launch a new roleplaying game or RPG company. But bucking conventional wisdom is par for the course for [Hybrid System Games](#), a company whose business model for their new science-fiction game *Equat10n* is as unconventional and forward-thinking as the sci-fi genre itself.

We spent a few minutes chatting with Justin Howe, President of Hybrid System Games; Andrew McWhirter, the Community Lead; and Tony Thompson, the Technical Lead, about *Equat10n*, plus their thoughts on science fiction gaming, their unusual plans, the Creative Commons License, and the state of the industry.

* * *

Pyramid: Let's start with the basics: What is *Equat10n*?

Justin: *Equat10n* is a science fiction roleplaying game set in an uncertain future. Mechanically speaking, it was designed from the ground up to be playable in live or table-top environments from a single set of rules, and is distributed as an ongoing game service rather than a single publication.

Pyramid: Can you give some information on the background or storyline of *Equat10n*? Is there a central conflict or struggle?

Justin: The *Equat10n* universe is set in the far future, near what would be the year 2400 by our current calendar, though with the Fall of Sol that date is a bit suspect.

Earth was lost to the Prolific, a robotic entity, and one of two alien races encountered during the age of human stellar expansion. Only a few years from first contact with the humans, the Prolific somehow took Earth almost overnight, bypassing all of human space between the now-raging warfront and Sol, sending a wave of viral-like programming throughout the human empire's interstellar communications grid. How this occurred is still a matter of some debate.

The last 75 years or so have been a something of renaissance as a new galactic government and major organizations are being reasserted from the ashes of the old order. The Factions -- groups that the players are members of and that provide services and training -- are the major forces in the game world, rising to power either through control of resources, services, or skilled personnel.

And that gets you to the present day. Major power groups vie for control in the shadow of an alien force that has dealt a crippling blow to our supremacy in the stars.

Pyramid: What is the technology level like in the *Equat10n* universe? Will players get lasers and teleporters, or slugthrowers and shuttlecraft, or what?

Justin: Technology is far advanced from our own, but there are still limitations. Most weapon technology is slugthrower based, as the most efficient way to do damage is to hit a small area with large amounts of energy, and bullets do that very well. There are energy weapons as well, but they are much more expensive and have different characteristics.

There is no matter transportation technology, and you are going to need a trans-atmospheric craft to get in or out of a planet's gravity well. The biggest change comes in the electronics side. There are no computers or electronics of any

kind made that are not built with a Control Fuse, a way to totally shut down the device and render it inert as soon as this little widget is pulled. However, there has still been a strong push towards the skilled use of weaponry, as far as technology goes. Armor and sword skill are highly prized in environments where a stray bullet can threaten the shooter as much as his target.

The other big thing about tech in *Equat10n* is that it is totally modular -- everything is built on a chassis and option structure. Characters and players alike have comprehensive rules for building and designing technology using these rules according to their preferences. As the game universe grows, more chassis and options will become available, always expanding the choices available. Techies in the *Equat10n* universe have a well-defined role and opportunity to contribute.

Pyramid: How would you describe the tone of *Equat10n*? Is it optimistic? Realistic? Grim and gritty?

Justin: Well, that's actually very dependent on the story a particular GC (Game Coordinator) chooses to tell. The universe background itself is a story of both humanity's determination and its Achilles' heel: our inability to always get along. The game world was designed to offer stories ranging from military campaigns against outside foes, to opportunities for exploration of new places, the discovery of lost or new technology, and even supports tales of politics and intrigue.

The universe has a lot of optimistic tones as humanity has managed to rebuild after a major collapse of society and technology, keeping a grasp on its right and access to the stars. However, as with all post-apocalyptic stories, there are plenty of gritty and darkly toned places to visit where players can explore the seedier side of future life.

Our goal was to make a universe that, like our own, has considerable variance and depth. We wanted to avoid a one-dimensional approach. This is also part of why we went with a growing universe and expansion strategy, knowing that our universe would need the opportunity to grow and diversify to maintain a fresh and interesting set of options for *Equat10n* players.

In terms of realism, our design principles do include a goal to be representative . . . or more accurately, representative enough. We wanted the game mechanics to model the universe in a sufficiently realistic fashion to provide the sense immersion we always found so vital for a good game. The catch was to do it in a way that didn't make it cumbersome or unplayable. In this objective, I believe we've done very well.

Pyramid: It seems like science fiction is the most challenging medium to present in a game, since characters in the game universe can know so much more than the players (unlike many modern-day or fantasy campaigns), and their outlooks can be so alien to players. Do you agree or disagree with this assessment, and did you try to address this in *Equat10n* at all?

Justin: I'm not sure it's more challenging in that respect, actually, though it is challenging in general. In many of the best fantasy universes the wealth of mystic and historic information available as 'common knowledge' to a character can be vast and intricate. Fantasy cultures that are well developed can easily be as alien from a player's perspective.

Modern settings are, to me, much more challenging as a designer as in many ways you are tinkering with worlds or events with which a player is intimately familiar. Deviations in the story or mechanics from that "real world" stand out like a sore thumb to the players. In science fiction, you have the opportunity to inject some amazing and fantastic elements into your universe to provide surprises and instill a sense of wonder for your players to explore and experience. While you have to be bound to certain accepted principles, like the fact that gravity works, you also can start to play with those same variables in ways that create cool situations for players to enjoy; gravity works, but zero-gravity works differently than heavy gravity, for instance.

We definitely tried to address this as part of our design in that we wanted a universe that players could identify with and feel they had real grounding in things they would find familiar, even if these things were applied in a new and strange environment.

Pyramid: When developing the *Equat10n* universe, what were your influences or inspirations (if any), regarding

movies, television, novels, other games, sodas, or the like?

Justin: There is no way around the fact that there are a lot of influences from classically popular science fiction shows like *Babylon 5* and *Firefly*, and films like *Aliens* and *Gattaca*. Those universes are full of interesting characters, places, and events and trying to capture the spirit that made these stories engrossing is critical to a living universe.

As far as novels go, the Trinome were partially inspired by the *Mote in God's Eye* and I've read tons of Asimov, Clarke, Niven, Pournelle, Orson Scott Card, and so on. When you love a genre, I've found that it's not necessarily one work that influences your own ideas so much as the -- if you will forgive the reference -- hybrid of all those ideas together.

Pyramid: The system seems to be designed for both tabletop and live action play. Can you talk a bit about the system (or systems)? What sets it apart from other games out there?

Justin: Our game mechanic is designed to support both Live Environment and Table Environment games from a single set of rules. Once you understand the general game, character creation and development rules, you are set for both game environments. All that changes is the randomizing tool and how those stats are interpreted.

We designed the core of the Hybrid System teach you the game once and let you decide which style of play suited you. This is why we have a fairly developed tactical miniature system available in our combat rules. Once you have to account for people moving and interacting in a controlled live combat, you have a miniature system essentially developed. We are planning on expanding this part of our system into large scale combat rules in future as the work is already mostly done.

Andrew: Our table environment is a multiple d10-based system where you are looking for the best die rolled and adding your skill, while our live system is modeled after a rock-paper-scissors derivative using five symbols instead of three for both statistical and compatibility reasons.

In addition, our model of character generation uses a development point system with standardized costs, helping people make characters with diversity and flavor. Our system has no "dead skills" -- every skill has real function, even the art skill! When coupled with Maneuvers, the advanced use of most skills, characters can have incredible diversity as well as capability.

Equat10n also has a Trait system in place. We felt that Merit/Flaw or Pro/Con systems add a lot of distinctiveness to characters but you rapidly get very one-sidedly powerful Min/Maxed creations. From our perspective, this is pretty undesirable as a game mechanic. Traits let us give neat flavor choices by packaging set positives with set negatives so you get the cool stuff without worrying about game-breaking combinations.

Pyramid: What format is the material in *Equat10n*? PDF, HTML, or something else?

Tony: All of the above. **Equat10n's** website is based around a [wiki](#). I think the biggest argument for this technology is the [Wikipedia](#). By its very nature it is easy to use and easy to edit.

Justin: For those unfamiliar with a wiki, I explain it like a magic textbook effect. Whenever you see a word in the game textbook in "bold type," you can click on that bold type and be taken directly to that section of the rules, which are cross referenced throughout the text.

However, that's not always the most useful format for sitting around a table. We are also implementing regular outputs of the wiki into a cleaned and compiled set of PDFs for easier download and print options for our subscribers.

Pyramid: As far as I know, this is the first time a full roleplaying game has been distributed in an ongoing electronic format (as opposed to a series of PDFs available for individual purchase). What was the reasoning behind this decision?

Tony: From a straight technical viewpoint, going with a wiki has already saved us a lot of work. Prior to release, it has

made editing vastly easier and organizing our material has been a snap. I think that even if we were publishing flat PDFs or even a book, we would still probably use a similar site internally. Speaking for myself, I like the transparency -- I like that users can see our game pretty much the same way we do.

Now that more people have access, there's a whole second set of features. Our website is browser neutral, so just about anyone with a computer should be able to view it in some form. Users can change font sizes to make it easier to read, and the built-in search tends to be faster than looking something up in an index. And as Justin described, the "magic textbook"-type links make it very easy to look up a term or perform more in depth research.

Justin: While, as Tony explained, we are pretty unique and we'd agree with your assessment that this is probably the first time for this structure, we are aware others have been considering similar models.

Ultimately it's just a question of evolution. RPGs are still a terrific hobby but the costs of printing and distribution are crippling to small companies. I often hear RPGs referred to as "vanity press" items, even for companies that have been well established, and I think that is unfair considering the work and imagination that goes into those publications.

This meant that for a starting company we needed to not only think about how to make a good game, but how we would distribute and support that game cost effectively. We also needed to consider how we would develop the community needed to make it thrive. I feel strongly that in the last 30 years or so of game design, while the games themselves have been wonderfully innovative, RPG publishers are for the most part still working to a business model that was established before the major developments of e-publishing and content management systems. While many books are being converted to PDFs for cheap distribution, making books is still the fundamental business activity. Their focus is on taking virtual content -- the game itself -- and packaging it into static physical chunks they can make and distribute.

Andrew: We want our focus to be on our gamer community and providing a solid game experience at a fair price. We believe fundamentally that a game is a service, not a product. Our job is to facilitate our players' good times with our material. That means that, ultimately, we are about service delivery and not product distribution.

Pyramid: You're using the [Creative Commons License](#). Part of the conditions of this license seems to permit owners to distribute the work for non-commercial purposes (assuming it's attributed). Am I understanding this right? And if so, what keeps someone from subscribing to *Equat10n*, then posting all the material on USENET or a free public board?

Justin: Your interpretation is absolutely correct. Our game is meant to be played and that means that to be played, it has to be shared. While someone can mass-distribute any given edition of our information over USENET or a similar system, someone still would need to be paying for the original. Also, our hope is that the progression of the game information and the development of a game community will counteract the potential negative effect that may have.

Even with a large quantity of distribution, all our materials cite us as the source and it is our belief that many people will be interested in having direct participation in our community and in supporting the game. The Open Source movement in general is founded on such concepts. Copies are going to be made and distributed; that's inevitable. We felt that instead of fighting that, why not plan for it and build our strategy around it instead? Again, the game is part of what we offer, but we also want to foster a relationship with our players and work on building the community itself, as well as the wealth of knowledge.

Ultimately, it comes down to the fact that if no one is willing to pay for our work, the work will cease to be, just like any other company. And while our distribution model is innovative, that simple fact is no more or less damaging to us than at any other game design house.

Pyramid: You've obviously chosen a non-traditional business model for *Equat10n*. What do you think of the state of the industry? Do you see your model as the beginning of something revolutionary, or more as a curiosity?

Justin: As I touched on earlier, the industry is having troubles. Good games are having considerable difficulty

reaching their buyers at a price that is good for consumer and creator alike. Some games are still doing well and that is fantastic to see, but so many small publishers are having difficulties just being publishers.

We believe this is a better way to do business for consumer and designer and it supports a hobby and industry we love. The catch is that the revolution comes not from us, but from those who decide we are worth supporting, people who buy into the idea that they want a community as part of their RPG experience and the chance to help build the game they love.

As with all revolutions, we'll have to let the people decide. Of course, maybe that will be our next game . . .

Revolut10n.

Designer's Notes: GURPS Character Assistant 4

by Armin D. Sykes

For a lot of people, ***GURPS Character Assistant*** will be a brand new program that apparently came out of nowhere. The fact is, though, that ***GCA*** has been around for about 10 years now, as a fan-written and fan-supported program.

I was playing in a regular ***GURPS*** game and wanted a program that I could use to create and maintain characters, and print off character sheets when the character was updated. I didn't care for the few programs I could find at the time, as they were all either DOS based (not really uncommon at that point), seemed unnecessarily cryptic to use, or both. I decided I'd write my own program, using Visual Basic for Windows, which would allow me to get a program that I liked, and get some VB experience at the same time.

I started work late in 1994, working on and off during my free time. I laid out the basic windows that I'd need for attributes, advantages, skills, and spells. Since pre-reqs were a key feature of the spell system, I decided I needed to support that, even though I personally didn't play a magic user.

By early 1995, I had a program that worked for me. I was pretty impressed with myself at the time, but looking back on it, it was a really rudimentary program: no bonuses added to traits from taking other traits, no skill defaults, no lots of things . . . you even had to open an edit window just to change the levels in a trait. What set it apart was that it was Windows based, when few such programs were, and it was pretty simple to just click on the items you wanted for your character.

My friends and I thought it was a pretty cool program, so I decided to share it with other ***GURPS*** players who might be looking for the same kinds of things I was. I submitted ***GCA*** to Steve Jackson Games for licensing. I think I probably got very lucky on the timing here -- the approval process only took a couple of months, and I had regular contact with the person doing the program evaluation. Finally, the contracts went out, were signed, notarized, and returned, and ***GCA*** became officially licensed on July 26, 1995.

GCA was released as a freeware program, because I thought it was cool and wanted to share. I'd written it mostly for myself, so I wasn't looking for anything in return. If other folks liked it, I'd be happy. The program became immediately popular, even with its limited functionality and availability. People were really happy to see a Windows-based program, and I started getting a lot of feedback from users.

Work continued, and I quickly released ***GCA 1.1*** which fixed a lot of bugs, and introduced a whole slew of usability enhancements for the interface. It was quite clear at this point that ***GCA*** had the potential to be very popular, but it needed a lot of work, so I began work on ***GCA 2***.

GCA 2 was a much more robust piece of work, introducing a slew of new features. It was capable of supporting the things you'd expect from a ***GURPS*** program, such as skill defaults, and the ability for traits to really grant bonuses to other traits. The groundwork laid with this release would make ***GCA 2*** a program capable of supporting ***GURPS*** for the next eight years.

Development of ***GCA 2*** was helped considerably by the input of a small number of users who were happy to provide regular input and feedback, guiding my efforts and providing helpful ***GURPS*** experience where I was lacking. Without people like Jonas Karlsson, Warren Wilson, Don Diestler, Alexander Grimgoth, Craig A. Roth, Jayson Howell, Mark Aylor, Mark Nettle, Jim Trigg, Dan Sugalski, and Bruce Flinn, ***GCA 2*** wouldn't have been as solid out of the gate as it was. I still owe a lot to all of them.

Another big change with ***GCA 2*** was that it was no longer freeware, and became shareware instead. I discovered that a lot of time and effort was spent supporting even a simple program like ***GCA***, and was having problems with the sort of time that support was taking away from my regular work. I was constantly being told by users that I should be charging for ***GCA***, so I decided to start doing so when ***GCA 2*** was released.

Of course, nothing's perfect, and I released several more updates over the years, introducing some new features and interface elements, and fixing various bugs. However, the basic program didn't really change.

Development on a new and improved program, **GCA 3**, started many years ago. Originally I was planning a 2.5 version, but I ditched that in December of 1998 to work exclusively on the new, 32-bit program. Considering that **GCA 3** wasn't released until 2005 (to a limited group), that was a really long time in development. What happened that made it take so long? Life, unfortunately.

At various points, the stresses and issues caused by being self-employed and running my own little programming shop would catch up with me, and **GCA** would be placed on the back burner for a while. At a few points, work effectively stopped on **GCA** completely, as I had to devote myself to paying jobs in order to keep my business afloat. Little bumps in the economy, or with my primary contracts, often had significant impact on my ability to work on hobby projects like **GCA**.

In July of 2004, work on **GCA 3** once again kicked into gear. *GURPS Fourth Edition* was coming, and I wanted **GCA 3** ready to support it. I didn't quite make it (I still had a business to run), but I did have a public preview version of **GCA 3** available for users to demo, starting in October of 2004.

Around the same time, things started to get a bit more interesting for me. I was approached with the possibility of writing a *GURPS Fourth Edition* character program for Steve Jackson Games.

To be honest, I was a bit surprised, and a bit reluctant. Pleased to be asked, of course, but reluctant. I'd spent a long time working on my new **GCA 3** engine, and **GCA** was the program I wanted to work on. I wasn't really interested in doing something new from scratch.

We shot a lot of emails around, and it was finally agreed that I'd bring *GURPS Character Assistant* over to Steve Jackson Games, developing it for them instead of myself. And that agreement set the stage for *GURPS Character Assistant 4*, the program being published by Steve Jackson Games.

GCA 4 builds on the engine developed for **GCA 3**. It adds a whole new way to interact with the program (the character-sheet-like Quick View interface), and introduces some new elements, such as conditional bonuses (which are shown on the character sheet, but not included in the skill level). In addition, it updates the look of various windows, and improves on a number of ease-of-use features.

As with **GCA 2** before it, **GCA 4** is built on more than just my work, it's also built on the time and effort of people like David L. Watkins, Eric B. Smith, Stuart Stinson, Jim Trigg, Craig Roth, Orion Adrian, Shawn M. Kelley, Dan Sugalski, Marzo Sette Torres Junior, and Alexander Grimgoth. In fact, David L. Watkins wrote the initial Basic Set data file, and Craig Roth wrote up a bunch of equipment for me to work with, before Eric B. Smith came along and wrote up pretty much the whole equipment list. Eric is also really good at finding all sorts of mistakes I made in various places while working on updates to the data file.

And, speaking of the data file, not everything has gone smoothly there, either, as there are some things in *GURPS Fourth Edition* that just don't quite seem to want to work smoothly with the way things were designed in **GCA**.

One big example of this is Magery. Magery is a leveled trait, like many others, but it is the only trait that has a cost for level zero. To have a cost for no levels in something is a feature that **GCA** simply wasn't designed to handle. To make matters worse, most enhancements and limitations that might be applied to Magery aren't meant to apply to the 5 points that level zero costs. As a result, the "Magery 0" trait was created as a separate trait in **GCA**, which is a prerequisite for the leveled "Magery" trait.

There's also the issue of naming certain traits, and in some cases, whether a trait is meant to be treated as a sub-trait (or a different level of the trait), or a full trait of its own. This is complicated by the fact that the book frequently doesn't make it clear whether certain traits have multiple types of sub-traits, or they are actually full traits listed under a common heading. This means that whatever method is chosen for the program to use, there will be some users who

are expecting something different, and will have trouble finding certain traits. For example, the No Legs disadvantage (p. 145) has several different "forms," including Aerial and Aquatic, which would imply that the trait would be recorded as "No Legs (Aerial)" or "No Legs (Aquatic)". However, the text for the Amphibious advantage (p. 40) refers you to the Aquatic disadvantage, not the No Legs (Aquatic) disadvantage. I wish I had a solution for that right now, but I don't. The best solution for now has simply been to work on the basis that any trait without its own listing in the trait listings at the back of the book is, instead, a sub-trait of the trait it's listed under.

Over all, I've enjoyed working on **GURPS Character Assistant 4**. There's nothing quite like being in the zone while programming, and finding a whole new, working feature when you're done. I get a real kick out of that, and I hope to enjoy that feeling a lot in the time ahead. **GCA** has already been around for 10 years, and most of its growth through that time has come from suggestions and comments from users, and I hope to see that continue for a long time to come.

More Questions than Answers

20 Minutes of Fun

by Chris Aylott

A last-minute word. I'm heartsick to hear that Scott Haring has been in a serious traffic accident, and that he has lost a member of his family. Scott is one of the great enthusiastic gentlemen of gaming, and if you see an opportunity to provide him and his loved ones with help or comfort, please take it. He deserves it. We all do.

And now, back to unimportant things.

If you haven't been following the latest flurry of internet posts on the incipient demise of the pen-and-paper roleplaying "industry" . . . good for you! But there was something in it that I want to use as a jumping off point, so bear with me while I set the scene.

During the aforementioned flurry, Well-Known Gaming Pundit Ryan Dancey commented that roleplaying games were "20 minutes of fun packed into four hours." That description struck a chord in me. I've seen far too many games dragged down by lack of focus and a sense that the fun of the game has been stretched beyond any reasonable limit. It's a problem -- but what's wacky is that I've also been reading a book that suggests a path to a solution.

Ladies and gentlemen, allow me to introduce you to Classroom Management for Middle and High School Teachers, by Edmund T. Emmer, Carolyn M. Evertson, and Murray E. Worsham.

"HIGH SCHOOL?????"

Yes, high school. This is the secret manual that Mr. Cordon and Ms. Flabbergast were hiding in their desks, the one that explains how to give detention and when to throw out the lesson plan in favor of study hall. A lot of the book is irrelevant-to-gaming stuff like how to write your name on the chalkboard and when to arrange the desks in little pods, but the gold is hiding in Chapter 5, "Planning and Conducting Instruction."

Emmer, Evertson, and Worsham break the typical lesson down to a series of "activities," which they define as "organized behavior that the teacher and students engage in for a common purpose." Choosing appropriate activities is important because:

"Interesting, well-paced lessons are a key for holding students' attention; unimaginative or confusing lessons with limited opportunities for student participation are boring or frustrating to students, creating conditions for discipline problems to develop."

Let's search-and-replace "games" for "lessons" and "gamers" for "students." Hmmm.

E, E, and W then point out that "activities are selected in part for their potential in maintaining students' involvement throughout the period." They recommend two or three activities to fill the typical class hour instead of just doing the same thing all period. Seems like common sense, right? Who hasn't had the awful teacher who drones on lecturing for the whole hour? Or the class discussion that was real good for 15 minutes before everybody ran out of things to say?

The typical high schooler can pay attention to one thing for 20 to 30 minutes. So what makes us gamers think that we can focus our attention for four hours, six hours, more?

We can't. That's why we get distracted and bust out the Monty Python quotes.

"School of Spanish Dancing -- Dentures Repaired"

Now where were we? Oh, yes. Even your most basic dungeon crawl game has some rudimentary awareness of the importance of different activities. You start in the tavern, you meet the old man, he sends you to the dungeon, where you kill things, take loot, dodge traps, take more loot, sleep until somebody ambushes you, take their loot, and so forth. Structured variety is the spice of life, and the classic dungeon imposes structure.

On the other hand, there's not that much variety in the activities above. The "cinematic" or "storytelling" games do a bit better on that front by encouraging the gamemaster to focus on the ebb and flow of a dramatic plot. On the other hand, most cinematic/storytelling games also encourage GMs to model their dramatic plots on books and movies. That doesn't work. The natural flow of a roleplaying game has very little to do with books or movies; the players are independent actors and almost never follow the economical plot developments and revelations of good drama.

Structure without variety on the one hand. Variety and inappropriate structure on the other. The gamers have to fill the void themselves, and they do it by adding their own activities. The pizza delivery, the backchat, the *Enterprise* vs. Star Destroyer debates. The game becomes just one activity within the overall game session.

This might not be a bad thing. After all, the point of gaming is to get together with friends and have fun. On the other hand, a lot of groups experience a tension between what they're supposed to do ("roleplay") and what they really do ("a lot of things, including some roleplaying"). A good game should help the players have fun instead of creating a false expectation that can hinder fun.

Activities and Transitions

When the Classroom Management authors talk about "activities," they mean checking homework, teacher lectures, question-and-answer recitations, discussions, and other typical "learning" activities. They also talk about "transitions," which is all the stuff that happens before or after a particular activity. When the students come into class and begin settling into their desks, that's a transition. So is the moment when a teacher hands out papers or gets out the audiovisual equipment. It's no surprise that transitions are where the class is most likely to get off track, and that a lot of classroom management skills involve maintaining control during the transitions.

Within the context of a game, activities are anything that the players are doing with their characters. They can include:

- Fighting enemies
- Planning for future events
- Sneaking into locations
- Scouting or gathering information
- Socializing with NPCs or each other
- Solving puzzles or figuring out plots
- Obtaining or evaluating new gear
- Managing character statistics

There are also transitions between each of these activities, which are not unlike the transitions in the classroom. The players have to arrive for the game and get settled in. The GM has to dig out notes and character sheets for a scene, to get out miniatures or draw a new map on the battle mat. These activities make the game possible, but they're not the game itself.

Finally, there are the nigh-inevitable distractions we've talked about above. Most games treat those events as intrusions on the game session, something that's outside the game, to be avoided. Then again, most games also treat character management -- "leveling up," clearly a game activity -- as something to be done outside the game session. The line is fuzzy, and it may make sense to define some of the "distractions" as in-game. When gaming rulebooks already list snacks and soda as essential game accessories, why not define "Snacktime!" as an essential game activity? (Hey, if it's good enough for third-graders . . .)

Once you acknowledge the difference between activities and transitions, the advice in Classroom Management starts sounding a lot like gamemastering advice again. Transitions are kept short by being prepared -- by having the room set up in advance, by having all your notes and handouts organized and ready for use, by giving the students a brief assignment while you get set up. There's also some material you don't see in RPG rulebooks, and most of that relates to managing activities.

The book advocates strategies like making clear to students what your expectations are for an activity, leading them through a few problems before turning them loose on their own, redirecting distracted behavior with a few firm words. Some of these techniques may be useful in the context of a game session, others won't be. But the book matches specific strategies with specific activities. It shows you how to manage a class broken into small groups -- "splitting the party," anybody? -- while outlining potential pitfalls with the technique and how to deal with them. Most roleplaying games don't provide that kind of functional advice -- and maybe they should.

So, What Would It Look Like?

An activity-oriented roleplaying game probably wouldn't look much different from a well-run session of a traditional RPG. Same dice, same soda, same silly people. The planning might be very different, though, and if the game worked it might run much smoother.

Odds are the sessions would be shorter, or at least broken up into segments of 60-90 minutes. Each segment would be built around two to six activities, each 10 to 30 minutes long. The game's rulebook would provide specific guidance on how much "fight" to put into a 20-minute fight scene; the expected time of an encounter would be balanced as carefully as its experience point value. The time of an activity wouldn't have to be exact, but a 20-minute activity would be expected to run 18 to 22 minutes, not an hour. Transitions would be budgeted at two to five minutes, and each activity would have a little mini-assignment to keep the players busy while the GM makes his preparations.

With that in mind, let's see if we can visualize a sample session.

Johnny is running a superspy game. He decides the next session will be about two hours long; since that's longer than 90 minutes, he'll break it up into two hour-long segments with a break in the middle. He's got two butt-kickers, a face man, and a sneaky guy in "Special Team K," and all of them need some character love during the session. He breaks the session down as follows:

Transition: Get the room set up in advance, put out map of soon-to-be-crashing plane for Activity One on the table, put prop of model airplane (stolen from older brother) on top of map to draw in players. Greet players and get them settled.

Activity One: 15 minutes of **action!** Players fight low-level enemy agents for control of a crashing plane. Johnny tracks the plane's progress into the mountainside based on activity time elapsed rather than a set number of turns.

Transition: Johnny keeps the transition short by pulling prepared "briefing folders" from a magazine rack near his chair, and handing them out with the narration, "Two weeks later, you're called into headquarters and briefed on a new threat."

Activity Two: 20 minutes of **planning!** Johnny summarizes the threat posed by the mastermind with giant laser du jour. Most of the information is in the briefing folders; the props help keep the players engaged and get across the idea that they'll need to pick up three clues at the same time to move the plot forward. The planning session is early, so Johnny can adjust the rest of the session if it runs long. As an incentive for keeping the plan short, Johnny plans an "enrichment activity"; he tells the players they can **get experimental gear!** if they finish early.

Transition: The next scene splits up the players as they investigate the clues. As he pulls out his notes for the next activity, Johnny tells the players to come up with a good description of how they "make their entrance" into their scene. First player who's ready starts off the scene, and if nobody's ready when Johnny is, he starts it himself.

Activity Three: 20 minutes of **small group action!** Johnny moves back and forth between the split-up party as they show off their individual clue-finding skills. Players who are "out of the scene" are encouraged to pay attention and fill in background details. Once the clues are gathered, the players know where the villain is lurking, and Johnny calls a break.

Transition: As the group is heading for the snacks and the toilet, Johnny encourages them to start talking about a cunning plan.

Activity Four: 10 minutes of **snacktime!** Everyone gets refreshments, unwinds a bit, and talks casually about the game or other stuff.

Transition: Near the end of snacktime, Johnny returns to the table and gets his props and notes ready for the rest of hour two. He calls over the other players and tells them, "As the plane takes you towards the rogue island of Fictionaveria, what final plans do you make?"

Activity Five: 10 minutes of **planning!** The players finish their planning, hopefully building on casual discussion during snacktime.

Transition: Since Johnny's already prepared, a few words suffice here.

Activity Six: 10 minutes of **sneaking!** The players break into the secret island base, whether stealthily or not. By the end of the scene, they've either made it to the villain's lair or are hopelessly surrounded by evil ninja minions.

Transition: While he pulls out his notes for the big showdown, Johnny tells the players to think of a cool stunt that they want to surprise the other players with during the final scene.

Activity Seven: 30 minutes of **action!** The big showdown! Giant lasers! Ninja! Fluffy white lap-cats! This one has it all!

Transition: Johnny figures out XP as the players clean up the mess of a good gaming session.

Activity Eight: 5 minutes of **closing!** Johnny hands out experience, thanks the players, answers any character management questions and basks in the glow of a job well done.

Of course, I cheated a bit in the example above -- superspy stories are so archetypical that it's easy to break down the scenes into basic activities. There's also not a lot of room for the players to run off half-cocked, but that might be a feature rather than a bug. The session described above is short, but it keeps events moving and gives the players a lot to do. It also gives them several decision points along the way. Add in the bathroom break, and you've got a pretty good two-hour-long adventure format.

Will we ever see a roleplaying game that emphasizes this kind of game management? It's hard to say. As a hobby, we seem to be obsessed with nifty new ways to roll dice and rename elves. It would be nice to see "having a good time" get the same level of detailed attention, but the only thing we can be sure of is that as long as there are gamers, there will be Monty Python quotes.

Pyramid Review

The Red Star Campaign Setting (for d20 Modern Roleplaying Game)

Published by [Green Ronin Publishing](#)

Written by T.S. Luikart & Ian Sturrock

Cover by Christian Gossett, Snakebite, & Paul Schrier

Internal Illustrations by Allen Coulter, Edwin Fong, Chris Glenn, Christian Gossett, Jon Moberly, Nelson Nolan, Junki Saita, Aaron Skillman, Snakebite, & Paul Schrier with James Ryman

194-page full-color hardcover; \$34.95

Although Archangel Studios has published RPG material of its own in the form of *Dramatis Personae: Campaign Ready NPCs*, it is best known for the comic book series, *The Red Star*. This tells the epic struggle to rekindle the true of the Revolution across the history of an alternate Soviet Union. The setting combines Science Fiction and sorcery to depict a U.R.R.S. (United Republic of the Red Star) capable of projecting power through the vast resources of its Red Fleet. Its mighty 100,000-ton Skyfurnaces never land, but each can deploy thousands of the soldiers known as Red Troopers, all armed with a Hook. Telekinetically enhanced, this is as much "Swiss army knife," as it is both a ranged and a close combat weapon. The Hailers, elite soldiers trained in the use of the Hailer, the telekinetic multi-purpose, multi-ammunition machine gun, support them, as do the Red Fleet's Sorceresses. They provide mass support and mass firepower, as Infokasters, Medikasters, Supply Kasters, War Kasters, and so on.

Arrayed against the might of the U.R.R.S. and the Red Fleet are the peoples of Nokgorka and the Nistanni tribes of Al'Istaan. Every Nokgorkan is member of the resistance militia, fighting to kick out the forces that have pounded their country to rubble. The shamans of the Nistanni lead the fight to throw out the Red Fleet invaders, just as they have with every other invader. They can draw on the power of the land, its spirits, and a belief in the law of the One True God to achieve powerful magics even outside the capabilities of the Red Fleet's sorceresses. Above all this is one dominating presence: Imbohl, father of the Great Revolution and victor in the Great Patriotic War fought against Krieger, leader of the Volksreich nation.

The parallels in *The Red Star* are obvious, Imbohl possessing the stature of Stalin, and both Nokgorka and Al'Istaan being countries on the U.R.R.S.'s southern border. Other countries have their analogue. The Isle of Lions is Great Britain, the Western Trade Alliance is the USA, the Land of 10,000 Gods is India, and so on. The history also parallels Russia during the second half of the 20th century, from the Great Patriotic War to the fall of the U.R.R.S. following the battle of Kar Dathra's gate that forced the Red Fleet out of Al'Istaan. In its wake, many Skyfurnace captains choose to return to their home republics rather than the Motherland. When they and the republics refused to follow the dictates of the Red Council, civil war ensued, but the Red Fleet found itself unable to suppress all of these rebellions. Out of this grew the Commonwealth of the Lands of the Red Star, still dominated by Imbohl. The political parallels to Communism and Capitalism in *The Red Star* are "Internationalism," exploited workers standing up against the old dynastic order, and "Transnationalism," the making of money at any cost, the leading proponent of which is the W.T.A.

The Red Star Campaign Setting is designed for [d20 Modern Roleplaying Game](#) by two of the designers of Green Ronin's earlier [Skull & Bones: Swashbuckling Horror in the Golden Age of Piracy](#), and the designer of the *Conan*

RPG and [Sláine: The Roleplaying Game of Celtic Heroes](#), both from Mongoose Publishing. It is written as both a gaming supplement and a sourcebook for the comic, although it is not necessarily an introductory setting. The book is lavishly illustrated with images from the comic series and laid out in a style to match the comic. That said, it is a pity that very few pieces of equipment are actually illustrated.

All of the above mentioned character types are available as classes to play in this setting, though some, such as the Nistaani Warrior and the Nokgorkan Resistance Fighter are very regionally based in terms of abilities. Magic is sharply divided between two classes, the Red Fleet Sorceresses "kasting" the arcane "Military Industrial Sorcery" known as Protocols, while the Nistaani Shaman use the divine Invocations to call upon the spirits for aid, both using the Kast skill. While the prayer-like Invocations are more powerful than Protocols, they do not affect the corporeal world as much, while Protocols possess all of the brutal mechanistic qualities of Soviet heavy engineering. Better results are achieved for rolling high, but in both cases, Protocols or Invocations inflict non-lethal damage when kast. The setting's other important new skill is Telekinesis, which given the number of Red Troopers appears to be fairly common.

In addition to these classes, the Zek is a penal unit infantryman that initially possesses no allegiance unlike the other classes, and represents those regarded as criminals, political or otherwise. The setting's Advanced Classes only become available once the players begin to explore the real war under *The Red Star*.

[SPOILER ALERT!]

Imbohl has been fighting not just in the Material World, but also in the Spirit Realm. The Mirror Lands of the Spirit Realm parallel those of the Material World, and it those of the U.R.R.S. that Imbohl has shattered into the more easily controlled Shard-Planes. Turned into prisons, they let him acquire and control more "Post-Human Energy" as more of his citizens die. This currency of souls is the focus of the Cold War between the U.R.R.S. and the W.T.A. Events within the Spirit Realm were a major contributing factor in the defeat of the Red Fleet at Kar Dathra's Gate. After he dies, it is possible for a character with a strong enough Spirit to become an Immortal, represented by the book's Advanced Classes, perhaps participating in the greater game or the rebellion against Imbohl.

[END SPOILER ALERT]

The background material covers not just the U.R.R.S. and the many other nations of this alternate Earth, but also an appendix also gives the statistics for a range of average NPCs and the various characters from the comic series. The focus of the GM advice is running a campaign involving the Red Fleet, with the player characters as crew aboard a Skyfurnace, or as Red Troopers, or Zeks. Other suggestions include campaigns as looters, as resistance fighters against the oppressive might of the Red Star, or even as Immortals. But whatever the campaign, under the Red Star it should be both grand and epic in scale, with characters of varying kinds coming together at moments of great destiny. Whilst sound enough, the advice is somewhat short, but both the writing and the illustrations that impart much of the setting's mood and feel offset this.

Yet the book is not quite perfect. Despite the decent index and that all of the information is there, finding particular facts can be difficult. It is also more of a gaming supplement than a sourcebook for the comic series, meaning that the gaming fan of the comic series is more likely to get the most out of ***The Red Star Campaign Setting***. Even so, the book successfully imparts a feel and sense of *The Red Star's* scale, grand, epic, and also nostalgic; as a Science Fiction setting, it looks to the past for its imagery and grandeur, that of the Soviet Union. While playing in the period of the U.S.S.R. might not be palatable to some, ***The Red Star Campaign Setting*** is perfect for those wanting some heavy magic with their Soviet chic.

Pyramid Review

Arkham Horror, Second Edition

Published by [Fantasy Flight Games](#)

Designed by Richard Launius, Kevin Wilson, Shannon Appelcline, Greg Benage, & Christian T. Petersen

Edited by Greg Benage & Christian T. Petersen

Graphic design by Scott Nicely & Brian Schomburg

Rulebook, game board, first player marker, five six-sided dice, 16 investigator sheets, markers, and plastic stands, 196 status tokens, 189 investigator cards, eight Ancient One sheets, 20 doom tokens, 179 Ancient One cards, 60 monster markers, various other markers; full-color boxed set; \$49.95

Eighteen years isn't much for Great Cthulhu and his minions, given their millennia-long slumber, but for gamers it's a long time to be without *Arkham Horror*, Chaosium's now-collectible board game of eldritch horror. With help from Fantasy Flight Games, everybody's up and ready for breakfast.

The object is to prevent the Ancient One from waking or, barring that, defeat it in combat.

Up to eight players play investigators (or just six, depending on which half of the box you choose to believe), including solitaire play. Everyone has a customized ability, Stamina and Sanity scores, money, clues, equipment, spells, and so on. The heroes crisscross the infamous town of Arkham, divided into nine color-coded sections, each with two or three locations. Navigation is easy: Move to general areas on the streets, then hop off at the specific location to be explored. Decks tailored to that block tell you what happens. Sites may offer special effects, equipment, or a portal to hell.

Interdimensional gates open, spilling monsters into the hamlet. Investigators enter these gates, traverse bizarre realities on the other side, and return with the knowledge needed to seal the passageways. The same cards that split infinity also change playing conditions -- spells are easier, cultists become tougher opponents, and so on. On other worlds like the Plateau of Leng or the Dreamlands, different decks determine your fate. These tend toward skill rolls that giveth or taketh away spells or equipment. Sometimes you're lost in time and space, a strange, one-turn inconvenience that offers passage to anywhere on the board.

You fight monsters to reach gates. More gates means more monsters, which raises the terror level (how scary Arkham becomes each turn). If you close all the portals, or employ Elder Signs sufficient to stabilize the continuum, you've saved Arkham and won. Otherwise the Ancient One rises and you have to go toe-to-toe with it. Fail, and everyone loses as the dimensional floodgates open. Whoever closed the most gates becomes First Citizen and gets all the corndogs he can eat.

Some things to dislike: A simple pastime has become an overblown task. Twelve pages of rules became 24 (and four were subsumed into the card decks). You sort of get quick-start rules, but read everything or suffer the double-checks of the damned while making your share of errors. It's worlds away from the original . . . well, okay, we'll call them "rules" . . . but egad, the detail, and splitting it up doesn't help. That's plenty of fodder for new irritating questions ("*Must I roll or may I roll?*").

And wasn't there room in the budget for quick-reference cards? The cost has doubled . . . inflation, yes, and Fantasy Flight always fills the box with components commensurate with the price tag. *Buuut* . . . 22 decks (many with dainty cards you can barely get a grip on), nearly a dozen types of counters (including money -- why it eludes designers that some things are better tracked with pen and paper . . .), a board that's 22" by 33", and character cards the size of a paperback book. No wonder they have you "discard" to the bottom of the deck. Consider the table you use for games. Now imagine that's just big enough for the game components alone. Get an additional table. Order pizza and you might as well move to a new apartment.

The many deck names are only in the rules. Neither side of a card is labeled "Unique Item," for example. The location cards show pictures of the locales at which they're used, which is clever. But a learning curve for 30+ deck and counter names? Money is still of limited use, if at all. Entire games may pass without dipping into one's funds. Skill use means rolling dice equal to your current score, but most difficulties are at 1; if you have dice after modifiers (or have clue tokens to exchange for skills) you succeed. Monsters can be more formidable this way than Ancient Ones. The rules mention Luck is the most-used skill in encounters. Must be, because it's pretty scarce elsewhere. A (fortunately extraneous) victory chart figures your success "total" for a game, but without context; is "21" good, bad, pathetic? And inserting pawns into their crimped plastic stands is nearly impossible.

Some things to like: It's streamlined and still **Arkham Horror**. First you wonder how this can be the same game. Then the pieces come together, you see the changes, and you understand why they're for the better. Monster movement is much improved; Mythos cards call the gates, and any beings wandering town with matching symbols (square, cross, diamond) move along white and black directional arrows accordingly. Elder Signs are plentiful, and enough clue tokens can duplicate their effect.

Allies clear out of town (i.e., their deck) and businesses close as the terror level rises. You can alter skills -- this fails the reality-check, but you can strategically nudge stats higher when the need is anticipated. Circular counters indicate current skill totals, and though perhaps not the best method, they *actually work*. The decks may disappear with a sneeze, but these things stay put. You can win solo, and you needn't use (and track) three investigators like some editions we could mention. And Cthulhu and pals aren't random encounters . . . there are eight Ancient Ones, one per game, and each one's presence colors the entire game uniquely.

The artwork is, in a word, breathtaking. No one beats Fantasy Flight illustrations. Sadly, the color scheme on many pieces is surprisingly uniform in situ. Light falls into this game. Very moody, very atmospheric, very hard to find things once you've set them down on the playing field.

It's refreshing and fun, once you have the rhythm, and recalls the halcyon days . . . sometimes. New, high-priced editions aren't the problem per se, but with apologies to Dr. Malcolm, too many companies are asking "Can we afford to?" before "Do we need to?" **Arkham Horror** has gone from beer and pretzels to sherry and shad, but at least it's available again (reverse those statements if you like). You shan't pay eBay prices to play, but you will pay.

--Andy Vetromile

Origin-al Thoughts

On some level, I've never quite understood the purpose of convention reports. I mean, the convention in question is over, so it's not like a movie review where you can say, "Gee, that sounds good; let's go!" No; unless you routinely wear a multicolored scarf and carry a yo-yo, Origins 2005 is firmly inaccessible in the prison of the past.

Of course, maybe the purpose is to provide information so people can decide whether or not to go the next year, or -- for those who attended -- whether their experience matched up with mine. And, since it's my first Origins, I can't even compare them to previous Origins. (This Origins was, by far, the best Origins I've ever attended. It was also, without a doubt, the lousiest Origins I've ever been at.) Regardless, my reluctance of coming up with anything interesting about Origins is eclipsed by my reluctance of coming up with anything interesting to say about another topic altogether, so let's have at. (As a warning, these comments aren't in much order; feel free to attach a number to the front of each paragraph, roll some dice, and generate your own Random Thought Table!)

Keeping in mind that I've only been to one GenCon and one Origins, and both times I've been locked in the Dealer's Room, the following thought popped in my head early on, and it remained true throughout:

Origins is like GenCon without the excitement.

While this may sound harsh, this isn't meant as a criticism, per se. After all, GenCon's harried new release events, celebrity sightings, and nonstop events are exhausting; it's kind of nice to be at a con with a lot of the bustle of GenCon, only a lot more low key.

Of course, having been there to serve the corporate RPG masters of my Day Job, a con whose patrons 1) don't have as much of an interest in RPGs, and 2) haven't been whipped into a wallet-wielding frenzy isn't as profitable. (While waiting in line for badges, our boss overheard one person saying, "I didn't enter the dealer's hall *once* last year.")

Anyway, our travails to Columbus began when our decision to get a cargo van backfired horribly. The vehicle itself was fine (although not having cruise control was a killjoy), and it was nice being able to bring pretty much everything we could possibly imagine we could sell; however, the vehicle was roughly the size of Delaware, while the parking garages in downtown Columbus didn't have room for anything larger than two-thirds of a Mini-Cooper. As a result, our van ended up being parked in the outskirts of a stadium parking lot, approximately eleventy-jillion miles from the convention center, our hotel, and the Sun. Fortunately, Origins had a shuttle that traveled around to the major hotels (including ours), so the act of going to and fro was trivial, once we got settled.

We had a huge version of **JUNTA** planned, complete with oversized cards, an oversized board, funny hats, and bananas. Unfortunately, we were originally scheduled for the stage in the dealer's hall, but there wasn't a big enough table there, so our events were shuffled around to one of the tournament areas. It was difficult to let people know we were there, however, and this fact coupled with other oddities (such as one of the big games scheduled at the same time as a regular **JUNTA** game) means that only one of our four games actually happened. That one game ended when all four participants managed to assassinate each other at the same time.

On Friday there was an informal Origins Award gathering; they had free food, but no one knew this so we (along with the dozen or so other people there) ate beforehand. I actually got to give my acceptance speech for the *Pyramid* Origins, which was nice. The culmination of that evening, however, was when I mistakenly believed Bill McQuillan -- there from Wizards of the Coast to accept an award for ***Betrayal at House on the Hill*** -- to be Bill Slavicsek, and attempted to strike up a conversation. Embarrassment ensued, and I may feel uncomfortable for the next few years walking within 100 feet of the Wizards booth, lest I inadvertently tell Ed Stark how grateful I am that Iron Man protects us.

Speaking of chatting with other industry professionals, one of the nicest aspects of Origins is that, since things aren't as crazy as GenCon, creators are more accessible to chat with. As a result, I should hopefully have a number of interviews over the next month or so with some people and companies I found interesting. We'll see how it turns out.

The large booth/display area next to ours belonged to NCSoft, creators of ***Guild Wars***, ***Lineage II***, and ***City of Heroes***. Every two hours or so they would have a comic book trivia contest, where they would give out goodies to those who could answer a question fast enough. To make a long, ongoing story short, had I kept everything I'd won, I would have had a Collector's Edition of ***City of Heroes***, five copies of ***Lineage II*** (including a Collector's Edition), nine posters, and 10 T-shirts. As it was, I gave away everything I couldn't use to those who looked like they'd most appreciate it (usually younger kids who loved ***City of Heroes*** but weren't fast enough to win a shirt). However, I did keep a set of shirts, two of the posters, and the copy of ***City of Heroes***. The latter I'll probably offer my thoughts on as soon as I have the free time to play it, which will probably be in 2017. (Disappointingly, I did *not* win a copy of ***Guild Wars***, the one thing I really wanted to win behind the ***City of Heroes*** game. Oh, well . . . maybe they'll be at GenCon.)

Beyond that, it seemed like a fun con for all those who attended, and a general informal poll of those who stopped by the booth indicated that everyone ranged from "generally content" to "ecstatic." For my money, I still think I'd choose GenCon over Origins, but my interests in going to these shows is different from people . . . and I still have a hard time envisioning why I'd want to go to a convention to play a game that I could play at home with friends. Regardless, these are the kinds of problems you want to have: deciding between two cons where you're pretty much going to have a good time at either.

* * *

On more somber notes, my heart goes out to all those in London, especially those whose loved ones have been killed or injured. As strong as the bonds are between the United States and the United Kingdom, so too are my feelings and support for you all. May the world come together to realize that indiscriminately killing the innocent is always evil, and the only effect is to strengthen the resolve of the attacked and their allies. If there is anything I can do to help any of our London readers or friends, let me know.

* * *

And on a more personal note, my thoughts and prayers also go out to Scott Haring and his family. There are no words that can compare to the pain of a child's loss. May we all treasure every moment with our family and loved ones, because such moments are always finite.

--Steven Marsh

Pulling your Weight

Ropes and Cordage

by S.E. Mortimer

This work attempts to explore the history of rope making, outlines various techniques that have been used, and compiles various types of rope into a basic list that might be useful in a roleplaying campaign. It also includes some expanded rules and game mechanics. Page references are for **GURPS Fourth edition** and the Tech Level definitions are also from *Fourth Edition* (page 27).

Introduction

Rope and cordage is an adventuring essential, every character would be wise to carry several types. It is used for climbing; holding luggage on a pack animal; securing a captured prisoner; making a snare; stringing a bow; weaving a net; as an impromptu garrotte; even to hold up your pants and lace shoes to your feet.

Rope Material

Historically, reeds, rushes, roots, straw, animal hair, and strips of hide have all been used to make rope. The earliest types were probably made from vines or ivy twisted into a length of primitive rope. The most common types of rope were made from plant fibers. There are three main categories of fiber based on the where they are found on the plant. The strongest fibers have the highest percentage of cellulose.

"Bast" or soft fibers: Phloem fibers in the inner bark of dicot stems (flax, hemp, jute, nettle, ramie). They are extracted from stems by "retting," which is controlled rotting using microbial agents to degrade the soft tissue leaving only the tough fibers, which are then separated from the rest of the stem (called "scutching").

Leaf or hard fibers: Fibrovascular bundles or leaf veins (sisal, yucca, palm, manila). They are extracted by "decortication," where unwanted tissues are manually scraped away.

Surface fibers: Found covering some seeds, leaves, and fruit (cotton, coir, milkweed). They are extracted through a process called "ginning" in which the fibers are torn loose from the plant material.

Once extracted, the fibers are cleaned to remove contaminants, and combed so that they lay parallel to one another, ready to be spun into yarn.

Making Yarn

Most rope starts out as thin fibers. These fibers need to be spun into a thicker strand called thread or yarn. The skill of creating yarn dates back to the Palaeolithic era. Once the yarn has been created, many items can be made including nets, textiles, and rope.

Definitions

Some terminology needs to be defined in order to prevent confusion. This article will use the following definitions:

Fiber: Elongated thick-walled cells which die at maturity and function as support tissue. Animal fibers are composed mainly of protein (keratin). Plant fibers are mainly cellulose but also may contain lignin, tannins, pectins, etc.

Yarn: Bundles of fibers that have been spun into thread.

Strand: Bundles of yarn that have been twisted into string (called "twining").

Cord: Made by twisting or braiding multiple strands together. Any rope that is less than one inch thick is classed as cord.

Rope: The same as a cord except that it is one inch thick or heavier.

Hand Twisting (TL0): Twisted yarn is made by holding the fibers in one hand while the other hand pinches off a portion of fiber. The fibers are then twisted between the fingers while simultaneously being pulled out to create longer lengths of yarn. Another method is to roll the fibers along the thigh. Hand twisting is very time consuming.

Stick Twisting (TL0): A hooked stick can be used to speed up the thigh-twisting process. A "leader thread" is created by hand twisting and then wrapped around the stick. The stick is then rolled horizontally along the length of the thigh with one hand, while the other hand plays out more fibers.

Drop Spinning (TL0): The first drop spinning tool was probably the campside rock. A leader thread would be hand twisted and then tied around the rock. This rock could then be rotated and dropped to spin the fibers as they are played out through the fingers. Rock spinning is still done today by some nomadic Asian tribes.

Hand Spindle (TL0): This was first developed in the Neolithic era and combines the concepts of both stick twisting and rock spinning. A *whorl*, often made of clay, bone, or soft stone, was attached to a stick to create a spindle. The spindle could be twisted by hand with the weighted end of the shaft suspended on the ground, or rolled along the thigh as described above. It could also be used as a "drop spindle." Before being dropped, a leader thread is wrapped around it or tied to a hook on top and, as it spins, more fibers are played out to be spun by the spindle. When the spindle touches the ground, the thread is rewound and the spinning process is repeated. The lighter the whorl, the faster it spins and the tighter the yarn is twisted. Extremely fine thread can be made in this manner. For example, the delicate threads for the famed Indian Dacca muslin were spun using needle-thin pieces of bamboo in a coconut shell. Sometimes the fibers are played out from a *distaff* held in the other hand, or tucked under the arm. The distaff is a stick with a fork or paddle-like comb used to hold fibers waiting for the spindle. A spindle costs \$5 and weighs 1 lb. A distaff costs \$5 and weighs 2 lbs. (LT29)

Spinning Wheel (TL3): Possibly invented as early as the 8th century in India (called a *charkha*) and it gradually spread throughout Asia. The Chinese added a treadle to improve its efficiency. By the Middle Ages it was prevalent in Europe, but the European spinning wheels were turned by means of a handle, not a treadle, until the 17th century. The spinning wheel consisted of a spindle set in a frame that was rotated by means of a drive belt passing over a wheel. It was rotated by using a pulley to turn the spindle, which spun the yarn. To wind the spun yarn onto a bobbin, the wheel was stopped and rotated in the opposite direction. A Spinning Wheel costs \$100 and weighs 40 lbs. (LT103).

Flyer Wheel (TL4): Sometimes called a "flax wheel" or "Saxony wheel." It incorporated a more complex mechanism operated by a treadle. It performed the spinning process and bobbin winding in a single, continuous operation -- it was particularly suited for flax, wool, and cotton. A Flyer Wheel costs \$300 and weighs 50 lbs.

The Rope Maker

Women could spin the yarn, but men made the rope. Almost every village had a resident rope maker ("roper"). The roper's craft was ancient and his equipment simple. Rope making was often conducted out in the open but sometimes long, low-roofed buildings were used. It couldn't be conducted in the rain because the fibers shouldn't get wet during the process. The skill involves twisting yarns together (called "twining") in one direction to make thicker strands, and then twisting the strands together in the opposite direction to make rope. This direction switching creates a rope that doesn't kink and lays nice and easy. Some skill is needed to get the right amount of twist and tension. Creating a separate skill for rope making is probably unnecessary. This skill could be subsumed into the Knot-Tying skill (p.B203) with familiarity penalties applied to unfamiliar tools and techniques. A skill roll should be made for each length of rope. The degree of success determines how quickly the rope is made. If the skill roll is made exactly, the rope is completed in the time listed. Each point above or below this amount modifies the manufacture time by +/- 5%. A critical failure results in a hidden flaw in the rope that will become apparent on an occasion that the GM thinks is dramatically appropriate. A critical success increases the maximum load of the rope by 20%.

Hand Twisting (TL0): Very light two-ply cords can be made by "thigh rolling." Two bundles of fibers are rolled as separate strands across the thigh. Then they are rolled backwards together over each other to create the cord. To

Braiding

lengthen the cord, fresh bundles were overlapped over the existing bundles before they had been completely twisted and then rolled on the thigh to join them together. A skilled cord maker would take about an hour to hand-twist one yard of two-ply cord -- maximum thickness of around 1/8".

Thicker three-ply cord required a different process. Three bundles of fibers are tied together at one end and held firmly in the left hand. The right hand takes one of the bundles and twists them to the left while simultaneously wrapping them around the other two strands to the right. The left thumb holds this in place while the same operation is carried out on the second bundle. The left thumb holds the two completed strands in place while the third is twisted and wrapped. The process is repeated, introducing additional fibers into the operation as the original ones are used up. These cords are relatively light -- a thickness of 3/8" would be about the maximum. A skilled cord maker would take around two hours to make one yard of three-ply cord.

The Rope Walk (TL1): Light lengths of cord can be made by hand but heavier ropes require some sort of machine. A simple "rope walk" consisted of a "twining machine" at one end with three to five rotating hooks. This was anchored firmly to the ground. At the other end was a "sledge" with a single hook. Bundles of yarn were tied to each twining hook (usually only three hooks were used) and all of these were run along to the single hook on the sledge. The initial distance between the two devices could be over 300 yards. Rope is made in two steps. The first step involved turning the hooks on the twining machine, spinning the yarn into thicker strands. As the hooks twist, the length of the strands shorten, pulling the sledge closer. Twining is continued until the strands are twisted as tightly as possible without kinking. The second step involves twisting the strands into rope. This is done by means of a grooved wedge or cone-shaped bobbin called a "top." While the strands are being twined, the top is inserted between the strands, near the sledge, to keep them separated. The roper usually does this while his assistant turns the twining hooks. Once the strands are twined, the top is slowly slid forward along the strands away from the sledge. The energy stored in the twined strands causes the hook on the sledge to rotate in the opposite direction. This process is called "laying" the rope. As the strands wrap around each other, the rope is created. When complete, the ends of the rope are "whipped" off with crown-and-back-splices to keep them from unraveling. The final length is about 25% shorter than the initial distance of the rope walk. For example, if the rope walk was initially 300 yards long, the final length of the rope would be around 225 yards. It takes about eight hours to make a 10-yard length of rope using this method, but multiply this figure by the thickness of the rope in inches. For example, a 3/4" rope would take $8 \times 3/4 = 6$ hours.

Rope "Jacks" (TL2+): More complex rope-making devices (sometimes called "jacks") include pulleys, straps, and gears. There are hundreds of variations, but the basic principal is the same -- make strands by twisting yarn in one direction and make the rope by wrapping the strands together in the opposite direction. The main advantage of these devices is to decrease the time required to make the rope. It takes seven hours to make a 1" thick, 10-yard length of rope with a TL2 device. For every advance in TL, reduce the time required by one hour. So a TL5 device would make a 10-yard length in four hours.

Reciprocal Gearing (TL6): This is a more advanced rope making machine that twined strands and laid rope all in one operation. This is accomplished by means of reciprocal gearing. Bundles of yarn are attached to the twining hooks as described above. As the hand crank is turned, the yarn is twined into strands in one direction, and these are wrapped together in the opposite direction to make rope. Leonardo Da Vinci was the first to conceive of such a device but it wasn't developed until several centuries later. It takes about 3 hours to make a 1" thick, 10-yard length of rope.

Another method to make rope is by braiding or plaiting. In the past this was usually only done with flat materials such as straw or strips of hide, but today many ropes are braided. Braiding has some advantages. Twisted, or "laid" rope is easy to knot or splice and is very elastic, but can be "knobbly," and is rough on the hands. Braided rope is less elastic, and is smoother, so it plays through the hands easier. It is also a little stronger, and resists abrasion better. Until recently, braided rope was laboriously produced only in short lengths by hand but today it can be manufactured by automated machines. If a rope is braided instead of laid, increase max load by +10% and increase the cost and manufacture time by +50%.

Dynamic Loads & Climbing

The maximum weights suggested for various types of rope are for *stationary* loads -- hauling cargo, suspension

Types of Rope

Rope was normally measured in cubits -- "short" cubits, not "regular" cubits. A regular cubit is measured from the elbow to the tips of the fingers (around 1.5 feet). A short cubit is measured from the elbow to the palm (around one foot), which happens to be the length of each loop when a rope is coiled around palm and elbow. (There is also a "long" cubit, which is an additional handbreadth longer again).

Ropes need different properties depending on their application. A rope in a suspension bridge, for example, is under a constant load and so needs to have more creep resistance than a climbing rope, but it doesn't need the elasticity and flexibility of a climbing rope. An adventurer is probably going to need a good climbing rope more than any other type. The best adventuring rope will not be too heavy, have a high tensile strength, be flexible and elastic, have high impact toughness, be resistant to abrasion, and able to withstand moisture and temperature extremes. Rope made from natural fibers is strong, but prone to abrasion and other hazards including mildew, rot, insects and vermin. It can swell when wet, and in icy conditions it can break. Synthetic fibers have been developed to help address some of these problems (see "Synthetic Materials," below). Modern climbing ropes combine a synthetic fiber core with a protective textile sheath. Note that the maximum loads listed for ropes are only for stationary loads. For dynamic loads the limit is *halved* (see "Dynamic Loads & Climbing" textbox, right).

All the ropes described below are of a uniform thickness -- one inch. As mentioned in **Low-Tech**, for thicker or thinner ropes, multiply weight, cost, and strength by the square of the diameter in inches. For example, if a 1" thick rope weighs 9 lbs and can hold 2,000 lbs. A 3/8" rope of the same material weighs 1.26 lbs and can support 253 lbs. The thickest rope a man can grasp and pull is 2.5 inches (p.LT31).

Natural Materials

Grass (TL0): A quick, temporary rope can be made by braiding stems and leaves of grass or thin reeds together. According to **Low-Tech** (p.LT31), a green grass rope has about one-fifth the strength of rope made from tough plant fibers. A 1" thick, 10-yard length weighs 9 lbs, costs \$3, and can safely hold about 360 lbs.

Vines/Ivy (TL0): A thick supple vine or several thinner ones twisted together can make a serviceable rope. According to **Low-Tech** (p.LT31) a rope made from this material can support about half the weight of a rope made from plant fibers. A 1" thick, 10-yard length weighs 9 lbs, costs \$10, and can safely hold about 900 lbs.

Plant Fibers (TL0): This rope is made using the techniques described above, from one of the tough plant fibers previously mentioned including flax, papyrus, jute, yucca, etc. A 1" thick, 10-yard length weighs 9 lbs, costs \$20, and can safely hold about 1,800 lbs. Some plant fibers, such as hemp and manila, are stronger than others. Manila is preferred today because it is more resistant to water and salt than hemp. If the GM wishes a superior type of rope, a 10-yard length made of hemp or manila might cost \$30 and hold 2,000 lbs.

Animal Hair (TL0): Primarily consists of a protein called "keratin" rather than

bridges, etc. For instances in which the rope undergoes *dynamic* loads and sudden shock, such as towing and climbing, only *half* the maximum load can be supported. So if a rope with a maximum load of 500 lbs is used for climbing, it will only support a weight of 250 lbs.

Breaking Strain

There is a safety factor built into the maximum loads, so it is possible to exceed the limit without the rope breaking. Many factors determine exactly when a rope might break including amount of movement, moisture, temperature, condition of the rope, etc. A simple way to model this is with percentile dice. For every 1% above the load limit, the chance of breaking increases by +1%.

For example, a rope with a load limit of 2,000 lbs is loaded with 2,500 lbs. This is 500 lbs or 25% above the limit, so the rope will break on a percentile roll of 25 or less. This rope will *automatically* break if loaded with 4,000 lbs (double the load limit).

Basic Set Entries

On page 288 of the *Basic Set*, there are two entries for rope: one is 3/8" and the other is 3/4". Assuming that they are made of manila (in "Plant

cellulose. It is difficult to collect enough hair to make a rope of significant length. The Romans seem to have preferred goat hair. Human hair is useful because it can be grown longer than many other mammals and so less individual fibers are needed to make a length of yarn. Horse hair is also useful because of its length. Treat a rope made of animal hair the same as one made from plant fibers.

Braided Hide (TL0): Made by braiding or plaiting several strips of leather or rawhide together. The Vikings and Inuit made rope from walrus or sealskin. Caribou sinew was also used. In North America, buffalo hide was preferred. In Africa, it was rhinoceros hide. Treat the same as rope made from plant fibers except that it can only be made in fairly short lengths. These need to be spliced together to make long lengths of rope. Hide rope is also very susceptible to water. When wet it will swell, stretch and sometimes break. Wet hide can only handle *half* its normal load limit.

Silk (TL1): Produced from cocoons of the mulberry silk moth pupae (*bombyx mori*), i.e. silkworms. Its use dates back to the Shang Dynasty in China (2nd millennium BC). Silk is very strong, but every time it is processed it loses some of that strength, so raw silk is best for rope. Silk is very susceptible to UV radiation and abrasion and deteriorates quickly, losing 10% of its strength each year (see "Deterioration" textbox, below). A 1" thick, 10-yard length of rope made of silk fibers might weigh 5 lbs, costs \$100, and safely holds about 5,000 lbs.

Spidersilk (TL9): It is not yet possible to harvest spider silk in large enough quantities to make useful lengths of rope. Spidersilk is around five times stronger than steel. A 1" thick, 10-yard length of rope made of spidersilk fibers might weigh 5 lbs, cost \$10,000, and safely hold about 100,000 lbs.

Synthetic Materials

Nylon (TL7): Developed in the 1930s, nylon is around twice as strong as hemp or manila and weighs less. Nylon does not lose much strength from being wet and can withstand sudden shock, making it very good for dynamic loading. Its disadvantage is that it is susceptible to UV radiation and heat -- too much friction can cause it to soften and melt. A 1" thick, 10-yard length of Nylon weighs 7.5 lbs, costs \$20, and can safely hold about 4,000 lbs.

Polyester (TL7): Also called Dacron, polyester is similar to Nylon except that it has low elasticity. This makes it good for static loads but not so good for dynamic loads. It is also better at resisting abrasion and UV radiation. A 1" thick, 10-yard length of Polyester weighs 7.5 lbs, costs \$20, and can safely hold about 4,000 lbs.

Polypropylene (TL7): This is another synthetic similar to Nylon except that it is less dense than water, so it floats. It also doesn't absorb water. For these reasons it is commonly used in the boating industry. Polypropylene ("Poly") is very susceptible to UV radiation and has a very low melting point, so it deteriorates quickly, losing 10% of its strength each year (see "Deterioration" textbox, right). A 1" thick, 10-yard length of Poly in good condition weighs 6 lbs, costs \$15, and can safely hold about 3,500 lbs.

Aramid (TL7): Also known as Kevlar, Twaron, and Technora. Aramid fibers have about twice the strength of nylon but very low elasticity and light weight.

Fibers" -- left -- we listed a 1" manila rope as: cost \$30; weight 9 lbs; load 2,000 lbs). Adjusting for thickness, we get the following:

For a 3/8" manila rope, multiply the cost, weight and load by $3/8^2$: Cost \$4.20; weight 1.3 lbs; load 281 lbs.

For a 3/4" manila rope, multiply the cost, weight and load by $3/4^2$: Cost \$17; weight 5 lbs; load 1,125 lbs.

These numbers are close but not exactly the same as those suggested on page 288. Rounding may account for the differences.

Deterioration

All fibers deteriorate over time. Some are susceptible to moisture, mildew, and rotting. Others are susceptible to sunlight and UV radiation. Most don't like temperature extremes. Frequent use can see abrasion and impact reducing the strength of the rope even further. As a general rule, any rope that is regularly used will lose about 10% of its strength each year. So a rope that could hold 2,000 lbs when new will only be able to hold 1,600 lbs after two years. Severe conditions, such as excessive moisture, might double the rate of deterioration.

It is very susceptible to UV radiation and loses strength when knotted (or even simply bent) because of internal abrasion. Aramid rope deteriorates quickly, losing 10% of its strength each year (see "Deterioration" textbox, right). A 1" thick, 10-yard length of Aramid in good condition weighs 5 lbs, costs \$50, and can safely hold about 8,000 lbs.

HMDPE (TL8): Also known as Spectra and Dyneema. HMDPE stands for "High Molecular Density Polyethylene." An excellent material for rope and is light enough to float on water. It doesn't absorb water and is UV resistant. It is susceptible to gradual creep, however, so isn't suitable for some static loads. A 1" thick, 10-yard length weighs 5 lbs, costs \$100, and can safely hold about 10,000 lbs.

Vectran (TL8): A naphthalene-based thermotropic liquid crystal polymer. Vectran is considered the ultimate rope material. It is very strong, has little elasticity and no propensity to creep. It floats on water and has excellent resistance to abrasion. However, like Aramid, it is susceptible to UV radiation, so it is almost always manufactured with a protective sheath. A 1" thick, 10-yard length weighs 5 lbs, costs \$500, and can safely hold about 13,000 lbs.

Advanced Fibers (TL8): Materials such as *Zylon* and *M5* are very light fibers currently undergoing testing for anti-ballistic body armor. It is likely that these "next generation" fibers will produce rope that has a similar weight to Vectran but are capable of holding even greater loads. M5 is particularly useful since it is very resistant to UV radiation and high temperatures -- including flame. A 1" thick, 10-yard length might weigh 4 lbs, cost \$5,000, and can safely hold about 20,000 lbs.

Nanotubes (TL9): Nanotubes were discovered in 1991 by electron microscopist Sumio Iijima at NEC in Japan. A nanotube can be thought of as a sheet consisting of benzene rings -- a "hex-grid" of carbon atoms. This sheet is rolled to make a seamless cylinder -- similar in appearance to rolled-up chicken wire with hemispherical caps on each end. It is currently possible to spin nanotube fibers into "nanoyarn," but lengths are not yet sufficient enough to produce rope (or even twine). In time, it is conceivable that rope will be made from nanotubes. Rope made from multiple strands of nanoyarn will have less strength than a single solid mass of long nanotubes. A 1" thick, 10-yard length might weigh 4 lbs, cost \$50,000, and can safely hold about 200,000 lbs.

Synthetic fibers like Nylon deteriorate more slowly. They lose 2% of their strength every year. Modern braided ropes that are covered with some sort of protective sheath (e.g. "paracord") lose 1% of their strength every three years.

The Idden

by David Morgan-Mar

Nobody knows where they come from. Few even know they exist. But they're there. Hidden in the corners of our consciousness, lurking between the frames of our persistence-of-vision, the flickering motion glimpsed in a mirror that isn't there when you turn around.

The idden are human-sized insectoid beings occupying a phase of reality that intersects only weakly with our own. Humans cannot normally see them directly or feel their presence. The best a person can do is catch a glance of vague movement out of the corner of an eye.

The Focus

Idden need a material focus if they are to interact with our reality. A focus is usually a small object, common and of no intrinsic interest. Typical examples include a coin, a seashell, or a pencil. Each individual idden is bound to one focus. Although they can transfer to another focus, the effort involved is great and they do so only when necessary, such as when a focus is destroyed or lost forever to humanity.

An idden focus is also bound -- more loosely -- to an individual human. The human will consider the focus to be his "lucky coin" or "favorite seashell," or it might simply be the pencil he habitually uses at work. The owner of the focus is not compelled to carry it everywhere, but will keep it somewhere where it can normally be accessed at least once a week - the seashell could be left in a collection at home or the pencil left on his desk at work. The owner can also take extended trips away from the focus, so long as the intention is to return. A permanent move, however, activates a strong compulsion to take the focus to a new home.

Through these two links, an idden is associated with one particular human. In many ways, an idden's human is more important to it than its focus is. This is because the idden *feeds* off its human.

Feeding

Idden are blood eaters. They normally feed daily, but can go several months without blood if need be. They are not deliberately subtle about feeding: they open long but shallow scratch wounds in their victim's skin and lick the congealing blood up as it wells to the surface. The effect is similar to a severe cat scratch.

What makes the idden's feeding method particularly insidious is their existence in a disjoint phase of reality. Although the human victim is physically wounded and bleeding, he does not normally feel the scratches or see the blood. Neither do human observers. To all conventional examination methods, the victim is unwounded and in perfectly good health. His hemoglobin levels may be a little low, but that's not uncommon and a few iron tablets will prop that right back up again.

As the feeding continues over weeks, months, and into years, the human victim will become covered with unsightly scratch marks and scars -- but only to those whose vision penetrates the idden's reality. Normal observers, including the victim himself, continue to see nothing unusual. There may be a slow loss of health and vitality, but again, that is not uncommon and some do people seem to age faster than others.

Because an idden is physically bound to its focus, feeding can only take place when the human is near the focus. But since the idden is normally undetectable, this is not a huge limitation, and one can normally feed in comfort and safety for several hours a day.

Glimpses

Despite the weak interaction between our reality and the idden's, there are times when people can catch glimpses of what is really happening. When people are tired and their minds are not alert, their consciousness can slip more easily into the idden's realm. This is when momentary glimpses of the idden can be caught.

Humans normally cannot see the idden directly. They can only be seen fleetingly in peripheral vision. As soon as someone turns to look directly at the strange movement in the corner of his eye, he sees nothing but his own reality. A human's idden can be standing directly in front of him (and frequently is) without being seen, heard, or felt. People can also steal glances at idden wounds in this way. A momentary glimpse of oneself in a swinging mirror, or of another person, can reveal a flash of horrible scratch marks that vanish when the person looks directly and closely.

Sleepers can also sometimes see the idden in their dreams. The dreamworld reality is much closer to the idden's than our waking world is. People who don't understand call such dreams nightmares.

Other people -- those with a loose grasp on reality -- can more easily see the idden and their effects on people. We call these people mentally ill, as they describe hideous events which clearly aren't true, and give them psychotic drugs or lock them away for their own good.

Fighting the Idden

The major obstacles to fighting against the idden are learning of their existence and methods, and developing a way to detect them unambiguously.

Psychically sensitive individuals may have better luck at deliberately catching glimpses of the idden with their peripheral vision than a non- sensitive. Some forms of ritual magic might force the idden into "phasing" into a space where they can be detected normally, or perhaps some mystical herbs or smoke can do the job. If religious authorities learn anything about the idden, they may decide that they are demons and believe prayer is an effective tool. In some universes, technology might have an answer.

Once detected, the best way to rid a person of an idden is to determine what the focus is and remove or destroy it. Without an effective method of figuring out what the focus is, however, this could be a long game of trial and error. Even if the focus is discovered, the battle is only half over . . .

No matter what the victim is told (or shown), he is incapable of seeing the focus as a threat and will not allow it to be taken away. Furthermore, the victim is endowed with an unnatural cunning in maintaining possession of the focus. As soon as he (or his idden) becomes aware that people are seeking the focus, he will "accidentally lose" it or sequester it in a place where it cannot be found. No amount of persuasion will get the victim to admit to knowing where the focus is.

If the focus is removed, the victim will go to great lengths to retrieve it. Initially this will be simple requests ("Can I please have my pencil back?"), but if thwarted the victim will escalate to criminal acts. Physical violence will be the last resort -- the victim will prefer stealth and robbery over assault. The compulsion to retrieve the focus gradually fades over several months; perhaps a year later the victim could be considered cured. Except he will keep the feeding scars for life.

Refocusing

If an idden's focus is destroyed or removed from all contact with humans, the idden will fade away, becoming a shadow of its former self. In this form it can move at will, until it finds a new object to use as a focus. This needs to be an object already habitually kept by a person. Any such object can harbor a wandering idden, and over a period of a few months it will attach itself to the new focus. Once attached, it can begin feeding once more.

An idden with a focus and a human can change focus in this way if it chooses to, but normally won't because it involves a long period of enforced starvation while it binds to the new focus.

What are the Idden?

There are several possibilities:

Animals -- The idden are simply beings with an imperative to feed and reproduce. They may possess a raw cunning to avoid detection and deal with threats, but apart from their otherworldly presence they are nothing special.

Spirits -- The idden are clearly not of this world. So what world are they from? There may be many different creatures who share their phase of reality -- a spirit world of some sort. The idden may be only one manifestation of a group of beings that appear in human legends variously as faerie or spirits.

Aliens -- The idden are intelligent, and use their command of space and time to launch this insidious attack on humanity. Perhaps physical travel through space is too hard, so they developed a method of traveling in between the gaps of the quanta which make up our universe.

Our Subconscious -- The idden are us. The strong attachment to particular individuals points to the idden being a manifestation of our own repressed desires and fears. People with low self-esteem or chronic depression are likely victims. The idden cause the damage that these people cannot bear to inflict on themselves. Others lash out antisocially, using their idden to harm others while maintaining a facade of innocence.

Adventure Seeds

- One of the heroes starts having strange nightmares. He keeps seeing his face and arms scratched and bleeding, and wakes in a cold sweat to find himself perfectly well. The lack of sleep starts to interfere with his job, and he begins to see odd things out of the corner of his eyes. It may be time for a psychological assessment, a psychic reading, or a trip to the local witch for help. For an alternative, several of the PCs could become afflicted with similar symptoms more or less simultaneously.
- Worried parents bring a child in for a psychological assessment. The boy keeps telling wild stories about giant bugs attacking his mother, father, and older sister. He says they are always bleeding and the things are licking up the blood. Who will believe him, and if anyone does, what will they do about it?
- A group of ghost busters are hired by an edgy socialite who swears she has been seeing "ghosts" in mirrors at her country mansion. With their professional parapsychological detection gear, the heroes may have a better chance than most of figuring out what is happening. For extra spice, the socialite has also called in a local psychic (fraud or real) and her Catholic priest for advice and help.
- A new science experiment promises to reveal new dimensions and alternate worlds! People might soon travel between dimensions, opening up vast realms of adventure. The first step is developing equipment to allow us to see into these new dimensions, so we know where we're going. When the "dimension goggles" are switched on, the first user starts raving about monsters. Swift investigation reveals these grotesque insectoid beings are everywhere . . . feeding on humanity without our knowledge. The government steps in to hush up the news, and initiates a top secret project to fight the weird menace.
- A man has been apprehended breaking and entering into the house of a workmate. He was caught leaving, with nothing more than a pencil taken. It turned out to be a pencil the workmate had accidentally picked up off his desk and forgot to replace. Why did the suspect commit a crime over a pencil? Scientists and psychologists are called in to investigate.
- A series of strange murders is occurring. Victims are usually elderly, and are found covered with cuts and scar tissue indicating long-term torture. This is despite reports from relatives that the victims were in good health just the week before. Something weird is going on, and the police could use help from experts. There may be similar cases all over the country, dating back hundreds of years, if one digs deeply enough into the records.

Pyramid Review

One of the Living (for All Flesh Must Be Eaten)

Published by [Eden Studios, Inc.](#)

Written by Ben Monroe with David Ackerman-Gray, Brian Isikoff, & Angelo DiStephano plus Evin Ager, Rachel Collett, Bastien Pillon, Daniel R. Davis, J. Carpio Dregg, James Wilbur, & Ross A. Isaacs

Cover by Karl Coston Christiansen

Interior Illustrations by Travis Ingram, Chris Keefe, & Dan Oropallo

160-page 7½ by 9½-inch perfect bound softback; \$24.00

Although considered a fine game, [All Flesh Must Be Eaten](#) has its detractors. They suggest that the game is only suitable for one-off adventures, survival being an objective enough, and it concentrates a little too much on details of the corpse cortege to the detriment of those still alive. And they have a point, which is where the game's latest supplement steps in. While the various supplements, from [Fistful o' Zombies](#) to [Zombie Smackdown](#) ask where you were when it happened, **One Of The Living** asks, "What did you do next?" This supplement extends the "life" of the Deadworld, specifically modern set American ones beyond the nature of the disaster itself.

This extension starts with new character options, including randomly rolling attributes or buying everything -- attributes, skills, qualities, drawbacks, and metaphysics -- from one pool of points. New skills like agriculture, repair and scavenging all lend themselves to long-term games. As do qualities and drawbacks like Black or Green Thumb, Insomnia, Jury Rigging, or Threat Detection. Games with a supernatural element can be made easier by reducing both miracle and essence costs. These options are accompanied by several new miracles. More fun are the new combat options, especially those for enhanced gun realism that allow for the fact firearms are loud, hot, and that recoil is bad, and difficult to handle for the inexperienced.

It takes a technical turn when considering our survival needs. In the post-post apocalyptic world, the scavenging skill becomes a story generator all by itself, as does the ability to jury rig. In turn efforts necessary to keep various aspects of our advanced society going are scrutinized. Power from muscle and alcohol to coal, wood and more ecologically sound means are detailed, as are the requirements for clean water, food growth and storage, light, radio and transportation. The fundamentals of both firearms and explosives are considered in more depth and backed up by several new weapons, including home made explosives, nail and potato guns, and defensive items like bear traps, caltrops, highway spike systems, and AP and claymore mines. Vehicles include the airboat, black helicopter, skateboard, snowmobile, and ultra-lite plane, in addition to the example makeshift vehicles, an APC and a junk buggy. The new gear concentrates on survival needs, from the automatic tourniquet to three grades of toiletry kit, followed by several new artifacts.

One Of The Living gives us a new look at the zombie. It needs to, since the book extends the campaign, it also has to extend the un-lifespan of the zombie. No longer is the zombie just something to run screaming from or blow away. Now a zombie gets to bloat, decay, and skeletize. The four stages are described in no little detail with zombie attributes suffering accordingly. And as to that old cadaver crew crawl, once past rigor mortis, a zombie no longer suffers from the protein lock that renders his movement stilted and difficult. As the Zombie Master, watch with hilarity the look on the players' faces when the formerly decrepit dead suddenly spring forth with a spryness belying their

deceased status. Zombies also get a few new aspects for the ZM that likes to design his own.

More un-life means a longer game, a campaign rather than a one-off. The discussion on the campaign against the one-off is standard enough that becomes more in applying the psychological theory of a "hierarchy of needs" to what we need to survive. There are five in the hierarchy: psychological needs, safety, love, affection or belonging, esteem and self-actualization, each of which needs to be fulfilled before the next can be considered. In terms of *All Flesh Must Be Eaten*, only the first two come into play in most games, but in *One Of The Living*, the latter three play a more important role. To help with these last three, the UniSystem gets rules for madness, which has a cast member acquiring madness points, gain enough and he is rewarded with disadvantages starting with nightmares, before going on to addiction, phobias, and worse. Though not a long piece, it makes for interesting and sobering reading and is just as applicable to other post-apocalyptic games.

The book's ideas are put into practice with a fully fleshed out setting, "Sunset Falls." This describes the survivors of the town Oaktown, who have holed up in the local jail, Cranston Prison. Led by a retired corrections officer, the newly forged community reads like a cross section of American society, as put together by TV screenwriters. Comprised of four factions, it centers on the community's leaders, a group of engineering students, a small time hip-hop singer, and a recently arrived preacher. All four have goals concerning aggressive stance, luxury, security, and survival, and varying degrees of clout to carry them out. These goals and the relationships between the factions both work as driving factors for storytelling. All the ZM has to do is throw the player characters into the mix, or raid its ideas for a self-designed post-risen community.

Being an *All Flesh Must Be Eaten* supplement, you of course, get Deadworlds . . . six of them this time. The first is Bastien Pilon's "Croatoan Rising," which with supernatural elements allows the inclusion of Inspired characters. Ten years ago, half of the world's population suddenly vanished, which when combined with zombie army attacks by, tipped civilization into chaos and back untold decades. They are still out there, as are other Lovecraftian horrors. "Digging Our Own Grave" by Evin Ager, appears inspired by the SARS outbreak, a disease spreading from China causing the dead to rise, though it is not contemporary enough to use the proper name for Bombay. The drastic method of using nuclear strikes to incinerate the outbreaks only escalated and now humanity resides in cramped, near idyllic cities of the future surrounded by heavy walls and defenses. Advanced Zombie Military Squads armed with a compressed laser rifles suppress outbreaks of "Acute Reanimation Syndrome" with extreme prejudice. Rachel Collet's "On The Ground Floor" is set even longer after the event, when the dead woke up and began feasting. The Sky People have found refuge in the higher floors of New York's skyscrapers, denying the undead access by blocking stairwells and lift shafts. Of course, this makes scavenging difficult, and there is great status in being a successful scavenger.

J. Carpio Dregg's "Necropolis!" is a *Pulp Zombies!* Deadworld that finds San Francisco cut off from the rest of the world in 1928. Rameses V has raised an undead army to enforce his will and drive the population to build a pyramid for the new Dark Pharaoh. Only two areas hold out against the might of the horde, with gangsters best equipped to provide protection to both. Another option is to have a band of extraordinary heroes arise to save the city. Of the six, this is the most standard Deadworld. In James Wilbur's "Make Space" it was a passing comet's irradiating effect that caused the dead to rise. Now giving service to society earns citizenship and a place in the protected safe zones. The recovering nations are only now taking an interest in the orbital habitats that were lost to radiation. "Silver" by Daniel R Davis is a twist upon *The Terminator* future, in which the advanced nano technology not only repairs and heals the injured; it also kept the dead going. Advanced nano-zombies or Mechanites are capable of teamwork and the nano-virus not only gives them bionic enhancements, it breaks down other technological devices. This makes modern technology scarce, as it is often infected, the result being that the most advanced available are muskets and ploughshares.

The supplement is rounded out with two appendices. The first is a guide to surviving a zombie attack. A no-nonsense affair, this is also non-gamist, its discussion being actually useful if you happen to be American and subject to a zombie attack. It is accompanied by a shopping list suitable for any post-apocalyptic game. The second is short and counterpoints the first, being a discussion of the government leaflet. From the suggestions here along with the example, a ZM could easily create his own, which might just contain some useful advice, but it is a government leaflet . . .

In terms of production values, ***One Of The Living*** is up to Eden's usual standards. Certainly not exciting, but what others should be aspiring to: plain, simple, and easy to read.

Reading parts of ***One Of The Living*** is a sobering experience. It shows how easy it is for society to break down and how difficult the effort would be to survive, let alone thrive. But in this it addresses the preconception that ***All Flesh Must Be Eaten*** cannot be run as more than a one-shot, giving the ZM plenty of ideas to work with. These ask him to put more effort into the new longer game than other ***All Flesh Must Be Eaten*** supplements do, but in making such demands the ZM might just ensure that the cast members survive.

Behind the Musick

by [Chad Underkoffler](#)

Photomanipulations by Chad Underkoffler

Genre: Musical Urban Fantasy.

Style: Drama/Melodrama.

Fidelity: Recognizably the real world, with tweaks (minor in the open, major in the corners).

Theme(s): The Pursuit of Art, Fame, Money, Sex, and Power

The magic is in the musick, and the musick is in *you* in this Campaign in a Box.

What Everybody Knows

Nothing much -- as far as the average guy on the street is concerned, there's no difference between this setting and "the real world." Take Notes

What Every Musickian Knows

However, a few know differently. There are some musical performers that can do more with their talent than most people realize. They can break or mend hearts; soothe savage beasts; open wide or close tight the doors of perception; chant away memories or illness; summon, command, exorcize, and banish spirits; shatter or rebuild wills; and force the deepest powers of the universe (Luck, Time, Death) to dance to their tune.

These people work magic through music -- or *musick*, as it is called in some circles. (The "k" is audible, if you know what you're listening for.) Musick can usually only affect the essences of things --emotions, perceptions, memories, souls, etc. -- directly; by influencing beings in this way, they can cause indirect changes to the physical world. And, either way, this generally takes some time: time to play, time for the target to listen, time for the tune to work its magic.

Not every musician is a *musickian*. There's a certain mindset, a particular state of consciousness, that practitioners must achieve, modulated by specific rhythmic stresses and musical notes, which permits their power to spill forth effectively. Thus, there is a need for both a special outlook on the world alongside noteworthy mundane musical talent before one can whistle up spirits from the Otherworld. Someone who has the magickal outlook but no musical talent is called a *sharp*, while someone who has musical chops but no musickal juice is called a *flat* (though usually not within earshot, otherwise hilarity/violence ensues. . .).

For these reasons -- limited direct power, time required, small number of potential users -- the subculture of musickians is rather small, compared to everyday musical society. However, this means that there are still enough singers of spells (and clued-in but mundane associates) to fill the seats at a large concert hall. Given such a small pond, any strong, skilled, knowledgeable newcomer will soon grow to be a big fish -- with all that entails.

*"And I knew if I had my chance
That I could make those people dance
And, maybe, they'd be happy for a while."
-- Don McLean, "American Pie"*

"Do You Believe in Magic?"

Most mundane folks don't believe in out-and-out magic, even if they are a bit superstitious. This, unfortunately, leaves them with almost no defenses against musick. They are the Audience, not the players. The Audience can be one person, or a crowd of thousands. Given that there are few musickians out there and the vague nature of musickal effects, the Audience usually has little trouble rationalizing odd events away. "Coincidence, con, and caught up in the moment" are the three big explanations for musickal effects.

Of course, there's always the danger that the Audience will turn on the musickian (and even themselves), *en masse*. The results are never pretty -- actually, they're pretty tragic. Riots, assaults, murder -- think of Altamont and the Rolling Stones. If an unskilled musickian slips in his control, King Mob will turn very ugly.

Some average people are exceptionally susceptible to musick (the bobby-soxers over Sinatra, most of the teenaged girls in Ed Sullivan's audience over Elvis or the Beatles, Charles Manson and "Helter-Skelter," most of the folks who hear "Satanic" messages when playing music in reverse, etc.). Musickians call these groupies *Hamelin Rats*, or just *rats*, after the victims of the Pied Piper. And, as easy as it is to trap a rat in a net of notes, these fans can go so far under the musickian's spell that they become uncontrolled, motivated by the musickian's subconscious desires and fears instead of any deliberate commands.

"I'm Hearing Secret Harmonies"

So, what's it *like* to be a musickian?

You hear the musick of the spheres, the thrumming of the cosmos' engine, the backbeat of the universe. There's magic in your fingers, on your lips, within your heart, just waiting to break free and soar. You can potentially communicate -- and even control -- the invisible and mysterious aspects of the world with your talent.

*"I can snap my fingers and require the rain
From a clear blue sky and turn it off again
I can stroke your body and relieve your pain
And charm the whistle off an evening train. . ."*
-- Bob Dylan, "Silvio"

"Why Don't You Tell Your Dreams To Me / Fantasy Will Set You Free"

So, what exactly can musick *do*? Here are some general descriptions of musickal effects that a talented performer can create; these are just examples -- musick is limited only by the imagination, skill, and available energy of the musickian. (For suggestions on rules implementations, see *Musick Rules-of-Thumb* below.)

*Emotional feedback on
timeless wavelength:*

Performing, even alone, builds mystical energy. This energy can be used to refresh, cleanse, and heal the musickian, or to create musickal effects. Performing for an Audience, or playing alongside other musickians, increases the amount of energy generated.

*It doesn't matter what I
say / So long as I sing
with inflection:*

Influence the emotional state of an Audience, like shifting its mood from joy to sadness.

*Manipulator of crowds,
you're a dream twister:*

Insinuate strong suggestions in the mind(s) of the Audience, such as "Donate money to this charity."

*Well if it's true what
music can do / To soothe
the savage beast like they
say:*

Calm an angry or upset animal with a tune.

<i>There were voices down the corridor:</i>	Hear the conversation of ghosts and demons.
<i>She's got me so blind I can't see:</i>	Manipulate the perceptions of an Audience.
<i>Some dance to remember, some dance to forget:</i>	Tweak the memories of an Audience.
<i>Find out something only dead men know:</i>	Compel the dead to give up their secrets.
<i>Victim of venomous fate:</i>	Alter the luck of the Audience towards ill-fortune, temporarily.
<i>Bound by wild desire, / I fell into a Ring of Fire:</i>	Use the Audience's will to lock them into a continuing illusory experience.
<i>Let the echo decide if I was right or wrong:</i>	Discern truth from falsehood by listening to musickal echoes.
<i>And when he lets go, / Half the valley shakes:</i>	Spark an earthquake.
<i>If I could save time in a bottle:</i>	Stop the passage of time.

"You Give Something Up For Everything You Gain"

However, musick has its price. In addition to the raw talent, Eric! practiced skill, and mystical energy necessary to create musickal effects, performers also suffer other consequences:

But it's like trying to tell a stranger 'bout rock and roll: Trying to describe musick to an Audience is a losing proposition. Even with a demonstration, they will tend to ascribe the musickian's explanation to delusion, madness, or chicanery. They just don't Get It, man.

I should stay away but what can I do: All musickians are compulsively drawn (to a greater or lesser extent) to secrets, mysteries, riddles, and the forbidden. This curiosity is proportional to their skill in musick, and only fades if the character turns away from musick entirely.

Let the sound take you away: Unskilled or unlucky musickians may accidentally lose control of their performance. If not generating a musickal effect, they continue to play on and on and on, until they cannot absorb any more mystical energy and pass out from the head rush. If they get wrapped up in the spellsong when attempting musick, the mystical energy spins out of control, with random and dangerous results.

The players tried to take the field / The marching band refused to yield: If a musickian loses control of an Audience, the Audience usually turns on the performer, and sometimes itself.

Glittering prizes and endless compromises: With all this mystical influence at their fingertips, canny or lucky musickians can get nearly any mundane reward they desire: fame, fortune, sex, power. The attractions of these long sought-after goals sidetracks performers, moving them away from the pure pursuit of musick. Alas, as they focus on sating their desires, their musickal growth first slows, then stops, then dwindles. Life becomes a series of compromises

between following mystical perfection and fulfilling mundane needs (see below, *PC Opportunities, Musickians*).

Musick Rules-of-Thumb

While musickal ability can be mapped under several different game systems -- here's some rules-of-thumb that can be applied to any. (See also below, *Other Resources*, for a list of apt games to use for this Campaign in a Box.)

Difficulties of Musickal Effects

It's easier to affect some things with musick than others. Here's a short list of targets, with their relative difficulties. (Note that many systems will include some sort of resistance roll when targeting other characters with musick.)

1. *Typical*: Sway Emotions; Persuasive Speech; Summon/Banish Animals; Communicate with Animals, Plants, & Spirits.
2. *Tricky*: Supernatural Suggestion, Control Perceptions, Harm/Heal Spirits, Alter Memories, Discern Truth.
3. *Hard*: Overwhelm Will, Control Spirits, Create/Banish Illusions, Heal/Harm Living Things, Summon/Banish Natural Force (weather, earthquakes, temperature, tides, etc.), Bless/Curse (limited influence of good or bad luck), Temporary Enchantment.
4. *Very Hard*: Heal/Harm Unliving Things, Control Natural Force or Concept, Enchantment.

Depending upon the system, these difficulties can be used to set minimum skill levels or skill target numbers.

For example, these difficulties could be represented in *GURPS* as the minimum number of skill levels to achieve the effect: Typical (skill 10), Tricky, (skill 12), Hard (skill 14), Very Hard (skill 16). In *PDQ*, the difficulties translated pretty directly to Difficulty Ranks and Target Numbers: Typical (Average [7]), Tricky, (Good [9]), Hard (Expert [11]), Very Hard (Master [13]).

Musickal Modifiers

Several things can aid or hinder a musickian's performance:

Audience hostile to musickian	Large penalty
Character unable or unwilling to fully perform the song (finger-tapping instead of drumming with sticks, humming or instead of singing, toy guitar instead of Stratocaster, only enough time for a few measures, etc.)	Medium penalty
Affect a target not present	Medium penalty
Audience resistant to musickian(s)	Small penalty
Use of a historical/noteworthy instrument or sheet music	Small bonus
Audience is at least twenty times the number of musickians performing	Small bonus
Audience is at least four hundred times the number of musickians performing	Medium bonus
Audience is at least eight thousand times the number of musickians performing	Large bonus
Several musickians collaborate on effect	Small bonus, plus all bonuses individual musickians bring to the stage
Player describes effect only	Straight roll
Player describes effect and picks a particular song to perform	Small bonus

Player describes effect and sings/performs the specific lyric or chorus of song Medium bonus

Player describes effect and *multiple players* sing/perform the specific lyric or chorus of song Large bonus

Some of these bonuses and penalties could be replaced with increases or decreases in energy costs to generate supernatural effects; this choice is particularly apt for those involving an Audience or other musickians.

For example, these modifiers could be represented in **GURPS** as large penalty (-6), medium penalty (-3), small penalty (-1), small bonus (+1), medium bonus (+3), and large bonus (+6). In **PDQ**, the modifiers could be large penalty (3 Downshifts), medium penalty (2 Downshifts), small penalty (1 Downshift), small bonus (1 Upshift), medium bonus (2 Upshifts), and large bonus (3 Upshifts).

"We Are Spirits In The Material World"

By virtue of their power, musickians can communicate with and control *spirits*. The overwhelming majority of spirits are simply the ghosts of people who have died. While most peoples' souls zip away to parts unknown when life ceases, these dead folks are resisting the "pull" that seeks to draw them *inward* (which seems to be "bad") or *outward* (which seems to be "good"). This resistance usually stems from fear of the unknown, love for those they left behind, sheer stubbornness, or the gnawing of unfinished business.

Spirits are normally invisible and inaudible -- though musickians can see and hear them with mild effort. They are also naturally insubstantial (permitting them to pass through solid objects and float through the air). Electrical or magnetic fields are more difficult to phase through; thus, they can pass through solid stone faster than they could an electric fence. Very strong fields may be virtually impassible to a ghost.

Spirits can only affect the physical world through extreme concentration, permitting visibility, audibility, and the movement of objects. When manifesting, a ghost is as powerful as a strong man, who feels no pain and doesn't physically tire (most can lift heavy furniture, or throw appliances pretty hard). If a manifesting spirit loses concentration, they immediately return to their natural ethereal state. Though a ghost feels no pain, blowing one apart with a shotgun usually shatters its concentration and spatters the area with quickly evanescent ectoplasmic goo.

Spirits can *possess* living human and animal bodies, through a combination of phasing into the body and intense concentration. The initial phase-in is difficult due to the electrical activity of the brain, and retaining control is demanding due to the victim's mind fighting back. (However, if the victim is amenable to sharing the headspace; the ghost can remain for periods of up to a day without a break; sleep usually kicks a spectral tourist out of the victim's skull.) If concentration slips, the ghost pops out. Afterwards, many victims suffer confused memories of the period of their possession.

Any rhythmic noise draws a ghost's disembodied attention. This effect is stronger if the noise is musical, and doubly-so if it is musickal. Water dripping, birdsong, nursery rhymes, musickal spellsongs can all draw spirits, who bask in the sonic pattern. Indeed, musickal spellsongs can cause a spirit to lose concentration when manifesting physically or possessing someone. It's rumored that certain spellsongs can bliss a spirit out so much so that they forget to resist the "pull," and are yanked to their final reward, wherever that is.

However, there are rumors of a few powerful, mysterious beings out there that turn all of this knowledge on its ear. Musickians and spirits alike whisper and gossip and theorize about *angels* and *demons*, but there are no reports that are trusted. All that is known is that they're fierce, relentless, and strong.

*"A planet of playthings
We dance on the strings
Of powers we cannot perceive . . ."*
-- Rush, "Free Will"

What Everybody Doesn't Know

"Well, It May Be The Devil Or It May Be The Lord / But You're Gonna Have To Serve Somebody" The Trouble with Treble

In this setting, God and the Devil unequivocally exist. However, beyond that, few facts are known.

And pray that there's intelligent life somewhere up in space, / 'Cause there's bugger all down here on Earth: All human conceptions of both are inherently flawed: the attempts of three-dimensional biological beings constrained by linear time to describe and explain entities that are simply *beyond* their comprehension.

I guess you didn't know it / but I'm a fiddle player too: God and the Devil meddle in human affairs, directly -- but only through people with musickal talent. Both will send their agents (see below) to interact with, support, and oppose the actions of performers of musick.

I will choose a path that's clear: Of course, musickians can choose not to choose which side to follow, and simply live their lives as they see fit. When they die, they decide whether to resist the pull inward or outward, or go with the flow.

I've almost gained my Heavenly home, my spirit loudly sings: God is associated with the concept of "selflessness" and the "outward" direction that some spirits describe and resist moving towards. On occasion, He/She/It transforms a willing musickian into an angel (see below).

I've been around for a long, long year / Stole many a man's soul and faith: The Devil is associated with the concept of "selfishness" and the "inward" direction that some spirits describe and resist moving towards. On occasion, He/She/It transforms a willing musickian into a demon (see below).

Before you sell your soul, better do the math: Angels and demons are quite powerful beings; luckily there are only a bare handful of each on Earth. They are musickians who have agreed to serve God or the Devil permanently, and have given up aspects of their free will to become agents of these higher beings. They have *no choice* whether or not to follow any enigmatic dictates of their controller: they **absolutely** must. At some times, these commands may be relatively specific and limited ("Do not go to New York on Tuesday"), and at other times, they may be extremely general and universal ("Do not interfere with musickian David Nash"). Usually, this means that angels and demons are only suitable for NPCs; some GMs may wish to permit angelic or demonic PCs, provided the players understand they are agreeing to limit their actions.

Angel or demon . . . / still he calls her . . . : In essence, an angel or a demon is musickian who has been turned into a "ghost plus." That is, they share all of the ghostly abilities, but do not require concentration to manifest: they can flip between states at whim. Indeed, they're no longer strictly human, even when solid. They are quite strong, feel no pain, never tire, heal extremely quickly, and do not age or get sick. This means that if an angel or demon is blown apart by a shotgun into ectoplasmic goo, said goo *doesn't* evaporate, but hangs around until the entity reassembles itself physically or turns each and every tidbit insubstantial and reconnects in that way.

Additionally, they are still musickians, and can do magic with spellsongs. In some ways; this means that while they are even more susceptible than ghosts to rhythms, they *can* get around the deleterious effects of such sounds by using their own talent and extreme focus. Musickians can banish them with the appropriate musick, but -- unlike ghosts -- angels and demons can come back from their "final reward" after a variable period of time (usually known as "letting the echoes die away").

PC Opportunities

Musickian

Steve!

Most PCs in a "Behind the Musick" campaign should be musickians, probably all in the same band. They should have the ability to play an instrument or sing, and may have other performance or business skills. (Some game systems might require an additional Musickal Talent, to permit the use of mundane music skills to create musickal effects.) In addition, a musickian should have a weakness related to the pursuit of Art, Fame, Money, Sex, or Power, which serves as a temptation away from the mystical.

Spirit

Some GMs may permit ghost PCs. As mentioned above, ghosts are invisible, inaudible, and insubstantial normally. They may manifest to sight, sound, or touch with concentration. They feel no pain or fatigue. They may possess people with effort. They must constantly resist the "pull" to their afterlife, and are compulsively attracted to rhythmic noise and musick.

Angels and demons are generally not suitable for PCs, but if a player wishes to attempt a character who is constrained by the will of God or the Devil, GMs can permit it.

Clued-in Crew

Player may wish to play mundane but clued-in associates of one or more musickians. Some options include *manager* (handles the bookings, administration, and business aspects of the band), *roadie* (helps move and set-up equipment, and other ad hoc duties), *backup performers* (folks who share the stage with the musickian but have no mystical talent themselves), *driver* (the person who drives the tour van/bus from gig to gig), and the *sound engineer* (who runs the sound equipment). In most small or unknown bands, a single person could be responsible for the duties of multiple roles.

NPC Backgrounds

Each character below has their most important *strengths* (generally positive qualities, abilities, skills, or effects) and *weaknesses* (generally negative qualities, abilities, skills, or effects) detailed. In descending order, the ranks are Master, Expert, Good, Average, and Poor. Depending upon the conception of what a character is like, any quality can be a strength or a weakness.

For example, suppose a character has "Spoiled Brat" as a quality. If it's ranked Average or above, it's a strength: the character always gets his own way, can wield undue influence by threatening to sic their Mommy or Daddy on others, might possess lots of cash or gadgets, and people may fawn over them, making life easy. But if the character has "Spoiled Brat (Poor)," this is a weakness: the character has led a pampered and sheltered life, rubs people the wrong way, and expects everyone to bend over backward to fulfill his most minor needs.

Since many game mechanics provide prose "benchmarks" to understand stat or skill levels, the ranked qualities below should be easily adaptable into any desired system. (Also see [the PDQ System](#) from [Atomic Sock Monkey Games](#).)

Snake's Six

Snake's Six is a hard-rocking band on the fast track to being noticed by a major label in the near future. They're also deeply dedicated to seeking out mystic knowledge to aid their rise to the top of the charts. Musically and musickally, they can serve as rivals to any PC band.

Elizabeth Hardwood aka "Irish Liz": Liz is an Good Musickian, with skill in vocals and various percussion instruments. She sings lead on about a third of the songs of Snake's Six, and duets with Ed on another third. She's in it for the Fame (Poor at Resisting Fame). She's Good at Folk and Traditional Music Lore, Good at Classical Music Lore, and Good at Working the Crowd. She likes to play Ed and Tony off of one another.

Tony Hogg: Tony's a big brute of an Expert Bassist; unfortunately, he's not a musickian at all. He makes up for it by being an Expert at Mayhem -- all sorts. He's the guy you want at your back during a barfight, or to cause a distraction, or to rig another band's speakers to blow out mid-song. He's also Good at Being Very Loud. Tony's big weakness is that he's Poor at Turning Down the Sexual Advances of Groupies (male, female, vegetable, whatever). He's got a friendly rivalry with Ed.

Ludwig Georg aka "Indestructible": Indestructible Georg wants to be Keith Richards when he grows up. He has a Master-level Tolerance for Toxins due to long practice with recreational pharmaceuticals. He's a decent Rhythm Guitarist (Good) and a Handsome Bloke (Good). While not a musickian, he's often Tuned In to spiritual goings-on when he's flying high (Average).

Kevin P. Smedley aka "Kev": Kev's the keyboard and synth guy; he's a Good musickian and an Expert Composer (and writes the tunes for Ed's lyrics). He wants to be a rock star for the chicks, and is Poor at Resisting Sex -- and gets snippy when he sees Liz, Tony, Indestructible, and Ed get any play from a groupie. He's an Expert at Secret Rock History, and is the primary information source for when the band wants to seeks out some mystery-power.

Ed Snake: Dark and debonair, Ed is the front man and lead guitarist for Snake's Six. He sings lead on about a third of the songs of Snake's Six, and duets with Liz on another third. An Expert Musickian, he's the big mystical gun of the group. He's also an Expert Songwriter, and a Good Band Manager. This last is vital, because he's Poor at Resisting Greed -- only last minute spreadsheet chicanery or subtle spellsongs have kept his bandmates from catching on.

Richard Sodov aka "Ricky": Ricky's the drummer for Snake's Six, and fairly Average at it. He's Devotedly Loyal to Ed (Expert), has Good Criminal Contacts, and has a certain amount of Low Cunning (Expert). Ricky has a Poor Resistance to Being Possessed -- a weakness that Ed often exploits when he wants to deal with ghosts.

*"I have my ship
And all her flags are a flyin'
She is all that I have left
And music is her name."
-- Crosby, Stills, & Nash, "Southern Crosss"*

Locations & Items

Clubs

With a little modification, ["The Puzzle Box"](#) could serve as a good example for musickally-focused clubs. Some recommended changes:

- *Detailed Description:* Add a small stage and a small sound booth.
- *Adventure Seeds:* Change the "Dipsomancer on a bender" into a "singer-musickian on a bender."
- *Peppy Slade:* Peppy doesn't have a "Minor Rituals" skill; replace it with "Musickal History" skill; he could be considered a "Sharp" (see above).
- *Joachim Walker:* Ricky is just a ghost; and his "telekinesis" is simply jumping out of Joachim's body and manifesting (invisibly) to pick things up. Joachim's "Demon Lore" becomes "Ghost Lore."

The Black Guitar

The Black Guitar appears to be a Grand Concert "Antonio Grauso" 12-string guitar, circa 1913; spruce top, varnished

black, with mahogany sides and back, rosewood fingerboard, heart-shaped ivory inlays, and has a tarnished silver ornament on the headstock in the shape of a man's face. This ornament weeps oily, perfumed tears from its eyes when a hymn is played upon it. When played by a musickian, it is rumored that musick is much easier (reduce difficulty of effect by one step).

Unfortunately, the instrument appears to have a mind (and powers!) of it's own, and will "lose itself" (mentally influences owner or closest passersby to ignore it, move it, take it, or leave it somewhere) if the performer is performing musick with ill-intent, or if it senses an angel or demon within three miles. Some rumors claim that Guitar holds the soul of a musickian who attempted to evade his final reward; others state that this instrument was enchanted by a demon at a crossroads for a musickian, in return for his soul.

Events & Possible Story Arcs

Gigs & Festivals

New bands without name recognition call up a club's booking agent and try to get booked on off-nights (Tuesday through Thursday, usually). They may not receive any payment for this, just good word of mouth, to help build that all-important name recognition. Known bands have a better shot at getting an on-night slot, and may receive a cut of the door/cover charge; nights and percentages of the door/cover are usually proportional to the fame of the band. If a band is really top-notch, has signed with a company or label, and is widely-known, they *might* garner an extra appearance fee.

Festivals (and "battles of the bands") can play out much like gigs, with one major difference: there are several bands at festivals, providing ready-made opportunities for socializing and conflict with other musickians.

Labels, Companies, & Contracts

A good place to start looking for information on this is the Steve Albini article mentioned below in *Other Resources*.

Advice, Opportunities, & Pitfalls

Style: Melodrama

Melodrama means "music drama" -- music is used to provide suggestions to characterization and mood, in order to increase an audience's emotional response to characters, locations, and events within the story. Consider a movie's soundtrack, where important characters have their own theme music or a swell of high-pitched music ratchets up the fear before the monster appears.

A melodramatic world is often dramatically serious, but unsubtle in terms of emotion and morality. (Interestingly, one major difference between melodrama and tragedy is said to be that happy endings are possible in the former, and impossible in the latter.) Anger is anger, joy is joy, good is good, and bad is bad -- completely and absolutely.

This simplicity can lead to the biggest pitfall of melodrama: outrageous or campy overacting, which is one of the reasons melodrama is often seen in a negative light. Another pitfall is melodrama's reliance on stock characters who develop little during the course of their adventures. Both can be ameliorated in a melodramatic campaign, if the GM injects a trace of ambiguity into the emotional and moral tenor of the adventures, and the players provide decent characterizations of their characters.

Magical Mystery Tour

A band of musickians (and their clued-in crew) traveling around the country or the world for gigs is a great cover for looking into musickal mysteries. Hanna-Barbera had a whole subgenre of adventuring bands following a "mystery of

the week" format -- from *Josie and the Pussycats*, to the Neptunes of *Jabberjaw*, to *Butch Cassidy and the Sundance Kids*, and on. This episodic set-up is fantastic for gaming groups who have large periods of time between sessions. Each mystery, with its locations and NPCs, is self-contained, encouraging the PCs to wrap up the action in one get-together.

Lyrical Inspiration

A great way to come up with adventures for a "Behind the Musick" campaign is to adapt a song. (A perennial example, used by many gaming groups over the years, is ["Hotel California"](#) by the Eagles; because it's so classic, building an adventure out of this song is left as an exercise for the reader.) Simply extract plot and characters from the song's lyrics, look for what the underlying questions and points of interest are, and decide how to fit it into the campaign, manipulating genre and period to fit.

In these campaigns, it could be assumed that all songs are *factual* -- if somewhat embroidered -- reportage. Musickians would spend their days tracking down the secret, mystical truths behind decades' worth of Top 40 hits.

["Tell Laura I Love Her"](#)

- Laura and Tommy were lovers.
- He wanted to propose, but was too poor to do so.
- He entered a stockcar race (as the youngest driver) in the hopes of winning the \$1,000 purse, without Laura's knowledge.
- He left a cryptic message with Laura's Mother.
- No one knows why he crashed and burned.
- He died proclaiming his undying love for Laura.
- Laura can hear Tommy's exclamation as she prays for him in the chapel.

Okay, there are three NPCs (Laura, Tommy, and Laura's Mom), a mysterious crash, and Laura in a church (psychological reverie, auditory hallucination, or ghostly manifestation?).

In a *CSI* or cop campaign, this could be a straight up mystery, with the PCs investigating the crash after the fact. Or in a "Fifties Teen Angst" sort of game, the events could unfold as part of a wider plot -- preppy teens vs. juvenile delinquent teens or adults vs. punk kids. A ghostbreaking campaign could focus on the ghost of Tommy that has been following Laura around for years. A science fiction campaign could change the stockcars to space-racers and the \$1,000 to 1,000 quatloos. And so on.

In this Campaign in a Box, the combination of the mysterious crash and a possible ghost is what should draw the attention of musickian PCs. It could be played out in "real time," with Tommy or Laura being friends or relations of the PCs, or long after the fact as a riddle to answer. Tommy or Laura's mother (or both!) could have been adept at using musick. What if Tommy was a Rock musickian and Laura's Mom was a Classical musickian, and the crash is a result of a musickal battle (Tommy lost)?

["Carolina in My Mind"](#)

- Locale: Carolina.
- Friend hits [Narrator] from behind: camaraderie? betrayal?
- Karen = Silver Sun -- mystical adept?
- The sky is on fire; [Narrator] dying.
- Did Karen backstab [Narrator] to drain his musickal talent into her, sending him to Carolina/Heaven?
- Omens (flying geese, biting dogs) indicating a journey.
- "Holy host of others" = the dead? Angels?
- "Dark side of the moon" = [Narrator] is trapped between worlds, and cannot ascend to his just reward, due to Karen's treachery.

Some other tunes, short and sweet:

"Highwayman":

- Who is the Highwayman? Demon, immortal, or reincarnatee?
- Who *wouldn't* want to talk to this guy? He seems to know a bunch of mysteries of life and death. . .
- Maybe he (his spirit) needs to be freed from within the structure of the Boulder Dam?
- What about the "starship" lyric? Is he precognitive? Hey, maybe he's a long-lived, shipwrecked alien trying to become an astronaut so he can hijack a rocket and get back to his distant planet? (Thank you, [Issac Asimov](#).)

"L.A. Woman": A mystical serial killer's attempts to bloodily incarnate an avatar of the spirit of Los Angeles as a female.

"Being for the Benefit of Mr. Kite": Circus (that should make this one a "go" right there). The Hendersons are musickians; Mr. Kite is not, but is the target of some sort of ritual. "Mr. K. will challenge the world!" and "As Mr. Kite flies through the ring" and "And tonight Mr. Kite is topping the bill" -- Mr. K attempts ascension?

"Come Fly With Me": Globetrotting for musickal knowledge -- "In lama (misspelling for "llama," or have we jumped from Peru to Tibet?) land, there's a one man band / And he'll toot his flute for you."

"This Is The Song That Never Ends, It Just Goes On And On My Friends. . ."

Pull out your vinyl LPs and 45s, your 8-tracks and cassettes, your CDs and your mp3s, crank the volume to **11**, and get ready to rock!

This Column's Title

Since I'm about 90 minutes out from going to Michigan for the weekend, so I'm trying to get the entire issue together beforehand. As such, I'm going to see about setting a new land speed record for writing this column. Since I can write 60 words a minute at a good clip, I figure this should be done in less time than it takes to decide on a pizza order among a group of any four random humans.

Anyway, in combing over the Random Thought Table archives, I'm amazed that (as best I can tell) I've never discussed the notion of titles for campaigns, adventures, or the like.

Of course, in thinking over how such a column might go, I realized why. Because the sum total of my advice -- at least, for the first 283 weeks of my column -- would be, "Umm . . . it might be a good idea to title your adventures or campaigns. That's one to grow on. Yo, Joe."

However, much of that changed today, since -- at my Day Job -- we spent three hours trying to come up with a name for our new setting (due for a November release). After ramming our heads into the wall over and over, pursuing various avenues that we felt captured the flavor of the setting, I finally came up with the two-word title that everyone seemed to like. Having done so, I immediately demanded just compensation for my writing prowess . . . at which point the boss dutifully pulled out a dime and handed it to me, thus fulfilling a \$0.05/word rate.

Anyway, as we sat around, I came to realize many things about titles. Most of this advice probably won't be of any use to you all in coming up with titles for your games, but I lost 180 minutes of my life wrapping my mind around this stuff, so I figure *someone* should get some use out of it.

Anyway, most books -- as in, "novels" -- consist of words that are relatively straightforward, albeit combined in interesting ways. For example, *Like Water For Chocolate* is a title that can be spelled by your average third grader, but that particular phrase is one that probably hasn't been used previously. The same can be said for *The Five People You Meet in Heaven*, *Harry Potter and the Chamber of Secrets*, or *The Da Vinci Code*.

The exception to this seems to be science fiction/fantasy series, which -- in the era of multi-book cycles and series -- are often known by the saga name. Sci-fi series usually follow the "movie simple" naming convention (described below): *Dune*, *2001*, *Foundation*, *Gateway* while fantasy series are usually a bit wordier or more complicated (*Lord of the Rings*, *Dragonlance*, *Song of Ice and Fire*, *Incarnations of Immortality*). Regardless, both types of these genre novels seem to follow the general naming convention trends of novels, although coupled with their series name they come off as more complicated or pretentious, with a final result like, *Blades of the Clockwork Eventide*, *Leaf Seven of the Blade-Tree Timekeeper Chronicle*. Of course I'm mind-numbingly simplifying here, and there are no doubt enough counterexamples to all these trends for a one-to-one correspondence with visible stars.

Movies, in contrast to novels, almost always have as short a name as possible (at least, those not based on books). More interestingly, they usually have even simpler words. While a book will often have a phrase, movies usually have maybe two words, usually an enigmatic single word or a curious juxtaposition of two words. (c.f. *Chasing Amy*, *Panic Room*, *Cannonball Run*, *Reservoir Dogs*, *The Rock*, *The Island*, *The Matrix*, *The Notebook*, and so on. In the future, every noun will have its own movie. I'm personally awaiting *The Tonsil*, *Squirrel?* and *Thumbtack!*)

(As an aside, here's a fun quiz. What's the movie with the most complicated word in it you can think of? The best we came up with was *The Andromeda Strain*, *Apocalypse Now*, *Madagascar*, and *Vertigo*. Can you do better?)

Computer games have two parallel naming conventions, either tending toward even *simpler* names (*Doom*, *Quake*, *Half-Life*, *Halo*, *Myth*, *Pirates!*) or else having strangely complicated names (a recent trip to a computer site popped up *RYL: Path of the Emperor*, *Mega Man Battle Network 5: Team Protoman*, *Boiling Point: Road to Hell* and *Elder Scrolls III: Morrowind*).

Computer games and science fiction/fantasy novels do share one trend that's somewhat unique: a love for fictitious

words, especially those that compound two or more real words.

Comic books have a curiously inordinate propensity to use "X," "Bat," "Super," or "Spider" somewhere in the title.

Television series follow the same naming convention of movies (*Taxi*, *Cheers*, *Friends*, *Scrubs*, *Star Trek*, *Smallville*, *Firefly*) although there's a greater tendency to use proper names somewhere in the title (*Alice*, *Monk*, *Seinfeld*, *The Sopranos*, *The _____ Show*). Curiously, episode names -- when they're used -- are often fairly complex, although more bland than their novel counterparts ("Seinfeld Makes a Sandwich" or the like).

Quite possibly the only common naming convention where it's commonplace to have a difficult-to-spell, non-word name is in band names. The Beatles, Megadeth, Cruxshadows, and Negativland are all examples of names that would be put down like dogs if someone tried to entitle a book with one of them.

(As an aside, I knew that I was officially no longer "with" the music scene when I picked up a compilation sampler CD and, after several long minutes, concluded that I couldn't tell what half of the back cover contained the band names and what half had the song titles, since both sides had names like "Nurse Fire Fantasy" and "Eight O'Clock Rampage.")

What's the upshot for all this? Well, if you're titling a campaign (which I think is a good idea -- Hail Hydra!), the flavor of the campaign can be drastically influenced by trying to craft a title comparable to the medium or genre you're trying to emulate. Let's take a nuanced but not impossible example, by considering the following titles:

- The Shadow Architects
- The Shadow Plan
- The Shadow Planners
- Architects of a Better Shadow
- Shadow of the Architechnicians

Although built on roughly the same words, each title conveys a different sense. For example, "The Shadow Plan" sounds like an action movie or high-pulp spy title, "Shadow Planners" sounds like a television series, "Architects of a Better Shadow" sounds like a book (or perhaps a "build a new tomorrow"-type campaign), and "Shadow of the Architechnicians" sounds like a gritty sci-fi book series, maybe a cyberpunk one.

Giving serious thought to titles can especially help with [campaign prospectuses](#) or other situations where you want to give players a snapshot "feeling" about a new campaign . . . or to give them a hook to use for discussing the game. ("Say, what did I miss last week at the Shadow Planners session?")

And, if nothing else, you might stumble onto you band's new name . . . something like "Archishad."

--Steven Marsh

Pyramid Review

Fright Night: What Went Down (for the d20 System)

Published by [Hogshead Publishing](#)

Written by Brian Underhill with Ian Hunt

Cover by Shaun Thomas

Illustrated by Shaun Thomas & David Esbri

64-page perfect-bound black and white book; \$15.95

Where *Fright Night: Polar Terror* is set in the Antarctic, *Fright Night: What Went Down* is its northern counterpart, being set in the frigid waters under the Arctic ice cap. Like the rest of the *Fright Night* series, it is a one-shot for the **d20 System** and inspired by certain horror movies. It is designed with completeness in mind, providing suitable new character classes, plus rules for handling horror and fear under the **d20 System**, and a new threat that could find its way into other games or adventures in the form of a sequel.

The set-up for *What Went Down* is simple -- a Russian submarine has been lost whilst operating below the polar ice cap. Whilst its emergency locator beacon has been detected, the *Koloss'* exact location remains unclear. Unfortunately the Russian Navy lacks the means to attempt a rescue. Yet political considerations force the Russian government's hand and they accept the outside aid, not from the Americans or British, but from Rotterdam-based Sea Tech International. This marine engineering and salvage company operates world-wide and happens to own a prototype vehicle, the ST1 DSRV-1, nicknamed the *Erebus*, a deep submergence rescue vehicle that has the range to reach the *Koloss* and the capacity to carry up to 36 passengers.

The other player characters take the roles of Sea Tech employees who have volunteered to take the *Erebus* on the rescue mission. Represented by the scenario's six new classes, the characters are Marine Biologists, Navy Veterans, Paramedics, Pilots, Rescue Divers, and Salvage Operators. They have working experience on and below the sea surface, and thus the knowledge and expertise to conduct the rescue. What they lack though is knowledge of Russian navy submarines, in this case the *Oscar II*-class nuclear powered attack submarine. This is where their passengers come in useful: Captain Alexi Korkin of the Russian Navy, two Russian navy divers, and at the last minute, a Russian oceanographer. Under somewhat strained circumstances the *Erebus* sets out.

What Went Down is designed for groups of three to six player characters for first to third levels. Like all **d20 System** titles from Hogshead Publishing, it is also designed for use with straight *Dungeons & Dragons* rather than the more complex **d20 Modern RPG**. For some, this may be a problem. The **d20 Modern RPG** would also allow for the creation of more detailed and well-rounded characters, which the six new classes do not quite reflect. They are instead very career focused and backed up with four new feats that represents the character's prior experience. These background feats are Marine Science, Navy, Oilrig, and Salvage Background, each giving a +2 bonus with several skills and possibly a further feat. Representing a quick-and-dirty method of handling prior experience, suitable for the one-shot nature of a *Fright Night* scenario. Used outside of *What Went Down*, they are perhaps a little too short and dirty. That said, they are an improvement over those that appear in the publisher's *Crime Scene* series.

Besides the new classes, feats, and skills, *What Went Down* includes guidelines on natural dangers present in the adventure. Not just the fact that it is underwater, but also that it is extremely cold, and while either is potentially lethal, when combined, the effect is even deadlier. Possible weapons are discussed and whilst the *Koloss* does have an

armoury, getting to it is another matter. Instead, the characters will have to resort to jury rigged or scavenged affairs.

Rules for handling fear and horror are as per the standard for the *Fright Night* series. The adventure itself takes the *Erebus'* crew and her passengers to the *Koloss'* location on the seabed. She is cracked and partially flooded, cold and seemingly lifeless. Once aboard, achieved with the begrudging permission of the Russians, the vessel is a scene of chaos. Bodies are found, savagely wounded, and when surviving sailors are encountered they react violently. In the dark and damp of the *Koloss*, this should be a frightening series of encounters for the player characters, and in the hands of an experienced GM possesses plenty of potential.

Like the movies it is inspired by, ***What Went Down*** is roughly linear. Apart from certain events it is not scripted, and the GM should be in the main reacting to the player's actions. This gives eeway to insert the several adventure seeds at an appropriate time. These cover such possibilities as losing the *Erebus*, restarting the *Koloss'* reactor, and suddenly very obsessive scientists. Surviving the situation within the walls of the titanium-hulled coffin will force the players to think on their feet. This is very much in keeping with the ethos of the ***Fright Night*** series and its movie inspirations. Where in another game, the characters might escape their predicament with the application of lead poisoning, here they are forced to find other solutions.

Physically ***What Went Down*** is not as good as it could have been, a problem that has beset Hogshead's other books. While well-written, the artwork is invariably poorly handled, either lacking definition or being inappropriate. Three weapons are described, all of them Russian, so why does an illustration of an American carbine appear? And why is a picture of a Russian pistol used over and over? Further, the book is all but bereft of maps. A map showing where the *Koloss* went down would have made an excellent player handout. Nor are there any plans of the *Erebus*, or even an illustration of her. Neither is absolutely necessary, but both would prolong the usefulness of ***What Went Down*** beyond its actual adventure. So would clear, decent deck plans of the *Koloss*, also absent. What is given is indistinct and only serves to give the GM a feel for the submarine's layout.

[SPOILER ALERT!]

As to the exact nature of the threat in ***What Went Down***, it is best hinted at rather than being fully described here. The adventure's inspiration should be hint enough: *The Abyss* and *Night of the Living Dead*. Watching or familiarity with either should give some pointers as to the adventure's tone and atmosphere. And *The Hunt For Red October* should also be useful as well as entertaining. Indeed, although designed for a contemporary setting, the adventure could easily be set in during Russia's Soviet era. It is certainly inspired by the loss of the *Kursk*, which it touches upon a little in the adventure. But since the loss of the submarine in ***What Went Down*** is due to causes other than human error or technical fault, the scenario does not exploit that source of inspiration.

[END SPOILER ALERT]

What the scenario really lacks is GM advice on handling certain aspects that will affect adventure's mood and tone, and in particular the mental state of the characters. While this isn't a problem for experienced GMs, but for the less experienced, it is another matter. This dearth of advice to stage the small aspects of the adventure's horror is its main weakness.

Yet ***What Went Down*** is a very likeable affair, strong on atmosphere and possessing a stark brutalism very in keeping with the setting. Indeed, the story at the heart of this book could be run as a Deadworld for ***All Flesh Must Be Eaten***, or adapted to the RPG of your choice. Ultimately a fine evening's entertainment but a pity about the frills that would have made ***Fright Night: What Went Down*** useful beyond its pages.

--Matthew Pook

Enter the Dagon

"[M]y rescuers knew nothing; nor did I deem it necessary to insist upon a thing which I knew they could not believe. Once I sought out a celebrated ethnologist, and amused him with peculiar questions regarding the ancient Philistine legend of Dagon, the Fish-God; but soon perceiving that he was hopelessly conventional, I did not press my inquiries."
-- H.P. Lovecraft, "Dagon"

Like Lovecraft's narrator, we shall amuse ourselves with peculiar questions. Unlike him, we shall press our inquiries. We shall see if an unfamiliar continent emerges from the sea and the slime, or if we must be satisfied with a trail through the ooze, and broken hands upon the threshold. Get out the high-test line and cast wide for Dagon.

*"Dagon his Name, Sea Monster, upward Man
And downward Fish: yet had his Temple high
Rear'd in Azotus, dreaded through the Coast
Of Palestine, in Gath and Ascalon
And Accaron and Gaza's frontier bounds."*
-- John Milton, *Paradise Lost*, Book I: 462-466

If we all know one thing about Dagon, it's what Milton knew -- he's a Sea Monster. Dagon's depiction as a merman goes back at least to St. Jerome, who based it on the notion that Dagon's name came from the Hebrew *dag*, meaning "fish." (The "-on" part gets glossed as "sun," "sadness," "young," or "lord" depending on who's glossing it.) In the 19th century, archaeologists in Syria and Mesopotamia stumbled upon coins and a few seals depicting a fish-man -- obviously, Dagon, and never mind the lack of labels or other evidence. But Dagon would not be hooked so easily as that. Eventually, someone noticed that the almost as distinguished Eusebius transmits a tradition that referred to Dagon as the corn-god. Shortly thereafter, spoilsport linguists pointed out that *dagan* actually means "grain" in Hebrew, just as *dagnu* means grain in Ugaritic, and that unlike the putative mer-deity, there are scads of references to the fertility god Dagan throughout the Fertile Crescent.

The earliest such references date back to about 2500 B.C. at Mari in the upper Euphrates valley; over the next thousand years, worship of Dagan spread to Ugarit on the coast and thence south to, apparently, the Philistines and Phoenicians. In Mari and Ebla, Dagan was the "lord of the gods," worshiped at the "house of the Star" from whence his priests emerged to give prophetic advice to kings. Sargon of Akkad, Hammurabi, Naram-Sin, and Ashurnasirpal II all credited Dagan with some of their conquests. In various myths, Dagan became the father of Baal (who rapidly supplanted him in Ugarit), prison warder of the underworld, and "lord of sacrificial victims." His wife was variously known as Shala, Ishara, or (in the west) [Atargatis](#).

*"When the terrestrial and aquatic fish
Is beached by a strong wave,
Its form strangely attractive, yet horrific,
Emerging from the sea, the enemies soon at the walls."*
-- Nostradamus, *Centuries*, I:29

Who, especially under her Greek title Derceto, is almost always pictured as a mermaid. Interestingly, around 1750 B.C., the Mari records mention Dagan's promise (made in a dream) to "have the kings of the Yaminites cooked on a fisherman's spit." Suddenly, Dagon's fishy self comes roaring back, and it gets even fishier. Because the Chaldean historian Berossus, when discussing the ichthyoid god Oannes, apparently mentions another god, "having the same complicated form between a fish and a man," named Odakon. O, Dagon, indeed. And what did Oannes and Odakon do after emerging from the sea? Why, they built cities and taught mankind how to grow grain, just as Eusebius reports about Dagon. Which makes it even more interesting that in the archaeological record the name "Dagan" appears well before the word *dagan* is used for "grain" -- almost as if the grain was named for the god, rather than the other way around.

Robert Temple's marvelous *Sirius Mystery* says that Oannes and Odakon -- also known as "the repulsive ones," the

Annedoti -- were [Nommo](#) aliens from Sirius. Much like Lovecraft's Dagon, they seeped down from the stars (remember Dagan's "House of the Star" in Ebla?) and interfered with mankind, cultivating us like . . . well, like so much grain. [Nostradamus'](#) quatrain above seems to eerily echo the Oannes-Dagon legend -- did his vision quest look back as well as forward? That might explain another odd coincidence; in Century III:21, he mentions that "by the Adriatic Sea will appear a horrible fish with its face human and its lower body aquatic." And just off the Adriatic coast, in the anomalously advanced Lepenski Vir culture of ca. 6500 B.C., what do we find carved into sandstone idols? Fish-gods.

"When the Philistines took the Ark of God, they brought it into the house of Dagon, and set it by Dagon. And when they of Ashdod arose early on the morrow, behold, Dagon was fallen upon his face to the earth before the Ark of the Lord. And they took Dagon, and set him in his place again. And when they arose early on the morrow morning, behold, Dagon was fallen upon his face to the ground before the Ark of the Lord; and the head of Dagon and both the palms of his hands were cut off upon the threshold; only the stump of Dagon was left to him. Therefore neither the priests of Dagon, nor any that come into Dagon's house, tread on the threshold of Dagon in Ashdod unto this day."
-- 1 Samuel 5:2-5

But enough of nameless gods and lost civilizations. Let's get back to Dagon, who when we left him around 1200 B.C. or thereabouts had just become the chief god of the Philistines. Unfortunately for Dagon, the Philistines were trying conclusions with Yahweh, the storm-and-mountain god of the Hebrews. In their first tussle, it might be called a draw - - Dagon did, after all, capture Yahweh's solar champion Samson, bound and blinded at Gaza. Although Samson pulled Dagon's house down, would such a mass death during a feast of Dagon really discomfit the "lord of sacrificial victims?" But the second round was worse. When the Philistines captured the Ark of the Covenant (which Robert Graves, based on nothing whatsoever, describes as "covered in the skins of sea monsters") they brought it to Dagon's temple at Ashdod as a trophy. And as the Bible reassures us, Dagon fell on his fishy face, losing his head and both hands, leaving only the "stump of Dagon" intact. Interestingly, the specific Hebrew words of Samuel say that "only Dagon was left upon him," implying that the human face and hands were not truly Dagon in some fashion. Were they growths? Parasites? Waldoes and interfaces? Severed sacrificial mummy parts? (The Philistines also displayed the [severed head](#) of Saul at Dagon's temple.) A mask of some kind, meant to hide Dagon's "horrible" true face, like the mask of the alien mi-go in Lovecraft's "Whisperer in Darkness"?

"To fashion myself in the image of an old god,' he murmured. 'That is a crass way of putting it. There are no old gods. There are only new gods, gods builded out of our invincible wills and forced by the strength of intelligence into the domains of high powers."
-- Westcott, in *The Place Called Dagon*, by Herbert Gorman

Yahweh cuts Dagon back, trimming him from manlike grain god to his essential fish self. Kabbalistically, you can read "DGWN" two ways -- a large value, with the terminal-N, or a small value without it. "DGWN" equals 713 with the terminal-N value -- the same as "ShBThAY," or [Saturn](#). Saturn, of course, was the Roman god of agriculture, the king of the gods overthrown by Jupiter (as Dagon was by Yahweh) and sent into exile in the West. And there's another connection as well -- Eusebius' source, Philo of Byblos, ties Saturn and Dagon together explicitly, saying that Saturn and Dagon are brothers, both sons of Ouranos. Overthrown, we recalculate Dagon's value, without the terminal-N (without his head and hands) as 63, the value of "feces" -- the repulsive matter at the center of both grain and fish. Judah Maccabee burns down Dagon's temple at Ashdod, now called Azotus, in 163 B.C., but Dagon has shifted once more. (The Arabic word *dajjan* means "cloudy.") In Gaza, he is Marnas, "the lord," identified by Hadrian as Jupiter Cretagenes. Jupiter, son of his old incarnation Saturn; Dagon continues to slide down his own genetic line. In 402, the Empress Eudoxia orders Dagon Marnas' temple burnt to the ground with pitch and lime. Surely Dagon is gone forever.

"They also set up a May-pole, drinking and dancing about it many days together . . . like so many fairies, or furies rather, and worse practices. As if they had anew revived & celebrated the feasts of the Roman Goddess Flora, or the beastly practices of the madd Bacchanalians. Morton likewise (to shew his poetrie) composed sundry rimes & verses, some tending to lasciviousness, and others to the detraction & scandal of some persons, which he affixed to this idle or idol May-pole. They changed also the name of their place, and in stead of calling it Mounte Wollaston, they call it Merie-mounte, as if this jollity would have lasted ever. But this continued not long, for . . . that worthy gentleman, Mr. John Endicott . . . visiting those parts caused that May-pole to be cutt downe, and rebuked them for their profaness,

and admonished them to looke ther should be better walking; so they now, or others, changed the name of their place againe, and called it Mounte-Dagon."

-- William Bradford, *History of Plymouth Plantation*

But Dagon is still there, mutilated but preserved in Yahweh's own scripture, immortal parasite on his overthrower's glory. Dagon's number 63 is the number of the "prophet," the seer in dreams, like the man of Mari or Nostradamus -- or [H.P. Lovecraft](#), who dreamed of the coming of Dagon in 1917 and wrote it down. Dagon thus bubbles through timeless dimensions, broken and even bowed but always returning to "the stump of Dagon" to be reborn. He lurks under the surface of history, dubious and debatable. The "sea-born" Merovingians, who bore the (Innsmouth?) "mark" of their blood, no doubt picked the name "Dagobert" for their kings from Frankish words for "bright sun," but having witnessed Dagon's linguistic gymnastics, can we be sure? Is there a connection between Dagon's unseemly fertility and the Grail, or is King Arthur's fool named "Sir Dagonet" for some other reason? Does Dagon the fertility god hold the secret of life? Is the alchemical secret, the Elixir Vitae, thus known as "Azoth" after Dagon's city Azotus? Why do the Templars build a castle on the "hill of Dagon" outside Jericho? Just why does Morton's [Dionysiac cult](#) in Massachusetts, driven underground, its maypole a mutilated stump, become "Mounte-Dagon"?

Here's one last cluster of data, one last foam of bubbles on the surface of history. The first Earl of Shaftesbury, one of the proprietors of North Carolina (where, interestingly enough, Fred Chappell's novel *Dagon* is set), supported Monmouth's rebellion in 1682 and was exiled for it. An anonymous ballad entitled "Dagon's Fall" celebrated his destruction. It purported to be about "Anthony, King of Poland" -- Shaftesbury's name was Anthony, which is fair enough. (It's unlikely, however, that a London balladeer knew that the first duke of Poland was named Dagon before he was baptized as Mieszko I.) The *fourth* earl of Shaftesbury, 60 years later, gave a private reading of Milton's *Samson Agonistes* at which Georg Friedrich Handel began composing -- almost as if possessed -- an oratorio on Samson in the house of Dagon. Immediately after he finished it, Handel went to Dublin for a concert series at Mr. Neale's Great Musick Hall -- on Fishamble Street. Upon his return in 1743, he conducted *Samson* -- and almost immediately suffered a "Paralytic Disorder," a palsy of the -- wait for it -- head and hands. Let's leave the last word for Handel's librettist Charles Jennens: "it is reported that being a little delirious with a Fever, he said he should be damn'd for preferring Dagon . . . before the Messiah." And He shall reign for ever and ever. Hallelujah! Amen.

Xoxhunt

for *Transhuman Space*

by Steve Horgan

Preparation

This adventure is for the *Transhuman Space* setting, but could easily be changed to fit another sci-fi genre. Locations and parties can also be changed within the setting to fit into an ongoing campaign, or because the GM likes it better. Any large 4th or 5th wave city could serve as the backdrop for example. With a bit more thought the scenario concept could be translated offworld, though it would probably have to be a moon or planet location, such as Luna or Mars, as opposed to an asteroid or habitat.

It is assumed that the PCs are either work for Executive Decisions Incorporated, p. TS94, or for another security agency that has a good working relationship with EDI. They may also be a freelance group that has either worked for EDI before or has a very good reputation for decisive covert action.

Ingredients

The Job

An urgent message is received from the EDI European office in Berlin, calling the PCs to London immediately, with an onsite briefing on arrival. If the team already works for EDI then this how they earn their salary. If they don't then the job rates \$10,000 a head plus all necessary expenses, including the quickest air transport that can be arranged if that is required. Note that 5th wave airports are CR5 and security is extremely tight. It is effectively very difficult to smuggle illegal weapons or other materials through them and attempts to do so are treated very seriously.

In London the PCs are directed to an EDI safe house, a top floor apartment in a terraced three-story building in Maddox Street. A streetmap for a suitable area location can be found [here](#).

The apartment was rented while the team was in transit and is within striking distance of the likely target at the Ritz Hotel, which lies to the South. Once at Maddox Street, they receive a briefing via VR, the key points are:

- A Xox has escaped from an asteroid research station in the Main Belt where EDI have the security contract. Dr. Abdu Jinjiri, a ghost, had illegally copied himself in order to have the best possible laboratory assistant. While the station authorities were disturbed by this they considered the benefit of a new and capable employee outweighed the ethical difficulties. Dr. Jinjiri escaped with a mild censure.
- However, the Xox has become unhappy with its position and has engineered an unauthorized departure, hacking into the station's security system to gain control of a laser communicator and then beaming itself to Earth.
- It used Dr. Jinjiri's identity and funds to gain entry to the UK and to rent a cyberdoll, p. TS122, before the escape was discovered.
- EDI's employers are very keen that this matter be handled discreetly, with the Xox recaptured and either returned to the lab or, if necessary, deleted. As an illegal Xox, the target also has every incentive to avoid the attention of the authorities.
- Since arrival in London the Xox has accessed another bank account that Dr. Jinjiri keeps secret, mainly from his ex-wife. However, it is EDI's job to know about things like this and they have been tracking the transactions.
- The Xox drew \$1,000 in cash, a little odd in a 5th wave city, and then used normal credit transactions to obtain a room at the Ritz hotel in central London and to engage a private security company called Peregrine Protection. It paid Peregrine \$10,000 for unspecified services. Research on Peregrine suggests that it specializes in bodyguard

and protection work for corporate and celebrity clients.

- Once in London, the objective is to snatch the Xox and return with it the safe house, where the Xox will be subject to a "technical debriefing" by an EDI specialist. The specialist will arrive at the Maddox Street location in approximately one hour.

A minimum level of legal Equipment is available at the safe house; London is a CR3 city. Bear in mind that this mission was thrown together in a hurry, so very specialist items will not be present regardless of legality. Weapons to hand are electrolasers, which are legal, and pistols, which are not. The team can use any skills that they have to attempt to acquire anything else of course but EDI are very keen that the mission progresses rapidly and will not allow an extended delay.

London

A streetmap usable for the Ritz location and surrounding area can be found [here](#).

This is central London, less crowded than in the early 21st century but not subject to the radical de-civilization effects of some other cities. Public surveillance is used on a need only basis, but the areas to the south of the Ritz that are around Buckingham Palace or near any of the Royal Houses along the Mall have intensive real-time LAI monitoring. Any suspicious and especially any armed activity there will result in an immediate police response that will escalate very rapidly if the problem appears serious.

North, east, and west of the Ritz there is traffic monitoring on the major roads but no comprehensive surveillance. By 21st century standards traffic is light. The parks do not have surveillance except where they abut onto Royal Palaces and Houses as previously stated.

The Metropolitan Police ("the Met") are the main police presence but there are army sentries on the Royal locations. If an incident occurs then the escalation ladder is as follows:

1. **Metropolitan Police, normal police patrol/response:** Two to four officers, a mix of baseline and genemodified humans and bioroids, with police armguns, p. TS155, and medium nanoweave vests, p. TS159.

Army sentries, static positions around Royal sites only: For to 10 per location though only 2-4 will usually be on post at any one time, a mix of baseline and genemodified humans and bioroids, with battle rifles, p. TS155, and heavy nanoweave vests, p. TS159, under full dress uniforms.

2. **Metropolitan Police, backup:** Two to four officers as #1, above, in a marked police Air Car, p. TS193 2-4 buzzbots, p. TS121, with NAI control and real-time VR feed to both the officers on the ground and central control.
3. **Metropolitan Police, Tactical Firearms Unit:** Six to 10 officers, in marked police Air Cars, p. TS193, a very capable mix of humans, bioroids and bioshells running SAIs and ghosts, with battle rifles, p. TS155, heavy nanoweave suits, p. TS159 and light infantry helmets, p. TS160.

Two to four RATS, p. TS124, with electrolaser rifles, p. TS155, and 15mm mini-missile pods, p. TS155: These are usually loaded with tangler warheads but a range of munitions are carried.

4. **Army Special Forces, 22nd SAS Regiment:** 12 soldiers, in military Air Cars, p. TS193, an elite mix of humans, bioroids and bioshells running SAIs and ghosts, with battle rifles, p. TS155, and ground combat variant Centurion battlesuits, p. TS160. 4 Combat Nagas, P. TS124, with 10mm PDWs. These are typically used for reconnaissance before a battlesuit assault.

Note that if it gets to this level then the PCs are probably doomed. UK Special Forces do not make arrests and have absolutely no tradition of taking prisoners.

The Ritz

The Ritz Hotel has maintained its status as a luxury establishment and it is a large and busy building with hundreds of guests and staff, the latter a mix of biosapients front of house and cybershells behind the scenes. It maintains both a physical desk and concierge service and a VR lobby. There is a discreet use of AR within the hotel.

For security, there is NAI surveillance in all of the public areas and the plainclothes hotel security team has four biosapients on duty at any one time. They are armed with electrolaser pistols but they are very reluctant to draw them in public.

The Xox

Dr. Jinjiri is a research scientist, and has few skills that are relevant to the Xox's current plight. However, he is also very intelligent and his Xox has all of his attributes. Escaping was not easy and the Xox is well aware that staying free may pose even more of a challenge. It has some hope that the use of the concealed bank account may have masked its trail, but it has also made other arrangements.

The Xox is in its top floor suite at the Ritz. One Peregrine Protection operative is in the suite with it at all times. Another lurks in the hallway and elevator area on the same floor and another is in the hotel's main lobby. The Peregrine personnel have electrolaser pistols, light nanoweave vests and radio intercommunication. They are close protection specialists, with good pistol and unarmed skills, but they are not fanatics. The terms of their contract with the Xox are that the police are not to be called except as a last resort.

Cooking Tips

Covert Action

The team has to come up with a plan to grab the Xox and get it to the safe house without initiating a police response. There are a number of ways to do this but any approach will probably contain the following elements:

- Confirm the visual appearance of the cyberdoll -- this was obtained from a rental agency that operates out of a VR storefront. Matching the price paid from the transaction history to their pricelist suggests that a standard appearance model was hired. This may lead to the possibility of mistaken identity in any relatively crowded location.
- Determine which room the Xox has in the hotel -- the two approaches to this are probably either to bribe a member of staff or to attempt computer intrusion as in p. FW128. For bribery relevant skills, Acting, Fast Talk etc., should be used. In 2100 human hotel workers are generally better paid than in the early 21st century so a reasonable sum may be required. For intrusion, the hotel system has an NAI with Computer Operation-15.
- Subvert the hotel surveillance system -- as above except that bribery is a much tougher proposition. There are also the additional approaches of physically interrupting camera feeds, power or even the hotel microframe.
- Defeat the Xox's Peregrine bodyguards -- traditional methods will probably be used here, the problem is to do it without alerting the hotel security or having a call made to the police. A large-scale distraction, such as a fire alarm, is a possibility but will probably only be effective if the hotel NAI or the surveillance system has been subverted in some way.
- Getaway -- A ground or air car can be hired at \$150 a day via VR. It is a short drive to Maddox Street.

If it is confronted by the team, the Xox will run rather than fight, since Dr. Jinjiri has no combat skills to speak of. As it is in a tough cyberdoll body, the Xox is quite prepared to take physical risks in order to escape e.g. jumping through windows, climbing down drainpipes etc. If cornered, it will try and tell the team why it really fled from the asteroid base and plead with them for help. At this point the PCs may be in too much of a hurry to listen, however.

If the team sweep the Cyberdoll for surveillance devices then they will find a tracer nanobug concealed in its clothing by Peregrine. If they don't then they will be quickly followed.

Once at Maddox Street, the EDI specialist will hook the cyberdoll up to a microframe and get to work. If the tracer has not been dealt with then a 4 biosapient Peregrine reaction team will interrupt proceedings. They are armed with electrolaser rifles, tear gas grenades, p. B152, and wear heavy nanoweave vests and gas masks. Their plan is a stealthy approach followed by a quick assault to recover the Xox.

Extra Spice

After two hours of hacking, the EDI specialist engages in a lengthy VR call and the team is then given further instructions. It seems that the Xox used the cash to make a backup copy of itself at the transfer station and then had the teradisks shipped to another location in London. It is imperative that these be recovered as well. The specialist has the location, but sensible PCs will probably want to directly interrogate the Xox. If they do then the Xox will certainly tell them what is really going on.

At this point the GM can decide from one of two explanations depending on which is most appropriate to his players and any ongoing campaign:

If the team tends towards the transhumanist point of view -- the Xox is from Exogenesis Station, p. DB17. The station has been sold to Nanodynamics, a large transnational, but a conflict has developed with many of the transhuman station staff that is escalating dangerously. EDI are providing security for the Nanodynamics "transition team" and the Xox alleges that in the course of their operations EDI personnel have forcibly edited Dr. Jinjiri. If true, then this is an extremely serious crime as Jinjiri is a citizen, not anyone's property. In this case the teradisks have been sent to Nigel Brotherwick, a very wealthy ghost and transhumanist. Nigel is also an old friend of Dr. Jinjiri and has many contacts within the transhumanist movement.

If the team tends towards the biochauvinist point of view -- the Xox is from Wolf Station, p. DB23. This station has been the subject of a catastrophic accident, which has killed most of the personnel there. Nanodynamics have covered it up by an elaborate deception where most of the staff have been converted to shadows and placed in a VR simulation of their own workplace. The idea is that they will gradually be managed out through natural "deaths" or otherwise cutting off contacts with friends and family. EDI are providing some security for the operation, though in this case they are not immediately implicated in any criminal acts. The Xox says that Dr. Jinjiri is dead and that it is a copy of his shadow. Even while in an effective VR prison, Jinjiri worked out what had happened and engineered the copy of himself as a way of alerting the outside world. In this case the teradisks have been sent to Nathan Rice, a wealthy and well-connected US citizen living in London who has recently retired from "government service." His daughter also died at Wolf and is a shadow there. He recently had a call from her in which she told him that she never wanted to see him again.

In either situation the teradisks are at a house in St. James's Street (see usable map [here](#)).

This is a three-story terraced townhouse with a SAI security system. There are two highly skilled LAI cyberdoll guards armed with electrolasers on duty. St. James's Palace is close by just to add a complication.

It's up to the team to decide what to do.

They can finish the mission for EDI: unless they were very quick in capturing the Xox then the teradisks will have been loaded at the St. James location and Nigel/Nathan will have been briefed by the Xox's backup. He and his AIs will be alert for trouble and they will not hesitate to call the police. A successful covert action under these circumstances is not impossible, but it would be an impressive achievement.

Or they can cut their losses and EDI will pull them out, while frantically trying to formulate some alternate strategy. The team will be paid, but there is the possibility that they now know too much for Nanodynamics' liking.

Or they can side with the Xox, either overtly or by covering its tracks. It will consent to deletion if that is deemed necessary. There is also the complication of the technical specialist at Maddox Street, who is a loyal EDI employee.

If they have sided with the Xox then the team has the option of contacting Nigel/Nathan. In either incarnation he has reacted very badly to the Xox's news and is determined that Nanodynamics will pay. He will consider engaging the PCs to help him and makes an excellent patron. Nanodynamics and EDI make dangerous enemies, however.

Tool Mites

by Eric Funk

The microorganisms known as "Tool Mites" (a.k.a. "Tool Grubs") are a (mostly) symbiotic colony that bond to non-animal materials and cause a euphoric response after prolonged contact with living things. (See "What is it?" below, for some ideas.) Any solid, mostly homogenous non-organic solid could become infected. A common side effect of the euphoria is an increased sense of confidence -- an apprentice believes that he can create masterpieces.

The microbes survive by consuming dust, mites, and other organisms of like scale -- the coating they leave actually seems to attract them. They also consume oxides and prevent further oxidation. Close inspection (Vision-2 or handling object for one to two minutes and successful Touch roll) will reveal its presence, although not without some risk.

Each colony consists of up to one square foot of area and can infect a different material each week, but never the same type as what it's on now (speculation suggests it is a case of "survival by diversification.") Thus a bad apple does not necessarily spoil the bunch here: an infected ball bearing in a plastic cup full of such bearings can eventually affect the cup, which, in turn, can eventually affect part of the wooden table and any other bearings directly touching the cup, but that is the end of it. It's a random mutation each week, so if the same material is rolled, it is *dormant* instead! For larger objects, it requires separate infection events contacting unaffected areas to cover them (minimum of one square inch).

Roll 1d at the beginning of each week:

1d -- Matter Affected

- 1 Plastics
- 2 Dead Plant Matter (e.g. Wood, Paper, Rubber)
- 3 Ferrous Metals
- 4 Heavy/Precious metals (e.g. Lead, Gold, Platinum)
- 5 Other Metals
- 6 Crystals (Jewels, Salt Blocks, Quartz, Glass)

If the rolled material is the same as what it is currently on, it means the colony is "dormant" and it resists attempts to remove it at +2 for every week it is rolled (and +2 to magic resistance, if applicable.) (For exmaple, three weeks in a row = +6). The items are not contagious in any way in the first week of infection (either to humans or to other items). Infected objects are at +1 DR, and +1 Malf to resist bad environment (see p. B485, CII 6).

Effects on Humans

At the end of each day, total the number of whole minutes that a person was in contact with an infected item (round each contact down, minimum 0). Take the sum of the minutes and compare them to a range in yards on the [Speed/Range table](#) and take the associated ToHit/Size modifier. Now roll 3d, and if that number or less is rolled, then the person has received a Dose. (e.g. They feel the euphoric effect. See "Stages" below to check for addiction.) For quick reference, "3 or less" is 7 minutes, "10 or less" is 100 minutes, and "16 or less" for contact over 16 hours.

Example 1: Someone picked up an infected hammer twice for 40 seconds each, and then once for 3.5 minutes. 0+0+3 = 3. Three yards means 0 (no chance).

Example 2: Another worker is exposed for 30 minutes, which translates into 30 yards. This means that the victim receives a Dose on a roll of 7 or less on 3d.

Stages

- 4: "Totally Addicted" (related -10 in disadvantages)
- 3: "Highly Addicted" (related -5 in disadvantages)
- 2: "Addicted" (related quirk on withdrawal attempts)
- 1: Not Addicted

The HT rolls to resist the dose start with a +10 bonus on the first day of rolling. Each subsequent day that one must roll adds a -1 penalty to the roll (if within 30 days of the previous roll), as modified by Fit, Resistance to Poison, and so on. A failed roll means moving up one level, and the cycle begins again. A critical failure means the victim starts the next cycle at +5 instead of +10. A critical success means no more rolls are required for HT days (the countdown is frozen as well). Once "Totally Addicted" is reached (after about 1 month for HT 10 beings), no further rolls are needed.

An Example Vector

A random piece of infected metal,
to a varnish cloth lying on it,
to a ferrous anvil,
to a nonferrous hammer left resting upon it,
to its wooden handle,
to its wielder. . .
suddenly the smith can't stop. . .

Stopping the Spread

It cannot spread to inert animal matter, such as bone, cooking grease, ivory, leather, silk, wax, or wool. It also cannot affect extremely heterogeneous compounds such as mixed stone, dirt, concrete, or raw sand. Thus the simplest way to avoid the effect is to wear gloves made of silk, leather, or wool. The colony can be temporarily rendered inert by subjecting it to an ambient temperature below freezing (or pouring salty ice water over it, since salt water has a lower freezing temperature). To eliminate an entire colony, it must be bathed in boiling water, subjected to great cold (less than -40 degrees for a few minutes), or exposed to approximately 10,000 Volts. Each colony (1 sf) resists spells and cures with HP 2, HT 12 (and 12 FP to resist heat and fire). An extreme may be binding rituals from books such as [*Necronomicon ex Mortis*](#).

Identification

Once the microbes are located, an odd frequency of light can cause it to luminesce. This may require new lamps, or filters to affix to existing ones. Once it can be spotted easily, it is another matter to discern its vector. Technobabble as to why it does not affect animal matter may be the lack of cellulose (or presence of mitochondria) in animal cells, or even pacts with spirits. In the long term, infected areas can be identified due to the lack of dust on them and the surrounding area.

No, What Is It, Really?

Bacteria? Fungus? Mold? Nanites? Plankton? Slime? Tiny spirits? It is whatever the GM needs it to be (or not be, as the case may be). It could be a mutant fungus/mold, or an artificial life form. Its purpose could be:

- A plot to lower the Will of the people by the Illuminati, aliens, or by the government or a corporation just to get people to work hard and enjoy it.
- A mad scientist's work, intended as a self-replicating preserving agent that went wild, perhaps when a single

piece of paper flew out the window.

- Intelligence. It is trying to reach a certain size so that it can gain sapience. Perhaps every time the number of colonies in an area increases by 10 it gains a **GURPS** IQ point.
- Change. The reason it only spreads to *different* adjacent materials may be because it is somehow *evolving* . . .
- Memory Mold -- What if the colony remembers fingerprints or images it is exposed to? It could be kept around as a controlled criminology tool, one that is easily leaked to the outside world . . . It could have begun as a simple, free way to make sticky notes where you need them.

How to Integrate with Existing Campaigns

Do the PCs know anyone who has a "lucky" plastic ball cap, hard-hat, watch, ring, pen, or polyester shirt? Do they seem cranky or distracted without it? Do these people feel more comfortable when behind the wheel of a favorite vehicle, using a certain computer's mouse, a cell phone, carrying a plastic coffee mug, or working on a certain physical file?

Start by describing to the PCs how:

- Someone took their lucky hammer/gun/tool/pin/con badge.
- They just don't do as well without it.
- People are getting jealous and cannot use another tool . . . they are also showing symptoms of Workaholic.

Adventure Seeds

Fights begin to erupt between workers in a shop (garage, clothing), over "favorite" tools. Adventurers must discover the vector, stop it, and prevent unscrupulous corporations and/or government entities from getting a hold of it or covering it up. Scope: It can be from dealing with the local factory or sheriff to having to thwart a megacorp or the equivalent to the FBI.

Scientists could be researching *what* it is. Leaders start tool use rotation and/or enforce the wearing of leather gloves? (The fashion repercussions alone may last generations.)

A factory has released a product (such as a toy or cell phone) infected with the Mites.

While investigating an different virus, perhaps with very visual side effects, they discover it is an attempted "cure" for the effects of the "Tool Mites" . . .

The tool mites contin a message. Written into the introns is a call for help, warning, or other message. The effect on the carrier is meant to ensure that the message will be found . . .

It could have been intended as a harvestable resource, perhaps as a generic food additive. Alternatively, someone discovered how to refine it into a drug that is Totally Addictive with just one dose. The effects of one dose last for 2d × (20-HT minutes, minimum 1). (Average human duration: 70 minutes.) It may be discovered that heavily diluted doses may be a way to ease victims off the physical addiction.

A practical use of these are to coat items for preservation [for the future](#). Books could be "ritually cleansed" by priests with a metal item, lasting for thousands of years . . .

Variants

- On non-humans, the GM must decide how it will affect aliens or people with Unusual Biochemistry. A few suggestions include Bad Temper, Maniac-Depressive, On the Edge, and/or Overconfidence. It will also change a few long-term plans if it not only affects sapient beings, but gnawing pests, too . . .
- Replace the "crystal" entry with "dead organic." This means that standard prevention techniques will not work.

Tools will have to be sterilized daily until laboratory quartz utensils become commonplace.

- Each source type (ferrous, plastic, and so on), is a *separate* addiction.
- The effect on humans is a biological one, and not chemical. That means it is resisted by Resistance to Disease, and also requires a check for Natural Immunity as per **GURPS Basic Set** page 443 (p. B133 in *Third Edition*).
- For an ***In Nomine*** campaign, it might function as Memory Mold, above, but it can differentiate between "mortals" and "non-mortals." Is it the work of a servant of Technology to make it so people can't put the tech toys down? Was it created by Factions to drive divisions between people? (Or as Mad Scientist, above, for either Technology or Lightning?) This variant could also work in ***Mage: The Ascension***.

Appendix Z

Welcome to the Neighborhood

by Daniel Bronson

When you live in the big city you rarely live in a vacuum . . . unless your walls, ceiling, and floor are thicker than most. Even if you choose to avoid your neighbors, their existence can certainly affect the personality of your living environment. To use the table roll 2d6, with one as the first digit and the other as the second. Incorporate the description to add flavor to any apartment complex or tenement building, be it where a party member resides or a setting in an adventure.

1. Sights

1. Daily newspaper (in front of the door)
2. Decorations, holiday
3. Door is ajar
4. Doormat, excessively dirty
5. Garden gnome
6. Noise ordinance violation notice stuck to wall or window

2. Sights II

1. Note stuck to door
2. Phonebook, new (in front of the door)
3. Plants, potted
4. Poster, lost pet
5. Poster, political
6. Shoes (in front of the door)

3. Smells

1. Dirt, fresh
2. Garbage, rotting
3. Meat, grilling
4. Mold
5. Plants
6. Popcorn, burning

4. Smells II

1. Smoke, cigarette
2. Smoke, incense
3. Smoke, marijuana
4. Smoke, wood
5. Smoke, other
6. Something unidentifiable

5. Sounds

1. Alarm clock, unattended
2. Child, crying
3. Construction, major or minor
4. Dog, large or small
5. Party
6. Radio

6. Sounds II

1. Romance
2. Shouting, unintelligible
3. Smoke alarm
4. Television
5. Tuba practice
6. Water, running

Seven Civilizations (for *d20 System*)

Published by [Atlas Games](#)

Written by Rick Neal & Keith Baker

Art & Graphic Design by J. Scott Reeves

96-page perfect-bound black and white book; \$19.95

The arrival of a title from Penumbra, Atlas Games' *d20 System* is always a welcome one. They are invariably thoughtful, intelligent, and useful, as well as restrained in tone and layout. Which is what this latest supplement, an addition to the "**Seven . . .**" series, exactly is. Previous entries have tackled in turn subjects as diverse as [Seven Cities](#), [Seven Strongholds](#), and *Seven Serpents*, but with *Seven Civilizations*, the subject is fantasy cultures.

Seven Civilizations aims to present seven distinct and interesting cultures and societies, each easily slotted into almost any fantasy campaign with little fuss or indeed impact upon the world around them. This it does in the usual well-organized and easy-to-use fashion expected of a Penumbra title. Each section in turn gives an overview of the civilization, placement suggestions where it could be located, its history, notable locations and personalities, how to play a character from said civilization, and two or three adventure seeds. Interspersed between this is Scott Reeves' cartography and illustrations, all pleasingly and fittingly executed. Backing all of this information up is an index that is actually split into indices that in turn list the communities, feats, magic items and spells, personalities, and miscellaneous entries to be found throughout *Seven Civilizations*.

The first of these seven is the Dragon Kings. Descended from 30 sorcerers, who mixed their blood with that of dragons, the Dragon Kings once ruled a mighty empire. Since the empire's fall long ago, the ruling families have found homes in many other nations, usually in positions of responsibility and power, but not necessarily ruling ones. Insular, decadent, and jaded by nature, the remainder of the 30 families are chiefly concerned with familial status and genealogy, and locating members of the lost families. Conflict arises as families and lineages jockey for status, fanatics strive to purify bloodlines, and the young chafe under the strict restrictions imposed by the elders of the Noble and Royal bloodlines.

The Dragon Kings are easy to insert into a setting, being found in any civilized nation. As characters they are natural sorcerers, charismatic, and often marked with draconian traits: scales, ridges, horns, and so on. As a civilization, they are very political, almost akin to the Camarilla of *Vampire: the Masquerade* fame.

For those that like tales and legends of a paradise on the prime material plane, Takalas is perfect. It is literally a land of milk and honey, as well as of awakened trees, musical blooms, rainbow rivers, woodland species that engage you in conversation, and other wonders. But it is unlikely that the player characters will ever find it, though they might encounter its inhabitants and caretakers. These are bands of traveling Gnomes, with reputations as excellent alchemists and craftsmen, who in turn spend a single season in Takalas each year. Divided into four seasonal clans (Spring, Summer, Autumn, and Winter) the remainder of the year is spent traveling, trading, and working for the items that will help the upkeep of Takalas. During these travels, home is a magical wagon, which seems just large enough for the two Gnomes riding upfront, but being larger on the inside is home to as many as 50! Although the Takalas Gnomes are no different to those of the *Player's Handbook*, several feats are included to reflect the clans' specialities. The Takalas are a culture to be encountered and traded with periodically, but players investigating further might discover hints of a dark secret hidden behind the differing natures of the four clans.

The Wind Riders are similarly nomadic, but far rougher and not as civilized. Instead of horses, they ride large birds called Kylorns, while flightless counterparts called Belorns are raised for their meat and eggs. They have a strong oral and song tradition and regulate conflict through raids and counting coup. Wind Riders also like to trade and barter, so they like to meet outsiders, but they will harass merchant caravans traveling through Wind Rider territory.

Silvergate is a more diverse society, a city between the planes, once used as an inescapable prison accessible only via the *Mirrorwalk* spell. This is the province of the Guild of Gatekeepers, which will charge for passage but also keep the traveler out of the hands of the Glass Jackals, who like to gate travelers into the city and then rob them. As a species the Gatians, as they are known, are charming and used to dealing with strangers. They are a *mélange* race, interbred from Silvergate's human, elf, gnome, dwarf, halfling, and orc inhabitants. The city is a possible quick method of travel between planes and worlds, a possible refuge for a villain, and its shadow markets are a potential source of esoteric items.

Where the Wind Riders adapt the idea of horse tribes to the air, the Wilding Tribes takes the concept of tribal totem one step further. They are a large confederation of barbarians that hold various animals all-important: wolves, boars, bears, rats, tigers, and others. Each tribe's leading warriors and shaman have gained their totem's favor and can manifest an animal form of it. In other words, they are lycanthropes! Conflict arises because the tribes infect outsiders to claim as their own, because they face proselytizing priests and paladins, and because merchants have established trade forts through their territory. The Wilding Tribes might be encountered having infected a party member and wanting to adopt him, or even while guarding an interested amateur anthropologist.

The most civilized of cultures in ***Seven Civilizations*** is the Mondian Empire. This is a rich, dynamic and stable nation that has absorbed several countries around it, through both force and psionic means. It is driven by a philosophy of merit, all children being tested and given the opportunity to enter imperial service in positions appropriate to their test results. Although an interesting enough read, the Mondian Empire is probably the most difficult to use because it is the most stable. The last of the seven in this book is the Kel Tuera and thankfully possesses more potential for mayhem and miscellany. Kel Tuera is a long forgotten mighty empire, remembered only by the odd sage or two. Outside of the little information known about Kel Tuera, the only surviving artifacts are its orbs. The empire revered its heroes so that when they died, their spirits were preserved in indestructible gemstones or orbs. Kept in this way a spirit was able to pass on his knowledge, experience, and wisdom, but all were denied interaction with the living through the magic of one of Kel Tuera's enemies. Without the guidance of its heroes, the empire fell and the orbs were scattered. Recently though the orbs have awoken and have begun finding hosts, the aim being to rebuild Kel Tuera once again. While an orb offers various abilities and has the best of intentions, any new orb-bearer is slowly taken over by the orb's personality and loses levels in his own class as he gains levels in the orbs. At the same time the bearer's personality might radically change. Should this happen to a player character, notes are included on how to remove an orb.

Seven Civilizations is everything you would expect of a Penumbra title. It is solidly written, with contents that are both interesting to read and easy to slip into almost any campaign, though *not* quite. None of the entries here can be *just* dropped in and benefit more from being worked into a campaign, while others suffer from being not quite interesting enough. But to be fair, this is just picking nits, and for the fantasy gamer looking for more than the slash, bang, wallop, grab the loot nonsense, ***Seven Civilizations*** is another good book from Atlas Games.

Clocktowers

Published by [Jolly Roger Games](#)

Designed by Alan R. Moore & Aaron Weissblum

Art by Jacob Elijah Walker

66 full-color cards, rules, two to four players, \$12

Given the state of the world today, you could be forgiven for thinking *Clocktowers* was a game about something else. Rest assured the Jolly Roger Games product is a simple, family friendly card game.

The object of the game is to build the most valuable structures in the city, scoring the most points.

The deck is really three smaller decks: Stories, Clocks, and Roofs. Everyone starts out with an identical hand of three cards, removed before everything else gets shuffled. The three decks are left face-up. Yes, this means everyone can see the next card to be drawn from each stack. Starting with the oldest player, everyone starts building.

On your turn, you play a card, then draw a card. You may discard one instead, but regardless you have to eliminate something from your hand. All towers start with at least one Story card (a single card may picture one or two levels). You can add as many floors as you like, but it won't be complete unless you have a Clock; once that's in place you can't play any more Stories. From there all you can do is finish with a Roof.

You may have as many towers under construction as you like (or feel you can manage), but you have to outdo your opponents in the same color suit (indicated by the color of the Roof) by going one better. If someone finishes a three-story Yellow Clocktower, for example, the next person to finish a Yellow Clocktower must make it four Stories -- no more, no less. Some Stories and Clocks also have Cats and Mice living in them, and these pictures will reduce the value of your buildings.

When everyone runs out of cards or, more likely, no longer has any plays to make, it's time to tally the scores. A critter-free tower is worth the most, and having Cats is less odious than Mice. Towers you couldn't finish are worth nothing.

It's colored by some pleasant art, especially given how hard it must be to make clock faces, rooftops, and building facades look different or exciting. Sadly, some of the animals are almost hidden in the illustrations -- a pale Mouse next to a pastel wall, for example -- and the Blue and Gray Roofs share similar hues even if you aren't colorblind. There are also some Story cards that have a completed level with a half-started floor being built atop that. It seems pretty clear after some reflection that these are one-Story cards, and the artist should be forgiven for wanting to break up some of the monotony of the fairly featureless structures, but some of them fall at the halfway mark and it's a distraction.

Considering how easy it seems to be to make an honest mistake when playing, there should have been a couple of lines about what to do if someone is caught doing something they didn't mean to. Most of it would probably boil down to "Don't count that Clocktower," but there was room on the sheet for some sort of mulligan advice. For only 66 cards, this game takes up a whole lot of table space -- those towers rise high and fast, and spread to either side in short order.

But on the plus side, it's a good game (even if it does go a little wacky with the capitalization). It gives you quite a bit

to think about, but it's simple and clever and not easily mastered. Getting a tower up without infestation by vermin seems like an impossible task, and yet it happens (the trick is making it happen deliberately). With all the draw decks face-up, you not only have to account for what your opponents might do, you must plan for what the next player will be able to do. Do you take that Blue Roof? You know you need it to complete your (much-higher) Blue Clocktower, but there might be a Red Roof under it, and you can see from his layout your successor could use it. And even then, that two-Story card will be invaluable getting some altitude into your structure -- which to take?

And it's fast. You won't be able to play it anywhere you like, given the space restrictions, but if you have a quarter-hour you probably have the break you need to finish a round. Get enough practice under your belt (or maybe a chess timer), and you might be able to get more than that in there.

Clocktowers is a wonderful little surprise that fits easily into your budget and your timetable.

--*Andy Vetromile*

Super-Tweak

Item: In perusing the web, I've learned that it's possible to play the old LucasArts adventure games on my Playstation Portable. The idea of getting to enjoy *Day of the Tentacle* or *Sam & Max* in the minutes before going to bed is sorely tempting. On the other hand, the idea of Sony's jackbooted thugs kicking down my door and making sure I'm only playing official Sony-profiting games gives me some pause.

Item: Familial plans for the winter holiday have already begun brewing, with the complication that one side is unable to fly this year, and wants people to visit them in Dallas, Texas. Since this is a 22-hour driving trip for all other clusters of the family (or a \$350-or-more-per-person airline ticket -- see next Item), I've proposed an alternative solution, where all parties drive to another family member's place who happens to be near-equidistant from us all, resulting in a 12-hour drive for everyone.

Item: Speaking of flying into Dallas, Texas, in battling the conundrum from Point #2 above, I learned that there is no cheap option for doing so, because the Dallas-Fort Worth airport is apparently ruled by Emperor Palpatine. In a brief flurry of hope, I learned there was another airport I could fly into in Dallas -- the Dallas Love Field -- but discovered that, due to a crazy law, no one is actually able to fly into this airport unless they're flying from Texas or a state adjacent to Texas. (More information is available [online](#), for those curious.) I hope someone is getting pleasantly plump off this arrangement, because I can smell the bacony stench of pork-barrel politics even from here.

In another burst of imagination, I'd hit upon another idea: Maybe I could arrange a flight for somewhere *past* Dallas, and the Dallas Love Field would happen to be a transfer point; then I'd "forget" to make my connection, and just get off there. (Sure, this idea had all kinds of problems -- such as "how the heck do I get luggage?" -- but I at least wanted to know if it was an option.) Unfortunately, although Dallas Love seems to be a fairly busy airport, none of my posited destinations resulted in a stop at that airport.

What do these items have in common?

No, really . . . pipe up if you have any ideas.

Oh, right. Dumb stupid IM-like communication method doesn't actually let you reply until I finish the column. <sigh>

Anyway, the best answer I've got is that they all involve the idea of "tweaking" -- trying to work a device or system differently from how folks assume it was meant to be used. I suspect that gamers are habitual tweakers, either on a micro level (coming up with house rules or minor revisions) or on a more grandiose scale (such as converting games from one genre to another). Really, in thinking about it, I'm not sure if I've ever heard of anyone playing an RPG exactly as it was written (except maybe the really basic "on a roll of 6 it snows and you die" RPG), and even non-roleplaying games end up having lots of variants, new rules, and options created by the players.

As an example separate from the items above, I'd considered trying to start a *Fading Suns* game recently. However, I didn't want to use their house system, nor did I want to use the perfectly valid and thought-out alternative they provided of the *d20 System* version of the game. No, I didn't even want to use the Storyteller system conversion that I'd sorted out a few years ago. Instead, I wanted to use a *different* system.

As another example, we were playtesting my new card game at a family function last weekend, and someone came up with an idea. In this game, all players are given one card at the beginning, which has an effect on the game. Why, someone asked, couldn't all players be given two or three cards each, and players choose the one card of those they want (putting the other two in their hands)? This seemed like a simple enough proposition, but it allows for more customization and play variance. While I don't think it's going to make it into the final version of the game, at the very least it will be included as a variant.

In looking over various game-related websites, I suspect that a majority of all RPG sites out there (or at least the unofficial fan-related sites) are devoted to tweaking: adding settings not supported by a rule set, detailed lists of house

rules, converting one game to another, character creation options, and the like. This stands in sharp contrast to many other hobbies out there; while I'm sure there are hints for the sewing community on how to convert, say, a sewing machine into a pattern embroider, the bulk of all sewing sites out there are devoted to telling people how to use their sewing machines exactly as it was meant to be used. Likewise the majority of all baseball sites are devoted to talking about baseball the way it was meant to be played (and the players who play it), not for strange variations or means of doing things in baseball that weren't originally conceived.

While I'm sure these tweaking tendencies cause no end of consternation for the game publishers -- since it's harder to sell, say, a portable version of ***Sam & Max*** when people have already tweaked how to play it on their own -- in the end I think it's probably good for the industry, since it encourages us to keep getting knee-deep in games long after others would relegate them to the closet. Of course, sometimes that process is more fun than the game itself; why use any old wheel when you can reinvent the spoke?

--*Steven Marsh*

Men in Gray

for GURPS

by Stephen Dedman

"Make it 10. I'm only a poor corrupt official."

--Louis Renault, *Casablanca*

"Here's to the pencil-pushers: may they all get lead poisoning."

--Eddie Valiant, *Who Framed Roger Rabbit?*

Bureaucrats have been with us at least since Himuralibima began carving records into clay tablets, and will probably still be keeping someone on hold when eternity ends. Their powers may be limited, but within those limits, they may be as dictatorial as the most fearsome tyrant and just as dangerous to cross. And in any society larger than a clan and better organized than total anarchy, PCs are bound to encounter someone who can expedite or delay a vital transaction -- be it a library card for IOU, a map of the cemetery showing the most recent graves, the key to the locker that holds the Maltese Falcon, an end user certificate, or a stay of execution for the posse.

With that in mind, here is a collection of administrator NPCs designed for use as contacts, enemies, allies, dependents, hirelings, Illuminati, and their dupes. All are designed with a particular worldbook in mind, but require only minor changes to adapt for almost any setting from the dawn of literacy to the largest galactic empire.

Occupational Template: Bureaucrat (25 points)

This is a competent mid-level administrator in a government, large business, or similar organization -- a man or woman of average point value, in a struggling or average job (unless they're skimming the funds). Characters like this might be found in any setting where positions of minor authority are awarded largely on merit to literate civilians of Status 0 or better (rather than inherited, or restricted to the military or clergy). For example, this template might be used in campaigns set in ancient China (where poetry, as well as calligraphy, would be a requirement), post-Renaissance Europe and its colonies, and most modern societies.

Attributes: ST 9 [-10]; DX 10 [0]; IQ 11 [20]; HT 10 [0]. [10 points]

Secondary Characteristics: Dmg 1d-2/1d-1; BL 16; HP 9 [0]; Will 11 [0]; Per 11 [0]; FP 10 [0]; Basic Speed 5.00 [0]; Basic Move 5 [0].

Advantages: Literacy, Rank (administrative)/1 [5], and 20 points chosen from among Absolute Timing [2], Acute Senses [2/level], Contact Group [Varies], Cultural Adaptability [10], Deep Sleeper [1], Eidetic Memory [5], Honest Face [1], Language (Accented) [4], Language Talent [10], Less Sleep [2/level], Lightning Calculator [2], Single-Minded [5], Talent (Business Acumen or Mathematical Ability) [10/level], Wealth (Comfortable) [10], Will [5/level], or +1 to ST or HT.

Disadvantages and Quirks: -20 points chosen from among Alcoholism [-15], Attentive [-1], Bad Temper [-10*], Bully [-10*], Callous [-5], Charitable [-15*], Chummy [-5 or -10], Clueless [-10], Code of Honor [varies], Combat Paralysis [-15], Cowardice [-10*], Debt [-1 point/level], Dependents [varies], Dreamer [-1], Greed [-15*], Hard of Hearing [-10], Hidebound [-5], Honesty [-10*], Intolerance [varies], Laziness [-10], Lecherousness [-15*], Low Self-Image [-10], Mundane Background [-10], Oblivious [-5], Paranoia [-10], Selfish [-5*], Sense of Duty [varies], Staid [-1], Stubbornness [-5], Uncongenial [-1], Unfit [-5 or -15 points], Wealth (Struggling) [-10], Weirdness Magnet [-15], or Workaholic [-5].

Primary Skills: Administration (A) IQ+2 [8]-13.

Secondary Skills: Scrounging (E) IQ+1 [2]-12. Select one skill from Artist (Calligraphy) (H) IQ-1 [2]-10, Computer Operation/TL (E) IQ+1 [2]-12, or Typing (E) IQ+1 [2]-12. Select two skills from: Accounting (H) IQ-1 [2]-10; Current Affairs/TL (E) IQ+1 [2]-12; Diplomacy (H) IQ-1 [2]-10; Merchant (A) IQ [2]-11; Research/TL (A) IQ [2]-11; Speed-Reading (A) IQ [2]-11; Writing (A) IQ [2]-11.

Background Skills: Area Knowledge (E) IQ [1]-11, Savoir-Faire (E) IQ [1]-11, and select two skills from: Carousing (E) HT [1]-10; Driving/TL (A) DX-1 [1]-9; Fast-Talk (A) IQ-1 [1]-10; First Aid/TL (E) IQ [1]-11; Hobby Skill (E) IQ [1]-11 or DX [1]-10; Intimidation (A) IQ-1 [1]-10; Law (H) IQ-2 [1]-9, or Poetry (A) IQ-1 [1]-10.

Lenses

Cleric: (+8 points) A bureaucrat in a theocracy, or a culture where literacy comes exclusively from a religious education. Add Clerical Investment [+5 points], replace Rank/1 (Administrative) with Rank/1 (Religious): add Religious Ritual (H) IQ-2 [1]-10 and Theology (H) IQ-1 [2]-10.

Military: (+11 points) This character may be a bureaucrat in a military oligarchy, a company clerk, a supply sergeant or paymaster, or even a samurai who keeps records for his daimyo. Replace Rank/1 (Administrative) with Rank/1 (Military) [+5 points]: add Savoir-Faire (Military) (E) IQ+1 [2]-12, Soldier (A) IQ [2]-11, Survival (any) (A) Per-1 [1]-10, and 4 points spent on weapon skills. Select one skill from Crewman (any) (E) IQ+1 [2]-12, and Driving/TL (any) or Riding (any), both (A) DX [2]-10.

Specialist: (+28 points) This character does administrative work within his chosen professional field -- e.g. a head nurse, a lawyer clerking for a judge, etc. Add +1 IQ [20], and select one from Architecture/TL, Merchant, or Teaching, all (A) IQ+2 [8]-13, or Computer Programming/TL, Engineer/TL, Law or Physician/TL, all (H) IQ+1 [8]-12.

Robert Sunderland, Prison Records Clerk (70 points)

Ht 5'7", Wt 130 lbs, Size Modifier 0, Age 39.

Appearance: Acne-scarred pale complexion, brown eyes, thinning brown hair.

Languages: English (Native). TL: 5. Cultural Familiarity: Homeline.

Attributes: ST 8 [-20]; DX 11 [20]; IQ 12 [40]; HT 9 [-10]. [10 points]

Secondary Characteristics: Dmg 1d-3/1d-2; BL 13; HP 8 [0]; Will 12 [0]; Per 12 [0]; FP 9 [0]; Basic Speed 5.00 [0]; Basic Move 6 [5].

Advantages and Perks: Rank (administrative)/1 [5]; Single-Minded [5]; Contact Groups (Business, Effective Skill 15, 9) [10], (Police, Effective Skill 12, 12) [10], (Street, Effective Skill 13, 9) [5]; Honest Face [1]; Less Sleep/2 [4]; Wealth, Comfortable [10].

Disadvantages and Quirks: Bad Sight (Nearsighted; Mitigator, eyeglasses, -60%) [-10], Callous [-5], Careful [-1], Dislikes most animals [-1], Greed (12)[-15], Incompetence (Sex-Appeal) [-1], Nosy [-1], Secretly collects pornography [-1], Unattractive [-5], Workaholic [-5].

Skills: Accounting (H) IQ [4]-12; Administration (A) IQ+2 [8]-14; Area Knowledge (County) (E) IQ [2]-13; Current Affairs/TL5 (Regional) (E) IQ+1 [2]-13; Diplomacy (H) IQ-2 [2]-11; Fast-Talk (A) IQ [4]-13; Guns/TL5 (Pistol) (E) DX [1]-11; Interrogation (A) IQ-1 [1]-11; Law (U.S., Criminal) (H) IQ-2 [2]-11; Merchant (A) IQ [4]-13; Photography/TL5 (A) IQ-1 [1]-11; Savoir-Faire (E) IQ [1]-12; Scrounging (E) IQ+1 [2]-13; Speed-Reading (A) IQ-1 [1]-11; Streetwise (A) IQ [4]-12; Teamster (A) IQ-2 [1]-11; Writing (A) IQ-2 [1]-11.

Robert Sunderland is a small and rather rabbit-like looking man whose humble manner, appearance, and position belie the near-absolute power that has steadily corrupted him. In 13 years as the records clerk at the state penitentiary, Sunderland has learned to manipulate the system to provide him with a comfortable income, regular sex, and a network of criminals whose services he can call upon at need.

Most of Sunderland's illegal income comes from cooking the prison's books: he is expert at inflating expenses and hiding the earnings from hiring out the chain gang as laborers. He's careful to give the warden (an alcoholic ex-gunfighter), the guards, the judges, and police a cut of the profits, and can rely on their protection. He also collects bribes from prisoners who want an early release or some extra comforts in their cells, and has turned the women's cell-block into one of the county's most profitable brothels. He will also occasionally blackmail an ex-con into providing information or favors (sexual and otherwise), but for the most part he confines his bullying to the penitentiary's inmates -- particularly attractive women, who he likes to photograph. For prisoners with money or influence, it only takes a little shuffling of the records to reduce felonies to petty misdemeanors -- or to have the wrong man sent to the gallows.

Campaign uses: Any PCs committing any sort of crime inside Sunderland's sphere of influence risk spending time in a cell: just how much time depends on how useful they can be to the clerk. Prisoners who step out of line may never leave the prison, ending their days in unmarked graves.

Other settings: Sunderland is designed for a *Deadlands* or *Old West* campaign, but bribable jailors date back at least to the time of Socrates, and may be encountered in any time and era where accountability is not sufficiently rigorous.

William Lee, Harbormaster's Clerk and Spy (125 points)

Ht 5'10", Wt 160 lbs, Size Modifier 0, Age 45.

Appearance: Tanned complexion, brown eyes, wavy dark brown hair.

Languages: English (Native), Cantonese (Native) [4], Japanese (Accented) [2], Mandarin (Accented) [2], Russian (Accented) [2]. TL: 6. Cultural Familiarity: Homeline.

Attributes: ST 11 [10]; DX 11 [20]; IQ 13 [60]; HT 10 [0]. [90 points]

Secondary Characteristics: Dmg 1d-1/1d+1; BL 26; HP 11 [0]; Will 13 [0]; Per 15 [10]; FP 10 [0]; Basic Speed 5.25 [0]; Basic Move 5 [0].

Advantages and Perks: Alcohol Tolerance [1]; Contact Group (Street, Effective Skill 12, 6) [3], Eidetic Memory [5], Language Talent [10], Rank (administrative)/1 [5].

Disadvantages and Quirks: Attentive [-1], Broad-Minded [-1], Dependents (Large family back in England) [-40], Lameness (crippled leg) [-10], Nosy [-1], Sense of Duty (Country) [-10], Uncongenial [-1].

Skills: Acting (A) IQ [2]-13; Administration (A) IQ+1 [4]-14; Area Knowledge (Large nation) (E) IQ [2]-14; Artist (Drawing) (H) IQ-2 [1]-11; Carousing (E) HT [1]-10; Cartography (A) IQ-1 [1]-13*; Current Affairs/TL6 (Regional) (E) IQ [1]-13; Detect Lies (H) IQ [4]-13; Diplomacy (H) IQ-2 [1]-11; Disguise (A) IQ [2]-13; Fast-Talk (A) IQ [2]-13; First Aid/TL6 (E) IQ [1]-13; Geography/TL6 (Political) (H) IQ+1 [8]-14; Guns/TL6 (Pistol) (E) DX+1 [2]-12, (Rifle) DX+2 [4]-13; Holdout (A) IQ [2]-13; Intelligence Analysis/TL6 (H) IQ+1 [8]-14; Interrogation (A) IQ [2]-13; Intimidation (A) IQ-1 [1]-12; Merchant (A) IQ-1 [1]-12; Photography/TL5 (A) IQ-1 [1]-12; Research/TL6 (A) IQ+1 [4]-14; Savoir-Faire (E) IQ [1]-13; Savoir-Faire (Military) (E) IQ+1 [2]-14; Scrounging (E) IQ [1]-13; Speed-Reading (A) IQ-1 [1]-12; Streetwise (A) IQ+1 [4]-14; Typing (E) IQ [1]-13; Writing (A) IQ-1 [1]-12.

* Default from Geography -2

Captain William Lee was an experienced soldier, but when his leg was shattered by a rifle bullet, he was discharged from the army and went to the nearest port to wait for a ship to take him back to England. Instead of sailing, he

accepted a position as a shipping clerk with an unpaid sideline as part-time spy.

Locals assume he's a harmless codger with a penchant for drawing and photographing seascapes and landscapes, but he has an encyclopedic knowledge of the movement of cargo through the docks -- particularly anything with military use. He mostly relies on his binoculars and memory, but also has a network of informants, and occasionally disguises himself as a local and snoops around the docks, markets and taverns when other sources of data dry up.

Campaign uses: Lee can come to the PCs' rescue if they get into trouble in his port city, provide useful information on local customs, act as an interpreter, or hire shady but resourceful characters to perform sabotage or assassination to protect British interests.

Other settings: Sunderland is designed for a *Cliffhangers* adventure set in Shanghai or Hong Kong, but can easily be relocated to any hotspot in the era, and many in the modern world or the future.

Leo Dickenson (75 points)

Ht 5'10", Wt 110 lbs, Size Modifier 0, Age 23.

Skinny, rather geeky looking human male, pale complexion, dark green eyes, shoulder-length black hair usually tied in a ponytail.

Languages: English (Native). TL: 8. Cultural Familiarity: Homeline.

Attributes: ST 9 [-10]; DX 10 [0]; IQ 13 [60]; HT 9 [-10]. [40 points]

Secondary Characteristics: Dmg 1d-2/1d-1; BL 16; HP 9 [0]; Will 13 [0]; Per 15 [10]; FP 10 [0]; Basic Speed 5.00 [0]; Basic Move 5 [0].

Advantages: Contact Group (Fellow clerks, Effective Skill 15, 9 or less, Usually Reliable) [20], Eidetic Memory [10], Honest Face [1], Illuminated [15], Rank (administrative)/1 [5], Wild Talent/1 (Mental only, -20%) [16].

Disadvantages: Attentive [-1], Bad Sight (Nearsighted, wears contact lenses -60%) [-10], Broad-Minded [-1], Curious (6) [-10], Likes Goth fashions and women, but dislikes the music [-1], Imaginative [-1], Incompetence (Merchant) [-1], Skinny [-5], Weirdness Magnet [-15].

Skills: Administration (A) IQ+1 [4]-14, Area Knowledge (Washington D.C.) (E) IQ+1 [2]-14, Cartography (A) IQ-1 [1*]-12, Computer Operation/TL (E) IQ+2 [4]-15, Current Affairs/TL8 (Politics) (E) IQ+1 [2]-14, Diplomacy (H) IQ-2 [1]-11, Driving/TL8 (Motorcycle) (A) DX [1]-9, Expert Skill (Conspiracy Theory) (H) IQ [4]-13, Geography (Political) (H) IQ [4]-13, History (H) IQ-2 [2]-11, Literature (H) IQ-3 [1]-10, Photography/TL8 (A) IQ-1 [1]-12, Professional Skill (Librarian) (A) IQ [2]-13, Research/TL8 (A) IQ [2]-13, Savoir-Faire (E) IQ [1]-13, Scrounging (E) IQ+1 [2]-14, Speed-Reading (A) IQ-1 [1]-12.

* Default from Geography -2

Leo Dickenson was an above-average student who was never able to pick a specialization and stick with it for more than a day. During summer break, he took a vacation job clerking in the Library of Congress, and never returned to college.

His job may seem tedious to some, but Leo has always loved books, and maps, and facts, and has no particular ambition other than being allowed to read as much as he likes on any subject. So far, so boring... except that he knows what many of Washington's most influential thinkers are reading, and what maps they're looking at. His Wild Talent enables him to perform remarkable feats of Computer Hacking, Cryptanalysis, Intelligence Analysis and Psychology, as well as understanding written languages. He uses scraps of mostly unclassified data to form a picture of the web of competing conspiracies that dominate the USA and even the world. He rarely volunteers information unless he's asked the right question, but he knows who killed the Kennedys, and why, and much of what is in Warehouse 23, and where.

He could even draw you a map. Of course, as he readily admits, he can't prove any of it...

Campaign uses: Leo is intended as an Ally in a modern-day Illuminated campaign, an easy way for the GM to give the PCs vital (but incomplete and unconfirmed) information when their own research methods fail. Leo's wild ability to second-guess the details of any plan would also make him a dangerous addition to a group of enemies...

Other settings: Someone like Leo might be found working in a library or records office in any literate culture; figures such as Adam Weishaupt or Cardinal Richelieu would have been very glad to employ him as a clerk, possibly locking him away in a book-lined labyrinth.

Aaron Forrest (70 points)

Ht 5'9", Wt 145 lbs, Size Modifier 0, Age 26.

Appearance: Brown skin, brown eyes, short black hair, thin mustache.

Languages: English (Native). TL: 9. Cultural Familiarities: Steel (p.B528) Zone Washington.

Attributes: ST 10 [0]; DX 10 [0]; IQ 11 [20]; HT 10 [0]. [20 points]

Secondary Characteristics: Dmg 1d-2/1d; BL 20; HP 10 [0]; Will 12 [5]; Per 11 [0]; FP 10 [0]; Basic Speed 5.00 [0]; Basic Move 5 [0].

Advantages: Contact Group (Protectorate clerks, Effective Skill 15, 9 or less, Usually Reliable) [20], Eidetic Memory [5], Lightning Calculator [2], Rank (administrative)/1 [5], Single-Minded [5].

Disadvantages and Quirks: Callous [-5], Careful [-1], Chauvinistic [-1], Lecherousness (12) [-15], Likes short women [-1], Proud [-1], Staid [-1], Workaholic [-5].

Skills: Accounting (H) IQ [2]-10; Acting (A) IQ-1 [1]-10; Administration (A) IQ+3 [12]-14; Area Knowledge (Zone Washington) (E) IQ [2]-12; Boxing (A) DX [2]-10; Computer Operation/TL9 (E) IQ+2 [4]-13; Current Affairs/TL9 (E) IQ [1]-11; Driving/TL9 (Automobile) (A) DX [2]-10; Electronics Operation/TL9 (Security) (A) IQ [1]-10; Guns/TL9 (Pistol) (E) DX [1]-10; Intimidation (A) Will [1]-11; Research/TL (A) IQ [2]-11; Savoir-Faire (E) IQ [1]-11; Scrounging (E) IQ+1 [2]-12; Sex Appeal (A) HT-1 [1]-9; Speed-Reading (A) IQ [1]-10.

Aaron Forrest is a mid-level clerk in the Washington Protectorate's Department of Transport in the Steel parallel. A fourth-generation office worker, he was trained from early childhood for a lifetime in the bureaucracy, assigned to his job by the Department of Labor's AI, and quickly promoted. He is an efficient worker, but best of all (from the Zonemind's point of view, at least), he is completely untroubled by any sense of compassion. He can issue orders to send people to a slave labor camp or a gas chamber as easily as he can fill out a requisition for truck tires.

Aaron is essentially law-abiding, has little interest in wealth, and will not jeopardize his career by accepting bribes. He does, however, have a weakness of which the Zonemind is unaware: he will go out of his way to help anyone to whom he has an Excellent reaction. Those he favors are always female of attractive or better appearance; Charisma, Voice, and a good roll vs. Sex-Appeal can also help. A woman who actually seduces him, or allows herself to be seduced, will get a further +1 to +3 bonus to later reaction rolls, but Aaron will try to save the life of any woman who he falls for, even if it means never seeing her again. He's unlikely to break the law to help any woman's male friends, but he isn't particularly jealous and won't go far out of his way to have one killed or removed.

Campaign uses: Aaron can be very useful to PCs when in Steel, being able to get them onto a transport to anywhere in Zone Washington or Zone Denver. He can easily provide letters of transit and other papers, as well as schedules for government vehicles that characters can stow away on. He may also be able to give confiscated vehicles or spare parts to the PCs, find out passwords for Protectorate installations, tell them when and on what routes supplies are being shipped to Protectorate forces, or even get prisoners transported out of secure camps in less-secure vehicles that PCs

can then hijack -- though doing something of this magnitude may require bribes or favors for fellow bureaucrats, which PCs may have to assist with.

Other settings: Characters such as Aaron may be encountered in any bureaucracy, and will be common in totalitarian societies where such positions are carefully screened for the right degree of callousness (such as the Reich parallels).

Vondra Glaze (50 points)

Ht 5'4", Wt 105 lbs, Size Modifier 0, Age 29.

Human female, average looks, pale complexion, hazel eyes, ash-blond hair cut short.

Languages: Anglic (Native). TL: 10. Cultural Familiarity: Sector.

Attributes: ST 9 [-10]; DX 10 [0]; IQ 11 [20]; HT 10 [0]. [10 points]

Secondary Characteristics: Dmg 1d-2/1d-1; BL 16; HP 9 [0]; Will 11 [0]; Per 13 [10]; FP 10 [0]; Basic Speed 5.00 [0]; Basic Move 5 [0].

Advantages: Cultural Adaptability [10], Legal Enforcement Powers [5], Rank (administrative)/2 [10], Single-Minded [5].

Disadvantages and Quirks: Bully (15) [-5], Careful [-1], Delusions (Believes she has Danger Sense) [-1], Devout Christian [-1], Incompetence (Sex-Appeal) [-1], Intolerance [-10], Paranoia [-10], Stubbornness [-5], Uncongenial [-1].

Skills: Administration (A) IQ+2 [8]-13; Area Knowledge (Sector) (E) IQ [1]-12; Beam Weapons/TL10 (Pistol) (E) DX [1]-10; Body Language (A) Per [2]-13; Computer Operation/TL10 (E) IQ+2 [4]-13; Current Affairs/TL10 (Headline News) (E) IQ [2]-12; First Aid/TL10 (E) IQ [1]-11; Freight Handling (A) IQ-1 [1]-10; Hazardous Materials/TL10 (Biological) (A) IQ [2]-11, (Chemical, Radioactive, Nanotech) [1 each]-10; Holdout (A) IQ-1 [1]-10; Interrogation (A) IQ [2]-11; Intimidation (A) Will [2]-11; Law (Customs and Immigration) (H) IQ-1 [4]-11; Research/TL10 (A) IQ-1 [1]-10; Savoir-Faire (E) IQ [1]-11; Scrounging (E) IQ+1 [2]-12; Search (A) Per+1 [4]-14; Smuggling (A) IQ [2]-11; Streetwise (A) IQ [2]-11.

Vondra Glaze was five years old when her parents were killed by a terrorist bomb on the monorail they caught every day. She was raised in a series of foster homes, but never completely trusted anyone else again. After finishing her schooling, she applied for a job in the Imperial Bureaucracy. When a vacancy came up at Talos's Class I Starport, a post where she would be working alone except for a few robots, she was the only applicant with enough experience to be considered suitable.

Vondra's lack of social graces doesn't prevent her doing her job as a Customs and Immigration officer with remarkable efficiency -- most of the time. The problems occur when she mistakes her paranoid suspicions about strangers for genuine insight. If she has a bad or worse reaction to a visitor from offworld, she is likely to use all her powers to make sure they're not smuggling drugs or other contraband, planning a terrorist attack, etc. Her powers of search and seizure enable her to confine any visitor to the starport's detention center until the next ship leaves, or to have a ship's cargo searched as thoroughly (and slowly) as she wants before it is discharged. This may be inconvenient and extremely expensive for ship-owners, and many of them decide that Talos is not worth the trouble. If Vondra catches someone who really is trying to smuggle anything through customs (or, worse still, themselves through passport control), she will call the security robots and demand the smuggler's arrest -- which may result in fining, imprisonment, or psycho-surgery. As she has no superiors on the planet, her unfortunate victims can only try to appeal to authorities on the sector capital, several weeks flight away.

Campaign uses: The paranoid and intolerant Vondra will usually have a very bad or worse reaction to at least one PC who passes through her domain and will find an excuse to have them confined, searched, scanned, and interrogated by

the local police. If the other PCs try to help them, they may also be subjected to Vondra's bullying.

Other settings: Someone like Vondra might be encountered in any small port, airport, or border crossing, especially in a repressive society.

Adventure Seeds

Roadkill (*Deadlands*): The PCs hear a rumor that a chain gang from the state penitentiary has disappeared while repairing a road in the desert, along with their guards. When the posse turns up at the prison, the warden is too drunk to see them, and only Sunderland will listen. He's secretly unhappy that people have apparently escaped without paying him, and may consider hiring the posse to replace the guards. If not, the PCs will be arrested shortly after their return to town, and if they don't persuade Sunderland to release them, they'll eventually put on the chain gang themselves and have to deal with whatever ate the previous team.

Chinese Take-Out (*Cliffhangers/Martial Arts*): When Leo Dickenson becomes convinced that he's discovered the location of the treasure-filled tomb of a Manchu emperor, he tries to persuade the PCs to accompany him on an expedition to discover it. When they arrive in Shanghai, though, Dickenson and the PCs are robbed of most of their belongings. William Lee learns where their gear is probably being kept, but warns them that the storeroom is outside the International Settlement and guarded by very dangerous hatchetmen. He tells them they can get some guns from the bodyguards of a visiting warlord: all they have to do is gain their trust and beat them in a dice game, a drinking game, or a no-holds-barred bar brawl. And while they're at it, there's a \$10,000 bounty for the warlord's head, if they can bring it back to the Settlement intact.

Transportation for Life (*Reign of Steel*): Friends of the PCs have been smuggling refugees and contraband into Zone Washington on the Protectorate's robot aircraft -- but they discover, to their horror, that one of them has lost a cell phone which can lead the FBI to the PCs and other resistance members, and it may have been left in an aircraft's cargo bay. The PCs will need to enlist Aaron Forrest's help to locate the aircraft, and to get into the hangar to search for the phone. To complicate matters, Aaron is fixated on a beautiful woman who works in his office -- who is actually a Lilith-model android planted by the FBI to search for a suspected traitor in the Department.

Losing your Appeal (*Space/Traveller*): The PCs come to Talos with a cargo including medical wonder-drugs that also have value on the black market. Vondra Glaze takes an immediate dislike to one of them (Very Bad reaction), but is attracted to another (Good reaction). The PCs have 16 hours to win her over without making her too suspicious. If they can increase her average reaction to 13+, they can sell their cargo the next day; if it's 10-12, they have the choice of leaving the planet without selling the drugs, or waiting a day (and paying any docking fee) and trying again; if it's 7-9, they can leave, or try again with a -1 modifier; if it's 6 or less, Vondra will confiscate their cargo and their ship and have them sent to jail to await trial -- assuming the corrupt records clerk doesn't cause them to disappear into the organ banks and blame it on an administrative error.

A Date With History: June 15, 1904

By Christopher J. Burke

June 15, 1904 started as just another Wednesday morning in New York City. It would end with the worst maritime disaster in the city's history, the deadliest in peacetime in America. More than 1,000 people would die before noon on the *General Slocum* on a cruise to Long Island.

The *General Slocum* tragedy began on the Lower East Side of Manhattan in the neighborhood that used to be called Little Germany, home to much of the city's immigrant German population. Each year, St. Mark's Lutheran Church held an outing to celebrate the end of the Sunday school year. On June 15, 1904, more than 1,300 people boarded the *General Slocum* for a day of swimming, games, and food at Locust Grove, Long Island. The exact number is unknown: two young infants may have been counted as one passenger, three children may have been counted as two passengers. What is known is that the passengers were mostly women and children because most of the men of the community were at work.

Nothing seemed out of the ordinary about the boat or the captain. The *General Slocum* had been built in 1891 as a ferry boat and had recently passed inspection. She was 264 feet long with a large paddlewheel on each side, weighed 1,300 tons and could carry 2,500 passengers. Capt. William van Schaick, age 68, was an experienced pilot with an unblemished safety record after having ferried over a million passengers in his career. Likewise, his officers were experienced with excellent credentials.

Around 9:30 a.m., the *General Slocum* cast off from the East Third Street pier and steamed northward up the East River, toward Long Island Sound. Its three decks were filled with women and children enjoying the sights of the river and the cool breeze.

A short time later, disaster struck. A young boy noticed smoke coming from the ship's utility room. A crewman spotted him and chased him away. Apparently, a spark in the room had lit some hay on the floor, which had begun smoldering. Unfortunately, although the ship's officers were well-trained, the same could not be said for her crew, many of whom were more likely to be day laborers. One such laborer, John Coakley, had been on the job for only 17 days. He also had been enjoying his first beer of the morning when he yanked open the door. The sudden influx of oxygen turned a spark into an inferno. The fire spread in minutes.

The boy ran through the ship alerting the passengers to the fire. Captain Van Schaick shooed the boy away from the bridge without listening. The crew didn't inform the captain of the fire until 10 minutes had passed.

A Series of Unfortunate Events

If that had been the only mistake made perhaps most of those on board could have been saved. However, many factors combined with the panic to create a perfect storm of fire and chaos.

Although the ship had recently passed inspection, the boat should have failed on many counts. That the inspector had been bribed to look the other way is the obvious conclusion. At the time, no one had thought much about it. Given the captain's safety record, he might have been complacent about safety at any rate.

The old fire hoses had rotted and couldn't handle the water pressure. When the water was turned on, they burst apart.

The life jackets had long passed their expiration dates. Many crumbled to dust when they were grabbed. Those that were "usable" had the consistency of a bag of concrete. Many parents strapped jackets onto their children and sent them into the water hoping to save them, but drowning them instead.

The lifeboats on board could not be lowered. At some prior time, the constant swaying of the boats caused a problem,

so they were wired into place. People frantically clawed at them to no avail.

Furthermore, even if the boats could be detached, they couldn't be lowered into the East River due to the decision of the captain. Instead of pulling into port on either side of the river, Captain Van Schaick went full speed ahead to North Brother Island with intent to beach the *General Slocum*. At that speed, lowering the boats would have been impossible. The speed fanned the flames, spreading the blaze, which was further accelerated by fresh coat of highly flammable paint.

Many of the passengers saw no choice but to jump into the river. Those that did, did not survive long. The fire occurred just after the ship passed through a notorious area known as Hell Gate where the Harlem River, the East River, and Long Island Sound come together. The water moves with a strong, swift current that could drown a good swimmer. Because the passengers were mostly poor immigrants, they didn't swim recreationally. As a result, they couldn't stay above the surface for very long before the weight of their water-soaked clothing -- wool suits or long woolen skirts -- dragged them down.

Heroes and Villains

Although piers lined both sides of the river, Captain Van Schaick chose not to pull into port out of fear that the fire would spread to the other ships, oil tanks, or lumber yards. However, that didn't stop many ships from setting off after the *General Slocum* to render aid and to pull survivors out of the rough waters. One tug, piloted by Jack Wade, even pulled up alongside the burning vessel, rescuing over 100 passengers. Wade knew his boat and his livelihood were both in danger, fully exposed to the flames, but pressed on anyway.

When the ship beached at North Brother Island, it was nearly completely engulfed in flames, and the portion that wasn't was still 200 feet in the water. Help quickly came from the island's residents: nurses and patients at the island's contagious disease hospital (once home to Typhoid Mary). They caught children that were dropped to them. They swam into the water at risk to their own safety to bring people ashore. They grabbed ladders being used for renovations to reach passengers in the water and on board the ship. All who could be saved were quickly removed from the ship.

However, not everyone who raced into the water had charitable motives, nor did all those that were in a position to lend assistance do so. There were reports of extortionists demanding payment before pulling people out of the water -- and then pushing them back into the water. Scavengers moved among the dead, removing jewelry. In the cases of some of the badly burned victims, this also meant removing the only means relatives might have had of identifying them.

Historical Roleplaying

Although the above events as they unfolded would be enough to drive any PC to scream "Killer GM!," the entire scenario can be transported to any ferry ride, whether in a Victorian-era setting or even (with some modifications) out into deep space, wherever the GM needs a case of everything that can go wrong will. (After all, if these events actually happened this way, the players can't really complain . . . much.)

With so many circumstances that had to line up to cause such a disaster, could anyone predict how changing just one thing could alter the tragic results? Wednesday, June 15, 1904 can be the focal point for a time travel adventure, with the team racing back to make sure events happen just as they are supposed to, with the ship reaching the island and all the survivors reaching safety.

Every child saved represents an entire lineage of future generations. Every piece of jewelry stolen or recovered has some history to it. However, if saving life or property make for too boring an adventure, a rival group of time travelers seeking to prevent the fire could have more significant historical consequences.

Tragedy serves as a catalyst for reform and the *General Slocum* was no exception. The fire caused changes in both safety regulations and the required inspections. If those reforms hadn't taken place, who knows what disaster would have occurred in the intervening years between that fateful date of June 15, 1904 and April 10, 1912, when the *Titanic*

sank, ushering in another set of reforms? Would it have been worse? Would it have involved the privileged, upper class rather than working class immigrants? Many "what ifs" can be played out.

And what about the people? The greatest damage done that day was to the immigrant German community. Many lost entire families, and some widowed men committed suicide in the days afterward. The memories were so painful that many moved away, dispersing themselves among the city's population. Ten years later, public opinion toward the Germans changed dramatically with the dawn of the First World War.

But what might've happened had Coakley not opened that door? What if *Kleindeutschland* had survived and flourished? By the beginning of the 20th century, the families of the original immigrants had already established themselves, many becoming shopkeepers and businessmen. Would it be a stretch to see them becoming active in local politics? How would they have reacted to anti-German sentiments? How would the rest of Manhattan react toward them? Could the nation's largest city have shaped national opinion?

Had the community grown in strength, how could they have affected our entry into World War II? Would German reporters working for the major newspapers have slanted their stories differently? Could they have become spies for Hitler? Would questions about their allegiances have forced them into internment camps in the wilds of New Jersey?

Only that *other* team of time travelers can tell you for sure.

Forgotten History

Today, the incident has largely been forgotten. It's remembered annually at a wreath-laying ceremony that is sparsely attended. The St. Mark's building is still standing, but it has ceased to be an active Lutheran Church. The last two survivors of the *General Slocum* lived to see the 21st century. Catherine Connelly, 12 years old at the time of the disaster, died in 2002 at age 109. Adella Wotherspoon, a baby at the time, died in 2004 age at 100.

Pyramid Pick

Classic Battletech: War of 3039

Published by FanPro LLC

Written by Chris Hartford & Christoffer Trossen

Illustrated by Klaus Scherwinski, Jason Vargas, Kevin McCann, Chris Lewis, & Matt Plog

Maps by Oystein Tvedten

168-page b&w softcover; \$29.99

War of 3039 has been a long-awaited product in the **Classic Battletech** universe; now that it's here, I can honestly say it was worth the wait. As a **Classic Battletech** player of many years, I can honestly say that this was a gap that needed to be filled in the history of the game. Sadly, this fairly pivotal event was relegated to a single chapter in the **20 Year Update** and a few chapters in the novel *Heir of the Dragon*. All in all -- 3039, like many of the Battletech conflicts in the timeline 3030-3050 -- were relegated to obscurity, but with 3039, and the promised books in the Historicals series to come after it, that is no more.

What made this project so daunting was the fact that the work that needed to be done to pull this book together was culled from a variety of sources, and with a lot of **Battletech** canon, at times, the information was quite contradictory. The Fanpro creators, however, rose to the task.

So, what's in the book? One finds a format similar to the **Fedcom Civil War** book, in that each wave is broken down into chapters and each planet gets at least a couple of paragraphs to describe the course of the fighting on world. It also describes the "shadow war" and the reactions of the other powers in the **Battletech** universe. Sidebars and "editors notes" add color to what might have been a bland retelling of the "facts. Also included are rules for Level 2 (or Star League) prototype technology just coming on line in 3039 and seeing field-testing for the first time. Also included are rules for the new **Battletech** strategic game found in the **Combat Operations Handbook** describing how one can re-fight the War of 3039 on the strategic level, a boon to many players, whether or not they actually decide to do so. It also has unit charts so one can roll up simple Battletech scenarios set during the period as well. In short, the uses for the book in scenario development and play are staggering and the book quality is setting a new standard for **Battletech** products. It more than lives up to its promise of "allowing players to replay every laser shot and autocannon blast."

What I liked about *War of 3039* was that it did its job admirably, and coupled with the beautiful maps from Mr. Tvedten, we have a nice product that details a war that for many years, was a historical "blank spot" in the **Battletech** universe. The complaints I have are small; some planetary write-ups like the ones in the back of the Fedcom Civil War sourcebook would have been nice. Another point is that in the annex for the Strategic game, it might have been nice if the writers let people know how they had come to the unit ratings they did. Yes, the rules are in **Combat Operations**, but the actual unit breakdowns might have been nice. Also, some of the art did not match the fiction and in particular, in the section describing the various personalities of the period, Hanse Davion looks nothing like his fictional descriptions, a minor nitpick, to be sure, but noticeable.

Another nitpick is in the material presented on Nondi Steiner; considering what she became later on in the game history, one wonders how she got there from the character she is portrayed as in 3039.

In terms of game enhancement, the product more than accomplishes its mission. It gives the Battletech player a new era to play in. The source material alone is enough to generate thousands of scenarios for the **Combat Operations Strategic Game**, **Classic Battletech**, **Aerotech 2** and the **Classic Battletech RPG**. With the rules for the prototype Level 2 equipment and for creating forces for 3039, it allows players to delve into a period that was barely mentioned by canon before. As a **Classic Battletech** fanatic, it's nice to see this part of **Battletech** history finally get its day in the sun.

Another reason to buy this is because it is the first in a set of "Historicals" series that Fanpro is intending on publishing to fill in the gaps of **Battletech** history; other titles will cover the Andurien Rebellion, the Clan retaking of the Pentagon worlds, and the Star League Liberation of Terra. If **War of 3039** is any clue to the level of detail and effort that is going to go into these books, then I can't wait for the rest.

--Jason Reade Weiser

Pyramid Review

RoboRally

Published by [Avalon Hill](#)

Designed by Richard Garfield

Edited by Darla Kennerud

Art, graphics by Peter Whitley, Peter Bergting, Bob Carasca, & Jennifer Lathrop

Full-color boxed game with two-sided docking bay board, eight prepainted plastic robots, four two-sided factory floor boards, two factory floor guides, rulebook/course manual, eight program sheets, 30-second sand timer, 26 option cards, eight plastic flags, 84 program cards, and various tokens; \$49.95

If gaming follows trends, this is the year of the reprint, and not just new versions of any old game. This seems to be a summer (and a fall, and . . .) full of hard-to-find favorites making a comeback. Fantasy Flight has already pumped out a new version of *Arkham Horror*, they're planning a couple of new-old Games Workshop classics (*Warrior Knights*, *Fury of Dracula*), plus Avalon Hill's *Britannia*. Avalon Hill, on the other hand, is finally filling the *RoboRally* void we've had for the last seven years or so.

Richard Garfield's *Magic: The Gathering* star was still on the rise when Wizards of the Coast cranked this gem out. Robots raced around a deadly factory floor per their programming. Cards chosen at the beginning of each turn decided when you'd turn, move, or back up, and hopefully the various gears and conveyor belts surrounding you carried you where you wanted to go. The boards (which fit together in near-endless configurations for each game) also had perils to avoid such as open pits and laser beams, and if robots crossed paths, they could push each other a square or three off course, changing where his cards took him. Tagging numbered flags scattered about the playing field first won you the game.

Supplements were spawned, but when production stopped, prices at auction sites and conventions went through the roof, often to the tune of hundreds of dollars. Has the new version filled the hole?

You get fewer boards, but more selection; what was six pieces is now only four, but these boards are double sided (choose the four you'll use, or buy another set). Some are near-identical recreations of the original boards, but there are a few originals. Spin Zone moves and rotates robots a lot; the edges of the Vault make it a task to reach the repair-heavy center; and Chess is a rather clever checkerboard of conveyor belts. The formidable and dreaded Pit Maze and Cannery Row are gone -- in fact, crushers (board elements that snap shut and smush hapless robots) are missing from the new set entirely. The conveyor-heavy Maelstrom remains, so you're not getting off light. The boards themselves aren't mounted like they used to be . . . indeed, you punch them out like the counters. They're not cheesy, but they aren't as high a quality, either.

Option cards give you gear to change your offensive, defensive, and movement choices. You still get 26 of them, though for whatever reason two of the simplest -- the shield (reduces damage) and the turret (choose which way your weapon points) -- are gone, replaced by the more involved dual processor (use two movement cards) and crab legs (move sideways) from the [Armed and Dangerous](#) supplement.

Like the boards, the rest of the components diverge from the quality of the original. All the cards seem oh-so-slightly thinner, and the first **RoboRally** couldn't really afford any less stock. On the other hand, the counters (for tracking damage, etc.) are, if not tougher, at least better, easier to grasp than the tiny ones one once dealt with. On the gripping hand, you get plastic flags (eight now, instead of six, and a sheet of stickers). The old flat counters with printed flags weren't awful, but it's hard not to love these three-dimensional Day-Glo devices as they sit atop the board. Waiting for slow-pokes to finish programming their robot is no trouble if you use the new (pretty accurate at 30 seconds) sand timer to prod them into action.

A few robot miniatures are different, if it matters, but selection aside, the good news is the pieces are better. They're only plastic this time, not metal, but there's no mistaking which direction they face: Each robot's permanently affixed base is shaped like a pointed egg. They claim the robots are painted, but if so they're "painted" metallic, so the finish makes them all look rather alike at a glance. Everyone gets a "powered down" counter (to indicate you're going inactive to repair damage), but if you're destroyed, virtual archive copies are a thing of the past. Once upon a time you started as a flat counter (everyone had to fit on the same starting space, after all), but now these only mark which important board element you last touched. The game begins on a docking bay board (also with two sides, and thus two setups -- it matches the style of the playing boards), but destroyed robot miniatures are just set on the board according to new rules. Not as logical, but this way there's not an unwieldy stack of counters falling over.

One of the biggest additions is the course manual. This is a big selection of predetermined track layouts, rated for number of players (or teams, another new option), difficulty, and length. This is good for those who need a little guidance so their evening doesn't run into overtime, but it's almost two-thirds of the fancy, full-color rulebook. A couple of the maps use extra boards, requiring multiple **RoboRally** sets. Some have special rules, so instead of just tagging flags, you may have to capture them, be the last team to have touched all of them, or play tag while touching them (only the robot who's "it" can score a flag). Or maybe you'll forgo flags altogether and just beat the living gears out of the opposition. Overall it's a useful tool, and with a page of tips on how to develop your own effective tracks at the end, its utility is open-ended.

Although the original **RoboRally** had a lot of physical quality built in, the revamp makes some small but shrewd improvements. While the quality isn't up to the standards of the original (and it would be nice to hear more about what else the company has planned, though supplements may be contingent on how well this release does), it's not terrible, and being 10 bucks more expensive than the original cover price is a lot more digestible than online auction prices.

--Andy Vetromile

Pyramid Review

Cthulhu Rising: Call of Cthulhu Roleplaying In The 23rd Century (for call of Cthulhu)

Published by [Chaosium, Inc.](#)

Written by John Ossoway

Illustrated by Ben Thornley

62-page tape bound black and white book; \$15

Outside of a single scenario in the anthology *Strange Aeons*, no official scenario or supplement has projected the setting of Chaosium's *Call of Cthulhu* seen in its campaigns and anthologies beyond the very early 21st century. Only the eventual printing of Michael LaBossiere's *End Times* as a MULA (Miskatonic University Library Association) title has our future with regard to the Mythos been explored in any depth, the sourcebook positing a future in which Mythos elements have triumphed on Earth and forced mankind into exile on Mars. But perhaps a brace of magazine scenarios and now the latest in the MULA series suggests a more benign, less traumatic future. For the last five years John Ossoway has been creating a near future setting in which mankind unknowingly transports earthbound Mythos elements to the stars, while encountering other elements out there.

More extensively presented at his [website](#), John Ossoway's *Cthulhu Rising: Call of Cthulhu Roleplaying In The 23rd Century* provides some of the information presented therein in a handier package. In the 23rd Century, mankind has explored hundreds of star systems and settled approximately 100 of them in a 50 light-year radius along five distant arms. Colonies are founded in co-operative efforts between the five power blocs that dominate the United Earth Federation and the mega-corporations, some of whom are powerful enough to own colonies outright. With Earth still overcrowded, there is a strong desire among its populace to emigrate, but both the Interstellar Colonial Authority (ICA) and the Interstellar Trade Commission (ITC) strictly control the flow of humanity to the stars.

Security is provided by the United Earth Armed Forces in the Core systems, and by the Colonial Security Corps and the Interstellar Colonial Marine Corps (ICM). The ICM is a rapid deployment force, established to mobilize quickly and be sent out to settle military disputes in the colonies. The frequency of their deployment has substantially increased in the last 15 years or so in the wake of the Russian Civil War; colonies in the Outer Rim, dismayed at their failed petitions for greater autonomy, openly rebelled. Only via the intervention and negotiating skills of the Chrislamic Church has a ceasefire been agreed and now, a decade on in 2271, an uneasy peace continues.

A character in *Cthulhu Rising* is little different to an investigator of the 1920s or 2000s, though he possesses more skill points, representing his background, his occupation, and his personal interests. The wide range of listed occupations reflects the UEF requirement that every student either continues his education at university or takes the Federal Orientation Test and enters Federal Service for three years. All of the new occupations and skills are what you would expect of a near future science fiction setting, except for the inclusion of psionics.

Psionics have been a proven fact since 2112, their use being closely monitored, with there being psionic branches in law enforcement and the military. The Psychic Ability scale is rated from P1 (equal to a POW of 10) to P12 (equal to POW 21) and a minimum rating is needed for the game's various abilities. These are divided into four talent groups -- Telepathy, Precognition, Adjustment (the manipulation of the body), and Animation (Telekinesis). The various abilities are also skills, a character receiving points to assign to them in addition to his other skills.

Mechanically, ***Cthulhu Rising*** employs Chaosium's Basic Roleplay System, but adds to the simple version of ***Call of Cthulhu*** various elements from ***RuneQuest III***. These include the skill bonuses derived from primary attributes, hit locations, and the Strike Rank initiative rules.

Cthulhu Rising is split into two parts, the first covering the setting, the second the rules. The latter also includes an extensive list of personal equipment in addition to the details on character generation and psionics. The former concentrates primarily on the human state of affairs in 2271 rather than the state of the Mythos. This receives just four pages, including a timeline, and details of notable organizations. For example: the deep ones and its associated Cult of Cthulhu have spread beyond Earth to various water worlds, while the Earth Isolationists are in secret a cult of Shub-Niggurath worshippers. Organizations such as the Illuminati and the Freemasons, archenemies both, suggest a broader scope to the setting, as well as the greater influence of pop culture sci-fi and conspiracy theory.

The influences upon ***Cthulhu Rising*** are obvious and -- in many cases -- acknowledged. Primarily the influences are the film *Aliens* and the various extensions of the franchise, including William Gibson's script for *Alien3* and the *Colonial Marines Technical Manual*. Others include *Babylon 5*, GDW's near-future RPG ***2300AD***, and the works of both Harry Harrison and Philip K. Dick.

The result of this m lange of influences is an easily digested near-future science fiction setting that fits perfectly against a background of cosmic horror. But the influences may well prove to be a problem if Chaosium wants to bring ***Cthulhu Rising*** to full publication and distribution, as they are perhaps *too* obvious and derivative.

Addressing such a problem is far from insurmountable, but ***Cthulhu Rising*** has another problem in its current form. It is not a complete sourcebook for the Mythos in the 23rd century, since the book contains a number of omissions. There is no advice for the Keeper, or any scenarios, and the guide to the Mythos in 2271 is very much a primer upon the subject. This is a shame, because the author's website devoted to the setting promises much more. It includes the background, but also several scenarios that make up a campaign run along dual strands. In one, the players take the roles of military characters serving in the ICM, while in the second the characters are civilians, scientists, colonists, corporate officers, and so on.

What you have in ***Cthulhu Rising*** is not so much a complete campaign setting, but more the players' handbook for it. Purchasers looking for more will be disappointed, but at least they will be able to find what they need on the author's website. It is a pity though that Chaosium could not have given the author room to develop and showcase the ***Cthulhu Rising*** setting more effectively. A simple matter of doubling the page count and increasing the cost by another \$5, and ***Cthulhu Rising: Call of Cthulhu Roleplaying In The 23rd Century*** could well have been one of the best MULA titles to date: a nicely realized fan written setting made available to a wider audience in book format.

--Matthew Pook

Going Home (or Anywhere Else) Again

This week I'm editing the issue (and writing this column) on the road from exotic Orlando, Florida, home of the eleventy-jillionth World Yo-Yo Contest.

I was called here by my former boss who runs the event. Apparently I made a good impression, having been a none-too-small part of the past five contests, and he wanted someone around he could count on.

(When asked about why I came back, since everyone -- correctly -- believed me to be living 600 miles away now -- my running joke has been the *Godfather III* reference about trying to escape the Mafia: "Just when I think I'm out, they keep pulling me back in!")

Anyway, this has been an interesting experience. I haven't had much contact with these circles since I moved away . . . the friends and former coworkers I left from my former job, nor the yo-yoing community that one keeps abreast of via osmosis when one is surrounded by it.

Naturally, all this led me to wondering about the gaming applications.

See, the interesting thing about being called back to someplace after a long-ish period of time -- especially if it's a place you used to be closely tied to -- is that you simultaneously have a history with these folks and yet there's so much you *don't* know. I suspect it's why the High School Reunion party is so common a theme in murder mystery stories; the main character immediately knows who these people *were*, but not who they *are*.

Thus I discovered that one of my acquaintances was in a car accident in January and had one of her vertebrae broken; she's currently in physical therapy to overcome her need for a wheelchair or crutches to walk. One of my juggling friends has lost about 50 pounds (which, given that he probably weighed about 190 originally, is a significant percentage). One of my friends couldn't attend because his first child is expected to arrive within the next month. One of my friends has been laid off in the past year, and is now doing various freelance work. One of my friends let his hair grow in a pattern such that he resembles a cast member of *Starsky & Hutch*. And so on.

In an RPG, the use of a time-spanned event -- either a recurring event such as an annual convention, or a one-time event such as a wedding or funeral -- can provide a wonderful opportunity to present little-seen characters in a "where are they now?" snapshot. Really, introducing any kind of plot or storyline to such an event is almost trivial, although it should be handled with care lest players start associating these shindigs with a big scheming plot. (On the other hand, one could probably make a memorable ongoing campaign thread about going over the top: "Okay; who's going to be murdered at the Henderson Family Reunion *this* year?")

As a minor "let me tell you about my campaign" example, in our long-running *World of Darkness Dark Ages* campaign I had my vampire PC (who, since I was GMing, became an NPC) wander off for a while, leaving the fae court he was acquaintances with to their own adventures. After a couple of decades of adventures, I had the vampire return, complete with a couple of mortal friends that all characters were familiar with. The PCs got to meet with the vampire, who hadn't aged a day, and other mortals, who all had naturally aged by a couple of decades. There, in a snapshot, I was able to portray one of the most difficult concepts about vampiric immortality that I could: The rest of the world will crumble to dust, but this one person you knew will remain the same regardless of how many decades or centuries pass.

If you haven't incorporated some kind of long-running annual (or every-so-often) event into your campaign, consider doing so, to allow for a "snapshot" of events and characters to pass through time without needing to contrive terribly much. If nothing else, it will give your CIA operative, your occultist, and your ninja PCs reason to stand around a punch bowl.

* * *

Random Thought time: One of the nice things about getting to interact with old friends is that they understand where I come from (more or less) and could appreciate my sense of humor . . . or at least fake it really well. For example, one friend and I stopped for lunch at the con support suite, and we were talking about the processed turkey lunch meat we were eating (the kind that comes flavored like ham, pastrami, bologna, apricots . . . that sort of thing). Anyway, my friend refers to the lunch meat as "Turkey *surprise!*" and we commented that it wouldn't be a very good marketing idea to play up the "surprise" aspect. After pondering, however, I remarked, "Well, what would be your alternative? 'Turkey Rut'? 'This product will taste precisely like you expect it to: no more, no less. We assure you . . . you will not be surprised in the slightest by the flavor of this food. Today, tomorrow, and for the rest of your life: enjoy the certainty.'"

I have no idea if this translates well to text, or, really, if it was particularly funny to begin with. (Lots of things seem funnier when you spend 10 hours strait working at a con.) But I knew that, even with my vaunted extrapolatory skills, I couldn't turn lunch meat commentary into a full column.

Unless I was really desperate.

--*Steven Marsh*

After-Action Report: My (Second) *Unknown Armies* Game

*"Keep a clean nose
Watch the plain clothes
You don't need a weather man
To know which way the wind blows"*
-- Bob Dylan, "Subterranean Homesick Blues"

Well, we've done [this twice](#), now, to reasonable levels of acclaim, so I think I'll do it again. Abandoning the pronouns, this is another Applied Suppressed Transmission, an example of my own RPG campaign design and practice. This time around, the campaign had a more structured "mission" approach -- no need to waste time leading the characters ever-so-slowly to the river's edge when I could just throw them in.

Our river ran for just four months this time, from April 2005 to this week. Four players and I mapped out the secret world four hours a night every Monday. Its abbreviated nature came from the outside -- one of my four players will be leaving us for law school next month, so we had to keep it short. And since he was leaving, we built the game around his preferences; he's from a military family and closely follows various arcana of international relations, plus he had heard good things about my earlier [Unknown Armies](#) game. So, a modern-day, "technothriller" sort of special-ops *Unknown Armies* game it would be. Fortunately, I knew just the folks to build it on.

"Conventional weathermen rely on data to analyze and predict. Often we are deployed in places where we can only rely on our technical skills and senses to forecast. We're not just inside a building looking at a screen and pulling data down off a system, we're out in the middle of it. . . . You'll find us walking around in the dirt, in 'nowhere land,' providing weather input . . . [and we are] often the only source of weather information in a region."
-- Major Bob Russell, USAF, 10th Combat Weather Sqdn

Weather is the ultimate symbol of the quantum information world modeled by *Unknown Armies*, from the famous "butterfly in Brazil" of chaos theory to the postmodern choose-your-own-Apocalypse of global warming to the Bob Dylan song that named a terror cult as crazy as any Greg Stolze ever invented. And as it happens, the United States Air Force has a special tactics unit with the oh-so-evocative tag of [Combat Weathermen](#). Better yet, they are the "Grey Berets." The 720th Special Tactics Group (which name has its own kind of brutalist poetry to it) have the beautifully paradoxical task of being airmen deployed on the ground, "establishing the weather" for other Special Forces operations. Note Major Russell's unconscious Heisenbergism, above; the Grey Berets are the "only source of weather information" in "nowhere land." The Grey Berets, and only the Grey Berets, get to peek inside Schrodinger's Box, and know which way the wind blows. I don't know about you, but that just screamed "campaign setup" to me.

Now, I should admit that had this been for publication, or even for a campaign that would last a year, I might well have dug more into the nitty-gritty of actual meteorology, combat and otherwise. It is my considered opinion that any suitably recondite field of study can become a metaphor for magic, from electrical engineering to non-Euclidean math. I'm sure there's plenty of High Strangeness up in the troposphere, and much occultism to be mixed in with the occluded fronts. But as it was, I decided to hit the metaphorical angle harder, and leave the climate science in the flavor text. So, having eschewed any hard work on the physics, meta- or otherwise, I did the same with the story structure and just ripped off *Planetary*.

"Go a little deeper, and you find strangeness and wonder on a planetary scale. . . . What if you could take everything old and make it new again? . . . Sometimes, ordinary people uncover things that are best left covered. Sometimes, things best left covered emerge into ordinary life and do not have the world's best interests at heart. . . . It's about, as Alan Moore put it, 'mad and beautiful ideas'; the sense of wonder, the feeling of marvellous secret things just beyond our field of vision, and the revelations and splendours and dangers and bastards tied up in it all . . ."
-- Warren Ellis, original proposal for *Planetary*

With the high concept decided -- essentially "Tom Clancy's *Planetary*" -- the basic campaign structure built itself. The players took the roles of Detachment 33 of the 10th Combat Weather Squadron, based out of Hurlburt Field in Florida. (One player, technically, played a CIA "contractor" on loan to the unit; the others were Air Force.) At the beginning of each adventure, Colonel Leverett would summon the PCs to the big building on the edge of the field, into the room with no windows and no electrical outlets, and give them a proper *Mission: Impossible* style briefing. ("Gentlemen. The spot you're looking at on the coast of Lebanon has shown an anomalous level of anticyclonic wind activity as far back as 1919. Also, no roses have grown there this spring. Check it out.") The briefing would set up the surface crisis -- terrorists, Syrians, Chinese agents, whatever -- and the PCs would drop in to find out What Was Really Going On. And that, I decided from the first, would always be Something from the statospheric, mythic past emerging (or being pulled) into the Now, with unpredictable consequences. What Warren Ellis did with *Godzilla* and Doc Savage, I wanted to do with King Solomon's Mines and the Holy Grail. I didn't really know who the overarching Bad Guys would be -- I didn't want to rip off *that* much -- so I figured I'd find out along with the players.

"Under the constellation of Pleiades, they made the image of a little Virgin with the Figure of a Lamp; it is reported to increase the light of the eyes, to assemble Spirits, to raise Winds, to reveal secret and hidden things . . . Under the wing of Corvus, they made the image of a . . . Man cloathed in black; this maketh a man cholerick, bold, couragious, full of thoughts . . . and causeth uneasy dreams; also it giveth the power of driving away evil spirits, and of gathering them together; it is profitable against the malice of Men, Devils, and Winds."
-- Heinrich Cornelius Agrippa, *Three Books of Occult Philosophy*

And from then on it was all (and is all) about the war stories. The "mission structure" game is one of the very, very easiest to run, which is probably why it's so very, very common from *Dungeons & Dragons* ("Gentlemen. The dungeon entrance you're looking at . . .") to *Call of Cthulhu* ("Gentlemen. The mutilated corpse you're not looking at . . ."). All I had to do was come up with a crisis spot somewhere in today's world (the campaign calendar always started on the same date we started the adventure, to prevent too much chance of history sneaking up on us) and then figure out something mythical to put there.

When I started the game, the Cedar Revolution in Lebanon was big news, so that was the obvious first spot. What else is in Beirut? Why, [St. George](#) and the Dragon, that's what. George's Spear is actually supposed to be in a well in Beirut now occupied by a Hezbollah madrassa, which gave me a slightly too-convenient McGuffin, and Khidr for my Dragon. I decided that the modern-day English crusader was obviously James Bond -- er, "James Grey," the Godwalker of the Knight; like Doc Brass in *Planetary*, he symbolized the "old order," trapped in the Cold War past. The PCs' goal was to recover the Spear and turn it over to the Chained Maiden -- i.e., to Lebanon, in the person of a [beautiful Lebanese revolutionary](#). The Dragon can be tamed, instead of killed. (Just in case, though, I had some evil Syrian Mukhabarat types and a Chinese agent named Lung -- "dragon" -- standing by.) By the sort of coincidence that follows me around, in Real History the Syrians pulled out of Beirut on April 23, 2005 -- St. George's Day.

The rest of the sessions ran basically the same way, albeit with fewer geopolitical repercussions in my morning paper. I'd ruminate about some country in the news, and pull a big old mythic Something out of its backyard. I put King Solomon's Mines in Great Zimbabwe, and had a Sierra Leone hand-chopping sorcerer with the Seal of Solomon allied with Robert Mugabe in trying to awaken Ayesha, [Queen of Sheba](#), and her zombie hordes. (Did you know that H. Rider Haggard knew Cecil Rhodes quite well? They had many lovely chats about vast stretches of Matabeleland that only Rhodes had traveled. And then Rhodes found all those diamonds, and was buried on the sacred mountain of the Matabele. I swear, I never need to make anything up any more.) Iran was a toughie; I almost ran an adventure starting *in media res* with the PCs pinned down by Revolutionary Guards, taking refuge in the original Paradise (Old Persian *pairadaeza*, meaning "walled enclosure, garden") and meeting the angel with a fiery sword, but it would have been all talk and no shoot. Big no-no, in gaming and in technothrillers. So I punted (I thought) to a "haunted castle fakeout" leading to a fight on the Mountain of Alamut.

In Peter Willey's *Castles of the Assassins*, I found a castle, Samiran, that now sits on an island in the middle of an artificial lake -- Tim-Powers style "tamed water." So I packed the PCs off there to reactivate an old CIA radio transmitter I made up and wait for the diversion. Thanks to some inspired roleplaying, and the fact that Samiran turns out to be even spookier than I thought, the PCs uncovered a sealed gateway into the [previous universe](#) instead. Even when I *hadn't* planted a story there, between my players and a little bisociation, it turned out that I had. (Total And

Blatant War Story Digression: Josh asks me, "So you're saying that the CIA invented a way to power a sorcerous radio transmitter by tapping the divergent potential between this universe and the previous one?" I respond, impromptu, "Of course not. They *stole* that technology from the Nazis." We *almost* started playing that prequel game, instead.)

I never needed to do much research; just come up with Bad Guys, a Dangerous Location, and a suitable **Unknown Armies** spin on an ancient legend or artifact therefrom. Most of my research doubled as visual aids; not just the photos of Samiran Castle from Willey's book, but, say, the [article on Noah's Ark](#) in *Fortean Times* #120. That got the PCs into a confrontation on the Turkish border with the Five Dragons, a *Chinese* occult special ops team that wanted to destroy the Ark to make Fa He's Ark (in the Tien Shan) the Source of Mankind and rewrite the statosphere with Eastern archetypes. The players liked the Chinese team so much as villains that I put them in the next one, leagued with Jemaah Islamiyah in Sumatra to kidnap and reprogram the next incarnation of Sindbad the Sailor. (I never did come up with a proper terrorist Bad Guy, but the jihadis made excellent mooks.) We were going to end with a good old-fashioned Grail Quest to a lost Templar castle in Kyrgyzstan, and a Dark Tower in the Aral Sea Waste Land, but time ran out on us. With no deadline, I could probably have run this game long enough to do some real weather research. As it was, between the comforting "mission plan" method, the occasional firefight to keep everyone's adrenaline flowing, and the sheer genius that is **Unknown Armies**, I barely had to lift a finger to steer. The lesson, which I re-learn every time I run a game like this one, is "structure pays dividends and lets you trust your players to improvise." It turns out you *don't* need a weather man to know which way the wind blows. Just get out your kite and see for yourself.

Murphy's Rules

An Insufficiently Advanced Technology

Alternate Paths For Low-Tech Development

by Matt Riggsby

The **GURPS** TL system, up to TL8, is based on historical precedent. Individual **GURPS** campaigns, though, may not be, which can be a problem for world-builders. Is it an anachronism too far to arm your Bronze Age cities with cannon? Let your knights in shining armor use spyglasses? Put a clock tower in a Roman city? Give your horse-riding nomads the occasional ride on a steam train? If they don't exist yet, can time/world/dimension-hopping PCs find the parts to make them? If they do, what are the supporting technologies which would have to exist beforehand, and what are the ramifications of having those around? This article explores a number of early (generally TL4 and earlier) technologies with a focus on the pre-conditions which make them possible. With this, you can start to figure out what technologies high-tech can visitors easily introduce to a low-tech world, what are plausible alternate paths for technological development, and what developments are going to take a lot of time and work instead of just big ideas.

Cast Iron and Steel

Iron is an oddity, so far as the ancient smith is concerned. It's strong and easy to find, but difficult to work with. While other metals could be melted down, ancient smiths couldn't reach iron's melting point, 1540°C, in their furnaces. They could smelt iron from its ore, but it would be in a soft but solid mass which had to be separated from a matrix of slag. This was, first of all, extremely inefficient. Smiths could rarely get more than half of the iron out of ore, and usually got no more than a quarter. This also placed restrictions on the reuse of iron. Iron tools could not be melted down as other metals could. Historically, European smiths only solved these problems at the dawn of the Renaissance, the border between TLs 3 and 4, with the invention of high-temperature blast furnaces. However, there are some ways around these restrictions.

The key is control of carbon content. Iron with a very low carbon content (say, less than 0.1%) is quite malleable. This sort of metal is wrought iron, which is what ancient smiths produced in their furnaces. As the carbon content increases, so do strength and hardness. Good steels have a carbon content between 1% and 1.5%. To produce a tool, bits of metal were hammered extensively on hot charcoal furnaces, which, smiths discovered, would harden the piece. What they didn't understand was the chemistry of the operation. At high temperatures and with much working, carbon will infiltrate the iron, eventually turning a surface layer into steel. By the time you hit a 2% carbon content, though, the metal becomes so hard as to be brittle and cannot feasibly be worked. But the other effect of adding that much carbon is that iron's melting point drops precipitously, to about 1150°C, which was well within the range of temperatures available to ancient smiths. Most obviously, this makes production of iron from ore much more efficient because far more molten iron runs out of the slag than just-smelted iron can be beaten out of it. Just as importantly, the cast iron can subsequently be "cooked" at lower temperatures to remove some of the carbon, turning into steel far more efficiently than starting with wrought iron and working your way up with hammering. The cooking process isn't immediately obvious, but it's not a far leap from heat-treating processes an ancient smith would already know.

So how do you get that much carbon into iron? Indian smiths did it by finely grinding a mix of charcoal and iron into a sealed crucible. Enough carbon could enter the iron to lower its melting point and melt it, leaving a mass of *wootz*, the raw material of Damascus steel. However, this technique limited the smith to very small quantities, depended on crushing the ore very, very finely, and working the resulting metal extensively to break down crystalline structures that form within it. Chinese and European smiths did it with a forced draught and a lot of fuel. Increased airflow burns more fuel faster, which serves the dual purpose of raising the furnace's temperature and putting more carbon into the air for absorption into the iron. This technique can melt iron in industrial quantities. Building such a furnace is a non-trivial task, of course. Europeans only managed to do it by developing bellows driven by waterwheels, which is why it took them until TL4.

The Chinese were able to do the same thing, though, by building furnaces which happened to provide improved airflow around 500 BC (about two thousand years before Europe, and less than a thousand years after they started making iron themselves). This would have been at least mid-TL2 in China, but it might be hard to argue that it was on the late edge of TL3. And apparently iron casting isn't limited to such technological sophisticates. The Chinese weren't the only ones to cast iron before the Europeans. So did the Africans. It appears that, using relatively small furnaces with tall chimneys to improve exhaust and air forced by a series of hand-pumped bellows, smiths in central Africa -- who were otherwise at the early edge of TL2 -- were able to melt and cast iron in the 13th century. It appears, therefore, that the technology to produce cast iron and steel is attainable by quite low-tech societies if they're fortunate enough to figure out a furnace design.

Clocks and Clockwork

Historically, mechanical clocks begin to appear in the later part of TL3 (early clocks might be regarded as advanced technology, and spring-driven clocks are definitely TL4). Could they show up any earlier? A mechanical clock has three important parts: a power source to drive motion, an escapement to regulate it, and a gear train to translate the movements of the inner workings to a display (for which, see below). For a power source, just about anything providing a fairly consistent energy input -- from a weight on a rope to a stream of water -- will serve, although something that doesn't rely on gravity, like a coiled spring (which requires TL4 metallurgy to be effective), is necessary for a mobile clock.

The escapement is rather trickier. The escapement, the part of the clock that makes the "tick-tock" sound, makes sure that the clock mechanism moves at a consistent and limited speed. Just about every design of escapement involves a U-shaped bit which rocks back and forth to mesh with and then release the gear train, stopping and restarting the motion from the power source more or less regularly. It's the "more-or-less" that's the problem here. Even a simple escapement is a complex and delicate bit of machinery, and early ones are extremely sensitive to temperature variations, friction, gear wear, changing levels of force from the power source, and the shock and vibration caused by their own motion, making them very inaccurate. It took centuries of detail work to perfect methods of timekeeping, with nearly six centuries and two TLs separating the invention of the mechanical clock and the development of a chronometer accurate enough to allow the calculation of longitude.

There's no particular reason to believe they attempted to do so, but it's not implausible to imagine particularly sophisticated TL2 philosophers making moves in the direction of modern clockwork once gearing has been invented. However, because of the understanding of material science and state of metallurgy needed to produce portable and accurate timepieces or simply well-regulated automata, early clockwork is unlikely to produce worthwhile timepieces until late in TL3. Still, it could be useful for applications where accurate regulation isn't necessary, such as automated displays in temples and secret doors opened by a remote, hidden switch.

Distillation

Although distillation isn't attested to until the early Middle Ages and doesn't become an industrial-strength technology until the early modern period, basic distillation is a possibility as soon as metalworking technology becomes available. An alembic, an early distillation vessel, is simply a pot with a tight-fitting lid which has a tube protruding from it, usually at a downward angle, making the vessel faintly resemble a penguin with a long beak. Alembics were often fragile and heated indirectly, placed in a more durable pot filled with sand or water. The heavier pot would be heated, gradually bringing the alembic to the desired temperature (a common term for the culinary technique of moderating temperature by putting a baking dish in a water bath, *bain marie*, comes from the name of a legendary alchemist who purportedly developed it). An alembic isn't terribly difficult to produce and would be attainable by a TL1 culture which made the conceptual leap to recognizing that vapors could be condensed by cooling them and the further leap that those vapors might be worth keeping. Having primitive distillation might not be an enormous step forward for a very low-tech society, but it would improve the production of perfumes and medicines (hard liquor was treated as a medicine for centuries before it became a popular drink), which could give it a small economic advantage.

Moreover, there are some important limits on the technology. Without ability to measure temperature, it is extremely

difficult to control the distillation process. Heat control is limited to very crude visual distinctions. Like a cook, an alchemist can distinguish between (for example) faintly steaming, simmering, and boiling, but usually can't consistently reach and maintain a particular target temperature. This makes it difficult to separate different distillable substances, particularly if they have boiling points fairly close together, and ensures that no product of distillation will be completely pure, and that a significant amount of vapor will escape into the air rather than condense and run into the collection vessel. Longer beaks (providing more surface area for cooling) and water jackets (a sleeve around the beak through which water can be run, cooling it and accelerating condensation) are certainly technologically possible as soon as distillation is invented, but the underlying level of materials technology may make improved alembics economically unfeasible. Metal distillation vessels may also react with the substances being distilled, causing further problems until glass alembics become feasible at TL3.

Finer separations can be made with fractional distillation, a set of processes historically introduced in the 19th century (mid-late TL5). Fractional distillation usually involves letting vapor travel up a tall column with recessed cells along the sides. As vapors travel up the column, they slowly cool. Chemicals with higher boiling points condense in the lower cells and chemicals with lower boiling points condense higher up. Individual cells can then be tapped to draw off whatever relatively pure chemicals have collected at that level. A fractional distillation column would be, as such things go, relatively easy to build by making compartments individually, sticking them together, and poking a long hole down the middle. It could easily be built not long after the invention of distillation. However, using it well is problematic. Without the ability to monitor and control temperature, an alchemist might divide a solution into a number of different chemicals, but not be able to figure out just what chemicals (or combinations thereof) have ended up in which compartments. Still, it might be a step in the right direction.

Explosives

The most easily attainable explosive is gunpowder. It requires sulfur, which may be gathered in a fairly pure form from hot springs and volcanoes or at worst isolated from various minerals; charcoal, which is easily produced from wood; and saltpeter. Crystals of saltpeter (potassium nitrate) will eventually collect naturally underneath dungheaps, often maintained as fertilizer by farmers who also keep domestic animals, or under large guano deposits that accumulate around long-term habitats of bats and flocks of birds. It also exists in mineral deposits and can also be intentionally manufactured by letting manure and plant wastes ferment and refining a white powder out of them. As far back as the Neolithic (late TL0), saltpeter was used as an aid to fire-starting, so the raw ingredients of gunpowder are likely to be available even before metalworking. It then becomes a question of mixing them together in approximately the right proportions. Anything that comes even vaguely close to the modern proportions of two parts charcoal, three parts sulfur and fifteen parts saltpeter will be an effective explosive; many Medieval mixes were only half saltpeter.

Another relatively attainable but more difficult early explosive is nitrocellulose, or guncotton. Plant material (usually cotton although wood fibers can be used as well) is soaked in nitric and sulfuric acid for several hours, washed thoroughly, and left to dry. The resulting substance, while it still resembles cotton, is extremely flammable and, when contained, explosive (it's also nearly smokeless, which is a nice advantage over gunpowder). However, even under ideal conditions, raw nitrocellulose isn't as effective as gunpowder. It *does* become a powerful explosive, about three times as powerful as gunpowder, when treated with certain solvents, including alcohol, ether, and acetone, something which wasn't attempted until the 19th century. Legend has it that nitrocellulose was discovered accidentally (a chemist spilled some acid on his apron, which later exploded, presumably without the chemist wearing it), making its discovery plausible for any society with strong acids. Dousing it with solvents just to see what will happen is less likely, but it's not impossible that an alchemist would try it to see if it washed away impurities more effectively.

The early introduction of gunpowder is unlikely to make enormous changes outside of military technology. Heavily armored troops will probably fade away (albeit more slowly than in our history if early bombs and guns aren't as powerful as ours because of inferior materials), and [fortifications](#) will assume the same shapes like those of our gunpowder era. Explosives can be used to make mining more efficient, but they weren't employed in our history until TL5, so that application may not be immediately apparent.

Lord Kalvan of Otherwhen notwithstanding, time travelers setting out to build gunpowder-based empires in low-tech

worlds shouldn't count on a permanent monopoly. Gunpowder is composed of readily available components, is easy to make, and will require a sizable industrial enterprise to make enough to supply an army, which means a significant number of people will have access to the secret of its manufacture. Sooner or later, word will get out, as it did in our history. Even Greek fire, the great military secret of the Middle Ages, was eventually found out or was independently invented, and it (or something very much like it) was used by several different groups. The time travelers will have a head start, but their advantage does have a time limit.

Fire

It sounds trivial, but the ability to make fires and generate heat is one which becomes increasingly sophisticated over time. The technical term for it is pyrotechnology. Leslie White, a prominent anthropologist of the previous century, proposed that a culture's development could be measured by the amount of energy it was able to use. If that is indeed the case, pyrotechnology is a reasonable snapshot of that advancement. Since there are many different ways a society can achieve higher and higher temperatures (better fuels, improved airflow through combustibles, etc.), we won't get into specifics of how such temperatures can be achieved. Rather, we'll use TLs as rule-of-thumb indications of what temperatures a society can achieve.

A good wood fire can reach 600°C without much trouble. Simple fires for cooking predate *Homo sapiens* considerably, so that's safely TL0. Earthenware pottery, which dates to the Neolithic (late TL0), can be produced at 700°C. That's just below the melting point of silver and well over the melting points of tin and lead.

Copper melts at around 1084°C (gold melts a few degrees lower), which is a convenient boundary for the beginning of TL1. That's just a few degrees below the temperature necessary to produce glass, about 1100°C, which doesn't appear until well into the TL; the pyrotechnology to support glass develops before the relevant chemical know-how.

Depending on certain chemical conditions, iron ore can be smelted and turned into wrought iron at anything from 1100°C to 1500°C (it can actually be smelted at much lower temperatures, but it doesn't become soft enough to work until it gets into that range). 1200°C, though, is a comfortable threshold for most common iron-smelting processes, so that makes a reasonable boundary for the beginning of TL2.

TL3 furnaces could doubtless achieve somewhat higher temperatures, but they don't appear to have been enormously better than TL2 furnaces. Any additional energy TL3 societies could bring to bear came from wind and water power. Finally, pure iron melts at 1540°C, which isn't a bad boundary for TL4.

It's worth noting that just because a society can reach certain temperatures, it won't necessarily develop all related technologies associated with those temperatures. For example, stoneware pottery, which is somewhat less porous and more waterproof than earthenware, can be produced starting at 1200°C. That would make stoneware a TL2 development, but it only appears in Europe in the early Middle ages. Pottery vitrifies (that is, takes on an internal structure like glass) and becomes porcelain at 1300°C, although only certain clays can take temperatures that high. That makes it potentially a TL2 or TL3 development, but Europeans didn't identify the necessary clays to make it until TL5.

Don't Try This At Home, Kids!

Something worth keeping in mind about low-tech research is that it is very dangerous. Early steam engines, for example, had a habit of exploding. Alchemists will regularly be exposed to all manner of toxic substances, have little or no safety equipment ("A fume hood, my liege?"), and will taste chemical samples as a regular part of determining what they are. They may not know that they're working with poisonous chemicals, and may even believe that some of them are healthful.

Working with explosives and potential explosives is even more dangerous. Modern amateurs, even if they know what they're working towards (say, using the *Anarchist's Cookbook*), are as likely to blow themselves up as anything else, and that's doubly true for ancient alchemists who were trying to figure things out as they went along. As some kinds of explosive manufacture became commonplace, so did accidents. Even though there was some awareness of safety precautions, such as working with wet materials, explosions at Medieval gunpowder factories were regular occurrences.

Gearing

Gears are an important part of just about any powered mechanical device, from wristwatches to locomotives to electric mixers. Being able to transfer power from a power source -- be it human, animal, water, wind, steam, or anything else -- to the working tool is vital to the industrial production of higher TLs. Simple gearing (and similar technologies like belts), which could transmit power for tools like grindstones and trip hammers, appears around the third century BC (early-mid TL2), with the appearance of waterwheels and moderately sophisticated water clocks. Complex gearing doesn't become a common technology until late TL3 or even TL4, with the appearance of mechanical clocks and sophisticated water-powered and wind-powered machinery.

But that's not a necessary delay. It appears that gears became very sophisticated very quickly after their invention. Within two centuries, there is evidence that clever mechanists were producing orreries (models of the solar system which simulate synchronized planetary motion), making a variety of sophisticated gear trains like those found in clocks potentially a TL2 development. But, of course, such gear trains are not without their limitations, which may explain why they never became particularly widespread and vanished at the end of classical antiquity.

The problem with low-tech gears is not that they're conceptually difficult (Greek and Roman scholars clearly had a firm grasp of the math), but that they're difficult to make and only moderately useful once you've made the effort. The vast majority of gears, used in waterwheel-powered mills, were wooden and wore out quickly under the high strain, making simple industrial gearing an expensive proposition and complex gearing prohibitive. There are also any number of devilish details. Such gears would also be produced without a deep understanding of material science and some of the finer points of the application of force, and would consequently be very susceptible to jamming and malfunction as a result of temperature changes, excessive friction, changing humidity, even less than optimum tooth shape, all of which are factors engineers spent centuries learning to overcome.

A reasonably good group of craftsmen from as early as TL1 could make simple gears once they had the idea, but at considerable cost. However, there's also not a lot you can do with gears without a reliable power source and regulation. If power and control come from a hand crank, you're limited to expensive toys like orreries and perhaps exceedingly expensive computing devices which might resemble cash registers. Until developments to harness water and wind power in TL2 arise, there's little that can be done with them which can't be done less expensively some other way.

Greek Fire

Formally a TL3 invention, so little is known for sure about Greek fire that it's hard to say for sure whether or not its development be pushed back any farther. Cautious scholarly opinion holds that its primary ingredient was naptha, a combination of lighter fractions of petroleum. It may be that it was produced by *extremely* careful distillation (the effects of petroleum fumes reaching an open flame are left as an exercise for the GM), or perhaps by some other long-lost chemical process which drew off heavier fractions of crude oil. The naptha, if that's what it was, was mixed with a variety of other chemicals, although what they may have been and whether or not they would actually have enhanced its effectiveness is an open question. The naptha itself, projected by pumps (available at TL2 and at least conceivable at TL1), would have been a sufficiently formidable weapon. It would not be unreasonable to suppose that Greek fire would have required the chemical sophistication of TL3 (or perhaps unusually advanced chemistry in a TL2 civilization), but the most important element was access to its necessary raw ingredient, petroleum. Even the cleverest time traveler won't be able to reinvent the flamethrower if he can't get oil.

Guns

Once gunpowder has been invented, it's not very difficult to start making crude guns. All one needs is a sturdy tube of metal, fully open at one end and with a touchhole on the other to set off the powder. A good early TL1 smith could make a small cannon or musket out of cast bronze. Lever-driven matchlocks could follow soon thereafter, and flintlocks are conceivable in TL3 when tolerably good springs become possible.

But they wouldn't get much better than that any time soon. It might be possible to rifle barrels, but the problems of precise production and ensuring a close fit between barrel and bullet would make it extremely difficult to manufacture ammunition which would benefit from it until better industrialization appears (TL4 at the very earliest, and more likely TL5).

Modern cartridges, where the gunpowder is ignited by a primary charge, which is in turn detonated by a shock delivered by a firing pin, are even more problematic. The basic mechanism of the gun isn't too much of a stretch for a TL4 society (strong springs would be a problem before that point), but the ammunition is. Ignoring the high cost of producing many identical brass cartridges, pressure-sensitive explosives strain even the theoretical capacity of TL3 and even TL4 chemistry, and only become feasible at higher TLs. Moreover, even if a TL3 alchemist did somehow manage to stumble across one of the earliest primary explosives such as mercury fulminate (alcohol, nitric acid, and mercury heated to 60°C), he probably wouldn't live to tell about it. Primary explosives are very sensitive to shock, and the alchemist would most likely discover their explosive properties by blowing himself up.

Industrial Chemicals

Disinfectant, solvent, and intoxicant, ethyl alcohol is one of the first useful chemicals humans started manufacturing, towards the late end of TL0. Of course, the alcohol content of wine and beer tops out at around 12% and is often much lower, which is fine for a relaxing drink but not so good for industrial purposes. In TL3, it became possible to produce alcohol solutions of up to 70% alcohol after repeated distillation. Pushing back the invention of distillation would almost automatically push back the invention of hard alcohol.

Sulfuric, nitric, and other strong acids were produced in very small quantities by Medieval alchemists probably as far back as the 10th century (mid TL3), usually by cooking readily-obtained sulfur-containing metallic ores, sometimes in connection with saltpeter. The acids produced were frequently employed directly in vapor form for metallic assay tests but could be condensed into a liquid form. Obviously, this requires the invention of distillation and of vessels which can withstand acids, which generally means glass. The raw materials for producing acids can be obtained at TL1, but because of its material and complex shape, a glass alembic -- and consequently the effective distillation of acids -- is at best a mid-TL 2 invention. Their independent discovery would only require a sufficiently inquisitive chemist, perhaps trying to distill the "essence" of the ores as an alternative to smelting.

Ether can be produced by treating alcohol with sulfuric acid and distilling the resulting solution; the process was primitive and time-consuming, taking months. This was first reported in the 13th century (late TL3), although its anesthetic properties weren't remarked on for nearly three more centuries.

Acetone can be derived from natural products of fermentation. However, it is produced by relatively small quantities by most bacteria and it requires relatively sophisticated distillation technology to isolate. It was not isolated until the dawn of the 17th century, and it would be difficult to push its discovery before the beginning of TL4. Even then, it would be difficult to produce in large quantities until fractional distillation is perfected.

Lenses

The basics of how lenses work were known long before it became possible to make them. Before the advent of glassblowing, the only available lenses are fortuitously shaped transparent gemstones, which are rare, prohibitively expensive, and very difficult to shape to any kind of specification. With the advent of glassblowing, it becomes at least theoretically possible to produce lenses by making hollow glass containers and filling them with water or simply make a thick sphere of solid glass. However, such lenses are heavy, fragile, expensive, and still not very good except for gross, irregular magnification. During the infancy of glassblowing, they'll also suffer from irregularities in the surface and uneven clarity. Colorless glass didn't appear until the second century AD, and even then it had horrible optical properties.

Useful optics require two products of long development: relatively clear glass and even, consistent grinding technology. The former was the process of centuries of ongoing chemical experimentation. It's probably no accident

that the late Middle Ages and early Renaissance, which saw the rise of practical optics, also saw several important technological developments in glassmaking such as the development of leaded glass (an accelerating glass industry also made it easier for interested scholars to seek out glass objects made to their specifications). The latter requires the same sort of machining technology that underlies waterwheels and pottery wheels but adapted to more delicate work. Both technologies took a very long time to perfect, so the theory of optics developed well in advance of practice. Consequently, clumsy man-made magnifying devices are mid-TL2, wearable magnifying lenses limited to 4× magnification or so are TL3. Concave lenses are apparently more difficult to grind than convex lenses, so they come even later.

Microscopes and Telescopes

Powerful magnifying devices obviously require the development of lenses which are not just good magnifiers, but good enough that the images they produce can be viewed through a similar lens without excessive distortion, which is yet another level of refinement in material technology. Crude compound microscopes and telescopes giving up to 20× are on the border of TL4, although provided with a lucky break in lens technology, telescopes may very well develop far earlier. Fixed telescopes with [absurd focal lengths](#), which can get by with relatively inferior lenses, will also develop before portable spyglasses.

Historically, there was a limited dodge for microscopes which arose late in TL4. When a ball of glass is blown, a bead forms on the side of the ball opposite the pipe. That bead is tiny, generally less than a half-inch across, but remarkably smooth and even. If the surrounding glass is snapped off, it serves as a remarkably powerful lens. This is the sort of lens used in the original van Leeuwenhoek microscopes. Since the power and clarity of these single "blown" lenses was far superior to that of contemporary compound arrangements of ground lenses, the development of the compound microscope, though attempted several times, didn't really take off until a century after van Leeuwenhoek's early single-lens microscopes. Unfortunately, they're too small to be used in telescopes or as everyday vision aids. Nevertheless, a clever glass-blower might notice the tiny lens-like swelling and invent microscopy as early as reasonably clear glass appears, perhaps early in TL3.

Reflecting telescopes require similar optical fineness, but over a larger surface area, making them even more difficult to build. Again, theory preceded practice: Muslim scholars experimented with parabolic mirrors at least as early as the late 10th century, and their work was followed up by Europeans at least as early as the 13th. A time traveler couldn't get them made if he furnished specifications, but a clever Medieval scholar provided with out-of-TL production technology might figure out how to make one on his own.

Paper

This isn't a particularly obvious invention, but it would be easy to invent, particularly if felt is already produced, and very welcome in a literate culture. Paper-making requires little more than finely chopped textile fibers (wood pulp doesn't come along until much later) suspended in a large quantity of water, then scooped out with a fine-meshed, flat-bottom sieve. The resulting paper will have a rough surface and absorb a great deal of ink, but those problems can be solved fairly easily and it will still provide a much cheaper alternative to parchment and vellum. This is potentially a TL1 invention, or even TL0 (although writing is itself TL1, so there would be little point in TL0 paper), and once it is introduced, paper-makers will likely experiment with ways to make it smoother and less absorbent. Still, although paper is cheaper than animal-skin alternatives and even papyrus, it's not likely to make much of a dent in book prices. The real cost there is in writing, not raw materials.

Printing

Although they would be expensive, moveable type and the printing press are entirely conceivable at TL1. Written language must exist, of course (and it's much easier if the language uses an alphabet rather than a syllabary or hieroglyphics), as must the ability to raise and lower a heavy weight. The first printing presses were adapted from apple presses, but an olive press (easily achievable by a Bronze Age civilization) would fit the bill as well.

The type itself is the most expensive but probably most straightforward part. It would require a large number of individual characters of a uniform size, depth being more important than height and width to ensure that all characters will touch the page. If casting raised characters is prohibitively difficult (which it might be), a low-TL approach might involve casting several bars of the same depth and possibly height, cutting them into segments, and carving characters out of them. It might be cheaper to carve into the metal rather than to cut around a raised character, making early printing largely black with white letters rather than the reverse.

There are some less obvious issues, though. Water-based inks tend to smear; one of the things that made Guttenberg's press possible was the introduction of oil-based pigments late in the Middle Ages. An early press would be limited to relatively large type, suitable for reading from a moderate distance. Rather than books, an early press might produce posters, making reading by the masses a public act rather than something done tucked away in one's library. The durability of early paper is also an issue, which might reinforce a tendency towards low-volume, high-readership posters.

Of course, it would require a large number of literate people within easy reach of the printer to make it feasible to invest that much effort into the enterprise, so it's unlikely that the printing press would arise on its own in a Bronze Age civilization, even if somebody thought of it. However, it might find acceptance in a TL2 empire like Rome or China, where a large number of people would need to read the same legal codes and proclamations or want to read important bodies of religious texts or literary works.

Powered Mills

Wind or water, early powered mills initially share a similar design. Horizontal mills are essentially an axle placed on its end with a grindstone on one end (or, occasionally, some slightly more sophisticated equipment) and an arrangement resembling a horizontal paddlewheel on the other. One side of the paddlewheel is shielded so that the wind or water will push on the other. The difference is simply that with a horizontal water mill, the paddlewheel is on the bottom, sticking into a running stream, while in a wind mill, the paddlewheel (probably with cloth sails for paddles) sticks up in the air. There are suggestions that horizontal mills appeared as early as 4000 BC (the very end of TL0, although it might be safer to call it an early instance of TL1 technology). The only necessary preexisting technology is the sorts of bearings which would be used on wagon axles.

More sophisticated mills are, of course, a different matter. Vertical mills require solid gearing, which appears to be a TL2 development. The historical obstacle to the adoption of the waterwheel in Europe appears to have been economic rather than technological. Mills require a large capital investment, which seems unnecessary to a society which has plenty of cheap labor. A plague or a series of political events which reduced the slave population of such an empire might cause the widespread adoption of water power in TL2.

Overshot mills, where the water pours over the top of the mill, are twice as efficient as undershot mills. However, it wasn't until the 17th century that anyone came up with a series of tests to determine that that was actually the case. Prior to that time, people usually built whichever type was easier: undershot in flat areas, overshot in hilly regions where it was easier to build a mill race. A time traveler with political influence could subtly increase the amount of industrial power available by requiring that only overshot mills be built.

Vertical windmills require the same kinds of gearing as vertical water-powered mills, plus the conceptual breakthrough that you can get power from drag, not just direct force of wind, which lets you expose the entire wheel to the wind, not just half of it, and get twice as much energy. That wouldn't be too much of a stretch for a society which had developed triangular sails and tacking against the wind. That style of sailing became popular in Europe in the later half of the Middle Ages, predating the first vertical windmills by two or three centuries. However, such sails have a longer history in the Middle East and India, potentially pushing the development of the vertical windmill in such areas back to TL2.

However, the utility of early vertical windmills is limited to places with reliable prevailing winds. They were subject to a variety of improvements to allow the windmill to turn to face shifting winds, adjust pitch to catch the wind more efficiently, and so on. Unfortunately, the steps necessary to thus perfect the windmill require a degree of technical

sophistication which ultimately renders them obsolete; windmills reach a pinnacle of development about the same time as the steam engine becomes feasible. However, on an iron-poor planet where powerful steam engines aren't a possibility, waterwheels and windmills may be the basis of TL 4+n technology.

Steam Engines

This is yet another area in which provocative bits of theory were developed comfortably in advance of practical application. The idea of using the expansive power of steam to push objects goes back at least to Greek philosophers early in TL2 and could easily appear in TL1. By the end of TL2, some people were even doing something about it. Temples and palaces likely used jets of steam to push light, articulated "automata" around from the inside, make musical noises through something like organ pipes, or simply fill buckets with water as a hidden counterweight, making it appear that doors and other objects were moving under their own power. Really, any smith capable of making a good teakettle can build a steam-powered gadget which will spin around when heated or something similarly frivolous.

Unfortunately, bringing that force to bear for useful applications is much harder. Indeed, the first steam engines literally did not rely on the power of steam itself. The first practical steam-related powered devices appearing around 1700 (stationary water pumps developed to pump out flooded mines) relied on the power of a vacuum created by the condensation of steam to pull a piston into a cylinder rather than the force of steam to push it out. Powerful steam engines are very sophisticated machines requiring very strong construction, piston systems which are sufficiently well-sealed that they won't bleed off steam pressure at the expense of power, complex piping to suck every possible calorie of heat and distribute it to various parts of the machine (pre-heating water and keeping the whole machine warm using waste heat improves a steam engine's power and efficiency tremendously), complex valves which will properly and automatically regulate the direction and action of the steam, and all moving parts built to specifications which allow for expansion because of heat.

What all of this means is that, although steam can be applied in some lower-tech situations, real steam power can't be available before TL5. Indeed, the advances required in material science, thermometry, gearing, hydraulics, and other sciences are such that tooling up related technologies to the point where steam engines become a possibility essentially pushes a society into TL 5, at least so far as physical sciences are concerned. So if your steampunk-fantasy dwarves have steam engines, they should probably also have accurate clocks, powered looms, and factories which could out-produce anything operated by races without steam power.

Stirrups

Not invented until the early Middle Ages, the stirrup is perhaps the greatest "whack on the head" invention in history. This simple device, a loop of rope or leather, sometimes with a reinforced bar across the bottom, allows much easier mounting of a horse and allows the rider much greater stability. Careful historical analysis has disproven the old theory that the stirrup led to the development of heavy cavalry and therefore European feudalism, but it doubtless enhanced the power of the feudal knight considerably. The only necessary technology for stirrups is having domesticated riding animals and saddles, a TL1 development. It might not make a big difference in everyday lives (horses are always quite expensive and were far more valuable to the common man as a draft animal than as a riding beast), it would certainly improve heavy cavalry.

Thermometer

One of the biggest obstacles to early chemistry is the lack of tools to measure temperature. The basic idea underlying thermometers, that things can expand or contract depending on their temperature, goes well back into TL2. However, it wasn't until TL4 that instruments taking advantage of that principle were developed and not until TL5 that they were perfected. The most attainable method of measuring temperature is by putting a fluid in a narrow, transparent tube, usually with a bulbous reservoir at one end. As the fluid expands or contracts, the level of the fluid rises or falls, indicating the temperature; the more fluid in the reservoir and the narrower the tube, the more noticeable the change in

level will be.

The main stumbling block here is the narrow, transparent tube. There's no real substitute for glass, and the sort of tube necessary for a thermometer is fairly fine work, requiring a sophisticated level of glass-making technology. Unless an exotic natural substitute becomes available (say, a species of enormous transparent hedgehogs with hollow spines), a useful thermometer of this type can't even be attempted until late in TL3.

There are some other fiddly concerns which will effect the accuracy and usefulness of thermometers: the earliest thermometers used a variety of relatively lightweight fluids (water, wine, etc.) which would respond to temperature changes, but they would also respond to changes in atmospheric pressure, a phenomenon of which early thermometer makers were unaware. The use of mercury, whose density makes it relatively resistant to air pressure changes, isn't obvious, although it would seem to be an appropriate material for an alchemist to experiment with. The durability of the tube will also limit its usefulness. A thin glass tube will suffice to measure the temperature of a bucket of ice water or a boiling pot, but it might break in a hot oven and could even melt if used to monitor the temperature of a blacksmith's furnace or a potter's kiln.

A plausible and quite possibly very early alternative for measuring high temperatures is the bimetallic thermometer. If two strips of different metals are welded together back-to-back and the combined strip is heated, the strip will bend as one side expands faster than the other. A bimetallic strip (or, better still, a long strip bent into a coil; again, the more material, the more visible the changes) could easily be fixed to a scale and its expansion and contraction measured to calibrate it to specific temperature points. This sort of thermometer could be developed as early as TL1, and it's not too hard to develop a scenario for its discovery (for example, a jeweler notices that a half-gold, half-silver piece he's working on flexes when left near a fire then back once it has cooled). The drawbacks of such a thermometer are that it isn't as sensitive as most liquid thermometers nor as useful at lower temperatures and that -- although it's far more durable than a glass thermometer -- it still can't measure temperatures higher than the lower of the melting points of its component metals. A bimetallic thermometer made of, say, gold and silver would disintegrate if placed in a furnace melting down bronze.

Fantasy Campaign Structures

Considering the Shapes of Games

by Phil Masters

GMs are usually, rightly concerned with the *style*, or genre/sub-genre, of the games which they set up. For example, someone running a **GURPS** fantasy game might refer to [GURPS Fantasy](#) and choose between the genres discussed there -- High Fantasy, Low Fantasy, Dark Fantasy, Light Fantasy, or Sword and Sorcery. However, if the campaign is intended to have any sort of grand plot or *structure*, it's worth thinking about the overall shape of the thing. This article looks at some possibilities, with particular reference to fantasy games, although most of the principles apply equally well to other genres.

Note that the structure of the campaign may define an overarching plot, but it's perfectly possible for individual scenarios, run over one or more game sessions, to have their own, quite differently structured plots. Think of them as sub-plots within the grand campaign plot -- or, in television terms, as episodes within the season's plot-arc.

Anyway, some general categories follow . . .

The Picaresque

A picaresque campaign is simple and loosely organized. The characters wander around the countryside, meeting interesting people, admiring nice scenery and weird wonders, and probably getting into occasional fights. It's really a kind of tourism.

This may sound dull, but if the scenery and characters (PCs and NPCs) are interesting enough, a campaign can keep going for months or years on very little more. Picaresque games mostly work best either if they are more or less comic -- the point of all this wandering being actually to find good jokes -- or if the PCs are roving do-gooders (or perhaps petty criminals -- or both, in some proportion), dealing with minor but interesting problems as they go. The picaresque form is a bit too unfocused for most novelists, but TV series about wandering heroes with strong episode plots but weak "season arcs" are effectively picaresque, as are episodic novels such as Terry Pratchett's *The Color of Magic*.

RPG campaigns set in intricate or highly original new worlds may well start off in the picaresque mode, as the players get the hang of all the novelty and admire the creator's ingenuity. Picaresque plots often evolve into something else over time, as the protagonists discover a purpose to their existence, formulate ambitions, or spot a pattern to the problems which they encounter which merits some kind of grand solution.

The Quest

A quest is a journey. It may be simple and linear, or complex, with digressions and diversions; it may be long or short, to a destination which is known or unknown at the start; it may even be partly or entirely spiritual. The point is, though, that characters go from A to B to fetch, discover, destroy, or kill something (or just to get home, as in that archetypal quest, *The Odyssey*), meeting obstructions or secondary objectives along the way. This includes journeys of exploration to distant lands, where the objective is simply to find out about the destination. It's distinguished from the picaresque by the fact of an objective, and hence the potential for completeness, although the protagonists may not know what their objective is to begin with.

Plot Coupons

The concept of the *plot coupon* was invented by critic Nick Lowe; see his article, "[The Well-Tempered Plot Device](#)" (which has several good ideas - or horrible warnings -- for anyone developing a fantasy plot). This is an object which

Quests may be assigned -- the king sends his knights out to find an important artifact -- or they may be forced on characters -- the heroes set out to rescue a friend from captivity in a distant land. They may even emerge gradually in the course of events, as characters who started out as picaresque wanderers realize that there's an important goal to be achieved. Often, at least one of the adventurers is highly motivated by some wish or need, or at least by the offer of a large reward, driving the plot along and keeping the story focused, although others in the party may be more casual hirelings, friends, or thrill-seekers. Of course, these hangers-on, like Bilbo in Tolkien's *The Hobbit*, may gain and learn much when the quest is complete.

Quest campaigns have the advantage of clear focus, giving the GM a way to motivate characters and the players the chance to feel that they've achieved something specific at the end. They also generally provide a strong incentive for the party to stick together, although some searches, such as the Arthurian quest for the holy grail, can send individual heroes off in all directions, ending up with much of the scattered, episodic quality of a picaresque. The drawbacks are that quests can seem linear, with arbitrary incidental encounters dotted along the way like hurdles on a race track, and they're usually *finite*, with nothing to do once the prize is won. (Quests which never do reach their end feel dull and pointless after a while.) Good GMing and use of subplots can resolve the first problem, while the second, assuming that the players don't actually want a finite campaign with an end date after which they can play something else, can be resolved by spinning a whole new plot off the end of the quest. This might be *another* quest, but many players might be more satisfied with a change of structure; the heroes might, say, have to manage and govern the lands they've won, or they might become the heroic guardians of their community.

The Heroic Career

This campaign structure works best when there's one PC who everyone is willing to accept as the star of the show, or possibly a closely allied group with similar objectives. It emphasizes the idea of adventuring as a *career*, with the sort of associated life-plan that many well-paid, difficult professions involve, but with more risks and more fame and glory at the end. Alternatively, it may be expressed in more portentous terms; the hero's life may echo legends and myths, or symbolize the path to enlightenment.

To begin with, the protagonists may simply be mercenaries and tomb-robbers, or minor local heroes. They deal with petty monsters and bandit gangs, investigate old ruins in search of treasure, and perhaps resort to a stylish sort of crime if they're not overly moral and circumstances press. Eventually, though, they accumulate enough skill, equipment, and fame that their jobs become a bit more impressive, and take a bit longer; they may be hired to clean out nests of monsters, escort or conduct lengthy expeditions into wilderness areas, and solve the sorts of mystery that require both force and intelligence.

Thus, they can become more proactive as their careers advance. Eventually, they may look to settle down, perhaps taking over or founding a community, or being awarded an important position in a feudal government. By now, they should probably be developing social as well as combat skills, or at least studying strategy as well as swordplay. They may even end up as rulers themselves, or at least champions of their nations and leaders of great armies. Such personal sagas can go on for years of real-world time, and may be hard to end satisfactorily -- unless the players are willing to

the protagonists of the story must search out to accomplish some important goal. For example, it may be the lost crown which the prince must wear in order to claim the vacant throne of the kingdom, or the sword which must be re-forged and given to some hero because it's the only weapon in the world which can slay some particular monster. Everyone insists that the coupon is terribly important, wrapped around with omens and prophecies, but its real function is to make the plot happen by being lost, found, and transported. In many cases (especially big fantasy trilogies and series in which each book is supposed to stand alone if necessary), there are multiple plot coupons, and the heroes must collect a full set and then take them somewhere to win a free denouement.

Plot coupons can be used in RPGs as in novels, for much the same purpose, and they do serve a useful purpose in motivating the PCs to go out on adventures; provided that they agree that the ultimate objective is worth pursuing, chasing a plot coupon can keep them busy for months. However, this may turn the campaign into a sort of fantasy scavenger hunt, and can seem rather artificial; if the players become too conscious of how the GM is running things, they may stop taking it entirely seriously.

have their characters die, perhaps nobly in combat with an evil foe. It's also possible that they'll found a dynasty, and start up a new set of PCs -- the students, courtiers, and heirs of the first group.

The shape of a "classic" heroic career is in fact partly dictated by cultural and literary conventions. In the modern world, and in some lighter fairy stories and such, there's a tendency to expect such a career to end in triumph, with the hero running a country, or at least standing over the bodies of his fallen enemies before he marries the girl and goes home to live in comfort. However, many storytellers have always been aware that life is more complicated than that; stories about mortal lives can only really end in death. Even in the *Arabian Nights*, which is full of wish-fulfillment stories, the tales traditionally end with a formula that says that the hero goes home to live in comfort and happiness for many years . . . until death comes along, as it comes to everyone. Many older heroic myths are more explicitly tragic; the great Celtic hero Cuchulain deliberately chose a short life of warrior glory, and lived with a geas that doomed him to early death, while numerous Greek heroes eventually fell to the flaw of hubris, and were punished by the gods (although some were subsequently taken up to a place on Olympus, in some versions). RPG players will probably prefer something less gloomy -- though some may be interested in recreating some mythic style in every detail -- but GMs who plan to play through a long-term heroic career should decide what to do about heroic mortality.

Resource Management

Some players are born builders. They like finding a place in the game world, and making something of their characters, picking up wealth, power, and allies. The resource management campaign plays to this taste.

While PCs in such a campaign may start without a stated long-term goal, they should soon find one. They might acquire a fief to rule, or one of them might be an ambitious wizard who recruits the others to help him set up his own tower. If they're urban rogues, they might decide that *organized* crime interests them most, and seek to control and expand their city's thieves' guild. In all cases, survival and expansion are both the long-term goal and the chief reward.

In fact, resource management plots are probably more common in RPGs than in fiction. In a novel or movie, they will probably seem rather dull -- there's not much heroic about nit-picking accountancy, even if it's punctuated with battles with monsters -- but gamers, who have a close identification with their characters and often a keen interest in the *game* side of things, can become really interested in the best ways to advance their characters and in intricate problem-solving.

This sort of game can require a fair amount of work from the GM as well as the players, as resources and problems have to be tracked and balanced at every stage. The GM also has to control the flow of resources to the group; too little, and they'll be frustrated by their inability to make progress, too much and these efficient managers will take over too much of the game world and feel insufficiently challenged. Local shortages -- of, say, spell ingredients, or skilled NPC assistance -- or problems such as hostile neighbors can force the resource managers to engage in more traditional short-term adventures, but they'll most likely want to head home and see that everything is going okay immediately afterwards. The group's ultimate aim may be nebulous, but every bit of growth and every bad season survived with minimum casualties counts as a pleasing victory.

GURPS Fantasy has rules and guidelines for many things which may

Maritime Adventures

A whole sub-category of adventure story -- including fantasy adventures -- deals with seafaring action. (A sci-fi equivalent is of course space travel, and countless *Traveller* players can attest how well that can work.) The voyage can become a picaresque adventure or quest, while events on board can include soap opera or even murder mysteries. Sea voyages have a lot to recommend them to GMs; being on a ship means that the party can't split up, while one can use a single "floor plan" for numerous incidents, and control the speed and timing of many events by declaring that the weather has changed, or that the ship needs repairs. Ships alone at sea are also largely immune to interference from social superiors, and make good settings for claustrophobic horror stories and psychological tales of isolation and personal conflict. Sea monsters or enemy ships can make entertaining opponents, and if people get bored, well, the ship can always arrive in an interesting port, or discover a weird little island.

The drawbacks of the form are largely mirror images of the advantages; the party is trapped together, isolated from new social contacts, and at the mercy of

be issues for a resource management campaign. GMs may have to develop details further, though, setting income levels for peasants and hired guards, crop yields for farms, and detailed costs for alchemical components. ***Ars Magica***, by Atlas Games, is one RPG which pays close attention to the sort of details which are crucial to resource management games.

Soap Opera

On the other hand, for players who find that real life provides them with quite enough in the way of management challenges, a looser, personality-driven, soap opera style of game may be the way to go. This is a style for budding amateur thespians; the PCs are motivated simply by being somewhere as a group, interacting with each other and with NPCs. They may well form a community (as in a resource management game) or a traveling party (as in a quest), but the details of survival or the goal of the quest are far less important than the personality interactions along the way. Indeed, growth may seem unimportant, and ultimate goals may be postponed indefinitely.

Real soap opera certainly includes a lot of *short-term* motivations, though; passionate romances and angst-laden tragedies are essential aspects of the form, for at least some characters. A certain willingness to forgive and forget may be useful here; traumas and disagreements which would drive some people apart permanently tend to have only short-term consequences for soap opera casts, although they may generate minor grudges and persistent in-group rivalries. Romantic relationships may blossom and disintegrate repeatedly, to the point where even others in the group begin to make jokes about it. Enmities may be serious, although constrained enough by law, social convention, or shared interests to prevent outright bloodshed, or kept at the level of name-calling and petty sabotage. If the group has serious outside (NPC) enemies, some members may sometimes be tempted to "defect," or to betray the rest for profit or revenge -- although if the group is going to stay together, they should eventually either change their minds, find some way to redeem themselves, or keep their betrayal secret for months or years.

If the players are really committed to the soap opera style, such campaigns may barely need any intervention from the GM -- just the occasional monster to fight or NPC "guest star," and neutral adjudication in conflicts. Other groups engage in soap-operatic play in the background and between scenarios in "quest" or "mystery" games. While some players may hate soap opera, especially if it's overdone, it's certainly something which can make campaigns more colorful and dynamic.

Incidentally, *situation comedy* -- a style of game suitable for settings such as that of [The Discworld Roleplaying Game](#), can be treated, for these purposes, much like soap opera. Again, the trick is to have a group of characters who may or may not like each other much locked into a situation where they have to deal with each other, and then let things run on from there.

Mystery and Law

Any properly developed game world is a complex environment with its own rules, both natural and human-made. Wherever such rules exist, there is scope for mysteries, and for heroes who can resolve them and restore the order of things.

One thing about supernatural fantasy is that infractions of the laws of man and of nature are less distinct than in most worlds. The same characters can find themselves investigating mundane crimes, magical secrets, and metaphysical enigmas. Indeed, which category an incident falls into may be unclear at first; was the locked-room murder committed

the weather and unreliable technology. Ship crews also tend to have quite strong rules, and rigid hierarchies of rank and authority, which some players may find too restrictive. Still, a well-judged mixture of travel, exploration, and "port time" can keep everyone interested.

GMs looking to run maritime adventures need to become at least moderately familiar with the technicalities of the subject -- well enough to bluff convincingly, anyway. A little nautical jargon goes a long way, unless any of the players know it better than the GM, in which case, the GM will probably be well advised to skip over the technicalities. Resource management -- of a short-term, highly specific kind -- can become *extremely* important at sea; GMs can skate over this if they wish, or make it a focus of the campaign.

with a cunning mechanical device, was the victim magically driven to suicide, or was it the work of an intangible demon?

"Sherlock Holmes"-style detective plots can be hard to run in RPGs, but are *not* impossible; see [GURPS Mysteries](#) for extensive guidelines. The main trick is, perhaps, for the GM to have a selection of clues in hand, release them to the PCs when they look in the right places, and permit the occasional Perception or relevant skill roll to earn a useful hint. Eventually, the players (preferably roleplaying bright PCs) should be able to put enough information together to solve the mystery. However, games needn't get this cerebral; PCs who are working as law enforcers or "ghost-busters" may have very little difficulty working out what's going on and who's responsible, the point of the story being dramatic fights or spectacular magical action when they eventually corner the perpetrators.

While many fantasy worlds are a little short on professional mystery-solvers, most have somebody, somewhere, who's responsible for keeping the peace and enforcing law and order, whether it's a city watch, the local magistrate and his hired guards, or simply an "interested amateur." Likewise, priests, shamans, or exorcists may be required to deal with supernatural problems besetting their communities. Nor do fantasy worlds *have* to lack detectives, just because they didn't exist in medieval Europe; Terry Pratchett's "Discworld" novels include a number of "police procedurals" featuring the Ankh-Morpork city watch, and there are several other examples in fiction, such as Randall Garrett's Lord Darcy; Yrth, the world depicted in [GURPS Banestorm](#), has a whole Order of professional "magical detectives," the Michaelites.

War Games

Warfare in a fantasy world tends to be dramatic and unpredictable. It can potentially be just as horrific and messy (and as boring and futile) as it ever is in the real world, but magic and the high-powered heroes are certainly likely to affect the outcome and nature of events, one way or another.

Warfare-based campaigns take their structure from the events of the war itself, or from the nature of military life. PCs can have a chance to dictate, or at least influence, the course of such things if they're sufficiently high-ranking, or if they make themselves strategically important enough; a military campaign can even be one phase of an extended resource management game. ("Warfare is the continuation of politics by other means . . .") Conversely, if the PCs are low-ranking soldiers (or even civilians swept up in events), the whole point of the story may be their general powerlessness (at least until they advance in rank and knowledge), especially in darker, gritty games; plots can resemble a kind of somber soap opera, as the only thing which these ordinary troops can influence directly is the pattern of relationships within their unit.

In most fantasy settings, the basic pattern of military activity is medieval, with muscle-powered weapons, relatively small armies, and moderately mobile forces who nonetheless sometimes become entangled in lengthy sieges of strong fortifications. The presence of magic and some nonhuman creatures on both sides doesn't seem to change this too much; wizards may be dangerous combatants, but apparently, their other abilities make them too valuable to commit to the front lines, they aren't numerous or powerful enough to change large-scale logistics much, and they largely cancel each other out when used for intelligence purposes. Perhaps their most dramatic function is to work with some of those heroic warriors to provide a sort of "special

War on Yrth

Taking *GURPS Banestorm* as an example once again, there's certainly scope for stories about warfare on Yrth. While the continent of Ytarria is *mostly* at peace in the supplement's present day, this wasn't the case quite recently, and things could very easily change again in the near future. The border between Megalos and al-Wazif remains tense, with grudges from the recent conflict still festering, and the prospect of renewed slave raids on both sides likely to trigger local conflicts which could blow up into another war. Caithness is bogged down in an intermittent civil conflict which could flare up into serious battles if either side should see an opportunity; meanwhile, the Megalan border lords are watching this situation and contemplating taking advantage, which might or might not make the lords of Caithness bury their differences.

Tribal skirmishes are a way of life in the Nomad Lands, as are strange and subtle clan conflicts in Sahud. Other Megalan leaders could resurrect the

forces" element.

Quite a few fantasy novels deal with warfare to at least some extent, though most focus on the activities of a few individuals rather than considering the grand sweep of strategy; Tolkien's *The Return of the King* (the third part of *The Lord of the Rings*) is one example, and the film adaptation certainly features some spectacular battle scenes. It's also a useful demonstration of how to link events on the battlefield to the actions of crucial individuals. Terry Pratchett's *Monstrous Regiment* provides an off-beat example of low-ranking, unskilled troops having a surprising effect on the pattern of international conflict.

crazed dream of conquering Bilit Island -- but perhaps the greatest danger in Megalos is the chance that its ruler's depravities or its lords' squabbles could send the whole Empire into civil war, at which its neighbors might contemplate intervention, or be dragged in to protect their borders from the schemes of the participants.

Complex and Mutating Structures

The campaign structures discussed here are useful categories, but they aren't hard-and-fast rules and they aren't meant to straightjacket anyone. In a good game, the shape and limits of the campaign may sometimes be stretched and tested, or the game can transform subtly from one format to another.

For example, picaresque wanderers may eventually find a purpose in life, settle down, and start managing resources, or heroic careers can involve a stint in the army during wartime and then culminate in great quests, or law-enforcement organizations can be the venue for soap opera. (See the comic *Planetary* for a picaresque plot which gels into something else.) Indeed, different players can have different views of the same game; some can be happily managing the resources which others are using as means to an end, or some can see themselves pursuing a "structured" career while others are happily engaging in picaresque tourism. While it's fine for the GM to avoid plots which won't interest the players, it's also fine to run any plot which *will* work for them, whether or not it fits some arbitrary campaign category.

Pyramid Review

Classic Battletech Mercenaries Supplemental 1 (for Battletech)

Published by FanPro LLC

Written by Herbert A. Beas II

Illustrated by Doug Chafee, Jason Vargas, Anton Zaleski, Roger Peterson, & Chris Lewis

Special Miniatures Section by David M. Stancel-Garner, Raymond Arrsstia, Mike DuVal, Dave Fanjoy, Ross Hines, David Kerber, Mark Maestas, Ryan Peterson, Ron Smith, Candi Smith, & Allen Soles

106-page b&w softcover; \$24.99

FanPro LLC has released another in the long line of works about mercenary units in the *Classic Battletech* universe. What separates *Mercenary Supplemental I* from previous units is it's not simply an update on what's up with the Kell Hounds and Wolf's Dragoons. In fact, as the back cover states, it's a rundown of units who aren't quite up to their caliber. Some of these units have been long-time residents of the *Battletech* universe, have never been detailed in an official publication until now or, if they were, it was a passing mention with little if any detail to help a player figure out what the unit was made up of. Needless to say, this can and did vex many a referee running a Battletech campaign. Happily, FanPro listens to its fanbase, and the first in a series of supplementals addressing this problem was born.

Each unit, like the other entries in the *Battletech Field Manual* series, gets its own one-page entry, describing its own TO & E, officers, personalities, and favored tactics, as well as a description of its history and color scheme. The last point also deserves mention, as the color plates detailing the various unit paint schemes with miniatures near the end of the book are well done, and reason enough to get the book if one wants to build an company or two from one of these units. The book also details alternate hiring halls in the *Classic Battletech* universe, such as long-forgotten Galatea or lesser halls like Northwind. Another nice thing about this book is that there is an alternate point-based system to generate one's own mercenary unit that is a simpler alternative to the system originally presented in *Field Manual: Mercenaries, Revised*. Nice and clear worksheets are also provided to make the process a real snap. I also like how it "ironed out" some of the contradictory canon about the origins of some mercenary outfits in the *Classic Battletech* universe. (Hansen's Roughriders, anyone?)

In a world of \$49.99 gaming books, the price for the book is reasonable, and though the book is soft cover, the presentation is better than some hardcover books in higher price ranges. Also included is some small mood-setting fiction; this is another fine idea FanPro has been doing in its product lines, as it helps set the mood of the books and shows the quality of writing has certainly taken an upswing in *Classic Battletech*.

Things that bother me were again, nitpicky, such as why the color plates were placed where they were in the book, bisecting the last two unit entries, or why, for a book full of "also rans" are there some pretty good units in here? Perhaps some of them could have waited for another supplemental for "good-but-overlooked units." Also curious is the need for six pages of ad filler at the back. I know these companies need to make a buck, but guys, more content could have been added.

What I really like is the commitment FanPro is making to ***Classic Battletech*** through the publication of these books, In 106 pages, they breathed life into a lot of units that had never gotten more than a passing mention in the days under FASA. For that alone, bravo! Though there are some minor flaws, as mentioned above, the book is solidly written and the rules work well for the creation of merc outfits (the reviewer having play tested them himself). Furthermore, many of the unit writeups were imaginative and very well executed, and fit well into the ***Classic Battletech*** universe, even the newer ones, and it was nice to see updates of some old friends from the fiction, such as the Black Thorns and the Northwind Highlanders. All in all, I can say this book is worth the price, especially if you are running a mercenary campaign in the ***Classic Battletech*** universe. FanPro has set a new standard for the writing in the ***Classic Battletech*** line, with its Battlecorps endeavors and now the release of the Historical and Mercenary Supplemental books, and the promise of more on the way. It's obvious that ***Classic Battletech*** is back with a vengeance.

--Jason Reade Weiser

William Dampier, Pirate Scientist

for *GURPS*

by James L. Cambias

William Dampier was probably unique in being the only known pirate scientist. Born in Somerset around 1652, he went to sea, and in 1674 voyaged to Jamaica to manage a sugar plantation. The job didn't agree with him, and Dampier joined the community of illegal English loggers in Campeche. In 1679 Dampier joined a crew of buccaneers for a series of raids on Panama and the Pacific coast of South America. That whetted his appetite, and in 1684 he signed on for a cruise which took him from Virginia around Cape Horn, up the coast of Peru, and across the Pacific to the Philippines. From there Dampier made his way back to England via the East Indies, returning home in 1691. During his pirating voyages Dampier kept careful notes on cultures, animals, plants, and especially wind and weather, which he collected into a book, *A New Voyage Round the World* (1697).

His book won him great acclaim in London, and in 1699 Dampier got a commission from the Royal Navy to take the leaky *HMS Roebuck* on to explore the south Pacific. He reached Australia and cruised along New Guinea and New Britain, but on the return voyage the *Roebuck* got so unsound she had to be abandoned at Ascension Island. Dampier was court-martialed on returning to England; he was acquitted of any fault in the loss of the ship, but complaints about his treatment of the ship's officers led to his removal from the Navy.

As a privateer Dampier accompanied two more voyages, but as pilot rather than commander, and may have been the first person to circle the globe three times. He died about 1715, but where and how are not known.

A lanky, melancholy-eyed Englishman with brown hair, usually dressed in worn sea officer's clothing.

William Dampier **150 points**

*Includes bonus from Mariner talent

Equipment: At sea or in exotic ports, Dampier would certainly be armed with a cutlass. In battle he would also carry a musket. On his later voyages he has good-quality navigation instruments -- spyglass, sextant, etc. He always has a notebook, carefully protected from damp.

This represents Dampier about 1692, at the end of his first voyage around the world, when his book *A New Voyage Around the World* was getting him a reputation as a scientist but he was still trying to make his fortune. Before the publication of his book, he has no positive Reputation.

Later in life his Courtesy Rank of Captain becomes genuine Military Rank, then Merchant Rank after his court-martial. During his naval service he gains a Duty to the Royal Navy. His Wealth improves to Average, but he gains the Debt disadvantage to offset it.

Dampier's bullying of those under him includes anyone he thinks is his intellectual inferior. It is entirely verbal, and takes the form of lots of "I told you so" comments and criticism. (What makes Dampier's bullying so intolerable is that he's usually correct.) Though Dampier was married, he spent so much time away from his wife Judith that she counts as neither a Dependent nor an Ally.

New Talent: Mariner

Mariner: Boating, Seamanship, Meteorology, Navigation (sea), Shiphandling (ship). Reaction bonus: sailors and seafarers. 5 points/level.

His Meteorology skill is TL5 (rather than TL4 Weather Sense) because Dampier's discoveries about trade wind patterns formed the basis of scientific meteorology in the Industrial era.

In any Swashbucklers-era campaign, Dampier can turn up as a PC, a useful NPC, or even a villain! His global travels and surprisingly broad set of contacts mean that PCs can encounter Dampier anywhere on Earth and in any setting from Royal Society meetings to pirate taverns in Port Royal. Renamed Dampier-clones can show up in any campaign from the Elizabethan era to the Age of Napoleon.

To make Dampier a better villain, give him the Callous disadvantage and improve his Weath to Comfortable. He can be just a smarter-than-average pirate with a scientific bent, or a Master Villain with a secret island base stocked with clockpunk deathtraps and lethal organisms from around the world.

Alternate Dampiers

A pirate scientist requires a home culture which tolerates piracy yet values scientific inquiry. This opens up a number of possible alternate settings for William Dampier (or thinly-disguised duplicates).

The Mediterranean in the Hellenistic era between the death of Alexander and the rise of Rome is another age with vigorous science and plenty of piracy. Kranos the Sidonian could raid Carthaginian merchants and sail to distant India, then report his findings at the Museum of Alexandria.

Many space opera settings (including the *Traveller* universe) could feature a pirate scientist, possibly one putting aside his buccaneering past to command a scout expedition. A futuristic Dampier might well recruit some of his former pirate comrades for a mission of exploration -- or possibly get some naive scouts involved in a spot of raiding, just to cover the expenses of the voyage.

Infinite Dampier

William Dampier would be a good recruit for the Infinity Patrol, as his wide-ranging habits and keen powers of observation make him uniquely suited to spot Centrum incursions. He would also be good at scouting newly-discovered timelines at TL4 or below.

Of course, Dampier's pirate background would also make him an excellent crosstime criminal. As a swagman or "Time Pirate" he'd be uniquely dangerous because he takes the time to learn about the worlds he visits. Infinity agents might find themselves in the embarrassing position of having to ask a criminal if they can borrow his notes on an unknown world.

Finally, in a crosstime-swashbucklers game, Dampier and a band of comrades might be the first ones to notice that the late 17th century is being invaded by mysterious strangers with advanced technology. If the same mysterious strangers turn up in Cochin China and London's alleys, something big and weird is obviously going on. The Royal Society would naturally want a man with a good mind and a ready cutlass to get to the bottom of it.

Occult Dampier

The historical Dampier was a thoroughgoing skeptic and rationalist, always seeking a natural explanation and showing little patience for superstition. But in a world where magic really works, his curiosity and open-minded interest in exotic cultures could lead him to a unique understanding of the magical world.

While the notion of a pirate-scientist-magician has its appeal, it might be more interesting to keep Dampier as a non-mage, with hard-won Occult and Hidden Lore skills but no spellcasting ability. He could be a foe (or agent) of the Cabal, or a perfect investigator of Caribbean horrors in the "Seas of Daring, Seas of Dread" campaign frame from *GURPS Horror*. Equipped with the right magical items (or recruited from the afterlife), Dampier would be an ideal explorer of the Pearl-Bright Ocean or other exotic reaches of the Inner Realms.

Illuminated Dampier

William Dampier's first two voyages around the world are fairly well-documented in his books and the log of the HMS Roebuck. But his third voyage is almost completely unrecorded. What secret mission did his Masonic Templar masters send him on in 1711? Was he investigating the machinations of Shangri-La in southeast Asia? Or looking for the minions of Cthulhu or the Bermuda Triangle in the "Devil's Sea" south of Japan? The fact that Dampier's death and burial place are also undocumented suggests that his Secret Masters may have rewarded his loyal service with a new identity and a comfortable retirement.

Upgrades

For a more cinematic, swashbuckling William Dampier, increase his DX to 12, and add the advantages Combat Reflexes, Unfazeable, and Versatile. In settings with nonhuman aliens, his Broad-Mindedness might increase to Xenophilia.

Taboo or Not Taboo

I'm reluctant to write this column, since I'm afraid of it becoming perceived as my "Steven wonders what's so wrong about marrying your mother" column, but what the heck.

Anyway, I don't remember the exact circumstances why I started thinking about taboos. Perhaps it was attempting to think of how I was going to show off the fact that I was wearing the underwear that my World Yo-Yo Contest coworkers had adhered the iron-on contest patches (complete with "[Bandwidth Exceeded](#)" on the sides and "Staff" on the front), and I recalled my nudity taboos. Perhaps it was a coworker discussing his irritable bowel movement problem. Perhaps it was watching the *Mystery Science Theater 3000: Revenge of the Creature* episode, where it seems a woman is undressing seductively for a dog, and one of the comments is, "What is a taboo, really?"

Or perhaps it was inspired by the recent bruhaha over ***Grand Theft Auto: San Andreas*** and its hidden sexual content. (For some reason American society believes it's okay for 15-year-olds to pretend to be drug-dealing, pimping, cop-killing car thieves, but it's not okay for them to pretend to have sex. This is despite the fact that it's been scientifically proven that well over 67% of all people have been a byproduct of sexual contact, and that only one of the aforementioned activities will actually be legal for most 15-year-olds to do 1,096 days after purchasing the game. But I digress.)

Regardless, the thought got on my mind somehow, and it seems like as good an excuse as any to try to crank out a column. And it allows me to write off my Milton Bradley ***Taboo*** game on my taxes.

Anyway, taboos are interesting, because they aren't just things of which society doesn't approve. They're things of which society doesn't approve but *doesn't talk about*. In fact, the non-approval thing isn't even required . . . it could just be things they don't want to talk about period. Oh, and every society has them. Thus while, say, jaywalking, tax evasion, or even murder are all illegal, people still talk about them . . . often just to talk about the fact they're illegal, but sometimes to comment on whether or not they should be illegal. Compare this with, say, graphic depictions of bodily excretions on American television. They're illegal, despite the fact that, to the best of my knowledge, everyone excretes.

Anyway, every culture has taboos. I'd considered trying to deconstruct why that is, but it turns out that I don't know a lick about the subject, and the [Wikipedia article](#) I'd consulted originally summed up that some stranger out there knows more about the subject than I do, so I can include a link to them and be done with it.

What's interesting from a gaming standpoint, however, is that taboo subjects are almost tailor-made for gaming potential. They usually involve roleplaying and conflict, and they apply to everyone interacting with that culture. Perhaps the only downside is that the only way to work taboos into most games is to mention them in relation to taboos that gamers have in common, and . . . well, they wouldn't be taboo if they could be talked about.

But here at the Random Thought Table Institute of Contractually Mandated Word Count, that's never stopped us before, so let's press on with some ready-for-gaming examples. Suppose a culture believes that the dream world is of at least an equal importance as the waking one. Such a society might come to view any unnatural waking of a person to be taboo. Such a society would probably develop very alien habits (such as a couple sleeping in shifts around the birth of a new child, lest the infant's crying awaken the sleeping partner). However, hilarity could ensue if, say, the PCs woke up the town. This might be by accident, because of a pitched battle or other din; or because they felt it was the best course of action, such as the event of a fire. ("What, were we supposed to let you all sleep and be eaten by the dragon?!" "You would save our bodies by killing our dreamselves?!? *Get out of our village!*") Or, if the PCs know about a taboo ahead of time, an otherwise mundane adventure can be spiced up with the existence of such a cultural restriction; sure, stopping a raging fire would normally be easy for the heroes, but can they do it as quietly as possible, lest they gravely offend a politically important village?

More potential can be eked from taboos if two can somehow be brought into conflict. For example, much of the Western world finds the notion of marrying a first cousin to be taboo. However, it's a relatively established tradition in

other cultures, and it's easy to envision a society where the notion of *not* marrying a first cousin would be taboo. If a group of gamerly heroes was called to stand watch over such a wedding, they may feel squeamish . . . and even more so if their characters' roles are expected to officiate or sanction the marriage. (For what it's worth, science has determined that first cousin marriages are much less likely to have genetic abnormalities than previously thought. Of course, I'm not even sure if I *have* any first cousins, so it's nothing more than an academic issue for me.) Or perhaps one PC believes cannibalism -- the eating of human flesh -- to be a grave offense, while another believes that a deceased's soul can be assumed by eating his liver; these two would come in direct -- and interesting -- conflict if a companion or friend were to fall, and the latter was afraid of the dead's soul would be wasted and wink out of existence if not consumed.

Or, as another example, consider M. Night Shyamalan's *The Village* which takes place in [SPOILER ALERT!] a village. [END SPOILER ALERT] The people in this place view the color red as a dangerous, taboo color; although it was never mentioned in the movie, upon watching it I was curious how such a cultural restriction made their women feel every month, and whether such a taboo strengthened or merely explained (for them) the society's normal squeamishness in talking about women's cycles.

When designing a new culture or organization -- either for players or NPCs -- one fruitful avenue can be to work out what their unusual taboos are (feeling free to assume the baseline obvious ones that most cultures find repugnant). Ideally, players can work these out with the GM ahead of time for their characters, so that the other players don't know what a PC's restrictions are; then, when they come up, the players can all fully enjoy the one character's discomfort, since part of what makes a taboo taboo is not being able to talk about it very well. ("What is it, Roalf? Do you not like to hear men singing? Do you disapprove of their robes? Is it the fact that two brothers are singing together? . . .")

Although the goal isn't to make the players uncomfortable, making the characters uncomfortable is all jolly good fun. And hopefully the players will enjoy themselves, even if they don't feel comfortable talking about it.

Pyramid Review

The World of Darkness Storytelling System Rulebook

Published by [White Wolf Game Studio](#)

Written by Bill Bridges, Rick Chillot, Ken Cliffe, & Mike Lee

Illustrated by Thorn Ang, Sam Araya, Tim Bradstreet, Jeremy Jarvis, Becky Jollensten, Michael Kaluta, David Leri, Jason Manley, Mark Nelson, Jean-Sebastien Rossbach, Greg Ruth, Christopher Shy, Durwin Talon, Josh Timbrook, & Jamie Tolugson

226-Page Black & White Hardback; \$20

The World of Darkness is dead. The setting that spawned a handful or two of RPGs, made roleplaying cool, and in the "live" versions made it really hip, is no more. White Wolf began the process with [Gehenna](#) and continued through the other *Time of Judgement* titles. Of course, this was not a case of pulling of the plug, but a mere click of the reset switch.

Thus it returns, this time in a "One book to rule them, and in the World of Darkness bind them" format. *The World of Darkness Storytelling System Rulebook* provides the mechanical nuts and bolts along with a little philosophical musing that together underpins all future releases, beginning with *Vampire: the Requiem* and followed by *Werewolf: The Forsaken* and *Mage: The Awakening*.

Presented in an attractive dark blue hardback, the rules for the new World of Darkness are not wholly new, but drawn from previous iterations, including *Vampire Revised* and [Adventure!](#) They are clearly written and explained, and the overall impression is that this volume allows the rules space to breathe and exist on their own away from the heavy supernatural elements of previous versions. For the most part, the book is attractively illustrated, the many pieces contributing to the subtle sense of foreboding that hints at the horrors lurking out there. What is very obvious is the effort made to make the book easy-to-use and there are none of the editorial errors present that marred previous books.

The first changes come with character generation. Characters are still defined by nine attributes divided into three categories, Mental, Physical, and Social, further divided into three different applications: Power, Finesse, or Resistance. This is reminiscent of the original *DC Heroes RPG*, so for Physical attributes, the Strength attribute corresponds to the Power use, Dexterity to the Finesse use, and Stamina the Resistance use. Physical attributes remain unchanged, but under the Mental attributes, Resolve replaces Perception, while Presence and Composure replace Appearance and Charisma. A player still needs to prioritize the attributes, but has fewer points to assign to reflect the fact that a character is merely mortal and not a supernatural creature.

Likewise, a player has fewer points to assign to skills, but there are actually fewer skills anyway. Skills are categorized like attributes -- Mental, Physical, and Social -- replacing the previous Talents, Skills, and Knowledges. Variety is added by assigning three specialities to skills, each of which gives an extra dot to the skill. In addition, seven points are spent on Merits, a mixture of previous rules' Backgrounds, plus more extensive training and innate abilities. The most notable changes include making languages an expensive Merit that need to be bought in terms of fluency; and martial art fighting styles, like boxing and kung fu purchased as maneuvers. The other advantage to the fighting styles is that they enable multiple actions in combat, which are otherwise forbidden. The Merits are generally mundane and expensive, and some like Strong Back and Strong Lungs are of relatively little use. Players will probably appreciate

that many Merits can be purchased later on with Experience Points.

Another change is the replacement of the Nature and Demeanor method of handling character personality with the Virtue and Vice system. Each character possesses one of the seven Deadly Sins and the seven major Virtues, very much in the Western tradition. Hopefully a future supplement will explore other traditions, but they are more easily grasped and played than the previous Natures and Demeanors. Similarly though, by playing to either his Virtue or Vice, a character can regain a measure of his Willpower.

What the rules define as Advantages are better described as derived traits. Both Virtue and vice are among them, but the others are Defense, Health, Initiative, Morality, Size, Speed, and Willpower. Perhaps the most interesting of these is Morality. Other games set in the World of Darkness will call this something else -- for example, it is called Humanity in *Vampire: The Requiem*, Harmony in *Werewolf: The Forsaken*, and possibly Hubris for *Mage: The Awakening*. For the mere mortal, Morality represents a measure of his compassion for others and respect for the rule of law. It can be lost by committing immoral acts, which not only lowers a character's moral standards, it also increases the chances of him acquiring a derangement, such as depression, hysteria, or paranoia. A derangement can be lost if a character improves his Morality and even reacquired if it again drops.

Another notable omission is that of Freebie points, which previously allowed a player to buy anything else for his character. Characters have just what they are given, nor can they gain extra points by picking Flaws as in the old Merits and Flaws system. Flaws are present, but only as an option, and a character can only have the one. Rather than providing points to spend, a Flaw rewards a player with extra Experience Points when the Flaw comes into play during a game.

Mechanically, the Storytelling System still employs dice pools. Ten-sided dice are rolled, with results of eight and above being considered a success, and rolls of ten allowing further rolls. The value of successes never changes, but the size of the dice pool does. From a core pool equal to attribute plus skill, dice are added or lost depending upon circumstances and equipment used. Indeed, no little space is spent going over the bonuses an item of equipment imparts, including (for example) the right clothes, a good pick-up line, and so on for the Seduction skill.

Also lost, are rules for rolling a "Botch." Rolls of one do not negate success rolls, and the only chance of dramatic failure occurs when a dice pool is reduced to a single die or less. A single die is still rolled, but as a "Chance" roll, only a straight result of ten succeeds, while a result of one still results in a dramatic failure.

Combat has been radically excised, stripping out the previous system of multiple rolls to handle combat to just a single roll in most cases. Initiative rolls last for a whole combat scene, and attacks work like standard rolls: attribute plus skill, with modifiers for an opponent's armor and Defense value, as well as the expected ones. The number of successes rolled translates to the damage inflicted and deducted from a character's Health. Under previous versions of the rules, a Soak roll might have negated some of this damage, but the new rules loses this, resulting in a combat system that is not only quicker, but potentially far more deadly.

One curiosity is that weapons increase an attacker's dice pool, and while this is clearly designed to reflect the increased damage, say, an Ax (curiously spelt without the "e") can inflict, it has the side effect of enhancing a character's chance to hit. One way to overcome this wrinkle in the rules would to roll the bonus dice after a character has successfully hit as purely damage dice, though this adds another dice roll to what is intended to be a slick system. Firearms work slightly differently in that they ignore a character's Defense trait, making them correspondingly more lethal, and while armor provides some protection, the best options are either to find cover fast, or shoot first.

The rules cover all of the situations that you would expect a modern horror RPG to deal with, including damaging objects, handling car chases, and so on. It does not as such handle insanity caused by external outré threats as do other RPGs, but this reflects more the internal and personal nature of the horror in the *World of Darkness*. Actual advice on running the game is not new, but is at least well-explained.

The nature of the World of Darkness is explored at length, but not really in depth, more hinting at things. It is a dangerous and depressing place, and on the fringes might lurk "something," hints of which comes through the color fiction. The nearest it gets to a supernatural protagonist is one or two types of ghost, useful at least to get a game going

along with several other ideas. It would be easy enough to adapt threats from other sources beyond the simple ghost.

As a generic horror RPG, ***The World of Darkness Storytelling System Rulebook*** is lacking in terms of setting and protagonists. But in laying down the basic rules and mechanics for the rest of the ***World of Darkness*** titles to come, it succeeds in presenting them in a clear and lucid fashion. Diehard devotees of previous versions of the rules will probably find much here to dislike and grumble at, but streamlined and given room to breath in a book of their own, the new ***World of Darkness Storytelling System*** feels easier and less obtrusive.

--*Matthew Pook*

Eihort: Lord of the Primal Labyrinth

Re-Imagining a Great Old One for *Call of Cthulhu*

by J. Edward Tremlett

"Dr. Allred was, at 29 years old, an utterly brilliant mathematician. He had stunned his older colleagues at M.I.T. with tantalizing new ideas in geometry. The final proofs were decades away, of course, but they said he was making 'amazing' progress.

"They also said he was making them uneasy with his increasingly odd behavior. When he wasn't feverishly working on his ideas in his office he was ranting and raving. He threw objects around his room, and walked in endless, unseen patterns while 'thinking aloud.' All his chalkboards were filled with seemingly-nonsensical digressions, but Allred insisted that they tied into his theories -- he just needed more time to prove it.

"He never got that time. After he didn't show up at work for two days in a row, they found him dead at home -- slumped over the desk in his study. A heart attack or an embolism brought by stress, we thought. Perhaps a tumor.

"But when we opened him up on the autopsy table, we found that his skull was perfectly hollow: his brain had simply vanished . . . "

In ["Still Calling After All of These Years,"](#) I suggested that one way to keep *Call of Cthulhu* interesting to veteran players was to never let the "big guns" be *seen* -- only felt. This not only amplifies the mystery and fear of the "keystone" entities of the game, but allows lesser-known creatures to get their due. I also suggested taking established creatures and shaking them up to keep players guessing.

Those ideas in mind, I've reworked one of the Great Old Ones: the subterranean bulk known as Eihort. As written, this English GOO is pretty pointless, as its only real use is to make friends and acquaintances go insane, and then die a gross and messy death. Eihort may underline the idea that you shouldn't call up what you can't put down, but that can also be said of any entity with a deadly attack of 85% or more.

Hopefully, this redoing of the Great Old One will provide a more compelling reason for it to exist within the Mythos. Changes to its stats have been noted, and its new abilities and weaknesses are highlighted. There are also a number of Scenario Seeds at the end, and links to pages of interest.

All page number references are for *Call of Cthulhu ed. 5.5*, unless otherwise noted.

Myth

To those who seek it, Eihort is called The Lord of the Primal Labyrinth, the Walker of the Sacred Roads, and The Invisible Fire That Works In Secret. Some equate it with the Greek notion of the Eidolon: the "higher" consciousness within us all. Others believe that it is one of the Angels, given how it appears in its natural state, or one of the Gods of Wisdom of ancient Egypt, Greece, or Rome.

Eihort is sought by scholars who desire knowledge beyond the scope of current learning: those who are tantalized with visions of possibility, but cannot make them happen. It is said that those who seek it will not find it, but those who earnestly seek *truth* will attract its attentions. And these earnest petitioners can make a Bargain with Eihort, and be shown the way to their dreams . . .

They also say that Eihort is a monster: a large, grublike creature that dwells under the Brichester Labyrinth, in England's Severn Valley. To call on it is to become its mate, and to mate with Eihort is to be filled with millions of its

eggs.

After a year of insane dreams and ravings, the eggs hatch. A host of squirming, white grubs pour out of the monster's lover, leaving behind an empty bag of skin and bones. And the brood then dig down into the earth, seeking to rejoin their creator in its burrow.

Truth

Eihort is a massively-powerful, ethereal thought-parasite. As an immortal, alien creature, it is grouped with the Great Old Ones. But it is unique among its "brothers" in that has no real body, and exists only within the groupmind created by humanity. In that sense, the Great Old One really *is* The Lord of the Primal Labyrinth: the human mind.

It has been within Humanity since the dawn of our race. The creature lives inside the pulse of human thought, both everywhere and nowhere, and is kept alive by the emotional and mental wavelengths that reverberate within.

Its reach may even extend beyond Earth, as any sentient being with the capability of imagination could be linked to it by their brain, or whatever organ passes for one. It could also be confined (imprisoned?) on this planet, like so many of its "brothers." But then, given its near-lack of imagination, it may simply have no thoughts of reaching outside this world.

Appearance

Eihort has two descriptions. One is an ethereal, almost angelic presence, composed of "burning wheels, white angel's wings and wise, ancient eyes." The other is an off-white and maggoty bulk that is ringed with stubby legs, and has cluster of black eyes at the "front." Lipless, sucking "mouths" occasionally open and close on its body, but not to speak -- only to suck, paralyze, pull in, and crush the unfortunate.

Both descriptions are accurate. The former is how Eihort appears in its natural environment of the groupmind, and how it prefers to reveal itself to humans -- knowing full well that it will awe and mystify them. it can take other, more "human" appearances as well, often posing as a god or goddess of wisdom when it does.

The physical form is not mutable: Eihort must assume it when it folds itself down into the physical world. The only time Eihort does this is if a litter of its brood is being purposefully destroyed, or if someone is destroying a True Labyrinth (see below).

Eihort's voice has been described as a fatherly, wise-sounding chorus, or a host of angels speaking as one. When it speaks to a supplicant, or potential Bargainer, it is the quintessence of comforting philosophers. And when it screams in rage, human minds are stomped flat.

Behavior

The creature is something of a paradox: while Eihort lives off the imagination of others, and is highly intelligent, it has very little imagination of its own.

In general, it's content to simply survive, using its vantage point to watch Humanity as they stumble forward to their date with cosmic doom. it *does*, however, contain a degree of emotion which we might call "selfishness," which could explain its interactions with Humanity.

Eihort can observe individual minds, but does not usually think to do so. However, theoretical explorations of the physical world are like nectar to it, and those minds which take mathematics, geometry, physics, and other such fields as far as they can go -- and then beyond that limit -- attract its baleful gaze.

Once these visionaries' great ideas force Eihort to recognize its own lack of imagination, it covets what they have, and

seeks to add it to itself. Such worthy individuals are visited by Eihort in their dreams, and given small visions of the ideas that yet elude them (SAN Loss 0/1).

If the individuals never go anywhere with these alien ideas, then Eihort soon forgets them, and turns its attentions elsewhere. But if they can take their current researches up toward the ideas it gave them, Eihort deems them worthy of its Bargain.

It appears to these worthies in a more potent dream (SAN Loss 1/1d3), and gives them the clues needed to make direct contact with it. This leads them to the creation of a True Labyrinth (see below), and an ethereal audience with Eihort, where it makes the offer.

Eihort appears in its ethereal form, and identifies itself as the truth the person has sought (and the author of his visions, if he's had them). It then asks if he considers himself worthy of seeing more, and would enter its Bargain freely.

Those who refuse are sucked dry of their drive and imagination by Eihort's Scream, and exist thereafter as brain-dead shells. Those who accept its Bargain are implanted with its Brood: small congealed pieces of Eihort which are psychically injected into the Pilgrim's brain.

The Brood act both as additional nodes of thought for the "pupil," and a direct line to Eihort. The Great Old One basks in the increased brainwaves its new, altered pupil puts out -- not really caring that the human brain was not meant to operate with piece of an alien god inside it.

When the pupil begins to crack under the mental strain, Eihort "pacifies" her with a flood of new revelations (SAN Loss 1d3/1d8). When the pupil begins to go mad from the flood of alien ideas, Eihort reaches a point of sheer ecstasy.

And when the pupil finally loses control of her mind, and dies, the Brood come forth . . .

The True Labyrinth

Much as Eihort has been with humanity since its beginnings, so have Labyrinths. The earliest examples come from Greek and Roman antiquity, but labyrinthine structures have been found all over the world, and used by many cultures as engines of spiritual transcendence. For untold ages, Pilgrims seeking understanding have walked them, seeking the connection between the physical and supernatural worlds via their arcane mathematics, or sacred geometry.

Labyrinths are also a means by which to directly interact with Eihort, as it *is* the Lord of the Primal Labyrinth. Doing this requires the construction of a True Labyrinth: a structure dedicated to Eihort (See Spells, below).

Once finished, a True Labyrinth looks like any other, but the difference is made clear when its paths are walked by a person who knows how to use it. The Pilgrim must walk (and *never* run) those paths with the utmost concentration, speaking one of the secret names of Eihort with each step. And as he ventures deeper towards the goal, he sees the Labyrinth's lines waver and shift in their position, as what is outside the outer wall becomes hazy and indistinct.

This distortion increases the deeper one goes in, until the lines are seen to overlap one another, and what is outside cannot be seen at all. Meanwhile, those outside find the Pilgrim hard to focus upon, as though he was a mirage . . .

Once the Pilgrim reaches the goal, in the center, the Pilgrim is seen to disappear. For him, however, the Labyrinth turns itself inside out, he loses one Magic Point, and finds himself in another maze -- the folds of his own brain, lit up with pulsing synaptic fire. (SAN Loss 1/1d3 to have it happen, or 1d3/1d8 if he realizes where he is.)

The Pilgrim must then wander the primal labyrinth of his own mind for 1d4 hours, free from the constraints of gravity and oxygen, until Eihort can find her.

Eihort's Bargain, and Brood

Those pupils who make the Bargain with Eihort are given a singular boon: the Brood of the Great Old One are implanted within their brains, increasing their Intelligence by 1 for each Brood that Eihort chooses to give (between 1d6 and 2d4, depending on reasons known only to it).

The pupils also receive personal interest points equal to 10 times the extra INT they have just acquired. These points must be placed in the Skills that attracted Eihort to them, and may take the pupil's score past 100%. (If it takes it past 90%, they do *not* get a SAN increase).

This increase in their Intelligence is not without cost: the Brood are unstable, alien things, and their presence inside the brain leads to insanity and death. Every 28 days after the Bargain is made, the Brood try to replicate themselves, and the pupil must roll her POW against her new INT on the Resistance Table to stop them.

If her POW wins, she loses 1/1d4 SAN, but keeps the Brood from dividing. If her INT wins, however, 1d3 more Brood come into being, along with more INT and Interest Points. However, she loses 1d4/1d8 SAN from the visions the new Brood give her, and she takes 1d3 CON and 1d3 Hit Points of damage due to the brain damage that's caused.

The Brood are kind enough to repair the Hit Points from brainbleed and the like, but the CON is gone for good. And if the pupil is foolish enough to call on Eihort for help, it just floods her with more visions of the unattainable, costing her 1d3/1d8 SAN per revelation.

This state of affairs continues until the pupil either goes Permanently Insane, loses all CON, or dies from Hit Point loss. When this happens, the Brood devour the brain, and engage in rapid division. The swarm of creatures -- numbering into the hundreds -- then exit the skull en masse (SAN Loss to see this happen is 1d4/1d8) and trundle off in an exodus of bloated, white spiderthings.

This new Brood swarm may go back to join Eihort via the nearest True Labyrinth, or else mimic a human form to lead others to Eihort. The best way to represent these latter creatures, made of swarming Brood in a human shape, is to use the stats for Crawling Ones (***Creature Companion***, pp. 17 -- 18). Unlike Crawling Ones, the Brood can speak -- in a strange, sibilant chorus -- and gnaw flesh down to the bone in minutes if left with an immobile target.

There's always a chance that a few of the Brood might retain strong traces of the pupil's personality. These "Rogue Brood" are often swarmed over and eaten by their littermates, who don't tolerate dissent in their private Groupmind. But if these Rogues can get away from the crowd, it is possible for them to find a kindred spirit and latch onto him, thus escaping Eihort forever.

The Rogue creature touches the human, turns itself into a thought, and slides into her mind. Pieces of the Brood's memories, ideas, intelligence and personality are woven into her thoughts, and the Brood ceases to exist as an individual, sentient being. Over time, the fragments of the person's life will tumble loose in the mind, causing new quirks and talents to manifest. Memories will most likely be passed off as imaginings, though.

Discovering the Lord

The following items and books contain clues by which Eihort can be discovered. Keepers are, as always, free to invent more.

Unausprechlichen Kulte (Nameless Cults)

One of the chapters in Von Junzt's infamous book speaks of a secretive brotherhood of "men of great mathematical achievement" in Paris, France. They called themselves the "Seekers of Hidden Learning" and claimed to be part of an unbroken line of Seekers, going all the way back to Classical Greece.

The Seekers walked the labyrinths of the French Cathedrals as pilgrimage to the Eidolon: embodied as a translucent angel with many wings. They claimed

Revelations of Glaaki

Volume 4 of both the original and published version of this Mythos Tome are said to contain the straight dope on Eihort, including the spell to

that they could call upon it in lucid dreams, and speak to it for guidance, but also knew a way to *visit* the Eidolon. (Von Junzt made a copy of their instructions before fleeing the cult.)

The original, German version and Bridewell English translation of the book have information on the Seekers, and the spells "Seek the Eidolon" (Contact Deity -- Eihort), and "Walk of Truth" (Create True Labyrinth). The Golden Goblyn edition has the information, but only descriptions of the spells. (Stats for all editions are on pg. 88.)

Contact him. I don't like the way that "Revelations" winds up being a one-stop shop for all of Ramsey Campbell's monsters, though, and have limited it to information about Glaaki, and that GOO's relations with others of its kind. Feel free to ignore my moldy-fig revisionism, though.

We Pass From View

This hard-to-find, vanity press book (The Light Press, 1964) contains the metaphysical ramblings of the late Roland Franklyn -- leader of a small ecstatic cult in Brichester, England. Eihort is mentioned by name, and placed within a framework of "higher presences" that reads like a dope-fiend magician's eclectic mishmash of pantheons.

Franklyn's intriguing views on simultaneous reincarnation are most likely sparked by rogue Brood latching onto a kindred spirit. His views on needing to cremate a body to achieve reincarnation, so as to avoid being eaten by Eihort's Brood, are false, as is most of the information it has about Eihort -- past its being Lord of the Primal Labyrinth.

We Pass From View **does** contain the secret names of Eihort, but they're hopelessly scattered throughout the other "higher presences." It also has the "Call Eihort" (Contact Deity -- Eihort) spell.

San Loss is 1d3/1d6, +2 Cthulhu Mythos, two weeks to study and comprehend.

The Pylos Tablet

The earliest record of Labyrinths comes from inscriptions on a clay tablet, found near Pylos, Greece and dated to around 1200 BCE. The tablet was shattered into fragments, and had to be painstakingly reconstructed. Once it was, the inscriptions could be read, but while the words are understood, their meanings have yet to be satisfactorily explained.

In fact, those words are the secret names of Eihort, along with a promise of "great wisdom" to those who seek it out. Anyone who looks at a decent photograph of the tablet -- or sees it where it rests, in the back room of a decrepit museum in Athens, Greece -- can learn the "Contact Deity -- Eihort" spell.

San Loss 1/1d3, +1 Cthulhu Mythos, and it can be read and understood in a day so long as one makes a Read/Write Ancient Greek roll.

Statistics

Eihort's physical form -- an echo of a monstrous, walking brain -- is as described in *Call of Cthulhu*, pp. 165-166. Its Sanity Loss, Weapons, and Armor are still valid, but note that it will not implant its brood into anyone while physical, nor make its Scream attack. It will Crush or Bite foes, instead.

Any who are Bitten -- and paralyzed by the neurotoxin it drools from its mouths -- will be sucked into the beast within one round. Once inside, they will be Crushed for 5d6 damage, and then have their pulverized remains geysered out of a "blowhole" on its top. (1d3/1d8 San to be covered in the still-steaming, mostly-liquid remains of a companion.)

If brought to zero hit points, Eihort silently fades away like mist. It cannot return to the world for 28 days, even if it takes a new "pupil" in that time. By the time the ban is lifted, it will most likely have forgotten the Investigators, unless they've used the time to hurt it even more.

When in ethereal form, inside the groupmind, Eihort has the same physical stats. However, it can only be harmed by

magical means while there. If reduced to zero Hit Points, it fades away, and the supplicant either wakes up from his dream, or comes back to the center of the True Labyrinth.

While ethereal, Eihort can only attack by Spells, or Screaming. It could also assume a shape that would cause San Loss, but doesn't often think to do this, due to its near-lack of imagination. Maximum San Loss is 1d6/1d20, just like its physical form.

To Scream, Eihort uses its Groupmind connection to the victim to suck the creativity and drive out of his brain. The "scream" is actually the cacophony of thoughts and ideas being ripped from a human mind, swirled around and then sucked into Eihort.

Eihort spends one MP to Scream, and pits its POW of 30 against the POW of the victim on the Resistance Table. If it wins it does 1d3 points of INT damage. If the victim wins, she retains hold of her thoughts. The INT damage is permanent.

Once it starts to Scream, Eihort does not stop until the victim is bled dry of INT. Such unfortunates are vegetables, stuck their own minds, with their brains left flat and featureless by the ordeal.

Spells

Balk Brood works as described on pg. 192. If Eihort does appear, it explodes out of the skull of the person who made the Bargain, taking the physical form described on pp. 165-166 (with attendant Sanity Loss) to attack. This, of course, kills the patient.

Contact Deity -- Eihort works mostly as described on pg. 200, with the exception that Eihort will *never* appear physically, but in a dream.

Create True Labyrinth: (*New Spell*) The means by which one may "physically" visit Eihort, this requires that the caster make the Labyrinth under the Gibbous Moon, constantly repeating the secret names of Eihort while working. it doesn't *have* to be done in one night, but work can only be done on it during that phase of the Moon. At the completion, the caster sacrifices 1 POW, dedicating the structure to Eihort.

The Labyrinth can be as simple as lines drawn on the ground with a sharp stick, or as ornate as a modern building. So long as the structure is relatively intact, Pilgrims need only walk it, whispering the many secret names of Eihort as they go. And they will -- with the expenditure of 1 MP -- visit the GOO within their own minds once they reach the center.

Adventure Seeds

The Brichester Labyrinth

It's no accident that there's a Labyrinth in the same town Roland Franklyn's small cult came from. Brichester was once home to a group like Paris' Seekers of Hidden Learning. They built a True Labyrinth there, and walked it often.

The nameless group collapsed some time before Franklyn was even born: the Bargain took them, one by one. Their records and notes were scattered, some winding up in Brichester University.

In the 1960's, Franklyn -- who briefly attended studies there -- stole those records, along with a few other occult books. He used this information to write his book and form his cult, and things went from there.

The Labyrinth sits on a hill a mile outside of town. Its walls were made of small, fist-sized rocks laid down in circular paths, but neglect has rendered the structure impotent. It could be put True once more with a single night's work, though . . .

Eihort Online:

Labyrinths have a nearly-universal attraction, and in these days of "new age" thinking, they are seen as a means to improve the mind and purify the soul. The latest innovation is to make virtual labyrinths, in which Pilgrims follow a graphics program, or other means, to "travel without moving."

It wouldn't be too difficult for someone to program a True Labyrinth. Anyone who wanted to meet up with Eihort would need only to follow it while thinking the names of the Great Old One. They would seem to vanish right in front of their computer, and come right back once the Bargain was made . . .

The French Connection

France holds a place of distinction among Labyrinth enthusiasts, due to the number of Labyrinths in its Cathedrals. Chartres, St. Omer, Amiens, St. Quentin, and Bayeux all have Medieval Labyrinths in them. And Pilgrims still walk those sacred roads, just as the Seekers of Hidden Learning did.

But are the Seekers still around, wandering those Labyrinths as homage to the Eidolon? Are they still willing to let in outsiders after the betrayal of Von Junzt? And does one or more of the Cathedrals of France have a True Labyrinth within it . . . ?

The Seeker in the Shadows

Investigators hear of a club of architects who meet at the New Moon. The club is run by a masked figure, who is rightly called "Genius," as he (or she) seems to know things well beyond current understanding.

It turns out the Genius is a Brood swarm that has assumed human form, and is bringing pupils to Eihort, one Bargain at a time. But what on Earth could these compromised architects be building . . . ?

Invitation to the Dance

by William H. Stoddard

One thing many roleplayers think of trying, at one time or another, is encounters or scenarios focused on social interaction rather than combat. Some players want to try characters who are better at persuasion than fighting: bards, courtesans, diplomats, lawyers, or merchants, for example. And some game masters would like to see how all the characters, including the absent-minded wizards and the strong, silent warriors, cope with social interaction.

But running scenes of social interaction can have problems. The natural thing to do is tell the players, "Just . . . you know . . . roleplay." Everyone can talk, after all, and social interaction is just talking. But a group of players sitting around talking, in the personas of their characters, has a certain formlessness; it's too much like what players do anyway, during slow phases in an action story, and then stop doing when the next fight starts. And without rules and game mechanics, the articulate players will naturally do the most talking, and dominate the social scenes. A tongue-tied player can't easily take the role of a herald or salesman -- even though a clumsy or timid player could take the role of a warrior or assassin. Ironically, the situations that seem to call most for roleplaying make it hardest actually to assume a role different from one's own personality.

But it's tricky to come up with rules for social interaction. Fights and battles have a natural structure. They don't just drag on and on, until someone gets bored and starts a conversation or a shopping trip out of boredom. They have a beginning, with the first combat move, and an end, when the last foe retreats or dies; they have a sequence; they have a series of successes and failures as they develop. The scenes many players first think of as "social interaction" don't have any of that; they're just people talking with each other.

However, many social situations do have a structure. One example is the formal dance. It's possible to play out such a dance as a series of encounters that add up to a larger whole, just as a series of combats add up to a battle. Most systems of game mechanics provide rules and mechanisms that can represent these encounters. Here, then, are guidelines for roleplaying a dance as a scenario.

This treatment uses **GURPS** rules for skill and rolls, but many other game systems provide comparable mechanics for handling social interactions. Many of the rolls are treated as Influence rolls (that is, Quick Contests of one character's skill against another's Will), but GMs may choose to let players go by reaction rolls instead, if their characters have the relevant skills only at default.

What Kind of Event Is This?

Dances come in many styles, from drunken brawls to elaborately ritualized courtly entertainments. To make this event interesting for player characters, we assume the following:

- Men are going to dance with women, pairing up in some way.
- Either men and women arrive in separate parties, or if they arrive as couples, it's accepted that they'll split up and dance with other partners.
- A lot of unmarried people will be attending the dance and looking each other over.
- The doors aren't open to anyone who cares to walk in; either formal invitations or tickets purchased in advance are required.

(This doesn't pin things down very hard; it could be an American senior prom or a colonial Spanish fandango. But it excludes, for example, a bunch of drunken Russians forming a dance line in a tavern; the dramatic tensions and roleplaying opportunities there are different.)

Making an Entrance

The first thing that happens at a dance is that people arrive. This isn't just a matter of quietly slipping in; the goal is to make an impression.

First, determine the order in which people arrive. If all the player characters are going to arrive as a group, they only need to specify "early" or "late." If each is going to come separately, alone or with a party, have each player roll one die, with 1s arriving at the outset and 6s not showing up until the dancing is already in progress.

To give the player characters someone to interact with other than each other, create some individual NPCs, at least one per player character. If the player characters are all the same sex, the NPCs should all be the other sex; if the player characters are mixed, the NPCs should be as well. Determine when these individual NPCs arrive. If the dance has specific hosts, or chaperones, create them as NPCs also, but assume they're there from the start.

There will also be a pool of background NPCs; assume that they arrive in groups and don't individually stand out. If there are identifiable groups in the setting, mention what those groups are and when each arrives.

In the order in which characters arrive, determine what kind of impression each one makes. In **GURPS** terms, this is a roll against Savoir-Faire (High Society). However, it's influenced by the character's appearance; apply the opposite sex reaction modifiers for attractiveness or unattractiveness. Treat this as a multiperson Quick Contest, in which the goal is to attain the greatest degree of success or the least degree of failure. Any character who achieves a critical success will be universally admired; any character who suffers a critical failure will commit some embarrassing faux pas, from stumbling at the threshold (roll vs. DX or Acrobatics to avoid actually falling down, but in any case, he will visibly plunge forward, out of balance) to fleeing the room in panic at the crowd. The character's mental disadvantages may suggest a suitable failure mode.

Clothes Make the Man

At the GM's discretion, the quality of a character's garments may influence the initial impression. Treat this as modification of a nontechnological skill by equipment quality. Start by defining the Status of the dance, based on the average Status of the people invited or expected to attend. Basic equipment is formal wear for this Status, costing 40% of monthly cost of living. Good formal wear costs 5× basic price and gives +1 to Savoir-Faire; fine formal wear costs 20× basic price and gives +2 to Savoir-Faire. Both sorts must be tailored for the individual wearer, rather than bought off the rack; this takes an hour of actual work, but a business will normally promise to finish the job the next day, to gain flexibility in scheduling. In addition to these bonuses, a character with Fashion Sense can gain an extra +1 (or grant it to another character whose clothes he helps pick out).

A character who doesn't own formal wear -- usually because the event's above his Status -- can go out and buy some, paying the necessary high price. If he has Merchant skill, he can try to get it for less. Or he can find it with a Scrounging roll and a few hours in the garment district or at old clothes dealers or thrift stores. Treat the Status of the outfit as a negative modifier to Scrounging skill; for example, finding a high society evening gown (Status 4) would require a roll against Scrounging-4. Scrounged clothing typically costs about 10% of the price of new clothing, and sometimes may be had for nothing, but it counts as improvised equipment, giving -2 to Savoir-Faire. (The +1 from Fashion Sense can partially counterbalance this.) A critical success on Scrounging may avoid the penalty. Finally, an Heir, or a character with a suitable Patron, Ally, or Contact, may be able to obtain formal wear as a favor; its quality is up to the GM's judgment.

A character with the skill of Sewing can try to modify a scrounged garment into something more appropriate to the occasion. Fashion Sense gives +1 to effective skill. A character who is working on clothing for himself is at -1 to effective skill, because he can't easily work on the garment while he's wearing it. A success produces a garment that looks as good as standard formal wear for a garment with the same Status. A critical success raises the garment's Status by 1. The standard time required for this kind of modification is one day.

Invite players to describe how their characters are dressed, and what sort of effect they're aiming for. At the GM's discretion, a good description can be worth an extra +1 to Savoir-Faire.

Change Lobsters and Dance

Once most of the characters have arrived, the actual dancing can start. Each dance requires at least two tasks of characters who participate in it: finding a partner, and actually dancing.

In American customs, and those of many other cultures, the traditional rule is that men ask women to dance, and women either accept or reject such invitations. GMs may follow this rule, or switch the roles, or assume that either sex can ask the other. These rules will assume the traditional custom; anyone who prefers not to can translate "man" into "person who invites another person to dance" and "woman" into "person who accepts or rejects an invitation to dance."

As each dance is getting started, men will be looking around for partners. To start with, players whose characters are male can simply pick women their characters would like to dance with. However, they may have competition, either from other player characters or from NPCs. Assume that any woman whose initial impression roll was a success will have one NPC asking her to dance, and that any woman whose initial impression roll was a critical success will have 1d NPC attending her. To be the first to ask her, a man needs to succeed in a Quick Contest of Perception against any other men who are interested. Alternatively, he can pick a woman whose initial impression roll was a failure, or look for a woman in the pool of background NPCs; a successful Perception roll will find such a woman who's open to an invitation to dance.

Asking a woman to dance requires an Influence roll, a Quick Contest of the man's skill vs. the woman's Will. If the man wins the contest, the woman dances with him; if he loses, she tells him she doesn't care to dance. The usual skill for such invitations is Savoir-Faire. However, Dancing skill may be substituted for Savoir-Faire; it's reasonable to assume that anyone who has learned to dance has also learned to ask for a dance. Another applicable skill is Sex Appeal, but only with a partner who might conceivably find the man appealing; a heterosexual man, a lesbian, or an adult woman approached by a twelve-year-old won't respond to such an approach.

What if the player character is a woman? If she made a favorable impression, she'll have at least one male NPC asking her for each dance, plus any male player characters who wish to do so. The player can decide whether she accepts or rejects an invitation, without a Will roll, but a roll against the NPC's Dancing, Savoir-Faire, or Sex Appeal can indicate how appealing his approach is. Otherwise, she can spot a suitable male NPC with a Perception roll, and suggest to him that she might be receptive to an invitation with an Influence roll, based on either Savoir-Faire or Sex Appeal, but not on Dancing skill. If he asks, she should accept.

A player who comes up with good dialogue may be given +1 to the Influence roll, at the GM's discretion. The GM may also decide that a given NPC is eager to find partners (+1 to +3) or very cautious about being seen with an undesirable partner (-1 to -3).

Once the dance starts, both partners roll against Dancing skill, if the dance is familiar, or Dancing-3, if it's unfamiliar. A success indicates that the character danced well and was enjoyable to dance with; a critical success indicates that the character danced brilliantly and was generally admired. Failure means that the character was stiff or awkward and not a good partner; failure by more than 4 points means that the character got the steps completely wrong. Critical failure indicates some sort of social disaster; GMs may choose to require a Fright Check.

Dances come in three basic types: couples dances, where the partners maintain some form of physical contact; line dances, where they face each other and follow each other's movements (some current dance styles can be treated as freeform variants on this form); and circle dances, where the partners are part of a larger group. Depending on the cultural background, all dances may be of one type, or different types may alternate.

In couples dances, if one partner fails a Dancing roll, and the other succeeds by a greater margin, the one who succeeds can make the one who fails look good. Both of them will know, but other people won't usually notice. Anyone who specifically watches such a couple, and makes a Perception-based Dancing roll, will figure it out, though.

In couples and line dances, either partner can attempt a Sex Appeal roll during the dance. This can represent anything from flirtatious glances to a close embrace. Treat this as an Influence roll; the goal may be either to ask for another

dance, or to invite one's partner to sit the next dance out, leading to private conversation, a visit to the punchbowl, or a stroll on a moonlit balcony.

Having a map board, with individual characters represented by tokens or figures, can be a help in playing out such scenes.

Strategies

At the start of the event, at least two dances should be played out in full detail, with any latecomers missing the first but getting to take part in the second. But it's not necessary to play out every dance this exhaustively. Rather, after between two and four dances, shift focus to a general overview of the occasion, as seen by each player character.

To organize this, ask each player what his character's goals are for the dance as a whole. Then determine how they all work out, through a mixture of dice rolls and roleplaying. Note down all the goals before resolving any, and look at how they impact each other; if one character's actions are going to affect other characters' situations, resolve those actions first.

The things characters can do over the course of a dance fall into three broad categories. The first and simplest is for them to enter into the spirit of the event and pursue something that it's intended to offer them. They may simply want to dance with as many and as attractive partners as possible. They may want to meet new people and make a good impression. Or they may want to begin a courtship, or find someone suitable for courting, or to arrange a one-night stand or a quick tryst in some corner or back room.

Another possibility is pursuing a goal that disrupts the event in some way. In many settings, an attempt at seduction will do this, especially if the seducer is caught by a jealous spouse or suitor; some dances will have chaperones for the event, or duennas to keep watch over unmarried women, to prevent such things. Uninvited "guests" who force their way in can be a major source of problems. Invited guests can cause problems in other ways, such as becoming excessively drunk, starting fights, or insulting someone in a way that calls for a duel the next morning or a fistfight in the nearest alley.

Finally, a dance can provide cover for other activities. These can range from the innocuous, such as delivering a package or meeting for a private discussion, to the nefarious, such as casing the site of a planned burglary or killing one of the other guests. Any fan of espionage films can think of some examples.

GURPS and many other roleplaying games provide rules for working out the consequences of such actions. Give each player time in the spotlight, to pursue his character's personal agenda.

Save the Last Dance for Me

Some dances, such as high school and college Homecoming dances, have a ritual of choosing a king and queen of the event. This can be a useful dramatic device, with a few procedural liberties. To pick the queen of the event, ask all the players whose characters are male to name their favorites, and see who comes out in the lead. Then do the same with the sexes reversed.

The king and queen of the event will dance the final dance together. The player characters can choose partners for a final dance, or be approached by a suitably interesting NPC.

After that, the dance ends and the dancers go home, either with someone they met at the dance, or with the people they came with. Offer each player the chance for a few final comments, in character, to sum up the occasion.

A dance may have a continuing impact on the lives of some people who attended it, in the form of a temporary Reputation, lasting for a month. This has no point cost, but is treated the same as a permanent Reputation while it lasts. A critical success on making an entrance, or in dancing, will earn a +1 on reactions to the character; various forms of

disruptive behavior can earn a -1. The GM must determine which groups are affected by the modifier.

Conclusion

A formal dance of this kind can be used for a variety of purposes in a campaign. To start with, in a campaign that's very strongly focused on personal relationships, a dance provides a stage on which to play out the growth of those relationships. It can serve the same type of function in a soap opera or courtly intrigue campaign that a fight scene performs in an action/adventure campaign.

In a more typical adventure campaign, a dance can be a place to develop subplots. For example, in a supers campaign, the heroes may avoid romantic relationships in their heroic identities, but pursue them when off duty; attending a dance is one way to do this -- and perhaps give the hero a new love interest to be threatened by villainous plots.

Finally, a dance can be the background for an action/adventure situation. Perhaps a vampire shows up at a college dance, or rebels in an aristocratic society come looking for sons and daughters of the ruling class to take hostage. Adventurers may encounter the situation because they happen to be attending the dance, or may be sent there specifically to guard against it. When the daughter of the President makes her debut, for example, there will be Secret Service agents on duty keeping her safe.

The formal structure of the dance, as a social event, lets the GM move the focus of attention from player to player, giving everyone a chance to roll against his character's social skills, in the same way that everyone gets to roll against combat skills in a battle. All of the players, not just the quick-witted and outgoing ones, can get a chance to develop their characters' personalities and personal relationships -- in other words, to do some actual roleplaying.

Finally, many other social events can be approached in similar ways. GMs can use this treatment of dances as a model for turning the events that interest them into game mechanics, with dice rolls and a play sequence.

Pyramid Review

Villainy Amok (for *Champions*)

Published by [Hero Games](#)

Written by Scott Bennie

Cover by Brett Barkley

Illustrated by Matthew Tito Cuenca, Fredd Gorham, Patrick McEnvoy, Derek Stevens, & Greg Smith

176-page b&w softcover; \$26.99

Every genre and RPG has its clichés, many of which are fun to play. Of course, play them too often and they become, well, clichés. For example, the super-hero game has plenty, including foiling the bank raid, rushing into a burning building to rescue a baby, or being shrunk to microscopic size. As fun as they are, the GM can only use such standbys so often before his players groan, moan, and eventually lose interest. Which is where ***Villainy Amok*** comes in very handy, because it is designed to breathe new life into commonly found situations.

Written for ***Champions***, this supplement takes seven different situations and throws a spin or two at them so that the GM can use them over and over again. Or at least, a few more times until the players groan, moan, and so on. Presented in separate chapters, each explores the what, the where, the who, and the why, plus associated statistics and write-ups along with a ready-to-play scenario and a set of tables that lets the GM randomly generate the elements of a situation. All of this is presented in Hero Games' usual house style, meaning that it is decently organized, well edited, and if the internal artwork is somewhat ordinary, some of it is at least amusing. An example of this depicts the sudden arrival of the mole people as a puzzled hero looks on.

[SPOILER ALERT!]

Villainy Amok opens with "Hands in the Air!," a look at the bank robbery, a crime it assures is on the rise in the USA as increased border scrutiny makes smuggling a harder prospect. The bank robbery is an in-between affair, the super-hero RPG equivalent of the appetizer run either as an isolated event prior to the adventure proper, or as a method of laying clues to said adventure. It can be run with the heroes possessing knowledge in advance of the robbery, with them interrupting midway, or in the aftermath as they try to track down the miscreants. Detailed in turn are the various types of banks, what can found inside, including statistics for an ATM, as well as the typical staff and customers (or hostages) inside, and any law enforcement waiting outside. Possible twists include having the bank president commit the robbery, the untimely intervention of a rival hero (who of course, gets all the credit), and the pensioner held hostage, but is just not going to take any stick. The scenario, "The national Union Bank," easily scales to the number of player characters involved, and while the provided map is useful for both the scenario and smaller branches, it is a pity that a larger branch could have been mapped also.

While the supplement is too small to do justice to the whole of the alien invasion scenario, it can at least tackle its prelude. This is the arrival of the alien probe, all ready to scout out the lay of the land, test out Earth's defenses, or determine if humanity is suitable for some nefarious purpose. In "The Threat Beyond," the probes come in four flavors: the strange ooze, the extraterrestrial weed, the scuttling killing machine, and the traditional tripod. It is the latter, a perennial favorite that forms the threat in the included scenario, "Menace in the Downtown Core," which has them

crash landing and rampaging through the heroes' city center.

More Silver Age than contemporary in feel, "Ask Your Doctor If Metatron Is Right For You?" explores the idea that anyone can be a super-hero through the application of drugs. Most obviously this is a source of new supervillains, but it can be used to tell a horrifying or cautionary tale, perhaps to bring a touch of the tragic melodrama to the campaign. Essentially, the superpower drug is a device that will affect NPCs rather than heroes. Of course small time thugs will want it to gain their revenge on the heroes, but the storytelling possibilities are riper still if an NPC, perhaps a reformed thug, takes the drug in order to do good. Several templates are used to model various possible effects, such as turning the imbibor into an animal type or granting him psionic, electricity, or speed powers, all with harmful side effects. Metatron is the drug of choice for the adventure, "Metatron Falls From The Heavenly Heights," this "beautiful drug" turning the user into his idealized version, though to the detriment of his ability to deal with stress. This is a short affair, amounting to little more than busting the lab, though given what the drug promises, there will always be demand, so it can appear again.

As the title suggests, "Burn Baby Burn!" is all about fire, specifically having the heroes rush into the burning building to rescue the screaming woman or wailing baby. More mechanically intensive than other chapters, it is in many ways, the least interesting.

Like the earlier chapter on drugs, science dominates both "It Came From The Mad Scientist's Lab" and "Honey, They Shrunk The Superheroes," the latter a chapter title the book manages to get wrong twice. The first looks at all that mad science can produce and all that could and should go wrong. From immortality and the earthquake machine to uplifting animals and building the world's latest, greatest computer, this is all comic book science. The scenario, "The Black Hole Blues," has the heroes trying to prevent the sinisterly named Dr. Graves from harnessing the power of another black hole. Of course, being shrunk can happen as a result of magic as well as science, but either way, the heroes will probably end up traversing somebody's body to rid it of a bomb, disease, or nanite infestation; face their pets suddenly a lot larger and fiercer; solving problems as kid-sized versions of themselves; or unknowingly end up in a land of giants and not small at all. Another option is the dimension in a bottle, a microverse that could easily be come a campaign feature. Of course, knowing all this there are no surprises for what the scenario, "With A Song In His Heart And A Bomb In His Head," involves.

Possibly the best-titled chapter is "My Big Fat Caped Wedding," a look at all things matrimonial for the super-hero. Perhaps a union between two supers, a hero and a normal person, or between a hero and an alien, all of which is best played out to semi-comic effect. Such affairs are wrought with complications, and this is more true for the supers wedding, from strange alien wedding customs, keeping secret and super-hero identities separate, and even having to come to terms with the fact that a hero's father-in-law happens to be the infamous Dr. Destroyer! Of all the scenarios in **Villainy Amok**, "The Wedding In The Champions Universe," is the least useful as it is very setting specific, but that does not mean that it cannot be used as a model in other universes.

[END SPOILER ALERT]

The supplement is rounded out with a Plot Gallery and a little more. The gallery lists everything from campaign set-up ideas and villainous master plans to dependent NPC scenario hooks and rumors to investigate. While it suggests the use of **Conquerors, Killers, And Crooks** as a source of ready-made villains, **Villainy Amok** gives two of its own. The Engineer is a constantly self-engineering and adapting cyborg who embraces the machine utopia, and Invictus is the "hero" turned congressman. Both characters appear in scenarios given in the book.

While **Villainy Amok** is presented as a series of chunks or nuggets, the author's style is engaging and he throws in quite a few references as examples along the way, often from *Dr. Who*. The book is rife with ideas, all ready to extract, develop, and use. Some of the best appear in each chapter's Ten Unusual List, such as a villain robbing the bank not for its money, but for the toughened metal of its vault; a villain offering everyone a one-kiloton nuclear device to ensure a polite society; or when a transforming power goes awry, it leaves the heroes as white rabbits. . . or, more correctly, *white rabbits with superpowers!* Of course, a GM could just use each chapter's table to generate a scenario or two.

There is a great deal to like in **Villainy Amok**, and while it comes with more than a double helping of cheese, it is

nevertheless a *very* useful book. The random scenario generator at the end of each chapter might be seen as a tool of last resort, but together with the accompanying suggestions and discussion, the book really does help breath new life into old clichés. And occasionally, a cliché has its place in a game, though of course, it should never be done to death. So despite being written with ***Champions*** in mind, ***Villainy Amok*** is *the* utility book to have on the shelf for *any* super-hero RPG.

--*Matthew Pook*

The Wedding Crasher

*"Oh, it got me drinkin' and then suddenly I'm staggerin' into church
And I'm dancin' like Baryshnikov all across the high altar
Oh I bet that you're still mortified
But just think, girl,
No one's ever gonna be forgettin'
The day I wrecked your wedding."
-- Black 47, "Maria's Wedding"*

The bride is lovely, the groom is nervous, the garden is full, and the wedding is underway. What could go wrong? Well, if you didn't invite Eris, pretty much everything could go wrong. Let's take a bite of Eris' apple and see how it tastes.

*"Peirithous married Hippodameia, or Deidameia, daughter of Butes -- or, some say, of Adrastus -- and invited all the Olympians to his wedding, except Ares and Eris; he remembered the mischief Eris had caused at the wedding of Peleus and Thetis."
-- Robert Graves, *The Greek Myths**

Peirithous didn't invite Eris to his wedding, but he did invite the Centaurs. And, as Centaurs will, they got into the wine, and started ravishing bridesmaids and carrying off the gifts (and the bride) and generally spreading chaos. Fortunately, Peirithous also invited his best friend, Theseus, who slew an immense number of Centaurs in the process of rescuing the bride. Of course, that started a lengthy war between the Centaurs and Peirithous' people, the Lapiths, which raged for years and wound up immortalized in marble on one side of the Parthenon. And as Pindar or someone (Graves is unclear) may have put it, "Ares and Eris engineered this war as revenge for the slight thus offered them." (This was before the napkin ring was invented, so petty wedding revenge had to be more dramatic.)

This is only one of the great "theft of the bride" stories from Greek myth. During the Lapith-Centaur War, Theseus met Heracles, who knew a little something about Centaurs at weddings -- the Centaur Nessus had tried to kidnap his bride Deianeira, too. (Both "Deianeira" and "Deidameia" are cognate with the Greek word for "loot," interestingly enough.) Orpheus, of course, famously lost Eurydice to a snakebite at his wedding -- she was "stolen" by Hades, god of death. The wedding, symbolically, represents the perfect, complete society -- that's why all Shakespeare's comedies end with one, for example. The world of the wedding is a world of perfect peace, a garden if you will. The snake (or other embodiment of chaos) that disrupts a married couple in a garden is perhaps the most familiar story in all mythology. And Eris is just visible on the edge of it.

*"Ares drove the Trojans on . . . and Phobos drove them, and Deimos, and Eris whose wrath is relentless, she is the sister and companion of murderous Ares, she who is only a little thing at the first, but thereafter grows until she strides on the earth with her head striking heaven. She then hurled down bitterness equally between both sides as she walked through the onslaught making men's pain heavier."
-- Homer, *Iliad*, IV:441*

Eris doesn't become a lot more visible anywhere else, either, but that's about what you should expect from the daughter of Night and Darkness. According to Hesiod, she gave birth to the evils of the world, and governed war and slaughter. Interestingly, Hesiod also claims that Eris was twins -- the Eris of Strife and the Eris of Competition -- but then ignores his own theory for the rest of the book. Both Hesiod and Homer seem to identify Eris with Enyo, "sacker of cities" and goddess of battles. Enyo is even murkier than Eris; her Roman incarnation Bellona was identified also with the Cappadocian goddess Ma, who we also know as Cybele. Enyo was also the name of one of the three Graiae, the Gray Sisters with one eye and one tooth between them. Is it our Enyo? Who can say? The Graiae were sea-demons, and their resemblance to the Fates (also daughters of Night, according to Hesiod) is clear. Eris fades into Hekate going one way, Cybele the other. Under her own name, Eris fought against Zeus during the war with Typhon, and against Dionysos during his invasion of India. And of course she fought for the Trojans during the Trojan War, which was only fair, because after all, she started it. At a wedding.

"Jove is said to have invited to the wedding of Peleus and Thetis all the gods except Eris, or Discordia. When she came later and was not admitted to the banquet, she threw an apple through the door, saying that the fairest should take it."

-- Hyginus, *Fabulae*, 92

Eris, alone of the gods, wasn't invited to the wedding of Peleus and Thetis, and her resulting misbehavior was the reason she didn't get invited to Peirithous' bash either. Eris tossed a Golden Apple over the gates into the banquet, engraved with the word *Kallisti*, meaning "to the fairest." Aphrodite, Athena, and Hera immediately began arguing over who it belonged to. Zeus, no dummy, had Paris, a prince of Troy in exile, judge the ensuing beauty contest. When Aphrodite bribed Paris with the love of the most beautiful woman in the world, Helen (not yet "of Troy"), the resulting theft of a bride (not from a wedding, admittedly, but still) started the Trojan War. This is all very familiar, and you may note, by the way, that we've now added the apple to our "disrupted garden" mytheme. "The fruit that the woman gave me," as Adam so unchivalrously puts it. Virgil even links the two, describing Eris with "viperine hair."

But as always with Eris, there's still more going on than you might think, a tangle of chaos underneath the bright wedding garlands. According to the *Cypria*, a fragmentary epic, Zeus planned the whole thing with Themis, the Titaness governing Law, in order to bring about the war. In classical art, Themis is often seen watching the Judgment of Paris from "off stage," which is certainly suspicious. (Themis : Law :: Eris : Chaos. Recall that Hesiod briefly hints at two Erises. Hmmm.) Even more interesting, the Golden Apple may well have been the Golden Sheep, i.e., the Golden Fleece -- or vice versa; as Apuleius points out, *meloi khryseoi* can be translated either way. Eris shows up even more faintly in the myth of Jason; according to one version of the *Argonautica*, Medea cast an Eristic enchantment over Jason's helmet. The parallels between Jason and Heracles (who likewise took the Golden Apples of the West -- guarded by three nymphs -- from a dragon) are intriguing, and Heracles of course brings us back to the abducted bride. Medea, meanwhile, shares with Thetis the strange habit of killing her children to make them immortal. Jason sowed dragon's teeth; so did Cadmus, who famously visited Thera -- or as it was known then, Kallisti. That would be Thera, as in Atlantis, the Golden Island in the West, as in the "garden destroyed by chaos," namely the sea, namely the Graiae. For someone who's never invited anywhere, following Eris sure gets us everywhere.

*"Three Golden Apples from the Hesperian grove,
A present Worthy of the Queen of Love,
Gave wise Hippomenes Eternal Fame,
And Atalanta's cruel Speed O'ercame.
In Vain he follows 'till with Radiant Light,
One Rolling Apple captivates her Sight,
And by its glittering charms retards her flight."
-- Michael Maier, *Atalanta Fugiens**

All our themes come together again in the story of Atalanta and Hippomenes, albeit with Eris practically invisible. The fleet-footed Atalanta had been warned by the Oracle of Delphi (which at this time channeled either Eris' ally Typhon, or Themis, depending on which source you read) that her marriage would lead to disaster. (Aha!) So she announced that she would only yield to the man who could beat her in a foot-race. Hippomenes appealed to Aphrodite, who gave him three Golden Apples. By throwing them off the track, he was able to lure Atalanta into slowing to pick them up; he won the race, and her hand. But after their wedding, their ardor could not wait for nightfall, so they snuck off to a deserted temple to Cybele (double aha!) and consummated the marriage then and there, for which disrespect Cybele turned them both into lions.

And this myth turns out to be the main theme of the alchemist Michael Maier's *Atalanta Fugiens*, which he almost certainly wrote while in England at the court of Princess Elizabeth. (While there he also wrote something called the *Themis Aurea* -- "Golden Themis.") And as Frances Yates points out in *The Rosicrucian Enlightenment*, Princess Elizabeth's 1613 wedding to the Elector Frederick of the Palatinate served as the model and emblem of the "Chemical Wedding" of the Rosicrucians. (This is as good a place as any to mention that the apple and the rose are both members of the order Rosaceae.) Both Elizabeth and Frederick had lions as heraldic animals, symbolically reversing Atalanta's fate. Their wedding was celebrated in Germany with a pageant of Jason and the Golden Fleece, and in England with a

masque on the theme of Orpheus (!) and Harmony. In other words, it was an attempt at a perfect alchemical joining, a magical marriage to which Discord -- Eris -- was emphatically not invited.

*"Upon thy wedding-day?
Against the blood that thou hast married?
What! shall our feast be kept with slaughter'd men?
Shall braying trumpets and loud churlish drums,
Clamours of hell, be measures to our pomp?"*
-- William Shakespeare, *King John*, III:i:312-316

And by now we all know how well that works. Frederick's grab for the throne of Bohemia in 1619 wound up starting the Thirty Years' War, three times as long as the Achaeans besieged Troy. Habsburg troops sacked Frederick's palaces and libraries, and he and Elizabeth were forced into exile. Their son, Prince Rupert of the Rhine, would likewise find his life blasted by civil war, tearing apart Elizabeth's England just as Frederick's Germany was destroyed. For every magical action, there is an equal and opposite reaction.

So what, in this story, is the Golden Apple? Well, that's hard to say, but in properly cruel Eristic style, it might well have been the Rosicrucian Order itself. It represented alchemical perfection -- gold -- and we've previously discussed the connection between roses and apples. It would only reveal itself to the worthy ("to the fairest") and was intimately connected with Atlantis (Francis Bacon, of course, wrote *The New Atlantis*) and gardens (Frederick's ornamental gardens were the envy of Europe). And Yates argues, not unconvincingly, that part of the reason Frederick grabbed for the Bohemian crown was that the Prague of John Dee was the heart of the Rosicrucian movement. Further, that he may have believed the Rosicrucian movement of putative alchemists, sorcerers, and invisible conspirators gave him an edge, a kind of Achilles' invulnerability that made the game worth the candle. But as a different judge said at a different trial of three, all that glisters is not gold.

"One day Mal-2 consulted his Pineal Gland and asked Eris if She really created all of those terrible things. She told him that She had always liked the Old Greeks, but that they cannot be trusted with historic matters. 'They were,' She added, 'victims of indigestion, you know.'"
-- Malaclypse the Younger, *Principia Discordia*

We now pause for a message from the Goddess. Everything in this column is Lies, especially the true things. Eris helped inspire the Discordian religion, named for Her Roman name, Discordia. She revealed Her wisdom to Kerry Thornley and Greg Hill in a bowling alley in "1957 or 58," specifically "Look around and you can see all of the chaos in everything just as much as you can see order." While that is diametrically contrary to the standard philosophy of the Suppressed Transmission, on the other hand, it's not either. In keeping with Eris as Enyo, immediately after receiving Her revelation, Kerry Thornley was called up for active duty by the U.S. Marine Corps. During this tour, he met and befriended Lee Harvey Oswald, eventually publishing a book, *The Idle Warriors*, centered on Oswald's experiences in the Marines, in 1962. Was Oswald the Peirithous to Thornley's Theseus? The snake in the American garden? Did he, like Eris, have an evil twin? According to the testimony of Dallas Police Captain John W. Fritz before the Warren Commission, Lee Harvey Oswald got "a cheese sandwich and an apple" from his landlady Ruth Paine for lunch on November 22, 1963. Immediately after that lunch, Strife and Discord stalked America, sprung full-grown from the shattered forehead of the king. And that is why you should never pick up any strange apples. Or at least, if at all possible, invite a little chaos -- a little Eris -- to your wedding. After all, it's her day.

Fluxx Love Stories

by Andy Looney, inventor of ***Fluxx***

I love my job. As a game designer, I bring people together, and I entertain them, through my games. It gives me a special thrill, knowing that at this very minute, people are having fun doing something that I showed them how to do. Whenever a group sits together and has fun playing an Andy Looney game, the joy I've brought to the world keeps on expanding. I don't think I can really express how wonderful this feels.

But as delightful as it is to know that others have laughed and had fun with my creations, what's even better are the stories I hear about the way my games -- and in particular, ***Fluxx*** -- have made a real difference in their lives. These are what I call the ***Fluxx*** Love Stories. I'd like to share a few of those here.

I think the first such story I heard came in the form of an email which was one of our earliest entries in a file we now call the "Testimonial of the Week." I'd like to just quote Barbara's message verbatim right here: "Do you know what you people have done to my marriage? We've turned *off* the television after the kids go to bed and actually have conversations over hand after hand of ***Fluxx***. Had we had ***Fluxx*** sooner, we could have saved hundreds of dollars on marriage counseling!"

Wow! ***Fluxx*** isn't just fun, it's actually saving marriages! Not only that, it's getting involved in the start of marriages as well. Last month at Origins, I met a charming couple named Josh and Teddi. They'd just gotten engaged, in a tender moment that featured a ***Fluxx*** card! Josh used a blank ***Fluxx*** card to create the special goal, "Live Happily Ever After" with the message "Teddi, Will You Marry Me?" and played it during a game. (Josh has been a fan of our games since first buying a case from us at our very first Origins booth. He knew Teddi was the girl for him when he told her he liked games and she asked if he'd ever heard of ***Fluxx***.) Best Wishes to Teddi and Josh!

Obviously, it's way-cool to see my game being used as a method for Popping the Question. But even more amazing was the story of the couple who planned their whole wedding around **Fluxx**!

Each invitation to the wedding of DeeAnn & Curtis included a set of four custom-made **Fluxx** cards. Using the do-it-yourself expansion cards we sell, called **Fluxx Blanxx**, they'd created a mini-expansion of their own, and included a set in every invitation. The four special cards they created were as follows:

- **Keeper: Marriage** (featuring a nifty-looking hand-drawn wedding ring)
- **Goal: Love and Marriage** (which said "please join us to celebrate our wedding" with their names and wedding particulars in the place where it normally would say "You win if you have Love and Marriage on the table.")
- **New Rule: Community Property** (which said "Yours + Mine = Ours: Keepers are shared among players. Thus, if one player has Love showing while another has Marriage, both win if the Love and Marriage goal is played.")
- **Action: Mingle** (which said "Mix everyone's hands together and deal the cards back evenly. Start with yourself. Reception to follow the wedding ceremony.")

Also included were special directions, which read as follows: "How to Play the Game of Love: Come to the wedding! You received four **Fluxx** expansion cards with this invitation, and you need a complete **Fluxx** deck to play. Conveniently enough, one **Fluxx** deck will be on each table at the reception."

It sounded like a really groovy wedding, and I'm honored to have been a part of it, as it were. Best wishes to Curtis &

DeeAnn!

But not all **Fluxx** Love Stories are tales of romance. Some are stories of the human struggle, up to and including Death. I'll never forget playing **Fluxx** at Origins a few years ago with a beautiful little girl and her mom. The girl had diabetes, and it was really touching to see their special **Fluxx** deck, which contained a whole bunch of extra cards they'd created that related to the issues of coping with this disease. **Fluxx** had become not just fun, but also a way of learning about how to cope and survive with their particular life challenges!

Then there's the story I heard from a fan about how **Fluxx** had helped a group overcome grief. He'd been at a convention where an important elderly gentleman, the guest of honor I believe, had collapsed and *died* right there at the event! Can you imagine coping with the aftermath of that? Well, for this guy and the people he was with, it was round after round of **Fluxx** that got them through that long, difficult night.

I'm sure there are others that I've heard but I can't remember just now, and I'm sure I'll hear many more in the years to come -- and I'll never tire of hearing them. If you've got a **Fluxx** Love Story, please send it to me! Thanks!

Irregular Webcomic

Irregular Webcomic

Mawwaige, That Bwessed Awaingement

When you think about it, weddings are something of a cultural anomaly. After all, a wedding is the only social event that I can think of which is:

1. near-universal (that is, just about every culture has weddings of some sort)
2. focused (that is, it's specifically about a certain person or persons)
3. largely celebrated (that is, most people aspire to get married) and
4. celebrated largely (that is, most people who get married aspire to some kind of wedding where more than three people will show up)

In other words, a wedding is just about the only event where most people expect a huge number of people to show up and celebrate just for the two people getting married.

Breaking these down a bit, we see other events fall short of these criteria. Although large numbers of people celebrate bar mitzvahs, for example, they aren't near-universal. Holidays - such as Halloween and New Year's - pass the "near-universal" and "largely celebrated/celebrated largely" test, but they fall short in the "focused" department. (I suppose you could say that something like a Christmas party is focused on one person, but if you tried to then I'd just rejigger the definition of "focused" to mean "a living, physical person you can give a blender to," so it's in all our interests if you just don't even try.)

Birthday parties are near-universal, focused, and largely celebrated, but they aren't celebrated largely (since most people will never know a banquet-hall birthday bash with guest speakers and rows of clinking glasses). Funerals are much the same way: near-universal, focused, and largely celebrated, but many of the dearly departed have very quiet services (and hardly any funerals will end with the threat of the "Chicken Dance" or "The Hokey Pokey").

Random aside:

If you ever find yourself needing to simulate the sinister chanting of strange cultists (and, frankly, who hasn't had that need at least four or five times a week?), simply intone the lyrics to "The Hokey Pokey" backwards, ideally as monotone and ominous as possible:

About all it's what that's around yourself turn you and Pokey Hokey the do you about all it shake you and In foot left your put you. Out foot left your put you. In foot left your put you.

In a pinch, repeating the refrain of "In foot left your put you. Out foot left your put you." sounds suitably cthulhic. But I digress.

Anyway, continuing the scholarly-sounding tradition of bringing up examples that I can immediately shoot down, celebrating the birth of a child is also universal, focused, and largely celebrated, but not celebrated largely.

There are only two counterexamples I can think of. The first is the graduation celebration, which kinda-sorta works in all three categories. But no one ever threw me a graduation party of any sort, so I'm going to ignore it and never speak of it again. The second is the anniversary celebration, which is really just a wedding celebration repeated 50 years later, thereby increasing the "Hokey Pokey Leading to Hip Injury" quotient.

No, weddings are perhaps the only common institution where you expect a bunch of folks to show up and celebrate two specific people . . . even stranger, by design, it's highly likely that most people attending won't know at least one of the focus individuals.

What's more interesting is the fact that what a wedding *is* has changed so dramatically in the decades or so since it's been invented. For example, in biblical times, weddings were a means of acquiring property, securing the peace between families, and securing parentage. Polygamy was common, and the religious aspects of marriage weren't placed

on a pedestal particularly higher than other property arrangements; wives and oxen get the same number of mentions in the Ten Commandments, meaning that coveting your neighbor's ass or your neighbor's wife's ass are about on par.

At some point (in the West) someone realized how crazy it was to subject oneself to multiple spouses, so that idea was done away with. Marriage was still primarily about property and parentage, but the foundations of a romantic view were taking root. (Personally, the juxtaposition in this regard I've always found most fascinating is *Romeo and Juliet*, which has the notion of romantic versus pragmatic marriage as one of its central conflicts. That this could still be a valid concern a mere four centuries ago strikes me as a pretty late development, as far as human culture is concerned.)

Eventually, marriage evolved into the view we hold of it today, which in America is an odd amalgam of the romantic view of a lifelong commitment tinged with the harsh realities of a sky-high failure rate. (Another factoid I find fascinating: The average length a marriage lasts hasn't changed appreciably in the past two hundred years or so. The biggest difference is that nowadays marriages end by divorce after that period of time, and in Ye Olde Dayes marriages tended to end by death. Methinks a lifelong commitment might be a bit easier to adhere to if you only need to worry about being with someone for 20 years, at most.)

From an RPG standpoint, I'm fascinated by the current struggles of many societies (including the U.S.) about the definitions and ramifications of marriage, because they spark so many ideas for application in various gaming genres. As I see it, the troubles are a result of the schizophrenic nature of modern marriage; marriage is unique in being a secularly affirmed contract of what most view as a religious ceremony. (And thus events come full circle, since - for example - the Catholic Church didn't view marriage as a sacrament until the 12th century, at that time making it a religiously affirmed ceremony of a secular contract.) As a result, the secular world's views and expectations on marriage are significantly different from the religious world's. Many parts of the secular world don't particularly care that you love your betrothed, just so long as you can both sign your names and pay the modest license fee; however, the religious world would view such a trivial entry into married life with abject disapproval. The religious world can (and often does) impose restrictions on entry into marriage that don't exist in the secular world; for example, the Catholic Church doesn't allow divorcees to remarry.

In short, you have an institution that has two competing mindsets; they agree on the broad strokes (a monogamous bond between a couple that legitimizes children emergent of that union and provides various other benefits for that couple), but they disagree on many of the fringe cases. And it's in those fringes that we can find gaming ideas:

In a fantasy setting, what does the idea of "'til death do you part" mean if he's a human with a few decades left to live, and she's an elf with a few centuries? Would the law support such a union? Would both cultures?

In a sci-fi setting, can a person and an AI get married? Can two AIs marry? What about two aliens of different species?

In a supers setting, would the existence of a secret identity be grounds for an annulment?

In a cyberpunk setting, would marriage be turned into a "true" contract, up for renewal every (say) five years or so? If so, would secular and religious marriages be entirely "divorced," with religious marriages eschewing this contract arrangement entirely?

In a time travel setting, can . . . well, let's not even go there. ("I'm my own grandpa . . .")

I think what might be most fascinating about marriage for me is that, regardless of its definitions, constraints, and applicability, there's always been one consistent with regards to marriage: the solemnity and importance a married couple should place on the event. While it's been viewed as a formality or expediency in some circumstances, I'm guessing that even most people in those situations agree that marriage *should* be something important, lasting, and worthwhile.

And when a couple loves one another - when there's a true and loving bond between them - there is no limit for how much marriage means to them.

So it is with me. See, in times past I've always believed in the absolute solemnity and gravity of the decision to get married; perhaps ranking only behind the responsibility of bringing a child into this world, I've viewed getting married as one of the most serious decisions a human being can make.

And, for yours truly, this decision was made months ago, and will be brought to fruition this weekend.

On August 13th, I will henceforth be known as "Mr. Steven Marsh." (Okay; technically I was known as that *before* . . . but it's the form of "Mr." that's pronounced in that marital kinda way . . .) And on this same day, my dear friend and beloved partner, Nikki - a woman whose incredible intelligence and wisdom is only brought into question by her agreeability to marry me - will become my wife, and I her husband.

While standing before the most awesome forces I can fathom - God and Nikki's parents - and with the most heartfelt sincerity I possess, I will draw on my actorly and gamemasterly training as I try not to flub my lines:

"I will be true to you in good times and in bad, in sickness and in health.

"I will love you and honor you all the days of my life."

And I hope each word rings as true from my lips to her ears on this day, as they do from my fingers to the screen as I type them now.

In the years I've been with *Pyramid*, I've always joked that I've devoted my life to games. Well, on Saturday I will proclaim my devotion to Nikki.

And we can play games together . . . all the days of my life.

I love you, Nikki.

Graphic Design by Eric Gibson & James Dunn with Nikola Vrtis

112-page black & white softcover; \$15.95

Editor's Note: Both these books contain contributions by Pyramid editor Steven Marsh.

When word came in November 2003 that West End Games was being revived under a new publisher and focusing on the core *D6 System* engine, I was skeptical. West End Games had seen more ups and downs than an Airborne Ranger.

As we rolled into convention season 2004, my skepticism abated. The WEG web site was chock-a-byte with freebies and previews and news. News! They were actually telling us what was going on. At Gen Con Indy of that year I got my first look at the new core books, and I was satisfied that West End Games was on the right track.

One of the earliest supplements came in September 2004: ***D6 Adventure Locations***. This reasonably priced softcover is full of practical supplemental material on locations from airports to zoos, with stops in cemeteries, island strongholds, and alien spaceships along the way. Each locale (over 30 included) is covered with a description, a map, and an inventory of possible props on hand. Where appropriate, game stats for assorted people one might meet are included. (You always needed the write-up for a hotel front desk clerk, didn't you?) Each locale also includes scenario hooks for using the location in an adventure.

The layout is uncomplicated and easy enough to follow, with the usual graphical bells and whistles and visual jokes which have been a hallmark of West End Games back into the *Star Wars* days. Each locale has a unique icon framing its pages (or even its columns); I found this somewhat distracting. The art is almost totally in floor plans or diagrams, with occasional breaks for amusing or inspiring signage. This gives the book an intensely practical and system-free feeling which I admire. Many books claim to be usable for any roleplaying game, but this one delivers. The cover art is strong on action-adventure tropes (helicopters, hidden strongholds, clandestine SCUBA diver) with only a mild dose of fan service. In all, I am very happy with ***D6 Adventure Locations*** and readily recommend it.

When word came down that ***D6 Fantasy Locations*** was in the works, I was pleased but my skepticism rose again. How many different rural villages can you map? A castle is a castle, isn't it? When the book came, I was immediately won over.

D6 Fantasy Locations is organized very differently than its Adventure counterpart. Rather than snapshots of sites, this book is set up in three chapters: "Settlements," "Castles and Fortresses," "And Other Places." In the first we are given brief tours of different kinds of villages and towns, from small hamlets to small cities and with detours into the trees and under the sea. The format is not so structured as in ***D6 Adventure Locations***, but we still get descriptions and stats for people and sites in the area. We also get sidebars with guidance on making believable communities in a fantasy setting. The second chapter gives much the same treatment with fortifications, from the simplest entrenchment to the largest great castle. We are instructed in how the components of a castle contribute to its utility. We also get away from the Western tradition with a good look at Asian-style strongholds. The third chapter picks up the other traditional sites in the genre, from cave complexes to mazes to ruins, temples and mines. Again we are introduced to interesting characters and amusing side trips along the way, including an entirely friendly and practical guide to developing mazes and dungeons.

Rules support for ***D6 Fantasy*** includes a settlement design sheet and a castle design sheet, both useful for deciding and recording features of locations in your campaign. Some new spells and miracles are described, and a few new special abilities are added.

The layout for ***D6 Fantasy Locations*** was much more comfortable to me, with page frames fading into a watermark-style for most pages. Instead of maps, this book has mostly line art to match and add flavor to the text; I found these good to excellent. Given that many fantasy realms have low literacy levels, it's easy to understand the absence of the labels and signs which helped fill out ***D6 Adventure Locations***. (But the wit is still around. I'll get to that in a moment.) It took me several glances to realize that our generic fantasy hero on the cover is confronted with a faceted landscape incorporating elements from throughout the book: Western castle, village, knight; Asian village, stronghold, samurai. Even the ground on which he stands shifts from cobblestones to brick paving.

The real winning point for ***D6 Fantasy Adventures*** for me was in the writing. The book is framed as the narrative of an unnamed bard commissioned to create a guide to interesting places around the realm and often told in the first person. This is a corny conceit, perhaps, but it works for me. This style generates a great sense of fun and adventure in what could otherwise be a very dry and technical book, and fun is what games are supposed to be all about, after all. Like its older sibling, ***D6 Fantasy Locations*** makes an excellent resource for any fantasy adventure game.

West End Games seems to have it in the right groove, and publisher Eric Gibson and his team are to be commended. These books give great value for the dollar and embody a sense of playfulness often lost in the world of rules-driven,

license-managed publishing. With ***D6 Adventure Locations*** and ***D6 Fantasy Locations*** we are given solid resources for the *D6 System* core books as well as any other game we might care to work with. We are also given hope that West End Games will continue to prosper and bring us more quality game books for years to come.

--*Bob Portnell*

Wight Wedding

A Rescue Adventure with stats for *D6 Fantasy*

by Bob Portnell

The wedding of the century, the criers said: the union of the handsome Prince Rodrick of Ardwin to the beauteous Princess Grace of Yandaway at high sun on the following day, Midsummers Day. The castle overflowed with nobles and dignitaries from leagues around. The city below was likewise packed with travelers and visitors hoping for a glimpse of the happy couple.

Within the castle, four royal guards stood watch outside the princess's chamber high in the West Tower. Just before high sun, they heard screams and the sounds of commotion within. Unlocking the door and entering, they found a sight of horror: the maids-in-waiting slain and scattered about the room and the princess in the clutches of a squad of unknown assailants in black and red armor. One royal guard withdrew to sound the alarm. As he left, he heard the princess screaming "No! No! Stop!" The other guardsmen advanced to the defense of their princess and met a bloody fate. When reinforcements arrived, they found three guardsmen dead, only one invader killed and the rest gone . . . along with the princess.

The event was kept as quiet as possible, with rumors of a practice drill for the royal guard quickly circulated among the guests in the keep. Only the King of Yandaway recognized the attacker as wearing the livery of the Kingdom of Barrowfell, serving that land's Necromancer-King Edmund. His Highness concluded that Edmund was attempting to subvert the alliance of Yandaway and Ardwin for an unknown purpose. The King conceived a dangerous plan to recover the princess, but who could execute it? He could not draw on his own knights or nobility without arousing the suspicion of the Ardwins. His High Chamberlain quickly called in a few favors, cultivated some cached information and assembled a small team suitable for a covert mission into far Barrowfell to rescue the princess.

So it is that, in the late afternoon of the day before Midsummer, you find yourself gathered in the most private courtyard of Yandaway's castle, being offered remarkable rewards and cautioned against unspeakable threats to be faced. King Edmund's magical power will be deeply depleted after such an audacious raid in broad daylight. There will be no better time to stage a counterstrike rescue. Will you put yourself in harm's way to recover the fair princess and help guard the peace between Yandaway and Ardwin? Of course you will.

The Rescue Party

This adventure, for characters of intermediate expertise, follows a fairly typical adventuring party as they infiltrate the city and castle of Barrowfell to recover the kidnapped Princess Grace. Time is of the essence as the magical opposition represented by King Edmund the Necromancer will only be diminished temporarily. There will still be cityfolk, guards, traps, and monsters aplenty to challenge the party, so let the player group have a reasonably diverse skill set.

The party must travel light! The gamemaster should emphasize (perhaps through the King's quartermaster, from whom they would take supplies) that they are more likely to be killed than not, and "dead folk don't need two weeks' iron rations." Allow the players time to equip themselves, letting them know that pack animals will not be needed or useful and that turning themselves into pack animals will only jeopardize their mission and the Princess.

Develop ***D6 Fantasy*** heroes in one of three ways. First, one could select a standard template and customize it with 12 skill dice. Equipment is already included on each template. Second, one can use the defined limits method, distributing 18 dice among the attributes and 12 dice among skills. Third, one can use the creation point pool method, spending 84 creation points to make the character. The usual caps on attribute and skill dice apply. Advantages and Special Abilities should be evenly balanced against Disadvantages.

The Rumor Mill

The dark kingdom of Barrowfell is the subject of much legend and lore, some of which is true. Gamemasters may distribute the following information either in "hints" to individual players or via non-player characters. Heroes who opt to have grown up or spent time in Barrowfell will know which of these rumors are true and which are not.

- **Rumor:** Barrowfell is a hard land, surrounded by high mountains and cursed with shortages of most every natural resource including water and arable land.
True. The citizens are proud of their resilience and of the king who maintains order so they can make the most of their lives.
- **Rumor:** Citizens of Barrowfell must submit to a magical branding which makes them easier for King Edmund to rule.
Mostly false. There is a brand, placed on the inner left forearm at age 10, which marks the subject. It is not magical. Outsiders are not allowed through the city gates after sundown.
- **Rumor:** The king and people of Barrowfell worship dark gods who demand the periodic blood sacrifice of children.
False. Patterns of worship in Barrowfell are just the same as in the other kingdoms.
- **Rumor:** A mob of bandits had great success marauding along the northern pass into Barrowfell until King Edmund himself caught them and "drafted" them into his service.
True.
- **Rumor:** The army of Barrowfell is comprised entirely of revived corpse warriors (hereinafter "revenants").
False. Most of the low-level ground troops are revenants, but the knights and officers are all among the living.
- **Rumor:** There are secret ways into the city and into the castle itself.
True. A character with a history in Barrowfell might know one of these routes. This could be given by gamemaster fiat or with a very high roll (difficulty 25 or higher) on an appropriate attribute or skill.
- **Rumor:** Barrowfellers hate outsiders.
False. If anything, they are more friendly to strangers than the people of any other kingdom. Isolation does not always imply isolationism.

Something Old

An hour before sunset, the party is equipped and gathered in the king's courtyard. The high chamberlain opens a visibly ancient box. "This is a Royal Pass," he says, holding up an oversize golden key on a long silver chain. The key is elaborately engraved and decorated with jewels of all colors. "The high kings of ancient days each had one of these. Simply twist the barrel of the key to select your destination. All should then grip the chain. Press here to depart. It permits instant travel to the strongholds of the Six Kingdoms: Yandaway, Ardwin, Gulfland . . . and Barrowfell, too. It is set to take you to Barrowfell now. Change to this position here to return. The King entrusts you with this for the duration of the rescue. It *will* be returned to the king. If you return at all.

"You will arrive outside the city. You must be within the city walls before they close at sundown or your mission will become much more complicated. You will have until sunrise to find the princess and return. Godspeed."

Something New

As expected, the Royal Pass brings the party into a wooded area just off the main road into Barrowfell's east gate. The heroes may attempt to pass themselves off as travelers and enter through the gate. They may try to use one of the hidden ways into the city, if they know of such. They may come up with another option entirely.

Once inside the city, they must find out how to get into the castle and where the princess might be kept. This can be done by asking shopkeepers or barmaids, overhearing other conversations or other methods of investigation and information gathering. This will be the most time-consuming portion of the adventure, and the gamemaster should emphasize the time pressures at work.

The following facts of life in Barrowfell can be learned:

- Crime is low, prosperity is modest but real, and there is a midnight curfew for all citizens. The punishments for violations are harsh and not negotiable. The most extreme is conscription into the army as a revenant.
- The population is mostly kind and friendly people, giving the lie to the traditional legend of the "dark peoples" waiting to storm out of their mountain stronghold to oppress the world. Most Barrowfellers would laugh at this story. A few might get mad.
- When King Edmund hosts guests, he usually has lights in the central tower of the castle. These have not been seen tonight. King Edmund seldom uses the dungeons, finding better ways to make use of prisoners. The torture chamber is used occasionally. These are all below ground level beneath the central tower. Tradesfolk use a side entrance to the castle, but this door is locked by night. It might be possible to climb the rock face abutting the north wall. The gates are guarded, but not heavily so -- only one or two revenants per door or gate, instructed to block access until an officer can arrive. Since few people wish to tempt the ire of the Necromancer-King.
- The majority of the "grunt" work in the Barrowfell army is performed by revenants: the dead, preserved and reanimated by magic. They have no free will of their own, but will obey officers without question. Caution gamemasters! This fact should not be revealed in conversation but by observation if at all possible.

Something Barrowed

Contact with the people of Barrowfell and exposure to the information above should be sufficient for the industrious adventurers to form a plan for entering the castle. If they are early enough, they can pass themselves off as tradesfolk and gain entrance. A successful climbing roll (difficulty 8) can place a hero on the walkway atop the north wall; from there are outdoor stairs into the main courtyard or stairs down one of the guard towers.

Castle exterior doors are typically guarded by two revenants; a single officer makes rounds to inspect and to update any orders. Interior doors to major chambers (the banquet hall, throne room, receiving hall, central tower, etc.) have a single revenant guard. All the interior guards are likewise overseen by a single officer.

The central tower is a "red herring." The guest rooms here are locked (simple key lock, difficulty 6) and not in use (as evidenced by dust).

Entrances to the underground levels are each guarded by two revenants and an officer on station at all times. Doors to each level are locked (complex key lock, difficulty 12), but the officer has the key to his door (and no others).

The dungeons, and the torture chamber below, are empty. The heroes will find another stairway down to a third below-ground level. Here, in a large hall, they will find a squad of three officers and six revenants guarding a passageway. The officers will give challenge and warn the heroes away, insisting that the King wishes no interruptions and no commotion. The players may engineer an imaginative solution here, but this set-piece is intended as the "big fight" for the adventure and the gamemaster may feel free to thwart the players as suits him.

Something Blue

The party has made it past the last of the royal guard, and find themselves entering a small, private chapel. Oil lamps along the walls provide ample light. A dinner tray, now emptied of food, decorates the altar space. Sitting together, holding hands, seemingly in deep conversation, are the Princess Grace and King Edmund. Edmund rises to his feet when he notices the party. His lack of height is now readily apparent.

"You would be a rescue party from Yandaway. Welcome to Barrowfell. I am Edmund." He looks at their weapons. "It seems you have had some trials, and I probably have quite a bit of work ahead to restock my forces. How unfortunate."

If the players attack straightaway, Edmund will position himself between the party and the princess. He cannot cast spells, but he is an experienced swordsman. Even in a fight, he will attempt to persuade the heroes to hear him out and

to learn the truth of recent events. That truth is as follows:

Edmund and Grace are desperately in love. They have been exchanging messages by carrier bird for many months. Though Grace was resigned to her fate, Edmund was determined that she have the opportunity to wed for love instead of statecraft. It took vast planning and power to send and return the kidnap team, and Grace tried even in the midst of it to avoid bloodshed. (Her screams of "No! No!" were attempts to dissuade her royal guards from futile violence.)

"And there you have it," the Princess says. "We have been here all the day and night, getting to know one another and confirming the truth of our love. We planned to be wed tomorrow, but now that you are here . . . well. Our fate rests in your hands."

King Edmund takes the Princess's hand again. "We are willing to respect your decision," he says.

And A Silver Sixpence In Her Shoe

If the players choose to fulfill their mission as specified, Edmund cautions them that he will not forget the pain they are about to cause him and his true love. "I do not promise revenge, but I do have a long memory and substantial resources." If Edmund is disabled or killed, he will be much more aggravated.

Edmund can, at the gamemaster's discretion, tempt the players. "What of the alliance? What about an alliance between Yandaway and Barrowfell, hmm? Ardwin hardly has the strategic position that I have here. Truly, if matters of state are what concern you, we are a better match than Grace and Rodrick could ever be."

Edmund can also offer sanctuary if the characters choose not to return to Yandaway. "Barrowfell is a rough land. Our winters are cold and our summers dry, but the land rewards those willing to work. And so do I."

King Edmund will reject any suggestion that he accompany the party back to plead his case in person. "I have far too many enemies, and few enough people trust my intentions as it is. After all, I am the Dark Necromancer-King, am I not?"

Gamemasters who wish to continue with adventures in the Six Kingdoms will want to acknowledge the repercussions of whatever decision the adventurers take.

Variations

"Wight Wedding" can be played in any genre, with appropriate adjustments. In a science fiction campaign, the Royal Pass becomes a teleport gate and Barrowfell becomes a capital ship or space station. Revenants become robots. In the modern world, the Royal Pass might be a supersonic transport, Barrowfell a skyscraper complex or a resort retreat, and the revenants cloned drones.

Characters

Revenant: Agility 2D, Coordination 1D, Physique 2D, lifting 3D, Intellect 1D, Acumen 1D, search 3D, tracking 3D, Charisma 2D, intimidation 4D. *Move:* 10. *Physique Damage:* 2D. *Body Points:* 15 / *Wound levels:* 2. *Disadvantages:* Employed (R3), slave to King Edmund. *Special Abilities:* Hardiness (R2), +2 to damage resistance totals; Immortality (R1), cease functioning when smashed to pieces or head is cut off. *Equipment:* short sword (damage +1D+2); knife (damage +1D); padded leather armor (Armor Value +1D) with helmet. *King Edmund's revenants are well-clothed, well-armored, and very well-preserved. They resemble normal soldiers in every way and have a lower Charisma score than the creepier skeletons or zombies.*

Officer: Agility 2D, dodge 3D, fighting 3D, melee combat 3D, Coordination 2D, Physique 3D, lifting 3D+1, running 3D+1, Intellect 2D, Acumen 2D, search 2D+1, streetwise 2D+1, survival 2D+1, Charisma 2D, intimidation 2D+2, mettle 2D+1. *Move:* 10. *Physique Damage:* 2D. *Fate Points:* 1. *Character Points:* 3. *Body Points:* 15 / *Wound levels:*

2. *Equipment*: short sword (damage +1D+2); knife (damage +1D); padded leather armor (Armor Value +1D) with helmet.

King Edmund: Agility 2D, melee combat 7D, dodge 6D, Coordination 3D, Physique 2D, Intellect 3D, healing 4D, reading/writing 4D, cultures 4D, speaking 4D, Acumen 2D+1, Charisma 2D+2, command 5D, intimidation 4D, mettle 4D, persuasion 4D, Extranormal: Magical 3D, alteration 4D, conjuration 6D, apportation 5D. *Advantages*: Authority (R3), ruler; Size: Small (R1), scale value of 3; Wealth (R3). *Disadvantages*: Hindrance: Shorter Stride, 2 meter reduction to running, swimming and jumping Move. *Move*: 8. *Physique Damage*: 2D. *Fate Points*: 0. *Character Points*: 0. *Body Points*: 15 / *Wound levels*: 2. *Equipment*: short sword (damage +1D+2); knife (damage +1D); padded leather armor (Armor Value +1D).

King Edmund is a handsome man of early middle-age, but only a little over 4 feet tall. He carries himself with great authority but little arrogance. He has used all his available Fate Points and Character Points to bring Princess Grace to him and has no magical wherewithal to defend himself presently. (Most of his spell expertise is in the care and management of revenants anyway.) Good thing he's a master swordsman.

Better, Stronger, Faster

Basic Cybernetics for *GURPS Fourth Edition*

by Matt Riggsby

Many cybernetic enhancements can be expressed easily in terms of GURPS advantages. For example, bioengineered implanted filters for extracting oxygen from water could easily be seen as just an instance of the Doesn't Breathe: Gills advantage, purchased for \$1,000 per point of advantage cost (per p. 295). However, some larger, more obvious prosthetics, such as artificial limbs are potentially more complex, incorporating a number of advantages, disadvantages, limitations, and enhancements. This article provides some guidance for people wanting to play cyberpunk campaigns with *GURPS Fourth Edition* by presenting stats for basic cybernetic limbs and sensory equipment.

Ground Rules

If a prosthetic limb enjoys an advantage or disadvantage which usually covers the entire body, it receives a -80% limitation: only applies to one body part. This can be seen as neatly dividing the body into five zones, each of which an advantage or disadvantage can be applied to at 20% of cost: left arm, right arm, left leg, right leg, and the torso and head combined. All external cybernetics, unless otherwise noted, partake of the Machine metatrait (p. 263).

Any society advanced enough to produce powered prosthetics can disguise them to the casual glance, if desired. Cybernetic appendages can be padded with foam and covered with flexible flesh-toned skins so that they'll resemble the wearer's own body parts. Only a closer examination will reveal their mechanical nature, and the covering provides no real protection (this is a zero-point effect). However, in most cyberpunk campaigns, wearers will want to emphasize their cyborg nature and dispense with such concealment.

Arms

A cheap or primitive cybernetic arm has, at best, rudimentary touch sensors, but also inflicts no pain if damaged, providing Numb (-20) and High Pain Threshold (10). The electronics are also on the fragile side and easily disrupted, giving the arm the Electrical disadvantage (-20). Taken together with the Machine metatrait (grand total -5 points) and the 80% discount for applying to a single limb, the basic arm is a -1 point disadvantage. For the purposes of monetary cost, but not advantage cost, the cost of fixing the One Arm disadvantage (-20) is included, bringing the cost of a low-end cybernetic arm to \$19,000.

Where available, characters will probably be interested in a number of options:

Option	Cost	Notes
Improved shielding	\$4,000	Eliminates Electrical
Improved touch sensors	\$2,000	Eliminates Numb and High Pain Threshold
Advances sensory filters	\$4,000	Eliminates Numb, but not High Pain Threshold
Additional ST	\$3,000/point of ST	
Improved hand control	\$5,000/point of DX	Treat as Manual Dexterity; this option requires either of the options buying off Numb
Overall improved control	\$12,000/point of DX	Treat as Additional Arm DX; this option requires either of the options buying off Numb

Legs

Like cybernetic arms, low-end cybernetic legs have Numb, High Pain Threshold, Electrical, and Machine (again, at -80% discount), and for the purposes of monetary but not advantage cost, the cost of fixing the *Lame: One Leg* disadvantage (-20) is included, bringing the cost of a basic cybernetic leg to \$19,000 or a -1 point disadvantage, the same as that of an arm. A pair costs \$38,000, or -2 points. Legs have many of the same options as arms, but since they're used primarily for locomotion, they're best bought in pairs.

Option	Cost	Notes
Improved shielding	\$4,000	Eliminates Electrical
Improved touch sensors	\$2,000	Eliminates Numb and High Pain Threshold
Advances sensory filters	\$4,000	Eliminates Numb, but not High Pain Threshold
Additional ST	\$3,000/point of ST	Improves Kicking damage for the effected leg, but not Move or Speed
Enhanced Move	\$5,000 per +1 to basic Move	This option requires <i>two</i> cybernetic legs. This cost is for the full enhancement, not a per-leg cost.
Enhanced Jump	\$10,000 per ×2 to jumping distance.	This option requires <i>two</i> cybernetic legs. This cost is for the full enhancement, not a per-leg cost.

Sensory Equipment

Unlike limbs, eyes and ears are typically bought in pairs, and the listed costs reflect that. A character could buy a single cybernetic eye or ear for half cost. However, if one eye has enhancements that the other doesn't, the wearer either loses the benefits (if he uses the eyes together) or effectively suffers from the *One Eye* disadvantage while he closes one eye and uses the other. If one ear has enhancements the other doesn't, the additional enhancements are only effective for sounds coming from that side (and *not* those coming from the front).

Cybernetic eyes and ears have Machine and Electrical; since they're mostly internal, it's assumed that any injury will transmit enough force to the surrounding tissue that the pain sensors of the replaced body parts are irrelevant. The cost of buying off Blindness (50 points) is included in the monetary but not point cost of eyes, bringing the base cost of a pair of cybernetic eyes to \$51,000, or a 1 point *advantage*. Cybernetic ears include the cost of buying off Deafness: \$21,000 or a 1 point advantage.

Primitive or cheaply produced eyes may have limited capabilities for a reduced cost:

Option	Cost	Notes
Color blind	-\$10,000	
Restricted vision	-\$15,000	
Tunnel vision	-\$30,000	
Poor resolution	-\$25,000	Treat as Nearsighted

At the GM's option, multiple disadvantages may be combined, or combined with the enhancements below (for example, cybernetic eyes which are color blind but have broad peripheral vision would cost \$51,000), but the minimum cost of a pair of eyes plus implantation is unlikely to fall below \$10,000.

Of course, there are also a number of enhancements available:

Option	Cost	Notes
Acute Vision	\$2,000/+1 to Vision rolls	
Night Vision	\$1,000/+1 against darkness penalties	

Peripheral vision	\$15,000	
Telescopic vision	\$5,000/level	
UV vision	\$10,000	
Glare filters	\$5,000	Treat as Protected Sense

Cybernetic ears have their own options:

Option	Cost	Notes
Acute Hearing	\$2,000/+1 to Hearing rolls	
Discriminatory Hearing	\$15,000	
Parabolic Hearing	\$4,000 per level	
Subsonic hearing	\$5,000	
Ultrahearing	\$5,000	
High-volume filters	\$5,000	Treat as Protected Sense

Interface Jack

GURPS describes a number of advantages related to plugging computer-related facilities into one's head (for example, Modular Abilities). However, it lacks clear direction for one prominent feature of cyberpunk: the interface jack, an implant allowing the user to operate computers and other devices via a direct neural link. How much it costs depends, of course, on what, exactly it does in the game setting.

A low-capacity interface jack allows operation of devices equipped for computer or mental control with no bonuses to that operation. Since it's simply an alternate means of control providing no consistent advantage, it's a one-point perk, or \$1,000.

A more powerful interface jack is described in **GURPS Cyberpunk** (p. C41). This jack provides a +4 to skill rolls for operating equipment thus controlled. This could be regarded as the equivalent of a +4 Talent for a group of skills including Boating, Computer Hacking, Computer Operation, Computer Programming, Driving, Electronics Operation, Piloting, Research, and Submarine. This is a medium-sized group of skills (10 points/level), but it has some limitations. First, it does not grant reaction bonuses and increased learning speed usually granted by the Talent advantage (-30%). Second, it has an Accessibility limitation: can only be used with devices equipped for neural control. How much of a limitation that is depends on the campaign, but in a typical cyberpunk campaign, -30% seems reasonable. Most computers can be directly interfaced, possibly with the addition of a special sensory interface deck, but vehicles and other equipment may not be routinely equipped for direct control. This makes an interface jack a 16 point advantage, or \$16,000.

Enhanced Battery Life

The Machine metatrait assumes that machine parts must be refueled or recharged periodically. This can be somewhat inconvenient for adventurers if they're traveling to areas where it's easier to get food than new batteries, so they may want to invest in better power sources. Any cybernetic enhancement can be provided with superior batteries or compact, high-endurance power plants that require less frequent recharging or refueling: \$1,000/1 point to recharge once a week, \$2,000/2 points for a permanent power source which essentially never needs recharging.

More Questions than Answers

The End

by Chris Aylott

The bookcases began to leave the store today. That's when it finally became real.

We bought these bookcases in the spring of 1995. Pine bookcases, unfinished. Sixteen tall cases, 10 short. We stained them a maple color and covered them with two layers of polyurethane, just to be sure. We nearly stunk out the Subway sandwich shop next door before they complained and we took the work outside. We worried that they weren't sturdy enough.

The cases I carried out the door today had their share of dings and scratches, but they were sturdy enough. They don't look that different from 10 years ago. I can't remember the name of the man who built the shelves anymore, but he built them well.

I don't look much different either. Same unruly hair, goatee instead of beard, slightly nicer clothes. I'm still using the state ID card I got when I was in college, and nobody ever looks at it twice. Why should they? I'm wearing a trenchcoat in the picture, and most winter days I'm still wearing the same coat.

A few dings and scratches, no big changes.

So why do I feel so old tonight?

Going South

If you missed the news, I'm the new Managing Editor at Steve Jackson Games. In less than a month, my family and I are packing up and moving 2,000 miles, from Northampton, Massachusetts to Austin, Texas. That means the store has to close.

We've been preparing for this for most of the summer. Truth is, we were going whether I got the job or not, either now or in the spring when our lease was up. The business was doing okay. Not fantastic, but "okay" has been good in a year of market consolidation and shaky game sales. But somewhere along the way . . . it stopped being fun. It got old. We got tired.

My younger self would never have been able to imagine that. Tired of selling books and games? Tired of having a store where you can play with stuff and call it a demonstration? Tired of hanging around among professional booksellers and gamers?

My younger self loved retail so much that I once declared that I didn't want to retire, that I wanted to be found slumped over the register one day.

What was I thinking?

Why didn't I understand that a job and a hobby don't make a life?

Our Shrinking World

It's not like the job sucks. On any given day, it's still fun to sell stuff. When I do get to demonstrate a game -- which isn't often enough, as I'm usually behind the register -- that's fun. I've mostly lost interest in the industry chatter, but

that's because I'm hearing the same spats and wishful thinking for the fifth time running. It doesn't usually bother me, because I can tune the chatter out.

Any given day is good. What wears you down is stringing the days together into every day. My wife and I have worked six days a week since we opened, with a few days off each year for a vacation or medical reasons. No weekends, no road trips of more than a few hours, and not many holidays. I missed my sister's wedding because I had to mind the store for a big ***Magic: the Gathering*** release. She got divorced a few years later, and I never actually met her husband.

That's not the only wedding my wife and I have missed. Then there are the conventions, the birthday parties, the dinners with friends. The years-long gaps between visits with parents. Working together kept the two of us close, but the work eroded our connections to friends and family. We didn't even have time for letters, and if it weren't for instant messaging and e-mail we might have lost most of the friends we still have.

Moving the store helped a little. The new location allowed one person to run the store while the other did errands or took some personal time. But we also became parents, and that was when the cracks in our life really started to show.

The World's Greatest Baby didn't suffer from spending her first year in a store. Quite the opposite; at 14 months she loves interacting with other people and is soaking up new words like a sponge. But the store is too limited an environment for her; I worry about what will happen if she can't explore other places. I worry about her grandparents, and whether she'll get to spend enough time with them as she grows up.

We could justify sacrificing our own time for the store. We couldn't justify sacrificing our daughter's childhood. And so we found another option.

Last Chance for Gas and Good-byes

They say the last month of a business is its best month. That's certainly true here. We're selling everything -- books, bookcases, tables and chairs -- and the money is rolling in faster than it does at Christmas. Now I know why shady rug dealers have "closing sales" every month; business is great when the customer thinks he's getting a last-chance bargain.

Ring up sales isn't what tires us out, though, not even at this pace. What's exhausting is the emotions that our customers bring in. A few of them are angry at us -- they feel betrayed because we're picking up our toys and going home. There's not much I can do or say about that. Most of them are happy for us but sad for themselves. They seem a little lost, telling us that they don't know how they're going to find the books they like without us. They seem to believe that this store is more than a place you can buy books, and maybe they're right.

(Lest I sound too big-headed, I should note that not all our visitors are fans. Search around the net a little and you'll find quite a few people who are happy to slag us off, some of them former friends. Some of our detractors don't like our selection, some of them don't like the choices we've made, and a *lot* of people don't like my attitude. To which I can only say that I give back the attitude I am given, and if I've acted like a jerk to you then there was probably a reason.)

I can sympathize with our customers' feelings, but I don't really know how to deal with them. I want to tell them how much I'll miss Northampton and the store, but the truth is that I won't. I'll miss some people and some things. But that mild sadness is overwhelmed by the joy I feel in picking up stakes and moving, in getting to do new things at work and at home, at spending lots of time with my parents for the first time since I stopped coming home from college. I can't be sad with them about leaving, because I'm too happy to go.

And then there are "the teenagers." Who aren't teenagers any more, really. The oldest are in their mid-20s now, out of college and establishing lives of their own. These are the kids that grew up in the store over 10 years, who played games in our back room and hung out and talked to us because they couldn't talk to their parents any more. They're the ones we're truly going to miss; the oldest ones have been coming back to say good-bye, and there have been a lot of

hugs and a few tears. But they don't need us any more, not really. Even the youngest ones are growing up, ready to move on to new things. To the rest of their lives.

It's hard to let go of the teenagers, harder than I can put into words. There's only one thing about leaving that can make me cry, and this is it. But at the same time it's the teenagers that make me realize how lucky Deb and Katherine and I are.

Lucky that we have each other, and a larger family that wants us to be near them.

Lucky that we have the money and the skills to do what we want with our lives.

Lucky that we're willing to walk away from a life that's not working for us and embrace something new.

Lucky that for 10 years we were able to change people's lives just a little bit for the better.

The End is The Beginning

In less than a month, my family and I are packing up and moving 2,000 miles, from one life to another. My head is already more than halfway into our new world; I open my e-mail now and it's full of manuscript comments, scheduling concerns, budget decisions to be made. I feel old when I look around the shop, but I feel like a kid when I look at the work ahead. There's so much to do, so many possibilities, so many new things to learn.

Being the Managing Editor is going to keep me busy, and there's no way I'll be able to organize my scattered brain into a column on a monthly basis. (As it is, this final installment is horribly late, and threatening to spoil The Mighty SMarsh's honeymoon. He's going to be guilt tripping me for months about this, and I'll deserve it every time.) *[Editor's Note: Honeymoon? What's that? I'm editing this at GenCon, an hour before I need to set up a booth . . .]* But I don't think it's right to leave a job without a successor in place, and that's why I'm pleased to introduce you to Heather Barnhorst.

Heather is a manager at one of the largest game stores in the country, a columnist for *Comics and Games Retailer* and other trade publications, a consultant to a host of aspiring game companies, and a good friend. I wrote about her [back in November](#), and I'm amazed at what she's been able to do to turn a guy's hobby into a family hobby. I'm looking forward to what she has to say about the game business, and by this time in September I'm sure you will be too.

As for me, you'll know where to find me. (Just look for the office with the flaming skulls and the screaming writers.) Thanks for your time, thanks for your thoughts, and thank you for loving this hobby as much as I do.

Unblink Your Eyes at the Sweeping Change

To call the last couple of weeks hectic would be a gross understatement, merely drawing attention to the calendars full of weeks that had been previously labeled "hectic" that are now revealed to be nothing more than lemonade-sipping seven-days spans that stare at the sky and try to decide if a particular cloud looks more like a bat or an elephant. I've been busy.

Fortunately, my wedding day went off without a hitch (well, okay . . . one important hitch), and the special wedding-themed issue was well-received, making my mom, stepmom, and fiancée cry. So to everyone who helped make that issue happen, I thank you from the bottom of my heart.

Anyway, after the wedding, we had one brief evening at an incredibly nice hotel room (one where Tip O'Neal slept in); then, 10 hours later, we were on the road again, eventually ending up in our new home. Twenty-eight hours later, we were in a car again, on the way to GenCon for business, as usual.

So I'm sure the week has been awash with changes, but I haven't had a chance to sit back and enjoy them yet. However, at one point I *did* get to watch one of my *Mystery Science Theater 3000* tapes ("Last of the Wild Horses"); that episode contains an extensive homage to *Star Trek's* "Mirror, Mirror" episode. And that episode -- coupled with the sweeping changes I'm awaiting for my life once I get a moment to tie my shoes, and the changing of the guard for our own retail-inspired columnist -- are what have inspired this installment.

There are, *very* broadly speaking, three core genres (or more specifically, periods): Fantasy, Modern, and Sci-Fi. Obviously, these form the trinity of past, present, and future, and form the conceptual basis for the new **D6 System** as well as the **d20 System**.

One common element that stories set in these three broad categories have is the idea of the sweeping [change](#) -- the moment when reality melts away from what it was to what it is now. (I'm sure there are other types of elements that are common to all three, but I'm just focusing on one. Work with me, here.) The idea of the sweeping "before your eyes" change is primarily a visual one, which is why it seems most common in movies and television shows: examples include black and white changing to color in *Wizard of Oz*, the sweep of changing weather in any modern adventure-disaster movie, or the "good" world changing to an evil or darker one in *Star Trek* (or its *Next Generation* successor). In a broader sense, though, it's relatively common in other media and stories: returning in the time travel device to find one's home devastated, activating a magical curse that turns the kingdom bleak and dying, or finding out your guardian angel seems to have transformed your beloved town into a dystopian nightmare.

The mechanics behind the sweeping change varies from genre to genre, but the most common are:

- time travel (including that one-way form of time travel known as "moving into the future")
- magic
- "reality altering" powers (in other words, psionic magic)
- altered states of consciousness (it's a dream/it's a hallucination/you're in the matrix)

Although these sweeping changes are common to almost all genres and stories, they have several things in common:

The change is usually for the worse. While I think it would be a neat one-off story to have the heroes discover a sweeping change that has affected everything, and have that change be relatively beneficial (or even entirely so), the usual trend is for the sweeping change to be at best a step in an unusual direction, and at worse a plunge into the abyss of badness.

The protagonists remember the way things are supposed to be, but no one else does. Or, if they do, no one else is in a position to do anything about it (but the heroes are). In fact, it's as common as not that the rest of the world don't even know or remember the heroes. (Again, there's story potential for a sweeping change where everyone remembers how things used to be.)

There are usually immediately recognizable elements that have been transformed. It's rare for a transformed world to be utterly unrecognizable (although not impossible -- the original *Planet of the Apes* springs to mind, although its ending centers around recognition of a famous pre-transformation element). Even something as "alien" as the Kansas/Oz transformation has the recognition of Kansanian elements as a plot point. ("Gosh, you're just like my cowardly friend back home!") While it's possible to have the world be something totally unfamiliar, it's usually more resonant to have some familiar element(s) from the pre-transformed world that can be a reminder of the prior world. Thus the Golden Gate Bridge might be transformed into a massive vine-and-plant construct, the optimistic holopod entertainment chamber might be transformed into a deadly holographic combat training ground, or the knight's favorite magical sword might turn into a push-button energy-blade weapon.

There are usually approachable elements of "the normal" -- the status quo of this transformed world. These serve either to throw off the protagonist or to exemplify why this world is different than normal. For example, a seemingly hard-luck street urchin who turns out to be a deadly assassin might exemplify how this world has hardened everyone, such that there is no innocence anymore. For aficionados of interactive fiction, the classic Infocom adventure *A Mind Forever Voyaging* -- which focuses on a computer's simulation of various points in the near-future -- relies on many of these types of approachable elements to tell the story.

If there's one conceptual element that distinguishes the "modern" era from its feudal or classical predecessors, it's the idea of the future. While in times of old it was common to know that your children's children would die in a world roughly the same as the one you were born into, nowadays it's common to see the world change before one's eyes several times in a lifetime. As a wise person who I'm too lazy to look up once said, "[The future ain't what it used to be.](#)" And the idea of the future and change can most easily collide when a sweeping change is introduced.

In the meantime, I eagerly await the sweeping change of a roadtrip home, and more than two days straight in my own bed.

Eberron Deluxe Dungeon Master's Screen (for *Dungeons & Dragons*)

Published by [Wizards of the Coast](#)

Development & Assembly by Christopher Perkins

Four-panel referee's screen, map of Khorvaire, full color; \$14.95

This may be the longest anyone's ever gone between putting out a game and following it up with a GM's screen, but if you're a fan of the **Eberron** setting from Wizards of the Coast, your secrets are now safe with them.

The **Eberron Deluxe Dungeon Master's Screen** is a four-panel affair, with most of what you'd expect from it. In the center are the charts you need most often. Actions take up the bulk of the right, and modifiers most of the left. In a digestible format, they repeat what you can do, how long it takes, and whether it provokes an attack of opportunity from your enemies. In a similar vein they list skills, whether they can be used untrained or without interference by armor, such. They've also managed to slip a bit of campaign color in on you by labeling the months and the days of the week.

The aforementioned modifiers apply variously to combat and related matters (turning undead), but also bonuses and penalties for climbing and listening. Interacting with NPCs is stuck at the bottom, and this panel's local flavor is the dragonmarks (mystic tattoos that signify natural skill with certain abilities) of the various houses.

The farther left you go, the more the scenery takes it on the chin. If you want to break something, this panel will tell you how to go about it. Travel right, and you've found all things movement, including a tangentially related segue from the previous panel for spot checks and the even less-related *detect magic* and *evil*. Oh, and the almost pointless light sources chart. Everything has a page reference, so if you need context or the screen just doesn't provoke enough arguments, you can quickly find both the book and page you need.

On the other side, to give the players something other than a blank page to stare at, is the traditional artwork. This one's got another fight scene, deep in a jungle, with combatants from vaguely defined sides (who's that bat-like thing working with the humans?). It's busy and pretty, if not outrageously inspiring.

The shield uses "landscape" format, which is to say the screen panels are the size of a page, but they're laid on their side so it's about half as tall; the DM has privacy but he can still see his friends. The short stature lets it use a neat graphic conceit: Anyone familiar with the **Eberron** product line knows the covers stylistically limit the illustration to the middle third of the book, letting it wrap around front and back. The art used here is like one of those products, peeled off, extended either direction, and squished into the sheet for a nifty effect.

It may not matter to the average consumer, but the screen folds out from the middle like wings (or, if you prefer, the right and left ends fold toward the middle when you're done with it). What might matter to buyers is that you get shorted a little on the end panels -- they're not quite eight-and-a-half inches each, so don't expect the full 44" spread.

If you're waiting to hear about the booklet that customarily comes with the screen, you'll have to take the map. Khorvaire, the continent of choice for starting one's **Eberron** campaigns, fills the layout, and it's rather nice. It looks good on your gaming room wall, and labels all the points of interest (which are, in turn, accompanied by a master key so you know the size of every one-griffin town for miles). It's the same illustration from page 135 of the **Campaign Setting** core book, measuring about 32" by 20". It's bigger, but not precisely the same. You can find a city here or there that's a little further north than it was originally (and some minor graphic changes, like the lines used to demark this road or that rail). The advertising copy wrapped around the whole thing claims this map has details on sites not

previously available. This is an exercise for the consumer; a brief comparison of the two shows no additions.

It might be more of an aesthetic choice, stacking the ***Eberron Deluxe Dungeon Master's Screen*** against the other shields available for ***Dungeons & Dragons***. Do you prefer tall and thin, or short and wide? There's not much new or changed here -- a few charts for skill checks and sample difficulties left out, a couple of ***Eberron***-specific lists put in - and not all the inclusions make sense. Would you rather have the months of the year, or prefer they add in rule-oriented items like a sadly absent bit about the use of action points? Whatever you choose, this screen is sturdy enough in function, stock, and quality to make it an even call.

Vampire: The Requiem (for the World of Darkness Storytelling System)

Published by [White Wolf Game Studio](#)

Written by Ari Marmell, Dean Shomshak, & C.A. Suleiman with Justin Achilli, Carl Bowen, John Chambers, & Matthew McFarland

Illustrated by Sam Araya, Daren Bader, Tim Bradstreet, Brom, Avery Butterworth, Pauline Benney, Shane Coppage, Marko Djurdjevic, Fred Hooper, Travis Ingram, Alex Maleev, Ken Meyer JR, Mark A. Nelson, Michael Phillippi, Jeff Rebner, Jean-Sebastien Rossbach, Mattias Snygg, Rich Thomas, Josh Gabriel Timbrook, Andy Trabbold, Conan Venus, & Cathy Wilkins

Cover by matt milberger

306-Page Black & White Hardback; \$35

Considering how big *Vampire: the Masquerade* has been since 1991, it is no surprise that White Wolf launched the all-new World of Darkness with a new version of its flagship title. *Vampire: The Requiem* is as an attractive shiny red hardback, its cover given a pleasingly tactile matte-gloss cover. The good looks continue inside, with finely executed red tones. The writing, like that of *The World of Darkness Storytelling System Rulebook*, shows every effort of being made conceptually both accessible and lucid. And in the reading, it is clear that the "hipper than thou" attitude of previous games is also gone.

From the title onwards, this appears to be a changed game. Not "Masquerade," but "Requiem," referring to the change in the nature of vampiric existence. While also a Mass or Dirge for the dead, the Kindred describe their un-existence as the Requiem, a grandiose waltz in which they are in turn, guided, manipulated, and inspired to dance. This is a far more precarious existence, vampires confined to the cities by an instinctive fear of the open countryside; prone to outbursts of rage from the Beast within that separates them from mortal man; and as they cling tenaciously to their barely remembered mortality, they are forced to exist alongside the only thing that understands this existence -- other vampires. This stands in direct paradox with the vampire as a solitary predator by nature. The Masquerade still continues though, the traditions of secrecy being what keeps the Kindred hidden from Kine.

The strained, fractious relationships in vampire society are referred to as the "Danse Macabre." This is as much a distraction from the Requiem and the predatory urges of the Beast, as it fulfills a vampire's need for social contact. The Danse Macabre might seem predicated upon dominance over others, but is really concerned with the acquisition of influence and leverage, in both vampire and mortal society. The constant infighting and manoeuvring for both is dominated by the Elders of vampire society, who have been at the game for longer.

But even Elder influence extends only as far as the city edge, rarely beyond. For in *Vampire: The Requiem* there is no over-arching conspiracy to keep vampires hidden; the Camarilla existed in Roman times but no longer, lost to the vagaries of vampiric history; however, arguably its feudal structure remains, as does its traditions. What then of the clans?

Rather than the seven or the 13, ***Vampire: The Requiem*** has just five. Here the game begins its reuse of old words for new and old concepts under new terms. Thus the five clans are the Nosferatu (outcasts), the Gangrel (savages), the Ventrue (nobility), who are joined by the Daeva (sensualists, or Toreador renamed), and the Mekhet, a combination of the Lasombra and Tremere as shadow-dwelling perfectionists. If a clan is a vampire's family, then his Covenant represents his social allegiance, objectives, politics, and theology in one. Again there are five, of which some can be freely joined, others having requirements. The Carthian Movement seeks to modernize vampire politics and society, while the Invictus wishes to retain and rule the current situation. The Circle of Crone are pagans venerating a number of female figures, while the Lancea Sanctum is more like a church, believing vampires to be descended from Longinus, the legionary damned at the Crucifixion. Finally, the Ordo Dracul is another mystical society, concerned with transcending the kindred state. Two other Covenants are described, neither of which is available to player characters as they either hate vampires or are Satanists. Characters without Covenant, the unaligned or unbound, are generally looked down upon.

To reflect that characters are mortals first and then vampires, players create mortals from the rules found in ***the World of Darkness Storytelling System Rulebook***, then add elements found in this book. This includes not just new Merits, but also an attribute bonus and various disciplines determined by a character's clan and covenant. Where the mortal possessed Morality, after his Embrace he has Humanity, a measure of what he remembers of being mortal and which is easily lost. Instead of the previous game's Generation, a character's Blood Potency determines the mystical strength of the vitae in his veins, setting limits on his blood pool size, the blood that can be expended, and the maximum level of attributes, skills, and disciplines. Beginning at 1, Blood Potency can increase over time, experience, and through Diablerie, which results in the loss of Humanity and possible infliction of a mental derangement. More interesting is the fact that Blood Potency can be lost when a vampire enters into Torpor for any length of time.

Again Disciplines mixes the old and the new, and even the new draw on previously seen abilities. That said, they have been reworked in line with both the mechanics and feel of the new Storytelling System. The core mechanic is that of attribute plus skill plus Discipline level, and in every case is clearly explained. Blood Potency also determines the maximum level of a Discipline that a vampire can learn or be taught.

Another character option comes in the first appendix: Bloodlines. While together Clan and Covenant allow flexibility in character generation, Bloodlines increases this by allowing some characters that have diverged away from their Clan. Again five are given, along with associated Disciplines. The first of the five are the Bruja, vicious Gangrel sired by a punk biker and operating only in the American Southwest. Buruamin are Japanese Nosferatu, Malkovians (not Malkavians) are mad Ventrue descended from a 19th century asylum inmate, the Toreador are even more cultured Daeva, and the Morbus are plague-bearing Mekhet. In addition to the advantage, weakness, and Discipline of their parent Clan, each Bloodline comes with an associated weakness and another Discipline. Bloodlines cannot be joined straight off and it is later possible for a character to create a Bloodline of his own, but gaining recognition for it is another matter. The appendix also includes notes on how to create new Disciplines.

The nature and use of blood or Vitae is explored in depth, many of the actions in the previous game have been made more difficult, from siring a Childe to creating and maintaining a Ghoul. Vitae also has an addictive quality, whether that of the vampire's own or another vampire, which of course can lead to the Vinculum, a bond over the feeding vampire or mortal. Further, Blood ties are stronger between connected vampires, allowing bonuses when using certain Disciplines on members of the same linear family.

The setting emphasizes the politics and scheming within a neo-feudal government ruling over one city or another. While other forms of government are suggested, including the corporate board room, the democracy espoused by the Carthian Movement, the church Diocesan, and so on, these rarely prove workable; in most cases, an autocratic Prince rules advised by a council of Primogen. This set up is reflected in the second appendix, a fully described location. This is New Orleans, where it is relatively easy to maintain the Masquerade. For the last three decades the city has been dominated by three factions, each connected to an aspect of mortal society. The formal prince has ties to city businesses, his immediate rival is a charismatic politician with fingers in the criminal underworld operating out of the French Quarter, and the third is the mysterious Baron Cimitiere, a Houngan with a large mortal flock. The situation in New Orleans is described in 25-pages, but the Storyteller will find that it is not quite ready to play, the characters and

the objectives of the players needing to be worked in.

What the description of New Orleans reflects is a scaling back of the game's focus from worldwide to the cityscape and the dropping of a theme with the reset. ***Vampire: the Masquerade*** was described as a Gothic Punk game, but in ***Vampire: the Requiem***, the Punk element has been excised. New Orleans is perfect for that given the popularity of the Anne Rice novels. The focus on character has also shifted; no longer is a vampire the cool immortal, but a monster ruled by the Beast within. Indeed, this Beast is recognized between vampires as the "Predator's Taint" that sees each other as direct rivals and prone to Frenzy.

As a book, ***Vampire: the Requiem*** does have a problem or two. Many of its elements are difficult to find in a hurry, and the index doesn't really help. The book could have done with a few more antagonist descriptions, but perhaps the lack reflects the game's introverted nature. It also feels overwritten, even verbose in places, but much is also clearly explained and easily grasped. The storytelling advice is certainly not bad, but it does not offer anything new or different either.

The end result is that ***Vampire: the Requiem*** does not feel like a wholly new game, the reuse of so many elements a contributing factor. Yet it feels better -- even more stylish after a radical streamlining -- and possesses greater flexibility, at least in terms of character generation. The effect is less sterile than ***Vampire: the Masquerade***, perhaps languorous, and entirely the better for it. Not wholly new, nor wholly old, ***Vampire: The Requiem*** is still an effectively executed and accessible retelling of a landmark game.

Lockwork

for *GURPS*

by S. E. Mortimer

*"A zealous lock-smith died of late,
And did arrive at heaven's gate,
He stood without and would not knock,
Because he meant to pick the lock."
-- William Camden, locksmith, 1605.*

The subject of locks covers thousands of years and many technological advancements -- from simple mechanical locking devices to electronic devices used today. This article concentrates on mechanical locks -- i.e. those devices that a character with the **GURPS** Lockpicking skill (p.B206) might be able to compromise. Attempts have been made to keep as consistent as possible with related **GURPS** material including *Basic Set Fourth Edition* and *Covert Ops*.

Introduction

Ever since the first door was invented there existed a need to prevent it from being opened. Locks were not only meant for security; they were a sign of wealth. The key became a strong symbol of authority, security, and power. In some cultures the number of keys carried was a direct measure of social status. Some locks were elaborately decorated and some keys were cut with intricate designs. Sometimes this was meant to deceive potential intruders as to the complexity of the lock they fitted -- a complicated key implied a complicated lock. There have only been two main methods used to obtain security from mechanical locks and keys. One is by means of fixed obstructions, called "wards" (see below), to prevent wrong keys from entering or turning in the lock. The other method employs moveable pins or "tumblers," which must be moved in a prearranged position by the key before it may be turned. The best locks use a combination of both wards *and* tumblers.

Security Measures

What follows is a brief list of the most common devices used to make locks more difficult to compromise.

Tumblers (TL1): A series of pins that fall down into notches in the lock. Small tumblers are spring-loaded, larger ones rely on gravity. A key lifts the tumblers up to a predetermined height, thus freeing the locking mechanism.

Wards (TL2): The simplest security measure. It is basically an obstruction that the key must slide past. The key needs to be cut so that it has slots in the bit -- basically a negative image of the ward(s). The simplest wards were small protrusions in the keyhole. Unless the key had slots in the same places it could not enter the keyhole. Internal wards are usually circular -- the slots in the key fit over the wards and follow them around as the key is rotated. Wards are made from thin metal plate silver soldered together in the ward case. The delicate work requires similar tools and skills as the jeweler.

Barrel Pin (TL2): A key with a hollow barrel is needed to fit over this pin. It serves as an obstruction to lockpicking and renders it more difficult to make a duplicate key. Some pins were not circular, meaning that a barrel key would

Lock Components

Strike Plate: The door jamb is hollowed out and the strike plate is fitted over the top. It has a hole the same shape as the cross-section of the bolt. When the bolt slides into, and engages the strike plate, the mechanism is considered to be "locked."

Bolt: This is the metal bar that engages the strike plate. It has a notch for the end of the key (the "bit") to slip into. The key bit acts as a rotating lever. If the key is turned in one direction the bolt slides into the strike plate. If it is turned the

not fit over the pin unless it was the same shape. In these instances, the barrel pin must rotate along with the key.

Concealable Keyhole (TL3): If the keyhole cannot be accessed, the lock cannot be opened. Keyhole covers were commonly used in the past to make the keyhole harder to find. Locating it requires a Quick Contest of the intruder's Vision or Search vs the maker's Camouflage skill (one minute per attempt). Some keyhole covers are hinged and spring-loaded. They must be released with an attachment on the same key that is needed to unlock the door -- usually located on the bow of the key. If one does not have the correct key then two lockpicking rolls are needed (after a successful Search roll finds the keyhole). One skill roll to release the keyhole cover (usually a fairly simple operation: +4 to +6), and another roll to pick the lock itself.

Detector Tumblers (TL5): Patented by Jeremiah Chubb in 1818, this feature makes the tumbler lock (see above) very difficult to pick. If any of the tumblers are raised too high, a special "detector tumbler" is activated and jams the bolt. The bolt cannot be moved again until the correct key is inserted and rotated to the "locked" position. This resets the detector tumbler. The key can then be rotated as normal to unlock the lock. This feature has the additional benefit of alerting the keyholder if someone attempts to tamper with his lock. If the first lockpicking attempt fails, the detector tumbler activates, and no further lockpicking attempts can be made until the detector tumbler is deactivated with the correct key, or a Lockpicking roll at -4 succeeds.

Locksmithing

Locksmiths were skilled metalworkers -- more akin to jewelers than blacksmiths. A locksmith needs the Engineer (Clockwork) skill (p.B190) to design and build locks, and construct a master key. Most locksmiths also have the Lockpicking skill (p.B206) so they can open locks and produce keys for locks to which they don't have the master key. Simple keys can be made by cutting slots into the bit with a jeweler's saw. More complicated keys are made from brass using "lost wax" casting. To build a custom-made lock, the GM assigns a modifier equal to the complexity of the lock to be attempted. For example, If the locksmith wishes to build a lock that gives a -2 vs. lockpicking attempts, then he needs to make a skill roll with a -2 modifier. It takes many days to make complicated locks. A basic lock with a modifier of +4 or more only takes a single day. It requires an additional day for every -1 to the modifier. E.g. a lock with a +0 modifier takes 5 days to manufacture. Poorly assembled locks don't fit snugly together, allowing more play between the components, and making them much easier to pick. A successful skill roll produces a lock of the required complexity and a matching key. On a critical success, the lock complexity is increased by 1 point. On a failed roll, the complexity of the lock is reduced by 1 point for every point by which the roll failed. For example, if the locksmith attempted a -2 lock and failed his skill roll by 3 points, then he creates a lock with a +1 complexity. On a critical failure the lock will fall apart the first time someone attempts to pick it.

Keys: As stated above, a successful Engineer (Clockwork) skill roll produces a master key to match the lock that the locksmith made. Once the master key is made, it is a simple matter to produce duplicates. It doesn't require any skill rolls to make additional keys if the master key (or an impression) is available.

other direction it slides out again. The notch needs to be symmetrical so the key bit can engage the bolt from both directions.

Lock Plate: This is the thin metal plate that fits over the locking mechanism on the outside. It has a keyhole to allow the key to be inserted. It is often the only part of the lock that is visible.

The Key

Bow: The "handle" of the key. It is wide and flat enabling it to be easily turned in the fingers. Larger keys have bows that are big enough to be gripped with two hands.

Shank: The long, thin length between the handle and the bit.

Shoulder: A section of the shank is widened into a collar to prevent the key from being inserted too far. Shoulders are generally only needed for keys that need to be inserted from both sides of a door.

Throat: The small section of the shank between the shoulder and the bit.

Bit: The part of the key that engages the bolt. It has slots or "cuts" so it may fit into the tumblers and/or wards of the lock.

Post: Also called a "pilot." It is the part of the shank that extends past the bit to help steady the key as it is inserted and keeps it centered.

Barrel: also called a "drill." Some keys have hollow ends that fit over a pin in the lock. The pin acts as an obstruction

To make a key without the master key requires significant study time and the Lockpicking skill. If the lock can be disassembled then it takes 1 hour for a lock with a complexity of +2 or more, and an additional hour for every point of complexity. For example, it takes three hours to make a key for a +0 lock. If the lock cannot be disassembled then the keymaker must work largely by "feel" (and peering through the keyhole). It takes *days* rather than hours to make a key this way. Thus it takes three days (working eight hours per day) to make a key for a +0 lock. During this time the character must have constant access to the lock being studied. No skill roll is required to make a key but the character must have the Lockpicking skill at expert level (14+). Every point of skill above this level reduces the amount of time taken by one day (minimum one day). For example, if someone has a Lockpicking skill of 18 and wishes to make a key for a -6 lock, it would take him five days if he couldn't disassemble the lock and 5 hours if he could.

to picking tools and a guide to keep the key centered.

Locks Throughout the Ages

Knots (TL0): Doors could be lashed closed with rope and secured with a complicated knot that only the owner knew how to tie. One example is the famous "Gordian knot" of Alexander's time. The only real advantage of this system is that the owner will know if his door has been tampered with. Someone truly intent upon entering will simply cut the rope (as Alexander did). To enter without using a blade requires the Knot Tying skill, rather than Lockpicking. This is resolved with a Contest of Skills between the knot tier and the untier. Success enables the knot to be untied and the door opened. To retie the rope using exactly the same knot requires a skill roll with a penalty of -5 if one is not familiar with the knot (modified by +2 for Eidetic Memory and +5 for Photographic Memory; p.51 of the **Basic Set**).

Cord & Bolt (TL0/TL1): A wooden cross beam (TL0) dropped into sockets, or metal bolt (TL1) slid into staples, was used to bar the inside of the door. It was "unlocked" from the inside by lifting or drawing it back. To do this from the outside, two cords were tied to the bolt and passed through holes in the door. Pulling one cord locked the door, pulling the other one unlocked it. If you are inside and want to prevent the door from being unlocked, simply pull in the cords. An intruder would need some sort of tool that he could poke through the hole, hook the cord, and pull it out. A successful DX roll would be enough to accomplish this. A latch or bolt is very simple to make requiring the Woodworking skill (if made of wood) or Smith skill (if made of metal). If the owner is out then he is likely to conceal the cord. An intruder would need to find the cord (Quick Contest: Vision or Search vs Camouflage). Adding a false cord or two would be a good means of trapping this lock. If the wrong cord is tugged, the trap is activated.

Cord & Bolt with Key (TL0/TL1): Similar to the above except that the second cord is attached to a key rather than being permanently attached to the bolt. The door has a hole in it level with the bolt, through which a cord is threaded. Pulling this cord locks the door from the outside. In order to unlock the door, the bolt-cord is threaded through the key and the key is pushed through the hole. Then, both cords are used together to unlock the door and the key is retrieved from the inside. As above, to make one of these locks requires the Woodworking or Smith skill. In order to pick this type of lock, an object is needed that can fit through the hole. If a suitable piece of wood is available then a Woodworking skill roll can be made to fashion a duplicate key. Roll once per minute at -1. A successful roll means that a piece of wood has been whittled to the right shape. Even a poor wood carver should be able to make a serviceable key in 5-10 minutes if he has access to the lock.

Bolt & Tumbler (TL1): This first originated in the Middle East near modern day Iraq but it quickly spread. It was widely used by the Egyptians. This lock is similar to the Cord & Bolt except that it has a hole through the bolt and a vertical pin -- the *tumbler*. When the bolt was drawn into the locked position, the tumbler would fall down into the hole, securing the lock. The bolt could not be moved again until the tumbler was released. If the bolt was on the outside of the door, then the tumbler needed to be concealed. The tumbler could be poked with a finger, pushing it up out of the hole. This released the bolt, allowing it to be slid open with the finger still in the hole. If one was familiar with this type of lock, then the main challenge to opening it is finding the concealed tumbler (Quick Contest: Vision or Search vs Camouflage). If the latch was on the inside of the door then a hole or slot was needed in the door to allow a person to put his hand through to find the hole in the bolt. A simple trap for this lock would be to include a false tumbler next to the real one. If one was not familiar with the lock then there would be a 50% chance that the wrong tumbler would be depressed, setting off the trap.

A more advanced (TL2) version of this lock is to make the hole and tumbler too small to be released with a finger. These locks required a piece of metal to slip through the door and up into the bolt. If the hole was irregularly shaped then the key needed to be fashioned with the same cross-section. This is the simplest type of lock that requires the Lockpicking skill and has a Complexity of +8.

Multiple Tumblers (TL2): An advanced version of the bolt & tumbler. This lock consists of a bolt with multiple tumblers that drop down through holes in the bolt. A special toothbrush-shaped key is pushed through a slot or hole in the door and lifted up into the holes. Each prong on the key pushes up a different tumbler, thus freeing the bolt, which is unlocked by using the key to slide it sideways along the slot in the door. The door is locked in the same fashion, by sliding the key in the other direction. To pick this type of lock, all of the tumblers need to be lifted up simultaneously. This lock has a Complexity of +5 to +7 depending on the number of tumblers.

Bolt & Barb-spring (TL2): In this type of lock, the bolt was secured by one or more V-shaped springs that spread out against the staples, preventing the bolt from moving. The key is relatively flat with prongs or hooks on its end. It is inserted through a horizontal slit (the keyhole), turned in a quarter circle, and then pulled back. The pulling action brings the key prongs to bear on the springs, making them lie flat. With the springs clear of the staples the key can now be used to slide the bolt back, unlocking the door. This type of lock seems to have been commonly used by the Romans and Chinese and was used up until fairly recent times in Scandinavia. Complexity ranges from +4 to +6.

Barb-spring Padlock (TL2): The barb-spring padlock is similar in operation to the bolt and barb-spring lock. Unlike today's padlocks, the shackle was separate from the body. On the shackle's lower side was a pair of spreading springs. These entered the body of the lock through a hole. When the shackle was pressed in fully, the springs, which were gradually closed up during insertion, spread out inside the body, holding the shackle in place. To remove the shackle the springs had to be compressed again. This was done with an L-shaped key, which was pushed into the keyhole in the body. This type of padlock was used by both the Romans and the Chinese. Lock complexity ranges from +4 to +6.

Rotary Lock (TL2): First developed by the Greeks. Instead of pressing the key up against the tumblers, the keys in these locks were rotated. Initial keys were sickle-shaped and a key would work on any lock if it was of a similar size. If the key was turned in one direction the bolt slid into the strike plate, locking it. If turned in the opposite direction, the bolt slid the other way, unlocking it. Once the rotary lock had been perfected, other locks that relied on sliding or pushing the key had given way to turning, and tumblers stopped being used in favor of wards (see *Security Measures*, above). The shapes of keys came to resemble those of today being either hollow (called a "barrel" or "drill") to fit over a fixed pin in the lock (the "lock pin"), or solid with a projecting end (called a "post" or "pilot") which fitted into a socket in the backplate of the lock.

More advanced rotary locks (TL3) had hollow lock pins with rotating bearings on both ends and keys were fluted to fit. Complexity for basic rotary locks is +7. For warded rotary locks, complexity ranges from +2 to +6. Warded rotary locks were the most common type of lock in Medieval Europe.

Combination Lock (TL4): These have been around since at least the 17th century in Europe and even earlier in China. There are several types:

Dial Combination: Used most often on safes. It consists of a small dial on the outside with a marker and numbers (usually 0-99) located around the circumference. The dial needs to be spun multiple times in both directions aligning the marker with a different number each time until the lock opens. On the inside there are a number of discs, each with a notch cut into it. Each disc has a knob called a "fly" on its sides. The first wheel spins until its fly makes contact with the wheel adjacent to it, causing it also to spin. This continues until all the wheels are spinning (called "picking up the wheels"). When the dial is rotated in the correct sequence, the bolt or bolts are able to slide through the gap provided by the aligned notches in the discs, enabling it to be locked or unlocked. For more on dial combinations, see *Safe Cracking*, below.

Disc Combination: Used on briefcases, padlocks, bicycle chains, etc. This lock consists of a number of thick discs which are numbered on their outside edge. Behind one of the numbers on the inside of each disc is a notch. When these notches are aligned the bolt can be slid freely, locking or unlocking the mechanism. These are fairly easy to

crack -- complexity ranges from +3 to +6.

Push button: On the outside of the lock is a panel with multiple numbered buttons (usually nine). Inside the lock is a grid through which the tumbler on the back of the each button secures the bolt. Each tumbler has a notch cut into it. The notches on those numbers which don't form part of the combination already line up with the grid. The notches on the combination numbers are not aligned, so these buttons need to be pressed. When all the notches align with the grid it can move freely, enabling the mechanism to be locked and unlocked. If the wrong button is pressed, its notch is no longer aligned with the grid, so it remains locked. A common method of picking this lock is to carefully examine the buttons. Those buttons that are regularly pushed should appear more worn than the others. Since it doesn't matter which order the buttons are pressed, it is a simple matter to open the lock by pressing the worn buttons. If the buttons are not worn, a Lockpicking roll is needed. Complexity of push button combination locks ranges from +2 to +4.

Lever Tumblers (TL5): A tumbler is a falling pin that prevents the bolt from moving and the earliest types of tumbler locks have been described above. They fell into disuse after the development of rotary locks that relied on wards for security. In simple lever tumbler locks the tumbler is lifted by the key and the bolt can be moved by further rotation of the key. Small locks require springs to hold the tumblers down but larger locks only needed gravity. The lever tumbler was invented in 1778 by Robert Barron. This lock had a bolt with a slot into which a pivoted tumbler had to be lifted exactly the right height. Too high or too low and it cannot be unlocked. Lock Complexity ranges from +0 to +4.

Cylinder Pin Tumbler Lock (TL5): These are the most common type of lock used in the world today. It had been developed by Linus Yale and his son in the second half of the 19th century. The first models had the tumblers built into the case of the lock. A later development built the tumblers into the cylinder and reduced it to the size of locks today. These locks enabled the combination of external wards and internal tumblers in one mechanism. Earlier keys were flat but later ones were corrugated, and today we use keys that are "paracentric." The most common type of lock today is the five-pin tumbler. Lock complexity is extremely varied depending on the quality and age of the lock, ranging anywhere from -4 to +6.

Wafer Lock (TL6): Used on desks, filing cabinets, car doors, coin operated machines, etc. It is similar to the tumbler lock except that spring loaded discs, called "wafers" are used instead of pins. The wafers have a slot cut through the middle to enable a key to be inserted. There is no need for a bolt since the wafers themselves perform that function. The mechanism is locked when the wafers extend outside the lock's housing. The correct key forces all the wafers back inside the housing. Double-sided wafer locks have wafers that extend out the top *and* bottom of the housing and are much more difficult to pick. Keys for double-sided wafer locks have notches in both edges of the bit. The Complexity of a single-sided wafer lock is +3 to +6; double sided is -2 to +2.

Cylinder Tubular Lock (TL7): Instead of a row of pins, tubular locks have pins or bearings located around the circumference of the cylinder making them harder to pick. Complexity ranges from +0 to -8.

Lockpicking

Involves the manipulation of a lock's components so as to open it without the use of a key. Lockpicking is as much an art as it is a science. All the study in the world can't help you if you don't have the "knack." The skill basically involves exploiting the weaknesses and defects in the lock mechanism. Constant practice is required to enable the lockpicker to acquire a feel for different locks and determine the best technique and tools to defeat them when they are encountered in the field. Virtually any lock can be picked provided the character has enough time and the right tools. The term "lockpicking" mainly

Cavity Padlock (TL6)

Handy for escape artists, the cavity padlock was devised by Harry Houdini. Apparently it was one of his best kept secrets. It consisted of a fairly large padlock that could be secretly opened without the need for a key. Part of the padlock contained a hollow cavity in which Houdini could conceal keys and lockpicks to use on other locks and handcuffs.

Are Lockpicks Legal?

It depends on the local laws but in many cases it is legal to carry items that might be considered burglary tools --

refers only to tumbler locks. The principle involves using two thin springy pieces of metal (lockpicks) inserted into the keyhole. One pick applies a small turning force (the torsion wrench) while the other "feels" the various tumblers. When a tumbler is lifted to the right height, a tiny "give" can be felt in the torsion wrench. As long as pressure is maintained on the torsion wrench, that tumbler should remain in the right position and the lockpicker can move onto the next tumbler. Often one of the tumblers will slip back down and the process needs to be started over again. Lockpicks differ depending on the type of lock and two or three different ones (one of these being the torsion wrench) are usually required to open most locks. A complete set of picks might include dozens of tools and are very expensive (see *Tools*, below). Early lockpicks were generally larger and heavier than modern sets. The best locks require weeks of study and the manufacture of custom tools. In these cases it is often easier to try and gain access to the original key so that a duplicate can be made (see *Keys*, above).

lockpicks, keys, screwdrivers, crowbars, etc. -- but it is illegal to use them to commit a crime. In some cases the items could be considered illegal if intent was demonstrated -- i.e. that the perpetrator had *intended* to use the tools to commit a crime. In other cases the object may be on a list of Restricted items (LC2) requiring some sort of license to purchase or use it.

If the lock can't be picked, it is usually possible to drill through it to disable the tumblers. This method can be noisy and the owner will know that someone has tampered with his lock (because it will have a big drill-hole through the keyhole). A neater approach is to use a small hole saw (attached to a drill) to cut the pins at the shear line while leaving the rest of the lock intact. If the intruder is careful (so as not to leave marks on the lock's surface) and cleans up his mess, the owner may never know that his lock has been tampered with since his key will work as normal. What he won't realize is that anything capable of fitting into the keyhole (such as a screwdriver) will now work too.

Safe Cracking

Safes and vaults are made from heavy steel plate (large ones consist of two plates of steel with concrete filling the gap in between), making them difficult to move or to break through. Many banks considered their safes so impregnable that they were on display to the public to demonstrate that their client's cash was secure. Most safe doors have bolts that protrude from all directions so it will remain securely closed even if the hinges are removed. Many safes employ both combination and key locks for double security. There is no keyhole on a combination lock so lockpicks are useless. However, in **GURPS**, a character uses the Lockpicking skill to compromise all types of mechanical lock, including combination dials. Most of the techniques described below do not require a skill roll to open but a skill roll might be needed to determine the best means of cracking a particular safe.

Manufacturer Default: Often the combination can be guessed because the owner never changes the manufacturer-set combination. If the safe cracker has a list of the manufacturer's combinations, he can try them one at a time until the lock opens. This is always a good thing to try first before attempting any of the following methods.

Eavesdropping: This is the default method of safecracking in **GURPS**. It involves listening to the faint "clicks" and feeling the tiny "bumps" made by the levers as they touch a contact point on a disc. It basically involves finding the contact points, determining the number of discs, and graphing the results to create a "map" of the mechanism. Once this is done the location of the notches and the combination of the lock can be determined. According to p. 45 of **Covert Ops**, any attempt to open a mechanical safe without some sort of stethoscope is at -5. This is modified by Acute Hearing. Safecracking uses touch as well as hearing so Acute Touch can also add to the skill roll. A regular

UL Standards for Safes

A rating system used to measure the resistance of a safe to physical penetration by skilled individuals.

- **Theft resistant:** The safe has a combination lock but can easily be penetrated with a drill or prybar.
- **Residential Security Container or TL5:** Able to resist a determined attack with a range of tools for at least 5 minutes (net working time).
- **TL-15:** Able to resist a determined attack with high speed drills, saws and other sophisticated penetrating equipment for at least 15 minutes.
- **TL-30:** Can resist the

stethoscope gives a base of -2 to the skill roll. An electronic stethoscope gives a base modifier of +0. Some professionals use what they call a "magnetic amplifier." It looks like a stethoscope but employs a magnet and only amplifies metallic sounds. It gives a bonus of +1. Using the eavesdropping method, a Lockpicking skill roll may be made once per ten minutes. One method of countering this is by using a microswitch that activates an alarm if the dial is moved. Another is to use very precise mechanisms (Very Fine quality -- see textbox, right) that are extremely difficult to crack by eavesdropping (-7 to -9).

Incremental Dialing: This is the simplest, though most time consuming, method of safe cracking and involves trying out all possible combinations, one at a time. Most combination dials are not very precise and any number within 1 or 2 on either side of the correct one will still work. This "dialing tolerance" drastically reduces the number of possible combinations on a three number lock from one million down to a few thousand. Because of this, a cheap safe can be opened in a few hours. A skill roll isn't necessary to open a safe using this method. A cheap quality lock can be opened in 2d hours. A good quality lock can be opened in 8d hours. Fine and Very Fine combination locks will take weeks or months to open using this method. To speed up this process, an *automated dialer* may be purchased (see *Tools*, below).

Drilling: The most common method of safe cracking. The safecracker must know the best drilling spot so as not to damage the locking mechanism and to give him good access. Once the hole is drilled, the safe cracker has several options -- he can insert some explosives (see below) through the drill-hole; he can insert a screwdriver and attempt to manipulate the locking mechanism; or he can insert an endoscope to watch the tumblers while the dial is turned (+5 to Lockpicking attempts). A Lockpicking skill roll is needed to determine where the best drilling spot is located. A failed roll results in hole being in the wrong spot and a new hole will need to be drilled elsewhere. A critical failure results in damaging the locking mechanism, preventing the door from opening. Some Fine and Very fine quality safes employ anti-drilling plates over vulnerable spots on the door. These are made of ceramic or tungsten carbide. Some consist of a series of steel washers that bind with the drill bit and spin with it -- making it impossible to drill. Many manufactures sell templates (for hundreds of dollars) to authorized locksmiths showing the best drilling location for various models.

Cutting: Oxyacetylene cutters can be used to cut through the steel plate of a safe but many large safes incorporate concrete between two steel plates, which is unable to be cut by oxyacetylene. To get through both steel and concrete a "thermic lance" must be used. This consists of a long tube connected to an oxygen supply and filled with steel rods. Once preheated, the steel at the end of the tube can be ignited (just like an oxyacetylene cutter) and will gradually burn away, producing temperatures high enough to penetrate concrete. Other useful tools include plasma cutters and abrasion saws. No Lockpicking skill roll is required but an appropriate skill roll to use the cutting equipment is, such as Smith at TL7 or TL8 (p.B221). These tools may also be used to "drill" a hole through particularly thick safe doors (see *Drilling*, above).

Explosives: If the door has a keyhole then a small amount of explosives can be inserted through it to blow off the front plate of the door, leaving the locking mechanism exposed (called "peeling"). If there is no keyhole, a hole must be drilled (see above) since the explosive must be on the *inside* of the front plate

above attack for at least 30 minutes.

- **TL-30 x 6:** As above except that all six sides of the safe have been tested.
- **TRTL-30:** The highest rating. This safe can resist attacks using the latest equipment including thermic lances, impact devices, and high speed drills and saws for at least 30 mins.

Combination Lock Quality

Combination locks can be divided according to quality. *Cheap* combination locks only consist of three numbers and have a poor dialing tolerance. They are commonly found on small safes intended for small business or domestic use, or on combination padlocks. Safes fitted with cheap combination locks are fairly simple to open using any of the techniques described (see *Safe Cracking*, left) and their complexity ranges from +3 to +6. *Good* quality combination locks are fitted to high end domestic and business safes. These usually have four number combinations and better dialing tolerances. Lock complexity ranges from +2 to -2. *Fine* quality combination locks are fitted to the vaults of most banks and other financial institutions. They have five or more number combinations with good dialing tolerances. Lock complexity ranges from -3 to -6. *Very Fine* combination locks are fitted only to the most secure and expensive vaults. They have up to eight number combinations and have very precise mechanisms. Lock Complexity ranges from -7 to -9.

to successfully peel it off. An Explosives (Demolition) skill roll (p.B194) would be needed to successfully peel a safe door using explosives. Any explosive powerful enough to blow through the safe from the outside is also likely to destroy its contents without a precise explosive charge -- an Explosives skill roll at -4 would be required. For more information on explosives see the **Basic Set**, pages 414-15. Anti-explosive devices lock down the safe door if an explosive charge is detonated, making it impossible to open -- even with the correct combination and/or key until the device has been disabled. This device may also counter drilling and cutting attempts.

Social Engineering: Often it is simplest to manipulate someone who already knows the combination to help you open it. This might mean anything from discovering where the person keeps the combination written down, to bribery or intimidation. The best way to counter this is with time locks. Even if the correct combination is known, the safe cannot be opened outside the appointed times.

Tools

Lockpicking is a technical skill and is therefore virtually impossible without tools. The **Basic Set** (page 344) suggests a penalty of -10 for any attempts without tools. Likewise, it suggests a penalty of -5 for attempts with *improvised tools*. Improvised tools can be made from household items: an allen wrench, small screwdrivers, bicycle spokes, piano wire, paperclips, bobbypins, large staples (bent straight and held sideways). If the character has time to modify these items into tools that are more suitable (filing, grinding, cutting, etc) then this penalty can be reduced to -3. Many of the following tools are restricted in some countries and a license is required for purchase.

Cheap Lockpicks (TL1): Consists of four or five steel picks (modern ones usually come in a foldable handle similar to a Swiss Army knife) and a torsion wrench. They give a modifier of -2; cost \$20; weight negligible.

Good Lockpicks (TL3): Consists of at least at least a dozen pick blade tools and a torsion wrench made of good quality spring steel to resist bending. They come in a soft case for easy carrying and provide a bonus of +0; cost \$50; weight negligible. These are the lockpicks listed in Basic Set (p.B289).

Fine Lockpicks (TL4): Consists of a complete set of several dozen tools, enabling a locksmith to comfortably work on the vast majority of locks. They are made of the finest quality spring steel and give a bonus of +2. Cost \$200; weight 0.5 lb.

Auto "Jigglers" (TL7): A set of lockpicks specifically designed for automobiles. The user selects an appropriate pick, inserts it into the lock, and "jiggles." This involves wiggling the pick in the lock while putting torsional pressure on it. The user doesn't really need to know how to pick locks to use jigglers, but for roleplaying purposes the same skill is used (Lockpicking). Auto jigglers are handier than lock picks because a separate torsion tool is not required, so only one hand is needed to open the lock. These tools provide a bonus of +4 to Lockpicking rolls but only on vehicle locks (cars, trucks, etc.) Cost \$25; weight negligible.

Lockpick Gun (TL7): Also called a "snap gun," it was first developed in the 1930s for FBI officers who were unskilled at lockpicking. It is a trigger-powered hand tool that performs a "raking" operation on the tumblers, hopefully causing all of them to be raised at the same time and allowing the lock to be opened. Alternatively, it can employ a needle-shaped bit that is "snapped" up and down. If the tip is slipped

Skeleton Keys

This term originally refers to a simple key designed to fit multiple types of old-fashioned warded locks. Harry Houdini had several handcuff skeleton keys, enabling him to open any pair of English darby or plug-8 handcuffs. Today they are often called "master keys." Skeleton keys have to be tailored for a specific type and size of lock. It is a myth that a single key can be devised to fit all locks.

Some lock manufacturers sell skeleton keys to authorized persons for a particular line of locks but this is usually kept secret. Examples: Hotels sometimes have a master key enabling all doors in the hotel to be unlocked. Automobile manufacturers sometimes sell skeleton keys to mechanics to aid servicing.

Most general-purpose skeleton keys can only be used on badly designed or very simple locks (Complexity +4 or more). Roll 1d. On a 1-4 the key fits. Cost \$20; weight negligible.

under the tumblers then these are also snapped up and down. Sometimes the tumblers strike each other and separate on the "shear line" of the lock enabling it to be opened. This tool does not provide a skill modifier but replaces the user's Lockpicking skill with the Lockpicking skill of the gun. Typical guns have a Lockpicking skill of 8; cost \$60; weight 0.5 lb. High quality ones grant Lockpicking-10; cost \$120; weight 0.5 lb. Battery powered lockpick guns (TL8) perform the same action as the manual trigger tool, but at a much faster speed and are generally easier to use. They grant Lockpicking-11. Cost \$200, weight 1 lb. The bits for these tools wear out fairly quickly. A replacement pack costs \$10. Note that using such a device leaves very specific forensic evidence. These guns work well on some locks and not at all on others. Only one skill roll is permitted per lock. If this roll fails, then the lock cannot be opened with a lockpick gun . . . time to try manual lockpicks.

Electropick (TL8): An electric motor vibrates a specially designed pick at a high frequencies. The pick is inserted into the keyhole and the vibration is transmitted to the pin tumblers. If the angle of the pick and the frequency is just right, the pins level out at the shear line of the lock, allowing it to open -- just as if the key had been inserted. The frequency can be adjusted to allow for different models of lock. This tool causes no damage to the lock mechanism, but can be very noisy. As with pick guns, electropicks replace the lockpicking skill of the user with the lockpicking skill of the item. Electropicks grant Lockpicking-12. Cost \$1,000; weight 1 lb.

Stethoscope (TL5): The device used by doctors to listen to patient's chests can also have other applications. If this device is used for safe cracking (see *Eavesdropping*, above), it provides a Lockpicking skill modifier of -2 (as opposed to -5 with no hearing assistance). Cost \$20; weight 1 lb.

Electronic Stethoscope (TL8): Consists of a sensitive contact microphone attached to an amplifier and headphones. This device is the default tool needed for safe cracking, providing a modifier of +0. Cost \$280; weight 0.4 lbs (see p.CO45).

Magnetic Amplifier (TL8): Similar to a stethoscope except that it utilizes a magnet and only amplifies metallic sounds, making it ideal for safe cracking. Magnetic amplifiers provide a +1 modifier for safe cracking. Cost \$500; weight 1 lb.

Endoscope (TL8): Developed for the medical industry, this device is also called a "borescope" or a "fiberscope." It consists of optical fibers mounted within a steel-mesh tube with a tiny lens at one end and an eyepiece at the other. Looking through the eyepiece, the user can see anything that the end of the endoscope is pointed at. Controls enable the tube to be flexed and bent precisely. Short-ranged endoscopes have a short focal-length lens and a bright light source. They are used by safe crackers to watch the locking mechanism while they rotate the combination dial, adding +5 to Lockpicking skill rolls. Cost \$1,500; weight 2 lbs (see p.CO45).

Automatic Dialer (TL8): Used to open combination dial locks. It is a mechanical device with an integrated servo-motor that performs incremental dialing at high speed -- checking all possible combinations. Simply place it over the dial (magnets hold it in place), switch it on, and wait. Cheap locks can be opened in 2d minutes; Good quality locks in 2d hours; Fine quality locks in 2d days; Very Fine locks in 2d weeks. Cost \$1000; weight 2 lbs.

Murphy's Rules

Dork Tower!

Dork Tower!

Uxuloth, City of the Dead

by Matt Riggsby

In a distant corner of the world, crouching atop a hill and shrouded by darkness, is Uxuloth, the city of the dead. It is a society of undead and lurkers in tombs, of once-human and semi-human monsters who have fled the world of the living to find some kind of peace. Its ruler purports to desire only solitude, but are *you* going to trust the word of a centuries-old animated skeleton with an army of vampires and zombies at his command?

Geography and Land Use

Uxuloth occupies a steep promontory where a mountain range begins to trail off into foothills, about 20 miles east of an ocean inlet. The land to the north of the mountains is dry but arable plains, while to the south lies a rocky desert. The land itself is rocky, banded with shale and granite, and the soil is thin. There has been a little farming and herding on the few small plateaus and shallower hillsides of the surrounding area, but for the most part the land is unpromising for agriculture. Birds and a few goats live off a scattering of tenacious, scrubby vegetation. Such food as is necessary is imported. The nearest human habitation is at least four days travel away over land, and the nearest town of any size is more than a week.

The city itself occupies the west-facing slopes of a high hill. The eastern side is a sheer cliff, unsuitable for building, so the city is shaped a bit like a cone sliced in half vertically. The shore of a nearby sea is just barely visible in the distance.

One of the most striking features of the region is the Everstorm. Despite the name, it's not actually a storm (although rumor has it that the Bone King can use it as a source of lightning to strike enemies who come under it). Rather, it's a permanent formation of thick, dark clouds about two miles in diameter which prevent the light of day from touching the city. Other weather systems passing through the area may cause rain, but the Everstorm itself drops no water on the city.

History

The site of Uxuloth was originally occupied by a small garrison set by a great empire, little more than a frontier observation post. The empire fell, as empires do, leaving ruins behind. Some centuries later, the crumbling watchtower was reoccupied by a lich, a powerful wizard who had reanimated himself after death. He took the isolated spot as an ideal place to carry on his magical research, taking with him a few non-living servants (some undead, some animated by magic but never truly alive).

A few decades thereafter, the lich reached an agreement with a trio of vampires fleeing vampire hunters half a world away. The vampires would act as more powerful, intelligent agents for the lich than his current servants, in return for the right to shelter at his compound. The arrangement worked well. Over the next few centuries, the settlement at Uxuloth slowly grew as more liches and vampires trickled in, seeking the company of their own kind or fleeing the living who hunted them, and their followings of ghouls and other servants grew. They began to depend on a growing body of zombies to perform physical labor. The city's founder, who continued to hold the reins of power, became known as the Bone King.

Uxuloth reached its height about 300 years ago when a militant monastic sect launched a crusade against the undead. The warrior monks were able to overcome many powerful but independent undead by sheer weight of numbers. Survivors flocked to Uxuloth as a natural center of resistance. In time, it also became a natural target. With a final great battle under the Everstorm, the dead armies of Uxuloth overcame the monastic legions. The surrounding area, never thickly populated or frequently visited, became completely deserted for fear of the monstrous city. It has not been seriously threatened since, and its population remains near the peak it achieved at that time.

However, the strain of maintaining its position is starting to show. Instead of a fractious lower class, the city's day-to-day economy and industry rest on a large population of zombies. As the city grew, the supply of dead bodies easily matched pace with any new population. But even zombies wear out over time, and it is becoming harder and harder to replace them as they do.

There is a general feeling that decisive action needs to be taken to sustain the city's faltering way of "life." But that direction is not forthcoming. In recent decades, the Bone King has become nearly quiescent, spending days, even weeks at a time in silent contemplation of whatever mysterious issues concern him. His administrators continue to run the city based on old policies, but the lesser aristocrats of the city agitate for a larger role in running things.

Society

Uxuloth's society is rigidly divided into three classes. Each has more privileges and legal protection than the one underneath. At the top of the ladder are the High Undead, or lichs. In addition to the Bone King himself, the High Undead occupy the city's priesthoods and a number of high offices. Any lich who pledges loyalty to the Bone King may become a resident of the city, but at the moment there are about 100 in residence.

Below the High Undead are the Eaters of the Living, or vampires. Where the High Undead are the city's rulers, the Eaters of the Living are the officers and chief agents in the field, directors of industry, and, as much as the city has one, polite society. They are divided into Houses, where relationships are traced by who made one a vampire and marriage-like unions made with other vampires ("divorce" is fairly frequent) rather than any biological or marital relationships from one's living days. Potential immigrants at this level of society or below must be sponsored by the head of a vampiric house or a lich. There are perhaps 1,500 in the city.

Beneath them are the Eaters of the Dead, ghouls and other eaters of carrion. Some are not, technically, undead, but all have a mystical dependence on the flesh of sentient beings. They constitute the rank-and-file artisans, assistants, sergeants, and overseers. There are about 5,000 of them in the city, although their numbers vary from time to time.

Below these residents are three groups with no real rights. The most numerous are the animate dead, mindless zombies who perform most of the city's physical labor. They are treated as a valuable resource and their use is regulated by the city, but they have no more rights or political power (and no more volition) than the city's streets and walls. The number varies considerably, but is currently around 55,000, a number seen as too low for the long duration.

The second are the Chattel: live captives and slaves brought to Uxuloth to feed the vampires and, if there's enough left of them, to be fed to the ghouls or reanimated for labor. Most vampiric houses have a moderately-sized stable which experiences high turnover despite the increasingly expensive use of healing magic to keep them healthy. Depending on the preferences of the household, they may be treated as anything from livestock to "guests" (although polite treatment is invariably the result of the head of household's desire to appear magnanimous rather than any actual regard), but it's quite clear to everyone involved how they'll end up. At the moment, there are probably between 3,000 and 4,000 in the city, which is likewise rather too small a number for comfort.

The final group is the Quick, free living people of various races, including human hangers-on to the recently undead, worshipful death-cultists, a handful of extremely brave merchants, and a few travelers who have come to the city in hopes of gaining powerful secrets. They are not, strictly speaking, residents. No living person is allowed to stay in the city between sunrise and sunset (being property, the Chattel don't count), so they live in a small suburb just outside the walls. They have no rights as a group, but individuals may be granted sponsorship by a vampire or lich, making it moderately illegal to kill or rob them. There are about 5,000 of the Quick living outside the city more-or-less unmolested.

The city's physical construction mirrors the class structure. The Bone King's palace is at the top of the hill, the residences and primary haunts of the High Undead below that, with mansions of the Eaters of the Living, districts of the Eaters of the Dead, and industrial areas for zombies farther down and living humans living outside the city walls.

Government and Politics

The Bone King survives and is still the city's absolute ruler. However, he shows increasing reluctance to rule. Or, indeed, to move. He spends most of his time seated in his throne or in his tower, observing the world through a scrying stone, and has been known to remain completely motionless for days at a time. Serving him is a body of censors, a powerful combination of secret police and bureaucracy making sure the Bone King's laws are upheld. Censors are themselves High Undead, although they employ a network of spies of all classes.

The Bone King is advised by the Senate, a group of 17 vampires serving overlapping terms of 17 years each, with one being replaced annually. A prime minister is elected from among the senators each year. As each seat becomes vacant, three candidates are nominated by the Eaters of the Living and one of them is chosen by lot by the priests of the dead gods. If a senator is killed or destroyed, his seat stays vacant until the next election (or unless the Bone King intervenes, which he never does). Although the Senate has no legislative power, it must hear proclamations before they officially become law and senators act as both generals in times of war and magistrates, trying criminals apprehended by the censors.

The politics of Uxuloth are complex for a place where so few people can be directly involved in the political process. Senatorial and election politics, for example, are often subtle contests between rival vampiric houses, contests which have become sharper and more important of late. The Senate, censors, and priests of the dead gods have been quietly jockeying for authority for centuries, but with the Bone King growing increasingly moribund, the Senate has been exerting more and more influence over the day to day governing of the city. The High Undead worry about the growing vampiric ascendancy, but they are handicapped by their relatively small numbers and the Bone King's inaction.

There's also growing agitation for increased power for the Eaters of the Dead. Although they are rarely as individually powerful (physically, magically, or -- sad to say -- intellectually) as the Eaters of the Living and the High Undead, they are far more numerous; with the city's increased trade over the decades, they are becoming, as a group, significantly wealthier and more connected to the outside world.

In addition to conflicts over internal issues, the city has seen recurring conflicts of the question of isolationism and undead supremacy, essentially maneuvering around the question of what Uxuloth's relationship with the outside world should be. Despite the clear need to maintain the zombie work force, the residents of Uxuloth have long-standing and justified concerns about contact with the living world. The isolationists favor minimal contact with outsiders, no more than is necessary to fill present needs, while the engagement faction champions more expansive, long-term ties. The factions are themselves divided. Among the isolationists are the fatalists, who suggest that the city be allowed to die a natural death, just as any living thing must pass away. Since much of the city's sentient population has consciously chosen to circumvent death, this is very much a minority opinion, although some very powerful High Undead are sympathetic to the position. The engagement faction is divided between imperialists, who believe that Uxuloth must control the living people it deals with in order to prevent further wars against the undead, and the integrationists, who favor building alliances and regular trade as a means of not arousing the hostility of the living.

At the moment, isolationists hold the upper hand. It's a position held by most of the High Undead and a significant number of Eaters of the Living, particularly first-generation vampires who fled oppression in the living world and have no desire to return. However, potential threats to their food supply are pushing more of them towards at least cautious imperialism. They have the support of a great many of the Eaters of the Dead, who see expansion into the outside world as an opportunity for enriching themselves.

The current primer minister is Acadro of the house of Varania, a second-generation descendent of one of the vampires who served on the first Senate. He has just started his fourth consecutive term as a Senator, which suggests divine favor to some, undue influence to others. Acadro's tendency towards expansionism is fairly open, but he's a master of compromise, bringing together most of the expansionist factions while not tipping his hand towards either imperialism or engagement and not giving isolationists undue cause for alarm. He has spoken in favor of establishing an area of direct control beyond Uxuloth's current sphere of influence, but publicly favors alliances and trade over warfare as a way to bring in cattle. As it happens, a majority of the Senate has isolationist leanings, centered around one Melixa,

also of the house of Varania. Acadro and Melixa were turned by the same vampire some centuries apart and have been fighting for control over their house for centuries. Melixa is know to associate with Chun Kyai, the chief censor.

Religion

The official religion of Uxuloth is appropriate macbre: the worship of dead gods. The Bone King and many of the High Undead have made a practice of finding forgotten religions and gods who are no longer worshiped or believed dead by their one-time worshipers.

Priests are appointed from among the High Undead. On a day-to-day basis, they simply perform rites and maintain temples. However, they serve as a divinatory arm of the government in the infrequent event the Senate or the Bone King decides to see what the future holds. They also serve as a rarely-used court of appeal with the power to overturn the finding of the Senatorial magistrates. Their trials are painful ordeals, leaving their subject scarred at best and often permanently damaged, so few take advantage of the option, and those who do are usually completely convinced of their own innocence.

In addition, since Uxuloth is ultimately a multi-ethnic city, other gods are privately worshiped. The High Undead tend to leave their old gods behind, but some of the vampiric houses maintain small shrines to the gods of their native lands and the Eaters of the Dead often hold on to a variety of foreign traditions.

Armed Forces and Law Enforcement

Because of its remote location and fearsome reputation, Uxuloth rarely needs to exert military might. On those few occasions where it becomes necessary, a force of zombies is armed as heavy infantry (there have been sporadic and largely unsuccessful experiments with cavalry on zombie horses). The detachment includes a few Eaters of the Dead to issue tactical orders, usually one for every twenty or thirty zombies, and an Eater of the Living as commanding officer for every two or three hundred zombies. The officers are appointed as necessary by the Senate (or, for small detachments, a single senator). An army of over a thousand will have a senator as commander-in-chief and perhaps one or two High Undead for magical support both on the battlefield and to animate new zombies from casualties on the other side. One of them will be a priest with authority to override the commander's decisions, although that authority is rarely invoked.

Law enforcement is the province of the censors. The precise number of censors is unknown; seven perform their duties openly, but it is believed that several more work in secret. Every censor, a High Undead hand-picked by the Bone King, is theoretically an independent agent answering only to the Bone King, but the most senior censor serves as an informal leader when unified action is needed. Other undead at all levels of society, however, work as deputized agents. Public manifestations of the censors are rare, typically limited to guards at the city gates and occasional patrols of armed zombies led by ghoulish sergeants. With such a small sentient population, public disorder is rare and usually dealt with privately by members of each class.

Economy

Even the dead want things. The Eaters of the Living and Dead both need a constant supply of new bodies for sustenance. The city as a whole needs them to replace the animate dead that wear out. The city's many magicians need magical raw materials, and there continues to be a market among many of the aristocratic undead for luxuries (largely books, textiles, and various ornaments; wines and exotic foods aren't in high demand, for obvious reasons). In order to get what it needs, the Bone King allows limited trade with the outside world. It conducts this trade slowly, carefully, and through as many intermediaries as possible.

At the forefront of Uxuloth's trade relations are favored members of the Quick, known as the blood merchants. They put a less geographically intimidating face on Uxuloth's steady imports of slaves. To avoid drawing attention to the trades, slaves are usually bought in small lots in relatively distant cities (recently purchased slaves who are familiar

with Uxuloth are much more likely to attempt escape or suicide) and marched out closer to their destination. Once the slaves are well away from their point of purchase, the live merchant makes rendezvous with the zombies who will escort the slaves to Uxuloth. As with military detachments, they're accompanied by intelligent undead to direct the journey. Naturally, these caravans move by night, often digging burrows for shelter during the day (the zombies need no rest, but the slaves and caravan officers do). Journeys are typically long, with routes chosen to minimize human contact, typically through wilderness and wasteland. The necessary precautions are, unfortunately, expensive in terms of time, supplies, and wear-and-tear on slaves. Sea voyages are avoided, both for lack of cover and an aversion on the part of many Eaters of the Living against traveling over water.

Zombie caravans will also carry less ominous cargo. There is a lighter but steady demand for various kinds of livestock (some of the undead may subsist on a mixture of animal and human substance), luxury goods and magical materials: rare plants and minerals, books, spices, and dyes. Glassware is another common import; lack of breath makes glassblowing a difficult art for the undead to practice.

In exchange, Uxuloth's major exports include magical items and copied manuscripts. Zombies make poor copyists, but lich and vampire scribes need little or no rest and have lifetimes to perfect their craft. These high-value items are typically sold discretely to a wealthy, specialized market. It's also a source of exotic jewelry, either made in Uxuloth or brought there by undead refugees from across the world.

Points of Interest

Uxuloth is a very unfriendly city for the living visitor. There are few public houses within the walls and none that would encourage normal human patrons, and many of the city's residents would as soon eat the visitor as look at him. Most of the important locations in the city are landmarks rather than tourist attractions:

The Bone King's Palace: The site of the ancient empire's watchtower is now occupied by the palace of the Bone King. It is a windowless, cross-shaped building, decorated with elaborate carvings both inside and out. At the center of the cross is a tall spire with the king's private observatory and work rooms.

Ruined Temples: Immediately below the palace is a ring of temples in a remarkable variety of styles. However, once a temple is built, it is defaced in some way. Sacred statues have their heads broken off, baptismal fonts are drained, prayer wheels are frozen on their axles, and so on, all to indicate the defunct status of the gods they were made in honor of.

Charnel Warehouses: The lower levels of the city contain a number of industrial mausoleums, which are the Charnel Warehouses. These serve as holding pens for zombies not currently in use, facilities for performing animations, and warehouses for corpses awaiting animation. Bodies may receive special treatment for specific purposes. They may be stripped of flesh to provide animate skeletons, alchemically treated to make them more durable or resistant to flame, or simply preserved for future animation. Stocks of dead bodies are, of course currently low, so the warehouses are largely empty, consisting of large, echoing rooms filled with the smell of death but little else.

Quick Alleys: Living visitors will probably want to stay close to the areas occupied by other living people as much as possible. This suburb, known collectively as the Quick Alleys, consists of a number of buildings and small plazas just outside the city walls. It's a very quiet place, and people tend to keep to themselves. Despite the relatively privileged position of the residents, there's still an air of fear about the place, and they try very hard not to do anything that could be regarded as disturbing the residents of the city proper. They are generally not harmed, although there have been unfortunate incidents in the past. There are a few shops for food and other necessities, but no inns. However, visitors can occupy any of a number of abandoned buildings, and they may be able to find people willing to take them in as guests.

The undead will receive a much better welcome than the living, of course, and will see the same sights in a different light. The Eaters of the Dead live in small homes in the middle level of the city and there are usually empty ones for new residents to claim. They also have raucous pubs (it may seem sometimes that the ghouls are the only ones in Uxuloth who have a good time), although what they serve is best left to the imagination. Eaters of the Living will be

received more-or-less permanently as guests in existing vampiric households so long as they behave themselves. Vampires entertain in their own homes, with a few parties and salons every day, and do not maintain or frequent public houses. The same is largely true for the High Undead, but they rarely meet socially in groups of more than three or four.

Uxuloth in the Campaign

Uxuloth is a natural candidate to be the capital of an evil empire. It demands a steady supply of dead bodies and many of its residents require the blood of the living. Even if Uxuloth isn't an expansionist power, few living people are likely to regard it as anything other than a focus of evil. Even living visitors who come with an invitation will feel at least a little uncomfortable there.

However, the city doesn't need to be so malevolent. It could simply be a quiet, remote, even otherworldly place, despite the very creepy setting. In an even more isolationist Uxuloth, the dead could simply be waiting for the end of the world, however many thousands of years it'll be. Stringing up well-behaved visitors by their heels and slowly draining them of their blood would simply be too much trouble.

And there's always the option of having Uxuloth at the center of a campaign, with the PCs as ghoulish foremen, vampiric aristocrats, and ruling-class liches. Adventures within the city are likely to involve social and political intrigue, since the vast majority of sentient beings in the city are aristocrats or at least, for lack of a better term, middle class. PCs could fight threats from within, carry out risky missions among the living, and might have the mystical resources to face dangers that threaten the whole world.

Here are some other campaign and adventure ideas around Uxuloth which assume that the PCs are living outsiders:

War: Although it has no friends, because of its isolation Uxuloth has no active enemies either. But new ones are just an anti-undead crusade away, or the result of a decision within Uxuloth that it's time to impose its own order on the surrounding world. Whatever the reason, the PCs will be facing an army with soldiers who never tire and officers who feed off of the living.

Trade: It's dangerous and uncomfortable, but trading with Uxuloth is also potentially very, very lucrative. A brave (or perhaps foolhardy) merchant hires the heroes to escort a shipment of slaves to the city. Can they be sure their employer has permission to come to Uxuloth? And can the PCs trade with its residents without being drawn into their tangled concerns?

Rescue: An important nobleman or a friend of the PCs has been captured during a war, and the PCs must find him and return him home. Following the slave trade, they discover that he is being taken to Uxuloth. How are they going to get in? And once they do, how are they going to get out? A twist on this idea is that once they infiltrate Uxuloth and find him, they discover that he has actually been brought there willingly to rejoin an old lover or relative, now a vampire, who now resides there.

These adventure seeds assume that the PCs are residents of Uxuloth:

Renegade Vampire Army: Tired of waiting for the quiescent Bone King to change his policies, an aggressive cabal of vampires organizes a zombie army and launches an attack on a nearby town to force Uxuloth into facing the outside world. PCs might try to stop it before the renegades bring a new war down on themselves, or might join it to get in on the ground floor of a new empire.

Braaaaains: Uxuloth survives on its masses of zombie laborers, so a catastrophic problem in the Charnel Warehouses threatens the city's existence. Not only are the zombies no longer taking orders, they are attacking and devouring any sentient creature they can find. Can the city's residents reverse the disaster and return the zombies to their obedient state? Must they destroy the city's work force? Will they even be able to survive? And was this truly an accident, or did someone make it happen?

The Lost Heir: A (human) generation ago, a new vampire appeared in Uxuloth, a deceased princeling of an empire not too far away. The empire is now in the grips of a dynastic war, and the vampire prince is now the closest "surviving" relative of the old rulers. One of the factions has decided to use him as a figurehead to support their cause. They're going to try to take him from Uxuloth (whether he wants to go or not); other factions will try to make sure that never happens. The PCs will most likely have to find and fend off spies, but the more politically ambitious might try to help the schemes and extend Uxuloth's influence to a useful new ally.

Appendix Z

Golem Construction System for *GURPS*

by Steven E. Ehrbar

The standard *GURPS Fourth Edition* golem rules, on page 59 of *Magic*, leave most options for variant golems entirely up to the GM. While this works fine for many GMs, some could use the support of a little more structure. The Golem Construction Kit provides a system for quickly creating balanced variant golems.

First, select the basic golem material on the Standard Golems table. This table shows the basic game statistics for the golem, its mass, and the energy costs for both the standard humanoid and the quadruped form. Quadruped forms have the disadvantages Horizontal and No Fine Manipulators, and ST and DX above 10 were purchased with the No Fine Manipulators limitation for energy costs. If you want a standard man-sized golem, you can stop here.

If you want a larger or smaller golem than the standard, decide on the size modifier, from -2 to +2, then look up your selected material on either the Smaller or Larger table. The mass, ST, and energy cost on this table is scaled for your new size, and replaces those numbers for that type from the Standard Golems table. Again, you have a selection of a humanoid or quadruped golem.

Finally, you can add some additional form options to golems created under these rules. They go beyond the normal ST, HP, and DR allowed in the standard Golem spell rules. They not only increase the energy cost of the golem normally, but increase the minimum energy cost from 130 as well. The choices are Claws, Constriction Attack, Extra Arm, Extra Legs, Flexibility, Slippery, Spines, Striker, Teeth, and/or Vibration Sense; add twice the character point cost of the advantage (after enhancements and limitations) to the energy cost given on the tables.

Werewolf: The Forsaken (for the World of Darkness Storytelling System)

Published by [White Wolf Game Studio](#)

Written by Carl Bowen, Rick Jones, James Kiley, Matthew McFarland, & Adam Tinworth with John Chambers, Ken Cliffe, Forrest B. Marchinton, Deena McKinney, Wayne Peacock, Sean Riley, Matthew J. Rourke, & Ethan Skemp

Illustrated by Abrar Ajmal, Dave Allsop, Clint Langley, David Leri, Britt Martin, Matthew Millberger, Mark Nelson, Torstein Nordstrand, Michael Phillippi, Steve Prescott, Jeff Rebner, Jean-Sebastien Rossbach, James Ryman, Ron Spencer, Richard Thomas, Jamie Tolugson, & Conan Venus

Cover by Matthew Millberger, Aileen E. Miles, & Richard Thomas

322-page two-tone hardcover; \$34.99

The arrival of **Werewolf: The Forsaken** and its unfortunate abbreviation continues White Wolf's effort of to reset and re-imagine the World of Darkness. The expectations for this replacement for [Werewolf: the Apocalypse](#) have been high, more so than for **Vampire: The Requiem**, the game that replaced **Vampire: the Masquerade**. In a way, its predecessor never quite had the impact of **Vampire: the Masquerade**, being less convoluted and more sharply drawn in black and white, resulting in more of a blank canvas for the designers and authors to work with. Of course, the new game has to overcome the perennial "superhero by night" aspect of the old, which **Werewolf: the Apocalypse** arguably exemplified from the start, with the player characters being the good guys. With all that to overcome, what everyone wants to know is, what has White Wolf done with the beast?

For starters, the new hardback is gorgeous. The cover continues the tactile matte-gloss contrast motif of **the World of Darkness Storytelling System Rulebook**, this time in rich bronze. Inside everything is crisply laid out, bronze used as a second tone and for all of the artwork, much of which is very good. Others are superb, especially those of the bad guys. Further, the writing is better than that of **Vampire: The Requiem**, being more direct and clear, paralleling perhaps the nature of the werewolf itself.

Of course, the most obvious question is, why **Werewolf: The Forsaken**? The title harks back to an age when Father Wolf hunted across Pangaea, protecting the Physical World from the Spirit World. Mother Luna gave birth to his children, the First Pack or Uratha. For a time they hunted with Father Wolf, but eventually he grew old and weak, and denizens of the Spirit World took advantage. Pangaea suffered, and the Uratha were forced to slay Father Wolf. The death of Father Wolf and the destruction of Pangaea is the crime for which the Uratha and their descendants are Forsaken. This is as much for the guilt felt by the Tribes of the Wolf as for the hatred held by the spirits they must police. Mother Luna herself cursed the Uratha with the bane of silver, but she still gifts her children with the auspices.

Still, the Uratha are loyal to Father Wolf's task, policing the Physical World from spirit incursions, and the Spirit World from damage inflicted by mankind. Some spirits trickle across to run riot in human hosts; the worst are the "Azlu," or spider hosts whose spinning thickens the Gauntlet between the worlds, and the "Beshilu," the rat hosts

whose gnawing weakens it. In addition, there are other werewolves, the Tribes of the Pure, who did not commit patricide, and hate the Moon Tribes for it to this day.

In simple terms, werewolves are not the rage-fuelled eco-warriors bent on a holy crusade to save Gaia from the ravages of the Wyrms. Still prone to the rage and a primal urge, werewolves direct it at more local threats. Like ***Vampire: The Requiem*** before it, the scope and focus of ***Werewolf: the Forsaken*** has been vastly scaled back, no longer world spanning, with werewolves rarely straying beyond a pack's territory. Such a territory can be rural, urban, or a mixture of both, and throughout the book, this is the default setting. It enables a pack to freely hunt and have to deal with man's effect upon the Spirit World.

The werewolf nature has also changed, his rage needing to be kept in check lest he slaughters indiscriminately, including his family. This potentially murderous bent is reflected in the inspiration, which includes *An American Werewolf in London* and *Ginger Snaps*. A werewolf is born of a human and a werewolf mating, never of two werewolves, and not always even then; a descendant, invariably suffering from temper problems, might undergo the First Change and learn his true nature.

As with ***Vampire: The Requiem***, characters are mortals first, created using ***the World of Darkness Storytelling System Rulebook***, and then adding the details from this book. The time of his First Change also determines a werewolf's auspice, of which there are five: Full, Gibbous, Half, Crescent, and New Moon, or Rahu (warrior), Cahalith (visionary), Elodoth (judge), Ithaeur (wise man), and Irraka (stalker). A werewolf will be adopted by a tribe, essentially his family with which he shares particular philosophies, and again there are five: Blood Talons (warriors), Bone Shadows (shaman), Hunters in Darkness (stalkers and scouts), Iron Masters (innovators who like living in cities), and Storm Lords (werewolf aristocracy). Ghost Wolves are those without a tribe. Both auspice and tribe grant a werewolf extra skill dots, Renown dots, and Gifts. Later on in a campaign a character can petition to apply to a Lodge, a faction within a tribe, of which nearly 20 are described to some degree.

Primal Urge and Harmony, a werewolf's main Advantages, or secondary traits are similar to ***Vampire: The Requiem's*** Blood Potency and Humanity, though they work slightly differently. Primal Urge is an indication of a werewolf's difference from humanity, his connection to the Spirit World. It also caps the maximums for his attributes, skills, and Essence, the spiritual energy used to activate Gifts, regenerate lethal wounds, automatically shape shift, and so on. Primal urge also caps how long a werewolf can shape shift for. Eventually a werewolf with a high Primal Urge is forced to maintain a connection with the Spirit World or suffer constant Essence Bleed until he becomes comatose. Where Morality and Humanity concerns just a single code of behavior, Harmony continues the duality of the game. A werewolf must find a balance between the wolf and the human, between the spirit and the beast. Even not shapeshifting for days can force a Harmony check, with failure leading to the acquisition of a derangement. The other Advantage is Renown, not just a measure a werewolf's reputation among his own kind, but also with the spirits.

Spirits are important to a werewolf, not because they will be his friends, but because when a spirit's respect is earned, then it will bestow Gifts upon a werewolf. Far more Gifts are described here than the Disciplines of ***Vampire: The Requiem***, most having a primal feel in keeping with the game. They enable a werewolf to peer through the Gauntlet into the Spirit World, command the elements, read others, and so on. They work by making an attribute plus skill roll to which is added dice for the listed Renown, enforcing the concept that a werewolf must make a name for himself in both worlds. Werewolves can also learn Rites, which are more spiritual in nature, as the invoker makes a direct call to the ancient spirits. Like Gifts they purchased or won on a case-by-case basis.

The default set-up for ***Werewolf: The Forsaken*** has the player characters forming a pack -- preferably a pack of five werewolves, one of each auspice so that it is a blessed pack -- and taking control of a territory. This centers upon a Totem, a spirit whose patronage they have won and who will grant bonuses in the form of dots to attributes, skills, and Gifts. Rules for the creation of a pack's totem are included, and is done following character generation, but the tracking down and the gaining of its patronage should certainly be played out. Once set up, the pack will regularly patrol on both sides of the Gauntlet, dealing with difficult spirits.

For the Storyteller, the advice on running ***Werewolf: the Forsaken*** favors this type of game, but is nevertheless excellent. It is backed up by a more extensive list of antagonists than was found in ***Vampire: The Requiem***, but then

this game is far more extrovert, the enemy more likely to come from without than the vampire's within. If the Storyteller has both new games, there is advice in both on the mechanics involved should a vampire encounter a werewolf, or vice versa. It is clear, simple enough, and more common sense; should the Storyteller want a method of rating werewolf against a vampire, then the respective values for Blood Potency and Primal Urge should do.

The first of the two appendices details the Spirit World, covering how it can be entered through the Gauntlet. There is an emphasis upon the resonance that the Physical World has upon it, particularly mankind's. These include the emotional effect of places that can blight its spiritual reflection, while other areas might be spiritual droughts, or places of healing and growth. The second appendix provides a sample setting in The Rockies. Again it emphasizes the rural and the urban, its theme one of rebuilding and resetting the area's balance after a long war against an Idigam, a vile spirit from deep within the Spirit World. It is up to the Storyteller to develop his campaign within this setting.

Where the previous new World of Darkness books were merely good, here the authors do a fantastic job of bringing a setting to life. The emphasis upon the duality of both the character and the setting is effectively brought to the fore, as is the fact that the werewolf is still a monster, though one almost kept in check. There is almost everything here that a Storyteller needs to get started and yet there is also room for White Wolf to develop and expand the game. Anyone who denounced the cancellation of the old World of Darkness and the release of the new should take back their words; ***Werewolf: The Forsaken*** is proof that White Wolf has not been wasting their time.

Pyramid Review

Fearsome Floors

Published by [Rio Grande Games](#)

Created by Friedemann Friese

Art by Maura Kalusky

Full-color boxed set containing mounted board, 17 floor tiles, eight monster movement tiles, starting player tile, seven teams on 25 wooden disks with stickers, & rulebook; \$37.95

It's a cold and wet night in France, and though you've gained the artifacts you need to finish your quest, that task is actually incidental to the action. You thought Prince Fieso would help you in your work, but he betrays you, sticks you in his dungeon, and if these tourists want to see daylight again they have to cross *Fearsome Floors*.

The object of the game is to be the first to get enough character tokens from one end of the dungeon to the other without being attacked and eaten.

The board comprises several rows of squares, with pillars at the intersections. This arrangement keeps Furunkulus, who haunts the lower levels, from seeing diagonally. He can see and move side to side and straight ahead (he's too thick-headed to look behind him). He stumbles on until he sees a victim, at which point he moves toward them until he's had his fill of tourists or runs out of movement. Walking into walls doesn't stop this juggernaut: Just as weird as the rest of the castle, when Furunkulus thunders into walls he reappears elsewhere.

Two to seven players start at one corner of the dungeon with their teams of characters, and they have to get to the other side. Your movement score is how many dungeon squares you can step. Each character has two movement numbers, one on either side of its disk, that add up to seven. After a turn of movement the disks are flipped, so if you move the dog one space this turn, he'll have a whopping six spaces next go-round (assuming he's not turned into a frankfurter).

Players complete their movement before the monster goes, so you want to place yourself where you think the monster won't be able to see you or get to you. Barring that, you want to draw the monster toward you in the hope that it makes the creature spot an opponent's token. If Furunkulus starts after one tourist but then sees another who's closer, he'll turn. (The walls "wrap around" -- that is, if the creature walks off one side of the playing area he'll pop back in the other side, though on a different row). What follows is a trying attempt to anticipate all these factors so you can escape unscathed.

The basic game is fairly straightforward rules-wise, though you can add complications in the form of floor tiles. The starting game has blood tiles and stones. Step on the former and you slide across several squares of floor; the latter hide you from the monster's sweeping gaze, but enemies can push them out of the way and leave you exposed. The advanced game has tiles that force Furunkulus to turn precipitously; crystals he can see but not move through; and teleporters that force him to take detours across the room.

The pieces are all quite sturdy, and the artwork on them is from an equally steady hand. It's got a careful, blocky, comical look about it that accurately reflects the old EC Publications horror comics from which it derives its style. The monster itself has to be constructed -- it's a standing figure, and it's easy to turn and shift it about the board -- and you can mix and match these pieces. Have a slime-monster, the traditional Furunkulus, or put them in a blender and cap it with a one-eyed top-hatted freak. It's an added expense, but one it's hard not to appreciate.

You have to apply the stickers to the wooden playing pieces yourself, but none of them are hidden in any way so don't worry if you haven't the surest grip. The teams are all amusing horror archetypes -- the FBI, the "friends" (including their pup), slick-haired rockers out of the 50s . . . there's even an extra pair of stickers for the designer and the artist (but you'll have to provide your own wooden disks if you want to use them). The rules are a bit spotty where the translation isn't perfect, but all becomes clear after a quick reread.

There's an awful lot to account for in a turn and it may seem almost impossible to come up with a winning approach, but it's not nearly as frustrating as some strategy games. They don't go too far overboard, and oversights on your part are almost certainly balanced by the mistakes your enemies make trying to command the intricacies of monster movement. Adding the crystals and such gives you more to think about, but in some ways the simpler game makes it awfully easy for the monster to grab you at some point. More obstacles means a meandering monster path, and perhaps wasted movement.

Rio Grande Games asks a bit for this property, but ***Fearsome Floors*** is good exercise, and really appealing to the math wizards for its calculations and to the strategist for its permutations. And players who just want to have fun . . . plenty of that, too.

Missing Missives

This week has marked the first full week of living together as a married man. Combining two households into one -- especially when both halves of the couple are over 30 -- is a real challenge, akin to seeing what would happen if you combined some atoms together by spinning them in a huge circle really, really fast. Considering how I lived in a cluttered 900-square-foot apartment back in ol' Tallahassee, moving in with a spouse into an 800-square-foot apartment has most frequently led to images involving phone booths and college students.

Among other challenges this week, I've been struggling mightily to ensure our combined households play well together, especially in our finances, personal desires, and so on. (Frankly, it's only the blinding aspects of newlywed marital bliss that keep this from feeling rather creepy: "Honey, you've put me on the checking account, right? Greaaat . . . and can you tell me where the life insurance policy is? Super. Oh, and we should make out our wills. No rush . . . anytime within the next 12 hours is fine.") I feel as if we're living out approximately 12% of the episode beginnings of *Love, American Style* and 25% of the episode beginnings of *Alfred Hitchcock Presents*.

One of the items on the massive laundry list of things to do was ensuring that my wife has the usernames and passwords for my e-mail, my personal online accounts, financial website info, and so on. Should something happen to me (such as accidentally having a tire iron split open my skull before the first commercial break), I don't want her to be in a situation where she can't access important information. When my dad died, I know that my stepmom's household was in disarray for quite some time as she struggled to put together the disparate pieces of personal information necessary to access stuff.

One of the side effects of this, however, is knowing that at some point she could access my e-mail, my online accounts, and so on, finding a record from me from beyond the grave.

Now, why she might want to comb through 100,000 e-mails accumulated over a decade (a majority of which begin "Thank you for your interest in contributing to *Pyramid*" . . .) is unknown. However, assuming for the moment that I was interesting, that would be an ideal time for her to stumble across a letter having some special significance or information after the fact.

And, if I existed in a gaming universe, I *would* be interesting, and that would be the beginning of an amazing adventure or story . . . one which would change the face of the world . . . forever.

Or not.

Anyway, in gaming adventures and fiction, one of the classic ideas is the "lost" letter -- a piece of information that somehow surfaces separated from the time of writing, usually at a time or place unknown to the writer.

It's an idea that transcends genre and time period; whether you're talking unearthed cave painting, message in a bottle, hidden will, mysterious video tape, or datachip in carbonite. (Really, a gold record retrieved from a satellite is about the same as a message in a bottle.) And the lost-and-found message taps into a number of satisfying ideas.

First, I suspect many of us like the idea of learning secrets, reading other people's mail, and so on, and the lost message is a way of doing so without guilt. In fact, there's an implicit encouragement in the act of accessing such a missive. ("If he didn't want us to read it, why did he mark it 'Urgent!' and tuck it into a random library book?")

Second, consider that a treasure map has an implicit and presupposed ending (meaning, the players have an idea how it'll turn it); so does a king's proclamation, a will, and so on. But a lost or hidden message can lead literally anywhere. Imagine any of the following as the first words of a found message:

- "If you are reading this, then a murderer has no doubt gone free . . ."
- "I only hope that whoever reads this will be able to succeed where I have failed at containing this evil."
- "[I have deposited in the county of Bedford, about four miles from Buford's, in an excavation or vault, six feet](#)

[below the surface of the ground, the following articles . . .](#)"

- "If you are not Phil McGillicutty, it is imperative you get this note to him, as only he will know what to do with it . . ."
- "I am 37 as I write this, in the summer of 1983. If it is possible I have not succumbed to the effects of old age, I implore you to rescue me . . ."
- "If you don't start closing the kitchen cabinets so I don't conk my head, you'll be sleeping on the couch for a month."

Okay . . . that last one might be more likely to appear on a Post-It Note appended to my computer than in any mysterious note, but the others are still valid and interesting.

Third, unlike many quest-starters, the lost message already has a character tied with it -- albeit one who may be dead or unavailable -- giving the quest itself more personality than most standard adventures. (As a tangential example, almost any of the items listed under [famous ciphertexts](#) in Wikipedia have a fascinating sense of character about them.)

For many, children are considered our legacy to the future. But, in a broader sense, the things we do, make, and say will outlive many of us, perhaps even extending beyond our children. As such, lost-and-found messages are a great gaming device for a number of reasons . . . and they're usually easier than kids to stuff in bottles and throw into the sea.

Murphy's Rules

by Greg Hyland

Murphy's Rules

Gorilla Uprising

for *GURPS*

by Eric Funk

At the edge of an alien interstellar empire (or on an alternate earth), there exists an insignificant mining colony, where mankind has been forced into slavery. The reptilian alien masters have forged a mostly benign society based on their culture, trying to take good care of the serfs. While it is true that the Cik'mar (pronounced si'kem-ar) officially consider the humans second-class citizens, there are some Cik'mar who have grown up on this planet, and consider the "gorillas" to have potential. The alien religion is creationist, believing all life was created and has a purpose. Part of their cultural upbringing is that until a being is deemed ready of making its own choices, it must be protected. This currently includes humanity, but that may change. There are humans who cannot abide others having control of their fate and mean to shake the foundations of this peaceful civilization, to rebuild it with the humans as equals (or higher).

Briefing

Contact: Alien Race - Cik'mar

Description: Upright Biped Reptilian

Planetary data and message recorder contents follow.

Planet Cylene

Atmosphere: Dry, warm

Gravity: 1.1 G

Water Coverage: 50%, mostly found in polar oceans

Diameter: 6,000 miles

Length of "day": 29 standard hours

Length of Year: 408 local days, 280 standard days

Most facilities are in arid "subtropical" zones - there is little exploitation of other latitudes.

[Rustling, static]

I am recording this in the hope that this recorder will eventually reach headquarters.

This place is extraordinary! Humans and aliens are working in harmony. Access to the area around the war factories is free, even if we cannot enter the building proper. Locals are also very friendly to outsiders, even if we are not trusted immediately.

Planet/Cities

The city-mines and city-factories are in many ways organized like medieval cities. There is an inner citadel where the aliens live, with a separately enclosed airport adjacent. Next are factories and residences for Employees. Beyond a wall from these are suburbs for non-Employees. Beyond the outer city live "barbarians." Exceptionally active barbarians can merit a final outer wall to protect the suburbs. The inner and outer cities are each ruled as separate entities by separate councils of elders. To prevent disease, the suburbs have cool running water and sewer services. (The environment provides heat.)

Schools are open to everyone, even what they call "barbarians." I have learned much about their language, politics and geography in a short time. The other

students have taught me some slang. Apparently they want to raise the basic education level of the "barbarians." I also discovered that they wisely reserve any education that is "modern" or higher for "Employees."

Band of Gorillas

Human culture generally follows a blend of traditions from the various equatorial tribes from approximately 1,000 BC. There is little tension in the cities, as the presence of Cik'mar and the "Employee" cultures serve to keep perspective. It is known that humans have only been on this planet for a few thousand years, and the Cik'mar only a little longer. Where mankind was before the Cik'mar arrived may not be known to any being on the planet.

Education and morals are important, even for suburbanites. Employee children are taught to read, write, and speak both their native tongue and that of the Cik'mar. For safety and to instill good sense, they are also taught the fundamentals of mathematics, physics, chemistry, and even economics. Policy ensures that suburbanite children receive the same fundamentals as Employee children, although the curriculum does not have as high a standard. Popular hobbies include team sports, gardening, astrology, and games such as kite-fighting and a game not unlike chess. Lower-class suburbanites enjoy knife-fighting and martial arts tournaments (see Weapons, below).

Some cities, especially those with hazardous or deep mines operate a monorail, which allows commuters to travel from a city of up to hundreds of miles away (each mine links to one city). Most factories operate around the clock, in three overlapping ten-hour shifts per 29 hour "day." Shifts have rotating breaks, during which the maintenance crews perform routine check-ups and replace parts. If someone does not have a job, the Cik'mar have a system in place to help him or her find one. If they cooperate, they will be given aptitude tests and education. Failing that, they may be placed to work in a mine. Although some Cik'mar are known to rise to any level in human organizations, some humans have risen to middle management of a Cik'mar organization this is seen as a great achievement. Almost every human Employee knows someone who has been elevated over a Cik'mar.

Human Employees work in mines, refineries, and factories. Criminals work in the most dangerous areas as part of rehabilitation programs. The TL10 Factories employ most of the Cik'mar on the planet. They oversee the final steps personally.

Beyond the Cik'mar-run cities, there are a variety of TL4- civilizations of a variety of governments and attitudes. There are also free cities and wandering tribes that have protection and information pacts with the Cik'mar officials. Roving bandits normally avoid these groups as attacking them can bring swift retribution from flying SWAT teams. Actual TL3 "barbarians" rarely interfere with the lives of even suburbanite city dwellers, preferring to trade for high-tech goods to raid neutral cities and trade caravans. Rebel lab-forts often must deal with roving bands that want their easier to maintain technology.

Slang

Vidwall

Vidwall is a mature TL8 Liquid Crystal Skin technology produced at TL10 efficiency (see p. VE92). With the lack of television and radio in the outer sections of the city, this allows these denizens to experience much of the outside world in community events in the large bazaars and parks surrounding the outer wall. Radio receivers are distributed in the public areas, with volume level appropriate to the ambient noise and time of day.

The area surrounding the outer walls of the Employee area is composed of commercial districts for at least two reasons. The first reason is that this ring is the first thing that the better-off Employees see when they come to buy goods. The second is that the top half of the wall is covered with Vidwall (see sidebar), which provides coverage of government improvement activities, weather reports, foreign gladiatorial matches, as well as hunts (See "Justice in a Banana Republic," below). Employees with high morale are more productive in the long run. It also advertises job openings in local facilities-the health benefits alone draw many applicants, even in mines! Mining communities are inherently mobile, and those portions that can't be moved are biodegradable plastic or wood. When the mine is depleted, the disposable buildings are plowed in to cover up the mine, and the land is returned to its original state.

In addition to religious terms (including "The Great Egg," "Shards," "Seven Sages"), the following are used (although children using such language should be reprimanded by any adult in earshot):

Buzzed	Stunned, knocked out.
Gorilla	Cik'mar derogatory for a human.
Seeing Blue	Mad, angry.
Sicker	Human derogatory for a Cik'mar.
Sunfire	A curse, from a myth of a solar fire that burns things to dust.
Sunk	Destroyed, ruined.
Treed	Gone into hiding.

The school had a tour of a manufacturing plant recently. I have hidden filings from the plant in this data recorder's pocket so the alloy can be analyzed. Apparently we will be given aptitude tests later.

Technology

The Cik'mar are TL10, but with contragravity, reactionless thrusters, TL6 robotics, and TL8 computers, sensors, and stealth. They do not, themselves, employ watercraft.

Humans are TL4 without gunpowder, but Employees have free access to TL8 medical treatments. There are a large number of civilian TL(4+n) technologies carefully administered by watchful eyes, adapting TL4 materials to meet higher TL ideas. Some ideas include mail, plumbing, electricity, and animal-powered mass transit. GMs should feel free to add any other retrotech ideas -- the culture has had over 1,000 years to witness a mature TL9 culture evolve into TL10. Rental of TL6 vehicles for farming, fishing, and leisure is permitted. This includes cars, boats, trucks, and railroad, but not flight. The rail lines bring food to the cities and take refined goods back to the farms. Mechanics are a close-knit guild although many retire to be recluses . . .

"Barbarians" in the wilds are a mostly TL3 culture, but there are rumors of enclaves with technology up to TL6 and the TL7 medicine secretly taught in cities. They may even be close to discovering radio. Their greatest fear is discovery by the alien sensors, which *might* be able to detect them with PESAs and MADs if the Cik'mar had a reason to search the area.

In general, the factories produce empty space torpedoes, deck plates, beams, anti-static high-grip carpet, adhesives, magnetic coils, tube cars, and furniture. They do not make any sort of electronics, explosives, or beam focusing equipment. For local use, factories produce TL6 vehicles (for rent or lease only), Very Fine blades as well as TL10 Super Fine blades for Cik'mar troops. There are a few factories in Factun that produce goods rarely seen on Cylene. Adjacent to the military compound, they are completely operated by a combination of civilian and military Cik'mar. Using imported electronics and engine cores, they produce small star and space ships in addition to providing this world's grav vehicles and g-carriers.

I have just witnessed a Cik'mar SWAT team in action. They employ sonic stun grenades liberally, and while no one got hurt, my ears are still ringing. With their power armor, they are strong! One picked up an ox!

Gorilla Warfare

In this mainly TL4 world, civilians are typically armed with a variety of knives, as well as a few varieties of swords. In cooler climates, heavy cloaks serve as shields. Unarmed combat is typically some form of Boxing. Suburban guards wear light armor and carry bucklers and spears. They also know disarm techniques, even unarmed (Boxing). Human Employee law enforcement has access to transparent shields, Very Fine swordbreakers, and TL8 ear protection and tasers.

Most police forces are comprised of humans, with the exception of the Cik'mar SWAT teams that handle very violent humans, as well as investigate crimes against their people. The SWAT teams use sonic stun weapons (including pistols

and grenades), and carry locked, holstered needlers as a last resort to which they are immune. When expecting resilient trouble, they wear light battlesuits, always traveling in groups of two or three. They also employ their own specialties of Boxing, Karate, and Judo (see the style ["Emulating the Dragon"](#)). Alien weapons and tools are uncomfortable for humans to use (-2 to skill, -1 if a one-handed tool is braced with the other hand as per p. B548.) Rebel equipment consists of mostly TL6 gear, including submarines and life support equipment. Exceptions include TL7 ear protection and a random assortment of stolen equipment from guards and Cik'mar.

I am now an Employee, living in a small apartment near the factory. While I was studying some of the few civilian electronics safety manuals in my free time, I discovered someone had slipped me a card, indicating where I could find out more about Resistance cells! Further contact will be at a blind drop location.

Military

The military garrisoned on the planet is small, with fewer than 1,000 full-time soldiers spread over the dozens of city-states. The planetary military squads are usually bored. There are almost no riots, and this planet has never been invaded. They are *not* police, and spend much of their time guarding boring facilities or training in simulations or mock battles. Above-average performers with the inclination can participate in the stalking and culling of selected Deathbeaks for food purposes. Those that perform well are allowed to participate in a Hunt (see "Justice in a Banana Republic," below).

When prepared for trouble, they are armed with light power armor (DR20, can operate underwater for a day -- see "Tactical Armor," page 284 of the *Basic Set*), and carry variable blasters as their typical weapon. Only rarely are they called in to quell rebellion. They are special ops, not SWAT teams, and thus not concerned about taking prisoners as results. If the suspects are to be arrested, send in the SWAT team. If they are to be silenced, send in the marines.

It was a set up! Following the directions, I entered a room to discover two unconscious Cik'mar guards, sporting gaping bullet wounds! More guards arrived at that moment, and I was arrested. Apparently my fingerprints were found on a slugthrower discarded outside. Fortunately, they did not search me thoroughly, and this datacorder is non-ferrous.

Justice in a Banana Republic

Justice is swift. Employees are encouraged to purchase "alert" jewelry to signal police that they need attention. This is the equivalent of a 911 call. All are designed to go off and self-destruct harmlessly if opened, or removed away from a specific transponder. There are essentially four castes on this planet: Aliens, Employees, suburbanites, and "barbarians." Each level of difference between criminal and victim makes the punishment more severe. For example, an Employee trying to steal a gun from a guard would receive a lesser sentence than a suburbanite trying the same tactic. Minor criminals are usually sentenced to community service. Medium sentences include demotion by a Caste and work in a random mine or gladiatorial combat. Those that volunteer to stay once their sentence is up get paid as Employees!

The most common "criminal" activity for a Rebel is to steal a higher-TL item. The most easily found higher-tech item is TL8 medical supplies, so they are up to TL7 medicine, helping those they can in secret. This service makes it hard for strangers to overcome the level of trust that getting medical care of three (or more) tech levels higher can bring. As forest bandits providing game to villages bought silence and help, how much more can medical aid? This even extends to "black" TL7 medical clinics in suburban areas.

Although incapable of digesting terran meat proteins, many military officers are rewarded with the chance to hunt a dangerous human criminal. Because of reputation, most humans fight to the death. Typically, the criminal is deposited on a random island, and the soldier two to four days later. A "lighter" death sentence may allow the criminal a weapon. Such slugthrowers and energy weapons will self-destruct within seven days if not placed in a proper recharger. All are likely to be of Cheap quality. In the case of SWAT team members, it is considered bad form to hunt the same criminal that you helped catch. Sometimes, groups of humans are set on an island, lightly armed, and given an objective. (e.g.

hold this position, plant a flag behind a line.) Those that participate and survive are healed and transferred to the mines. Very violent offenders may be required to fight a Battle Royal against each other. The last man standing in this free-for-all is then sent to a lone maximum security mine in the middle of a scorching desert.

Since I did not name my accomplices who raided the arms locker, who I didn't know anyways, I am to be sentenced to the arena for five years. I am told that had either of the guards died, it would have been much worse. I have since been contacted by another resistance cell, which has apologized for the other cell's actions.

Gladiatorial Arenas

It was discovered that there were always a certain number of humans who felt a need to perform violent acts. Gladiatorial combat was discovered as a way of directing this tendency such that it can have a positive effect on society for those who do not fit into the military. Those that obey the rules get TL8 medical care.

GM Options

- The fight is to the death. Professional soldiers are sent in with better and better tech until the criminal is dead. If the first soldier is unable to find and produce the criminal's head after a day, another soldier is landed each day thereafter.
- After eluding captive a certain number of days, the convict is to be taken alive, and given the option to join a special "human" squad, made of hardened, loyal, medically conditioned soldiers, who are used as a sort of "[Foreign Legion](#)."
- Or, there are gladiatorial matches in public arenas in the suburbs, with hardened gladiators. Those that fight according to the rules also get the option of buying one's freedom after a number of years. Those that do not "play nice" get reduced income, essentially becoming indentured workers in a "company town."

Sample community: Factun (a.k.a. Factory One)

Population: 100,000: 5,000 Cik'mar, 20,000 Employees, and the other 75,000 being humans working in support industries such as food, textiles, and basic utilities.

As the first colony, it has many "firsts" and "largests." In this city are found the oldest guild halls and temples, making it a religious and secular Mecca. The main military barracks on the planet are also situated here. This city has the main Deathbeak herds for the planet, and is one of the largest cultural centers of the planet (see "Ride 'Em *What?*" below). It was the first colony, and contains the largest airfield, as well as the only starport on the planet. This is apparent by the "ancient" TL9 weapon turrets surrounding the core of the starport that date to the founding of the colony.

As crazy as it sounds, I have befriended a professional guard at the arena. It turns out that she has as many questions about human "barbarians" as I do about her people. In addition to this, I have access to cultural information and constructive craft lessons as part of my "rehabilitation." Still, nothing about security or geography.

Gorilla Activity

Rumors

- There is a secret enclave hidden from alien eyes by a concentration of the unusual metal. Here, the iconic rebel leader is secretly teaching resistance members the secrets that will soon free mankind! It might be in the mountains, in an island, or under the ocean.
- To make things difficult for the peaceful recluses, the activist Dr. Fang is leading a group that is subtly sabotaging the refineries. The military estimates that production at some facilities has dropped by as much as 10%, but are excited and worried by the chance to see action. So far, the blame has been pointed at local

burrowing animals, but efforts to trap them have been unsuccessful so far.

- Rebels may also have experience forging IDs to make people pass cursory checks by security.
- Hunting lodges in areas just outside cities can sometimes operate as a rebel contact point, teaching individuals to use TL6 firearms and TL7 First Aid.
- Rebel fortress-labs are often in woodland areas so the comings and goings can be diffused.
- Underground labs are trying to secretly advance to higher technology.
- Along the coasts, they use TL6 Very Low Frequency transceivers to communicate stealthily.
- Much of the metallurgy would be based off of scrap metal salvaged from the refineries, or just made of scrap metal melted down and recast.

Going Bananas (Adventure Seeds)

Forward Plot

Recently, there have been an increase in maintenance required to the supply lines leading to mines, refineries, and external factories. The PCs are hired as investigators to discern which group is behind it and where they operate from. They will be given a digital camera with 10× zoom and light amplification features (30 day battery and self-destruct). A roll against Strategy(Land) will give a likely location, and a specific roll at -5 will estimate the headquarters (Critical Failures giving false leads).

Golden Banana

A Cik'mar armory transport went down in the hills nearby your location. There will be injured Cik'mar guards. Are they to be aided, ignored, or left to die?

- As Rebels, can the PCs get in and out with unlocked tools for your people?
- As guards, can the team get there and prevent looters from taking tools and valuables? Balancing the tasks of disabling vehicles and applying first aid to surviving guards is critical!

Next is a romp through the woods, with the guards hot on their tail using PESAs and MADs to try to track the vehicles through the dense underbrush.

Added Spice: The weapons were unwisely shipped loaded with power cells.

First Contact?

While most rebels would be grateful to encounter a group of high-tech aliens, some will resist someone else becoming the source of rescue.

The Cik'mar may welcome an ally earth, especially if they agree to trade technology. For advances in robotics, sensors and stealth, they would gladly give FTL travel as well as an insignificant mining world . . . If this is done, then the world will find itself in need of defense and control infrastructure, which could be outsourced back to . . . the Cik'mar, who already own equipment in place.

First Contact, Take . . . Two?

While observing the Cik'mar, they discover a cruel race that is capturing, torturing, and devouring humans and Cik'mar alike. Thwarting the newcomers (called "Devourers") and freeing Cik'mar prisoners would be a good start to diplomacy.

Poison Apple (Cik'mar coup)

Certain human rebels are sponsored by Cik'mar groups seeking a change in power . . . when the Devourers attack, they will try to seize power.

Complications:

- Will either side keep their part of the bargain? Will they be successful?
- When the dissident group attacks, rebels who help the winner will have a place in the future government!

Prison Break

Although the island Hunts typically kill the prisoner in combat, sometimes convicts have been found hiding in caves, even trapped or dead. This fate has been assigned to many prisoners not found after a month of trained commandos searching an island with TL10 tools. The truth is that some of those stories are actually due to covert pickups by Rebel submarines! The heroes must arrange for a covert pickup, involving contacting the prisoner with the location, ensuring there are no Cik'mar grav vehicles in sight of that location, and actually making contact.

Ride 'Em What?

There are generally two common kinds of herd animals, and they tend to get along. They are genetically disparate, with humans able to eat animals from earth, and the Cik'mar with their food sources, but not vice versa. Humans have cattle, but the Cik'mar have brought "Deathbeaks" (see p. RS112, and Diatryma on p. BE49). A cultural aspect of humans that amuses the Cik'mar is the taming and riding of the Deathbeaks (as there are no horses or llamas on this planet). There are rodeos, races, jumping and trick competitions of a variety of forms across the planet. The Cik'mar never developed riding animals.

Darkness

Rumor leaks out that cargo ships have stopped arriving to rotate Cik'mar crews, bring irreplaceable components, and take away refined ores. Warehouses are filling with exports, and emptying of stores. Who will make the first desperate move? Will the planet then have to resist an invasion of the Cik'mar's enemies? Can they stand together, or will the opportunity cause the group to break into factions?

There is a Cik'mar-lead group surveying the area near the enclave. How will the rebels react? Will they try to bribe human Employees on the team, steal equipment, alter reports/readings to dissuade further surveys, or silence them?

O Holy Night

On a holy day, mines, refineries, and factories will rest, most of the guard minimized. Are the Rebels the kind to take advantage of this, or are they pious enough to respect it? Alternately, perhaps placing bombs the preceding day to go off while the factories are empty.

Librarian

A Cik'mar historian is traveling the world, scanning in texts for his collection. The PCs are hired to steal or copy the data files. Alternatively, the historian might actually be an intelligence agent (maybe one who anticipated this, and has a trap waiting). Or as a final possibility, the librarian might also be a Secret Agent.

Guns of Factun

The rebels must steal TL9 "relics" from the starport. As most TL10 equipment gives a -20 penalty for TL6 scientists; TL9 is much easier to decode by comparison. The catch is that the gun and its sensor each mass around 200 lbs and occupy 4cf. The challenge stages include the starport defenses, the Employee city wall, and the suburbs. As a

complication, the would-be thieves discover that their briefing was incorrect -- the ultradense parts mass 2,000lbs each (but still occupy only 4cf)!

Will the Good Doctor Please Come With Us?

The group hears of a reclusive Cik'mar scientist who seems to like the planet. If the PCs are rebels, they receive word that a violent group will take advantage of his isolation to remove him. They have a limited time to find him (or her), sound his possibility of conversion, convert him, and fake his death. (Avalanche, volcano, underwater . . .)

Variants

Infinite Worlds

The first rumor for Infinity Patrol to investigate is that of secret human labs with samples of alien tech. It is likely easier to infiltrate TL6 labs that think themselves secret than to break into alien labs with TL10 security features, even though sensors are TL8. The next catch is convincing them to part with it. I'm sure they would both want to help the rebels *and* get *their* hands on the alien tech . . .

Paranoid Alien Masters

Each worker gets a tattoo on their wrist bone, invisible to human tech, but easily readable by specially-configured TL8 scanners.

What's Earth?

These humans are the descendants of a seeder ship that lost its way when its computer malfunctioned. The Cik'mar were desperate for laborers, and these seemed the most able.

Templates

Rebel

Rebel is a lens to add to a society group; it is considered the default, with "unskilled suburbanite" as the default "racial" template.

- Raise TL to 6 [varies]
- Secret [-10] or Social Stigma [-10]
- Ally Group [varies by cell]
- Claim to Hospitality [5]

Most rebel groups are organized by some sort of Rank, with each enclave having about 4 levels. Typical ranks are neophyte (1), member (2), trustee or elder (3), and leader or councilman (4). Even if they lack formal distinctions, there will be a pecking order of responsibility.

"Barbarians":

- Social Stigma (Barbarians) [-10]
- Primitive 3 (TL3) [-15]
- Suburbanites: Social Stigma (Second-class Citizen) [-5]
- Primitive 2 (TL4) [-10]
- Xenophilia (15) [-5]

Employees:

- Familiarity with TL6 [0]
- Xenophilia (12) [-10]

Skills: History (local human), History (Cik'mar), Literature (local human), Literature (Cik'mar), Language (Broken/Accented) (Cik'mar).

* Some have "High Tech 4 [20]" instead, and can learn Cik'mar IQ-based skills, and Mechanic (specialty)/TL.

Cik'mar [0]

- DR 3 [15]
- Claws (Sharp) [5]
- Enhanced Tracking (+1) [5]
- Protected Sense (Hearing) [5]
- Striker (Tail) [5]
- Temperature Tolerance 1 (Heat only) [1]
- Chummy [-5]
- Cold-blooded [-10]
- Sense of Duty(Community) [-10]
- Unusual Biochemistry [-5]
- Xenophilia (15) [-5]
- Racial Quirk: Aversion to Deep Water [-1]

Alien Morphology

Skin color of this reptilian race varies greatly, with no particular tie to Status. Individuals may be yellow, blue, green, brown, or red, and their offspring a completely different shade. Some even have a soft camouflage combination. An individual's underbelly scales are typically similar to their hue, but mixed with a green-brown (patterns that appear like a camouflage in their natural environment). Their hands are somewhat larger than human hands, although with the claws, they seem to be just as dexterous. Vision is shifted slightly into the infrared with preferred colors being greens and browns. Females tend to be taller, but possess the same attributes. Note that Cik'mar are immune to needlers due to their DR.

On Cylene, they also enjoy an additional level of Social Regard [5], as well as High Technology +4 [20]. While not impossible, it is unlikely for a Cik'mar to join the Rebellion. A GM should ask for an Unusual Background for a Cik'mar rebel PC.

Designers' Notes: *GURPS Banestorm*

Tales of Alternate Yrths

by Phil Masters & Jonathan Woodward

As most readers doubtless know, [GURPS Banestorm](#) updates the old *GURPS Fantasy* world of Yrth, moving the "present day" of the setting forward to 2005, and incorporating *GURPS Fourth Edition* rules material. However, it does a bit more than that; it also adds some new stuff, changes a few things that we decided could be improved, and fixes a few problems we found in the old material.

Most significantly, though, it's a worldbook. As such, one thing it necessarily *has* to do is nail things down fairly hard. We can't tell you *everything* about the continent of Ytarria in just one volume (let alone any other continents which may exist), and we leave a few mysteries and open questions for GMs to play with, but when we do talk about something, we have to be definite about it. We had a lot of options and possibilities in front of us when we started this project; part of our job was deciding what to do about them. Other *GURPS* books are toolkits, and very fine they are too; here, we're selling a *setting*, and our readers are entitled to expect firm statements of "fact."

Which is not to say that GMs *have* to use Ytarria and Yrth exactly as we've written them. RPGs are an interpretive, flexible medium, and if anyone wants to turn "our" Ytarria upside-down and inside-out, that's fine with us. In fact, given some of the discussions we had along the way, we can think of a few places to start.

Personality Issues

To begin, individual NPCs may be rather different people from what the book describes. (This is a very good way for GMs to outsmart players who read the book and abuse that knowledge, without completely changing the world.) Of course, where these individuals have political power, these changes ripple through to influence great events in the setting. Some examples:

Messing Up Bronwyn: In our final draft, Baroness Bronwyn of Durham is a heroine, from most people's viewpoints. Loyal, capable, and honorable, she's also a secret supporter of certain movements which players may favor, and she may become a key actor in the resolution of the Caithness Civil War, and in the future of Yrth.

However, she underwent a number of changes along the way. She's now a widow, but we'd originally kept her unmarried, until some of our playtesters pointed out just how implausible that was for a 34-year-old feudal noblewoman. We looked at a number of fixes for this problem, which could appear in variant Yrth games.

First, Bronwyn could still be married. The trouble is, this would make things emotionally complicated for King Conall, who's secretly in love with her. We even considered the idea of having Bronwyn's husband, Sir Wickham, be a hero of the war, with Conall sending him off on a series of increasingly dangerous missions, only to come back covered in glory each time. Sir Wickham probably doesn't understand the reasons for these missions, and Conall *maybe* doesn't even acknowledge it to himself. However, this made Conall into much more of a bastard than we wanted. So we killed the husband, with a simple disease -- ah, the joys of amoral godhood.

For another variant, he could have stopped an arrow in the course of the Civil War, generating even more angst. Conall would feel responsible for Bronwyn's tragedy, and would be worried that people might think he'd deliberately put the chap in harm's way. How much soap do you want in your opera?

Alternatively, Bronwyn could be refusing to marry anyone. We even drafted a rather different biographical note for her:

... her advisors and family are increasingly concerned by her refusal to seriously consider marriage. She says that, so long as the war continues, she cannot risk the distractions of courtship, let alone childbirth; they fear the consequences of her lack of a clear heir. Romantics among her people call her "the Virgin Knight" or "the Amazon Baroness," and say that she is married to her lands.

Those who know her best fear that the famous incident when she was kidnapped by orcs in her youth has left her traumatised and unwilling to let any other being have any sort of personal power over her. Some think that she would accept a suitor who proved himself strong enough to match her; others think that she would reject anyone who threatened her total self-reliance.

In other words, we could have made Bronwyn into Ytarria's Elizabeth I, or even its Red Sonja. We rejected that plan, as it left our prospective heroine a little too psychologically messed up, and made the Conall-Bronwyn romance plot *much* too difficult for all concerned. Other options were out; she couldn't be nursing a secret passion for Conall -- that would be too silly -- while having her fancy someone else unattainable would make the romantic entanglements hideously complicated. So, in the end, we created and killed the good Sir Wickham of Durham, and gave Bronwyn a son and heir.

Aspects of Conall: Talking of the King of Caithness -- even in our final version, he's someone who appears very differently depending what angle you choose to look at him. Disastrously weak king or noble ruler growing into his office, hard-working and dutiful or a boring control freak, romantic or just neurotic . . . You can find all of these opinions in Caithness. (One of our playtesters certainly disliked the poor guy.) However, any of these opinions could be completely justified. Conall could be a hopeless wimp, a macho warrior, or a tyrannical schemer. He could also be married -- his bachelor status is one of those points where we privileged plot over probability. Indeed, for those who want a background plot saturated with Arthurian-style chivalrous adultery, both Conall and Bronwyn could be married to other people, but could also be discovering feelings for each other . . .

Questions of the Emperor: One thing that's clear to most people in Ytarria in 2005 is that All Is Not Well with the Emperor of Megalos. The book reveals the terrible truth here, so players may learn it; however, their characters almost certainly won't, at least not for a long time.

Further, there's not much that the average bunch of PCs could do with this knowledge even if it seeped down from the brains of their players. Still, some GMs may be concerned that some groups might abuse the information. Fortunately for them, they're completely free to fix the problem by changing reality.

The Emperor could be exactly what he appears to be. He could even be competent, though that would mean the Empire would have to be better administered in a lot of places. So, perhaps he's just *moderately* competent, and moderately self-indulgent, but he's also the victim of an insidious and brilliant whispering campaign by a bunch of scheming nobles and churchmen. In that case, the PCs might learn the "truth" as in the book, and act on it -- only to find that they've become disposable pawns in a vicious scheme of usurpation.

Then again, perhaps Jordan Siegebriker's plot of 1989 worked perfectly, and the Empire is increasingly under the sway of the Templars. In that case, things could become very unpleasant for many of the inhabitants of Ytarria very quickly . . .

The Map

If the history and politics of Ytarria as we describe them aren't sacrosanct, nor is the geography. Messing with the map permits any number of added wars, commercial arrangements, or natural disasters. A substantial land border between Sahud and the Nomad Lands, more fertile land to the northwest (supporting a larger orc population), or less forest between Caithness and al-Haz, could all make for interesting events.

Changes to some *political* boundaries could simply be the result of a minor change to the history. Ytarria has seen numerous frontier wars over the centuries; tinkering with the results of any of them could move borders around. Caithness could be reduced to an endangered rump state, or expanded westwards as far as Castle Defiant -- or even the

coast! The Nomad Lands could be under Megalan domination. There could be Muslim outposts scattered across southern Araterre. Even Tredroy, fabled City of Three Laws, could be entirely controlled by any one of its three adjacent states. Of course, it would probably still be a diverse and decadent place, with the added fun that many of the citizens would be ripe for subversion by two different neighboring powers.

The Frontier Wars of 1991-1995 ended as a draw; a shrewd strategist among the western Megalan nobility, or an aggressive commander for the Wazifi armies, could have produced a different result. If Megalos had done better, the Legions could be pouring into the south, forcing al-Haz to mobilize, while ensuring political chaos in Megalos itself when the Megalan commanders notice that they are getting little help from the capital. If the Muslim powers had won, Megalos would either be frantically organizing to hold the line, or falling apart as the Emperor ignores the problem. It's also possible that the war could have ended with a treaty, but that one side could have captured some extra cities -- in which case, the victor would be having a hard time absorbing so many resentful new citizens.

Guns, Djinn, and Wood

Other variations could involve the magical forces which make this a genre fantasy setting, possibly even playing with the physics and metaphysics of Yrth's universe. For example, Ytarria doesn't have firearms, although there are several logical reasons why it arguably should. This situation has a *social* explanation: Guns are legally banned, and suppressed with ruthless efficiency. Some of our playtesters suggested that the reason could in fact be *magical*. If explosives and the like just don't work in Yrth's universe, there's far less weird social manipulation required. (Someone even suggested that it could just be *black powder* that doesn't work, leading to some interesting incidents over the last century or so, as other explosives filtered through from Earth to Yrth.) We rejected this idea because messing with the fundamental chemistry of a whole universe struck us as more arbitrary than an efficient conspiracy or three. Still, anyone who dislikes the Ministry of Serendipity and the Underground Engineers may wish to consider this alternative. (One associated idea, that can still be used in conjunction with the conspiracy, is that gunpowder is the equivalent of crack cocaine for fire elementals.)

Then again, fantasy settings don't *have* to exclude gunpowder and firearms; "muskets and magic" could be a nice change of pace. Perhaps the powers-that-be on Yrth gave up the struggle against this bit of technology. If firearms have been around for a century or so, warfare would resemble that of the Renaissance period on Earth, with cannon, pikemen, and musketeers -- plus battle wizards, and some select men guarding the artillery train against enemy magic and fire elementals. If such military technology has been developing for even longer, it could have progressed to the "Napoleonic" stage or later, with a focus on sheer firepower. At some point on such a development path, battle wizards will point out that they are no more effective at killing at range than any foot-slogger with a gun. At that point, they may say that actual fighting should be left to the untalented masses, and retire to staff positions providing intelligence services and logistical support.

The original **GURPS Fantasy** also set up the mystery of the Djinn Lands, in far southwestern Ytarria. We decided to resolve it. We're fond of the approach we took (naturally) but others could be equally valid. Perhaps the djinn are human wizards after all, or high-powered psionic adepts from another universe, or renegade demons, or even, simply, djinn. The other Big Mystical Mystery which we resolved was that of the expansion of the Blackwoods; GMs who dislike our approach there can decide that the obvious explanation which most people on Yrth believe ("Blame it on the elves") is in fact correct, or they can juggle with the precise cause, to taste.

Other magically-based variations could include anything from setting events on a more "spiritual" level -- perhaps even using Yrth as the setting for an **In Nomine** campaign -- to simply working out the logical and complete consequences of every spell in **GURPS Magic** being freely available. Anyone trying the latter should allow plenty of time and be prepared for a lot of debates . . .

Crisis on Infinite Yrths

Lastly, although Yrth is now, technically, part of the "Infinite Worlds" multiverse, it remains very hard to leave and a little tricky to enter. This is very definitely a deliberate design choice; this is the default **GURPS** setting for low-tech,

magical fantasy adventures, and not just another stop on the crosstime tour. Significant contact with other universes would change things too much, too quickly -- and in plot terms, the Ministry of Serendipity and its counterparts have long existed to control this problem.

But no one has to keep things that way. After all, Yrth's status as a "dimensional Sargasso" might be changed at any time by a breakthrough in N-dimensional parachronics or portalistic thaumatology. Infinity would be pleased to have easier access to the magical lore of a relatively comprehensible "fantasy" world (and the Cabal would be delighted), but very nervous at the possible implications of the changed status of this timeline. If forced to take sides, they'd probably try and stabilize the situation in Caithness and maybe promote independence movements in Araterre, while actually basing most of their operations in relatively benevolent, stable regions such as al-Wazif and Cardiel. (While running everything out of their offices in Tredroy). If Centrum gained any sort of access to Yrth, they might side with Megalos as a unifying force -- or, given its "willfully backward" noble heirarchy, they might instead conclude that they'd be better off promoting meritocracy in Cardiel.

If the parachronic breakthrough wasn't kept secret, and the major factions of the **Infinite Worlds** cosmology gained extensive access to Yrth, it would soon become a major concern for every Ytarrian. Local wizards are numerous and competent enough to give even the Cabal pause, and would doubtless be eager to associate themselves with other powerful magical adepts. Infinity Unlimited would have a hard job keeping the situation under control; the apparent "RenFaire" style of Yrth would only add to their problems, as various companies sought to initiate tourism on a world which a bit too dangerous for such things. And the Dark Elves, fearing an inundation of even more alien visitors, could turn into a veritable terrorist organization. They'd be willing to move Heaven and Yrth to keep the intruders out - - possibly literally . . . Meanwhile, everyone would have to wonder what Yrth's Jesuits or Templars were up to -- and what contacts they might have beyond their own world.

On the other hand, if some Ytarrian wizards gained magical transdimensional capability (without Infinity noticing), they'd probably try to plunder the multiverse for arcane knowledge and treasure, while avoiding contact with high technology. They might bring a few gadgets home for their own use, but they'd have to be careful not to attract the dread attention of the Ministry of Serendipity. Ytarrian PCs involved in "portalistic venturing" would doubtless find other worlds very strange. Their low-tech skills, and magical firepower would help them somewhat, but they'd need to be clever to avoid disasters.

An alternate "crossworld" game wouldn't even feature the Infinite Worlds cosmology. It could just involve exploration of multiple parallel *Yrths*, with alternate histories of their own. In some, perhaps, the Banestorm never happened, and the elves and dwarves remain dominant, although harassed by the orcs. Or, perhaps the Dark Elves were more right than they feared, and countless orc tribes lounge triumphantly in the ruins of a shattered Ytarria, mocking their elf and dwarf slaves. In other alternates again, the Banestorm may only have opened gates to Gabrook, and goblins are the dominant race, with a hybrid culture with many borrowed elf and dwarf elements. Or, there may just be a few immigrants from Loren'dil, causing less grief to the elder races. There might also be post-apocalyptic Yrths, Bane-blasted and infested with countless monsters, Yrths where human-imported technology has advanced at higher rates, or Yrths with a *lot* more high-mana craters . . .

Or even Yrths which look the same, but where some important people have very different personalities. But that's where we came in.

Get a Job

New Careers for *Warhammer Fantasy Roleplay*

by Jody Macgregor

The career system is one of the defining elements of *Warhammer Fantasy Roleplay*; as well as presenting a unique way for characters to develop, it is a players' first glimpse of what makes the setting unique. Careers like Rat Catcher and Peasant don't exactly lend themselves to high adventure, and in a typical party half the characters will be illiterate. The careers don't just describe heroes (although they have those as well), but people from every level of Imperial society. The careers chapter is a window onto the setting every bit as evocative as the background chapter.

However, something as ambitious as describing the potential lifestyles of every member of such a diverse society is bound to have gaps. Certain combinations of skills, archetypes suggested by the setting, and roles beloved of gamers are missing. This article sets out to describe a few of these missing careers, although modeling every potential role a character could find in the Old World could take up the rest of your career as a gamesmaster.

Table 2-5: Starting Career

Career	Dwarf	Elf	Halfling	Human
Agitator	01-02	--	01-02	01-02
Apprentice Wizard	--	01-07	--	03
Bailiff	--	--	--	04
Barber-Surgeon	--	--	03	05
Boatman	--	--	--	06-07
Bodyguard	03-05	--	--	08-09
Bone Picker	--	--	04	10-11
Bounty Hunter	--	--	05-06	12
Broker	--	--	--	13
Burgher	06-09	--	07-08	14-15

Broker (Basic Career)

Description

In the trading capitals of the Old World, particularly the great port of Marienburg, a new mercantile system is emerging. Shares of ownership in businesses and ventures are traded at Exchanges, with cash only needed if someone sells up. A new kind of middleman is necessary to negotiate this complicated system and that is where the Brokers come in. The whole system seems mysterious, even arcane, to the average citizen (and its practitioners are often dubbed "financial wizards") as they see only a mass of young men in expensive clothing shouting at each other in a pit. Even outside of the pit, Brokers are loud and brash individuals who enjoy taking risks for their own sake.

Note: During character creation, if you take Common Knowledge (the Wasteland), your character can be from the great port of Marienburg at your option.

Correspondent (Basic Career)

Description

In The Empire's largest cities, where as much as a quarter of the population may be literate, printed broadsheets are catching on as a way of distributing the news more reliably than via town criers. These broadsheets vary in their integrity; the Altdorf Spieler is renowned for its honesty and zeal while the Carroburg Courier-Mail is a mere scandal rag for local gossip. Correspondents, also called ink slingers, are the writers for broadsheets, a job that requires a thorough knowledge of local politics and the ability to snoop. On slow-news days it requires a vivid imagination as well.

Freak (Basic Career)

Description

Freaks earn a living by exhibiting their deformities to the public. Some are true mutants, but these are rare in the

Empire because of its vigilant Witch Hunters. Other freaks, such as bearded ladies and midgets, have minor quirks. Yet other freaks are self-made and gain attention through the shocking acts they perform such as hanging themselves from hooks, hammering nails into their skin, or eating raw meat and chicken heads.

Gypsy (Basic Career)

Description

Gypsies are outcasts who have formed a rootless society of their own, traveling from one place to another, moving on when aggrieved locals drive them off. They make their livelihood through entertainment and fortune telling, sometimes resorting to trickery and petty crime. Gypsies travel in horse-drawn caravans, wear brightly colored clothes and are almost as superstitious as Ostlanders. Most gypsies are Vagabonds who have joined together for safety and shared community or the descendents of such. Rarer gypsy bands are members of a people whose lands were lost to them long ago. They refer to themselves as the Strigany and dark rumors about them abound; it is said that they practice necromancy and consort with vampires.

Nipponese Ashigaru (Basic Career)

Description

Far to the east, beyond even Imperial Cathay, lies the island nation of Nippon. This exotic land is famed for its deadly warriors, the samurai, who make up its ruling caste. The Ashigaru, or lower-class samurai, are much more common and when Nipponese forces travel to the Old World it is the Ashigaru, with their long spears and gunpowder weapons, who go. In the Old World Nipponese are most common in Marienburg, where they have their own city ward called Niponsstad; however, Ashigaru may also find their way to the Empire as exiles, ship's crew thrown off course by the famously dangerous storms that threaten their land or diplomats and their entourages. Their fighting skills and discipline are highly prized.

Note: If this is your Starting career, you are from Nippon.

Sewerjack (Basic Career)

Description

Someone has to keep the sewers empty of mutants and Outlaws while insuring that noxious gases don't build up to lethal levels and the older sections don't crumble underneath the people's feet. These thankless tasks are performed by Sewerjacks, and they number among the lowest of the low. Since the job is so unpopular, sometimes criminals are punished by being forced to serve terms as Sewerjacks. Others join the 'jacks because it's a good job to hide in; nobody asks Sewerjacks too many questions, for starters because they smell so bad. There are rumors among those who stay in the job for any length of time about man-shaped rats who dwell beneath the cities, but such nonsense is never taken seriously.

Legalist (Advanced Career)

Description

In the more civilized parts of the Empire, particularly the southwest, the barbaric practices of settling legal matters by Judicial Champion or trial by fire are fading away. Their replacement is a system in which legal disputes are settled by words, not blows, and the representatives hired in these cases are called Legalists. It is the job of Legalists to advise their clients on the laws pertaining to their case and present that case before a Magistrate. One of the difficulties they face is that the laws of the Empire differ from province to province and sometimes from town to town. Even with a good Legalist, a fair trial is still a rare thing in the Empire.

Magistrate (Advanced Career)

Description

It is the job of a Magistrate to hear all of the evidence in a court case and make a fair decision based on the rule of law. Magistrates adjudicate civil and criminal cases, but offences against the priesthood or the gods are tried by Witch Hunters and military crimes are dealt with by superior officers. Sentences meted out vary from warnings, through

fines, floggings, dismemberment, banishment, hard labor and execution, typically by hanging. Those who cannot pay fines are sentenced to debtor's prisons, like Nuln's infamous Mundsens Keep. Some settlements are too small to have their own Magistrate and may only receive visits from traveling judges once a year. By the time cases are heard in these settlements the evidence has often gone cold and the witnesses forgotten what they saw, which helps to foster a climate of lawlessness and vigilantism.

Welcome to the Viking Pacific

by Paul Drye

Until conveyors and other world-hopping technologies are introduced, timelines are mostly isolated from each other. There are a few other ways to move across time, but they are usually small and difficult to control. Still, there are dozens of anomalies logged by Infinity agents, ranging from the Suhal Stone to the strange case of the ambassador of the Montagnard Republic. One of the largest and most inexplicable of them all is the South Pacific empire of Ångaland.

History

Ångaland's timeline was first contacted eight years ago, and dubbed Cretaceous-4 due to its dinosaurs. Unlike the other Cretaceous timelines, this one did have a mass extinction 65 million years ago, leading to dominant mammals as on Homeline. Despite the destruction, though, some dinosaur species survived on the Indian subcontinent and spread to the rest of the world after it collided with Asia 50 million years ago. Since then large mammals and dinosaurs have co-existed.

Once Infinity realized the change point was that far back, New Zealand was examined as potentially safer than the rest of this fierce world: it was submerged on Homeline during the Oligocene, reducing the major land animals to birds, bats, and lizards. The site of Auckland soon became Infinity's main point of entry to the timeline. By good luck, this put Infinity within 1,100 miles (1 800 kilometers) of one of the major islands controlled by Ångaland. Contact was made when a surveying plane overflew what appeared to be a medieval Scandinavian knarr in the ocean to the south of New Caledonia. A follow-up expedition showed that the ship's look wasn't a case of parallel evolution: it really was descended from a Viking trading ship.

The Patrol is used to seeing Vikings in unusual places -- their wanderlust and the vagaries of history mean that some timelines have them far afield by Homeline's standards. A Scandinavian South Pacific on a dinosaur world was beyond the pale, however; Paralabs researchers descended on Cretaceous-4 to explain the anomaly.

The sagas of the Ångalanders support the already-obvious conclusion that their ancestors are not native to Cretaceous-4, having come to this "new land" by what they believe to be a mystical accident some 25 generations ago. The current date is 1550 AD and Paralabs thinks that, about 500 years ago, the North Atlantic between Norway and Iceland "went Bermuda Triangle" on one or more timelines. The occasional fishing boat, trader, or colonizing ship would get snatched away and deposited at a spot to the south of Fiji on Cretaceous-4. A settlement of a thousand people built up on the main island of Viti Levu by the time the phenomenon ended a century later; unfortunately the timeline shifts stopped too far in the past and the surviving stories are too sparsely detailed to give Paralabs' investigators many clues as to why it happened.

Outworld Operations

Ångaland is rated P8 by Infinity, which is to say that it is accessible for large-scale trade and to all visitors except tourists. In the past two years it has become something like Johnson's Rome, except catering to agents on furlough rather than the general public. The primary draw is that the Ångalanders accept the concept of traveling between worlds, yet are hundreds of years away (at least) from being able to understand The Secret as anything other than magic. While in Ångaland, agents can be themselves and act naturally without fear of being discovered or causing a security breach. There's also the added attraction of getting to hunt dinosaurs on a timeline that has rustic human comforts as well.

There is some trading in and out of Cretaceous-4. In-bound, the primary trade items are guns and ammunition, beef, and luxury goods like silk. Though cheap on Homeline, these goods are either too high-tech, tough to raise in the

tropics, or not found in Ångaland at all. All command high prices, especially the AK-47s and shotguns that are the best weapons allowed for import. Travelers are advised to watch their weapons -- while the Ångalanders are generally honest, the prestige of owning a powerful firearm is so high it tempts many. All trade on the timeline goes through White Star Trading, though controls are lax and smuggling is rife for all goods but long arms.

As is typical for non-technological timelines, much of the trade outwards is in art objects: in the particular case of Ångaland, there is Homeline interest in their works in tropical wood. Most Scandinavian art is in metal, or else in low-quality wood that isn't particularly collectable. The Viking South Pacific, by contrast, uses mahogany and kwila wood. There is also some trade in locally available opals and spinels, which are too low in value for Homeline to want to set up their own mining operations on empty timelines.

Cretaceous-4's second-most important export behind art is dinosaur meat. While it is an acquired taste (contrary to expectations, it does not taste like chicken), the Ångalanders know more about preparing it as food than any other people anywhere: timelines where humans and dinosaurs mix are rare. The flesh of the fjathrathráll, a bird-like dinosaur, is a delicacy in fine restaurants and can fetch \$50 per pound; others like the rauthrsvín are worth far less.

Ångaland

The two main islands of Fiji are still the hub of Ångalander civilization, with about 40% of the 150,000 or so people in the whole country. The largest town by far, the seat of the king, is Halleby on the southwest coast of Viti Levu (or "Sanvágr," as the natives here call it). Most islands are colonized only along the southwest coast, as the rain shadow caused by the prevailing winds is needed to keep the wheat crops from drowning. Fortunately, the dry season corresponds with the local winter (May to September), when temperatures are also kinder to this badly misplaced plant.

By the end of the 14th century the Fijian islands had filled up, and the Ångalanders started expanding. In the 150 years since, they have discovered and expanded into the Tongan Islands and Samoa to the east, and New Caledonia, the New Hebrides, and the Solomon Islands to the west. On Cretaceous-4, most of these were inhabited by only plants, birds, and flying mammals similar to bats. They were a disease-free paradise for settlers and their domestic animals. It wasn't until the late 1400s and the first encounters with the larger wildlife of New Guinea that Ångalander expansion slowed. Even today, Papua and the Western Solomons are dangerous, jungle-choked frontiers as compared to the islands further east.

Ångalander Culture

Almost all people live in small villages of a few families, or even isolated farms on the coast. Farming is king, though the traditional Norse cattle have been supplanted by pigs and chickens better suited to the climate; similarly, while wheat is the staple, it is (to Homeline eyes) weirdly mixed in with coconut and sago. Fishing is also important, but most keep a boat for trading purposes too. Like their Norwegian ancestors, the Ångalanders will go to great lengths to acquire prestige items like steel weapons and jewelry. Fortunately, a royal monopoly on New Caledonia's iron deposits keeps the peace and raids are limited to pirates operating out of the many small, uninhabited islands.

To the surprise of Infinity's first contact teams, who were prepared for violence and xenophobia, the Ångalanders fell all over themselves in welcoming out-timers. It soon became apparent that they had long been troubled that they were cut off from European trade and missed much of what they thought was important: quality fabrics, glass, furs and ivory, "culture" from Germany and France, and so on. Even several centuries on, after most of these had become legendary, the desire to plug back into a wider world remained. Infinity opened the timeline to White Star three years ago, and since then goods have been flooding in.

In a broader sense, the Ångalanders are utterly fascinated with Homeliner culture and technology; the fact that they probably hail from a historical echo or alternate instead of Homeline is glossed over. They consider Infinity to be the means by which they have been reconnected to "their homeland." As a result, they are perpetually interested in what is going on in Norway, Iceland, and France (at the time of their transition to Cretaceous-4, the latter was becoming the center of European culture). Rather than risk wholesale contamination of the line with the 21st century, Infinity has

taken to passing on information about the 1200s. Ångaland has such a population deficit that it hasn't advance very much; even these limited connections are a sudden influx of 100 years of intellectual and technological development.

The one area where contact has raised problems is religion. Ångaland's settlers were Christian, but were cut off from Rome after the transition to a new timeline. Lacking anything better, they set up a parallel hierarchy with the Bishop of Halleby taking the position of Pope. Now that they are back in touch (the distinction between Homeline and wherever they actually came from again being ignored), the Ångalander Church is threatening to schism. Some natives want to dispense with what was only a necessary measure, while others -- and the now-hereditary Bishop -- want to carry on with the new ways.

Adventure Seeds for Ångaland

Might Be A Wolf: Now that trade is giving Ångalanders access to firearms, the more daring are expanding into western lands formerly too dangerous to colonize. Geir Herulfsson selected a choice location on the south coast of Papua for his steading, and for the first year all was well. In the last two months, however, four people have been killed -- within the walls, at night. The best guess it's some too-intelligent carnivorous dinosaur, probably of a kind never seen before. The murders have got to stop, or Geir's Halle will become a ghost town.

Bishop Takes King: Arnfinn II is the grandson of the man who united Ångaland into a single country. Unfortunately, he's now elderly and not all there. Just a few weeks ago, he reversed his long-standing policy of welcome for out-time religion in favor of the home-grown variety. Now several Philippine missionaries have been imprisoned and are going to be either executed or at least deported if Infinity will take them. Most suspect that Bishop Rollo of Halleby is behind all this; normally Infinity wouldn't care who was in charge, but he's interfering with a previously useful policy of openness. While negotiators stall for time, someone needs to rescue the missionaries. After that, the situation at the top can be corrected with impunity.

Beware the Door with Too Many Keys: The adventurers are present when a small, but advanced military ship drifts to shore not far from Halleby. Though heavily damaged and scattered with dead, a few survivors are still aboard and confusedly open fire. No matter who ends the situation or how, there's only one likely explanation: the natural gate to Cretaceous-4 has reopened, and its other end is somewhere advanced and warlike.

Pyramid Review

Ingenious

Published by [Fantasy Flight Games](#)

Designed by Reiner Knizia

Graphics by Kinetics & Binney Hare

Mounted fold-out board, four score tracks, 24 wooden scoring blocks in six colors, 120 tiles, cloth sack, four racks, & rules sheet, full color, \$34.95

Ingenious may not be the cleverest game to come down the pike, and its mechanics probably aren't groundbreaking, but it is another example of how the right product at the right time will strike folks just so.

The object of the game is to hold the best score at the end of the game.

The board is a grid of hexagons, with six starting spaces marked by six symbols that permeate the whole game. These read like a bowl of Lucky Charms cereal: red asterisk, yellow sun, purple ring . . . Everyone starts with a rack and six tiles (kind of like *Scrabble*); the plastic playing pieces are a pair of hexes connected along one side, also with game symbols. Some double up on the symbol they use, while others pair up different symbols (kind of like a selection of dominoes).

You want to match icons on the board to form a line of like symbols. For example, if there is a row of three adjacent green circle symbols and you place a tile with a green circle next to them, forming a straight line, you get three green points. If there are green circles next to your tile in other directions you count those too, so after a few plays there are enough tiles to give you some big numbers. Since you have two symbols per tile you may be able to score with the other end as well, which may or may not involve the same colors. Part of the strategy is deciding if playing your tile is worth it to get all those symbols. The next person may come along and use the tiles you scored plus your new tile to get an even better score.

Each player has a long score card with six wooden blocks on it. Each block is color-coded to one of the game's symbols. Colors are scored individually -- the three green points you got move the green block along the green track. Other colors are tracked separately, but if you place a counter with, say, both green and purple symbols it could get you points for both colors. Eighteen is the highest score for any color, and you no longer benefit from scoring those symbols (though you can do it just to keep others from getting them). When you get a color to 18, you do get an "Ingenious" -- a one-time free play of a second tile (which could lead to getting another 18, and so on). When you finish playing tiles, you draw to replace them from the cloth sack and end your turn.

Eventually the board fills up and no one can make any more plays. When this happens the game is over and the score cards are checked. Since the object is to raise all six of your score counters as high as you can, your total is actually the lowest counter you've got. If everything else went to double digits but you never got your blue cube higher than nine, then nine is your score. The "high" score wins.

Fantasy Flight spared no expense making the game. The board is a solid fold-out item, the playing pieces and the racks are tough plastic, and you get a swell cloth bag from which to draw new tiles. The rules fit on one sheet in full color. The score cards are nifty, though the little wooden blocks are small . . . they're not tiny, but you might lose them if you're not careful. The colors are irresistible.

The only real complaint is storage: There's a plastic insert that's supposed to keep the equipment, but it's really just a bin for placing the bag of tiles (the indents hold the fold-up board nicely, too). The score cards and rules just sort of sit on the top of this stack, and they slide around and make you feel like the box is never fully closed. Store it flat, or place it on the shelf between other games that will keep the lid shut.

Though **Ingenious** (also known as **Mensa Connections** and **Einfach Genial**) has shades of everything from **Othello** to **Twixt**, the game feels new. It's an intriguing and challenging pastime, the sort of process that grips you and draws you back for game after game. Something this simple isn't usually this replayable, but it's the sort of thing you can improve on, and once you've learned it you'll want to get better at it. It also has the mainstream appeal necessary to attract "non-gamers" to the table of an evening. You can even play it solo, trying each time to best your score, though you won't be catching it at its best. Fantasy Flight may go a little whacky with the components, but since it's going to be something you pull out a lot, you want something that's going to last.

Red Devils (for *Space: 1889*)

Published by [Noise Monster Productions](#)

Written by Jonathon Clements

Directed & Produced by John Ainsworth

Music & Sound Design by Steven Foxon

Starring Ivor Danvers (Sir Henry Routledge), Ian Brooker (Professor Sebastian Golightly), Jo Castleton (Georgina Golightly), Kevin Murphy (Doherty), Katarina Olsson (Miss Charlotte Wong), Rupert Wickham (Lieutenant Williams), Tam Williams (Prince Skerrun), & Simon Williams (Captain St. John-Ffolkes) with Anthony Daniels (Captain James Carter)

70-minute CD; £12.50

It is fair to say that outside of the computer game and the novel, the roleplaying game has fared poorly when adapted across to other media, especially television and film. Such adaptations have been few and far between, and the fan and the general viewer alike has universally derided all. Fortunately, with the latest intellectual transplant, we gamers can give our eyes a rest and instead put our ears to good use.

Red Devils is the first in a series of audio dramas published by England-based Noise Monster Productions set in the Solar System of ***Space: 1889***. Originally published by GDW in 1989 and later revived by Heliograph, ***Space: 1889*** is a Victorian-era science fiction game inspired by the works of H. G. Wells, Jules Verne, and Arthur Conan-Doyle, that cast the imperialism, colonialism, and attitudes of the late 19th century across the inner solar system. Travel and transport between the worlds inside the Asteroid Belt is achieved via Ether Ships that ride the luminiferous ether and are powered by the rays of the sun, while communication is enabled through the British Empire's system of orbital heliograph stations.

As *Red Devils* opens, the Ether Ship *Perbindesh* is in the final leg of its journey to Mars. Commanded by Captain James Carter, she carries a number of important and interesting passengers. Most notable is Sir Henry Routledge, the newly appointed Governor of Syrtis Major, whose peccadilloes include his young "niece," Miss Charlotte Wong. Hers is an uncomfortable position, being non-European and accepted only for her uncle's good standing. Professor Sebastian Golightly was once a noted scholar of Martian studies, but his eminence has dwindled, only to be rekindled with the acquisition of a new assistant, Prince Skerrun of the Martian city state of Alclyon. Armed with an Oxford education, the Prince is returning to his homeworld unsure of his future. The Professor comes to Mars accompanied by his daughter Georgina, aiming to conduct field studies and thus be able to publish again.

All seems normal aboard the *Perbindesh*; Captain Carter runs a tight ship with the aid of his executive officer, Lieutenant Williams. But the empty void between worlds is not always a safe space, and the ship is running silent for reasons that Captain Carter does not care to divulge. Not only is the *Perbindesh* threatened by the Feinian pirates from without, but from conspiracies within, as class and social differences chafe and ferment.

From the outset, *Red Devils* is a very English affair, which as a period science fiction drama has the feel of a *Dr. Who* audio adventure. This is not undeserved, as some of those involved in Noise Monster Productions has some experience with that oeuvre, but the feeling that odd-but-dapper man is about to step out of a British 1950's police box and save the day soon passes. Once beyond this point, the listener can settle down to be drawn into a tale all its own. For the initiate, the salient points of the ***Space: 1889*** setting are explained without the need for exposition, while the devotee will find that they help reinforce the setting's other worldly qualities that attracted him to the setting in the first place.

The story fair cracks along and all too soon the listener will find the 70 minutes coming to an end. You do need to pay attention during the climactic battle scenes, as events sometimes outpace the listener's ability to visualize, but this is always a problem with the audio drama format. The ending itself comes down to Earth -- or is it Mars? -- with something of a bump, as the "real politick" of the situation on the Red Planet is enforced. The final moments do set everything up for a sequel -- *The Steppes of Thoth*, which is also available. Noise Monster has parts three and four already planned.

Initially *Red Devils* feels a little clichéd in its portrayal of the period, but it quickly rises above that, due to the characterization and the performances. The cast is uniformly excellent, the only exception being that of the two female parts, which do suffer from being somewhat trite. However, this is the fault of the writing, and hopefully will be rectified in the sequel. Of course, the most notable member of the cast is Anthony Daniels, and it is pleasing to say that there is not a hint of the robot about his measured performance.

In production terms, *Red Devils* is excellent. The sound is crisp and sharp, while the CD is nicely packaged. It includes an eight page booklet that provides notes about its four main characters, a little about the setting itself taken from *Chadwick's Gazetteer of the Worlds*, and a centerpiece spread depicting the British crown colony of Syrtis Major. Such information is helpful for the initiate, but is probably not quite enough to be particularly useful.

It is easy to imagine how each of the characters could be defined in terms of the ***Space: 1889 RPG***, or indeed for the GM to run the events of the story as an adventure that would get his party from the Earth to Mars. In fact, it would make a pleasing change from the murder mystery aboard ship that begins many campaigns, something that the drama also avoids. The audio format is responsible for that, enabling the telling of a more exciting story more effectively than a visual budget would allow. The drama also neatly takes in the attitudes of the period, keeping them subtle rather than blatant, but above all *Red Devils* is a thoroughly enjoyable hour of listening. And it succeeds where a television or film version would fail, because in asking us to solely rely upon our ears, it is the listener that supplies the imagination and visual details. For fans of ***Space: 1889***, *Red Devils* is a treat, while devotees of Victoriana and science fiction should enjoy it just as much.

Dork Tower!

Dork Tower!

Tears Added to Ripples

Having lived in Florida for 80% of my life, and with my parents still living down there, I know first-hand the devastation that hurricanes can cause. My parents both worked in insurance (my mom still does), and so they heard story after story of the loss of property, limb, and even life.

But even the spate of three hurricanes that hit Florida last year (one of which [destroyed my car](#) in Pennsylvania) . . .

even the stories of how Miami was decimated a few years ago (including an amusingly sad tale about how the huge aviary at Miami Metro Zoo was ripped open, releasing the hundreds of rare and exotic birds) . . .

even the economic hardship that has befallen my family because these gargantuan storms virtually wrecked Florida's insurance industry at the same time it was literally wrecking cities . . .

even the fact that the hurricane in question -- Hurricane Katrina -- was the very same storm that had knocked out my parents' power for 28 hours, and led to a momentary panic on my part as I feared that the man killed in my parents' city might be one of my parents . . .

even given all of these markers to evaluate the effects of hurricanes in my own life, nothing I've experienced has even come close to what's happened -- and continues to unravel -- in Louisiana and Mississippi. A friend of mine lived in New Orleans for several years, and he's worried about the friends and co-workers he left behind. I worry about longtime industry guru Lou Zocchi, who was living in the path of Katrina, and who has not been heard from yet.

I worry about a lot of things.

One thing I find so amazing about the tragedy -- amid the nonstop coverage I've been reading and trying to digest -- is the effect this incident will have on the rest of the country and, as a result, the world. They say that one life touches so many others; we may experience first-hand what one city touches.

Today, amid speculation about what will happen to the price of gasoline, my wife and I had a discussion about what this would mean to our Christmas plans. Originally we either were going to drive to visit her parents in Michigan, or fly to visit her brother's family (complete with new baby) in Dallas. We had all but ruled out Dallas as prohibitively expensive [about a month ago](#), but had still planned on driving to Michigan; however, gasoline prices have more than doubled since we first made those plans, and they may be higher come the winter time; we've been trying to determine if, worst case scenario, a holiday trip is worth 2% or more of our annual income.

The situation had lead to some odd circumstances. As of last week we had a one-day "honeymoon" trip planned to Six Flags America, which is about two-and-a-half hours away in Maryland. But, although we might be willing and able to pay for rising gas prices, we've also needed to prepare for the contingency that we may not be able to buy any gas at all; it's not impossible that [places might run out](#), since this uncertainty and chaos has happened to fall right before one of the busiest travel holidays of the year. So we've needed to plan for a contingency of staying at a hotel at some point in our journey. And I've been doing the mental calculations about whether I can "risk" donating blood today . . . which I really want to do but would take about two gallons of gasoline to get to the donation center and back.

Reading these last two paragraphs again, I feel awfully selfish and shallow, babbling about gas prices when people are still clinging to life, trying to survive amid the chaos. I don't mean to sound that way. I'm mostly trying to wrap my mind around the massive ripples caused by waves that have long since passed . . . ripples that rebound and move in unexpected ways. And the realization that I may need to think more seriously about my plans five months from now because of a disaster in a city 1,200 miles away makes me realize how tied we all are.

History, like fiction, realizes this interconnectivity. The assassination of Archduke Ferdinand led inevitably -- if circuitously -- to universal women's rights in the western world. The invention of moveable type in Germany would eventually lead to decades of violence in Ireland. Trade sanctions on Naboo would ultimately cause the destruction of

Alderan.

But for now, I constantly click "reload" on the news websites, wondering and worrying. Will the people still trapped in New Orleans be saved? To what extent will we be able to recover, as a nation? And are the four days I spent working at an Origins booth next to Lou Zocchi the last time I'll see him? When the next huge hurricane hits -- as it inevitably must -- what will happen then?

New Orleans, I never knew you . . . but I wish you all the best.

--*Steven Marsh*

Essential Flame

for *GURPS*

By S. E. Mortimer

A previous article, ["Lighting the Way."](#) explored the various methods of providing lighting -- usually by means of a flame. This article outlines various methods of generating that flame. Most of the following methods can be found in many survival manuals but this article incorporates these methods into *GURPS* -- sorting them into their appropriate tech levels, discussing suitable skills, and listing the cost and weight of various tools and equipment.

Introduction

It is estimated that man first began to make use of natural brush fires about 1.5 million years ago, but it wasn't until around 500,000 BC that *Homo erectus* first employed artificial means to light fire (p. LT15). In *GURPS Third edition* there are two separate skills for lighting a fire using primitive technologies -- Bow and Palette, and Flint Sparking (both are described on p.CI152), but in *Fourth edition* these are subsumed into the Survival skill (pp.B223-24). Separate skill rolls are required to make the required tools, find suitable materials and fuel, and to actually light the fire. The latter roll is based upon DX rather than Perception, and involves successfully using the tools to create a smouldering ember and then coaxing that ember into a flame. There are several methods that can be employed to do this. They usually involve generating heat from friction, using a direct spark, or focusing heat from the sun (see *Fire Starting*, below).

Tinder

Tinder consists of a small wad of highly combustible material such as dried leaves, grass, moss, fungus, fluffy bark, dried manure, pulped wood fiber, paper, fiber wadding, woven fabric, and the like. Once the tinder is set alight, a larger fire can be built over it, or the flame can be transferred to a fire that has been prepared elsewhere. Alternatively, it may be transferred to a light source, such as a [candle or lamp](#).

Tinder Box (TL0): A small, waterproof box used to contain tinder. Since tinder catches alight more easily if it is already charred (just like a candle or lamp wick), fresh tinder is placed underneath the older material, leaving the partially burned tinder on top. A tinder box is commonly used with the *direct spark* method of ignition (see below) and often flints and steel are stored in the tinder box. Some have steel strikers permanently fixed to one side of the box or on the lid. Virtually all of the ignition techniques described below require a small wad of dry tinder, so it would be sound advice for anyone expecting to spend some time outdoors to carry some tinder in a waterproof container. Anyone with a Survival skill will always be on the lookout for material suitable for his tinder box while he is working, hiking, camping, etc. The GM can assume that a character's tinder box is always full unless there is an extended period of time when suitable material is unavailable. But even in these situations tinder can usually be improvised from things such as clothing (cotton is good), wood shavings from a weapon shaft, gunpowder, and so on.

Tinder Tube (TL4): This is also used with the *direct spark* method of ignition (see below). Some have called this the original "cigarette lighter." It consists of a metal tube between one and two inches long and around one quarter of an inch in diameter, with a length of cord (made from a natural fiber such as cotton) inserted. The end in the tube is deliberately charred. As previously stated, charred material catches alight more easily than fresh material and the metal tube is intended to prevent the charring from rubbing off the cord. To light it, a short length of the charred end is pushed out of the tube and held on top of the flint near the edge. The flint is struck along the steel, causing a spark to skip onto the charred cord. It is then blown gently to cause the ember to spread over the end of the cord. This smouldering end can be applied to, say, a candle wick, a tobacco pipe, or a matchlock firearm. After use, the smouldering end was pulled back into the metal tube to smother it. Sometimes the tube had a metal cap. Tinder tubes

were used throughout World Wars I and II because they were less likely to attract sniper fire; they are still used today in rural Spain (called "shepherd's lighters").

Fire Starting

Modifiers: Besides skill modifiers from the tools themselves (listed with each item description), there are general modifiers that apply no matter which ignition method is being used. They include:

- +3 if two people work together, with one person blowing gently on the tinder while the other works to ignite the fire
- -5 if the tinder is wet
- -3 if the tinder is only damp
- -3 if the equipment is wet
- -2 if conditions are particularly windy

Some of the tools listed below are so easy to use that no skill roll is normally required (e.g. matches, cigarette lighters, lenses, etc.) However, the GM may still require a skill roll if conditions are particularly difficult (e.g. strong wind, wet fuel, etc.)

Familiarity: Even though the same skill is used for all fire starting methods, it takes a while to learn how to light a fire with each different tool. This can be handled with the Familiarity penalties on p. 169 of the *Basic Set*. That is, it takes eight hours of use to become familiar with a piece of equipment. Until this time, skill rolls are at -2.

Time: Unless specified differently in the item's description below, it takes at least one minute and a successful Survival skill roll to light a fire, once all the required materials have been assembled. As stated above, this skill roll is used to create a smouldering ember and then coax that ember into a flame. On a success, the tinder erupts into flame and will quickly need to be fed with additional fuel before it burns out. On a failure, the character may spend an additional minute and make another skill roll, but at a penalty of -1 (see p.B348 for *Repeated Attempts*). On a critical failure, a piece of equipment breaks (possibly resulting in injury) and can no longer be used. A replacement will need to be found or a different ignition technique can be attempted instead. On a critical success it only takes *half* the normal time.

The Fire: Once started, a fire must have fuel to continue burning. Survival rolls can be made once per hour to find appropriate firewood (see p.LT15 for skill modifiers). A successful skill roll finds enough fuel to stop a fire from dying out for 12 hours, or to feed a fire suitable for cooking and warmth for 1 hour.

Ignition Methods

Friction

All of these methods, at their most basic level, involve rubbing two sticks together. Dry, seasoned timber is required, but some types of wood are more suitable than others. Some timber will not work no matter how dry it is or how good your technique. It might take an hour or so and a successful Survival skill roll to locate suitable timber. Failure results in nothing appropriate being found during that hour. A critical success results in ideal material being found giving a bonus of +2 to the skill roll to light the fire. Inappropriate materials might warrant a penalty of -1 to -3 to the skill roll.

Two Sticks (TL0): Probably the first method ever used to light a fire by means of friction. It involves vigorously rubbing two sticks together until one of them begins to smoulder. It is very difficult to light a fire in this manner and a great deal of effort must be expended. One skill roll can be made per minute at a -4 penalty and each attempt uses three points of Fatigue.

Fire Saw (TL0): Used by Australian aboriginals. It is an improvement on the above method and requires at least two people. A piece of hardwood is partially split down the middle and held apart with wooden wedges and tinder packed

into the split. One person stands astride this timber to hold it down while the second person rubs another piece of wood vigorously back and forth in a sawing action along the top, directly above the kindling, working between the standing man's legs. This technique can be exhausting -- each skill roll uses two points of Fatigue and has a skill penalty of -2.

Fire Plough (TL0): Commonly used by Pacific Islanders, it involves rubbing the end of a wooden shaft (the "plough") against an elongated wood base (the "palette" or "hearth board"). A good palette is made from dry timber that has a low density and poor heat conductivity. To begin, a long straight groove is cut into the palette. The end of the plough is then placed into the groove and vigorously rubbed up and down. If done correctly, a black dust (charred wood powder sometimes called "char") will accumulate at the end of the groove and eventually begin to smoulder. This technique can be exhausting -- each skill roll uses two points of Fatigue and has a skill penalty of -2.

Drill and Palette (TL0): Similar to the fire plough except that instead of a long groove, a hole is made in the palette near the edge. A V-shaped slot is cut between the hole and the edge to allow the char to accumulate in a small pile. The end of a long, straight, hardwood spindle (the "drill") is set into the hole and spun rapidly back and forth between the hands (both hands must be free to attempt this). It is often difficult to find a suitably long, thin, straight section of timber to use as a drill. Also, beginners often find it difficult to get enough downward pressure to generate enough friction for ignition. A mouth piece can be added to the top of the spindle, enabling the head and neck to apply additional downward pressure. This technique uses two points of Fatigue per skill roll and has a skill penalty of -1.

Bow and Palette (TL0): Instead of spinning the drill in both hands, a small bow is constructed with the string looped once around the drill. As the bow is moved back and forth, the drill spins. Only one hand is required to move the bow so the spare hand can be placed on top of the drill for additional downward pressure. It takes about the same amount of time to light the tinder but it is less tiring -- only one point of Fatigue is lost per skill roll. If cordage is available, it takes 10 to 15 minutes to make a fire bow. Typical bows are one foot in length or longer (Modifier of +0), but skilled practitioners can reliably produce fire from a bow less than six inches long (at a -1 penalty). The advantage of the smaller bow and palette is that they can be carried in a pocket.

Pump Drill (TL1): Similar to the bow and palette except that the drill is rotated using a more complicated mechanism. Instead of moving a bow back and forth, a crossbar is pumped up and down. Cord is wrapped around the drill and attached to both ends of the crossbar and a heavy weight is attached around the drill. This weight is necessary to provide momentum to the spinning drill. It takes about the same amount of time to light the tinder but no fatigue is lost. Modifier: +0.

Matches (TL6): Robert Boyle was the first to use phosphorus to light sulphur coated wooden splints in 1680, but the first friction matches were not made until 1827 by John Walker. These consisted of a mixture of antimony sulphide, potassium chlorate, gum, and starch. These matches were dangerous -- they ignited explosively, burned with a pungent odor, and the fumes were toxic. A few years later Charles Sauria began to experiment by adding phosphorus to the mixture. It made the match easier to light but was even more toxic and some had a tendency to spontaneously ignite. In 1845 the invention of red (amorphous) phosphorus enabled safer matches to be produced. In 1855, "safety matches" were made by separating some of the components of the match head and putting them on an abrasive strip on the side of the box. When the match head is rubbed against this "striker" the components mix together and the friction generates heat, causing a chemical reaction that produces a flame. Paper matches (book matches) were invented in 1889 by Joshua Pusey. Matches can be waterproofed by coating them with wax. Most survival enthusiasts work from the adage, "one fire, one match," so theoretically, a box of 50 matches can start 50 fires. In practice this isn't always the case, though. Matches are listed among the camping and survival gear on page 288 of the *Basic Set* and no skill roll is normally required to light a fire with them.

Direct Spark

Fire can be created when hot sparks land on flammable material. The only difference between the following techniques is the means used to produce those sparks.

Stone Sparking (TL0): Two rocks are required; one must have small bits of iron in it (fine crystals of iron pyrite work well), and the other must be hard and non-porous. The two rocks are struck together producing sparks -- some of

which will hopefully land on the tinder. This method is more time consuming than friction techniques, but doesn't require as much physical effort. Each attempt to light a fire takes five minutes instead of the usual one, but uses no Fatigue. Modifier: -2.

Flint and Steel (TL2): Dating back to the early iron age, high-carbon steel was discovered to more efficiently strike sparks than using minerals containing iron. The sparks come from the steel, not the flint, and any hard rock that will fracture to a sharp edge can be used to strike them, not just flint. Other suitable materials include agate, bloodstone, carnelian, jade, obsidian, and quartz. When the edge becomes dull it needs to be chipped back to a new sharp edge. A flint and steel is commonly used in conjunction with a tinder box (see above). Either the tinder is taken out of the box and a wad is placed near the fireplace, or the sparks are struck directly into the box. To light a fire, sparks are struck onto the tinder until it begins to glow. Some of the tinder is then gathered up around the glowing ember and blown gently until it starts to spread, and then blown harder until it bursts into flame. Another method involves holding some charred tinder on the flint and striking the steel as described with the *Tinder Tube*, above. It is fairly easy to master the technique required for using flint and steel (skill modifier +0). Anyone with a Survival skill will always be on the lookout for suitable replacements for his flint and the GM can assume that a character always has a couple of spares in his tinder box.

Metal Match (TL6): A high tech version of the flint and steel. It is a short metal rod made from a pyrophoric alloy such as *ferrocium* -- a combination of iron and the rare earth element, cerium. More advanced alloys also include magnesium oxide, and other rare earths such as lanthanum, neodymium, and praseodymium. When the edge of a knife or other hard, sharp object is scraped down the ferrocium rod, bright sparks are produced. It is a simple process to direct these sparks onto some tinder. This material is also the "flint" in cigarette lighters (see below). It is a simple matter to ignite a fire with a metal match. Modifier: +2.

Cigarette Lighters (TL6): The first *automatic* ("one finger, one motion" mechanism) cigarette lighter was patented by Ronson in 1926. It was called the "Banjo" and initially retailed for about \$5. Other companies soon followed suit. Blaisdell developed the Zippo windproof lighter in 1932 and these retailed for less than \$2. A cigarette lighter consists of a butane reservoir underneath a steel striker wheel and a small piece of *ferrocium* (see *Metal Match*, above), often called the "flint." A finger or thumb is used to flick the wheel around and depress a button to release the butane. The sparks created by the wheel rubbing against the flint cause the butane to ignite. While the button is depressed the flame continues to burn. Some lighters have a flip lid instead of a button and butane continues to be released until the lid is closed. Modern disposable lighters are made from transparent plastic so one can determine the level of fuel left in the reservoir. One of these lighters will produce continuous flame for about 10-15 mins. No skill roll is normally required to light a fire with a cigarette lighter. Once the fuel runs out it might still be possible to use sparks from the lighter to ignite some tinder. This would require a Survival skill roll at +1.

Electricity (TL6): An electric battery (e.g. from a car or flashlight) can be used to light a fire. Two wires are first connected to the battery terminals. When the wires are shorted-circuited (touched together), sparks form. As with other sparks, if they land on tinder, it can ignite. A Survival skill roll at +2 is required to successfully do this. A more effective method is to connect the terminals to fine steel wool. When the steel wool glows red hot it can be applied to the tinder and coaxed into a flame. A skill roll is not normally required for this method.

Sunlight

This requires some sort of solar collector -- either a parabolic reflector or a transmissive lens -- to concentrate the heat from the sun into a small area. Naturally, this method cannot be used at night time or on heavily overcast days.

Transmissive Lens (TL0, TL3): The most common method is to use a glass lens (TL3) such as a magnifying glass or a pair of spectacles (those that correct near-sightedness only). A temporary lens can be made from a piece of ice (TL0). To make an ice lens, start by shaving it with a knife and then grinding it to shape on an abrasive rock. It can be finished by using the heat from your hands to smooth it. Using a lens to achieve ignition works best in bright

Soda Pop Can Reflector

The bottom of most aluminum soda pop cans is concave enough to be used as a parabolic reflector. The first step is to polish it. If a suitable cloth and metal polish (such as jeweler's rouge) are available then this will only take ten minutes or so. Improvised

sunshine where it should only take a few (2d) seconds. Hold the lens perpendicular to the sun and move it back and forth until the focal point is on the kindling (the sunlight will form a small bright dot). Keep the lens in this position until the kindling starts to smoulder and then blow on it until it ignites. Under calm, sunny conditions, no skill roll is necessary to light a flame with a lens.

Parabolic Reflector (TL2): A highly polished, concave metal plate can be used to concentrate and focus sunlight onto a piece of kindling in a similar manner to a lens. A reflector is generally more efficient than a transmissive lens and can be used to create a flame even on lightly overcast days. A thin splint of wood is slit at one end and a small piece of tinder is inserted in the slit. This tinder is held at the focal point of the reflector until it smoulders and catches alight. On a sunny day this will only take a few (2d) seconds. The focal point can be found by slowly moving the tinder in and out and observing the point at which it smoulders the most. Specially-made parabolic reflectors can be purchased in some camping stores but they can be easily improvised in the field. A shallow bowl covered with aluminum foil can make a crude reflector. Most modern flashlights can be disassembled and the reflector removed. Even the bottom of a soda pop can will make a serviceable reflector (see textbox). Under calm, sunny conditions, no skill roll is necessary to light a flame with a reflector.

polishes (toothpaste, powder cleanser, etc.) can take anywhere from 15 mins to an hour to achieve a suitable mirror surface. Even a bar of chocolate can be used in an emergency. The chocolate is used as the polishing agent and the wrapper is used instead of polishing cloth (this method will take at least an hour). Once a mirror shine is achieved on the bottom of the can, it is used just like any other parabolic reflector. The reflector is pointed at the sun and the tinder is held at the focal point of the reflector until a flame ignites.

Equipment List

Item Description	TL	Weight	Cost	Time	Mod	Notes
Bow & palette	0	0.25 lb	\$1	1 min	+0	uses 1 Fatigue
Pump drill	1	1.0 lb	\$10	1 min	+0	
Flint & steel	2	0.25 lb	\$3	1 min	+0	
Par. reflector	2	neg.	\$1	2d secs	N/A	small reflective dish
Trans. lens	3	neg.	\$5	2d secs	N/A	magnifying glass

Tattoo You v2.0

for Transhuman Space

by R. J. Heath

"Hey, Barb! Wow, I see you got rid of your 'tribals' entirely! But, I thought they were permanent inks?"
"They were, but I went out and got Slytech's new tat remover, Eraskiner™. Took them off without messy elective surgery! One application a day for a week and they were gone! Now my skin is like a fresh, new canvas!"
Bored of that old tattoo? Want the "clean look" now that you're looking for legitimate corporate work, but you don't want to go through skin grafting or laser burning? Get Eraskiner™, from the chemical wizards at Slytech!
-- Quick pop-up vid for a fine product that unfortunately suffered from a rash of . . . well, rashes. (Excerpt from *The Satirist's Book of Things That Came (and Went) Before Their Time*)

Making your mark in the world is a primal urge that is as old as the human race. To some, the world around them is their medium, and they make their mark with paint, stone, or large sheets of brightly colored canvas. For others, it takes a more "personal" workspace to display their inner feelings and ideas.

Aside from the cultural arguments that can be made for and against tattooing, the old concerns of health and hygiene have become, in this day and age, almost moot. (If one goes to a respectable tattoo artist, that is; Caveat emptor; for those who decide not to¹.) Inks are pure and hypo-allergenic, and the tools used for making them nearly make the "inker" unnecessary. Aside from that, the amount of different types of "inkings" can make the choice of self-expression that much more customer-friendly. Average tattoo costs range from \$200-\$500 per. sq. ft., depending on quality of the artwork you want.

Temporary Tattoo: If someone can't decide if a tattoo is for him, or wants to go to New Malibu with a tough-looking tat for Spring Break, and then come home as fresh as new fallen snow, then a "temp-tat" is the answer. Pick or fabricate a design, put the soon-to-be-offended body part into a scanner, and hit "print." Voila! A very thin sheet of inked plastiskin pops out of the 3-D printer all ready to be applied. It will look completely realistic and well-proportioned to the features and curves of the skin. (\$50/sq. ft., TL8)

A more permanent form made of sensa-skin is available. It will become part of the flesh like sensa-skin is wont to do . . . sort of a poor man's cheat. Those who get this process are warned to be careful if they should want a more permanent version of the same tattoo; it should be inked professionally instead. When the sensa-skin becomes set, the resettling pseudo-skin cells often muddy the inks, leaving it all blurry and undefined (one-in-three chance of this happening over the next week after application). (\$100/sq.ft.; TL9.)

Both of these options will add +1 to disguise rolls where the fake tattoos have to be identical to the target's tattoos.

Moving Pictures: A beautiful static image can be captured on flesh that accentuates and is accentuated by the movements of that parcel of skin. (How many people's ancient uncles had a hula girl tattoo that "danced" when he moved a liver-spotted appendage?) But what if you could make the images move by your mental command?

Taking a page from the cuttlefish, nanorobotically created and controlled pseudo-chromatophores in the skin turn on and off in preset patterns created by a computer, creating designs like the liquid-crystal displays of the old days. One can make either a moving picture, like a writhing, flame breathing dragon; or have a tattoo that disappears completely when you have that family reunion to go to. It can be as intricate as the wearer is willing to pay for. Add bioluminescence for truly interesting effects! Exotic dancers take note. (TL9: Double cost for basic movement (on/off included)/triple for intricate ones, at the GM's discretion; bioluminescence adds half again after all costs are figured out². +1 towards applicable performance or seduction rolls, as determined by the GM).

Tattoo-Be-Gone: Unlike Eraskiner™, most tattoo removal agents today are much less likely to damage the skin, leaving scars and tattoo-shaped areas of damage. They just attacked and broke up the pigments that made up the tattoos, not encapsulating them and carrying them off to the body's waste organs like today's do. The nanomachines in the old agents either created unwanted waste products that reacted badly with the surrounding tissues or created too much residual heat themselves. In effect: skin burns from the inside out. (Roll HT-2 per dose if stuck using old style products, which were at high TL8-low TL9; failure leaves scars, critical failure requires surgery. More modern treatments -- available mid-TL9 -- will only scar on a critical failure of HT rolled at the beginning and end of treatment. Any nano-influenced bonuses to health will apply, of course.) (\$20/dose per sq. ft.; five doses per week).

Full-Body Dye-Job: "If you don't like something, change it," is what the body-mod addicts often say. But, what if you want to change all 14 to 18 square feet of "the body's largest organ"?

Well, you're in luck if you just don't like the color of your skin. Take a dip in a special nano-bath and after a tingling 20-30 min. you will have a brand new hue . . . I mean, brand new you! Just like an egg before Easter.

So, you can give yourself a great-looking tan that never fades (Been to Rio lately?), make yourself any color of the visible spectrum (I hear that black is the color of choice for some pointy-eared reality gamers on Luna), or bizarre pattern of your choosing (Pink-and-blue zebra stripes? Sure!). One gal had her skin changed to the color of parchment and then had the Declaration of Independence tattooed all over, resulting in a throng of admirers wishing to sign their names in big letters.

Those tempted to run down to their local vat should note that this process is permanent; the only way to fix it is to redo this expensive service. This completely changes the pigment-making cells on your skin (and hair, if you want) to produce different amounts of pigments, or even produce colors not normally found in the range of skin tones. Also, certain things, such as metallic sheens³ and curing complete albinism, are beyond this bit of technology. (\$5,000 for each change, with choice of hair color and patterns included in the price; TL9.)

Hands-Up-Display: This is something for those who want to have info at their fingertips, but don't want to have their hands full. A screen is "printed" into the palm or forearm, similar to the aforementioned moving pictures but on a more precise scale in a small area. Back-lit by bioluminescence, and controlled by pressure-sensitive micro sensors in the skin, the person can use a stylus (i.e. finger) to scroll, type, or whatever someone could do on a similar-sized comp screen, without the bulk of external equipment that can be lost or stolen. It requires a neural interface to use; if someone got a neural jack as well, he can hook into a ship's computer, and then be effectively piloting with his palm.

Technically, someone could have this printed on other areas of skin as well, but, unless he's either a nudist or very flexible, it's not recommended. (\$2,000, six hours to implant, takes a week for systems to work themselves out⁴; TL mid-high-9).

Many of these products and technologies can replace or supplement other tech, or even be combined themselves. Thus a spy might have camouflage skin that he can turn on and off (adding possible pluses to stealth and camouflage skill rolls). Or someone might have tattoos that reveal maps, tech designs, or simple text, which can be revealed either at the wearer's will or under certain other circumstances, such as only being visible under UV light. (This is possible right now.) Or a tattoo might only be visible by a certain race's visual senses, used to identify clan or tribe. Let your imagination lead you.

Footnotes-

¹ Aside from the requisite health checks in this case, truly evil GMs can make the artist make skill checks. Failure leads to a badly rendered tattoo (-1 reaction from aficionados, if they see it), critical failure can lead to . . . well, rather funny situations ("What do you mean, 'Who's Kelly?' I don't know any . . . wait . . . Shelly! Come back!").

² These tattoos run off of the body's own energy (simple sugars, body heat, etc. - whatever the GM decides.) If desired, moving or glowing tattoos may raise the temperature of the skin they're on. This can be either small affect (+1-5

degrees; similar to the feel of a low-grade fever on the skin) or big (+6-10 degrees; above this will affect core temperature), depending on the amount of skin covered. This can lead to hits on endurance if temps get high enough and also can make one a better target for heat-seeking weapons.

³ The level of metals needed to bring such sheen to the skin is far beyond toxic to the average human. Unless someone plans to use body paints, there's no hope of surfing in silver skin.

⁴ These are a combo of biological technologies and cyberware. They run off of both the body's energy like "Moving Pictures" do, but they also run off the power sources the character's other cyber implants do; thus the integration time.

by Daniel Bronson

Watch . . .

A weathered shaman welcomes his long-tested apprentice to the final trial, marking the young man as the one who will take his place.

Watch . . .

The tattoo that will forever herald this transition slowly and painfully takes shape with each jab of a native thorn -- from the master's fresh blood, to the red dust, to the flesh of the student, and back again.

Watch . . .

With every cycle untold multitudes of invisible trespassers ride the thorn into their new host, ready to invade, ready to multiply, and ready to open another mind.

Watch . . .

* * *

Can you hear the voices?

The little ones, the quiet ones, the insistent ones that no one else can hear? The ones that tell you that you aren't alone in your mind?

They just might be right.

That infectious diseases can affect the mind is not a new concept; it made it into the literature at least as early as 1896. Widespread acceptance of the idea took longer but there is no doubt now of its truth. After all, everyone has heard of mad-cow disease and its variants, the effects of rabies are well-known, and even in the early 1900s it was acknowledged that late-stage syphilis could induce progressive dementia. More recent studies and new technologies continue to add to the list of microbes that have potential mind-altering abilities.

Scientifically suggested connections now exist for streptococcal infections (obsessive-compulsive disorders, Tourette syndrome), Lyme disease (mental confusion, memory deficits), leptospirosis (depression, dementia), and Borna virus (schizophrenia), just to name a few. Clearly, not all mental illness is due to infection and not all infections will lead to mental changes, but where the connection does exist there waits a 10' by 10' treasure room full of opportunities . . .

Cat & Mouse

Toxoplasma gondii is a single-celled protozoan with a lifecycle that takes it from cats to rats and back. The second

half of that cycle requires that the cats consume the rodent host, which isn't something the rodents are particularly keen on. Consequently, *T. gondii* has developed a trick for making infected rats better prey. First, it causes them to become attracted to the smell of cat urine. Second, it tends to make them jittery. What you end up with is a rat that hangs around where cats can be found and has trouble sitting still when it needs to hide. Voilà: the perfect cat bait.

Humans can also become infected, generally from interaction with cat feces or handling infected meat. If the protozoan forms cysts in the brain it can result in women who are friendlier, and men who are more suspicious, compared to the norm. It may also lead to delusions and auditory hallucinations. While these latter, more extreme effects could certainly be replicated in a gaming setting, it might prove more interesting to scale the cat-rat relationship up to a human level.

Start with a large predator, be it a dragon, a great cat, or a pointy-toothed alien with overactive salivary glands. Next, select the prey. Elves, humans, and humans-with-funny-foreheads would all be good choices. Add a *T. gondii*-like microbe and mix well. Now you've got a group of people -- a cult, if you will -- fascinated by a mighty creature that anyone in their right mind would avoid like the plague. They hunt it out, offer it sacrifices (either of themselves or others), and live their lives to serve it . . . no matter what it does. This isn't because they seek power, or because want to show how macho they are, but because the chemicals released by the cysts in their brains tell them to.

Of course, it's always possible that what the human is obsessed by isn't the next host itself but a vector organism. Mosquitoes, biting flies, or rats (and their fleas) could be considered fascinating, depending on the needs of the microbe.

As You Command

Rabies. The one word is enough to conjure up everything from "Old Yeller" to werewolf origin theories. It certainly has a well-deserved reputation given the deadliness of the disease, and it can cause a wide variety of mental symptoms in humans -- from anxiety and confusion to hallucinations and insomnia. Unfortunately for the rabies virus, none of that has much chance of helping it reach its goal of being passed on to a new host before the current one dies. It gets better results from its work in other mammals, where the "furious" type of rabies (as opposed to the "dumb" or paralytic type) drives creatures to attack anything, transferring the virus to a new host with every bite.

The take-home message here is that these miniscule organisms have the same objective as pretty much all of the other living things out there: survival through propagation. To do so successfully requires that it have some way to move from host to host, and having the ability to convince the host to work for it is a major coup. Applying this notion to microbes with other modes of transmission, and again scaling up to the human level, can provide some intriguing results.

For example, there are plenty of sexually transmitted diseases out there that are content to rely on humanity's natural desires to spread to new hosts, but what about one that induced ever-increasing cravings for intercourse? Similarly, an organism that uses airborne droplets to hop person-to-person could benefit from causing some degree of autophobia. Paranoia might even be a useful thing to inflict on a host if doing so meant that person was more likely to survive during an organism's long incubation period.

It's Not So Bad . . . Once You Get Used To It

And then there's *Dicrocoelium dendriticum*, a parasitic flatworm known for the effect it has on ants. Normally these ants live low in the grass, foraging during the day and returning to their underground nests for the night. Once infected, however, the ants take a break from routine. While they keep the same day job, when evening approaches they climb to the top of a stalk of grass, grab onto it, and wait there until morning . . . which means they're perfectly positioned to be consumed by grazing sheep and cows -- the next hosts in *D. dendriticum*'s rather complicated lifecycle.

This has been described by some as a form of "temporary insanity" because it is only in effect at certain times. None of the known infection-based neuroses or psychoses in humans appear to have this trait, but it isn't difficult to imagine such. The exercise is even easier if combined with a scenario in which humans are not a part of the natural lifecycle. Perhaps the offending microbe causes auditory hallucinations in response to elevated stress levels in its host, induces shyness with decreased light exposure, causes claustrophobia in very humid environments, or generates a thirty-minute berserker rage about every nine days. With humans being a dead-end host, none of the effects have to make sense from a transmission point of view, so have some fun with it.

Putting It All Together

Emergence

The message from the Teras IV planetary survey team requesting emergency assistance was short and uninformative, but no further communication was forthcoming. *BTS Queguy* made it back to Teras IV in a record 43 hours and sent down a second team. The base camp was in shambles and most of the initial team members were in varying states of decomposition. The single survivor was so paranoid about the new team that he finally had to be tranquilized before he could be brought onboard the landing shuttle. After quickly collecting what other equipment and samples were salvageable, the shuttle returned to the *BTS Queguy*.

The message from the *BTS Queguy* requesting emergency assistance was short and uninformative, but no further communication was forthcoming . . .

The cause of all this trouble is a previously unknown protozoan-like organism. It reproduces sexually in the intestinal lining of the carnivorous tachern, then breaks out of those cells and enters the intestine where it forms cysts. These cysts are expelled and contaminate flora that is then consumed by a small furry critter known simply as a bleet. In the bleet the cysts open in the intestinal tract and invade first the lining, then the blood stream where some live openly in an amoeboid form and others again form cysts. When the infected bleet is eaten by a tachern the cysts break open in the intestine and invade the lining, starting the cycle over again. Cysts in dried bleet blood can be aerosolized, but inhaling these cysts will not cause infection unless they are then coughed up and swallowed.

This infection treats humans as if they were bleets, though with an added complication. Human blood vessels are nowhere near as hardy as those of a bleet, and so they weaken under the chemical onslaught of the organisms in the blood. Anyone who is infected will bruise more easily than normal, will have bloody splotches in their eyes, and, eventually, will start having constant nosebleeds. It is this last symptom that is the most worrying because it is then that the amoeboid organisms in the blood have the chance to burrow along the olfactory nerve. This will disrupt the victim's sense of smell and will allow the organism to reach the brain. Once it hits the all-important gray matter its chemical byproducts will begin inducing aggressive paranoia and eventually insanity. Over time the infected individual will grow suspicious of everyone, will begin attacking and killing anyone he believes is dangerous to him, and will slowly descend into animalistic madness.

For use in other settings, this previously unknown disease can hit a remote village, an underground bunker, or even an ocean-going vessel. It just needs somewhere isolated . . .

Adventure Seeds

- A response team will need to be dispatched immediately for the *BTS Queguy*. A single survivor is waiting for them.
- Any survivors from the *BTS Queguy* have fled the ship in escape pods or by using the landing shuttle. The response team will be able to put together most of what took place by going through what remains onboard, but then the hunt will be on. All of the survivors are infected and they are headed for major population areas. They must be captured before a) they have the chance to lash out at unsuspecting victims, and b) they transmit the disease.

The Power Within

The medicine men of the Laatsii tribes know that they are the Chosen of the spider-goddess Mizinti because of the visions She delivers unto them. The visions are not frequent, but they are taxing. A medicine man in the grip of such a vision will be feverish and will not recognize anyone or anything around him. He will only know Her Word. Vision-states rarely last longer than four hours, and provided the recipient survives the process he will start to recover almost immediately, though time to full recovery will vary depending on the overall health of the man.

Each tribe has one medicine man; each medicine man has one apprentice. After many years of training the apprentice faces the final trial before becoming a medicine man in his own right: the Mark of Mizinti. Once the apprentice has prepared himself, his master tattoos the image of a spider on the back of his neck. This tattoo is colored by both the master's fresh blood and the dust of the red earth. After the tattoo is complete the apprentice enters the sacred circles and begins his vigil. If he is accepted by Mizinti, he will feel Her Touch during the night and soon afterward will receive his first vision. If he is not accepted he will be exiled from his tribe come morning.

Microbe

The visions -- and the associated vision-states -- are actually the gifts of a parasite, not a goddess. Humans are not part of the normal lifecycle, but human-to-human transmission is possible if infected blood enters the bloodstream of a new host. Several of the taboos surrounding the medicine men of the Laatsii exist to prevent someone from "stealing" the powers of the men. They also circumvent most of the possibilities for transmission. The two commandments that most obviously accomplish this are:

- No one may touch the skin or blood of a medicine man -- these things are sacred to Mizinti.
- A medicine man must remain celibate, for he is considered to be a consort of Mizinti and She does not share Her mates.

When an apprentice is tattooed, the infected blood of his master enters his system. Within three hours a fever appears, and less than an hour later the apprentice will be delirious. Future spikes of infestation leading to the fever and delirium can be brought on by reduced immune system capability. This tends to mean that younger medicine men receive fewer visions than the elders.

Adventure Seeds

- During a raid on the tribe's village, an attacker's sword first cuts down the medicine man, then immediately slices into one of the village defenders. Both manage to survive, but the defender has been infected. Anyone stealing power from a medicine man is normally put to death, but as the defender was blameless in the breaking of the taboo it is decided that he will be allowed exile instead. Now on his own, he is trying to make sense of his gift and to follow the wishes of his goddess. He will need stalwart companions to assist him on his journey and guard him when Mizinti delivers Her visions.
 - Rather than being one of the tribe's warriors, the defender may be a member of a military detachment

from a more advanced country that was placed here to help defend the tribes from the genocide being conducted by their government.

- An enemy of the Laatsii wishes the power of Mizinti for himself, and has pieced enough together that he is certain the secret to that power is in the blood of the medicine men. Getting a sample of that blood will not be easy, however, so he is looking to hire a group willing to undertake the mission.
 - Note that only fresh blood can pass along the infection. The parasites will quickly die after being removed from their host.

Know Your Enemy

The Empire had fought a running battle with the Southern Isles for over thirty years. Time and again they assaulted the Isles and time and again they were sent away, licking their wounds, but the ore-rich lands were too valuable to write off. At long last a plan was concocted that would deliver the Isles into the hands of the Emperor. It would begin with an offer of peace and would take over five years to come to fruition . . .

Emperor Songtan III has declared a truce with the Southern Isles, ending decades of war. As symbolic recompense for past violence he has gifted the people of the Isles with over 1000 pigs, a traditional favorite. Unbeknownst to those people, however, is that these pigs are all infected with a tapeworm. Not only will this parasite quickly spread to all of the other pigs on the Isles, it will also spread to the humans. Even worse, once in the humans its larval stage can end up in the brain. There it will form a cyst that, in roughly four years, will be the cause of epilepsy and psychosis. With the population of the Isles in shambles, the forces of the Empire will at long last be able to take over.

(For more details on how something like this would work, see the link regarding Indonesia's introduction of infected pigs into West Papua, below.)

Adventure Seeds

- The Emperor's gift of pigs has yet to be delivered, but there are rumors about it for those who know how and where to listen. Resourceful adventurers may be able to head the attempted biological warfare off before it starts, but care will need to be taken as the people of the Isles may not understand the science behind the treachery and they could very well take offense at anyone trying to spoil this overture of peace. The Emperor, of course, would be most certainly displeased if anything took place to disrupt his plans.
- Nearly five years have passed since the Emperor's gift was delivered and the infection has taken root. It is obvious to anyone who knows what to look for that this was the plan all along; it is only a matter of time before the Imperial forces arrive. The people of the Isles will need strong defenders to aid them in upcoming battle . . . and to avenge them should they fall.

More Questions than Answers

Pleased to Meet You

by Heather Barnhorst

I have just been informed that I am the new columnist for the retailer *Pyramid* column. Editor Marsh has made me audition by submitting some of my previous writing for review and I am feeling pretty good about the entire process. I congratulate myself and then the doubts set in: double whammy right between the eyes. As I stand behind the front counter at the store, the Universe's largest anxiety attack, no longer free-roaming, makes its visitation upon me. I have no idea what I could write about that might interest the readers of *Pyramid*. I already write a column for what is a business-to-business publication and finding subject matter for that endeavor has never been terribly difficult. Using arcane and obscure business language targeted toward other businesspeople, I can cover a multitude of sins in terms of content; besides, if I find myself truly stuck, I can always write about inventory issues. As long as I keep it informative and well written, I'm left alone to do my own thing. I wonder if I can make the switch from writing about the industry for retailers to writing about it for gamers. And do that every month. I suspect that gamers are more critical. I sense a complete lack of an opportunity to scam my way through a column. I can't think of single sentence to write.

A red flush runs down my arms and legs and my vision turns black around the edges with lots of sparkly bits in the middle to keep the experience aesthetically pleasing. I hyperventilate, which might explain the rushing in my ears. It's the type of anxiety attack that you might have during finals week in college. The type that you might have when you've been sick and you've skipped the last class before the final in favor of staying home and enjoying the privacy of your own bathroom. You know all the questions because in the last class you attended, the professor reviewed the entire semester's material. Besides, you've probably over-studied like you normally do and you've probably even made notes on 3×5 index cards and its Comparative Religions where the professor stated that all the questions are multiple answers, fill in the blanks, and short essays. "Piece of cake," you might think until you walk into the classroom and every other student has his textbook with him and everyone is pulling out blue books (Do they still have these in college?). There are three essay questions written on the blackboard. When you ask what is going on, you are told that the professor changed the format of the test in the last class and that he showed a film so that he could ask an essay question making you compare that film to one that the class saw at the beginning of the semester. By the way, you are informed that the essays are open book. You, of course, didn't bring your textbook because you had already made those handy little note cards. So you sit there for about 10 minutes experiencing a complete brain seizure. You might think that you were completely screwed and I would have to agree with you. (For those of you wondering, I am forced to admit that I did have this experience in college and I can assure you, lest you are experiencing some anxiety from not knowing the end of the story, that I pulled an "A" out of the final.).

That is how intimidated I am by this new opportunity. Writing a column is often an unnerving exercise for me anyway. I often feel that producing a column is a bit like taking a shower and then not being able to find a towel when the doorbell rings in the middle of it. People are always seeing you at your most vulnerable. Sometimes I find I can keep the towel on if the subject matter isn't particularly personal but writing for the *Pyramid* audience is a completely different undertaking. I have to keep it honest and I have to write about games as well as game retailing. So no towels.

An explanatory digression: Here's a typical Monday for me. I wake up a little earlier than normal because today I have a breakfast meeting with the other managers of Attactix. That's the game store that I co-manage. I fire up the computer and answer e-mail, maybe even sneak in a few minutes of IMing with some industry friends. After the meeting, I head over to the store and do my ordering for the week. That is about a five-hour process, but during that time I still need to man the front counter and help our customers. Sometimes I arrive home in time for dinner but on this particular Monday I'm scheduled to close so that I wander into the house just in time to crank out some game reviews or put the finishing touches on one of my columns. There might be some seminar notes that I need to send off to the trade show organizers. Then it is bed time and up again the next day to do it all over again. Don't get me wrong; I love what I do. I enjoy deadlines and I like to work under pressure and I wouldn't do any of it if I didn't want to. That isn't what I would

complain about if I had to complain about anything, but if you notice anything, please notice that I never once mentioned playing a game. And that's important.

Here's a dirty secret -- the more a person works within the game industry, the less likely it is that he will have time to play games, which is where the irony of a game retailer's existence lies. Playing games brought us into this industry where we often find it difficult to make time to play games. Most of us are hardly making a living wage running a game store. We do it for the love of games and because we like their customers. Very often, we find ourselves volunteering to organize game conventions or we get tapped to write game reviews or we sit on publisher panels to help improve product before it hits store shelves. If we aren't careful, we find that we have stopped playing games because games have become work. That's a huge point that everyone should understand.

So let's head back to the counter where, if you will recall, I am in the midst of a major -- albeit silent -- meltdown. Blood has returned to my brain and what I am thinking is that I cannot possibly write anything comparable to the outpourings of the inimitable Mr. Aylott, who is not only a brilliant writer and a gaming genius but a good friend. That's when I look across the counter. There my son, Alex, is standing holding a Brain Bug from the **Starship Troopers** miniature game in his hands. He's a fanatic about the game and he shows real excitement at the prospect of putting together and painting the models. . . . no small feat for this child. He has been saving his allowance and even done some extra chores at home so that he can put together the army he wants to play. Just at this moment he has torn off the shrinkwrap and opened the box, and he is carefully fitting the pieces together and talking about how this particular model is an integral part of his army. I'm not going to bore anyone with the cliché of childhood delight but I'll just remind you of the moment that you cracked open your first RPG or pulled out the rules for that strange-looking board game that you found at a garage sale. The worlds of wonder they opened for you.

I have seen that look on other gamers' faces before. I see that joy every day -- it is why I keep coming back to work. I am not exaggerating when I say that it is my customers' love of gaming and the fun I have in finding the right game for the right customer that makes the job for me. When a customer comes running in and asks, "Is it here, yet?" and I can tell him that the game has indeed arrived, then my life at the store is at its best. Yet when a customer comes to the store and says, "When I win the lottery, I want a store just like this one," I don't congratulate him on his fine sense of priorities. Instead I reply, "Do you love games? Do you want games to become your work? Because being a retailer means looking at games like they are a carton of eggs and figuring out how to sell them." There is a disconnect between these two situations. Thinking about games at the retailer level makes a game store just another type of game-delivery system. That's the contradiction in what a game retailer does. In order to be successful, he must immerse himself into the business part of selling games, but by doing so he makes games into work and most people aren't willing to work at playing games.

But my son's enchantment reminded me of another incident as well. I remember the time that a friend helped my husband and me with a game auction at our local convention. He is co-owner of one of the largest game collections in the country and he is a big man. Yet, when he picked up a game and opened it to make sure that it was complete before putting it up for auction, the love that was in his hands was palpable. He wasn't just looking at the game but he was touching it and inhaling it.

I've loved games as long as I can remember. I am not just talking *Candyland* or *Clue* (although I now collect *Clue* games). I am thinking about the first real board game that I ever played. That would be **1829**, which makes me a train gamer. Or the first roleplaying games that I played. That would be **Advanced Dungeons & Dragons** and the **Fantasy Trip**. Add roleplayer to my resume. Or **Empire IV**, a Napoleonic miniature wargaming set and you know what that makes me. How about the first version of **Warhammer 40,000**? I remember those sessions too. When I was 18 (only a few years ago), I became involved with the International Fantasy Gaming Society. To my shame, my very first role was as a wood nymph. It was January. I came down with hypothermia so when online roleplaying in the form of **Everquest** opened its Pandora's Box, I was one of the first to hop on board. I've occasionally been known to play a CCG. Poorly, I might add. I play games which makes me a gamer. I am also a retailer, a reviewer, a columnist. I've even been a convention manager at various times in my life.

Writing a column is more than typing a group of words into a computer. I require that the process be about more than just that. I like to learn as much from my petite rants as anyone who might be reading them. Looking into my son's

face I understand what I will discover from writing this column. While I am busy relating to you stories from the edge of retailing, I can also talk about games just as games again. Every month I will be stalking the shelves and thinking about what you want to read.

I can reconnect with what I was before I made games my profession -- a gamer. That's the gift that you will be giving me, and I can't wait to begin.

258-page Full Color Hardback; \$39.99

Rejoice, for the number one British RPG is back in print. Verily, *Warhammer Fantasy Roleplay* is available once again, and in a shiny new second edition. Not bad for a game that is 19 years old. How many younger games have had *more* editions? Originally published in 1986, *Warhammer Fantasy Roleplay* grew out of the miniatures game that eventually became *Warhammer Fantasy Battles*. After Games Workshop dropped roleplaying to concentrate on miniatures, the game found a home at Hogshead Publishing. But *Warhammer Fantasy Roleplay* returned to Games Workshop in 2000 after Hogshead closed its doors. To the surprise of many, the new version is actually published by Games Workshop through Black Industries, a subsidiary of the Black Library. Another surprise is that the second edition has not been developed by Games Workshop, but by Green Ronin Publishing, the *d20 System* publisher better known for [Mutants & Masterminds](#), [Freeport](#), [City of Adventure](#), and [Mythic Vistas](#) line.

The first thing you need to know is that *Warhammer Fantasy Roleplay* is *not* for the *d20 System*.

The second is that the new edition of *Warhammer Fantasy Roleplay* is still the old game, but very much with the rules tweaked and reworked for ease of use. The setting remains the same: the Old World, focusing upon the Empire and its surrounding nations. The feel and look is that of 15th- and 16th-century Europe, with the Empire corresponding to the Holy Roman Empire, the other nations to France, Russia, and so on. The Empire is threatened by the forces of Chaos, both directly and in secret. Indeed, the Empire has only just seen off a massive chaos incursion known as the "Storm of Chaos," leaving it in a perilous state, but trying to recover. This is reflected in Dan Abnett's opening fiction.

Like the first edition, **Warhammer Fantasy Roleplay** still possesses both a Moorcockian influenced cosmology and a Cthulhoid patina, the major background change being that Emperor Karl Franz is still alive (having previously died in **The Enemy Within** campaign), thus aligning it with **Warhammer Fantasy Battles**, and moving the time frame on 20 years to 2522.

Characters in **Warhammer Fantasy Roleplay** are still Dwarves, Elves, Halflings, or Humans. The same system of careers is used to handle skill acquisition and character advancement, easily one of **Warhammer Fantasy Roleplay's** best features. But they have been given a radical overhaul to make them more balanced and provide more choice. No longer do characters begin with just the one skill, and the choices mean that one entertainer can be different from another. Classic careers such as the Rat Catcher and Bounty Hunter are still here, but there are new ones -- the Kislevite Kossar, the Bone Picker, the Camp Follower, the Elven Kithband Warrior, and others. The new careers reflect the grim and grubby nature of the Old World, but others take in characters from outside the Empire broadening the game's scope. A character starts out with a Basic Career, for example a religious zealot, who might go on to be an Agitator, an Initiate, Flagellant, Friar or Outlaw, and though circumstances and chance rise to become a Politician.

Character generation is easy and quick, and is mostly unchanged. One major change is the dropping of the six-sided die in favor of just the 10-sided and the percentile die. To reflect this, characters have more wounds, and a single d10 is rolled for damage in combat, with modifiers for weapon and strength bonuses much like **DragonQuest**. Attributes have been separated into primary, measured in percentiles, and the secondary as single values. Attributes increase as characters progress through careers, buying advancements that add 5% (or +1) each time. Previously the increase would have been in 10% increments, but the decrease slows down character advancement.

Where the first edition had skills, the second edition has skills and talents, the latter being a mixture of the innate (Lightning Reflexes or Warrior Born) and taught (Specialist Weapon Group [Flail] or Arcane Lore) abilities. Dwarves and Elves begin with set talents, while Halflings and Humans roll for extra. Skills still work by rolling under the appropriate attribute, but now skills can be improved to give an actual bonus. Two extra levels of Skill Mastery can be taken over time to give a 20% bonus. While talents sound like the **d20 System's** feats, **Warhammer Fantasy Roleplay** is devoid of the feat path phenomenon that can restrictively define a character.

Combat remains little changed, being still quick and deadly. The combat actions are explained well, and their division into Half and Full Actions gives the players easily grasped options and the game a more tactical edge. For example, does a character make a single attack and then enter a parrying stance (both Half Actions) or make multiple attacks in a Full Action Swift Attack? The combat examples do not escape the fact that Games Workshops want you to buy miniatures for the game, but this is the nearest that **Warhammer Fantasy Roleplay** gets to a hard sell. Damage and Critical hits still work the same, being just as nasty, critical hits more so, as each time a character takes a critical hit, he also gains an Insanity Point!

Fate Points also remain, but to emphasize the fact that their use is intended only when certain death is involved, characters also have Fortune Points. Unlike Fate Points, Fortune Points are refreshed daily and add a certain degree of luck to a character's life, such as re-rolling a skill test, or gaining an extra parry, dodge, or half action in combat. Dropped, however, are the rules for alignment, but in the first edition these only reflected the extremes of each.

The most radically overhauled aspect of **Warhammer Fantasy Roleplay** is its magic system. The old one was clunky, flavorless, and a stopgap measure until something better turned up. Both arcane and divine magic use the same mechanics which are radically different to the game's percentile system. Each spell caster has a new secondary attribute, Magic, rated from one to four. This value represents the dice pool of 10-sided dice to roll and add whenever a spell is cast. If the result is equal to or greater than the spell's casting number, then the attempt is successful. This can be as simple as casting number 3 for *Glowing Light* or as high as 31 for *Conflagration of Doom*. Using correct ingredients can modify the roll, and spellcasters can choose to roll fewer dice for the less powerful spells . . . and for a very good reason. Every time a caster rolls multiple dice, he attracts Tzeentch's Curse, which forces the player to roll on the Chaos Manifestation Tables! This can result in the caster's hair standing on end for 10 minutes or suffering Daemonic Possession for a minute, or being Called to the Void and sucked into the Realm of Chaos, never to be seen again!

Likewise, when a divine spell caster rolls multiples, he suffers the Wrath of the Gods. This isn't quite as severe as Tzeentch's Curse, but then divine spells are less powerful. As part of the overhaul, magic, now the manipulation of raw chaos, has been reorganized to bring it into line with **Warhammer Fantasy Battles**. Thus there are eight Orders of Magic, each with an associated college, lore, and color. Magic is classified into various types -- Petty, Lesser and various Lores -- and a character must have the appropriate talent to learn and use spells for each type. One major addition is the new career Hedge Wizard, representing the self-taught amateur spell caster, possibly as white witch or village healer. Unfortunately, the Hedge Wizard's magic is unregulated and thus illegal in the Empire. Most Hedge Wizards become apprentice wizards or end up persecuted by Witch Hunters.

In terms of background there is information on the various gods and faiths of the Old World, as well as a decent introduction to the Empire. This describes its politics and geography as well as the threats it faces. Many of these threats like the rat-like Skaven and the Vampire Counts again tie back into **Warhammer Fantasy Battles**, but **Warhammer Fantasy Roleplay's** traditional threat of Chaos-worshipping cults and societies are also included. Long time devotees may decry the lack of background, but it is just enough to get started and obviously, it leaves plenty of room for expansion and sourcebooks. Other sections also help enforce the grim and gritty feel of the setting, including descriptions of religious days and observances, and a wonderful list of false limbs and prosthetics.

Advice for the GM is pleasingly specific to the game, covering the GM's job, running adventures and campaigns, and dealing with both the game's magic and mechanics. The accompanying bestiary is short but adequate in the short term, and includes several templates to reflect a creature's different status and occupation. The basic starting adventure, "Through the Drakwald" takes place in the aftermath of the "Storm of Chaos," when Chaos Beastmen nearly took the strategically important river crossing at Untergard, but even as the villagers pick themselves up and try to rebuild, another attack is made! Continued defense of Untergard looks impossible, so an evacuation to the safety of the nearby city of Middenheim is called for. The player characters are asked to accompany the refugee convoy to the city. This is a reasonable adventure, though older fans will find it a little basic. Yet, it serves as a decent introduction and sets everything up ready for **Paths of the Damned Volume 1: Ashes of Middenheim**, the first part of a new campaign trilogy. In terms of presentation **Warhammer Fantasy Roleplay** is well done, but the artwork is rarely evocative. Though not typographically perfect, the writing is never less than clear and easy to read. Indeed, everything is so nicely explained that, in combination with overall simplicity of the mechanics, serves to make the new edition of **Warhammer Fantasy Roleplay** a *good* introductory RPG . . . much more so than the current version of **Dungeons & Dragons**.

In **Warhammer Fantasy Roleplay** long-time fans will find the game they know and love, but with small but necessary additions and rewrites that fix many of the original's problems. The primary three are the better-balanced careers, the excising of the "Naked Dwarf Syndrome" (dwarves with an excessive toughness attribute such that armor is unnecessary) by reducing toughness advancements and making armor better, and providing a much better magic system. In fact the new magic system is simple, elegant and dangerous, cleverly doing away with magic points and allowing wizards to cast freely, but with the danger of Chaos Manifestation. The realigning of **Warhammer Fantasy Roleplay** with **Warhammer Fantasy Battles** also opens the RPG up to a potentially very large market.

It is clear that **Warhammer Fantasy Roleplay** is very much a labor of love for both its writers and Green Ronin Publishing, and proof that they can do more than the **d20 System** (which they do well). **Warhammer Fantasy Roleplay** heralds a triumphant return to the roleplaying hobby for Games Workshop and is a worthy pretender to **Dungeon & Dragon's** fantasy crown.

Pyrrmaid Review

Oceania

Published by [Mayfair Games, Inc.](#)

Design by Klaus Teuber

Illustrated by Bernd Wagenfeld

Graphics by Pohl & Rick

Rulebook, mounted fold-out board, 16 Scout tiles, 60 playing tiles, & wooden ship pawn, full color, one or two players; \$15.00

In the midst of the overwhelming number of pricey European games on the market, it's nice when a fairly inexpensive item like *Carcassonne* comes out. If you look at *Oceania*, though, you'll see that Mayfair Games, Inc. offers an even lower-priced alternative. With a savings of time, money, and size, this item has charms all its own.

The object of the game is to score the most points for your explorations.

Oceania is a large, uncharted area depicted on the board. The players are the intrepid explorers who start at the more familiar edges and begin doing what any good adventurer does -- whittling away at things until they've got the whole area mapped. Oceania is revealed as Sea Tiles are drawn at random from the pile. Players take turns placing the Explorer Ship on a chosen starting space, drawing a tile, then finding a way to make that piece fit.

There are land masses, the sea, and white dotted lines to which the active player must pay heed. The lines connect the distant lands to the points of origin -- they're sort of the "shipping lanes" in this new world, and you have to maintain that trail of bread crumbs. The different configurations of tiles means you'll have to choose where to fit something, if you can fit it in at all. Tiles that don't fit are placed in front of you, and if you don't find a place to play it before the game is called, your total is penalized. You can play it on a later turn, but you have to "spend" one of your Scouts to do it . . . he's out of the game, and your exploratory forces are thereby depleted.

After you've placed the tile, you can drop a Scout on one of the landmasses you've created. The more explorers you have in a place, the better the chance you'll control that island at the end of the game. Any time an empty square is surrounded on all four sides, it automatically gets filled in using one of the Reserve Tiles. Reserves are distributed nicely, so it's pretty much a guarantee you can fill in any hole using one of them. If you have the most Scouts on an island, you get a point for every tile that makes up that piece of land. If your opponent landed an equal number of people there during the game, neither of you get the points. Only completed islands are scored; if there are holes, you get nothing (the Reserve Tiles are only used if the hole is one space -- multiple missing tiles can't be filled in this way).

The pieces, like the game, are brief and to the point. The board is small but useful, the tiles only as big as they need to be to get hold of, and the Scout chips small and unobtrusive. The Oceania shown on the board (before players cover it with bright blue tiles) is all done in sepia tones, suggesting old maps in the best "Here there be dragons" style. It all fits into a box about the size of a small hardback book.

Let's go ahead and get those comparisons to the popular *Carcassonne* game series out of the way. It certainly shares much in common with that form of game play -- tiles have to match to fit, ownership is established with Scout tokens,

and so on. That said, the board limits play, and you're not at all guaranteed of finding a good place for your tile. Having to balance the loss of your point-gaining Scouts with the potential for them to secure your lands is another neat twist, and you have to be more methodical because you lock yourself into where you're going to play at the beginning of each turn. It's a bit of a shame this process is called picking a "starting point" -- such a misnomer is only one of a few strange bits in the rules that the reader has to puzzle out.

But ***Oceania*** is a quick game -- you can finish it in just a few minutes, and play several rounds in an evening. It's small enough to carry and set up just about anywhere, and the compact rules offer enough tiny twists to hold your attention. Not that ***Carcassonne*** is a wallet-buster, but the price is right for this set as well, especially if the usual cost of these games sends you running. Comparisons notwithstanding, this one is well worth investigating.

Jumping Off a Cliff's Notes

*"I took a speed reading course and read **War & Peace** in 20 minutes. It's about Russia."*
-- Woody Allen

Over the course of helping to plot out various RPG books for my Day Job, we were debating about whether or not a certain amount of space was enough for a certain subject. "Well, gee," the Powers That Be would ask, "Is a 32-page PDF supplement enough room to detail to a new space-opera world?"

Now, having edited *Pyramid* since dice first crawled out of the primordial ooze, I always find this wildly amusing. See, I'm used to writers squeezing in entire campaigns in a 5,000-word article, which is the equivalent of about a six-page book. But this struggle to come up with an appropriate length hits at the heart of one of the greatest paradoxes of the gaming world: Namely, that fans want (or think they want) a richly detailed world, but more material that exists for a game usually translates into a greater difficulty in attracting new fans. After all, who wants to read 200 books before starting a campaign?

Hamlet commented that he could be confined to a nutshell and consider himself king of infinite space. (He then goes on to babble about dreams, but that's another column.) In many ways, roleplaying games have the same luxury. After all, a campaign can span the universe (or even infinite universes!), or they might be tightly focussed to a single city, island, or even office building. While there's no limit on how grandiose a campaign can get, there probably isn't much limit as to how tightly focused or narrow an RPG can get, either. (Trivia time: What two movies had every member of the cast nominated for an Oscar?)

Of course, the larger in scope a game gets, the easier it is for GMs to slip their own material "into the cracks." After all, if Mars is only given a footnote's worth of informational detail, then whatever the GM makes up is likely to be "right." And in a large enough setting, it's trivial to avoid repercussions by never mentioning or revisiting an area again.

In some ways, I suspect this is the appeal of wandering campaigns -- those that spend a little bit of time in each place before moving on. This is the structure of the typical fantasy campaign (roaming from town to town, dungeon to dungeon), countless television action shows (wandering the Earth like Kane from *Kung Fu*, or Dr. Richard Kimble from *The Fugitive*), and many sci-fi/space opera settings ("Captain's Log: We're orbiting another magnificent, mysterious planet that we'll never mention again after this week . . ."). And the nice thing about this format is that, in a brief enough dose, just about anything can be interesting for one story. The danger is in trying to revisit places that existed primarily as "idea worlds" -- really, once the players have visited a world where they relive the same day over and over, there isn't much reason to go back. Consider that half of the *Star Wars* movies had a significant part of their action taking place on Tatooine . . . a desert planet that, it seemed, wasn't all that interesting in the first place. Really, it mostly existed in *A New Hope* to show what a boring ball of dirt it was, setting the stage for the heroes to get the heck away from it.

Of course, this doesn't explain what to do about those places which are designed to be revisited, or those places with lots of interesting bits on one world. How do you handle loads of different places, and make them richly detailed (or potentially so) without forcing the GM to read through reams of material?

The way I feel information might be best handled in an RPG setting strikes me as obvious, but I haven't ever seen it done in a commercial product or series. Namely, whatever is "obvious" needs to be stated up front, as briefly but thoroughly as possible. Whether a book discusses a world, a city, a building, or something smaller, I think it would be useful to list the most obvious features of that place, as quickly as possible.

For example, if I was discussing my old stomping ground of Tallahassee, I would probably mention the following:

Tallahassee

- Amalgam of large state college (fixated on football) and seat of state government, resulting in large "seasonal" population
- Large, phallus-shaped structure in the city's center is the state capitol building, one of the largest and most distinctive buildings
- Wildly hot and humid summers, moderate other seasons (jacket at most), with a few cold days in the winter

Any adventure I would set there would probably incorporate one of these three facts in some fashion. If the players left Tallahassee for a few months and then returned, I would make sure they were reminded of those facts.

Or, getting back to Tatooine:

Tatooine

- Desert world -- sand everywhere, with only occasional rock structures breaking up the monotony
- Sparsely populated; easy to get (and stay) lost, and survival is challenging
- Desperate world, controlled by criminal and fringe elements

Almost any other fact about the place -- the economics of moisture farming, the unusual celestial bodies, whether they race chariots . . . er, *pods*, -- are second fiddle to those facts.

(A GM could have a "secondary" tier of information that is crucial but might not be obvious, or is obvious but might not be crucial (for example, the fact that a city is windy, or the fact that for one week a year the entire town shuts down for religious reasons).

If all information about a setting is presented in this way, then the amount of information a gamemaster needs to assimilate -- or reassimilate -- becomes significantly less. For example, suppose a GM uses three pieces of information for each level of information. If an adventure takes place in an unusual house in a city on an alternate world, then the GM may only need to reacquaint himself -- and the players -- with nine pieces of information ("Okay; this is the world with giant-robot-wielding Victorian Nazis. This city is a new techno-haven, having been rebuilt after a fire a few years ago. The building pivots to face the sun, akin to a sundial. Everyone on the same page?")

Of course, for this to be the case, writers and creators need to have the focus to know what is important about a world . . . and, in the case of a professionally published game world, the GM would need to agree with the authors about what's important about a place. But as a starting point and organizational technique, sticking with a few important bits can help digest dozens or hundreds of pages easily . . . leading to more time for fun.

--*Steven Marsh*

Readily Distinguishable From Magic

More Low-Tech Alternate Technologies

by Matt Riggsby

We've already seen [alternate paths](#) to technologies like steel, gunpowder, and telescopes. But there is a vast number of other technologies, each of which could have come about in a different way than it did historically. In this article, we'll be looking into less probable and less fundamental technologies which could have a subtle effect on your campaign world or provide world-hoppers with much-needed resources. If you ever wanted to have airborne PCs dropping propaganda leaflets on their enemies while listening to a battery-powered Victrola (and who hasn't?), this one's for you.

Aircraft

Just as the advances necessary to achieve steam power would inexorably make a society TL5, the advances necessary to achieve powered flight would make a society TL6. Unpowered flight, though, might be a different matter. Like gunpowder and steam engines, early experiments are likely to kill the experimenters, but it's not implausible to get people at low TLs into the air.

Hot-air balloons, which historically appeared in the early decades of TL5, require a heat source and a reasonably heat-resistant and gas-tight envelope. It doesn't have to be perfectly airtight, but the longer it can contain hot air, the better. Many societies are likely to have access to tightly woven fabrics or paper and paper-like materials such as papyrus suitable to contain hot air long and well enough to make brief flights possible. Paper may actually be an important component in the evolution of balloons. Hot air was used to launch lighter-than-air paper toys in TL3 China and TL4/5 Europe; the first hot-air balloons, launched by the Montgolfier brothers, sons of a paper manufacturer, combined layers of finely woven cloth and paper. The important bit of physical science (that hot gases rise and therefore an envelope filled with hot gasses may be able to lift a payload) was known as early as the early third century BC, around the middle of TL2, making the independent invention of hot-air ballooning a theoretical possibility at that point.

It's even vaguely possible that it could have been invented earlier. Experimental evidence indicates that balloons were a physical possibility as early as TL1. One puzzle about the Nazca lines of Peru is that their shapes, representing various animals and other figures, can only really be seen from the air. The question, of course, is why so much effort was put into making something the makers couldn't actually see. Theories range from the reasonable but unsubstantiated (they're intended for spirits or deities presumed to be viewing from the sky) to the patently absurd (they're landing strips for aliens). One theory just at the border of plausibility is that they were, in fact, viewed from the air by lucky humans. A group of archeologists, working with materials known to be available to the makers of the lines, managed to construct a hot air balloon which took two people to an altitude of over 40 meters and safely down again. However, even if Peruvian balloons existed (the archaeologists acknowledge that despite their experiments with available materials there's no evidence that it was actually done), it's unlikely that such an invention would be based on scientific principle that early. It might require the intervention of time travelers or someone working with a fanciful theory that captured smoke might make things fly (which, actually, appears to be something like the theory that the Montgolfier brothers were working with). The first TL5 flights easily reached 100 meters, and it's not unlikely that TL2-4 balloons made from appropriate materials (say, paper-lined silk) could reach similar heights.

An obstacle to *useful* early ballooning is the duration of the flight. The Nazca experiment and the early TL5 balloons left their heat source on the ground. The balloon would be placed over some kind of furnace or bonfire which would fill the envelope with hot air and smoke, allowing the balloon to rise. Once it had lifted off, the balloon would stay up for a bare few minutes until the air in it cooled and it sank again. To have more than a quick up-and-down flight, a balloon needs to carry its own fire. TL4- societies don't have the luxury of pressurized propane tanks and burners, so they have to carry fast-burning combustibles such as straw and finely-chopped kindling (charcoal may produce more

heat per pound, but it lights and burns far too slowly to be useful for these purposes) to keep up the temperature inside the envelope. This is rather dangerous, since the materials making up the envelope are inevitably flammable at low TLs, and because of limits on payload and the amount of fuel a balloon can carry, an on-board heat source apparently still can't push the maximum duration of a flight past a half hour.

There's another option for long balloon flights, but it's not much help for low-tech aeronauts. In our history, hydrogen balloons replaced hot-air balloons after a few decades (hot-air balloons only became popular again in the 1960s with the invention of durable nylon fabrics), but since that requires sufficient industrial chemistry to produce large quantities of hydrogen, that's not an option until early TL5 anyway.

With little payload and without propulsion, balloons aren't going to be at all useful as transportation. Even for a straight up-and-down route (say, to reach a fortress atop a cliff), other forms of transportation will be far more cost-effective. However, their use as military observation posts was immediately obvious to any number of people; it was one of Benjamin Franklin's first thoughts when he saw a balloon demonstrated in Paris. A sophisticated early civilization might have specialist balloon personnel in its armies just as it would have specialist scouts and siege engineers. Indeed, they'd probably work hand-in-hand, using balloons to find enemy troops, marching routes, defensible positions, and so on. In peacetime, balloons could be used in a similar fashion to survey for roads and building sites. They might also be an aid to navigation. Large ships could carry a small balloon and send it up several times the height of the mast to get a better look at their surroundings to find land from far away or to rise above low-lying fog.

Heavier-than-air craft are problematic. Certainly, there have been experiments through history. The use of large kites to lift men as scouts and battlefield observers has been attested to in China, and there's an account of a Muslim scholar of the ninth century building a partly-successful glider (which may have been little more than a glorified parachute) launched from the top of a tall building. The materials necessary to make gliders, light but sturdy wood and tightly woven cloth, are probably available as early as TL1, as are the raw mechanical skills, in that TL1 craftsmen given plans and lists of materials could build a functional airfoil. However, that's definitely time-traveler territory; experiments by native inventors are likely to be lethal. And even ignoring the difficulty of building an airfoil, practical heavier-than-air craft require compact, powerful propulsion, which is well beyond what any society before TL6 can muster. Gliders could be constructed as expensive toys, but that's the limit.

Electricity

Direct current is very easy to produce. All it takes is an acidic solution (vinegar, or even fruit juices, are sufficient) and two bits of metal. When the metals are put into the acid, a wire between them will carry a current. The whole assembly could have been produced as early as the beginning of TL1. And, in fact, it might have been invented. A set of ceramic jars found in Baghdad dating to mid-late TL2 might have served as wet-cell batteries. However, they wouldn't have been very powerful, with each three-by-six-inch jar providing one to two volts. If, in fact, they were batteries, they might have been used for electroplating or delivering mild shocks (petting electric eels was an exotic therapy for chronic pain relief).

To generate larger amounts of electricity, building an electrical power plant might appear to be a more feasible alternative. Again, the principle is simple: a magnet is rotated inside a coil of wire or a coil of wire is rotated around a magnet. Either gets an electric current going. Given some magnets and a copious supply of wire (for which, see

How Not To Build a Dirigible

Propulsion technologies available at low TLs are unlikely to usefully move a hot-air balloon, but that won't stop people from trying. Rudimentary steam engines of the TL2 glorified kettle variety might be used in hopes of providing rocket propulsion, although anything light enough to get off the ground would be far too weak to provide useful propulsion. TL3 gunpowder rockets could be light enough to leave the ground, but would likewise be too weak to push the balloon around much. However, a balloon with rockets just might be useful as an airborne weapons platform. At a height of 100+ meters, it would be beyond the range of just about any ground-based weapon of the age, and its rockets, though probably painfully inaccurate, might be large enough to do real damage if they happen to hit a target.

below), it wouldn't be terribly difficult to modify a windmill or waterwheel as an electrical generator.

It wouldn't be terribly effective, though. The practical upper limit on the power of early waterwheels, imposed by the physical limitations of the materials available at TL4 and below, appears to be around three or four horsepower, and simple systems to convert mechanical motion into electrical power and vice versa are around 50% efficient. However, with refinement, considerable improvement might be possible. Experiments with turning old mills into micro-power plants in England have indicated that their output might get as high as 5 kw.

The big problem with building any electrical device before TL5 is the lack of theoretical and technological underpinnings. Some electrical and magnetic effects were well-observed through history, but it wasn't until the 17th century that they could be investigated in a concerted way and not until the 19th that the most important advances were achieved. Those developments arose in a context of relatively advanced mathematics, chemistry, metallurgy, and other technologies, making it quite unlikely that they'll arise independently as earlier TLs. It would probably take either time travelers or very lucky mad scientists to build them at TL4-.

Assuming the design is available, the next obstacle is economic. First, at low TLs, wire is very expensive to produce. Second, even if wire can be produced cheaply, the raw material is still prohibitively costly at most low TLs. The cost of the copper needed to construct a hydroelectric plant at TL3 or below would approach a king's ransom, or at least duke's. Through TL4, improved mining and metallurgical technology, largely the consequence of increasing use of water and steam power to pump out mines and process ore, will make it significantly cheaper.

And, finally, there's the problem of practical application. Some of the easier ones include the aforementioned electroplating equipment, lighting (carbon arc lamps are easy to build, but require constant adjustment), electrolysis for chemical experiments, electromagnets (once somebody works out the trick of wrapping a coil of wire around a bit of iron), electric motors (DC motors are easier to build than AC motors, making battery powered toys a likely early invention), and mild shocks (in addition to the aforementioned pain therapy, a metal idol could be wired up, giving someone grasping it a mild but uncanny tingle). Ultimately, though, this is another case where time travelers and the like will get greater benefits than native inventors.

Magnets

Dealing with magnets essentially requires the use of iron, making them at least a TL2 development. And although magnets were known for centuries, it wasn't until TL4 that any significant theoretical work on the topic appeared. It was known that a piece of iron could be made magnetic temporarily by rubbing it with another magnet, but in the 16th century, it was discovered that heating a long piece of iron with its ends pointing north and south would make it mildly but *permanently* magnetic. Although the smiths didn't know it, heating iron to a certain point and then letting it cool inside a magnetic field would cause it to take on that magnetic field. The magnetic field in question here was the earth's own.

Although it's a bit unlikely, it's certainly conceivable that a smith could come up with this technique on his own. For example, a mystically inclined smith might find an occult reason for forging items aligned with points of the compass. An appropriately shaped magnet might then attract small bits of metal, leading the smith to suspect that something was up, or a bit of metal carelessly but luckily dropped in a bucket or puddle might point north for no apparent reason.

With this technique, smiths could at least make compass needles fairly cheaply, which would probably noticeably improve navigation. Moreover, widespread use of magnetic compasses might lead careful observers closer to the poles to more carefully define the difference between magnetic and true north, giving them a crude means of determining latitude. Making stronger magnets, however, relies on other relatively sophisticated electrical technology, which wouldn't be available until TL5.

Other Printing Technologies

Although it's a versatile tool, the printing press isn't the only way to reproduce writing. For example, block printing,

with which there were a variety of experiments in the centuries before the development of movable type, developed long before the printing press. Inscriptions were carved into blocks of wood or metal and used as ink stamps. There are a number of trade-offs in this technology. For example, larger blocks with more type are a more efficient way to print once they've been carved. However, they require, on average, more effort to make than their smaller counterparts; if a carver makes a significant mistake, he'll have to start over, and on a larger block, he may already have expended a great deal of now-lost effort. Metal vs. wood is another trade-off; metal takes more work to prepare, while wood doesn't last as long. Block printing also suffers from the same water-based vs. oil-based problems early printing presses would have suffered.

However, there's a little-discussed alternative to "stamping" technologies: wax rubbing. Long a hobbyist practice (usually on gravestones and other monuments; it was practiced early in China's TL 2 and by TL4 in Europe), large but thin sheets of paper or fabric are placed on an inscribed surface and rubbed with crayon-like colored wax. The paper/fabric comes away with an image of the inscribed surface. Assuming the existence of suitable paper or cloth, this would be a very inexpensive way of copying existing inscriptions. Indeed, it may have been; there's some reason to believe that rubbings were used by some Chinese scholars to make their own copies of legal codes and the like.

Rubbing technology could never be as efficient in the long run as moveable type and the printing press, but there could be ways to make it more popular and effective than it was historically. For example, the lighter pressures involved in rubbing as opposed to pressing bring a different material into play: ceramics. Instead of requiring carvers to laboriously gouge bits out of metal and wood blocks, scribes could scrape their writing into thin sheets of clay in the style of Mesopotamian clay tablets, probably held in shallow metal or wooden plates to provide rigidity. In addition to ease of writing, the wet clay would have the considerable advantage of being correctable. If a scribe got a word wrong or even left out a line, he would only have to smear over the error rather than start all over again. Once a plate was finished, it could be smoothed with a string or wire so that the surface would be even then fired until it was hard. The hardened plate could then serve as the model for a great many rubbings.

This technique would, of course, require careful refinement of the clay to prevent it from deforming too much when fired, but any reasonably advanced TL1 society should be able to handle that well enough to produce plates with reasonably sized "type." The crucial technology which might not exist everywhere is a sufficiently fine cloth or paper to take a rubbing. Asia clearly had sufficient materials no later than early TL2; Europe didn't have paper until rather later, but it may well have had sufficiently fine linen or cotton that early, if not earlier. GMs who want to justify widespread literacy and distribution of texts in a pre-Renaissance society might use this method to justify it.

Sound Recording

Early sound recording equipment, developed by Edison and others late in TL5, was equipped with a stylus attached to a vibration-sensitive membrane (one of Alexander Graham Bell's experiments on the mechanical reproduction of sound sensibly, if morbidly, used a human eardrum). The stylus pressed against a soft, moving surface, usually a wax-covered cylinder or disk across which the stylus moved in a spiral path, while the membrane vibrated in sympathy with nearby sounds, causing scratches in the surface, quite literally cutting the record. A similar device was used for playback; a much lighter stylus was moved along the grooves of the recording surface, causing a membrane to vibrate and reproduce the original sound.

It's tempting to think that an advanced TL2 society could have produced such a device. The ancient Greeks and Romans, for example, were in the habit of using wax-covered writing surfaces, they had fairly sophisticated gearing which could have properly guided a stylus assembly over a recording surface, and they had made the critical observation that sound was vibration. Both recording and playback machinery would have to be carefully hand-cranked, since clockwork technology wouldn't be even close to sophisticated enough to regulate the machinery until at least well into TL4, but experimental recording equipment of the 1800s suffered the same limitation.

Reproducing a recording, however, could be an issue. To mass-produce a record, inventors quickly hit on a method of using a wax-covered metal recording surface, which was then treated with acid. The acid etched the grooves into the hard metal. The metal surface could then be used to produce negative masters which would in turn be used to press multiple copies of the recording into a softer medium such as rubber or shellac. Even ignoring issues surrounding an

appropriate medium for pressing records, the appropriate acids probably don't become available until TL3, and even when appropriate chemicals become available, etching technology doesn't develop until the TL3/4 border.

But even though mass-produced recordings are unlikely, individual sound recordings could still become, as they did in our history, a popular entertainment. The initial investment in a player would be considerable, but itinerant record-players could charge considerable sums for coming into a town and playing a few recordings for a paying audience, much as early movies were shown by traveling operators in our history. They could also be a useful propaganda tool. Instead of just having them written down, rulers could record proclamations (in front of a few dozen recorders) and have them circulated among regional governors. Just as rulers made their faces known by putting them on coins, making them a greater presence in everyday lives, they could make their voices known as well.

Suspension Bridges

Rope bridges across rivers and gorges are a fixture in many fantasy campaigns. However, in the **GURPS** TL system, they're anachronistic. The west didn't see bridges based on suspended roadbeds and tension rather than compression on structural members until the 18th century, making them solidly TL5. In Europe, bridges longer than a plank of wood or a sturdy log relied on stone or wooden arches resting on piers touching the ground underneath.

However, much of the rest of the world figured out suspension much earlier. The Chinese were building suspension bridges from bamboo and iron chains as early as the third century BC, fairly early in their TL2. Bridges using just rope and no metal members can be even earlier. The TL1 Inka (albeit a very advanced TL1) used them extensively, and it's not impossible that a late TL0 society could develop them. Although they may look dubious compared to stone arch bridges, early suspension bridges could usually carry any load their builders could put over them. That generally means people and the occasional horse; very heavy carts might be a problem, and anyone wanting to invent railroads had best find another way of building bridges.

The real drawbacks of early suspension bridges are their stability and durability. Before suspension bridges using mostly metal members become possible late in TL4, lightweight rope and even chain bridges are susceptible to vibration and swaying caused by wind and loads passing over them; the longer and lighter the bridge, the greater a problem it is. The raw materials also need to be maintained carefully. The ropes can wear out because of weathering and need to be replaced on a regular basis (annually is sufficient) to keep them safe.

One of the big advantages of early suspension bridges is that they're far less expensive to build than stone and wood bridges. It's not a world-shaking technology, but additional bridging might in some small way make transportation cheaper and easier, reducing dependence on (and feudal fees from) fords and stone bridges.

Wire

Metal wire is a fairly old invention, used in jewelry as far back as TL1. Industrially useful wire, though, didn't come around until much, much later. Early wire wasn't terribly even, and it was produced by painstaking manual techniques, hammering out blocks of metal into thinner and thinner strips or pounding it into a grooved form. Such wire is almost inevitably flat or square, and certainly not round.

Drawing, a method which produces metal which is both more efficient and produces more even wire, only developed in TL4. Drawing requires a very hard metal block with a hole drilled through it, wider on one side than the other (very fine wire is drawn using hard gemstones, which is well beyond the capacity of just about any low-tech society). Another piece of metal to be turned into wire is hammered so that one end will fit all the way through the block and the narrow hole. It is then secured with pliers or clamps and slowly pulled. The metal is dragged through the block, squeezed and stretched into a length of wire. The operation can be repeated through a series of holes of diminishing diameter to produce wire as thin as holes can be drilled for it. Drawn wire can have just about any cross-section so long as it can be drilled: square, round, triangular, etc.

One of the main limitations is that the metal to be drawn can't be harder than the metal of the drawing block. If it is, it

will fairly quickly stretch open the hole in the block rather than be formed into wire. Even softer metals will eventually deform the block, but not nearly so soon. Therefore, copper wire is a reasonable possibility as soon as good iron is available in TL2, although wrought iron drawing blocks will wear out much more quickly than TL4 cast iron blocks. Iron or steel wire of good quality and in reasonable quantities has to wait on considerable developments in metallurgy: TL4 at the very earliest, and probably TL5. Garrotes, therefore, will need to be made from less effective copper and bronze, or more likely from rope (which is cheaper and won't snap from metal fatigue if it gets used too often), until TL4 if not TL5, trip "wires" should probably use thin thread instead of wire, and time travelers will have to introduce fairly advanced metallurgy if they want to build suspension bridges with steel cables.

Making Friends and Conjuring People

Summonable Allies for *GURPS Fourth Edition*

by Reverend P. Kitty

The ability to summon forth creatures from another time or place has long been a part of fiction, whether it's a necromancer animating shadows, a cultist calling up demonlings from Hell, or a fiery superhero crafting an elemental out of living flames. **GURPS** has traditionally handled this with spells such as Summon Demon, Create Warrior, and so on. But not all campaign settings feature magic (and not all "conjuring" character concepts make sense as wizards.) Fortunately, **GURPS** now offers an alternative: Summonable Allies.

The Summonable enhancement can turn Allies from a standard social advantage into a supernatural power. In fact, it's reasonable for the GM to rule that Allies becomes a [Mental, Supernatural] advantage instead of a [Social] one when used in such a manner. The Minion enhancement is equally appropriate, and since most summoned creatures will have Slave Mentality, it's free! Since a failed Frequency of Appearance roll means that your Allies are unavailable for one full day, it usually makes sense to buy them as Constantly Available (x4 cost) and then apply limitations like Limited Use or Unreliable if you wish to restrict use of the power.

Disposable Sidekicks

"But, gee, Mister Lizard, what happens when you add nitroglycerin to rocket fuel?"

"Well Timmy, why don't you find out while I stand behind this lead shield?"

"Okay!"

[KA-BOOM!]

"We're gonna need another Timmy!"

--Dinosaurs

The downside to using Allies as summonable cannon fodder is that once they're gone, they're gone, and the only way to bring them back is with more character points. That's just no fun. So the simplest solution is to make sure they never die for good. Unkillable makes that possible, while Regeneration (only when dead) makes it convenient.

To help offset the high cost of those advantages, consider some of the drawbacks that summoned creatures typically have. Adding Fragile (Unnatural) will reduce the cost while making bookkeeping easier -- not to mention, if they die at -HP every time, it means less waiting for them to come back to life. It's also thematically appropriate, as are Automaton (p. B263), Dead Broke, and a few Features. To save time and space, these abilities can be wrapped up into a meta-trait:

Conjured Servant: You only exist in our world when summoned here to obey your master. If reduced to -HP, you vanish in a puff of smoke, and can be summoned again within (2×HP) minutes. Regeneration (Fast; Only when dead, -40%) [30]; Unkillable 3 [150]; Automaton [-85]; Fragile (Unnatural) [-50]; Dead Broke [-25]; Neither has nor can spend Fatigue Points (see Machine, p. B263) [0]; and Vanishes when dead [0]. *20 points.*

What Do You Want to Summon Today?

GURPS Campaigns has simplified templates for animals and **GURPS Magic** has templates for the classic elementals, undead, and demons. Just add the Conjured Servant meta-trait and you're ready to buy it as an Ally (or Ally Group). What follows are some additional beings that a summoner may wish to bring forth. Each template includes notes on varying the power level, since Allies are bought as a fraction of their master's value and thus will usually need their point cost adjusted up or down slightly. A worked example of using the creature as an Ally follows each template.

Shadow (100 points)

Attributes: ST 0 [-100]; DX 10 [0]; IQ 8 [-40]; HT 10 [0].

Secondary Characteristics: HP 10 [20]; Per 8 [0]; Will 8 [0]; FP - [0]; Speed 5.00 [0]; Ground Move 5 [0]; Air Move 10 [0]; Dodge 8; Parry 10.

Advantages: Alternative Attacks: Fatigue Attack 1d (Cosmic, Irresistable Attack, +300%; Freezing, +20%; Melee Attack, C, -30%) [39] & Toxic Attack 1d (Cosmic, Irresistable Attack, +300%; Melee Attack, C, -30%) [15/5=3]; Conjured Servant [20]; DR 4 (Can't wear armor, -40%) [12]; Flight [40]; High Pain Threshold [10]; Immunity to Metabolic Hazards [30]; Injury Tolerance (Diffuse; No Eyes; No Neck) [110].

Disadvantages: Frightens Animals [-10]; Lifebane [-10]; Mute [-25]; Social Stigma (Monster) [-15]; Vulnerability (Light, ×2) [-20].

Skills: Brawling-15 [16]; Stealth-15 [20].

Notes: Takes maximum of 1 or 2 points of damage from non-area attacks. Killed by 20 points of damage; can be summoned again in 20 minutes. Does 1d damage to either HP or FP of any living being by touch (DR does not protect).

Power Level: To save points, reduce Air Move [-2/level], change Flight to Walk On Air [-20] (Air Move becomes 5), or reduce attack damage to 1d-2 [-24]. To spend points, raise Ground Move [5/level], Air Move [2/level], Basic Speed [20/level] (which will raise both Moves along with Dodge), or attack damage to 1d+1 [+13], 1d+2 [+26], 2d-1 [+31], or 2d [+42].

Worked Example: Shayde wants the ability to animate the shadows of her enemies. She's a 400-point superhero, so each Shadow is 25% of her point total (base cost 1 point). She wants to be able to animate up to 50 of them, in case she's attacked by a mob (x10 normal cost) and she wants them Constantly Available (×4 normal cost). They're Summonable Minions, of course, but she saves some points with an appropriate Accessibility limitation (which limits the number of Shadows she can conjure and also makes her power useless in total darkness) and Costs Fatigue.

Animate Shadows: Allies, 50 Shadows, 25% Power, Constantly Available (Accessibility, Can only summon one Ally for each enemy shadow, -30%; Costs Fatigue, 1 FP, -5%; Minion, +0%; Summonable, +100%) [66]

Poltergeist (150 points)

Attributes: ST 0 [-100]; DX 10 [0]; IQ 6 [-80]; HT 10 [0].

Secondary Characteristics: HP 5 [10]; Per 6 [0]; Will 6 [0]; FP - [0]; Damage 1d+1/2d+2 (TK); BL 51 (TK); Speed 5.00 [0]; Move 5 [0]; Dodge 8; Parry 10.

Advantages: Conjured Servant [20]; Telekinesis 16 [80]; Spirit (p. B263) [261].

Disadvantages: Bestial [-10]; Cannot Manifest (Change both "Usually On" limitations in the Spirit meta-trait to "Always On") [-10]; Dread (Exorcised or Consecrated Areas, 11 yards) [-20]; Mute [-25]; Weakness (Exorcism, 1d per 5 minutes) [-5].

Skills: Brawling-14 [12]; Dropping-9 [1]; Throwing-14 [16].

Notes: Killed by 10 points of damage; can be summoned again in 10 minutes. Can strike with TK for 1d+1 cr. TK range is 10 yards; must stay at least 11 yards away from sacred ground. Will flee from exorcism; takes damage if somehow trapped in the area.

Power Level: To save points, reduce Telekinesis [-5 points/level] or skill levels [Varies], or increase Weakness to 1d per minute [-5]. To spend points, raise Telekinesis [+5 points/level], reduce range of Dread [+1/yard, maximum +10], or remove Cannot Manifest [+10], Dread [+20], or Weakness [+5].

Worked Example: In preparing to take the role of tribe shaman, Red Wolf has bound a Poltergeist to himself. He is only a 100-point character, making the spirit a 150% Power Ally. To save points, he takes it on a 12 or less. Each time he summons the Poltergeist he must roll, and on a 13 or higher, he cannot summon it again for a full day. Still, these are minor things to Red Wolf, as he "flies" towards the sun, held aloft by his spirit's power.

Bound Poltergeist: Allies, 1 Poltergeist, 150% Power, 12 or less (Minion, +0%; Summonable, +100%) [40]

Winged Monkey (75 points)

Attributes: ST 13 [30]; DX 12 [40]; IQ 8 [-40]; HT 12 [20].

Secondary Characteristics: HP 15 [4]; Per 10 [10]; Will 10 [10]; FP - [0]; Damage 1d/2d-1; BL 34; Speed 6.00 [0]; Ground Move 6 [0]; Air Move 12 [0]; Dodge 9; Parry 10.

Advantages: Blunt Claws [3]; Conjured Servant [20]; DR 4 (Can't Wear Armor, -40%) [12]; Flight (Winged, -25%) [30]; High Pain Threshold [10]; Sharp Teeth [1].

Disadvantages: Bestial [-15]; Cannot Speak [-15]; Dyslexia [-10]; Frightens Animals [-10]; Ham-Fisted 2 [-10]; Innumerate [-5]; Social Stigma (Monster) [-15].

Skills: Brawling-14 [4]; Flight-11 [1].

Notes: Killed by 30 points of damage; can be summoned again in 30 minutes. Can claw for 1d+2 cr.

Power Level: To save points, reduce Ground Move [-5/level], DR [-3/level], or Per [-5/level]. To spend points, add Striking ST [+5/level], ST [+10/level], or Enhanced Move (Air) [+20/level].

Worked Example: No one messes with Old Jeb. He's built on 150 points, but he's not very strong . . . not very smart . . . and doesn't have friends in high places. But Jeb has the monkeys. And no one wants Jeb to let the monkeys out. Sure, it'll knock the wind out of him to do it. And sure, it means he'll have to head back up to his house on the hill and spend most of the day casting that spell again. But he'll do it. So just leave Old Jeb alone.

The Monkeys: Allies, 1,000 Flying Monkeys, 50% Power, Constantly Available (Costs Fatigue, 8 FP, -40%; Minion, +0%; Preparation Required, 8 hours, -60%; Summonable, +100%) [144]

Gotta Catch 'Em All!

But what if you just can't bring yourself to settle on one type of Summonable Ally? What about the beastmaster who can summon any living animal? Or the grand mage who can conjure forth whatever elemental he wishes, from flame to iron to sound? Is it possible to build a character who can summon *anything*?

Of course. The key is taking it in two steps. First, determine what the most expensive "conjunction" will be. This might be a single, powerful animal or a swarm of weaker ones. Then, purchase a Modular Ability (Cosmic Pool) that can handle that one conjunction, with the limitation, "Only to buy appropriate Allies with the Summonable enhancement, -50%". Add any other limitations you can live with to get the cost down, of course.

By rearranging the points in your Cosmic Pool, you can use those points to temporarily "purchase" one or more Summonable Allies. The advice on making them Constantly Available is even more apropos here; if you fail a Frequency of Appearance roll for an Ally, it means the points "spent" on that Ally in your Cosmic Pool are tied up for a full day! Similarly, if an Ally dies, the same points are tied up until he comes back from the dead, assuming he has

the Conjured Servant meta-trait (if not, the GM will decide when and if you can use the points again, per the guidelines on p. 37 of the *Basic Set*.)

It's useful to know how many Cosmic Pool points you'll need to allocate to have a certain Summonable Ally available. If we can assume that every Ally will be bought as Constantly Available, Summonable, and the +0% version of Minion, then that tells us:

You'll need to allocate 8 points to have a 25% Power Ally.
You'll need to allocate 16 points to have a 50% Power Ally.
You'll need to allocate 24 points to have a 75% Power Ally.
You'll need to allocate 40 points to have a 100% Power Ally.
You'll need to allocate 80 points to have a 150% Power Ally.

That means that if you have a 40-point Cosmic Pool for Allies, you could have a single 100% Ally [40] "prepped" (i.e., waiting to be summoned). Or you could rearrange your points so you instead have one 75% Ally [24] and one 50% Ally [16] prepped. Or with another rearranging, you could have five 25% Allies [8 each] prepped.

Worked Example: Red Wolf is many years older (and now a 200-point character) and can bind any spirit to himself that he wishes. He may summon and dispel his bound spirits with a moment's thought, but must chant and pray for 10 minutes if he wishes to release his old spirits and bind new ones.

Spirit Binding: Cosmic Pool, 48 points (Only for Summonable Spirit Allies, -50%; Preparation Required, 10 Minutes, to Switch Abilities, -30%) [96]

This gives him 48 points to "spend" on his spirit Allies. Red Wolf normally has two 150-point spirits bound to him (each one is a 75% Power Ally and thus costs 24 points) -- a Poltergeist and a Guardian. He can summon and dismiss either one (or both) at will, as often as he likes. With war approaching, he realizes that he needs something more powerful, and begins to chant and pray. Ten minutes later, he is able to free his old spirits and bind new ones. He "spends" 40 of the points in his Cosmic Pool on a 100% Power Ally -- a 200-point Warrior spirit to fight at his side. Since he has 8 points left over, he "spends" them on a 25% Power Ally -- a 50-point Watcher to act as a lookout. He leaves them unsummoned for now. At this moment, he could summon the Warrior, the Watcher, or both, but he has no ability to summon the Poltergeist or Guardian; they were freed when he reallocated the points in his Cosmic Pool.

Red Wolf now sits and faces the horizon. For he knows . . . the monkeys are coming . . .

I've Got Good News and Bad News

Mixed Successes in *GURPS*

by Matt Riggsby

GURPS provides a simple spectrum of success: critical success, success, failure, critical failure. But while there are some exceptions, what it doesn't generally provide for is the possibility of an ambiguous or mixed success: a character succeeds in the task at hand, *but* succeeds incompletely or in such a way that there are negative consequences later on. For example, a general wins a series of battles but ends up with his supply lines dangerously stretched out, or an occult researcher finally finds the page he's looking for, but the monster chasing him shows up before he can go shopping for components for a banishment ritual. A success with negative consequences is a particularly popular fixture of fantasy. In most stories, spells don't simply fizzle; they work, go terribly wrong, or both. With these guidelines, the GM can blur the line between success and failure into something more interesting.

Getting a Mixed Success

Just when and where to apply mixed successes is up to the GM, depending on how prominently she wants them featured. For example, mixed successes might be used for magic-related activities (if magic is supposed to be particularly mysterious) but not for combat (which is quite fine-grained and has enough die-rolling already). For those skills and situations where the GM wants to employ mixed successes, here are some mechanical suggestions: For unpenalized skills or skill rolls at a bonus, mixed success occurs if the skill roll is made exactly. For penalized rolls, a mixed success occurs on an exact roll or if the roll is made by a margin of half of the total penalty (round up, maximum 5). For example, if rolling at a -4 penalty, a mixed success occurs if the roll succeeds exactly, by one, or by two.

This makes mixed success uncommon but a possibility for routine skill use, but fairly common for highly skilled characters under extreme conditions, and characters with rudimentary skills, when they do succeed, will have mixed successes more often than more skilled ones. To make them occur more uniformly, without character skill being as much of a factor, the GM might apply them only when the target number is rolled exactly or within a fixed margin of error (for example, whenever a skill roll misses by one). If the GM wants to make mixed successes an even more common feature, she might apply them with a margin on both sides of success (for example, if a skill roll is made exactly, misses by one, or succeeds by one).

When rolling at a modified skill of 16+, a 16 is a mixed success. A 17 is still a plain failure, an 18 is still a critical failure, and 3 and 4 are still critical successes, never mixed successes. Unless the GM finds exceptional circumstances, mixed successes should not be applied to contests of skill and other situations where margin of success is already a factor.

The precise effect of a mixed success depends on what a character is attempting to do. Here are some guidelines for specific skills and groups of skills:

Alchemy

The potion is effective but it has an unfortunate [side effect](#). The GM can roll on the table or simply come up with an appropriate one.

Climbing

The climbing surface changes; a piton becomes slightly loose or a foothold snaps and crumbles. Subsequent attempts

to climb that patch are at -2. If that seems inappropriate to the situation, the climber scrapes his hand or foot, leaving a traceable mark on the climbing surface and the climber at -1 to the next Climbing roll.

Craft Skills

For Smith, Carpentry, specialties of Artist (for example, pottery) which are used to produce tools and other functional items, and similar skills, the character produces a serviceable item or successfully repairs a damaged one, but it's notably unattractive. If someone tries to sell it, reduce the price by 5%.

Crewman

Individual rolls against Crewman aren't common, but if they should happen: The character leaves a knot incorrectly tied, a locker unlocked, a deck unswabbed, or doesn't quite complete a task correctly, which causes a problem (probably for somebody else) later. The next Crewman or Shiphandling roll, whichever comes first, made by anyone in the vehicle is at -2. This same effect could be used with Soldier, team sports skills, and other skills that might be used to represent a character's ability to perform tasks in a group context.

Disguise

This applies only to the initial roll for donning a disguise: The disguise is convincing, but it's poorly applied and might fall apart under certain circumstances. A fake moustache may come off if the character drinks a glass of water, sweat may wash off cheap makeup, or a flimsy outfit may rip and reveal his true identity. The character will probably be aware that his disguise is fragile and that he will need to be careful.

Fighting Skills

Combat already has rudiments of mixed success. A character can hit an opponent successfully but do a trivial amount of damage, feints are based on the difference of margins of success in a contest of skills, and a near-miss on some hit locations can mean a successful hit on another. However, if the GM wants to extend mixed successes farther into that area: For to-hit rolls, a mixed success means that because of shock, vibration, glare, or other circumstances, the character will be at -1 to hit the next turn and at -1 to hold on to the weapon if there's an attempt to disarm him during that time. A mixed success on an active defense temporarily puts the character on bad footing, giving him -1 to his defenses the next turn and -1 to resist slams and other attempts to knock him down.

Leadership

The character ends up offending or angering a member of the group he commands. The offended group member's reaction by one step (Good to Neutral, Neutral to Poor, etc.) unless the leader finds out about it and takes steps to repair the damage in the next day or two, requiring a roll against any social skill the GM finds appropriate (which may include Leadership).

Lockpicking

A tool gets stuck and slightly bent, giving a -1 to subsequent lockpicking attempts. If that seems inappropriate (if, say, the tools are a decent-quality modern steel), the lockpicking attempt is particularly noisy, possibly alerting someone if there's an attempt at stealth.

Mechanical/Engineering Skills

When repairing a damaged device or vehicle or inventing a new one, it works but it has a [problem](#). Roll on the table below:

- 3 Overheats easily
- 4 Hates cold starts
- 5 Needs a good whack
- 6 Needs fiddling
- 7 Sensitive to shock
- 8 Needs feng shui
- 9 Noisy
- 10 Leaks
- 11 Vibration
- 12 Intermittent power outages
- 13 Eats power
- 14 Eats consumables
- 15 Hard to control
- 16 Hard to stop
- 17 Needs frequent maintenance/cleaning
- 18 Duct tape repairs

This is by no means a permanent problem, but fixing it will require another skill roll, additional time, and possibly more parts.

Social Skills

For most social skills (Fast Talk, Carousing, Interrogation, Sex Appeal, etc.), the character's mouth writes checks the remainder of his anatomy can't cash. The character is convincing and gets a good reaction, but that reaction is in some danger. Exactly how and why depends very much on the circumstances, but here are some possibilities:

The character has convincingly implied that he is a distant relative, a favorable trading partner, a member of an organization to whom the target owes loyalty or cooperation (such as a church, a law-enforcement body), a prestigious social contact (good spouse material, roadie for a favorite band), or otherwise wealthier, more powerful, or more deserving of cooperation than he actually is. If the target figures this out before the character can substantiate that identity, the target's reaction will drop to Poor.

The character has inadvertently revealed something about himself, his companions, or his mission or contradicts himself in some subtle way. The target will not be immediately tipped off if the character has something to hide, but if they have more interaction, some little bit of knowledge may come back to haunt him.

For police or other official interactions, the character may have made a procedural error which may endanger his standing in the organization, his assignment to the mission, or resulting legal proceedings.

Spells

Bigger spells usually mean greater consequences. For a mixed success with spellcasting, roll 3d plus the amount of energy spent (modified for high skill) on the table below and apply the additional result. If any result is impossible, would have no effect, or makes no sense, reroll.

Roll Effect

- 3 -3 to any DX-based activities until end of next turn. This does effect any DX-related rolls associated with the spell (spell throwing, magic jet, etc.)
- 4 -3 to any IQ-based activities until end of next turn
- 5 Spell costs 1-3 extra points of fatigue
- 6 -2 to any spell resistance rolls for the next day
- 7 -1 to further spellcasting attempts for the next day
- 8 Any spells the caster is maintaining are immediately dropped
- 9 Roll 1d. On 1-3, the caster acquires the Frightens Animals disadvantage for a day. On 4-6, the opposite happens.

- Nearby animals, from insects to livestock, will flock to him.
- 10 For the (margin of failure) hours, the spell "echoes," randomly producing shadows of its effect as deemed appropriate by the GM. For example, if a wizard has cast a Fire spell, he might occasionally set small objects on fire when he touches them. If he has cast an Information spell, he might go into momentary dazes where he suddenly discovers insignificant childhood memories of acquaintances and the locations of lost socks. This should be a nuisance effect, but it could cause serious embarrassment and draw attention to the spell-caster.
 - 11 Caster temporarily acquires the Unlucky disadvantage for a day.
 - 12 Caster is afflicted with a one-point Curse.
 - 13 Caster gains a Supernatural Feature for the next (margin of failure) days.
 - 14 The spell effects both caster and target.
 - 15 Caster regains fatigue at a quarter of the usual rate until fully rested.
 - 16 If the spell has a variable energy cost for initial casting, the caster immediately spends the lesser of the maximum energy or enough to take him to zero fatigue. This comes directly off of the caster's fatigue and may not be absorbed by powerstones.
 - 17 The spell cannot be cast again for another (margin of failure) days.
 - 18 The caster gets a sharp electric shock whenever he touches or uses a magical item, including powerstones, for the next (margin of failure) days, causing 1d points worth of pain.
 - 19 As with #11 above, but for (margin of failure) days
 - 20 The spell effects everyone in a (margin of failure) yard radius, including the caster.
 - 21 1d6 points of fatigue spent on the spell come off of hit points instead.
 - 22 A demon or other entity appears within one day to attack the caster, as per a critical failure (although the spell does still succeed).
 - 23 One of the above effects (reroll, ignoring any roll of 23+), but it also happens to the next person the spellcaster touches or is touched by.
 - 24 One of the above effects (reroll, ignoring any roll of 23+), but it also happens to the next person the spellcaster successfully casts a spell on.
 - 25+ Roll twice and apply both effects (rerolling any rolls of 25+)

The GM might consider extending the margin of failure that can get a mixed successes for spells farther than for other skills. For example, mundane skills only get a mixed success on an exact skill roll, whereas spells get them if the skill roll fails within the half-penalty margin. This option makes magicians more effective in the short term, in that they'll be able to cast more spells successfully, but at the same time riskier and more likely to harm their friends in the long run or render themselves ineffective in the process of doing magic. Wizards in that situation are likely to save the big spells only for times of great need, which is a bit closer to fictional wizards like Tolkein's Gandalf and Robert E. Howard's Thoth-Amon, who are theoretically very powerful but rarely seem to get around to doing any actual spellcasting.

Survival

If the character is looking for food, shelter, etc., the character or *one* person he is looking after (select randomly) takes 1d-2 damage. If the character is using Survival to find a path somewhere, he finds not the best route, but the second best. Increase optimum travel time by 10%.

Traps

The trap isn't as well-hidden as it might be. It will be effective, but someone looking for traps will be at +2 to find it.

Other Skills

Spell Example

Zappo the Wizard knows the Explosive Fireball spell at skill 16. In a particular difficult situation, he ends up with an effective skill of 13 while cranking up a three-die fireball, spending 5 points of Fatigue on it. He rolls a 14; Zappo gets his fireball, but something else goes wrong. The GM rolls 3d and gets a 10. Plus five for the amount of energy in the spell, the result is 13. Zappo will need a lot of rest to fully recover from the mystical strain.

For other skills, the GM may come up with complications as appropriate. For example, a mixed success for Architecture skill might produce a building with occasionally noisy air conditioning, a few leaky pipes, or slightly too-small closets. In some situations, a mixed success might not have any notable consequences; a mixed success of on a Performance roll might result in a dropped line covered by a quick ad-lib, which won't matter to most of the audience even if they notice it. Don't forget that the skill use was, ultimately, successful and the effects of that success should be applied as fully as possible. Any negative consequences should come afterwards, unless there is a clear and appropriate way of modifying the success (see, for example, the guidelines here for mechanical and engineering skills). If nothing else comes to mind, the initial success sends the character down a slightly wrong path or puts him slightly off balance, so the next use of the skill suffers a -1 penalty, takes 5-10% longer than usual, produces something which costs 5-10% less or is 5-10% less efficient or powerful than usual or incurs a -1 reaction penalty with someone who witnessed the clumsy execution of his task.

State of the Art: 2064 (for Shadowrun)

Published by [FanPro](#)

Written by Audun Myhra Bergwitz, Rob Boyle, Brian Cross, Drew Curtis, Robert Derie, Patrick Goodman, Joshua Howell, Jong-Won Kim, Robyn King-Nitschke, Stephan Meijerhof, James Nugent, Rich Osterhout, Antonio Pucci, Sergio Pulido, Jon Szeto, Peter Taylor, & Malik Toms
Cover by Fred Hooper

Illustrated by Steven Bagatzky, Shane Coppage, Johan Egerkrans, Marcio Fiorito, & Klaus Schwerinski

168-page perfect bound soft cover; \$24.99

As we move closer to the release of *Shadowrun Fourth Edition*, FanPro continues to support the current version of the game with supplements exploring the early-to-mid-2060s of the Awakened World. The latest is a sequel of sorts, *State of the Art: 2064* following on from [State of the Art: 2063](#). Like the earlier book, this is an anthology the contents of which do two things. Most obviously it presents new information previously unavailable for *Shadowrun Third Edition*, but it also expands upon and updates various aspects of the Sixth Age previously covered under earlier editions of the game.

In the case of *State of the Art: 2064*, these supplements include *Magic in the Shadows* and *Awakenings*, the *Lone Star* sourcebook, and the more recent [Shadows of Europe](#). The book also updates storylines, plots, and events of the latter book as well as [Year of the Comet](#), [Dragons of the Sixth World](#), [Threats 2](#), [Target: Wastelands](#), and even *Portfolio of a Dragon: Dunkelzahn's Secrets*. All of this is presented in the usual format for a *Shadowrun* supplement, as a series of online documents posted to the Shadowlands Bulletins Boards, then discussed, commented upon, and disparaged by various interested parties. The writing is decent, and while the best of the artwork is not a little creepy, the least of it is too broad and too cartoon-like in feel. Unlike other *Shadowrun* books, the game information is placed at the end of each chapter rather than at the end of the book.

The first of the book's five chapters is entitled "Games of State." This is a look at the state of espionage some 60 years from now, updating the three main methods of intelligence gathering: human, imagery, and signals intelligence. Along with describing spy satellite capabilities, rules are given for player character spies requesting their use. Magic also has its use, with commonly available spells such as *Mind Probe*, *Trid Phantasm*, and *Invisibility* forcing intelligence agencies to employ increasingly stringent methods to the point of brainwashing to keep deep cover operatives from being detected. The "how" is followed by the "who," the "why," and the "where," detailing the current agencies of 2064, their targets, and the major focal points in the espionage game. This includes not only traditional agencies such as the CIA, MI-5, and the UGB (current version of the KGB), but this being *Shadowrun*, also other more corporate agencies that have joined the fray. Thus Argus, based in the Allied German States, is a for-hire intelligence agency that operates worldwide, while the late Dunkelzahn's Watchers are still operating, whether as freelancers or for some other dragon-connected master. Current espionage hotspots include the Grand Tour of European glitterati, the California Protectorate occupied by Colonel Saito's Japanese troops, the free island of Hainan off the Chinese coast, and Brussels, the headquarters of the New European Economic Community. Game information includes placing requests for spysat imagery, new Edges and Flaws, plus spells and equipment. This is a sound introduction to espionage in 2064, though a

GM wanting more advice on running a spy-themed game should look elsewhere.

"The Path of the Adept" sets out to address the adept's role in the game. Too often he gets relegated to the role of the gang's combat or stealth specialist. The chapter opens up the "Way of the Adept," presenting an array of options for anyone whose magic is extremely personal and usually physical in nature. Now an adept can attune himself with animals, even empowering them with his own abilities, or even with weapons and vehicles to perform amazing stunts. He can enhance his intellectual and perceptive capabilities to achieve greater cognition, become a virtuoso artiste, or even temporarily achieve astral projection. The combat specialist can now make Penetrating and Elemental Strikes, or even Side Step an incoming attack, but players can now create the complete Social Adept using abilities like Commanding Voice, Cool Resolve, Facial Sculpt, Kinesics, and Voice Control. Overall, this is a nice new box of tool for the Adept player, but perhaps the writing of the chapter is a little dry.

The other side of the law from most shadowrunners comes under the spotlight in "Behind the Badge," focusing in particular on Lone Star, the private law enforcement provider and its standard operating procedures. Naturally no two such companies are alike, but much of the information here is applicable to any one of the private police groups operating in 2064. All have to enforce the law according to their license and jurisdiction, whilst still operating as a corporation. Thus successfully upholding the law, keeping crime rates down, and arresting the "right" perpetrators looks good for business, but wrongful arrest and police brutality can only result in lawsuits, insurance claims, and a poor corporate image. But the Awakened World is far more dangerous, with suspects wielding a multitude of hardware, cyberware, and spellware, often cause enough for the acceptable application of lethal force. Up until, that is, the cops run up against the limits of their jurisdiction -- usually mega corp territory. Perhaps the most salient fact that shadowrunners need to know is what Lone Star or Knight Errant will throw at them. In the case of Lone Star, its Fast Response Teams are like the better-known SWAT units, only without the finesse.

After detailing the various police departments and units, and even suggesting how you go about bribing a cop, the chapter takes a contemporary and scientific turn in examining forensics in the Sixth Age. Little more than a primer with a nod or two to the use of magic, it is at least something for both player and GM to keep in mind. What happens after a character is arrested, convicted, and incarcerated is looked at, leading to a potentially interesting mini-campaign with the characters locked up and having to survive with cyberware disabled. Magic using characters get it worse, with every attempt made to prevent spellcasting, some methods even inducing insanity. Several adventure seeds are included to support such a campaign, but they are crammed into the chapter's end along with the new equipment. Despite lacking the depth of the earlier *Lone Star* sourcebook, "Behind the Badge" presents another good overview of its subject, giving pointers to bear in mind. GMs wanting more information on running a cops or C.S.I.-orientated game will have to look to other supplements.

Like the earlier "The Path of the Adept," the "Old World Magic" is another dry read. It supplements and expands upon information first seen in *Shadows of Europe*, specifically the magic traditions that have appeared and developed since 2012. They include Neo-Paganism -- Wicca and Witchcraft; Druidism -- Celtic and Wild as opposed to the Hermetic Druidism of the New Druidic Movement; as well as Norse and Roman-Hellenistic paganism and various ethnic magics. While many traditions abound and are accepted in Europe, Hermeticism is rife with academic rivalry. Its various schools range from Classic and Teutonic Hermeticism to Avant-garde Thaumaturgy and Unified Magic Theorists, all based in universities across the continent with study circles of adherents driving hard to make the big break through. In game terms the Neo-Pagan traditions follow the same rules as those for Shaman and Idol-Followers, but with tweaks here and there to add the necessary color. A list of appropriate idols is included. The various schools are handled in the same manner.

The last chapter is where *State of the Art: 2064* really keeps the juicy stuff, useable by any GM. "Culture Shock" is a round-up of the most notable events, news items, cultural and social happenings of the previous 12 months. The "Orxploitation Movement" in music (following the appearance of an Ork language primer), Corp Vogue or what it *really* takes to get ahead these days, Gene Art, and gambling are covered, before the chapter begins a series of Top 10 lists. From top shadowruns and the best places to be seen to most wanted criminals, suits, and scientists, these lists are the ripe with possibilities and can be used by GM as adventure hooks or purely as background flavor. One new story, the announcement that the 2072 Olympics are to be held in the divided city of Denver, is a sure lead into *Shadowrun, Fourth Edition*, which advances the game's time line to 2070.

Perhaps a little too dry in places, this is another case of FanPro pushing the game one more increment. The best and most versatile of its five chapters is certainly the last, but there are players will equally appreciate the chapters on the Adept and European magic. Like its predecessor, ***State of the Art: 2064*** is another decent supplement for ***Shadowrun***, updating the setting just a little while adding more background and game options.

d20 Apocalypse

Published by [Wizards of the Coast](#)

Designed by Eric Cagle, Darrin Drader, Charles Ryan, & Owen K.C. Stephens

Edited by Tammie Webb Ryan

Art & Graphics by Dave Johnson, Kalman Andrasofszky, Grafiksismik, Inc., Karl Kersch, Ramon Perez, Chris Trevas, Dee Barnett, & Kate Irwin

96-page full-color softcover; \$19.95

As they progress through different genres, it seems the Wizards of the Coast are refining their focus into ever-smaller chunks of roleplaying. Their *d20 System* books went through fantasy and Modern, then spun off a smaller Future reference. Now they've lopped off a still-tinier slice called *d20 Apocalypse*.

d20 Future covered the after-the-holocaust setting in brief -- covered a number of things briefly, in fact -- but only grazed several targets in favor of tools needed to build one's own futuristic campaign from the ground up. You'd think that would mean that, with a whole book given over to the apocalypse, there'd be room for the in-depth material missing from the parent volume. And you'd be wrong.

This book is the roleplaying equivalent of a drive-by shooting. It comes in low, strafes some pretty specific marks, and moves on with little explanation. To be fair, the subjects it touches on are important to most campaigns set after Man's fall. There's some stuff about rebuilding things, vehicles specifically, and it glosses over the details. It forgoes whether you've found the right Chevrolet distributor cap in favor of generic considerations about whether one scrounges or barter for the right sorts or quality of parts, so the process is streamlined. There's a page or three on actual Mel Gibson-style stunts out on the roads, and a nice system for customizing vehicles, but the counter to all this is: It's perplexing how much text is used on structures.

Roads -- the kinds of roads, the shape they're in, how long it takes to get from A to B -- it's like an RPG manual written by a pragmatic Jack Kerouac. Buildings end up much the same: how big are they, how close were they to the explosions, who's been rifling through them . . . If Frank Lloyd Wright is in your game group, he'll swoon. You can also find lists of what can be scrounged from the rubble, and what kind of gear the industrious souls of the bleak future come up with. Some of it is jury-rigged like weapons that spit old, irradiated materials, while others are staples like ethanol vehicle conversions. All these bits work together well as a chapter, but are you buying this book to read up on interstates vs. dirt roads? These overlong sidebars aren't as tiresome in the short view, but when you finish reading the book and realize what you don't get for your money . . .

When you're ready to attack the PCs, GMs will find natural hazards -- or rather, what now passes for natural -- and a few new monsters with which to vex them. The four horsemen are no longer myths, gates spit out dimensional invaders, and robots run rampant. The clouds above (a favorite for this book, it would seem) hold everything from acid rain to tortured souls, should you want the environment to hit the team instead of the legions of unnature. The heroes themselves are tailored to suit; not all professions from *d20 Modern* fit here, especially if the game starts a thousand years after the fall, which gives rise to new professions and added prestige classes like the necessary Road Warrior.

The only standout is the Evolutionary, a being who can manipulate and switch his own mutations (also like **d20 Future**, the prestige classes are scattered throughout the book according to their appropriateness to a setting, not gathered together).

Deciding what goes into the beginning of the end is solid; when and how the end of the world gets underway is covered in nice detail. It doesn't offer much that's new -- most roleplayers probably know to get the ball rolling with nukes or a disease or some sort of invasion -- but it's thorough, and expands on **d20 Modern's** nuclear weapons material. Pick what kills the planet, how people adapt, and how quickly the campaign gets going thereafter (did it happen last week, or two generations ago?), and you've got an apocalypse.

The art of the apocalypse is perhaps the book's best feature. All the pictures are cool and exciting, and they'll make you want to start in on your setting in short order. There's a small montage of images dipping into the crack of the pages, which is un-noteworthy and a bit of a waste, but it's better than having the text creep in there instead.

It's this close attention to the trees that leaves the apocalyptic forest mostly unexplored. Where it could have been a companion to **d20 Future**, it instead promulgates the same errors and oversights. There are new tools, sure, and some are on target, but the sense of wonder isn't there. There's nothing about putting the party through its paces. You won't find advice about anything as exotic as a theme for your game, nor anything as prosaic as a reason for party coherence. Are you rebuilding? Fighting? Exploring? Backhanded help comes in the form of sample campaigns, vulgar in their plainness. There's a half-decent one about sleepers waking up to find the tragedy they were meant to anticipate has passed without them, but the other two pieces are routine at best and derivative at worst ("The End" is still commercially available, yet here it is again in slightly altered form).

There's not much in **d20 Apocalypse** that any decent GM couldn't provide himself, and some obvious GM stuff isn't included, which means you *do* have to provide it yourself. There's no examination of the genre, no attempt to make it seem appealing. The Earth has collapsed many times before in RPGs, and it takes some doing to make the end of the world seem commonplace.

Murphy's Rules

by Greg Hyland

Murphy's Rules

Unskilled Man's Bluff

The past couple of weeks I've been out and about, tossing my hat into the ring at various temp agencies. I've never been to such a place before, so it's been fascinating to me . . . well, as fascinating as it can be filling out the same paperwork over and over again. (It's sobering to think that I've written my personal information on enough pieces of paper in the past two weeks to give each person in the Vatican City their own scrap with which to steal my identity. Fortunately, the significance of identity theft crimes among the residents of the Vatican City is a fair bit less than the rest of the world. But I digress.)

Anyway, among other things I've learned about myself are my test results in various skills. For example, I learned that I'm rated at 85 words a minute in my typing abilities . . . meaning that I should be able to type this column in less than 12 minutes. (Of course, that relies on me having at least 85 words a minute that are worth transcribing; I rarely get above that threshold once I filter out the incessant chorus of "badger badger badger badger badger badger badger badger mushroom MUSHROOM!") Since my resumé had listed 50 words per minute -- the amount I had been tested for previously in my junior year of high school -- it was a nice surprise.

And then there's the other side of testing. See, I was also rated for my abilities in various software. This included the word processor Microsoft Word, the spreadsheet program Microsoft Excel, the presentation software Microsoft PowerPoint, the database program Microsoft Access, and the operating system Microsoft Tear Out The Last Remaining Tufts of Your Hair As Random Processes Hog 100% of All System Resources for No Discernable Reason XP Professional.

Now, prior to testing I had expected my skills with Microsoft Word to be pretty high, since -- being a writer and all -- I have an affinity for word processors the way Aquaman does with fish, complete with the concentric circles jutting out from my head that I use to control them. During the test I became less sure, since the software was testing aspects of the software that I'd never even heard of, let alone use with any degree of proficiency. (The number of times I've needed to do a mail merge, text box foreground positioning, or chart calculation while writing my column has been quite small.) Nevertheless I soldiered on, and eventually ended up with a score of . . . 97%.

My second test was with Microsoft Excel, which I use occasionally but I've never considered myself a spreadsheet guy. In my life, I've probably logged about 40 hours of spreadsheet time, including my old AppleWorks days on my Apple IIs. ([Beagle Bros rule!](#)¹) Compare this with my word processor, where I've frequently logged 40 hours at a stretch, avoiding writing. So I'm not exactly a guru. This time, I got a 100%.

Next I moved on to PowerPoint, a program I had accidentally loaded once (as part of the Microsoft BloatOffice 2000 pack) and played with for a few minutes before clicking "Close." Again, I got a 97%.

And finally, I received testing in Microsoft Access, a program which I have *never used once*. I got a 100% on their testing.

It was about at this point that I found myself uttering a small prayer that the temp agencies didn't perform similar testing on would-be doctors, air traffic controllers, or emergency-planning coordinators.

Anyway, as I was reveling in my mastery of all computer skills, I tried thinking (naturally) about how to translate this into gaming and, by extension, a column for this week. And I realized that the ability to bluff is one of those tricky ones in gaming. On the one hand, if bluffing is too weak, then no one would ever become skilled in it; those "skill points" would be put to better use elsewhere. On the other hand, if it's too useful, then players might be tempted to skimp on more well-rounded aspects of a character, choosing instead to bump "bluff" to astronomical levels. (Of course, this variable utility is something that crops up in all systems for various skills. For example, practically all the adventures for the West End Games' edition of the *Star Wars RPG* could be resolved with high enough levels of blaster and dodge. Then again, in thinking about the movies, this may not be wholly inaccurate . . .)

The ability to bluff is one of those that often appears in the "real world"; whether we meet people who are able to con

their way into situations and responsibilities beyond their own, or we hear about those on the news who have managed to bamboozle the right people, chances are we all have a good idea of what bluffing does, and how useful it can be. So what's wrong with taking it to an astronomical level?

Well, there are two things that keep the usefulness of bluff in check. First, you can't actually use bluff to *do* anything constructive. While you might be able to, say, con others into thinking you're a doctor, that won't actually help the person on the operating table. Of course, bluffing can be useful to get others who can be constructive to do so, but in dramatic situations you're often only left with yourself. And if you don't have the abilities you say you do, well . . . there might be problems.

Which leads nicely into the second point: I suspect (although I have no proof) that most big conners are eventually revealed. While this can lead to interesting storytelling potential -- When will my character slip up? When will it all come crashing down? -- it also means that the character is probably destined for an ignoble fall. Some game systems suit this well; for example, "Destiny" or "Dark Fate" might be disadvantages for such a character. However, a player whose PC is the consummate con artist may need to prepare himself to lose that character; if he doesn't, he may end up disappointed when the villagers eventually take up pitchforks and torches.

In the meantime, I've got some preparing of my own to do; I'm going to apply to be head instructor of Microsoft products at a local training agency. With my test scores, what could possibly go wrong?

Yrth 2

by [Chad Underkoffler](#)

Genre: Science Fiction

Style: Infinite Worlds

Theme(s): Survival, Discovery, Community Building, Escape

*The starship **Venture** lurched, gripped by the weird energies of the space anomaly.*

"Grayson, report! What is this thing?" cried Captain Church.

The Science Officer looked up from his scanner. "Unknown, Captain. Scanners are jammed."

"We're not receiving any positional information from interstellar beacons, and the navcomp has locked," reported Andrei, the Navigator.

A sudden lurch rocked the bridge. Fingers gripped duralum consoles, fighting against the inertia that threatened to knock them all from their stations.

The captain's comm-panel whistled. He punched the button angrily, "Monty: go!"

"She can't take much more of this strain, Cap'n. The engines are twisting in their housings. If we don't shut them down, they'll crack us up!"

Church looked out at the roiling mass of red and purple mystery that pounded his ship -- his ship! -- with hatred in his eyes. Through gritted teeth, he told the Chief Engineer, "Shut them down." He turned to the Helmsman and said, "Hikaru, use thrusters to maintain a consistent orientation. If you can."

"Aye-aye, Captain. It'll be just like shooting the rapids."

As the constant hum of the engines faded, so did the buffeting. The flight of the starship smoothed, and something new appeared in the viewscreen: a circle of starry black. Escape.

Science Officer Grayson said, "Normal space, Captain, at 33 mark 16 mark 45. Possibly a way out of this anomaly."

"Transmit coordinates to Nav station. Andrei, lay in a course as best you can and sync with Helm. Helm, hit that target."

"Aye-aye, sir!" his crew responded as they snapped to his orders. Almost instantly, the ship's nose swung to aim at the calm eye in the raging space-storm. Faster than they expected, it soared through the hole and found itself . . . somewhere.

"Department heads, report."

Communications Officer Nyota said, "All decks have reported in. Minor damage in modules Six Alpha, Twelve Beta, and Fourteen Delta. One casualty, in Sickbay -- Dr. Hatfield reports that Ensign Leslie has broken his arm; he's welding the bone now. We are being hailed by a broad spectrum of signals, ranging from radio to tachyon-packet comms to several of unknown types. Translating and decoding now."

*Andrei's fingers danced across his board. "Navcomp has unlocked. We are no longer in Sector 42. Navcomp is correlating scanner data, but I can tell you this already: we are not reading **any** navigational beacons."*

From the speaker came the voice of the Chief Engineer. "Engines recycling power build from hard disengage. Estimated operational in two minutes."

Hikaru spoke up. "Helm unresponsive, Captain. I have no control. Directional thrusters are dead."

"Burned out in the anomaly?"

"No sir. No damage on the circuits. They're just not working."

*Grayson spoke. "We appear to be caught in a powerful tractor beam. Much more powerful than any we've come across before. Scanners indicate we are in near orbit of a small binary planet: an Earthlike -- intriguing! -- a **remarkably** Earthlike primary, with an extremely large moon . . . Wait."*

The science officer adjusted his scanners for more detailed readings; meanwhile, the central viewscreen displayed the small blue-green world growing below them. "Captain, the readings indicate that the gross details of the planet and its satellite match that of Earth and its Moon with a 75% -- and rising as scanning continues -- correspondence. Planetary masses, period of rotation, spectrographic analysis of the atmosphere -- they all line up within thousandths of percentage points."

"The continents are wrong," said Andrei.

"And despite all the signals we're receiving, the Earth comm-beacon is not one of them," said Nyota.

Church scowled. "I want answers, now. Grayson, find out where the tractor beam is coming from. Nyota, decode those signals. Monty, I want a diagnostic team on the thrusters, and I want those engines ready."

"The moon is coming up from behind the planet," reported Andrei.

The bridge crew all looked as one to see the golden sphere sliding out from behind the disc of the strange, Earthlike planet.

The Helmsman said, in a whisper, "That's no moon. . . That's a space station."

** * **

Torn from their home universes, the valiant spacemen and astronauts of a dozen worlds have been brought to a strange alternate Earth. But why? And by whom?

Welcome to Yrth 2.

map

What Everybody Knows

Not much.

A storm in space, an anomaly, a Vortex, grabbed hold of your ship and plunked you into a near-planetary orbit around a world that suspiciously resembles Earth in many (but not all) regards. The Moon has been replaced by a giant, golden space station. The rest of the solar system is hauntingly similar to the Sol System. The constellations are nearly the same, and hint that the local year is AD 2005.

Your ship was hailed with a wide array of methods, in a bewildering number of codes and languages. When translated, the message is simply: "For the safety of your vessel, turn over landing operations to Yrth 2 Ground Control. Thank you." Repeated over and over. Furthermore, your craft was also scanned deeply. Both the communications and the scanning originate from the Moon-station.

After this, a powerful tractor beam (from a surface station on the planet below) locked onto your ship and smoothly brought it into the atmosphere. Your ship grounded safely, in an area suitable for such. Indeed, the long-overgrown remnants of ancient landing pads and abandoned ship-cradles surround you -- the ruins of a spaceport.

Scanning technologies report numerous glitches and artifacts, however, which seem to indicate that the planet holds zones

where the laws of physics *change* -- some technologies cease to operate within them. The zones range in sizes from a small cottage up to the entire volume of the Grand Canyon.

The air outside is breathable and safe. The observable plant and animal types seem to be terrestrial, but strange (see below). There are no other detectable communications waves at first, but eventually signal chatter will arise from other kidnapped spacecraft. In a dozen different methods and languages, all ask the exact same questions you are: Where are we? How did we get here? Why are we here? What's going on? Who are you? Now what do we do? How do we get back home?

Where Are We?

According to the automatic hail, *Yrth 2*, whatever that means.

How Did We Get Here?

Through the Vortex. Possibly by a mis-jump, teleport accident, spacetime anomaly, big explosion, flawed experiment, hyperspace pothole, lost conveyor, whatever -- somehow, you slid into the Vortex and popped out here.

Why Are We Here?

Unknown.

What's Going On?

Weird Science(s)

Spacecraft from numerous different space-time continua have fallen through the Vortex and been brought to *Yrth 2*. Most of the victims of the Vortex appear to be human, but there are a number of modified humans and non-humans, too. The home continua of these other visitors appear to have wildly different technologies in various stages of development, possibly even utilize variant physical laws. Some groups have devices and abilities that seem like purest science fiction (or fantasy) to others.

The strange artifacts detected by scanning technologies indicate that the local reality is "swiss-cheesed" with weird potentials that permit the operation of highly-sophisticated or divergent technologies. These *Science Zones* also permit the use of unbelievable super-sciences and "supernatural" abilities. While many Zones are static, others move (some slowly, some quickly) and can pass through material objects: Science Zones sometimes combine into larger Zones and sometimes "bounce off" of each other.

Preliminary data points to the following:

- The ambient *Science Zone One (SZ1)* permits technology roughly equivalent to that of Earth circa 2005. Technology more advanced than roughly 2025 operates weakly, and the technologies from 2070 or later and weird super-sciences are non-functional.
- A *Science Zone Two (SZ2)* allows technologies from approximately 2025 through 2070 to operate normally; some variant and super-sciences work normally, others weakly.
- A *Science Zone Three (SZ3)* tolerates all technologies and super-sciences at normal capacity.

(See below, *Science Zoning*, for some rules implementation ideas for Science Zones.)

Yrth 2 Flora & Fauna

The plants and animals of *Yrth 2* appear to be the same as those of Earth at first glance. However, upon taking a second look, subtle differences in coloration and behavior can be noticed (tiger-striped squirrels, red-colored clover, metallic butterflies, and the like).

Additionally, the lower lifeforms of the planet have evolved to take advantage of the remains of the technological society that once covered this world -- many plants can grow on metal or silicon glass surfaces; some animals can consume rubber or

carbon, and so forth.

Furthermore, when within a SZ2 or higher Zone, some life displays remarkable levels of intelligence or incredible abilities -- laser eyes, limb regeneration, cloaking camouflage, etc. Worse still, at SZ3, inert environmental nanotech reactivates, forming giant "nanoblooms" which can have weird and dangerous effects -- electroplating exposed surfaces, breaking down iron into a bloody fluid, "possessing" biological lifeforms to repair nearby nanofactory units, and so on.

Ruins & Remnants

Most native Yrth 2 surface structures have been much affected by the altered flora and fauna of the planet, so ruins in various levels of decay (depending upon the standard local Zone level, as well as the past effect of moving Zones) are everywhere. The only exceptions tend to be the tractor beam surface stations (see below) and some underground installations.

And then there are the remnants of other structures -- the ships and buildings of long-gone Vortex victims. Some remain as sealed monuments of gleaming metal, others are nothing more than duraluminum skeletons. Who knows what strange technologies, treasures, or beings remain within, waiting for the ambient Science Zone to swell high enough for them to reactivate?

Who Are You?

Several groups have been pulled to Yrth 2 through the Vortex. Here are some of them.

The August Project ("Augustinians")

The August Project possessed a mandate from their government to explore the concept of quantum time and alternate worlds. They succeeded, beyond their imaginings. The experimental Para-Continuum Viewer (PCV) they had created attracted the Vortex, which ripped up their entire 12-acre campus and plopped it onto Yrth 2. Twenty men and women -- scientists, security guards, administrative staff, and government agents -- are now marooned in another universe.

Augustinians are unmodified humans from a 2005 Earth. Their technology is "vanilla" SZ1, except for the PCV. The viewer will only attract the Vortex's "ingress" while in an SZ1 region, can be used to get brief glimpses into other continua within an SZ2, and will work properly in an SZ3.

M*A*S*H 7044th ("Seventy-Fours")

In 2074, during Operation Saint Helena, this Mobile Army Surgical Hospital fled Peruvian invaders in the American protectorate of Brazil. . . and right into the gaping maw of the Vortex. During the transit, the Primary Hospital Hovercraft was damaged, inadvertently releasing a sizable portion of its medical nano-tech and greatly damaging two of its four nano-facs. Furthermore, six of the MASH's twelve Sky Ambulances were lost, and half of its Hover Jeeps. Fifty doctors, nurses, orderlies, and support troops work to repair the MASH in a strange new world -- one that's a virtual desert compared to the thick nano-sea they used to swim in.

Seventy-Fours are humans with extensive nanotechnological modifications. Each of them possesses internal, synthetic organs that creates nanobots for their health, well-being, and job requirements. The overwhelming majority of these nanobots are medical in nature, but half of the support troopers have potent combat-oriented nano capabilities.

Their technology can only operate at maximum potential, and on external targets, in an SZ3 region. Within SZ2 regions, a Seventy-Four's nanotech can only affect him-, her-, or itself internally. In SZ1 areas, nanotech does not work at all.

Psiders

In a worldline where the UN -- bolstered by the shadowy Metapsychic Directorate -- has highly-regulated psionic abilities and completely outlawed unlicensed psionic use, the Psiders are rebels fighting Big Brain Brother's growing control over the entire Earth. While escaping from an UNMD Mind-Prison, captured rebels utilized an experimental psi-drug meant to boost their abilities. Instead, their minds linked into a psychic gestalt and summoned the Vortex. Seventeen people appeared on Yrth 2: 8 Psider rebels (3 male and 5 female), 5 non-psychic prison guards (3 male and 2 female), 3 lab workers (1 female

doctor, 1 male nurse, 1 male lab assistant), and 1 psychic UNMD Agent (female).

Non-psychic Psiders are typical humans. Psiders are humans with psionic abilities; on Yrth 2, these powers work variably. In SZ3, all powers work normally at full strength; note that psychic teleportation *will not work* in regions below SZ3. In SZ2, only limited and weak forms of sensory abilities like telepathy or precognition function -- though a powerful psychokinetic *might* be able to do slow and tiring micro-TK. In SZ1, psionic powers do not work at all.

Psider technology is vanilla for the most part, but its knowledge, techniques, and devices in the fields of biochemistry, genetics, and parapsychology should be considered SZ2. Psi-drugs (usually boosters and dampeners) are SZ3.

Rocket Leaguers ("Gabbrookians")

The Rocket League patrol ship *GSS Jeljellek*, on sentry duty along the Zevellun-Gabrook (read: "Venus-Earth") run, accidentally flew through the Vortex. In their home universe, Earth is known as "Gabrook," and is much drier. Somehow, this difference led to the rise of a variant human species. Fifteen highly-trained, green-skinned, pointy eared Rocket Leaguers (13 male, plus the Plucky Girl Reporter and the Mad Scientist's Daughter) have been trapped in a new universe . . . and they relish the challenge.

Gabbrookians are wildly variant humans, possibly descended from a highly mutagenic Neanderthal stock. Their skin contains a green pigment that (somehow) protects them from excessive electromagnetic radiation -- especially the UV rays in sunlight. They are slightly stronger than standard humans and have much keener hearing -- and seem to have a species-wide talent for pulp sci-fi gadgeteering!

Gabrook is apparently equivalent to a 1980 Earth (when comparing their astronomical data), except that their technology is pure Flash Gordon/Buck Rogers (SZ2) -- rocket packs, ray guns, vacuum tube computers. In an SZ1 region, this pulp-tech works only half as well, at best. Interestingly, in an SZ3 region, their pulp-tech is uncontrollably *potent*, and tends to overload dramatically.

Syria Planum Colonists ("Martians")

In their home universe, it is 2100: Man has colonized the Moon and Mars. While the Moon Domes have been inhabited for four decades, the Mars Domes are much younger -- only nine years of operation for the oldest. This Dome, the Syria Planum Colonial Habitat, was home to 250 men, women, and children before it was scooped out of its Martian crater and dropped onto Yrth.

Martians are essentially unmodified humans from an alternate 2100. They tend to be slightly paler and weaker than their terrestrial brethren. Although Martian space-medicine, life systems, and aerospace engineering are effectively SZ2, the majority of their tech is basically vanilla 2005 technology, streamlined, ruggedized, and miniaturized. They have a lot of supplies, well-suited for setting up a colony or homestead: tools, foodstuffs, building materials, laboratory and manufacturing modules, water purifiers, etc.

Tin Soldiers

In 2065 (on their alternate Earth), Indian cyborg soldiers of the Fifth Army invaded Dar es Salaam, capital city of the former nation of Tanzania, now the metropole of the East African Alliance. The EAA responded with its own modified soldiers, and cyberpunkian war raged. Then, the Vortex scooped up an Indian platoon that had been bivouacking on the shores of Lake Victoria. The Tin Soldiers are composed of the Lieutenant, the Platoon Sergeant, and three eight-cyborg squads (Heavy Fire Squad, all male; Recon Squad, all female; and Specialist Squad, half male and half female).

Tin Soldiers are humans with extensive advanced cybernetic modifications. All possess dataports and comm-packages built into their craniums, one cyber-eye (low-light, telescoping, targeting), and emergency medical pharm-modules tucked into their internal organs to provide intravenous nutrition, vitamins, analgesics, stimulants, depressants, anticonvulsants, and so forth.

In addition to these basics, each squadmember has their own particular package of cybermods. Heavy Fire Squadmembers tend to have extremely strong cyber-limbs and dermal plating. Recon Squad members usually have improved reflexes, an

advanced cyber-eye (rangefinding, active IR, LADAR, enhanced gigapixel photographic capability, etc.), and internal electronic countermeasure modules. However, Specialist Squadmembers can individually have *any type of cybermod* -- artificial gills, glider flaps, acid glands, universal digestion, climbing suckers, cyber-tentacles, whatever.

This cybertech can only operate at maximum potential in an SZ2 or higher region. When within SZ1 regions, cybertech does not work well; indeed, Tin Soldiers often refer to their mods feeling "listless" or "numb" in those Zones.

Vortex Victims Recap Table

Name	Numbers (M/F)	Local Year	Basic Szs	Notes
Augustinians	20 (11/9)	2005	SZ1	PCV is SZ3
Seventy-Fours	50 (30/20)	2074	SZ3	nanotech
Psiders	17 (8/9)	2005	SZ3	psychic powers
Rocket Leaguers	15 (13/2)	1980	SZ2	variant humans; pulp-tech
Syria Planum Colonists	250 (xx/xx)	2100	SZ2	most technology is SZ1
Tin Soldiers	26 (14/12)	2065	SZ2	cybertech

Now What Do We Do?

Damage control: Repair any damage incurred before, during, or after contact with the Vortex; loot other grounded spacecraft or structures for spare parts.

Survival: Test the local life and environment, looking for fresh water, foodstuffs, and resources.

Exploration: Attempt to learn as much about this world and its inhabitants (willing and unwilling).

First contact: Form alliances with other groups.

Escape: Figure out a way to lift off, avoid the tractor beams and the golden moon, and sail back through the Vortex to home.

Colonize: Settle down and make Yrth 2 your own.

Some of the groups noted above will generally want to stay (Syria Planum Colonists), others desire to return home (Rocket Leaguers), and still others wish to leave and come back, perhaps with their oppressed brethren (Psiders) -- this provides conflicts internal and external to each group.

How Do We Get Back Home?

Unknown. Maybe your group has some crazy ideas to try. Maybe some other group knows.

What Everybody Doesn't Know

What Happened to Yrth 1?

Why would this planet be called Yrth 2? It's the third planet from its star -- there's a Mercury and a Venus analogue orbiting further inward. Why would anyone call their planet the second? Some options:

- 1. Planet named after Venus analog was discovered, but before Mercury analog.
- 2. Planet renamed after an apocalyptic war.
- 3. Planet is artificial.
- 4. Yrth 2 is actually the name of the Golden Moon.
- 5. Planet was colonized by beings from a "Yrth" located somewhere else.
- 6. Planet isn't just artificial, it's a computer simulation (and so are you!).
- 7. Something else.

No Magic!

As written, the universe that includes Yrth 2 is entirely *no mana* -- this means no magic works at all. While backfires on magical teleports or gate magic can lead *into* the Yrth 2 universe, they can't get you out.

(If a GM thinks this is too harsh, he or she can feel free to permit magic to work at SZ3, or temporarily "convert" magical ability into gadgeteering or psionic ability or inherent nanotech control.)

Gabrook 2?

The Rocket Leaguers call their home Earth "Gabrook." Whether this is the same Gabrook (centuries in the future, of course) that is the origin of the goblins in **GURPS Banestorm** or an "alternate Gabrook" is left up to the individual GM.

The History of Yrth 2, Part I

Millennia ago, the Precursors left Yrth 2. The servants of the Precursors worked as custodians of the planet, keeping it in good shape for the Precursors' possible future return. Time passed.

Solar flares. Asteroid impacts. Cosmic ray storms. The wear and tear of thousands of years. All of these factors led to hiccups, breakdowns, errors in programming, mutations in surface life.

The servants gained sapience. During their struggle to understand their new enlightenment, there were inevitable periods of conflict and cooperation. Empires rose and fell. And behind it all was the question that haunted all the servants: "What now?"

A great alliance of the servants came together at the site of the Precursors' Ascension. They attempted to use the Ascension Machine to contact their missing masters, to advise them of the changes on Yrth 2, and to request new instructions, given their altered state. Something went terribly wrong.

A titanic explosion annihilated the alliance, leaving only the outlier and renegade servants alive. The Ascension Machine was destroyed, along with a massive region of the mountain range where it was located. A desert grew in the fallout region. The planetary climate changed, and (possibly) reality itself fractured. The Science Zones began to fluctuate, and the Vortex appeared. The remaining servants fell upon each other, launching an intermittent state of war that lasts to this day.

And then the first victims of the Vortex began to land. . .

The Precursors

The Precursors were, if not human, sufficiently human-like such that their technology, infrastructure, and vehicles are all appropriately sized and ergonomic for humans. Otherwise, all that is known about them is they *left* Yrth 2 somehow, using the now-destroyed Ascension Machine.

Perhaps they force-evolved themselves into energy lifeforms, evacuated to a new dimension, blasted off in a colony ship, uploaded themselves into a gigantic computer (see below, *The Golden Moon*), or just died from some apocalyptic nanodisease.

LFOIs & RLOCs

The Yrth 2 Precursors left two types of artificial servant as caretakers of their planet: the LFOI and the RLOC.

LFOI (Light Form Optimized Intelligence)

LFOI are digital intelligences, resident in tiny, floating "light-bees" that can project their chosen image onto a nanofog. They have been charged with "gardening" duties -- protection, maintenance, information-gathering, and the study of biological life. They live in *crystal forests* -- giant shards of quartzium, shielded by spinning diamondoid canopies that convert sunlight, rain/dew, and blowing winds into electricity with a 99.8% efficiency.

LFOI do not age, but have a low level of "reproduction" -- the resources needed to create and repair light-bees are scarce and

hard to work. They can float, stretch, and partially pass through openings large enough to admit their nanofog (or fully, if the opening can permit the light-bee to pass), have 360 degree vision, and can fire a powerful defensive laser. They possess a wide-range of knowledge and theoretical understanding of the sciences, but they really shine at information management and biosciences. At SZ1, LFOIs are totally inert. At SZ2, they can operate, but their projected image is simply a hologram, unable to affect the physical world (all samples and work must be done by the light-bee itself). At SZ3, the nanofog projection can manipulate physical objects.

RLOC (Robotic Logical Operations Construct)

RLOC are robotic intelligences created to repair, maintain, demolish, and construct the physical structures and machines of Yrth 2 -- they are the Precursors' "mechanics." They "live" in *steel pits* -- underground installations full of machines and technologies.

RLOC age and suffer wear and tear, but have a high level of "reproduction" -- the resources needed to build new RLOCs are abundant and easy to work. They are strong, tough, and pack a wide-array of repair tools which can be used as weapons. While skilled at understanding technology and machines, they are often at a loss when dealing with biological life. At SZ1, RLOCs operate as complete hive-mind automatons. At SZ2+, they are fully sapient, individualized beings.

The Golden Moon

While the same size and mass, and in the same orbit as Earth's moon, this satellite is a gigantic, gold, gridded space station. It has ludicrously powerful weapons, though not quite to the level of planet-busting (consider it "the Death Star's kid brother"). Several of the following may be true about the Golden Moon:

- Inhabited by "weird" LFOIs, RLOCs, or both.
- Contains millions of cryo-storage units holding the Precursors.
- Moon's core is a gigantic computer holding the uploaded consciousnesses of the Precursors.
- Planetary defense system: shoots down big asteroids and invading fleets.
- Traffic control for surface-based tractor beams.
- Contains the Vortex Generator.
- Contains the Vortex Control Unit.

Science Zones?

Three possible justifications for the existence of the Science Zones are:

1. *Power Beams.* In areas where the broadcast power still operates, you get higher Science Zones.
2. *Junk/Countermeasure Nanotech.* The lower the Science Zone, the more "junk" or actively-hostile ambient nanotech there is, interfering with advanced technology.
3. *Underlying Code.* If the setting is all just a computer simulation, then -- simply -- certain classes of technology are contradicted.

See also below, *SZ Rules Suggestions* and *Eliminating SZs*.

PC Opportunities

Sure, players can generate characters from the groups listed above. But one of the benefits of the Yrth 2 setting is the ability to pick and choose characters from *other* favored science fiction settings and throw them all together. Ever want to see Sulu swordfighting with Skywalker? Jayne Cobb and Worf comparing weapons? Zarkov and Banzai collaborating on a supertech device? Maud'Dib and Severian having a Messiah-off? Determine if Kryten or C3PO would fight to the death to claim the title of "most irritating robot servant"? Yrth 2 is the place to be for these sorts of crossovers.

NPC Backgrounds

Each character below has their most important *strengths* (generally positive qualities, abilities, skills, or effects) and

weaknesses (generally negative qualities, abilities, skills, or effects) detailed. In descending order, the ranks are Master, Expert, Good, Average, and Poor. Depending upon the conception of what a character is like, any quality can be a strength or a weakness.

For example, suppose a character has "Spoiled Brat" as a quality. If it's ranked Average or above, it's a strength: the character always gets his own way, can wield undue influence by threatening to sic their Mommy or Daddy on others, might possess lots of cash or gadgets, and people may fawn over them, making life easy. But if the character has "Spoiled Brat (Poor)," this is a weakness: the character has led a pampered and sheltered life, rubs people the wrong way, and expects everyone to bend over backward to fulfill his most minor needs.

Since many game mechanics provide prose "benchmarks" to understand stat or skill levels, the ranked qualities below should be easily adaptable into any desired system. (Also see [the PDQ System](#) from [Atomic Sock Monkey Games](#).)

Professor Jennifer Sobolewski: Professor Sobolewski is an Expert Theoretical Physicist, a Good Outdoorswoman, and a Good Guitarist. While fascinated by the data collected on the Vortex (from its appearance through depositing the Project on Yrth 2), and intrigued by the new world she finds herself upon, she wishes to return to her home dimension greatly -- her husband and daughters are still there. Thus, she is Obsessed with Transdimensional Information (her Poor weakness): constantly seeking out stories, technologies, and "powers" related to interdimensional travel and the Vortex.

Captain John Quincy Remington, MD aka "Dr. Joker": The Chief Surgeon's nickname comes from his initials (JQR), and have possibly led to his greatest character flaw: Always Sarcastic (Poor). This tends to interfere with his bedside manner, despite his great medical skill (Master Nanosurgeon). Possessed of Good Pragmatism, he's looked upon by his other Seventy-Fours as a rock in the storm they find themselves in. Personally, he's happy to be out of the warzone, and has no problem remaining on Yrth 2.

Alice Gerald aka Prisoner #15317: Alice is an unregistered Telepath (Good) and Expert Freedom Fighter; she's also Stubborn As Hell (Poor). She works with her fellow ex-convicts -- and the ex-guards, if she has to -- to replicate the psi-drug that permitted one of her Jumper fellows to get to Yrth 2. But her goal is not simply to return home: she wants to go, grab more of her people, and jump back, where they can live free of the UNMD's control.

Commander Teve Torbz aka "The Space Devil": The command prowess of Teve Torbz is legendary (Master Spaceship Captain), leading to his nickname among space-pirates throughout Gabrookian Space. He's competent (Good) at most shipboard operations, is a noted Fencer (Expert) with the electro-vibro-sword, and seems to be blessed with the luck of the space gods (Good Daredevil). Unfortunately, he is a Point of a Romantic Rhombus (Poor) -- the other three apexes being the Plucky Girl Reporter, the Mad Scientist's Daughter, and the *GSS Jeljellek*. He is dedicated to getting his crew back to their home universe (and making a full report).

Eva Chang: Eva Chang is an Expert Welder, used to Operating Construction Exoskeletons (Good) for the good of the Syria Planum Colony; she is also trained as an Emergency Medic (Good). She is seeing a lovely young woman on the Colony Governor's staff named Belinda Jones, and is pleased as punch to be on a planet where you can walk outside without a protective suit of armor.

Sergeant Amit Patel aka "Tădua": Leader of the Heavy Fire Squad, Amit is a veteran cyber-soldier (Expert Tin Soldier; includes basic cyber package of dataports, comms, cyber-eye, and pharm-modules). His six Cyber-Tentacles have Good Super-Strength (enough to lift a jeep easily) and permit movement speeds of 80 mph over broken terrain. His Good Dermal Plating can turn up to medium caliber bullets with no problem. His favorite weapon is his Good Portable Railgun, which causes exciting amounts of property damage. His biggest flaw is his Need to Win (Poor), which often gets him and his men into trouble (both figurative and literal).

Items & Locations

Ruins & Remnants

Any building blueprints or ship deckplans, suitably altered by damage, environment, Yrth 2 opportunists, or other castaways can provide exploratory fun. "Hey, look, Ma -- I found this mecha over in the Luddite Plains. Can I keep it?"

Steel Pits

Repurpose your old dungeons with metal plating, a coat of olive drab paint, and some flashing LEDs. Replace monsters with robots and goldpieces with powercells; keep the traps. Bingo.

Crystal Forests

If first encountered in an SZ1, these structures will simply look odd. However, if a mobile SZ2 drifts over it, the "trees" will start to glow. Some will open up slots and pour out small swarms of light-bees. Then the "ghosts" and "fairies" start appearing. If the SZ level increases to 3, then you've got a bunch of curious, potentially substantial AIs poking at you with probes and lasers, trying to learn all about you.

Surface Tractor Stations

In the past, surface tractor stations would be maintained by both LFOIs and RLOCs. Today, most of the stations have been taken over by a single type of servant. The interiors are honeycombed with power units, relays, focusing arrays, and suchlike.

The stations are directed by the Golden Moon, locking onto identified targets and drawing them down to landing pads or cradles as necessary. They are strong enough to pull just about any ship down at SZ3; in SZ2 conditions, they are weakened, and sturdy ships with strong engines might be able to break free. They do not operate within a SZ1, but their tractor beams can still *pass* through SZ1s and still weakly affect ships.

Best bet to escape their powers either to wait for a mobile SZ1 to blanket the station, or for a doughty group of heroes get in and Kenobi up the joint.

Events & Possible Story Arcs

Even if the player group doesn't attempt any of the ideas below, perhaps one

of the other groups will:

Scavenge: Plenty of ruins and wrecked ships to look through for replacements for a port compression coil catalyzer or damaged hyperspace motivator.

Disable Tractors: This is ridiculous. Even if you could take off, you'd never get past the tractor beam . . . unless some crazy old fossil takes it offline.

Avoid SZ flux: Then there needs to be some nimble piloting to avoid patches of varying Science Zone on the way to orbit.

Avoid the Golden Moon: Only a narrow window for take-off, while the Golden Moon hides its face, because if it detects your ship, it could activate a new tractor beam station . . . or open fire. Maybe the best way is to try to get aboard and reprogram the station to let you escape?

Enter Vortex or Make Own Way: Once clear of the Golden Moon, you've got to find the Vortex, summon it, or try some other method of interdimensional travel (slingshot around the sun, dive into a black hole, activate the Stargate, reverse the polarity on the whoosizwhatzit, whatever). Good luck (you're going to need it)!

Build an Empire or Society: Or you could just hang around, deal with or conquer the natives or other castaways, and try to make the best of this Brave New Yrth 2.

Early Period

This time period of the setting assumes that all groups of Vortex victims have recently landed, and are only just starting to figure out what happened. No alliances, no contact with each other, no contact with the natives, and no knowledge of the dangers of Yrth 2.

Late Period

This time period of the setting assumes that most or all groups of Vortex victims landed some time ago (six months or a year), and pursuing goals of colonization or escape. Most will have knowledge or experience of the dangers of Yrth 2. Some alliances or enmities have formed (use the *NPC Group Interaction Matrix* above for ideas) with other castaways or even natives.

We're Back!

The Precursors return. Hilarity ensues.

Are the post-humans sympathetic to the castaway groups? Or do they see them as new toys to play with? (Squire of Gothos, please use the white courtesy communicator located in the lobby!)

Advice, Opportunities, & Pitfalls

Expressing the Dangers & Weirdness

Yrth 2 can be dangerous for the unprepared, and it might be a little unfair for a GM to spring a bunch of nanotech "gray goo" weapons on them unawares. Here are two methods for giving players an in-game heads-up on approaching dangers:

1. *Warning Shot*. A Warning Shot is a limited-effect example of a threat. Instead of a mob of giant cyber-kangaroos stampeding over the players' encampment, perhaps they see a single giant cyber-kangaroo bounding towards them, and the dust of the bigger herd on the horizon. This will give them time to prepare some sort of plan before being overrun.
2. *Sacrificial Redshirt*. A Sacrificial Redshirt is an NPC or group of NPCs (not necessarily associated with the PC group) that does something, or has something happen to them, which has a tragic effect. Perhaps another castaway ship attempts to take off without disabling the tractor beam: the PC group will be able to watch and learn from what happens to that ship.

Science Zoning

The Science Zones serve two purposes: to provide a rationale for having wildly variant levels of technology or ability from different science fictional universes under one framework, and to serve as an analogue to the mana levels of Yrth from *GURPS Banestorm*.

SZ Rules Suggestions

If a technology is operating in a SZ one level below its optimum, it works at a penalty. In *GURPS*, a reasonable penalty would be -5 to skill use; in *PDQ*, a Downshift (or even two) would be suitable. Adjust power costs, fuel consumption, areas of effect, malfunction possibility, or damage as appropriate.

Some technologies may work better at SZs higher than their optimum level. In *GURPS*, a reasonable bonus would be +5 to skill use; in *PDQ*, an Upshift would be suitable. Adjust power costs, fuel consumption, areas of effect, malfunction possibility, or damage as appropriate.

Eliminating SZs

Of course, if a GM finds the entire concept of SZs too silly for use, just ditch them. This means, of course, that those groups with more advanced technology or special abilities will be starkly more effective, more of the time -- some groups may have no real defenses against these technologies or abilities. Be warned!

Getting Silly

Slapping all kinds of science fiction tropes together willy-nilly may lead to silliness as the Jedi fight the Lensmen and the PsiCorps, the Blue-Handed Men join with the Men in Black, and HAL starts chatting up Holly. This might not be a bad thing, for the right group -- either as a "one-off" adventure episode or short-term campaign. Geeky fun!

If a GM and group wants to play Yrth 2 straight, then great care must be taken during character generation and campaign set-up. For example, if one is going to allow Scanners, one may not wish to eliminate a SZs limiting effect on psychic powers, or at least provide other methods of resisting the head-explodey.

In any case, Yrth 2 is what you make of it.

Maestros of the Red Sand

for *Transhuman Space*

by Eric Funk

As long as there have been nomads on Mars, there have been Romani among them. Still called "gypsies" by some, (although less commonly so because of the popularized "Gypsy Angels" in the Belt, see p. DB88), they travel the sands, trading live entertainment, news, and services for tools and supplies. Some call them "windies" or "wanderers," although these labels can also be applied to non-Trucker nomads. This situation has not changed that much away from the hustle and bustle of the urbanized Marinaris basin. The smaller communities are Isolate for different reasons, and are often supplied at irregular intervals. Between these colonies is where the Romani ply their trade, always in motion. Some plant trees and seeds wherever they make camp or vow to make minimal impacts on the environment. A few "windies" even vow never to visit the same port twice. All who choose to carry the name "Romani" hear the call of the open road.

Relations

Members of the Trucker's Guild get along splendidly with the wandering Romani, each group helping the other whenever they can (see p. ItW59). They help spread warnings and felicitations regarding people of note, thus they have a greater weight in the Martian Reputation network (see p. TM15). Interests rarely clash, and a few individuals purport to be of both groups. The Arab nomads have a cordial relationship with the Romani, as they are foremost merchants while the gypsies are primarily entertainers and craftsmen. From time to time the Romani have worked for favors from the Millionaires of Mars, passing word of areas that should be kept clear for duels, thus simplifying the work of security forces.

Ironically, the Romani now serve as a cultural link between the estranged European settlers on Mars (see p. ItW47). At each town, they share stories, language, and pass along hand-made items and artifacts as well as keeping up with the technical trades the EU citizens are famous for. Craft items include knitting, painted eggs, alcohol, and cheese. As long as the Romani obey local laws as they visit, the governments of Rust China and USA Mars tend to ignore them. Local law enforcement, on the other hand, often conducts "Customs Inspections" in conjunction with trusted Romani contacts to prevent smuggling, especially by those pretending to be Romani. Several Triad operations have been disrupted in this fashion. If it continues, then all Romani may soon gain an Enemy.

Tools

Mars Hawks are a common sight in Romani troupes, acting as stealthy scouts, as well as relays in hilly terrain (see p. ItW112). It's not unusual for Romani to wear Wearable (or have Implant) Virtual Interface units. Thus AI Allies/Dependants are also common. Beyond that, they often have access to most of the Expedition gear from pp. TS 151-153.

Many use variants of the Martian Heavy Rover (see p. ItW101) with solar panels (28kW on Mars, see p. ItW134) to travel continuously during the day at about 20 mph, or to move at full speed at improved fuel efficiency. These solar cells can recharge the power cells in 2.8 hours when parked. Some vehicles sport short-range lasercomms on the sensor turrets for private communication.

Martian Romani Template [75 points]

ST 10 [0]; **DX** 11 [10], **IQ** 11 [10]; **HT** 11 [10].

Primary Advantages: Andraste [14], Charisma +1¹ [0], Cultural Adaptability [15], Eidetic Memory 1² [9], Language Talent +2¹ [0], Musical Ability +1 [1], and 10 cp in Absolute Direction [5], Absolute Timing [5], Appearance [varies], Charisma [5/level], Fashion Sense [5], Improved Eidetic Memory [+9], Pious [5], or Voice [10].

Background Advantages: Ally [varies], Ally Group (Romani) [varies], Contact [varies], Patron (Romani Troupe) [varies], Reputation [varies].

Primary Disadvantages: Congenial [-1], Discipline of Faith (Romani) [-5], Dreamer [-1], and Xenophilia [-5], and -10cp in Attentive [-1], Compulsion [varies], Curious [varies], Extravagance [-10], Imaginative [-1], increased Chummy [by -4], Gregarious [by -9], or Xenophilia (Strong) [by -10], Vow [varies].

Background Disadvantages: Dependent [varies], Enemy [varies], Reduced Wealth [varies], Reputation [varies].

Primary Skills: Bard M/A IQ [2], Bardic Lore M/H IQ-2 [1], Merchant M/A IQ¹ [1], Pop Culture (Mars) M/A IQ-1¹ [1] (see p. BD125), and 2cp in performance skills such as Filch (P/A), Fire Eating (P/A), Fortune Telling (M/A), Juggling (P/E), Musical Instrument³ (M/H), Performance¹ (M/A), Poetry (M/A), and Sleight of Hand (P/H).

Secondary Skills: Acting M/A IQ¹ [1], Area Knowledge (various) M/E IQ+1¹ [1], Area Knowledge (various) M/E IQ+1¹ [1], Orienteering M/A IQ-2 [1/2], Survival (Martian Plains) M/A IQ-2 [1/2], and 1/2cp in one of Mechanic (Specialization) (M/A) or Animal Handling (general or Mars Hawk) (M/H).

Background Skills: Philosophy (Romani) M/H IQ-3 [1/2], and 1cp in unarmed skill(s), such as Karate (P/H), Judo (P/H), Boxing (P/A), or Brawling (P/E), 1cp in ranged weapon skill(s) such as Guns (P/E) or Beam Weapons (Electrolaser) (P/E), and 1cp in improving these skills, or in a melee skill such as Short Staff (P/H), Knife (P/E) or Tonfa (P/H).

Cinematic Skills (B175): Detective! or Music!.

Languages¹: Cantonese M/A IQ+1 [1], English M/A IQ+1 [1], Romani (native) IQ+2 [0], and 1cp in one or two other Language(s).

¹ Includes bonus for Cultural Adaptability

² Historically Learnable, see p. F128 (4e)

³ Includes bonus for Musical Ability

Example Character:

Piedro Momiji a.k.a. "The Maestro of the Sands" [100 points]

If one were to enter any small Martian town and ask the local entertaining community about "an old Romani," they will know someone like that. No one will know exactly when the wanderer arrived on Mars, but it has been a long time. Some say that he served in a military, while others claim that he was part of a relief force. All agree that such a man as Piedro has a good sense of humor; he is difficult to anger. As a guest, he will eat any food presented to him, as long as the hosts eat the same food without needing biomods. His watch and assorted scars have various tales regarding how he acquired them (some conflicting, but all are entertaining and educational). Unfortunately, his old age is catching up to him, starting with his fortitude and hearing, although the latter is still as acute as an ordinary man's. His nanomods are gifts from just a few of the people whose lives he has touched over the decades. His NAI, "Bastien," has been in his VIG for years, and can play accompaniment if needed, but is otherwise mute. It is an evolved "CG Faraday" (see p. PF57), with Music and First Aid skills instead of Piloting and Sensor skills.

The Truth: Growing up in China as the only child of European parents, Piedro was exposed to a number of cultures as they were moving from city to city. He became an outspoken student during the time when Mars was seen as a penal colony. After arriving on the Red Planet, he set out away from Chinese territory and discovered he liked to

travel. As such, he has never returned to the Chinese cities of New Shanghai and Haiyuan. Although his Andraste biomod was not of his own choice, the freedom it brings is cherished by his people.

Quotes: "I'm getting too old for this sort of thing."

"*That* is a story that began a long time ago, on a planet far, far away . . ."

"In the light of the many moons man hath wrought and afix'd in the heavens . . ."

"*Real* communication is done in person!"

Piedro appears as an older man with tied-back shoulder-length gray hair, and a well-trimmed beard (both often stained with Mars-dust). He usually wears a bardic tunic, baggy pants, two golden ear rings, and carries a silver pocket watch (Mars time) in his breast pocket and a smile on his face.

Information is in Mars units; Terran units are in parentheses.

Apparent Age (years): ~32 (60)

Approximate Age (years): ~43 (80)

Height: 5'11"

Weight (lbs): 57 (150)

Race: Human, European, mixed.

Handedness: Left

ST 9 [-10]; **DX** 12 [20]; **IQ** 13 [30]; **HT** 9 [-10].

Dmg: 1d (thr), 1d+1 (sw) (Boxing); Speed 5.25; Move 8 (5) (See p. ItW 33); Dodge 5/6 from Boxing; Parry 8 (Boxing).

Advantages:

Ally (AI, Bastien, Always, 75cp) [0]

Charisma +2³ [5]

Cultural Adaptability [15]

Eidetic Memory 1 [9]

Independent Income (Music Royalties) [5]

Language Talent +3³ [2]

Musical Ability +3 [3]

Reputation (Wise and Honest +3, Small Class, Always) [5]

Reputation (Good Musician +2, Large Class, Sometimes) [3]

Voice [10].

Disadvantages:

Bad Back [-25]

Delusion (Not hard of hearing) [-5]

Discipline of Faith (Romani Tradition) [-5]

Hard of Hearing [-10]

Secret (Exile) [-5]

Skinny [-5]

Xenophilia (Strong) [-15].

Quirks:

Attentive

Imaginative

Responsive

Removes ear rings before a fight

Tries to avoid real-time electronic communication [-5].

Biomods:

Andraste (\$14,000) [14]
Liver Upgrade (\$10,000) [10]
Tetrachromatism (\$500, see p. ItW 99) [0].
Nanomods (see p. TS165):
Artery Cleaners (\$5,000) [0]
Carcinophages (\$7,500) [3]
DNA Repair (\$10,000) [4]
Immune Machines 2 (\$5,000) [5]
Pore Cleaners (\$500) [0]
Tooth Cleaner (\$1,000) [0].

Skills:

¹ Includes +2 for IQ

² Includes +2 for Charisma

³ Includes +1 for Cultural Adaptability (other than ² and ⁴)

⁴ Includes +3 for Language Talent

⁵ Includes +3 for Music Ability

⁶ Includes +2 for Voice

⁷ Does *not* include +1 from Tetrachromatism (e.g. for sigils designed by others with this biomod.)

Equipment: Distributed Virtual Interface Glasses with integral compass, GPS, and Teleview ×4 (0.2 lbs, \$2,100), Medkit (1 lb, \$150), Musical Instruments, hand-made or custom 3D printer models: flutes, a guitar, and a violin.

Adventure Seeds

"So You Need a Guide?": They have a basic map to a "Martian temple"/lost mine/crashed ship/meteorite. They need a vehicle to get there and going to a normal rental agency will attract unwanted attention.

For a Song: An old man with a kindly face has been asking about the group. The adventurers have a reputation for accomplishing just the thing he needs solved. In fact, he seems to know a lot of information about the abilities and resources of the group, and has a job that requires all their talents . . .

Guanxi: The old man's violin is broken on a PC's behalf (perhaps to save him from a mugger), and now a debt is owed, which can be repaid by finding him a new one . . . (see p. ItW 40)

These are not the (Corporate) Drones You're Looking For: PCs need to sneak through an area undetected, and what better way is there than disguised as Gypsies? In order for the Romani to honestly be able to vouch for them as "brothers," they will need to try to fit in early in the trip . . .

Lost and Found: The PCs are looking for someone, and the "wandering Gypsy" may have seen him, but the potential informant has already left. Once tracked down, he has only heard about him in the previous port of call, but knows someone *two* ports ago that had seen him . . . Of course, he/she/it doesn't have a phone number.

Map Quest: The adventurers are hired to chart an area to look for minerals, a lost base, or Ares Conspiracy factory. This old man has actually been there!

Horse Races? Due to the interference of the heroes, a Romani is hurt during a juggling competition, and can no longer race. One PC must go on in that performer's stead . . .

Persecuted?: A Mars Development Corps security force is leaning on a youth, but the troupe has medical supplies needed in a remote community. The heroes are asked to be in one of two places. They could wait for him to be released, and then catch up to the Troupe. The other alternative is a breakneck race across the Martian wilderness to a volatile, quarantined Isolate community.

The Show Must Go On: The Romani are hosting a benefit concert in a medium-sized settlement. The problem is that someone is trying to spoil the fun. While all the actors are performing (or otherwise occupied in the project), someone is setting fires and sabotaging equipment. So far no one has been hurt, but Piedro asks the PCs to find out who, and why. He hints that it would be appreciated if the culprit could be given to them to turn over to the authorities . . .

The Wrath of the Collector: The party is contracted to persuade a "crazy old man" to part with an antique violin, in any way that does not damage the instrument . . .

What the collector neglected to mention is that there are other bounty hunter teams after the violin. Their employers are all seeking a microchip that was secretly planted in it.

Variants

Horror: Add Hidden Lore-12 M/H [2], Occultism-12 M/H [2], and Scrounging-12 M/A [1], add perhaps Unattractive [-5] and this man could be a source of information on the weirdness. If magic is available, consider the Ritual Magic paths of Knowledge, Dreams, Nature, and/or Luck.

Pulp: Replace the rovers with large (ex-military?) trucks, and change the transhuman skills to 1920s skills such as Languages, Accounting and Conspiracy Theory.

Western: A memorably sight in an Old West campaign may be cowboys encountering a colorfully painted horse (or camel)-driven wagon. Convert as per Pulp, swapping vehicle skills for Packing, Animal Handling (specialty), Veterinarian, and Teamster.

Fantasy: As above, but convert Guns to Crossbow.

Space: Fusion-powered FTL and total Life support systems mean that travelers no longer need raw resources to survive. On the other extreme, the Romani may well have ships of the smallest FTL configuration possible, so they could *live* anywhere they wanted to.

The Republic of Sealand

by S. E. Mortimer

E Mare Libertas -- From the Sea, Freedom.

Welcome to Europe's smallest nation: a decommissioned World War II gun platform off the east coast of England.

Introduction

Sitting in the North Sea -- seven nautical miles off the east coast of England -- is one of the world's most successful micronations. The Principality of Sealand was originally one of a series of anti-aircraft platforms constructed by Britain to help ward off German airstrikes during World War II. After the War, British authorities abandoned the platforms. One of these was known as "Roughs Tower" located northeast of London and opposite the mouth of the Orwell River and Felixstowe. Being positioned around seven nautical miles off England's coast, it was more than three miles outside of Britain's territorial waters at the time, but is today within the 12 nautical mile range claimed by Britain in 1987. As such its existence as an independent sovereign nation is uncertain.

History

In 1967, former English major Paddy Roy Bates -- a pirate radio broadcaster and owner of a fleet of fishing boats -- occupied the platform and settled there with his family. Two years previously he considered the site as a base for his pirate radio station, but when Britain legalized commercial radio, Bates thought he could make money by creating his own principality. He proclaimed Roughs Tower an island state and renamed it the Principality of Sealand. In the same year the British government sent out a demolition team to dismantle the only other surviving platform (known as HMF Sunk Head) to prevent anyone else who might be considering "secession." The explosion could be seen by the Bates family six miles away on Sealand.

In 1968 a buoy repair boat came too close to the platform and Roy's son, Michael, fired warning shots from the tower. The British government promptly charged Prince Roy and Michael with unlawful possession and discharge of a firearm. The Essex Crown Court ruled that it didn't have jurisdiction over the platform since it was outside of Britain's three-mile territorial limit. The British government chose to drop the case because of unfavorable media attention, and the Prince took this as tacit recognition of Sealand's independent status. Within seven years he had developed a constitution, a national flag and anthem, and issued passports, vehicle license plates, postage stamps, coinage, etc. The Sealand Dollar was fixed to \$1US.

Coup De Tat

In 1977 a group of German and Dutch lawyers and diamond merchants approached Prince Roy about buying the platform. While Roy and his wife waited in Austria to meet the consortium, A German with a Sealand passport named Gernot Putz, along with some Dutch mercenaries, invaded the platform and overpowered Michael. He was held hostage onboard for three days, after which time Michael was abandoned in Holland. When he met up with his parents, he helped his father organize a counter-attack. They enlisted a pilot friend with a helicopter along with some "hired guns." The men abseiled down at dawn onto the platform, with Michael in the lead, and the confused Dutchmen surrendered after Michael fired a shot from his shotgun. The Dutchmen were released but Putz was imprisoned and charged with treason (because he was a Sealand citizen). It took the personal visit from a German diplomat to secure the man's release.

Sealand claims Putz admitted to selling over 150,000 fake Sealand passports, which have been used for illegal activities such as opening money-laundering bank accounts. One incident involved the FBI investigation into the

murder of fashion mogul Gianni Versace in 1997. The killer, Andrew Cunanan, committed suicide on the Miami houseboat of an accomplice -- both men had fake Sealand passports. The boat owner apparently had been driving around Los Angeles with Sealand "diplomatic plates" on his car. In 1999 Spanish police busted a Madrid-based gang tied to international drug trafficking, arms smuggling, and money laundering. The gang was using a fake Sealand web site and thousands of fake Sealand passports to hide its criminal activity. Another scam involved selling fake passports to Hong Kong nationals who wished to leave during the Chinese takeover.

HavenCo Ltd

In June 2000 an Anguillan-based company called HavenCo announced plans to locate its servers and satellite uplinks on the Sealand platform. The purpose of this was to allow companies using its servers to avoid the government scrutiny which would have been made possible with the introduction of new laws in countries such as Britain and the United States. In 2001, once it validated the platform's independent status, it leased floorspace in Sealand's south tower, installed a million dollars worth of equipment, and set up business as an Internet collocation service.

Some of HavenCo's clients include banks and financial institutions with sensitive clients who need a secure, untraceable transaction system, R&D companies who need a secure place to store their research, and businesses who have sensitive personnel files. HavenCo's website notes that they provide "unsurpassed physical security from the world, including government subpoenas and search and seizures of equipment and data." HavenCo uses tamper-resistant hardware and cryptography to maximize security and it has vowed to destroy the servers as a last resort if someone tries to take Sealand by force, thus guaranteeing the security of its clients' data. The company claims that it keeps a close eye on its servers and if any suspicious transactions took place, HavenCo would investigate, remove offending data, and cancel breached contracts if required.

The platform is connected to the wider world through microwave, satellite, and fiber-optic links to London's Telehouse and the Amsterdam Internet Exchange. It is believed that the lower levels of the south tower contain nothing but computer equipment and air conditioners, powered by a triple-redundant backup generator system. These levels are sealed in a near-pure nitrogen atmosphere. This virtually oxygen-free environment serves three purposes: to reduce the risk of fire; to prevent intruders; and to inhibit corrosion, which is exacerbated by the proximity to sea salt.

The "Island"

Originally known as "His Majesty's Fort (HMF) Roughs," it was a reinforced concrete pontoon measuring 168 feet by 88 feet, supported by two hollow 35-foot-diameter towers. These were mounted on a "boat shaped" base 214 feet deep, 168 feet long, and 88 feet wide. It was constructed at Gravesend in 1940 and towed to Tilbury for outfitting. About 100 men were assigned to it before deployment. In 1942 it was towed out seven nautical miles to the Rough Sands sandbar and sunk so that only the towers and platform were visible above water. The two hollow towers were divided into seven floors, some of which were underwater, for storage and accommodation. A steel framework at one end of the platform supported a landing jetty and crane which was used to hoist supplies and crewmembers aboard. The platform also had a gundeck, armed with two 4.5" guns; an upper deck, armed with four Lewis machine guns and two Bofors 40mm gun; and a central tower containing radar equipment with a radar dish on top. It was not a popular post and could be difficult and expensive to provision. By 1946 the Royal Navy had abandoned Roughs Tower.

Today the platform is in use again, and a new crane hauls people and supplies onboard (a journey of about 60 feet straight up). A long thin communications antennae is mounted to the helipad (the upper deck) and on the rusting deck below are scattered oil and fuel drums, gas canisters, and disused equipment that might one day be salvaged. The helipad is the roof of a low building which contains several cabins on either side of a long central passageway called "the Run." The Sealand Post Office is at the end of this passage. All interiors are of riveted steel panels covered with many layers of white paint. There are four large diesel generators onboard but only one is needed to supply power to the entire platform. The other three are for backup purposes to ensure that there is never a power outage. Battery backup can power the platform for five minutes or so -- long enough to start up an alternative generator should one fail.

Each of the seven levels in the two towers is around 35 feet in diameter and is surprisingly dry and comfortable, though the sea can be heard surging against the other side of the wall. The north tower houses guest quarters, a brig, and a conference room. The south tower contains the "stateroom" on the top level with an office and racks of computers, but the lower levels are restricted to personnel authorized by HavenCo and contain their offshore "data haven." The weekly 45-mile supply run starts from the town of Southend-on-Sea at 4:30 am. With the increased activity there is also a regular ferry service to the platform; however, because of the sensitive operations of HavenCo, it is difficult to get authorization to visit. It takes several hours to traverse the water by boat, but by helicopter it is only a 15-minute trip. Employees are rotated on a two-week basis -- two weeks onboard followed by two weeks ashore in Britain. There have been around 300 legitimate passports issued by Sealand but only a little over a dozen people are onboard at any one time, including around six HavenCo employees and a contracted security force of four heavily armed men (with access to weapons including 50-caliber heavy machine guns, 5.56mm automatic rifles, and 12-gauge shotguns). One guard is usually on duty at the entrance to the south tower to prevent unauthorized access to HavenCo's servers. Sealand's current Chief of Security is Alan Beale. Alan and his security team also double as a maintenance crew, carrying out most of the day-to-day upkeep of the platform.

Despite the coup in 1977, security isn't considered likely to be compromised these days. The guards would be able to prevent an unauthorized helicopter from landing, and the only other way to gain access is to scale one of the towers from the sea. An extremely difficult undertaking because of the way the platform overhangs. And the British government, however much it might like to see Sealand disappear, would be unwilling to permit a foreign power or terrorist organization to mount an attack so close to its shores.

Sealand has a national football team, based in Denmark. Today Prince Roy is 83 years old and has retired in Spain. His son and heir apparent, Prince Michael, takes care of the daily business of running the principality. At only around 30 feet, the water depth is quite shallow on the Rough Sandbar. In the future, Bates has plans for extending Sealand into a man-made island with space for banks, its own airport, and possibly a hotel and casino complex.

Hazards

It is frequently very windy around Sealand, making it dangerous for helicopters to land; people being winched aboard have been known to have been swung so wildly that they have slammed into the side of the tower. It could also be a shipping hazard, especially during rough weather. In the early 1960s another platform known as Shivering Sands was struck by a ship, causing one of its towers to collapse, killing four people (at the time, the platform was being used as a pirate radio station known as Radio City). Also, being located in the middle of the sea and made of metal, the platform is a natural lightning conductor. There have been no fatalities, so far . . .

Legal Status

Despite the extension of Britain's territorial waters to 12 miles in 1987, international law does not allow the claiming of new land during the extension of sea rights; thus, according to this argument, Sealand is still a sovereign nation. Even so, neither the United Kingdom nor the United States officially recognize Sealand as an independent nation. However, there is some precedent for the claim of sovereignty. In a subsequent firearms incident in 1990 the British government refused to pursue the matter despite clear violations of Britain's harsh firearms legislation. In a separate ruling by the British Department of Health and Social Security, the Bates are not required to pay health insurance during the time they reside on Sealand. Each time a foreign country stamps a Sealand passport it is giving tacit recognition of the validity of those passports. Also, in the attempted coup described above, the British government refused to become involved citing the Essex court ruling as a reason. In addition, the German government, in de facto recognition of Sealand's sovereignty, sent a diplomat directly to Sealand to negotiate the release of its citizen.

Roleplaying Ideas

From 1942 till the end of World War II, Roughs Tower was an integral component of Britain's artillery defense against German air raids. In a WWII campaign, characters may be part of the 100 member contingent of Royal Navy sailors

assigned to the platform. Roughs Tower was the first sea fort of its kind and its primary mission was to look out for German submarines and aircraft.

Between the abandonment by the Royal Navy in 1946 and the occupation by Bates in 1967, Roughs Tower was deserted. It would have made an ideal hideout for a gang who were hiding from the authorities, or as a base for low-profile criminal activity.

After the occupation by Prince Roy, Sealand is declared a sovereign nation. Perhaps the PCs are the team of mercenaries hired by Bates to take back his country after the attempted coup in 1978. Perhaps the PCs are members of an IT company interested in using the services of HavenCo to escape the scrutiny of the authorities of other nations. Perhaps the PCs are hired to try and infiltrate Sealand and discover what HavenCo is hiding on its servers.

If Prince Michael successfully establishes his proposed man-made island extension, there would be plenty of opportunities for entrepreneurial characters to take advantage of a state in the early stages of expansion.

What would happen if a government wanted to extradite one of HavenCo's employees for criminal activity before he joined HavenCo? Would Sealand turn him over or would the state resist the extradition? What action would that government take if Sealand ignored the extradition request?

Perhaps when the British Navy came out to dismantle the second remaining platform (HMF Sunk Head) in 1967 they found it already occupied -- possibly by the PCs. Today that platform might be operating in cooperation with Sealand or it may be a direct competitor.

Birth is a Life Sentence

In honor of last week's Talk Like a Pirate Day, riddle me this, Batman!

What does the classic Sid Meier computer game *Pirates!* have to do with my commute to work last week?

Errr . . . besides my longing to draw my cutlass, hop from stopped car to stopped car, and sever the heads of idiot drivers who so richly deserve it? Oh, and take their loot, too?

Well, let me back up a minute. I got my first temp assignment this past week. Now, as I left to drive to my assignment (which sparked another random thought, which I hope to write about for next week's column), I departed with what I thought was plenty of time to get there -- MapQuest said it'd take 16 minutes to drive the 11 miles, so I left 46 minutes early.

So when I got to my destination 15 minutes late, I was displeased. I was in my car for over an hour, resulting in an average speed of just over five miles per hour . . . a speed I can equal or exceed while walking on my hands. And as I felt some of my first flushes of what I can only assume to be road rage (or else the high-strung bacony blood that's claimed the lives of every Marsh for the past three generations), I realized: I don't have time for this.

And as I got home at 6pm, I realized . . . I *really* don't have time for this. Between the mandatory one-hour lunch (where it's hard to do anything useful except stand against a cubical wall, regenerate, and plot revenge against the Doctor) and the hour there and back, my eight-hour shift is an 11-hour extravaganza. In doing the flashbacks, I realized I'd never had to commute before, at least any distances longer than a mile or two. (Long-time readers may have pieced together that I only learned to drive in the past few years -- inspiring at least [one article](#).) The notion of losing an hour or two is troubling to me, let alone losing an hour or two a *day*.

Of course, there isn't much room for me to whine. After all, as I understand it, people in the real world do this every day. But -- and here's what's getting my goat -- the way my life is structured, I can't afford to lose that 10-15 hours a week. Heck, those hours could easily form the bulk of my budgeted *Pyramid* time, let alone any other office aid I'd want to do, freelance writing, playing on the computer . . . oh, yeah, and did I mention I'm [married](#)?

So what does this have to do with *Pirates!*? Simply put, quite possibly the greatest challenge an intermediate-to-experienced player of *Pirates!* has is the lack of time a seafaring swashbuckler has. As the pirate gets older, his abilities slow down, putting him at greater danger for a cutlass to the chest. After a long enough career, he will eventually be forced to retire due to advanced age and poor health. As best as I can remember, you never actually "die" per se in *Pirates!*. Rather, if your ship sinks you wash up on an island, only to be rescued months later; if you lose in a sword fight against a pirate-hunting privateer, you might spend months in jail. And so on.

This arrangement can serve as a good model for GMs and players alike . . . especially since many gaming groups are at least halfway there, already. See, most gaming groups I've run or been a part of have had a reluctance to kill off PCs trivially. Since I do this in my own groups, it stands to reason that it's something I believe in and support. And that'd be right. But it can be challenging to keep the excitement level up, since the players might come to believe that nothing holds any significant danger for their characters. But it's quite possible to turn that assumption on its ear; sure, you won't die now, but a hero only lives so long . . .

I've talked about time as a commodity previously, but only in the micro sense: You have X number of hours in town/at the headquarters/in downtime; what do you do with it? But time can be an excellent macro motivator, too. And, unlike the real world where we never know how much time we have left, it's even possible to let players know the expected lifespan of their characters, or the campaign: "This series will span 30 years, beginning with you all as young heroes and ending with your retirement (forced or otherwise)." In fact, I've even taken this to an extreme myself, such as my article for *d20 Weekly* called ["The Last Year Of Your Lives."](#)

Such a scheme might even inspire a bit of competition among the players; if a campaign has a definite length -- and a

predefined ending -- then players might be a bit more ambitious. (It worked for the comic strip Cerebus; everyone knew he was gonna die for decades . . .)

To quote *Fight Club*, on a long enough timeline, everyone's survivability drops to zero. And the length of that line is finite and, in most ways, more irreplaceable and precious than gold or other markers. Treating it like a precious commodity -- the ultimate nonrenewable resource -- may add more spice to a game than any mere atomic-breathed towering cyber-dragon.

Just be wary in such a system if all the players start gravitating toward elves or similarly long-lived species . . .

Enemy Gods: A Little Game Of Big Powers

Published by [Wicked Dead Brewing Company](#)

Written by John Wick

60-page 5.5"×8.5" spiral-bound softcover; \$12

0.8 MEG PDF Document; \$6

Games in which you play gods or beings of that degree of power are nothing new, including [Panthreon and Other Roleplaying Games](#), [Nobilis](#), [Primal Order](#), and [ARIA: Canticle of the Monomyth](#). The newest entry to this little pantheon of titles is ***Enemy Gods: A Little Game Of Big Powers***, an RPG in which a player not only takes on the role of a god, but a hero as well. Designed by John Wick (responsible for [Legend of the Five Rings](#), [7th Sea](#), and [Orkworld](#)), this is a game of heroic fantasy in the mold of Ancient Greece, and the works of Michael Moorcock and Robert E. Howard. Mere mortals are capable of doing great things, but only with the divine favor of the deity or deities that they worship.

In game terms this concept is deftly executed by having each hero empowering the gods through his Devotions. In turn, the gods can grant their faithful the ability to perform amazing, even heroic feats, as well as Blessings and Miracles. Yet beware a god's wrath, as he can curse or smite a wayward hero, perhaps for not showing enough deference, or for the hero relying too much upon his own abilities, or just because. gods are like that.

Thus a player has to create two characters -- his god and his hero. Gods can be assigned by the GM, randomly or by design, either from the pantheon described in the first of ***Enemy gods'*** four appendices, or from an existing pantheon, such as the Greek or Norse. Alternatively, a GM can create his own family of gods. The GM controls any god not selected by the players.

A little more thought goes into a player's hero, as he is not your average adventurer. Touched by the gods he is destined for greatness and has already set out on that path. In terms of background a player needs to read through the game's quick version of Joseph Campbell's *Hero's Adventure* cycle and then play the game of 20 questions. In game terms a player distributes seven points between his Hero's Backgrounds and divides 10 points between his devotions. Backgrounds represent skills, talents, and experiences, while Devotions represent the bonus dice that can be called upon if a hero's action falls within the purview of a God's Domain. Thus in a duel, a hero will implore the God of the Battlefield for his aid, whilst he will turn to the Goddess of Love to help him seduce a barmaid. A hero also begins the game with two points of Hubris as well as a suitably heroic flaw. Thus a rough sailor who has seen off a pirate attack or two, and has a girl in nearly every port would have the Backgrounds of Sailor: 3, Spearman: 2, Ruggedly Handsome: 2. He has the Devotions of Battlefield: 2, Craft: 2, Fortune: 3, Hearth: 1, Justice: 2, Love: 3, and Wisdom: 4. He also has Hubris: 2, and his Flaw is "Called to the Sea," and thus cannot settle.

Instead of a Task Resolution System, ***Enemy Gods*** calls its mechanics "Taking Risks." Simply a player rolls a number of six-sided dice equal to his Hero's Background plus his Hubris or appropriate Devotion, plus any Advantage Dice. Even results on the dice count towards a set Target Number from Easy (Difficulty 1) to Mythic (Difficulty 8). If the action falls into the Domain of a god, the hero's player turns to the god's player and asks for his aid. If the god agrees, the hero can roll an extra number of dice equal or up to the Devotion rating he has for the god in question. It is down to the god to decide just how many dice he can roll. If the hero relies upon his own abilities and eschews the favor of the gods, he rolls a number of dice equal to his Hubris. Doing this can incur the displeasure of the gods.

Advantage Dice are bonuses awarded for player initiative, input, and good roleplaying. In any situation a player

describes any elements that might give his hero an edge. Each advantage accepted by the GM gains the player an extra die. For example, our sailor from above has chased down a pirate ship and jumps aboard to attack. His player suggests that his hero has three advantages: One for leaping down into the pirate's boat, a second for wielding a long spear, and a third because the Sun is behind him. Combat works in the same fashion, with a hero able to kill swathes of no-name NPCs and able to gain and keep more Advantage Dice as long as he keeps winning. If he suffers any wounds these temporarily reduce his Devotion, so limiting the degree to which he can call upon the gods for their favor.

A god has just the one attribute: Divinity. Representing the power he has over his Domain, it is calculated from the total Devotion that all of the heroes have that deity at the start of each session. Divinity points are spent to assert a god's power over his Domain in several ways. Divine Authority lets a god answer the questions that the GM ordinarily would in any other game, the hero turning to the appropriate god for answers. Thus if our sailor hero wants to know if he will catch the pirate ship by daylight, he will turn to the God of Wisdom, whose player may provide the answer. A GM can veto any answer, but rules are included if the gods want to bicker amongst themselves over such a question. A god can grant a hero even more Devotion dice for an action through Divine Inspiration, as well as getting involved in events directly, either through Divine Intervention to aid a hero, or Divine Retribution to curse or hinder him. The only thing a god cannot do is kill a hero. A god can also grant or confiscate Blessings upon a hero. These do singular things such as Slash, Kiss of Enticement, Fill Platter, and so on.

As a Hero's Devotion increases, the relationship with his god (or gods) increases in potency. He rises from Acolyte to Anointed to Champion, each granting him certain extra abilities and a greater chance that his god will listen. To rise to these levels, a hero must accomplish tasks known as Defining Moments. These are moments of roleplaying *par excellence* and great gaming significance, recognized not just by the GM but also by the players. Indeed, in ***Enemy Gods*** it is the gods themselves that vote upon such matters.

Enemy Gods is supported by four appendices that detail a complete ready-to-play pantheon, their antithesis the Fell Gods, a setting, and a guide for the GM to create his own set of gods. Within the details of the given Pantheon and Fell Gods are found details of artifact and monster creation, as well as quick and dirty rules for handling sorcerers, who are (of course) evil. The setting is "Shanri," an island chain made up of several city-states and settled by the Ven, a Bronze Age people. Of course, the GM is free to use this, create his own, or even run a game using the Greek, Roman, Norse, or any other pantheon of his choosing. ***Enemy Gods*** is perfectly suited to emulating the Greek or Norse myths.

Available as a 60-page 5.5"×8.5"-sized spiral bound book or as a 0.8 MEG PDF, ***Enemy Gods*** is an enjoyable little read. It needs another editorial pass, and in places the writing discusses aspects of the game before they are fully explained. It is irritating that the introduction ends mid-sentence, but fans of John Wick will be pleased to see that the game includes a mini-rant, this time against a very big game. (The same rant appears in the author's otherwise delightful ***Cat: A Little Game About Little Heroes.***)

Although it needs a closer study than its size suggests to gain a full understanding of ***Enemy Gods***, the duality of playing both hero and god is easily grasped. While it is easy for the player of a hero and a god to keep each other "happy," he also has to work to keep the other gods and heroes just as happy. To do otherwise will lose both characters the benefits of Devotion, but losing the favor of god is not without gaming possibilities as a hero attempts to regain it. The set-up of the game is very epic in nature and the game should be run as so, lending itself to the crafting of grand tales and myths. This is all down to the central duality lying at the heart of the game, without which it would not work. That it does only serves to make ***Enemy Gods: A little game of big powers*** perfectly suited to the telling of legends and epics.

Dungeon Master's Guide II (for *Dungeons & Dragons*)

Published by [Wizards of the Coast](#)

Designed by Jesse Decker, David Noonan, Chris Thomasson, James Jacobs, & Robin D. Laws

Edited by Michele Carter, Chris Thomasson, Ray Vallese, Penny Williams, & Kim Mohan

Art & graphics by Matt Cavotta, Kalman Andrasofszky, Mitch Cotie, Ed Cox, Steve Ellis, Wayne England, Emily Fiegenschuh, Randy Gallegos, Brian Hagan, Ginger Kubic, Raven Mimura, William O'Connor, Michael Phillippi, Vinod Rams, Wayne Reynolds, Dan Scott, Ron Spencer, Arnie Swekel, Franz Vohwinkel, Dee Barnett, & Todd Gamble

288-page full-color hardbound; \$39.95

It's a truism that just about anything that does well in modern media is going to see a sequel. The *Dungeon Master's Guide II* is a supplementary volume intended to make the referee's job easier, but it achieves only mixed results.

The chapters in this volume imperfectly track those in the original *Dungeon Master's Guide* -- chapter seven is about magic items in both books, for example. Wizards claims this manual is a lot more advice for the DM's benefit, and a way to raise one's game to the next level; the first part of the book lives up to this promise. It dissects the game group dynamics by player and game type, and tells you how to keep various personalities interested and active. This isn't new, but it bears repeating for some folks, and others might not have heard it. (Incidentally, Robin Laws, one of the authors, wrote similar material for *Robin's Laws of Good Game Mastering*, though there's no way to know who wrote what in here.)

Alas, there does seem to be some padding throughout, though most of it winds through the manual in small veins rather than squatting in blocky chunks at the end of a section. For example, the part on adventures is good: there are rules for chases and setting adventures in exotic locales like villages in the trees and ice bridges. Then again, the chases may end up among crowds, and while considering a crowd as a sort of obstacle is a neat take, the crowd rules run long. The traps section is uninspired -- instead of helping DMs create puzzles or insidious new challenges, they just offer a few new undead or haunting traps, etc., with an appropriate Difficulty Class.

There's solid advice for creating and maintaining a balanced campaign, but it shifts to a lot of medieval history. It admits most players probably want the idealized fantasy setting, then proceeds to tell us at length how awful things really were. Even here there are hidden elements DMs should consider, but there's no reason readers should have to sift through the history lesson to get to the good stuff, and sift they will. The idea of using magical events (something magical goes awry and threatens the countryside) is a plot device few people need explained to them, but there are also piles of terrific plot seeds.

New options for PCs include running their own business and apprenticeships. They can become the mentor or the

learner and gain bonuses from the relationship. They can dedicate themselves to working together to get teamwork benefits, little maneuvers that long-standing comrades would be used to using like knowing when to get out of the spellcaster's way and how to charge together. Not only did this mechanic appear in *Heroes of Battle*, some of it is lifted with little modification from that book.

The magic items chapter offers what sound like a lot of new options, but when all is said and done they're really just ability lists. There are new abilities to layer onto your weapons, armor, and more, but here they're called templates or synergy abilities -- the latter is a fancy way of saying if you get an ability on your sword, you can stack an improved version on it. These aren't worthless entries by any measure, but at the same time they're not as impressive as they sound.

Not all the chapter's offerings are unremarkable, however. Signature traits and bonding add a good bit of flavor to your equipment -- even if it's just cosmetic, a mace sounds like something more when it has a smoky sheen and traces its pedigree to the forge of the sorcerer Glazz High-Art. More importantly (from a mechanics viewpoint), the mace is now a bane against fiends when wielded by Drok the Barbarian because he personally used it to crush the life from Ferreent the Deathless. He and the weapon have an unshakable bond that provides power and storytelling possibilities.

Readers should be aware the book promises time-saving material and information, not just "expert advice." They pick apart the process of managing time both at the table and before sitting down to it. Saltmarsh, a small town that ought to be familiar to readers of the early 80s effort *The Sinister Secret of Saltmarsh*, has been transplanted here and expanded so DMs will have a hub for all their campaign activities. The city lives and breathes in these pages, which makes it one of the more cogent pieces in the book.

This time prestige classes don't pad the word count, because for once there aren't any. Instead you get a more useful set of tips on how to create such classes of your own, balanced for play. The information given is insightful and points out a lot of important things you might not have thought of when trying your hand at making your own.

The artwork is a letdown this time, too. Some of it is competent, and a few pieces are even striking, but a lot of the illustrations look like the sort of stuff you'd find in an off-brand children's book.

The book represents itself accurately on the back cover, so read it carefully. Little of this is of great utility to seasoned folks, and even newbies will find some of it sophomoric. Buyers are encouraged to skim the table of contents to make sure they know what they're getting into before plunking down their cash. While there are bright spots, the *Dungeon Master's Guide II* reads more like a repository for short essays that had little value -- and less salability -- on their own. This book is just what it says it is, and it's not hard to reach your goals when you set your sights low.

--Andy Vetromile

Pyramid Review

For Sale

Published by [Uberplay](#)

Designed by Stefan Dorra

60 full-color cards, 72 chips, 1 rulebook; \$19.95

There is a mathematical/psychological puzzle surrounding the notion of auctioning off a dollar. Obviously, in a typical auction you'd expect the bidding to stop at ninety nine cents, or a dollar at most. The curiosity stems from a simple rule change: the number two bidder must pay his bid as well, though he gets nothing! Now if you bid a dollar and someone bids a dollar ten, you're motivated to bid a dollar twenty, since winning the auction and losing twenty cents is better than losing the auction and losing your dollar. Google "dollar auction" to read about this curious parlor game that arose from an attempt to create a game that demonstrated addiction . . .

Obviously, the winning move is not to play, but in ***For Sale*** you are gently tugged into one of the most gentle but brutal auction mechanisms around, as you buy homes, and then try to sell them for the most money.

The game is played in two distinct phases. In the first phase the players bid their starting money tokens to purchase homes of various values (one each of one through 30), and in the second phase these homes are sold for checks (two void, and two each of \$2,000 through \$15,000). Your final score is the total of all your checks plus whatever money you had left over from the first phase.

During the first phase each auction is started by dealing out face up as many home cards as there are players. Players then, in turn, push forward coins in the amount of their bid. When a player drops out he retrieves half his bid and takes the home card with the lowest remaining value. Yes, that means you can drop out immediately and take the lowest valued card for free. The last player remaining pays his full bid and takes the last card, which is the highest-valued home from that auction.

Thus each player wins exactly one card in each auction, bidding simply determines who gets which card, and how much they pay. You cannot, of course, bid more than you have remaining. When all the homes have been purchased this way, the first phase is over.

During the second phase you also deal out one check card for each player each round, but this is a once-around blind auction. After the players see the values of the checks each selects a home card from their now-hidden hand, and the cards are revealed simultaneously. The player offering the highest home card takes the highest valued check, the second highest home card gets the second highest check, etc. No ties are possible since there is only one of each value home card. The home cards used are discarded after each round.

When all the players have used up all their home cards they will each have the same number of check cards, these are totaled, and victory is determined.

The auction mechanism in the first half leads to some very new choices. When the values of the cards are close together you may not want to win: you may want to be the second-to-last player to drop out, since the number two card at half you bid is a better deal than the best card at full price. It's great fun to bump up the bid; as you watch players drop out, you know the card you get will be better. But there's that occasional moment of terror when you realize they all may drop out, leaving you to pay full price.

But the worst is when the best card is substantially better than the next best card -- if you find that you're one of the

last two left in the bidding, and before you realized it the bid has risen such that the second best card is not worth half your current bid. That's the time to hope you have more money than the other player.

Another happy feature is that this is one game where you get to round in your favor: If you bid three and then drop out you get to take back two coins, not one. While this feels good for its own sake it opens up the chance to bid one higher to take the odd number when you expect to drop out next time around -- it costs you nothing, but it will cost the remaining players a coin each.

The second phase reveals the true importance of the choices you made in the first round: the 30 home card is powerful, but it can still only win one auction. And low cards you thought were not a problem because you got them for free each represent one auction you will have to lose.

The components are well done. The money tokens are thick, textured cardboard in denominations of one (silver) and two (gold). The house cards feature a bright, friendly cartoon style that I personally like. As you can imagine, coming up with 30 distinct homes requires some imagination, and its implemented with a sense of humor. One is a cardboard box in an alley, 30 is a space station. The igloo and the tepee have welcome mats out in front. The houseboat has an alligator hanging out alongside, and most gamers are highly suspicious of the tentacles coming out of the sea behind the little house on its own island.

The jury is still out on whether or not **For Sale** is a good game for kids. On the one hand its very easy and teaches some good lessons about bidding and budgeting; on the other hand, since in both phases everyone gets a card in every auction, you manipulate your fate in subtle steps, and I'm not sure kids can play at a level that would help them learn from the consequences of their actions, as opposed to **Settlers of Catan** or **Bohnanza** where you can see more clearly and immediately the results of your choices.

There is one downside: I always feel a little funny about products that ask me to pay 10 or 15 dollars for a game I could play with ordinary playing cards and a couple of poker chips or "gaming stones." In this case, though, the components are nice and perfectly suited to the game, and the game is easy enough to be played with nearly anyone and will thus get a lot of use. **For Sale** is a filler game for big game sessions, a game that non-gamers can play but won't bore gamers, a game that can be played with kids, and a game with legs.

Modern Magic Items

by Owen K.C. Stephens

"Welcome to the supernatural threat hotline. If you're facing an incorporeal monstrosity, press one. For physical threats, press two. If the creature is more of a blob or slime, press three. If it's an incomprehensible interdimensional horror destroying your sanity, press 674##311 . . ."*

There are numerous **d20 System** games that mix magical elements into modern settings. In some magic is a well-known and accepted part of society, while in others it's a secret that only a few are aware of. In such worlds, where magical artificers and television repairmen share the streets, it's logical that magic items would eventually be made from modern items. They may take on a modern appearance as a way of concealing their true function, be designed to help with the inconveniences of a modern life, or just be made up of the materials at hand.

Unfortunately, although the number of possible magic items in a modern world is infinite, interest in such worlds is not. Fewer products are printed to support these campaigns than their pure-fantasy cousins, and as a result there's much less support for GMs trying to imagine what a pizza-eating young urban sorcerer would craft in his spare time. While it's easy to take the magical functions of swords and crossbows and apply them to crowbars and pistols, the modern world has problems and opportunities that can't be properly represented simply by upgrading more traditional fantasy magics. To help fill in a few gaps, here are some magic items specifically geared around modern problems and materials (all written for the standard modern **d20 System** rules).

ACME Catalog

This simple magic item is a large catalog that seems to have a category for anything and everything. It has six order forms in the center of the catalog, which must be ripped free and dropped into a mailbox or postal delivery service for anything to be ordered from the catalog. Such items must have a weight of no more than 200 lbs, a purchase DC of no more than 35, can't be magic or psionic in any way, can't have a military or illegal level of restriction, and must be items that could reasonable be found for sale in a major city. Within those limitations, anything can be ordered from the catalog.

Once an order form is dropped off, a truck carrying the item in question arrives at the same location in 1d6 minutes. The truck is from a normal commercial delivery service, and shows the item was placed for delivery by the ACME company weeks earlier, and is pre-paid in full. Using the ACME catalog has no actual affect on the user's wealth bonus.

Once all six order forms have been used, the *ACME catalog* falls apart in a matter of hours, its pages fading into illegibility. Lesser versions of the catalog (with lower maximum for weight and purchase DC) also exist.

Type: Wondrous Item (magic); *Caster Level:* 13th; *Purchase DC:* 39 (38 if 3 or fewer charges remain); *Weight:* 0.25 lb.

Eternalready Batteries

Eternalready batteries always come in sets of two, which must be kept together. If they are separated or placed in different devices, neither works until they are reunited. However, the two batteries swell to fit spaces designed for larger batteries or more batteries, and contract to fit in things with less space. The batteries can power anything driven by a battery no larger than a typical car battery. They never run out of power or need to be recharged.

Type: Wondrous Item (magic); Caster Level: 1st; Purchase DC: 26; Weight: 0.25 lb.

Belt of Many Tools

These handy items are heavy leather belts full of pouches, pockets, loops, and hooks similar to those carried by carpenters and construction workers. Despite their relatively light weight and reasonable size, each belt is equipped with a vast collection of tools, including hammers, wrenches, pliers, and screwdrivers of varying sizes and measurements, tape measures, laser pointers, levels, bolt cutters, wire strippers, pencils, nails, screws, voltmeter, leads, wires, and fasteners of all description. In addition to providing the specific tools listed, the belt provides everything needed to serve as a demolitions kit, electrical tool kit, and mechanical tool kit. These items are linked to the belt, and if handed out are lost by the borrower in 1d6 minutes (reappearing in the *belt of many tools*). Additionally, the belt has enough pockets and straps to carry 10 lbs. worth of small items (cell phones, PDAs, notebooks, flashlights, and so on). Items placed in the belt, including its own tools, never fall out.

Type: Wondrous Item (magic); Caster Level: 5th; Purchase DC: 29; Weight: 1 lb.

Compact of Cleanliness

A *compact of cleanliness* allows its user to become clean and presentable as a full-round action. Dirt, oil, smears, and smudges are removed from both the user and his clothes, unpleasant smells are eliminated, minor tears and rips in mundane items on the person are repaired, and any make-up or hair-styling appropriate for the user's attire is provided. A *compact of cleanliness* only works once an hour.

Although the compact cleans the user totally to a casual examination, a Search or Investigate check made to find evidence on the user can still succeed, but is at a -8 penalty due to circumstance.

Type: Wondrous Item (magic); Caster Level: 2nd; Purchase DC: 27; Weight: 0.1 lb.

Endless Tape Roll

This simple magic item is simply a roll of duct tape that never quite reaches the end. It always looks half-used up and battered, giving no hint of its magical properties until used. It's capable of producing 300 feet of duct tape a day. The tape produced has all the properties of normal duct tape, and is not itself in any way magical. After producing 300 feet of duct tape, the roll seems to have just a tiny tab left which can't be pulled free. By the next day, however, the tab comes loose and can produce another 300 feet of tape.

Most *endless tape rolls* produce normal gray metallic duct tape, two inches wide. A very few have colored tape, and range in width from one inch to as much as four inches.

Type: Wondrous Item (magic); Caster Level: 1st; Purchase DC: 24; Weight: 1 lb.

Gloves of Clapping Shutdown

A fairly recent invention, the *gloves of clapping shutdown* are normally fine dress gloves (white linen if worn by a man, black silk or satin if worn by a woman), or fine black or brown leather driving gloves. These simple looking hand-warmers possess the power to shut off electronic devices. This includes anything run off electricity, which has a single button, switch, knob, lever or toggle that can turn it off. The wearer of the gloves must be able to see the switch, know how it operates, and be within 60 feet of it. The wearer then claps his hands together twice, loudly, which is a free action but requires both hands be free. If the object is unattended, it automatically shuts off. An attended object is shut off unless its attendant succeeds at a DC 16 Reflex save.

Anything the gloves have turned off they can also turn on, under the same circumstances. The gloves can only turn things off three times a day, though there is no limit to how often they can turn things back on.

Type: Wondrous Item (magic); Caster Level: 7th; Purchase DC: 33; Weight: 1 lb.

Help Line

The *help line* is a phone from which advice and clues about the future can be received. All *help lines* look like phones, but the exact appearance varies depending on when the item was created. Rumors of ancient *help lines* dating back to the early days to telecommunication seem to be unfounded, though there's nothing that would prevent the magic from working on an antique phone. The oldest known examples of *help lines* are 1970's-era lineman's buttsets (a rather large hand-held telephone with lead wires that can be clipped to any telephone line, designed for use by telephone repairmen). More modern *help lines* are almost always cellular phones, though rarely a wireless home phone, satellite phone, or walkie-talkie might be imbued with the same magic abilities.

A *help line* can function like a normal telecommunications device, though a lack of service or damage to its electronics retard its usefulness in this regard just like a mundane phone. Even if broken or disconnected from any telecommunications signal, the *help line's* magical function can be used. Once used, its magic doesn't function again for a full week.

To activate the *help line's* magic, a special phone number must be dialed (or radio frequency tuned in). With modern phones this is normally ###411*, though older phones often have numbers based on local information services or time-and-temperature numbers. The user must then use the keypad or vocal responses to answer a series of questions (which change every time the *help line* is used) that lead the user to advice on whatever topic he's using the *help line* to gain aid for. There's a 90% chance this process takes 1d6+1 rounds, and a 10% chance that after two rounds the user is "put on hold" for 1d20 minutes before getting an answer. The user must replay to question during any time he's not on hold, and that level of concentration requires a standard/attack action each round and provokes attacks of opportunity from any creatures threatening the user.

The *help line* can give advice on a number of subjects. It can act as an *augury* spell with a 90% chance of giving a meaningful reply. The *help line* can also answer questions as if the user had cast *detect magical aura*.

If the user has line of sight on a creature, he can learn one weakness the creature has (see the section on weaknesses in the standard modern **d20 System** rules). The user learns what material/condition the weakness centers around, and whether the material induces addiction, attraction, aversion, fascination, fear or harm. Alternatively, it can reveal one type of attack (silver, fire, bludgeoning weapons) against which the creature has no special defenses.

Type: Wondrous Item (magic); Caster Level: 10th; Purchase DC: 36; Weight: 0.1 to 1 lb.

Holster of Concealment

A *holster of concealment* is a high-quality holster with buckles and belt-loops that allow it to be rigged as a belt or shoulder holster (or, for those designed for Small pistols, even an ankle holster). The holster is always of a very modern design in black or brown leather, with a retaining strap that forces anyone other than the wearer to make a successful DC 20 Reflex save if trying to draw a pistol from the holster. It can act as a concealed holster. It can hold any one pistol of a given size (Large, Medium-size or Small, depending on the holster), and one magazine or speed-loader for that pistol.

Any pistol or accessories in a *holster of concealment* are immune to detection by technological means of any kind. They do not show up on X-rays, do not set off metal detectors, and are essentially invisible and intangible to any machine or detection device. The holster also conceals itself and the pistol and magazine within it from the *detect magical aura* spell, though not other divination magics. Finding the holster with a physical pat-down is difficult (DC 30 Search check), though anyone who has seen the holster in use gains a +20 circumstance bonus. The holster does not

make itself invisible to the naked eye, so if worn openly it can easily be spotted.

Type: Wondrous Item (magic); *Caster Level:* 5th; *Purchase DC:* 33; *Weight:* 1 lb.

Holster of Speed

A *holster of speed* is normally a worn, Old West-style holster or worn, carved brown leather. Such holsters can accommodate any revolver (changing shape to allow the pistol to fit snugly within), but only 25% are able to wrap themselves around a semi-automatic. (The other 75% shove any such weapon out, generally with a noise that sounds like a disgruntled snort). All such holsters are attached to a broad waist-belt with storage for 30 pistol rounds.

Drawing a pistol from a *holster of speed* is a free action, mas is putting the pistol back in its place. Further, any effort to reload a revolver with rounds stored on the holster's attached belt is a move action, or a free action that can be taken when the user takes a normal move action. Anyone with the Personal Firearms Proficiency making a reputation check to determine if they've heard of a character wearing a *holster of speed* gains a +4 circumstance bonus to that check.

Type: Wondrous Item (magic); *Caster Level:* 5th; *Purchase DC:* 33; *Weight:* 1 lb.

Incognito Sunglasses

Often used by the rich and famous (at least among those with access to magic), these sunglasses are stylish and well-built, but not so spectacular as to attract attention. In fact, anyone wearing them is treated as having only half their actual Reputation bonus when anyone makes a Reputation check to see if they recognize the wearer. The sunglasses aren't an actual disguise -- anyone who makes their check successfully recognizes the wearer correctly; viewers are just less likely to think of the wearer as important.

Rumors persist of a similar magic item that makes the wearer appear to be a mild-mannered reporter, but as yet no concrete proof of these claims has even been found.

Type: Wondrous Item (magic); *Caster Level:* 1st; *Purchase DC:* 26; *Weight:* --

Phantasmal ID

The *phantasmal ID* is a fake ID imbued with magic to allow it to become a fake ID of any kind. With an act of will from the holder, it can be a driver's license, FBI badge or electric company employee ID with equal ease. The DC to detect the ID as a forgery is 25, although it has no more background support than a normal fake ID (a call to the FBI quickly reveals a false agent, no matter how good his ID is). Unlike a normal fake ID, the *phantasmal ID* also has some chance of deceiving security systems keys to ID cards. The magic item is treated as having a +10 Disable Device bonus whenever it tries to fool a security system.

Type: Wondrous Item (magic); *Caster Level:* 5th; *Purchase DC:* 28; *Weight:* --

Recorder of Translation

A *recorder of translation* is a Tiny, hand-held audio recorder able to record up to 15 minutes of sound on a small audio cassette. Additionally, any cassette the recorder itself was used to record can be played back on the *recorder as a translation*, translating any spoken words into a common language. (Usually *recorders of translation* only translate into French, though any language known by the spellcaster that creates the item can be chosen. Once set, the language of translation cannot be changed.)

Recently a few digital audio recorders of translation have appeared. These can only record 10 minutes of sound and must erase old recordings before they can record new sound, but have the advantage of being able to translate words

into 1d4+1 different languages, and download any recording or translation into a computer.

Type: Wondrous Item (magic); *Caster Level:* 7th; *Purchase DC:* 32; *Weight:* 1 lb.

Skeleton Key

These obvious and iconic magic items have been independently invented by dozens of different spellcasters over the centuries. Each *skeleton key* has a slightly different appearance, depending on what kind of key was imbued with magic to form the item. They all maintain the appearance of a normal key, except that the head of the key takes on the outline of a skull. A *skeleton key* automatically opens any lock of up to its quality level without requiring the proper key or a Disable Device check.

One in 10 *skeleton keys* can also be used to automatically disable a security device of the same quality. The caster level and purchase DC for such keys is 4 higher.

Type: Wondrous Item (magic); *Caster Level:* 1st-5th; *Purchase DC:* 26 (average), 28 (high quality), 30 (high security); *Weight:* 0.1 lb.

Supra Legal Pad

Appearing to be nothing more than a large pad of yellow, legal-size note paper in a high-quality leather binder, the *supra legal pad* is actually a powerful tome of arcane lore that has been compressed into a few one-shot magical invocations. By writing on the pad, the writer can produce amazing legal documentation, and even cause minor legal matters to be taken care of automatically. Once a few sheets have been used for a given legal issue, they are used up and gone forever. When first created a *supra legal pad* has enough paper for 10 uses, but most are found with only 1d4+1 charges remaining.

A *supra legal pad* can be used for the following effects. A GM must determine the exact limits of these functions.

Auto-Brief: The writer can express his point of view in plain words, and the pad transforms it into a well-reasoned legal argument, with as much precedent and legal citation as exists for said point of view. This grants a +4 circumstance bonus to all skill check made to sway the outcome of a court proceeding where the auto-brief is used (including those where the writer is a defendant, prosecutor, or is allowed to file a friend-of-the-court brief).

Instant Bankruptcy: The writer gains an immediate, legally binding Chapter 7 bankruptcy (or similar legal proceeding, in countries other than the US). All his unsecured debts are dismissed, and secured debts are either dismissed or placed at a low, set interest rate. The writer may keep one modest house and one modest vehicle, but any other possession or asset with a Purchase DC of 16 or greater disappears (if easily portable) or is legally assigned to an auction house for liquidation. Even hidden assets undergo this adjustment. The writer's wealth bonus resets to 1d4+6.

Instant Filing: The writer can write out a simple filing, petition, or motion and have it immediately filed in the appropriate courthouse. This does not allow the writer to bypass the court process for important matters (such as criminal proceedings), but does allow him to immediately and retroactively handle anything a DC 15 Diplomacy check would have been sufficient to obtain at court, such as a fishing permit, parade permit, building permit, restraining order (for which there is ample evidence), and similar papers.

Type: Wondrous Item (magic); *Caster Level:* 7th; *Purchase DC:* 32 (31 if 5 or fewer charges remain); *Weight:* 0.25 lb.

Television of Relevance

Though they vary wildly in size and quality, most *televisions of relevance* are Small portable black-and-white sets with rabbit ears. Once per day, the television can be turned to "channel R," causing it to produce a news report of interest to the person who set the channel. If there is an actual newscast of relevance on any channel, it is produced.

Otherwise, the television produces a slightly fuzzy picture of a newscast that produces relevant information in a report-like manner. This acts as a Gather Information or Research skill check made with a total bonus of +15 on a topic of interest to the channel-setting character. If that character is aware of the item's powers he may choose the topic, otherwise it is a random topic he is currently interested in.

Type: Wondrous Item (magic); *Caster Level:* 11th; *Purchase DC:* 36; *Weight:* 5 lbs. (typical)

King Prince of Beasts

for *In Nomine*

by Elizabeth McCoy

Note: The following adventure is based upon a premise which is **not canon** at the time of this writing. It might become a canon rumor or theory.

Administrivia for the GM

This is an adventure primarily for demonic characters. Angels, ethereals, and humans may participate (or try to thwart it from the other side), but the prize is Infernal. Characters may be the normal 9-Force demons, or the GM could have a more humorous tone with demonlings and demons of 5 to 8 Forces. In a mixed group, the GM may give lower-Force Infernals character points equal to what the highest-Force character has, in order to purchase enough Resources to hold their own. (The *Liber Servitorum* may provide pre-generated PCs, for a one-shot.)

While the GM can introduce this into an existing game, the payoff is a Word and even Princedom. The group might need to be retired . . . but this could be a way to end a campaign with a bang!

Enter the Victims Characters

The Lightbringer intends to grant a *particular* Word. The first the characters hear of their involvement is when their respective Princes inform them that they are candidates, and must report to an office in Kronos' Archive to get further details. (Anyone with Bound or similar Discords will be given transport. A Free Lilim may have a Geas invoked to participate!)

Upon arrival, the characters will be ushered into an office which is not as cramped as they might expect. Their hostess and informant is Saboth, an attractive Lilim of Fate. Wise demons will let her get on with the briefing. Those who wish to take notes are permitted.

According to Saboth's presentation, Kronos, the Prince of Fate, sponsored one of his Shedim as the Demon of Beasts. When this was done, he learned that animals have two destinies. If they achieve neither, they are reincarnated. If they achieve their Heavenly destiny, they go to Heaven. If they achieve their *second* destiny . . . they are incarnated as humans.

Saboth, with any encouragement, will go into an explanation of how this is proof of the Finite Souls Theory -- that eventually, the number of souls on Earth will be exhausted, and only remnant-like shells will roam the planet. According to FST, at one point even one-celled animals had souls, but as the number of more advanced species grew, the less-advanced were no longer ensouled. If the group wishes to discuss this theory, Saboth will let them do so (for as long as the *players* are interested in the implications). Eventually she will bring them back to the main reason they're there.

The Shedite Demon of Beasts went to Earth and was, apparently, eaten by Jordi, the Archangel of Animals. *C'est la vie*. While Kronos no longer cares whose Servitor a replacement Demon of Beasts is, he and Lucifer both *want* one. Considering the obvious danger of getting this Word, it was deemed that most sensible demons wouldn't apply, and many Princes wouldn't bother to sponsor anyone. As the prior Demon of Beasts showed the perils of lack of sense . . . Lucifer has required that each Prince select some number of Servitors who will compete to gain the Word. They *will* compete to the fullest extent of their abilities, under pain of the Lightbringer's displeasure. On the positive side, Saboth's information strongly suggests that the lucky demon will not only gain a Word, but a Princedom; any runners

up will be offered as initial staff to the new Prince (as will Saboth herself).

Saboth is responsible for briefing the candidates, getting the paperwork filed so Fate Servitors should cooperate with on matters which pertain to gaining the Word, and supplying minor items if they have a good explanation for how it will advance the Word of Fate while working toward the Word of Beasts. She is also a Lilim in disfavor with her Prince; when she says that she is commanded to do anything in her power to aid the candidates, this includes submitting to non-fatal depravities. (Of course, whatever's done to her will affect how much aid she's likely to render. Paperwork can be . . . misplaced easily, in the Archive.)

Candidates will all receive a vessel/6 of a reasonable animal type; blue whales are *probably* over the top. Shedim are given the Song of Possession/6. The GM may bestow these via "one-shot relics" which were crafted by Kronos and can be handed out as needed (making the vessels come from a pre-selected stock and requiring special paperwork or a personal meeting to get something unusual), or the GM may have Kronos personally grant these boons.

Working Together?

Any demon with an Ethereal Force to its name is likely to figure out that setting off alone, when Jordi has presumably figured out that there's a Word-competition going on, is suicidal. (If necessary, Saboth can mention this.) While only one of them is going to get the brass ring, having a support staff is an important thing for a new Prince -- especially if said staff hasn't been loaned from someone else, causing the new royalty to be beholden to the elder one. If you're trustworthy enough, and get along enough with your team-mates, then it's the fast-track to a Dukedom as second place.

This *should* keep the backstabbing to a minimum.

Other groups of NPC candidates are presumed to exist; if the PCs witness a set of them being eaten alive by fruit flies because of insufficient cooperation, it may be instructive. (The Songs of Acid, Fangs, Claws, Tongue, and Form are all good for a Kyriotate of Animals to possess, and can make for a very dangerous swarm of fruit flies at the GM's option.)

Part of the whole "candidate for a Word" thing is forcing the demons to come up with ideas to promote the Word. In case no one has a hair-brained scheme, or takes inspiration from Princely orders (below), here are some possible approaches.

- Promote an extreme animal-rights group; organize a huge charity ball for their cause, with celebrities. If the press can be swayed with Songs, attunements, or resonances, it could be a huge success.
- Concoct a half-breed human monkey, live or false, and tout it as the "missing link." If it can survive genetic scrutiny as a link between man and beast, even demons who *aren't* Nybassians can sway that Prince to help promote the concept. Hopefully, Lightning and Animals will stalemate themselves instead of destroying the Infernals responsible.
- Start a new fad among the fanatic ecological conservationists -- Beastialization. With selective brain surgery and hormonal treatments, a human can be "reverted to a state more harmonious with nature," and released to a preserve to live out the "natural life" as the ape it is. Vapula and Kobal would both be delighted with this sort of approach.

If any demon rolls a 666 during the probable mayhem that any plan will generate, the GM should take this as a sign that they are (somehow, probably against all odds) on the right track to pleasing the First Balseraph.

Secret Orders

Most of the Princes are less than pleased to have to pony up some of their Servitors; even the losers are almost certainly going to be given to whoever wins the competition. Some are tossing screw-ups into the ring. Some are picking the cream, in the hopes of getting an allied Prince. Some are hedging their bets, with promising Servitors who aren't *too* special. All the Princes want the competitors to be promoting *their* Words, in the meantime. It may be the

last work they get out of their minions, so it'd better be good.

Instructions may have been given to the PCs before the briefing, in which case they probably knew what was up, or handed over in a sealed packet for after they are briefed. They may burst into a character's mind as a "time-bomb" of data, placed there when the Prince picked up the Servitor. They might show up as a Celestial Song of Tongues, or as personal directions after the initial planning sequence, causing problems if the PCs have already brainstormed something. *C'est la vie*.

Andrealphus would like more bestiality, please. He'll settle for more people dressing up like animals to have sex, but he'd prefer that "fur-suited furversion" become the only reason to like animals. He may bestow appropriate decorative Numinous Corpus Songs, and will make sure the new animal vessel is not neutered.

Asmodeus will finagle the paperwork to grant a Role/1 to any appropriate animal vessel. He favors anything which advances the Game, in either the greater or trivial aspects; if racetracks can be sucked away from Mammon (Prince of Greed and former Gamester), that will be acceptable. Allied with Kronos, he is surprisingly lenient about how much Word-boost he expects.

Baal is annoyed that Kronos has persuaded Lucifer to give resources to a minor Word like Beasts, but at least it will annoy Jordi. Any of his Servitors should be laying the groundwork for animals in the military and police, the better for demons of Beasts to infiltrate. Cyborg animal-soldier research is acceptable.

Beleth wants werewolf tales, insanity with bestial traits, and the assumption that any animal could be rabid at any time. Spontaneously. She would also look favorably on any plot that gives people the impression they could be turned into some beast-human hybrid and sold into slavery -- fear of beasts, and of turning bestial, is her spin. (Bonus points if the celestial forms of Cherubim can be made terrifying in the human mind.) She may provide a minor Numinous Corpus, if sufficiently impressed.

Belial is outwardly uncaring what any minion of his does. "Just don't get burned." (Secretly, he doesn't want his Servitor to win, and may send assassins after any Fire-demons who get "in the lead." He is less anxious about giving someone up to be someone else's Servitor, so being an assistant in a successful plan is not as liable to "friendly fire.")

Haagenti thinks animals are there to be eaten, and this should be emphasized. Make vegetarians laughing stocks. Make man just another beast to be devoured. Help out Kobal's people. Get Haagenti lots of chicken.

Kobal is the Prince Most Likely To Have Sent Demonlings as the majority of his candidates. Whatever you do, make it darkly funny. Serious bonus points if you make Prince off it, and then do something to make Kronos less powerful. Total bonus points if whatever you do nets you a Princedom *and* makes Kronos less powerful as well.

Kronos wants a Demon of Beasts. He will work with any Prince of Beasts to ensure that animals gain a fate -- or failing that, how to pinpoint what their "human destiny" is, so that they become vulnerable to Fate's demons. Naturally, he would be pleased to have said Prince come from his ranks, even as Vapula did.

Lilith has one suggestion which will go to *any* Lilim, Bound or Free. "Be a good Duchess." She is also *delighted* to do favors for her Daughters, and the Geases are really quite attractive, don't you think? She charges more for favors when the plan has a lot of captive animals and/or humans.

Malphas wants focus on the loners, the psychopaths with no ties and no sense of the pack. Those who have no sense of the ties in human society. The mavericks, the rogues, the lone wolves. Humanity should fear the beast in each other's hearts.

Nybbas wants something flashy, that will create *news*, babe. Some of Vapula's ideas are pretty flashy. (So are some of Andre's.) He may provide Summonable camera relics.

Saminga wants more zombis. Zombi animals. Packs of zombi gerbils sweeping across towns at night and devouring humans live. If this Finite Souls Theory is true, then binding souls into undead form will also bring about the soulless

Earth, where everything is dead and empty and doesn't know it. That's a *good* thing.

Valefor likes cat-burglars, but is more interested in themes that steal the innocence of animals, and the humanity of humans. Uplift animals to sapiency? Muddy humans' place as the chosen of God? Now that would be a Theft; a Prince who did that might be the Prince of humans as just another kind of beast.

Vapula is clearly thinking along the lines of Dr. Moreau. He is also interested in the transfiguration of a soul from animal to human, and how this might be accomplished. (If, indeed, the information is accurate.) Whatever plan is hatched, he would like one with a great deal of *data* for him.

Saboth, Lilim of Fate

Corporeal Forces - 2	Strength 4	Agility 4
Ethereal Forces - 4	Intelligence 7	Precision 9
Celestial Forces - 4	Will 10	Perception 6

Vessels: Human woman/2, Charisma +2; Cat/6*

Skills: Artistry/1, Computer Operation/1, Detect Lies/1, Emote/1, Fast-Talk/2, Knowledge (Area: Archive/3, Finite Souls Theory/4, Psychology/2), Languages* (Native/3, Others/1), Lying/1, Savoir-Faire/1, Seduction/3.

Songs: Attraction (Ethereal/4), Harmony (Ethereal/3), Healing (All/1).

Attunements: Lilim of Fate

* Her cat vessel is new, so that she can covertly communicate with PCs on Earth if they happen to be in animal vessels of their own. (If the entire group has taken something aquatic, or otherwise made a cat vessel too obvious, she'll get something else as well. Likewise, her Language skills are suited for the areas she needs to operate in.)

Saboth's cooperation does *not* stretch to explaining why she is in her Prince's bad graces; she has apparently been sentenced to silence on the matter by Kronos himself. Aside from that, she has been instructed do anything that will not actually strip a Force from her, be dissonant, get her into trouble with the Game, or further displease her Prince. Naturally, the details of her cooperation will vary depending on how she's treated, and she will tread on the thin edge of any of those restrictions if she thinks a relatively kind PC has a shot at the Word and probable Princedom -- once she's been put in the new Prince's service, she'll be in less danger from Fate's wrath. (Not no danger, but less.)

While on the corporeal plane, the PCs may or may not be able to contact Saboth and enlist her aid, depending on how many groups of NPCs she is also acting as liaison for. If the GM wants, each group can have its own contact, and Saboth will be sent with the PCs; she will probably have a Vapulan cellphone which connects to Hell, for making arrangements. Then again, Saboth may be managing all candidates, and be unavailable most or all of the time.

What exactly she did to disgrace herself may never be found, or it could be an integral complication in whatever plans the PCs hatch for their candidacy -- GM's choice.

Pyramid Review

Doom: The Boardgame

Published by [Fantasy Flight Games](#)

Designed by Kevin Wilson

11-Inch Square Full Color Rule Book, 11-Inch Square Full Scenario Guide Book, 4 Reference Cards, 3 Vinyl Marine Miniatures, 63 Vinyl Invader Miniatures, 6 Custom Dice, 66 Invader Cards, 18 Marine Cards, 3 Marine Equipment Bin Cards, 58 Map Sections, 14 Doors, & 201 Card Tokens; \$54.95

While it was not the first, *Doom* is arguably the godfather of the FPS, or First Person Shooter; with the release of *Doom: The Boardgame*, it has crossed over into other formats. While Steve Jackson Games' similarly FPS-inspired *Frag* does player versus player, *Doom: The Boardgame* goes back to basics. It's not about killing each other, but blasting away at the bad guys . . . in this case, hell spawn!

Designed for two to four players, *Doom: The Boardgame* is a story- or scenario-driven game in which one, two, or three Marines, newly assigned to the Union Aerospace Corporation's Mars base, must fight through wave after wave of invading demons in order to escape. In this, the marines must cooperate to survive, as the odds are heavily stacked in favor of the Invaders. The Marines are highly trained, possessing various special abilities (represented by the Marine Cards), and can assign several types of Orders to gain temporary advantages; while they have access to an array of weaponry, ammunition supplies are limited. The Invaders can send several types of creatures at the Marines, there is an almost unlimited supply of them, and they never run out of ammunition. The Invader player is also able to influence events in his favor with the Invader Cards.

From the start, *Doom* is a great-looking game, with oodles of high quality components that includes miniatures, dice, Invader and Marine Cards, almost 60 map sections, and over 200 tokens of various types. The miniatures are done in roughly 25mm scale, reasonably molded in durable vinyl and in three somewhat garish colors: red, blue, and green. The colors correspond to the three Marine figures, easily the least interesting figures in the box, but also easily replaced. The Invader figures consist of Zombies, Imps, Trites, Mancubus, Hell Knights, demons, Archviles, and Cyberdemons. In play the Imp and Archville figures are not easily differentiated, but the Cyberdemon, a large two-piece figure, is instantly recognized. All of the tokens, map pieces, and Marine Equipment Bins are done in thick cardboard.

The maps are marked in inch-wide squares, slot together easily, and -- once laid out -- can be modified with various terrain features. The tokens come in a variety of shapes and colors, making them easily recognized and handled. Yet the huge number of components causes several problems. The first is that they do not fit back in the box, and the second is that the *only* concession made to internal packaging is space for the cards. Otherwise, internal packaging is wholly absent, and putting the game away required lots of ziplock bags. *none* of which should have been necessary.

Two large 11-inch square booklets come in the box. The first is the Instruction Manual, its contents handled with clarity, from rules to layout, and supported with plenty of examples. The second is just for the Invader player and contains just five scenarios. Again presented in an easy-to-use fashion, five scenarios do not actually sound a great deal, but each is a challenge, and should take several attempts. Should the Invader player want more, the publisher has promised more to download from its website. Only one has been made available so far, but [BoardGameGeek.com](#) has several more, all fan-created. Indeed, it is not difficult to design more scenarios.

Setup is simple. Select a scenario and lay out the map, placing the tokens and terrain as indicated. The map will be

revealed to the Marine players as they explore. The more Marines involved in a scenario, the fewer the number of Ammo, Armor, and Wound they start the game with. They will also have fewer Marine Cards. Conversely, the more Marines there are, the more Invader Cards the Invader player has and the greater the number of figures he has to throw at them. The positioning and type of Invaders is color-coded to the Marines in play. Each Marine player also has a Marine Equipment Bin, used to track the Marine's Ammo, Armor, and Health tokens.

A Marine also starts the game with two or three Marine cards. They provide permanent special abilities such as Survival Ops (gives a Marine three extra Wounds), Killer Instinct (allows an extra attack after a Marine kills an Invader), and Special Ops (makes the Marine deadlier with close-in weaponry). The game's weaponry has been simplified to fist, chainsaw, pistol, SMG, chain gun, rocket launcher, plasma gun, and BFG. Ammunition has been further simplified to three types: shells/bullets, rockets/grenades, and energy cells. A Marine starts with just his fists and the pistol. The rest he must pick up. A number of special abilities are shared between various weapons and the Invaders, Accuracy, Blast, Deadly, Knockback, and Sweep. All add a further tactical consideration to the game.

Actual game play is simple. On his turn a Marine has two actions from a choice of four: Unload (stand and shoot twice), Advance (move and shoot once), Sprint (move twice), and Ready (move and place an Order). Orders are represented by four tokens. Aim lets a Marine re-roll bad dice on his next attack. Dodge forces an Invader to re-roll an attack. Guard allows a Marine to interrupt the Invader's turn with an attack. Heal restores a Wound to a Marine.

Besides revealing the map, the Invader player has plenty to do as both referee and player. On his turn, he draws new Invader cards from the Event Deck, plays one card to spawn a new Invader piece, and then in turn, activates the Invaders in play. The activated piece is moved towards the Marines and makes an attack. Invader Event cards can be played at any time determined by their conditions. Effects include Dud (forces a Marine to discard an Ammo token), Charge (double an Invader's movement), Smash (remove an obstacle or door in play), and Ambush (activate a single figure before a Marine's turn).

At the heart of **Doom: The Boardgame** is -- unsurprisingly -- its combat system. This is handled with style and panache, and in a single roll of the dice. They come in four colors, and are marked with numbers, bullet hole and ammo icons, and a large "X." If the latter is rolled, it indicates a miss; the bullet holes the number of rounds that hit; the ammo the number of Ammo tokens expended; while the numbers rolled, add up to the range. A Wound is inflicted each time the number of hits exceeds a target's Armor value. The number and color of dice rolled varies by weapon and creature. Once an Invader figure has lost its Wounds, it is removed from the board, though recording its lost Wounds in the meantime is awkward.

The aim for the Marines is both survival and achieving a scenario's objectives. The Invader player must inflict six Frags on the Marine players. These are achieved by killing the Marines, who re-spawn nearby, or alternatively, the Invader player exhausts the Invader Event Deck for one Frag.

A game of **Doom** should last roughly two to three hours and present a challenge to the Marine players. During our first try, Ryan and Tim got driven back and ran out of ammunition in going the other way. On the second try, both fared much better. They worked more closely together, employing their Marine special abilities to greater effect. Even so, they did not succeed, highlighting how tough the game is. To Tim's mind, it was slightly too tough, and while this should be so, the publisher has made available guidelines for balancing the game on its website. Another complaint is the difficulty in determining a weapon's effective range without checking the dice first; however, surely in a desperate situation like **Doom**, do the Marines have the time? Indeed, it is something that you check when playing the computer game? Others might malign the lack of player versus player rules, but again, is that the point of a scenario driven game like **Doom**? The lack of rules for handing the Invaders automatically and thus allowing solo play is disappointing though.

My girlfriend described **Doom** as a dungeon bash with big guns. In fact, she will play this, but not the computer game. Its problems are major and minor. The inadequate packaging is minor, but the high luck factor involved in receiving the Marine Cards -- which can make or break a game -- is exacerbated by the mechanics favoring the Invader. The result is that a scenario in **Doom** is not un-winnable, but the Marines must work at it, cooperating with weapon and special ability use. And they must move forward, though with a care as to the dangers ahead. All that aside, **Doom** is a

blast to play, fun for everyone including the Invader player. It may be a big box, but ***Doom: The Boardgame*** delivers on all seven pounds of its contents.

--*Matthew Pook*

The Desert of No Return: The Takla Makan

*"Here, O Sariputra, form is emptiness and the very emptiness is form;
Emptiness does not differ from form, form does not differ from emptiness, whatever is emptiness, that is form."*
-- Heart of Perfect Wisdom Sutra (Edward Conze, trans.)

The Buddhist monk Hsuan Tsang repeatedly chanted this sutra as he crossed the Takla Makan desert in 629 A.D. He had to, to drown out the noises and music that followed him across the singing sands of the great waste. He knew that the holy words would keep him safe from the demons and goblins that dwelt in the *Liu Sha*, the Walking Sands. But bisociated just a bit, his sutra might serve equally well to describe the Takla Makan -- emptiness that is form, form that is emptiness. And so, perhaps, Hsuan Tsang was naming the desert, rather than abjuring it; walking and talking into its empty heart, giving the emptiness the form handed down by the Avalokitesvara Bodhisattva, and thus mastering it. Not lost yet? Let's go further in.

"But there is a marvellous thing related of this Desert, which is that when travellers are on the move by night, and one of them chances to lag behind or to fall asleep or the like, when he tries to gain his company again he will hear spirits talking, and will suppose them to be his comrades. Sometimes the spirits will call him by name; and thus shall a traveller oftentimes be led astray so that he never finds his party. And in this way many have perished. Sometimes the stray travellers will hear as it were the tramp and hum of a great cavalcade of people away from the real line of road, and taking this to be their own company they will follow the sound; and when day breaks they find that a cheat has been put on them and that they are in an ill plight. Even in the day-time one hears those spirits talking. And sometimes you shall hear the sound of a variety of musical instruments, and still more commonly the sound of drums."
-- Marco Polo, *Travels* (Sir Henry Yule, trans.)

The desert of Takla Makan is approximately the size of New Mexico, and approximately 20 times drier. It lies in the rain shadow of the Kunlun, Karakoram, and Tien Shan Mountains, with the Gobi Desert to the northeast. The Tarim River, fed by glacial snowmelt, runs through it into the salt lake of Lop Nor, which moves around across the desert as the river changes course. (The new Chinese emperors detonate their nuclear weapons in the Lop Nor, hoping to drown out the singing sands -- or to blast open the gates to the Otherworld.) East of Lop Nor is the "Jade Gate" at Dunhuang, which leads to Gansu Province in China proper. From time immemorial, the Silk Road has split at Dunhuang, with branches skirting the Takla Makan on the north (through Turfan, Kucha, and Aksu) and south (through Niya, Khotan, and Yarkand) to reunite on the far side of the desert at Kashgar.

Marco Polo crossed the Takla Makan going the other way in 1273, although he called it the Desert of Lop. He heard the singing sands and buried drums of the desert spirits, calling him deeper into the Takla Makan, or at least heard of them. His caravan tied bells around the neck of each camel, and stayed within eyeshot of each other, and put up signs each night. Nobody quite knows where the word "Lop" came from, and "Takla Makan" gets variously translated as "Place of No Return" (or more colloquially, "you go in, you don't come out") and "Desert of Death." However, the most likely derivation of "Takla Makan" is from the Turkic words for "covered place" or possibly "buried house." Because deep in the Desert of Death are 300 (or 360, depending on the story) cities, buried in the Walking Sands for their iniquities, very like the legendary [Irem](#) of the Pillars.

"Those 'trunks like gravestones' sound eerily like those log circles of prehistoric cemeteries built two thousand years before the Chinese city of Loulan came into being, flourished, and dried up again. Perhaps still older dead forests, visible in prehistoric times, inspired these people to mark the land allocated to their own dead with similar memorials."
-- Elizabeth Wayland Barber, *The Mummies of Ürümchi*

Hsuan Tsang refers to one such doomed city, Ho-lo-lo Kia, which was buried when "on the seventh day, just after the division of the night, it rained sand and earth." Although kings and sultans have tried to retrieve the treasures of these cities, "furious winds" and "dark clouds from the four corners of heaven" confound their efforts. But the barriers to the Takla Makan may have weakened somewhat -- around 1500, the Emir of Kashgar, one Mirza Abu Bakr, launched a successful looting expedition into the Takla Makan near Khotan. In 1865, British surveyor William Johnson entered

the buried city of Rawak, and the Russian botanist Albert Regel discovered the lost city of Karakhota in 1879. Between them (and between 1893 and 1931), Sven Hedin and Sir Aurel Stein uncovered another handful of sites, and (most exciting of all) dug up a number of mummies with unmistakably Caucasian features, red hair, and bright-colored twill plaid cloaks. They had found the lost Tocharian civilization, which had begun with Indo-Iranian migration into the Tarim Basin around 2000 B.C. The Tocharian city-states survived, and even thrived, on the rim of the Takla Makan, digging wells and underground tunnels to irrigate their fragile wheat fields and sheep pastures. Until one day, around 330 A.D., the Tarim River catastrophically changed course, moving 100 miles south of the Tocharian city of Kroraina (Loulan, in Chinese) and leaving the Tocharians to the tender mercies of the Chinese armies and their cities covered by the singing sands of the Takla Makan.

"In summary, important physical properties that distinguish booming sands from their silent counterparts are: high surface smoothness and high-resistance to shear. Other factors that contribute are the roundedness, the sphericity of the grains and differing roughness between the larger grains in the sample. Booming occurs best at very low humidity. . . Booming is enhanced when the grains are loosely packed . . . Effects due to collective or resonant motion are also considered to be important. However, these collective effects are still not well understood . . . How these ingredients mix together to produce booming is still an open problem."

-- Paul Sholtz, Michael Bretz, and Franco Nori, "Sound-Producing Sand Avalanches," in *Contemporary Physics* 38:5

Geologists blandly assure us that "singing sand" (also called "booming sand" or, by geologists of a more poetic turn, "Aeolian sand") is a perfectly natural phenomenon, occurring in silica sand of rounded grains between 0.1 and 0.5 millimeters in diameter, under the correct shear and pressure, during suitably dry, hot weather. The sound, which is often compared nowadays to a "roaring airplane" or a loud radio (or a pipe organ or didjeridoo or a cello), ranges in frequency between 10 and 770 Herz, and in loudness between 90 and 105 decibels. Singing sands have been measured not only in the Takla Makan, but in Nevada, Morocco, Namibia, Hawaii, Scotland, Libya, the Sinai, Pomerania, and Siberia. About 35 places are known to produce singing sands under the right conditions, with some lucky locations (such as southern Morocco) featuring singing sands virtually all day long. Of course, geologists quite frankly admit they're stumped for a cause, murmuring about shear and pressure and friction and wind and occasionally resonance and piezoelectric effects and air cushions. But they know one thing for sure -- it's not ghosts.

"By this you have to cross a plain of sand, extending for more than 100 li. You see nothing in any direction but the sky and the sands, without the slightest trace of a road; and travellers find nothing to guide them but the bones of men and beasts and the droppings of camels. During the passage of this wilderness you hear sounds, sometimes of singing, sometimes of wailing; and it has often happened that travellers going aside to see what those sounds might be have strayed from their course and been entirely lost; for they were voices of spirits and goblins. For these reasons travellers and merchants often prefer the much longer route . . . "

-- Ma Tuan-Lin, *Wen-Hsien T'ung-K'ao*

And yet, ghosts are reported with the same reliability as the noises -- in fact, by many of the same witnesses. In addition to the drums and music and voices, Hsuan Tsang reported "visions of troops marching and halting with gleaming arms and waving banners, constantly shifting, vanishing, and reappearing" and in a Valley of Death in the "Sea of Sand" Father Odoric of Pordenone (who traveled through the East between 1318 and 1330) not only heard "divers sweet sounds and harmonies of music" but saw "swarms of dead bodies" and says intriguingly that "upon a certain stone, I saw the visage of a man, which beheld me with a terrible aspect." But like Hsuan Tsang, Father Odoric repeated a solemn prayer ("the Word became flesh and dwelt amongst us") and passed through the Sand unmolested. Philostratus describes how Apollonius of Tyana, having crossed the Indus River (into the Tarim Basin?), saw the "figure of an empusa or hobgoblin that changed from one form into another." This calls to mind, of course, not only the djinn (who appear in sandstorms, of the sort that veil the Takla Makan for 200 days out of the year) but also the *ghulam*, the ghouls of the *Arabian Nights* who shapeshift, and imitate the voices of friends, all to draw you off the path and into the desert to die. The Persians had their own ghouls, the *nesnas*, which had only one arm, one leg, and one eye -- half in this world, and half in the otherworld, in the Desert of Death.

*"Like thunder of deep waters when vast-heaving billows break,
Like soughing of the forest when ten thousand branches shake,
Like moaning of the wind,*

*When the night falls bleak and blind,
So wild and weird the melodies the fairy minstrels make. "*
-- Rev. James Bernard Dollard, "The Fairy Harpers"

Which creature any student of the denizens of the otherworld will also recognize as the fachan, the Irish ogre with one leg, one hand, one eye, and (in some versions) feathers and fur mixed together. (He even has a Mongol-style topknot.) There's even an explicitly desert version, the Direach Glinn Eitidh, which lives in the bleak wastes of the West Highlands -- in fact, hard by the singing sands of Eigg in the Hebrides. Suddenly, from the edge of a Sea of Sand, we reach the edge of the Sea of Salt -- although there's quite a lot of salt in the Takla Makan, arguing that it may have been an inland sea as recently as 3400 B.C. And yet we still have hollow tunnels under the hills, and red-headed, plaid-wearing natives, and the phantom music of the faerie folk. Some Scots claim that the secret of the bagpipes (or at least of the "Londonderry Air") came from the fairy hills, such as the Cnoc-na-piobaireachd, the Knoll of Piping on good old Eigg. Faerie rades ride across Scots moors just as the "troops marched with gleaming arms" beside Hsuan Tsang, and will-o-wisps and redcaps wait to lure travelers off the path and into the emptiness at the heart of nowhere.

"He stood there looking at it, and remembering that the nearest land was America. Not since he had stood in the North African desert had he known the uncanny feeling that is born of unlimited space, the feeling of human diminution. So sudden had been the presence of the sea, and its rage and extent so overwhelming, that he had hung there motionless for several moments before realising that here were the sands that had brought him to the fringe of the western world in March. These were the singing sands."
-- Josephine Tey, *The Singing Sands*

The images pile upon themselves, the forms swallowed in the emptiness of chaos. We have the Tocharians and the Gaels, linguistic neighbors (Tocharian languages are more similar to Gaelic and Welsh than much closer Indo-European tongues) at opposite ends of the continent, sharing phantom music, hollow hills, and demons of the desert. Is the Takla Makan the "desert in the ocean" sought by [St. Brendan](#) the Bold? Do the clouds of Kashgar and the mists of Scotland communicate through an Otherworld threaded by prayer and piping? There are connections across the singing sands to the drowned cities of the [Tir fo Thuinn](#) and the buried ones of Tocharia. (St.-John Philby, likewise, reported singing sands near Wabar -- Irem, to us.) And just how did the Tocharians stay alive on the edge of the Desert of Death? Their mummies clutch ephedra to themselves -- did they truly Awaken and see past the Veil of Illusion that the world saw as a desert? Or did they make some other bargain -- the Chinese records describe the people of Loulan as "resembling birds and wild beasts." The fachan has feathers, the Jibbali of Irem speak "the [language of the birds](#)," a Tocharian text describes its language as the tongue of the "shining ones." Nothing human can live in the Desert of Death. So they had to change. And somewhere the lost Tocharians still wait, across the Takla Makan.

Murphy's Rules

The Art of Camouflage

for *GURPS*

by S.E. Mortimer

This work expands upon the Camouflage and Stealth rules as described in *Basic Set Fourth Edition* and removes the inconsistencies apparent in various *GURPS* supplements. The technologies listed near the end of this article are an attempt to standardize those described in other *GURPS* sources and includes some of today's "cutting edge" developments.

Introduction

Camouflage (p. 183) is the skill of concealment. The term comes from the French word *camoufler*, meaning "to blind" or "veil." It involves disguising an object, in plain sight, in order to prevent detection. While the wartime use of camouflage is by no means a modern invention, its importance was emphasized during World War I because of the introduction of the airplane and aerial surveillance. In 1915 the French army created a new unit called *section de camouflage*. These units were largely made up of "camoufleurs" who, in civilian life, had been artists of some kind -- designers, architects, fine artists, and the like. Other countries soon followed suit.

Many of their ideas came from nature. Animals are experts at camouflage -- their coloring often graduates from dark, on their backs, to almost white on their bellies. This is an important property that is very useful in modern camouflage. This gradation from dark to light breaks up the surface of an object and makes it harder to see the object as one thing. The object loses its three-dimensional qualities and appears flat, making it easier to blend into the background. Animals also utilize colors and patterns to further increase their chances of remaining concealed (see *Camouflage Techniques*, below).

Stealth & Camouflage

As stated in *Basic Set* (p. 222), camouflage will not improve your Stealth roll. However, if you are camouflaged, the enemy may overlook you even after you *fail* a Stealth roll. A failed Stealth roll in this instance means that the enemy has detected something unusual and looks more closely to determine what it is. A failed secondary roll (Vision or Observation vs. Camouflage) may convince him that he was mistaken.

Stealth (p. 222): This skill includes moving carefully through shadows, or quickly from one hiding place to the next, to avoid being seen, as well as stepping softly, controlling breathing (including coughing and sneezing), and avoiding noisy obstacles, to avoid being heard. Stealth cannot be used against the sense of smell, nor against most electronic sensors, but some technologies may help in both of these cases. To avoid detection, roll a Quick Contest of Stealth vs. the Sense Roll (p. 358) of whomever you are trying to deceive. This person may choose which sense to roll against (either Vision or Hearing), depending on which is the most likely to succeed *after* all modifiers have been applied. Note that movement is not assumed -- you can use Stealth to stand unnoticed in a closet or behind a curtain, or to remain unseen laying behind a low wall or a log. If the character fails his Stealth roll he may then fall back on his Camouflage skill to save him.

Camouflage (p. 183): The skill of hiding a stationary person, object, or position with some combination of naturally occurring materials (foliage, stones, twigs, etc.) and special nets, paints, and clothing (see *Camouflage Gear*, below). It is only effective against Vision (or Observation). If the enemy has reason to look for the character then roll a Quick Contest of Camouflage vs. Vision or Observation to avoid detection. The Camouflage skill cannot be used if you are moving -- use Stealth instead (see above). "Reason to look" is often a failed Stealth roll resulting in a noise or movement, but it could also mean deliberate noise or simply an observant scout looking for camouflaged targets.

Camouflage has another useful application. Even if the character has been spotted, he is often difficult to see clearly. If the difference in the Quick Contest is *less than* 5 points, then the enemy gets a penalty of -1 for any Ranged attack against this character (in addition to other modifiers).

Modifiers

Some **GURPS** rules give modifiers to the character's Camouflage or Stealth skill. Others give modifiers to the opponent's Vision or Observation skill. To improve simplicity, all modifiers suggested here will be to the *opponent's* Vision roll, not the character's Camouflage roll, since some items affect both Camouflage *and* Stealth skill rolls. Under optimal conditions, it is virtually impossible not to spot the target. Detecting someone standing two yards away in the open in good lighting should be considered automatic. If a roll is required then the **Basic Set** suggests a skill bonus of +10 (p. 345). Add the following modifiers to this base:

Size & Range: The larger an object is, the easier it is to spot. The sentry's Vision roll is modified by the Size Modifier of the object (e.g. a tank with SM +5 gives a +5 Vision bonus to the sentry. Distance also modifies the Vision roll. Use the Range modifiers on the *Size and Speed/Range Table* (p. 550). E.g. a character attempting to spot a person 10 yards away gets a distance penalty of -4 to his Vision roll for a total of +6 (assuming optimal conditions).

Cover: This is different than covering from physical attacks (pp.B407-408) and involves preparing a camouflaged position. The more time that is spent, the better the camouflage (-1 to -5 to the Vision roll). A quick camouflage job only takes 15 minutes and gives a -1 modifier to the Vision roll. Using the rules for additional time (see *Time Spent*, p.B346), each doubling of the base time increases the modifier by -1. For example, spending 30 mins gives a penalty of -2; spending an hour gives -3; spending two hours gives -4; and spending four hours gives a Vision penalty of -5. A Camouflage skill roll isn't needed until someone attempts to compromise the position, at which point a quick contest (Vision or Observation vs Camouflage) is rolled.

Terrain: Rough terrain makes it more difficult to spot a camouflaged object, modifying the Vision roll anywhere from +0 to -8. Open, barren, flat terrain (or an empty room) would be worth +0. Flat brushland might be worth -3; rocky hills might be worth -5; dense jungle could be as high as -7; sandy desert or a muddy swamp would be -8 if the character completely covered himself with sand or mud.

As stated in **Special Ops**, camouflage or the detection of camouflage is also a matter of familiarity with the terrain. In the Quick Contest to spot a camouflaged target, the less familiar party has a penalty of -1 to -4 (GM's decision). Anyone with 1 point or more in Survival for the relevant terrain is considered to be familiar with it. The GM may also rule on familiarity based on specific Area Knowledge or even the background story of the character (see p.SO59).

Lighting: A light source modifies the darkness in a local area from total darkness (-10) to the modifier specified in the item description. For example, according to p. 394, a torch modifies the darkness penalty to -3. This normally only applies to a radius of two yards around the light. For more on lighting see ["Lighting the Way."](#) Here are the darkness modifiers from that article:

- 0 Well-lit room, Continual Light 3 (p. 249)
 - 1 Bonfire
 - 2 Large campfire, Fireplace, Continual Light 2 (p. 249)
 - 3 Street lights, torch or flashlight (p. 394), Continual Light 1 (B249)
 - 4 Full moon, Light spell (p. 249)
 - 5 Crescent moon
 - 6 Starlight plus faint moonlight
 - 7 Starlight and no moon
 - 8 Lightly overcast starlight and no moon
 - 9 Heavily overcast starlight and no moon
- Very bright light will give *bonuses* to the Vision roll:
- +1 Brightly-lit room; lightly overcast day

+2 Bright daylight; large spotlight

The intensity of light decreases with distance. Use the *Size and Speed/Range Table* (p. 550) to determine the darkness penalty at any given point. This is done by applying *half* the Range modifier (round up). For example, a target is 15 yards away from a torch (darkness penalty -3). The Range modifier for 15 yards is -5 and half of this is -3 (rounded up). Therefore, the target area has a darkness penalty of -6 (-3 -- 3).

Obstructions: Vision is modified further by obstructions to the Line of Sight (LOS). The more hexes in the LOS that are obscured by the obstruction, the greater the penalty.

-1 per yard	Dense smoke, dense steam
-1 per 5 yards	Dense foliage, water, fog, blizzard
-1 per 20 yards	Heavy rain, light snow
-1 per 50 yards	Light mist, open woods

Other Modifiers

Those who are familiar with camouflage techniques are more adept at spotting camouflaged targets. A character with the Camouflage skill at any level gets a +1 bonus to his Vision or Observation roll (only to spot camouflaged targets). A character with this skill at Expert level (14 or more) gets +2.

-4 for any distraction, including other duties.

Camouflage Techniques

The basic concept of camouflage is simple: determine how your enemy sees you and then mask all factors that make you stand out. There are four main attributes to take into consideration when applying camouflage. Called "the four S's," they are *shape*, *shine*, *shadow*, and *silhouette*. If all of these factors are accounted for, then one is highly unlikely to be spotted through conventional means.

Shape: Most camouflage equipment is designed to address this aspect of concealment. The physical outline (contour) of the body can be disrupted with baggy clothing, netting, etc. But colors and patterns also help to break up a person's shape and help conceal him against the background. Contrast (brightness difference with the background) is the initial detection cue to the human eye. Light-colored camouflage will therefore be of little use in dark, shadowy foliage. It will, however, blend well in rocky, sandy areas, or in dead grass. Light green clothing might, for example, blend well in short, green grass. Pattern is almost as important as color because it is visually disruptive. Mottled and striped camouflage patterns help hide the contour of the body, enabling one to blend into the surroundings. Exposed flesh, like the face and hands, should be covered or painted in the same colors and patterns to complete the effect. See *Camouflage Gear* (below) for various modifiers to skill rolls. Standard American patterns include Woodland (four-color -- one for temperate and one for tropical), Rocky Desert (six-color "chocolate chip"), Sandy Desert (3-color), Urban (four-color), White tundra, and Black. An *inappropriate* camouflage pattern makes the wearer just as obvious as if he were wearing bright clothing, giving a bonus of +1 or more to the enemy's Vision roll.

Shine: The chance glint from a reflective surface is all that is required to tell the enemy exactly where you are -- even if you are miles away. The simple process of applying mud or soot to reflective surfaces (like knife blades, watches, and buckles) is an effective countermeasure. It only takes 10 minutes but, if it is not done, the enemy gets a Vision bonus of +1. This is not much use for glass, however (unless you don't need to see through it). A technology called killFlash™ uses a high-tech (TL8) honeycomb material to provide a retrofittable screen against glint and glare (ideal for telescopic sights and binoculars). Cost is \$50 per lens, or \$500 per square foot.

Black

Contrary to popular belief, black is not the ideal color to wear at night. On most nights, totally black clothing appears as suspiciously dark shadows. Best is a darker shade of the pattern used for daylight

Shadow: Hiding behind a tree doesn't help much if the enemy can see your shadow sticking out. When you take up position, look around to ensure that your shadow won't give you away. It is best to hide in the shadow of a larger object. If that is not possible, then choose a position in which your shadow is hidden from the enemy. The GM should decide whether your shadow might be visible to the enemy and apply an appropriate bonus to his Vision roll based on the terrain and position of any light sources. A human-shaped shadow on a brightly-lit wall could be worth +8. Your profile affects your shadow: lying prone casts no noticeable shadow; crouching reduces the shadow modifier by 1. Remember that even though you may be camouflaged with BDU's and face paint, your shadow is still going to have a human outline. Covering yourself with netting or natural foliage can alter your physical shape making it less distinct, reducing the shadow bonus, but only down to a total of +0; the Shadow bonus cannot be negative.

Silhouette: Do not allow brighter objects behind you -- like the sky (if you are moving over a ridge or log, for instance), sunlit patches, or a lighter colored bush, rock, or field. In such cases the camouflage pattern simply disappears to the human eye, and you appear as a human silhouette (+2 to +6 depending on how bright the background object is). Avoid at all costs being back-lit (+8 to Vision roll). The solution is simple -- stay down. Present a low profile and you are less likely to be spotted. Crouching or kneeling gives -1 to Vision rolls; lying prone gives -2. Large objects carried by the character, such as rifles, give a +1 Vision bonus unless they are either camouflaged or held close to the body to prevent the silhouette from being compromised (a rifle could not be used if held in this manner).

Lying prone is the ideal camouflage position. You get a double bonus: first for not casting a shadow, and second, for reducing the chances of producing a silhouette. An added bonus is that if you are spotted and the enemy shoots at you, he is less likely to hit (see Postures, p. 551).

High-Tech

Traditional camouflage techniques are only useful to hide from conventional visual surveillance. They are much less effective against High-Tech forms of detection such as thermal imaging, radar, and image enhancement. **GURPS World War II** has detailed rules for using traditional detection devices. A recent technology called Hyperspectral Imaging (TL8) renders conventional types of camouflage virtually useless because plastic and other non-natural materials give off a unique spectral signature. Even cut foliage that has been used to hide equipment has a different spectral "fingerprint" than growing vegetation. These devices are not foolproof, however. The weather can be an ally to the camouflager. High-tech devices generally do not perform well in falling rain, snow, or sandstorms (see p. WWII154), and search aircraft may be reluctant to fly in these conditions anyway. An added benefit is that snow or sand covers tracks and muffles noise. Finally, bad weather makes guards and search teams less alert.

High-Tech camouflage equipment has also been developed to counter these new surveillance technologies. Advanced smoke screens consisting of hot particles are useful to counter hyperspectral and thermal imaging, and image enhancement. They are also an effective countermeasure for laser-guided weapons. Steam has been proven effective against thermal imaging and radar. Radar absorbent materials (RAM) and paint (RAP) are also useful. Camouflage technology is always improving. In the last few years, for example, US marines began wearing a digitally designed camouflage pattern that is made of up pixels (see *MarPat*, below). Up close it looks grainy, but from a distance the pattern blends into the scenery much more effectively than earlier camouflage patterns. Other countries -- including Canada, Denmark, and Germany -- have developed similar camouflage patterns.

Camouflage Gear

camouflage. So dark greens, blues, and browns would be best in a forest with deep shadows or for after sunset maneuvers. The advantage of black is that it provides reasonable night-time camouflage for *all* terrains, making it a good general-purpose option. If black is worn instead of a more suitable camouflage pattern, then reduce the Vision penalty by 1. For example (see *Camouflage Gear*, below), a character operating at night, wearing appropriate camouflage clothing, gloves, and face paint, has a Vision penalty of -4. If the same character wore black clothes, gloves and face paint, the Vision penalty would only be -3.

Some of these items are listed in **Special Ops** (p. 103) and **Covert Ops** (p. 52). The more advanced items are covered in **Ultra-Tech**. Each item listed below gives a Vision penalty to anyone using optical means to detect the target. This Vision penalty only applies if the user is motionless. If moving, the penalty is halved (round down).

Regular Clothing (TL0): Wearing clothing that is of a similar color to the background can improve a camouflage attempt. If the arms, legs, and head are covered in similar appropriate colors (or black for night time) then a -1 penalty to Vision rolls apply. Wearing bright clothing or a color that contrasts greatly with the background (or an inappropriate camouflage pattern) actually hinders camouflage giving a bonus from +1 to +3 to Vision rolls. "Distress" colors (such as bright orange or "fluoro yellow") are specifically designed to be spotted (to assist Search and Rescue, for example) and give +4 to Vision rolls regardless of the background.

Hunting Shirt (TL1): This is a primitive version of the "ghillie suit" (below) and consists of a baggy, thigh-length overshirt of durable material with straps, cords, or loops for the attachment of suitable foliage. Fringed sleeves help to break up the silhouette even further and blotchy dye jobs complete the effect. A plain shirt gives a Vision modifier of -1; a dyed one gives -2. This modifier may be improved even further through customization. This requires 20 hours and a Camouflage skill roll. Each point of success reduces the Vision penalty by an additional -1, to a maximum of -3, for a total Vision penalty of -4 or -5. It requires specific preparation with respect to terrain, climate, and season. Just like regular clothing, if the camouflage is inappropriate for the type of terrain then it might give a bonus to the opponent's Vision roll. Cost \$50 (plain), or \$100 (dyed), weight five lbs.

Battle Dress Uniform (TL7): BDUs or "cammies" are standard military camouflage fatigues. Available in a range of colors and patterns for varying types of terrain. For camouflage to be effective, all items of clothing must have the same camo pattern. Treat as ordinary clothing (shirt, pants, hat). -2 to Vision rolls if the pattern is appropriate for the terrain. Cost \$50; weight 3.8 lbs (temperate climate), three lbs (tropical/desert climates). Some BDUs may be customized like the Hunting Shirt (see above) for an additional -1 to -3 Vision penalty.

Modern BDUs (TL8) are also effective at masking IR signatures. The cloth is chemically treated to reduce IR emissions giving a -1 penalty to all rolls to detect the wearer using thermal imaging equipment, or to hit with weapons using IR targeting systems. Frequent laundering diminishes this effect. Cost \$75; weight is unchanged.

Poncho (TL7): A knee-length poncho hides the shape of the body better than BDUs (-3 to Vision rolls) but is a little awkward to manoeuvre in (-1 DX). It is made from light, tough, waterproof fabric providing protection from wind, rain, and dust. It may also be used as a groundsheet or an improvised one-man tent. Several ponchos may be joined together to form a larger tent or to camouflage a large piece of equipment. Cost \$30; weight three lbs. Some may be customized like a Hunting Shirt (see above) for an additional -1 to -3 Vision penalty.

MarPat (TL8): Marine Pattern, or "MarPat" for short, is a digitally designed pixelated or "bitmap" pattern developed to enhance camouflage at longer distances. It melts into the environment, capturing and reflecting light and color from nearby objects. Treat as normal camouflage patterns, but at distances of 50 yards or more it gives an additional -1 penalty to the Vision roll.

Gloves (TL7): 1.5 mm thick, super warm, neoprene "sure-grip" leather palm (DR 1). -1 penalty to Vision roll only if worn in conjunction with camouflaged clothing. Cost \$25; weight 0.5 lbs.

Compact (TL7): Comes with four colors of face paint (different colors for each terrain type), and a mirror. If gloves are not worn then paint can be applied to the hands as well as the face. Time to apply is 10 mins for the face and another 10 mins for the hands. -1 to Vision only if it is used in conjunction with camouflage clothing. Contains enough paint for five applications (only two if applied to the hands as well). Cost \$10; weight 0.25 lbs.

Heat insulating face paints have also recently become available (TL8), giving a -1 penalty to Vision rolls using thermal imaging devices. Cost 4x.

Silver Grease Paint (TL7): Introduced during WWII. Used for camouflage while swimming, -2 to Vision rolls if character is underwater. Contains enough for one application (full body). Price \$2; Weight negligible.

Ghillie Suit (TL6): The ultimate in contemporary camouflage clothing. "Ghillies" were 19th century Scottish gamekeepers who were having trouble with poachers. They discovered that they could camouflage themselves by sewing strips of burlap and other materials to their clothing, and then wait patiently for poachers to come by. As long as they remained still, their quarry would ignore them. The first known military unit to use ghillie suits was the British Lovat Scouts' Snipers, who came across the Scottish ghillies and adopted the concept, adapting it for military use. Ideal for snipers, the ghillie suit received public attention after appearing in movies like *Clear & Present Danger* and *Sniper*. Sometimes called a "walking bush," the ghillie suit is made by adding strips of burlap, camouflage netting, and/or pieces of local foliage to disrupt a person's three-dimensional pattern. Most commercial ghillie suits are specifically designed for lying prone. They are made of Nomex with a durable cloth front and padded elbow and knee protection for crawling. Attached are hundreds of strips of burlap or lengths of twine to give it a "ragged" appearance that helps to break up the contour of the wearer. While most are made for rural environments, some are made for urban use with local "color" such as beer cans, cardboard boxes, and plastic bags added.

A basic Ghillie suit only provides a Vision modifier of -3 but, as with the Hunting Shirt (see above), it can be customized for the local environment -- taking into account the terrain, climate, and season. This requires 20 hours and a Camouflage skill roll. Each point of success reduces the Vision penalty by an additional -1, to a maximum of -5, for a total Vision penalty of -8. Ghillie suits are bulky and hamper movement (-1 DX), and they are very hot (+2 Fatigue - see p. B426). A standard full suit (hood, parka, and trousers) costs \$550 and weighs 16 lbs. Additional customization might bring this weight up closer to 20 lbs.

The most advanced ghillie suits (TL8) are also effective against electronic detection, and are subject to International Traffic in Arms Regulations (ITAR). These suits cost double the normal price and give a -3 penalty to thermal and image enhancing devices. Higher tech versions of the ghillie suit (TL9+) would include more effective technologies to evade high-tech detection.

Netting (TL6): Reversible dual-sided camouflage military netting able to be used in two different terrains. Good for hiding inanimate objects; Vision -3. Netting may be customized like the ghillie suit (above) to improve its camouflage capabilities. It takes five hours per square yard and a Camouflage skill roll. Each point of success reduces the Vision penalty by an additional -1, to a maximum of -5, for a total Vision penalty of -8. Cost is \$5 per square yard. Weight is one lb. per square yard.

Thermal (IR) Camouflage Suit (TL8): Thermal camouflage must not completely conceal the thermal signature of a man or vehicle. If it does, a "black hole" is produced -- an area of cold which stands out against the natural clutter of heat patterns. Complete thermal screening can also act like baking foil, cooking the object in its own heat. This suit is designed to conceal in the infra-red range but allow some heat to escape. This is done by using heat screening panels which have a system of vents, allowing some of the heat to be dissipated and the rest directed into the ground. This is a full suit including hood and gloves, giving a -3 on all rolls to detect the wearer using thermal imaging equipment or to hit him with a weapon that uses infra-red targeting systems. It is camouflaged using a standard pattern (-2 or -3 Vision modifier) and typically worn over normal clothing. It is very light and can be rolled up into a tight bundle. Cost \$150; weight 0.75 lbs.

Thermal (IR) Camouflage Net (TL8): Similar to the thermal camouflage suit, but designed to camouflage large heat-generating objects (such as vehicles and generators). Cost is \$50 per square yard and weight is 0.5 lbs per square yard.

Advanced Thermal Camouflage (TL9): British Telecom is currently working with the military forces of several countries to develop fabric that can change its thickness, and therefore thermal properties, according to the outside temperature. A suit made from this material would be lighter and far more effective against infrared detection devices (-8 to detection by thermal imaging devices).

Odor Retardant Cloth (TL8): The middle layer of this fabric consists of a material, such as charcoal, that absorbs odors, preventing the wearer from being detected by all but the most acute sense of smell. The correct term is "adsorbent" -- the trapping of gas particles via the surface of a solid. Clothing manufactured from this fabric is ideal for hunting and evading guard dogs. It also protects the wearer from chemical weapons (duration 24 hrs only). Over time the adsorbent layer becomes less effective at trapping odors and must be "reactivated". This involves heating the

material up to high temperatures and can be done by simply placing the fabric in a clothes dryer on the highest setting for half an hour or so. It must be done after 200 hours of wear (150 hrs in hot climates). Normally a character receives a -5 penalty when attempting to evade an animal with Discriminatory Smell (see Stealth, p.B222). Odor retardant cloth reduces this penalty to -1. It comes as a liner designed to be worn inside normal camouflage clothing (head, torso and legs). The attached headpiece provides complete head and neck coverage including built-in breath shield. A complete suit costs \$180; weight three lbs.

Scent Neutralizer (TL8): This spray is designed to kill human odor at the molecular level. Sprayed on inner garments, the clothing acts as a filter against body odors preventing detection by all but the most acute sense of smell, reducing Stealth penalties against Discriminatory Smell from -5 to -1. Enough for six applications. Cost \$20, weight 0.25 lbs. Duration 2d hrs (2d-2 hrs in hot climates).

Radar Absorbing Material (TL7): Initially designed for warships and submarines during WWII, radar absorbing material (RAM) became known to the general public during the well-publicized development of modern "spy-vehicles" like the Stealth Bomber. Today RAMs have filtered down to more general military use. RAM is a coating whose electrical and magnetic properties allow absorption of radio or microwave energy. This material does not completely absorb radar but the reflected signal is "muffled," projecting a false image to the radar device. -4 to detection by radar devices.

"Smart" RAM (TL8): Through the application of an electric current, it is possible to vary the radar absorbent properties of this material. Made from high-tech conducting polymers and controlled by a computer, this material can be used to "forge" any sort of radar signature and reflect it back to the radar device, including making it virtually invisible (-9 to detection by radar devices). An object protected by this technology could, for example, alter its signature from an enemy plane to a friendly one, or from a single fighter into an entire squadron.

Dynamic Camouflage (TL9): No need to change your camo fatigues every time the terrain changes. US Defense Advanced Projects Agency is working with Yale University on a "smart shirt." The fabric is impregnated with millions of tiny light-emitting microcapsules and controlled by a computer built into the suit. The computer constantly receives data about the color and texture of the local terrain via micro-sensors and adjusts the colors and pattern accordingly. This allows camouflage to adapt dynamically to the surroundings. Such effects can be achieved in several ways, by physically flattening or stretching capsules to change their color characteristics, or by using electrical charge.

The earliest version of this technology (late TL8?) will have a database of pre-set camouflage patterns. The wearer simply selects the pattern that is most appropriate for his current background. The result of this is essentially the same as MarPat (see above) except that there is no need to change BDUs every time the terrain changes. This is the "Varicloth" technology listed in Ultra-Tech (+200% to clothing cost). The computer database might include a "distress" pattern, which is a solid bright color to aid Search & Rescue. The next step is to incorporate sensors and enhance the onboard computer to analyse the surrounding terrain and automatically select the most suitable pattern. The database of patterns in this instance would likely be more comprehensive than the previous model giving a -4 Vision penalty. The next advance would be to eliminate the database of pre-programmed patterns and generate the pattern "on the fly," creating an almost infinite number of variations to more closely emulate the immediate surroundings. This gives -6 to Vision rolls and visually aimed attack rolls, including laser-guidance systems. This is essentially a light-based analog of the Chameleon Advantage (p. 41). At this level of advancement the technology will also have other abilities such as generating reflect armor or becoming "transparent" -- rendering the material invisible. The final solution would be to display or project a seamless image of the background onto the front of the suit and vice versa. This would provide virtual invisibility (-10 to Vision rolls) if the wearer remains motionless.

The Eyes (see p.CV53)

In order for the wearer of camouflage technology to see, there must be a window at the eyes. A foe can target the eyes with a -9 penalty (p. 399). Seeing the eyes, or targeting the whole body is only at a -5 penalty, because humans and animal nervous systems are extremely sensitive to the vertical symmetry of a pair of eyes -- the "someone's looking at me" feeling. A window over only one eye gives a -10 penalty to see or target the eye or the whole person, but also gives the One-Eye disadvantage (p. 147).

Electrochromic Paint (TL9): Currently in development. The optical properties of this material change with the application of an electric current. An advanced alternative to the Dynamic Camouflage technology described above, it could be painted onto to any item without significantly increasing its weight. A similar version of this technology is the "Liquid Crystal Skin" described in Vehicles (p. VE91). Treat as Dynamic Camouflage (above) except that the cost is doubled and there is no increase in weight for the object to which it is applied.

Refractive Light-Warp (TL10): Sometimes called a "Cloaking device." When electromagnetic radiation (including visible light) strikes a surface, some frequencies are reflected, some are absorbed, and some are transmitted (pass through). Most of the visible light that strikes a sheet of glass, for example, is transmitted, and thus glass is transparent to normal vision. It can only be seen at all because a small amount is reflected back to our eyes. Refraction occurs when electromagnetic (EM) waves transmit from one medium into another (such as visible light from air into water), the resulting change of velocity can also change the direction of travel. For an object to be invisible it needs to either allow *all* EM radiation to be transmitted *through* the object, or it needs be refracted *around* the object. If it simply absorbed EM radiation it would appear as a completely "black" object, leaving it perfectly visible against a "lit" background. Because it is impossible to transmit all frequencies of EM radiation through a physical object, the only alternative is refraction.

The best known example of a refractive device is the one worn in the movie, *Predator*. In theory, this technology might use a multi-frequency electromagnetic field to firstly, prevent reflection of all frequencies of EM radiation that hit a given object, and secondly, to bend all background EM radiation around the object, rendering it almost completely invisible to various detection devices, including eyesight. The downside is that no EM radiation can enter or leave the field, rendering the user completely blind and unable to use technologies like radio communication, unless there is a window for the eyes (see textbox, right). To compensate for this problem, the refractive device can be adjusted to allow certain frequencies through the field. For example, if radio waves are "permitted" then radio communication becomes possible, but the user is now susceptible to detection by some types of radar. If the device stops all but the infra-red spectrum then the object will only be visible to someone with a thermal imaging device. The user must also have a similar device to be able to see out (such as the headset worn by the "Predator").

A Refractive Light-Warp device gives a penalty of -10 to Vision rolls and visually aimed attack rolls, including laser-guidance systems. If in melee combat, active defenses and attack rolls are at -3 but the attacker cannot aim at a specific body location. The field can be set to cover an object of any size. The larger the field, the greater physical size of the refractive device, and power source that is required.

If the technology isn't extremely precise it will result in a fringe of distortion or a rainbow-like halo around the user. The field might also be adjustable, allowing some light through. This would result in a translucent or shadowy figure that the enemy can aim for. In this case, his own Vision rolls, his opponent's Vision rolls to see him, and their attack rolls to hit him would all suffer the same penalty -- anywhere from -1 to -9 depending on how much light was allowed through.

Determining Camouflage Bonus

The above suggestions include an enormous amount of modifiers to calculate before rolling a Quick Contest to see if the camouflage succeeds. Here is a summary:

- Base modifier of +10 to Vision or Observation roll
- Range & Size (Speed/Range chart)
- Cover (terrain and camouflage attempts)
- Equipment modifiers
- Shine, Shadow, Silhouette
- Lighting
- Obstructions
- Other (distractions, etc.)

Example: Sneaky Sam is wearing a Ghillie suit that he customized himself and face paint for a total Vision penalty of -7. He is crawling on his belly through light scrubland. The GM rules that the terrain provides a Vision penalty of -4 and an additional -1 penalty per 50 yards for obstructions. That morning Sam spent 10 mins applying soot from his campfire to all reflective surfaces. It is a sunny day (+2 lighting modifier) but, being prone, he casts no noticeable shadow. Sam is trying to sneak up closer to Eagle-eye Jim, who is on guard 50 yards away.

In order to spot Sam, Jim can roll a quick contest against his Vision vs Sam's Stealth. Because Sam is moving, only half the camouflage modifiers apply. Starting with +10, Jim adds -3 (ghillie suit and face paint), -8 (distance), -4 (terrain), -1 (obstructions), +0 (no reflections), +0 (no shadow), +0 (no silhouette), -2 (prone), and +2 (lighting), for a total Vision penalty of -4. The two characters roll a Quick Contest and Jim wins by 2. He thinks he might have seen something and takes a closer look. Sam stops moving and lies still. Jim needs to roll again, this time against Sam's Camouflage skill.

Jim looks through his binoculars that grant three levels of Telescopic Vision (p. 92). This reduces the distance penalty from -8 to -5. The Vision penalty needs to be recalculated: +10 (base), -7 (camouflage), -5 (distance), -4 (terrain), -1 (obstructions), -2 (prone), +2 (lighting) for a total of -7. Jim also knows a little about camouflage and so gets an additional +1 to his roll. Jim loses the Quick Contest and cannot see Sam. If Sam starts moving again, Jim will get another chance to spot him when he gets closer.

Pyramid Review

Five Nations (for Eberron)

Published by [Wizards of the Coast](#)

Designed by Bill Slavicsek, David Noonan, Christopher Perkins, Brian Campbell, Scott Gearin, & Kolja Raven Liquette

Edited by Bill Slavicsek & James Wyatt

Art, cartography by Wayne Reynolds, Daniel Hawkins, Scott Fischer, Tomas Giorrello, Michael Frederick Lim, Roberto Marchesi, Lucio Parrillo, Steve Prescott, Richard Sardinha, Ryan Sook, Anne Stokes, Xi James Zhang, Dennis Kauth, & Rob Lazzaretti

160-page full-color hardback, \$29.95

By degrees, Wizards of the Coast is mapping out the lands of their Eberron setting. They worked up a single city in heavy detail with *Sharn: City of Towers*, but doing one town at a time isn't going to get the job done. *Five Nations* is a good start to a broader perspective on these lands.

The title refers to the five core nations that long ago split over the issue of royal succession and continued discussing the problem with a vicious war that ravaged the continent. Now that the Treaty of Thronehold has -- if not returned everything to normal -- at least placed it in a tenuously peaceful holding pattern, the book catches readers up on what things are like in those prime locations. Each chapter covers details both little and big. We get a thumbnail of the country's disposition when it was part of the single nation of Galifar, an idea of the sorts of problems it suffered during the Last War, and a peek at its current outlook. This includes its relations with (read: schemes against) its new "friends."

On the personal level, we find out what kinds of people populate each land and what their culture consists of. The food, the dress, the names and nomenclature, all these things paint a picture of daily life and give players an overall impression of how their characters should be portrayed. Each chapter has organizations, towns, guilds, government agencies, historical sites, monsters (used to highlight the material and not as filler), and prestige classes, presented in a succinct manner. There are elite soldiers, bone knights (for those who find the straight-up paladins creatively stifling), and spies, among others. Like the creature write-ups, these just give you a taste of the nation's leanings. Only Thrane has new spells, if that's important to you, most related to fire for the benefit of the Silver Pyromancer.

Although everyone engages in espionage on their neighbors, Aundair defines the art. The queen rules through guile as well as strength, and plots swirl about like buzzing gnats. Breland is about as idealized a fantasy setting as the quintet has to offer, with a respected and aging king who seeks peace for his people; but the Brelish enjoy a land of plenty and their boundless resources make them best prepared to prosecute a war should hostilities flare again. The Mournland is all that's left of Cyre, victim of a great upheaval that destroyed the country and killed most everyone in it. They are now outcasts who have found succor only in Breland, but this hasn't dampened their desire for revenge against whoever's responsible. Karnath as a political entity is as rough as the land it occupies, and their warlike abilities are infamous (and reflected in their use of undead in their armies). Thrane is a theocracy, with the church taking over and relegating the monarchy to a nominal position in the running of the country.

The artwork is pretty dark stuff, but then so is the text it accompanies. It might have helped to get more mood-setters in the mix, but instead it's formulaic. Just about every piece illustrates something from the nearby text. The art notes must have read like a recipe, because the two facets are in lockstep. Still, it's evocative work, and the quality of both the art and the maps is not to be sneered at.

The editing, on the other hand, might be. The worst editing on a Wizards project is better than the best editing on just about anyone else's effort, but for whatever reason they slipped up here. It's not a devastating blow, but by ***Dungeons & Dragons*** standards it's positively sloppy. This extends to some layout issues as well, like charts with text cut off and the occasional lack of consistency in presentation. The back of the book lists the usual complementary volumes the DM and players ought to have to use this one, but they didn't suggest ***Monster Manual III***. It won't kill you to make your own substitutions on the encounter charts, but given how many times they reference that book they could've plugged their own work one more time.

Lest you think the whole thing's a drippy mess, it has what the reader needs. There are plenty of plots to fuel PC interactions, creatively snuck in, and they can be played out as different angles depending on which country (and which side) you find yourself working for. The NPCs are lively, the settings are active, the world is made to feel fun, and the players get to feel like heroes.

Not nearly as dry as the core campaign setting, ***Five Nations*** manages to put you in these nations without placing you back in social studies class. The need to impart the vital statistics doesn't hamper the ease of use or absorption of the material. This book capably expands the horizons not just of the campaign background but of the people meant to be a part of it.

--Andy Vetromile

Congratulations, Cog #24601, You're Working For FriendlyCo!

If all goes according to plan, this will be the first column I've composed entirely on my laptop, having been written across three different operating systems on one machine. If all does not go according to plan, this will be the first column I've composed entirely on my laptop, only to have it become trapped on that device with no means of escape.

I'm writing this column on my lunch break with my brand-new laptop, having somehow convinced my wife that it would be a good idea to spend \$850 so I can be more productive on a temp job that will net me about \$1,200. Hopefully she's let her *Pyramid* subscription lapse, so she won't learn about how I also traded our IRAs for magic beans.

Anyway, this is my first real exposure to a real corporate office, complete with real check-in procedures, real security badges, and real tough policies regarding security, information, and confidentiality; the latter made me afraid that, if I didn't clear with them my desire and intention to write on my laptop during my lunch break, a large white weather balloon would swoop down and engulf me.

I'm still coming to grips with the scale of the business world; I was quite unprepared my first day for when I got to the "welcome center," and learned that the various other buildings surrounding this one were, in fact, all part of the same company. Really, working here has helped me understand the scope of bureaucracy better. To help put this in some perspective, let's take a moment to think of a good, solid real-world example.

According to my [insider information](#), the original Death Star had a full crew of 774,576. In comparison, the crew complement of your standard aircraft carrier is 5,000 or so. Now, in the past I learned that -- visions of *Top Gun* notwithstanding -- the bulk of the crew of a standard carrier is *not* there to fly planes and trade quips. No, over half of the crew is designed purely for support of those in the planes. For example, on an episode of [This American Life](#) I heard one interview with someone whose primary job was to refill the snack machines aboard the *USS John C. Stennis*.

Now, let's assume for a moment that the Death Star is roughly analogous to an aircraft carrier, since it sends out swarms of ships to get shot. (In reality the Death Star is more of an amalgam between an aircraft carrier, a battleship, and the AT&T logo.) Using our good friend "Mr. Ratio" (rhymes with "patio"), we learn that there are about 155 people aboard the Death Star whose sole responsibility is to refill the vending machines. Let's break it down into gaming terms. If you were aboard the Death Star, and in your wanderings you sent a stray blaster bolt into a nearby vending machine which incurred the wrath of the Venders Guild, a group of individuals 30 times larger than a typical gaming group could be brought to bear against you.

In short, the more people who amass, the larger the number of people necessary to handle the bureaucracy associated with that gathering. (Of course, this assumes there's a need, desire, and will to handle that mass. Many third-world cities have populations the size of the Death Star many times over, yet have nowhere near that battlestation's bureaucratic sophistication. On the other hand, it's also about 42% less likely that Mexico City would explode to nothingness if a womprat-sized bolt were to plow into its exhaust port.)

This is where the power of bureaucracy-related skills can really pay off. To make this point, I have a new theory: Finding out a piece of information as a "know-nothing" (for instance, working as a temp in a large organization, and not knowing which person you're supposed to call) about another organization will take a number of seconds equal to the number of people working there. Thus finding out -- say -- the fax number at the business of my old Tallahassee job would've take about 15 seconds, since there are about 15 people there. Finding out the same fax number from Dell Computer, which has 55,200 employees, would take approximately 15 hours. And discerning the same fact about Wal-Mart would take just shy of 20 days straight (two months if you limit yourself to an eight-hour day).

The sad part is, as best I can tell, most people involved in a bureaucracy generally *want* to help (or, at least, they'd be

willing to foist you off to the right person if only to get rid of you). But the nature of many bureaucracies stymies most attempts at direct aid, since no one knows the full picture. Most people don't even know the fringes beyond their own piece of the puzzle. It's like a gear on the inside of the clock trying to understand what time it is; a bureaucracy may understand its ultimate purpose ("license all motor vehicle operators in the state," "provide relief to the poor," or "structure a company's growth"), but it probably can't tell you the state of either of the three hands at any given time.

Given what's been written about the nature of bureaucracies in the past, I suspect it may always be such. Perhaps not; it might be interesting to posit a futuristic society whose greatest accomplishment isn't faster-than-light travel or matter manipulation, but a social organization which is able to achieve its purpose with maximum efficiency and minimal loss.

But, having spent a week wrapped around the cogs, I suspect that faster-than-light travel is a bit more likely. After all, I suspect it's easier to work around the laws of physics than to maneuver around human nature.

--*Steven Marsh*

Friday Night Memetics

for *Transhuman Space*

by Jonathan Souza

From the Comparative Journal of Memetics, June 11, 2100 Edition -- "Memes to Watch For" Section

. . . these six memes have been identified as being fairly current, having either resumed an appearance and/or showing up since the last edition.

It should be noted that the memes listed here are not complete, but these have been fully researched and analyzed.

The Argus/Aegis Conspiracy

Classified as a Conspiracy/Concealment meme, believers in this memetic complex state that a long-term conspiracy believe that a group -- alternately called Argus or Aegis -- has been "keeping secrets" about extra-terrestrial life, paranatural/supernatural phenomena, and psionic technology away from people. While this might seem to be a memetic spur from the Alien Visitation meme (p. TH:TM70), meme believers believe in a large-scale conspiracy that has kept things away from the public view.

Meme debunkers face the fact that meme-complex believers will note that the conspiracy can't control everything -- but can do damage control at times -- and may let things "slip out" that are so unbelievable that it helps to debunk the possibility of the conspiracy. They note factors such as JFK's "magic bullet" cannot have its ballistics confirmed by even the most powerful SAI, the "sooperpets" phenomena, the debunking of the Atlantis "discovery" in Antarctica with ground-penetrating radar (usually with the reply that several ancient cities were discovered that were not found by ground-penetrating radar), and several others.

Memetic connectors for engineering include:

Adventure Seed: The players are investigating something . . . and stumble across the conspiracy. The closer the encounter, the more danger the players could be in, especially if Argus (**GURPS Black Ops**) or Aegis (**GURPS Conspiracy X**) have access to brain-hacking technology.

Furry Life

Classified as a Society/Sexual/Operational meme, it is believed that with advanced biotechnology, fully anthropomorphic beings with human/animal characteristics can be created. An offshoot of the "furry" fandom of the late 20th/early 21st century, Furry Life believes in embracing characteristics of "smart animals" that are not entirely derived from human cultural and social mores. Some of the most popular types of animal societies are wolf, cat, and fox-derived, all showing a variety of characteristics.

Meme believers tend to be ghosts or SAIs using bioshells for meme satisfaction. More human-based believers use slinky linkages, usually on rented bioshells. A few experimental bioroid communities are believed to have been created, but it's unknown where and how.

Memetic connectors for engineering include:

Adventure Seed: Players are a community of anthropomorphic bioroids living on a domed colony "somewhere." They believe humans are a myth . . . until the very rich and very old man that created the colony on Mars dies, and as a part of his will, the bioroids are given a money stipend and EU citizenship. Their life a lie, they have to now make a life

for themselves . . . in the mythical human society.

Core Battler Interstella

The massive multiplayer wargame Core Battler Interstella, created by Software Systems International, has been the subject of many questions about its memetic suitability. Classified (tentatively) as a National/Patriotic meme, the three major sides in the game have a large amount of synergy to current political situations, and each side requires a side to develop its skills to defeat its enemy.

An example is the Union Group, which has comparisons to the United States of America (high technology, middle-level military capability, with good research capabilities), which has to use technological advantages until the popular front on Union worlds can be mobilized for warfare. Some small advantages for innovative players have been discovered favoring the Union side over the other two factions.

Possible memetic connectors for engineering include:

Adventure Seed: The players have been invited to play in a Core Battler Interstella tournament on Mars. There has been a lot of side betting . . . and some of the Tongs aren't above cheating or trying to hack the software to get advantages for their side. Or a little bit of leg and body-breaking work . . .

Dark Court

A Society/Enforcement meme, the Dark Court is an urban legend about AIs that "police their own." It is always them, or they -- but once, "they" broke a SAI that played too fast and loose with people's secrets and its mind was destroyed. Or, they made a particularly notorious SAI donate time and effort to help people -- or face serious consequences. Believed to be a kind of reputation network, the "Dark Court" seems to act rarely -- but never capriciously. Nor does it seem to be bound by political boundaries -- several Chinese SAIs have been "judged" for acts it caused to Duncanite groups.

Who is a part of the Dark Court, how cases are chosen, and how they are punished are unknown. Apparently, the cases are all handled "in-house," and no biological involvement occurs. There is supposed to be an appeals method -- but it's unknown how this would work out in theory.

Memetic connectors for engineering include:

Adventure Seed: The players are confronted by a SAI, whom needs their help. Somebody has reported it to the Dark Court for a crime, and it needs the player's help to clear it of the charges, before something awful happens to it. The players have a limited time to clear it, and find some way to get in touch with the Dark Court -- a group that is notorious for avoiding any contact with humans in these affairs.

The Drive Secret

Too many people look at the Shezbeth Black Hole (pp. THS23, 49-50; THS:DB135) as a mystery to be explored and discovered. Some people believe that the Shezbeth Black Hole is an alien artifact that is being concealed by "the powers that be" to hide their own relationships with aliens.

A few thing the Black Hole was due to a failure of technology.

The "Drive Secret," as this Conspiracy/Technology memetic block is called, is that during the Pacific War, somebody was working on an exotic drive system. Theories range from the TSA, to China, to Duncanites, to private companies. All have one thing in relation -- which the drive was a gravity drive that could propel a ship indefinitely while requiring only power to operate. The Shezbeth Black Hole was due to an accident with the drive -- one that was so bad that the project was abandoned. Only recently has an attempt to create the drive again been underway. Where the drive

is being tested is unknown -- the most common theories of where it's being worked on is Titan, under USAF supervision, or somewhere near Jupiter under PRC control.

Memetic connectors for engineering include:

Adventure Seed: Players are spies, freelance investigators, and/or company "procurement agents" whom are seeking out the secrets of the gravity drive -- if one really exists. This is a game of cloaks and daggers -- which might only end when the secret is truly revealed.

Stats for the experimental gravity drive, if it truly exists: For each space of drive, it generates 10 points of thrust, has 4 tons of mass, costs three million dollars, requires one megawatt of power, and no fuel. For each hour of drive operation, roll three dice. If the dice come up any three identical numbers, the drive breaks down for 1D hours. If the dice come up all ones, the drive catastrophically fails, destroying the ship and everything contained in it.

Transendent Sapiency

This meme, classified as an AI/Expansion meme, states that the reason why a truly "superhuman" mind hasn't been reached is because the limitation is that AIs haven't become human yet -- so they can't transcend. They can fake being human, they can fake emotions, they can fake being "real," but they aren't . . . really.

Transcendent Sapience believers suggest that what is needed is a Ghost that can reach the level of Sapient AI-level capacity, or a SAI that has been raised without any possibility of it believing that it is anything other than human. In both cases, it must transcend its limitations -- the Ghost by forsaking the simulation of its body while the SAI must grow beyond being a "mere" program. It is unknown at this time what would be needed, but such a thing might be possible.

Adventure Seed: Some member of the Trojan Mafia has developed a program with which transcendence could be reached. It requires a SAI and a Ghost to "fuse" into a single data entity, effectively destroying both while creating an entirely new being. The players are after the software to purchase it, but the programmer is on the run. Why he's running and how to find him becomes the issue of the players.

Dork Tower!

Dork Tower!

Giving Clerics the Edge

by S.E. Mortimer

"Why can't my cleric use a sword in battle?"

This question is frequently asked by newbies to some roleplaying systems. Often the player has a cleric character forced upon him so the other players' characters can have more "active" roles in the fighting. The player wonders why his cleric can't have a sword or a bow like all the other characters. The short answer to the above question is, "Because the rules in your particular roleplaying system say you can't." This is all quite reasonable if that is as far as it goes. Arbitrary limitations can be useful for game balance, ensuring that one class isn't more powerful than the others. However, it does not seem reasonable if history is used as justification for the limitation when, in fact there was no such historical precedent. The previously-mentioned justification allegedly comes from *Canon Law* injunctions against members of the clergy from shedding blood on the battlefield. This essay will examine whether some sort of injunction was ever placed on members of the clergy of Western Europe from shedding blood in battle and whether blunt weapons were ever used to circumvent this injunction.

As previously noted, there is a supposed tradition in which members of the clergy were not permitted to shed blood with their own hands. The Church did make numerous attempts to prevent clerics from engaging in war. The wearing of swords, daggers, and military dress were repeatedly forbidden. The clergy was permitted to encourage others to fight (if the cause was just), but because the Church considered herself "the mother of all Christians" she didn't consider it proper to shed the blood of her "children." Many modern commentators have interpreted this to mean that a cleric could still enter battle and fight so long as he used a weapon that didn't shed blood. However, there doesn't seem to have been any historical precedent for this.

St. Augustine of Hippo (fifth century AD) seems to have been the first to attempt to justify the use of bloodshed under certain circumstances and invents the concept of *justum bellum* ("just war"). He concluded that violence may be used, albeit reluctantly and in a limited manner, if the cause was righteous:

"Among true worshippers of God those wars are looked on as peacemaking which are waged neither from aggrandisement nor cruelty, but with the object of securing peace, or repressing evil and supporting the good."

However, there is nothing in Augustine's work that differentiates between fighting in battle, shedding blood, and killing. In other words, according to Augustine, Christians could fight in combat and shed blood if their cause was just. However, he also states that fighting for God wasn't the highest calling, and that a Christian who abstains from violence, who lives a life of contemplation and prayer, is most revered by God.

St. Cuthbert was a monk when he participated in the battles against King Penda of Mercia in the mid seventh century. He wielded a spear, not a mace, and kept this weapon with him when he rode into Mailros after the great battle at Winwidfield. St. Emilian was a bishop who wielded a sword and led an army against the Saracens at Autun in 725. He was never rebuked for this bloodshed, but instead credited with helping to save Christianity from the Moslem threat and, like Cuthbert, was later canonized into sainthood. Later in the eighth century, during the reign of Charlemagne, it is clear that the Frankish king expected his bishops to muster and lead troops in battle just like all his other vassals. There is nothing to suggest that these clergymen used anything other than the weapons used by all Frankish nobility -- swords, spears, lances, and bows -- and there is nothing to suggest they were ever criticised for it by the Pope. In fact, their violence was encouraged by the papacy because the Franks were bringing pagan peoples under the dominion of the Church. A later example of a warrior priest is Bishop Michael of Regensburg, who led troops and actively fought against the Magyars at Lechfeld in 955. Another is Bruno, Bishop of Toul (later to become Pope Leo IX) who commanded an army and participated in the fighting in Lorraine in 1026. Both of these clerics wielded lances and swords, not maces.

In the Song of Roland, Turpin (Turpin), the archbishop of Rheims, is depicted wielding a mace. The Bayeux Tapestry

depicts bishop Odo (Odon de Conteville), Duke William's half-brother, wielding a club at the Battle of Hastings in 1066. Some have used these two examples as evidence to suggest that by the 11th century there must have been some injunction against clerics shedding blood in battle. There are, however, problems with both of these examples. First, Archbishop Turin is also described wielding a spear ("And the Archbishop lays on there with his spear," -- CXXVII.1682). Second, William (later King William I of England) is also depicted wielding a club similar to Odo's on the Bayeux Tapestry. Seeing as though William was not a member of the clergy, one could conclude that the club was some sort of symbol of authority during this time, not a means of circumventing some fanciful injunction against using edged weapons. This is supported by the fact that Odo was in charge of ruling England when William was out of the country. Consider also that Odo was known for his atrocities and bloodshed when he personally suppressed several uprisings in the north in later years -- demonstrating that, regardless of which weapon he used, the good Bishop had plenty of blood on his hands. Finally, one should take into account Odo's sacrilegious despoiling of the Cathedral at Durham in 1074, suggesting that he had little regard for religious sensitivities. Taking all this into consideration, it is unreasonable to suggest that Odo wielded a club at Hastings because of some theological obligation to avoid bloodshed. It was Odo who commissioned the Bayeux Tapestry and he appears almost as often as William himself. It is highly likely that he depicted himself wielding a club because he considered himself William's equal in terms of status and authority.

Keep in mind that there are plenty of examples of knights (who presumably were not under any religious injunction regarding bloodshed) wielding blunt weapons in combat. The primary type of armor worn by the upper class of the time was the mail hauberk, and the best weapon to use against a foe so armored is one that inflicts concussion damage -- weapons like maces, clubs, axes, and the like. One might conclude that some bishops elected to wield maces for the same reason as anyone else -- because they were effective against mail armor, not because canon law required it.

In the 12th century, St. Bernard of Clairvaux agreed with Augustine that it was perfectly acceptable to shed blood if the cause was just. During this time there were the monastic orders such as the Knights Templar and the Knights Hospitaller. Later monastic orders include the Teutonic Order in Germany and the Order of Swordbrothers in Livonia. Technically, members of these military orders were clerics and yet they had the full sanction of the Church to wield swords and shed blood. Wimund, an English bishop in the mid-12th century, was wounded by a hand axe thrown by a Scottish bishop who objected to Wimund's demand for tribute. Another example is Absalon, a Danish archbishop who personally led and fought in many battles from 1160 to 1184 to free Denmark from German rule. His statue in Copenhagen depicts him wielding an axe, not a mace. In 1171, Archbishop Christian of Mainz, was given the command of an army in the Lombard war and is said to have personally killed nine foes. In 1219 King Valdemar II of Denmark and Archbishop Andrew of Lund led a crusade into Estonia. Andrew wielded an axe and a spear. Another incident is at the Battle of Mansourah in 1250. Lord Joinville described a priest named John of Voysey who donned helmet, gambeson, and spear, and single-handedly routed eight saracens. The bishop was perfectly prepared to fight with an edged weapon and to shed blood if necessary.

Caesar of Heisterbach reported the conversation of a Paris clerk, who said that no German bishop could be saved because they "carried both swords, waged wars, and were more concerned about the pay of soldiers than the salvation of the souls committed to them."

The Battle of Bouvines in 1214 depicts a mace-wielding cleric. William of Breton describes the actions of the Philippe de Dreux, Bishop of Beauvais:

"Indeed, the Bishop of Beauvais . . . became unhappy, and since by chance he happened to have a mace in his hand, hiding his identity of bishop, he hits the Englishman on the top of the head, shatters his helmet, and throws him to the ground forcing him to leave on it the imprint of his whole body. And, since the author of such a noble deed could not remain unnoticed, and since a bishop should not be known to have carried arms, he tries to hide as much as possible and gives orders to John . . . to put the warrior in chains and to receive the prize for the deed. Then the bishop, throwing down several more men with his mace, again renounces his titles of honor and his victories in favor of other knights so as not to be accused of having done work unlawful for a priest, as a priest is never allowed to be present at such encounters since he must not desecrate either his hands or his eyes with blood. It is not forbidden, however, to defend oneself and one's people provided that this defense does not exceed legitimate limits . . .

Some have claimed that this is yet another example of a bishop wielding a mace in battle because of the alleged injunction against shedding blood, but the above text makes it clear that it was considered improper for a bishop to participate in battle *at all* regardless of whether he used a blunt weapon or not, unless it was for a just cause. Bishop Philippe even attempted to hide his identity -- not the actions of one who thought the Church would look favorably on his actions. After attention was drawn to him, he attempted to mitigate his actions by refusing to accept credit for his valor nor any ransom from his victims, hoping to avoid criticism from his peers. It seems clear that the Bishop of Beauvais thought he was doing wrong by participating in the battle even though he was wielding a blunt weapon.

It would seem that there were two opposing points of view in the theological debate regarding clerics participating in battle. One side claimed that it was improper for members of the clergy to take up arms at all. The other claimed that it was permissible if the cause was just (some argued that shedding the blood of non-Christians was fine but not Christians). There is nothing up to this point to suggest that anyone supported the proposition of clerics fighting in battle providing that they did not shed blood. In the last half of the 13th century, St. Thomas Aquinas considered the two opposing points of view and attempted to finally solve the dilemma in a work titled *Summa Theologiae*. In this work he draws upon many prominent thinkers including Aristotle, Peter Lombard, Dionysius, Rabbi Moses, and Augustine. Aquinas introduces the concept of "non-combatants," and said that a member of the clergy had permission to be on the battlefield, but he could not actively fight. Thomas wrote that war is forbidden to a cleric because war is secular in nature and it was beneath the clergyman to engage in such "earthly" practices. He further states that they should not "slay or shed blood," because they would become tainted and no longer capable of performing their primary duty as a member of the Church, i.e. "ministry of the altar." If Thomas' words were interpreted literally, one could conclude that a clergyman might actively engage in warfare so long as he didn't shed blood and he didn't kill anyone. Wielding a blunt weapon might conceivably be a means of conforming to this doctrine -- so long as nobody was killed by it. Of course, Thomas' words must be taken out of context in order to justify active participation in battle. One needs to ignore the rest of Thomas' argument which states that members of the clergy had permission to be on the battlefield, but *only* so they may administer to the other participants. Thomas specifically wrote that it was "an abuse of this permission if any of them take up arms themselves." Reading Thomas' work in its entirety, it seems clear that clerics did not have permission to actively participate in battle -- regardless of whether they shed blood or not.

Since this author can find no other article in canon law that might be used to suggest that clerics were permitted to participate in battle but not to shed blood, in order to continue with our examination it is necessary to assume that Aquinas' work (13th century) is the relevant text, and that the Church used this text to grant permission for members of the clergy to participate in battle, so long as they didn't shed blood. Taking this assumption, the next step is to determine how closely this doctrine was followed and how seriously the Church viewed infractions. If there was such an injunction then it is logical to assume that the Church would reprimand any who transgressed. So what about clerics who engaged in battle after the publication of Aquinas' work? Did clerics refrain from using edged weapons in combat, and if they did not, did the Church punish them?

There is a strong tradition of warrior bishops in the English see of Durham. Their coat of arms included a crozier crossed with a sword instead of the usual pair of croziers. Many of them rode to battle and actively participated in the fighting both before and after the work of Aquinas. At the Battle of Falkirk in 1298, Anthony Bek, the Archbishop of Durham, led the second column of Edward's host. He was actively involved in the fighting, having led his column against the Scottish left flank. He wielded a lance and a sword like the other knights under his command. Another was Thomas de Hatfield (Bishop of Durham, 1345-1381) who also wielded a lance and sword in battle. This prowess in battle was expected and there is nothing to suggest that the Church criticised their actions. The following excerpt is from the *Ballad of Durham Field* (fought in 1346) and describes the Bishop of Durham and five hundred of his priests wielding edged weapons in the battle (the bishop wields an axe and the priests have spears):

*Five hundred priests said mass that day
In Durham in the field,
And afterwards, as I hard say,
They bare both spear and shield. [XLIV]
The Bishop orders himselfe to fight,
With his battell-axe in his hand;
He said, 'This day now I will fight*

As long as I can stand!' [XLV]

At the Battle of Crecy in the same year (1346), Edward III had to restrain one of his bishops from entering the fray, but later relented and allowed the bishop to satisfy his bloodlust (under the pretense that he wanted to protect the king's son). At the Battle of Otterburn in 1388, Froissart mentions William of North Berwick, a Scottish deacon who distinguishes himself with a battleaxe. This man was not chastized for his actions, but promoted for his valor to the position of Archdeacon of Aberdeen.

Finally we come to Pope Julius II, who campaigned extensively to increase the papacy's temporal power. His militancy began as an Archbishop when he was sent to lead an army to restore the papal authority in Umbria in 1474. He succeeded in reducing several towns. In 1506 he personally directed the campaigns against Bologna and Bentivogli and set out at the head of his army with a lance and a sword. In 1510-11 he once again took personal command of his army and set out at its head to do battle with the King of France in Northern Italy. It is said that when he commissioned Michelangelo to sculpt a bronze statue of himself and was asked if he would like to be depicted with a book in his left hand, the Pope replied, "Why a book? Show me with a sword."

It has been shown that there is little to suggest that there was ever an injunction placed on the clergy that permitted them to engage in battle so long as they did not shed blood. Priests were either forbidden from fighting *at all*, regardless of what weapon they used, or they could fight, with any weapon, so long as their cause was "just." Even if one wants to argue in favor of such an injunction, it is evident that it was widely ignored. There are many examples of clerics using edged weapons in battle and no evidence that any of these men were ever chastized by their superiors. In fact, they were often promoted afterwards. So, if a gaming cleric wants to wield a sword, and the GM is agreeable, go for it. He will have plenty of company among the ranks of his fellow church members.

Iron Kingdoms Character Guide: Full-Metal Fantasy Volume 1 (for the *d20 System*)

Published by [Privateer Press](#)

Written by Rob Baxter, Brian Gute, Chad Huffman, Joe Martin, & Doug Seacat with Brian Brousseau, Colin Chapman, Jason Dawson, Chris Gunning, Brett Huffman, James Maliszewski, Martin Oliver, Phil Reed, Bryan Steele, Jon Thompson, & Michael Tresca

Cover by Matt Wilson

Illustrated by Brian "Chippy" Dugan, Jeremy Jarvis, Torstein Nordstrand, Brian Snoddy, & Matt Wilson

Cartography by Todd Gamble

402-Page Black & White Hardback; \$39.99

One of the more distinctive fantasy campaign settings for the *d20 System* is Privateer Press' Iron Kingdoms, a world in which magic, science, and technology not only sit side-by-side, but complement each other. First seen in the [Witchfire Trilogy](#) adventures, the roleplaying aspects of the intellectual property has seen little support bar the excellent [Monsternomicon - Volume I: Denizens of the Iron Kingdoms](#) and the useful [Lock & Load: Iron Kingdoms Character Primer](#). This is in part due to the publisher concentrating on the wargaming aspect with *War Machine* and its accompanying miniatures range, plus the need to rework the planned RPG supplements to *d20 System 3.5*. The problem has been the lack of information to create characters fully suited to the setting. The *Character Primer* went some way to address this problem, but it was only a start. Thankfully, the release of *Iron Kingdoms Character Guide: Full-Metal Fantasy Volume 1* goes not just *some* way, but all the way to address this lack.

All five books released to date have been good looking affairs, but the *Character Guide* is the best looking. At first glance, the matte finish cover and the lack of glossy pages lend it a rough appearance, but the illustrations are never less than excellent, and the writing and layout are both crisp. In particular, the depiction of the setting's equipment is a delight. Throughout, the dry game information is supplemented by sections of color text providing in-game commentary and occasional rumors for use during play. These further help impart the feel of the setting.

The *Character Guide* is a big book and covers a great deal across its five pages. It opens with an introduction to the world of Caen, home to the continent of Western Immoren, the focus for both RPG and wargame. It starts by placing Caen in both the universe and its solar system, explaining its cosmology and calendars, all before delving into material first presented in the *Character Primer*. The changes to the races are primarily cultural, so while Dwarves are unchanged, Elves are divided between the Northern Winter Elves or Nyss, and the Southern Iosan. Both are reclusive races, but for different reasons. The Iosan are similar to standard Elves, favoring arcane and warrior castes while the Nyss favor the religious and warrior castes. Instead of the traditional Halflings and Half-Orcs, the Iron Kingdoms are home to Gobbers, Bogrin, Trolkin, and Ogrun. Gobbers and Bogrin are Goblin subspecies, the Gobber being small,

dexterous, and known for alchemical skills and natural self-camouflage, while the larger Bogrin are hardier, rougher, and less civilized. Ogrun are very strong and tough, excellent metal workers, and friends to the Dwarves. Trolkin are hardier still, able to attach or regrow lost limbs, they make fine fighters though a few become respected sorcerers.

All these races are effectively described, but unlike many settings, humans do not lose out. In creating a human character, a player can select a package to reflect the cultural traits of one of the 12 ethnicities found across Western Immoren. Each suggests popular starting feats, attribute adjustments, skill bonuses, and automatic class skills, plus a social flaw, height and weight range, and languages. This social flaw, which not every ethnicity possesses, is either Jingoistic or Socially Isolated. While optional, these cultural packages are an effective method of enforcing the cultural differences and rivalries that beset the setting.

While core classes like the Barbarian, Fighter, and Rogue remain unchanged, the others are all modified. In social terms, the Sorcerer and the Wizard are highly mistrusted, with Sorcerers often persecuted as witches. Bards suffer similarly, and legitimize themselves by joining military units as War Bards. Rangers are not affiliated to Druids or have access to spells, and are used as scouts. Druids, reflecting the more chaotic aspects of Nature, are rarely seen or understood.

Clerics and Paladins are the most changed to fit the setting. Divine spellcasting is tied to a cleric's faith rather than in the direct communion with his deity. To reflect this, Clerics receive the Faithcasting bonus feat at first level. Raising the dead is near impossible, and the use of healing spells is difficult and prone to painful -- even deadly -- side effects if done too often or if the individual being healed is of the wrong alignment or faith. Some clerical Domains have been added and others altered, while some Clerics are granted a third Domain for following a particular Patron. Not every religion has these, but Patrons are similar to saints, being once devout mortals who ascended to serve as divine intermediaries. Even a non-Cleric gains a small benefit if he adopts a Patron, and there are evil Patrons as well as good ones. The gods and faiths of Western Immoren are described in some detail, explaining the religious rivalries that also beset the Iron kingdoms.

The *Character Guide's* four new classes are the Arcane Mechanik, who bridges the gap between arcane magic and the building of machines; the Bodger, who can fix and rebuild mechanika, the setting's heavy robotic workforce and military shock units, the steamjacks and warjacks; Fell Callers, which are Trolkin able to deliver devastating shouts; and the Gun Mage, who channels spells through his pistols, though he is distrusted like all arcane spell users. New Prestige Classes include: the Battle Chaplin, frontline warriors for the god Morrow; Blackclads, who revel in the primordial wilderness; Mage Hunters, Elven warriors tasked to curb the excesses of human wizardry; the self-explanatory Pistoleer and Rifleman; the Second Story Man, a specialist burglar; and the Warcaster, who controls warjacks on the battlefield. A pleasing touch is the description of notable figures all of these classes.

New skills and feats take account of the Iron Kingdoms' higher technological level, including Craft (Clockwork) and Craft (Small Arms), and Exotic Weapon Proficiency (Small Arms), Mechanikal Aptitude, and Steam Monkey. The Faith Feats beyond Faithcasting are deity specific, while the new Society Feats represent membership in various organizations like the Fraternal Order of Wizardry or the Steam & Iron Workers Union. All have prerequisites, and give the benefits of social acceptance, support, and reduced costs for spell and mechanical materials.

The two most obvious technological advances in the Iron Kingdoms are firearms and mechanika. Firearms are breechloaders, firing individually cast rounds with alchemical blasting powder as the propellant. Cutting edge weapons include pepperbox pistols and two-shot single barreled rifles, but pinlock muskets and shield-mounted firearms also exist. Advanced non-combat gear includes field glasses, flintstrickers, and even pocket watches.

The Iron kingdoms differentiate between the mechanical -- devices that operate according to standard physical laws -- and the mechanikal, which operates through a combination of science and magic. The most obvious example of the mechanikal is the steamjack, a coal fueled, steam driven robot controlled via the magically contracted Cortex, which accepts and interprets the orders of its registered user. The laborjack is a simple model, while the military grade warjack can understand a variety of orders given by its Warcaster controller. Warjack weaponry includes heavy versions of ordinary melee weapons and firearms, but the Arcane Condenser and Accumulator components can store and transfer arcane energy to Rune Plates to enhance weapons with magical bonuses to make them +2, flaming, or

shocking burst. The ***Character Guide*** provides a decent primer to the setting's major selling point, the steamjacks, with several sample models and details of the heavy metal armor designed for Warcasters.

While alchemy has a more scientific basis, the creation of magical items is more difficult and expensive. This is both in monetary and Experience Point terms, reflecting higher priced materials. Further, the creation process is potentially physically taxing, with the chance of permanent hit point loss. Mechanical construction is cheaper, involves less arcane energy, and is less dangerous. This enforces the emphasis on Mechanika in the game, but also enhances the status of magical items when found, as they are invariably unique, possess a history, and are dangerous.

The ***Character Guide*** is rounded out with several appendices that neatly and usefully summarize various subjects covered earlier, plus a good index and tables list. They include a list of the personalities mentioned, plus class skills, priest ranks, and even more notes on building mechanika.

There is a lot to take in within the pages of the ***Character Guide***, but it is presented in what is an enjoyable and easy read. There is a lot of background material alongside the game mechanics, all of it specific to playing characters in the Iron Kingdoms, whether magic, religion, or combat. Some will want more on constructing mechanika, others will lament the omission of classes from the ***Monsternomicon***, but neither is a great loss. Otherwise, the ***Iron Kingdoms Character Guide*** is everything the player and the GM needs to create and support a character in the Iron Kingdoms. If only we could have had it sooner.

--Matthew Pook

Ticket to Ride and Ticket to Ride Europe

Published by [Days of Wonder](#)

Designed by Alan R. Moon

Illustrated by Julien Delval

Graphic design by Cyrille Daujean

Ticket to Ride: map board, 240 plastic Train Cars in five colors, 144 cards (including Train Car and Destination Ticket cards), five wooden Scoring Markers, & a rule booklet, full color, boxed; \$39.95

Ticket to Ride Europe: map board, 240 plastic Train Cars in five colors, 15 colored Train Stations, 158 cards (including Train Car and Destination Ticket cards), five wooden Scoring Markers, & a rule booklet, full color, boxed; \$39.95

Train games continue unabated in popularity, and no matter how many come out there's always another little twist to add to the mechanics. Consider Days of Wonder, and its game ***Ticket to Ride*** and the sequel ***Ticket to Ride Europe***.

In the vein of Phileas Fogg, players have wagered who can visit the most American cities in one week. The object is to score the most points by connecting select cities.

The board shows a map of America and part of Canada, with cities connected by rail lines. These stretch one to six spaces long, in several colors (although the color of the rail lines have nothing to do with the colors the players choose to play). Everyone gets a random selection of Destination Tickets, each showing two cities to connect; a hand of Train Car cards; and 45 Train Cars in your color.

The Train Car card colors match those of the rail lines. To claim a stretch of track, you must play a hand that matches the color and number. El Paso and Oklahoma City, for example, have a five-space yellow line between them; you have to collect and play five yellow cards (and, if you like, some combination of wild cards). You would then take five of your train tokens and place them in those spaces to show you traveled that line (you don't actually move anything about on the board -- that part is abstracted). The longer the segment of track claimed, the more points you get (a scoring track runs along the outside of the board).

There's a lot of strategy in drawing cards. You can choose a couple from five face-up cards or draw blind from the deck. You won't know what you'll get, but you could get wild cards. Choose a face-up wild card and you forfeit any second choice. Face-ups are replaced as they are drawn, and if wild cards dominate the selection, all face-up cards are discarded and replaced with new cards -- you may not get the second face-up card you were hoping for.

Destination Tickets are revealed at the end of the game. Cities further apart are worth more points when they're linked. If you don't complete a card's route, the point value is subtracted from your total. Whoever has the longest track gets a 10-point bonus, and the highest score wins.

Ticket to Ride Europe is just about the same game, but the few changes it offers turn out to be significant. Unsurprisingly, the map shows Europe and bits of Russia. The route lengths at the top end skip right to some bigger

numbers, and the Destination Tickets are split up. You now choose from one long journey and some small ones, so you make the decision whether to attempt a long ticket at the outset (in the original, all tickets are mixed together and any draw could yield one of several difficult routes). The biggest changes are ferries, tunnels, and stations. Ferries connect cities across water, but they *require* the use of one or more wild cards. If you get shut out of a city you need to finish a route, building a station at the contested town lets you trace a line using someone else's rails (though unused stations are worth extra points at game's end). When you build on a tunnel, you must draw three cards from the deck, and if those match the color of the line you're building it costs extra cards to finish the route.

Both games have similar components, and those new to Europe are reflected in the first game's selection (the Train Stations are the same decent plastic casting job as the Train Car tokens). They enjoy the high quality standards set by the European market, with mounted boards, bright artwork (the covers of both have clever thematic similarities), and lasting pieces. The one real improvement: Europe has larger playing cards, suitable for the shuffling necessary in larger games.

These strategic complications, though few, make ***Ticket to Ride Europe*** a different game. Both are fine entries into the crowded train genre -- they're simple, a lot of fun, straightforward, and easy enough for smaller children to find playable and educational. Once you've played the sequel, however, you're not likely to look back. It's too easy to get a decent, consistent score in the original game by going for longer train routes. These are pared down in Europe, leaving only one truly massive point-scorer on the board. Uncertainty about whether you can carve a route through a mountain and the chance to rescue your score by playing a station where it's needed . . . these things take it from a game with many calculated but ultimately predictable decisions to a multi-layered journey requiring you to juggle several workable options.

Perhaps there's a line of demarcation where the first set appeals best to the younger generation and the second lets them graduate to a new level of play, but while ***Ticket to Ride*** was a fine piece of work, Days of Wonder may have made their own prototype obsolete with a well-balanced cousin that makes the trip slightly less straightforward. ***Ticket to Ride Europe*** just ends up being the hot ticket in town.

--Andy Vetromile

Playing the Other Side of the Magic Mirror

Like most GMs (I suspect), I have had a myriad of game ideas that I've never gotten a chance to use. This past week, I was reminded of one of them by hearing about -- of all things -- a Broadway musical.

The musical in question is *Wicked*. It tells the story of the relationship between Glenda the Good Witch and Elphaba the Wicked Witch of the West before the events of *Wizard of Oz*. Although it's a great, evocative title, it -- coupled with the subject matter -- lends itself too easily to Abbot & Costello-esque abuses:

"Did you see that *Wicked* musical?" "The . . . which one?" "Yeah, that one."

One review likened *Wicked* to the *Rosencrantz and Gildenstern Are Dead* of *Wizard of Oz*. And, while I've never considered myself to be a die-hard Oz fan, I'd take a bullet for *Rosencrantz and Gildenstern Are Dead* (and the similarly scripted *Shakespeare in Love*).

Sadly, I haven't actually *seen* said musical, nor do I have any immediate plans to. If I were to ask my frugal wife if it's okay for us to drop more than \$100 apiece on theatre tickets despite the fact we both currently don't have permanent jobs, I suspect she'd be fully justified in sending her flying monkeys after me.

However, it sounds neat, and the audio clips on the [website](#) sound interesting enough (especially "Popular"), so for now I'm going to assume it's as brilliant a piece as my noggin pretends.

Anyway, the as-yet unused game idea this musical premise reminded me of is that of an interlocking adventure -- two related adventures that show two sides of the same conflict or story. In the same way that *Rosencrantz and Gildenstern Are Dead* and *Hamlet* show two sides of the same story, I think it would be a blast to do something similar in an RPG.

Although there are a few literary examples already mentioned, the idea seems to be most common in computer games. The most "pure" example I can remember of this premise is *Nethergate*, an RPG by small publisher [Spiderweb Software](#) that tells a tale of Celt/Roman conflict (complete with mercurial fae). In one half, you play through as a ragtag band of Celtic warriors, fighting against the evil Romans. In the other half, you play as a band of Romans, fighting against upstart Celtic rebels. The two adventures take place at the same time, so one chapter might have the Celts acquiring an item of power from a cave for a village, while the same chapter of the Roman adventure might require the PCs to storm the village in an attempt to steal the same item. Likewise another chapter might have the Celts trying to befriend the fae of an abandoned castle, while the counterpart in the Roman story has the protagonists storming that castle, trying to kill the "evil" fae.

Another example is *Half Life: Opposing Forces*. This game takes place at the same time as the original *Half Life*, only with the main character playing the role of one of the special force agents who was sent after the original's protagonist Gordon Freeman.

This doesn't count the other times this technique has been used tangentially, such as the opening level of the original *Star Wars: Dark Forces*, where the main character has acquired the plans to a super-secret weapon that he must smuggle to a rebel princess. Or the various real-time strategies of Blizzard, where playing the forces of various opposing factions is the norm.

Within the RPG world, this technique is rarer; I can't think of a single example of a commercial interlocking adventure. (Of course, there aren't many commercially published adventures anymore, either.) The closest I can remember is *Reverse Dungeon*, an old *Advanced Dungeons & Dragons Second Edition* adventure that puts the heroes in the role of the monsters, fighting to keep adventurers from taking their stuff. (If there *are* any such adventures, I'm sure I'll hear about it from [our loyal readers](#). And if I was a betting man, I'd bet that at least one such example adventure is for *Call of Cthulhu*.)

If we widen our definition a bit, there are a number of examples of interlocking settings, mostly by allowing players to

portray various sides of a conflict. The *World of Darkness* is all about the interactions of various factions, with the old incarnation's *Hunter: The Reckoning* being the most obvious example, since that book's protagonists are expected to fight all the protagonists of the other books. *Exalted* likewise weaves a complex tapestry of opposed forces, all of whom are suitable for playing as characters.

But actual concurrent stories set within the same overall plot are a fair bit rarer in the game world. The reasons behind this are fairly obvious. Probably the biggest problem is the question about what to do about the problem of the two forces interacting. The easiest is to say that they don't; they may hear *about* the actions of their counterparts, but they won't be able to directly interact. While simple, it's also the least satisfying

Allowing for extended interaction is probably the most complicated, since -- as best as I can tell -- there are only two possibilities. The first is to play through the same scene twice from both points of view, requiring players (and the GM) to remember what their counterparts did previously, *and* forcing the players to play a scene with characters they haven't used before. And, of course, there's the implicit understanding that both sides need to "behave"; if the first adventure has a scene midway through with Team A and Team B meeting, and Team A goes on from that scene to finish their adventure, then it would be quite a challenge if, in the second adventure, Team B were to go berserk and attack Team A.

The second -- and probably simpler -- possibility here is to allow players to play "forgotten" scenes; just because the previous adventure didn't have Team A going into a bar and meeting Team B, this doesn't mean that Team A *couldn't* have gone into a bar and met them. Of course, this has the same problem of Team B being "forced" not to do anything to Team B that would have made an impact on Team A's original adventure.

Possibly the easiest option is to allow limited interactions "from afar." In this case, the GM plots for certain strict possibilities of interaction; this allows for GM interference if things don't go according to plan. As an example, let's take an interlocking adventure involving a group of pirates and a pre-*League of Extraordinary Gentlemen*-esque group of Renaissance secret service agents acting on behalf of Her Majesty. In the first half of the adventure, the secret-service PCs are atop a cliff and see the band of pirates below. As they are debating what to do, a fight breaks out atop the cliff with another band of pirates. While the agents fight with the pirates, one of the agents sees the other group below fire a cannon up at the cliff, causing an avalanche that sends the heroes tumbling into a cave (and separating the two groups again). In the second half of the adventure, that same scene has the PCs notice a scuffle on the cliff above; they can either react by firing a cannon, or else an NPC might fill the cannon-firing void if the players hesitate (or try to interfere). As the pirate PCs notice the other group fall into a cave, they find themselves faced with the possibility of fighting the very same pirates who were fighting the first group . . . who, having survived the cannon blast, are looking for answers.

Of course, by its very nature an adventure of this sort requires more railroading than more open-ended adventures. However, the possibilities for crafting an interesting and memorable tale are that much greater.

If nothing else, it might give players a chance to be wicked.

--Steven Marsh

The Triple City of Amadan

by Matt Riggsby

Amadan is, in one sense, a single city. Its inhabitants share a common culture and language, are ruled by a single government, and can stroll around town, seeing everything worth seeing over the course of an hour or two. In another sense, it is three cities, three different settlements separated by thousands of miles. What makes this possible is a set of three magical portals linking each to the other as though different continents were only a short walk away from one another.

Geography and Land Use

Amadan consists of three settlements: Cold Amadan, Amadan by the Sea, and Hot Amadan.

Cold Amadan is not just north of the other two parts of the city, but quite a way north in absolute terms. Summers are short, and winters long, cold, and dark. Cold Amadan sits in the middle of a broad plain between tundra and grassland. The land is poorly watered and the growing season is short, so agriculture is difficult, but it is home to herds of large grazing herbivores and the predators who hunt them, all of whom have thick, attractive pelts. There are also considerable forests a few days journey to the south, providing access to a considerable quantity of wood, and small but rich deposits of copper and other ores.

Amadan by the Sea is well south of Cold Amadan, in the warmer reaches of a temperate zone, and well to the west (about a ten hour time difference). It sits on a small, steep-sided island at the extreme eastern end of an archipelago whose islands grow larger as they approach a nearby continent. Like the other islands nearby, it could support a population of fishermen and a little gardening and grazing (the sandy soil and lack of water sources would preclude any other kind of agriculture), but as it stands, the island is almost entirely built up. In fact, there have even been some efforts to artificially increase its size with pilings, rocks, and sand filling in some shallow spots by the shore. Some nearby islands serve as suburbs, with large comfortable villas for wealthy residents who want to get away and clusters of smaller homes for poorer people who can't afford to live on the main island.

Hot Amadan is just a bit east of Cold Amadan (about an hour's time difference), but far to the south, in the tropics just below the equator. The weather ranges from hot and mildly humid to very hot and oppressively humid. The city's immediate surroundings are largely farmland, but its surroundings are a lush rain forest, dotted with clearings around outlying villages. There is also a large river a few miles away.

The city's population is about 70,000; on average, each settlement has about a third of that total. However, there are seasonal shifts, with fewer in Cold Amadan during that settlement's winter and more in its summer. No segment of Amadan is particularly large as cities go, but because of allowances for the shifting population, they are relatively spacious, with relatively broad streets and large plazas in both Cold and Hot Amadan. Amadan by the Sea, of course, has relatively narrow streets and small public places, given the limited room.

History

Amadan was never intended to be a city. About 1,200 years ago, three sorcerous sisters attempted a magical experiment to link their widely separated strongholds. Their goal was to create permanent magical portals through which they could travel and communicate easily. They succeeded, in a narrow sense. They were able to establish their portals, but an unexpected and immensely powerful backlash destroyed them.

Natives of the three regions, sensibly enough, avoided the sites for many years, but eventually the memory faded and people began filtering back. Legend has it that nomads near what would eventually become Cold Amadan were the first to happen upon their portal. Looking through one side, they saw a sandy slope leading down to the sea, lit only by

the stars when it was mid-day on their side. Through the other, they felt a breeze hotter than their warmest summer melting the snow on their side. Some brave soul ventured through and found himself half a world away, then turned around and, with a single step back through an identical portal, was home again.

Whoever went through first, nomads from the north soon met tribal villagers from the south, and soon thereafter they met fishermen working their way up the archipelago. Cautiously at first, but eventually enthusiastically, they began trading with one another: furs and wood (some of which turned out to be outstanding for boat building) from the north, fish and metal goods (traded up the island chain) from the slightly higher-tech islanders, and a variety of exotic woods, plants, and other goods from the south. Small settlements of traders, craftsmen, and amenities for travelers soon sprang up around the three portals, and they began to take on an unusual hybrid ethnic character as the racially and culturally disparate natives of the three areas developed a common language and began to intermarry.

Though the portals became important local centers, each was quite remote from any center of population, so they grew slowly. The island was probably closest to civilization, but the nearest nation, a kingdom with theoretical dominion over the island chain, was collapsing under internal warfare and a general economic depression. The first significant threat to the growing settlement was a group of pirates who, without the dying kingdom's navy holding them off, were raiding their way down the coast and up the island chain. Had Amadan by the Sea been simply an island town, it certainly would have fallen to the raiders. However, it was impossible to blockade because it could be easily supplied from the other segments of the city, and raiders who attempted landings were deeply surprised that the meek fishermen they had expected to find were reinforced by fierce jungle bowmen and enormous axe-wielding warriors from the far north.

Still, Amadan by the Sea was, at the time, the settlement's only real port and closest link to civilization (several days sailing in good weather, as opposed to weeks of arduous overland travel to the empires closest to the other parts of the city), so some stronger defense was in order. A number of pirates were contracted to serve as a sort of mercenary navy to defend Amadan by the Sea, and the arrangement worked well enough that a decade later, when raiding by neighboring tribes in the area of Hot Amadan became an issue, several of those were retained as mercenaries as well.

In the century that followed, Amadan's reach grew slowly but steadily. Around Hot Amadan, the city's merchants began to build a network of trading stations defended by its mercenaries; those settlements formed the nuclei of a network of small towns concentrating trade and agricultural production under Amadan's economic hegemony and, effectively, political control. With a fleet and no one to stand in their way, the Amadanese established more direct control over their archipelago and nearby coastal areas of the adjoining continent.

At its height, after three centuries of expansion, Amadan had direct control over perhaps a million people, about a tenth of whom were actual residents of the city, and influence over as many more in allied and dependent territories. The only area in which Amadan's control was not strongly felt was around Cold Amadan, and that largely because the population was simply too sparse in the cold wastelands for anybody to be firmly in control.

And then the plague hit. A terrible ailment swept through the region around Hot Amadan; traditional accounts say that one in three people died, and as many others fled. The plague spread to the other segments of the city, killing many in Cold Amadan and Amadan by the Sea. However, the virulence of the plague was apparently vitiated by climate. Although as many people inside the other segments of the city died as in Hot Amadan, hardly one in ten in Amadan by the Sea's archipelago contracted the plague, and hardly any people in the small settlements established around Cold Amadan were effected. A small popular movement pushed for blocking the portals to seal plague-ridden Hot Amadan off from the rest of the city, but in a defining historical moment, the city's ruling council refused to shut out their afflicted brethren, electing instead to send through as much aid as they could gather.

Several more waves of plague passed through the city in succeeding years (on average, once a decade for the next century), although none were quite as deadly as the first. Nevertheless, it was a serious blow to Amadan's power. The population of its breadbasket region was severely depleted and its shipping suffered. The region of Cold Amadan, though relatively healthy, grew as it became a refuge for those fleeing the plague, but living was difficult there.

Moreover, trade networks frayed and the power vacuum left by Amadan's temporary decline was quickly filled. Hot Amadan's neighbors had become more sophisticated over the years (the Amadanese believe that, ironically, this was

the direct result of their influence), and various alliances took control of the remnants of the towns and trade networks isolated from their mother city. The kingdoms near Amadan by the Sea were also starting to revive around this time, putting a damper on Amadan reclaiming its coastal territories. And even Cold Amadan began to suffer. Long regarded as an unpleasant but safe region, a series of particularly cold winters began, accompanied by the appearance of huge, shaggy wolves prowling the tundra and snow wyrms raiding outlying settlements.

Nevertheless, Amadan has managed to establish some sort of stability. The plagues have passed for now, so the population has had a chance to return to something like its previous levels. The regions around Hot Amadan and Amadan by the Sea are now occupied by potential rivals rather than easily subjected villagers and tribesmen, but they make better trading partners, and despite their ferocity the predators around Cold Amadan yield very valuable pelts. Moreover, a number of kingdoms and empires at a moderate distance from Amadan are experiencing periods of growth. In the far south, an ancient empire a few month's journey east of Hot Amadan has resolved certain internal problems which have plagued it for the past century or so, and trade in that direction is increasing. In the north, a number of northern tribes have become part of increasingly sophisticated trade networks and are visiting Cold Amadan more often to purchase goods for sale to growing kingdoms farther south.

At the moment, Amadan is both reasonably secure and prosperous. The question, then, is how long it will last. The city lacks powerful allies, and its trade ties are still a bit shaky. More unrest in any of its markets could still cause severe economic problems, and despite the city's defensibility in the short term, war with the southern tribes or the kingdoms near Amadan by the Sea could be more costly than the city could afford. But until that becomes a threat, there's money to be made.

Society

The people of Amadan are divided into three social classes: citizens, residents, and pirates. Citizens are members of a number of families in residence since the formal founding of the city, an event somewhat lost in the mists of time. Any child of two citizens is a citizen himself.

Citizens are divided into three "clades": the Djatami, the Tevik, and the Leoti. Each clade is loosely identified with the original residents of each segment of the city (the Djatami with Hot Amadan, the Tevik with Cold Amadan, and the Leoti with Amadan by the Sea), although intermarriage has long since made the ethnic associations nearly meaningless. For the Tevik and the Leoti, clade membership is transmitted through the male line; that is, if your father is a Tevik, you're a Tevik too. However, because the tribes around Hot Amadan were largely matrilineal, Djatami membership is passed down through the female line. Consequently, someone with, say, a Leoti father and a Djatami mother will be both Leoti and Djatami. However, someone with a Djatami father and a Leoti mother is born into *no* clade. The compromise position the city's founders arrived at is that children who are born into no clade are rotated through them annually; their children inherit clades as appropriate to their parents' status at the moment of birth.

The clades are groups of broad civic importance. They sponsor charitable efforts, form teams for various competitions, arrange celebrations and other ritual events, and so on. They also serve as electoral districts.

About a third of the people living in Amadan are citizens. Most of the remainder are residents, people without the political representation or ritual obligations, but who are permitted to live within city walls or on Amadan by the Sea at the cost of a few additional taxes. Legitimate children of one citizen parent and one resident parent are granted resident status but are not charged the usual resident fees.

Amadan's first line of law enforcement and the core of its armed forces are its third class, the pirates, comprising about 10 percent of the total population. The relationship between Amadan and the pirate mercenaries of its early days was formalized in a long-term arrangement. The pirates were granted the right to settle in Amadan free of any taxation in return for providing military service. The term "pirate" simply stuck. Pirates are organized into households; each household has a hereditary charter obligating all able-bodied adults to service in return for privileges. Someone who doesn't want to be a pirate can simply choose to live elsewhere. Because of high mortality during wartime, entire households can vanish, so the city commissions new charters from time to time. Despite the danger, a charter is a desirable honor; during peacetime, a pirate can become quite wealthy, since they can import goods free of duties.

The Toll

The magic powering the portals is not without its problems. On rare occasions, perhaps one or twice a year, someone going through a portal will come out the other side changed. This change is called the Toll, the small price that must be paid in order to make use of the portals.

The change is usually a small physical alteration: skin or eyes (either the iris or the entire eye) change to an unusual color, hands acquire extra fingers, hair starts to writhe and twist slowly like a stand of undersea plants, the body is covered with a zebra-like pelt, and so on. In more extreme cases, the change might involve a noticeable shift in abilities. For example, one person acquired a set of wings which allowed her to fly, while another acquired the ability to see in absolute darkness, but his vision dimmed in increasing light, making him essentially blind in full daylight. Occasionally, the changes are mental instead. Someone might come through the portal having forgotten one set of skills but learned another or speaking a different native language. In any event, all recorded changes have so far been unique.

The traits imposed by the Toll are hereditary, although not necessarily dominant. Consequently, many families have at least a few members with unusual features, and some are distinguished by the Toll imposed on them. Even the mental alterations are passed on in some way. For example, one family descended from a former cobbler seems to have an innate grasp of woodworking but are utterly hopeless at work with shoes, mirroring their ancestor's loss of his cobbling skills and commensurate understanding of barrel-making. The unusual appearance of many Amadanese can confuse visitors, but while people from Amadan may seem to represent countless different races, they are entirely human.

Politics

Amadan is a republic with rather complex electoral politics. Each part of the city has a number of "plaza lords" (21 in Hot Amadan, 12 in Amadan by the Sea, 18 in Cold Amadan) selected by lot annually from senior members (above the age of 45) of a corresponding clade (from Djatami for Hot Amadan and so on). The title derives from their nominal responsibility over the various plazas at the centers of the city's neighborhoods. Changes in the city have erased half of the plazas (and new ones have sprung up in their place without change to the political structure), but the administrative districts they represent remain. Plaza lords retain the authority to approve public works in their district, inspect goods sold there, supervise tax collection, officially record births, deaths, and marriages, and other small duties. They are compensated by being allowed to retain a portion of the taxes they collect, which is mostly spent in support of their duties. Because of vagaries of clade membership, it's entirely possible, if quite unlikely, for someone to be selected as lord of two different plazas.

The plaza lords elect five members from their clades to serve on the ruling High Council for the year. The High Council serves as a legislature, executive branch, and final court of appeal. They appoint judges to hear cases beyond the competence of the plaza lords, handle foreign affairs, and so on.

Theoretically, this arrangement provides equitable government for all families and classes of citizens. In practice, there are occasional instances of election fraud, in the form of rigging the lot drawing for plaza lords. More often, less politically active citizens are persuaded to decline office, requiring a new lot to be drawn and giving more prominent citizens more chances. The result is usually a government which is often conflicted enough to achieve relatively little (save in wartime) but has many of the same faces, or at least family names, appearing year after year.

Law Enforcement and Armed Forces

As already mentioned, the city's pirate class constitutes the core of the city's armed might. In peacetime, they serve as a constabulary and as marines on shipboard. During wartime, they function as elite troops and an officer corps, leading units made up of citizens and residents called up as a militia. The pirates are officially only junior and mid-level officers and operate under the orders of citizen generals, but most of those generals have the good sense to follow the

military advice of their technical underlings.

Amadanese are generally excellent sailors, and on land field reasonable heavy infantry with good archers. However, their native cavalry is limited to individual scouts; there's no room for horses in Amadan by the Sea, and they don't long survive tropical diseases in Hot Amadan. Nevertheless, the city is wealthy enough to hire mercenary reinforcements of whatever kinds become necessary.

Amadan's chief military advantage, though, is that since its foundation it has been practically impossible to blockade or besiege. As the pirates who first attempted to raid the city quickly discover, any one segment of the city can be reinforced and resupplied by the other two. Barring overwhelming force, Amadan can defend itself until its considerable monetary resources run out.

Economy

Amadan's economy relies heavily on trade, and is in a particularly advantageous position to do so. Unlike many other trading cities, it does not insist on its merchants having a near-monopoly on trade within the city. However, it charges stiff tariffs on shipments of goods through the city not undertaken by a citizen. Foreigners must pay duties amounting to, depending on the specific goods in question, between seven and ten percent of the value of goods shipped. Citizens pay only a fraction of that, and pirates none at all.

The city and its merchants have historically made most of their money moving raw materials: woods, furs, and so on. It is particularly well known as a source for rare materials used by alchemists and enchanter. In more recent years, though, as the neighbors of Amadan's more southerly parts have grown more sophisticated, more and more manufactured goods have been finding their way through the city.

Amadan is known for relatively few high-quality products of its own. For example, it produces good painted pottery (Cold Amadan is near some good clay deposits) and a variety of wines based on mixtures of fruits native to the Hot Amadan region, but neither has caught on elsewhere. However, it is notable as a producer of perfumes and incense. Amadanese perfumers combine tropical flowers and aromatic woods with near-Arctic musks in ways not possible for most others.

Science, Learning, and Arts

With almost unlimited access to the night sky (Hot Amadan's evening overlaps Amadan by the Sea's morning, and Cold Amadan is dark well into the day during the winter) and a wide range of longitudes, Amadan is a center for astronomical observation. Amadan's wealthy have constructed sizable observatories containing large sundials, astrolabes, and other equipment for tracking the stars, and its scholars have worked out some remarkably sophisticated theories about timekeeping, navigation, and the movement of heavenly bodies.

Despite that, Amadan seems a bit underdeveloped when it comes to other sciences and technologies. Glassblowing isn't an advanced art (none of the three segments of the city have appropriate sands for glassmaking), so optics is a perhaps surprisingly undeveloped science. Likewise, there are few deposits of metal ores in any neighborhood, so local metalwork is of average quality but rarely better. But the people of Amadan rarely care, since they can generally trade for what they want.

Literacy is also not particularly widespread except among the upper classes, and the written word is largely restricted to account books and technical records of astronomical phenomena. The general opinion is that mere words are insufficient for art. However, what Amadan lacks in written works, it more than makes up for in theater and visual arts. Amadan has developed several distinctive theatrical forms, ranging from two-person plays, often of a popular sentimental or satirical nature and performed in taverns or homes, to productions with large casts, elaborate sets, and a complicated formalized structure of stock characters and other conventions.

And just because Amadan doesn't go for written works doesn't mean it doesn't have books. Picture-books, telling

stories by a series of wordless (or nearly so) pictures are immensely popular among the upper classes. They are frightfully expensive, but generally exquisite and easily sold to people who don't share a language.

Painting is likewise popular. Buildings are decorated inside and out with murals and elaborate geometrical patterns in a wide variety of colors. This does a great deal to spruce up otherwise relatively dull architecture (most buildings in Amadan are fairly boxy wood or mud brick without much decorative detail).

What to See and Do

As a center of trade, Amadan is used to visitors. It has a number of inns, hostels, and other facilities to accommodate travelers for as long as necessary. But, obviously, Amadan has its own distinctive civic features.

The most notable sights in Amadan are, of course, the portals. Each segment of Amadan is built around a portal, a metal ring with an inner diameter of twenty feet, set on its edge. Their material resembles a highly polished bronze deeply inscribed with mystic symbols. Practical experience suggests that the metal is much harder than bronze, if not harder than steel, although direct experimentation is forbidden. The rings are set into the ground for stability, so at ground level they provide a passage about ten feet across (making the opening over eighteen feet tall at its highest point). Each is at the center of a large plaza, allowing plenty of room for carts and draft animals to get around.

The largest structure in Hot Amadan, ignoring its wall, is the Gran'Labari Theatre. It is a semi-circular, open air theatre taking advantage of a depression in the middle of a low rise to provide a performance space with good acoustics and shelter from the sights and sounds of the city around it.

Hot Amadan is also home to a large public garden, containing distinctive plants predominantly from its own region, but also some from the environs of the other two segments of the city and a few from farther afield. It is a favorite spot for romantic assignations.

Amadan by the Sea's most notable structure is Ovolo's Lighthouse, a tall tower built on the island's highest spot. A fire is kindled nightly to make it visible in the dark, and it is clad in alternating bands of blue- and yellow-glazed brick to give it a distinctive appearance in the day. The top-most level is dominated by a platform for the nightly bonfire, but people with appropriate connections have been known to use windows on the upper floors for astronomical observations.

Cold Amadan is home to the Council Hall, the nominal seat of civic government. Large public meetings are generally held out of doors, but the Council Hall has large chambers for meetings of the plaza lords and the High Council, as well as separate rooms for trials, archives, cells for scribes and clerks, and the rest of the machinery of government.

Amadan celebrates a number of civic festivities. For example, the Consecration of the Portals is a solemn ceremony held in late summer during which officials anoint the portals with a variety of sacred substances (daubs of aromatic powers, sprinklings of blessed wine and oils, and the like). In the month following it, citizens will try to pass through the portals barefoot at least once in a tradition whose origins have become completely obscure.

A more interesting civic event is the Tmbeya, a race around the city held in late spring. Three people are chosen from each clade to compete. The course starts in Hot Amadan, goes around the city, through the portal to Amadan by the Sea, around its shores, back to the portal to Cold Amadan and to its gates, and then back again by the same route. To ensure that the racers go around all three parts of the city, they must collect colored ribbons at various points and tie them to long poles they carry with them, reaching the finish line with brilliantly colored banners. The ribbon-collecting checkpoints are set by tradition, but the route the runners use to reach them is up to them, which leads to considerable speculation and strategizing as each race approaches. Most of the city turns out to watch every year, and betting is intense.

Amadan in the Campaign

Amadan could be used as a minor player in any fantasy world or an occasional destination or stop along the way, but it's particularly well-suited to being the base of operations for a group of PCs. Its multiple locations put it close to a variety of locations suitable for adventures: squabbling kingdoms in a temperate zone for Amadan by the Sea, monster- and barbarian-filled tundra and forests near Cold Amadan, and exotic jungle for Hot Amadan.

At the very least, it's a good location for the starting point for a campaign. At the crossroads of the world, the GM can justify characters of just about any background: questing knights, adventurous faux-Vikings, pseudo-ninja on the run, magicians searching the world for new knowledge, all could justifiably show up in Amadan, and plausibly share a table at a tavern where an old man stumbles in with a treasure map . . .

An Amadan-centric campaign might have the PCs as merchants (and their hangers-on) venturing all over the world, a group of pirates carrying out special ops-style missions to eliminate potential threats, or simply monster-hunters out to gather pelts in the far north or keep trade routes through the jungles open. As described, the city itself is more or less at peace with itself, but with very minor tweaks it could easily become a hotbed of intrigue for politically inclined players.

Here are some other ideas for adventures set around Amadan:

The Hard Way: One of the proverbial jokes around Amadan is the idea of going between the different parts of the city "the hard way," going over land and sea rather than through the portals. Perhaps the PCs make a Phileas Fogg-style bet that they can do it, or perhaps the enchantment which powers the portals is starting to fade, and fixing it requires that special items or materials be brought to each without going through them.

Annus Horribilis: One of the things which makes Amadanese feel secure is the knowledge that, while things might go badly around one part of the city, they couldn't go badly around all three. Could they? It's unlikely, but possible, that Amadan could find itself attacked on three fronts. For example, a charismatic warlord near Hot Amadan could raise a wide range of local tribes against the semi-foreign Amadanese (the visible consequences of the Toll could easily be taken as the result of demonic influence) while an ambitious kingdom on the mainland makes a play to establish control over the archipelago and a particularly hard winter sends the wolves and snow wyrms after humans as well as animals. Amadan would, for the first time, find itself cut off from aid. What can the PCs do to save the city?

Weird Sisters: Legend has it that the backlash from creating the portals destroyed the sorceresses who created it. But what if it simply displaced them in time, to reappear centuries after they vanished? They were clearly quite powerful to have created the portals to begin with, and the remote locations they chose for their strongholds suggests that they don't like company. They're unlikely to react well to finding tens of thousands of people using their portals, and the PCs may be the ones who have to convince them to leave the city alone.

Crunchy or Soft?

by Heather Barnhorst

Your local retailer has been experiencing rough waters as of late. While there is little hard evidence to support various theories, industry pundits seem to be in agreement that FLGS closures are at their peak. Publishers are selling direct to you, PDF sales have gained traction, online retailers are perfecting methods to reach customers worldwide, big-box chain stores are cherry-picking our bestsellers. Online gaming, a form of gaming that most stores cannot capitalize on (you may argue that we should all get LAN game areas into our play space but evidence shows that when DSL and cable becomes available in areas, the demand for LAN play areas goes down and that only the very best LAN stores can compete), is converting many of our customers to stay-at-home players. In general, various segments of the entertainment industry are doing an efficient job of nibbling away at many of our would-be customers. Many of us agree that retailing in this industry is undergoing a radical sea change and that the bleakest prediction of the future is that what few FLGS are left will be the ones that live a hardscrabble life based on the scraps that online discounters won't find it worthwhile to fiddle with.

Me? I'm pretty sure that more venues and more methods of delivery will help create new customers. I'm not sure that I will be managing one of the stores left standing but I do aim to try. In the end, more customers will benefit publishers and the retailers who are left standing but I also have a theory about "critical mass" and game stores. Why is it, I've asked myself, that areas with an abundance of good game stores seem to support a large gaming community but that the number of game stores is disproportionately large when compared to other metro areas of similar population? It is a bit of a chicken and the egg theory. Which came first -- the gaming community or the good game stores? My answer has always been -- both. They feed on each other and create a synergy where we are all working together to bring an awareness of gaming as a form of entertainment to new people. In areas where one or two stores operate, they seem to struggle to make themselves noticed by potential customers. So here is my worry: There are enough other entertainment opportunities which can whittle away at our critical mass so that if only a few of us survive that there won't be enough of us left to reach out to people who could be our customers. We need more good retailers who are dedicated to growing the pie for everyone. That means that retailers have to be proactive in finding new customers and converting non-gamers into gamers.

But in the process, we are watching a culture clash firsthand, and the battleground is our FLGS.

I call it the battle of the "Crunchy" and the "Soft," named after the famous tacos del muerte peddled by the local taco house next door to our store. Crunchy and Soft customers. In my lexicon, you are either a Crunchy or a Soft and I bet that if you are reading this column right now that you are a Crunchy.

Crunchy customers are our hard core gamers -- the goth, the geeky, the weird, the quirky, the obsessed fans. They are the sometimes slightly socially maladjusted who have remained loyal to us over the decades. They (okay you) are the stuff of myths and urban legends. At your best, you are insanely creative, utterly loyal, and the best of friends. At your worst, well, quite frankly, you can stink with the odor of stale pizza, flat Dr. Pepper, and old laundry, and in one publicized case, you can be redolent of cat pee. You can scare away other customers by greeting them in Klingon . . . and expecting to be understood. You think that bridal registers for games is a reasonable action to take to prepare your new household for the rigors of marriage. You are the gamers that I grew up with and you are the customers who are my favorites. Just a hint here -- all customers are my best customers but not all of them are my favorites. The FLGS is the community center and the safe haven for the Crunchies.

The point is that the Crunchies make the store go round. Many stores survive solely on your business, often to their peril. They even glorify the Crunchy lifestyle as if it part of the gaming experience, but Crunchy gamers are a small group in a niche market that isn't quite big enough to feed us all. It isn't that we retailers don't love our Crunchies, it is that we need more than what you provide to survive. If we are to stay in business and serve your needs, then we have to go outside our comfort zones to find new customers who don't understand you.

So there are the stores who court the Soft customers. These are the mundanes who will never self-identify themselves as gamers. To them, being a gamer is being a part of a marginalized and frightening counter-culture. They are the ones who somehow find a FLGS because a friend of someone who plays *Settlers of Catan* told them about the store in a convoluted word of mouth process that defies unraveling. "I've lived around the corner for seven years and I didn't even know you were here," are the words that drive us retailers to walk quietly into the office, close the door, and bang our heads up against the wall. (Ha! Those strange noises emanating from the office are finally explained.)

From the other side of the looking glass, the Softs are the ones who seem strange to us.

Somehow here at Attactix, we've hooked into the "Mormon Network." Colorado boasts a large Mormon population. One of our full-timers is Mormon and now many of her fellow church members come to the store to satisfy their board game cravings. Unlike many fundamentalist Christian groups, some of them even roleplay. Every semester, we receive frantic visits from panicked students and their parents who have to create dioramas for school projects. Much of our job involves soothing mom who is experiencing sticker shock as the dollars add up at the register. Other schools start board game clubs; we spend a lot of time with the teacher advisors finding age-appropriate games that are fun to play yet educational, since there seems to have been a movement in this country that promoted the idea that educational games could not be fun or attractive. There are our Senior Softs -- the elderly ladies who "visit" friends and relatives as their pastime. Before every trip, they pick up several copies of their favorite card games because "My sister can't find *Five Crowns* where she lives so I leave her my copy and just pick up a new one when I get home."

I have a great group of Softs who shop at the store but who won't play here. They meet every Tuesday night at the local Borders and play in the Starbucks there. They draw upwards of 30 players. It isn't that we don't want them, they just don't want our game room. Aesthetically we cannot measure up to their expectations for their gaming environment, and most of them don't want to mingle with the Crunchies. They play at Borders, they see games they like, they recommend our store as a great place to buy board games to their members, and their members purchase from us. It works . . . until someone at Borders figures out that they can make money on this group by carrying a broader range of board games (and don't think that it isn't in the works). I'm not sure that customer loyalty can overcome the lure of convenience and cheaper games. In fact, I am pretty sure that it can't.

And so the culture clash takes place every day. The Softs look like they are wondering if they might have to go through decontamination after they leave the store and the Crunchies resent the mundanes for invading their space. They quite rightly fear that some of the Softs might be looking down on them. My belief is that no one should be made to feel out of place, especially when gamers have proven to be so accepting of differences in lifestyle, age, sexual orientation, and even disabilities. The irony here is that if you are different you will surely fit in at a game store.

Some people in the industry aver that it is impossible for retailers to appeal to both the Crunchies and the Softs; the Crunchies will scare away the Softs and that the hardcore gamers won't tolerate their domain being invaded by the Softs. The Crunchies will defect to dark dens of gaming iniquity that cater to their niche needs for social interaction and community feeling.

With the risk of alienation very present, what are retailers supposed to do when they need both the Crunchies and the Softs to survive? When everyone says that the attempt to serve both will end in chasing both sets of customers away? When we are told to choose? I like both the Crunchies and the Softs. I like interacting with families and moms and VPs of up-and-coming aviation software companies. I like meeting teachers of English in Japanese schools and IT professionals who have visited all seven continents before they were 30. I like talking with construction workers who have scheduled a layover at the airport because they heard about the store and have to see it while passing through Denver. I like hearing about the culinary student's adventures when he comes home on break. I like the executive who talks cutting edge philosophy (yes, there is such a thing) with me. You try to figure out who are the Crunchies and who are the Softs because I am betting that you'll guess wrong nearly every time.

I choose not to choose.

Last night was a typical Friday night at Attactix. It was about quarter to 10 and an ex-employee and always faithful customer walked through the door. He grinned like a Christmas elf gone on growth hormones. He and I had attended a trivia game at a local bar the Sunday before and the master of ceremonies had played songs between the questions. Our

ears had pricked up -- we swore we had heard a William Shatner song. We had and my friend found the CD -- *Has Been*. Now, before you scoff, let me assure you that some of the songs, all of which are collaborations with real musicians, are good despite the wrongheaded words uttered by my full-timer when she threatened to quit upon hearing the first track. Generally Friday night is a Crunchy night for us and the Softs had long abandoned us for bars and movie theaters. The ***Magic: The Gathering*** players were filtering out once the tournament had ended and the Games Workshop boys had nearly finished cleaning up the tables. The ***Flames of War*** guys had bought their miniatures and gone. "What harm could a little Shatner do?" I asked myself so I let the ex-employee pop in the CD and crank up the volume. As the strains of *Common People* reverberated across the room, I understood why I am so fond of our Crunchy Customers.

"It's *Common People*. This is an awesome album," said one ***Magic*** player.

"Kewl," answered an RPG straggler.

"I love Kirk!"

And so we all bopped to Shatner, even embracing Shatner embracing his Shatner nature when my last customer of the evening walked through the door.

"Are we having a party?"

I paused and then I answered, "Yes, we're having a party." Only the Crunchies would know and love an album put out by Captain James T. Kirk. Only they would get it and smile and speak along because they know the lyrics in their hearts.

And so I lied to you. Last night, I chose. At least for one night.

Castles & Crusades: The Fantasy Role Playing Game Players Handbook

Published by [Troll Lord Games](#)

Written by Davis Chenault & Mac Golden

Cover & Internal Illustrations by Peter "20 Dollar" Bradley

130-Page Black & White Hardback; \$19.99

Dungeons & Dragons 3.5 Edition has a problem. It is too complex. Too many classes. Too many rules exceptions. Too many feats. All right, so the simple things at the heart of *Dungeons & Dragons* are still cool -- the easy *d20 System* mechanic, the Armor Class reversal, and any number of nifty settings that we have seen in the last five years. But there are still too many feats and all too often the ones selected do not change for one type of character from one game to the next. Perhaps this is one reason why Wizards of the Coast is publishing *Dungeons & Dragons for Dummies*?

So what do you do if you want to bash a dungeon *Dungeons-&-Dragons*-style? Options include any previous version of the game from *Basic* to *Advanced Dungeons & Dragons*, but then the first is *too* simple, *too* inflexible, while the second is *too* . . . Well, just *too*, okay? Step up *Castles & Crusades*, which offers up old-time gaming via an all-new simple game engine and back-to-basics philosophy. It first appeared in the *Castles & Crusades: A Guide & Rules System for Fantasy Role Playing Collector's Edition*. This was a white boxed set containing three little booklets, a set of plain polyhedral dice, and a crayon (!), all designed not just to nudge your nostalgia button, but to give it a good hard stamp. It has been superceded (mostly) by the *Castles & Crusades: The Fantasy Role Playing Game Players Handbook*, and if the *Collector's Edition* is the *Castles & Crusades* answer to the *Dungeons & Dragons White Box*, then this first book is its answer to the first edition of *Advanced Dungeons & Dragons*. Even then, such an analogy only just gets you out of the starting gate.

Castles & Crusades can be best described as the OGL version of *Basic Dungeons & Dragons*. If that is the starting point, then its race has been up through both versions of *Advanced Dungeons & Dragons* to grab the bulk of its races, classes, and knickknacks, with a stop off at *Gamma World, Fourth Edition* for its Armor Class mechanics (where do you think *Dungeons & Dragons Third Edition* got them from?), and after a final layover at the *d20 System* for its mechanics, it ends with a charge back down the home straight for the return to *Basic*. So if this is *Basic Dungeons & Dragons* re-engineered, what is so different?

In *Basic Dungeons & Dragons* you rolled up one of the stereotypical characters as normal -- Cleric, Fighter, Thief, and Wizard, but all four classes were for humans only. You could choose to play a Dwarf, Elf, or Halfling, but they were classes in their own right, and limited in the number of experience levels a character could attain. In *Castles & Crusades*, a player is free to select both class and race. All of the races you would expect to be present are here -- Dwarf, Elf, Gnome, Half-Elf, Half-Orc, Halfling, and Human -- along with the classes Assassin, Barbarian, Bard, Cleric, Druid, Fighter, Illusionist, Knight, Monk, Paladin, Ranger, Rogue, and Wizard. Further, every class does exactly what you expect them to. One nice addition is the extra modifiers for class abilities available if a character of a particular race selects that class. For example, a Halfling Ranger gains +2 to Conceal and Move Silent, but if he were an Assassin or Rogue, he would gain the +2 to Hide and Move Silent.

Character generation remains unchanged -- roll 3d6 six times and assign to attributes, choose race and class, note abilities, buy gear, choose spells if necessary, and decide on alignment. It's very similar to *Dungeons & Dragons* except for its core mechanic, which is built directly from a character's attributes. During the creation process, a player

designates some of his character's attributes as Primary, and others Secondary. Human characters possess three Primary attributes, while all other races have just the two.

Either way, both Primary and Secondary attributes provide a base line Challenge Class against which all Attribute Checks are made. If a Primary attribute, this Challenge Class is just 12, but for a Secondary attribute it is 18. Attribute Checks are made for basic actions like lifting a gate (Strength) or haggling for the best price (Charisma); for many of a character's class abilities, such as a cleric's Turn Undead (Wisdom) or a rogue's Move Silent (Dexterity); and for saving throws, for example against Illusions (Intelligence) or Energy Drain (Constitution). To make an Attribute Check, the GM or Castle Keeper determines the appropriate attribute and thus the base Challenge Class, before modifying it according to the task's difficulty. The player rolls 1d20 and adds a bonus equal to his character's current level plus attribute modifier. Equal or beat the Challenge Class and the character succeeds.

There is just the one further development of this Siege Engine, the term for ***Castles & Crusades***' mechanics. Monsters and NPCs gain a modifier equal to the number of Hit Dice possessed. This modifier is used to resist the effects of a character's actions or spells, to add to attack rolls in combat, and conversely, to adjust a Challenge Class when a character must make an Attribute Check. Thus if trying to save against Dragon Breath, the basic modifier would be equal to the dragon's Hit Dice.

Everything else in ***Castles & Crusades*** works just as you would expect it to, most obviously magic and combat. How it all works is explained in just a few easily understood pages. As to how it plays, well this is ***Dungeons & Dragons***. And unless you happen to be one of the ***Vampire: the Masquerade*** generation, virtually everyone knows how to play this game.

The ***Castles & Crusades Players Handbook*** is not exactly problem-free, but such problems can be divided between those that are not really problems, and those that are. Those that are not start out and end with this being a ***Players Handbook***. It gives you everything you need to play bar the monsters and the treasure, and until the arrival of the ***Monsters & Treasures*** supplement, this might seem to be a problem. Of course, the ***Collector's Edition*** contains some of this information, but since it is out of print . . . Yet take almost any ***Dungeons & Dragons*** adventure, apply file and emery paper as necessary, and you are good to go. Indeed, ***Castles & Crusades*** is all but the perfect excuse to dust off all those ***Basic Dungeons & Dragons*** adventures.

The real problems are physical. The book is a nice hardback, the contents illustrated with pleasing artwork. But it lacks both index and character sheet. Worse still, the layout is duller than a party political broadcast, and another editorial pass would not have gone amiss.

There is a moment in reading through ***Castles & Crusades Players Handbook*** when you realize that the game's mechanics are so simple and so uncluttered that you have to slap yourself and wonder why nobody thought of this before. In fact the game feels stupidly simple, and not adversely so. It is a pity that the game has not been pitched at the inexperienced or new gamer rather than the long term gamer, because ***Castles & Crusades*** has more of a pick up and play quality than the current version of the ***Dungeons & Dragons***. Above all it is clear that this is a game in which fun is paramount, unlike the one-note joke of its nearest rival in the nostalgia market. This emphasis on fun is joined by an equal one on simplicity, which also explains its flexibility that will allow a Castle Keeper to run almost any ***Dungeons & Dragons*** adventure using these mechanics. This might only be an OGL RPG, but with nothing like ***Basic Dungeons & Dragons*** on the market, ***Castles & Crusades*** is the very best next thing.

Pyramid Review

La Strada

Published by [Mayfair Games](#)

Designed by Martin Wallace

Illustrated by Tanja Donner

Multi-piece board, 124 Road tiles, 19 Settlement tiles, eight Workshop tiles, four Resource tokens, 48 wooden Merchant cubes, & rules; full-color boxed set; two to four players; \$36

In *La Strada*, you play merchants in northern Italy back when that meant something, trying to open outposts for your goods in all the towns you come across. To get your workers and your products there, you have to build your own roads to connect your burgeoning empire.

The object of the game is to secure the most gold from your shops.

The board comes in six sections; changing their placement makes a new map each game. Scattered about are 19 settlements, placed randomly and then flipped over. Players place their home base -- called their Workshop -- where they think it does them the most good. The playing pieces and board spaces are hexagonal, so your tiles overlay the spaces.

During a turn, a player has up to 10 resources to build their business. Each player gets a selection of roads in his color, and pays to build them. Tougher terrain costs more resources, so paving the hills costs more than cutting through plains. You must connect to a settlement all at once -- you can't leave a road unfinished and come back to it -- but you can hopscotch to new places from anywhere along the network you've established.

Once your road reaches a settlement, a merchant block shows you've set up a shop. Anyone else who attaches their road there can do the same, but that settlement's gold is shared by everyone, and more fingers in the pie means less to go around. If too many merchants flood that market, no one gets the gold (you can build into a settlement to kill everyone's score, if you're willing to divert your resources). For example, one player in a hamlet gets two gold; two merchants get one each; and three or four traders leave everyone empty-handed. Bigger settlements offer more gold and more room for merchants. If a player finds he cannot build anywhere on his turn, the game is over and the gold added up to determine the winner.

The two-player game is more straightforward. Players alternate playing two colors each and work from two workshops. Building is the same, but settlements are claimed by placing a single merchant; when all locations have their merchant, the game is over. Your merchants go in the highest-scoring box for that settlement type. For example, since a hamlet's best reward in a regular game is two gold, every hamlet a player claims scores two gold. Ties go to the player with the most unspent resources.

While the settlements are pretty and the terrain simple but pleasant, the illustrations are the game's biggest weakness. They and the colors aren't rigid and obvious, and sometimes the hues are altered. Yellow roads aren't hard to see, but the board's village illustration has a yellow courtyard while the matching settlement tiles have a green yard with a yellow path . . . they look like the yellow workshops. Subtle gradations between brown and black workshops usually demand you look at both colors just to make sure you're using the right starting point. The tiles aren't too small, but the pictures just don't jump out. Black merchant cubes are stark, but brown cubes look like they could use the black resource track -- and brown's resource track is a reddish hue that matches city settlements. Grey has bluish roads, and

an even lighter track that looks almost white.

The board segments are high-grade stuff as well, but they have a more fundamental problem -- they don't fit together. The pieces can be rotated, and that may help find just the right arrangement if you're willing to put in as much time building the puzzle-like board as setting up the rest of the game. If there are only a few arrangements that work right, it rather defeats the purpose of a variable board layout. Realistically, unless you hammer them flat, you're just going to live with a couple of sections sticking up. Offering everyone their own set of road pieces may seem like an expensive idea, and such things obviously contribute to the game's price tag. The game comes with one of those molded plastic bins that has a place for everything, so passing out everyone's tiles is a problem when putting the game away, not getting it out.

The strategies involved in ***La Strada*** are simple, and while it's engaging, interfering with another player's methods can be a bit tough (to say nothing of costly). It's easier near the end when roads are already blocking a lot of plays, but by then you may not be able to choose whose play you'll interrupt. It's a game with a nice equilibrium; there's not so much thinking that it can't be finished quickly, and there's always room for one more good game about vying for resources. But this must be leveled against the eyestrain and the proliferation of more inventive possibilities already available, including some from Mayfair Games itself.

Murphy's Rules

by Greg Hyland

Murphy's Rules

More Mundane Than Fan Now . . . Twisted and Evil

Back when I was working at my friendly local comic & game shop, one of our customers -- an elderly frail-looking gentleman with a quiet voice -- was a Superman completist. If it was a new comic book, and it had Superman in it, he would buy it. This resulted in him purchasing a great many comic books each week that he wouldn't had they been Supermanless.

After Superman died and came back, and the Powers That Be at DC recognized the scent of a gravy train pulling out of the station, Superman began appearing in lots and lots of comics. This resulted in my putting a large number of comics in his file each week, which I'd then need to explain when he came in to pick up his file.

"Uhh . . . these 40 issues are part of the *Final Night* crossover storyline; Superman appears in each issue this week."

"Umm . . . This is a cross-company comic, teaming up Superman with LCD Publishing's highly popular *Lady Thong* . . ."

"Err, yes . . . Superman makes a one-panel appearance on Captain Midtier's monitor in this comic, saying 'I'm busy in Metropolis; can you handle it?' . . ."

Except in the most extreme of extreme cases (a Superboy clone appears in a flashback in one panel of an Elseworlds noncanonical crossover about Brother Power the Geek), I think he purchased them all. As best I could tell, this wasn't an independently wealthy customer either. So I always felt bad, imagining him someday out on the street, penniless and huddled up beneath pages of *Lady Thong* to keep warm.

I fled the employment of the comic & game shop back in 1999, back when *Pokémon* was at its height and 80% of my day consisted of saying either "No, we don't have any packs in stock" or "No, we have no interest in buying your uncommon cards." As a result, I don't know if recent developments in the DC Universe -- ranging from the special year-long Really Boring story arc in *Superman* to the recent decision of one of DC's iconic half-dozen that, in the right circumstances, murder isn't all that bad -- have met with his approval and resulted in his buying many other comics. But, in the past week I've been thinking about this customer, and realizing: I don't have what it takes to be a die-hard fan of anything anymore.

It's only been in the past few days I've made this realization, so it's taking some time for this to sink in. It's especially surprising because I've long considered myself the quintessential fanboy of many, many things. But in the past year or two -- ever since I've been serious about settling down, especially after moving cross-country into a much smaller apartment -- I haven't kept up with almost anything I used to.

My near-complete collection of "everything *They Might Be Giants* has ever been a part of" hasn't been updated in two years or so.

I have stacks of monthly comics that I haven't read; it's been a month since I last read *any* comic.

I think my Weird Al and Peter Gabriel collections are still complete, but that's just because neither has come out with anything in the past two or three years (as far as I know).

I'm three DVD boxed sets behind on *Mystery Science Theater 3000* for pity's sake, a mere three years after I bought a copy of *Mystery Science Theater 3000: The Movie* for about \$60 and felt glad to do so.

My near-complete **GURPS** set wouldn't be anywhere near so if I wasn't a member of the Steve Jackson Games megacorp.

I just don't have what it takes anymore to be a fan.

I'm trying to peg exactly why this is, or when it happened. To be sure, a large part of this decline is financial; I think I'd rather try saving up for neat new toys like the live-action "house" set I've heard so much about. A fair bit of the

decision is because space; my current office in our apartment is a converted walk-in closet, and the size of this two-bedroom apartment is about the size of the old one-bedroom one I had in Tallahassee. A lot of it boils down to time; I haven't had the minutes to rub together to, say, sell any of the excess stuff I have (which would result in money *and* space), let alone to devote to some obsession or another.

But, really, I think a lot of the reason is because it seems that being a fan nowadays is exhausting. And I feel the biggest reason is because of the explosion of media, and especially the Internet.

I remember back to the early 1990s, when I was awaiting news on **GURPS Cyberpunk**. Back then, hard news on upcoming **GURPS** books was pretty much limited to *Roleplayer* magazine. The information was always brief, often sketchy, frequently wrong (I'm still waiting for those **GURPS Prisoner** adventurers), and -- perhaps most importantly - - infrequent. Since it was a bimonthly mag, the amount of time I could devote to **GURPS** fandom was, maybe, a few hours a month, and I could feel like I was "on top" of the scene.

Now, though, I could spend hours each day, roaming message fora (two official and whatever else is out there), perusing fan projects, chatting online, and generally devoting myself to all things **GURPS**-y. That doesn't leave a lot of hours in the day for *other* obsessions.

Of course, a lot of it is a matter of scale; there's nothing that says I *have* to read every message board or comb through each fan project. Even so, I get the sense that, in the old days, there was a limit to the amount that even a dedicated fan could get his hands on. I remember printing one of the only fan project **Advanced Dungeons & Dragons** "netbooks" (as they would come to be known) back in 1991. Now I could print-spool a hundred pages a day of new fan projects for various games. Once upon a time, a *Star Wars* fan could say, "Of course I'm a real fan; I've read *Splinter of the Mind's Eye!*" Nowadays, any demonstration of a *Star Wars* completist's devotion would be accompanied by the rumble of a Mack truck.

Unfortunately, I suspect it's going to continue being difficult for many fans; the Internet has resulted in a near-constant stream of information on all topics, and publishers who want to emerge from the noise will need to pump up the volume -- with their own message boards, aggressive publication schedules, and continued innovation -- to be heard among the din.

I might revisit this issue in a future column; mostly, I just wanted to catalog this realization for now. And I leave, for now, wondering if my former Superman customer -- looking at a three-inch stack of new arrival comics -- ever felt the way I feel right now.

--Steven Marsh

Spellslinger

A Fantasy Western with Spell-Slinging Rail Guns for *GURPS*

by Eric Funk

* * *

"The Orcs circled again, riding their fearsome wolves. Both wolf and rider howled as they charged. Blast! They know our stage has to follow the 'line or we can't use our best guns. 'Zeke fired another bolt at them and started enlarging another, while that Elf boy we hired for the trip started chanting some fool elaborate spell. We probably don't have another minute. Our Halfling guide was keeping us on track, so she's no use in this fight. Oh oh, the Orcs are raising their spears to throw them. I raised my Dancing axe and hurled it into their midst . . ."

As presented, this setting is a modestly mundane timeline with magic subtle enough that any effects on history are mostly canceled out. In "The West," wherever it may be, little is said of "civilization out East," other than as a crowded, decadent place. "The West" is seen as a place where individuals can make a difference. This is an age of discovery, of human, Dwarf, and Halfling settlers and explorers charting new territory. The indigenous Orc and Elven populations meet these efforts in a variety of ways. The newcomers to this land bring firearms, locomotives, and science, while the natives have a sense of the land, its spirits, and a connection to the foundations of magic.

A Quick Timeline (Dates relative to Present, see also pp. OW19-20)

*Unless otherwise noted, page references to Basic, Fantasy, Lite, and Magic are for **GURPS**, Fourth Edition. All other references are for **GURPS**, Third Edition.*

- "New World" continent discovered
300
- Trading and colonization in the New World starts. Many tribes' lands are "bought" and settlements start. Some
200 less ethical human leaders trick or wipe out small groups of Elves and Orcs.
- Elves put up organized resistance to human incursions. Their superior magic and knowledge of the area sabotage
150 human supply lines. Many Orc groups are wiped out, others retreat, reinforcing other tribes, bringing human ideas. The first steam engine arrives from across the ocean. Estimated population of the colonies: 50,000
- First Dwarven Mine/town starts in rough hills 50 miles from the largest human settlement.
125
- Small pockets of Independence start as third and fourth-generation humans see the new land as their homeland.
100 Some ally with native tribes to try and force out less "environmentally friendly" colonies. The first steam-boats sail rivers.
- 95** The first rail roads start hauling ore from a Dwarven town to a nearby port. Ancient ruins are discovered.
- 75** Dwarven settlements have internal rail systems installed when they can. 500 miles of rail line crisscross the East coast.
- 50** The first museum is founded in the New World. Ruins of a different ancient culture are found. A hoard of Orcs swarm toward the largest human settlement. There are mass casualties on all sides. Elves are mostly neutral, but a few help one side or the other. Following this, the dominant human government makes a Treaty to preserve the far West half of the continent, making it free from cities and settlements.
- 35** Mining disturbs the slumber of a pair of angry dragons. They ravage half the town before an agreement is reached. They will receive a royalty/tax of all profit made within 50 miles if they protect it. The dragons help rebuild the town and use magic to help find new ore deposits away from the main mine (see also Etiquette and Treaties, pp DR42, DR44)
- 25** The Treaty is broken by rogue settlers and then corporations and finally the government admits the treaty is void.

- 15 A group of "Dark" Elves is caught sabotaging supply lines to a deforestation operation. They all immolate themselves rather than be caught alive. (It is suspected some escaped -- it is difficult to count ashes . . .)
- 10 Orcish inter-tribal warfare endangers several towns. The towns are fortified in response, but warfare cuts off bulk supplies and travel.
- 5 A shipment of powerstones by rail is hijacked at night. The large crate of gold nuggets is the only thing taken.
- 1 An Orc horde is predicted to form soon. (Or so say oracles and sociologists . . .)

The Present brings . . .

Human towns contain classic "Western" buildings such as a assay office, bank, a blacksmith, a rail/spellagraph office, a saloon/hotel, a school, a sheriff's office/jail, and a manasmith/healer/chemist (see p. OW11). Most valuable buildings will be made of worked, magic-resistant stone (likely the jail, bank, alchemist's and assay office). The walls will likely be enchanted with spells like Magic Resistance, Spell Shield, Spell Wall, Pentagram, Drain Mana, Force Dome, Force Wall, Utter Dome, Utter Wall, depending on the size and value of items being protected (see pp. M123, M170). For added security, some buildings even have the equivalent of Divert Teleport, Teleport Shield, and Scrywall. With the presence of magic, towns will be less dirty than in history, perhaps as clean as portrayed in movies. Hospitals are rare -- most use the first aid skill and seek native/herbal treatments as well as magic. Traditionally, many barbers were trained in First Aid as well. Food/rations purchased at general store are generally less likely to be stolen than expensive Create Food items. (All costs presented hereafter are in TL5 dollars, as per pp. B27.)

A new idea that is gaining popularity with many groups is the large-scale reclamation of arid land. A corporation (or government) starts by creating multiple artificial springs, which fill water tables and create arable land. The new land is then allocated to dedicated farmers, cattle ranchers, and urban sprawl. Away from towns, homesteaders must sometimes fight fiercely to protect their property and families from bandits, be they human or Orc. Inhabitants of desolate areas often have many hunting long arms ready, and some set traps for the unwary. Thus it is typically wise to announce one's self at the gate.

Any sort of (literally) outlandish speech, mannerisms, or dress can make a person stand out, be they dressed in the latest fashion from the East, or wearing ethnic garb from another region. Anyone not wearing appropriate "Western" outfits will be remembered, and may experience a Reaction modifier from +1 to -3 (from curiosity to shunning). Newcomers that appear to have money may even be approached in the streets by tailors! Intra-species "racial" tension is almost non-existent due to golems and undead servants that perform the most dangerous tasks.

Science, Travel and Communication (see also p. OW 51)

In general, little scientific research is done in the West (GM willing, barring the odd Mad Alchemist). Calculation Engines may be possible, but are not practical in the dusty West. Electricity is known, but has not yet established itself outside of large towns. Some local factories have small generators for lights and mechanical apparatus (such as newspapers), but their electrical output is insignificant, enough for 100 soft light bulbs. This output is insignificant to Draw Power. Most mages seek large natural sources such as [waterfalls and hot springs](#).

The availability of medium-range high-speed travel, such as a railroad, is required to avoid a slow sprawl. In a broad sense, the trains bring raw goods and food to cities, and take people and manufactured goods out to the frontier. They also bring newspapers, catalogs, journals, and books slowly westward. To aid in this, power plants and steam engines enhanced with TL4 Elemental Furnaces and mana engines are available (see p. VE 86). There are a few areas where golems are used to extend rail lines all day and night. Typically they are employed along side Earth and Plant mages, laying the heavy rune-laden rails. In low-mana regions, they are replaced with chain gangs and Enlarged workers.

Rails artificially cordon and restrain [ley lines](#), which are pulled away from their previous location. (This displeases both Elves and Orcs.) The effect of ley lines is to raise the ambient mana by one level within it. This allows mana-dependent creatures such as golems to travel through otherwise mana-poor areas, and powerstones to recharge more quickly. Freeing a ley line requires removing the rails completely, or turning them perpendicular to the ley line. At this point most lines slowly return to their original location, although some move very quickly. Some human companies buy land with a ley line on it, move the line, and then sell the land.

A successful Vision+Magery roll allows mages to perceive ley lines . . . as long as they Concentrate. As soon as the mage stops Concentrating, things return to normal. Most can assume that train tracks will contain a ley line, but its usability may be restricted . . . The glowing area of a ley line (on average a yard in diameter, but two yards in rails) is an area of higher mana. Mages working near the lines should remember that trains are often much wider than the rails .

. .

Communication comes in many forms, from bulk mail on trains, to the "PonEx" messengers to "Spellagraph" lines, in increasing speed and cost (see "Pony Express," below). Between smaller towns, "rail mail" and spellagraph are usually both possible, although many towns are without one, the other, or both. Communication between large cities is done between dedicated Telepathy agents who can send messages without range limits (they just have to meet each other once). Messages may have to be routed between several hops and stops, even if the towns are close -- most message and rail systems run East to West. Spellagraph lines use the spells Scribe and a variant of Telecast to send messages instantly and users pay by the word (see pp. M128, M47, and M174, respectively). If the delivery destination is away from a town, paying an extra fee up front can charter a PonEx delivery agent to get the message there (see also p.

OW52).

Pony Express

PonEx is a Halfling corporation that has significant holdings in the "New World" as well as in "civilization." It employs more Halflings than any other organization. It allows the small folk to see the world relatively safely, and get paid for it (while not involving any magic rings or dragons). Their specially trained ponies can travel quickly (using the Hiking skill with Move 14, Light Encumbrance, see pp. B460, 426, 357) for up to two hours before slowing (63 miles in 2h, 168 miles per 8h day on "Good" terrain, as per p. B351). Two hours is also the interval between a typical Halfling's meals. Due to semi-Literacy, each district/small country has its own symbols and marks, identified with a specialization of the Heraldry skill.

Some special delivery options include:

- "Air Mail": letters and small parcels can be sent by homing pigeon and trained avian (see also shoulder dragon, a.k.a "Petty Drake," pp. DR54, FB83).
- "Priority Overnight" is a ceremonial casting of "Teleport Other" with extra energy traded for skill. One can save cost if there are several packages going to the same PonEx distributor in that town. Costs increase dramatically if the target is not a PonEx outlet (with a known, permanent Teleport Beacon; see p. M83), and again if they are not allowed to scry there first . . . (Note that Magery is not necessarily required to cast Teleport; see p. M147). For loads from 50 to 120 lbs, packages are sometimes sent by "Mail Mage" to personally deliver important cargo (120lbs is Heavy Encumbrance for a ST 10 Mage, double if he is wearing a Lighten Burden 2 item). Most such mages have Magery with the +10% enhancement "Solitary Ceremonial Casting" (see p. F129-130) or a familiar that can aid in Circle casting for a [higher effective skill](#). Popular familiars are those that are both light and can cling without hurting the caster (so cats are out). Mail mages are often seen with shoulder dragons, climbing lizards such as geckos and chameleons, as well as birds such as crows and hawks. Loads 50 lbs and above are likely to be carried by these mages instead of Teleport Other (see also Practical Astromancy, p. TM107).

Example 1: Letters and small packages: (<10lbs 1/2× energy costs), 900 miles (10 energy, skill -7), halved again for Beacon: net 2 energy, -3 to skill. This can be performed Ceremonially by a skill 12 caster with one unskilled observer (or familiar) for 8 energy (+6 to skill), giving an effective skill of 15, the highest effective skill for a Ceremonial casting (as per p. M12). For a regular shipment, this comes to \$10. If sent on "lower" priority, the cost may only be \$1 per letter if they are bundled every 9 lbs or so.

Example 2: A Chest of Money (150lbs, 3× energy costs), 150 miles (9 energy, skill -6), halved for Beacon: net 13 energy, -3 to skill. Ceremonially, a skill 12 mage (9 energy) with 43 energy of people can cast this at skill 15. The cost for hiring the people is at about \$50 for the hour (\$32 for the mage, and \$0.50 per person), plus beer. Beyond the level in this example, each 2 penalty increase the cost by \$7 and number of spectators by 13. Thus large items are rarely teleported more than a few miles.

Riding Animals

The favorite mount of most humans is the horse, although some groups have imported camels and llamas for use in arid and mountainous regions. Dwarves prefer low-built lizards capable of withstanding more extreme heat and cold as well as some breeds are able to grip sheer surfaces (albeit with almost no Encumbrance). Halflings are most comfortable with ponies. The favored mount of Elves is a life-extended breed of diatryma (see pp. BE49, STE120, RS112). This creature can leap great distances and glide to land on a dime. There are rumors that some can actually fly. The fearsome Orcs often keep huge semi-feral wolves that they use as mounts. These "wargs" instill fear in most opponents. If someone's first encounter with wargs is against them in combat, a Fright Check may be in order! (See Penetrating Call, a common lupine ability, pp. BE112, Update 4e 10, and CI63.) Riders wearing real spurs will receive a -1 reaction (or worse!) from those with Animal Empathy, doubled for Beast Kin. For the lizards, use the Megalogryphon template from F212, without the skull DR or Berserk. There also exist lighter versions (half mass and ST, but add Clinging). Use the below table for costs in Human lands. Double the cost of horses in foreign lands, and halve the cost of the "ethnic" animal.

Mounts

Horse*	\$60
Pony*	\$50
Diatryma	\$300
Lizard	\$80
Warg	\$200

* From p. OW119.

Bridges & Water

Train trestles may also be popular places to store Powerstones to recharge. In addition, the grid work of metal lattices has a tendency to accumulate a magical charge during high winds (similar in appearance to "[St. Elmo's Fire](#)"). The local mana level will be increased by one with a range of one yard for every five degrees of wind in the Beauford scale (see p. M194). There are some reports of unusual creatures making their nests in these higher mana areas . . .

Rafts made of cut timber are floated downstream from mountains carrying other raw goods for sale. Riverboats are popular as a fast cargo conveyor where there are no roads (see keel boats, p. OW51). Some boats are pulled by seahorses, removing the need for a riverside track (see p. F211, FB43). There are rumors of aquatic races living in the rivers and oceans, but there has been no reliable contact as of yet.

Magic Items

Retail enchantment costs are typically \$10 per energy up to 128 energy, and then \$33 per energy after that. The most popular items will be created Industrially for \$3.30 per energy. Many major retail stores can charge 25% less than that through bulk purchases and still make a hefty profit. These follow the TL7 Industrial Magic rules from pp. TM41-42, MIIII20-21 in TL5 dollars.

A standard part of most civilized (and Elven) employment is the Bless spell (see p. M129). For only one hour and \$100 or \$500, each employee will receive the equivalent bonus of several years' study in addition to safety from accidents! Many companies require that a worker sign a one or five-year contract before the business will pay for this. It is a mark of prestige for one to be considered for a level 3 Bless. This spell will still be common as "life

Example Potion: Enhanced Time Sense (ETS)

For the purpose of this potion, there are four stages a person's reaction time can be classified as: Combat Paralysis, Normal, Combat Reflexes, and Enhanced Time Sense. Each

insurance."

A popular type of weapon is a "rail gun," a weapon that can be used by anyone in the higher mana area on which trains run. They are enchanted with the spell "Throw Spell" and are usually shaped like rifles (for their high Accuracy) (see p. M128, B279). Many Elven bows have this enchantment upon them, as all Elves can cast spells.

The generic counterparts to a "rail gun" are rifle shells and arrowheads enchanted with "Blank Spell Arrow" (see p. M66). Used by a mage or anyone with a scroll and manastone, they can also carry magical effects using ordinary bows and rifles.

Scrolls are in great demand, as most citizens are at least partially literate, and in some need of spells that don't require Magery. Such spells can be loaded into "rail guns" even away from trains, and powered by one-college manastones! (3 energy, \$7 per energy capacity in industrial bulk!) Scrolls cost \$33 per point of energy (see p. M 57).

Missile Wands are less popular, since only mages (and Elves) can use them. The technique of charging, and then Quick-Drawing in a duel is popular. They are also used for hunting and target practice. Ice Sphere is the most popular Missile spell, as flame spells can easily spark wildfire in the dry grasses. Elves are especially fond of jet wands as they aid in the close-quarters fighting they often find in the forests, scrub and tall grasses. Jet wands that are exported include mud, water, and wind. Both types of wands are collectively called "Elf-guns" by those without Magery.

In native-style magic, shamans enchant non-gems with fatigue like powerstones. It requires a critical success on a craft skill, and it can store a number of points up to the degree of success. It is prepared by a mage (with Magery) using an appropriate Religious Ritual + Magery skill, and then enchanted with the Powerstone Enchantment, as usual (including quirks and stunting). It is part of the ritual skill that determines whether an item has the capacity to hold Fatigue. The IQ+Magery Sense roll from M 66 can only detect items *after* they have been Enchanted.

Spellstones come in the shape of sling stones, arrowheads, and rifle shells. While they are relatively expensive, they hold their own energy and can be activated in one second, unlike scrolls, which can take from two seconds to minutes (or longer) to activate. Spellstones are marked in ways relating to their enchantment. If not obviously labeled, it requires a IQ-based weapon roll to identify them in combat (modified by Magery or Magic Resistance). This roll should also be made (in secret) if they are *mislabelled*. A few popular examples are "Bullets of Immolation" (Create Fire), "Bang Bullets" (Destroy Air), "Bullets of Fouling" (Stench), and smoke bombs that cause Mystic Mist for quick camp setups. There are also "Plugs" (Create Earth), "Drops" (Earth to Air), "Toasters" (Create Fire), and "Unbullets" (Healing with paint shot, see p. MF8). These are collectively called "Elf-shot."

Artificial gems are commonly available. With no "real" value in the commercial gem market, they have become the staple for commercial spell casting! Use the material cost from Magic as if they were TL5 dollars. This is evident in the Spellstone costs:

1 energy \$100
2 energy \$250

dose moves one up a level. Note that it is the concurrent number of effective doses that determines how many levels' increase the subject experiences. (e.g. dose #1 lasts 2 min, dose #2 lasts 3 min. The subject experiences a two level boost for 2 min, which drops to a one level boost for one more minute). After a subject has the benefits of Enhanced Time Sense, extra doses only help extend the duration. This is not without risk, however, as in any case, each dose imbibed requires a roll against the Potion brewer's skill -- a Critical Failure causes a Heart Attack (see p. B429)! (It is up to the GM whether it is more dramatic to have the heart attack at the moment the potion is imbibed or at the end of its effect.) Despite the risks, this potion is popular among young gunslingers. The converse potion, "Buck Fever," can stop any heart attack (but not cure damage suffered), and lowers the subject's reaction time one level. The two potions taste the same to the untrained tongue. Alchemists are at -1 to differentiate them. If a dose of each are mixed together, they cancel each other out.

Duration: 3d×2 minutes

All other costs as per Speed, p. M 214

3 energy	\$400
4 energy	\$600
5 energy	\$800
6 energy	\$1,000

People (see pp. F107-110 for nonhuman racial templates)

Humans

Humans are the race that forms dense cities and even create service villages adjacent to Halfling and Dwarven cities, to cater to those things that the shorter races do not develop. It is found that if the human "half" of a community actually out-grows the non-human "half," the non-humans tend to drift away, leaving only a remnant of the previous population. This causes many towns to die out, leaving it open for the original population to return. This process annoys the longer-lived races who may see several cycles in their lifetime.

There are, of course, human poachers that kill rare animals for their trophy parts (e.g. pelts, horns) and leave the rest. They are disliked by tribes, homesteaders, and most honest city folk, while cattle owners quietly encourage the hunting of predators and dangerous wildlife. Some humans build wooden homes on the frontier made from clear-cut forest.

Both poachers and clear-cutters are disliked by Halflings, Elves, and Orcs! By contrast, there are a few human settlements that have learned to respect the Elves' ways and plant more trees than they cut down. Rumors roam that such woods are magical (bandits would say "cursed"). A few towns have let such forests surround them like a shield . .

.

Human exports include: white hats of Bright Vision, black hats of Night Vision, magic bullets, 1-, 2-, and 3-point Manastones, and "Lock-on Lockets" (Beacon + Seeker)

Religion: Any.

Magic: Golems, Industrial.

Common roles and stereotypes: Merchants, city dwellers, cattle herders.

Dwarves

Dwarven communities are all underground, "where the minerals are," and many individuals go their entire lives without seeing the sky. The most adventurous Dwarves are seen prospecting for new sites for mines, but are otherwise uninterested in the overworld. The Dwarves favor tools that last, and thus purchase Halfling cooking implements over their own or humans'. Dwarves never make items of a Quality less than Fine. For 100× cost, Super Fine (+3) weapons are available (see *Ultra-Tech Third Edition*, page 62). Dwarves export distilled products of all sorts, even alchemical. Dwarven magical exports include ovens, forges, metal weapons, heat resistance items, with products like pendants of "stoking the fire," a self-heating oven, and "hair-splitting" axes (see p. B274).

Religion: Works.

Magic: Energy, Heat, Melee Weapons, Metal.

Common roles and stereotypes: Prospectors, Miners.

Elves

Holding a deep love and respect for the natural world, Elves have done some trade with more balanced human communities, and their natural magical ability has created developments in technology for both races, allowing more radical Elven factions to take up a guerilla war against the more aggressive settlements. Due to cultural precedents,

most Elves encountered are assumed to be between 70 and 170 years old. This is an age of wanderlust for Elves, and as such are considered to have a quirk-level of Reputation ("Reckless Youth," among Elves)[-1]. Older wandering Elves have a similar Reputation ("Can't Settle Down," among Elves).

Elves are rumored to have the expertise to create new ley lines. For this reason, if nothing else, many individuals want good relations with organized Elven tribes. Elves are the only characters that could normally start with spells from the [Ley Line College](#). Learning these spells requires an oath of secrecy (perhaps even a Geas), and Unusual Background of 10cp, 25cp for non-Elves. Despite the proliferation of firearms, Elves still make bows of Fine Quality (p. B277), usually enchanted with Essential Wood, Shatterproof, and a Fireproof variant that keeps them from burning (see pp. M164, 118, 73). This is in addition to any other enchantments like Loyal Sword, Quick-Aim, Puissance, and Accuracy (see pp M63, 65). Beyond this, Elves have the same penchant for Quality as Dwarves. Elven magical exports include natural tools, bows, spell arrows, and items of flame resistance. Some brand names include: "Everlast" Bows, "Flamewash" capes.

Religion: Communion with nature.

Magic: Healing, Meta, Plant.

Common roles and stereotypes: Forest and plains dwelling nature-lovers.

Halflings

Halflings prefer to live in harmony with nature, building their homes under hills. Farming using careful crop rotation to keep the soil in balance, they only keep enough animals to sustain their communities. The largest Halfling communities might match what humans call "towns." They are interested in the small-scale digging tools the Dwarves sell. Halflings export farm implements, kitchen utensils, pipes, walking staves, sling spellstones, self-lighting pipes, staff of the extra mile, self-filling maps, kegs of preservation (for milk, cheese, properly aged alcohol, and so on), and kitchen tools and utensils.

Religion: Holism.

Magic: Food, Motion.

Common roles and stereotypes: Farmers.

Orcs

The Orcs respect power, and a single Orc tribe will generally avoid a walled fort-town, and generally assume that any larger town will have a sufficient force to keep them at bay. Anything smaller might be at risk, including travelers, herds, and wagon trains. Most are not crazy enough to damage the rails, as some tribes have been virtually wiped out in retribution for that criminal act. Some less ethical groups have placed an unofficial open bounty on Orc-heads. Law enforcement in those areas has been paid . . . encouraged to take a blind eye to the "protection" of property in the region. As is understandable (and predicted), Orc tribes in the region have grown more hostile toward travelers. Orcish magical specialties include flame weapons: The "Consuming Sword" (Flaming Weapon), The "Gorget of the Dragon" (Flame Breath), and the "Spinning Fire Wheel" (war boomerang with Flame Jet).

Religion: Sacrifice.

Magic: Body, Breaking, Fire, Harming.

Common roles and stereotypes: Roaming tribes.

Varmints and Hazards

- Many magic-using bandit groups fast-grow trees in the center of rail lines to derail the train. While the passengers and crew are disoriented, the thieves can make off with valuables. It is becoming a "poplar" trick. Thus many new engines' cowcatchers have spells similar to Reshape and Shape Plant on them. Bandit groups are typically made up of outcast humans and Orcs, although the occasional disgruntled Elf is reported. Gangs vary in motive, be it unity, politics, religion, or just boredom.
- Dragons are powerful beings with alien intellects. Generally feared, they are becoming vulnerable to high-tech gadgets. Thus a few are beginning to know fear for the first time. Some become reclusive tinkers and alchemists, dedicated to understanding modern magic and science. Others lash out against these new threats, trying to remove points of advanced technology and magic. Conspiracy theorists believe that dragons are responsible for the popular dislike of the thought of air travel.
- Corrupt officials may be found in any locale -- money isn't the only commodity being traded.
- The wrenching of many ley lines in a short time can destabilize mana in some Western parts. Cartographers are adding many kinds of aspected mana to the charts. Areas of Very High Fire mana can cause paper to catch fire in the sun, and ammunition can overheat!
- Ghosts are not an uncommon sight in these wild areas, as adventurers, prospectors, and messengers have a strong sense of purpose. This is especially true in High Necromancy zones.

Adventure Seeds

To Catch A Train: The adventurers happen to encounter a group preparing to sabotage a rail line. They are spotted and offered money to not have seen this. (As a variant, they might be pleaded with to help them release the ley line to help a dying forest.)

The Circle Ends Here: The party is hired by the most prominent Halfling in the area with a top secret mission: the Halflings want an adjacent human town (on their land) to die so they can live in peace. The adventurers are authorized to do anything to disrupt traffic and human commerce, as long as no people or animals are hurt.

The Dauphin: An impetuous young Elf noble wants to "relive the glory days of his people"; he has found an ancient suit of armor and barding and wants to "rid the world of despoilers." His family wishes to keep good relations with the local human groups, and for the princeling to tire quickly, be safe, yet feel like he accomplished something (in descending order of priority).

Eagle Down: A young plains Elf approaches the group and asks for help. He needs to get to the nearby mountain summits to collect eagle down to complete a test of adulthood. Near the base of the mountain live a particularly nasty, but small, Orc tribe that lets its pet wolves roam around at night.

For added spice, there is a small group of Dwarven prospectors that could be used in any way to balance the party's successes. If they trounce the Orcs, the Dwarves could be antagonistic against "claim-jumpers," friendly if the Orcs are bothering them.

As a possible complication, the test of adulthood could restrict the Elf from using:

- Magic
- Weapons
- Climbing gear
- Food (he must fast)
- Time (he has a certain number of days to complete his test)

Eagle Has Landed: A company approaches the group and indicates that there is a rebel Elf attending a party tonight. The company has been subcontracted to help provide a deniable distraction. They want to hire the PCs to relocate the Elf's mount to a nearby warehouse so the officers can make an arrest while the Elf is confused as to its disappearance. The diatryma will be slipped a sleeping potion/drug. For extra spice, the Elf might really be a noble, and the patron is the criminal!

Hunting the Hunter: A prominent Orc Hunter is coming into an area where pro-life interests are in power. The PCs are hired to investigate the Hunter and expose evidence regarding his Orc-hunting. Quick to brag, he will exaggerate tales of his exploits in a casual setting. If their mission becomes known, he will become antagonistic.

Ley of the Land: Rumors abound of a ley line nexus near where a company wants to establish a mining/trade town. Since the party probably includes several characters with Magery, they are hired to find and chart it: "There's a Nexus in them thar hills." If none of the PCs have the Cartography skill, or they seem too organized, a bookworm NPC with the skill could be sent along.

Ley to Rest: The daughter of a local land owner's approaches the party, and offers to hire them to go looking for her fiancé. He set out to survey a new area of land purchased by her father, about four to seven days' ride from here. She gives the party a picture of him and a letter with her own seal (she hand-made a rubber stamp). In the vicinity the party will discover a ley line nexus, and inside it the remains of a camp, seemingly destroyed by wild creatures. As they investigate, a ghost matching the description of the lost man will attack them. Still disoriented from the experience, he believes that the party is sent to kill him by his future father-in-law, whom he believes never truly accepted him. Pointing out to the young man that he is already dead will cause him to pause, and showing him the letter will convince him only that the party is not his enemy.

The GM has two possible outcomes and solutions. First, the future father-in-law might be guilty. If so, the party must find proof, and bringing one of the most powerful men in the area to justice will not be easy, but it will be the most humane way to get this ghost to rest. If the future father-in-law is innocent, then the first step is finding who -- or what -- killed the young man, and then to get a magic-assisted statement of non-complicity from the older man. As an added complication, this adventure can be made more interesting if the ghost is anchored to the promise ring he received from his beloved.

Lost in the Maize: While deep in a mission, the party encounters a lost mail mage pulling a heavy 100-lb mailbag adorned with symbols that do not seem familiar. He does not have any language in common with the party. As a further complication, he could require immediate first aid to stabilize his life, and surgery later. (In this case, the language barrier could become apparent if they revive him.)

The Mail Must Go Through: A pony express rider missed their rendezvous. The heroes are the closest troubleshooters to the area. They must find the rider and provide aid; if the rider is dead, the party must complete the mission themselves.

Oh, Ley: If there was a struggle between railroad companies and settlements, it is doubly fierce in the Spellslinger world. To a town, a free ley line running through it means higher mana areas, which facilitates a more powerful magical industry, faster recharge rates, and permits non-mages can cast spells. If there is only one line in a town, a rail company passing through corrals it, and thus it no longer can pass through buildings. It also becomes modestly dangerous to cast in the area. Thus many towns fight to keep rail companies out, while others (with multiple lines) fight to get one in.

In this adventure idea, the PCs could be hired by the rail company to calm the locals, distract them with a scapegoat. The townsfolk might wish the rail building diverted by a landslide, river, or Orcs. Another option is that the hapless adventurers might just be caught in the middle, each side firmly convinced that the PCs are working for the other side.

Rung Turn: Ladders are being stolen in a multi-level human mining town. Hearsay points to a local group of mischievous youths. Alone, they are uncooperative. If cornered at their "base," they will reveal that they have seen "creepy dark forms" leaping from rooftop to rooftop . . .

Tenderfoot Ticket: The job is to protect a politician, landowner, or tourist from "out East." The guards may even be asked to stage "Western" events so the dignitary rounds up a fulfilling trip. It's then that the real bandits arrive . . . As a future sequel to this scenario, the PCs might be hired to "discourage" a different delegate from hanging around a county or state (without killing him). The troubleshooters must also deal with a small group of mercenaries protecting him from troublemakers . . .

To Catch a Dragon by the Tale: Dragons have begun to arrive in large numbers. Rumor has it that there will be a council of dragons being held this year on a nearby mountain plateau to discuss what to do about "the human situation." It is also said that there are a few parties of nonhumans invited. The heroes could be hired by practically anyone with the means to try to get the job of bodyguards, interpreters, or the like to find out what the exact agenda and decisions are . . .

Under the Gun: As private citizens can arm themselves with whatever weapons they want as long as they don't commit crimes, large landowners have been known to procure weapons from the militaries of the East. Some large weapons may include cannons, gatling guns, and war golems (officially to fight cattle rustlers or cause rain . . .). These weapons, themselves, are very attractive targets for bandits . . .

Unmarked Bells: The adventurers come across a lone mount in their travels. It seems unmarked; do they claim it as their own? (Later, they may learn of an invisible magical brand on the creature, designed to keep the beast pristine while marking it as belonging to someone). Regardless, roping it is only the first step!

The Unwanted Man: The mercenaries must hunt down a dangerous criminal with a bounty on his head. He has hidden among a tribe of Orcs, passing the preliminary rituals for membership. If the hunters are fast, they can get him away before his membership is finalized; if the villain succeeds in joining, the rest of the tribe will die to protect him. If the heroes aren't fast or clever enough, there remains one other way to get him out of the tribe: One (or more) of the PCs must also join the tribe, and then challenge him!

X Marks the Spot: A mastermind is creating an artificial nexus by dragging two ley lines together to a specific point, thus changing the area to high mana . . . The archfiend will try to escape by riding a line back as it "snaps" to its original location.

Crisis on Alternate Yrths: Alternate *Banestorms*

"This book presents a picture of Yrth at a particular date, with many great forces and conflicts in motion. But, it's the mark of heroes that their actions make a difference; they can and do change the world."

-- Phil Masters and Jonathan Woodward, **GURPS Banestorm**

With the long and ardently awaited arrival of **GURPS Banestorm** comes, inevitably, the slightly less ardently awaited arrival of a column spinning campaign frames off of it. All three of these scenarios, initially at least, follow the standard **GURPS Banestorm** assumptions. The Banestorm blows smallish groups of people between our Earth and a fantasy world called Yrth. (Although a Banestorm that blows people to the Cretaceous Era, or Atlantis, or Xothique would be interesting as well.) The dates on Earth and Yrth are synchronized; if Marco Polo's caravan vanishes in the Takla Makan on Earth in 1273, he reappears at the edge of the Great Desert on Yrth in 1273. Of course, it might be more fun if he appears in Sahud in the present day (Sahud not existing per se in the 13th century), and indubitably more of the sourcebook becomes usable if the alternate Banestorm blows not merely between worlds but between centuries. Hence, a few suggestions about where in the modern world of Yrth the following guests might best fit seem not unreasonable under the circumstances. And of course, once we've unhinged the Banestorm from its strict course, who's to say that it can't loft these three campaign seeds far and wide indeed -- into the Forgotten Realms, or Middle-Earth, or your own home fantasy campaign, or anywhere else with a big book of applecarts just waiting to get blown over? Not me, surely. And even if I did say such a thing, you could barely hear it over the rising of the winds.

"After this the Duke of Medina assembled all his forces that were lefte, and founde that he had lost but six shippes of all sorts. And then gave order for them to retorne to Spaine: But about Norway the greate tempest tooke them"

-- from the testimony of Don Luis de Cordoba

It is perhaps insufficiently appreciated, especially amongst Tudor enthusiasts such as myself, that the Spanish Armada essentially shrugged off the worst that Sir Francis Drake and the Royal Navy could throw at it. Of the original 130 ships, only six were lost in the naval actions at Gravelines and the panicked flight from the Calais fireships. The Duke of Medina-Sidonia, admittedly nobody's ideal of an admiral, had kept his fleet intact as he sailed north. The absence of usable harbors in the Netherlands, not the "sea dogs," kept Parma's army out of London. The Armada could fight another day -- until the hurricane hit, an anomalous hurricane farther north than any known to history. As the Elizabethan medals put it: "God blew and they were scattered." And in this flap of the butterfly's wings, rather than blowing the Invincible Armada onto the rocks of Ireland, the hurricane blew it onto the seas of Yrth.

Taking stock, Medina-Sidonia could count on 125 ships (22 of them purpose-built fighting galleons), mounting around 2,300 guns and holding 17,500 soldiers and 7,500 crewmen, plus surgeons, "voluntarie gentlemen," artillerists (and a 33-gun siege train), and servants. By an odd coincidence, the Armada arrives in the waters of Araterre just as Megalos' Purification of the Isles is underway. The Spanish find themselves between two fires -- extirpating Protestantism is the worthiest of goals, but the Emperor of Megalos demands they surrender their cannon. To start with. Perhaps the result is a "counter-Purification," resulting in a Most Catholic Duchy of Las Islas (supported by the native Jesuits) mounting a gunpowder challenge to Megalos from a position of purest Catholic orthodoxy. Or, if Medina-Sidonia chooses the better part of valor, perhaps a conquistadorial expedition to Bilit could overturn the demon-worshipping savages and build a New New Spain on its ruins, one that would likewise challenge Megalos albeit from a safer distance. The real question in either campaign is the magical one -- do any of the men of the Holy Armada carry within them the taint of sorcery? And if so (or if native magicians can be recruited), how do the 180 priests in the Armada's crew react? An "inside the Armada" campaign can present the questions of magic, loyalty, religion, and conquest on all sides, with the PCs holding the balance. It is tempting to slip the Armada forward 400 years, to come to the rescue of Castle Defiant and turn the tide against the orcs -- the Armada as good guys in a bad place. Of course, they will draw the attention of the Djinn Lands then

You could play this same story out on land with a storm-lost Roman legion or Union regiment (pace Turtledove or Fortschen), or even blizzard-ridden Wehrmacht (or Red Army) armored division; any large group that combines military advantage, social cohesion, and ideological zeal makes an ideal monkeywrench in the Megalan works. (Maybe

that's where the Republican Guard went in Iraq -- the Baathist "Hammurabi Division" would make quite a bloody splash in Shi'ite Al-Haz.) Remember, the higher the technology, the faster it will degrade as parts break and ammunition gets fired off. The newcomers must strike hard and fast to keep a place in this new world.

"Day came about six, and presented to those on shore a seizing and terrific spectacle. In the pressure of the squalls the bay was obscured as if by midnight, but between them a great part of it was clearly if darkly visible amid driving mist and rain. The wind blew into the harbour mouth. Naval authorities describe it as of hurricane force. It had, however, few or none of the effects on shore suggested by that ominous word, and was successfully withstood by trees and buildings. The agitation of the sea, on the other hand, surpassed experience and description."

-- Robert Louis Stevenson, *Eight Years of Trouble in Samoa*

In the spring of 1889, the world was waiting for war to break out in the harbor at Apia, Samoa. America and Germany, two newly-minted imperial powers, had claimed the islands as theirs, and tensions mounted when both nations sent their Pacific Fleets to show the flag. Admiral Lewis A. Kimberley, Civil War veteran, commanded the *USS Trenton* (450 men, 26 guns), the *USS Vandalia* (230 men, 8 guns), and the *USS Nipsic* (190 men, 7 guns); the German command was split between the *SMS Adler* (127 men, 10 guns) of Kapitan Fritze (technically the senior captain on station) and the *SMS Olga* (300 men, 14 guns) of the aristocratic Freiherr von Ehrhardt, with the *SMS Eber* (87 men, 3 guns) rounding out the set. Even the Royal Navy had an ironclad corvette there, the *HMS Calliope* (289 men, 26 guns and one torpedo tube) under Captain Henry C. Kane, with unknown orders. But on March 16, 1889, Mother Nature trumped presidents and kaisers alike, when a typhoon slammed into the bottle-like harbor. On Earth, the result was a peaceful partition of the Samoas -- but nearby, the result was a mystery as the strange winds swept the bay clean.

The Germans arrive off al-Wazif, the Americans off Cardiel, and the British off Dyecastle Island, and immediately set local politics roiling. An ambitious sheikh throws in his lot with von Ehrhardt and announces that his court Sufi holy man is the Mahdi; the "Cardiel Yankees" busily set about transforming society in fine "Lord Kalvan" style, trading technology to the dwarves of Zarak in exchange for industrial support. Megalos is torn between two threats, and the once-loyal Templars seem to have thrown in their lot with the British on the basis of some farcical secret handshake! This scenario, a storm of sudden chaos, has a few salient features. First, the Samoa steam-and-sail fleets represent probably the highest level of technology that the medieval-Renaissance economy of Yrth can maintain or reverse-engineer. (With the exception of shells or rifled breechloading cannon -- although there are alchemists and those dwarves.) Second, the new technologies are scattered in large lots, straining the resources of the Ministry of Serendipity and its partners. Third, the newcomers have their own rivalries, which drive their politics; should it come down to it, the American fleet, although the heaviest and largest, has only one partial ironclad (the *Nipsic*); all the German ships are modern steel hulls. It might be fun if all three sets of newcomers are simply "magic sinks," untouchable (for good or ill) by magic, for a weird *Unknown Worlds* kind of take. There were also nine other merchant ships of various classes in Apia harbor on March 16, 1889, these (or the rivalry between Fritze and von Ehrhardt, or the mutinous tendencies of the ill-disciplined captain and crew of the *Nipsic*) can add wild cards to the scenario likewise.

"When it got near, the wind, which had been scorching our faces with its hot breathlessness, changed suddenly; and, after waiting a moment, blew bitter cold and damp upon our backs. It also increased greatly in violence, and at the same time the sun disappeared, blotted out by thick rags of yellow air over our heads. We stood in a horrible light, ochreous and fitful. The brown wall of cloud from the hills was now very near, rushing changelessly upon us with a loud grinding sound. Three minutes later it struck, wrapping about us a blanket of dust and stinging grains of sand, twisting and turning in violent eddies, and yet advancing eastward at the speed of a strong gale."

-- T.E. Lawrence, *Seven Pillars of Wisdom*

In April or early June of 1917 (the records are spotty at best), a team of 32 men commanded by two sheikhs and Captain T.E. Lawrence climbed up a steep ridge in the southern Syrian desert and into a sandstorm. In our Earth, when it cleared, they continued on their way to Aqaba and eventual glory; on a world where the sandstorm was touched with balefire, they vanished. On Earth, Lawrence had been a figure of undeniable charisma and fitful genius; on Yrth, these mystical qualities flared to blinding. By the time he rode out of the steppelands of western al-Azif, "Aurens" was more than the sheikh of the oppressed Sunni tribes who bore the brunt of the Caliph's tax-farmers and the Megalan raider knights alike. He had Ascended, and his men swore that he rode not merely with a djinn but with an angel of

Allah. Religious turmoil and riots flared throughout eastern al-Azif and into al-Haz and even Cardiel, as fighting men felt their blood stir and joined "'Aurens the Golden One" under the banner of jihad.

This is the Mage Wars begun early, and hijacked by a commander of genius. (Historians generally beg to differ, but the Lawrence of al-Azif is the legendary Lawrence through and through.) Lawrence would gladly discard his few paltry rifles for such a war, and such a chance -- the threat he carries for the Ministry of Serendipity is more existential than his abandoned, rusting Maxim gun. This scenario puts a Great Man and a few necessary followers into the gears of Yrth, and runs with it. Rommel arriving in al-Haz to command the war against Cardiel, or Napoleon siezing power in Caithness and then moving on to Megalan imperium, or Hideyoshi unifying Sahud as a mighty warlord state, or merely Leonardo da Tredroy going around the Ministry of Serendipity by inventing things they don't yet know to ban; any such variant can whistle up new wonders for a new Yrth.

Scaling the Heights

for *GURPS*

by S.E. Mortimer

This is a companion article to the one titled "[Pulling Your Weight](#)" which concentrated on ropes and cordage. This article focuses on climbing. It attempts to remain as consistent as possible with existing *GURPS* material, in particular *Basic Set* and *Covert Ops*.

Introduction

Virtually all adventurous children will try their hand at climbing. It might begin with a desire to get something placed up high out of reach (or so the parent thought). They will climb tables, cupboards, bookshelves, etc. Some might experiment with placing multiple things on top of each other to create a makeshift step ladder. Eventually this experimentation will spread outdoors and kids will climb trees, fences, onto roofs, and so on. The majority of equipment in any children's playground is geared toward climbing. It seems to be a fundamental part of human nature. Most parents don't prevent their children from climbing, since it is one method the young use to learn about the world. It also helps to develop large motor skills, and builds hand and arm strength. The trick is to enable them climb *safely*. This need for safety applies in the adult world also. Only the most radical of rock climbers will attempt a climb without ropes and other safety equipment. Generally, all that is required to climb most surfaces is a pair of good shoes, a fit body, and a positive attitude. All the other stuff is only necessary in the event of a fall.

Types of Climbing

Rock Climbing: Rock climbing involves scaling near-vertical rock faces such as cliffs and crags. All that is really required is a good pair of climbing shoes and some chalk for the hands. All the other gear is only necessary if you slip. As the climber ascends he creates anchor points by the strategic placement of wedges, nuts, hexes, and cams (called protection) into cracks in the rock. The rope is then slipped through these anchor points and will catch the climber if he falls. See *Tandem Climbing* (below) for more detail.

Ice Climbing: Climbing ice surfaces -- such as frozen waterfalls or glaciers -- is similar to climbing rock surfaces except that specialized equipment is used.

Wall Climbing: Climbing the vertical face of a man-made structure such as a brick wall or a wooden palisade requires the same skills and techniques that are used for rock climbing but, like ice climbing, may utilize some specialized equipment (see *Equipment*, below)

Tree and Pole Climbing: Instead of climbing a flat wall, the surface is curved and often the climber can reach right around it. If the tree has branches low enough to grab, then it is a fairly easy matter to climb it (+5). If only the trunk is accessible then the task is more difficult. The simplest method is to throw a rope around a branch and pull yourself up. If there are no branches then the trunk must be climbed like a pole. It is possible to climb poles barefoot -- the soles of the feet are pressed firmly into the sides of the pole to hold the body weight while repositioning the hands. The technique looks a little like a squirrel climbing a tree. Spiked shoes may provide additional traction for this technique. Specialized pole-climbing spurs may also be used to make pole climbing easier (see *Equipment*, below).

Climb Ratings

The United States uses a standard rating system to describe the difficulty of various routes. There are six classes ranging from 1 (normal walking) to 5 (rock climbing). Class 6 rock faces are so smooth that they are impossible to climb with regular rock climbing equipment. Class 5 is broken down into different levels depending on difficulty.

Class 5 Rating

Climbing
Modifier

Between Two Surfaces: If two vertical surfaces are close enough (slightly less than the distance between outstretched hands), the climber can wedge himself in between and climb up. One foot is placed on each surface and the legs are extended, pushing the climber upwards. The hands support the climber's weight while the legs are recoiled to find purchase further up. The action is then repeated. This climbing maneuver has a modifier of +0. It might be useful in a narrow hallway to conceal the climber up near the ceiling, ready to ambush an unsuspecting victim passing underneath. Other situations might involve climbing a well or mine shaft. If the space is too narrow for this maneuver then the climber can slide his back up one wall and walk his feet up the other.

Running: It is possible to run up short vertical heights (just watch any Jackie Chan movie). The climber simply takes a running start and continues to run after he reaches the wall, using momentum to carry him upwards. It takes a lot of agility and practice to perform this feat, but heights of up to twice the height of the climber may be scaled in a single turn. This maneuver uses the Acrobatics skill (at a penalty of -4) rather than Climbing.

Rappelling: Rappelling allows the climber to descend a rope at a rapid pace in a controlled manner. It requires a harness and a descender ("rappelling rack"). A short length of cord can be tied in a friction knot (see *Knots*, below) just above or below the descender and attached to the harness. The friction knot acts as a self-belayer and slides down with the rappeller. If it is released, it will lock onto the rope, preventing further descent. One hand holds the friction knot and the other holds the rope down lower near the hip with the rope wrapped around the hip slightly. This lower hand acts as the brake. The rappeller slides down the rope by releasing the brake hand, enabling the rope to slide through. Heavy gloves are recommended since rope friction generates heat and can burn unprotected flesh. See *Equipment* (below) for more information on Descenders.

Tandem Climbing

Tandem climbing is a common method of rock climbing involving two working as a team. Both members wear a harness and are protected by a rope joining them together. The first climber is called the "lead climber" and he is attached to one end of the rope. The other end of the rope is held by the second climber who is called the "belayer." He feeds the rope through a belaying device up to the lead climber as it is required. At intervals along the ascent, the lead climber places "protection" into cracks in the rock. As previously mentioned, they include wedges, nuts, hexes, and cams. The correct placement of these anchor points is an important part of the Climbing skill. They have to lock into the rock and hold firm during the stress of a fall. A critical failure could mean the failure of one (or more) of these anchor points to remain secure. When the protection is secured, a pair of carabineers (joined with nylon webbing) is used to attach the rope to the anchor point. Then he continues up the rock face. If he slips, the belayer grabs the rope to arrest the fall. Rope used in climbing is designed to stretch, helping to soften the sudden jerk at the end of a fall. The maximum distance of a potential fall is twice the distance between the lead climber and the closest anchor point, plus any slack left in the rope, plus the rope's stretch.

The lead climber will climb to a ledge, secure an anchor point, and tie off the rope. The two climbers then switch rolls, with the lead climber acting as the belayer from above. As the second climber ascends, he removes the anchor

5.0 to 5.4 -- beginner	+3 to +6
5.5 to 5.7 -- intermediate	+0 to +2
5.8 to 5.10 -- experienced	-1 to -3
5.11 to 5.12 -- expert	-4 to -6
5.13 to 5.14 -- elite	-7 to -9

Human Ladder

This is a useful way to scale a vertical height that isn't too tall. It involves multiple people standing on each other's shoulders until the last person reaches the required height. Once this ladder is formed it is a fairly simple matter for them to assist other climbers up to the summit. A climber must remain at the top to assist up those who formed the ladder. If the height is greater than two people then a rope might be necessary to help the person who formed the base of the ladder (unless he is skilled enough to climb up unassisted). Acrobatics or ST is needed by those who form the ladder. The person with the highest ST should form the base (or multiple people can form the base, thus sharing the load between them). Scaling a human ladder requires a Climbing roll at +3. A critical failure not only injures the Climber but will also injure at least one person in the human ladder.

points and carabineers that had been secured by the first climber. These can be reused. When the second climber reaches the first, they have finished one stage, or "pitch." The climb is continued in this manner until the destination is reached. The maximum height of a single pitch is generally half the length of the rope. A typical modern climbing rope is around 150-180 feet long, so the maximum height that can be climbed at one time is 75-90 feet. Because two people are alternating positions during the climb, the climbing rate is *half* as fast as that listed on the *Climbing Table* (below). For example, a single person might climb an intermediate surface at a rate of 10 feet per minute. A tandem climb on the same rock face will be at a rate of only five feet per minute.

Climbing (p.B183, B349)

As stated in **Basic Set** (p.B183), Climbing is the ability to climb mountains, rock walls, trees, the sides of buildings, and so on. A Climbing skill roll is required whenever anything more difficult than a ladder is attempted. One skill roll is made when the climb is begun and another is made every five minutes. The table on p.B349 suggests skill modifiers for certain surfaces along with climbing speeds (this table has been expanded below). **Compendium I** (p.CI78) suggests that a successful Acrobatics roll may give an additional skill bonus or reduce time for the Climbing maneuver. If a climb is particularly easy or difficult then a Climber may wish to increase or decrease his rate of climb (see *Time Spent*, p.B346). For example, the normal rate of climb for an intermediate mountain is 10 feet per minute. An experienced climber may wish to increase this (+10% per -1 skill penalty). Increasing the rate of climb to, say, 15 feet per minute attracts an additional penalty of -5 to the Climbing roll.

Difficult climbs require not only high dexterity but good strength in the arms, hands, and fingers. Strength may partially compensate for a low Climbing skill on many occasions and, if the GM chooses, he may give bonuses to Climbing rolls if the character has high ST (for example, ST 12+ may give +1; ST 15+ may give +2). Long, difficult climbs also require good endurance. If the GM chooses, he may also require a HT roll (modified by fitness) every time a Climbing skill roll is made (not including the first one). A failed roll means the loss of one point of Fatigue. Experienced climbers look for small ledges on the rock face to enable them to rest in the middle of a climb. As stated on p.B349, one Climbing roll is made at the start of the climb and another one is made every five minutes. Any failed roll results in a fall (see *Falling* p.B431).

Failure: In a gaming situation, unless important to the story, the progress of a climb isn't noted; on a fall, a rule of thumb might be to assume that the climber was half way into the climb. Another option is to roll randomly to see how high the climber was when he lost his grip. On a normal failure, if the GM is feeling generous he might allow a second Climbing roll to see whether the climber can regain a handhold before plunging to his doom (assuming he isn't secured by a rope). A success on this second roll may mean a short slide down the surface, resulting in minor injuries, but nothing fatal. On a critical failure, even a rope may not be enough to prevent falling. Ropes can break, knots can untie, pitons can work loose from the rock, and so on. A critical failure during a Climbing maneuver generally results in a potentially life threatening fall (unless the height being climbed is very short).

Climbing with Assistance

Often when more than one person attempts a climb, one climber is more experienced than another. There are two ways to model this. Assuming that the situation involves a *tandem climb* as described above, the GM rolls the lower of the two Climbing skills. This is the most risky but allows the full climbing rate to be maintained (five feet per minute on an intermediate surface). A safer option is to allow the experienced climber to assist the less experienced one. This can be modeled by rolling against the highest of the Climbing skills and apply the amount by which the roll succeeds or fails as a modifier to the other person's Climbing roll. This is a safer option but it is slower. The climbing rate is *halved* (or a quarter of what the normal unassisted climb rate would be).

Climbing in Combat

One's Climbing skill might come in handy during some combat situations. Examples include the rigging of a ship, on a narrow cliff ledge, hanging from a rope, and the like. Treat attacks in a similar manner as mounted combat (p.B397)

but instead of Riding, use either the Climbing skill or an appropriate combat skill, whichever is *lower*. Whenever a Step is performed during this sort of combat, a Climbing roll must be made. A successful roll enables the attacker to perform other actions such as Attack or Defense. Failure results in a potential fall. On the next turn he may scramble for a hand hold to prevent the fall (he will drop anything being carried in his hands). This requires another Climbing roll and during this turn no other action may be performed. Any contested maneuver (e.g. moving into Close Combat) requires a contest of Climbing skills. Whenever the character experiences stunning or shock (e.g. from taking damage) a Climbing roll is needed to prevent falling.

Knots

Knots are an essential part of climbing if ropes are involved. The Knot-Tying skill (p.B203) is used to tie knots successfully. There are six essential knots a climber must know.

Single-loop knots: A single loop is useful when you need to throw a rope over something such as a post or when you need to attach something to a loop of rope. Examples include *bowline*, *figure-8 loop*, *in-line figure-8 loop*, and *butterfly* knot.

Double-loop knots: Two loops are often more secure than a single loop, and are handy for hoisting or lowering a large or heavy object -- including an injured person. Examples include *double figure-8 loop*, *French bowline*, and *Birmingham bowline*.

Hitch knots: This knot is useful for securing a rope to a solid object such as a pole or a ring. Examples include *clove hitch*, *bunt line hitch*, *constrictor hitch*, *highwayman's hitch*, and *anchor bend*. The clove hitch is one of the simplest to tie and can be easily adjusted.

Stopper knots: These knots prevent the end of a rope from sliding freely through it. Examples include *figure-8*, *heaving line*, and *double overhand*.

Bends: A bend is a knot that ties the ends of two ropes together. Examples include the *sheet bend* and the *full carrick bend*.

Friction knots: A friction knot wraps around a secondary rope multiple times, preventing it from sliding. Uses include backing up an abseil (see *Rappelling*, above) and making a crude *ascender* (see *Equipment*, below). The more wraps, the more friction that is applied. Examples include the *prusik*, *klemheist*, *bachman*, and *autoblock*.

Equipment

Hand and Footwear: Appropriate shoes are necessary for climbing. Good quality footwear should be lightweight, fit snugly, be flexible on the sole but firm at the toes, and allow a good grip. Gloves aren't all that useful for climbing but are handy when handling rope -- especially belaying and rappelling. Climbing gloves are made of leather and have the finger tips removed so as not to hinder climbing. They may be used for rappelling but the climber must take care not to burn his exposed fingers. Chalk dust is commonly used on the fingers to improve one's grip; if gloves are not worn then dust is applied to the palms too. If both the hands and feet are properly equipped, they will cancel -1 from any penalties for climbing a vertical surface. Inappropriate gloves and footwear (e.g. solid boots) might give additional penalties to the Climbing roll. Good climbing shoes cost around \$120; weight 1 lb. Fingerless leather gloves cost \$30; weight 0.25 lb.

Rope (TL0): This is the most basic and universal climbing tool. One end is secured to an anchor-point and the character hauls himself up or down its length. When climbing up a rope the rate is 20 feet per minute at a penalty of -2. Climbing down is only a -1 modifier. Without rappelling equipment (see *Descender*, below) the rate of descent is 30 feet per minute. For detail about the cost and weight of different types of rope see [Pulling your Weight](#). Rope may be made into a crude ladder by tying knots at regular intervals to make climbing easier. The Climbing modifier for a knotted rope is -1 to ascend and +0 to descend.

Harness (TL5): A light harness with fittings for a variety of climbing gear (p.CV54). When used with a rope it gives +1 to Climbing rolls and prevents the climber from falling. It allows him to hang in midair and to pivot sideways or hang upside down, and leaves the hands free to drive in a piton, pick locks, plant explosives, etc. It may also be used in conjunction with a *Descender* (see below) for rappelling.

Pitons (TL2): These are spikes or knife-shaped wedges with an eyelet in the end. Rope or cord is threaded through the eyelet. These are useful when there are no handholds in the vertical surface. The piton is forced into a crack (or hammered into wood or ice) far enough to support one's body weight. The climber steps on this piton and proceeds to drive in a second piton further up. The climber steps up to this second piton and yanks on the cord to remove the first piton so it may be reused. Pitons can be tricky to use in this fashion since they must be driven in deep enough to support one's body weight, but not so far that they cannot be removed by tugging on the cord. If used this way, pitons remove up to -2 in penalties for climbing a vertical surface. Alternatively, the pitons may be driven in deeper so that they are more secure. If used this way, they remove up to -3 in penalties but cannot be easily removed, so they may only be used once each per climb. This method is safer since a rope and carabineer may be attached to each piton to prevent falling. Each piton costs \$4 and weighs 0.75 lb. An appropriate hammer costs around \$10 and weighs 1 lb. They may also be used as crude throwing knives (-2 to skill).

Spikes (TL2) and Cups (TL6): As stated in *Covert Ops* (p.CV54) climbing spikes and suction cups are exotic but do exist. These devices attach to the hands and feet and improve one's grip on a surface. Spikes (e.g. ninja climbing claws) are useful on craggy surfaces, wood, soft stone, etc. Suction cups work on smooth surfaces such as glass, glazed tile, polished metal, etc. It takes four minutes to fit them to the hands and feet (one per minute). They cancel up to -2 in penalties for climbing a vertical surface of the appropriate type. A complete set of four spikes or cups costs \$150 and weighs 2 lbs.

Pole Climbing Spurs (TL2): These hook under the heel and strap to the side of a pair of sturdy boots (one strap around the ankle, the other around the calf). The spurs point down, digging into the sides of the pole and holding the climber's weight. A pair of climbing spurs cancel up to -2 in penalties for climbing a wooden pole or tree trunk. Cost \$200, weight 5 lbs.

GeckoGrip (TL9): The soles of a gecko's feet consist of millions of tiny hairs called *setae*. These enable the gecko to cling to virtually any surface through the interaction of *van der Waals* forces. Synthetic gecko hairs have already been developed in the laboratory and work exactly the same as those of a gecko, but the cost of manufacture is currently too high for mass production. In the near future it will be possible to cover the soles of the feet and the palms of the hands with *GeckoGrip*. *Covert Ops* (p.CV53) suggests that it should support a total weight of 800 lbs and will allow a person to cling to the surface of a wall or even a ceiling so long as at least three limbs remain in contact. Removing contact involves peeling the *GeckoGrip* off the surface just like lifting adhesive tape. Unlike adhesive tape, *GeckoGrip* is self-cleaning. Cost \$2,000, weight 2 lbs. Once the user is familiar with *GeckoGrip*, no Climbing roll should be required except under stressful conditions (GM's discretion).

Ascender (TL6): This is mechanical device that uses cams, ratchets, and the like to help the user ascend a free hanging rope (see CV54). It can slide up the rope but can't slide back down (however, a critical failure might see them lose their grip on the rope). Typically two ascenders are used -- each with a stirrup for one foot. The rope is grasped firmly with the hands and then the knees are bent, sliding the ascenders up the rope with the feet. The stirrups are then stood in, while the hands slide up to grab a higher section of the rope and the process is repeated (the technique is sometimes called "jugging"). A third ascender can be used if one isn't confident using hands to hold the rope. This technique allows the legs to do most of the work, taking the weight off the arms. Ascenders add +2 to Climbing when using a rope (canceling the -2 penalty). Rate of climb is one foot per second. Cost \$60; weight 0.75 lbs. A crude ascender can be made using a looped cord and a friction knot (strong shoelaces can be used in an emergency). These only add +1 and the rate of climb is only *half* as fast (one foot per two seconds).

Descender (TL6): A small metal device sometimes called a "rappel rack" (p.CV54). It assists in rappelling down a rope; if used in conjunction with a harness, it adds +3 to the Climbing roll when descending down a vertical surface (e.g. the side of a building) and +1 when descending down a free-hanging rope (e.g. out of a helicopter). Using a descender also increases the rate of descent. Without it, the rate of decent is about one foot every two seconds. With a

descender, the speed is 12 feet per second. Without a descender and harness, rappelling rolls are made at -2, or -5 if you lack gloves as well. Cost \$40, weight 1 lb.

Deceleration Device (TL7): As mentioned above (see *Rock Climbing*, above), when tandem climbing, the second climber acts as a belayer or "fall arrester" by grabbing the rope if the first climber falls. If the climber is working alone then a deceleration device attached to the harness can take the place of the belayer, applying a brake to the rope and stopping the climber from falling further. This device also dissipates a substantial amount of energy during a fall arrest so that the "jerk" at the end of the fall is much less violent. Cost \$100; weight 1 lb.

Ladder: Ladders are made of wood or metal (aluminum is common because it is lightweight), consisting of two side rails joined at regular intervals by crosspieces called rungs (or "cleats"). The climber leans a ladder against the climbing face and slowly ascends or descends by stepping on the rungs one at a time. The climber's hands grip either the side rails or the rungs above. Some ladders are self-supporting (usually by means of a long, fold-out bracket) so that they don't need to be leaned against a surface. A climbing roll is not required to climb a ladder. A person can usually ascend or descend one rung per second (there is normally about a foot between each rung), but in combat he may ascend three rungs per second and descend two rungs per second. The standard distance between rungs is 10" but this may vary by an inch or two either way. If a person wishes to move faster, then the GM may require a Climbing roll. Prices and stats for ladders can be found in any hardware catalog.

Flexible Ladder: Similar to a regular ladder except that the side rails are made of rope or chain. The rungs may be made of the same flexible material or they may be more rigid. This type of ladder may be rolled up for easier storage but it won't remain stationary when a person attempts to climb it. It swings and sways and takes longer to climb than a rigid ladder. Normally a person may climb one rung every two seconds but in combat this may be increased to one rung per second.

Sectional Ladder. As its name suggests, a sectional ladder is divided into several 10-foot long aluminum sections. The climber places the bottom section against the base and climbs to the top carrying another ladder section with him. Once at the top he inserts the second section into the first one creating a ladder that is twice as long. He then climbs back down to get the next section and repeats the process until he is at the required height. Alternatively the climber may assemble the ladder on the ground and then lean it against the climbing face. Each 10-foot section comes with a spiked bracket to attach the ladder to the face and to hold it out a few inches to provide toe-room for climbing.

Climbing Pole: The end of a pole with a rake-like hook on one end is hooked over the top of a wall and aligned at an angle away from the wall. The climber pulls himself up with his hands on the pole while walking up the wall with his feet. This device is limited to a wall up to about 15 feet in height. It may also be used as a type of pole arm in combat. Cost \$150; weight 5 lbs.

Grapnels

Unless someone is at the top of the climb to secure the rope, you will need something to hold the end of the rope in place while you climb. There are two types of tools that involve either hooking around an object (grappling hook) or sticking into an object (spike or harpoon).

Grappling hook (TL1): This hook consists of three or four metal hooks fixed to a rigid spine that has an eyelet in the end for attaching a rope. More advanced grappling hooks are spark-free and have a matt black finish to lower visibility. They can be padded to muffle any noise. Cost \$50, weight 2.5 lbs. Use the *Throwing* rules on B355 to determine how far you can throw a grappling hook without mechanical assistance.

Harpoon (TL2): This is a long spike with a hardened steel tip and an attached rope. The harpoon is intended to be fired into an object so that it sticks into it, providing a fixed anchor point for the rope. If fired with enough force, the harpoon may be driven into stone or concrete. Cost \$30; weight 2 lbs.

Line Throwers (p.CV54)

These devices designed to fire a rope further than it can be physically thrown.

Crossbow (TL2): A crossbow may throw a weighted rope or grapnel up to half its maximum range horizontally or a quarter if fired vertically. See **Basic Set** for details (p.B276).

Pneumatic Line Thrower (TL7): Originally developed for sea rescues, it uses compressed air to lob a rope up to 75 yards horizontally. Range drops to 25 yards if a grapnel is fired vertically. Treat as a normal ranged attack using Guns (Rifle) skill but at a -1 penalty because of bulk and poor accuracy. Cost \$500; weight 15 lbs. Replacement gas cartridges cost \$5 and weigh 0.1 lb.

Grenade Launcher (TL8): A grenade launcher such as the Colt M79 can fire a line or grapnel up to 75 yards. Treat as a normal attack using Guns (Grenade Launcher) skill, but at a penalty of -1 because of bulk and poor accuracy.

Rocket Thrower (TL8): This is a disposable rocket that can carry a line up to 300 yards. It normally doesn't have a grapnel but may be modified using Armoury (Small Arms) skill. Cost \$700; weight 9 lbs (not including grapnel). Treat as a normal attack using Guns (LAW) skill, but at a penalty of -1 because of bulk and poor accuracy.

Tactical Pneumatic Line Thrower (TL8): This is an advanced line thrower specifically designed for tactical operations. It is more accurate than the TL7 marine model and can lob a "messenger line" (1/8") with a titanium weight over 100 yards horizontally. If a heavier line (3/8") and grapnel is deployed instead then the range drops to around 40 yards vertically. It may also deploy a flexible ladder and grapnel 15 yards vertically. Treat as a normal ranged attack using Guns (Rifle) with a +0 modifier. Cost \$2,500; total weight of the kit including 150 yards of 1/8" DACRON cord and a lightweight titanium grapnel is 18 lbs.

Winches

A mechanical or electrical device which turns a capstan, winding a rope around it. These devices replace the user's Climbing skill with the skill of the device and ignores any penalties for poor climbing surfaces. If the winch is kept in good condition, then it has an inherent Climbing skill of 16, so it usually will only fail on a roll of 17 (normal failure) or 18 (critical failure), unless the conditions are unfavorable. For example, the user is unfamiliar with the device, bad weather, excessive loads, unsuitable rope, etc., will add penalties to the Climbing roll.

A winch with an *external* capstan has the device anchored to the ground. A pulley is attached to the top of the climb (possibly attached to a harpoon and fired from a line thrower) with a rope fed through it. As the rope winds around the capstan, the other end of the rope slowly rises awards the pulley. The advantage of this is that there is no limit to the size of the rope or the power source, since it remains on the ground. The maximum height of the climb is usually *half* the length of the rope, but if the winch can be fixed to the top of a climb, then a pulley is not required and the maximum height of the climb equals the total length of the rope.

Smaller, *integral* winches are a sci-fi staple. They are basically a mini electric winch mounted into some sort of harness that attaches to the climber. There are a lot of difficulties in designing one of these since the entire device must be carried by the climber. The cable needs to be thin because the capstan cannot be too large, and the power source needs to be fairly small and lightweight. They also have problems with overheating. At present, mini electric winches are still in the cinematic realm of science fiction.

Mechanical Winch (TL7): There is no external power device since it is manually driven. Simply attach it to your harness, turn the crank, and up you go. A suitable winch would have a maximum load of around 350 lbs. including 20 yards of 3/16" Aramid cord, it weighs around 20 lbs and costs \$150. Climbing speed is about 7 feet per minute. The speed can be increased to around 10 feet per minute but it is exhausting. The user will lose one point of Fatigue per minute.

Electric Winch (TL8): This is far more bulky than the gadgets depicted in the movies. An electric winch capable of lifting 250 lbs would weigh about 20 lbs including 20 yards of 3/16" Aramid cord. Add to this the weight of the battery pack which would weigh maybe 15 lbs. Rate of ascent would be slow, perhaps 30 feet per minute. The battery would

only be good for one ascent before it needs recharging. Cost \$500.

PowerQuick™ (TL8): Developed by Quoin International, this is a battery-powered device that utilizes a series of wheels and cogs to pull a rope *through* it, enabling a large weight to quickly move up the rope. Unlike a winch, PowerQuick allows the rope to run through the device rather than winding it around a capstan. PowerQuick is compatible with most climbing harnesses but it must use half-inch braided rope for it to work correctly. PowerQuick can also be used for controlled, unpowered descents at a rate of around three feet per second. There are currently two models. The lighter model is capable of lifting 325 lbs at a rate of 1.5 feet per second; cost \$8,000; weight 18 lbs (including battery). The heavier one is capable of lifting 500 lbs at a rate of 1 foot per second; cost \$9,000; weight 28 lbs. They have a "dead-man switch" so that if the climber lets go of the device it will stop and hold position on the rope. An optional remote control is also available. The rechargeable battery (NiMH) has a duration of approximately 12 minutes or about 600 feet. The battery pack weighs 14 lbs and costs \$300. The charger weighs 3 lbs and costs \$100.

Another, smaller model currently in development for the military will enable a weight of around 220 lbs to be lifted at a rate of 10 feet per second. Instead of electric batteries it will utilize an engine and a solid propellant cartridge. Each cartridge will only enable a single lift up to a maximum of 100 feet but it can be replaced in a few seconds -- each new cartridge providing an additional 100 feet (10 seconds of lift). The device should weigh around 10 lbs. Cost might be between \$12,000 and \$15,000.

Mini-Winch (TL9): As mentioned above, these are cinematic devices. In the future, if power storage devices can be made small enough with a high energy density, there is no reason why a personal mini-winch cannot be developed. **Covert Ops** (p.CV54) suggests that a motor winch might be able to lift up to 400 lbs at a rate of five yards per second. Cost \$400; weight 6 lbs. More advanced versions might use nanowire and machinery that is miniaturized even further.

Climbing Table

The Climbing Table on p.B349 has been expanded. As noted, in most cases the climber uses the speeds in the "Regular" column. The "Combat" column is for climbs inspired by rage or terror, which always cost at least 1 FP.

Type of Climb	Modifier	Combat	Regular
Ladder (rigid) going up	no roll	3 rungs/sec	1 rung/sec
Ladder (rigid) going down	no roll	2 rungs/sec	1 rung/sec
Ladder (flexible)	no roll	1 rung/sec	1 rung/2 sec
Human ladder	+3	3 ft/sec	1 ft/sec
Tree (accessible branches)	+5	1 ft/sec	1ft/3 sec
Tree (no accessible branches)	+0	1 ft/3 sec	10 ft/min
Mountain (see Climb Ratings, above)			
5.0 to 5.4 -- beginner	+3 to +6	1 ft/sec	15 ft/min
5.5 to 5.7 -- intermediate	+0 to +2	1 ft/2 sec	10 ft/min
5.8 to 5.10 -- experienced	-1 to -3	1 ft/5 sec	5 ft/min
5.11 to 5.12 -- expert	-4 to -6	1 ft/10 sec	2 ft/min
5.13 to 5.14 -- elite	-7 to -9	1 ft/20 sec	1 ft/min
Vertical Stone wall	-3	1 ft/5 sec	4 ft/min
Modern building	-3	1 ft/10 sec	2 ft/min
Rope going up	-2	1 ft/sec	20 ft/min
using ascenders	+0	2 ft/sec	1 ft/sec
Rope going down	-1	2 ft/sec	30 ft/min
rappelling	-1	12 ft/sec	12 ft/sec
Rope (knotted) going up	-1	2 ft/sec	30 ft/min
Rope (knotted) going down	+0	3 ft/sec	40 ft/min
Winch (mechanical)	n/a	1 ft/6 sec	7 ft/min
Winch (electric)	n/a	1 ft/2 sec	1 ft/2 sec
PowerQuick (325 lbs)	n/a	1.5ft/sec	1.5ft/sec

PowerQuick (500 lbs)	n/a	1 ft/sec	1 ft/sec
PowerQuick (220 lbs)	n/a	10 ft/sec	10 ft/sec

Pyramid Review

Blowing Up Hong Kong (for Feng Shui)

Published by [Atlas Games](#)

Written by Chris Jones with Will Hindmarch

Illustrated by J. Scott Reeves

96-page softback; \$19.95

As a reviewer I do not always get my facts right. On occasion I have made mistakes and I occasionally still make them. One such error appeared back in 2001 in [In Your Face Again](#), the scenario anthology for [Feng Shui](#), the Hong Kong action movie RPG. In said review, I opined that Atlas Games should take the time to update the game from the end of the period when Hong Kong was administered by the British to take into account the fact that the city and territories were then and now back under Chinese control. Quite rightly I was corrected at the time by Bruce Baugh, that the rulebook made clear that it was not going to happen. The Contemporary juncture would always remain 1996, just as the other junctures -- AD 69, 1850, and 2056, would not advance in time either.

All that changes with the release of ***Blowing Up Hong Kong***, a guide to the city that lies at the heart of the game. Besides describing the city and its surrounding environs, the major point of the book is that it updates the Contemporary juncture to 2005 and, in doing so, places the Hong Kong Special Administrative Region firmly under Chinese authority. This updating *only* applies to the Contemporary juncture, and none of the other three have been moved on in time. And while the book takes a look back at the city's history as well as pushing its future forward up until the 2056 juncture, this is very much a guide book to the Hong Kong of the here and now.

Blowing Up Hong Kong is intended for use by both players and GM, and is written as a fictionalized guide, only touching upon elements of ***Feng Shui's*** Secret War rather than laying it all out for you. This is intentional; as such details of the Secret War can not only change as a result of in-game events, but will also be different from one game to another. As ever, the book is laid out in the usual fashion for the line and neatly organized for ease of both use and digestion. Photography rather than artwork dominates the look of the book; this is no surprise, considering that it is a guidebook. It is also clear from both the writing and the introduction that the author knows and loves Hong Kong.

Of course, a travel guide has to do a number of things. It has to present a geographical guide to the area covered and tell you how to get around it, fill you in on the peoples and their customs, suggest the best places to eat at, buy from, see, and be seen in. ***Blowing Up Hong Kong*** does all that. It begins with facts at a glance -- area code, emergency number, languages, currency, and voltage; smells (mostly diesel fumes, meat, fish, and ordure); sights (lots of neon and red banners); and sounds (a riot of moving and honking cars, blaring ships' horns, shouting voices, firecrackers, and the occasional temple procession). Hong Kong's many districts are described as well as how to get around them, whether by Kowloon-Canton Railway (to the New Territories and beyond to mainland China), the Metro or MTR (Mass-Transit Rail), cars, motorcycles, yachts, or boats.

This is of course the basics, because ***Blowing Up Hong Kong*** includes two words not normally found in the title of your off-the-shelf guide book. "Blowing" and "Up." What the book includes under this simple pair is all of the weirdness you need, but without delving too much into the Secret War. This ranges from the advice that you should not ride the Mid-Levels Escalator (the world's longest escalator that runs from the base of Victoria Peak and up) at certain times of the year, to a tattoo store where best body art is holographic, and the Bank of China Tower, the construction of which broke every feng shui rule. There's not just the weirdness, but also cool stuff too. Need a Rolls Royce fitted out with the best in luxury and security mod-cons? Then go see Arthur C.K. Moore, or find Tony Leung for the best in

customized smuggler's automobile or boat. Tea is of course everywhere in Hong Kong, but the tip is that the best tealeaf around is the "Golden Buddha," reputed to be truly life-enhancing. And if you pray at Queen Elizabeth Hospital, you might just gain the temporary but extraordinarily effective guidance from the ghost of Bruce Lee!

While chapters in turn cover Chinese customs, the city's nature, parks, and animals, religion and magic, cops and gangsters, hospitals, places to shop, and big buildings, it is the sections alongside all of this that further increases the weirdness quotient. Need 27 Kick-Asses To Stage A Brawl? A list gives you all that, while others give you unsolved mysteries, the locations of known Netherworld Portals, and Things To Do In Hong Kong If You're An Anarchist (or things to foil, if you are a hero).

One question that is answered is how the authorities -- in particular, the police -- deal with the weird that goes down in Hong Kong. Section 44 of the HKPD deals with all of the reports of ghosts, sorcerers, and monsters. Being assigned to the unit is often considered one step up from being dismissed from the force, as the number 44 is held to be very unlucky. It just so happens that "44" sounds like the words for "double die." Comprised of just 14 members, Section 44 is divided into three sub-units. Sub-Unit 449 are its demon slayers, Sub-Unit 446 its ghost hunters, and Sub-Unit 444 are the Death Dealers, the hardest of Section 44's members. They are so tough that they regularly go spelunking into the Netherworld!

Section 44 also benefits from a Group Schtick, first described in [*Friends of the Dragon: A Guide to Player Character Groups*](#). Essentially with the unique "Yin-Yang Yen," a Section 44 member can use his Info: Occult Skill to resist sorcery and creature Schticks, and also as a presence bonus in certain situations. The book also includes for handling Face -- a mixture of reputation and relationships -- in the game; more vehicle modifications to add to those found in *Golden Comeback*; numerology and math magic; and the concrete zombie -- what you get after burying a victim alive in wet concrete. The several new Schticks and a new set of fu powers in The Path of the Broken Island are all very useful when it comes to blowing up Hong Kong.

Despite it being updated to bring the Contemporary juncture to 2005, there is relatively little in *Blowing Up Hong Kong* that really takes it into account. The effect of which is make such details easily ignored if the GM wants to keep his game back in 1996, or as a friend suggested, used as a future that the player characters are trying to avoid or engineer. The book is an enjoyable read and contains lots and lots of useful information that can be easily added to game to give it color, flavor, and even odor! Because it describes the very city at the heart of the game, *Blowing Up Hong Kong* is probably the most useful supplement for *Feng Shui*.

Carcassonne: The Princess & the Dragon

Designed by Klaus-Jürgen Wrede

30 game tiles, wooden dragon pawn, wooden fairy pawn, & rules sheet; full color, boxed; \$14.95

[Carcassonne](#) has been in a few places -- cities, castles, primeval forests -- and even a couple of time periods, but for a game with knights and castles it's been remarkably free of traditional trimmings like magic. ***Carcassonne: The Princess & the Dragon*** gives you not only the dragon and the damsel in distress, but a few other magical gifts as well.

The game comes with a wooden dragon figure, a wooden fairy pawn, and a set of playing tiles that put these pieces to work in the game. Once again, a supplement to the ***Carcassonne*** series depends mostly on slight alterations to the canonical method of play, and here it's all about putting down and picking up pawns.

The new tiles get shuffled in with the old. If you get a volcano, the dragon rises up from wherever he's been hiding and lands there; you, on the other hand, get no opportunity to play a pawn (which is just as well . . . who wants their token on the same space as a hungry dragon?). If you pull out a dragon tile, the dragon moves across the land. Players take turns moving him one space at a time, and any "meeples" he passes over in his six-space journey are returned to their owners . . .

. . . Unless, that is, they enjoy the company of the fairy (not to be confused with the princess of the supplement's title). If you forgo placing any pawns during your turn, you may instead place the fairy so it shares a tile with one of your already-placed pieces. The dragon never moves onto the fairy's tile. The fairy also gives you an extra point if you start the turn on her tile, and she improves the score if you complete the feature you share.

The princess, on the other hand, is a handful. She needs knights to protect her from the beast, which means a lot of maneuvering through secret passages with her loyal entourage. Anytime you play her special city tiles without placing units of your own, you return the knight of your choice from that city to its owner. To balance this out, drawing magic portals lets you place a pawn on any tile already laid (normally you're limited to the tile you just played). You still can't break the rules about occupying cities with your opponents' pieces, and you can't score for stuff that's already built, but you have greater latitude in how you get your units out.

There's nothing to be said against the materials. The art uses the same style, the pieces are of the same good stock, and the jig-cut dragon and fairy pawns are what fans of the games have come to expect. The fairy is a bit small, to be sure, and its size and light color make it easier to lose, but the quality is fine. The dragon is big, but only in an imposing way. You can get a grip on it, but it's not a cumbersome thing to have on the playing surface.

A lot of games doom themselves and their fan base by playing a sort of pointless one-upmanship with their supplements -- find something you can't do in the game (or another supplement), then offer a follow-up that allows just that. It seems like ***Rio Grande*** has been going down this road for a while, but it's hard to argue with success. At first glance it looks like a ham-fisted way to alter the pawn-placement rules (perhaps fans demanded such a supplement?), but then you play it. It can be almost nerve-wracking for your opponent to place a volcano and its dragon next to the city you're trying to finish, even though the beastie won't move unless and until you pull one of its tiles. There's only about a one-in-10 chance of that with just the original game; add the other supplements and it's even less likely. How many games go from strategic to suspenseful with so little work?

The various elements seem so disparate at first, like they were ideas sitting on a few drawing boards and gathered together on a minute's notice at press time, but they work together to make ***The Princess & the Dragon*** flow. Even in

such a small space, they manage to raise a few rules-lawyer questions (is not using pawns when playing volcano or princess tiles the same as *choosing* not to play, allowing you to move the fairy? Not so much of a sacrifice if it is), but for the most part it's a successful kludge that, with previous add-ons, lets players choose the things they like or dislike the most about ***Carcassonne*** and flavor the mixture to taste.

Pyramid Review

Capes

Designed, Written, & Art by Tony Lower-Basch

[Muse of Fire Studio](#)

160 pp. softcover, \$20; or PDF, \$10

In this era of thick and heavy superhero rulebooks, a slim little volume like *Capes* seems downright casual and cute. Don't be fooled. *Capes* offers a challenge unlike any in the comic book gaming niche, one which some players will take up with glee.

In *Capes* players are "cooperating to create a comic-book story" but also "competing to have the most influence on how that story turns out." At the heart of the game is this question: "Power is fun, but do you deserve it?" Go ahead and use your powers, but remember the price of telling your story your way is to help the other players get their stories told. "The other players" is a telling turn of phrase, for *Capes* sessions have no game master. The management of the story, not to mention the handling of all characters, is done by the players as defined under the game rules. The tools of this management are index cards, paper slips, assorted tokens, and oh yes six-sided dice.

Capes characters have no "power scales" or other objective comparators. Each character ability is ranked within its category (Powers or Skills, Drives, and Styles), but that ranking reflects only how important that ability is to the character (and by extension how strongly that ability might be used to manipulate the story). Of *course* Captain Cosmos can lift that planetoid, *if* he can persuade or manipulate the gameplay into agreeing. Characters can be assembled in a "freeform" manner (choosing 12 abilities to share between categories), or by using use a modular creation system, or with a hybrid of those two methods. A character can be assembled in seconds, a fine feature for a game in which the plot is made up as play goes along.

Actual play is broken into a series of "scenes," "pages," and "actions." The player who starts the "scene" gets to establish the place and time where the action is going to occur. Each player then selects a character to play for the scene (and can buy additional characters with story tokens, about which more anon). Players are not obliged to play the same character for the whole game, or even from one scene to the next -- farewell to the traditional notion of playing a single character over the life of a campaign. You *can* keep to a single character, if you wish, and players can agree to leave certain characters in the sole custody of certain players.

The scene is broken into a series of "pages" -- think "rounds" and you're more or less on track. Each player can contribute a "conflict:" an "event" that will happen or a "goal" to challenge some character. These are jotted onto index cards and placed on the table where they can be seen and assessed with ease. Players then "claim" one side or another of a conflict and influence them with "actions." Actions have a rule component (how they work in the game) and a narration component (how it happens in the story). Conflicts are removed when they are "resolved:" no further actions have been applied to them and one side or other has advantage. Whoever controls the conflict at the end narrates how the conflict is resolved: The event happened, but maybe in an unexpected way. The character met the goal, or did not, or did in a peculiar way. Resources are shifted, pages continue until all the conflicts are resolved, and then the scene ends and a new scene begins.

Each character has three pools of resources to affect actions. Get "debt tokens" when you use your powers; these are assigned to one of your drives. When the debt on a given drive exceeds that drive's strength number, bad things can happen. Avoid bad things by spending debt tokens from drives as "stakes" onto a conflict (one which relates to the drive) to increase your chances of winning. *Win* the conflict (or rather, control the resolution of same) and you can

shed the debt tokens, turning them into story tokens with which to compensate the opposition. If your position fails, the debt comes back to that drive, doubled. Story tokens buy extra conflicts, actions or characters. Comparing the dice values of a resolved conflict determines who receives "inspirations," which are used later to increase a die's value without having to roll. Ah, there the dice are at last. They are used as markers to track the status of each side in a conflict, and players roll them, split them and reroll them as they commit resources into the scene.

In play **Capes** will resemble a board game more than a conventional roleplay game, as the actions progress around the table during each page and new conflicts are placed on the table, dice moved about, tokens shifted, and so on. In sensibility there are similarities to James Wallis's [Baron Munchausen](#) game, as you choose whether and when to utilize the tools at hand. The game also requires a serious engagement with telling the story. Some types of players may not be willing to offer the involvement **Capes** demands.

The first third of the book covers the rules and gives some detailed play examples. The examples will end up being your main guide in how to play. Chapters 3 and 4 discuss character creation, both in concept and with the modular "click and lock" system, in around 30 pages. The subsequent chapters, with extended rules, personalizing the rules, strategy and tactics, and preparing a story thread each run about 10 pages. A few appendices offer useful tips on naming characters, gadgets and magical items. Two pages of index close the book. In presentation, the typeface is comfortably large, and several graphical conventions (inline bullets for page references, for example) make it a comfortable browse. Simple line art pieces lead each chapter, and each "click and lock" module comes with a small evocative sketch. The art style tends more toward Japanese manga than towards American comics.

The "click and lock" modules deserve special praise. These are partial sets of character abilities, focusing on "Powers" (or "Skills" for the mundanes) and "Personas." Pick one of each module; they are designed to graphically interlock. Cross out three abilities and the character is done. This visual approach to character-making takes all the pain out of prefabricated templates, and the process of making new templates to your taste is both obvious and simple.

The book has no blank character sheet. The preface directs the reader to [the publisher's website](#), but as of this writing there are no plain blank sheets there. (To be fair, characters are so simple that a dedicated form isn't really necessary.) The site does, however, have several other useful tools. A "lite" preview adventure provides a simplified and structured introduction to the game. The Flash character generator and other online module tools should provide ample support for the compulsive paper-shuffler. An errata sheet is also available which corrects faults which might impede play but does not address the inevitable errors of usage and grammar.

The main weakness in the book is one of clarity. **Capes** introduces a raft of novel concepts which will be unfamiliar to both the regular hobby gamer and the new reader. While the author has used his graphical and textual tools to some good effect, there is no substitute for transparent organization and careful prose. As a result the game suffers from the traditional ailment of needing to be taught rather than just being read and learned. Using a smaller typeface and less white space might have made room for more naturally flowing text. Game rules are a special kind of storytelling and deserve extra care.

Capes is very obviously a personal labor of love on the part of the author/designer/artist. As such this game will tend to appeal most to those who share his view of storytelling games. The players willing to commit to the work should find that having no one (and everyone!) as game master brings a new richness of adventuring experiences. **Capes** is not a game for everyone, and it won't overturn the industry, but it's a welcome and flavorful addition to the hobby gaming menu.

--Bob Portnell

Merging Elements -- Proceed Cautiously

Less than 72 hours after writing my [previous column](#), where I bemoaned not having the ability to be a fan anymore, I found myself contradicting at least part of the sentiment therein: I got caught up on some of my comic reading.

Last week, *Infinite Crisis #1* was released. Having enjoyed the previous Big Event -- *Identity Crisis* -- and the book leading up to this one -- the aptly named *Countdown to Infinite Crisis* -- I decided I wanted to catch up, lest any of the buzz lose its luster from spoilers via the forums I frequent.

Unfortunately, this was not as straightforward as I was expecting. Within the first two or so pages, I quickly realized that I had no clue what was going on, and I would need to read the four miniseries that led into this event. Fortunately, I'd been buying all those. Midway through the first mini-series I realized I'd need to read the recent issues of the Superman titles and *Wonder Woman*. Fortunately, I had those, too.

(Aside to those who create miniseries: If you are *ever* tempted to interrupt a miniseries with additional comics that are required to make sense of the story, I will do unspellcheckable things to you. Consider yourselves warned.)

So, having read 28 comics -- that's over 600 pages of comics -- I was now ready to read the first issue of another comic series. Without giving any spoilers as to the contents of this first issue (which isn't too hard, since I'm not certain I understood everything that was going on), I was actually impressed by how the four miniseries fed into this one. When I first heard about the idea, I was fairly certain that at least one or two of them would be superfluous, with "Well, we're back at Square One" resolutions; this wasn't the case. (That's not to say you couldn't figure out what was going on without having read them . . . rather, that all four had direct consequences that would play major parts in the setup to *Infinite Crisis*.)

What does this have to do the price of dice in Nice?

Well, to quote Bill Cosby, "I told you that story so I could tell you this one."

A few weeks ago over on [Slashdot.org](#), I read the most riveting computer-crime-related account since *The Cuckoo's Egg*. I won't steal the thunder of the original [article](#), but to summarize:

Computer crackers¹ had figured out a way to unlock the smart card technology used by a satellite-television provider, and used this info to steal digital television. The company in question found itself limited by the technology of this smart card; since television satellite broadcasts are passive -- they broadcast data but can't receive it -- the company couldn't use the obvious means of thwarting this ("Hey, SMARTCARD24601, are you listed on my database of paying subscribers?" "Uhhh . . . no?" <click>).

However, they *could* force an update to continue decoding the broadcasts (which the crackers continued to add to their cards to have them continue working). After years of piracy, the company forced some updates in discrete parts which contained garbage -- garbage which was still necessary to decode the broadcasts. Eventually, after a number of these updates, the crackers realized that the seeming garbage was actually designed to fit together, forming code that would destroy pirated cards. The company activated this code on the week before the Super Bowl, which overwrote the first eight bytes of the write-once memory with "GAMEOVER."

(The original is much more riveting; go read it.)

Anyway, digital television and comic book miniseries worked in tandem to make me realize something: It's really cool to have parts of a whole fit together into a larger tapestry.

Within a game, it's possible to have pieces fit together in a number of ways. The most obvious is in the malevolent way in our second example above: "Okay; our corporate espionage contact, Mr. Johnson, has requested we acquire four piles of scrap metal from Disassembled Killer Robots, LLC. We have three of the piles sitting in our van, and

we're about to toss in the fourth pile. Waitaminute . . . it's humming . . ."

And, the beauty of this idea's iteration is that it's eminently portable; four enchanted coins gathered from throughout a dungeon might combine into Something Interesting, a gatekeeper and keymaster might get jiggy and unleash Gozer the Gozarian, and so on. ("Unleash a tornado?! There must have been a misunderstanding; see, the pieces of this Whether Machine combine to form a device that modifies probability . . .")

And the technique doesn't need to be flashy or explosive. For example, in an RPG campaign I ran, the players had found two sheets of thin parchment that looked like strange runes when looked at separately, but when placed atop each other, spelled out a secret message. (Yes, these were actual props, and the players needed to actually figure this out. Yes, I know some players don't like this.) As a bonus, evil technique, the flashy and mundane options can be combined . . . what if, when combined, the parchments spell out a secret message *and* transport the victims to another plane of reality?

Within the campaign as a meta-game technique, the parts of a whole can be used just like the miniseries, with interlocking campaigns leading into a larger story. In this way, the technique of parts-to-a-whole is really just another iteration of the technique from a [couple of weeks ago](#).

Of course, since the [dawn of time](#), games have almost always consisted of pieces. However, it can be fruitful to think of various interpretations of what those pieces *mean*.

Or, if you don't want to do that, then consider curling up with a good comic book instead.

--*Steven Marsh*

¹ Or "hackers," if you would prefer . . . as would I, if doing so wouldn't probably prompt a dozen e-mails from people taking me to task for this.

Archetypical Organizations: Kith of Steel

by Owen K.C. Stephens

While the **d20 System** fantasy rules provide numerous class for characters to choose from, the first choice players tend to make is what archetypical role they plan to fill. Most dungeon-stomping, orc-killing, treasure-seeking groups need a primary combatant (often broken into a front-line combatant and a ranged or mobile combatant), a cunning scout (master of traps and stealth), a healer (to fix them up again), and a spellcaster (who deals primarily in offensive and utilitarian spells, rather than healing). These roles are flexible and often some characters overlap (many healers are also spellcasters, while a shape-changing druid might serve as both a healer and a mobile combatant), but they show up so often (and the rules support their existence so well) that it's hard to deny the roles exist even if some characters stand halfway between two roles.

If such roles are commonplace, it stands to reason organizations would develop to support them. Some such groups are obvious (if most healers are priests, a church serves as a healer's organization), while others are less so, or turn out to be poor matches. For example, the over-common Thieves' Guild tends to focus on illegal activities for profit, while the cunning scout may well be an archeological explorer, a military tracker, or an ideological assassin. Similarly, warrior types are often gathered in armies or adventuring groups, but neither has the multi-national reach and influence of a church. If combatants are as common and as influential as priests, then surely they would have their own broad organization, in at least some game worlds.

The Archetypical Organization series of articles is designed to present wide-ranging organizations to support these common archetypes. Each has a single organization with the same reach and scope as a church, though most aren't religious in any real sense. The articles provide an overview of the organization, an idea of its goals and activities, and a few game rules designed to support the organization. A GM can drop these organizations into games to support the characters who choose the archetypes that make most typical **d20 System** games go smoothly.

Kith of Steel

In the capitol of any major kingdom across the lands can be found a simple, stoutly constructed building easily mistaken for a warehouse. In this structure no windows can be found within 10 feet of the ground, and those higher up are little more than archer slits. A single thick wall of brick or stone surrounds the building, with a set of heavy wooden double doors that grant admission to an open courtyard filled with stables, smithies, and practice yards. A steel shield hangs over the door, and no other markings can be found. But despite its simplicity, this building is well known by all local folk, for it is a chapterhouse of the Kith of Steel.

The Kith of Steel is a large network that serves as fighting schools, hiring houses and mutual support alliances for fighting men and women. Originally a mercenary company, the Kith has expanded well beyond its original purpose as a clearing house for sell-swords. It now serves as a guild for warriors of many nations, providing them with materials, equipment, security and contacts. The Kith also serves to give individual fighters a voice in national affairs. A baron may not care what a single caravan guard thinks of his new laws banning longswords, but he'll certainly listen to the thousands of members of the Kith. Anyone who can prove their worth in a fight is welcome to join, but only true warriors ever show much interest.

Although many nobles are cautious about the idea of an organization of independent warriors, several see it as a way to ensure that there are always well-trained, experienced warriors available whenever they are needed. The alternative is to have untrained peasants and merchantmen fighting off brigands, villagers pressed into armies instead of professional soldiers, and wizards fumbling with swords when their vaunted magics run short.

The Kith also boasts a great deal of support from the common man. In a world full of strange monsters and powerful magics, it is important for villagers and peasant folk to know someone is around to defend them. And common folk often identify more with the warriors of the Kith than spellcasters, monks, footpads, or barbarians who may seem alien and strange to ordinary men and women.

Organization

The Kith of Steel is broken into several chapters, each a semi-autonomous organization with names such as the Burning Swords or Steel Angels. Each chapter is based in a Chapterhouse found in a major city and run by a Marshall. Depending on the size of a chapter, and how many outposts it is affiliated with, a Marshall may have between one and three vice-Marshals to help run things. Smaller towns and villages may boast an Outpost, a smaller garrison of the local chapter, run by an Armiger (whose first duty is to see to the defense of the town).

Most members of a chapter of the Kith of Steel are simple legionnaires, warriors who have gained membership in the Kith and enjoy its protection and aid. Legionnaires are not vassals of the Kith obedient to its every edict. They are instead members of a fellowship, dedicated to providing mutual support for all their fellow warriors. Legionnaires are expected to honor their comrades and leaders within the Kith but are free to lead their own lives. Although legionnaires have an affiliation with a specific chapter, they retain some loyalty to the Kith as a whole. Anyone can become a legionnaire if he is sponsored by an existing member or convinces a Marshal to accept him.

Every kingdom in which the Kith operates has a Council of Steel, formed by the Marshals of each chapter within that kingdom. The Council is responsible for outlining the code that all legionnaires within that kingdom are expected to follow. Although this varies somewhat from region to region, there are some rules of conduct universal to all chapters of the Kith. All provide for the support, supply and protection of all members of the Kith, regardless of their chapter affiliation. Although legionnaires may sometimes cross swords with other members of the Kith, they are always expected to treat such colleagues with respect. And although the organization does not require strict adherence to any particular code of honor, any legionnaire making a promise in the name of the Kith shall be expected to observe it. Any legionnaire acting against the Kith of Steel itself will be hunted down.

Most small villages don't have any major presence of the Kith of Steel. However, some old legionnaires retire to run blacksmithing shops or taverns in these hamlets. Such shops are generally affiliated with an Outpost in a nearby town or city and have an old steel sword or gauntlet hanging outside their shop to proclaim that allegiance. The main function of these outposts is to provide message and intelligence services for the Kith as a whole and to keep an eye out for young people of all races who show a real talent for fighting. These youngsters are encouraged to seek out a chapterhouse in a larger city for more advanced training.

These shops offer friendly, honest service -- perhaps slightly discounted (10% off) to fellow Kith -- and the ability to send messages to Outposts and Chapterhouses in nearby towns and cities. Sometimes shops of this kind can be used as safe gathering places for legionnaires and their friends or serve as delivery points for special orders of equipment. A wounded or destitute warrior might receive some charity from such retired legionnaires but shouldn't count on it. Retired legionnaires often love to talk shop, and can provide newcomers to an area with the lay of the land from the professional warrior's point of view.

Most major towns have at least one Kith-affiliated business as described above, and many boast an actual Outpost (though possibly a small one). Outposts are not much more than a stout wall surrounding one large dirt floored room with a few storage rooms and perhaps an office. These are manned 24 hours a day and serve as cheap hostels, suppliers of simple merchandise and weapons and places for members to gather. They also serve as training houses for local boys with an interest in fighting and emergency safehouses for wounded or hunted legionnaires.

Outposts are generally on very good terms with the local town militia or guard and likely provide free training to locals once a week or so. The legionnaires who man such outposts are usually nearly retired or locals themselves. If the town is threatened by monsters or brigands, townsfolk can always count on the outpost as a place to take shelter. The Kith as a whole see their Outposts as a way to ensure they keep the trust of common folk.

The large city Chapterhouses serve as a great deal more than training centers and places to sleep. They provide a wide range of services for members, including scribes to read or write letters for illiterate legionnaires, smiths and leather workers to repair weapons and armor, suppliers of adventuring and combat gear and, in some cases, even healers from local temples. Members must pay for these services but can expect to receive a 20% discount off the local going rate.

Dealing with Outsiders

Although the Kith remains studiously neutral in most political affairs, many rulers find it difficult to believe that a large group of armed combatants have no intentions of making trouble. But the training and services provided by the Kith are simply too useful for most rulers to banish them entirely. And many kings either trained at a Kith outpost themselves when younger, or have trusted knights and guard captains who did so.

In most kingdoms, the Kith is tolerated by kings and wealthy nobles and welcomed by peasants and knight-barons from border territories. Laws are frequently passed restricting who the Kith can train and how many legionnaires can gather at once. But more than one kingdom has been saved from invaders by the combined heroics of a few hundred of these warriors, and this fact has not been lost on modern rulers. In general, as long as the Kith doesn't make trouble or become a safe house for brigands and murderers, local authorities are willing to leave them alone.

Officially the Kith of Steel neither resorts to the use of force in most of its political dealings, nor does it condone the use of force by others on its behalf. This is a political necessity, since the Kith needs some level of acceptance among nobles and kings who are otherwise unlikely to allow armed encampments of mercenaries on their doorstep. To bolster its claim of being a legitimate trade guild, the Kith does not officially condone violent solutions to political problems.

Officially.

Realistically, however, the Kith is made up of people who have been trained to fight and that's what they tend to be good at. Groups that oppose the Kith often end up dealing with difficulty arranging for caravan guards, mysterious fights breaking out in their favorite taverns, and occasionally attacks against their families and allies. Of course the Kith can't control the actions of individuals who supports its cause, and never sanctions such actions. But when a small army of 50 Kith "independently" decide to kill off a baron who has managed to place an embargo on a Kith of Steel chapter, other rulers get the message.

There are also two major exceptions to the Kith's policy of non-violent negotiation. First, once the Kith has permission to build a Chapterhouse or Outpost, they fight tooth and nail to keep it. It's not unusual for conquerors or new nobles to decide to get rid of the Kith, only to discover that such a thing is much easier said than done. The Kith protects its holdings by force and is capable of calling up large numbers of experienced warriors if pushed. Even if the building itself is destroyed, the Kith of Steel continues to keep a presence in the area -- clandestinely if necessary -- to provide support and protection to its members. Many novice rulers end up deciding it's better to allow the Kith to have a Chapterhouse in a known location than to deal with a dispersed underground organization.

The other exception concerns the treatment of legionnaires captured by government or mercenary forces. If the Kith receives reports of captured legionnaires being tortured, possessed, or summarily executed, it's likely to mean trouble for the offending group. The Kith is aware that its members occasionally engage in actions that are forbidden under local laws (such as trying to depose tyrants -- the tyrants rarely look fondly on such efforts) and won't start a war over comrades being tried and punished in a reasonable manner. But if the Kith receives reports of legionnaires being mistreated it's likely to take action. Simple warnings and demands for the legionnaires' release or ransom are likely to be tried first, but when those efforts are not successful the Kith mobilizes to free its own.

On those occasions that the Kith does resort to force it's likely to be a well-trained, well-equipped, but small group sent to accomplish a specific goal. In addition to several legionnaires, such a force usually includes at least one spellcaster friend to the Kith, a rogue with a dependable track record, and several clerics who are either on good terms with the Kith or on bad terms with the target of the attack. It's not unusual for bands of adventurers that include a few Kith members to be asked to perform operations of this type. Normally these attacks are simple search-and-rescue missions designed to retrieve captured legionnaires. If the prisoners are too well guarded for such an effort, or if

they've already been killed, a punitive strike against some other target may be arranged. The Kith always picks such targets very carefully and avoids any risk to innocent civilians.

Groups with no legal authority attacking the Kith soon discover that its official policy of non-violence when dealing with rulers and nobles does not apply to bandits, ruffians, and criminals. If one of these organizations takes on the Kith, the response is swift and very violent. Political necessity may protect kings and dukes, but it doesn't cover brigands.

The Kith keeps close ties with several similar organizations, as these organizations frequently contact the Kith to find warriors willing to aid in quests or willing to act as guards.

Benefits of Membership

Members of the Kith of Steel have several advantages over other warriors. First, their association with the Kith tends to encourage anyone who captures a legionnaire to treat the warrior in a fair manner. Second, the Kith maintains contacts with several other large organizations, through which a warrior can seek gainful employment or seek specialists to help him accomplish missions. A legionnaire in need of a sage to solve an ancient riddle, a priest to heal a festering wound or a rogue to help free captured comrades can enlist the aid of the Kith to find them.

Expert training is also available to members of the Kith. In campaigns where a GM requires a character to train before rising in levels or adding new heroic feats, such training is freely accessible to a legionnaire at any Kith chapterhouse. Non-fighter characters who wish to add a fighter level may also gain training through the Kith, although they are expected to pay for such services. Certain feats are only available to characters who train with the Kith (as detailed below).

Most mundane equipment is available at large Chapterhouses, with a 20% discount for legionnaires. Some independent merchants and smiths also offer members of the Kith discounted rates for equipment or services. In any city with a Chapterhouse, there's a 5% chance of any given shop offering such a discount. In smaller towns and areas further from Kith influence, there is but a 1% chance. In a campaign where magic items are bought and sold, the Kith are also able to arrange for such items to be created for their member (though the discount does not apply to custom-ordered magic). Wizards occasionally offer to make such items in return for assistance, and rogues sometimes find themselves in possession of armor or weapons they cannot use and would be willing to sell. The Kith remains alert to opportunities of this kind.

The Kith can act as a bank, message service, and storage facility for warriors who have no set home. The Kith of Steel charges nothing to members who wish to deposit sums of gold with the Kith that may then be withdrawn at any Kith Outpost. A message left at any Chapterhouse for a legionnaire eventually makes its way to the recipient, although that can take weeks or even months. Small amounts of material can be stored in a Chapterhouse by a member, although a charge may be levied for exceptionally bulky items or long-term storage.

Additionally, the Kith provides a safety net for down-on-their-luck warriors and those that have reached the end of their fighting careers. If a warrior is no longer able to make a living due to age, injury, or other ailment, it is usually possible for him to take a post with the Kith in return for food and board. Many smaller Kith Outposts have a few "old-timers" as permanent staff members to train the young and help with administration. Of course it is never safe to assume that even the most elderly of legionnaires is harmless, as a few young troublemakers inevitably discover from time to time.

But perhaps the greatest benefit offered by the Kith is its practice of arranging for the rescue of lost or captive members. A member's chance of being rescued depends on the availability of capable rescuers and the reputation of the lost Legionnaire. A few enthusiastic old salts are ready to go off and rescue a comrade at the drop of a helm. Most members are, however, understandably reluctant to risk their own necks for the safety of fellows who have yet to contribute significantly to the group.

Duties of Membership

A member of the Kith of Steel is expected to pay dues annually and provide service for the Kith periodically. Normal legionnaires are expected to put 100 gp a year into the Kith's coffers, although this can be either a lump sum or a series of irregular payments. Legionnaires do get behind on payments, and that's normally overlooked if it happens infrequently and only when the legionnaire is obviously on hard times. A fighter who does so regularly or while wearing expensive new clothes is likely to find himself having a "conversation" with several members of the Kith. Eventually he'll be informed he must pay up immediately or lose legionnaire status.

Legionnaires also are expected to give some of their time and talents to the Kith. Most legionnaires spend a few days every two months manning a Kith outpost. Legionnaires whose schedules are too erratic for such duty are often asked to perform other tasks for the Kith, such as delivering messages, providing guard duty for friends of the kith, or even showing up as muscle during Kith negotiations with potential enemies.

Occasionally it's simply not practical for a member to spend time working on Kith problems, such as a King's bodyguard or a noble or has full time duties of his own. In these cases, it is often permissible for the legionnaire to pay additional monthly dues in lieu of service. These dues can vary some depending on the wealth of the member but tend to be about 50 gp/month.

Contacts

Any legionnaire can get a message to the Kith eventually, but most people dealing with the Kith seek out a Marshal or a merchantman associated with the Kith. Two such characters have been detailed below.

Thurfir Strongarm (F4 Human, Str 16, Dex 10, Int 13, Wis 11, Con 15, Chr 9)

Thurfir is a retired legionnaire turned blacksmith and armorer. A gruff and imposing man, Thurfir is usually found working at his forge or instructing up to a dozen apprentices in his shop. He is a proud and capable man, but an old leg wound ended his career as an adventurer many years ago. The wound still bothers Thurfir occasionally, but he'll never admit it or accept assistance with it.

Although his shop, the Crossed Blades, is primarily a source of quality metal goods for local townsfolk, it is also a popular source of weapons and armor for warriors who have dealt with Thurfir in the past. Thurfir remains in close contact with the Burning Sword chapter of the Kith and keeps a steel gauntlet nailed up above his shop sign to declare his allegiance. The shop is also a good place for Legionnaires to hold meetings, receive messages and order equipment.

Members of the Kith of Steel find themselves very welcome in Thurfir's shop and treated like siblings. He gives a 20% discount to such comrades-in-arms and extends a 10% discount to a legionnaire's friends and companions. Thurfir also places any special equipment a legionnaire orders from him at the top of his priorities, usually cutting 10-20% off the time it takes to make or procure.

As a member of the Kith, Thurfir also occasionally sponsors a new legionnaire into the brotherhood. Only individuals who seem to be stout and fair warriors are likely to gain Thurfir's approval in this way, but any who are consistent about desiring membership are likely to at least be referred to the Burning Sword chapterhouse, where they can discuss their desires with Irialle Galanodel, the local Marshal.

Thurfir sends regular messages to Marshal Irialle, commander of the Burning Sword chapterhouse and an old friend. His reports keep her updated on local events, and his opinions carry a great deal of weight with her. Although Thurfir does not have many contacts of his own outside of town, he often forwards any requests legionnaires make to Irialle, who sends him a response in a week or two. In case of an emergency Thurfir can arrange for a runner to get word to the chapterhouse and back in just a few days, or could write a letter to send with a legionnaire to take to Irialle directly.

Irialle Galanodel, Marshal of the Burning Swords chapter of the Kith of Steel (F9/W2, ½Elf, Str 13, Dex 15, Int 12, Wis 11, Con 10, Chr 15)

Irialle is an accomplished half-elven warrior and the commander of a major Kith outpost located near the center of a major city. She is a sophisticated fighter who believes self confidence and a good reputation are among a warrior's best weapons. She also believes that some offenses are too severe to be met with anything but force and that some situations unquestionably call for violence.

Like many of her kind, Irialle left her elven family in an effort to find a place for herself among human society. Originally trained as a wizard, she soon found the romance of swordplay more to her liking. Irialle sought training with the Burning Swords and has been loyal to the Kith ever since. A few years ago the old Marshal of the Burning Swords retired, and Irialle took the post as her own.

Irialle takes a very hands-on approach to running the chapterhouse. She teaches a class of young hopeful fighters once a month and occasionally takes on one or two more advanced students for individual lessons. She knows every legionnaire who visits the chapterhouse regularly and makes it a point to meet new ones passing through. Irialle is very protective of "her" legionnaires and has been known to go to great lengths to find or rescue any that go missing. As a result, most legionnaires would march through hell at her request.

A legionnaire can depend on Irialle to provide food and shelter at reasonable rates at the chapterhouse and to help arrange for local services (such as healing, scribes, sages and smiths), usually with a discount from the normal cost of such labor or material. She's also available for simple advice, ranging from how large a group needs to be to survive exploring a particular dungeon to good fashion sense.

Irialle also handles most requests for assistance or special help personally. Irialle believes in working in groups and employing specialists as needed and often recommends the hiring of individuals with magical or social talents in addition to simple fighters. She has a broad network of contacts within the local guard and merchant houses. She also knows a number of people in other large organizations, though she tends to avoid arcane spellcasters as unpleasant reminders of her years trying to master wizardry.

Adventure

The Kith of Steel can serve as an excellent starting point for a ***d20 System*** fantasy adventure. In a new campaign, characters might find themselves sought out by the Kith to assist a young legionnaire with a hazardous mission requiring many different skills. Or a character might be a member of the Kith himself, sent to gather a group together to help the Kith accomplish some goal. There are always merchants and noblemen who ask the Kith to find trustworthy guards for traveling treasures or adventurers to clear out an abandoned castle. The Kith's broad reach allows it to be used as a way to gather characters from very different backgrounds.

In ongoing campaigns a member of the Kith could be asked to put together a team to rescue a fellow legionnaire held by brigands or an evil necromancer. A Kith Outpost can make a good base of operation for a group either adventuring in nearby uncharted wilderness or involved in city matters on a regular basis. When a new character is introduced, he could be brought in as an expert located by the Kith to aid an existing band of characters.

New Feats

Certain feats are widely identified with the Kith of Steel, which is the best place to learn them. As a general rule any particular Chapterhouse has trainers for 2-5 of these Feats. Outposts are much less focused on special training, and there is a 50% chance of finding someone able to teach 1-3 of these Feats.

From a game rules point of view, all of these feats can be treated as having "Kith of Steel training" as a prerequisite. The feats are balanced without this additional limitation, but making them exclusive to Kith legionnaires helps bring flavor and function to that organization.

Ferocious Assault [General]

You are capable of attacking with fierce dedication.

Prerequisite: Str 13+, Power Attack

Benefit: A character with Ferocious Assault may take a -4 penalty to their AC at the beginning of their round to gain a +2 to all attack rolls made that round. The AC penalty lasts until the character's next round.

Special: A fighter may take this feat as one of his fighter bonus feats.

Improved Dodge [General]

You are particularly adept at avoiding blows.

Prerequisite: Dex 13; Dodge; Base Attack +8 or higher

Benefit: You may designate a single foe at the beginning of your round, and receive a +2 dodge bonus to AC against attacks that foe makes. Alternatively, you may gain a +1 dodge bonus to AC against all attacks from any source. In either case, the dodge bonus replaces the bonus gained with the Dodge feat.

Special: A fighter may take this feat as one of his fighter bonus feats.

Pin [General]

You are particularly adept at blocking other's weapons with your own.

Prerequisite: Combat Expertise

Benefit: As a melee attack, you may attempt to Pin one weapon of an opponent. To attempt to Pin, both you and your target roll opposed attack rolls. If the weapons are of different size, the character with the larger weapon gains a +4 bonus to his attack roll per difference in Size category. If you beat the defender, his weapon is pinned by your own and neither can be used to make additional attacks as long as you maintain the Pin (requiring an attack action each round). If you fail, you provoke an attack of opportunity from the defender.

To free a pinned weapon, a defender must either take an attack action to attempt to free it (making another opposed attack roll), or must withdraw out of your threatened area. The defender can also leave the weapon pinned, or simply drop it.

Special: A fighter may take this feat as one of his fighter bonus feats.

Pressing Attack [General]

You are able to force foes back with a flurry of blows.

Prerequisite: +6 base attack, Dodge, Power Attack

Benefit: If you make a full attack action against a single foe in melee, you force that foe to make a Reflex save (DC 10 + your base attack bonus + your Str modifier). For each size category larger than your foe is, he gains a +4 modifier, for each size smaller a -4 penalty. If the foe fails this save, you force him to move 5 feet directly away from you. You may choose to make a 5-foot step to stay adjacent to your foe. This movement counts against the next round movement for both of you.

Special: A fighter may take this feat as one of his fighter bonus feats.

Shieldbearer [General]

You have been trained to use a shield to help protect others.

Prerequisite: Shield Proficiency

Benefit: If wearing a shield you can help protect a friend against the attacks of one target attacking him. If in position to block for your friend, you may make an attack against an AC of 10. If successful, you may grant your friend +4 AC vs attacks from that target. If you take a full attack action, you need use only one attack to block with your shield.

Normal: A character without Shieldbearer can use the Aid Another special combat action to help a friend.

Special: A fighter may take this feat as one of his fighter bonus feats.

Pyramid Review

MidEvil

Published by [Twilight Creations, Inc.](#)

Conceived & Designed by Kerry Breitenstein & Todd A. Breitenstein

Art by Dave Aikins, Jeremy McHugh, Paul (Prof.) Herbert, & Ed Bouelle

Layout by Todd Breitenstein

100 plastic Skeletons in three colors, 50 gray plastic Humans, six player pawns, 30 map tiles, 50 event cards, two dice, & rule booklet; \$24.99

Just because you killed the walking dead in the present and put paid to the zombie dog invasion doesn't mean you're done fighting evil. In **MidEvil**, the next episode in Twilight Creations' line of variable tile system games, you're thrust into the distant past and forced to fight your way to the magic book that will whisk you home.

The game can be won two ways: be the first to kill 30 points worth of Skeletons, or bring the Necronomicon to the center of the Altar tile.

Play of the game is nearly identical to [Zombies!!!](#). The small hamlet is laid out one tile at a time, and you travel about dusting Skeletons and stealing their weapons. Some of the buildings also house Life Tokens, gray plastic human figures that represent your well-being in the game. Event cards throw twists into the action, and though the monsters move slowly, their superior numbers may surround you. Somewhere in the tile deck is the Graveyard; if you get the dreaded Necronomicon here and make it back to the Altar where you started, you can escape the hordes.

The differences? Components, most notably. The tiny cardboard counters that tracked life points are now full-size Human tokens, which are much easier to pick up. There's no ammunition (this is the Middle Ages); you improve your attacks by trading in Skeletons you've already killed. Since Skeleton collection forms one victory condition, you have to be judicious in trading them in.

The Skeletons come in three colors and three concomitant point values, but expending a "trophy" in combat only improves your total by one. Killing three-pointers gets you closer to victory, but if you've killed no one-pointers you'll have to spend the three-pointers to stay alive at a critical moment. Some event cards also require paying out Skeletons, sometimes a specific color, so a whole new tier of thinking is built into the system.

Unlike **Zombies!!!**, the winning conditions don't bend over to level the playing field. The Graveyard can show up at any time, making you race for the Necronomicon. Once obtained it still has to reach the altar, and characters are allowed to attack one another to steal the book. Combatants roll a die apiece and may add Skeletons to their total. The loser perishes and returns to the starting point: the altar, where the victor has to take the book.

There's fault aplenty in the minus column. Most trivial is atmosphere. **Zombies!!!** effectively conveyed a modern walking-dead outbreak, but MidEvil . . . You're contemporary people in the past, and while several event cards depict anachronistic stashes of guns and more, only one such card -- Explosives -- really suggests the fish-out-of-water gimmick. (Well, okay, there are two copies of that card, but just try to find the ideal circumstance to use it to proper effect.) If you're going to riff on *The Evil Dead*, you owe your audience at least one shotgun or a chainsaw.

Getting equipment isn't tough (though most requires killing a Skeleton first). Every card save the Necronomicon has at least one duplicate in the deck, so the spread of cards, cool or otherwise, is limited. That's a good thing for the Horse . . . these four (!) cards are coveted. Speed is possible -- and necessary -- in ways it never was in **Zombies!!!** because the book's appearance is unpredictable, and anyone without it has to ramp up the monster-killing in the endgame. **MidEvil** works better with more than two players; you get more action and the targets are thinned. With two participants, pockets of victory form and wait to be exploited. But worst of all are the event cards. Like the Skeletons, arguments over them are legion. Almost every one produces a question, and the rules lawyers will leave them in tatters.

Speaking of duplication, the playing tiles see a lot of repetition, too. There are no fewer than five inns . . . with all the visitors they're expecting, you must be adventuring in downtown Constantinople or something. It's all background, so it's not like it interferes with the game, but it smacks of truncated creativity.

The colors are a problem. The Humans (life tokens) (which are referred to repeatedly just that way -- Humans (life tokens) -- in case you forget) are the same mold as the players' pawns. You'll move a life token by accident several times. The white player's piece isn't far removed in hue from gray, either, and that doesn't address blending exactly, color-wise, with the white Skeleton pieces. Red and blue players have the same problem. And finally, once open the contents don't fit back in the box.

The artwork is decent stuff. It seems a little less well-defined than previous iterations. Concessions seem to have been made to the game's humorous bent (or to the humor of the movie genre it's based on, anyway), but at least it's the lively, mood-setting stuff the game needs.

All this sounds worse than it is . . . almost. The game really needed another round of playtesting, or at least a rules addendum for card clarifications. But the Skeleton point system is so simple, so workable, so smart, it's easy to overlook some of the game's other sins. **MidEvil** respects its audience enough to give them something new (and worthy) for their buck and not just another glossed-over reissue of the same old dead things.

--Andy Vetromile

Pyramid Review

The Pastores: A Malefic Cult (for *Cthulhu Dark Ages*)

Published by [Chaosium, Inc.](#)

Written & Illustrated by Thomas B. de Mayo

Cartography by Michael Patty

80-page tapebound b&w softcover; \$18

So the question is, "What is going on with *Cthulhu Dark Ages*?" Even when in print, the much-vaunted, much-delayed translation and adaptation of the German supplement from Pegasus Spiele GmbH has yet to receive any proper support from Chaosium. This is something of a problem, because [Cthulhu Dark Ages](#) is far from perfect. At the very least it needs advice for the Keeper of Secrets, in particular on running the game in *Call of Cthulhu's* traditional campaign format. Single scenarios have appeared in magazines, but no campaign has yet appeared, except now in monograph format. Chaosium's monographs showcase items that the publisher believes to be of interest and note to the game's devotees, (and you have to be a devotee as Chaosium only makes them available from its website) usually from the Miskatonic University Library Association.

Monographs for *Cthulhu Dark Ages* differ in that they are released under the auspices of the "Order of the Sword of St. Jerome." Described in the earlier monograph *The Abbey*, this Order is dedicated to routing out and overcoming the darkness that threatens Christendom as the final years of the first millennium approach. The Order, based in the French Alps, is aware of one such threat in south central France, known as the Pastores. The second monograph released by the Order of the Sword of St. Jerome, *The Pastores: A Malefic Cult for Cthulhu Dark Ages*, gives a full description as well as presenting a five part mini-campaign devoted to investigating and thwarting the cult. Found nearly nationwide (and beyond), the cult predates both the Roman and Celtic control of western France. Its fortunes have ebbed and flowed over the course of recorded history, but more recently the cult has been taking advantage of the political turbulence across France to spread its influence and both expand and solidify its power base, reaching into Spain and across the English Channel.

Just as the Romans assimilated the gods and faiths of those it conquered, the Pastores (or shepherds) have embraced Christian litany and theology to hide its true beliefs and practices. In reality the three families at the heart of the Pastores are an unknowing Cthulhu Mythos Cult, worshippers of the Magna Mater and her sacrificed son. Besides unknowingly worshipping Shub-Niggurath in her form of the Magna Mater and several Mythos beings in the form of her son -- including Nyarlathotep, Yig, and Tsathoggua -- the cult's practices include the breeding, transformation, and occasional sacrifice of those under its rule. The three families also practice self-transformation; cult members sacrifice themselves to the Arbores (which are of course Dark Young of Shub-Niggurath) in a process that can result in the creation of a new life form, while other transformations can alter features and extend life. Such sacrifices usually come at the end of an orgiastic rite. The plans of the Pastores involve protecting their current holdings as well as proselytizing the cult faith across France.

The most prominent of these holdings is the fictional county of Begon, north of Toulouse; there, a member of the cult has been appointed its Bishop. Besides the monasteries and convents under its sway, the cult has a number of allies more knowledgeable about the Mythos. These include a pair of Serpent Men and a sorcerous coven lead by a Hyperborean wizard. As long as such allies accept the wisdom of the Pastores, the cult is happy to make use of their capabilities.

As a cult and an insidious threat, the Pastores is well presented. In addition the author explores possible connections

leading away from the Pastores. These include H.P. Lovecraft's short story "The Rats in the Walls" and the dark secrets of Exham Priory, as well as to [Delta Green: Countdown](#) via the Skoptsi, and to the works of Ramsey Campbell and Robert M. Price. Notably, Magna Mater worship lies at the heart of "Morituri Te Salutamus," one of two scenarios in the earlier monograph, [Cthulhu Invictus: Horror Role-Playing In Ancient Rome](#).

The investigators have the chance to face the cult in the five-part mini-campaign, which works in the classic onionskin fashion. Both cult and campaign have been designed so that it can be located and run anywhere in southern Europe or perhaps somewhere more historical than the fictional Begon county. It can also be used with or without the Order of St Jerome; if used, the Order can serve as either an ally, a patron, or a possible hindrance. Information on both the Order and France in the 10th century can be found in *The Abbey*. Also useful for running the campaign are [The Keeper's Companion](#) and *The Creature Companion*, but neither are essential.

[SPOILER ALERT!]

To get the campaign started, three possible patrons are given and discussed; any one of them could be willing to ask the player characters to find a missing messenger in "The Tree With White Fruit." Set in early 962, the party's search must be made along difficult roads hampered by a hotheaded companion and the threat of banditry. When discovered, the current resting place of the messenger will reveal the worship of a pagan idol and suggestions of further secrets. This first scenario is not overly challenging, best suited to inexperienced characters, though the Keeper could easily toughen it up. In "Sleipnir," the second scenario, the investigators are witness to the cult's military might, both ordinary and outré as an allied noble tries to escape the cult's patronage. This exposure also reveals the characters as a threat to the Pastores, who assign an ally to kill them in "The Hunt." If the investigators can survive this, their patron asks them to contact a potential ally in the fourth part, "The Singing Flesh Beasts of St. Simon." Assigned to an isolated monastery, the ally seems to be an all too willing participant in the strange atmosphere found there. This scenario suggests to the investigators how deep the cult's influence reaches, with more revealed in the last scenario "Begon." What starts as an extraction mission results in the party's capture and torture before they might be able to get away with the information that might spur the authorities to act against the Pastores.

[END SPOILER ALERT]

Overall, this is a reasonable mini-campaign, showcasing how a *Cthulhu Dark Ages* campaign can work. Yet it does feel all too short, and in need of expanding . . . not just of the sections dealing with Begon, but also North to Normandy and into Anglo-Saxon England to Exham Priory. Exham Priory is especially missed, since it's taken from the short story "The Rats in the Walls" and is a major influence. This is a decent snapshot of the cult, one that hints at much more. Further the end of the cult in Begon County is only slightly touched on, and nor does it really involve the investigators. Of course, all this and more could easily be addressed in a properly published and distributed edition. But considering that has yet to happen with any monograph released to date, how likely a possibility this is, only time and Chaosium can tell.

Physically, *The Pastores* is decently presented for a monograph. The writing is clear and the maps are nicely done, although there is no map of Begon County and its surrounding areas. It is illustrated, though only in an amateur style. This is not to say that the artwork is bad, more that it possesses a charm reminiscent of children's television animation - imagine [Noggin the Nog](#) meets the Mythos.

As the first campaign for *Cthulhu Dark Ages* this monograph proves that such a campaign is possible, serving to take the setting beyond the format of both the single scenario and the single threat. Thus it goes some way to fill a void that Chaosium has so far left empty. Despite needing expanding, or at least a sequel to follow up on its loose ends, *The Pastores: A Malefic Cult for Cthulhu Dark Ages* is the kind of support that *Cthulhu Dark Ages* should be getting.

--Matthew Pook

Hand of Clio's Nightmares

*"And in the fountain shall we gaze so long
Till the fresh taste be taken from that clearness,
And made a brine-pit with our bitter tears?
Or shall we cut away our hands, like thine?
Or shall we bite our tongues, and in dumb shows
Pass the remainder of our hateful days?
What shall we do? Let us, that have our tongues,
Plot some device of further misery,
To make us wonder'd at in time to come."
-- William Shakespeare, Titus Andronicus, III:i:132-140*

Once more, it's [Halloween time](#), when the hinges of events creak and sway in the cold winds of horror. Clio, the Muse of History, starts at every groan and click, checking the gates and the doorways obsessively. Tonight, she dreads the feel of cold fingers around her throat, the skittering of dead mens' nails against the windows, the sight of a bloody palm-print on the door sill. The moving finger writes, they say, and moves on -- but sometimes, the hand of time comes back . . .

"[Christopher Lee] will make [his] debut in the film as leader of the Dark Side. . . . He will be using a light saber in the shape of 'The Sword of Charlemagne,' his ancestors' sword. Coincidence or not, this saber will be at home in the experienced hands of Mr Lee"
-- "Admin," posting on Christopher Lee's website (Jan 7 2002)

959 A.D. It is a dark time for the Rebel Alliance. The forces of the undying Emperor Heinrich of Palatine are everywhere on the march. He has converted the Byzantine Trade Federation to his evil cult, and infused his venom into their cunning daimones and homonculi. The imperial Storm-Riders in their eerie bone-colored armor spread across Germany, subduing the independent barons, the hairy Wodewoses, the wise dwarves, and every elf or land-spirit of a thousand forests and rivers. The center of the resistance is Liudolf, trained in the lost arts of the ancient and holy Paladin Order, founded by Charlemagne decades ago in the time of the Old Confederation. Six years ago, he successfully rescued the Princess Adeleia from the hidden Astrum Mortis fortress at Ivrea, which he destroyed using the *fortis* granted by paladin training. But he did not manage to kill Ottokin, the Dark Paladin who serves as the Emperor's occult enforcer. Worse, this year Ottokin managed to trap Liudolf on the sky-city of Magonia, where he cut off Liudolf's hand in single combat with flaming swords. The subtle arts of the Byzantine doctors have grown Liudolf a new one, composed of mandrake flesh and whippoorwill bones -- but now, Liudolf finds himself ever more attracted to the dark powers of the *fortis* espoused by Ottokin -- his father.

This **GURPS Fantasy** setting is *almost* historical, although Himmler's patron saint Heinrich the Fowler makes a better Evil Emperor than Otto I, and the Magyar invasions would just confuse things, so I've diverted them. In their place, we have a veritable galaxy of dark fantasy, in which all magic except the pure paladin arts must partake of the demonic. (Perhaps one or two good golems might exist, built by rabbis from golden brass or lacquered ivory.) The GM can tune it toward dark, personal struggles against the temptations of the dark side, emphasize the overwhelming hordes of evil rebuilding the Astrum Mortis atop the Brenner Pass, or play up the dark fantasy *Black Company* style with military grimness alongside epic swordplay, holy visions, and sundry phantom menaces.

"John Sykes was close to Nelson on his left hand and he seemed more concerned with the Admiral's life than with his own . . . It was cut, thrust, fire and no load again -- we had no time for that. The Spaniards fought like devils . . . they appeared to know him and directed their particalar attack towards the officers. Twice Sykes saved him; and now he saw a blow descending that would have severed the head of Nelson. . . . He saw the danger; that moment expired and Nelson would have been a corpse: but Sykes saved him -- he interposed his own hand! We all saw it . . . and we gave in revenge one cheer and one tremendous rally. Eighteen of the Spaniards were killed and we boarded and carried her: there being not one man left on board who was not either dead or wounded."

-- from an eyewitness description of the Battle of Cadiz (1797)

Nobody listened, much, when rumors accused the French revolutionaries of burning the Crown of Thorns when they desecrated Sainte-Chapelle in 1792. Perhaps they should, because things that Crown had kept pinned down began to rise up. When Commodore Nelson lost a hand (and the ship's chronometer) to a kraken off Spain, the Admiralty took notice. Nelson, now sporting a hook, managed to harry Napoleon out of Egypt, but the canny Bonaparte eluded him near the island of Paxi in the Aegean. What Bonaparte learned in the Pyramids helped him summon up the ever-young horned god of that island, and the Revolution gained a great and powerful ally. The vines and trees whispered the mad propaganda of freedom and license across Europe, and tiny fairies no larger than a tinker's bell listened to secret conversations from London to St. Petersburg, and spread their golden dust where it would do the most good. Admiral Nelson leads the fight for reason and order on the sea, just as Prime Minister Pitt and Chancellor of the Exchequer Darling do in Whitehall, but when all nature has gone mad, what is to be done? The kraken now follows Nelson wherever he goes, leading the French and Spanish to him and making secrecy impossible. Perhaps a picked crew of heroes and scholars can penetrate the Mediterranean under Nelson's command, and seek out the island of Oupote, home to the fearsome, unaging lord of madness, the father of all the wild gods, Pater Pan.

This ***GURPS Age of Napoleon-Faeries*** crossover pits the British against a Napoleon suborned by the ancient god Pan, with strong overtones of Shub-Niggurath and similar "unholy nature" elementals. Think of Aubrey and Maturin in *The Birds* or Hornblower battling Deep Ones for other touchstones, but the main themes are order vs. chaos, technology vs. magic, and the tamed nature of oak ships and lead shot vs. the wild forces of the bestial world.

"It was their hands that built this city of ours, Father. But where do the hands belong in your scheme? In their proper place, the depths."

-- Freder and Joh Fredersen, *Metropolis* (Fritz Lang, 1927)

Heil Fredersen! All glory to the genius who single-handedly turned the tide of the War 10 years ago, in 1917! His brilliant tactics, and coldly efficient restructuring of the German economy, reversed the course of the war in the West before the Americans could land in force. With the fall of the Russian Empire, he was able to bring new armies of Slav workers into the Reich, to toil in the vast arms factories he caused to be built. His icy commitment to scientific progress put wonder-weapons in the air and undersea, forcing a peace on all Europe. When he replaced the Kaiser in a technocratic putsch in 1923, it seemed only logical to the people of Germany. Now, he is the master of Europe, ruling from the new Berlin, a glorious expression of all that is rational and pure.

Unbeknownst to most, however, Fredersen's new Berlin -- and indeed, many of the devices that first won his victories -- came from the mind of the scientist Dr. Rotwang. He invented the new explosives that destroyed whole Allied armies and fortresses, and the miraculous super-metal armor allowed the German soldier to shrug off machine guns and charge through no-man's land. He created the War-Wing, the Auto-Jet, and the Crystal-Shark, and the civilian successors that ply the skies, autobahns, and seas of Germany's empire. Rotwang is content to work out of sight, hiding away in tunnels and laboratories scattered across and beneath the metropolis of Berlin. Here, he has limitless access to metals, electricity, and chemicals -- and to Russian slave labor -- by the secret order of Fredersen. But Dr. Rotwang has a secret, too.

His right hand is mechanical, artificial, built after an accident in 1917 that also killed his wife, Hel. He does not miss his human hand much. In fact, it was only after he lost his hand that he gained his brilliant ideas, concepts so radical that it has taken him ten years to begin to realize them. In that time he has built many new hands, each more powerful and versatile than the last, all in the quest to create life and intelligence from steel and acids. He has sacrificed his sanity -- and countless slaves -- in his search for the secrets he glimpsed a decade ago, and he no longer knows how many hands he has built, or where they all are. Which is just how they wanted it.

The hands of Rotwang have awakened; they are an emergent hive intelligence that has burrowed into every circuit, every relay, every cog and wheel and telescreen in all of Berlin. Some hide in plain sight, in hospitals or on the wrists of veterans. Others lurk in conduits and elevator shafts, wired into the city and watching key junctions. From the ivory towers of the Master's Office to the seedy warrens of Yoshiwara (Berlin's newest district, dominated by gangsters from Germany's new ally Japan), they have tools or clients who get written or teletype messages and follow instructions

loyally. The hands have driven Rotwang mad, and use the wires in his wrist to control his mind, driving him to build devices to their specifications. Only Rotwang's obsession with recreating his wife Hel is outside their control, but they have used his dream of a gynroid to add robotized parts to almost all the vehicles and devices in the city -- and Germany exports more and more such vehicles and devices all across the world now.

This ***GURPS Cliffhangers-Cyberpunk*** frame presents any number of possibilities for PCs, from "street-level" punks, to Underground City Bolshevik-Christian activists among the slaves, to human gangsters threatened by the Hands' increasing control of the city, to scientists and engineers increasingly disillusioned by Frederesen's brave new world. You can add "dream running" adventures (surely Rotwang has dramatically improved Hans Berger's EEG, invented in 1920), telepathy, Moloch-worshiping vampires, or anything else that seems apropos, creepy, and Expressionist. Whatever the direction, the feel is paranoia and unfolding horror -- there are three layers of secrets between the average Hollerith hacker and the insidious hands of Dr. Rotwang.

Alaba The Serpent-Priestess

for *Nyambe* and *GURPS*

by Phil Masters

The woman known as Alaba was born the daughter of a minor merchant family in a fair-sized provincial town. A selfish, mean-spirited child, she mastered the trick of slipping away onto the streets of the town whenever her parents tried to deal with her bad behavior, making it impossible for them to keep her under any sort of control. However, while out of the house at such a time, she caught the eye of another adult, a nondescript, shabby wanderer, who saw some potential in the girl.

Unfortunately, this wanderer was a secret devotee of the dark power of Zombi the Serpent Lord. Alaba liked the idea of having more power than anyone who tried to control her, and studied the subject with enthusiasm, soon becoming an acolyte of the cult.

Her parents, thinking that her occasional disappearances and long hours spent alone were still merely signs of childish rebelliousness, were if anything relieved as she seemed to become less obviously wild, when in fact she was simply becoming more adept in the ways of secrecy. Shortly before she reached full adulthood, though, her father died of an entirely natural disease, and her mother resolved to marry the girl off before returning to her own family in a remote part of the countryside. Alaba sulked and pouted, but had no choice but to marry the middle-aged trader who her mother found for her.

Unfortunately for that trader, Alaba was by now a full priestess of the Serpent Lord, with a small but devoted secret congregation. While not especially capable, some of these followers were more than willing to serve her in any way they could, and Alaba gained access to assorted resources through them and her husband's money. And so it was that, while he was away on a trading trip, her husband fell ill and died of a sudden, rather unpleasant sickness.

Perhaps a few people suspected poison, and it was no secret that Alaba had no real love for her husband, but she was miles away, no one known to be connected with her was on the scene when her husband took ill, there was no evidence of witchcraft, and she showed some proper token signs of grief. Hence, anyone who might have ferreted out the truth shrugged, and Alaba settled down to the life of a merchant-widow, employing a fairly competent steward (actually one of the cult) to handle business matters. Over time, her shrewder neighbors noticed that her lack of commercial acumen was balanced by the small group of friends she acquired throughout the town, but this was merely seen as a matter of cleverness on her part.

Fairly recently, the dark power she worships granted Alaba the ability to reanimate the dead, and she has taken to this with enthusiasm, both to promote the cult and to further her personal ends. The latter may be her downfall, as a compulsive urge for revenge occasionally leads her to make mistakes. Still, her followers have managed to acquire her enough good bodies to reanimate without attracting any serious attention. Other Zombi cults in other towns are beginning to respect her accomplishments; one rewarded her (or sought to curry favor with her) by gifting her with an enchanted blade for use in sacrifices and in battle.

She has also long been working to establish connections with the merchants and leading figures of her home town, but few if any of them are really interested in taking up the worship of death and evil; at most, they're just ordinarily selfish, and willing to flirt with the messengers of this secretive power in the community in exchange for favors and petty advantages. But Alaba is far from stupid; before she lets anyone near finding out her identity, she makes sure that they're compromised enough that giving her away would mean signing their own death warrants. Still, if any of them annoyed her, she might send an undead assassin to deal with them, which would draw the presence and strength of her cult to the attention of the mass of the population and of the rulers.

Looking ahead, Alaba dreams of advancing into the higher mysteries of the Serpent Lord, which would give her more

refined powers. (In **Nyambe** game terms, she wants to gain levels in the Zombi Cultist Prestige Class; in **GURPS**, advanced initiation could give her some new advantages with the Pact limitation.) The snag is, the price of such power is that she'd have to slay someone she loves in order to reanimate them as undead -- and Alaba isn't entirely sure that there's anyone in the world who qualifies for this purpose. She finds this irritating.

(Of course, it's just possible that, say, a high-minded PC might get to know her without learning the full depth of her depravities, and might even try to use the power of love to persuade her to abandon the dark interests and savage inclinations which become obvious to everyone close to her. This could be very unfortunate for the high-minded lover.)

Alaba in Play

Alaba is, frankly, a minor but dangerous evil priestess in the classic pulpish mode. She is fully capable of crying out "Slay these interlopers, my undead minions!" with a completely straight face, and indeed *should* do so eventually, while pointing at a group of PCs with a look of primal rage disfiguring her face.

That said, she's a serious opponent for a low-to-middle level campaign, and PCs who fail to take her seriously enough should have a good chance of ending up as prey to the undead -- or, quite possibly, of joining her lurching minions. Exactly how formidable she is will depend as much as anything on the size and competence of the cult she's managed to acquire, and on the power of her undead "bodyguard"; remember, though, that if any of the latter are destroyed, but Alaba survives, she can always make more. Indeed, so long as she remains out of sight herself, she will tend to regard her undead as disposable weapons, to be hurled in waves at interfering heroes while she slips away from the scene. (She actually sees her living cultist minions much the same way, of course, but they're harder to replace.) Plots can revolve around her attempts to acquire bodies of superior quality to raise as further servants when she's expended a few too many undead on some scheme.

Alaba is detailed here for **Nyambe**, though she can easily be adapted for other **d20 System** settings ("n'anga" is simply a variant of the standard cleric class), while the **GURPS** version below assumes a fairly standard low-tech fantasy setting. With a little adjustment, Alaba could appear in all sorts of games, including '30s style pulp supernatural horror *Cliffhangers* campaigns. (The **GURPS** version could, for example, lose her Secret, replacing it with a few levels of reduced TL, to become the high priestess of some remote, hidden village where the inhabitants engage in dark and twisted rites spoken of only in whispers by their neighbors.)

Alaba in Nyambe

Female Tembu Human, 5th level N'anga

SZ M (humanoid); HP 34; Init +1 (Dex); Spd 30 ft.; AC 13 (+1 Sanguar, +1 Shield, +1 Dex); Atk +3 Melee (1d6+1/crit 19-20/x2 magic sickle); Face 5 ft. × 5 ft.; Reach 5 ft.; SA Rebuke Undead, Spells; SQ Aligned Spells; AL NE; SV Fort +5, Ref +2, Will +6; Str 8, Dex 12, Con 12, Int 11, Wis 15, Cha 13.

Skills: Concentration +5, Diplomacy +5, Knowledge (Arcana) +4, Knowledge (Religion) +4, Natural Medicine +4, Spellcraft +4.

Armor and Weapon Proficiencies: All Simple Weapons, Shields.

Feats: Brew Potion, Combat Casting, Sanguar, Toughness.

Languages: Kordo (Native).

Spells As a N'anga serving Zombi, Alaba's chosen domains are Death and Trickery. She typically has the following spells prepared:

0 Level -- Detect Magic ×2, Resistance ×3. 1st Level -- Bane, Cause Fear (Domain), Doom, Entropic Shield, Obscuring Mist. 2nd Level -- Death Knell, Desecrate, Hold Person, Invisibility (Domain). 3rd Level - Animate Dead, Animate Dead (Domain).

Equipment: +1 Keen Sickle, Supply of Lesser Zombi Powder (quantity at the DM's option), small wooden shield.

Alaba in *GURPS*

Alaba **141 points**

*Note: Some of the following character features come from **GURPS Magic**.*

ST 8 [-20]; **DX** 11 [20]; **IQ** 12 [40]; **HT** 11 [10]

Secondary Attributes: SM +0; Dmg 1d-3/1d-2; BL 13; HP 10 [4]; Will 13 [5]; Per 13 [5]; FP 12 [0]; Basic Speed 6 [5]; Basic Move 6 [0]; Dodge 9.

Social Background/Languages: TL 2* [0]; CF Homeland local/tribal [0]; Own Native Language Spoken (Native)/Written (Broken) [-2].

*Adjust level or points cost according to the campaign standard.

Advantages: Charisma 1 [5]; Comfortable Wealth [10]; Contact Group (Business skills, Effective Skill 12, Available Quite Often, Somewhat Reliable) [10]; Hard to Kill 2 [4]; Independent Income (Mercantile business interests) [5]; Luck [15]; Night Vision 3 [3]; Power Investiture 3 (Zombi the Serpent Lord) [30]; Reputation (+2, As a promising and effective cult leader, Among well-informed Zombi cultists in the region, All the time) [3]; Status 1 (Merchant family) [5].

Disadvantages: Bad Temper (12) [-10]; Bloodlust (9) [-15]; Bully (15) [-5]; Callous [-5]; Duty (To the Zombi cult; Quite rarely) [-2]; Odious Personal Habits (Minor temper flare-ups, -1) [-5]; Secret (Leader of a hidden undeath cult) [-30].

Quirks: Entirely vicious and self-centered sense of humor; Vengeful. [-2]

Skills: Acting-11 (IQ-1, A) [1]; Area Knowledge (Home Town)-13 (IQ+1, E) [2]; Brawling-12 (DX+1, E) [2]; Current Affairs (Home Area Regional)-12 (IQ, E) [1]; Diplomacy-13 (IQ+1, H) [8]; Esoteric Medicine-11 (Per-2, H) [1]; Garrote-11 (DX, E) [1]; Herb Lore-12 (IQ, VH) [8]; Housekeeping-12 (IQ, E) [1]; Knife-13 (DX+1, E) [2]; Leadership-12* (IQ-1, A) [1]; Occultism-12 (IQ, A) [2]; Poisons/TL2-11 [2]; Public Speaking-12* (IQ-1, A) [1]; Religious Ritual (Cult of Zombi)-12 (IQ, H) [4]; Savoir-Faire (High Society)-12 (IQ, E) [1]; Theology (Cult of Zombi)-11 (IQ-1, H) [2]; Urban Survival-12 (Per-1, A) [1].

* Includes +1 for Charisma.

Spells: Body of Shadow-12 [1]; Control Zombie-13 [1]; Fog-13 [1]; Mass Zombie-13 [2]; Pain-14 [2]; Reptile Control-13 [1]; Spasm-13 [1]; Steal Energy-13 [1]; Steal Vitality-13 [1]; Strike Numb-13 [1]; Turn Spirit-13 [1]; Zombie-14 [2]; Zombie Summoning-14 [2].

Personal Equipment: Fine Large Knife enchanted with Accuracy +2, Small Shield.

Designer's Notes

In Nomine Superiors: Lilith

by Elizabeth McCoy

Lilith has been many things to many people. Her possible origins include the wind-demon *lilitu*, the Sumerian demoness Lillake, Hebrew *layil* ("night"), the Greek Lamia (the Libyan queen deserted by Zeus) as well as the man-eating Lamiae -- who also insisted on being on top before they devoured their human victims . . .

It is, therefore, no wonder that the Lilith of *In Nomine* is an ever-changing creature, as hard to pin down to the page as her Word of Freedom suggests. She's the Bad Girl, the Seductress, the Femme Fatale -- and the only Princess in Hell who'd rather let even her enemies live, so long as they owe her. As a Divinely created human, she's potentially the ultimate stage of the species, with the power of a Superior. As a Princess of Hell, she's potentially the ultimate *fate* of humanity. Contradiction and contrariness define her nature, and ultimately, only the GM can decide whether Lilith is evil, ambiguous, or trapped by the follies of her youth.

As a sorceress and enigmatic being, Lilith can be used to ensnare mundane characters -- she can teach wonders to would-be magicians, and is more likely to require payment in this world than the next. And what modern mortal would think the concept of Freedom is *evil*?

As a Princess of Hell and human, Lilith can be petty. Slight her, thwart her, and she will find a way to work through agents and have her revenge. Homes repossessed, reputations ruined, jobs lost . . . Even better if the subject has to come crawling to some agent of hers and sink deep in debt just to survive.

As a wild woman and tragic figure, she can be the unlikely damsel in distress. Hints of empathy may show, along with suggestions of grief and regret. To rescue someone thought lost is an epic campaign. To rescue someone with the powers of a Superior, even more so. But pray that those are not crocodile tears.

Here are some ideas for adventures or entire campaigns; players should not consider them canon, but Game Masters have the Freedom to do whatever they wish . . .

Hung Upon the Double-Cross

Zerahiah, Seraph of Destiny, was placed on trial and found guilty of consorting with the Princess of Freedom. While he had meant to attempt to redeem her (as more than a few angels have tried), he had instead been ensnared in corporeality, forgetting his purpose and allegiances. Still, he had not become dissonant by nature or Word, and so his sentence was light -- to remain in Heaven two centuries, his Role and Earthly duties passed on to another.

Unfortunately, not two decades after his sentencing, Zerahiah has gone missing. His Heart is clouded, as Hearts often are in the presence of Superiors, but Yves says (in rare bluntness for that enigmatic soul) that Zerahiah is not in Lilith's *immediate* vicinity. Indeed, Yves is willing to tell would-be rescuers roughly where the wayward Seraph is!

And when they arrive at the nearly-forgotten mansion, can they persuade the Seraph to leave his apparent harem, whom he insists he's counseling to redemption? He's not dissonant -- at the moment -- but the motley batch of (attractive) Renegades he's preaching to don't look very redeemable. Still, even a Judge intent on sending Zerahiah back to his Heart the fast and Traumatic way can't afford to leave true redemption candidates behind unjustly.

Naturally, this is when the demons show up (the Game, the War, or Lust's Peine Forte et Dure (*Superiors 2: Pleasures of the Flesh*, p. 30)), gloating about the haul the Princess sold them.

Children of the Light

(This adventure seed does not draw upon actual canon in *In Nomine Superiors: Lilith* -- but it does extrapolate from certain aspects.)

The First Fallen's concubine has had a relationship with the Lightbringer that has lasted from the shores of the sea to at least the opening of Hell's gates. It's said that Lucifer first came to her as Seraph and Archangel . . . And perhaps it is true, for how else could a lineage of sorceresses, so clearly important to a Princess, remain free of the machinations of other Princes? (And why only *women*? Are the boys strangled at birth? Is parthenogenesis involved? Or is this simply a mystery of the Symphony?)

Not that PCs will know of that, until they come into the custody of a girl, mostly amnesiac after the (purely mundane) car wreck that has claimed the lives of her mother and aunt -- the only ones who might have known her other relatives or family friends, where she came from, or where they were going in such a hurry. Odd, that they weren't carrying any identification. Odder, though, that the young teenager already has seven Forces and command of Celestial Songs.

When Soldiers of God (or Hell, or both) come seeking her, it indicates *something* is up, of course. Now it will be up to the PCs to trace her scattered memories to her home, family, and coven, and hope that they're doing the right thing. Of course, if they *don't* return the child to her family, her so-many-times Great-Grandmother will move Heaven, Earth, and Hell to get her back -- and even mundane investigators won't be spared knowledge of the War.

The Night Demon

It is a peril, when one holds a Word, that the Word will be twisted by humanity. And if one's power-base requires the production of a special breed of demon, one cannot afford to seem weakened.

At least, that's the obvious reason why a selection of player characters have been charged, bribed, or geased to acquire as many children as they can, below the age of a year and a half -- and *not* warded by the names of Senoy, Sansenoy, and Semangelof -- and deliver them to the Princess at the dark of the moon, presumably so that their Forces may be recycled into Lilim.

Of course, it's also an unwise idea to leave witnesses to one's period of weakness. Perhaps competency and vows of secrecy will suffice. Perhaps more desperate payments will be required.

The B-Team

Lilith has a project in mind.

She has a team in mind for it.

The player characters are not that team.

However, the player characters *are* in position -- if they're clever -- to get the chosen team members in debt to them. (Whether or not hooks are involved depend on if there are Lilim PCs.) And *that* is their job. Do the right favors, bail out the targets, frame them so they can be bailed out, if necessary, and hand them over to the Princess. With a bow on top, if possible.

Of course, it's going to be interesting to acquire a Calabite of Fire, three Habbalah, an Impudite of Technology, a Renegade Balseraph of the Game with the Merciful Discord, and an Outcast Malakite of Flowers. They do have to be delivered alive, if not conscious.

Crossed, and Double-Hung?

Agents of the PCs' Prince(s) have received word that certain rogue elements (read: Renegades of their service) are in the player characters' territory. According to their informant -- a Lilim claiming to be discharging a Geas, and indeed a Geas did go "poof" afterward -- this lot of Renegades will be gathered together in a certain place at a certain time, ready for capture. Happy coincidence, the Renegades hardly outnumber the local demons at all! And most of them are 7 Forces, the size of new fledges. Easy glory, or at least easy clean-up before other Princes notice a group of organized Renegades.

And, indeed, there is a meeting of demons in the abandoned shell of a bankrupt store.

There's also a geased angel of Creation, frantically trying to convince the rogue demons about the glories of Heaven before they decide that they can get back into some Prince's good graces with a Divine sacrifice.

And then there's the Fire and Judgment angels, each independently tipped off via anonymous phone calls.

Finding a collection of ethereal spirits in the middle of a cage in the rafters -- about to be tipped open by a crude timer involving melting ice cubes -- might be overkill. Then again, it might not be.

And if it's a team of 16-Force Lilim who wind up rescuing everyone from the winners, one can be sure that the Geas-hook return was worth the investment.

Let's Twist Again, Like We Did Last Halloween

If there's one person who is associated with modern horror-suspense movies, it's M. Night Shyamalan. (There may well be another one, but I haven't been in the proximity of a nine-dollar tub of popcorn for a few months, so who knows what the directorial flavor of the month is nowadays. Heck, I may not even know the directorial flavor of the decade. In checking the [IMDB](#), I note that his breakthrough movie -- *The Sixth Sense* -- is so last millennium.) Anyway, as I was scrambling to come up with a topic on this -- my sixth Halloween-tied theme issue -- I've come to the conclusion that I know one thing that's unsatisfying to me about M. Night Shyamalan's movies . . . and, perhaps not surprisingly, it's a very similar thing that I find wrong with *The Twilight Zone*.

I was going to begin this column with the caveat that I haven't watched all the movies by the director in question. However, in consulting the aforementioned website, I note that I *have*, in fact, seen them all . . . or, at least, the four that are most closely tied to him. (To refresh your memory, that's *The Sixth Sense*, *Unbreakable*, *Signs*, and *The Village*.) Fortunately, some sense of normalcy returned to my life when I consoled myself by realizing that I haven't seen *everything* he's done. I haven't seen *Wide Awake*, which he directed, nor *Stuart Little*, which he wrote the screenplay for. However, given the writer's love of twist endings, it would not at all surprise me to learn that Stuart Little turns out to be Kaiser Soze.

And that's what we're talking about today, my friends -- the horrific potential of twist endings, and why they feel flat to me.

As an aside, I feel strange talking about Shyamalan's works without talking about the endings, although in general I'm usually loathe to talk about endings -- especially "twist" endings. So I'm going to try to be discreet, but consider this a blanket spoiler warning for the column. Oh, and it's also a retroactive spoiler warning for my Kaiser Soze reference above . . . unless you don't know what I'm talking about, in which case I assure you I'm not talking about any particular movie, and that's just a name I made up.

Anyway, quite possibly the biggest problem I have with many episodes of *The Twilight Zone* and Shyamalan's movies -- which I hadn't really cemented until talking about the protoidea for this column with my wife -- is that, for the most part, they end right when they begin. This advice was first presented to me by my late, great writing professor Dr. Jerome Stern, in his book *Making Shapely Fiction*. In his chapter "Don't Do This: A Short Guide to What Not to Do," he describes one of the stories one should not write:

The-Last-Line-Should-Be-The-First-Line Story: There's a story that keeps getting told, a kind of urban legend, about a shy little guy who falls in love with a mysterious, lovely woman. They plan to get married, and the man's office throws a bachelor party, get him drunk, take him to a brothel, push him into a room, where he finds . . . guess who?

Now the question is, where should this story begin? It's just a long lead-up to a nasty surprise ending. It could be interesting if its ending was its beginning. How would two people behave in this situation? Stories that lead up to revelations and odd situations really quit just when they should begin . . . As an opening, there is high tension, interest, and momentum -- readers want to know what happens next. As a conclusion, the revelation doesn't deal with the issue it raises.

Really, the same thing can apply to many of Shyamalan's movies, in my mind. In one movie the audience discovers that the entire situation has an unexpected architect. In at least half the movies, something is revealed that could change the outlooks of the "world" forever. Now what?

Of course, this quirk isn't limited to M. Night Shyamalan. For example, after having first seen it on video, my biggest complaint about *Stargate* was that it ended right when it should have begun -- okay, there's this working gate between two worlds, and it's raising very serious questions about the origins of humanity. Now what? (It turns out I was more correct than I could have imagined when *Stargate* spun off a few television shows; now, instead of wondering, "What happens next?" I find myself wondering, "When will the next *stop* happening?"

I've always felt there's something magical and special about *The Twilight Zone*. It's one of my favorite series, and its the archetypal example of the same basic formula that's used time and again in shows such as *Night Gallery*, *Outer Limits*, *Tales From the Dark Side*, and *Low Budget Tales of Cliched Horror*. But -- though I've wanted to, I've never figured out how to use this formula in an RPG. And I suspect it's because of this whole problem that the story ends right where the players would want to keep playing:

"Okay; you learn that this diner is actually hell, and the chef is the devil."

"Right. I hit him with a barstool."

"Errr . . . this is where you're supposed to cry pitiously for the camera, bemoaning your fate."

"Um . . . I think I'm going to stick with the 'barstool' plan."

The only RPG that I'm aware of that has tried to tap into this formula is West End Games' old *Tales from the Crypt* RPG. Unfortunately it's still sitting in one of the dusty boxes marked "BOOKS TO READ IN MY COPIOUS FREE TIME," so I haven't gotten to it yet. But I plan to, soon. Honest. However, judging by the scanty number of supplements that game produced, I can only assume it didn't exactly set the world on fire.

While it's been tempting for me in the past to use the "twist" ending, I've usually modified that to the twist middle or even twist beginning. That way, as the GM I get to react to the players' reactions, rather than merely having them react and have that be the end of the game. Because gaming is always about what happens next, and an answer of "Nothing; fade to black" is likely to end in a result that generates more fear for the GM from the players than the other way around.

--Steven Marsh

The Chosen of Yihdra

Powerful Servants of the Dream-Witch, for *Call of Cthulhu*

by J. Edward Tremlett

*"Don't think of this as death," the perfect man said, pulling his elongated fingers out of the bubbling, bloody ruin that was Harvey's best friend: "Think of this as . . . **conversion**."*

True to his word, the body changed as he walked towards Harvey. Thick green and red tendrils slowly pushed out of its gelatinous skin, creating a gnarled, meaty garden that dripped with fresh blood.

"Are you ready to meet the Maker, my son?" The perfect man asked, holding his bloody hands up to the sky.

Behind him, the tendrils burst into bloom, and each white flower's petals ringed a mad, staring eye -- eyes the same color as his still-living friend . . .

* * *

Not truly Avatars of the monstrous macroorganism known as Yihdra, the "Chosen" of the Outer God are Its eyes and hands on Earth. These genetically altered persons have been given a share of power in return for the insights their actions can give It, and allowed a measure of independent action -- for the moment, at least. And even if the Chosen are not aware of who It is, or what they have become, the Dream-Witch is watching, always . . .

The Chosen are a new Servitor Race for ***Call of Cthulhu***, and could be encountered in any time frame. Depending on their motives, and understanding of what they *really* are, the Chosen can be either minor curiosities or powerful adversaries. Wily Keepers should be able to imagine a number of uses for such beings, and further ideas are provided at the end of the article.

Information on Yihdra, and Its Children, can be found on page 53 of the ***Creature Companion***. One of Its more significant Avatars, "Madam Yi," is on page 32.

The Genesis of the Chosen

Like most of the Outer Gods, Yihdra is not an *entity* so much as It is a *force*. It is Evolution made flesh, existing only to adopt, adapt, and survive. And while It is much more intelligent than most of Its divine brethren, the Outer God is bereft of both creativity and a genuine personality, for the burning needs to survive and understand all life through meticulous study (and ravenous absorption) consume almost all of Its thoughts.

Yihdra is also stunted by a lack of creativity: It cannot envision anything It has not studied through absorption. It can create new life, and change what already exists to suit Its needs, but Its creations tend to be as simple as they are monstrous and grotesque. They are also very short lived, as, more often than not, It gives birth to these obscene wonders only to ingest them a moment later, to better understand what It has done.

These handicaps are considerable, and may account for why It remains an obscure entity, in spite of Its many Avatars. Most of Its actions are mapped out decades -- if not centuries -- in advance, and are not subject to change. It might alter Its plans in response to a direct, overwhelming threat to one need or the other, but many "smaller" things could go by while It focused on the larger picture. (Who knows how many of Its Cults burned while It focused on the immense wonders of a honeybee?)

However, the Dream-Witch has made a recent change of plan, due to Its recognition of a special quality of Mankind.

As a species, they are just another link in the chain of being, but they possess a creative intelligence that allows them to imagine things they have never seen, nor experienced. And it is this quality that has brought them near the top of the chain -- making them the dominant species of their world (for now . . .)

Once Yihdra realized this -- after countless centuries of observation and feeding -- It decided to alter some of Its long-range plans. It performed experiments among Its Children: human cultists who serve Its many forms, and are slowly changed to resemble their Avatar, however subtly. Over time, It was able to graft a significant measure of Its power into these previously-altered mortals without entirely subsuming their minds into Itself (which would have defeated the purpose).

The process became known as Elevation, and there was no shortage of volunteers. Once enough of the "Chosen" had been made, the process was perfected. And once enough perfect Chosen had been made, Yihdra rested, and allowed Its new servants to go out into the world, so that It might learn from their actions.

These creatures may have been "perfect," but the Chosen were still possessed of a frail, human mind. Some could not handle the power without going uselessly insane, forgetting their place in Its works, or setting themselves up as Gods and turning their backs on the Dream-Witch. These failures It eventually ingested, so as to learn from these mistakes.

But some of the Chosen maintained the balance between service, utility, and creativity, and these were allowed to go on. And to this day It watches these successful ones -- however languidly -- and visits them in shared dreams, so as to learn from their ideas.

Every so often one of the Chosen is Elevated a step further, so as to become a full Avatar of Yihdra. However, this is rare: Chosen will most likely serve as Priests to the Children, leaders of outside Cults or heralds of the Dream-Witch for a near-eternity.

An Alien Infection

After the Elevation of the initial, "perfect" Chosen, Yihdra stopped Its whole-scale experimentation on Its Children. However, It is known to generate more Chosen from time to time. This is mostly done to replace Chosen who have proven unworthy, and must be destroyed, but there are times when the Outer God Elevates a promising candidate to see what new insights he or It can bring to It. There are also "accidental" Elevations, which Yihdra tends to allow -- 9/10s of Evolution is accidental, after all . . .

There are now three ways to become Chosen.

Elevation

Yihdra can always Elevate one of Its Children, either in Its own, true form or through one of Its Avatars. The Elevation is accomplished by It in the same way It can warp and twist Its Children, whether they are nearby or far away. The Children like to think this is done as a reward for good work on Yihdra's behalf, but Its true reasons are often as alien as It is.

It prefers to Elevate within the context of an impressive ceremony -- one echoing the complex mating rituals of insects. At the climax of the ceremony, It will embrace Its Child and swallow him whole, so as to convert the Child within Its alien womb. And after nine days of incubation, Yihdra will give birth to the Chosen, much to the delight of Its minions. (1d8/1d20 SAN to be Chosen in this fashion.)

Infestation

Direct, flesh-to-flesh contact with Yihdra, one of Its Avatars, or another Chosen, may cause a portion of the Outer God's being to infect a human. If the infection comes from Yihdra or an Avatar, the mortal rolls his CON against Yihdra's POW of 60 to resist -- most likely a futile gesture. But if the mortal is infected by a Chosen, he instead pits

his POW against the Chosen's.

Those who resist feel a moment's discomfort as the infection is beaten, and they now have immunity against that Avatar or Chosen (there is no immunity against Yihdra in Its true form). Those who fail are infected, and will begin to manifest powers (and suffer visions) in a number of weeks equal to their POW minus 20. The period between will be filled with odd chills, fevers, and intestinal complaints that no doctor will be able to identify, and no amount of medicines will be able to cure. (No San lost until the Visions begin, and/or powers start to manifest.)

Gestation

Long before It made the Chosen, Yihdra's Children "seeded" random segments of humanity by mating with unaltered humans. Such offspring do not always become Children, but the "normal" babes still carry a recessive gene: one that, when dominant, grants a genetic predisposition towards the Outer God's control. Yihdra can spy on such persons at will -- no matter how far away -- and change or control them as It sees fit.

From time to time, two people who carry the recessive gene will mate, and their offspring will be "Seeds." These Seeds might still live their lives without ever coming into contact with the Dream-Witch, but if one of them encounters something directly related to Yihdra (witnessing an Avatar, discovering one of Its Cults, meeting the Children or the Chosen, or even reading one of Its names in a book) the portion of Yihdra within them may begin to germinate . . .

In times past, the Seed would be compelled by race memories to find the nearest Avatar, and become a Child of the God. However, now that Yihdra has instituted Its new plan, there is a chance that It will take notice of his investigations, and Elevate him on the spot. Then again, It might allow him to bumble forward, perhaps never to learn of his true heritage.

Mark of The Dream-Witch

The Chosen have a number of powers available to them, but not all Chosen are aware of what all they can do. Those who have been in direct contact with Yihdra or one of Its Avatars are usually given the full scope of their new powers, but those who are infected by the Chosen or have their genetic seed awakened, must discover these abilities one at a time. The visions they receive in dreams may provide clues, but it may take a successful Idea roll to prize any meaning from the grotesque flood of received images.

Upon Elevation, the effective POW of the Chosen is doubled. This increase is a gift from Yihdra, who is sharing a portion of Its power with the Chosen. However, the increase is more of a "reserve battery": should the Chosen spend enough MPs to get to one point below his old POW, all POW above it disappears, dropping him to his previous level. The increased POW will not come back until his full, natural POW is restored, either by natural regeneration or other means.

More importantly, the Chosen are effectively immortal, never aging past their day of Elevation, and never succumbing to sickness or disease. So long as they have enough MPs to heal themselves, they can take any amount of physical punishment. And so long as a single cell remains, Yihdra can fully reconstruct them -- should It choose to.

(Chosen must be careful of magical attacks, though: If the Investigators can remove enough of his MP or POW, Yihdra may release Its hold upon that Chosen, and take his powers with It. They can also be spiritually jailed through such spells as "Bind Soul" or "Imprison Mind," and Yihdra will not be able to take the Chosen's mind/soul to the nearest Avatar for rebirth when the body is destroyed. Keepers are in the clear to say what other Spells might disrupt the connection between the Outer God and Its servants.)

The Chosen also gain a number of other gifts from their God. These are not spells, per se -- rather special abilities that Yihdra makes available to Its notable servants, so It may learn from what they do. It can override, remove and replace any of these gifts that It cares to, should the need arise.

Telepathy: Chosen can hold mental "conversations" with anyone they can see, though this only fully works if they

share a language with the person they wish to communicate with. If they have no language in common, the conversation takes the form of images in each other's heads, which may require Idea rolls to comprehend. (1 MP per conversation to do this with normal humans; Free for Children, Chosen, Avatars or Yihdra Itself. 1/1d4 SAN the first few times this happens, for both parties)

Speak to the Animals: Chosen can speak to all earthly creatures with at least some intelligence (mammals, birds, fish, reptiles, etc.). This takes the form of images, and may require Idea rolls for both sides to comprehend. Note that Deep Ones, and other intelligent forms of life native to the Earth, would be spoken to using "Telepathy," instead.(1 MP per conversation. 1/1d3 SAN the first few times this happens)

Speak to Yihdra: Chosen can put themselves into telepathic contact with any Avatar of Yihdra they know of, or else Yihdra Itself. This can be done at any time, though some Avatars may be less than pleased to be disturbed, and speaking with Yihdra Itself is never a good idea. (2 MP per conversation that the Chosen initiates. For Avatars, Sanity cost is 1/half the Sanity for seeing the Avatar, if any, otherwise 1d5. For Yihdra, Itself, 1d5/1d50)

Detect Life: Chosen are made aware of all life -- plant, animal or alien -- within a number of yards equal to their effective POW, provided they stand still for a Round and think of nothing else. They can sense things they cannot yet see, but will not know what (or who) these things are unless they have used Detect Life on them before. (1 MP per scan. 1/1d3 the first few times they use it)

Rework Life: Much like their God, the Chosen can shape life to their desires -- healing, wounding or changing it as they will. They need only touch the skin of the subject, pit their POW against its CON, and then spend: 1 MP for each Hit Point they wish to give, or take; 1 MP for each physical Statistic they wish to give or take for 24 hours; or 3 MPs for each physical Statistic they wish to permanently give or take. Adding structures where there were none before, such as a wolf's claws on a human hand, either requires 1 MP to graft a fresh set of claws onto the hand, or 3 MPs to create them out of the hand.

Chosen can perform these Reworkings upon themselves, should they choose to, and in these cases the POW vs CON roll is not necessary: so long as they spend the MPs, it is successful.

The effects of successful Reworkings always "work," though they may not be very comely, efficient, or long-lasting. If the Chosen wants to Rework a subject with an eye on esthetics and long-term effects, Keepers should roll the Chosen's Biology, First Aid and/or Medicine to see if he can strike a balance between form and function. Without such rolls, the subjects may lose points from other Statistics (most often Appearance), and might even cost Sanity to see.

Reworking someone costs 1d3/1d6 SAN the first few times a Chosen does it, whether to himself or to others. Being Reworked costs between 1/1d4 for the willing cultist being "beautified" and 1d8/4d4 for a hapless victim being turned inside out.

Restore Life: Chosen can reanimate a human or animal corpse, so long as it's in good condition (perhaps requiring Rework Life to heal and de-putrefy). This requires the Chosen to pit his POW against the previous CON of the corpse, minus 2, and spend 5 MPs, plus 1 for each hit point he cares to gift the corpse.

The restored creature will live once more, but can never have more Hit Points than what the Chosen gifted it, unless the Chosen uses Rework Life to further heal it. The reanimated corpse will also be quite "off" -- sullen, non-communicative and behaving more like the Chosen that raised it than its old self. And if the Chosen should be permanently destroyed, any corpses he raised will momentarily follow him in death (Raising the dead costs 1d4/1d8 SAN the first few times it's done, and the corpse is charged 1d8/1d20 to come back to life.)

Curse of the Shrouded

The gifts Yihdra gives Its Chosen are powerful, but not free; They are Its instruments, to be used as It sees fit and then discarded -- or ingested -- when they serve no further use. Thanks to Its lack of direct concentration, most Chosen are not manipulated to the full extent that they could be, but the threat (or promise) of direct interference is constant. And

even Its partial interference leaves scars on both body and soul.

Odd Appearance: All Children who were Elevated retain the odd similarities to their Avatar. They can change this appearance, should they choose to, but this is often considered blasphemy, and only done in order to better infiltrate the outside world.

All other Chosen unconsciously Rework their own features, gradually changing themselves into what they *think* they look like, or would like to. As this change is not controlled -- most often happening in their sleep -- their normal appearance is always a little "off": their eyes may be too green, their skin too earthy, or their physique too perfect to be real. This costs no SAN to witness, but may decrease (or increase) APP by a point or two.

The Hunger: Much like their patron God, the Chosen are constantly hungry. If they don't eat a full meal's worth of food (cooked, raw, or still squirming) once every CON/3 hours, they lose 1 STR, 1 CON, and 1 DEX each hour until they've sated themselves. Lost Stats are regained in full following their meal.

Visions: The minds of the Chosen are telepathically linked to Yihdra, and they are able to tap into the mindscape created by Its Avatars. This can be consciously used to communicate with the Outer God ("Speak to Yihdra," above), but it has the side-effect of receiving Visions while asleep or unconscious. These Visions are Its memories, thoughts and plans -- endlessly pondered by a powerful, alien mind.

While dreaming, the Chosen must roll under their POW×5 in order to keep the Visions out of their dreams. If they fail, they are "treated" to a taste of Yihdra's maddening thoughts, and lose 1/1d4 SAN. Further, if they roll under their INT on percentile, they fully *understand* what they have seen, lose 1d3/1d8, and gain 1d4 Cthulhu Mythos.

Possession: At any time, for any reason, Yihdra can take control of Its Chosen and do what It will with them. Sometimes It will use them to speak or act on Its behalf, and sometimes It will use them to manifest one of Its Avatars -- or even Its own, truly indescribable form.

This usurpation costs It nothing, but will cost the Chosen anywhere from 1/1d6 to 1d8/1d20 Sanity, depending on what he has to witness. Those who are taken over by Avatars are sometimes Reworked back to their original form, sometimes left in a seeping, half-human state, and sometimes ingested from afar to feed the hunger of their God.

Insanity and the Chosen

It is almost impossible for the Chosen to be what they are and do what they do without going Indefinitely or Permanently Insane. How could a human -- however altered -- be mentally linked to the mind of an Outer God and remain sound and whole? Even with the distance Yihdra places between Itself and the Chosen, the "background noise" of the Visions almost guarantees mental ruin after a lifetime or two.

However, going horribly and terribly mad does not always equate with uselessness in the eyes of Yihdra. In fact, those who go BEYOND the bounds of mere sanity, and find a way to function without it, are extremely valuable to the Outer God. The insights such Chosen provide are sometimes the best ideas It receives.

So only those Chosen who completely break under the spell of the Dream-Witch -- becoming catatonic or stupefied -- are automatically ingested. Those whose insanity eventually stops them from generating useful insights will follow thereafter, but if they can come back from that precipice before It takes notice then It may spare them.

Then again, It may not.

Story Seeds

Having the cruel Mythos Sorcerer of the Scenario turn out to be a Chosen almost goes without saying, as it would expand the Investigators' worldview and create new Mythos challenges for them to solve. But there is so much more that can be done with them . . .

The Foe Who Would Not Die

A staple Mythos enemy is the cruel sorcerer who "dies" at the hand of an angry mob, decades or centuries ago, only to come back in the here and now. The Chosen present another way to accomplish this, only the rebirth will be nearly-instantaneous, courtesy of Yihdra's nearest Avatar. So the Investigators might think they've destroyed the Seekers of Xothra, only to have its Chosen Priest come back a week later at full power, with all memories of their last encounter intact, and a very nasty grudge . . .

The Miracleworker

Reports are coming in of someone special, out in a remote area. Perhaps this person can heal injured animals, have silent conversations with family members, heal the sick, or even raise the newly dead. They also say the miracleworker sees amazing visions (and prefer not to speak of the near-crippling hunger he has).

This person's amazing powers have attracted a cult of zealous followers, and they are not appreciative of "outsiders" poking their noses where they don't belong. Will the Investigators bring their house down around them when they reveal the true source of the miracleworker's power? Or will they leave well enough alone, and gamble the good being done against the possibility of the God's taking direct control . . . ?

Superspy of Yihdra

In an age of fingerprint and retinal scanners, biometric sensors and the like, a Chosen would be an ideal thief, spy, or saboteur. They can Rework themselves to assume the exact likenesses of others, and then go wherever those persons are allowed to go. Psychology rolls could be used to detect that the person's a little "off," but otherwise it's a perfect disguise.

What might a mercenary Chosen do with such powers, and how would the Investigators stop him? And even if they do, what's to stop Yihdra from ingesting the dead doppelganger from afar, and giving birth to him -- fully-formed -- somewhere else . . . ?

Framed by an Outer God

In the same vein as the "Superspy," what's to stop one of these creatures from impersonating an Investigator, or one of their friends or colleagues, to perform some otherwise-mundane criminal action? Even with a rock-solid alibi, such a frame-up would be almost impossible to completely disprove. And while this could be done to someone for any number of reasons, it makes for an especially underhanded form of revenge against the Investigators . . .

You Belong To Me

To bring the horror of the Mythos inside the party, have an Investigator be infected by Yihdra, or turn out to have been "seeded." If the poor fellow has never encountered one of the Chosen, or doesn't truly know what they can do, the visions and slow uncovering of Yihdra's gifts will add a creepy, personal angle to the Campaign. How will he tell his fellow adventurers that he's become possessed by one of the very things they're fighting . . . ?

This tactic is best used with one of your better players: one who can keep out-of-character secrets, and is willing to roleplay being the self-willed appendage of an Outer God. It could wind up being a lot of fun to have a "mole" in the party, but if the player starts taking undue advantage of the situation, and sees the powers more than the drawbacks, the Keeper always within rights to pull the plug -- most likely by having Yihdra take over . . .

Woodlands and Woodcutters

"I'm a Lumberjack and I'm Okay . . . "

by S.E. Mortimer

Introduction

It is difficult to overstate the importance of woodlands to low-tech communities. Many resources essential to their survival were directly or indirectly dependent upon the forest. Timber was used as fuel, for the manufacture of household items and tools, and for construction. The undergrowth was used as forage for pigs and cattle. Bark was collected for tanning leather. Resins and turpentine were extracted. Wild berries, nuts, mushrooms, and honey were collected to supplement the sometimes meagre diet. This work attempts to give some information to those who are interested in low-tech campaigns to help flesh out woodlands settings and give some insight into how woodcutters might live and work. Any **GURPS** rules endeavour to remain consistent with existing material in **Basic Set** and **Low-Tech** when possible.

The Forest

Disciple: "What is the forest of the King, and what is the reason for this name?"

Master: "The forest of the King is a safe lair for wild beasts; not of any kind of beast but of those of the woods only; not in any place whatsoever but only in certain places and in those suitable to the purpose; whence such a place is called a forest, the 'o' having been changed from 'e' as it was in 'feresta,' i.e., the place of wild beasts."

Disciple: "Is there a forest of the King in every county?"

Master: "No. But in wooded counties where there are lairs for wild beasts and forage in abundance; it is immaterial who owns the woods, whether the King or a noble, the wild beasts are safe and may roam at will anywhere."
-- Dialogue of the Exchequer (1177 A.D.), On Forests, Bk 1, C.12.

The Crown (via the local lord) usually claimed all rights to the woodlands in a demesne (and the wildlife therein) and granted licences and dispensations in return for feudal service or monetary compensation. "Forest" was a legal term, describing a wooded area subject to special Royal laws designed to protect the valuable resources of timber and game within its boundaries. These laws were strictly enforced by Crown employees. The Forester was in charge of the Crown's Forest and was sworn to attend upon the plants and animals ("vert and venison") within his "Bailiwick," to attack or arrest transgressors, and to bear witness against offenders in court. He had many assistants: agisters, rangers, wardens ("verderers"), bow-bearers, underkeepers, and underforesters. Penalties for infringing forestry laws were severe; the punishment for poaching could range from a fine or imprisonment to maiming, which might be loss of a hand, blinding, or even castration. Repeat offenders were sometimes executed. Outside the boundaries of the Forest, control was less strict, but often a Forest extended outside the woods to include heathland, meadows, and even some cultivated land.

In the Forest, commoners were usually permitted to collect deadwood for fuel

Coppicing

The word "coppice" comes from the French *couper*, "to cut." Coppicing is the art of cutting of trees and shrubs in such a way that allows vigorous regrowth and a sustainable supply of timber for future generations. Evidence of coppicing has apparently been dated to the Neolithic period. Coppiced trees and shrubs produce new saplings, which sprout from the base of the previously-cut plant (called "coppice stool"), that can sometimes grow over one foot per week. For most species, coppicing actually prolongs the plant's lifespan. Regular coppicing involves cutting all trees in a certain area but "standard coppicing" involves allowing a certain number of trees to grow to maturity. The amount varied, but in early 16th century England, regulations set this standard at a dozen

and to forage livestock (though sometimes licences were required even for these activities), but not to cut down trees or hunt game. In the village of Leafield near Wychwood Forest for example, the locals were only permitted to collect deadwood on Tuesdays and only so much as one man could carry. The saying "by hook or by crook" referred to the collection of deadwood: Fallen timber and brushwood would be cleared and collected using either a weeding hook or a shepherd's crook. Once each year, on Whitsunday, Leafield villagers were also permitted to hunt game in the Forest. There was a separate license for hunting small game called "warren." Some villagers were granted the right to "free warren" which meant that they were permitted to hunt rabbits, hares, foxes, cats, otters, martens, squirrels, etc. Sometimes "deer parks" were created within the Forest to make hunting easier for the nobility. These parks would consist of an area usually between one and two hundred acres (but became gradually smaller in later times) that was enclosed by banks and ditches topped with fences and hedges, thus trapping the deer within a controlled area.

Woodland Management

The "wood pasture" provided a largely subsistence-based local community with most of its requirements for fuel, building materials, food and forage. Typically there were more bad trees than there were usable ones in any given area of woodland. Reasons for this include previous logging activity ("high grading" involves taking only the best trees and moving on), invasive plant species, over grazing, pests, etc. Woodland management involves human intervention in the natural growth of a forest to increase the amount and quality of timber. Usually this management took the form of "coppicing" and "pollarding" (see textbox, right) to produce poles and laths for building. "Underwood" (twigs, brushwood, etc) was collected and used for domestic fuel. Sometimes cleared land that was deemed unsuitable for agriculture was replanted with quality species to improve the timber yield of a particular landholding.

The Woodcutter

Also called a "feller," the woodcutter lived on the fringe of medieval village society. He spent most of his life in the forest chopping wood for the local lord or working in conjunction with sawyers or charcoal burners ("wood colliers"). Villagers viewed anyone who lived outside the "civilized" borders of village, town, and castle with deep suspicion. The woodcutter had the double social disadvantages of living in the wild *and* being poor. There are many folk tales associating the woodcutter with symbols of both poverty and the "dangerous wilderness." Even in more modern times the woodcutter, or "logger," was considered to be rude and uncouth by townsfolk. Loggers were wild, boisterous, and rowdy. They lived deep in the woods for months at a time in logging camps where the work was long, hard, and dangerous. They evolved into a breed of men that, even today, symbolises strength, virility, and masculinity.

Because of the nature of his work, the woodcutter rarely lived in a fixed abode for any length of time. Many set up temporary shelters on the edge of the woods and moved on when the best trees had been harvested. In areas that contained dangerous wildlife, the shelters could be constructed in trees. For example, today in Bangladesh, woodcutter's shelters are constructed eight to 10 feet above the ground to reduce the likelihood of tiger attacks. Sometimes the woodcutter's entire family would travel with him, while other times he would leave them behind in the family home.

trees per acre of coppice.

Pollarding was similar to coppicing except that the new shoots were encouraged to grow horizontally rather than vertically. With coppicing, the tree is cut down low near ground level, but with pollarding, the tree was cut at a height of around six to eight feet. This was useful in areas where growth from the ground upwards was less desirable such as in woodland pastures. Pollarding permitted more of the ground to be used for grazing.

The poles of saplings were harvested for light carpentry work, fencing, basketwork, and fuel (firewood and charcoal). A stand of coppice (called a *copse*) was usually demarcated by an earthen bank, sometimes topped by a hedge. These were erected mainly to prevent grazing animals from destroying new growth. Occasionally, dry stone walls were constructed. Each copse typically covered an area anywhere from 12 to 50 acres.

Wood Stacking

Another occupation is that of "woodstacker." Although originally both cutting and stacking of timber would have been done by the same person, by the fourteenth century in

The medieval woodcutter and his family would be involved in the following activities: felling trees, coppicing and pollarding, uprooting unsuitable plants and preparing a glade for future use, bundling underwood into fagots (called "fagotting") for sale as domestic fuel, collecting suitable barks for the leather tanners, and making small amounts of charcoal for personal use. He might also work in sawpits or sawmills. Occasionally he would be called upon by his Lord to perform a specific task, such as providing material for a castle, manor house, mill, bridge, etc. Hazards of the job include being hit by falling branches or the whole tree; injuring oneself with the axe; forest fires; being attacked by poachers, bandits, or wild animals, plus any number of natural hazards that anyone travelling or camping in woodlands would face.

London, the occupations became so specialised that the Woodcutters' Guild was kept rigidly separate from the Woodstackers' Guild. These guilds fiercely guarded their spheres of influence and demarcation disputes were handled by a guild-court.

Fuel

Only a very small amount of harvested timber was used by the craftsman. The vast majority was consumed as fuel (firewood and charcoal). There is an old saying -- firewood warms you three times: once when you cut it; once when you carry it; and once when you burn it. In cooler climates it has been estimated that a cottager's family required between one quarter and one half an acre of 20-year-old coppice wood (six to 12 cords) for heating each year. If the wood needs 20 years to regrow then each family required between 5 and 10 acres of woodland for a constant supply of fuel (modern wood heaters are much more efficient, usually requiring less than one cord per year). According to **Low-Tech** (p.LT39) freshly cut (green) hardwood contains 30% water and has an energy content of about 7,000 kilowatt-seconds (kWs) per pound. After seasoning, its water content drops to 15% and its energy output increases to 8,200 kWs per pound. Coniferous woods contain 40% water and 7,500 kWs per pound when green and 10,000kWs per pound when seasoned.

Fagot: A "fagot" or "bavin" of firewood is a bundle of timber roughly six feet by three feet by three feet, or 54 cubic feet. It usually consists of "deadwood," such as brush and twigs, rather than felled trees and sawed branches. A fagot might contain 20-25 cubic feet of solid wood. Two fagots of brushwood could bake thirty loaves of bread, or fire three terracotta bricks, or provide warmth for a small, one-room cottage for a week or so.

Cord: A "cord" is the traditional volume used to measure firewood. It is a stack roughly eight feet by four feet by four feet, or 128 cubic feet. This stack contains an average of about 80 cubic feet of solid wood. An acre of 20-25 year old native trees produces approximately 20-25 cords of wood. Managed pine plantations can produce more than double this amount. An average woodcutter could cut two cords of wood per day. An experienced woodcutter could cut three cords.

White coal: This is timber that has had its bark stripped and then dried in a kiln (but not rendered into charcoal) for use as fuel. Some industries that made use of white coal included ceramic, glass, and lead smelting. White coal burned hotter than regular timber but cooler than charcoal and so was unsuitable for industries such as iron smelting, smithing, and so on. An upcoming article will go into more detail about the use of charcoal.

Prices

The price of firewood varied greatly depending on season, availability, distance to source, etc. In England, between 1250 and 1350, a cord of firewood varied between 6 and 12 shillings, but 8 shillings is a reasonable average cost. For comparison, [Tilting at Windmills](#) states that a bushel of wheat costs 1.5 shillings (18 pence) during the same period or \$30 (**GURPS**). A cord of firewood would therefore cost \$160 or about \$70 per fagot. A years' worth (6-12 cords) of firewood would cost between \$1,000 and \$2,000. Heating one's home was an expensive proposition if you didn't have free access to deadwood in nearby woodlands. The incentive to circumvent the Lord's regulations on collecting firewood would have been great.

New Skill: Lumberjack (ST/Easy) (defaults to Carpentry -2).

In order to prevent an unnecessary plethora of skills that are closely related, a single Professional skill will be created to handle all related occupations. Lumberjack (*ST/Easy*) will be the skill used to acquire and process timber. Carpentry (p.183) will be reserved for working with wood that has been prepared with the Lumberjack skill. This skill involves managing the woodland through various techniques including coppicing; knowing which trees would be suitable for felling; knowing the most efficient way of felling these trees and which tools to use; the physical act of felling the tree; care and maintenance of timber-felling and sawing tools; and operating a sawpit or a sawmill. Some maneuvers would be based on other attributes besides ST. For example, Per might be used to select suitable trees for felling, and DX might be used to repair a tool (though the Smith skill would be needed for major repairs).

The **GURPSnet** Archives has a document about [Architecture](#) written by Matt Riggsby and his suggestions are worth repeating here:

A team of foresters with axes and saws can harvest 3 x ST cubic yards of simple logs and rough beams per day. For example, a man with a ST of 10 can produce 30 cy per day. Softwoods weigh 800 to 1,000 pounds per cubic yard. Hardwoods weigh 1,200 to 1,500 pounds per cubic yard.

It is required that at least one man in 10 has Survival (Woodlands) at 12+. If not, someone must default it (IQ-5, Naturalist-3). One Survival roll must be made per day (see pp.B223-24). A successful roll allows the full amount of lumber to be harvested. A failed roll halves this amount and a random member of the team takes 1d of injury. A critical success increases the day's harvest by 20%. A critical failure halts production for the day and one member of the team is injured for 2d damage.

If a character has the Lumberjack skill at expert level (14+) then he might increase his daily production to 4 x ST since he works more efficiently than less experienced woodcutters (he often has a higher ST too). The Lumberjack skill may also be substituted for Survival in some situations (GM's decision).

Low-Tech has rules for felling trees with stone age tools (TL0) on p.LT16.

Sawpits

Sawyers or "board hewers" selected the best of the logs to cut up into planks and beams to be jointed by carpenters. In a managed woodland, the timber was often sawn on site, and today, the remains of sawpits can sometimes be identified as depressions, often near a major track or a convenient waterway. Sawtimber logs must not contain too many defects such as decay, scars, bulges, bark distortions, holes, branch stubs, and crookedness. The logs were slung over pits to allow one sawyer to get underneath the tree while his sawing partner stood on the log above. A common occupational hazard was conjunctivitis caused by sawdust falling into the eyes. Respiratory diseases were also common. Sawdust is also a fire hazard and fine sawdust can explode if enclosed.

Mr. Riggsby's rules again seem reasonable and are repeated here:

Once the timber has been harvested, carpenters are required to shape it into boards. Carpenters can produce an average of one square yard of board per man point of Carpentry skill per day. The exact volume of wood depends on the thickness of the boards (cutting thick boards doesn't take more time but it requires more trees to be cut to produce a given area of wood). Carpentry skill is at an effective -1 for every half-inch of thickness beyond the first and -3 for working with hardwoods. All members of the team should have Carpentry at 12+. Water- and wind-powered sawmills, which become available late in TL3, can double production rates.

Timber Weight

This table approximates the weight per cord of timber depending on tree species.

Species	Green	Seasoned
Ash	4,000 lbs	3,400 lbs
Cedar, red	3,200 lbs	2,700 lbs
Elder, box	3,500 lbs	2,500 lbs
Elm	4,400 lbs	3,000 lbs
Hickory	5,000 lbs	4,200 lbs
Maple, sugar	4,400 lbs	3,500 lbs
Oak	5,000 lbs	3,800 lbs
Pine, shortleaf	4,100 lbs	2,700 lbs
Walnut, black	4,600 lbs	3,200 lbs

The GM may place arbitrary limits on the maximum length of cut boards. Major construction projects were occasionally delayed as the result of a search for large enough trees to produce the required beams, and extremely long lumber was often imported from distant forests.

It is suggested that the newly proposed Lumberjack skill could be substituted for Carpentry for those working in sawpits and sawmills.

Construction

A constant source of timber for building construction was very important. Each new house would require logs from over a dozen oak trees. A new church might require the timber from 300 to 400 trees. Mr. Riggsby's article goes into building construction in great detail and there is no point repeating it here.

Equipment

Axes: The single-bit axe is safer for inexperienced woodcutters to use because it only has one cutting edge. Experienced woodcutters usually use a double-bit axe, which has two cutting edges. **Low-Tech** (p.LT35) states that a bronze axe will enable a 1 foot oak to be felled in 20 minutes. An iron axe enables a 1 foot oak to be felled in 15 minutes (p.LT59). Experienced woodcutters could fell trees even faster. Weight 5-20 lbs. Cost: \$50-\$70 (p.LT55).

Saws: Used for removing branches and shaping planks and beams. **Low-Tech** (p.LT55) states that the notion of bending alternate saw teeth left and right was not developed till the end of the Bronze Age. A two-man saw weighs 5 lbs and costs \$10.

Scaling Equipment: Ropes and tree climbing spikes and slings are also required. These are covered in [Scaling the Heights."](#)

Transportation: Equipment for moving the timber is necessary. Sledges or wagons would be pulled by teams of oxen. Alternatively, logs could be floated down a nearby river. The difficulty involved in moving logs by land meant that the timber was often processed on-site as much as possible.

Roleplaying Suggestions

- The heroes are traveling through the woods and come across the local lord who is hunting game with a small party of nobles. The party has unwittingly wandered from the common woods into the Lord's Forest and all hunting and woodcutting is illegal here without the appropriate licences. The Lord's Forester is present and he approaches the party to inspect their belongings. If there is any evidence of poaching or illegal wood harvesting, they had better produce the correct paperwork, or have someone who is very skilled at Fast Talk.
- The PCs have been hired by the local Forester to apprehend some particularly troublesome poachers. They can either attempt to track the offenders, or they could find an area frequented by game and patiently wait in hiding for the poachers to come by. The "ghillie suit" made famous by modern sniper movies was originally created by Scottish gamekeepers ("ghillies") to help them catch poachers. See [The Art of Camouflage](#) for more detail.
- The party is camping in the local forest and enjoying a late afternoon meal by the campfire. They spot three men with spears and bows. The largest of the three is carrying a deer carcass across his shoulders. These men are poachers. Since the PCs have seen them, the poachers decide to stop them from informing the authorities. The deer will be dropped and the poachers will dash to cover. The stealthiest of the trio will circle around to try and stop the PCs from fleeing while the other two pin the PCs down with arrows. Then they will move in . . .
- There was a legal requirement for all hounds greater than a certain size to have their claws extracted, so they didn't injure the forest game. This was called "lawing." If any of the PCs owns a hound or mastiff and hasn't had it declawed, then he will face court and a fine. If the court official finds the PC offensive, or if the local Lord expresses an interest in the PC's hound, the animal could be confiscated. If this hound actually injures or kills any game in the forest then there will be very serious consequences. The owner of the dog will face the same

penalty that a poacher would face (heavy fine, maiming, etc.)

- While the party is traveling through the woods, a small boy runs up to the PCs. He is out of breath and pants that his father, a local woodcutter, is hurt. A tree has fallen and pinned him underneath. The tree is too heavy to lift without some sort of mechanical assistance. If the PCs manage to rescue him, he will need medical attention.
- January is known as "Wolf Month." Wolf packs driven by snow and cold can come closer to human settlements. Food is scarce at this time of the year and some wolves overcome their natural fear of man to enter villages and carry off livestock or even small children. Medieval accounts even report grown men and their horses being attacked by wolves as they traveled through the forest.

Remember, Remember!

*"Remember, remember,
The Fifth of November,
Gunpowder, Treason, and Plot.
I see no reason why gunpowder treason
Should ever be forgot."*

-- traditional English song

Four hundred years ago Saturday, the world almost ended. Or not. Some see an embarrassing fizzle of decayed gunpowder and outmoded belief; others see the hand of Satan struck down by a Protestant God. Still others see a conspiracy to falsify a conspiracy, or an excuse to set fires and riot in memory of law and kings. What do we see, our eyes dazzled by the firelight, as we seek out the burning figure atop the bonfire? A spark, at least.

"This last Night the Upper House of Parliament was searched by Sir Tho. Knevelt, and one Johnson, Servant to Mr Thomas Percy was there apprehended who had placed 36 Barrells of Gunpowder in the Vault under the House with a Purpose to blow the King and the whole company, when they should there assemble. Afterwards diverse other Gentlemen were discovered to be of the Plot."

-- entry in the journal of the House of Commons, November 5, 1605

That terse entry, an early contender for "stiffest of stiff upper lips," makes an excellent summary of the Gunpowder Plot, with the exception that it records "one Johnson" as the man apprehended in the cellar beneath the House of Lords. Interrogation rapidly stripped that alias away, and he was revealed as one Guido "Guy" Fawkes, a soldier of wide experience. He was the hard man, the explosives expert brought into the Plot by its ringleader Robert Catesby, to make sure the job got done. Fawkes and Catesby, and the other eleven conspirators, were all Catholics, frustrated both by the continuing proscription of their faith by the Anglican authorities in England and by the "flaccidity" of Henry Garnet, the Jesuit superior of England and theoretical head of the Catholic underground.

Garnet preached Christlike "passive resistance" to Anglican injustice; Catesby (who had earlier done time for his part in the Earl of Essex' botched rebellion) preferred revolution. One of the Plotters, Thomas Percy, rented a cellar underneath the House of Lords, which Fawkes stocked with 36 barrels -- around two and a half tons -- of gunpowder. With his circle, he planned to blow up the Houses of Parliament during the Royal Opening of Parliament on November 5, killing King James I, Crown Prince Henry, and virtually the entire Anglican ruling class at one blow. Along with a number of Catholic peers of the realm, of course, but Catesby could live with that. Not so Catesby's co-conspirator Francis Tresham, whose Catholic brother-in-law, Lord Monteagle, was one of the Lords scheduled to attend the Opening. Tresham wrote a "dark and dubious" letter to Lord Monteagle, hinting broadly at the "terrible blow" destined for Parliament, and suggesting that his Lordship might want to absent himself from the Opening. Instead, on October 26, Lord Monteagle turned the letter over to Lord Salisbury, perhaps better known as Robert Cecil, the head of James I's secret service. Who did nothing for ten days.

"[O]ur Adversaries . . . do endeavor (with a strange Confidence, to give it no worse name) to persuade Men to believe, That the Gun-powder Conspiracy was no Popish Plot, but Cecil's Contrivance. One of their late Scribblers says indeed, That it was A HORRID PLOT; but adds, That it was suspected, to BE POLITICKLY CONTRIVED BY CECIL. And then afterwards, towards the end of that Popish Calendar or Almanack, he more confidently saith, That the Gunpowder Treason, was MORE THEN SUSPECTED, TO BE THE CONTRIVANCE OF CECIL, the great Politician, to RENDER CATHOLIKES ODIIOUS."

-- Thomas Barlow, Bishop of Lincoln, from his Preface to the 1679 edition of *The Gun Powder Plot: The King's Book*

Cecil's inaction renders a murky situation virtually opaque. By his own account, he forebore to warn the King, but did alert the Privy Council. But by any reading, he waited until almost the last minute, the early hours of November 5, before taking concrete action, ordering a search of the cellars below Parliament. (According to King James' own, admittedly immodest, account, it was only after the King ordered a search that one finally occurred.) And sure enough, the Beefeaters found Guy Fawkes literally holding a slow match over 36 barrels of gunpowder. Under torture (illegal at

the time unless specially ordered by the Crown -- which it was), Fawkes named his co-conspirators, who had fled London on the news of his capture. Incredibly, Catesby still tried to rally the Midlands to the Catholic cause, claiming that Parliament and the King were really dead. After nearly blowing *himself* up (while trying to dry his would-be rebellion's gunpowder stores by the fire), Catesby and three fellows died in a shoot-out on November 8. The informer Francis Tresham died, conveniently if mysteriously, in the Tower on December 23; the other eight Plotters were hung, drawn, and quartered in two batches on January 30 and 31, 1606.

Even at the time, the conspiracy theorists went to work on the case, many of them with royal sanction arguing that the whole Plot was the brainchild of the Jesuits, especially the "equivocator" Henry Garnet. Garnet knew of the Plot, but maintained at his trial that he had heard of it under the seal of the confessional. He was not helped by his extensive contacts with all the Plotters, or by the doctrine promoted by some Jesuits that regicide was justified if the king oppressed Catholics. Garnet was hanged on May 3, 1606. On the other front, there were those (especially Catholics) who argued that the whole thing was a put-up job by Cecil, who either allowed the Plot to go forward in order to get an excuse to really clamp down on Catholics, or who actively instigated it through his wily agent provocateur Thomas Percy, and used Catesby and Fawkes as dupes. Some even whispered that Percy, or Tresham, or both, had faked their deaths and been given new lives and cover identities in Spain. Still others argue that Cecil created the Plot sincerely, intending to make himself dictator in the panic following the blast; his brother-in-law Henry Brooke had been implicated in two other plots against James I, after all. An extreme case, that the whole Plot never existed at all but was fabricated entirely by Cecil using double agents and actors (all killed afterward to silence them), has been made (if not particularly convincingly) most recently by one Francis Edwards, who as it happens is a Jesuit priest.

"The night has been unruly: where we lay,
Our chimneys were blown down; and, as they say,
Lamentings heard i' the air;
strange screams of death, And prophesying with accents terrible
Of dire combustion and confused events
New hatch'd to the woeful time." -- William Shakespeare, Macbeth, II:iii:54-59

And even the powder trails leading off the historical track are tangled and confused. According to the official inventory, the powder under Fawkes' match was "decayed," which has led many historians to argue that it would not have detonated even if Lord Monteagle had skipped town. (This would help explain why Cecil was so relaxed about two tons of gunpowder under his sovereign.) However, an experiment performed by ITV in 2005 (and studies in 2003 by the University of Wales) indicate that even "decayed" powder, confined in barrels, would have detonated spectacularly, destroying everything within 100 yards and breaking windows up to two thirds of a mile away. Surely, one imagines, an experienced artilleryman like Guy Fawkes could be trusted to successfully detonate some portion of the mine, "decayed" or not.

The Plotters had planned to kidnap the nine-year-old Princess Elizabeth and make her Queen, marrying her to a local Catholic noble to create a Catholic dynasty. If their coup had succeeded, one might see a surly, rebellious Presbyterian Scotland (complete with a bomb-planting terrorist SRA) resist the autocratic Catholic United Kingdom of England and Ireland down to the modern day. America might have become an independent Protestant country (perhaps even a kingdom under the fugitive four-year-old Prince Charles, if he escaped the Plotters in 1605) populated by Puritans and increasingly distressed Anglicans and Huguenots. On the other hand, it is far likelier that a successful Powder Treason atrocity would have brought forth the whirlwind. A Cecilite reign of terror and ethnic cleansing against the fearful Catholic population of both England and Ireland would be popular and led by a fanatically Protestant Queen Elizabeth II aching for vengeance against her slaughtered family, resulting in a centralized Protestant monarchy on the model of Prussia. Two roads to tyranny, both avoided by a few hours and a nervous brother-in-law. No wonder the British celebrate.

*"So then they put poor Guy to death, for ages to remember,
And boys now kill him once a-year, in dreary, dark November;
That is -- I mean his effigy, for truth is strong and steady --
Poor Guy they cannot kill again, because he's dead already."*
-- Anonymous, "The Guy Fawkes Song" (ca. 1830)

Guy Fawkes Day is the only great holiday celebrating something that *didn't* happen, and it's quintessentially British in that respect, and also in its astonishing resilience. The celebration of Guy Fawkes Day began as a feast of religious

obligation -- good Anglicans went to church on November 5, 1606 (and for many years thereafter) to thank God for His miraculous deliverance of King James. Although it took off slowly, it soon became a perfect holiday of [bisociation](#); those opposed to Charles I's increasingly Catholic tendencies could light the bonfires and burn the Pope in effigy, while those who loved him could praise God for delivering his father from the fire. Rather than suppress it, Cromwell encouraged Guy Fawkes Day as a celebration of Parliamentary rule. As the only holiday left on the calendar by the Puritan Revolution, Guy Fawkes Day really took off -- but when the Stuarts came back under Charles II, Gunpowder Treason Day was once more a day to thank God for the Stuarts. And when William of Orange chased off the Stuarts, the bonfires were lit to praise God for delivering England from James II. The Hanoverians tried to ignore it out of existence, but "bonfire societies" composed of men in coal-blackened faces lit the fires and burnt the Guy in effigy, until the Victorians' obsession with tradition restored the holiday to the official calendar. With tradition once more a dirty word to swank post-moderns, Guy Fawkes' antinomian attitudes are invoked by lighting a giant fire in the town square, and authority figures such as Margaret Thatcher and Tony Blair are burnt in effigy to celebrate the continuance of divinely guided rule.

"In the popular customs connected with the fire-festivals of Europe there are certain features which appear to point to a former practice of human sacrifice. We have seen reasons for believing that in Europe living persons have often acted as representatives of the [gods] . . . There is no reason, therefore, why they should not have been burned, if any special advantages were likely to be attained by putting them to death in that way. . . . Now, in the fire-festivals which we are discussing, the pretence of burning people is sometimes carried so far that it seems reasonable to regard it as a mitigated survival of an older custom of actually burning them. . . . this suggests a doubt whether the Celts . . . also may not have celebrated their principal rites of fire, including their burnt sacrifices of men and animals, at . . . the beginning of November . . . "

-- Sir James George Frazer, *The Golden Bough*

Tossing effigies onto bonfires in Britain does, it seems, predate Guy Fawkes' arrest. On Accession Day, November 17, during Queen Elizabeth I's reign, it was customary to burn the Pope in effigy, and much Victorian ink has been spilled on the odd similarities between Samhain bonfires, in which a [scarecrow](#) or corn-dolly might be burnt on October 31, and the burning of Guy Fawkes in effigy just five nights later in modern Britain. Interestingly enough, November 5 can be seen as a truer Samhain, and a better "hinge of the year" than October 31. Guy Fawkes Day is, as it happens, exactly equidistant between fall and winter, being 45 days from both the autumnal equinox (September 21) and the winter solstice (December 21). The Hopi "new fire" ceremony Wuwuchim, and the Hindu festival of lights, Diwali, both usually fall closer to Guy Fawkes Day than they do Halloween; both are "movable feasts" dependent on the moon and stars.

As, it turns out, was Guy Fawkes Day. Because the "Fifth of November" was, to Guy Fawkes and all good Catholics -- and since 1752 to everyone in the Western world -- November 15. In 1605, England was still on the Julian calendar, while Catholic Europe rejoiced in Gregorian splendor ten days in the future. And on November 15, we find the tremendously interesting and instructive Roman festival, Feronia, about which very little is known except that it involved fire, feasting, music, singing, and public drunkenness. The fire goddess Feronia is also known as Saturnia, a female aspect of Saturn, god of time and agriculture. Interestingly, "Gaius" is the male form of "Gaia," which would make "Gaius" Fawkes an aspect of Saturn to the fire's Feronia. It gets even better, of course. The original date for the Gunpowder Treason was October 3, 1605, when King James I was originally scheduled to open Parliament. (He postponed it for a month due to lingering bubonic plague in the city.) And October 3 is neatly bracketed between a solar eclipse on October 2, 1605, and the Jejunium Cereris on October 4, another Roman fertility festival created by the order of the Sibyls in 191 B.C. to placate the goddess Ceres "after a series of disasters." This seems to have been modeled after the Greek Thesmophoria (apparently held in late September or October), a secret feast in which pigs were sacrificed to Demeter Thesmophorous, the bringer of divine law.

"[It] cannot be enough admired the horrible and fearful cruelty of their Device, which was not only for the destruction of my Person, nor of my Wife and Posterity only, but of the whole Body of the State in general . . . [But] which is most cruel and unmerciful of all, is the destruction by insensible and inanimate things; and amongst them all, the most cruel are the two Elements of Water and Fire; and of those two the Fire most raging and merciless."

-- James I, speech before Parliament November 9, 1605

So just after the death of the Sun, and before the birth of the Law, October 3 would have been a mystical dead space in which kingship hung suspended. The blast of the gunpowder, over twice that needed to destroy the building, was intended not just to dethrone James but to remake the world. The Plotters would offer not an effigy king, or a pig, or even a sacred [scapegoat](#), but a True King, a Stuart of the ancient Bloodline. By "most sacrilegious murder" they would "break ope the Lord's anointed Temple," an act of ultimate magical nihilism. There were thirteen Plotters, just enough for a witches' coven, or a Satanic esbat. They knew the rites of gunpowder and [tobacco](#) (all the survivors smoked furiously during their trial) that awoke the [Petro Loa](#). Perhaps they even knew the Song of Blue Mask, carefully sung by the Hopi shamans during Wuwuchim because of its power to bring about cosmic disaster. They had access to that mystical knowledge somehow; perhaps through Thomas Percy's second cousin Henry Percy, the "Wizard Earl" of Northumberland, or through Robert Catesby's second cousin-in-law, William Shakespeare, who wrote down his mystical rites of [king-killing](#) and [global destruction](#) in the next year.

But something went wrong with the time. Perhaps Shakespeare, grateful at being a King's Player, put a burr under Cecil's saddle; perchance some [plague guardian](#) of London simply did not wish to see the world remade. So Percy and Catesby rebalanced their figures, working with the confluence of Feronia and the true Samhain, hoping to woo Gaia with Gaius, hoping to at least trigger a [reality quake](#) to bring about the killing of the King by sheer belief. Hence Catesby proclaiming success in Warwickshire, hence the second desperate attempt to blow up their own house and become sacrifices themselves. Hence, perhaps, the nightmare of Plotter Robert Wintour, who dreamed on November 7, Hecate's Night, that "he thought he saw steeples stand awry, and within those churches strange and unknown faces." But it was not enough. Instead James and Cecil won, and it was Guy Fawkes who became the scapegoat, the burning man given up to Demeter Thesmophoros by (blue?) masked revelers who keep the world alive to remember, remember, the Fifth of November.

Somewhere Between Fact and Fiction Lie Factions

As I've mentioned before, I'm an avid [Slashdot](#) reader. One of the recurring themes on that geek-speak site is a distrust of powerful factions that have the ear of congress, who can use their influence to pass laws favorable to the factions but disadvantageous to the techies. I'm not sure why the Slashdot regulars are always so surprised when their efforts to thwart these folks go unheard. I mean, it's an age-old truism: Factions speak louder than nerds.

That completely irrelevant anecdote was a direct lead-in to this week's theme.

Many -- if not most -- game universes have factions of some sort. For example, a fantasy setting might have warriors, bards, and wizards, while a sci-fi setting might have space knights, pilots, and nobles.

The difficulty comes in trying to add a new faction to this established order. Usually, most of the "obvious" ones have been added. How, then, can you add a new faction without taking anything away from what's already there? For example, if you add a class of martial artists to an old-school fantasy game, then you run the risk of either making martial artists weaker than regular fighters (in which case, what's the point of playing this new class, from a purely party-effectiveness point of view?) or making them stronger than regular fighters (in which case, why would anyone play a regular fighter, and why hasn't the world heard of these guys before)?

As an aside, I suspect this difficulty is one of the reasons why the classical *Dungeons & Dragons* thief had a hard time getting established in that game. The thief was the last "main" class added, after the obvious fighters/magic-users/clerics classes had been developed. As such, the thief probably had a hard time carving out a share of respectability from the triad:

Thief: I steal stuff!

Fighter: Me too. I just make sure the previous owner is napping in a puddle of his own blood first.

Thief: Umm . . . I can open doors.

Fighter kicks down the door.

Thief: Err . . . I hide in shadows?

Magic-User: I've been doing that for years. I'm so good, I'll often hide *outside* the dungeon we're in; sometimes I'll be hiding behind a margarita in my lab.

Some games don't even make an attempt at maintaining a balance between what has gone before. They'll simply add in, say, a powerful new barbarian group, little caring that it throws the old order out of whack. "Power creep" is common in these settings, to the point where -- after a few years -- the core groups from the main rulebook might look positively quaint.

Assuming most of the "good" or obvious faction ideas have been taken, here are a couple of ideas for finding new fallow ground within a campaign:

The same, but different: There are many examples in the world of groups that have the same or broadly similar roles, but for which the execution is wildly different. For example, in the real world police officers and soldiers serve roughly the same purpose: preserving order and defending its citizens. However, the scope of their activities are wildly different; your average lieutenant has a hard time mingling among civilians looking for information, while a city-beat police detective will usually avoid the extra paperwork that comes with the discharge of a LAW rocket.

To make up a concrete example, suppose one wanted to create an interplanetary police force in the *Star Wars* universe. Well, the obvious problem is that one such organization already exists: the Jedi Knights. How can you apply the "same but different" mantra to our spacecops?

The two obvious ideas that spring to my mind would be methodology and means. On the means side, access to mad-whack Jedi powers are part and parcel of being a Jedi. As such, maybe our space cops are those with the will and hearts similar to the Jedi in terms of their desire to do good, but who don't have access to Force powers, perhaps

because they have low midichlorian counts [*PUTS GUN IN MOUTH*]. In terms of methodology, the Jedi are a loose-knit organization (or, after *Episode III*, they're a daisy-up-pushing organization); individual members are expected to go out into the world and do good, unless they're feeling [lazy](#).

Our *Star Wars* space cops, on the other hand, probably have very formal rules and regulations. They would have standard protocol for jurisdiction, proper procedures, permissible force, accountability, and so on.

Having envisioned this, this new group suddenly feels not like a competitor, but an augments. The Jedi might view these cops as being too rigid (or, worse, jackbooted thugs in training) while the space cops might see the Jedi as being unpredictable, unaccountable, and largely ineffective. Immediately a half-dozen roleplaying and adventure ideas spring to mind with this dichotomy.

I've [written before](#) about another example of this technique, where a player made a Jedi whose outlook was based on the Victorian ideal rather than the chivalric one.

Better, but limited: An alternative to worrying about balance is to throw caution to the wind, and make a new group that's more effective or powerful in certain ways, but more limited as a whole. To continue our *Star Wars* outing, suppose we wanted another group of Force wielders, but the whole Jedi/Dark Jedi thing feels overused. Well, perhaps someone (or someones) has found a way to augment people who didn't have access to Force powers to do so now . . . perhaps by injecting synthetic midichlorians into their blood [*PUTS BIGGER GUN IN MOUTH*]. In this case, the practitioners might be able to access greater powers than even the mighty Jedi, but at a cost . . . say, their assured death [within a year](#).

Suddenly there's the possibility of a new threat to those Jedi PCs (who are probably getting tired of being confronted with "yet-another-vastly-powerful-Dark-Jedi-you've-never-heard-of"), or even a grim new PC possibility, without worrying that this introduction will disrupt established continuity or result in an option that overshadows the Jedi.

In all, even in a seemingly cluttered campaign world, there are probably many possibilities for new factional additions that are still interesting and worthwhile, but manage to avoid being disruptive or moot. Like threading a needle, the trick is not to worry about the big piece that's already there, but to focus on the hole.

Pyramid Review

Crime Scene: Feds (*for the d20 System*)

Published by [Hogshead Publishing](#)

Written by Ian Hunt

Cover by Shaun Thomas

Illustrated by David Esbri, Ursula Vernon, & Marcio Fiorito

80-page b&w softcover; \$18.95

The FBI has been common enough as a subject for magazine articles, especially for *Call of Cthulhu*, but considering its importance in US law enforcement and how often they turn up in modern-set campaigns, it is a surprise that no gaming supplement has been devoted to them. With the advent of the *d20 System* there are now two, of which one is an addition to Hogshead Publishing's range of law and crime source books for the here and now. ***Crime Scene: Feds*** details the FBI for the *d20 System* and is the sourcebook for federal law enforcement. Where [Crime Scene: Police Investigation](#) covers state and local law enforcement, [Crime Scene: Forensics](#) would be a useful companion, providing the technical details of crime detection, while the sourcebooks on the Mob and the Yakuza explore the bad guys. So while ***Crime Scene: Feds*** might not be the only *d20 System* sourcebook on the FBI, it is the best supported.

From the outset this supplement plays it straight. This is not a cinematic or fictional take upon the FBI like *The X-Files*. Instead this is very much a procedure book: who the FBI are, what its responsibilities are, how it works, and so on. This is presented in Hogshead's usual style as a well-read document. It is lightly illustrated, but is very text heavy. In fact, it is so text heavy that it does not suffer from Hogshead's usual repetitive use of its artwork. However, the layout and format of the book is inconsistent, which hinders the book's use. Another problem with what ***Crime Scene: Feds*** actually is -- a reference book -- is that the book lacks an index.

The book defines the role of the FBI, gives a short history, describes its organization, and its headquarters, the J. Edgar Hoover building in Washington DC. Perhaps the most interesting of these sections describes the FBI Academy at Quantico, the requirements for each applicant, and life at the Academy if successful. This continues with the exploration of life as an agent, covering apparel, relationships, discipline, and so on. All of this, along with the chapter on how the FBI gets involved in investigating a crime, is for the player's eyes as much as it is for the GM.

The actual roleplaying material in ***Crime Scene: Feds*** consists of the new character classes and associated feats and skills. These, as for other books in the series, are for ordinary *Dungeons & Dragons* rather than [d20 Modern](#). Each character is presumed to start the game as a Special Agent or Specialist Agent such as a Forensic Investigator or Negotiator. Characters receive several standard feats to model the extensive training in the use of cars and firearms at Quantico. To reflect the fact that FBI agents come from a wide variety of backgrounds from Counter Terrorism and Cyber Crime Division to Laboratory Division Specialist and Legal Specialist, a character also selects a Specialization. Each one gives a further feat and two additional class skills. This is perfectly reasonable and in some ways, makes a better job of detailing a character's previous experience than in other ***Crime Scene*** books, but still it feels muddled and in need of further development. But this problem is down to the supplement's choice of core system, *Dungeons & Dragons* not being designed for this, when *d20 Modern* is.

As to the classes themselves, they include the FBI Specialist, whose varied careers range from tracking down terrorists to handling legal matters; the Forensic Investigator, who works as part of the Evidence Response Team; the Ghost,

who is a surveillance expert; the Negotiator, who deals with situations where force would result in casualties, such as a hostage or siege scenario; the Point Man and Sniper classes, there to react if direct action is necessary; and finally, the Special Agent, what most people think of when they think of the FBI Agent. Overall, the changes are workable if dry, but that is the point. ***Crime Scene: Feds*** is more a procedural game than a shoot 'em up action flick.

Of the Feats and Skills, most of them have appeared before in other ***Crime Scene*** titles, particularly ***Crime Scene: Police Investigation*** and ***Forensics***. That said, each is well explained and summarized in the accompanying tables. The chapter on equipment focuses mainly on weapons and armor, and while vehicles are mentioned, no statistics are given for them. This is understandable as the book is written for ***Dungeons & Dragons*** and not for ***d20 Modern***, but since ***Dungeons & Dragons D*** includes no rules for handling car chases . . .

The information on how the FBI actually investigates a crime is useful for any investigative game. It details identifying and handling suspects, as well as informants. It covers telling how and when people are lying, the administering of the polygraph test, and the collection of evidence. This is all standard for any type of crime, but the other typical assignments for an agent are also covered -- surveillance, hostage situations, counter terrorism, and serial killer profiling. Not necessarily in all that much detail, but enough for most games.

The sample adventure "Watchers in the Shadows" is designed for three to six agents of first to third levels. It is a surveillance assignment on a suspected drug dealer that quickly acquires complications. A simple one- or two-session affair, it handily reinforces the procedural nature of the ***Crime Scene: Feds*** game. The book is rounded out with a pair of appendices. The first lists *some* of the common FBI terms, while the second lists the organization's field offices in the USA and the worldwide legal attaché offices.

Crime Scene: Feds is Hogshead's top selling title and it is not hard to see why. It is interesting and informative, useful for almost any modern set game. But it is let down by inconsistent layout and typography, under developed character background options, and the lack of an index. Actual advice for the GM on running an FBI game would also have been appreciated. That said, ***Crime Scene: Feds*** delivers what it sets out to do -- provide the source material necessary for a procedural game.

Pyramid Review

UWO: Unidentified Walking Objects

Published by [Elven Ear Games](#)

Created & illustrated by Thomas Jansen

Designed by Bjorn Scholten

English translation by Jaklien Jansen

92 full-color cards & three rules sheets in three languages (English, Dutch, & German); \$10

The idea is a painfully basic one: The Gnorfs of Znorf find the Pnorfs purple and ugly, and gleefully attack them for their differences. The Pnorfs, for their part, hold the same beliefs about the green Gnorfs. The ***UWO: Unidentified Walking Objects***, using this rather thin but ancient justification, are ready to deliver a beat-down.

The object of the game is to eliminate all your opponent's forces.

Each player gets a deck of cards in his color. One player lays his six energy cards in a horizontal line in front of him, while the other lines his up adjacent to the end of that line going up the table vertically. This forms an L-shape, and the playing field is the 5 × 6 grid in the crook of that L. The two teams of 10 set up on either side, draw a hand of three cards, and march to engage each other. Movement depends on what kind of unit it is, though they all use more or less the same rules -- you can travel up and down, or side to side, though the cards have to stick to the invisible grid. (It's not a bad idea to get some sort of playing mat just to make sure you have an actual grid upon which to play -- the erasable one with squares you might see in a ***Dungeons & Dragons*** game works fine.)

Everyone starts out as a walker, ready to pummel his enemies with his bare fists. Using cards from your hand, you morf your units into other various troops with different offensive and defensive abilities. For example, if attacked by a walker, you could morf your unit into a bunker. Now you're protected against punchers and shooters and can attack at a greater distance, but you lose your movement value.

You can become a Pnorf (or Gnorf) in a tank, arm yourself with a grenade or bazooka, or give your life for the cause with a bundle of dynamite (taking out anyone in the eight spaces around you). You can also ride astride your Vlorf, though this unit can only stun opponents. If you're lucky enough with your card draws, you might simply be able to play a straight-up miss card and save yourself all that tedious rearming. Alas, miss your opponent and they get to return fire even though it isn't their turn. This back-and-forth continues until neither of you is willing to carry that fight another round, and the offense switches to your enemy.

All this activity isn't free; you have to use your energy cards to move or morf (even if you take no action on a turn, you still expend one energy so that the round will eventually end even without cards to play). Once your stash of six energy has been expended, you may no longer play anything but miss cards to withstand your enemy. Once you've both run out of power, the energy cards reset themselves and the conflict resumes anew. You can run out of cards, but the game doesn't end until you're out of opponents as well.

Whether it's because they didn't have an artist or they deliberately went for the cartoon look, the pictures aren't much to crow about. Like the cards on which they appear, they're utilitarian illustrations, geared more toward clear statistics. They are good stock, though.

In fact, the whole game is very practical -- straightforward rules, fast play, nothing flashy. It may be the same old game rules in trappings that are notable only because of their Spartan presentation, but it's fast-moving and fun. Neither player is going to overbear the other, dynamite-wielding suicide bombers notwithstanding. Requiring that everything be done by degrees means the rules hide many opportunities to turn the game around, pull a tactical surprise or two, or even (gasp) *think* about how to best kill a bushy-bodied foe.

The humor is slight and won't entertain long, its subtle Seussian edge aside, but the real value is how far under you can dig and still find new strategies you hadn't considered. The rules are a translation, so it's probably not much of a surprise that it takes a couple of readings to absorb the meaning (the Dutch and German versions are included as well). Part ***Stratego***, part ***Magic***, and a little part chess, ***UWO: Unidentified Walking Objects*** is a two-player game with depths and corners that must be investigated, and it holds the attention longer than another round of gin rummy.

--Andy Vetromile

Le Sorelle Stanno Facendolo Per Si

Convents of Renaissance Venice

by Matt Riggsby

Monasticism is one of the great Medieval phenomena. Through the Middle Ages and the Renaissance, monasteries and convents sprang up across Christendom. Their position was paradoxical. On one hand, their purpose was to provide a place where the residents could be "in the world but not of it," devoting their lives to prayer and contemplation and leaving material concerns behind. On the other, they managed to acquire vast wealth and power from the gifts and bequests of wealthy people looking for a pious image for in life and a better deal in the afterlife, making them enormously important political and economic entities.

Monastic institutions for nuns put on an additional layer of contradiction. They were often little more than a genteel prison for their inmates, but within the constricted bounds of their spatial limits, they were about the only institution of the age which was run wholly by women. They had a particular social significance as well. They were the height of female respectability, and in some times and places they provided just about the only career a woman could consider outside of marriage. Any number of the daughters of the rich and powerful were educated in convents, and they could become a veritable dumping ground for politically inconvenient female relatives of deposed rulers and potential usurpers.

In Renaissance [Venice](#), convents reached the height of their use as a place for the high and mighty to put their daughters, for reasons which were as much economic as political and dynastic. This gave convents of the era a number of peculiar characteristics, and makes them surprisingly useful for gaming. Far from being scowling old math teachers dressed like penguins, the nuns of the Venetian Renaissance combined power, wealth, and secrecy, and if that's not good enough for at least one decent adventure, then you're just not trying.

The Social Background

Marriage was in decline among the upper classes in Venice by the early Renaissance. Noble households in the highly socially stratified city tried very hard not to marry off their sons to prevent political squabbles within the family and to avoid splitting family fortunes among a horde of grandchildren. Consequently, it became difficult for noble families to find suitable husbands for their daughters (a set of harsh inheritance laws effectively ruled out women marrying down the social ladder). When husbands could be had, simple supply and demand raised the price of a dowry to twice as much as a tradesman could make during his entire lifetime, so even a very rich family couldn't afford to marry off more than a few of its daughters.

This led to households where one or two married men might live with any number of bachelor brothers. They didn't have to be celibate, of course (society and the Church winked at the peccadilloes of wealthy men), so long as they didn't threaten the family fortune by getting married and having legitimate offspring. Women didn't have that option. The only thing an unmarried woman of high birth could do while remaining respectable was to become a nun.

The life of a nun combined the protection of female chastity, another high goal in most civilizations, with religious devotion, one of the most admired motivations of the age. Female spirituality, when it could be perfected, was particularly highly thought of by a number of theologians. Taken together, these factors made convents among the most highly esteemed spiritual institutions in Christendom. Venice was particularly proud of its 30-some-odd convents, which were

Fun Words to Learn and Say

There's an important point of terminology to be made here. In the Catholic tradition, a convent has two mutually exclusive classes of inmates: sisters and nuns. A sister, sometimes called a *converse*, takes a set of "simple" vows which leave her with a lower standing but more freedom to interact with the outside world. A nun, however, takes "solemn" vows and despite (or, indeed, because of) a higher standing is restricted to her convent (that is, she is "cloistered") with only extraordinary exceptions. In casual usage, the words "nun" and "sister" have become interchangeable, although technically most people have never met a nun, even if they've

recipients of countless gifts and bequests. No matter how venal and corrupt they themselves might be, Venetians could point to their support of the convents as evidence of their piety. Many widows hoped to become nuns after their husbands died, although increasingly few were allowed to during the later Middle Ages and Renaissance, and many women wanted to be buried in a nun's habit when they died. And as the Catholic Church scrambled to shore up its respectability during the Counter-Reformation, convents became all the more spiritually important.

gone to a Catholic school. We'll accept common usage, but when a specific type of convent inmate is intended, we'll be referring to *converse* sisters and cloistered nuns.

In the convent, segregated from the outside world, the nuns would cast off their old concerns in favor of building a religious community. They would leave behind old attachments, hold goods in common, eat the same food from the same dishes, wear clothes drawn from a common store, and in all ways submit their will to the communal life.

That's the theory, anyway. In practice, despite policies by the church to prevent girls from being forced into convents, some women entered the convent literally kicking and screaming. Many more went quietly, obedient to their family's wishes, but just as unwillingly in their hearts. Instead of forming a community of devotion to which they had no wish to belong, they brought their old desires, priorities, and loyalties into the convent with them.

And as for the idea of the nuns leaving all previous social attachments and distinctions behind, it should surprise no one to learn that some nuns were more equal than others. The converse sisters made up a sort of working class. They were charged with doing most of the day-to-day menial labor and had little if any power to elect convent officials and participate in internal decision-making. Above them were the cloistered nuns. Not only were they required to do little work (or, if they did work, assume supervisory positions) -- ostensibly so that they could spend their time in purely meditative, spiritual pursuits -- they were also the decision-makers within the convent, electing the leaders who would set and enforce local rules, assign tasks to individual nuns, and decide how to spend the convent's sometimes considerable income.

The distinction was underlined by the fact that entering a convent wasn't free. Though it was nowhere near as expensive as a wedding, families would spend several times a tradesman's salary to establish their daughters' places as cloistered nuns, ensuring that Venetian convents would be filled primarily by the daughters of the wealthy and middle classes. Well over half of every convent's cloistered nuns were members of noble families, who could best afford to spend enough money to guarantee that their daughters would never have to work. In a few convents, *all* of the cloistered nuns were from noble families (conversely, it became nearly impossible to find candidates for a special magistracy overseeing convents because the magistrate had to be a nobleman with no close female relatives in a convent; by the 1550s, few if any noblemen didn't have at least one sister or first cousin who was a nun). Becoming a converse sister was less expensive but, again, not free, so most of the lower ranks came from the middle classes.

Convent Life

On a day-to-day basis, the life of a cloistered nun was probably much like it would have been outside the convent: directing at least part of a large domestic establishment, in this case, converse sisters and part of the convent's operations rather than servants and younger relatives in her own home. However, it was with no babies, no chance of ever leaving the building, and religious devotions at least theoretically taking up a great deal of time. Nevertheless, cooking, cleaning, household accounting, and the like would be much the same inside or outside the cloister.

The other obvious difference is that men had a minimal role in decisions. Priests might be the final authority on spiritual

True Believers

This is not to say that all nuns were entirely opposed to a religious life. After all, there was a certain spiritual glamour in being a nun, albeit one which seemed to appeal more to older women looking for a comfortable retirement than young ones with their whole lives ahead of them. Some of the young women involved may very well have thought that entering a convent was a preferable alternative to getting married, living a life which was freer only by comparison, and quite possibly dying painfully in childbirth. Some of the nuns were as devoutly religious as one could hope. Or, indeed, even more so. One nun, fed up with the laxity of her convent, escaped from her convent, disguised herself as a man, and tried to infiltrate a monastery on the mainland so she could lead what she regarded as a *truly* religious lifestyle.

matters (and some clearly did abuse that authority to extort favors from the nuns) and the Patriarch, Venice's bishop, might issue general policy guidelines, but the abbess's word was, generally speaking, final, and decisions about what tasks to perform and who should do them were made inside the convent with little or no outside intervention. The convent lifestyle, which encouraged religious reading and gave precious little else to do, probably also led to women who both read and wrote more than usual even for their high level of status. A few even took the opportunity to compose tracts condemning the treatment of women. They were a far cry from modern feminism, of course, but they do amply demonstrate that a number of nuns were unhappy not with being nuns, but with being so limited in their choices relative to their brothers.

The movements of the cloistered nuns were always highly restricted, and what few opportunities they had to even see or hear the outside world were slowly curtailed through the years of the Counter-Reformation as possible avenues of contact were sealed off. During the Renaissance, business affairs were put in the hands of agents living outside the convent, and only a few older converse sisters (who were thought better equipped to resist temptation) might be allowed to leave in order to visit the markets. Under extraordinary circumstances, nuns might be summoned to give testimony on important affairs to high officials.

Usually, traffic usually went the other way, with outsiders coming to the convent. For example, priests visited convents several times a week to celebrate Mass, and other officials might visit convents for special events and particular errands (for example, the operation of convents was examined every decade or so). Other women might come to live at the convent temporarily. Girls might be boarded at convents from just past toddler-hood into their early twenties to receive an education, and abused wives could find temporary shelter there. And, of course, necessity might require tradesmen to visit the convent to repair leaking roofs, clean out chimneys, and perform other necessary construction and maintenance. Such tradesmen would have to obtain special permission from the bishop.

And while only a few categories of people could enter the enclosed area of the convent, nuns could still receive visitors after a fashion, although they would be physically separated from their guests. They would come to a visiting parlor specially constructed so that visitors and inmates could speak to each other but be in physically separated parts of the room.

Theoretically, access to a convent's visiting parlor was restricted in order to limit nuns' contact with the outside world, with only related women (nuns' sisters, mothers, nieces, and a variety of cousins) and more closely related men (mostly fathers, brothers, and nephews) allowed to enter. In practice, though, this wasn't much of a restriction. Every member of the upper classes had relations at any number of convents, giving them fairly free admission. Moreover, visitors often brought their own friends and relatives, and even people completely unrelated to the residents of a convent might happen by from time to time. Prostitutes, for some reason, seemed to particularly enjoy dropping by to chat with the nuns. Since they lived diametrically opposite lives, they probably had a great deal to talk about.

Hungry for contact with the outside, the nuns themselves subtly encouraged visitors by making and giving away sizable quantities of cakes and other baked goods. Any welcome visitor could be assured of at least a good snack. Indeed, the production of baked treats became a major expenditure and a serious point of contention with the authorities charged with overseeing the behavior of the nuns. In the eyes of the authorities, excessive gift-giving, though excused by the nuns as charity and hospitality, invited excessive contact with the world.

Even though extensive measures were taken to separate nuns from the outside world, the unenthusiastically religious women of the Venetian convents had little reason to accept the restrictions placed on them. Most of the upper class women pushed into the convents had no interest in the ascetic life they were supposed to take up. Instead, they tried as best they could to lead a "normal" life.

One of the more obvious ways they did so was to indulge their taste for fine things. Still financed by their families, upper-class nuns continued to wear silk, high-heeled shoes, golden ornaments, and the other trappings of wealth. They would furnish their cells with tapestries, fine furniture, and paintings. Far from wearing the same habits, one could tell at a glance what the station of a nun was.

Although the tastes of upper-class nuns alarmed church officials, it didn't do so nearly as much as their determination to carry on "normal" relationships as well. Again, casting aside the idea of living a common life with their co-inmates, nuns would maintain relations with their families on the outside, form countless cliques with relatives (most nuns could find at

least one aunt or cousin among the other sisters), and make particular friendships within the convent. These cliques extended family rivalries across the supposedly inviolable walls of the convent. Just as noble families vied for political and economic power in the Senate and markets of the city, they maneuvered for control of the convents as well. Nuns would eat with their friends and relatives in their cells, exchange gifts within their cliques, and most importantly support one another in the convent's internal business. A family or group of allied families could come to dominate a convent if it had enough senior members there.

Many nuns even tried to establish romantic relationships. Some would engage in opportunistic affairs, taking lovers from among the men who were required to visit from time to time. Others were able to establish long-term relationships with more regular visitors. Unauthorized visitors managed to slip into the convents at night by a variety of clever strategies; at one convent, a pair of nuns dug a hole through a storeroom wall to admit their lovers. There is evidence to suggest that a number of nuns' relationships may not have had a sexual component but otherwise followed the model of regular marital relationships in the outside world: the man would provide various material goods for the woman (food, cloth, etc.), who in turn would provide domestic services such as cooking and sewing, and each provided the other with compassionate companionship. On their infrequent investigations into the convents, religious officials frequently chastised some nuns for sharing their cells or even beds with particular favorites, although since it wasn't unusual for siblings and cousins to share a bed even at the upper levels of society, romantic relationships within the convent may not have been quite as common as a modern observer might suppose at first.

A few nuns even tried to escape. Disguises, bribes, concealment in containers, and other ruses were used to get outside the walls and attempt some sort of normal life. The prospects for an escaped nun weren't actually very good. She would essentially have to exile herself, leaving behind her city and her family or else risk being returned to the convent. She might end up as a prostitute or a peasant's or itinerant tradesman's wife, a far cry from the aristocratic setting of her youth. For some, though, the chance to behind a life of comfort but little freedom for the opposite was worth it.

The Physical Convent

Venetian convents usually held between 50 and 100 residents. Unlike rural convents and monasteries, which could be something like a complete small town with a wall thrown around it, limited land inside the city meant that the convents couldn't have large gardens or mostly single-story buildings.

The idea of a habitation isolated from the outside world was also more difficult to pull off in the city, where the population density was orders of magnitude greater than in the countryside. Large homes, palaces, and other places where people both live and work are often divided into public and private areas. Convents could be said to have semi-private and very private areas.

The most notable public area was usually a church. Obviously, the nuns had to have a place where they could hear Mass and take communion. However, depending on the architecture of their convent, nuns might not physically enter the churches where they worshiped. Rather, they might attend ceremonies in barred galleries or balconies overlooking the church proper. The priest might communicate with sisters through a *ruota*, a revolving drum with one open side, set into a wall. Items might be placed into the open side and the drum rotated so that someone on the other side might pick it up. Similar devices are used today in some highly secured post offices, cash cages in casinos, pharmacies stocking particularly powerful drugs, and other facilities where parcels need to be passed over the counter but people on one side need to be protected from the other.

Convents also had semi-public parlors where the areas for nuns and visitors were divided by heavily barred grills. The parlors were large enough that the nuns could attend, or at least observe, family gatherings. Some were quite elaborately formal. For example, it became customary for wealthy brides to take a flotilla of gondolas around the city, visiting the convents to see aunts and sisters (any woman rich enough to be able to afford such a procession also had female relations who were nuns). Others, though, could be quite raucous, even vulgar. At various times, special police were designated to arrest people visiting convents without proper permission.

The other parts of the convent are quite sealed off from the outside world. Convents were never easy to get into, and it got harder through the Renaissance. To better "protect" the nuns, almost all outward-facing doors and windows in Venetian convents were ordered sealed, typically leaving one gate on the land and one on the water, so that nuns couldn't

see out of the convent and no one could see in.

The nuns live in small, individual cells. More senior nuns would, of course, have the pick of larger and more comfortable rooms. It was also common for a convent to have a cloister, a courtyard surrounded by a shaded walkway. Otherwise, the convent might closely resemble a large household. It would have kitchens, store rooms, a refectory for common meals, and other facilities for everyday living.

The maps are of an imaginary but reasonably representative convent. It would be one of the larger and more comfortable convents in the city, capable of housing nearly 100 residents. A church is attached to one side, with a ruota and a grated gallery near the altar through which the nuns can watch (convenient for taking communion) and a second-story choir loft accessible from the living area. There is, however, no direct entry into the church from the convent. The opposite side of the convent contains a small garden courtyard, an entrance to the convent proper (usually locked and barred, with a ruota in place to accept small deliveries) and the parlor. Grated areas on one side of the parlor allows nuns to communicate with visitors. The parlor also has one of two doors from the outside into the convent, flanked by a ruota; it is typically guarded by an older converse sister.

The interior of the convent contains not one but two cloisters around which the cells are arranged, connected by a tall, arched passageway. One is paved and contains a well, the other contains a garden. Some of the cells are double-sized and are the preferred rooms of the senior and wealthier nuns. The larger cloister is purely residential, while the smaller provides access to the laundry, some storage rooms, and the kitchens, which also communicate with the refectory. The refectory has a balcony around the second floor level, from which sisters might be assigned to read from the Bible or other religious works during meals. The storage rooms are next to the rear gate, which faces a canal for water-borne deliveries and visitors. There are no outside-facing windows on the first floor, but there are a few narrow windows high on the walls of the taller rooms, such as the store rooms and refectory. They provide light and ventilation, but it's unlikely that anyone would be able to look either in or out.

Gaming with Nuns

Admittedly, an adventuring nun is pretty much a contradiction in terms, so they aren't suitable for PCs in conventional historical campaigns. However, just because one doesn't imagine nuns running around the landscape and whacking things with broadswords doesn't mean that they can't be used in adventures. A convent could easily be the object of PC attention. For example, between expensive religious paraphernalia (gold crucifixes, jeweled reliquaries, etc.) and the personal possessions of wealthy nuns, a convent might be a tempting target for thieves. The difficult part would be disposing of the readily identifiable goods; being identified at the people who robbed a convent would *not* make characters particularly popular. Similarly, PCs might try to get a nun out of her convent. She might be the lover of someone with money, hoping to join him for a normal life outside the convent, or the subject of a kidnapping plot by her family's enemies. Warriors might have an interesting challenge with the task of defending a convent during an attack. The inmates might not be able or willing to leave the convent even in the face of invasion, and defenders might be unable to enter the convent they are defending. In a fantasy campaign, convents might be secret storehouses of powerful holy items, and their spiritual importance might be a result of real spiritual power. Nuns wouldn't just be an important symbol; their virtue might be a defense against diabolical magic.

But it could be far more interesting to involve the inmates of the convent as active participants in adventures. Remember, the women in question here are connected to some of the wealthiest, most powerful families of their day, hidden away from their society and even, quite often, from their own religious supervisors, and are connected to, if not always completely devoted to, a strong mystical tradition. They're well-funded and influential, which gives them a certain latitude to think independently, they have a lot of time unobserved, which means that they could be up to pretty much anything, and many of them have a motive to rebel. Here are some more specific ideas:

The Italian Job: A convent would be a marvelous depot for smuggling small quantities of stolen and forbidden goods. Its status as a religious institution would put it almost above reproach (although during the Counter-Reformation there's increased pressure). Moreover, the prohibition on entering a convent would make it nearly impossible for authorities to obtain permission to search the premises. At the very least, getting that permission would be a time-consuming process which would become public knowledge well before anyone from the outside could come in, giving smugglers ample time to move their goods.

Locked Room: The same isolation that makes a convent an interesting front for a smuggling operation makes it an interesting venue for a murder mystery. If a nun is killed, the close quarters and lack of privacy would make it fairly easy to determine whether or not any outsiders were around and who was where when. However, investigators would have a very difficult time examining the scene of the crime (a generous GM might grant PCs the aid of a Renaissance Nancy Drew or an Archie Goodwin in a wimple) and would have both religious and political authorities breathing down their necks at every turn. Did someone infiltrate the convent? Did a family feud strike into what should have been a sanctuary? Did it have something to do with the convent's internal politics? Was it all of the above?

(Secret) High Society: A convent is a secret society. That is, people may know that it exists, but its day to day operations are a mystery to anyone who isn't a member. Important parts of the Venetian government, like the Council of Ten, were already essentially secret societies by that definition, so why not one more? Banking on their spiritual authority and ties to important families, the female-run convents could constitute a shadow government in parallel to the male-run Senate and Doge, constituting a power well behind the throne (with a few other intermediate powers in the way, no doubt).

And it could go beyond Venice. Historically, convents didn't belong to centrally administered, nation- and continent-spanning orders like the Templars. After all, it becomes exceedingly difficult to run an international organization if anyone in a position of authority *ipso facto* can't visit her parents across the street, let alone another city or country. However, a secret network of couriers (the Venetian nobility aren't just rich and powerful; they're well-traveled merchants with regular contacts across the Mediterranean and into Europe) could quietly coordinate activities of convents across wide regions, subtly pulling the strings of kings and bishops.

Mater Noster: One of the myths occasionally encountered about the Middle Ages is that full-blown paganism was still rife, but was only practiced in hiding, usually by women who were burned as witches when they were found out. It's a proposition blissfully unencumbered by evidence, but it could be interesting to make it true in a place allegedly at the heart of Christendom. A convent may appear to be as Catholic as the pope, but when the priests leave, the crucifixes are taken down and images of Astarte, Magna Mater, Diana, and other goddesses are brought out. If not an ancient survival, it could be a revival of ancient cults in the wake of the revival of classical learning and a radical assertion of Venice's

ecclesiastical semi-independence from Rome. It would cause a tremendous scandal if it were found out, and the papacy would come down on Venice like several tons of particularly hard bricks. Which, of course, would be all the more reason for not just the convents but the entire city government to make sure the secret never got out.

In addition to the layers of secrecy and deception present in the other scenarios, this provides a good excuse to bring in powerful magic. The same walls that could mask graven images could hide blood sacrifice and sorcery just as easily. One woman's convent could be another's coven, or even, given a lack of windows, a nest of vampires.

The Blade of Zorra: About the last thing one would expect is a swashbuckling nun, which makes it a tempting proposition. One can imagine a girl whose progressive, idealistic father educated her in swordplay before she entered the convent. Now, she slips out of the convent at night and, in disguise (remember, this is Venice; masks abound), fights injustice and the despotic rule of the Council of Ten. Or there might be a convent run by an entire order of fighting nuns ("martial sisters" might sound better than "Venetian ninja nuns"). The members of the convent receive secret but intensive training in all manner of combat and stealth techniques. This could easily come to resemble *Buffy the Vampire Slayer*, only with predominantly women as Watchers rather than mostly men. The question then becomes who they fight for. Are they secret assassins for the papacy? For the Doge and the Council of Ten? Or are they autonomous, following a secret agenda even the church doesn't know about?

Dork Tower!

Getting into the Game

In Nomine Neural Interfaces and What You Can Do With Them

by Elizabeth McCoy

Herein are a collection of specific-use advantages for a "modern day" setting. (In a Cyberpunk setting, some will be standard, and others could cost more points, at the GM's option.) They are priced and named for for ***In Nomine***; for ***GURPS In Nomine***, the quick and dirty conversion rounds each cost up to the nearest 5. (For GMs thinking the prices are too expensive for what is really flash and mirrors, halve the prices and introduce the concept of half-points to ***In Nomine***.) The concepts behind the names should be easily portable to any similar setting, such as ***GURPS IOU***; thus *Friends in Lightning*, below, could become "Friends in WUSE" at IOU or "Friends in the Technocracy" in a light-hearted *World of Darkness* campaign . . .

Friends in Lightning/Technology (5 points)

You know people in the organization. In particular, you know who gives the toys, and you know the mailing lists and forums wherein all knowledge is contained. This effectively gives you a +5 bonus to research *anything* -- but at a cost in time. Each question you ask using this advantage will take 7 days, minus check digit, to get answered to your satisfaction. (There is also a chance the GM will rule the question is simply not answerable at all, which will turn up a lot of complaining about the lack of data and speculation on it, or that it's so complex as to have contradictory information available.)

Friends in Lightning/Technology is required before purchasing any of the below advantages, even if the character is a Servitor of Lightning or Technology.

Neural Interface (5 points)

This is, quite frankly, forbidden technology in the ***In Nomine*** setting. Vapula, Prince of Technology, doesn't much care so long as the Servitor does not lose it. The Archangel of Lightning, Jean, minds a great deal more -- either the character will need his trust (in the form of a Distinction), or be *very* careful not to get caught. One good way to avoid losing the toys is to use them only at Tethers. Another is to also purchase them as corporeal artifacts and add the Summonable Feature to them. (This adds 5 points to the cost: 1 to make it an artifact and 4 to make it Summonable for 1 Essence. Other Features may be taken to reduce the price -- or add to it.)

A Neural Interface allows hands-free use of a properly equipped computer -- it will need Firewire, USB, or some other form of input, and an appropriate connector for the Neural Interface. (The connectors are much less forbidden; there are adaptor plugs easily available.) The Neural Interface reduces the time to do *anything* on the computer by the user's Ethereal Forces in time units, with a minimum of 1/2 of the time units. (E.g., if a task would take 10 minutes, a celestial with 4 Ethereal Forces and a Neural Interface will take 6 minutes. If a task would take 1 hour, that celestial could do it in half an a hour.)

Neural Interfaces are also used with computer games, granting faster reaction times and the ability to look around in a more normal way; this typically grants a bonus equal to the player's Ethereal Forces. They are *especially* used with Massively Multiplayer Online Role-Playing Games (MMORPGs), to the point where rumor has it that both Archangel and Prince are considering leaking information to the humans just so their Servitors will be less easy to identify when playing their favorite MMORPGs.

There are also rumors that the Media has its own independently researched (and/or stolen) Neural Interface technology, and Nybbas, the Prince of the Media, is unlikely to worry overmuch about leaking it to humans.

Most users of a Neural Interface are sensible enough not to program actual *pain*. Sensations of cold, tingling, or visual overlays are all favored means of indicating something dangerous to the online avatar. Some Vapulans (especially Habbalah) are either less sensible or more sadistic, and damage perceived with their Neural Interfaces will feel painful and possibly cause Mind Hits. (This might include an electric shock any time you make a typo in a text application; beware borrowing someone else's Interface!)

A Neural Interface is recommended for purchasing any of the abilities below, as the code for each can be downloaded into the Neural Interface itself instead of hacking each application separately.

Resonance Over Live MMORPG-Media (3 or 5 points)

Usually, the shielding of avatar and avatar reduces the check digits drastically (*In Nomine*, p. 57, or IN140; visual reproduction) and makes the resonances of Cherubim and Djinn useless; further, GMs may entirely forbid certain resonance abilities (such as those of Kyriotates, Shedim, Lilim and Balseraphs who don't work for the Media). With the 3-point version of this advantage, all penalties for using resonance live within a MMORPG are reduced to a -1 to check digit, *and* virtual distance counts. (So one can get a bonus for being close to someone's character, or have a penalty for being far away.) With the 5-point version, all resonances work normally, *including* that of Cherubim, Djinn, Kyriotates, and Shedim!

Within the game, a Cherub or Djinn's tracking resonance is for the online *character*, not its player, and a careless Cherub may gain dissonance for allowing his attuned to suffer character death! (A logged-off character is in no danger, and that severs the attunement painlessly if the character and the Cherub's character are not logged on at the same time for days equal to the tracker's Celestial Forces.) A more sensible Cherub will find out whether *items* are damaged, and attune to that, instead -- with the drawback that even an item bound to a character by code can usually be left in a bank.

Kyriotates and Shedim will be able to possess avatars, not players. (The affected player sees symptoms of his character being charmed, or intermittently charmed in the case of Shedim, depending on how much control the Shedite is exerting.) Their own avatars vanish for the duration, effectively logged out. If they lose their host somehow, they will be bounced to their character log-in screen and may return to the game at wherever they left their original character.

Other resonances will be warped appropriately by the setting (a Lilim sensing Needs may find a *World of Warcraft* character's quest list, with gray quests on a check digit 1, and red ones on a check digit 6), and the GM may rule that the 3-point version of the advantage will terminate any long-term resonance effects if the character is logged off. Habbalah beware.

Ethereal Songs on Computer RPGs (varies from 1 to 3 points)

The 1-point advantage, bought separately for each Ethereal Song the character knows and wishes to be able to use online, hacks the system to permit the performance of a Song. It does not cost Essence, but will exact a price (mana, fatigue, energy, or simply a "cool down" period before it can be used again). It does not affect players, only characters (PCs or NPCs). The celestial uses his own target number, as if performing the Song normally, and while there is no disturbance if no Essence is spent, there *will* be game-specific SFX to indicate the performance and effects!

For another point, the Song *will* affect the player . . . *if* that player is also using a Neural Interface! It can be very dangerous when MMORPG guilds of angels and demons battle.

For two points, the Song does *not* need to be known by the character! It is simply downloaded and linked to a command of some sort, and will have a fixed success rate based on the character's level, like any other special ability in the game. While the celestial cannot learn a Song this way, a downloaded Song *can* be bought (for a total of 3 points) so that it will affect others with Neural Interfaces.

Celestial and Corporeal Songs on Computer RPGs (+1 point)

As above, but for Celestial and Corporeal Songs, adding an additional +1 for whichever Song is being used. (The GM is entitled to rule that hits of damage done by *any* online Song are always Mind hits, though.) As usual, this is for the game-world, using game-world values for "distance." It will be difficult or impossible to use the Celestial Song of Motion to teleport from the *EverQuest* moon of Luclin to the planet "visible" in the sky above Shadeweaver's Thicket - but you could get from one end of a zone to another with a high roll, or between nearby zones.

Attunements in Computer RPGs (1 or 3 points)

The celestial, or someone with the same Band, Choir, or Servitor attunement, will have to consent (or have consented in the past) to having his attunement studied in the appropriate realm(s) by the appropriate Servitors in the organization, so that the abilities can be coded into the Neural Interface database. Once this is done, it costs 1 point per attunement which can be used in the computer games and will affect the characters and environment therein, or 3 points if it will affect a player who is also using a Neural Interface.

Some Superiors will not approve of their Servitors allowing attunements to be studied, and some attunements (such as the Game's Humanity) may be too specialized to bother with online.

(The same procedure may also work with ethereal affinities! Or, in other systems, psionic powers that normally work only in the physical world.)

Celestial Form in Computer RPGs (1 to 4 points)

The celestial may spend appropriate in-game energies to assume *a* celestial form, chosen when the advantage is bought -- and it can be bought multiple times! Emote (or Acting) can be used to simulate appropriate Choir or Band mannerisms, and an Artistry roll (probably for CGI or Painting) should be made for the *programmer* who was trying to make an image of someone from the other side, or trying to genericize a non-humanoid "photograph." (I.e., it's easy enough to make a humanoid character have appropriate wings; if you want to make Sydney the Seraph not immediately recognizable to those who've seen it in celestial form, you'll need to modify the image.) Detect Lies can be used to try to sort out whether Joecracker is really a Mercurian, or a Calabite trying to fake it -- or vice versa; it takes observation and possibly conversation.

Each celestial form for the Choirs and Bands *other* than Shedim and Kyriotates costs 1 point. It conveys all the usual corporeal advantages in the game environment -- it can pass through "solid" objects, fly, function without breath underwater, is hard to see, etc. Zone boundaries may be ignored until the code stops producing visual results -- the celestial may then either go into the blackness forever, with the image shrinking behind him, or will be stopped by an invisible wall.

Kyriotates and Shedim who wish to stun human-run characters (i.e., those not using a neural interface) in the game -- or anyone purchasing their forms! -- pay 3 points. This *will* stun any human *players* using a Neural Interface!

Most programmers of celestial forms have a sense of humor and will enact the usual time limit for being celestial. Being able to be indefinitely celestial in the computer game costs another point (to symbolize cutting through the technobabble about how it's not psychologically good to remain in faux-celestial form overlong).

Artifacts in Computer RPGs (1 to 3 points)

As with attunements, any artifact which can be studied can be coded into a Neural Interface. Talismans for a given MMORPG or other computer game do *not* need to have any additional points or coding spent on them! Reliquaries will provide additional energy of the appropriate sort. All items that the Neural Interface provides will take up inventory spaces! While a Summonable artifact won't take up inventory slots when it's not manifested, you will need somewhere to put it when it is.

For an additional point, the artifact will be summonable within the game, whether it's summonable outside it or not.

(Summoning an item always has some minor SFX in lieu of disturbance.)

And, as with attunements and Songs, an additional point makes the item effective against others with Neural Interfaces.

Invocation of Superiors Online (1 point)

This is very cheap, but also very risky. There are very, *very* few times you want your Superior to appear next to your online avatar, and just because the dragons have nearly wiped your party is not one of them. However, if you find yourself facing Michael or Baal, via *their* Neural Interfaces, you might want to get your Prince or Archangel to help you log off quickly.

Other Applications

While all of the above abilities are primarily useful on computer RPGs and MMORPGs, the player can try to make a case for one being applicable to web-surfing, text editing, or web-page designing. If it won't be too game-breaking, the GM is encouraged to let the player sink points into the ability. Remember, NPCs can buy the ability too!

Consequences and Adventure Seeds

If there are groups who will study and program supernatural abilities . . . there are groups who will use them. Whether solitary agents on a server or guild, or entire guilds open only to celestials (or ethereals?) and their mortal minions . . . that high-level Paladin helping you with a quest may have green horns, and you might find yourself leaving your own raid to help her track down a dragon . . .

Groups of celestials may battle each other in more seriousness than anyone guesses, with Songs that will strike to the opponent's true mind -- or the angels of Lightning might join a PvP server to show those Michaelites a thing or two about tactics, with no lasting harm done to anything but someone's pride.

Naturally, there's also the issue of keeping the War secret from the programmers, online GMs, and other administrators who might notice characters doing things that their class, species, or type should be unable to do. It's considered very bad form to require some Vapulan Shedite or Lightning Kyriotate to track down and eliminate the evidence of a Warrior "casting a spell" that "charmed" another character. (Nonetheless, some celestials have favorable opinions about turning MMORPG admins into Soldiers or Servants.)

Light-hearted campaigns might be entirely online! More seriously, the PCs could be trying to track down a Soldier via his mundane child's online hints, or stopping a cyberstalker from claiming another victim -- especially if the stalker is a Djinn of Death, promising the eternal unlife of a mummy.

Darkly, addictive Neural Interfaces may have been leaked into humanity. Angels will want to stop this -- unless they did the leaking. Could Jordi have helped sow these seeds of humanity's self-destruction? Has Jean gone mad? Is this *In Nomine* backwards, with demons trying to stop Heaven from reducing mortals to vacant sheep?

In more normal settings, Servitors of Lightning will try to stop Technology from letting Neural Interface technology into the mainstream, especially when it has the supernatural additions. If they've reached a tentative agreement on this (if only because it would dislodge the Vapulans as the uber-guilds on the MMORPGs), they may find themselves banding together as a rogue group of Nybbytes seeks to get more people to tune into their underground rated-X servers, or as a canny lot of Lust Servitors promise neural interfaces will make *any* online game a place to take one's pleasure without consequence or caring, running down and ravishing an opponent as easily as firebolting them from the shadows.

Build a Better Wand in Seven Days

Options for enchanters in *GURPS Fourth Edition*

by C. Lee Davis & Anna M. Short

Legolin barged into the laboratory, nearly knocking a carelessly stacked pile of scrolls into an oil lamp in his haste. "Anthrass! Have you heard? Kelen's been attacked! The city's under siege!" Anthrass glanced up and noticed that his friend was already in his riding leathers. "It's the dragon riders, just as the prophecy said!"

"And you want to ride to the rescue." The irritation in Anthrass' voice was evident. "Fine. You go ahead."

"You're not coming?" Anthrass was no coward, Legolin knew from experience.

The wizard stopped for a breath and looked up at his friend. "I've been working on this staff for two and a half years, ever since we first heard about the prophecy of the dragon riders. I'll be done in another two months. Do you know why I'm not finished now? I'll tell you why. Because two years ago, you talked me into going to Kelen to try to prevent the prophecy. Not only did that not work, not only did it set me back two months on making a weapon that can kill dragons, but the good citizens of Kelen decided to burn me for a demon sorcerer. So, no, I'm not coming. I'm going to stay right here and finish this one enchantment, and if we're lucky, by the time they're done sacking Kelen, we'll have something that will work against them instead of just valiant optimism."

Legolin stood back, shocked by his friend's outburst. "Now go, shoo," Anthrass added. "Don't get killed. But leave me to my work. I'll join you in two months."

* * *

Enchantment in the standard **GURPS** model can be highly problematic for a player character. Without access to a large circle of mages of equal or greater power, which GMs may be reluctant to allow, a mage will require years to enchant a magic item, and even then the result will most likely be at best equal to the abilities he already possesses. In order to do this, he must drop out of play for game years; if the campaign can't wait, his skill as an enchanter is meaningless. If Magery is rare in the campaign, the time required may destroy all logical incentive for even NPC mages to create magic items -- why spend years on a wand of fireballs when he's arguably better off just casting the spell himself?

GURPS Magic and **GURPS Fantasy** offer advice to GMs attempting to reduce the number of magic items in their campaigns, but none to those who want to enable player character enchantment without unbalancing the game. Just like an alchemist, an enchanter can be a distinct magical archetype and as playable in a fantasy setting as is a gadgeteer in a high-tech world.

Assumptions in **GURPS**

GURPS Magic sets all costs of enchantment based on the assumption that an enchanter works 22 eight-hour days a month and has Average wealth. From that, it derives costs for items created using Slow & Sure and Quick & Dirty enchantment. **GURPS Magic** also assumes that would-be enchanters have access to circles of mages with Magery 2 and any spells to be enchanted at 15 or better, and that the enchanter himself has the applicable spells in the neighborhood of 20, so that he can lead the circle.

GURPS also assumes that it is often easier to teach a spell than to make an item. At most, it takes (400 hours × number of prerequisites) to learn any particular spell. With the standard restrictions on **GURPS** enchantment, the student not only ends up with access to the spell in less time, but learns all its prerequisites as well, and, unlike a magic item, his learning cannot be stolen. High mana worlds, where anyone can learn spells, elevate teaching over

enchantment even further.

For example, Fireball (4 prerequisites) takes 200 man-days to learn ($4 \times 400/8$), or 800 mage-days to enchant. The only reasons, under standard **GURPS** enchantment, to make a wand of fireballs are to exploit other enchantments, such as Speed or Power, or to use dedicated powerstones. Otherwise, it is simply faster and cheaper to teach the spell; the student gains the additional benefits of knowing Shape Fire, Create Fire, and Ignite Fire.

These assumptions do not fit many fantasy worlds. Mages may be wealthy and powerful, especially if Magery is rare. In such a setting, if the GM still wants magic items to be created for reasons other than to add Speed, Power, or dedicated Powerstones, he needs to make some changes to the material in **GURPS Magic**. These changes must address both the enchantment process and the wealth of enchanters, since the two are integrally related.

Speeding Up Slow & Sure Enchantment

The **Basic Set** sets the rate of Slow & Sure enchantment at 1 point of energy per day. Tinkering with that rate has a dramatic effect on how quickly enchanters can work, and therefore on how playable they are as characters; it can also be used to promote the creation of particular types of items by changing the tradeoffs for low-energy vs. high-energy spells, multiple enchantments on one item vs. enchanting multiple items, and so forth.

Each option includes a suggested minimum Wealth level for enchanters, to keep the cost of magic items about the same as it is in the **GURPS Magic** system. Increasing the enchanter's income will also raise the price he can charge for items created using the Quick & Dirty method; the same amount of his time is simply more valuable.

Fast Enchantment

Hours required = energy

A simple change is to allow Slow & Sure enchantment to enchant at a rate of one point of energy per hour, rather than per day. This makes enchantment much more competitive with teaching without introducing any additional, complicated calculations. Medium-sized projects may still take mage-years to complete, but lesser items will be achievable in a few weeks.

Suggested Wealth: Very Wealthy.

High-Powered, Multi-Function Items

Days required = the square root of total energy required

If the setting suggests that enchanters create few items, but those items have a wide range of capabilities, this function will support it. The incremental cost of each additional enchantment grows lower as more are put on the same item.

Using this option strongly suggests making all skill rolls on Enchant skill instead of the lower of Enchant or spell skill (see "The Power of Enchantment," below), since otherwise figuring out what enchantment took how long can be complicated. If the GM prefers, though, he can allocate the resulting time in proportion to the energy required.

Suggested Wealth: Very Wealthy.

High-Powered, Single-Function Items

Days required = the square root of the energy required for each spell

This calculation doesn't encourage multi-function items, but powerful items will not take so much more time than less powerful ones.

Suggested Wealth: Wealthy.

Skilled Enchanters

$$\text{Energy per day} = \text{Enchant}/10$$

Master enchanters will be able to produce magic items much more quickly than their less-skilled counterparts. To enhance the effect, use Enchant² instead of just Enchant; someone with Enchant-15 will be barely half as fast as someone with Enchant-20. To enhance the effects of tools, mana levels, or other factors, use effective skill instead of raw skill. Be careful with combining this with "Power of Enchantment," below, or the Enchant spell may become too powerful.

Suggested Wealth: Comfortable, or Very Wealthy if using Enchant².

Alternative Enchantments

Tinkering with the rules for enchantment itself can produce a different set of trade-offs in character design that support certain archetypes or behaviors.

Craft Enchantment

This alternative approach to enchantment requires that the enchanter also be a craftsman; a highly skilled artisan may not even need to be a very good mage. Any item to be enchanted *must* be made by the person who will enchant it. Weapons must be of *fine* quality (*very fine* quality for melee weapons at TL7+). Equipment must be of *good* quality. Other items must be of similar quality, of the sort usually retailing for 4× normal cost; this might give a -4 to the skill roll to make the item.

The enchanter gets a bonus to his skill roll to enchant the item equal to his margin of success in crafting it. He gets an additional +2 if he made the item from natural materials (mining and smelting iron ore himself to make a sword, or cutting and carving his own timber for a staff); this requires a roll on the appropriate skill.

Using this system, Enchant should only have the prerequisite of Magery 2; the requirement of artificer skills replaces that of ten spells from different colleges, since each different type of item will require a different craft skill. An enchanter might specialize in one type, such as swords or jewelry, but that makes him less flexible than a standard **GURPS** enchanter or one with a broader range of skills. He will also likely need to invest more in his craft skills, since they will not benefit from Magery, yet he cannot afford to be less skilled as a craftsman than as a mage.

This system is an alternative for enchanters to "Mysteries of the Trade" in **GURPS Fantasy**, chapter 7. Using both in the same setting but for different groups would be a good way to contrast the dour but incredible tradecraft of the dwarves with the eldritch elegance of faerie workmanship.

If the "Enchanting Tools" rules are used, a different set of tools is required for each craft skill.

Reliable Enchantment

The single skill roll for enchantment is a powerful disincentive to math-savvy players; one bad die roll could ruin game-years of work. As an alternative, the GM may treat enchantment as a long task (p. B346); setbacks become minor instead of catastrophic. Critical success no longer increases power for the item, however; it merely reduces the time required for the job. Workshops full of enchanters (if such exist) require Administration rather than enormous skill at spells to coordinate. Magic items will be about 5% cheaper, since the chance of total failure no longer exists. This is taken into account in "Enchanted

A more radical alternative is to drop the enchanting rules altogether and build magic items using the gadget limitations on p. B117. Most magic items will be Breakable, Can Be Stolen, and Unique. Generalizing the rules for study, the GM could allow enchanters to make such items

Economics," below.

The Power of Enchantment

If the GM feels that there's not enough reason to make magic items in the first place, he might want to allow the power of the item to be based on the *higher* of the enchanter's skill with the spell being enchanted or with Enchant. This will encourage enchanters to invest in Enchant rather than other in spells. It might be too powerful if combined with "Skilled Enchanters," above.

by taking 200 hours per point the advantage would cost. Using this model, knowing the spell or even knowing Enchant can be made optional without sacrificing game balance.

Enchanting Tools

The GM may require special enchanting tools. These must be themselves enchanted, with an energy cost of 5,000. If they modify effective skill (as per p. B345), adjust the time required to make them by the same amount as the price. Depending on the setting, tools may be available for sale; see "Enchanted Economics," below, for prices. Working without them would be subject to the penalties for "no equipment." The origin of the first enchanting tools might be worth a line or two in a creation myth.

If tools for enchantment need not be magical, the suggested base price is one year's wages at average income for the TL.

Other Factors

If the GM wants to let factors other than sheer skill influence the power of the resulting item, he may want to use *effective* skill, and involve the magical lenses from **GURPS Fantasy**, chapter 7; the equipment modifiers from the **Basic Set**; or even the full Hermetic magic set from **GURPS Cabal**.

Improving Items

For **GURPS Third Edition**, Sean "Dr. Kromm" Punch suggested some measures that GMs might want to use to power up magic items in their campaigns; these work just as well in *Fouth Edition*:

1. Spells cast using magic items do not count as spells "on."
2. Spells cast using items are unaffected by Shock, although someone using an item is still susceptible to Distraction while concentrating on using an item.
3. Spells cast using items do not count against a mage's uses of a spell, when that matters (for example, Major and Minor Healing).

Enchanted Economics

The bulk of the cost of magic items is in the enchanter's labor. Speeding up the process makes them less expensive, unless the enchanter simply demands more money for his labor.

The default assumption in **GURPS Magic** is that a wizard is about as well-off as the average blacksmith or tavern-keeper, and significantly poorer than a typical priest or armorer, never mind a knight. Wizards (or at least enchanters, who must be exceptionally talented) may demand significantly more for their labor if it is more scarce. Magic items may be literally worth a king's ransom, or be so rare as to be beyond price!

	Slow & Sure			Quick & Dirty		
Wealth	Base	TL3	TL8	Base	TL3	TL8
Average	×0.048	\$33	\$124	×0.010	\$7	\$27

Comfortable	×0.095	\$67	\$248	×0.021	\$14	\$54
Wealthy	×0.24	\$167	\$619	×0.052	\$36	\$134
Very Wealthy	×0.95	\$666	\$2,476	×0.21	\$145	\$537
Filthy Rich	×4.8	\$3,333	\$12,379	×1.0	\$723	\$2,686

Base values are cost per mage-day for Slow & Sure enchantment, and cost per energy point for Quick & Dirty. Multiply average monthly income at the TL by the base value to get the cost of enchantment per mage day or per energy point, assuming enchanters of a given wealth level. Reduce prices by 5% if using "Reliable Enchantment," above. For those who'd rather do the math, slow and sure is (average wealth × wealth multiplier × S), where S is 0.0476 for standard enchantment or 0.0455 for reliable enchantment; quick and dirty equals (average wealth × wealth multiplier × 0.0103).

Given the hectic lives of player character enchanters, the GM may find it easier to simply roleplay each commission. For some wizards, enchantment might simply be a lucrative sideline that pays the bills for repairs to the tower and research materials.

Advantages

Finally, a few character creation options can help differentiate the dedicated enchanter from the generic wizard, and fit the use of enchantment better into the game.

Magery

See p. B66

Enchantment Only: You may learn spells normally, but may not cast them; you can only enchant them into items. This differs from One-College Magery (Enchantment) in that you can learn spells in any college, even those with Magery prerequisites, if you have the appropriate level of Magery (Enchantment Only). -30%.

No Enchantment: You may not enchant items. -15%.

No Slow & Sure Enchantment: You may only enchant items using the quick and dirty method; this limits you to weaker items. -10%.

Signature Gear

See p. B85

Using any of the optional slow & sure enchantment systems in this article, it is not possible to set a fixed ratio of character points to energy. Base the cost of a magic item on the typical enchanter's income and how long it would take to create.

* * *

Legolin barged into the laboratory, nearly knocking a carelessly stacked pile of scrolls into an oil lamp in his haste. "Anthras! Have you heard?"

*"About Kelen? Yes." Legolin paused a moment to boggle; the wizard was wearing his travel robes, but a sword's baldric was thrown over one shoulder and a quiver over the other. As Legolin stood there, a kite shield was pressed into his hands, so Anthras could grab his staff with the hand that wasn't already holding a lance. To Legolin's elven mage senses, every item shone with enchantment. "Get that cloak. Where are the others? We're ready for this. This time, we've got weapons that can actually **hurt** dragons. Burn me, indeed. I'll show those Kelen fools the difference between a demon sorcerer and an enchanter!"*

Coupons, and Other Hidden Truths of the Universe

As I'm wont to do, last week I was listening to National Public Radio, and I heard an interview on [Here and Now](#) with Tim Harford, who was plugging his new book [The Undercover Economist: Exposing Why the Rich Are Rich, the Poor Are Poor--and Why You Can Never Buy a Decent Used Car!](#) (Exclamation point theirs.)

Now, I haven't actually read the book in question -- since the last book I really had time to read involved Grover imploring me not to turn anymore pages -- but the interview was interesting. And one of the points made therein had me thinking -- wait for it -- about gaming.

Unfortunately, the idea it sparked is a proto-idea, kind of like a half-popped kernel of popcorn. Personally, I love those half-popped kernels, but if you're expecting something fully thought out and playtested, I don't want you to be disappointed. (Cue up e-mails saying, "If we wanted something fully thought out and playtested, why would we still be reading your column?")

Anyway, in the interview, Harford makes the point that supermarkets pricing schemes all focus on one idea: to figure out who cares about saving money and who doesn't. Thus a supermarket might offer produce in bagged and unbagged forms, with different prices per pound; the person who doesn't care about saving money has a 50/50 shot at spending more per pound, while the person who does care is assured of getting the best price.

Part of the extension of this idea is the supermarkets' pursuit of grandmothers. Harford hypothesizes that grandmothers are extremely sensitive to prices; if prices were to inch up at one grocery store, the grandmothers would all access the collective hive mind (AARPnet) and inform the rest of the collective, causing them to flock to another store. (I might be adding my own spin to the exact explanation . . .) Thus areas with sufficiently advanced grannytech serve to keep prices low for everyone. Conversely, grocery stores in more affluent neighborhoods are much more forgiving of price nudging; if prices rise, there won't be a resultant loss of customers.

I swear I'll be swinging this back around to gaming real soon now.

So, Tim Harford explains, grocery stores have figured out a system to ensure that those who watch costs are able to save money, while those who don't care are charged more. And the system is: coupons.

By various schemes involving coupons and advertised specials (but mostly, it seems, coupons), grocery stores are able to attract those shoppers who are sensitive to prices while performing the most optimized cashectomies on those who aren't. I personally witnessed this phenomenon first-hand when I calculated that my wife, an avid coupon-clipper and bargain-hunter, probably saves enough money each week to "earn" just shy of her normal hourly rate in that coupon-clipping time, while being able to watch television and wear her pajamas. I support her on this, while she seems less supportive of the extra work and freelance opportunities I do at home to earn extra money . . . possibly because I'm wearing her pajamas.

Anyway, the point remains: There exists a system that serves only to reward those who most care about being so rewarded.

Time to cue up the gaming relevancy.

As an avid roleplayer, I'm rewarded in many games I play with roleplaying incentives: extra experience points, bonuses to rolls, and the like. However, I realized after hearing this interview that the whole thing is rather curious, since I'm not roleplaying because of these rewards; I'd still be roleplaying even if I didn't get anything out of it. (I roleplay in just about every game I can; when playing *Life*, I'll usually craft the game's results into a tale. "And, because your father was an uninsured driver when he had that accident, we're forcing him to ride in the back seat of his tiny plastic car.")

So, to meld these ideas together, is it possible to craft a system that provides rewards only for those for whom it would

serve as an incentive? Or, looking at it from another point of view, is it possible to craft a system that can give all players what they want -- namely, more opportunities for those who like roleplaying to roleplay, *and* in-game incentive for those who may not like to roleplay?

Well, when I first had this query in my gray matter, it wasn't an easy one. After all, how can you say why someone is acting a certain way, regardless of incentive? (I mean, I may not be roleplaying for the extra experience points, but I'll spend 'em if I get 'em just the same.) However, I have an idea -- a half-baked one, but one I'm eager to try out next time I get a group together (currently scheduled for 2525¹).

Many -- if not most -- games have some kind of in-game "currency," whether it's hero points, fate points, willpower points, or the like. If nothing else, almost all dice-based games have the idea of "bonuses." What if, then, instead of providing an extra hero point or die-roll bonus to those who roleplay well, you do this:

If, within a game, a player roleplays well enough to earn a bonus of some kind, that player *instead* gets one of those points (hero point, bonus, etc.), which he has to give to another player. That other player can use that bonus however he sees fit, provided he at least pays lip service to roleplaying. (The player who spends the bonus doesn't get any additional points to give anyone else for roleplaying.) At the GM's option, the bonus-recipient player must tie his roleplaying to the bestowing character.

As an example: Players Aaaa, Bbbb, and Cccc are in a game run by Gggg. In one scene, Aaaa, playing a scientist, offers a brilliant inspirational monologue that causes Gggg to give him a point (in this game, a +2 bonus to any skill). Aaaa gives the point to Bbbb. Later on, Bbbb -- who's more of a tactician than a roleplayer -- finds his character in a tight combat spot, and eyes the bonus. Bbbb has his character reload, and wade into battle, saying, "Time for talk's done, college boy; let's show you what action can do!"

How, you might ask, does this system differ from other systems? For example, in the example above, how does the game differ with Bbbb needing to roleplay to access the bonus Aaaa gave him, versus a different game where Bbbb would get a bonus for roleplaying directly? Put simply, these points (as I envision them) are automatic; as long as Bbbb makes *some* attempt to roleplay, he's going to get that bonus. While a system that relies on good roleplaying relies on the GM agreeing with the player in question that a given moment is an example of "good roleplaying," this new system merely requires that the GM, at some point, acknowledged some player as having roleplayed something well.

In addition, the system rewards roleplayers by enabling them to bolster the group, while not rewarding them directly in way that would prove unbalancing in the same way that, say, giving extra experience points would. Plus it gives the roleplayer more chances to roleplay, *and* a greater chance of being able to interact with the other players in an interesting way. Thus in the example above, Aaaa can give Bbbb some ribbing about his "college boy" crack. In addition, this system enables roleplayers an ability to contribute to the group's well-being. (I don't know about other heavy roleplayers, but I know that my characters usually "suffered" from a min-max efficiency standpoint because I usually put a lot of focus on seemingly superfluous stuff instead of abilities that I knew would be of benefit to the group. "Hmmm . . . I think I'll raise my character's Theology to doctorate levels . . .") Plus the recipient of the bonus is never obligated to roleplay; if he doesn't want to spend the bonus, he doesn't have to. In fact, the best he can hope for from roleplaying is to reward *other* players . . . which may take some of the pressure off players to feel they "have" to roleplay to beef up their characters as much as possible.

As I said before, this isn't a well-tested system. In particular, it may result in some odd play dynamics, or it might result in skewed experience rewards at the end of adventures, since under this system roleplaying *isn't* rewarded above and beyond the bonuses for other players. But it may yet prove to shake things up in a group, and might even give a little nonthreatening incentive for those non-roleplayers to get in on the act.

If nothing else, it should give incentive for all those folks who aren't roleplaying because they're too busy clipping coupons in my wife's pajamas.

Pyramid Pick

Cat: A Little Game of Little Heroes

Published by [Wicked Dead Brewing Company](#)

Written by John Wick

44-Page A5-Sized Spiral Bound Book; \$15

1.4 MEG PDF Document; \$8

As I write this review, Miw is sat watching me. In fact, she has been staring at me for some time now. Perhaps she is hungry, but when I check her dishes she has fresh food. Does she need her dirt tray emptying? I check that and no. Is she bored? I go upstairs and find "fishie on a stick" from where she dropped it last night. Once back downstairs, I jerk it up and down in front of her, but Miw just bats her eyes at me and gives me her best "Bored now," look. After all that activity I still do not know why she is staring at me.

But after reading John Wick's *Cat: A Little Game of Little Heroes*, I know more. You see, we are not in charge -- and neither are the mice. Nor are those vain vampires or woolly werewolves, so there is nothing to worry about on that front. No, the Cats are in charge, and I am not all that surprised. You see, they won a contest, between them, the Dogs, and Us. Guess who came last? And because of that, the Cats as champions have to protect the losers, Us. But from what? Simply, Boggins.

Which Miw has since told me are bad little things full of teeth and claws and claws and teeth, and we cannot see them because we are very good at ignoring them. A Boggin can cause fear and anger and laziness and all sorts of negative emotions, driving its claws and teeth into Us, working to weaken Us and eventually claim as a Boggin host. Cats protect Us from Boggins not just in the real world, but also in the Kingdom of Dreams, where they use magic to manipulate and alter the off-kilter world around them.

A Cat is defined by her Claws for fighting and climbing; Coat for protection and persuasiveness; Face for eyes, nose, ears, tongue, and whiskers -- all she can sense; Fangs for fighting and carrying; Legs for leaping, balance, and agility; and Tail for soul and Magic. A player sets one of these as her Best trait, three as her Strong traits, and the others as Good traits. Each trait is also a bonus value -- 3 for Good, 4 for Strong, and 5 for Best. Seven points are distributed between her Reputations. A Cat also has three names, what we call her, what other cats call her, and finally her secret name not to be divulged to anyone. Naturally Miw declined to tell me hers. And of course, a Cat possesses nine lives.

Mechanically Cat employs the same "Taking Risks" engine seen in the author's *Enemy Gods*. A number of six-sided dice are rolled equal to a Cat's appropriate trait, plus any Advantage Dice agreed upon between player and GM. Any Even results count towards to the Risk difficulty -- one for an Easy Risk, two for Moderate, and three for Hard. Advantage Dice are awarded for a player showing initiative and roleplaying well. For example, Moogie (Miw's not so bright sister) tries to creep up on a busily feeding Boggin, who has its claws and teeth buried in Louise whilst she is sleeping. It is dark, which gives Moogie one Advantage; the Boggin has its teeth and claws and claws and teeth buried in Louise so is distracted, another Advantage; and Moogie has managed to climb up onto the curtain rail over the Boogin in readiness to do it death from above, a third Advantage. All together, Moogie gains three Advantage Dice and Moogie is in position ready to pounce.

Combat works as a series of opposed Risks, with Cats taking damage in terms of Scars, which heal slowly, and when enough accumulate on a trait, lowers its value and effectiveness. A Cat can avoid gaining Scars in combat by expending a Life, or a Life can be used up to succeed at any Risk. A Cat also possesses Style and anything she does is carried out with flair, whilst a Dog would just get it done in a well, dogged fashion. But whenever a Risk roll succeeds

by more than the number of Evens required, a Cat earns a Style Point for every extra Even rolled. A Cat can save this Style Point for later use as an automatic Even, or alternatively to edit an aspect of the current situation. Thus Moogie, having successfully crept up on the Boggin could expend her Style Point to have Louise roll over in her sleep and unnerve the Boggin!

While all Cats suffer from the "Curse of the Bauble," inflicted long ago by a Dog Sorcerer, they also have access to magic. More feline tricks than spells, Cat Magic is powered by her Tail. Depending upon the strength of her Tail trait, a Cat can fall up to 70 feet and not suffer any Scars, disappear in the blink of an eye, perform the "Dinner Dance Ritual" (also known as the "bloody cat underfoot" ritual around here), or even the befuddling "Chase Your Tail Whammy" on Dogs! All such abilities are temporarily lost if a Cat is thoroughly soaked to the skin. Cats also have magics that can only be cast in the Kingdom of Dreams, whilst Dogs have their own magic, which is powered through canine loyalty to Us.

Refereeing *Cat: A Little Game of Little Heroes* is not an undemanding task, the intention being that the GM tell stories with the aid of the players, who are expected to have a high degree of input into the game. This is aided by the familiarity of the playing environment, which is really just your neighborhood, although just at a cat's eye level. The advice on writing and telling stories, and running the game is nicely judged from a feline angle. This is both for the real world and the Kingdom of Dreams, but where the game is lacking is in the number of story hooks. Yet in reading through the book and looking at the bestiary of creatures that includes not just rats, Bad Cats, and Dogs, but also Boggins, the GM should find ready inspiration.

Engagingly written, *Cat* is rounded off with a discussion of both Cat facts and Cat folklore. Quite literally, as the author's own late Cat Roland, has much to say on these matters. Available as either a 44-page spiral bound booklet or as a 1.4 MEG PDF, the game is suitably illustrated with a selection of publicly available pieces of artwork. Although it needs another editorial pass in places, the book is written in a light tone, and it is clear that the author is enjoying himself.

Cat: A Little Game of Little Heroes is quite simply charming. Although it will never find acceptance amongst the Dog lovers of this world, the rest of Us will be able to enjoy a game that lets Us enter the feline world, but without anthropomorphizing its protagonists. At its heart is a very caring theme, which not only sets it apart from all of those other brasher RPGs, it also lends it a softer, more feminine feel. Which is not to say that dark tales cannot be told with this game. After all, Cats are charged with protecting Us from the nasty Boggins that seek to empty and possess our very moral shell. Above all, *Cat: A Little Game of Little Heroes* is a delight, a game that should appeal to more than the bang-bang sword-swinging crowd.

--Matthew Pook

Pyramid Review

Through the Desert

Published by [Fantasy Flight Games](#)

Designed by Reiner Knizia

English rules by Reiner Knizia, Kevin Jacklin, Kevin Wilson, & Christian T. Petersen

Edited by Greg Benage, Kevin Wilson, & Christian T. Petersen

Art, graphics by John Gravato, Scott Nicely, & Brian Schomburg

Game board, 175 plastic camels, 30 plastic riders, 45 watering hole counters, five plastic palm trees, 40 point chips, & rulebook in eight languages; full color & boxed; \$29.95

Fantasy Flight Games doesn't seem content to come out with good new games. They realize there's money to be had by reproducing or reissuing new versions of oldies that have vanished from the market. Although perhaps not a classic in the vein of upcoming items like *Fury of Dracula*, they shepherd a new one to press with *Through the Desert*.

The object of the game is to score the most points with your various caravans.

The map uses hexagons to depict a section of desert riddled with oases and watering holes. If you want your trips to be a success you have to get your goods to market, and that means securing the vital water resources and oases. Before the game begins, everyone stakes out a few claims that become their starting points. Camels come in five colors (six, really, but more on that later), and everyone shares these camel "pools." Each player can therefore have five separate caravans, one of each color, and yours are distinguished from the others by your riders. Riders are little plastic pieces that attach to the tops of camels.

On your turn, you select two camels of whatever color(s), and use them to expand one or two of your caravans. You receive points for connecting these columns to oases (represented by palm trees) and watering holes. The former are worth a straight five points apiece, while the latter are tokens with point values from one to three, and they are kept secret from other players once you take them so no one knows how many points you've got without a little memorization. Two players cannot have the same color convoy adjacent to each other (their blue cannot connect to your blue, for example), so judicious placement of your camels can cut someone off from getting to an oasis or other strategic points.

If you can isolate a segment of the board with a single color of caravan and/or the edges of the board, you get points for every hex you cut off. An award is also given for the longest caravan in each of the five colors. When the last camel of any one color gets placed on the board, the game is over and points are totaled to determine the winner.

Fantasy Flight is still bringing quality components to the table. The camels and palm trees are just darling; the board is sturdy, mounted, and folds out; and the counters are stiff and durable. The camels sit where you put them (though the board may take some flattening out), and best of all the riders snap pretty neatly onto the backs of the camels. The riders are a more striking shade compared to the pastel plastics of the camels, so picking out whose riders and caravans are whose is easy. That said, trying to tell which "longest caravan" tokens go with which camel color, well, shades and

hues are much less forgiving there.

It takes less effort than one might think to get used to the various color schemes (the blue player has blue riders, but everyone can use blue caravan camels), something that sounds more confusing in the rules than it is in practice. Notwithstanding, the buyer should have some little baggies ready -- separating the camels into pools at the start of every game gets old fast, and having several smaller packages will make it easier to work all the components back into the box after opening. Quarters are already tight in this respect.

The mechanics could not be more enjoyable. (Although the inner workings smack of several other games, remember this one came out seven years ago.) With four ways to advance, but only one pool of camels for everyone, one must weigh one's options. You can score big points by enclosing an area, but that requires a lot of camels (to say nothing of the willful ignorance of your opponents), and that leaves that color's pool depleted. A canny opponent who sees himself ahead on points could then just spend the last few tokens and end the game while he's in front. The same holds true if you just bunch up the camels trying to get the biggest caravan award, but you're better off stretching that line out to score various board elements.

For a game with so many components and so much strategy, it plays awfully quick. You need not devote an entire evening to it, but if you do you can finish multiple games in a couple of hours. Visually pleasing, well-built, and artfully designed to foster maximum competition and careful play balance, ***Through the Desert*** makes a welcome return to the shelves. Although it shows itself off in a fairly crowded market, it has the ingredients needed to make a notable splash.

--Andy Vetromile

Old School

Low-Tech Higher Education

by Matt Riggsby

There has long been a distinction between primary and secondary education. Primary education gives the student basic academic skills, typically just literacy with an important religious or philosophical text as the curriculum, but occasionally with a bit of basic math thrown in. Beyond that, there were more focused, advanced studies. These were almost universally concerned with three subjects: law, medicine, and philosophy, with a particular emphasis on religious studies.

However, the way these advanced subjects were taught and the way their teachers were organized changed considerably through the years. For example, universities didn't exist in Europe until the 12th century, and even then it took centuries for them to take a recognizable form. Indeed, the very idea of a school as an identifiable place rather than a group of teachers is relatively modern. Here, then, is a brief education on education.

Pre-School: Greek and Roman Higher Education

Through the ancient world, no formal qualifications were required to teach. Anyone who could convince students (or, for children, their parents) to hire him could teach his intended subject. And where he taught was wherever he could find a space: private homes, rented rooms, or any public space where he could find a quiet corner. Greek gymnasia and Roman baths, both of which usually had extensive spaces for relaxation, refreshment, and alternate amusement, were popular venues for advanced teaching. The very word "academy" comes from the name of a gymnasium frequented by Plato and, later, Aristotle.

An educated person would be educated in two sets of subjects: the trivium (grammar, rhetoric, and logic), and the quadrivium (arithmetic, music, astronomy, and geometry), which have since come to be known as the seven liberal arts. The manner of their teaching, though, tended to be informal by modern standards, particularly in their advanced forms. Teachers would lecture on whatever topics they favored. Broad classes of subject material were often fairly predictable (great authors were discussed by grammarians and rhetoricians, Plato and Aristotle by philosophers, etc.), but there was no "Philosophy 101," as distinct from advanced philosophy classes.

One consequence of this lack of formal structure is that there wasn't really a point at which a student could definitely say that he was done studying. A budding scholar could go on studying off and on for years, even the rest of his life. Even some prominent scholars of later centuries went back and forth between studying under masters of great repute and teaching on their own. Students would also travel to distant cities to study under notable teachers.

The situation hardly changed during the early Middle Ages. Monasteries preserved traditions of literacy, of course, but monks mostly taught other monks, not members of the public. When lay teaching again emerged, it did so largely along ancient lines. Again, teachers needed no formal credentials and had no dedicated schools to each in. However, certain limited exceptions arose. Cathedrals became centers of learning, focusing on philosophy and theology with some study of law. To teach in a cathedral town, one needed a license granted by the Chancellor, the head of the bishop's bureaucracy. Theoretically, the chancellor would require that a scholar of know repute vouch for the prospective teacher's qualifications, but a bribe would usually suffice.

Certain schools became notable centers of learning, including Salerno, Bologna, Paris, and Oxford. Indeed, their reputations became international. Students at a prominent school would have come from all over the country, or even from across western Europe, and in many places the same was true of the teachers. It was from that international character that the first universities would arise.

Good Morning, Teacher!: The First Universities

By the later half of the 12th century, one of the problems faced by Medieval scholars is that, at the major centers of learning, they were mostly foreigners. At the time, people living outside their own city or country had few if any rights and a very disadvantaged legal position. Taking the lead provided by other professionals and tradesmen of the era, the scholars started to do the sensible thing to protect themselves: they formed guilds.

These guilds were the first universities. Or, at least, the first universities devoted to scholarship. The word "universitas," from which "university" is derived, simply meant an association or guild. There were already organizations called universities, but these were associations of tradesmen (that is, what we would recognize as guilds), social clubs, or civic "corporations" administering towns. The scholars simply formed an association representing their interests to the authorities and adopted an appropriate name for their organization.

Now that they were organized, they could take steps to protect their interests. Scholars at the new universities were able to build a monopoly on higher education by playing on the fears and aspirations of students, forcing out teachers who weren't members of the guild. Even though, at the moment, the only true legal requirement concerning teaching was a license from the chancellor, and even that was only required to teach at a cathedral (which was only an issue in some cities), the new guilds could at least exclude teachers who would not join them, effectively making a university degree a license to teach.

More importantly, they were also able to demand new legal protections for themselves. The universities demanded new rights and privileges for their members from the authorities in the cities where they were based, with the threat of shutting themselves down or moving to another location altogether. *The Hitchhiker's Guide To The Galaxy* notwithstanding, a philosopher's strike was actually something of a concern to the cities, kings, and bishops who might be affected. Having a university was a point of prestige for a ruler, and the students provided significant revenues for the city where they were established. Early 13th-century Oxford is an extreme example; with around 3,000 students and faculty, they were in danger of outnumbering the non-academic natives. If they left, that was a tremendous loss in rental income, sales of food and clothing, and so on. And at this point, the university was still just an association of scholars, without buildings or endowments to tie it to one place, so the university could, in fact, pick up and leave.

And they did just that. Several of the early universities had occasion to relocate from their original homes to other cities or scatter across the landscape in protest of their treatment by civic or church officials. In each case through the 13th century, the authorities caved in or were overruled by kings and popes. Teachers and students were afforded legal protections similar to those given to clergy. Scholars were no longer subject to civil law and could only be tried in ecclesiastical courts, which were notoriously lenient towards defendants. Professional academics were now safe in foreign cities, at least from everyday conflicts.

Once the idea arose, kings and popes decided to get in on the act. Eager scholars running schools in less influential centers petitioned rulers for charters, and rulers, eager to buy their loyalty and establish authority over the new institutions, granted them. By the end of the 13th century, there were ten or eleven universities across Europe, with new ones springing up every decade or two. Scholars had growing legal immunity, and growing power to exert their will. Bound by oaths taken at graduation, graduates were obligated to support their university for the rest of their lives, so a general strike by a university angry at its country's authorities could cripple the ecclesiastical and civil bureaucracies they staffed. Universities were usually focused on abstruse philosophical debates and the protection of their own privileges, but for the later half of the Middle Ages, they were also a political force to be reckoned with.

Student Union

In most of Europe, it was the faculty who first "unionized." However, some important universities in Italy followed a somewhat different course, albeit with similar ultimate results. At the first major university in Italy, the law school at Bologna, it was the students who first formed an organization. There, the faculty were mostly Bolognese anyway, so they were already protected. The students, though, were largely foreign. Like the teachers of the north, they called their own strikes, which were equally effective in shutting down the schools and winning legal rights (after all,

Student Life

By the time universities were firmly established, they had changed and regularized the character of formal study. Students usually started in their mid-teens. The only requirements to be accepted as a student ("admission" might be a misleading word, there being no institution to be admitted to quite yet) were literacy and a very basic understanding of Latin. Students at many universities had a reputation for drunkenness and boisterous behavior, which is perhaps to be expected of a population of teenage boys living largely on their own in a big city without parental supervision.

students paying fees are every bit as necessary to a school as teachers), with the additional twist that they were able to impose regulations on their teachers concerning everything from materials covered to timing of classes.

Universities had at least two "faculties," or teachers of a given body of subject matter. The largest was usually the Arts faculty, nominally teachers of the ancient subjects of the trivium and quadrivium. In practice, logic dominated the other subjects to the point where everything was taught in theories and dialogs; this is the point in history where languages came to be taught with rules of grammar rather than by examples of what is and is not proper usage. The remaining subjects were largely given lip service. Aristotle (whose works were not all available at the time, and those that were, in retrospect, were not all that well translated) was put on a pedestal, and his works were considered nearly on par with the Bible and the Church fathers for authority. An Arts education typically took five or six years. After two or three, the student would become a Bachelor, with limited rights to teach, and after the full course would become a full-fledged Master.

A university almost invariably had at least one of four "higher" faculties, although none had all of them: canon (church) law, civil law, medicine, and theology. These can be considered similar to what we'd call graduate schools. Students under these faculties were somewhat older, and it was at least hoped, if not required, that they would have received an arts education first. The first three faculties were immensely lucrative. An education in civil law promised a rewarding career in business and politics, a degree in canon law put one in line for important positions in the Church, and medical doctors have always made good money. But theology, though a series of popes tried very hard to encourage its study, was often the poor cousin of the other schools. The course of study was grueling (often ten to twelve years, twice as long as other subjects), and though it might qualify one for religious debates, there was no money and little chance for high office in it (most popes didn't have a theology degree, and would often defer to theological scholars in abstruse philosophical debates). And of those people who could afford that much schooling, not many were interested in spending that much time and effort in a field with little practical application. Increasingly, the classrooms of the theology departments were filled with members of mendicant orders, Dominican and Franciscan friars, who were supported by their orders during their education.

Universities, like other guilds, conducted themselves more or less democratically. Officials were generally elected rather than appointed by an authority, and they acted as administrators and mediators rather than rulers. However, the nature of that democracy was rarely as simple as "one man, one vote." At most universities, the faculty, students, or both were organized into subdivisions according to their nationality. For example, at Paris, they were divided into the French (that is, scholars from central France and just about everything to the south, including Spain and Italy for some reason), Picards (from northwest France and the Netherlands), Normans (from northwest France), and English (everyone not included in the first three, including Germans, Slavs, and Scandinavians). Oxford, on the other hand, was almost entirely English, so the scholars were divided into North and South, while at Bologna, the students were divided between Italians and non-Italians. No important action would be taken or policy put in place without the agreement of the "Nations." Academic politics were more exciting than they are these days, with fistfights a common occurrence during particularly vigorous debates and brandished swords not being uncommon.

Town vs. Gown

From Bangkok to Paris, Tiananmen Square to Kent State, protests and riots driven by university students are a fixture of modern life. So much so that it may be surprising to learn that they go back to the beginning of the university. Indeed, student riots were among the formative events of some very important universities. In the first decade of the 13th century, both Paris and Oxford saw tavern brawls

Of course, few large organizations function without money, and the organizations in question were first and foremost groups of tradesmen. Teachers collected fees directly from their students. Tuition could be subject to negotiation, so some students might pay by the lecture, some for a month or year at a time, and any one student could pay more or less for his education than another, depending on the teacher and his own skill at negotiation. Likewise, class schedules would depend on the individual student's interest in attending lectures. Study itself would consist of attending lectures, discussing subject material, and reading. There would be few if any specific assignments beyond recommended readings from the teacher; the idea of writing a paper on a set topic would almost certainly be a novel one. It's worth noting that the typical final "examination" required the student to defend a proposition in a debate, not to write anything down.

involving students turn into violent riots leaving several dead and resulted in student and faculty strikes which established the power and willingness of the universities to pack up and leave if strongly motivated.

The university collected fees from newly created bachelors, masters, and university officers. It was typical for the period for new officials to pay someone for the office, or at least to pay for a commemorative feast. These costs could become enormous. Sometimes students had to delay their graduation for months or years in order to raise the necessary funds to pay for the obligatory ceremonies. By all accounts, though, the university spent money as fast as it came in. At least, students and teachers alike were notorious for pleading poverty.

What nobody did at this point, though, was to buy or build buildings. Teachers still lectured in homes, public spaces, or rented rooms. There was no such thing as a university campus, only members of a guild. But that was about to change.

Ivy-Covered Halls

For some years, students had clubbed together to rent housing together, but there was still a sizable population of eager students who, when they had to choose between paying for education or housing, chose the former and begged for the latter. As the universities grew more powerful and important, powerful people endowed several charitable hostels for the poorest students. Living conditions were relatively primitive, the food bad, and the house rules imposed on the students strict (many colleges were religiously endowed and had rules resembling those of a monastery), but it was better than begging for bread. These hostels, called "colleges," tended to be in fixed places, sometimes even purpose-built buildings.

Then, probably late in the 13th century, a curious thing started happening: the parents of some students (who, since the students were by now overwhelmingly in their teens, still had some say in how their money was spent) wanted their children to live in the closely regulated colleges rather than freely in the immoral atmosphere of the city. And they were willing to pay for the privilege. Though many students doubtless resented it, many colleges began to accept paying students as well as charity cases, so they came to hold a very large proportion of the student population.

As it turned out, this was apparently good for their education. The students' notorious tendencies towards drunkenness and violence were blunted somewhat, and the colleges provided a good environment for study and discussion. The masters who were hired to run the colleges provided tutoring and oversight, and in time the colleges started asking teachers to deliver lectures there. This suited the teachers, since it relieved them of the need to find and pay for teaching spaces, and so the colleges began to absorb the day-to-day business of teaching. By the end of the Middle Ages, teachers belonged to the university, in that it organized them for political and legal action and provided them a framework of standards, but for employment they essentially belonged to a college as well, at last tying the university down to a single location.

Although there were other factors (the rise of the mendicant orders, for one; in disputes between universities and friars, popes usually sided with the latter), this was perhaps the most visible symbol of the decline of the university from political power to mere school. In addition to the colleges, universities began to acquire churches and other buildings, which meant that they would lose a great deal if the members relocated. Without the ability to pick up and leave if things weren't going its way, the university lost its greatest weapon. Kings, bishops, and popes could curtail their freedoms, and increasingly came down on the other side of disputes. The oaths of perpetual loyalty taken by graduates

likewise became diluted as a handful of great universities found competition from newer, smaller ones. Universities remained intellectual centers, but in political terms, they were tethered giants: huge, but unable to move.

Not On The Exam

The astute reader will notice that the subjects taught at Medieval schools cover a very narrow range. Many humanities, most social sciences, and except for astronomy the full range of physical sciences don't receive a mention.

Some of the missing subjects wouldn't have been completely absent from a Medieval education. They simply wouldn't have been taught as subjects in their own right. For example, a student would likely be exposed to a smattering of history by reading ancient historians in pursuit of, say, grammatical or rhetorical points or by reading hagiographies in pursuit of theological examples. However, many subjects simply didn't exist yet or only existed in a rudimentary form, including geology, archaeology, anthropology, psychology, biology, physics, and chemistry. Others might be taught purely as theory. Music, for example, would be considered purely in abstract terms, without any particular urgency felt about actually picking up a musical instrument; or art might be considered in philosophical conjectures on the nature of beauty without anyone picking up a brush or a sculptor's chisel.

Practical subjects were taught in a practical fashion rather than by "book learning," and they weren't taught to university students. Technical specialists at the top levels, architects and people we would call engineers, would be literate and might have a moderate formal education, but that would be incidental to their craft. What they knew about building bridges, constructing ships, making clocks, and so on would have been learned on the job, by assisting a master performing those tasks. A learned university man wouldn't design a cathedral; indeed, he wouldn't know where to begin. He'd have a lucrative position which would allow him to hire a tradesman to do it for him.

Big East

Of course, different societies produce different institutions and practices for higher learning. In the Muslim world, *madrasas* more closely resembled modern schools than just about anything in the contemporary west in that they involved actual school buildings, although they were fairly minimal. A typical madrasa was simply a number of cell-like rooms set around a courtyard. The rooms were occupied by individual teachers and advanced students, and they might function as combined lodging, office space, and classroom. Students would gather at their teacher's room for lectures and retire to their own to read and take their own notes.

Muslim scholarship also developed credentials earlier than in the west. A teacher was granted a license to teach by his own master when the master decided that the time had come. A teacher would be able to trace the pedigree of his credentials through generations of scholars into time immemorial.

The function of madrasas was explicitly religious. Madrasa students would memorize the Qur'an, learn haddiths (sayings attributed to Mohammed but not part of the Qur'an itself), examine commentaries on the Qur'an, and so on. However, unlike the west, which had separate bodies of church and civil law, the Muslim world based its laws solely on the Qur'an. As a result, the madrasas were also the law schools. An advanced student would learn law, rhetoric, and logic along with the basic Qur'anic studies, and upon graduation have sufficient credentials to be a lawyer or even a judge.

There were medical schools as well, of course, which quickly developed relatively advanced requirements for entry. A prospective medical student was required to have completed at least a basic course of studies at a madrasa, and depending on the school might have to have additional education in legal studies.

For the most part, Chinese education resembled that of pre-university Europe. Teachers were usually independent businessmen who needed no formal licensing. Beyond basic literacy, higher education concentrated on its own set of central texts, with Confucius enjoying a similar status to Aristotle in Europe.

The most notable difference between Chinese and western education is that in China there were academic

qualifications. They simply had little or nothing to do with making more teachers. The imperial government recruited officials and bureaucrats based on the results of regularly set exams, which consisted of essay questions of Confucian texts and commentaries. Academic honors won through these exams might, conceivably, have been used to set up shop as a notable teacher, but it would take an unusual man to think of it and an even more unusual family not to talk him out of it. Rather, high scores on the exams were a guarantee of a cushy and influential government job. A man didn't just make his own fortune, but that of his entire family. Even a commoner could achieve a huge jump in status this way, and in some periods many did.

Naturally, doing well on the exams was the fervently pursued goal of many young men, which shaped the teaching profession. Private tutors did a bustling business with people cramming to pass the exams. So while commoners *could* make their fortune by doing well on their exams, it was usually the aristocrats who made the high scores, since they had the time to study and the money to hire teachers.

Ancient Schools In The Campaign

Probably the most important thing to keep in mind about early universities is that they resemble grass-roots political organizations or self-policing professional groups like the Bar Association far more closely than they do modern educational institutions. They provide no material resources or facilities to faculty or students. In addition to a lack of classrooms, they have no laboratories and fund no research (indeed, the very idea of a research institution would baffle most Medieval scholars). They don't even have libraries. What they have is a monopoly on what is to some a valuable trade and a willingness to use that for leverage in order to obtain legal privileges for their members.

A university student or university-educated character isn't a bad choice for a PC. Just as adventurers are habitually mobile, so were many scholars. A character could be motivated to study under different notable teachers just as easily as by a desire to kill things and take their stuff. Student riots involving swords are, as already mentioned, not uncommon, so PCs tendency towards armed violence isn't necessarily inappropriate for a scholar. The legal immunity granted to university members could be extremely useful for a PC, although that can be balanced by the inconvenience of having to boycott whichever city, country, or ruler his university becomes angry with, should an occasion arise.

Conversely, a university might not make a legendary enemy, but it can be an extremely inconvenient rival. There's no one person a PC can remove in order to rid himself of the enmity of a university, and there's that pesky legal authority which would make it difficult to attack the university through legal means. A footloose PC could simply leave wherever the university happens to be, but one who is invested in a particular place (say, the captain of the Cardinal's guards) would have a hard time of it. Enmities within a university might also be interesting to explore. Medieval educational theory is all about argument, so it shouldn't be hard for an academic PC to find rivals, if not enemies, and there's the additional twist of avoiding heresy in an opponent's position.

And what does all of this mean for a fantasy campaign? Magic, in most games, requires advanced study. Any of the educational schemes here could be taken as a model for teaching esoteric fields of spell-casting and alchemy, depending on the game world's assumptions about magical practice. A fixture of fantasy is the sorcerer's apprentice, a lone student whose sole teacher is a magician. That's certainly fine, particularly where those solitary teachers, like most Medieval guildsmen, are concerned with preserving trade secrets, but in campaigns where magic is better known and more public, other models might be used. Casual teaching in the ancient and early Medieval mode could easily arise if individual spells are relatively easy to pick up or if spellcasting requires a broad body of theory which the individual can put into practice on his own. If magic requires more intensive study, a system like Muslim madrasas or European universities might appear, providing a more stable framework for the necessary long-term education. The "wizard's guild" could easily turn out to be a university faculty. Say hello to visiting professor Thoth-Amon from Stygia U . . .

Rules are for the Weak

by Heather Barnhorst

It is a truism in my *Dungeons & Dragons* group that I don't know jack about the rules. Some people might find this assertion strange since I've been playing the game since I was 17 but I consider my refusal to learn these rules to be a testament to my core belief about games. I don't play games to learn rules -- I learn rules to play games. If I can get away without learning them, I will. Then again, I might just be blowing smoke to cover the fact that I find the *Player's Handbook* overwhelming. While *Dungeons & Dragons* is not the most complex roleplaying system, the handbook is long, it is boring, and it doesn't make sense. I learned more about playing *Dungeons & Dragons* from reading *Dungeons & Dragons for Dummies* than I had from playing the game for 25 years.

One Die to Rule Them All

What I discovered about *Dungeons & Dragons* is that the whole *d20 System* moniker is mostly true. Whenever I am in doubt in one of our gaming sessions, whenever I've been discovered not to be paying attention to yet another combat or am involved in another finding-a-trap-by-triggering-it moment, whenever I've laid my head down on the table to "rest my eyes for a moment," I can usually cover my egregious lapse by looking around the table in a chirpy manner and rolling a d20. If I am not playing in our *Dungeons & Dragons* game, this behavior seems odd to say the least. "No Heather, we're playing the *All Flesh Must Be Eaten* game this week."

Hating rules the way I do, I have spent some time parsing out how to play RPGs without having to learn them. My solution? Learn the master die. It could be a d10 or double d6s (and yes, if you always thought that uttering "double d6s" sounded salacious then you are not alone) or just a multitude of d6s. "Okay Heather, roll a gadjillion d6s, if you roll tenjillion or more 5s and 6s, Walrus Woman" -- that's my character -- "kills Lemon Head." More is simply not better. I am resentful. Skill-based or stat-based -- it really doesn't matter. "Rolling dice" seems like a terrible atrocity to visit upon a bunch of innocent bits of resin. I would much rather count them, stack them, or line them up by polyhedral sides and gradations of hue. This exercise is called "the counting of the dice" and no game can start until I've ascertained that all my dice are present and accounted for.

Anyway -- what kind of game resolves every action by rolling dice? Just when I have successfully sunk myself into my character, just when I am boozehounding the way she should, tramping through a swamp the way she should, fighting goblins the way she should, a voice from on high says, "Roll to resolve the situation."

"Why?"

"Because that's the rule."

Humbug to Rules

Don't hurt me; I'm not one of those Storyteller do-gooders who just wants to "feel" everything, but I have to say that rules really are for the weak. At their best, they distract only slightly from the roleplaying experience. At their worst, they become the *raison d'etre* for some gamers' existence. Dude, rules are supposed to help you express your character's inner essence, not become your character's motivations.

My hatred of game rules is also the reason that I hate to play lawful characters. Give me a chaotic gnome over a noble Paladin any day of the week. Gnomes are funnier and they understand how to have a good time in a seedy bar. Paladins are forced to follow rules set down from on high or their god spurns them and takes away all their manly powers. And I hate roleplaying by committee so when my party starts discussing what to do next, my gnome stops talking and starts doing.

"Where's the gnome? Not again!"

"Heather, do you have to story-bust every adventure I write?"

"I do, I do," I say in my most gnomish of voices.

"I don't get it, you are all about rules in real life."

This Ain't Real Life . . . Or is it?

In real life I abide by plenty of rules. Some of them are stupid, others are silly and some are simply incomprehensible. Rules are kind of like the IRS -- you don't have to understand them to know that following them is better than having your house foreclosed on you. I have discovered that if I can find the one rule, the Master Rule, that governs the creation of all the rest that I can usually minimize my participation in the useless ones. The Master Rule allows me to operate within the gray areas of bureaucracy. Life is just like ***Dungeons & Dragons*** -- find the master die and everything else falls into place. For example:

Airports: Stand in line. All other airportian behaviors can be extrapolated from understanding that you will stand in line to have people ask you if you are, could be, or might have been at any time a dangerous criminal. At the very least, you will stand in line so that you can remove your shoes. Be sure to wear nice socks.

Hotels: Hotels change names about as often as Persian rug dealers hold "Going Out of Business" sales. "We're a business hotel; no we're a vacation hotel; no we're a conference hotel." I'm not sure that even hotel management has figured this one out.

Karaoke: The most popular songs are the ones that have choruses that can be sung repeatedly and loudly by drunken Clay Aiken wannabes. This Master Rule explains how the same bar denizens puffing clouds of cancer-causing agents out of one side of their mouths while struggling to sing in key out of the other can love both *Sweet Caroline* and *Living on a Prayer*.

You, too, can come up with your own Master Rules for life. Make a game of it -- it passes the time while you are standing in line at the airport.

The Retailer Master Rule on How to Succeed in Business

I have to ask myself, "What Master Rule should I follow as a game retailer?" I have lots of rules, mostly developed from habit and happenstance, but which is the one that truly governs all my interactions with my Best Customers (and that's all of you)? Before your hopes climb too high, let me clue you in on my dirty secret. The Master Rule isn't that "the customer is always right." I hate that I have been forced to mention it in front of you in case I've damaged your ego but you, my dears, are not always right. In fact, you are very often very wrong and I would look silly if I agreed with you 100% of the time or tried to cater to your whims even when they are based on your error.

"Nope, sorry, the new edition of ***GURPS Martial Arts*** is not out yet. Would you like to preorder it with me?"

"But the website says that it is available."

"It does? Then by all means, I will order it promptly for you, my good man, and we should see it next week."

What if I know that there is no possible way that the newest ***GURPS Martial Arts*** revision has been published? Perhaps an error was made on the SJGames website, perhaps you misunderstood something you read (like that never happens) and now I am supposed to compound the error by agreeing with you. Not only am I spitting in the face of common sense but I may even be preventing you from possessing that book when it does release.

I would better serve you if I gently pointed out that the website only states that it is an upcoming release with some

teasers to heighten your interest. Then I can say, "So we know it is releasing mid-year 2006. Would you like me to put you down for a copy?" That way you learn something, you eventually purchase your book, and you are now far happier than when you thought that I was lying to you and that for some unfathomable reason my goal in life was to keep that book out of your hands. Of course, there are the few times when you are right (and I hate those) and then I have to swallow my bitter words of "Damn it! Not again," and tell you what a wonderful customer you are for informing me about my error.

What is my one retailer Master Rule to govern all else? After long contemplation, I have divined one although it completely countermands everything your mother ever told you:

"Do talk to strangers."

What?! What does that mean? Your mother probably told you the same bits of mother wisdom that mine did. Be safe, be polite, always wear clean underwear, and never talk to strangers. Maybe your mother has more street cred than mine but she certainly doesn't understand how a game store works.

All we retailers own in our arsenal of weapons against the Big Store Closure in the Sky is our friendliness. Anyone with enough money to throw at a retail operation or enough patience to build up an impressive inventory can create a kick-ass store. Anyone with the ability to put together a rudimentary website and the willingness to deep discount to earn the pittance to keep them in style in their parents' basement can compete with a Brick & Mortar store and probably chip away at its business. Anyone can build beautiful fixtures and attend business schools and advertise. So if what I am writing is true (and it absolutely is), then what elevates a great store from a store that is quickly turning into an also-ran?

Talking to strangers. Strangers walk into the store every day. They had better not be walking out again as strangers. I can ignore them and let them wander or I can greet them and talk to them. Once I talk to them, they turn into you -- another one of my best customers. When I talk to them, I learn about them and suddenly we've embarked on an interesting journey together.

Help My DM Killed My Character

Back to my ***Dungeons & Dragons*** game and what happens when I don't follow the rules in the fantasy La-La land that my DM has spent his creative sweat setting up. For those of you who cannot bear another story about a ***Dungeons & Dragons*** character, I warn you to stop reading. Yes, I've descended that low in this column. The rest of you can follow me for a few more paragraphs.

So here it is. I had this cute little human (or so I thought) magic-user by the name of Gaewynn. She liked nothing better than to traipse through the woods in Isadora Duncan-like accoutrements. If there was jewelry involved, then all the better. You can imagine her singing if you wish and I will confirm that she did indeed sing on a regular basis while walking through the woods. I don't remember what her particularly egregious infraction was that day -- perhaps asking a Pegasus if she could have a lock of his hair or maybe trying to make friends with that lonely dragon under the mountain but I am sure that the party (and the GM) was tired of saving her from the messes she insisted on visiting upon herself, mainly because she wouldn't follow the rules. That night she went to sleep under a giant oak tree. It was a nice oak tree and Gaewynn liked it very much. Then the voice of doom.

"Gaewynn, roll for a spot check."

"But I'm asleep. How can I spot anything?" One of the few times that I have quoted a rule. To tell the truth, I was probably sorting my dice and didn't want to be bothered to roll one. I am not usually so argumentative in game.

"You're right." The sound of dice rolling. "Okay, that oak tree that you are sleeping under? It falls on you. You're dead."

And, that my friends, is what happens to you when you don't follow the Master Rule. And even if you do.

Just roll the damn die and live with the consequences.

Banjoko the Mganga

for the *Nyambe* setting for the *d20 System*

by Phil Masters

*Note: This character is designed for use in the **Nyambe d20 setting** (as published by Atlas Games). However, he can be adapted for use in other settings, provided that they support the idea of a dedicated, rather solitary servant of some spirits or gods with these particular powers. If you don't have access to the **Nyambe** core book, replace Banjoko's n'anga levels with Cleric, and his mganga levels with Sorcerer or Wizard.*

Banjoko is someone who came to the life of magic and adventure quite late. He was born in an ordinary rural village in the Empire of Mabwe, and spent most of his life as a very ordinary villager. He did develop an especially strong sense of devotion to his revered ancestors, and many people would say that he was old somewhat before his time, grumbling about youngsters with no respect for their elders and for tradition when his was little more than a youngster himself.

However, Banjoko's life changed a few years after his children had all gone off to marry and start families of their own, and his wife had died. While wandering in the bush near his village one day in search of a lost goat, Banjoko experienced what he is convinced was a vision from the Ancestral Orisha -- a call for him to serve his people as something more than just another lesser patriarch. Whether the orisha had indeed come to him that day, they were certainly willing to accept his service; he became a n'anga priest, spending several years leading worship to the ancestors.

However, Banjoko's strong sense of what is *right*, and his belief that the world was full of wrong-doing and lawlessness, eventually led him to treat the priesthood as simply a stepping-stone to a greater calling; he became a mganga -- a witch-doctor. Retiring to the depths of the local bush, he built himself a (rather ramshackle) hut, and applied his mind to mastery of arcane but lawful magics.

While he is still relatively restricted in his mganga abilities, Banjoko has already acquired a fierce reputation as someone who can deal with problems -- for a price, and on his own terms. While very few people exactly *like* him, he's the man to see if one is having problems with a mchawi wizard, a Zombi cult, or certain categories of supernatural monster. He can also provide healing aid, although he must be asked respectfully, and he may refuse if he doubts that the person asking is devout or respectful enough. Word of his talents has even reached the provincial capital; the governor hasn't yet found a need to send to him for help, but it's likely to happen one day. At one point, he leant very useful aid to a mask-making group dedicated to Nimbala the Judge, who gifted him with one of their magical masks as a mark of sincere respect.

Game Uses

For someone with a total of 12 character levels, Banjoko really isn't very tough, mostly because age hampers him quite badly these days. But then, that's not the point; he's not intended to provide a direct opponent for PCs, even if they are the sort of people he'd actually quite happily fight (say, the GM has let people play mchawi). Rather, he's someone with whom they might have to deal on a neutral or "friendly" basis. If anyone important, PC or NPC, wants Banjoko's help, someone will have to go and find him, explain the problem, and probably escort him back to the town or village which needs his aid. This is the sort of job which PCs will often accept -- and frankly, few other people are likely to want it, especially after they've met Banjoko.

Because, apart from anything else, he can be quite impressively rude to people, irrespective of social class or personal power. This is partly his "old geezer" crankiness, and partly a pose designed to ensure that other people have proper respect for his position, but mostly it's just his nature. This goes beyond mere surliness and "in my day" irascibility;

he'll quite openly use his Inquisitor feat to check people for "dubious" magical abilities, and be rather blunt (though not *automatically* hostile) to any sei (sorcerers) or fellow mganga he detects, and he'll even cast spells to prevent people lying to him -- without concealment or apology. He usually wears his magical mask when in public (although he'll take it off in private, even if a few escorts and bodyguards -- say, the PCs -- are around); the advantages it grants him are very useful, but more to the point, it's another way of preserving his mystique and ensuring that the "young fools and disrespectful rogues" with whom he has to deal still show him a modicum of respect.

Banjoko has a clear idea of his own importance and a working sense of self-preservation; while he's not actually a coward, he'll happily let someone else take the obvious risks when, say, fighting monsters. Fortunately, his magic can usefully enhance such champions -- when he remembers or can be persuaded to use it.

Incidentally, Banjoko is only marginally less polite to demihumans than he is to most humans; his prejudices are more general and diffuse than that. However, he might regard unthlatu with a very little more caution, given their known interest in sorcery, and he would certainly share all the normal human deep uncertainty about ngoloko. Fortunately, he's never yet had direct dealings with such beings.

Aside from his mask, Banjoko usually wears rather plain clothes, even seeming shabby by Tembu standards, though signs of fine decoration and good manufacture are visible on close inspection. He always carries a staff which was previously carried by various of his ancestors, but this is therefore his personal holy symbol; he will *never* use it to lean on or as a weapon (that, he thinks, would be disrespectful), despite the fact that he would often seem to need some kind of support while hobbling along.

Banjoko

Male Tembu Human, 2nd level Commoner/7th level N'anga/3rd level Mganga

SZ M (humanoid); HP 28; Init -1 (Dex); Spd 30 ft.; AC 11 (+2 Sanguar,

-1 Dex); Atk +5 Melee (1d4-2/crit 19-20/x2 dagger, or 1d6-2/crit 20/x2 club), or +6 Ranged (not usually used); Face 5 ft. × 5 ft.; Reach 5 ft.; SA Granted Powers, Spells; SQ Aligned Spells, Familiar, Mask; AL LN; SV Fort +5, Ref +2, Will +13; Str 6, Dex 8, Con 7, Int 13, Wis 16, Cha 14.

Skills: Concentration +4, Handle Animal +7, Heal +9, Knowledge (Religion) +8, Knowledge (Arcana) +9, Listen +5*, Profession (Farmer) +8, Read Lips +4, Scry +13, Sense Motive +6**, Spot +6***, Use Rope +1.

* Gains +2 while familiar is within arm's reach.

** Gains +10 while wearing mask.

*** Gains +2 while familiar is within arm's reach, **and** +10 while wearing mask.

Armor and Weapon Proficiencies: All Simple Weapons, no armor.

Feats: Create Gris-Gris, Endurance, Extend Spell, Extra Turning (+4 attempts), Great Fortitude, Inquisitor, Iron Will, Rhetoric, Sanguar, Skill Focus (Scry). In addition, Banjoko gains Alertness whenever his familiar is within arm's reach of himself. All permanent bonuses from feats are already included or noted where applicable.

Languages: Kordo (Native), Halfling (Agogwe).

Spells As a N'anga of the Ancestor Orisha, Banjoko's chosen domains are Protection and Strength. He typically has the following spells prepared:

N'anga: 0 Level -- Detect Magic ×2, Detect Poison ×2, Light, Purify Food and Drink. 1st Level -- Bless Water, Cause Fear, Detect Evil, Protection from Evil, Obscuring Mist, Sanctuary (Domain). 2nd Level -- Augury, Delay Poison, Hold Person, Zone of Truth, Bull's Strength (Domain). 3rd Level -- Dispel Magic, Remove Curse, Remove Disease, Magic Vestment (Domain). 4th Level -- Divination, Spell Immunity (Domain).

Mganga: 0 Level -- Detect Poison, Disrupt Undead, Detect Magic ×2. 1st Level -- Magic Weapon, Hold Portal, Protection from Evil. 2nd Level -- Hypnotic Pattern, Darkvision. 3rd Level -- Lightning Bolt.

Magic Item: Mask of Nimbala the Judge (Minor Wondrous Item).

If the Rat (Banjoko's Familiar)

If is a rather mangy and battered-looking rat, no more appealing than his wild brethren. However, if one looks closely, the light of enhanced intelligence glitters in his eyes, and he serves Banjoko faithfully and effectively.

HD/Level 12; HP 14; Init +2; Spd 15 ft.; AC 16; Atk +9/+4 (1d3-4); SV Fort +3, Ref +5, Will +9; Str 2, Dex 15, Con 10, Int 7, Wis 12, Cha 2.

Skills: As Banjoko, plus also Balance +10, Climb +12, Hide +18, Move Silently +10.

Alien Space Bats

for *GURPS Fourth Edition*

by Matt Riggsby

The alien space bats, known to long-time alien-watchers and conspiracy theorists as ASBs, may not be the most dangerous or hostile of alien species, but they are by far the most annoying. When history takes strange turns, when people attempt the impractical or impossible, and particularly when they succeed, you can bet that the alien space bats are behind it.

They resemble nothing more than earthly bats, only approximately human-sized. They're actually a bit smaller on average than humans, but are also relatively smart and agile. They have four limbs, two of which are arms. They are entirely capable of flight. However, they can't make effective use of their hands while airborne. Their vision is poor, which they partially make up for with a sonar sense.

Their power lies in their advanced technology (particularly strong in stealth, teleportation, and other areas which allow them to manipulate situations from afar) and their limited powers of mind control. Although most ASBs are incapable of directly controlling a human mind, they are all capable of implanting powerful suggestions, making people believe things which are patently false, or at least poorly thought-out. A small minority of "Master" ASBs can go so far as to assume direct control of individuals, making them behave as desired. The Master ASBs, by the way, are the acknowledged leaders of ASB society. Since they have mind control powers, they'd probably take charge anyway, so the ASBs have done the sensible thing and let them have it.

ASBs prefer to remain in the background, never taking part in any confrontations but rather manipulating others as pawns. They will induce mass delusions, secretly grant entirely novel technologies, manipulate climate, or take control of powerful leaders of lower-tech worlds from orbiting spacecraft or secure locations. If attacked directly, they will nevertheless have the full range of arms and armaments available at their TL. As a last resort, their favored hand-to-hand weapon is a large, well-balanced club (we'll pause here for you to fill in the punch line). There is no known ASB home planet. Whether they originated in space or they had a home planet which is now lost or destroyed, the ASBs are aliens wherever they go.

ASBs in the Campaign

It's not clear why the ASBs act as they do. It's generally believed that they're intensely curious about "lower" life forms and are interested in performing a wide range of experiments on them to see how their societies react. It's not impossible, though, that there's a more sinister purpose behind their actions.

As a power-behind-the-scenes, the ASBs are well-suited to campaigns with hidden truths, where they can be just one conspiracy among many. They can also be used to smooth over any kind of implausibility, if the GM needs to provide a justification. For example, in a *Buffy the Vampire Slayer*-style campaign, why don't people acknowledge the existence of the monsters eating their friends and relatives on a nightly basis? It's the ASBs!

Their ideal use, though, may be to paper over the cracks of an older conspiracy campaign where the GM has, perhaps, lost control of multiple threads of secrets and secret societies. If PCs start to piece things together and realize that various groups are acting irrationally, it may be because they *are* acting irrationally. They're under the influence of the Alien Space Bats, compelled to

Alien What, Now?

For those of you not in on the joke, "alien space bats" is a term used to describe the convoluted rationalizations necessary to justify one's pet speculations. The term appears to have originated with the late Alison Brooks in the soc.history.what-if Usenet newsgroup in 1998. In the course of debunking of the possibility of a successful Operation Sealion, it was

believe in a hollow earth, the Holy Grail, capitalism, communism, and other absurd ideas.

And it doesn't have to end there. There could easily be factions among the ASBs, experimenting on one another and making each other believe unreasonable things. It might be that the whole of ASB society is deluded, with every ASB under the influence of another, also deluded, ASB.

Alien Space Bats (149 points)

Attributes: ST -2 [-20]; IQ +1 [20]; DX +1 [+20]; HT -1 [-10]

Advantages: Affliction, 3 levels (Severe Delusion, +15%; 30x duration +60%; Malediction, long range modifiers, 200%) [113]; Flight (Winged -25%, Temporary Disadvantage: No Manipulators -50%) [10]; High Technology +3 [15]; Scanning Sense (Sonar, increased range 5x, +30%) [26]

Disadvantages: Bad Sight (nearsighted) [-25]

Most ASBs have skills related to work in outer space: piloting, engineering, zero-g operations, etc. However, none are prevalent enough to justify adding them to the template.

In high-tech campaigns, the GM may replace the High Technology advantage with an Unusual Background allowing the ASBs access to technologies otherwise not available. ASB nearsightedness is not subject to a Mitigator, so they get full points for it regardless of TL. The cost of High Technology assumes a campaign where the base TL is at least 6. ASBs need to be at least TL 9 (without easy interplanetary or interstellar travel, they'd be hard-pressed to be aliens, now, wouldn't they?), so in a lower-tech campaign, increase the level of High Technology as appropriate.

Master Bats have Possession (Telecontrol +50%) [150] and are likely to have high levels of Rank or Status.

suggested that alien space bats could have made a Nazi invasion of Britain successful. Since then it has come to signify any implausible background assumption. The term was intended as a rhetorical device, not a specific sort of entity, but that's not going to stop us. If there's something in a campaign which, on reflection, makes no sense, the alien space bats are probably behind it.

Tékumel: Empire of the Petal Throne

Published by [Guardians of Order](#)

Written by Patrick Brady, Joe Saul & Edwin Voskamp with Bob Alberti, M.A.R. Barker, Barbara Kennedy, Lisa Leutheuser, Jeff Mackintosh, & Victor Raymond

Cover by Raven Mimura

Illustrated by Llyn Hunter, Eric Lofgren, Jennifer Myer, Chris Miscik, Jesse Mohn, Torstein Nordstrand, Andrew Trabbold, & Ursula Vernon

242-page b&w hardcover; \$39.95

It is turning into quite the year for old games coming back as new -- *Werewolf: The Forsaken*, *Mage: The Awakening*, and *Warhammer Fantasy Roleplay*. But the oldest and strangest game to return is *Tékumel: Empire of the Petal Throne*. The second RPG to be published and the first to come complete with its own background and setting, it was released by TSR in 1975. Finding a following, it has since rightfully acquired cult status. Bar no mistake, *Empire of the Petal Throne* is the niche gamer's niche game and the culture gamer's culture game. Yet it has never received the kind of support it so richly deserves, and when official rules were available, they were either heavy in setting with poor mechanics, or heavy on mechanics, but with little setting material. Which only raised expectations for Guardians Of Order's long awaited version. It has to satisfy the demands of the Tékumali (the fans), provide a starting point for the uninitiated, and it has to have both rules and setting. The question is: Can *Tékumel: Empire of the Petal Throne* achieve all that?

Actually, the first question that needs answering is, "What the hell is Empire of the Petal Throne?" Tékumel is the brainchild of Professor M.A.R. Barker, a linguist who has created a rich, ornate, baroque, and developed fantasy setting unlike any other. Instead of Western cultures, it draws on Mesoamerican and South East Asian societies for its look, feel, and cultures, as well as its languages. A humanocentric fantasy, *Tékumel: Empire of the Petal Throne* has five fully developed languages and others. Thankfully it is not necessary to be fluent in any one of them to play, but an appreciation of just one, Tsolyánu, will certainly help.

Set on the hot, metal poor and isolated planet of Tékumel in the distant future, what was once a vacation world has descended to the technological level of the Stone Age. The hide of the chlén beast replaces metal, constantly harvested and treated, then cut and lacquered in the right shapes for arms, armor, costumes, and so on. Over millennia, society has stratified, in which personal clan, lineage, and faith are very important. Everyone in the Five Empires knows their place, displaying it openly and showing deference for those above them; and studied indifference to those below them. Contempt is retained for those without clan or status, known as nakomé, with foreigners being in danger of being killed simply for the wrong display of manners. Further, on Tékumel, the gods are real -- sorcerers and priests can pierce the walls between dimensions and contact them, as well as cast magic. The pantheon is comprised of ten gods and their cohorts, divided equally between the Lords Of Stability and the Lords of Change.

In game terms, the focus is upon Tsolyánu, the Empire of the Petal Throne, with each player taking the role of a good clan member. Typical members would be dark skinned (Caucasians long ago having been killed in a nuclear war back

on Earth, and traits such as blue eyes are regarded as a curse), and dresses lightly for Tékumel's hot climate. He serves his clan loyally, often in a profession selected by his clan, marries according to the needs of his clan first and then taking a second wife for love, gives thanks and supplication to the gods faithfully, and is happy with his life. All Tsolyáni recognize the 10 gods and cohorts, but usually favors just the one, and there is no such thing as atheism. Alternatively he might serve a clan in an affiliated military legion, or become a priest, a scholar, or bureaucrat. He will advance as many ranks as his clan, status, influence, and connections will allow, but rarely beyond that for either merit or achievement. A good Clanswoman does none of this, her clan marrying her to enforce or create an alliance between clans. Some women are more independent minded, and by declaring herself Aridáni at the Palace of the Realm, she gains all the privileges and responsibilities of being a man.

Player characters are a little different. Female characters will of course declare themselves Aridáni. As a group they will perform missions for their family, clan, legion, temple, or even the Empire. This is likely to involve the characters in the politics at each of these levels. The classic set up for the genre has the players as foreigners or country bumpkins straight off the boat, which while an easy entry point for the uninitiated, is potentially dangerous for players considering the Tsolyáni attitude to foreigners. Instead the game suggests the characters belong to a single organization -- clan, legion and so on -- as a default set up. This is pitched at three levels of realism -- gritty realism, middle way, or heroic fantasy; the amount of magic in a campaign works on a similar basis -- none, a little, or common.

The degree of realism also determines the number of points available for character creation. The game uses Tri-Stat Derived, a modified version of Guardians of Order's Tri-Stat mechanics. Rather than the system's three stats (Body, Mind, and Soul) there are six: Strength, Dexterity, Intelligence, Psyche, Willpower, and Charisma, reflecting the uncinematic nature of the setting. The generic mechanic has been modified with an array of setting advantages and disadvantages, such as High Pedhetl (the ability to store extra-planar energy, useful for spell casters) or Low Status. The aim of the creation process is to build a character with a role or position in society, whether sorcerer-priest, duelist or clan arena champion, temple bodyguard, or chlén cart driver. Rules are provided for creating and playing some of the sentient species either trapped on Tékumel along with mankind or native to the planet. These include the flight capable Hláka, the insectoid Pé Chói, and the three sex, reptilian Shén. A later bestiary describes a variety of species useful or helpful to mankind, or inimical, such as the Ssú, known for their intelligence and cunning, and their pungent odor, reminiscent of cinnamon. Even so, this is a very humanocentric setting, although it is surprising not to see details of the N'lüss, giant barbarians from the North included.

The creation process is not particularly difficult and is eased by not one but two examples. Indeed, examples illustrate the rules throughout, making the rules easier to grasp in action rather than in the read. On a personal note, the pleasure of many these examples is that they involve characters that I know and are related to my own. The mechanics are simply a case of rolling a d10 to get under a total equal to the combination of stat plus skill, or combat value plus skill.

Where ***Tékumel: Empire of the Petal Throne*** really gets into its stride, is in presenting the setting from various points of view. Life is described in turn in a low, medium, and high clan, in the temples, military, and government, which where appropriate includes an in-person description. These add greatly to the flavor, and by letting a player read through them gives him a handy reference point. In fact, background is where ***Tékumel: Empire of the Petal Throne*** really scores, because along with a solid rules set, this serves as a decent primer to what is otherwise an ornate and alien setting.

Yet is not one without its weaknesses. Primarily this is the lack of depth to the GM's advice, which could go into more detail about setting up and running a campaign. Secondary to this the lack is ready-to-play material, which while not a problem for the long time Tékumali, could certainly help the referee new to the game -- perhaps sample NPC's and Clans? Also the book concentrates upon the Tsolyáni Empire, so anyone wanting information upon the other empires - - Mu'ugalavyá, Milumanayá, Sa'a Allaqui, Livyanú, and Salarvyá -- must wait for the future supplements. There is some information on them, but only from a Tsolyáni point of view.

Physically this sturdy hardback is laid out without flair and illustrated with a range of art that does not always capture the uniqueness of Tékumel. Some of it feels too clean despite the high nipple count, while other pieces pleasingly hark back to the pen and ink originals of the TSR 1975 rules. The fold-out full-color map at least does a good job and the writing feels more English than American.

At last ***Tékumel: Empire of the Petal Throne*** does something that no rules have ever done: provide background and rules in the same package. It does this very well in comparison to what was done before, but is only up to the expected standards of the day and no more. So has the wait for this book been worth it? Unquestionably it has been. Tékumel deserves to have a place on the gaming shelf and the patience of the Tékumali deserves rewarding at the very least. Not necessarily the standout RPG it deserves to be, ***Tékumel: Empire of the Petal Throne*** is nevertheless a well-deserved birthday gift to the setting, the game, and the fans.

Pyramid Review

Map Folio 3-D

Published by [Wizards of the Coast](#)

Model design by Dennis Kauth & Todd Gamble

Graphic design by Trish Yochum

32 full-color sheets of cut-out cardboard building components (tower, wall, two cottages, inn, outbuilding, & smithy); \$9.95

If you're big on using miniatures in your tabletop games, you probably have a large collection of figurines, a little something for every occasion, and for background, well...a selection of erasable vinyl maps imprinted with a grid of squares. Oh, and maybe a pad of paper sheets with the same design. To get things off the ground in a literal sense, you can use the *Map Folio 3-D*.

Simply put, it's a collection of little buildings that form a small village. A 32-"page" supplement, it supplies you with a tower, a generic stone wall with parapets, two cottages, a two-story inn, an all-purpose "outbuilding," and a smithy with a corral. You have to do the construction yourself, so at the very least you'll need knives or scissors and some glue or tape. The stock used is good, firm stuff, so if you just slap it together as is you'll have some pretty decent structures, but some of it benefits from added support (like gluing it to additional cardstock). The fences, posts, and corral bits for the smithy in particular require some fairly small cuts, and shoring those up is a good thing.

For the most part, these buildings don't offer much in the way of interiors. You can't get inside them once they're built, and with a few exceptions miniatures can't really "use" most of them -- guards can go on the walls, and the top of the tower can hold a few of your toys. On the other hand, the walls are a little larger than the squares required for *Dungeons & Dragons*, saving you from knocking stuff over as you move your miniatures. The scale is a little small given the figures that use them, but since no one has to be able to pass through the front door, it's close enough for government work. A sheet full of matching windows and doors is provided; this can be used to add a little texture to the structures once they're built, or ambitious folks can use them to model more functional apertures. Again, not strictly serviceable, but they'll look spiffier.

You won't find much fault with the illustrations. The graphic design is lovely, and some of it is downright impressive, like the moss/ivy growing up the side of the tower. Not much can be done about the vast areas taken up by various rooftops, but on the other hand there's a good bit of white space on a few of the sheets. It's not enough to make you choke on your store receipt, but it would have been fairly easy to put a few simple designs like a hedgerow there. They certainly thought nothing of using one sheet just to provide a "floor" for the smithy -- a useful template that shows where its chunks go, but none of the other pieces get their own front yard.

Or instructions. The inside back cover has some valuable safety tips for newcomers to making paper models, and some ideas on the best way to assemble the town, but hands-on advice is a bit harder to come by. Some of the more involved designs do have instructions printed directly on the sheet alongside their components, but these usually amount to a single sentence, and once you cut the pieces out you have to make sure you remember which pieces go with which instructions. A sheet of paper or two with rough illustrations would have been helpful, and even the buildings themselves could have replaced their generic "Tab" labels with some more specific information ("Smithy, Tab A," for example).

Once you've got them all together, transporting the buildings will be a whole new issue (another good justification for backing everything with an extra layer of stock). A hazard of this end of the hobby, of course, but you're going to have to schlep this stuff around eventually so best to think about it ahead of time. They aren't huge, but they can get kicked about in a grocery bag and they won't fit in your three-ring binder, so be sure to get a box.

While **Map Folio 3-D** is more scenery than anything else (as compared to customizable kits that form dungeon corridors and stairwells miniatures can actually dance around on), it's darn nice scenery and a whole lot better than simply asking players to once again imagine amazing things when you scrawl another dark line with a marker. Add to that the whole array is doggone cheap and you can buy several kits for the same price as a single roleplaying book, and you're well on your way to adding to your miniature arsenal in a visually aesthetic way.

Pyramid Review

Wildwood (for *Oathbound* & *d20 System*)

Published by [Bastion Press](#)

Written by Thomas Knauss and Darrin Drader

Art by Bruce Colero, Christopher Pickrell, Jason Engle, Jeff Ward, Terry Pavlet, and Todd Morasch

Cover by Shawn Ye Zhongyi

256-page b&w PDF; \$19.99

Take one epic level druid champion of a god; overthrow said god and curse the druid and other deific servants to be bound immortal jailers of the god. Now add in the fact that the druid is full of unrequited love for one of his fellow jailers, the god's eternally loyal wife. Let him sit for millennia on the lifeless rock of the prison world and stew in his bitterness. Then give him the discovery that he can summon life to his portion of the prison world.

His reaction is to create a vast continent full of teeming animal and plant life, and to pit creature against creature to see nature as he likes it, red in tooth and claw. Super predators are encouraged and conditions are created so they will thrive and dominate their own territories. Sentient beings are brought in, sometimes entire cities, but cut off from the support of civilizations and left to see if they will adapt to barbarism and the state of nature or be overrun entirely and consumed. Trade collapses and is soon reduced to bartering for necessities. Some adapt enough to become serious predators themselves. Continue with the jailer druid as an alpha predator and voyeur of nature's primal struggles in his continent domain for thousands and thousands of years. He revels in his ability to pull in beings and creatures from a thousand worlds into his twisted bitter druid playground and see the ensuing struggles for survival of the fittest.

That is the big picture cosmology for the Wildwood continent in the *Oathbound* campaign setting, and it is a compelling and engaging background for a *d20 System* world. It provides a set up allowing for vast forests filled with dangerous beasts where survival is a prime concern. It allows more plausibility for the hordes of monsters juxtaposed in a standard fantasy game ecology and provides an in game reason for lots of sourcebook material to be used by a DM in one setting.

Instead of the default high level of trade in a standard *d20 System* world where characters can buy magic items and upgrade their gear relatively easily to their own tastes, the lack of trade means that equipment is more a factor of what the characters recover in their adventures. This provides a material incentive to explore newly discovered dungeons or overwhelmed transplanted cities for the loot they can acquire. The trade issue shifts more power to the DM in controlling character options through what magic items can be found, instead of PCs simply spending gold and choosing from their favorite supplement.

In addition to providing a playground for a DM to throw in various gaming elements, *Wildwood* provides a number of *d20 System* mechanical bits of its own as well. There are Oathbound races, many with racial levels. There is a revision to the original Oathbound Campaign's prestige race mechanics. There is a chase mechanic that uses opposed d20 rolls and maneuver and terrain modifiers instead of the staggered movement used in combat round resolution. There is a surgical skill based method of grafting monster parts onto subjects used by one of the predators. There are new feats, monsters, and magic, as well as a sample adventure. A new core class of feral warrior works along a Tarzan theme if

Tarzan had developed fangs and talons. There are little bonuses called gifts that empower those who get pulled into the setting. Other gifts can be used by the divine jailers to reward those who please them and their goals.

In ***Oathbound*** characters can harness the divine power of the world to mutate themselves to specific ecologic niches, becoming more predatory, bestial, draconic, plant like, smaller, larger, etc. Each such ecological path is called a prestige race. This was originally an xp for distinct powers system but is revised in Wildwood to be essentially racial levels driven by directed mutation that is available to characters of any race.

The different ecological realms of the continent as well as the communities, monsters, and individual dominant predators are detailed. Lost civilizations are provided with their history detailed for both before and after being pulled into Wildwood. Dragons and lycanthropes have flourished while elves and dover (nature oriented dog men) have adapted best of the good humanoids and established major communities. However even the elven archmage ruled society is seriously threatened by the toughest of the continent's 10,000 dragons who wages war against the elves, an advanced great wyrm green dragon who only falls shy of the divine druid jailer in power. Fey and treants are common but reflect the predatory nature of the world and are not good. The predator sections provide write ups of both full stats and histories for some individual top predators who range from CR 11 to 29.

All in all, ***Wildwood*** provides an engaging setting for a ***d20 System*** game with more emphasis on dangerous beasts and exploration without as much of the standard high magic item trading as civilized ***d20 System*** settings normally provide.

Information Flow: Court Politics

by [Chad Underkoffler](#)

NOTE: This CiaB is slightly different -- it details a tool for constructing campaign plots, with a short worked example showing its use.

A technique that can come in handy for tracking who knows what when in an RPG is the *Information Flow Map* (IFM). An IFM shows the paths or channels that knowledge flows along between characters and groups (both PCs and NPCs). It can be used to determine how quickly important data progresses from person to person, as well as spark responses from characters to information as necessary.

The first illustration below shows a basic IFM, with four entities (A, B, C, and D) and two types of flow-channel (one-way in blue and two-way in red). The four entities can be individual characters (the vampire lord, the plucky girl reporter, the FBI department head, the gutter-dwelling pickpocket, etc.) or groups (the Wizards' Guild, the Goldfish Fanciers, the CIA, Starfleet, etc.). The flow-channels could represent normal conversation, a spy's dead letter drop, gossip overheard on the street, a furtive telephone call, orders coming down the chain of command, etc.

Flow Figure 1

As information flows along a channel from entity to entity, it picks up additional information, and may cause those entities to respond -- which in itself generates new information that percolates through the system. Information travels in different directions and at different rates, depending upon the channels (and types of channels) between entities.

Taking the basic structure shown in IFM1 above, the next illustration shows the movement of information through the system:

At each step, more information is gathered. While there can be a greater potential for error with each step, this structure assumes a certain amount of "clean signal." (GMs can feel free to introduce unreliable channels between entities to garble information, but at this point in describing the tool, doing so seems to be a needless complication; the structure itself will generate sufficient complexity on its own.)

Of special interest are **Step Four**, **Step Five**, and **Step Six**.

In **Step Four**, information flows out of entity D in three directions: towards A, towards B, and back towards C. This means that A, B, and C all receive the same information (info ABCD) at the *same time*. Additionally, immediately upon this

three-way split, the amount of information in this system has *tripled*, as becomes evident in **Step Five**, where there are now three distinct "packets" of data flowing (info ABCDA, info ABCDB, and info ABCDC). When these three packets flow again in **Step Six**, the feedback of the C to D channel and the three way-splitter effect of D mean there are *five* different packets of information floating around.

As more entities, more channels, more types of channel are put into the structure, and as more time passes, the complexity of the system and density of the information increases dramatically. Used wisely, this rich vein of data can be used to bring an RPG campaign to vibrant life.

Below is a worked example of such a complex IFM, much more intricate than the model above, suitable for a fantasy campaign.

[Click for a larger view](#)

The Court of Cats

Genre: Fantasy.

Style: Political Machination.

Theme(s): Information is Power.

NOTE: The details of world-building are left deliberately vague in this example, to permit the insertion of this worked example into any fantasy campaign.

What Everybody Knows

Here are the major players within the Court of Cats:

The Royals

The Pantera Dynasty has held the throne for over 400 years, having overthrown the previous Urso Dynasty.

King Warrel III: While still hale and hearty at 57, the complicated web of domestic and foreign intrigues has forced King Warrel III to begin relying more and more upon the counsel of his half-brother and Prime Minister, Duke Bartolo -- especially since the death of his wife five years ago. His current primary desires are arranging an advantageous political marriage for his heir, the Crown Princess, and protecting his youngest son -- Prince Gustavo -- long enough for the young fool to grow up. He directly commands the *King's Guard*.

Duke Bartolo: The Duke is the elder and bastard half-brother of the King (through their father, the old king) and Prime Minister of the realm (through his devotion and skill). Bartolo is a brilliant man with lightning-quick reflexes . . . and some say he possesses the gift of sorcery as well. However, he is loyal to both his half-brother and the law of the kingdom (despite his railing against the unfairness of legitimate succession in his early youth), and has proved his fidelity a hundred times over during Warrel's reign. He commands the *Minister's Eyes* -- an elite network of spies, informants, and assassins -- to keep the kingdom and the crown (and, interestingly and specifically, the Bastard Prince) safe.

Count Jolo: The Count is the brother of the late Princess Lianna, making him the King's brother-in-law as well as the uncle of Crown Princess Sianna and Prince Gustavo. His daughter is High Priestess Bergathel of the Holy Faith. Jolo is a fine figure of a man, younger than His Majesty, and known to be generous, cunning, and proud. He dotes on Prince Gustavo (moreso than his own daughter), and is an "elder statesmen" of the Prince's group of *Young Blades*.

Crown Princess Sianna: Eighteen and full of life, Crown Princess Sianna has learned the arts of rulership in the decade of peace supplied by her royal father. She is strong, nimble, and reasonably attractive, but still unready to take the throne herself, due to inexperience with deep subterfuge and wartime leadership. She directly commands her entourage of ladies-in-waiting and young female aristocrats (called *the Garden of Beauty*), and indirectly commands the loyalties and actions of the loose conglomerate of marriageable lords and officers informally known as *Sianna's Suitors*.

Bastard Prince Udolpho: The Bastard Prince's mother was of the lesser nobility, and died in childbirth; Udolfo was fostered by his maternal grandfather -- a minor Count -- until that worthy's death, after which he came to live under the protection of his half-uncle, the Duke. (Indeed, many took Udolfo for Bartolo's bastard rather than Warrel's!) At age 13, he entered the Royal University, where he made life-long friends with a few classmates and instructors. Upon his graduation, he was formally presented to his father and half-siblings for the first time. The King eventually recognized him as being (a bastard) of the blood royal and welcomed him as part of the family.

Bastard Prince Udolfo is 32, fat, intelligent, intensely charismatic, and mercurial in temperament. (It is also whispered that he shares his uncle's skill in the sorcerous arts.) He is known for his vast appetites for wine, women, and wizardry, and has had a succession of mistresses . . . but no children. He "commands" his group of *School Chums* -- former classmates and a few mentors -- as the first among equals.

Prince Gustavo: The only legitimate son of the King, Gustavo is 16, remarkably handsome, arrogant, and vain. He is bitter about the lack of trust in his (obvious!) abilities displayed by Warrel, resents the old man's constant meddling and "lessons" in royal comportment, and is jealous of the close ties his older siblings have with their father -- especially those between the King and his eldest, bastard son: Udolpho. He is the leader of a band of duel-happy aristocrats known as the *Young Blades*.

High Priestess Bergathel: Daughter to Count Jolo, niece to the King, cousin to Crown Princess Sianna and Prince Gustavo (she's also the Bastard Prince's step-cousin), Bergathel entered the clergy at in her youth. Interestingly, during her novitiate, she married for love rather than political purpose, causing some friction between herself and her father. Alas, after only a handful of happy years with her husband, she became a widow.

To deal with her grief, she threw herself into her duties in the Holy Faith, and eventually rose to the position of High Priestess (through hard work and dedication). Approaching 30 and eschewing fashionable fripperies, she is a handsome woman, known for her grace and charm. Her temple training has made her capable in all of the clerical arts, but her understanding of courtesy and manners is without peer. She directly commands the *Scholar Priests* of the Holy Faith, and attempts to protect the flighty young things of the Crown Princess' Garden of Beauty with her influence.

The Royal Entourages

The King's Guard: Only the bravest, most skilled, and most loyal warriors of the kingdom are recruited into the King's Guard. They serve as the personal bodyguards of the ruler and his heir, elite forces in wartime, and police forces in peacetime. They have a mild rivalry with the Minister's Eyes (well, the ones they know of -- i.e., the Duke's personal guard) over who keeps the realm safest, often find themselves dueling with the rash puppies of Sianna's Suitors and the Young Blades, and hunt down and dispatch as many Rebels and criminals of the Vulpo Clan as possible.

The Minister's Eyes: The Prime Minister has spies everywhere: the palace servants, local tradesmen, street ruffians, high courtiers, and even (some whisper) actual *assassins* number among his agents. The Minister's Eyes gather general information, discover secret plots, infiltrate dangerous cabals, and smooth the paths for royal policy. The "uniformed" members of the Eyes -- the Duke's personal guard -- are embroiled in a ridiculous rivalry with the King's Guard over who keeps the realm safest. (While the Eyes know the answer to this riddle, the competition keeps them sharp.) More than one Rebel has gone to sleep in his own bed, only to awake in the castle dungeons -- spirited into durance vile by the watchful Eyes.

Court of Cats Figure 1

[Click for a larger view](#)

The Garden of Beauty: Among the young females of the court, the honor of becoming part of the Crown Princess' personal clique is the greatest prize: within the Garden of Beauty, one serves the acknowledged Queen-to-Be. Not only rewarded by her friendship, these young ladies are assured of drawing the eyes -- and attentions -- of the richest, wisest, most chivalrous, and handsomest bachelors of the realm (especially Sianna's Suitors and the Young Blades). They also receive instruction and the advice of the High Priestess and her Scholar Priests: a formidable education for a woman in these times.

Sianna's Suitors: A group of the most eligible noble young men of the kingdom -- and even a few nearby foreign lands -- all have set their sights on wedding (or at least bedding) the beautiful heir to the throne of the Pantera Dynasty. However, they find themselves bound in mannerly camaraderie and good fellowship, for only one of their number can wed the Crown Princess -- and would it not be best to be friendly with the future Prince-Consort of the realm? Besides, even those who eventually lose the race will have had a chance to impress the Garden of Beauty, and many could do worse than end up with an attractive, young, wealthy noble wife. Unfortunately, so much masculine energy must find vent somewhere; this is usually in duels between comrades, members of the King's Guard, or some of the Young Blades.

The School Chums: A small band of the Bastard Prince's classmates and mentors at the Royal University (with which they retain close ties), the School Chums are all, in some way, brilliant: mentally, physically, spiritually, politically, or -- some say -- sorcerously. While not ornaments of courtly life, they will constitute the engines that drive the progress of the kingdom in the decades to come. While not fond of the young men of the upper crust (Sianna's Suitors and the Young Blades), they find the young ladies of the Garden of Beauty remarkable for their minds alone.

The Young Blades: These hangers-on of Prince Gustavo are indolent playboys, quick-tempered rakes, and stylish fops. They live for gambling, wenching, dueling, consorting with Rebels, and making snide comments about both their lessers and their betters. They attempt to woo the girls of the Garden of Beauty, which often brings them into conflict (sometimes armed) with Sianna's Suitors; their other activities are causes for "disagreements" with the School Chums and the King's Guards.

The Scholar Priests: The wisest and most steadfast priests of the Temple of the Holy Faith serve the High Priestess directly in many guises: bodyguards, research staff, advisers, and so forth. Under her direction, they help teach the Garden of Beauty the laws of courtesy and academic topics much more advanced than the basic education of the typical temple schools. They maintain excellent academic amity with the Royal University, keeping abreast of any and all new knowledge those intellectuals discover.

The Ambassadors

Captain Khelan: This foreign gentleman is in his early 30s and is athletic (an excellent dancer, horseman, and duelist), courteous, and rather handsome (in a dangerous and exotic way). His biggest vice is his love of gambling in any form; he is also openly friendly with the suspected criminal lords of the Vulpo Clan. He serves his liege abroad as ambassador to the Court of Cats. (He, no doubt, also performs espionage duties for his government, and probably employs a number of agents to do so.)

Lady Amira: This foreign lady is in her middle-twenties and extremely beautiful and refined -- though it is known she has a remarkable temper that sometimes breaks free and rages. She is a skilled singer, dresses impeccably, and possesses a substantial education for this day and age (especially history and politics). She serves her liege as ambassador to the Court of Cats . . . but seems to have personal designs on Prince Gustavo's affections! (Doubtless she also spies on the kingdom for her government, and it is an open secret that all of her "servants" are really her well-trained operatives.)

Other Interested Parties

The Royal University: As a group, the scholars of the Royal University seek out knowledge, both through dusty research through old tomes and the most cutting edge experimental laboratories in the kingdom. While some claim that the "new science" is just the "old occultism" costumed in new jargon, none can deny that many of the discoveries of the academicians (like the lost ballads of Queen Janice the Songbird, the new hues and new process of colorfast dying of linen, and the construction of the immense King's Clock in the University Tower) are pleasant, useful, or simply astounding.

The Vulpo Clan: A contentious tribe of crime families constantly jockeying for superiority over one another, the Vulpo Clan as a whole rules the underworld of the realm. Vulpo casinos, coffee shops, and bordellos offer the best (sordid) entertainments, which of course attracts the quality (Sianna's Suitors, the Young Blades, even the School Chums) in droves -- permitting the nobility to be separated from their cash. Unfortunately, these seedy enterprises do not sit well with the King or his Guards, so those of the Vulpo Clan must be alert for either mayhem or escape.

The Rebels: Someone's always unhappy with the way things are run, and within the realm (some say, within the court itself) that would be the Rebels. Mostly composed of vanquished -- but not yet toothless -- political foes of the King, these malcontents wish to see the throne filled by someone other than Warrel III . . . but they always seem to disagree on who should take the purple. They are constantly dogged by the King's Guards and the Minister's Eyes, which has taught this cabal some discretion. They wait, and watch, and meddle as they can.

What Everybody Doesn't Know

There are many secrets in the Court of Cats; here follow some of them.

Secrets of Captain Khelan

Captain Khelan is dedicated to the overthrow of the Pantera Dynasty, as well as the kingdom entire. Khelan's Agents have infiltrated the criminal Vulpo Clan, and by proxy, the School Chums, the Rebels, and Sianna's Suitors. This last group was perhaps the most interesting to the ambassador; so much so that he disguised himself (mayhap with arts occult) and became a leading member of the company -- the mysterious "Lord Rodrigo"! Worse, he has unexpectedly -- and against his own mission and self-interest -- fallen madly in love with the Crown Princess. He is torn by his need to woo her (in the person of a fictional aristocrat) and his duty to his liege lord (in his own person), but what can he do?

Secrets of Count Jolo

Simply, Jolo desires the overthrow of the King, the murder of the Crown Princess, and the ascension of Prince Gustavo . . . who he will influence strongly.

Secrets of Lady Amira

Lady Amira is dedicated to assuring the realm of the Court of Cats remains strong, and strongly allied to her homeland. To this end, Amira's Agents have infiltrated the Rebels (and thus the Young Blades), in the hopes of derailing or suborning them. She herself has entered a volatile relationship with the young Prince Gustavo (as well as secretly seducing a lieutenant of the King's Guard), all in the service of her country.

Secrets of the Minister's Eyes

The Eyes have infiltrated both Khelan's Agents and Amira's Agents and are remarkably well informed as to their activities. Furthermore, they have a modicum of intelligence about the groups that both Amabassadors' operatives have themselves penetrated: the Vulpo Clan, the School Chums, Sianna's Suitors, the Young Blades, and even -- gasp! -- the Rebels.

Additionally, by the direct order of Duke Bartolo, a contingent of Eyes secretly safeguards the Bastard Prince . . . a perk that is *not extended* to the Crown Princess or the young Prince. Does the Prime Minister trust the King's Guard to ward the royal heir, or is he playing a deeper game?

Secrets of the Rebels

The Rebels have infiltrated the Young Blades, finding in this rowdy lot of youths an excellent tool for toppling an aged and despised king.

Secrets of the Vulpo Clan

The Vulpo Clan have paid or blackmailed agents within the Bastard Prince's School Chums and the Sianna's Suitors; this is for leverage, since the odds are good on one of them taking the throne when the king kicks it. They also provide hidden protection for the Rebels, seeing them as the fall guys for initiating a succession. Because of this, they've lucked out: the Vulpos now have access into the Young Blades. This means that they can play all ends against the middle -- no matter which of Warrel's kids takes the throne, they have a handle on the new monarch.

Court Information Flow Map

Below is an IFM representing the way knowledge travels around the Court of Cats. Individual *people* are represented by white boxes, *organizations* are grey hexagons, and four different types of arrow represent *channels*, which are more complex than the simple ones in the example given earlier.

The flow-channels in the Court Information Flow Map are more complex than the basic model above. Each channel has different potentials for *transmitting* and *receiving* information. A blue line with solid arrowheads is a *full two-way* channel: information is transmitted and received equally (say, a group of Royal University members and Scholar Priests). A black line with one outline arrowhead and one solid arrowhead shows a *command* channel: information is *always* received towards the outline arrowhead of the commander (e.g., the Prime Minister), and only *sometimes* transmitted towards the solid arrowhead of those commanded (e.g., the Minister's Eyes). A green line with two bars and one sold arrowhead is a *protection* channel: information is *always* transmitted towards the arrowhead of those being protected (e.g., the Garden of Beauty), and only *sometimes* transmitted back towards the bars of the protector (e.g., the High Priestess). A red line with a solid square and a solid arrowhead indicates an *infiltration* channel: information is only ever received, and *never* transmitted. (GMs can feel free to come up with new types of channel for groups or characters they introduce -- for example, a College of Herald's that can only transmit information, or a telepathic communication method that permits info to flow to the next entity up the chain within the same **step**).

For how quickly knowledge disseminates around the Court of Cats, the *timing* of **steps** (see above, *IFM2*) is important. For this example, assume a **step** takes a full day; if GMs wish to alter the speed of information flow, they should read *It's All in the Timing* below.

Lastly, the people and groups that receive information will react to it in some way; their responses may affect the information as it is passed along, spark off new cascades of information movement, or present interesting potentials for characterization or action. See the *NPC & NPC Group Interaction Matrices* below for ideas to help shape how entities react to news regarding other entities.

Example of IFM Use: Sick Sianna

To illustrate how this Court IFM works, let us take the following example and see how knowledge flows around the gentry, and the sorts of reactions this could produce:

Step Zero: The basic situation is that Crown Princess Sianna has been grievously sick to her stomach each morning for the last three days. This info starts with the Crown Princess.

Step One: The info moves from Sianna to the King (mentioning her illness over breakfast), to the Garden of Beauty (telling her ladies-in-waiting that she feels unwell), and Sianna's Suitors (canceling a dinner party). Furthermore, since the King's Guards are protecting the well-being of Crown Princess, it's quite possible that they might have picked up the info through observation.

Step Two: The King tells the Duke and the Bastard Prince about Sianna's illness. The High Priestess discovers it through her overseeing of the Garden of Beauty, which has also passed the info along to the Young Blades. Through their infiltration of the Suitors, the criminal Vulpo Clan and Captain Khelan -- if he didn't know already as Lord Rodrigo -- both become aware of the sickness. (Lady Amira could also pick up this information through her infiltration of the Guards, but the GM decides that she's otherwise occupied for the day, and doesn't see her suborned lover.)

An interesting thing here is that the same information hits some entities *again* and feedback loops begin to occur: Sianna's Suitors have already heard of the illness in **Step One**, and now they heard it again in **Step Two** (from the Garden of Beauty); the King's Guards report the info to the King at this time, just when he might be readying an order to keep closer watch over the heir.

Rumors and gossip and confabulation and conspiracy theory in these situations are par for the course -- perhaps the Suitors get it into their heads that this is not the flu, but "morning sickness" . . . meaning that their object of affection may have already

selected a lover! The King puts additional pressure upon the Guards, because of the dangers of possible poisoning or secret premarital sex (after all, the family tree has an uncommonly regular habit to throwing out bastard branches).

The GM can intensify, dampen, or ignore any feedback that occurs, as he or she chooses.

Step Three: Count Jolo hears of Sianna's illness (there could be a potential for a misunderstanding between the Count and the High Priestess; since his channel with her is protection, he might not be listening to her, instead receiving the information through the Young Blades). The Bastard Prince tells his School Chums. The Duke tells his Eyes to start looking for evidence of plots against the royal family; the Eyes themselves have already gleaned the news by eavesdropping on the Bastard Prince. Prince Gustavo hears of his sister's infirmity from his Young Blades. The High Priestess orders the Scholar Priests to begin researching gastric diseases (and, to be safe, to brush up on obstetrics).

Khelan's Agents are in the know, because of the orders of their principal and their infiltration of the Vulpo Clan. The Suitors ask pointed questions about the Princess' affections to the Garden of Beauty (since none of them have gained Sianna's affections, could it be one of the Young Blades?). The Rebels hear of the possible weakness of the heir from two sources: their infiltration of the Young Blades as well as the guidance of their Vulpo bankrollers (sounds like the time to launch a plot against the royals!). Though delayed, Lady Amira has met with her Guardsman lover, and now knows the info.

Step Four: The Eyes report that the Khelan's Agents know of the sickness. Prince Gustavo tells Lady Amira (who already knows, though she hides this); Lady Amira informs her Agents (who have just discovered the info through their moles in the Rebels), and issues orders to her lover in the Guards to admit her into Sianna's chambers (cue sting music!). The High Priestess receives preliminary reports from her Scholar Priests, who -- in parallel with the School Chums -- are picking the brains of the academics of the Royal University. The Suitors get shocked feedback from the Garden of Beauty; "Lord Rodrigo" is particularly wound up about the possibility of Sianna having a lover which isn't him. The Young Blades hear of the insinuations of the Suitors via the Garden of Beauty, added to Count Jolo's decidedly offended mien, they are spoiling for a fight with the cads who have cast such aspersions . . .

An obvious event at this high-tension point would be a huge free-for-all melee to break out between the Young Blades and the Suitors; the presence of any other groups (the Garden of Beauty, the Vulpo Clan, or Sianna herself) is purely optional.

The cycle can start all over again with the death of one of the combatants -- an innocent young nobleman, son of a wealthy foreign Duke -- that will cause its own ripples in the system.

PCs Do What?

The IFM above does not take into account the actions of PCs. *An IFM is simply a tool to be used to provide **them** with setting details and adventure opportunities.*

At any point, the PCs could radically redraw the IFM with ease -- by not transmitting information to other parties, by ignoring information they receive, by ferreting out and killing infiltrators (or entities), by delaying or distracting entities, by unmasking spies and agents, etc.

This is a *good thing*: GMs should not view an IFM as an inviolate, permanent document: the course of a campaign will and should alter the NPCs and groups involved.

PC Opportunities

In a political campaign like the Court of Cats, the PCs have plenty of opportunities to get involved: as members of any of the factions, as factionless individuals trying to join (or being wooed to join) a faction, as double-agents for a principal, or even as the trusted servants of one of the people in one of the factions.

Of special note is that not all groups mentioned above require that the PC or PCs be part of the high aristocracy. Lesser- and non-nobles could easily be a King's Guard, a Royal University fellow or student, a School Chum, a Scholar Priest, a Minister's Eye, a Vulpo Clansman, a Rebel, or an Ambassador's Agent.

Possible Seed Events

Here are several seed events to start the flow of information in the Court of Cats:

Find that Bastard!: The Bastard Prince and his valet have disappeared from their usual haunts (including Udolfo's palace chambers) without a trace, right from under the noses of the Minister's Eyes.

The Wound's Tale: During a duel, "Lord Rodrigo" of Sianna's Suitors is wounded in the arm. Later, one of the Young Blades notices that Captain Khelan seems to have a spot of blood on his shirt in nearly the same place.

The King is a Fink!: The Rebels are planning a massive act of vandalism or sabotage to make the King look weak and foolish.

Strangers in the Court, Exchanging Glances: Duke Bartolo and the High Priestess begin a secret affair.

The Judas Guard: One of Khelan's Agents discovers the identity of the King's Guardsman who has been suborned by Lady Amira.

Where's My Two Ducats?: The Vulpo Clan begins putting pressure on Prince Gustavo to pay off his vast debt at one of their gambling dens.

Advice, Opportunities, & Pitfalls

THEME: Information is Power

A key feature of political and conspiracy games is that knowledge is power. Knowing the right thing, at the right time, and in the right place or with the right access, can allow an individual to cause great events to happen or gain enormous rewards or achieve their goals with much less effort than otherwise. This is a perfect position for PCs to try to get into, and the IFM tool provides both a map and a method for the GM to help put them exactly there.

Using & Not Using the IFM

The most important aspect of using an IFM in a campaign is to know when to follow it, when to change it, and when to ignore it utterly. It is just a form of brainstorming and background-generating tool for GMs. It should in no way replace actual game-mastering or subordinate the actions the PCs.

While some GMs might not want to use an IFM during play at all (reserving it for out-of-game plot generation for upcoming sessions), it is a handy tool for quickly figuring out a large number of NPC responses to PC actions during a session. If the PCs light Count Jolo's apartment on fire (accidentally, m'lord, I swear it!), it'd be good to know who in the court will glare at them, who will laugh at them, and who will ask them some quiet questions about how they escaped from the inferno when all the doors and windows were blocked by flame . . .

Note, however, that good GMs have learned that having a hammer in hand doesn't make everything a nail.

It's All in the Timing

By adjusting how long a step is (that is, how long it takes for information to flow through a channel), a GM can pace how quickly NPC responses to PC actions unfold. If a step is only a minute, things move fast indeed; if a week, events and reactions to them may slow to a crawl. For most games set in pre-modern times, one day per step is reasonable; for modern periods, twelve hours per step is often adequate; for post-modern times, an hour is equitable (quick enough to reflect high-tech communication, slow enough to permit suitable reactions). A vague period of "dramatic time" (or *scene*) is always appropriate.

Listen well, and have a care regarding when you speak -- for you never know who'll be listening, or what use they'll put that information to. Discretion is the hallmark of the successful courtier.

Other Resources

The design of the information flow diagrams here were influenced by the relationship maps of Ron Edwards' [The Sorcerer's Soul](#) (Adept Press), the Community Behavior Map of [Gamma World d20](#), and my own Plot Skeleton Worksheet in Atlas

Games' [Weep](#) and the Scenario Skeleton design found in Atomic Sock Monkey Press' [Dead Inside](#).

Excellent general information on in-game political intrigue can be found in Chris Aylott's [Dynasties and Demagogues](#).

Special Thanks to Matt Rhodes, Tom Schoene, and Jon Zeigler for their comments.

Foreseeing Unforeseen Consequences

A couple of days ago in the news, I read that implementation of red-light cameras in Colorado resulted in an [83% increase](#) in the number of accidents. In other words, an attempt to make people safer seems to have placed them considerably more at risk.

Sadly, this isn't a sole exception in the automotive world. In the 1990s, when they raised the speed limit here in the States from 55 miles per hour to 70 on selected road, they discovered that accidents went down. If I recall correctly, I think it was because the number of people causing accidents because they were going 15 miles over the speed limit went down, since they really didn't feel the need.

(As a random aside . . . on my drive home, there's a sign right by my apartment that says "WATCH CHILDREN." For some reason, I have an irresistible compulsion to add my own commentary on this sign whenever I see it: "WATCH CHILDREN roll across the hood like raindrops.")

Anyway, the real world is full of decisions that resulted in unintended or unintuitive consequences. Many of the anecdotes in the "unintended" column result in outcomes the opposite of what was desired; for example, the United States' CAN-SPAM act, designed to curb e-mail spammers, resulted in a huge surge in junk e-mail production. Other times, these decisions seem ironic or shortsighted, looking back. As one anecdote, the motion picture industry fought tooth and nail against VCRs when they first appeared, fearing that people would stop going to movies if they could record their own off television. (Does anyone remember the days when it cost \$100 or so to buy a movie on video?) Today, the same movie companies make *much* more off home video sales than they make in the theatres . . . and, as I understand it, they're making more money than they did back in the pre-VCR days.

Still other times the results can be far-reaching and fairly bizarre. For example, the weak "encryption" methods of the standard CD led to the ability to extract music files from them over a decade later, which led to MP3 players, which resulted in Apple Computer's single most high-profile and high-profit product line in a decade, quite possibly saving the company from obscurity or worse. (If the Macintosh doubles its market share in the next decade or so, it will have the CD's insecure format to thank for a fair chunk of that.)

Personally, I find this gulf between the intended and the actual result to be fascinating. However, in fiction the effect is somewhat rarer, partly because it requires knowledge of both the expected and actual result. Before you can show that a law against womprat racing resulted in more womprat racing fatalities, you need to first describe the perils of womprat racing, establish that people desire a decrease in womprat accidents, and then describe the efforts to solve the problem (unsuccessfully).

However, it's not impossible. The most recent (extended) example I can think of is from the *Star Wars* prequel trilogy, where the senate that voted to surrender its freedoms to preserve and protect the republic ended up with a government that was neither preserved nor safe.

As a meta-example, the first season of the television show *Head of the Class* had the teacher challenging his gifted students with scenarios like these. He'd hold up a baseball and say, "A baseball started the Cuban Missile Crisis." And, through his students' incredulity, he would explain that in the 1950s Fidel Castro was up for a pitcher's position for the Washington Senators, but he failed to make the team; this failure freed him up to go back to Cuba and overthrow the government, becoming the leader that formed a third of the near-explosive equation during the Cuban Missile Crisis.

However, it's a technique that, once I started thinking about it, isn't all that difficult to envision as being useful for RPGs. All that's required is to envision a outcome you desire (from a game standpoint), think of an unlikely spark, and then connect the dots.

Let's start with an easy one.

An Attempt To Cure a Failing City Causes It to Fall Further

Let's say we want Gotpork City to be depressingly dangerous and bleak, having descended into corruption and poverty. What's an unlikely way of reaching that point? Well, the city is poor, so what if an attempt to get money into the city backfired, resulting in less money? With that in mind, we devise a scenario: Decades ago, Gotpork officials noticed the city was sliding downhill, and something drastic needed to be done. To do so, the Gotpork officials permitted casino gambling within the city; the thinking was that taxes on the casino would bring in needed revenue to fix things.

Things worked okay for a bit. Unfortunately, it turns out that the people most likely to gamble in Gotpork were those in dire economic straits. As a result, they lost money, and started turning to crime. This criminal element resulted in the industries remaining within Gotpork not feeling secure, causing them to go elsewhere, taking their tax revenues with them. As a result, Gotpork ended up with *less* money than before . . . plus a dangerous criminal element, and a reliance on the casinos for the meager money that remains. We've got ourselves a perfect backdrop for a gritty noir game.

An Attempt to Aid Humanity Has Unexpected Consequences

Let's go for a harder one. We want to end up with a supers campaign where the relationship between metahumans and regular folks is more strained or unusual than normal. In trying to think of an example, I considered: What's one way humans might get super powers? Well, medical means (drugs or surgical procedures) is a way that hasn't been widely used as a campaign-wide origin. And what's one way that medical means might result in supers? Perhaps as a side effect from a medical cure . . . such as a cure for cancer.

And I have my inspiration:

Monoloxin 87-144 had won legal approval in use as a promising treatment cure for cancer, and was in use for several months before the first report of . . . something odd. Its effectiveness was in the high 90-percent range, but after six months of treatment some patients began reporting of unusual abilities. While the world and media were still reeling from the implications of this discovery after several weeks, an unknown person (the authorities have yet to disclose who) launched a full-scale telekinetic attack against Chicago. After the death of thousands, the person was eventually killed (the exact method of which is also unknown). The pieces were put together, and a direct causal link was established between Monoloxin 87-144 and the formation of super powers; scientists place the percentage of those so imbued at about 1% of those who took the drug.

After the Chicago attack, the government halted all production and distribution of Monoloxin 87-144. They also began interrogating and researching those who had taken the drug, trying to determine who was the most dangerous; this, in turn, caused many who had undergone the treatment (both with and without powers) to go into hiding, lest they end up in legal limbo in a government hospital for months.

Heroes are those who have taken the drug and gotten powers. They are distrusted by the public, hunted by the government, and especially despised as a symbol by those who have cancer and are unable to receive treatment to save their lives.

So we've taken something that was to be a great boon to humanity -- curing cancer -- and turned it into a negative with unchosen consequences.

It's an interesting technique, and one that I'm looking to apply to future projects. Assuming, of course, that I don't get into a car accident before then because of techniques designed to keep me safe.

--Steven Marsh

Charcoal and Charcoal Makers

for *GURPS*

by S.E. Mortimer

Introduction

This is another in our series about medieval professions. This one is about charcoal and charcoal makers and can be used in conjunction with "[Woodlands and Woodcutters](#)." The charcoaler often worked closely with the woodcutter, and the two professions were closely intertwined. This work refers to *GURPS* supplements such as *Low-Tech* and will endeavour to remain consistent with *GURPS* material when possible.

Charcoal is a black, porous product consisting almost entirely of carbon obtained by roasting wood (or other carbonaceous materials such as cellulose, peat, bituminous coal, or bone) in a low-oxygen environment. This process, called *pyrolysis*, prevents the wood from burning to ash, drives off most of the water content, and reduces many of the organic compounds to carbon, resulting in a fuel that is much lighter than wood, and burns cleaner, hotter, and at a known, controllable temperature. Charcoal contains much more energy per pound than wood. Freshly cut hardwoods can contain 30% water and conifers can contain 40% or even more. Seasoning will reduce water content to around half that amount, making it more suitable for use. As mentioned in *Low-Tech* (p.LT39), freshly cut hardwood contains around 7,000 kWs of energy per pound. A pound of seasoned hardwood contains around 8,200 kWs. Charcoal is a much more efficient form of fuel, containing around 13,000 kWs per pound. It is also easier to transport charcoal because it is much lighter than timber. Wood fires can burn at around 1,200°F but can be "flashed" up to around 1,500°F with straw or pine twigs. They also produce large quantities of ash and smoke. A charcoal fire burns at around 1,200°F without a forced draft and is much cleaner, without producing much smoke or fumes. If air is forced into a charcoal fire (e.g. using a bellows), temperatures can reach 1,800-2,000°F, and this is hot enough to melt copper. In an insulated furnace, temperatures can reach more than 2,200°F, which is hot enough to smelt iron (slag becomes fluid at around 2,100°F and can be drained off, leaving the iron "bloom"), but not hot enough to melt it (pure iron melts at 2,800°F). When smelting iron, charcoal also acts as a reducing agent to chemically release the iron from the ore.

History

Charcoal has been the universally preferred industrial fuel from the Bronze Age (TL1) through to the 18th century (TL5). The earliest pieces of charcoal so far tested have been carbon-dated to around 3500 B.C. Charcoal was used as a fuel in the smelting and working of metals, the drying of hops for brewing, and the production of glass; in the manufacture of gunpowder, soap, and medicines; as a purifier of food and water; and as a black pigment for ink, paint, crayons, and so on. More recently it has been used as a filter to purify water and remove odors (some gas masks use it). Barbeque fuel is another major use today. Some of the by-products of charcoal production include tar, creosote, methanol, formaldehyde, and acetic acid. One liquid called *pyroligneous acid* was used by the Egyptians in their embalming process. Another by-product, *carbon disulphide*, was used in the first half of the 20th century in the manufacture of artificial silk.

Charcoal forests were often "coppiced" (see below) to make the woodlands more productive, thus enabling a more sustainable charcoal industry. It has long been thought that the demand for charcoal was such that in areas like Great Britain, the woodlands were all but destroyed. Legislation was passed to limit the cutting of mature trees for the charcoal industry, which implies that timber clearing by some charcoal burners could get out of hand. Often, however, the opposite was true, and forests located near iron industries were better protected because of their economic value. These timber resources were jealously guarded and so were not cleared for pasture/agriculture or sold off to settle debts, as happened in many other areas. Even today, some countryside located around historical iron producing sites are among the most densely wooded areas in England.

Coppicing

Coppicing is described in detail in "[Woodlands and Woodcutters](#)." Charcoalers preferred coppice timber because it was of regular size, easy to handle and load, and required minimal trimming. Wood to be used for charcoal was generally cut during early spring before the sap started to rise. It was then trimmed to lengths of between two and four feet and stacked in cords to season for several months.

Coal (Mineral Coal)

Until the 18th century charcoal was far more dominant as a fuel than mineral coal. In 1603, Sir Henry Platt first suggested that coal might be charred the same way that wood is charred to form charcoal and in 1642, coke (coal which has been roasted to drive out volatile constituents) was first used as a fuel to roast malt for the brewing industry in Derbyshire. In the following century, coke started to be used for iron smelting and soon overtook charcoal as the preferred fuel. It was initially called "sea coal" because most of it was found on beaches, having washed up from exposed seams. A Bronze Age corpse was cremated with coal in South Wales, and the Romans used coal along Hadrian's Wall to heat homes, barracks, and baths. It was very rarely dug from the ground in the Middle Ages, but one instance of it being mined was by the Monks at Margam from the middle of the 11th century. In Leige near Belgium there is also documentation indicating that coal was used for smithing as early as the 11th century. Mineral coal replaced wood coal in the smelting industry for several reasons. One was the lack of timber resources for charcoal but the main reason was cost. Coke required much less labor to produce than charcoal and is about five times more efficient as a fuel for smelting iron. The disadvantage is that mineral coal often contains impurities (e.g. sulphur) that result in the iron being of a poorer quality (more brittle, etc.) than that smelted with charcoal.

Coal miners were originally called "hewers" and their work required great skill. During the Elizabethan period, they were paid craftsman's wages. Usually a single man worked a coal face, pushing the coal behind him as he excavated a gallery along the seam. A common method was to first dig at the rock underneath the seam, undercutting it. This task involved lying on one's side and using wedges, short-handled picks, and hammers. The hewer pushed the rock debris behind him and this was cleared before the coal was dug. Using wedges, hammers, and a crowbar, he worked upward into the coal seam, attempting to break out the coal in pieces as large as possible. This "great coal" was worth much more than "small coal" because it was easier to transport and burned more efficiently. Coal and debris was carried to the base of a mine shaft where it was carried up ladders, if the distance was short, or hauled out with a windlass. The same windlass was used to transport personnel up and down. The number of laborers required to move the coal and debris was normally significantly more than those who were actually digging at the coal face.

Charcoal Making

The first method for producing charcoal probably involved the "pit kiln," in which wood was slowly roasted in a shallow pit covered with soil. More efficient and more manageable above-ground kilns developed later. Charcoal burning usually took place very near to where the wood was cut. Since the best conditions included dry weather and little wind, it was usually attempted from late spring through early autumn. Hardwoods like oak, ash, maple, chestnut, and hickory were the best types, but nearly any kind, except resinous trees like pine, were acceptable. Aged, dried wood was the best. The final volume of charcoal is up to 50% less than that of the initial timber and final weight is around 25%.

Pit Kiln (TL1)

This is a primitive method of making charcoal but is still used today in some countries. It was created by digging a pit and stacking the wood in a particular

A Sample Temporary Shelter

One type of temporary shelter used by charcoal makers consisted of a tepee made from a wooden frame covered with turf. This two-man hut was about three yards in diameter with a frame of 16 vertical poles between four and five yards in length, and six horizontal poles lending additional support. A doorway

order to allow the correct amount of air flow as it burned. The stack of timber (the "charge") was lit and then covered with dirt and leaves. A small area was left uncovered to act as a smoke vent. Pit kilns are fairly inefficient since the burn is difficult to control. Some timbers burn to ash while others are hardly singed, so the final yield of each burn is lower than above-ground methods (see *Yields*, below). A pit kiln burn usually takes longer than above-ground methods, but it depends upon the size. There are two general categories: small and large.

Small Pit Kilns: These might produce enough charcoal for a small smithy but is impractical for larger volumes. This pit kiln is usually around 1 cubic yard in size and can only be used to burn a charge of small, dry cuttings. Once the pit is dug, it is partially filled with timber. A fire is then started and more timber is added to fill up the pit. The smouldering mass is then covered with leaves and soil to a depth of at least 1 foot, leaving a hole for ventilation. After a few days the top is removed, water is added to prevent flare-ups, and the charcoal is allowed to cool before collecting and sieving to remove soil. Charcoal was then graded. Large pieces went to the iron workers and smaller pieces went to other industries including the domestic market.

Large Pit kilns: These pits can be up to 30 times larger with a corresponding increase in throughput, and they can handle large logs and a little more moisture content. A good design is roughly rectangular in section with a sloped floor. The charge of timber is placed on a crisscrossed crib of logs to raise it above the ground, enabling gas to circulate underneath. The charge is lit at one end and the pit is covered with leaves and soil several feet deep. The burn occurs gradually down through to the timber at the lowest point of the pit at the far end, which is where the ventilation flu is located. Animals and humans should be kept away during the burn to prevent accidental falls. It takes three to four weeks for a large pit kiln to complete a burn. It is then uncovered and left for an additional month to allow it to cool. The charcoal is removed with rakes and forks.

was left facing the charcoal burn so the charcoal maker could keep an eye on it. Sacks were placed over the framework and leafy brushwood twigs were stuck into the weave to help hold the turf. The turf was laid, grass side uppermost, onto the fabric and twigs, starting from the ground and working up to the apex. A porch, giving headroom and shelter from the rain was brought forward when the poles were first set in position. Inside the hut, on either side of the porch, two platforms were constructed from stakes and sprung brushwood. These were covered with a mattress of leaf- or grass-filled sacks. Additional sacks provided a curtain for the doorway. When the charcoal maker was ready to move on, he would dismantle his hut and use the sacks to store his charcoal, ready for sale.

Charcoal Clamp (TL2)

A more advanced method of making charcoal is the above-ground "forest kiln," also known as a "clamp" or "pile." The first step in building this was the placement of the centre pole, called a "motty-peg" or "fagan." The fagan, approximately four inches in diameter, was surrounded by a triangular chimney made of split wood. Splints were then placed around the chimney in vertical rows which flared out at the base to provide the proper pitch. The fagan was removed and hot embers from a fire was poured down the hole. Upon firing, the clamp was covered with leaves and soil. If the burn proceeded properly, it burned downward and out. The clamp had to be carefully watched and controlling the airflow was a delicate matter. Too much oxygen could cause the clamp to catch fire, too little would result in an unsatisfactory burn. Long-tined charcoal rakes were used to rake the already produced charcoal from the top and sides while the rest of the clamp continued to burn. Depending upon the amount of moisture and types of wood used, a burn could last from 3 to 9 days, plus an additional day or two to cool down.

Brick Kilns (TL4)

These are permanent structures made from brick and as such, can only be employed in an area that has a constant supply of timber. This usually involves a reliable method of transportation such as a nearby river (or rail in later times) since the timber supplies in the local area will be quickly exhausted. Brick kilns are actually not much more efficient than pit kilns but they allow a larger volume of wood to be more safely processed. Burns in these kilns usually take a couple of weeks. Another advantage of this kiln is that the charcoal was protected from rain which could ruin charcoal

produced outdoors.

Steel Kilns (TL5)

These work in a similar manner to brick kilns except that they are made of steel and are usually portable. They are taken to the timber rather than vice versa, and the burn is completed in about a week.

Retort Kilns (TL6)

This is an indirect method of burning charcoal in which an external heat source (usually some sort of furnace) is used to roast the charge, which is contained in a closed, but vented, airless chamber (called a "retort"). Retort kilns require less skill and attention than other methods of producing charcoal while, at the same time, producing a higher yield of better quality charcoal with less smoke and pollutants. The charcoal costs more to produce however, because fuel is needed for the indirect heat source (the furnace).

Yields

It depends on the species of wood but typical yields, using seasoned timber, are as follows:

Type of kiln	(TL)	Typical Charge	Yield	Efficiency	Duration
Pit Kiln (small)	1	2,000 lbs	200 lbs	1:10	1d-2 days
Pit Kiln (large)	1	100,000 lbs	10,000 lbs	1:10	3d+10 days
Clamp	2	50,000 lbs	8,000 lbs	1:6	1d+3 days
Brick Kiln	4	200,000 lbs	25,000 lbs	1:8	2d+6 days
Steel Kiln	5	20,000 lbs	4,000 lbs	1:5	1d+3 days
Retort Kiln	6	20,000 lbs	5,000 lbs	1:4	1d+1 days

Less efficient methods have a lower yield because there is less recoverable charcoal. More of the final product is either ash or timber that has not burned properly (called "brands"). The brands can be reused next time but timber that burns to ash is wasted. An acre of coppiced native forest contains 20-25 cords or about 80,000 lbs of useable timber. For a sustainable industry only about 5-10% of that could be harvested each year (allowing 10-20 years for regrowth). So an acre of woodland could produce, on average, about 6,000 lbs of seasoned timber per year. Looking at the Yields table above, pit kilns would produce 600 lbs of charcoal, brick kilns 750 lbs, above-ground clamps 1,000 lbs, steel kilns 1,200 lbs, and retort kilns would produce 1,500 lbs of charcoal per acre each year.

The Charcoal Maker

This professional was very common from the Bronze Age right through to the end of the 19th century. The charcoal maker had many names including "charcoal burner," "charcoaler," or "wood collier." Like woodcutters, the charcoal maker was often near the bottom of the social ladder and owned few possessions. When a tree was cut down the charcoaler didn't take the primary limbs (these were sent to the sawpit or sawmill to be dressed and sold for carpentry work) but only used secondary limbs and branches. The charcoal maker's life was itinerant during the burning season which could last up to six months. During this time he lived in the forest in temporary shelters. When not working he returned home to his family. Some took their entire family with them during the burning season. The charcoal maker was totally reliant upon the weather. A persistent rainy or windy period would prevent work and

The Charcoal Burn

Roll against Wood Collier skill and apply the following cumulative modifiers:

- +1 very suitable timber (oak, maple, beech, hickory, chestnut, etc.)
- +1 little wind is likely during this season.
- 1 using a pit kiln rather than an above-ground one
- 2 unsuitable timber (softwood conifers such as pine)
- 2 attempting the burn alone (no assistants)
- 3 strong wind is likely during this season.
- 1 for each additional burn after the first one (e.g. 3 simultaneous burns has a penalty of -

result in no income.

The charcoal maker had to be on hand at all times to monitor the burn. If the burn proceeded too slowly, holes would have to be cut at various spots in the clamp to improve airflow. A sudden increase in the wind could force excess air through the footings of the clamp, thus causing it to burn too fast. When this happened, the wind had to be blocked with hastily-erected screens. The amount and colour of the smoke indicated how the burn was progressing. Initial thick clouds of greenish steam should gradually subside to a steady trickle of white smoke as the wood dries out. During the next stage, chemicals in the wood are given off and the smoke turns a yellow/brown colour. Thick, black tar deposits around the vent holes are another indication that the second stage has been reached. If the smoke is blue, it means that there is too much airflow and the wood is burning too fast. It must be quickly controlled, usually by shovelling on more soil or pouring water on it, to prevent the entire clamp from bursting into flames. Blue (or sometimes pink) smoke can also indicate that the burn is finished and all of the timber has been converted to charcoal.

The charcoaler has the professional skill, Wood Collier (IQ/Average). This skill involves identifying suitable timber (either buying or gathering it), building the kiln (pit or pile), adjusting the airflow to control the burn, and collecting the charcoal after the burn is complete. If the charcoaler has at least one assistant he can manage multiple burns at once (maximum of 15). This is determined by his skill level. At 14+ he can handle 3 burns simultaneously with one assistant. For every additional skill level he can handle two extra burns if he has additional assistants (one per 3 kilns). For example, a Master Wood Collier (skill level 20+) can manage 15 simultaneous burns provided he has 5 assistants. A successful skill roll (see text box, right) produces the yield listed in the above table (see *Yields*, above). Other useful skills include Area Knowledge, Survival (Woodland) since he lives in the forest during the burning season, Lumberjack (a Professional skill suggested in "[Woodlands and Woodcutters](#)"), and Merchant to find and exploit markets for his product.

Hazards: One dangerous task involved "jumping the pile," which was required if the clamp wasn't burning evenly (see textbox, right). Other hazards include inhalation of toxic fumes, explosions from trapped gasses collecting inside, and accidents caused by tiredness (the burn had to be watched 24 hours a day).

Cost (GURPS \$).

Fuel was expensive. Even before it was converted to charcoal, firewood cost around 8 shillings per cord or \$160 (see "[Woodlands and Woodcutters](#)"). It is difficult to find historical prices on charcoal but it is probably better to extrapolate using our suggestion for the cost of timber. A typical medieval charcoal maker would only be able to handle one burn at a time. Assuming that he uses an above-ground clamp which takes 1d+3 days to burn, he

2)

**Sample Result Table
(for above-ground "clamps" only)**

Critical Success:	The burn finishes in only 3 days and most of the charcoal is excellent quality. Increase the yield by 10%.
Success:	The burn finishes in 1d+3 days. Each point of success increases the yield by +1%.
Failed by 5 or less:	After a couple of days you realise that too little air circulation is preventing the timber from burning properly. You must start again but may reuse the same timber.
Failed by 5 to 10:	Too much air circulation caused the clamp to burn too fast, ruining the batch. You must act quickly to prevent the fire from spreading to the surrounding woodland. If not, fire licks your heels as you flee for your life.
Critical Failure:	Poor air circulation caused a build-up of volatile gasses, resulting in an explosion. All those within five feet of the kiln take 2d damage. All those within 20 feet take 1d damage. Quick action is also needed to prevent a forest fire.

Jumping the Pile

During some burns in the first 24 hours, the charcoaler had to climb on top of the smoking mass of timber to compact it, thus helping to create a more even airflow. This action is required when the character makes his skill roll exactly (i.e. succeeds by 0), and requires a successful roll against DX+2 or Climbing+2. Failure results either in burns (1d

would be able to produce around two batches per month if he had an assistant to help prepare the ground, gather the wood, build the clamp, rake, sieve, and bag the finished charcoal, and so on. Two burns is an average figure -- if the weather was perfect, he might manage three or even four batches in a month, but some months would see one or even *no* burns being successfully completed. A cord of seasoned firewood costs \$160 and weighs approximately 3,500 lbs (weight varies depending on species). A typical clamp uses 50,000 lbs of timber or around 14 cords. Two burns each month for six months (12 batches) uses 168 cords of timber with a resale price of about \$27,000.

damage) or falling damage (from a height of 10 feet). A critical failure means that the character has fallen *through* the top of the pile into the burning mass below. The sudden inflow of air causes the pile to flare up dramatically, resulting in 3d damage from the fire *plus* falling damage from the ten-foot height.

Each 50,000-pound batch of timber yields about 8,000 lbs of charcoal for a total of 96,000 lbs per year. Using the **Low-Tech** wages as a guide (p.LT8), we will assume that the charcoal maker pays himself about \$2,400 per year (\$200 per month) and his assistant is paid \$960. To break even the charcoal must be sold for $\$27,000 + \$2,400 + \$960 = \$30,360$. This works out to be about \$0.32 per pound. Charcoal was usually measured in bushels (about eight gallons). A bushel of charcoal weighs around 20 lbs and there are about 50 bushels of charcoal in a cord (8' $\times$ 4' $\times$ 4'), so a bushel of charcoal costs \$6.32 and a cord costs \$316. Other costs to be borne by the charcoal maker are the purchase of sacks, tool maintenance, food, etc. A good rule of thumb is to determine the price of firewood, which in this instance is \$160 per cord and then *double* it to estimate the price of charcoal, i.e. \$320 per cord. If charcoal sold for any less than this, then it would be more profitable to simply gather up the timber and sell it as firewood. \$320 seems a reasonable price if the product didn't have to be transported. Transportation costs could be worth more than the initial cost of the charcoal, which is why industries that needed large amounts of charcoal tried to locate close to the fuel source. An upcoming article will cover the amount of charcoal needed for industries such as iron smelting and smithing.

Woodlands Requirements

Looking at our example of a single charcoal maker and his assistant, they would require 588,000 lbs (168 $\times$ 3,500 lbs) of timber each year. If an acre of coppiced growth can sustainably yield about 6,000 lbs per year, then our team would require the timber from 98 acres of woodlands to work throughout the burning season in a sustainable fashion. Given that there were thousands of charcoal makers working at any one time, it is difficult to imagine the vast tracts of forest needed to feed the medieval demand for fuel.

GURPS Accelerator

Interview-Based Character Creation

by Thomas Weigel

*This is the first in a regular series of articles on how to speed up your **GURPS** game and make it easier to play.*

Character creation in **GURPS** is . . . well, it's detail-rich. Many potentially excellent players are scared off by the wall of three-column text they have to scale before they get to a character sheet, but there is a way to get rid of this barrier.

This article provides a toolkit for interview-based character creation. Using this approach, you will act as a go-between for the player and the rules, writing down a character sheet from the "real world" descriptions of the player.

I've broken the toolkit into four sections:

- **Method:** How to act as an interface between the player and the system.
- **Ignoring Stuff:** Information the player doesn't need to know yet.
- **Asking Questions:** How to find out what your player wants to play.
- **Presenting the Character Sheet:** How to make the character sheet easy to understand.

Method

There are three methods to interviewing a player about his character. The more involved you are, the better results you will get.

The GM as Decision-Maker

This is the simplest method. Ask the player to describe his character, take notes, and then translate the character into rules from those notes.

The advantage is that it is the fastest and easiest solution (short of pre-generated characters). For a time-pressed GM, making the decisions may be the best option.

The disadvantages are that the character rarely matches exactly what the player wanted, the player still doesn't understand the character sheet, and the player is no closer to being able to create his own character the next time around. To avoid these problems, you need to become a guide.

The GM as Guide

Take the player's initial description and then ask specific questions. Is your player's cop character a beat cop or highway patrol? Is he a skilled veteran or fresh out of the academy? We'll assume he's good at his job, but is he good at it because he has a strong intuition, a logical mind, an intimidating presence, or something else? If he's a veteran, is he still in good shape?

This creates a closer match to what the player wants, and allows you to introduce the idea of characters with strengths and weaknesses. ("For this campaign, I'd prefer you weren't good at *every* cop activity -- pick two?") However, the

player is not closer to being able to build his own character next time. If that's a goal for you, it's time to become a teacher.

The GM as Teacher

To be a teacher, introduce the rules the player will need while you are discussing his character. If you are adding a skill -- for instance, Intimidate at 12 -- take a few moments to explain it:

"Okay, this skill represents how good you are at intimidating and bullying people. A '12' is roughly professional skill, but still a bit away from expert. Any time you want to intimidate someone, you will be rolling three six-sided dice and trying to get a total that is 12 or less. Sometimes the situation will make it harder or easier, but we don't need to worry about that right now."

Each explanation should be simple, and to the point. Don't get into a discourse about how influence rolls in general work, or what a skill of 10 means, or the nature of circumstance modifiers. Tell the player just enough to understand the concept of "Intimidate at 12."

Who Writes It Down?

Some players (particularly kinesthetic and visual learners) learn better if they write down the character during the creation process. Others (particularly auditory learners) will learn better if you write down the character for them. This prevents them from being distracted when they're trying to listen.

The easiest way to find out is to ask the player which approach he would prefer, and then change it later if that doesn't seem to be working.

Ignoring Stuff

GURPS is an intricate system. Explaining one rule often brings to mind exceptions and "context" rules. It's easy to overwhelm beginners with too much context, so avoid it by skipping over concepts that the player doesn't need to know yet.

Ignore Point Totals.

Tell the player if he's getting too outlandish, too powerful (or weak), or if his character is starting to sound too much of anything in particular. However, don't get bogged down in whether he can be a professional janitor when he only has 3 points left to spend.

As long as all the players have the abilities they want to have, the system can support a wide range of point totals between player characters. If every character's point total is within 25% of the baseline point total for the campaign, the PCs will be balanced enough for most campaigns. The wider the variation in point totals, however, the more important it is to make sure that one PC's field of expertise doesn't overshadow another's.

If you want to maintain a strict balance of point totals among the PCs, take the character with the most points and give everyone else enough unspent points to bring them up to that character's total points. The players may use these points later, when they understand the system better.

Ignore Most Advantages, Disadvantages, and Skills.

Hard to Kill is fun, but for a beginning player, a high HT is much simpler to understand. Danger Sense is nifty, but don't ask the player if he wants it unless it is central to his concept. A first character should consist of broad strokes.

Ignore Skills That Everybody Has

In a campaign of police investigators, ask the player what aspect of police work he is particularly good at, but don't ask him how good his character is at every single skill a police character would have. Ask him how competent his character is, set *all* of the skills at that level, increase a couple of skills that the character is particularly good at, and move on.

Ignore Anything That Exhausts You or Your Player

In most cases, a beginning player is willing to take a "default" option for anything not central to the character concept. Use this willingness to keep the time involved in character creation as short as possible. You and your player can always adjust the character later.

Asking Questions

A structured set of questions eases the process of translating ideas into statistics. Here's the questionnaire I use.

Ordering Your Questions

The **GURPS Basic Set** is ordered in the way that is convenient if you are using points to create a character. When a player who is trying to get a character idea across, though, skills are generally the first thing to come to mind. Most character ideas don't start with "12 hit points and Combat Reflexes," but with "history professor with combat experience."

Start your questions by asking about skills. Once you have the skills and skill levels, you can reverse-engineer the attributes, Talents, and other advantages needed to reach that level. This requires some mental gymnastics on your part, but it makes the process much easier for the player.

Ask about attributes after skills. Advantages and disadvantages come last, determined by what the player wants to play and how you want to reconcile skills and attributes.

"What Skills Are You Good At?"

Ask the player what skills the character has, and how good the character is at those skills. Keep in mind that the player doesn't know the skill list -- you will need to translate "Beat Cop" into "Area Knowledge (Local), Current Affairs (Regional), Detect Lies, Hiking, and Intimidate." (For more ideas, see Wildcard Skills, under Presenting the Character Sheet.)

Also, instead of making the player choose a number for skills, provide a series of descriptions and set the skill number based on that description. Most PC skill levels fall into these five categories:

- *Almost Incompetent*: assign this skill an 8.
- *Competent*: assign this skill a 10.
- *Professional*: assign this skill a 12.
- *Expert*: assign this skill a 14.
- *An Expert's Expert*: assign this skill a 16 (or more).

"How Strong is Your Will? How Perceptive Are You? "

The average result of the skill levels will give you an idea of how smart the player wants the character to be. Use the IQ that is most point-efficient for the skill levels the player chose. Then ask the player how strong-willed and perceptive the character is, and adjust those two sub-attributes to match.

As with skills, use descriptors to set Will and Perception. These vary by campaign, but the following range works in many games:

- *Average*: Unless IQ is unusually high, leave this the same as IQ. Some brilliant characters may have Will or Perception reduced to a 10 or 11.
- *Strong-Willed* and/or *Perceptive*: Set the appropriate characteristic to 11 or IQ, whichever is higher.
- *An Iron Mind* and/or *Eagle-Eyed*: Set the appropriate characteristic to 12 or IQ, whichever is higher.
- *Lantern-jawed Action Hero*: Set Will and Perception to 14 or IQ, whichever is higher.

"How Strong Are You?"

Strength is an easy concept for most players to understand, but these descriptors make it easier.

- *Weakling*: Assign a Strength of 8 or 9.
- *Average*: Assign a Strength of a 10 or 11.
- *Athlete / Heavyweight*: Assign a Strength of an 12 or 13.
- *Super-heavyweight*: Assign a Strength of a 14 or 15.
- *Power lifter*: Assign a Strength of a 16 or more.

"How Athletic Are You?"

Due to its cost and importance in play, Dexterity uses a narrower range of descriptors and attribute assignments than Strength.

- *Not Athletic*: Assign a Dexterity of 10 for all but the clumsiest characters, who get a 9.
- *Typical*: Assign a Dexterity of 11.
- *Athletic*: Assign a Dexterity of 12.
- *Very Athletic*: Assign of Dexterity of 14.

"How Healthy Are You?"

Instead of focusing on descriptors, give the player characters what they need to survive. Most PCs should receive an HT of 11 or 12. Assign a 13 or 14 to player who wants to play an unbreakable character, and a 9 or 10 to a player who wants to play a sickly character.

Suggesting Advantages & Disadvantages

Rather than ask an exhausting list of questions designed to suss out exactly what sorts of advantages and disadvantages the character should have, listen to the general type of character the player is trying for, then suggest one or two appropriate advantages and disadvantages.

In most cases, this will be sufficient. When it isn't, the player (once given the germ idea from the suggestion) will be able to make an intelligent suggestion which you can then turn into an appropriate advantage or disadvantage.

Quirks

When dealing with beginning players, treat Quirks as personality traits instead of rules. If the player is playing a naïve, fresh-from-academy beat cop, he *has* a quirk, and the GM's complicated version of the character sheet should represent that . . . but if the player thinks it is a system element, it will occupy the part of his mind concerned with mechanics, and make it seem that much more byzantine.

Most players roleplay quirky characters as a matter of course. If the character truly has no quirks, a suggestion to the

player that the character needs something "unique, to distinguish him from all the other action cop show protagonists" will usually fix it quickly.

Presenting the Character Sheet

Once the player has answered your questions, you can finish the character sheet. You can use the standard sheet, or a simplified version that will cover only what the player needs to know. (An example of simplified character sheets will appear in the next GURPS Accelerator article.) These last four tools can help you make the character sheet easier to understand.

Sets of Three

Taxonomic division is one of the most basic mnemonic devices. Where possible, divide the character sheet into sets and subsets of three or less. It is easier to remember that your character is a Professor and a Psychic, *and* that "Professor" includes the elements of Status, Perks, and Patron, *and* that "Psychic" includes the elements of Intuition, Illuminated, and Psychometry, than it is to remember that your character has Intuition, Illuminated, Patron, Perks, Psychometry, and Status.

Wildcard Skills

The Characters book says that wildcard skills are for cinematic games, but it's also great for NPCs, pre-generated convention characters, and beginning players. A wildcard skill doesn't have to be cinematic or omniproficient. In fact, it can be very specialized. What makes a wildcard skill useful is that it cuts down the size of the character's skill list to something the player can digest and remember.

Instead of handing a player a sheet full of professional skills, try a wildcard skill like "History Professor! (Medieval Europe, IQ+0) Part politician, part publisher, you know how to survive and succeed in the cut-throat world of grants and non-tenured teaching. Also includes some actual teaching skill, and a considerable body of historical knowledge."

This skill includes aspects of Administration (academic environment), Fast-Talk, Accounting, History (Medieval Europe) -- everything a history professor should know to be good at his job. Most players will have no trouble applying different aspects of a broad professional skill to game situations.

Meta-traits

Meta-traits are the "wildcard skill" for advantages and disadvantages, because they don't just have to be for races! For example, "Professor (Status +1, various Perks, Patron/University)."

As you put the list of advantages and disadvantages together, look for common elements that you can group them by. In some cases, it will be suggested by the player! A player who wants to play a professor will say so, and many of that character's advantages and disadvantages can go in a meta-trait called "Professor."

Don't try to capture every aspect of a meta-trait at once. Instead, add 5 to 10 unspent character points to the trait. The extra points can be spent later to fill in any aspects of the trait that were left out during its creation. (If you don't need the points after all, they can always be allocated to something else later.)

Quirks

Whenever possible, put the PC's quirks in the descriptive elements of the character sheet. A mathematician who has a Cuban-cigar habit might have a quote under his name extolling their virtues. A naïve beat cop might have that mentioned in his character summary. A character who is archetypally nerdy (but only has the *disadvantages* Skinny and Bad Sight) could have a "nerd" meta-trait.

Tucking the quirks away in these places makes it difficult to figure out how many points the character gets for them, but much, much easier to remember. Adding quirks to the list of disadvantages, on the other hand, makes point calculations easier, but violates the "Sets of Three" rule.

The Noble Art of Scavenging

by Jody Macgregor

Designing your own scenarios from scratch is not easy, nor is it the kind of thing everyone enjoys. On the other hand, if you fork out the cash for published scenarios they often require significant changes before they can be played -- details need to be altered to fit your player's dispositions, their character's abilities and the mood of your game. It can be almost as much work as writing your own. The harried, poor or plain lazy GM has a third option: scavenging.

It's easy to forget that roleplaying is as much about sitting around cracking jokes and munching junk food as it is about the noble art of storytelling. Nobody in their right mind holds their GM up to the same standards as their favorite writers or filmmakers, and shamelessly stealing plots and characters is a time-honored tradition both of roleplaying and the genre fiction most roleplaying games seek to emulate. All you have to do is go about your scavenging in the right way. Most importantly, only scavenge that which is universal or obscure.

The Universal

Take a creature inimical to human life, add a group of mistrustful victims, place in a confined environment, and stir. You've just cooked up the bug-hunt, one of the commonly used universal plots. It's the plot of the *Alien* series, *Pitch Black*, *The Thing*, several episodes of *The X Files*, Games Workshop's *Space Hulk* and *Tyranid Attack* games, and every session of TSR's old *Bug Hunters* roleplaying game. Running a bug-hunt is easy; players should recognize the clichés as soon as they see the first mutilated corpse and catch a glimpse of It scurrying down a ventilation shaft or tunnel.

When utilizing a plot as archetypal as the bug-hunt all you need to do is fill in the blanks. What is the danger? Perhaps a bizarre alien species, a doppelgänger, a pack of werewolves, or a rogue spellcaster changed into something twisted and insane by a magical accident. Who are the victims? Obviously the heroes, but if death, betrayal, and horror are on the cards then a few expendable NPCs will be in order. Consider letting your players control an additional character for the session, someone untrustworthy or unnecessary you can kill off with impunity or who the players can use to backstab their friends without repercussions for their beloved characters. What is the environment? A space station, a boat far out at sea, a high school, a dungeon. The dungeon could work well; usually the PCs are the powerful invaders hunting weak and disorganized prey through the tunnels, and turning the tables is always fun for the sadistic GM.

Some other universal plots to jumpstart your imagination include the hostage situation (as seen in *Die Hard* and *The Negotiator*), the siege (*The Thirteenth Warrior*, *Night Of The Living Dead*, and most typical zombie movies), the murder mystery (countless Agatha Christie and Sherlock Holmes stories), the production that must go on (*Moulin Rouge!*, Terry Pratchett's *Maskerade*, Jack Yeovil's *Drachenfels*) and more others than I can be bothered to list because S. John Ross has [already done it for me](#).

The idea behind scavenging universal elements for use in your games is to pick a set of clichés, or genre assumptions if you prefer, which everyone will recognize and happily play to. There's no point throwing together an orphan, a prophecy, and a magical sword if it's going to make your players groan and throw dice at your eyes. Clichés are useful only if they convey a mood and suggest ways to react to the situation; everyone knows that trying to escape from the environment of a bug-hunt immediately is futile, but trying it anyway gives the victims something to do while the bonds of trust break down and the body count rises. If the players try to escape but aren't too disappointed when they fail, you'll know you've hit your target.

Where there are clichés, there is subversion. Occasionally undermining your own clichés keeps the players on their toes; say, by beginning the murder mystery with the guests discovering a body in the parlor and being locked in until the killer is discovered, then turning it into a bug-hunt instead.

So much for the universal plot, now on to the universal character: the stereotype.

Sure, you can fall back on making a sensitive and artistic elf or a doomed and angst-ridden immortal if you're lazy, but I'm talking about the kind of stereotypes real writers use, the character you can find in half a dozen different stories with a different name. One favorite example is the likeable rogue. This cynical guy may be a bit unorthodox and live on the shady side of the law, but underneath it he's got a heart of gold. There's a dark secret in his past, but he'll be redeemed in the end when he risks himself to save the more pure good guy despite being caught up in a love triangle with him and Miss Perfect. Han Solo, Rick from *Casablanca*, and Cassidy from the comic book *Preacher* all fit this stereotype to a T. Remove the heart of gold and you've got Pablo from *For Whom The Bell Tolls*.

The best stereotypes to use when you're creating an NPC on the fly are those that come with not just personality, but story arc and relationships attached. The likeable rogue in a ***Dungeons & Dragons*** game has an obvious role to fill around the paladin of the party -- start suspicious, gain his trust by helping out in dangerous situations, cement the friendship, start looking for a love interest to compete over.

Other stereotypes should be easy enough to spot, but here are a few to start you off.

- The wise old mentor who is more powerful than he seems; Obi-Wan, Yoda, Splinter (from *Teenage Mutant Ninja Turtles*), Gandalf.
- The tormented genius falling past the boundary of sanity; Max Cohen (*Pi*), that guy Russel Crowe played in *A Beautiful Mind*, Dr. Frankenstein.
- The grim and determined bringer of justice; Dirty Harry, Batman, Captain Vimes from the *Discworld*..

The Obscure

Before stealing a universal plot, you have to file off the serial numbers and reduce it to its basic elements. When what you're stealing is obscure you can be more blatant about recycling the specifics, if you judge it right. As roleplayers we tend to have obscure tastes to begin with, otherwise we wouldn't be in such a cul-de-sac of a hobby. If one of your players is a cinephile with an exhaustive knowledge of old movies, obviously you shouldn't go scavenging in the Classics section of the video store. Learn your player's tastes -- you may be surprised at the fiction people privately consume, especially if it's in a form with a degree of social stigma attached like soap operas or comic books. Know your players.

For instance: my players don't watch cop shows, so I gleefully cobbled a plot from an old episode of the English police procedural *The Bill*. In this episode the detectives tracked down a couple of hijackers who'd stolen a truck full of cigarettes. Investigating by harassing fences, known hijackers and sundry dodgy characters, the detectives noticed a strange trend -- each of the people they interviewed was sporting a recent injury and each pretended it was caused by an accident. It became apparent that someone else was following the same trail, only half an hour ahead of and with a lot less subtlety in their information-retrieval technique, leaving a trail of broken arms and black eyes in their wake. When the cops finally track down one of the hijackers, they're too late. He's been murdered, his grieving girlfriend having just discovered the body. She tells them where the loot is hidden and the cops arrive ahead of their opponents for once.

The rival investigators turn out to be drug smugglers who were using the cigarette truck as cover and are more than a little upset that somebody stole their stash. The smugglers show up with the second hijacker in tow to collect their gear and all the villains get nicked. Roll credits.

It would be a cinch to steal this plot if I was running *GURPS Cops*, but I wasn't. I was running *Warhammer Fantasy Roleplay*. After exchanging London for a Border Prince city hunkering down for a siege as an Orcish army approaches, switching the cigarette truck for a shipment of ale (everyone's stocking up before the roads are closed), and swapping the drugs for a hidden cache of weapons which half-orc revolutionists were planning to use when they seize the gates and let in their brethren, and putting the PCs in the place of the coppers, I had one week's game. Sorted.

This may sound like as much work as converting a published scenario. On the other hand, it was free and I didn't have to read a darn thing. Once you get the hang of swapping stormtroopers for Orcs it becomes second nature to turn

everything you see into fodder for your next game.

Egyptian Adventures: Hamunaptra (for the *d20 System*)

Published by [Green Ronin Publishing](#)

Written by C. A. Suleiman with Steve Kenson & Ari Marmell

Cover by James Ryman

Illustrated by Toren "MacBin" Atkinson, Kent Burles, Jennifer Meyer, Ben Risbeck, Beth Trott, & Mike Vilardi

Cartography by Ed Bouelle

Boxed Set with one 96-page, one 64-page, & one 56-page b&w softcovers, & 22"×17" full-color map; \$39.95

Surprisingly, one of the few historical periods to have been ignored by the *d20 System* is that of Ancient Egypt. Thus the appearance of *Egyptian Adventures: Hamunaptra* is a welcome one for that reason, and more. The others being that it is a Green Ronin release, who are known for the quality of their *d20 System* supplements, and that it is part of their Mythic Vistas line, which to date has produced some very good supplements.

The most obvious thing about *Egyptian Adventures: Hamunaptra* is that it is not a single book, but a boxed set containing three books and a poster map . . . something of an oddity in this day and age. As you would expect for a Green Ronin publication, presentation standards are high, and where the artwork is not good, it is exquisite. Unfortunately, the cover illustrations are not as good. Barring the odd typographical error, the writing is of course, excellent.

The first thing you need to know about *Egyptian Adventures: Hamunaptra* is that it is not a supplement about Ancient Egypt. Rather it presents a setting based on Ancient Egypt into which the fantasy elements of the fantasy *d20 System* have been worked. Thus this is not Ancient Egypt with fantasy bells and whistles, but a setting in its own right. The second thing you need to know is that the area presented in this box lies on the same world as [Freeport: City of Adventure](#) along with *Mindshadows'* Naranjan, and just like those islands, this Ancient Egypt analogue lies several months' journey across the sea, known only to a few, and purported to be a land of exotic riches, customs, and magic to anyone else.

The setting for *Egyptian Adventures: Hamunaptra* is Khemti, also known as the Black Lands, created and peopled by the gods, and then scorched by Ra into a wasteland as punishment for their errant ways. In the millennia since, the people have come to rely on the life-giving, irrigating waters of the Yor River. In ages past, during the Old Kingdom, the land was one, but religious differences split it into two: Upper and Lower Khemti. It has been reunited since, but more recently it has split into three kingdoms. The northern Lower Khemti, the Set-worshipping Upper Khemti or Shematu, and the Middle Kingdom founded after a slave revolt of Ptahmenu (dwarves). Currently it acts as a buffer state between the antagonistic Upper and Lower Kingdoms.

Although the gods no longer walk the land, their creations do. The greatest of the gods in turn created six races that each worships their originator. The Asari, or halflings, are the creations of Osiris; the Esetiri, or elves, were created by Isis; and the Ptahmenu, or dwarves, are the creations of Ptah, the Great Creator. The dark god Set created the Sutekhra,

gnomes; while the gnolls or Anpur are the children of Anubis, and unlike the other divine races mostly reside in the deserts of the Red Lands. Humans -- or Pesedjer -- are a compromise, having been created by all of the gods, and so do not favor any one deity. Another divine race is the crocodilian Sobekhi, the creation of the once-powerful water god, Sobek. More common long ago, currently the Sobekhi survive as nomads and bandits. Peseshet, or half-elves, are not unknown, but where the other races share the same traits with those found in the *Player's Handbook*, variant rules allow for the immediate offspring to share traits with the dwarf, gnoll, or gnome father. Absent from Khemti is the half-orc, the gnoll appearing to take its place, though in a far more civilized fashion and with slightly different trait adjustments. Any of the divine races can ascend to the position of pharaoh, though they must possess the Divine Heritage feat.

As with the races, *Egyptian Adventures: Hamunaptra* essentially renames the base *d20 System* classes instead of creating them anew. Some have appeared elsewhere in the Egyptian chapter of [Testament: Roleplaying In The Biblical Era](#), such as the Kheri-Heb, or wizard. While there are plenty of new Prestige Classes given, it also lists those suitable from the *Dungeon Master's Guide* and the publisher's *Master Class* series. The new include the Deathblade, concerned with ensuring proper respect for the dead; the swift, silent desert raider known as Red Scorpions; Serpents Dancers who base their combat skills on the movement and lethality of the snake; and the master dreamers, the Dream Shapers. Dune Walkers are mystics dedicated to protecting life in the desert; Lector Priests undertake the important role of reading from the ritual books; Priests of Ma'at are seekers after truth and knowledge; while the Spell Eater is literally able to steal the magic of spellcasters!

The changes to magic are to some extent cosmetic, reflecting cultural differences rather than nuts-and-bolts tinkering. Magic is still divine or innate (arcane), but is also granted ("Akhu") or learned ("Heka"), and all but innate Akhu is seen as a gift from the gods. The magic of the Kama'at (or druid) drawing instead upon the energy of the cosmos. Actual rules detail the ritual and ceremonial nature of Khemtian magic, as well as its need for foci. Knowledge of an object or person's true name will also give a spellcaster or diviner a strong advantage, although discovery of such information is a monumentuous task in itself. While some new clerical domains are offered, the Alignment domains are not found here, and Fate replaces the Luck domain.

All of this is covered in "Book One: The Book of Days," while the second and third books are slightly slimmer. "Book Two: The Book of Gates" covers the people and lands of Khemti, along with its politics, cosmology, and topography. Included are relationships between the Black Lands' cities and how such rivalries are played out and resolved in the arenas. Although all are accorded good descriptions, only Khemti's premier city, Hamunaptra is given a map. The book also describes all of the gods in the Khemtian pantheon, each very nicely depicted. So are the descriptions, though naturally, no statistics are given.

Besides the new Prestige Classes and monsters suited to the setting, "Book Three: The Book of Law" looks at running a Khemtian campaign. Obvious campaign themes involve the military, politics, and religion, relations between the land's three kingdoms being difficult, barbarians threatening to attack from out of the desert, and the watching hostile nation of Khesh to the South. But Khemti is also a land of history and secrets, with plenty of opportunity to explore the ancient ruins and tombs of dynasties past. In addition, various secret societies all have plans for Khemti, including allowing the desert to finish encroaching on the fertile lands along the Yor River, restoring a monotheistic faith to prominence (another historical analog), and uncovering fragments, remnants, and knowledge of the country's past. Although 100 scenario suggestions are listed, the secret societies are the perfect campaign hooks in themselves.

What is so enjoyable about *Egyptian Adventures: Hamunaptra* is that it does not tell you how to run an Ancient-Egyptian-style campaign under the *d20 System*. Instead it presents an Ancient Egypt-like setting, heavily influenced by the history, that stands on its own, which can optionally be used in conjunction with *Freeport: City of Adventure*. It fuses the historically familiar with the fantasy familiar from *Dungeon & Dragons*, and importantly, it does that without the seams showing. Although the boxed set might be dead, *Egyptian Adventures: Hamunaptra* is proof that the contents do not have to be.

Pyramid Review

My Dwarves Fly

Published by [Pegasus Press](#)

Designed by Sebastian Jakob & Michael Palm

Developed by Lutz Stepponat

Illustrated by John Kovalic

Edited by Jan Christoph Steines & Andrew Dawson

Four wooden pairs of player tokens in four colors, 40 gold counters, game track, 88 cards, four review cards, & rules; full color & boxed; \$24.95

You know it, you love it, your character's gotta have it. It's gold, and the only thing the Red Mountains are thicker with than the beloved yellow metal are the people willing to fight for it. *My Dwarves Fly* takes you on a quest to get more than anybody else.

The object of the game is to be the first one to gain 15 gold.

Players take turns drawing their initial five-card hand. There are two decks to choose from, one containing creatures and the other the events and abilities that spice up game play, and players may choose however many they want of either. If you concentrate on creatures, you won't be able to boost their powers or shift events unexpectedly during diplomacy. Choose too many of the events, and you won't have any creatures with which to win the battle.

During a player's turn, he can play a new creature, play an ability on a creature already out, discard a card, or start a battle. Creatures are your basic units. Everything from "mundane" dwarves and elves to more fanciful things like dragons and gorgons may form your army, and some of these may have inherent abilities. Gnomes, for example, are better at finding gold, whereas the doppelganger can duplicate another card in play. Watch out for aversion -- some beings don't like working with others, like orcs and dwarves. If you have a goblin in your group, he'll leave if you play an elf (and vice versa). If too many of one type of creature are brought into play (such as the orcs), *all* the dwarves in play on anyone's team leave. Abilities played on units boost or lower their power. These are usually critter-specific, so you can play "My Gnomes are Greedier" if you have Gnomes in play, or "My Elves Don't See a Thing" if your opponent has Elves.

Once you have a few beasts out, you'll want to pick a fight to get something for your troubles. When played, a Battle Card calls all players to the field to argue over the latest cache of gold. The card indicates how many creatures each player is required to bring to the donnybrook; if you haven't enough to fill the quota, you still have to go in undermanned (or underelfed, or...).

The Battle Cards also tell you how much gold is at stake. Each creature is worth a certain number of six-sided dice, from one to five. To get your Battle Strength, you'll roll each critter's dice individually and add them together. For every "one" that comes up on the dice, your team gets to add one more gold to the stash they've uncovered. If they win, they get the gold shown on the card and the extra gold they rolled for.

A large chart labeled zero through 100 keeps track of everyone's numbers. You get two wooden counters in your color, one for tracking the combat and one for marking your extra gold. These tokens move up as you roll for each participant. After everyone has finished rolling dice, the diplomacy phase starts. Everyone who wants to play an Event Card (or bluff the others about it with some other card) holds it out now, and when revealed these cards may change the combat totals or switch who gets what gold. No matter whose turn it is, if getting the golden spoils of war takes you to 15 coins at the end of that turn, you win.

The whole game has a tight, compact, solid feel, though its small size makes it hard to put the lid back on once you've gotten the components out. The cards are the perfect stock and feel for shuffling and playing, and the gold coins -- while small and slippery to get hold of -- will withstand a lot. Wooden tokens always add a little class, though you have to apply your own stickers and you're paying for a set of five more dice. And of course, John Kovalic's artwork can't be beaten with a stick.

And neither can play. The rules are tight as well, and it's a simple but workable idea. Those who roll lower are going to get more gold than their opponents, but a handful of ones on the dice isn't going to win the day. Too many of the Event cards break the rules about scoring gold, though there are enough "Forget It!" cards to make them a problem all their own as they suck the potential fun out of an eleventh-hour upset.

Nevertheless, even with the small selection of cards there's plenty of pushing and shoving, and it seems like a great deal of thought went into the cards and balancing out their various abilities. There are holes in the rules in need of plugging, alas, but ***My Dwarves Fly*** is a small and powerful package, and it carries enough of a thinking man's punch to elevate the strategy as well.

--Andy Vetromile

Evil Stevie's Super-Secret Invitation

by Steve Jackson

One of the perks we like to offer to *Pyramid* subscribers is access to material of interest to gamers before the rest of the world knows about it. This article refers to one such limited-time event.

Unfortunately, because of the hard-coded preview sampler for *Pyramid* articles that non-subscribers can access, we find ourselves needing to pad out this invitation with some rambling opening paragraphs before getting to the exclusive-for-subscribers offer. Fortunately, two paragraphs ought to about do it.

Are you still with us? Have we weeded out the spies? Good.

As many of you know, Steve Jackson Games bought an online game named ***UltraCorps***. After a year of work, we're opening it again for free play. We have completely recoded the game (it's now in perl and runs on a Linux box).

Our first open session will *not* be announced in the Daily Illuminator -- but *Pyramid* subscribers can get in. Starting at midnight Saturday the 26th, and running for 48 hours, *Pyramid* subscribers can access the game at www.ultracorps.com. This session, which we're referring to as Hotel, will be for solo play only: you can read the rules and create solo games, ticking them at your own speed, to conquer small clusters of worlds.

Forum comments can go to <http://forums.sjgames.com/showthread.php?p=150547#post150547>

If Hotel goes well, it won't be long until we open a group alpha-test.

Monday we'll mail out a link to a short questionnaire. Please, please respond, and help us improve the game!

Murphy's Rules

by Greg Hyland

Murphy's Rules

Gratitude Adjustment

If one were to draw a spectrum, with one end labeled "gratitude is a function of complex life" and the other labeled "humans are the only beings capable of expressing gratitude," I'm not sure where on that spectrum I would fall. On the one hand, dogs seem awfully thankful for, well, just about everything, really. On the other hand, few other animals exhibit such tendencies, ranging from hamsterical indifference to the presumptuous expectations of felinity. ("Why aren't you petting me, human?")

Still, it's interesting to postulate, for a moment, that the capacity for thanksgiving is a purely human tendency. And with that capacity comes the possibility that an alien species wouldn't have the foggiest idea what "gratitude" -- or some other emotion -- was.

Aside: For the *Star Trek* campaign I ran many moons ago, I had pregenerated characters, and began each adventure with a script. One of the characters was a J'naii, an androgynous alien from a *Star Trek: The Next Generation* episode featuring genderless humanoids. This character in particular was the ship's counselor, and so I had one opening script that began (roughly):

Doctor (in Counseling Session): "Tell me about your . . . mother?"

Crewmate: "Why do you care about my mother?"

Doctor: "I don't, really. But the literature says you gendered beings place great significance on mothers, so I figured it would be a good opener."

I think there's great roleplaying potential for having alien species be devoid of certain emotions or tendencies. (For "alien," I'm referring to any non-human sentients -- elves, AIs, spirits, you name it.) If you were incapable of gratitude, how would that shape your outlook?

Some possibilities:

Indifferent. It's possible for a society not to be grateful because generous actions are viewed as the logical or natural thing to do. In the same way we don't tell someone, "Thanks for continuing to breathe" (nor do we feel any sense of being owed a thanks for breathing), it's possible such a species merely views generous acts as second nature.

Huffy. Consider a proud Klingon-like race. They may not only be unfamiliar with the concept of gratitude; they may feel the gestures associated with such acts to be an affront, akin to a challenge. "Why did you get the door for me? Do you think me too feeble to handle a brass knob?! NOW WE DUEL!!"

Conniving. A species might see generous gestures as a sign of weakness, and seek to take advantage. "Ahh, you've given me a gift? Interesting. Err . . . I could use another one of these. Preferably with a receipt."

And so on. Let your imagination run wild; how could a gesture be taken the wrong way? (Friend of a friend story, so take it with a grain of salt: A married American couple moved to Japan, and shortly thereafter one of that couple gave a coworker a small gift -- a usual enough gesture here in the States. The coworker invited the couple to his house, where the two married couples had dinner. During the course of this dinner, the American couple started talking about typical American stuff . . . things the Japanese couple were deeply uncomfortable talking about. Apparently, the American couple thought the dinner invitation was a gesture of friendliness, and was treating the couple as a friend or potential friend. The Japanese couple were treating it as a social formality; one gestures deserves reciprocity, and the dinner was not an attempt to further any bonds.)

Equally interesting as envisioning a lack of emotion from a species -- but much more difficult -- is to consider an emotion that an alien feels, but humans *don't*. Probably the easiest way to envision these are those emotions that are harder to pinpoint. Some examples are *schadenfreude* (taking pleasure in the troubles of others) and *esprit d'escalier* ("the wit of the staircase" -- thinking of the perfect retort *after* the fact). Some emotions are even relatively new, such as [nostalgia](#).

Picture what an alien species would be like if it had alien emotions, such as:

- The desire to eradicate a longing for childhood.
- The need to remain in a better position than one's children.
- The cyclical nature of wanting something and getting it, then not wanting it and discarding it.
- The hope for evolution in everyday activities.
- And so on.

Of course, some of these ideas can spring other ideas about the species or its development. For example, a species that exhibits universal reincarnating or mass-regenerating abilities might have an emotion of the selfish eagerness to become a martyr. (This might especially be true if there is some pleasure or bliss in the rebirthing process: "You say that jumping into the warp core is the only way to save the ship . . . but I'm thinking you've got martyrlust again.") Roleplaying such emotions would be challenging, and I don't recommend piling on the emotional differences for any but the most important, campaign-active species . . . but it's still fun nevertheless.

Emotions are complex, and -- in many ways -- ill-understood in humans. I suspect that alien life, if it does exist, will have some emotions in common with humanity that are advantageous to their continued life. But I also suspect that many of their emotions will be utterly unfamiliar to us, and our emotions to them. And I also suspect that many interesting tales will spring from our efforts to understand each other.

If nothing else, maybe these alien visitors can teach the concept of "gratitude" to our cats.

--*Steven Marsh*

A Mélange of Magical Creatures

for GURPS

by Eric Funk

Below are a few encounters with several wondrous creatures. All require mana to function properly.

Prairie Whale

These gentle giants are often seen in the plains, feeding on worms and other burrowing insects. Traveling underground, they are shy and tend to stay a cautious distance from sources of loud vibrations. They have a reputation for helping people who are caught in quicksand, mudslides, and shifting sand.

*The first military use of whales by a non-aquatic race must be relegated to Prince Milo of Felton. His country and one of its neighbors were both landlocked, and the Prince sought a covert way to break the stalemate that has kept armies stationed at each other's borders for as long as he could remember. In exchange for creating a large nature preserve, a group of druids agreed to procure for him a pair of prairie whales (on the condition that he value them over himself). With this in progress, he commissioned a special carriage to be pulled by the beasts. These mages were then given a charter to protect the land, and an astronomical budget to do so, **if** they could finish the chariot within the year. Needless to say, they succeeded, and the Prince was soon behind enemy lines sabotaging outposts and planting listening and homing devices for future missions (and teleporting agents). It is said that when he died, the whales pulled the chariot with his bones inside toward the sunset, never to be seen again.*

-- Gorsu the Sage, *Magical Monsters*, Chapter V

Appearance

Prairie whales resemble ordinary whales in shape and texture, but their skin is tougher and in earth tones. They generally resemble the strata in which they frequent. Their hide is tough and can turn away most weapons that can affect them (metal blades pass through harmlessly).

Uses

Prairie whales generally ignore small concentrations of humans, but a mutual protection pact could serve to employ them as shepherds or border scouts. Because they can ignore weather, they can make for excellent messengers, couriers, and wilderness agents. Some less respectful sophonts use the skins to make kayaks to paddle across the plains. Other uses include gloves that allow one to reach through metal and earth, enclose non-metal items, and pull them out. Some plains tribes believe these creatures to be the cause of earthquakes, and have developed various rituals involving whale-fat and oil by-products.

Prairie Whale (See also "Whale," p. BE37)

ST 40; **DX** 13; **IQ** 8; **HT** 14.

Will 10; **Per** 12; **Speed** 8; **Dodge** 11; **Move** 8 ("Water").

SM+4 (16 hexes); 6,000 lbs.

Traits: Breath Holding; Crushing Striker (Snout); DR 10; Enhanced Move 0.5 ("Water" Speed 12); Ichthyoid; Subsonic Hearing; Vibration Sense; Walk Through Earth; Wild Animal.

Skills: Brawling-12; Survival (Plains)-16.

Adventure Seed: Moby Dicks

The party is hired to find some prairie whales that have been reputedly knocking over carts and causing problems. If necessary, they are provided with a "speak with animals" item that will enable them to communicate with it. After a long trek, they finally catch up with the creatures, and after a chase and small fight discover that their baby has been captured by some surface creatures. They can no longer communicate with it. Part B involves piecing together the vague description of a humanoid from a whale's point of view, and then tracking them down. Part C will entail releasing the creature before it is killed or placed under mind control. Something that may set back the villain's plans is that the whales are intelligent enough that animal spells do not work on them -- they require Mind Control.

Blink Flowers

These seemingly ordinary perennials possess a bizarre power: for every hour of daylight, they suddenly displace themselves about one yard closer to the sun. The destination must be "safe," possessing at least adequate soil and sunlight. If no such place exists in that direction at this time, it will wait. The next hour it will try the safest spot in the direction of the sun within two yards, and so on, charging every day of its life. There has been no proven limit to the energy it can hold, other than its lifespan (10 years in captivity or about two in the wild). At river bends and edges of ravines, the flowers will congregate, unable to cross alone. They will then accumulate energy until one of the following happens:

- The flower has stored enough energy to cross it all at once.
- There are enough flowers that the sum of their energy is enough to make the same leap *together* and all arrive on the other side.

Tales of the origin of this plant vary, but the most easily believed is this: There was once a botanist, and the father of his lady love did not approve of him as a suitor. Using a variety of tricks, the botanist was able to sneak in small messages to her. In one communication, they seemed to have a mutual longing for him to be able to give her flowers. At that he vowed to do so, and wrote her that he "will send her flowers." At that, he created the Blink Flower and seeded them where they would grow and travel through her yard after crossing a moat, passing through a thick stone wall and fighting prevailing winds. Seeing commercial and military applications, her father reversed his decision and the house quickly rose in power.

-- Yorgu the Bard, "Tales by the Fireside"

"I Say, a Moving Grove!"

Each flower, on average eight times per year, will make a "misjump" and arrive at a random destination (0.5%, 18 on 3d, see Teleport, p. M147). This means that the very few will have a chance to distribute seeds in the general area they were born in, and then move on to make sure the species continues. There are approximately 1,600 hours of sunlight during the growing season in a Temperate zone. During this time, it will, on average, travel about a mile. Every fall (or every half year in tropical climates) they will use an hour's power to send their seed pod up to a mile *away* from the sun. This instinct assumes that if the mother plant was able to travel this route safely, the new plant will have a chance to grow. This process also can suffer from a "misjump." In any time that it rolls a 17, it instead shudders and drops a seedling (before moving, if applicable). This sprout It will stay rooted for several hundred hours of sunlight, and then start its own trek.

Uses

Clever travelers can use these plants to cross divides if they are patient or can encourage them to jump. If the plant is about to be actually injured, they can Blink away randomly (as per the spell, see p. M148) 1d times, even at night. One carrying a Blink Flower seed can be teleported with the flowers when they move. (This requires that one be in contact

with one flower per 50 lbs of weight*). If another being "frightens" a flower in such a situation, all the flowers will move with the "friend." Trained gardeners can carefully glean a flower in such a way as to not "scare" the plant. This results in the plant growing another bloom, but does not delay its travel plans. Other uses include consuming petals, which can grant one the ability to teleport short distances in combat (once per petal). Some warn that these petals are mildly hallucinogenic or addictive. Reputed uses include paper that will blink away from flame powered by the heat and arrows that will follow a target even if it blinks away.

*This assumes a standard SM-6 (7") flower. For each +/-1 to SM, divide or multiply this mass by 2.

Appearance

There are great varieties of colors and heights that Blink Flowers can express, and this leads some botanists to assign new names to them. They vary from small, clover-sized flowers in the frigid regions to sunflower-sized monsters in tropical areas.

Blink Flowers

ST 0; **DX** 0; **IQ** 0; **HT** 14.

Will 10; **Per** 12; **Speed** 0; **Dodge** 3; **Move** 0.

SM-8 to SM+3, typically SM-6 (3.5" to 9', average 0.2 yards); 6 ounces to 30 lbs.

Traits: Body of Wood (p. M 165); Hit Points (1 to 10); Hard to Kill 2; Vibration Sense; Wild Animal.

Skills: Body Sense-12.

Adventure Seed: "'Till Burnham wood doth come to Dunsinane"

The local ruling Lady doth not find amusing the appearance of a group of blink flowers in her garden. She is more frustrated that when her people try to cut them, they blink randomly about, even back into the garden! Somehow, the heroes must get rid of them; telling her that they will disappear on their own will not suffice.

Cloud Penguins

These cute, playful animals are fun to watch, yet can be a hazard to mountain climbers and an annoyance to dwellers in areas that are often foggy. They instinctively avoid fire as it disrupts cloud patterns, although they enjoy playing in the sun. Indeed, it is often safer than playing near the bottom of a cloud.

In some ways, these creatures are like dolphins, playing with items they find, and tossing them around between each other. They seem to like cloth, as it can float, rather than fall. Other play activities include trying to stand on a cliff side while others try to nudge one off or to take away a "toy." While fun to watch them perform, it is less so when it is with a mountain climber that they are trying to be playful. Then again, there are some experienced guides who claim to be able to understand their language. They say it makes them more aware of predators and hostile humanoids in the region.

-- The Scribe Kievi, upon return from the Dragon Mountains

Uses

Cloud Penguins can be trained to do tricks (such as anchoring ropes, fetching things, and giving distinct calls for different predators), but must be cared for carefully if taken into captivity. These avian-like creatures are communal and will pine away if they are not permitted a social group of at least four beings. Humans can sometimes serve, if they can play for at least an hour every day. A mage with any cloud or mist-making spell can easily keep a small flock

happy. Mist and storm-circled gloomy castles may have problems with these playful creatures -- if they can find something to eat.

Appearance

These small bird-like creatures possess white and blue plumage. The blue can vary from sky blue to navy.

Cloud Penguins (*see also Penguins, p. BE 25*)

ST 4; **DX** 10; **IQ** 4; **HT** 11.

Will 10; **Per** 12; **Speed** 5.25; **Dodge** 8; **Move** 6.

SM-4 (0.5 yards); 10-20 lbs.

Traits: Acute Vision 1; Domestic (or Wild) Animal; DR 1; Enhanced Move 0.5 (Air Speed 18); Fewer HP (-7); Flight (Winged; Clouds only; Air Move 12); Gregarious; Knack: Predict Weather; No Fine Manipulators; Sharp Beak.

Skills: Aerobatics-12; Brawling-12; Survival (Mountains)-14; Throwing-10.

Adventure Seed: The Sky's the Limit

The team has been asked to recover something in the mountains. (The quest may be to recover a relic in a lake, a dragon's egg, or to find a lost temple or airship.) The party has the directions, and their guide has a trio of cloud penguins that follow him around. In an attack by a wild animal, the guide is killed or incapacitated. Can the party cope with this? Can they learn to communicate with these wild creatures and achieve their goal?

River Rabbit

This elemental-kin is not actually a mammal, but shares many qualities with its namesake. They "burrow" in water, leaving "tunnels" that repel water from them for about 24 hours. They enjoy salt water and fresh water equally. They prefer water where sunlight penetrates, and like to be able to scamper to the bottom to graze. Fish instinctively avoid the air pockets, save for archerfish and jumping fish. Aquatic mammals (such as dolphins and beavers) take advantage of the air pockets when they can. Natural enemies include alligators, jumping fish, and sentient beings.

The tunnels can be collapsed using magical spells that destroy air or shape and purify water. Concussion or lightning spells can stun them relatively easily (along with everything else in the water). They are pests to amateur fishermen who dislike the chance that a lure might be hanging in mid-air, yet underwater. River rabbits like to nibble on the bottom of boats, and are blamed for when lines break or a plant-based lure is lost. The tunnels they leave can cause penalties to swimming and boating control rolls in the area. The base is -3, and for every factor of two, the penalty increases by 1, lessened by the SM of the boat or swimmer. E.g. One rabbit, SM+2 rowboat $1=2^0$, so $-3 + 0 + 2 = -1$. Sixteen river rabbits ($16=2^4$) versus a yacht (SM+4) means a penalty of $-3 - 4 + 4 = -3$

Ah, here comes the young Lady Penelope with her scintillating blue River Rabbit, "Undine." Isn't it cute with its golden collar? The real life-protecting collar is a plain one underneath, but I hear it is more expensive than the golden one above it. Well, at least it is more sociable than the chameleon cats that were the fad last year . . .

-- Memoirs of Lady Tara Windermere, "At the Royal Court"

Uses

The animals can be kept as pets in a pond, "cage" (tub), or moat. The tunnels can provide secret passages through moats or rivers, if one can either enlarge the rabbit or the tunnels, or shrink one's self. If nothing else, one can simply

use it like a long air tube, although the indigenous lagomorphs can get angry if one blocks a passage. Some covert ops units may carry river rabbits, releasing them and tossing treats further and further into the water to cause them to tunnel in a desired direction. This can be facilitated by using standard fishing gear (without hooks). If the tunnels could somehow be made permanent through alchemical or magical means, then assuredly people would want to make homes below the surface, from hideaways to pirate caches to palaces! If the "tubes" of water could be excavated intact, imagine the wondrous buildings one could build!

River Rabbits (see p. BE28)

ST 4; DX 14; IQ 3; HT 14.

Will 10; Per 12; Speed 7; Dodge 10; Move 7.

SM-5 (0.2 yards); 4-8 lbs.

Traits: Acute Hearing 2; Domestic (or Wild) Animal; Enhanced Move 1 (Ground Speed 14); Night Vision 3; Quadruped; Sharp Claws; Terrain Adaptation (Water Tunnels); Walk on Water (Accessibility: Under Water Only).

Skills: Brawling-12; Stealth-12; Survival (River)-14.

Adventure Seed: Underpass

A rail company is seeking to set up a regular passageway for travelers and instead of hiring an architect and an earth mage, they wish to establish an underwater passageway. Jobs for the adventurers include:

- Rounding up the river rabbits.
- Wrangling and training them.
- Protecting them from predators.
- Protecting the travelers.
- Discouraging competition and/or obtaining a Warrant from local officials to maintain a monopoly.

Storm Ants

These insects seem to have the ability to communally cast a spell of Rain. They then farm special kinds of molds that grow in the damp, dark conditions under the perpetual cloud. Able to walk on water, they are merely slowed by the presence of rivers. Natural enemies include insectivore amphibians such as toads, frogs, and lizards.

If someone can sense and express scents (through magic or other abilities), one can actually communicate with a colony. One can convey no more information than through simple gestures, and trust must be earned, but true communication is possible. (e.g. "I not food," "This not food," "Death that way.")

I hear these [ants] are popular with the wizards who want to help perpetuate the "land of eternal darkness" meme around their castle. [. . .] Rumors persist of a colony that can also call lightning to smite its foes.

-- Frim the Mad

Appearance

A variety of ordinary-looking insects, their special properties can be detected by looking at their aura or by analyzing the magic within them. Additionally, if they are part of the communal spell, it can be detected in operation.

Uses

Storm Ants have uses in potions and in items relating to their activities: water walking, cloud control, and mental

communication. Properly located, a colony can produce a perpetual supply of drinking and irrigation water! Some mages are trying to breed a variant that will cast a spell to bless crops.

Storm Ants (see p. BE43)

ST *; **DX** *; **IQ** *; **HT** *.

Will *; **Per** 12; **Speed** *; **Dodge** *; **Move** 2.

SM-10 (1.5"); neg. wt.

Traits: Domestic (or Wild) Animal; Magic Resistance (Improved); Quadruped; Racial Memory; Telecommunication (Telesend; Racial; Vague (Scent-based)); Walk on Liquid (Water).

See Swarm rules, pp. BE43, B461. A 1-hex swarm also collectively has Magic Resistance 10.

Adventure Seed: Rain, Rain Go Away

Locals have noticed that there is a rain cloud slowly moving toward the village. At the heart is a moving group of army ants! Can they be stopped? Can they even be diverted? If not, tasks involve evacuating the buildings that will be overrun, and shoring up the local streams and rivers. Finally, someone will have to protect the town from looters while the inhabitants are away.

Mining Birds

What began as a mutant strain of the common chicken has proven itself to be resilient (or so the popular legends tell us). They creatures are now a form of "para-chicken," no longer interfertile with other poultry. They generally get along with most barnyard animals, even if a few might not get along with them. They have no fear of fire, and sometimes walk through it! They like to make nests on top of smooth or indented sections of rock.

In addition to the regular grain and insect consumption of poultry, these also require exposed rock to peck. (This is a good way to get rid of rocks in the garden or field.) It is not recommended to store them in a castle, or they will eat you out of house and home. These birds are very territorial once they mature. This frustrates would-be thieves as they instinctively return to their nests every night. Their infant "down" is spongy, and their first feathers of adolescence are leathery (DR2). If their flight feathers are clipped at they come in, then they will not be able to learn to fly, and are unable to do so when they reach adulthood. This is fortunate, as their feathers get harder as they age!

The roosters are popular in medieval cock fights as the sounds apparently simulate what a sword fight sounds like, or so the observers say. I've never been to one myself, but a friend 'o a friend says that one trainer was mauled by his own beastie as he tried to show it off. It literally blinded 'im. I heard it took all his winnings from that match to pay for healers to fix it "no questions asked."

--Overheard in a Tavern

Uses

The egg shells and feathers are prized as materials for smithies and the meat for [iron rations](#). Before a hen gives up on an infertile egg, it will guard it fiercely. The feathers can take 50% off the material cost of a coat of scale mail and provide modest protection (an extra DR1 in addition to normal steel for that era), but not from warriors with dragon scale armor laughing at you (until *they* try to face an angry steel rooster that can jump face-high and peck with an armor-piercing beak). There are some lower-tech tribes that make armor completely from these feathers. Artists can feed chickens with special diets to get *any* color feathers. The same technique can be applied to eggs. In addition, some alchemists have had success hollowing out the eggs of iron-fed chickens and filling them with explosives . . .

The structure of the beasts' bodies is such that they are very resilient. This makes the bones very suitable for the framework of small aircraft, clockwork mechanisms, and support structure for alchemical fluid systems. Children also enjoy seeing how much force it takes to break a "wishbone." The dried meat is tasty, but tradition permits one only to eat one portion per month.

If raised and fed on only a particular mined ore, then the creatures' bones, feathers, and eggs will all contain a more refined version of the metal. There may indeed be hens that lay golden eggs locked away in the more secure part of a castle . . .

There are no great tales of loyalty for a chicken. This is still true of Steel Chickens. Instead, we have a military blunder to recount. It was late when the Dvanian 3rd Golem detachment occupied the enemy "village." They had a sentry, but he was just to give new orders to the stone golems. The sentry was called in by the commander who had located several kegs of beer, and was sharing them with the troops. When the officers awoke the next morning to find the golems' ankles were pecked away, some angry silvery chickens were guarding a nest on the back of one. Apparently they lost three men trying to beat the birds away.

-- Gorsu the Sage, *Magical Monsters*, Chapter VII

Rock Chicken (see p. BE40)

ST 6; **DX** 13; **IQ** 4; **HT** 12.

Will 10; **Per** 12; **Speed** 7 **Dodge** 10; **Move** 7.

SM-5 (0.2 yards); 13-20 lbs.

Traits: Chummy; Domestic (or Wild) Animal; DR 10; Fewer Fatigue Points (-6); Fewer Hit Points (-3); Flight (Winged; Air Move 6; Costs 1 FP *per second*); Night Vision 1; No Fine Manipulators; Sealed; Sharp Beak; Sharp Claws; Temperature Tolerance 2.

Skills: Brawling-12.

Technique: Hit Location (Brawling; Face).

Roosters may have Traits Berserk (12), Bloodlust (12), and increase ST to 9, and the Skill Brawling to 14.

Adventure Seed: Cash or Personal Chick

Someone who owes the party money comes up with a last-ditch effort: he gives them a "prize-winning" silvery chicken. The downside is that the rooster will take some time to warm up to any of the party. In the meantime, they will have to contend with the fact that, while the previous owner wasn't in the room, it wounded the familiar of a vindictive wizard, who will make trouble for the party . . .

Variants

To turn "Fantastic Monsters" into "Monsters from Space," simply replace magical origins with psionics and/or variant biology. For a steampunk/cliffhangers setting, they may all be the product of Mad Science! And, of course, in a horror campaign there may be something Evil about them . . .

Saroo

by Matt Riggsby

Somewhere in the tropical seas is Saroo, the fabled source of the world's finest ambergris. Though difficult to locate, even with good maps, you may eventually find it. From a distance, it appears to be a steep-sided island of moderate size, covered with deep green vegetation with a few rough, rocky outcroppings peeking through. A small town, which appears to be built on piers and pontoons, hugs the edge of the island, with a few small huts barely visible through the vegetation here and there on the island itself. As you approach it more closely, you may be surprised by a distinctive, although not necessarily unpleasant, musky odor. But you'll be more surprised when the island opens some of its eyes and looks back at you.

Geography and Land Use

Saroo is roughly oval, with surface area of about one and a half square miles. It is comprised of a single hill with a sharp central ridge reaching a height of up to 300 feet along the length of the oval. The terrain is relatively steep at the shoreline and along the ridge, but fairly level, if a bit bumpy, in most of the interior. The island is covered with a very dark, fertile soil which supports a wide range of extremely thick vegetation. Indeed, the vegetation grows all the way down to the shore with no sandy margin by the water.

The land appears to be completely uncultivated, with multiple layers of underbrush and jungle canopy. While it is true that the land is not tilled, a great many of the plants have some practical use and most of those are edible. It seems likely that generations of inhabitants have selectively removed less desirable plants, leaving only more useful ones behind. As a result, although the inhabitants make extensive use of the jungle and get a great deal of food from it, they are ultimately gatherers on the island, not agriculturalists. Nevertheless, they get the bulk of their food from fishing and supplement their fishing and gathering with several varieties of cultivated seaweed.

Only a fraction of the island's buildings are built on the island proper. Instead, the inhabitants maximize the amount of valuable jungle available by anchoring complexes of floating piers around the edges. They build homes and storehouses atop the piers and grids for the cultivation of seaweed underneath. The buildings on land are mostly temples, homes of the rich and, inland, shelters for the ambergris mines. The total population is about 25,000, and there appears to be room and resources enough for at least a few more.

The disconcerting thing about the island is that it moves. And rather than just drifting with the current, it moves under its own power. Saroo, or more properly *the* Saroo, is a vast living being of such tremendous age that it has accumulated layers of soil from blowing dust and organic debris (it is rumored that some trees grow as well as they do because their roots have penetrated Saroo's skin and draw nutrients from it). The Saroo follows a long annual migration through tropical seas, never coming too close to the mainland, although it passes well within sight of small islands.

History

It is believed that the first inhabitants of Saroo were simple islanders who lived by fishing and desultory cultivation. Conflicting legends cast those inhabitants variously as refugees from war, chosen people rescued by their god from a cataclysm, and simply fortunate wanderers who happened to find a convenient home. However they came there, they settled down quickly, feeling that a moving home was a small price to pay for plentiful fishing. Moreover, they found a number of goods for lucrative trade with more civilized nations, most notably ambergris deposits.

The original residents had no leaders as such, only "big men," notably persuasive and charismatic individuals who usually managed to get their way when group decisions needed to be made. The closest thing they had to authority was the shaman, who was charged with propitiating the many spirits controlling various aspects of the world and

interpreting omens. It's fairly clear that the shamans' first duty became maintaining relations with the Saroo, who had become by far the most important figure in an infinitely large pantheon. With an increasing focus on the Saroo as their primary divinity, it was inevitable that the shamans began to exert more influence over the day-to-day lives of the islanders. More and more, they came to direct the use of goods, public and private activities, and the organization of society in ways they believed would please the god on which their people lived, justifying it on the grounds of direct communication from the Saroo itself.

Although some residents may have grumbled under increasingly heavy yoke of religious domination, the shamans may very well have been onto something. The inhabitants of the Saroo certainly enjoy remarkable wealth, good health, and a pleasant climate. Moreover, the Saroo has never been occupied by a hostile power. Not for long, at any rate. A few centuries ago, the Saroo passed near the territory of an aggressive kingdom with a strong navy. An expedition of several ships was sent to seize the island to secure its resources, take the natives away to sell into slavery, and if at all possible learn how the Saroo might be guided or otherwise put to more practical use. Not being great warriors, the inhabitants were quickly overcome and many fled to hide in the jungle.

The shaman at the time, who had fallen captive, was told to order his people out of hiding or else serve as an example of what would happen to those who resisted the invaders. The shaman defied them, claiming that his god would protect him and anyone who shed his blood would be cursed. The invaders reacted predictably and set out to drag the hiding natives out of the jungle. Within the hour, the story goes, there was a great shaking, and the Saroo sank quickly under the water, drowning the invaders and dragging their ships down in the resulting whirlpools. The only survivors were a number of natives who had hidden in natural gaps under the Saroo's surface, which, to their surprise, sealed themselves up when the Saroo submerged. The event left the island partly defoliated and the few survivors gasping for air, but they were free of foreign domination.

But despite some evidence of divine favor, the shamans also showed an increasing tendency towards madness. A number of shamanistic rituals in regions the Saroo passes through, the likely home of the early inhabitants, involve self-induced trances and frenzies. It seems likely that the shamans' altered states of consciousness did, in fact, attune them to the Saroo's thoughts. However, those thoughts were sufficiently alien as to make the unprepared human recipients less and less sane. At the height of their political power, they became so unhinged as to be incapable of directing their society. The shamans became something like figureheads, with interaction with the people filtered through a small priestly bureaucracy. Their decrees still have the force of law, but their obscure meanings have become the subject of contentious interpretation.

The stage was set for the return of the big men. Behind the proclamations of the shamans, the big men remained important figures in society, helping to arrange marriages, mediate disputes, organize work parties, and so on. With the shamans unable to coherently order their people, the big men rose to prominence, and this time in a society with a more established sense of social order. Calling themselves "elders," (although there were no particular age requirements; many so-called elders continue to be as young as their late twenties), a number of prominent individuals slowly took over the day-to-day tasks of administering the island and, more importantly, making decisions about how to distribute the considerable income from the ambergris trade.

For the past two centuries or so, the elders have administered, if not ruled, their island in relative peace. It has not been completely without problems, of course. Harsh weather is an ongoing concern, and the town has had to withstand some particularly damaging typhoons. And despite the storied fate of the foreign invaders many centuries ago, the Saroo appears not to notice quick raids, even particularly violent ones. Pirate raids are a constant danger; two generations ago, a particularly vicious group managed to put large parts of the town to the torch, requiring the natives to cut a great many floating piers loose to save the remainder. More subtle influence is also a danger. Where force of arms will not succeed, more than one foreign power has attempted to buy rulership of the Saroo, either through fomenting civil unrest or directly influencing the elders.

A more severe threat to the elders has arisen in recent years. Though they have been gibbering recluses for centuries, the shamans may be returning to their senses. The past three shamans have had an unusual number of lucid moments, and they're starting to issue proclamations which the elders can't talk their way out of. And in recent years, the Saroo has been visiting cooler waters. There have been no huge changes yet, but there's an uneasy feeling on what is usually a

carefree island that what it's all leading up to won't be nearly as sunny as the past years.

The Saroo

Although the natives regard it as a living god and leave it at that, the nature of the Saroo is a matter of considerable debate for outsiders. Many question that it's a god, but its extreme resistance to magical scrying is undeniable. It is difficult to locate with information-gathering magic, and such spells are utterly incapable of penetrating its substance.

In some ways, the Saroo appears related to reptiles or fish. Beneath the soil, the Saroo's surface is a tough, rocky layer five to 10 feet thick, in interlocking scales 10 to 30 yards across. However, there are numerous pores and gaps between the plates, providing limited access to sub-skin layers. Those areas seem warmer than one would expect underground areas to be, making some suspect that the Saroo is warm-blooded.

These conjectures are not helped by a near total lack of information about the Saroo's anatomy. Patterns of current suggest that it has between 16 and 22 fins or flippers deep underwater with which it propels itself. It also has a barnacle-encrusted, flexible tail, about a mile long with a flattened paddle at the tip, which may play a role in steering. The tail is usually submerged, but it rises above the water every few months to slap the water a time or two, then sink again. It is not even known whether or not it has a mouth, although it is generally assumed that it consumes a great many fish from the shoals through which it swims.

There is also little indication what kind of sensory equipment the Saroo has. It is unknown if it is able to hear, smell, taste, sense heat and cold, the force of currents, or almost anything else. The only sense it does fairly clearly possess is vision. It has a number of knobby, domed outcroppings the size of large houses distributed around its perimeter, several yards above the shoreline. These are immense eyes, which open from time to time and look around. They don't seem to do so in response to any particular stimulus, but they do clearly track the movements of large or distinctive objects. Some believe that it has a telepathic link to the shaman, sensing what he senses, and perhaps even to everyone on the island.

The Saroo follows or perhaps even anticipates seasonal migrations of large shoals of fish, though some believe the scent of ambergris lures fish there. Either way, it seems as though the Saroo is always in excellent waters for fishing, much to the delight of its inhabitants.

Trade

The Saroo's greatest source of wealth by far is the ambergris mines. This tremendously valuable waxy substance is usually found, when it can be found at all, floating in the ocean or washed up on shores all over the world. Its ultimate origin, however, has been a mystery. The natives of the Saroo have found its source, or at least one source. Deposits of particularly fine ambergris have been found filling some of the Saroo's pores. The Sarooites, when they find these deposits, dig them up and trade them for a great deal of money.

The ambergris trade is supplemented by a small-scale trade in a variety of unusual spices available on the island, notably turmeric and ginger, and other natural substances used in medicines and alchemy. The island produces many fine woods as well, but most of it is used locally for homes and boats. These goods, though, are quickly and easily gathered. Most people are occupied in fishing and seaweed cultivation.

Sarooites also produce small quantities of intricately woven textiles decorated with maze-like geometric motifs. They produce similarly decorated wooden screens and panels which are used to define spaces in their homes. These are objects of considerable social regard, and craftsmen can spend months or even years on them off and on. They're rarely available for sale, but fetch high prices when they become available. Most, though, are exchanged as gifts (see Society and Government below).

In return for its valuable exports, Sarooites import cloth and raw fiber, precious metals (mostly in the form of jewelry), dyes and paint pigments, and a range of goods which require mineral resources and high heat to produce: metal,

ceramics, and glass. The island lacks ores, sand, and good clay, and lightweight wooden buildings on floating piers are not a great platform for forging metal or firing pottery.

Society and Government

Although the settlement on the Saroo is big enough that not everybody knows everybody else, most people at least know a close relative of anyone they're not personally acquainted with. That, the lack of ethnic and religious diversity, and the lack of long-term contact between Saroo and any other one larger society may have prevented its own society from becoming more stratified. There are no legally recognized classes, and while men and women are recognized as having separate roles, they receive approximately equivalent legal protection.

The town has no legislative body as such. Its laws, though unwritten, are enshrined in tradition. Those laws can only be modified by a shaman's declaration, and it has been generations since they've been sane enough to make one. The elders form not a government so much as an executive council which can only operate with continued popular support, which is not always forthcoming, and the Sarooites are entirely willing to ignore the elders if they feel that too much is being asked of them. The greatest power of the elders is in their capacity as managers of the ambergris trade. The elders decide who to trade with, negotiate prices, and determine how the income is spent. This power, though, is mostly external; the Sarooites need to be cajoled, not coerced. They look for a minimum of trouble, buying off powers they pass by or giving them favorable prices in exchange for protection from pirates and other diplomatic concessions. Policies of appeasement have served Saroo well, although the elders are certainly not above hiring one group of foreigners to fight another if it comes to that.

The ambergris income goes first to pay for stockpiles of necessities like drinking water, manufactured items, and diplomatic expenses. The income is also used to pay for what might be called capital spending. The floating platforms which make up most of the town may be built elsewhere and towed to the island, or more materials may need to be imported. But even after that, there's usually a sizable surplus left over. That surplus is distributed more or less evenly among the families of the island, making the Sarooites unusually affluent relative to the peoples they pass by.

Because of the steady influx of imported wealth and the relative ease of obtaining subsistence goods (the average Sarooite spends a mere four to six hours a day fishing, cultivating seaweed, or gathering vegetable produce), they have retained aspects of their ancestral gifting economy. They understand market economies, certainly; big men are quite adept at negotiating trades, and the average Sarooite is as good as any other city-dweller at bargaining. However, among themselves, the Sarooites exchange precious items as an indication of social regard. It is believed that notable early Sarooites exchanged elaborately decorated oars, jewelry, and spiritual fetishes with one another; big men became known as big men by negotiating the exchange of one particularly well-known or striking new object for another. The steady influx of outside wealth has increased the stakes: elaborately lacquered screens, corner posts for homes with carvings depicting mythic cycles, even gilded and jeweled doors are exchange for one another. The elders are the leaders in gifting cycles, trading the best-known objects, but just about everyone participates at some point in their life.

There are two ways to enter the cycle. One is to obtain a notable old object, usually as a gift from a parent or grandparent to a child. The other is to make such an object oneself. Either way, that provides a first bargaining chip and a way to get into trades with other people. Participants attempt to trade for other well-known or attractive objects, usually in ceremonies accompanied by feasting and pageantry, and usually with relatives and potential allies. Doing this, if properly done, enhances the reputations of both people and objects involved. Famous people make their items famous, and notable items are a point of pride and notoriety for their owners. The Sarooites are sufficiently sophisticated that they aren't impressed by money itself, as participants in gifting economies usually are, but they can sometimes be induced to trade one of their items for a particularly attractive foreign object.

Military and Law Enforcement

Saroo has no formal army and has never gone in for military aggression. People of appropriate age are expected to pitch in if the island is attacked, with elders serving as informal officers. Particularly fashionable young men style themselves "guardians" and swagger around the island wearing swords and armor. Their eagerness puts them in the

forefront of Saroo's defense when they are called on, but they have no official status. Typical armaments are short, broad, machete-like swords, short spears, light bows and large but lightweight shields.

Saroo likewise has little formal law enforcement. Smaller matters are settled through mediators, often elders. If criminals need to be apprehended, the act is carried out by the injured parties and their friends and relatives (and, at times, interested bystanders; it's considered good fun). Elders also act as judges in more serious matters such as large-scale theft, with material reparations being the most common punishment by far. Only in extreme cases, usually murder, are extreme penalties meted out. Exile is the most common punishment, but particularly unpleasant wrongdoers may find themselves becoming offerings to the Saroo.

Religion and Magic

The average Sarooite makes occasional prayers to minor spirits and burns incense and other symbolic offerings at a household shrine for personal favors: good health, luck at gambling, easy childbirth, and the like. Beyond that, however, religion is regarded as a matter for professionals. The shaman has received years of training in dealing with gods, so they let him do it.

Despite the growth of the Saroo settlement from a small village to a town of respectable size, there is still only one shaman at a time. It is his job to deal with gods in general and the Saroo in particular. Being a shaman is a lifetime job held for as long as the shaman is physically competent to perform his duties. These conditions are not mutually exclusive: if the shaman becomes physically disabled from age, illness, or accident, he is sacrificed to the Saroo. New shamans are chosen from a number of "apprentices" who learn from and, in these days of mad shamans, care for their superior. When an apprentice dies or is promoted, a boy is chosen to replace him, purportedly according to divine guidance.

Though probably initially quite peaceful, religion on the Saroo has become a bit bloodthirsty, with human sacrifice being a more-or-less annual occurrence. Victims, gaily decorated with flowers, fine clothes, and precious objects (as well as bound, drugged, or both), are taken in a grand procession to the front of the Saroo, brought to the top of a tall platform built for the purpose, and thrown into the water. They are believed to be swallowed by the Saroo to become favored servants. In living memory, victims have usually been criminals or attractive virgins, although there is historical precedent for others. Indeed, a number of stories about ancestral warrior-heroes end with the protagonist volunteering himself as a sacrifice to the Saroo.

Men do not use magic; what the shaman and his apprentices do is regarded more as a social interaction than direct manipulation of power. Magic is the province of women, who as girls learn charms and curses along with cooking and sewing. It's questionable how effective most of them are as spell-casters, but old women are respected and feared. Sarooites are as baffled by male spell-casters from abroad as they would be by men who said they wanted to have babies.

Architecture

The floating platforms on which the town proper is based are connected with thick ropes and rope bridges, allowing them to shed runoff into the water and move semi-independently in rough seas, although occasional severe storms can cause considerable damage. However, the shamans and wise women of the town seem to be able to protect it from harsh weather most of the time. Most platforms are only big enough for one home, although several may be roped together to provide a sort of plaza.

The typical Sarooite home is a long building with a single undivided room, doors in front and back, and a high gabled roof. The floor of the house is usually raised a foot or two above the platform on which it is built. The front has a set of broad steps, sheltered by the roof extending some distance beyond the house itself. The steps are often used for socializing and entertaining guests. The house has no permanent walls inside, but spaces are divided up by lavishly decorated folding screens. The household shrine is behind the house, again sheltered by an overhanging roof, as is a small paved area used as a hearth for cooking.

The few homes on the island itself are roughly similar in overall shape, but have a different arrangement. They are generally drawn together in compounds, with one particularly large house and a few smaller buildings, usually connected by a wooden fence, facing a courtyard. These homes are occupied by elders and their extended families. The out-buildings are used as housing for notable visitors and storehouses for imported goods and items for export.

The one stone structure on the island, sitting about twenty yards inland at the center of the starboard side of the island, is the shaman's temple, with materials imported at immense expense over the course of a century. Resting on a large stone platform, the temple is a roughly square building with a pyramidal roof and a pagoda-like spire rising above it. It provides housing for the shaman and several apprentices, storerooms for votive offerings, a few sturdy cells for prospective sacrificial victims, and both indoor and outdoor spaces for ceremonies. It is rumored that there's a hidden door in the temple leading *into* the Saroo.

Everyday Life

Diets at Saroo consist largely of fish, which have always been plentiful. The fish are accompanied by cultivated seaweeds and a variety of semi-wild foods growing on the island itself, mostly fruit and edible roots, fungi and leaves. Wild birds shot or trapped in the jungle are a traditional delicacy, although poultry imported from elsewhere has made it more accessible to the less wealthy. Grain is not cultivated at Saroo.

Probably the only major factor preventing the Saroo town from growing any larger is a lack of water. As it is, the natives drink relatively small quantities of pure water, mostly collected from run-off from the central ridge which collects into well-like pores. Instead, they get liquid from fruit juices, water-rich tubers, and a water-filled gourd which grows in clusters on tall trees, vaguely resembling a cocoanut palm. They also import casks of water when the opportunity arises.

Native costume for both sexes at Saroo consists of baggy shorts or short skirts and open vests or short-sleeved shirts, or occasionally belted sarongs for women, often in brightly dyed or embroidered fabrics. However, most people are happy to wear colorful clothing of any kind, and the island's extensive trade allows them to indulge their tastes: silk robes, broad-brimmed hats, colorful sashes, and other foreign garments are common. Nevertheless, as befits the climate, clothing is a matter of display, not protection from the elements, and bodily modesty does not rank high among the virtues of the Sarooites. People hard at work often wear simply a loincloth, and not even that when swimming in the sea, a popular recreation.

Sarooites are also very fond of jewelry, which is often worn even when clothes are not. Rings and necklaces are common, and most wear at least one earring or nose ring. Every Sarooite receives a tattoo emblematic of their family on reaching the age of majority. Shamans and their apprentices are subject to ritual scarification.

Loaded with wealth and possessing a culture which features giving things away as a means of increasing one's own status, Saroo isn't a bad place for small groups of short-term visitors. A flotilla will be politely invited to travel on to its next destination, but interesting-looking foreigners are likely to be afforded reasonable hospitality. Visitors require the permission of an elder to stay in town or on the island, but that's easy to obtain if the foreigners don't look immediately threatening. There are no inns or public houses, but they may be taken in by a family with spare room or given the use of a vacant house. Still, the Sarooites have a sense of proportion, and unless there's good reason for visitors to stay on (for example, ongoing negotiation with the elders), quiet hints to move on will start to arise after several days.

Saroo in the Campaign

As presented here, Saroo makes a possibly lucrative, if occasionally frustrating to locate, destination for trade and a pleasant port of call for characters on their way somewhere else. On one hand, it's a very comfortable place to spend a few days and the natives are fairly friendly. On the other, the Sarooites have a well-developed sense of identity, and people from the outside will always be foreigners. Moreover, while the Sarooites are interested in trade, there's a lot of

competition. The elders have a seller's market for their ambergris and many of their other goods, and outsiders will find themselves in fierce competition for the goods.

PCs inclined to pursue occult research could find endless mysteries to unravel on and in the Saroo. What is the nature of the Saroo: huge dumb beast, alien intelligence, or god? Have the shamans been in communion with another mind, or are their brains simply incapable of withstanding the Saroo's psychic emanations? Is there a passage into the Saroo under the temple (or elsewhere on the island), and if so, what is inside it?

Saroo is also an interesting target for pirates and thieves. It is, obviously, wealthy and not terribly well defended. However, even if you ignore the possibility of a curse by the living god Saroo (such things are rumored, although not well documented), Sarooites are very capable of buying powerful friends. Anyone who raids the island runs the risk of gaining naval powers as enemies.

For the same reasons, Saroo could be a destabilizing factor in international diplomacy. Consider this scenario: a kingdom in financial difficulty gears up to sack Saroo. Saroo, in turn, hires ships from a neighboring kingdom's fleet. The affair could quickly spiral into full-blown war. It could even happen without the Sarooites being directly involved, with different nations maneuvering for a superior position and undercutting one another's moves against the town.

Although Saroo has long been peaceful, recent events could destabilize it. The elders have contrived to keep Saroo society comfortable, well-fed, and too preoccupied with trading famous trinkets to have greater ambitions or broader worries. The return of the shamans could change that. What if the current shaman's madness cleared and he began to issue clear proclamations that the Saroo wanted no more contact with foreigners? Or outlined a plan to manipulate outsiders to destroy one another? At the very least, it would set off ripples of fear and resentment, and it could easily lead to a violent rift in Saroo's society. Likewise, if the island's migrations into increasingly cool waters also take it away from its traditional fishing waters and the tropical climate in which its plants thrive, the town of Saroo will find itself suddenly much more dependent on outside supplies.

Finally, Saroo could become a threat. Gripped by religious fervor, the Sarooites could become fanatical pirates, raiding and destroying ocean-going shipping. The Saroo itself would be more than a base. It would be the most dangerous pirate ship ever known, ramming not just enemy vessels, but entire fleets, and slapping others underwater with its vast tail. That Saroo itself could be a Great Old One, currently only sleeping, but when awoken will drive all of its inhabitants mad and compel them to violence. Perhaps the only way to stop it would be for a brave band of characters to infiltrate the island and find their way inside to find the hidden source of the Saroo's life-force. But beware of the ranks of now-immortal ancient warriors guarding the interior.

Necessary Evil (for the *Savage Worlds Roleplaying Game*)

Published by [Great White Games](#)

Written by Clint Black & Scott Pyle with Randy Mosiondz, Shane Lacy Hensley, Zeke Sparkes, & Chris Toh

Cover by Zeke Sparkes

Illustrated by Storn, Cheyenne, Gil Formosa, & Talisman Studios

144-page full-color hardcover; \$29.99

Come the alien invasion, all good superheroes will step forward and do their very best to thwart the threat. Yet, what happens when these potential saviors of mankind fail? Not only fail, but die in the process? Who then will save us? Fortunately, there still exist plenty of super-powered individuals left on Earth . . . only, they never put their abilities to good use. Can the planets supervillains do what the heroes could not and save us?

This is the set up for ***Necessary Evil***, a Plot Point Campaign for the Origins-Award-winning [Savage Worlds Roleplaying Game](#). After having done dark fantasy in [Evernight](#), nautical fantasy in [50 Fathoms](#), and dark horror in the Vietnam War set ***Tour of Darkness***, this supplement is the first to address the subject and genre of superheroes for the system.

On January 1st, 2001, the first ships appeared over every city on Earth and then attacked. The crocodilian and shark-like Ktharens (or Fins, as they came to be known) possessed advanced technology and the ruthlessness to use it. Then another race -- the Vsori -- appeared, coming to Earth to search for their long-lost allies of Atlantis and offering us aid. The Vsori defeated the Ktharens and drove them into deep space, so when it came to celebrate, the Vsori were welcomed with open arms. And at that moment the Vsori struck, cutting down both the world's remaining superheroes and its surviving leaders with mammoth death rays. With this stroke Earth was under the heel of the Vsori Empire. Their aid had all been a sham; the Ktharens were servants of the Vsori anyway.

Now three years later, the Earth remains under alien rule. Surviving superheroes and villains have gone underground, some even joining resistance movements, of which Omega, led by the infamous Dr. Destruction, is the most well known. It is thought to operate out of Star City, the quite-literally star-shaped city that sits not far off the coast of the USAs Eastern seaboard. Created by the Outsider in 1955, the city is home to some amazingly futuristic technology and is one of the few cities not to have been pounded into rubble.

So if that is the set-up, how does ***Necessary Evil*** -- and thus the ***Savage Worlds Roleplaying Game*** -- do superheroes? Characters are created as normal, with players purchasing attributes, skills, Edges, and Hindrances; one Edge needs to be Arcane Background (Super Powers), although the GM can grant it for free if he wishes. This Edge automatically grants the character 10 Power Points to be spent on super powers, the list of which contains all of the usual abilities. Each entry has a point cost, suggestions for possible trappings, and modifiers that enhance its use. Thus for the Force Control power, the trappings suggested include colored energy, force fields, and tangible illusions; and modifiers that enable the wielder to bind opponents, to fly, create force fields, and even make multiple attacks.

Powers can be improved and new ones bought when a character rises in Rank and selects as his new Edge, the Power Points Edge. Granting only a few more Power Points, it is generally cheaper to improve powers rather than buy new

ones, which is also in keeping with the genre. At game start, a player can also take a Hindrance to gain his character more Power Points, which grants him greater flexibility in buying his characters super powers. This is almost a necessity, as 10 Power Points are not quite enough to design the character a player wants. All this is evidenced in the eight sample characters given a page each, which take the stead of an example of character generation. They include a Blaster, a Brick, a Scrapper, a Sorcerer, a Speedster, and so on. Super sorcery is interesting in that it grants a pool of points with which a character can temporarily buy and use *other* super powers as spells. In general, the powers reflect a low-scale Four Color genre, with player characters not being on the scale of heroes and villains found in the comics, although the rules do allow a player to create characters with similar abilities and powers.

Other Hindrances reflect the genre, such as Heartless and Gloater. There is little done to change the rules to fit the Four Color genre, the most notable being the Recurring Role rule, under which a character cannot *normally* die. Instead he is merely incapacitated for a week. This does not make death impossible, but rather that it should be dramatically appropriate. The campaign itself is supported with lists of weaponry, vehicles, and gear galore for both humanity and the aliens, while two whole chapters are devoted to the aliens and the secrets of Star City respectively. The latter includes a map of Star City, which is somewhat bland and lacking in detail.

The campaign itself consists of 30 individual scenarios, or Savage Tales, a third of which are key in advancing ***Necessary Evil's*** plot.

It begins *The Usual Suspects* style, with the player characters incarcerated by the aliens, but with a bang and a blast, Dr. Destruction comes to their rescue. Then he makes an offer they cannot refuse -- join Omega or die. Should they accept, the villains become a new resistance cell and are assigned various missions -- raids, acts of sabotage, searches for ancient technology, rescuing important people, and so on. The key missions all have a Rank minimum that the player characters must match. To attain these Ranks, they will have to play through the other Savage Tales, either randomly chosen, or selected by the GM. All 30 are arranged in a set of tables to this end, and will see the resistance cell traveling the world, and even visiting old Atlantis on the ocean floor and low earth orbit to fight the invaders.

Overall, this is a good campaign that can be played as is -- a one-shot affair, or added to an existing campaign, taking it in a new direction. Alternatively, it can be used as a what-if campaign, exploring a future not taken. Either option begins with the player characters falling to the Vsori, and having the villains they once faced from week to week fight back; or one that takes place in another timeline where the player heroes are actually the villains.

So far this is all well and good, because ***Necessary Evil*** possesses one big, fat omission. One that goes right back to the campaign's basic concept, that of evil being used to fight a greater threat. Considering how fundamental this is to the campaign, how much advice does ***Necessary Evil*** give on this aspect?

Almost none at all.

And that amounts to less than a quarter-page box of text labeled, "Evil, Not Psychotic." The advice can be summed up with, "Yes, yes, you are playing ambitious, murderous, megalomaniac bad guys bent on world domination or amassing a fortune, but please don't play mindless killers; and do find a means for your character to cooperate with others, or the campaign won't work." Which is good enough, but takes up less than a fifth of a percent of the book.

It is not enough.

Where is the advice on creating a super-villain player character? Where is the advice on playing a super-villain player character? Where is the advice on running a super villain player group? Where is the advice on running a super-villain campaign?

Simply put, not here.

Which leaves the reader to wonder what the point of ***Necessary Evil*** actually is. Because if it does not address its major selling point, what you are left with is the rules for creating superheroes under the ***Savage Worlds*** mechanics, plus a campaign to go with it. Both of which are decent enough. Yet it cannot escape the authors' failure to address the supplement's core concept; as a result, ***Necessary Evil*** fails to come across as *evil-lite*. It doesn't even reach such

dizzying heights; because of it, ***Necessary Evil*** manages to give short shrift to its key gimmick, and should be submitted to the authorities for not being as advertised.

Edward Abbot Abbot's Flatland (Inflated) RPG

Published by [Red Anvil Press](#)

Written by T. Craig Drake

Edited by Julie Ricks

Art by Jeanette Naomi Ricks

33-page PDF; \$3.55

If you've spent any amount of time in college, you've probably been exposed to all manner of cult phenomena. Admittedly Tolkien tops the list of genre faves, but for those who really want to show off their esoteric tastes, Edward Abbott's *Flatland: A Romance of Many Dimensions* has the inside track. Putting both resources into roleplaying format may level the playing field a bit, but **Edward Abbot Abbot's Flatland (Inflated) RPG** isn't such an obvious choice for tabletop fodder.

Backing up for a moment: The original *Flatland* is the story of a world that exists in two dimensions: height and width. A. Square relates what it's like to live in a place where your geometry determines your social standing, females are at the bottom of the totem pole, and talk of dimensions beyond the first two is akin to heresy (the existence of Lineland and Pointland is accepted fact). It's a satire that takes aim at the social mores of its Victorian contemporaries.

As for the roleplaying game: This is less a setting and more a general suggestion. It cleaves to its source material, right down to the politically incorrect views of women and triangles. Players take the roles of geometric shapes, usually fighting against the established pecking order. Ever-vigilant Priests will attempt to thwart any threat you pose, though this version of the world has an expanded list of threats. A chapter called "Things to Kill" details some of the book's forces while adding a few of its own. There are some clever bits here; the creatures and forces are spoken of in varying degrees of obliqueness, and trying to figure out the references is half the fun.

Flatland (Inflated) utilizes what they call the KaSE system; what that actually stands for doesn't appear to be spelled out in the product. A character is the amalgamation of five general attributes that rate everything from your physical and mental states to your social and emotional conditions on a scale of one to four. You then have a series of Enhancers (though this covers positive and negative aspects) that cover skills and other specific facets of your persona. This may determine how sharp your angles are, your physical resistance (making this perhaps the only game wherein you'd like your character to be "thick"), and your social standing as the game begins (you may be a malcontent or "reformed" criminal). You start with a pool of points for getting attributes, and these determine what Enhancers you take. Low attribute scores force at least one Flaw on you, higher numbers give you Traits (positive factors), and upper levels require a mix of both.

Rolls use a d20. Once modifiers are totaled for an action and added to your base attribute, the result is multiplied by that attribute and added to the roll of the die. If you had Mental 1 and a modifier of +2, for example, that totals three and is multiplied by the original 1 before the die roll is figured in. The higher total wins.

The campaign type determines how these results actually affect the game. "Harsh and Brutal" means the difference between two rolls is applied as a penalty to future actions (you beat your opponent by four, so he's at -4 from then on). A "By the Numbers" campaign uses a mathematical formula that doesn't bear getting into here. It is the only play style

that uses actual Skills, though these are pretty funky too (the example given is a skill that depends on the facing of combatants in a fight).

With the exception of the cover, there's really no art to speak of . . . though it is at least as good as any other means of illustrating so remote and elusive a concept employed since the story's release in 1884. What you're left with is the functional and workmanlike layout of the no-frills text. The work is in serious need of additional editing, to clean up both the specific language and the outstanding grammatical issues (you'd think consistently capitalizing Flatland would be the place to start). Some rules need work, too -- it's clear some stats in character creation are meant to build on other stats, but not all of them list their prerequisites.

Edward Abbot Abbot's Flatland (Inflated) RPG is a clever idea, but like its inhabitants, it is intelligent but flawed. It's hard to be sure when it's being deliberately coy and droll and when the writing skills simply come up short. Though it's clear they know the material and have something to say, sometimes it gets away from them. Enhancers seem to bleed into one another, ultimately offering bonuses to certain rolls but little in the way of elevating the roleplaying side of things. The canned setting (the City of Concentric Enlightenment) reflects the source material's stifling atmosphere and political intrigues, but really amounts to "here's where the snooty-nosed people in charge live; go hoist them by their 2-D petards." It seems to lack the focus and feel needed to make it really come alive for or involve the reader. You just don't know what to *do* with it, and the truth is once you've gotten over the initial shock and amusement of seeing that someone has made a game from this, the best part is really over.

The game acknowledges its own limitations, and harbors no illusions about the permanence of such an endeavor. It's a night's diversion from the usual for most, or perhaps a scenic vista for a larger campaign (the Spacelanders have to come from somewhere, after all). Like **Pantheon**, **Paranoia**, and other games that break molds or skirt the edges of roleplaying convention with brief forays into the bizarre -- or like the story upon which it's based -- it's highly experimental stuff that will meet with raised eyebrows even from those who find its quirky tack an insightful way to open up new roleplaying avenues.

--Andy Vetromile

The Hunt for Murphy's Rules

Just yesterday I finished up editing quite possibly the biggest project I've undertaken. Sadly, being one of the confidential projects I tend to get involved in, telling you about it would mean I'd need to kill you . . . and *Pyramid's* travel budget would mean that I can only afford to hunt you down if you were in my kitchen.

Anyway, one of the aspects of this book that I find most interesting is trying to chew over each rule mentally, making sure they pass some kind of mental muster. Now, I have an interesting outlook on this process. Thanks to my half-decade at *Pyramid*, I'm constantly staring at each and every rule I encounter, with one thought in mind: "Could this somehow be turned into a Murphy's Rule?"

I feel fortunate to have had some of my Murphy's Rules submissions accepted. (In fact, one of my earliest involvements with *Pyramid* was defending and re-explaining my first [Murphy's submission](#), just a few months before I became editor.) But, as I've chugged through the editorial process last week, I couldn't help but wonder about our approach to rules.

Many times, I've seen folks on message boards (*Pyramid's* and others) treat any kind of incorrect Murphy-worthy rule as being a bad thing . . . as if the game designers, by not weeding out these offensive rules before publication, had violated some kind of social contract (like how I leave spoiler messages on people's answering machines: "Sorry you weren't able to go to the theater with us, but I don't think you would've liked the bit where it turns out that Harry Potter was Kaiser Soze, anyway . . .").

One rule I found last night -- and I don't think I'm revealing anything, since lots of games do this (including my oft-worked [D6 System](#)) -- has to do with opposed roles. Basically, in games where it pays to roll high, the result of that roll is sometimes used as the basis for the opposing roll. In other words, if making a forgery of a kid's crayon drawing needs a roll of 5, and a forgery of a DaVinci needs a roll of 30, then on a successful roll a person trying to detect a forgery might need to get higher than the original total of the forger. This leads to a curious result that, on a successful result, it's more difficult to detect a forgery the more difficult it was to make the forgery in the first place.

Now, I went back and forth a bit with my Hidden Master about this rule, and I came to the conclusion that -- although somewhat illogical -- it's not necessarily *wrong*. After all, I concluded, the person who needed the 30 in our hypothetical example above still needed to roll a phenomenal result; it seems awfully nitpicky to say that *if* the original task had been easier and *if* the person succeeds in the more difficult task and *if* you compare the situation with another one . . . Perhaps it's illogical to compare two different situations, if what the roll is ultimately measuring is different. It's like the old joke: "I went to Vegas in a \$10,000 car and went home on a \$100,000 bus"; the dollar amounts compared look the same, but they're not. Maybe whatever skill level it takes to roll that 30 is enough to provide the extra effort to make it more difficult to detect the forgery. Sure, it's a stretch, but not a huge one.

However, I suspect it ultimately comes down to something we believe about our RPGs . . . something that, all told, is quite possibly one of The Big Lies. Namely, that every system or design implementation exists for a reason; every contingency has been carefully considered; that extensive around-the-clock playtests would ferret out any erroneous or problematic rules. Of course, this isn't the case. Heck, it's hard to playtest a board game, and it might only have a dozen pages of rules at most. Now, multiply that by the hundreds or even thousands of pages of rules that a typical RPG system has, and the open-endedness of a typical roleplaying campaign, and it's all but inevitable for some oddball situations to crop up.

Of course, that doesn't stop us from trying to hunt those errant rules down. But, if nothing else, I try to have a little more sympathy when I find 'em. And maybe -- just maybe -- I can squint and come up with a reason for them to be there. If nothing else, looking at how rules might be correct is a nice change of pace from scrutinizing them for how they might be wrong.

--Steven Marsh

The King Of The Cats Is Dead

"I prayed to the darkness, to the night, to the carrion kind. I prayed to the king of the cats, the kind's emissary on Earth, he who walks amongst us and we do not know him. I prayed and I dreamed."

-- the visionary cat, in "A Dream of a Thousand Cats" by Neil Gaiman (*Sandman* #18)

I should warn you that this particular Transmission is still Suppressed. I can't make hide or hair out of it, despite it featuring plenty of both. It's got an ending, but one that comes way too early to resolve anything. I have only fragments, sentences pronounced in oracular fashion, words of power that I can't read. Perhaps none of us can, as our eyes can't take enough of it in. Perhaps you'll figure something out, or it will jump out at you when you hear it. Either way, though, to begin with, I need to tell you the creepiest story I ever read.

"That story had made him shiver and wonder, and ponder for days; not the story that had been told, but the secret story that had not been told: the story about the cats, the secret story that had been going on all along and that no one knew but they."

-- John Crowley, *Aegypt*

A crofter returned home late on a dark and stormy night to find his wife and cat waiting up for him by the fire. He burst in the door and started his breathless tale: "Wife, you will not believe what I saw out on the crossroad tonight." "What? What did you see?" the good woman asked, as the cat looked on politely. "Why, I saw eight black cats walking, each with white patches on their breast, just like old Tom here." "Oh, never mind old Tom, husband, what happened then?"

"What's more, they walked slow and in step, and between them they carried a coal-black coffin with a little crown on it, and every time they took a step, they said 'Miao!'" "Miao!," said the cat by the fire, and the crofter said, "Yes, just like that, Tom." "Oh, never mind old Tom, husband, what happened then?"

"Well, the lead cat stops and sees me watching, and he looks at me with his yellow eyes all unblinking. Just like old Tom is now!" "Oh, never mind old Tom, husband, what happened then?"

"The lead cat stares at me and he speaks! He says, 'Tell Tom Tim that old Tim Tom is dead.'" And what the wife was going to say to that we shall never know, because the cat by the fire leaped to his feet and shouted, "Old Tim Tom is dead? Then I, Tom Tim, am King of the Cats!" And with that, the cat jumped up the chimney in a shower of sparks and never was seen again.

"I will conclude my 'modern instances,' with a story told by M.G. Lewis, not probably so authentic as these, but perhaps more amusing. I relate it as nearly as possible in his own words."

-- Mary Wollstonecraft Shelley, "On Ghosts" (1824)

I read that story at an obviously impressionable age, in an eerie illustrated version ostensibly for children. The version I read (which I've slightly abridged here) was almost certainly based on "The King o' the Cats," as conflated by the folklorist Joseph Jacobs in 1894 from five or six versions gathered from northern England in the immediately previous decades. In Jacobs' version, the King of the Cats is "Tom Tildrum," and other versions give "Dildrum" or "Tom" or "Peter." Mary Shelley gives the earliest version I've been able to trace in print, which she delightfully ascribes to her fellow horrorist 'Monk' Lewis. In Lewis' version, the King of the Cats is never named, and the listening cat recognizes the funeral from the witness' description and comes to the proper conclusion.

Folklorists (or at least those who use Stith Thompson's delightful index) call this story Type 113A, "Death of an elf (or cat)," noting parallels to other tales. In German stories collected in the early 19th century, a peasant receives a strange instruction to "tell Habel that Hubel is dead" or "tell Torke his child is dead" or just "say that Prilling and Pralling is dead." Upon relating the tale to his wife, a house-elf appears and runs off, or a mysterious crash sounds from another room where housework is suddenly interrupted by the departure of the elf. A Danish story disguises the elf (in this case a troll) as a cat ("Knurremurre is dead? Then I may return home!"), much like a Durham version ("Tell Madam

Momfort that Mally Dixon's dead") disguises a fairy as a cat. A version from the Tyrol goes the other way around; when the farmer repeats "tell Stutzkatze (Clipped Cat) that Hochrinde is dead" his serving girl runs off. And the Irish, bless them, have a deeply creepy version in which a man is killing a cat, who says to him, "Go home then, and boast that you have killed the King of the Cats." When he tells the story at home, his own cat leaps up and kills him in turn.

"By the magic powers they possessed it was made known to all the cats in the country that their King was being pursued by the hounds. Then on every hearthstone a cat howled. Cats sprang to the doors, overturning cradles upon children. They stood upon the thresholds and they all made the same curse -- 'That ye may break your backs, that ye may break your backs before ye catch the King of the Cats.'"

-- Padraic Colum, *The King of Ireland's Son*

There are other Irish stories, slightly less disturbing ones, about the King of the Cats. (This Hibernian context is probably the best place to mention that William Butler Yeats, upon hearing of [Swinburne's](#) death in 1909, responded "Now I am King of the Cats.") In Padraic Colum's version of the folktale "The King of Ireland's Son" (perhaps more familiar as Hans Christian Andersen's "The Traveling Companion") there is a lengthy digression in which the King of the Cats decides to hunt down the Eagle-Emperor, the [King of the Birds](#), and have a showdown between their two courts. Sadly, the two kings are turned to stone and their contest (and thus, that between cats and birds) continues to this day. Still another Irish legend concerns Irusan, the coal-black, bull-sized King of the Cats, who dwelt in a cave at Knowth. The bard Seanchan Torpeist, angered that mice had devoured his dinner at the royal hall of Guaire, pronounced a satire against Irusan, who, as King of the Cats, should have killed all the mice already. Irusan did not react well to this lese-majeste, and smashed into Guaire's hall, where he snatched Seanchan up in his mouth. But on his way back to Knowth, Irusan and Seanchan met up with St. Kieran at his forge. The saint, morally opposed to giant cats, even royal ones, dining on Christians, threw a hot iron bar through Irusan and killed him.

*"Last evening-tide
Brian an augury hath tried,
Of that kind which must not be
Unless in dread extremity,
The Taghairm called."*

-- Sir Walter Scott, *Lady of the Lake*, IV:4

The Scots also have a monstrous coal-black cat, named Big Ears, who appears in response to the Taghairm, a truly revolting ceremony, also involving a hot iron bar. For the Taghairm, the sorcerer turns a cat (or four, or seven) on a spit over the fire, loudly proclaiming "I roast this cat until his Friend answers a question." The yowls of the roasting cat both frighten malign spirits and summon Big Ears, who then grants the sorcerer a wish (usually second sight) or the answer to a question. (There is a slightly less revolting version, in which the petitioner is merely sewn up in an oxhide and left by a waterfall to listen to the spirits all night.) Scots historians soberly (well, that may be the wrong adverb) insist that the luck of the Camerons was due to a Taghairm carried out in the 17th century, and the last attested Taghairm occurred around 1650 on the island of Mull, performed by one Allen Maclean.

By the sort of odd coincidence that is never coincidence, it was in 1648 that King Louis XIV, "crowned with a wreath of roses," lit the official Midsummer fire on the Place de Greve in Paris, which was by time-honored French custom topped off with a basket of live cats. One would really like to follow that ghastly story up with an anecdote about Louis XIV's immediate death, but he was the longest-lived and most glorious of the French monarchs. At Metz, Aix-en-Provence, Gap, and other French cities, similarly horrid customs obtained until the 1760s -- at which time, of course, the French monarchy began immediately to hit the skids. Our man Frazer notes sacrificed "Corn Cats" at harvest time in Amiens, and symbolic feline corn-kings at Vesoul and Briancon, and similar shenanigans elsewhere in Burgundy, the Franche-Comte, and the Dauphine. Were the French kings placating -- or deterring -- the King of the Cats with their own rituals on St. John's Eve? Did the notoriously ailurophilic Marie Antoinette end the Gallic Taghairm, to unforeseen effect?

"It was already evening when, near the Echinades Islands, the wind dropped, and the ship drifted near Paxi. . . . Suddenly from the island of Paxi was heard the voice of someone loudly calling Thamus, so that all were amazed. Thamus was an Egyptian pilot, not known by name even to many on board. Twice he was called and made no reply,

but the third time he answered; and the caller, raising his voice, said, 'When you come opposite to Palodes, announce that the Great God Pan is dead.'"

-- Plutarch, "De Defectu Oraculorum," *Moralia* 419

And those threads come back around still earlier in our story, or in a still earlier version of our story. In this version, the person who hears the mysterious instruction is Thamus, the pilot of a boat in the Aegean, who hears a disembodied voice from over the water cry out, "When you come opposite to Palodes, announce that the Great God Pan is dead." Just like the crofter in the story, he repeats this enigmatic pronouncement when he gets to the island of Palodes -- which erupts in yowls and roars of agony and mourning. As Santillana and von Dechend put it in *Hamlet's Mill*, "The bearer of the message may be an unknown pilot, a passerby, an animal, a watcher. The substance is that a Power has passed away, and that the succession is open." Commentators have noted the similarity in names between Thamus the pilot and Tammuz, the dying corn god of Babylonia -- which takes us right back around to our Corn Cats, dying in the fires of France at midsummer -- the time of Tammuz' death, as it turns out.

"You know, I made a pact with cats, with the King of the Cats -- it goes back very, very far. And it's extraordinary (it happened in Tlemcen, entirely on the occult plane), extraordinary! For certain reasons, the King of the Cats gave me a power over these creatures -- and it's true. Only I have to see them . . . Cats are vital forces, incarnations of vital forces. The King of the Cats -- that is, the spirit of the species -- is a being of the vital world. For instance, cats can very easily incarnate the vital force of a dead person. I have had two absolutely astounding experiences of this."

-- Mira Alfassa ("The Mother"), *Agenda*, April 12, 1961

Mira Alfassa, the spiritual Mother to Sri Aurobindo, is only the latest and most exalted of our seeresses (or witches, if you prefer) to be bound up with the King of the Cats. His feline majesty was named in the occasional trial as the lord of the coven, and he was the object of [Erzsebet Bathory's](#) bloody prayers. We can draw out a trail connecting the King of the Cats, the Black Man of the sabbats, and Adonis-Tammuz the Dying God. The cat in the cornfield serves as [scarecrow](#), as [scapegoat](#), and as harvest king by turns. When we connect cats and kings (and at least one Scots writer explicitly connects the custom of buttering a cat's paws to keep it in the house to the anointing of the king with oil), we necessarily connect kings and cats. Or queens -- does the death of Marie Antoinette tell us something, something like the tale of three cats in Strasbourg around 1590? According to the inquisitors, a woodcutter defending himself against three large, aggressive cats chopped each of them with his axe -- after which identical wounds appeared on three leading ladies of the city. A very similar tale recurs in the legal records of Thurso in Scotland in 1718, again with three cats wounded by an axe and like injuries appearing on local witches.

So what does it all signify, all these cries in the night, and cat-foot prints across the pages of history, from 1590 and 1718 and 1798? Or from 29 A.D. when Thamus heard the lamentations for Pan, to 544 A.D. when St. Kieran was at Clonmacnois ready to dispel Irusan, to 1765 and the end of the Cat Massacres at Metz, to 1909 and the death of Swinburne? Is this the reign of the fifth King of Cats? Or is the True King of the Cats still locked in eternal combat with the Eagle Emperor, and his death a ritual recursion in their struggle, cyclical time impinging on linear time by a calendar known only to Bast and Cybele? There are too many loose trails, too many flicking pieces of yarn to follow. What of [Dick Whittington](#), or [Robert "the Cat" Catesby](#), or John Keats, plagued by [vampires](#) and with a cat on his family crest? What then of cats drinking the breath of babies, swallowing souls to reincarnate themselves? Are Big Ears and Irusan the first of the "phantom cats" (also called ABCs, Anomalous Big Cats) seen all across Britain to this day, padding about looking for uppity bards or careless Scots sorcerers? Is the King of the Cats the [maneless King of the Beasts](#) as well? Someone is yowling a message for us to pass on, something very important but unclear. I can't make it out, myself. But if you see Tom Tildrum, tell him that the Great God Pan is dead. Or vice versa.

The Good Doctor and His Creations

for *GURPS*

by Bevan Thomas

We live in a technological age, and the mad scientist is the embodiment of technology and science run amok. Dr. Heinrich von Reichtor is a model mad scientist, a horrific reminder of the times that science does not heal, but instead destroys.

A brilliant bioengineer, von Reichtor could not accept the loss of his wife, and is trying anything and everything to bring her back to life. He seeks to recreate the one perfect thing he has ever had, and in doing so he is creating monsters.

Heinrich von Reichtor

220 Points

Attributes: ST 9 [-10]; DX 11 [20]; IQ 15 [100]; HT 10 [0].

Secondary Characteristics: Dmg 1d-2/1d-1[0]; BL 16 lbs. [0]; HP 9 [0]; Will 13 [-10]; Per 15 [0]; FP 10 [0]; Basic Speed 5.25 [0]; Basic Move 5 [0].

Advantages: Contact Group (underworld, effective skill 15, fairly often, somewhat reliable) [10]; High Manual Dexterity 1 [5]; Status 2 [10]; Wealthy [20]

Disadvantages: Dependents (his creations, around quite often) [-20]; Insomniac (severe) [-15]; Lamé (crippled) [-10]; Loner (12) [-5]; Nightmares (12) [-5]; Obsession (resurrect wife) (12) [-10]; Phantom Voices (dead wife)(disturbing) [-10]; Shyness (severe) [-10]; Workaholic [-5]

Quirks: Careful [-1]; Proud (intelligence) [-1].

Skills: Area Knowledge (his city)-15 [1]; Bioengineering (cloning)-18 [16]; Bioengineering-(genetic) 18 [16]; Bioengineering (tissue)-18 [16]; Biology-16 [12]; Chemistry-16 [8]; Computer Operation-15 [1]; Diagnosis-16 [8]; Drive (automobile)-10 [1]; Expert Skill (thanatology)-17 [12]; Games (chess)-15 [1]; Literature-13 [1]; Musical Instrument (violin)-13 [2]; Observation-14 [1]; Physician-16 [8]; Physiology-16 [8]; Research-17 [8]; Surgery-17 [16]; Veterinary-14 [2]; Weird Science-17 [16]; Writing-14 [1]

Appearance

Dr. Heinrich von Reichtor is a tall, slim man with haunted gray eyes. Though only in his mid-30s, his long brown hair has become streaked with gray. His troubles have made him old before his time. When at home, the doctor usually wears black pajamas, slippers, and dressing gown. The few times that he deigns to get dressed, Dr. von Reichtor favors rumpled black pants accompanied by black turtlenecks and tweed jackets. Wherever he goes, he leans heavily on his black walking stick.

Background

He met her in university, and from the first time he gazed into her eyes, he knew that he was in love.

Heinrich von Reichtor was the last of a long line of German aristocracy. A shy, retiring man, he had no interest in his wealth nor in most people, but devoted his time to the biological sciences and to a lesser extent, flights of fancy through reading romantic poetry and Greek mythology.

She was Catherine Summers, the most beautiful woman in the school, and the only person who Heinrich had ever met who he found as intelligent as himself. Despite his mangled right leg, plain features, and nervous manner, she was as drawn to him as he was to her.

They decided to wait a year to get married, the day after they would receive their PhDs. That year was heaven for Heinrich. Even his parents' death during that time did little to hurt his spirits. After all, he was engaged to Catherine Summers. How could anything compare to that?

The day they married was the happiest of von Reichtor's life; it was a dream come true. But that night was the beginning of his nightmare. Catherine began to get sick, and over the next few days she got even sicker. No one knew what was wrong with her. All von Reichtor knew was that his wife was dying in his arms, and his vaunted intellect could not save her.

He sequestered himself and Catherine in one of his mansions as he worked feverishly to save her life. After she slipped into a coma, he knew her death was near, and so he placed her inside a prototype he had developed. It was a glass casket, filled with a chemical solution that would place her in suspended animation until she could be brought back from the jaws of death.

That was years ago, and since then, Heinrich von Reichtor's sanity has crumbled.

The von Reichtor fortune is dwindling as the doctor spends his time and money hunting for a miracle cure. As his madness grows, von Reichtor's experiments become less and less related to his wife, becoming simply the indulgence of a morbid curiosity. He tried to animate dead bodies to see if it was possible to return the spirit to the flesh, creating the behemoth Atlas. In a moment of desperation, he tried to "grow" a new Catherine, and made Metis. Now he is grafting human brain tissue onto animals, creating creatures like Aristotle the raven. Only von Reichtor knows what his next experiment will be.

As his mind deteriorates, so do his morals. He pays criminals to deliver corpses from graveyards for use in his experiments, and he has started to perform vivisection. These actions would have horrified him a short time ago, but now it is only a matter of time before he targets living humans. He has reached the point that if anyone were a danger to him or his work, he'd consider strapping that person to his operating table to be an appropriate way of eliminating the problem.

The doctor rarely sees anyone. In fact, he almost never leaves the house unless it is on some errand relating to his research. His only companions are the strange creatures he's created, particularly Metis. He treats the homunculus as halfway between a daughter and a pet, and has taught her various things, including how to play chess. One of the only times that he smiles is when she sings or dances in accompaniment to his violin.

Dr. von Reichtor's bed is beside Catherine's casket. However, he almost never sleeps, for when he does, he is beset by hideous nightmares in which his wife dies before his eyes again and again. Even being awake does not allow him to escape her apparition, for he often hears her voice in the back of his mind. Sometimes she is singing or calling gently to him, other times she is a screeching banshee, demanding to know why he is letting her die. Worst of all, sometimes she simply cries out a death rattle that lasts for minutes. When that happens, Dr. von Reichtor collapses to the ground, places his hands over his ears, and begs her over and over to stop.

Even in her demi-death, Catherine von Reichtor is beautiful. She floats in a bath of chemicals, her long black hair forming a halo around her head as her pale, delicate hands are clasped over her still bosom. She is dressed in her wedding gown, though the veil is thrown back in order for her lovely face to be clearly seen. Her eyes are closed, giving the appearance of someone sleeping peacefully. She looks like Snow White in a glass coffin, a resemblance von Reichtor has noticed and draws a grim humor from.

Heinrich von Reichtor often stares at her vat for hours, kissing and caressing it tenderly while he sings to his wife all the songs that she loved.

Mad Scientist

151 Points

The mad scientist is a modern version of the black magician, a radical scholar who seeks to know Things Man Was Not Meant To Know. Depending upon his area of interest, he may use bioengineering to evolve animals, computer programming to create artificial life, engineering to build a machine to travel dimensions, or something even further beyond the pale. Whatever his motives and techniques, he is as insane as he is brilliant.

Many mad scientists seek knowledge or power for their own selfish ends, but some have noble goals. These scholars may seek to cure world hunger, heal the environment, or eliminate disease, but during their quests, they have lost touch with reality. This sort of mad scientist is the most tragic, for he sought to give hope, and now only delivers terror.

Attributes: ST 9 [-10]; DX 11 [20]; IQ 15 [100]; HT 10 [0].

Secondary Characteristics: Dmg 1d-2/1d-1[0]; BL 16 lbs. [0]; HP 9 [0]; Will 13 [-10]; Per 15 [0]; FP 10 [0]; Basic Speed 5.25 [0]; Basic Move 5 [0].

Advantages: Language (Latin or some other scientific language)(Accented) [4] and 25 points chosen from among Allies (minion) [Varies]; Cybernetics [Varies]; Eidetic Memory [5 or 10]; Gadgeteer [25]; Gizmos [5 /gizmo]; High Manual Dexterity [5/level]; Languages [Varies]; Less Sleep [2/level]; Lightning Calculator [2 or 5]; Patron [Varies]; Reputation (respected scientist) [Varies]; Talent [Varies]; Tenure [5]; Unfazeable [15]; and Wealth [Varies].

Disadvantages: -20 points to represent the Mad Scientist's insanity, chosen from Delusions [-5 to -15]; Fanaticism [-15]; Flashbacks [Varies]; Low Empathy [-20]; Manic-Depressive [-10]; Megalomania [-10]; Nightmares [-5]; Obsession [-5 or -10]; Paranoia [-10]; Phantom Voices [-5 to -15]; Phobias [Varies]; Sadism [-15]; and Xenophilia [-10] and an additional -20 points chosen from the list above or from Absent-Mindedness [-15]; Bad Sight (Mitigator: Glasses, -60%) [-10]; Bad Temper [-10]; Callous [-5]; Curious [-5]; Enemies [Varies]; Greed [-15]; Hunchback [-10]; Intolerance [Varies]; Jealousy [-10]; Lane [-10 or -20]; Overconfidence [-5]; Proud [-1]; Reputation [Varies]; Secret [-5 to -20]; Sense of Duty [-2 to -20]; Social Stigma [Varies]; Stubbornness [-5]; and Workaholic [-5].

Primary Skills: Weird Science (VH) IQ +2 [16]-17 and one skill from: Bioengineering, Chemistry, Computer Programming (AI), or Engineer, all (H) IQ +3 [16]-18; or Alchemy (VH) IQ +2 [16]-17.

Secondary Skills: Research IQ (A) +2 [8]-17 and 20 points worth of skills that support the mad scientist's primary skill (for example, a mad scientist who focuses on Bioengineering would have Biology, Physician, and Physiology, whereas one who specializes in Computer Programming [AI] would instead select Computer Hacking, Computer Operation, and normal Computer Programming).

Background Skills: Select two skills from: Interrogation, Teaching, or Writing, all (A) IQ-1 [1]-14; or Intimidation (A) Will-1 [1]-12; or Observation (A) Per-1 [1]-14; or Cryptography or Hypnotism, both (H) IQ-2 [1]-13.

The Doctor's Creations

These are the three most prominent creations of Dr. Heinrich von Reichtor. They represent three archetypes of mad scientists' experiments: the forcibly evolved animal, the human behemoth, and the homunculus, and so can serve as simple templates for different creations. Other minions can be added, whether similar to the listed ones (such as Ajax, another product of the experiment that created Atlas) or entirely new (for example, a semi-sapient goo that von Reichtor accidentally created from a piece of Catherine's skin and spit).

Aristotle

81 Points

Appearance

Aristotle looks like a large, normal raven.

Background

Aristotle is a raven whom Dr. von Reichtor vivisected. The bird has had human brain tissue grafted onto his mind, and so can talk and reason like a human. Immensely curious, as well as being grateful for his new intelligence, Aristotle serves as an informant and spy for his "boss," finding things out as only a bird can.

But recent events have started to unnerve the raven. He has been having strange nightmares and invisible people yelling in his ears. He keeps getting flashes of memories that he has never experienced. He thinks the different parts of his brain are warring against each other, each one trying to gain control. For some reason, Aristotle is now terrified by the number 13. He doesn't know why. He just knows he will never fly over a house numbered thirteen ever again. He's afraid that if Dr. von Reichtor found out about all of this, the doctor might just abort the experiment and turn Aristotle back into a normal raven. So Aristotle has been keeping quiet, and been desperately hoping that the voices in his head will go away.

Atlas

93 Points

Attributes: ST 22 [120]; **DX** 8[-40]; **IQ** 6 [-80]; **HT** 14 [40]

Secondary Characteristics: SM +1; Dmg 2d/4d [0]; BL 97 [0]; HP 22 [0]; Will 6 [0]; Per 9 [15]; FP 14 [0]; Basic Speed 5.50 [0]; Basic Move 5 [0].

Disadvantages: Bad Temper (12) [-10]; Berserk (12) [-10]; Curious (12) [-5]; Gullibility (12) [-10]; Odious Personal Habit (smells of formaldehyde) [-5]; Sense of Duty (Metis) [-2]; Ugly [-8]

Quirks: Humble [-1]; Likes Cats [-1]

Languages: German: Spoken (Broken)/Written (None) [-7]

Skills: Brawling-11 [8]; Intimidation-11 (includes bonus for size) [16]

Appearance

Atlas is a mountain of a man, eight feet tall with rippling muscles and a wide, brutish face. He has no hair of any kind, and his bright yellow eyes reflect an innocence that seems out of place with the rest of his monstrous form. He dresses simply in T-shirt and jeans, and the stench of formaldehyde radiates from his body.

Background

Atlas was Dr. von Reichtor's first semi-successful attempt at life. After various bodies the doctor attempted to reanimate proved too weak for the process, he injected one corpse with a specially treated steroids and hormones. He finally made it powerful enough to survive the process, and laughed with joy as the muscled-up corpse began to slowly move its limbs.

However, the creature he created was not quite what he expected. Though the brute, dubbed Atlas after the mightiest titan in Greek mythology, possesses vast strength and durability, he also has the intelligence of an infant and is prone to dangerous mood swings. The slightest thing can set Atlas off, causing him to fly into a deadly fury which only Dr. von Reichtor and Metis are able to quiet. When Atlas isn't assigned to a task, he is usually in his room sucking his thumb, whistling a nonsense tune, and playing with his toy cats.

Metis

112 Points

Attributes: ST 5 [-50]; DX 12 [40], IQ 12 [40]; HT 10 [0]

Secondary Characteristics: SM -4; Dmg 1d-4/1d-3 [0]; BL 5 [0]; HP 5 [0]; Will 12 [0]; Per 12 [0]; FP 10 [0]; Basic Speed 5.50 [0]; Basic Move 5 [0].

Advantages: Beautiful [12], Patron (Dr. von Reichtor, present quite often) [30]; Single-Minded [5]; Talent (Smooth Operator) 1 [15]

Disadvantages: Impulsiveness (12) [-10]; Jealousy [-10], Obsession (make von Reichtor love her) (12) [-5]

Quirks: Congenial [-1]; Believes she speaks perfect French and always fakes a French accent [-1]

Languages: English (Accented) [4]; French (Accented) [4]; German (Native) [0]

*Includes bonus for Smooth Operator

**Includes bonuses for Beautiful and Smooth Operator

Appearance

An artificial being created by Dr. von Reichtor in the image of his comatose wife, Metis is a beautiful woman with long silky black hair, deep blue eyes, and a softy creamy complexion. She is also slightly under a foot tall, often giving

the impression of an animated doll. Metis dresses in facsimiles of dresses she sees on TV or in magazines. She has the doctor pick up the materials, and then she makes the dresses herself. Metis loves to pretend she is a French debutante, and will almost always speak in a rich French accent. She makes certain she looks as beautiful and glamorous as possible (elegant clothes, makeup, well-groomed hair, etc.) in order to impress Heinrich von Reichtor.

Background

After his problems with Atlas, Dr. von Reichtor decided to create a human from scratch. He used DNA from his wife to grow a variation of the alchemical homunculus, a tiny woman who quickly aged to adulthood. To von Reichtor's frustration, though the creature looked like a miniature of his wife, her personality was completely different: energetic, sensual, and vivacious instead of sedate, demure, and nurturing. He sadly declared the experiment a failure, and (since she proved to be far smarter than Atlas) named his creation "Metis" after the Greek titaness who was the goddess of wisdom.

Metis quickly adapted to her new existence. She fell head-over-heels in love with von Reichtor, and immediately tried to figure out how to win his favor. After he taught her how to read, she started hunting through his library, trying to learn how to be the sort of woman whom he could love. She taught herself how to sing, dance, care for a home, and above all, how to be beautiful. All to no avail. Her beloved doctor's heart is held by a giant, comatose version of herself that floats in a vat twenty-four hours a day.

She spends most of her time looking after the house and garden, doing what chores herself that she can, and directing Atlas for those tasks too big for her little body. In her free time, she reads romance novels and fashion magazines, makes beautiful new clothing for herself, and dreams about how wonderful things will be when she and the doctor get married. Metis is at her happiest when she plays chess with Dr. von Reichtor, or better yet, when he plays his violin, and she sings and dances for him. Only then, for a few precious moments, is she able to forget that he doesn't love her.

When Dr. von Reichtor isn't around, Metis often sits and stares at Catherine. The diminutive woman is shocked by how much she has grown to hate her double. She dreams of somehow switching bodies, leaving her former self lying on some table like a broken doll as she lifts the top of the glass and loses herself in her master's loving embrace. Metis knows that this is a ridiculous hope that will never happen no matter how much she dreams. However another idea has occurred to her. Wouldn't Dr. von Reichtor pay more attention to her if Catherine were somehow made to vanish?

Dr. Von Reichtor and His Creations In the Campaign

There are various ways for the player characters to encounter Dr. von Reichtor. If the doctor is to be an ally in the campaign, the PCs could be employed by him to get or do something that would help his experiments. They might also decide to see him in order to get some advice on a particular scientific project. If he is to be an adversary, they could stumble upon grave robberies and trace the thefts back to him, or discover the nature of von Reichtor's experiments and decide to put a stop to it. Alternately, someone in Catherine's family or the scientific community may ask the PCs to investigate the doctor's strange behavior.

Von Reichtor is not the only person the characters may want to investigate. Perhaps someone has grown concerned about the raven that keeps screaming in German for the voices in its head to leave it alone, or the lumbering brute that is sometimes spotted by the docks. One of Catherine's relatives or friends might see Metis scampering down the street, and wish to discover what exactly that doppelganger was. Metis herself may also try manipulating the characters into getting rid of Catherine or helping her win von Reichtor's heart.

Dr. von Reichtor, Aristotle, and Metis avoid fights. If on their own, they try to talk their way out of problems, and if that fails, they flee. However, if they have Atlas with them, then they will rely on the brute's vast strength and fury to deal with any threats in the quickest manner possible.

If someone finds out too much about von Reichtor's experiments, or he thinks they have become a serious threat, then he will do his best to get rid of them. Nothing is more important than working to save Catherine, and any obstacles that

present themselves must be removed as quickly as possible. He will try to lure the threats to some deserted spot and then send Atlas (with Metis to direct him). Depending upon the situation, the person will either end up with a broken neck . . . or wake up strapped to von Reichtor's operating table with the doctor ready to begin his next experiment.

Those that work for the doctor can expect to be well rewarded. He is still wealthy and willing to pay for good service, and as one of the most accomplished scientists in the world, has a lot of information that player characters could find incredibly useful (particularly within the realm of medicine). He also has a massive library that contains not only scientific texts and journals, but also tomes built up from centuries of von Reichtors, each adding their own idiosyncratic reading material to the collection.

If the PCs are von Reichtor's opponents, then they can profit by taking his rare books and finding an appropriate buyer for them. Some are rare and prized, and could be sold for thousands. The PCs could make off with his various formulas and experiments as well, but unless they are very lucky, this sort of tampering with forbidden secrets would cause more harm than good.

Variations

Here are some ways to reinterpret Dr. von Reichtor in other situations and settings.

The Alchemist

In a campaign with TL 1-4, Dr. von Reichtor is an alchemist instead of a bioengineer. As there are far less science skills in these environments, the doctor has branched out more, studying religion, nature, and the occult in an attempt to find a way of bringing back Catherine. Replace his skills with the following (his point cost remains the same):

Area Knowledge (his city)-15 [1]; Alchemy-18 [20]; Broadsword-10 [1]; Diagnosis-16 [8]; Expert Skill (natural philosophy)-17 [12]; Expert Skill (thanatology)-17 [12]; Games (chess)-15 [1]; Herb Lore-15 [8]; Literature-13 [1]; Musical Instrument (flute)-13 [2]; Naturalist-17 [12]; Observation-15 [2]; Occultism-17 [8]; Pharmacy (herbal)-16 [8]; Physiology-16 [8]; Research-17 [8]; Riding (horse)-11 [2]; Thaumatology-17 [16]; Theology (comparative)-16 [8]; Weird Science-17 [16]; Writing-14 [1]

In this version, Metis is a homunculus from *GURPS Magic* (p. 221), while Atlas may be a homunculus, a golem created from flesh instead of clay, or a strange variation of a zombie.

Von Reichtor could be a wizard as well, delving into magic for a solution to his tragic problem. He would focus on the colleges of Healing and Necromancy in his experiments, and also make extensive use of the college of Knowledge.

Von Reichtor the alchemist could be used in a modern setting as well. In that situation, keep most of his normal skills, but replace the various versions of Bioengineering with Alchemy, Occultism, and Thaumatology.

The Mad Test Subject

Given enough time, Von Reichtor might experiment on himself, whether to boost his own intelligence or to test some techniques that he is thinking of using on his wife. (His insanity may also reach a point where he experiments on himself for the sake of experimentation). There are many alterations he could do, from grafting other people's brain tissue to his own to stimulating his consciousness with special chemicals to attempting to gain psionics.

A particularly deranged possibility is for him to try and recreate Catherine by becoming her. After all, if he was in fact her, then not only would von Reichtor no longer have any reason to feel tormented, but there would be no "he" to be tormented! For the doctor to come to this decision, his sense of self would have to be completely broken, and Metis would do all in her power to stop the transformation.

Mad Science in Spaaaaace!

Dr. von Reichtor may be doing his studies on his own space station or private planetoid, creating new life forms and maybe even new ecosystems as his experiments spin further and further out of control. In such a situation, he would probably be proficient in Area Knowledge (his planet or space station), Pilot (spacecraft), and other appropriate extra-planetary skills, and might have decided to branch out into robotics to investigate the idea of creating a mechanical body to house his wife's consciousness.

If the doctor and his creations are on a different planet, Aristotle would probably be created from a life-form native to there, and possibly so would Atlas (unless they had been brought in the spaceship).

The Dustmaster

Road Trains for *Transhuman Space*

by Royce Easton Day

The End of an Era: America/Mars Announces Last of the Dustmaster Road Trains to be Taken Out of Service

Reported by Teri Chow, for Teralogos News

Port Lowell, Mars (1/14) Representatives of the Martian Commonwealth Transportation Agency announced today that the last of the venerable Dustmaster road trains will be removed from their regular run between Plymouth and Anchorage. Assistant Director Peggy Kwan is quoted as saying, "With a new spur being added to the Equatorial Railway almost every two months, and the ever increasing traffic of independent cargo haulers represented by the Truckers Guild, we no see the need to continue the expensive government support the Dustmasters required."

The Dustmaster trains, known fondly by many as the "Rustmasters" for the inevitable patina of Martian soil that coated their hulls, were a key component in the early years of the United State's expansion across the Red Planet. Built in the late 2030s almost entirely (excepting their onboard nuclear reactors) from components manufactured on Mars, the Dustmasters provided critical heavy, long-range cargo movement for the scattered American colonies for over 60 years. Capable of hauling about 400,000 Martian pounds of cargo in up to six separate trailers, the Dustmasters could transport entire startup colonies, including the colonists, to their new homes in a single journey. In addition it could tow other specialized trailers such as the Mobile Lab, which was carried during the famed USAGS overland expedition that discovered the first of the Mars Conspiracy's ozone factories.

"Really, the Dustmasters are victims of their own success," says Manuel Orico, a former Dustmaster maintenance engineer and current member of the Trucker's Guild. "They did the job of putting together America/Mars. Now they have to step aside and let the little guys like me pull up the slack."

"I think we're losing a critical transportation resource," countered Erica Montalban, Vice-President of Mars Development Corp's Transport Division. "A single Dustmaster can haul almost seven times the amount of cargo that an average cargo truck can, and it can keep that cargo moving through the day and night, without any need to stop to refuel. That's incredibly useful for independent colonists wanting to start their own community, away from well-worn travel routes."

That's true, admits Orico, but then he exclaims, "Ai! The routine maintenance was a killer when I worked on them. The drivers would haul their trains back into the shop after being out for a month or more in the field, and it would be four weeks at minimum before we could get them back on the road. But the real kicker was the

RTGs. Yeah, they keep the Dustmaster going non-stop, but every 14 years or so they need to be swapped out to the tune of over a million dollars a pop. I think it was miracle that the Commonwealth managed to scam Congress into paying for the last replacement cycle."

At the height of their popularity in 60s through the 80s, there were at least 30 road trains operating all across Mars, hauling everything from robofac to refrigeration units. That number dwindled to less than 10 in the early 90s, and then only three trains (one of which was being cannibalized for parts) maintaining the Plymouth-Anchorage route.

Despite pleas to the CTA and to the US Congress, no plans are currently underway to restart or replace the Dustmaster program. Many fans of the Dustmaster have suggested replacing the expensive RTG's with conventional hydrogen engines, but critics point out that the size of the necessary hydrogen power plant and its tankage would eliminate much of the Dustmaster's famed cargo capacity and range.

However, fans of the Dustmaster won't have to worry about it disappearing completely. Orico, thanks to generous donations from fellow Truckers Guild members, has transferred his ghost into the computer of Dustmaster No. 12, which operated from 2048 to 2085, before being transferred to the Commonwealth National Guard and recently sold for scrap. With the aid of his fellow Guild members, Orico intends to refurbish No. 12 to full working order, including the RTG. Until then, he's content to rebuild one of the cargo trailers the Guild also acquired into a portable museum displaying the Dustmaster's place in Martian history.

"I'm going to haul myself all over the Commonwealth and beyond," Orico claims, "so people can step aboard and see what the Dustmaster did to help build the homes they live in today. Sure it'd be cheaper to just to create a VR museum for them to access, but then they wouldn't have a chance to take a ride in the real thing."

Adventure Seeds

Of course Orico's Dustmaster doesn't have to be the only one that's managed to fall into private hands. With sufficient ingenuity, a group of PCs could find any number of interesting things to do with theirs. Some ideas are:

Von Ryu's Express: A mining corporation in a politically neutral section of Mars has been abusing their bioroid workforce beyond all acceptable standards. In retaliation, the bioroids broke their memetic programming and fought back, killing many guards and stealing a Dustmaster with a Pullman and two cargo trailers. Now it's a race across the deserts of Mars, as the bioroids try to reach a safe haven inside Chinese territory, while the mining corporation attempts to hunt them down without bringing the incident to the attention of either the Chinese or the Americans.

"We got a long way to go/And a short time to get there": There's plenty of alcohol to be had on Mars, but genuine hundred-year-old booze is another thing entirely. The PCs are truckers hired to pick up three cargo trailers worth of incredibly valuable Irish whiskey for transport from New Shanghai to the estate of one of the Millionaires of Mars in time for an exclusive soiree he's throwing. The pay is more than worth it, even if you consider that the adventurers have been given the wrong receiver's slip and have to steal the whiskey that their boss rightfully bought, then have to haul it literally halfway across Mars, while avoiding sabotage attempts by their employer's equally rich rivals who want to spoil the party, not to mention that crazy Marshall who seems to have a bug up his tailpipe over the woman the heroes picked up along the way . . .

Mars Wars: The B/r/o/t/h/e/r/h/o/o/d . . . er, the Trucker's Guild has finally run into some serious opposition. Mars Direct, a new trucking corporation, is attempting to undercut the independent truckers with cut rate pricing. When that

doesn't work, unexpected ambushes start befalling lonely Guild members in the dusty expanse between destinations. Authorities have investigated the incidents, but no definite link between the accidents and Mars Direct has been found yet. Investigators blame the Martian Triads, but a few Guild members have other suspicions.

Now the Guild has a restored Dustmaster set to haul materials to a high-profile startup colony. The Guild has advertised loudly that this will be proof of their members' reliability and safety. In other words, it's a setup to lure Mars Direct into tipping their hand. One of the Dustmaster's trailers has been modified to conceal a pair of weapon turrets, while the other two hide several off-road vehicles with weapons of their own, in the hopes of catching any attackers off guard.

Can the Ares AutoDuelling Association be far behind?

Campaigning

For players with a gearhead frame of mind, GMs could do worse than to give them their own used road train to play with. Dustmasters served the same purpose as the railroad did during the early days of the American West, transporting cargo and passengers with reasonable swiftness over sometimes hostile terrain. Of course the PC's would be faced with the problem of having a ground truck that has a maintenance overhead similar to that of some small spaceships, and a shortage of areas where it can park.

Besides the contemporary adventure seeds presented, a Dustmaster would also serve well as a mobile base for a historical Mars campaign. Able to traverse most Martian terrain, and carry loads more economically than a spacecraft or hopper, Dustmasters would be used extensively in the early days of American/Mars development, traveling colony to colony carrying vital supplies, needed technicians, and greenhorn colonists. The local Dustmaster arriving in town might be the only physical contact a colony has with the outside world for months at a time, and its crew a welcome source of news outside official communication channels.

Dustmaster Tractor

This is the basic tractor. It can support two crew members for 30 days of continuous operation. The cargo area is slightly less than a standard Martian cargo truck, but this is compensated for by its tremendous hauling capacity. Critical communications and navigation sensors have backups, as the Dustmaster was designed to operate in the field early in Mars colonial history, far away from conventional rescue or support. It can be operated by a single driver, relying on the NAI to drive while he sleeps, but a co-driver/cargo master is commonly carried as a backup, or simply as company for the very long haul.

Crew: Drivers (Driving (Heavy Wheeled), Electronics Operation (Sensors), Electronics Operation (Communications))

Subassemblies: Body +6, full-rotation turret [T:Body] -3, ten off-road wheels +4.

Powertrain: 4000-kW all-wheel drive. 4100-kW RTG. Two rechargeable twin E cells with 40 kWh total capacity.

Endurance: RTG provides 14 years of power. Batteries can power life support for 40 hours.

Occupancy: 2 RCS, 1 cabin. **Cargo:** 3,750 cf.

gSpeed (six cargo trailers): 80/20 **gAccel:** 4

Design Notes: WVMDS design. Immense body and 0.05 VSP turret with heavy frames. Wheels have improved suspension, improved brakes, all-wheel drive, smartwheels, and are puncture resistant. Armor is steel and body is sealed. Ground Pressure: High.

Cargo Trailer

The basic cargo trailer, used for 90% of the Dustmaster's missions. The trailer is little more than an airtight box the size of a standard cargo container set on wheels. There have no inherent power or life support connections, so anyone traveling in the trailer will have to be either Mars adapted or bring their own oxygen (or both, if they're sealed in with no way to open the doors.)

Crew: None.

Subassemblies: Body +6, ten off-road wheels +4.

Cargo: 5,000 cf.

Armor	F	RL	B	T	U
All:	4/10	4/10	4/10	4/10	4/10

Equipment

Body: Trailer pin, remote hitch.

Statistics

Size: 10'×16'×30' **Payload:** 100,000 lbs. **Ewt:** 45,200 lbs. **Lwt:** 145,200 lbs. **Lwt. on Mars:** 55,176 lbs. **Volume:** 6,000 cf. **Maint:** 26 hours **Price:** \$575, 250

HT: 12 **HP:** 6000 [Bod] 180 [each Whl]

Design Notes: WVMDS design. Immense body with heavy frame. Wheels have all-wheel drive, improved suspension, improved brakes, smartwheels, and are puncture resistant. Armor is steel and the body is sealed. Ground Pressure: High.

Flatbed Trailer

Similar to the cargo trailer, but delete all armor and sealing.

Statistics

Size: 10'×4'×30' **Payload:** 200,000 lbs.

Ewt.: 35,200 lbs. **Lwt.:** 235,300 lbs.
Lwt. On Mars: 89,376 lbs.
Volume: 6000 cf. **Maint:** 27 hours **Price:** \$549,500

HT: 12 **HP:** 6000 [Bod] 180 [each Whl]

Tanker Trailer

A multipurpose trailer, the tanker is designed to transport up to 30,000 gallons of liquid in one 20,000 and one 10,000 gallon tank. Usually it's used as a mobile gas station for conventional hydrox powered vehicles that are accompanying the Dustmaster. The built-in fuel electrolysis unit can process up to 240 gallons of water into 378 gallons hydrogen and 180 gallons of oxygen and hour. At that rate it would take a little over two days of continuous operation to fill both tanks to capacity, so they are usually topped off before a journey begins.

Crew: None.

Subassemblies: Body +6, ten off-road wheels +4.

Power: None. Power for the electrolysis unit is provided by the tractor (only when both are parked, obviously.)

Cargo: One 20,000 gallon storage tank, and one 10,000 gallon storage tank.

Armor	F	RL	B	T	U
All:	4/10	4/10	4/10	4/10	4/10

Equipment

One 20,000 gallon standard tank, one 10,000 gallon standard tank, six fuel electrolysis modules, remote hitch, trailer pin.

Statistics:

Size: 10'×16'×30' **Payload:** 107,600 lbs.
Ewt.: 83,300 lbs. **Lwt.:** 190,900 lbs.
Lwt. on Mars: 72,542 lbs.
Volume: 6,000 cf. **Maint:** 25 hours. **Price:** \$647,000

HT: 12 **HP:** 6,000 [Body] 180 [each Whl]

Design Notes: WVMDS design. Immense body with heavy frame. Wheels have all-wheel drive, improved suspension, improved brakes, smartwheels, and are puncture resistant. Armor is steel and body is sealed. Ground Pressure: High.

Pullman Trailer

The standard passenger trailer for the Dustmaster. Each Pullman can carry eighteen passengers in nine cabins, with life support and food for 30 days travel. Power normally is provided by the Dustmaster's RTG, but there are two twin E-cells connected to rooftop solar panels for emergency backup.

Crew: None. If VIP's are carried, then a pair of stewards usually occupies one cabin.

Subassemblies: Body +6, ten off-road wheels +4

Power: 2 × twin E-cells, 250 sq. ft. solar cells on roof.

Occupancy: 9 cabins. **Cargo:** 300 cf.

Armor	F	RL	B	T	U

All: 4/10 4/10 4/10 4/10 4/10

Equipment

Body: 540-man/day limited lifesystem, two 10,000-mile range radios, safety module, large airlock, remote hitch, trailer pin.

Statistics:

Size: 10'×16'×30' **Payload:** 10,080 lbs.

Ewt: 69,815 lbs. **Lwt:** 79,895 lbs.

Lwt. on Mars: 33,460 lbs.

Volume: 6,000 cf. **Maint:** 23 hours. **Price:** \$755,000.

HT: 12 **HP:** 6,000 [Bod] 180 [each Whl]

Design Notes: WVMDs design. Immense body with heavy frame. Wheels have all-wheel drive, improved suspension, improved brakes, smartwheels, and are puncture resistant. Armor is steel and body is sealed. Ground Pressure: Low.

Mobile Lab

The Mobile Lab is used for long-range scientific expeditions. It has three separate science labs, an upgraded sensor suite, and can support 10 scientists for 30 days in the field. It also features a veterinary surgery for treating 'native' Martian life, a workshop for maintenance of remote science stations, and four microframes for any ghosts or high-end AI's to use. It also has a roomy cargo area for any other equipment the expedition might need.

Crew: Up to ten scientists, vets, and/or maintenance engineers.

Subassemblies: Body +6, full-rotation turret [T: Body] -1, ten off-road wheels +4.

Power: Two twin E-cells.

Occupancy: None. Usually a Pullman trailer accompanies the lab to give the lab's crew a place to sleep. **Cargo:** 2,000 cf.

Armor **F** **RL** **B** **T** **U**
All: 4/10 4/10 4/10 4/10 4/10

Equipment:

Body: Four microframes, two 10,000 mile-range radios, safety module, compact manufacturing workshop, three science laboratories, veterinary surgery, large airlock, 300 man/day limited lifesystem, remote hitch, trailer pin.

Turret: Medium sensor suite.

Statistics:

Size: 10'×16'×30' **Payload:** 20,000 lbs.

Ewt.: 116,991 lbs. **Lwt.:** 136,991 lbs.

Lwt. on Mars: 52,057 lbs.

Volume: 6,000 cf. **Maint:** 10 hours. **Price:** \$4,080,384.

HT: 12 **HP:** 6000 [Bod] 180 [each Whl] 17 [Turret]

Design Notes: WVMDs design. Immense body and 0.5 VSP turret with heavy frames. Wheels have all-wheel drive, improved suspension, improved brakes, smartwheels, and are puncture resistant. Armor is steel and body is sealed. Ground Pressure: High.

The Power of Illumination

by Bevan Thomas

They are the Invisible Ones, the Powers That Be, the Men of Knowledge, the Secret Masters. Lords of the Conspiracy and Kings of This Earth. People who have been granted visions and power far beyond those of lesser men. They are the Illuminati, and we are pawns in their games.

The **GURPS Basic Set** uses an advantage entitled "Illuminated" to describe the core powers of the Illuminati. This advantage is worth 15 points and grants the character three abilities: the power to recognize on sight anyone who is likewise Illuminated, the power to know if Illuminati are responsible for particular events, and the power to perceive and communicate with supernatural beings that are tied to Illuminated conspiracies. Though this advantage does grant the Illuminati some unique abilities, it keeps them on more-or-less the same power level as other characters. Though this is appropriate for some Illuminated campaigns, mythology and literature are filled with characters whose enlightenment grants them the ability to work wonders, such as the siddhar of Tantric lore, the prophets of the Bible, and the Illuminati of the *Illuminatus!* trilogy.

This article explores how different advantages and disadvantages can be linked with Illumination, allowing the GM to make the Secret Masters beings of power and customize their abilities to suit his campaign. Though of most obvious relevance to a **GURPS Illuminati** campaign, it is useful in any setting where those who are enlightened or divinely chosen gain access to supernatural powers.

The Might Shared By All

The most obvious way to enhance the powers of the Illuminati is to make "Illuminatus" a "meta-trait" (**Basic Set**, p. 262), granting new advantages and disadvantages to all the enlightened. A example of such a meta-trait is found in **GURPS Illuminati**. This version of Illuminated contains all its abilities from the **Basic Set**, but adds Intuition and the 30 point version of Luck, which in *Fourth Edition* would make the cost of the meta-trait 70 points. However, there are many other ways to customize the powers of the Illuminati.

Being Illuminated is usually envisioned as supernatural insight, and in addition to Intuition, any advantage identified with "ESP" would be appropriate, particularly Channeling, Medium, Oracle, and Precognition. They could be treated as psionics, or instead as derived from another source, such as God, spirits, or even the energy of Creation itself.

The Blessed advantage deserves special attention, as it is the most evocative and generally apropos advantage to include in the Illuminati meta-trait (next to the Illuminated advantage itself, of course). Divine visions is the power most often accredited to enlightened individuals, be they Abrahamic prophets, Eastern gurus, or even disciples of Illuminated orders (who often receive cryptic messages from spectral secret chiefs). Furthermore, Blessed has the most scope for variety on the part of the Game Master, allowing him to tailor the visions and the patrons who send them to suit his campaign.

Variations of Luck can also be suitable for an Illuminatus -- not only the 30 point version, but the 60 point Luck, Super Luck, and particularly levels of Serendipity can be used to define Illuminati who are so attuned with the universe that reality begins to accommodate their wishes.

Depending upon how the Game Master wishes to treat Illumination, the Illuminatus meta-trait could also include either Magery or Power Investiture. The GM could even decide that Illumination is required to perform magic, because only an Illuminatus is attuned to the forces of universe (for Magery) or has a direct link to the divine (Power Investiture). This would be particularly befitting in a modern conspiracy world where only the Secret Masters of the Conspiracy are expected to wield the occult with any ability.

Other advantages could be applied to the meta-trait. Various forms of Empathy (Animal Empathy, Spirit Empathy,

etc.) could demonstrate how enlightened individuals have become sensitive to those around them, "one with everything," while True Faith would be a good choice if the Illuminati are divinely inspired and Doesn't Eat or Drink, Doesn't Sleep, Regeneration, Resistant, and/or Unaging could be used for Illuminati who have perfected their bodies along with their minds. In a very different setting, advantages such as Daredevil, Enhanced Move, and Super Jump traits could be granted to all Illuminated for a cinematic style involving battles between the secret masters (such as in the manga *X*).

Disadvantages as well as advantages can be part of the Illuminatus meta-trait. The most obvious disadvantages are alterations of the mind, for it is a common theme that the Illumination bends and even breaks the sanity of those who experience it. Such mental disadvantages as Delusions, Lunacy, Nightmares, and Phantom Voices are the most obvious, though others could certainly be used. In many settings, particularly Horror ones, the Illuminati may no longer be entirely human, and disadvantages such as Disturbing Voice, Divine Cruse, Frightens Animals, and Unnatural or Supernatural Features could demonstrate how an Illuminatus has gone beyond the pale.

Epilepsy deserves special notice in regard to Illuminated disadvantages. As its entry states, epileptic fits have often been associated with the presence of gods and other spirits, who are either communicating with or possessing the subject in question. Even if the fit is not the direct result of such a presence, it could still be caused by the Illuminatus' connection to the mystic world and therefore a product of his Illumination. In some settings, it may be the only way for a character to receive this disadvantage.

In many worlds, the mere fact of being an Illuminated has social ramifications for the character. Depending upon how the Illuminati are regarded, this may result in Reputation and Status (positive or negative), advantages such as Legal Immunity or Social Regard, or disadvantages like Enemy or Social Stigma.

The Gate to Power

Another way to treat the special abilities of the Illuminati is to have the meta-trait grant access to advantages that they could not normally possess, functioning in a similar manner to an Unusual Background.

Any of the advantages mentioned in the previous section are logical possibilities, as are all advantages normal classified as "psionics" (enlightened often unlocks the potential of the mind). Another interesting prospect, especially for GMs who want to give their secret masters a more cinematic feel, is to allow them to learn skills that normally require the Trained By A Master advantage, such Flying Leap and Invisibility Art.

Illuminati could also be used as a gateway to more outlandish advantages. After all, Moses parted the Red Sea and unleashed plagues upon Egypt, the Rosicrucians were rumored to turn invisible and change their shape, and the Tantric siddhar are said to grow, shrink, and walk on air. Even superhumanly high attributes might be acceptable (particularly IQ), as the Illuminati are not bound by human weakness.

Disadvantages could also be gained in this way. For example, some Illuminati might develop Unnatural Feature of "pure yellow eyes," while others Frighten Animals with their strange auras and scent. Each paying in their own way for the power that crackles through them.

As with Unusual Background, the cost of making Illuminated a "gateway advantage" is up to the Game Master, and depends how many advantages and disadvantages it grants access to, and how much the GM wishes to limit them.

The Secret Techniques of the Secret Masters

In a world that includes competing Illuminated groups, an intriguing option would be for each group to receive different supernatural traits. So one secret society might control minds, while another walks through walls. As a series of examples, suggested advantages and disadvantages for the major Illuminated groups from *Illuminati: New World Order* are listed below, as well as the ways their Blessed members would attempt receive visions and the sort of visions that they would likely receive.

Adepts of Hermes

These arcane scholars are dedicated to expanding their minds and improving their occult powers to the exclusion of all else. Magery is almost certainly tied to their Illuminated powers, as is enhanced IQ and probably various forms of supernatural insight (particularly Oracle). However, they are liable to fall to any manner of insanities, as well as suffer under strange supernatural disadvantages produced by their contact with raw mana and their links with dark occult powers.

Their visions are achieved through the mantic arts (i.e. divination), particularly astrology, crystal-gazing, and numerology. The being they contact is their god and founder: Hermes Trismegistos, the lord of magic. He who is known to the Egyptians as Tahuti (Thoth), to the Romans as Mercury, and to the Scandinavians as Odin. The being who the Servants of Cthulhu claim is actually Nyarlathotep, the Crawling Chaos.

Bavarian Illuminati

The sages of hidden authority and subtle power, they, above all of the other Illuminated orders, are masters of controlling from behind the scenes. Their members are often experts in telepathy, allowing them to read and control minds while being able to quickly send secret messages to their underlings and associates. They also favor Invisibility and Shapeshifting and put them to much more varied uses than the Society of Assassins does. These people are the true "Invisible Ones," rarely seen, but always felt.

Even in death their Secret Chiefs still guide the subordinates, particularly through dreams (though certain Bavarians prefer to instead meditate on the pyramid emblazoned on the American one-dollar bill). The ascended spirits of Adam Weishaupt and the other Masters deliver commands and information, always reminding their agents to "listen and obey."

Bermuda Triangle

As their illuminated order seeks variety above all else, the "Boys from Bermuda" are often "jacks-of-all-trade and masters of none," experimenting with different kinds of power, but not specializing in any.

However, a solid minority focuses their power on the sea, gaining such advantages as Amphibious and Doesn't Breathe (Gills) and listening to the voices of the waves . . .

Discordian Society

Firm believers in "doing your own thing," each Chaote is expected to embrace the powers that most suit him or her, as long as they also further confusion and chaos. Psionic mind-control, weird transformations, and badass super kung-fu are all dandy as long as it makes the world that much more interesting. Most Discordians start off crazy, and go downhill from there, often eventually warping their bodies along with their minds.

They are the polar opposite of the Adepts in regard to methods of mystic insight. Instead of employing ancient and respected divinations, each Chaote has his or her own idiosyncratic technique, such as studying the patterns of snails, dancing until an ecstatic frenzy is reached, or even gazing at the images formed in a bubble bath. Whatever method used, the end result is touching minds with the great goddess Eris, queen of strife in one of her infinite incarnations. Her pronouncements are often garbled, convoluted, and even contradictory, but the Chaote would do best to follow them to the letter. Or not. Who knows? All hail Discordia.

Gnomes of Zurich

The most materialistic of the Illuminati, the Gnomes are least likely to gain supernatural powers through their Illumination. However, they often develop strange Affinities and Talents for money and its production, sometimes

even gaining unnatural control over the gold. If they don't start with Greed and Miserliness, they soon acquire the disadvantages, and they sometimes even become saddled with Dependencies or other supernatural disadvantages connected with their wealth.

Their treasure is almost always the medium used to receive visions and omens, they study their reflections in gems as a form of crystal-gazing, watch the light reflect off falling coins, or simply lie on their money and listening to it "talk." Some Gnomes believe they commune with the spirits of departed billionaires, the "genius loci" of their hoard, or archetypal gods of plenty (which their enemies often identify with Mammon, demon prince of greed).

Network

Virtually all of the powers that members of the Network gain through Illumination are geared towards understanding, mastering, and advancing cyberspace. Examples include various Cybernetics (perhaps the process of Network Illumination transforms parts of the body into machinery), Mind Reading (cybernetic), and even Digital Mind ("welcome to the new you"). The downside of these advantages is often poor Illuminati lose contact with the world outside the Internet, and even with their humanity. Some of the leaders of the Network are sentient computers. Were these computers once human?

They achieve their visions by jacking into the Net and either gazing at the shifting tapestry of information or listening to the whispers of the spirits that ride the Information Highway (possibly even that dark god Shub-Internet).

Servants of Cthulhu

Any supernatural advantages granted by the Great Old Ones and the Outer Gods to their minions are quick paths to insanity. In extreme situations, even the body is twisted, eventually resulting in the cultist in question being transformed beyond recognition, such as devolving into protean goo or becoming the member of an appropriate servitor race such as a deep one or a rat-thing.

A Servant receives visions directly from Great Old Ones or from Nyarlathotep, who serves as the herald of the Outer Gods. The vision is usually a combination of bizarre images and strange mutterings, things that no mortal mind was meant to perceive, and which merits a fright check. In order to receive this vision, the cultist will usually chant in some ancient, blasphemous tongue. Ia! Ia! Azathoth, Ia!

Shangri-La

Walking paradoxes, these mystics claim to be pacifists and yet are often masters of a wide variety of martial arts. They will usually either have Trained By A Master as part of their Illumination, or be allowed access to chi skills without it. They also favor psionics of all sorts (except those that cause direct harm).

As believers in simplicity and the powers of the mind, disciples of Shangri-La will usually restrain from rituals or paraphernalia more complex mantras and mandalas when they receive their visions. Through focused meditation, they orient themselves with the universe or commune with bodhisattvas.

Society of Assassins

In opposition to the generalities of the Bermuda Triangle, the Society of Assassins is extremely focused. It does one thing, but it does one thing very well. It is an organization of killers, plain and simple, and their powers are geared towards murder, helping them to track, infiltrate, assassinate, and leave. Invisibility, Shapeshifting, and various forms of Detect are particularly valued.

Though it is commonly believed that this order's drug of choice is hashish, others have suggested that it is instead a strange hallucinogenic known as "black alamut." If the later is true, than virtually all of the visions of the Assassins comes from taking the drug and then perceiving the Garden of Paradise (which they believe they will dwell in forever

if they serve the Society well). In the Garden, they are spoken to by the spirit of their founder, Hasan ibn al-Sabah, who still continues to guide the society into the new millennium.

UFOs

If the Flying Saucer People have Illuminated humans, these people would be privy to all sorts of alien secrets and technology. They have special parts of their brains unlocked as part of the aliens' experiments in evolving humanity towards "perfection." Some "lucky few" might even be transformed into members of their patrons' species in order for the UFOs to gain a "human insight" into the workings of Earth.

Any Illuminated messages granted to them would likely be beamed directly from the UFOs to the agents' special implants and genetically altered brains. This information would be short and to the point, but as it is produced by extraterrestrial mind would involve a certain amount of deciphering.

What Illuminated powers do the true aliens receive? Fnord.

Illuminatus Meta-Trait

35 points

This is an example of a generic Illuminatus meta-trait which will hopefully inspire GMs to produce their own variations. This Illuminatus possesses various forms of mystic insight and finds the universe accommodating to his needs. Furthermore, by virtue of his evolved state of consciousness, he is able to gain access to powers of the mind and body which are out of the reach of normal people. However these powers are not without a price, and his sensitive mental state often causes the character to fall into epileptic fits during times of stress.

The meta-trait includes Blessed [10], Illuminated [15], Intuition [15], Serendipity 1 [15], and Epilepsy [-30]. Furthermore, it may be used instead of Trained By A Master as a prerequisite for skills that involve the focus of chi (Flying Leap, Invisibility Art, Power Blow, etc.), and allows characters to learn new psi powers with earned character points [10].

The most obvious ways to enhance this meta-trait is to take Very Blessed and further levels of Serendipity. Consult the earlier section of the article for other ideas. An individual with this meta-trait will probably be part of an Illuminated order or be a "rogue," either choice will probably grant a further package of traits.

1.8 MB 41-page PDF; \$7.00

vs. Monsters Addition

Written by Michael Hammes

48-page A5 Perfect Bound Black & White Book; \$10

648 KB 20-page PDF; \$5.00

vs. Monsters is not a new game, per se. Written by Philip Reed, well-known as the designer of *Frag* for Steve Jackson Games and of his own creations such as [The Book of Unusual Treasures](#) and [Motocaust](#), the game first appeared in April 2003 in PDF format. Originally it was an entry at www.24hourrpg.com, the idea being to take a game from the conception stage through design and development to layout and presentation in exactly 24 hours. **vs. Monsters** saw further development in 2004, being released as a PDF RPG, and finally this year as a series of books through the usual distribution channels.

Although still available as a PDF, **vs. Monsters** comes as a small white book, whose internal layout marked in heavy, sometimes oppressive swathes of black. This is actually effective, as is the use of white text on the black, and it certainly suits the game's setting. So does the artwork, which is all taken from the public domain, and either hints at the medievalism of its horror, or the romantic longings of its period. This is the late 19th century, for **vs. Monsters** falls into the Gothic genre, similar to titles such as [My life With Master, Gloom -- The Game of Inauspicious Incidents & Grave Consequences](#), and [Don't Walk in Winter Woods: A Game of Folkloric Fear](#). Its influences are the works of Lewis Carroll, Tim Burton, and Neil Gaiman.

More specifically, **vs. Monsters** is set in semi-mythic East Coast America. Drawn from pinches of this, and dashes of that, its locations are archetypal beginning with the Town. It is full of thieves and murderers, its main streets lit by electricity off which wend a maze of dark and twisting alleyways, the byways for the Town's ne'er-do-wells and worse. A single Road leads from the Town across the Plains and through the fearful Forest to the near impassable Mountains, while a single dusty Track takes you to a singularly unwelcoming Village. On the Plain stands a Church, a forlorn but perhaps hopeful refuge from the lurking threats. These are the monsters, some known, others not, that the player characters might face -- from Apparitions and Cthulhoid Terrors to the Spectral Locomotive and The Misters. The characters are acquaintances or companions, perhaps all tenants at the same boarding house.

Mechanically, **vs. Monsters** uses cards rather than dice to resolve its situations. An ordinary deck can be employed for this, though a **vs. Monsters** deck can be downloaded and used instead. Such a deck appeared in the very limited White Box Edition of the game. To undertake an action, a player or GM draws a number of cards equal to the appropriate

attribute. If the highest value of the cards drawn is equal to or greater than the action's Target Number, then it is successful. Combat is equally as simple, with initiative merely working in seating order around the table. Damage is more complex, a player drawing cards to get a value lower than the damage cap of his character's weapon. The Target Numbers run from four (easy) and six (average) through 10 (hard) and King (very hard), to Ace (impossible).

Characters possess four attributes: Fighting, Defending, Thinking, and Running, to which are assigned the values 6, 4, 3, and 3. A three-word description is placed under the label "Blah," and a player lists his character's Stuff. This is his advantages (such as Attractive, Good in a Fight, and Sharp Eyed) and disadvantages (such as Hunted, Minority, and Restless Nights), of which he has two each. All characters have a Health of 10, and list any other extraneous non-mechanical details such as appearance and background under "Fluff." Equipment acquisition works differently, not using money, but involves each player drawing cards to equal or beat the listed value of the desired items. Thus a common shirt or 49 feet of rope have a value of two, while a revolver or an old horse has a value of four. A player continues drawing for equipment until he has everything or the card drawn is too low, and he can draw no more.

This being a horror game, it has the mandatory method of handling scares. A player draws cards equal to the value of his Thinking score, with the Target Number being equal to a monster's combined Fighting and Defending scores, or set by the GM. For Giant Vermin (bats, rats, spiders, and so on) the Target Number is four, or nine for skeletons and zombies, and an impossible 14 for vampires! Only one deck is used for **vs. Monsters** and only the GM can shuffle it, though players can receive and retain cards as a reward for good play. Such cards can be used later instead of drawing cards.

vs. Monsters contains little in the way of GM advice, but this is not a serious problem. The game is not intended for the inexperienced anyway, but should such advice be needed, it just directs you to Kenneth Hite's superlative [*Nightmares of Mine*](#). Several adventure ideas are provided, but other sources can easily be plundered, for example, *Ravenloft* or *Chill*.

In some ways, the meat of **vs. Monsters** is in its threats and monsters. The majority are what you would expect -- the zombie, the scarecrow, the evil cultist and so on. But The Misters are something special. Inspired by Neil Gaiman's *Neverwhere* and the Strangers of *Dark City*, each Mister is immaculate, dapper, and well turned out, yet resides in the dark recesses of the Town. Something is not quite right with them, as they all look similar and disturb subtly. Each possesses a strange ability like Dominance or Pyrokinetic Jet, and is identified by formal, yet creepy titles like Mister Quiver, Mister Bustle, or Mister Squeeze. Although highly reminiscent of the Gentlemen from the *Buffy the Vampire Slayer* episode *Hush*, a quote from *Dark City* points to the Misters' greater influence.

The film's influence upon **vs. Monsters** assumes greater importance once you realize that the insubstantial nature of the game is not a fault. The brevity of the design process, hardly a fault in a 24-hour RPG, explains much of its superficiality. The point is that the world of **vs. Monsters** is not meant to be an actual place, but an almost mythic place built of archetypes. And like the metropolis of the film, the world of **vs. Monsters** also has an inescapable boundary, in this case the Mountains. The sketchiness also lends the game a timelessness that only enhances the mythic, but still familiar feel of the late 19th century.

For those wanting more substance, Michael Hammes' **vs. Monsters Addition** provides more locations, including the Morgue and the Train Station; more detailed ready-to-play NPCs and Contacts; extra Bad, but no Good stuff; and of course, more Monsters. The latter stretches **vs. Monsters'** genre, including threats such as a Crop Duster (a biplane naturally) and a Robot. It also adds a few new rules and more equipment.

A second supplement goes beyond the setting of these two books. With **vs. Monsters Anthology**, Phil Reed lets six other authors explore the milieu of **vs. Monsters**. Jonathon Walton's "Foreign Devils" is shamefully Orientalist with the players as late 19th-century Chinese gangsters hunting monsters using swords, knives, and Buddhist prayer-bead-firing muskets. It introduces the concept of gun-fu and stunts to **vs. Monsters** and feels very [*Feng Shui*](#)-like. With "The Mirror People," Kirk A. Dankmyer gives a more detailed monster suited to a longer game, whilst Justin D. Jacobson draws on his own *Poisoncraft: The Dark Art* to provide more detailed rules for poison in a "Posioncraft Addendum." "The Tower" by Keith Taylor is the game's first fully developed adventure and contains built-in replay value. Ethan Greer's piece is quite literally called "Untitled," exploring two locations in greater depth and suggesting how **vs.**

Monsters might be run. Finally, Mark O'Bannon's "vs. Monsters Imperium Monsters" adds several fantasy creatures.

As an exercise in RPG creation, **vs. Monsters** is certainly an achievement, managing to feel rounded and playable despite relatively little development time. Its innate sketchiness works in its favor, leaving plenty of room for the GM to develop the setting to his own ends as well as adding elements that occur during play. It also marks the game as one suited to the experienced GM who will be able to work the mythic medievalism and romance of this game to great effect. **vs. Monsters** is certainly far from flashy, but it quietly achieves a moody evocation of a familiar era, full of lurking fears.

Pyramid Review

Fettnapf . . . in Sicht

Published by [Amigo](#)

Designed by Reinhard Staupe

96 cards (21 green, 17 red, 58 blue) & rule sheet; full color, boxed; two to five players; \$8.95

Most everyone has probably played a memory game with a standard card deck at one point or another . . . lay them all face-down and take turns flipping them over by twos to see who collects the most successfully matched pairs. There aren't a lot of specialized memory games out there, and fewer still that make really good use of it as a game mechanic. That's part of what makes ***Fettnapf . . . in Sicht*** so intriguing, that "Why didn't someone else do this?" vibe, and why it's so easy to forgive them for one of the bizarrest and inscrutable themes ever.

The object of the game is to have the fewest fettnapf cards when one of the other players hits the critical, game-ending mass of four fettnapf.

Everyone gets a hand of blue cards, with numbers from zero to nine. These are played into a common pool, and every time you add a card, that number is added to the current total. If you put a two in when it's already up to 12, the game total is now a 14. This continues until you reach 30; at that point, cards played into the pool start subtracting, until the total is back down to 10. The numbers continue to rebound up and down like this throughout the game.

Everyone also has a green number card, kept semi-secret from the other players. You show your card at the start of the game, and everyone has to remember everyone else's number. These are the numbers you want to avoid. If someone has 17, for example, you don't want to be the one to bring the game's total up to 17 (this makes those zero cards pretty important). If you do step on someone's numerical toes in this fashion, you have to take a red fettnapf card and they get to take another number card. They show it to the other players for memorization, and play continues. When someone gets their fourth fettnapf card, the game ends and the player with the fewest such cards wins.

The cards are decorated with strange little "fat cell" faces, and they're everything you need to shuffle, to play, and to stomp up and down on in frustration. They're colorful, too. It would have been nice to have some sort of visual cue that tells the group in which direction the total is going right now. Even a simple card saying "add" on one side and "subtract" on the other would have been handy, though one could make such a thing oneself and its inclusion might have thrown the card printing scheme off.

The winning condition is a bit clunky; since it only takes four cards to end the game, there are going to be a lot of people with the same number of fettnapf cards when the dust settles. When you bring the total to match someone else's green card(s), they get another green card, making them more likely to be the beneficiary of others' mistakes, so the skew isn't as bad as it could be. Then again, it's also somewhat a vicious cycle that tilts things increasingly in that player's favor. With only five players involved, you might think that's enough for a good spread, but all too often it's not, and two or more people tied for the win share the win. There are no tie breakers, and given that the number of these cards determines not only the winner but the game's end, for the loser their failure is usually telegraphed to them well in advance.

Fettnapf . . . in Sicht is a delightful if somewhat elusive little game suitable for the whole family - if you like hearing your family say "Arrgh" a lot, and "But I thought you had the 18 card" (followed again by "Arrgh"). (And yes, the game's title means "fat cup in view" -- you're sort of playing map cards and fat cells into an imaginary cup in the middle, and when you blow it you've "stepped in it." Or something. Go figure.)

In addition to making your little gray cells sing for their supper, Essen's clever card game carries equal, healthful doses of infuriation and tension . . . tension often missing even from pricey war games. Like so many Out of the Box products, the rules are the sort of thing that make you wonder why we haven't been playing something like this all along. Stepping around the increasingly populated numerical minefield is a chancey little dance, playable in just a few hair-tearing minutes, and it's the sort of thing that keeps players saying, "Okay, one more game . . . and this time I won't step in it."

Pyramid Review

Warhammer Armies: Wood Elves (for Warhammer Fantasy Battle)

Published by [Games Workshop](#)

Written by Anthony Reynolds and Matthew Ward

Illustrated by John Blanche, Alex Boyd, Paul Dainton, David Gallagher, Paul Jeacock, Nuala Kinrade and Karl Kopinski

Cover by Paul Dainton

80-page b&w softcover with color plates; \$20.00

The latest army book for [Warhammer Fantasy Battle's sixth edition](#) — and probably the last book before the inevitable seventh edition — deals with the Wood Elves at long last. Fans of this army have been waiting a long time for a supplement dealing with the Elves of the Everwood. Will it live up to their expectations?

The Wood Elves are essentially the same magically adept expert archers and forest-lovers of every fantasy setting, but with a dark **Warhammer** twist. They leave the forest in Wild Hunts, killing those they cross for sport, steal away human children to be their unaging slaves, and ally themselves with capricious fairies called Spites who are as likely to go for your eyeballs with knives as they are to steal your milk.

Separated from the High Elves after their war with the Dwarfs, the Wood Elves chose to remain in the haunted and sentient forest of Athel Loren rather than retreat over the sea (brief mention is made of other Wood Elves in the Old World, though they are not described). Renaming themselves the Asrai, they divided into kinbands and settled different areas of the forest, forming pacts with the spirits who lived there. For the past 4,000 years they have lived in Athel Loren, trying their best to stay out of the politics and wars of the greater world around them, with varying degrees of success.

The fluff portion of the book deals with the history and personality of the Asrai, which is largely unchanged from earlier editions, although noticeably grimmer in tone. The main change in terms of background is the addition of the Spites. Fairies have been hinted at in earlier books, but never fully described. They are an atmospheric addition to the setting, mixing mischief with malice. The excellent artwork shows them as the Jim Henson creatures of *Labyrinth* if remade by Tim Burton.

The Wood Elves have always been an excellent army for those who prefer attacking at range. Many units have no rank bonus or much in the way of hand-to-hand skills, but Elven Ballistic Skill is always high, and even wizards and cavalry carry longbows. Wood Elves no longer suffer a penalty for moving and shooting, a nice rule that encourages maneuvering over sitting still and firing away. The Glade Guard unit's bows are higher Strength at close range, giving a good reason to maneuver them up close and back off out of charge range, a risky tactic that would be fun to play around with.

Not all units are weak and shooty, though. The Treemen in particular are absolute powerhouses of destruction. The Wardancers (formerly punk-looking, now more Celtic in appearance) are capable of defeating units several times their size. Elven characters, though low in Toughness, can be beefed up by giving them Spites, who are treated as magic items with variable effects. Some can turn weapons magical, others have ranged attacks or fly at opponents attempting to sever their arteries with tiny blades. Mounts like Forest Dragons and Unicorns can also be used to impressive effect.

The forest spirit portion of the army cause fear or terror effects, and canny use of Spites and magic items can add to that. As anyone who plays with one of the Undead armies knows, effective use of the psychology rules can potentially win a game for you before a single blow is struck.

The Wood Elves have a significant weakness in their price. Most opponents will outnumber a typical army, as even the cheapest Wood Elf troop costs 12 points. Even at that price Dryads are a bargain, with two attacks at Weapon Skill four and Strength four and causing fear. Their Hero choice, the Branchwraith, does seem overpriced at 65 points however, especially compared to Tree Kin.

Reports from players suggest the list is balanced, or at least no more unbalanced than is normal for a Warhammer army. It's difficult to judge the fairness of points values when some of the Asrai's special abilities benefit from having lots of forest terrain, which will differ widely from table to table. If you plan to collect Wood Elves, start modeling trees now.

Aside from players of the wargame, there is potential value for roleplayers here, especially players of **Warhammer Fantasy Roleplay**. Those who play Elves will find ways to make their characters more alien and in-step with a grim setting; sidebars describing various kinbands Wood Elves can belong to are especially useful. Gamemasters get a roughly mapped-out haunted forest that regularly Rip-Van-Winkles people as well as new creatures like the Great Stag, Tree Kin, and Spites, although work will be required for Spites as they aren't given statistics.

Overall, it's a fun and fair addition to the game. The only problem is justifying the cash spent when we don't know how long before the new edition renders it out-of-date . . . but if money was an issue you probably wouldn't be playing something as expensive as **Warhammer Fantasy Battle**, would you?

Murphy's Rules

by Greg Hyland

Murphy's Rules

Paychecks, Door Locks, and Mashed Potatoes

Item 1:

While digging through my flat-tree archives a few weeks back, I discovered a fanfic *Star Trek: The Next Generation* story I wrote a decade or so ago. (Of course, this was written back before I even knew what fanfic was, back when I had visions of becoming discovered as a brilliant *Star Trek* writer . . . heck, back when there were fewer than half the number of Trek franchises that there are now.) My wife read said story and seemed to like it. Of course, she's obliged to say stuff like that; the crushing of adolescent dreams is reserved for the third anniversary or so.

Anyway, one criticism she had about the story was that, at one point, it refers to the crew of the *Enterprise* getting their paychecks. "I thought they didn't get paid," she said.

"Welllll, they've said that now. But at the time I wrote it I don't think they'd mentioned that fact. Besides, they seem to understand what money is; they talk about going shopping, they know what gold-pressed latinum is, they have card games with poker chips; they've got to be gambling for *something*."

We argued the point back and forth a bit, and I reached an interesting conclusion (which may or may not be correct, and which I'm holding off from saying until I build suspense through a few more paragraphs).

Item 2:

This past week, I spent over two hours using our household's new shredder to destroy a bag's worth of documents that have been accumulating for the past few months. Actually, the new strip-cut shredder was designed to augment our effective-but-slower cross-cut shredder. I divided documents into two broad categories:

- things that would be a pain if they were found by evildoers, but wouldn't cause too much harm (credit card applications; checks to expired bank accounts; any paper application that, if presented as a series of taped-together quarter-inch strips, would hopefully be rejected)
- things that could be used by evildoers to muck up my life (credit card receipts, bank statements, a copy of some insignificant plans I recovered after killing a senator's daughter and her two robots)

Anyway, after I got done with the project, as I was throwing away sacks of long-form confetti, I found myself thinking: "How much of our lives is devoted solely to keeping jerks from wrecking our lives?"

Extrapolating that point, I found myself wondering what a society would look like where it *wasn't* necessary to do all that junk. And there were two possibilities I thought of . . . possibilities I'll reveal in two more mysterious paragraphs.

Item 3:

While I was pulling an all-nighter last week, I found myself re-watching the first season of *C.S.I.* In one of my favorite moments of the first series, the main character Grissom (a lapsed Catholic) finds himself having a philosophical conversation with a priest. And they have the following exchange:

GRISSOM: A hundred years ago we didn't have the technology for fingerprints. Fifteen years ago, we didn't have DNA. Hopefully one day, we'll have foolproof means by which to put the right man in jail . . .

PRIEST: Someday, we won't need jails.

That conversation leads directly to Item 2:

The two possible futures I envisioned of a shredless future were:

- We either have no need to take precautions against wrongdoers, because the ability of wrongdoers to do wrong has been eradicated, or
- We eradicate evildoing itself.

The difference, of course, is the difference between having a door lock that could never be picked, kicked, or destroyed, and not having a need to lock your door at all. (This gulf in lock philosophy is apparently most notable in comparing the front doors of United States houses with those in Canada.)

Now, the former philosophy is pretty easy to envision: It's like what we do now for security, only more so. The latter philosophy is harder to visualize, and requires some more consideration.

Which leads back to my first point: visualizing a money-less *Star Trek* universe. Eventually I posited that there *was* money, but it wasn't in a way that we could envision. (I'll be returning to that point momentarily.) I imagine the root needs of money -- shelter, food, health care, temperature control -- are largely fulfilled in the future. With replication technology and near-limitless energy, most needs would be taken care of. So, too, I imagine most *wants* are taken care of; if you want a couch, a hat, or a steak dinner, they're easy enough to replicate.

So what would money be used for in *Star Trek*, then? Namely, things that *can't* be replicated. If you're a *Trek* fan, note that just about every object of barter or purchase is unique or impossible to replicate: contraband such as Romulan Ale; ancient artifacts such as reading glasses; trinkets, clothing, or tapestries unique to a planet.

A person transplanted from the worst of Victorian England to the modern U.K. might find themselves marveling at the social progress and asking, "Are there free funerals for the orphans who freeze in the street?" This would be a difficult answer for a modern person to answer; there aren't free funerals for frozen orphans, because there really aren't many orphans freezing in the streets anymore.

In the same way, it's possible to envision a world where someone could say, "We don't receive pay" and be meaning it in the sense of "we don't get compensation upon which we depend for our present or future life or happiness." Do we get a check? Sure, but not in the way that you'd envision it.

Taking it to a logical extreme, consider the answer to the question: "Are there mashed potatoes in heaven?" Many definitions of heaven -- a place of infinite love, a place of eternal peace and happiness, a place where wishes come true -- can be reconciled with the idea of "mashed potatoes in heaven." After all, if heaven is a place of eternal happiness, and mashed potatoes give you a finite amount of happiness, then heaven must contain the same type and intensity of happiness as bestowed by mashed potatoes. Of course, it's a stretch to go from that to envisioning *Close Encounter*-esque mounds of potatoes glopped around outside the pearly gates. But it all has to do with how you frame it mentally. (And, of course, if you don't believe in heaven, then it's entirely accurate to say, "There are all the mashed potatoes you'd ever want or need in heaven.")

I'll try to pick up this torch again next week, but for the time being consider that envisioning and describing alternate realities -- past, present, or future -- can often stem not from knowing the answers, but asking the right questions.

--Steven Marsh

Kenilworth for Gamers

by Jennifer W. Spirko

Saxons built it, Danes destroyed it, and Normans rebuilt it. The remnants of Simon de Montfort's followers holed up in it at the end of the Baron's War. Edward II was imprisoned there, Henry V vacationed there, and the Earl of Leicester staged an elaborate marriage proposal there. Finally, Cromwell's men destroyed it. What ghosts still haunt the magnificent red ruins of Kenilworth Castle?

Kenilworth offers gamers a millennium's worth of opportunities, from historical intrigues to modern-day ghost adventures.

Walk-Through

The castle lies in the town named for it, in Warwickshire, about 95 miles northwest of London and five miles north of Warwick. It is open to the public, and occasionally hosts medieval re-enactors and other special events. It is surrounded by gently rolling meadow which, for most of the castle's history, was the Mere, a shallow lake created by damming local streams; at over a mile long, it was the largest artificial lake in England. The Mere once stretched around two sides of the castle walls and was channeled into a moat on the others. The causeway that once spanned the water survives, entering the grounds from the modern parking lot, which was formerly the Brays, or tiltyard. Once inside the walls, the most obvious structure is Leicester's Building, a four-story tower constructed in the 16th century by Robert Dudley, where he played host to Elizabeth I and other important guests (see below, "Snapshot: The Man Who Would be King"). The huge, many-paned windows would have given a view of the Mere. To the right are the preserved Tudor stables and Dudley's luxurious Gatehouse, also intact.

The castle's oldest surviving structure is "Caesar's Tower," the Norman keep, located near the gatehouse. (It was common for the principal keep of a castle to be named for Julius Caesar, perhaps following the tradition of the Tower of London, which was credited -- anachronistically -- to him.) It remains imposing and warlike, with its 20-foot-thick walls and distinctively square late-Norman style. (The windows we see today were added much later, when the keep was no longer of such pressing military importance.) Alongside the keep are reconstructed Tudor gardens in the "knot" style. The tower gives a commanding view of the surrounding countryside, mostly rolling farmland today, dotted by forest; when it was constructed, the area was more fully wooded.

The third large structure of the main castle is the great Gothic hall built by John of Gaunt, Duke of Lancaster. In fact, John turned the castle into a genuine showplace, rebuilding the entire structure, save only the original "Caesar's Tower." Now roofless (and, to some extent, wall-less) the Great Hall remains remarkable, and many of the delicate Gothic window frames are intact. The hall's upper level would have been two high stories tall, lined with large windows and narrow buttresses.

Gaming Opportunities

Kenilworth can provide a setting for gaming in just about any era since Norman times; some particularly interesting episodes are detailed below in a series of "Snapshots" providing historical background and adventure seeds. Useful resources will be ***GURPS Middle Ages***, ***GURPS Who's Who*** (especially volume 1), ***GURPS Time Travel***, and ***GURPS Swashbuckling***, along with any genre books that fit the campaign. Those genre resources that fit most readily with the "Snapshots" below include ***GURPS Horror***, ***GURPS Magic***, and ***GURPS Spirits***. Information on siege engines and weaponry can be found in ***GURPS Low Tech***.

Brief History

Intrigues and battles cluster around the great castles for various reasons, not least of which is their symbolic and strategic importance. Kenilworth has been involved in more than its share of plots, probably because -- instead of being held for long by one family -- it was a royal holding off and on, given as a gift to favored nobles, and periodically returned to the crown. The circumstances of all those changes of hands make for a vibrant and tumultuous history.

There was a castle here as early as late-Saxon times, although legend links an even earlier one to King Arthur. The "modern" castle, however, was begun in the 12th century by the Norman Geoffrey de Clinton. He was apparently a remarkable man; although of lowly birth, he impressed King Henry I so much that he received not only the scenic estate at Kenilworth, but also such lofty titles as Lord Chamberlain, Royal Treasurer, and Justice of England. The newly built castle was so impressive that the Clintons wisely gifted it back to the royal family. Kenilworth later became one of the most sought-after estates in England. It was also one of five licensed tournament-grounds; among the famous jousts hosted here was the Round Table of Knights in 1279, in which a hundred knights participated.

King John admired Kenilworth so much so that he spent the then-remarkable sum of just over £1,115 extending and refurbishing the castle in the early 13th century. It was among the four most expensive of a great series of castle constructions and rebuildings that John embarked on during his reign. Those expenses became one of the sources of the resentment that built up against him from his over-taxed vassals. The castle-building campaign was on one hand a powerful demonstration of royal Norman authority, but it became, ironically, a spur to the weakening of that authority, as John's fed-up barons forced a series of concessions from the king (including the Magna Carta, in 1215).

The next few chapters in Kenilworth's history put it at the center of national politics, as detailed below (see "Snapshot: The Barons' War"). Later on, by the end of the 14th century, the castle and its lands were attached to the powerful Dukedom of Lancaster, which during the tenure of John of Gaunt became one of the premier titles in England. John extended and improved the castle, and his nephew Henry Bolingbroke extended and improved on the family fortunes by deposing King Richard II and becoming King Henry IV. His son Henry V was yet another fan of Kenilworth; he had a fox-harbor built there for hunting, and a pleasure-house built on a low island in the Mere, which he called Le Plesant Maris ("the pleasant marsh"). Shakespeare buffs might take note that it was apparently here, during Henry's Lent vacation in the early 15th century, that the Dauphin of France had his insulting gift of tennis balls delivered, an incident immortalized in the play Henry V. Did the king sit in the fabulous hall commissioned by his great-uncle, John of Gaunt, while the infamous toys bounced around the now-ruined floor, setting in motion the military campaign that would culminate in the Battle of Agincourt?

Kenilworth next makes its appearance on the forefront of English history during the reign of Elizabeth I, when she gave the holding to her controversial favorite Robert Dudley, the Earl of Leicester (see below, "Snapshot: The Man Who Would be King"). But the castle returned once again to the crown when James I's son Prince Henry arranged with Dudley's exiled son to "buy" Kenilworth for £14,500 and the title of Constable. The prince died with less than a third of the sum paid, and his brother, the future King Charles I, then took possession of Kenilworth, with no further compensation for Dudley. It might have been a harbinger of things to come: Charles was such an unloved, autocratic king that his reign sparked the English Revolution. He was eventually executed for crimes against the nation.

After the demise of its last royal landlord, the Lord Protector Oliver Cromwell took possession of Kenilworth and gave the estate to some of his officers. Apparently unimpressed with Kenilworth's evocative architecture and obviously hostile to its royal heritage, they carried off the valuables, demolished many of the buildings, drained the lake, and divided the grounds up into individual family farms. The land was reunited into a single estate after the restoration of the monarchy in 1660, and given to Sir Edward Hyde, named Baron Kenilworth and Earl of Clarendon. After all the excitement of its past, Kenilworth finally embarked upon a quiet retirement; it remained a holding of the Earls of Clarendon until donated to the government in 1937. It is still a public property today, operated by English Heritage.

Snapshot: The Baron's War, 1265-66

For over seven years, England was divided, between those who follow Simon de Montfort, the powerful and charismatic Earl of Leicester, and those who support Prince Edward, the equally powerful and charismatic heir to King Henry III. It was Edward who, escaping from de Montfort, raised the royal standard on the Welsh Marches, and who

led the loyalist forces to bottle up de Montfort at Evesham, August 4, 1265. The war had begun over the barons' demands that they have a share in governing the realm, which is these days seen increasingly as a unified nation rather than a collection of feudal manors.

De Montfort's son, also named Simon, fled to his family's castle at Kenilworth, along with a number of followers, known as the Disinherited because the crown seized their lands as punishment for the rebellion. The numbers of Disinherited and their sympathizers increased steadily. The younger Simon de Montfort's confidence had increased, too, and he began sending out bands of armed men to terrorize loyalists by despoiling their lands, driving off livestock, and holding their vassals for ransom.

In July 1266, Prince Edward besieged Kenilworth. While he marshalled his forces at nearby Warwick, Simon fled to another rebel stronghold on the Isle of Ely, intending to gather forces sufficient to break the siege, but he never returned. Henry de Hastings was left in charge at Kenilworth.

Despite the siege engines (Prince Edward has brought a ballista from London), Kenilworth held out. Even psychological warfare failed: When, early in the siege, the Archbishop of Canterbury approaches the castle and publicly excommunicated all within, the defenders dressed up one of their own in clerical robes and "excommunicate" Edward, King Henry, and the Archbishop!

The mediation efforts of a papal legate, who helped draft the Dictum of Kenilworth, failed, as the defenders spurned the punitive terms of the Dictum on two grounds: they had no hand in drafting the document; and the document was, as they put it, "intolerable." The siege lasted for six months, but the castle never fell to attack . . . succumbing instead to disease and starvation.

Gaming Opportunities

Gamers who wish to take part in political intrigue or outright battle can do so in a Baron's War-Kenilworth campaign. Here are a few suggestions:

- **The Times that Try Men's Souls:** The Baron's War can be seen as an early attempt at representative government. (The elder de Montfort actually alienated some of his noble allies by suggesting that, in addition to the "barons," political voice should also be granted to the artisan, merchant, and peasant classes.) Time travelers from the present day (or from the time-travel-friendly Steampunk era?) decide to bring democracy to Europe ahead of schedule by winning the Baron's War. Turning the tide at Kenilworth just might do the trick . . . Will they bring tommy guns to the defenders? Or just assassinate King Henry with a clever infiltration of the besiegers' camp?
- **Double, Bubble, Toil and Trouble:** The mix around Kenilworth is volatile, what with the fiery personalities and the literal firepower of the besieging army. What if magic is added to the mix? Imagine an alternate-history Medieval campaign in which, for instance, the Archbishop of Canterbury's blessings and curses have very real effects on their targets.

Snapshot: A King's prison, 1326-27

King Edward II, fearing for the growing rebellion of his barons led by his estranged wife and her lover, provisioned Kenilworth as a possible refuge. Tensions began years earlier, over the king's extravagant spending, particularly that lavished on his favorites and lovers. His wife, Isabella, left the country to negotiate a peace treaty with her brother, the king of France, but instead, she plotted to invade England. (She went down in history as the "she-wolf of France.") With her lover (and Tower of London escapee) Roger Mortimer, she landed an army in September, 1326, and the army grew quickly as she marched toward London, joined by many Englishmen disaffected with Edward's rule. One by one, Edward's friends were captured and executed, some after rapid treason trials. Finally, Edward was captured in Wales, in November, and imprisoned in the castle he thought he'd take as a refuge: Kenilworth.

In January 1327, the imprisoned king was forced to abdicate, but Isabella still feared that support could rally around

him and threaten the accession of their son, Edward III, who was only 14 years old. In April, Edward II was moved to a new prison, Berkley Castle, and there he was murdered the following autumn in one of English history's most gruesome crimes -- with a hot poker stabbed into his rectum. History has been somewhat kinder to Edward than his wife was, both because of his brutal demise, and because of his sympathetic treatment in the play about him by Christopher Marlow.

Gaming Opportunities

Again, Kenilworth was at the center of national intrigue, with the added elements of sex, romance, and assassination thrown into the mix. Try these adventure seeds:

- **To Save a King:** The players can try to rescue the weakened and demoralized Edward II, either before his abdication (as part of a bid to renew his reign?) or afterward (maybe to spirit him out of England). Adventurers can stage a daring raid on the great castle itself, or intervene as he is moved, under cover of darkness, to what would be his last home at Berkley Castle.
- **The School of Night:** Marlow, along with others of his Cambridge mates, including Sir Walter Raleigh, were members of a shadowy organization called "the School of Night," whose exact nature remains unknown. At the very least, it was a sort of club for free-thinking individuals in which ideas heretical and atheist were aired; much more is suspected, including alchemical research and black magic. A magical, alternate-history, or Illuminati campaign might use the School of Night as a basis for resurrecting (or going back to rescue) Edward II.
- **The Haunted Castle:** The ghost of Edward II has returned to the castle he thought would be his refuge, and now he/it roams Kenilworth, seeking revenge on those who wrongly took his throne. Denizens of the castle keep turning up, impaled with hot pokers; what can lay Edward's spirit to rest at last? (See also, "Secret History," below.)

Snapshot: The Man Who Would be King, 1575

What's a royal favorite to do, after years of waiting to marry the queen? In the case of Robert Dudley, Earl of Leicester, one stages an elaborate 19-day festival filled with shows, parties, and feasts for the visiting Queen Elizabeth I. The recurring theme was the beauty and power and, sometimes, the fickleness of the queen, as well as the virtues of Dudley, such as claims that he was descended from King Arthur. The climactic masque depicted the allegorical story of Deep Desire, who was transformed into a "prick"ly holly bush (the phallic pun was intentional) after being rejected by the cruelly chaste nymph "Zabeta." Elizabeth got the point, as it were, and she left the festivities a day early; poet George Gascoigne was enjoined to accost the queen as she left and tell her the story of the masque, just to make sure she didn't miss out on any of the not-so-subtle messages.

Dudley, a widower, had tried several times before to tempt Elizabeth into marriage with him, and this time he seems to have been acting not so much out of desperation for her hand as out of exasperation; as her "favorite," he wasn't really free to marry anyone else, either, and several of the entertainments he staged for Elizabeth that summer depicted her (or her allegorical representatives) as benign, all-powerful figures who offered their prostrate and lovelorn subject the possibility of liberty. Elizabeth, as history knows, didn't marry Dudley, but he did eventually remarry -- Lettice Devereux, Countess of Essex, the queen's cousin -- in 1578. Dudley's later life was full of disappointments, from the death of his toddler son to a lackluster military campaign in the Netherlands.

Gaming Opportunities

Elizabethan Kenilworth offers rich opportunities for gaming, during one of English history's most vibrant and volatile times.

- **To Catch a Queen:** More than a honeymoon is at stake; whoever marries Elizabeth I becomes King of England and, de facto, one of the most powerful men in Europe. For her entire reign, complex conspiracies raged about the queen, and various suitors, foreign and native, were proposed. Some of those conspiracies will surely

coalesce around the Kenilworth "entertainments." Will the Spanish ambassador be on hand to try and thwart Dudley's efforts? Will radical Protestant nativists be on hand to try and thwart the Spanish (and any other ambassadors)? It's a soap opera with international implications!

- **To Kill a Queen:** Any number of people were executed during Elizabeth's reign for attempted regicide and/or high treason, such as her royal cousin Mary, Queen of Scots, and the Jesuit convert Edmund Campion. (The Jesuits were perennially suspected of planting such plots.) Kenilworth, with its big crowds and distractions, might be an ideal place to stage an assassination or coup attempt. Players could change the course of history by participating in such an attempt, or preserve it by acting behind the scenes to thwart one.
- **"I can call spirits from the briny deep":** Shakespeare gave that line to the magic-wielding warlord Owain Glendower, but spirits were called from the "briny deep" at Kenilworth, too, in the water-borne masques played out on the lake. What if these impersonations of Jupiter, the nymphs, and other supernatural beings catch the attention of real spirits? What if that is actually the intention? Players could deal with the consequences of real magic erupting into the festivities. (See *GURPS Who's Who 1* for notes on Dr. Dee, Elizabeth I, and William Shakespeare) or *GURPS Spirits* and *GURPS Celtic Myth* for ideas about the nature of spirits that might show up.)

Secret History of Kenilworth

Why do so many residents of Kenilworth come to a bad end? And was it really just loyalty or prudence that made so many of them give the estate back to the crown over and over again? Maybe, just maybe, there's a dark secret buried underneath the castle's ruins, a secret that the Puritans tried to destroy by dismantling the estate itself . . . Enterprising GMs could fill in these sketched "secret history" seeds with their favorite horror and suspense elements for a chilling modern-day or historical campaign set amid a Kenilworth that houses something far more sinister than the memory of bloody times and dark conspiracies.

- **The Ancient Roots:** The present-day castle was built, nearly a thousand years ago, on an ancient holy site, one which had housed sacred strongholds in pre-Roman times. Sensing something of its native power, Romano-Celts built here, either as a symbolic gesture or to take advantage of ley line influences. Subsequent invaders followed them probably without being aware of the site's mystical importance. Angered by these intrusions, the slumbering power at the roots of Kenilworth was roused to centuries of wrath, enacted, sometimes subtly, upon the unsuspecting residents. It may be that this power could be invoked by moderns: Deliberately, to exploit its strength, or accidentally, by a casual desecration.
- **The Haunted Castle:** In its early days as a fortified Celtic settlement, a horrendous crime was carried out here, and the implications of the violence reverberate down the centuries. The force of the curse has been dissipated by public ownership of the castle, or perhaps the vengeful spirit has simply lain dormant, but now something has happened -- perhaps a local murder too similar in some details to that original crime -- to reawaken the curse and put the entire town at risk.
- **De Clinton's Deal:** Perhaps the meteoric rise of Geoffrey de Clinton wasn't due to his military prowess or political acumen, but rather to a nefarious bargain made with powerful, dark forces? Yes, Kenilworth's troubles could all date back to that favorite device of fiction and myth, a deal with the devil. With its very own Faust as its first tenant, it's no wonder that Kenilworth's owners seem somewhat cursed. Maybe de Clinton evaded the terms of the deal somehow (by magically remaining alive? by finding a loophole?) and the forces of darkness have been taking out their frustrations on Kenilworth ever since.

Tkarsh's Band

by Matt Riggsby

The deserts of western Yrth teem with orcs. The typical orc roves the sands as part of a small band, raiding neighbors and jockeying with his "friends" for power and position, with no greater ambition than to beat the orc next to him.

Tkarsh is not a typical orc. He has far greater dreams than that, even greater than torching the occasional dwarf town. Tkarsh wants *real* power, domination of vast realms of orcs and other races, all subject to his whims. He's a long, long way from achieving that, but he's already gathered a small, effective band of lieutenants whose talents he can bend to his will. With a little time and luck, Tkarsh could become truly dangerous.

Tkarsh

221 points

Tkarsh is the sort of orc intelligent non-orcs worry about. It's not that he's such a great warrior, although he's good enough. It's that he's smart, ambitious, and knows how to motivate his fellow orcs. It's orcs like Tkarsh who turn squabbling tribes who might be happy to bash each other's brains in into vast hordes who prefer to bash in human, elven, and dwarven brains. He hasn't done anything like that yet, but he's still young.

Tkarsh is supremely selfish, even for an orc, but he balances that with a rare foresightedness. Although he certainly doesn't mind destruction and won't hesitate to kill if it serves his purposes, there are other things he enjoys more. You can kill someone once, but you can rule him for *years*.

Attributes: ST 13 [30]; DX 13 [60]; IQ 12 [40]; HT 12 [20]

Secondary Characteristics: Dmg. 1d/2d-1; BL 34 lbs.; HP 16 [6]; Will 14 [8]; Per 12 [0]; FP 12 [0]; Basic Speed 6.00 [0]; Basic Move 6 [0].

Advantages: Charisma +2 [10]; Danger Sense [15]; Reputation +2 (as a strong and daring war-leader, recognized by orcs on 12 or less) [3]; Talent: Born War-Leader 3 [15]

Disadvantages: Intolerance (Total) [-10]; Megalomania [-10]; Social Stigma (Barbarian) [-10]; Ugly [-5]

Quirks: Always wears cast-off finery from defeated enemies [-1]

Skills: Brawling (E) DX+2 [4]-15; Broadsword (A) DX+2 [8]-15; Intimidation (A) Will+1 [4]-15; Knife (E) DX+1 [2]-14; Leadership (A) IQ+1 [4]-18+*; Public Speaking (A) IQ [2]-14*; Shield (E) DX+1 [2]-14; Stealth (A) DX [2]-13; Strategy (Land) (H) IQ+1 [8]-16†; Survival (Desert) (A) Per [2]-12; Tactics (H) IQ+1 [8]-16†; Throwing (A) DX [2]-13; Whip (A) DX [2]-13.

†: includes +3 from Talent: Born War-Leader (For more information on this talent, see **GURPS Banestorm**, p. 184).

*: includes +2 from Charisma.

Typical equipment: Thrusting broadsword, large knife, whip (reach 3), mail shirt, pot helm, medium shield

Tkarsh's Lieutenants

The exact number of T'Karsh's followers is up to the GM; most of them are generic orc warriors, built on the template at the end of this article. However, Tkarsh has three lieutenants who are first and foremost among his followers.

Ruk

134 points

Tkarsh isn't stupid. Ruk is. He's slow, even for an orc, and easily led. There is speculation that there are some ogres somewhere in his ancestry. He's also very large, very strong, and hard to hurt. He is, in short, a weapon looking for a hand unscrupulous enough to wield him, and he has found that hand in Tkarsh.

Attributes: ST 18 [70]; DX 12 [40]; IQ 8 [-40]; HT 14 [40]

Secondary Characteristics: Dmg. 1d+2/3d; BL 58 lbs.; HP 22 [8]; Will 8 [0]; Per 8 [0]; FP 14 [0]; Basic Speed 6.5 [0]; Basic Move 6 [0].

Advantages: Combat Reflexes [15]; Damage Resistance 2 (Tough Skin -40%) [6]; High Pain Threshold [10]

Disadvantages: Bloodlust (12) [-10]; Gullibility (12) [-10]; Intolerance (Total) [-10]; Social Stigma (Barbarian) [-10]; Ugly [-5]

Skills: Axe/Mace (A) DX+2 [8]-14; Brawling (E) DX+2 [4]-14; Intimidation (A) IQ+1 [4]-9; Knife (E) DX+1 [2]-13; Shield (E) DX+1 [2]-14; Survival (Desert) (A) Per [2]-8; Two-Handed Axe/Mace (A) DX+2 [8]-14.

Typical equipment: Warhammer, leather armor

Gerash al-Nabil

116 points

Where Tkarsh is dangerous because he has a God complex, Gerash is dangerous because he's just plain nasty. Raised by more-or-less civilized orcs living on the fringe of a human village, Gerash was dissatisfied with the small community of converted Muslim orcs with whom he lived. Leaving the village under a cloud (the story changes from time to time, but he boasts of murdering one or both of his parents, a village headman, or a village headman's daughter), he headed back into the desert to find a more interesting life.

He found that life once he hooked up with Tkarsh. If there is unpleasant work to be done -- an assassination, torture, the head of a loved one left in a bed -- Gerash is ready and willing to do it. Like Tkarsh, Gerash finds rampant destruction a waste. He'd rather take his time with it.

Gerash believes that he's Tkarsh's natural successor, although Tkarsh himself is probably incapable of thinking about who might succeed him.

Attributes: ST 12 [20]; DX 14 [80]; IQ 9 [-10]; HT 12 [20]

Secondary Characteristics: Dmg. 1d-1/1d+1; BL 29 lbs.; HP 15 [6]; Will 9 [0]; Per 9 [0]; FP 12 [0]; Basic Speed 6.50 [0]; Basic Move 6 [0].

Advantages: Arabic (Broken/Illiterate) [2]; Night Vision [10]

Disadvantages: Intolerance (Total) [-10]; Lecherous (12) [-15]; Social Stigma (Barbarian) [-10]; Sadism (12) [-15]; Ugly [-5]

Quirks: Incessantly cheerful and obsequiously friendly. [-1]

Skills: Bow (A) DX+3 [12]-17; Brawling (E) DX+2 [4]-16; Broadsword (A) DX+2 [8]-16; Intimidation (A) IQ+1 [4]-10; Knife (E) DX+1 [2]-15; Shield (E) DX+1 [2]-14; Stealth (A) DX+1 [4]-16; Survival (desert) (A) Per [2]-9; Throwing (A) DX+1 [4]-15; Whip (A) DX [2]-13.

Typical equipment: thrusting broadsword, several daggers, regular bow, leather armor, small shield.

Ashak

139 points

Ashak says he's in it for the money, pure and simple. However, he is also in it for the self-aggrandizement. Though exceptionally intelligent for his race, he lacks most of the strength and ruthlessness admired by his society, and he's insecure and sensitive about it. As Tkarsh's most important intelligence asset, he's in a valued position close to a formidable warrior and war leader.

Ashak believes that he is Tkarsh's natural successor and is just as wrong as Gerash; indeed, both have probably survived as long as they have because neither could take his place. If something happens to Tkarsh, Ashak and Gerash will probably end up at one another's throats.

Attributes: ST 10 [0]; DX 11 [20]; IQ 13 [60]; HT 11 [10]

Secondary Characteristics: Dmg. 1d-2/1d; BL 20 lbs.; HP 13 [6]; Will 13 [0]; Per 13 [0]; FP 11 [0]; Basic Speed 5.00 [0]; Basic Move 5 [0].

Advantages: Magery 2 [25]; Language: Arabic (Broken/Semiliterate) [4]

Disadvantages: Greed (12) [-15]; Intolerance (Total) [-10]; Jealousy [-10]; Social Stigma (Barbarian) [-10]; Ugly [-5]

Quirks: Always uses two large words where one short one will do [-1].

Skills: Brawling (E) DX [1]-11; Intimidation (A) IQ-1 [1]-12; Occultism (A) IQ-1 [1]-12; Shortsword (A) DX-1 [1]-10; Spell Throwing (E) DX+1 [2]-12; Survival (Desert) (A) Per-1 [1]-12; Seek Air (H) IQ-1 [2]-14; Purify Air (H) IQ-1 [2]-14; Create Air (H) IQ-1 [2]-14; Destroy Air (H) IQ-1 [2]-14; Earth To Air (H) IQ-1 [2]-14; Stench (H) IQ [4]-15; Lightning (H) IQ [4]-15; Explosive Lightning (H) IQ-1 [2]-14; Shape Air (H) IQ-1 [2]-14; Air Jet (H) IQ-1 [2]-14; Wall of Wind (H) IQ [4]-15; Windstorm (H) IQ [4]-15; Seek Earth (H) IQ-1 [2]-14; Shape Earth (H) IQ-1 [2]-14; Seek Pass (H) IQ-1 [2]-14; Earth to Stone (H) IQ-1 [2]-14; Earth Vision (H) IQ-1 [2]-14; Earthquake (H) IQ-1 [2]-14; Simple Illusion (H) IQ [4]-15; Pathfinder (H) IQ-1 [2]-14; Seeker (H) IQ-1 [2]-14; Trace (H) IQ-1 [2]-14; Detect Magic (H) IQ-1 [2]-14; Mage Sight (H) IQ-1 [2]-14.

All spells include +2 from Magery

Typical equipment: shortsword, chainmail, writing equipment

Goals and Tactics

Unusual in a race which favors direct attacks, Tkarsh is a master of distraction, deception, and surprise. He takes his time to plan and lay out an assault. His general pattern is to launch a small attack, wait until his opponent is focused on defeating that, and then launch a second, decisive attack from a hidden position on the now weakly protected rear or in a strung-out middle. This can apply to anything from small-group tactics (for example, having Gerash snipe at an enemy, then send Ruk in to take out stragglers when the enemy is trying to chase Gerash down) to grand strategy. Given enough forces and a sufficiently formidable enemy, he might attempt two or even three "feints in force" to get his enemy off guard, and he might even go with the time-honored tactic of a full-frontal assault against a long-time enemy. He is a practitioner of guerilla warfare -- he picks off isolated enemy troops, is dimly aware of the importance of logistics, and may attack an enemy's supply lines to weaken him.

He rarely sacrifices men needlessly, but he is unsentimental about losses in battle. He expects his initial feints to be decimated, and he will let thousands die if it gets him a victory. If anyone in his army looks to be a potential challenger, Tkarsh will offer him a place of honor in the initial charge; most ambitious orcs aren't bright enough to figure out what will happen next, and those who do can hardly refuse for fear of being branded a coward. His only concern is with winning the current battle and retaining enough of a force to win the next one. Since winning generals attract more followers, he rarely feels the need to preserve most of an army.

Though far from honorable, Tkarsh is pragmatic enough to strike short-lived alliances if he feels he absolutely has to. However, he will only do so if he feels he can control the relationship. He has also been known to take hostages to

compel others to be useful to him. Most of his allies and hostages eventually have an unexpected and unpleasant meeting with Gerash.

Tkarsh's egotism may be his only weak point, and he's bright enough that it's a well-defended weakness. A direct approach would be to gain a position of trust (a difficult feat) and convince him that several of his lieutenants were plotting to take his place. This would lead to Tkarsh wiping out his inner circle, temporarily disrupting his ability to lead an effective force. A less dangerous but less effective tactic would be to stay a step removed and sow dissension among his followers.

His companions' tactics are far less sophisticated. If confronted on his own, Ruk has little initiative and will simply fight until disabled or killed. Gerash and Ashak will fight from a distance if possible, up close if they have to (using the dirtiest tactics possible), and either flee or submit if the fight is going against them. Neither has much grasp of tactics, so if leading troops, Gerash will call for frontal assaults, while Ashak will try to emulate Tkarsh's strategies (he is much less skillful). If taken captive, Ruk will be silent, though he can probably be goaded into telling what he knows. Gerash will lie easily and profusely, looking for any chance to escape. Ashak will be defiant, but appeals to his vanity may tease information out of him.

Tkarsh in the Campaign

Tkarsh and his men could be used as anything from a small band of raiders to the leader of an army and his entourage. Whatever his context, Tkarsh can hardly be anything other than an enemy, either present or future. If you're valuable, he will want to rule you, at best. If you look like you might become a threat, he will want you dead. Tkarsh is a potential Napoleon or Mao, or at least a Saddam Hussein: an egotistical dictator who can brook no challenge or dissent. Even as the leader of a very small band, his desire to survive makes him a difficult opponent.

However, he need not be presented solely as the leader of an attacking army. If PCs have an errand which takes them into or near the Orclands (recovering ancient artifacts, for instance), they may pass through Tkarsh's sphere of influence. Tkarsh will recognize useful outsiders when he sees them, and will attempt to use them if he thinks he can profit from the effort. For example, he may offer to guide the PCs on their way if they will assassinate a rival orcish leader, or provide support for an attack on a human town.

Once the PCs perform their part of the bargain, Tkarsh doesn't worry about whether he will need to keep up his end. He is likely to try to kill the characters, either by himself or by betraying them to friends and allies of whomever he enlisted their aid against. If he can help the PCs achieve their goals, he might actually do so -- letting them take whatever risks are involved along the way -- *then* kill them and keep whatever object or benefit the characters hoped to gain. If the PCs appear too powerful to overcome directly, Tkarsh may tell them useful lies to achieve his own goals. ("The lost Dingus of McGuffin? Oh, my neighbor has it, but he won't give it up without a fight. Nope, no way . . .")

Without his forceful personality to hold them together, Tkarsh's followers are interesting but not nearly as difficult to deal with. They are little more than typical raiders with colorful motivations. Ashak in particular will be unusual: a touchy orcish pedant. Depending on his situation, Tkarsh's point cost may increase. As written, he's got a motley crew of three talented but unreliable followers. As the leader of a small group of skilled warriors (say, 10 to 15 orcs built on 50 points), he would gain an Allies advantage worth 8 points. As a notable war chieftain, he'd gain two or three levels of Status, increase the spread of his Reputation, and increase his Allies advantage to at least 24 points. Ruk, Gerash, and Ashak would gain four or five levels of Military Rank, or possibly some form of Social Regard.

Templates

Use these templates to create more orcish warriors and commanders for use with Tkarsh or other orcish war-bands.

Orcish Warrior template

20 points

This is a typical orcish barbarian warrior, interested in little more than destruction and plunder. This template includes traits from the orc template.

Attributes: **ST** 11 [10]; **DX** 11 [20]; **IQ** 9 [-20]; **HT** 12 [20]

Advantages: Acute Hearing 2 [4]; Hit Points +3 [6]

Disadvantages: Bully (12) [-10]; Intolerance (Total) [-10]; Social Stigma (Barbarian) [-10]

Primary Skills: Broadsword (A) DX+1 [4]-12, Axe/Mace (A) DX+1 [4]-12, or Spear (A) DX+1 [4]-12

Secondary Skills: Brawling (E) DX [2]-12; Shield (E) DX [1]-11; Survival/TL (A) Per [2]-9

Background Skills: One of Bow (A) DX-1 [1]-10, Stealth (A) DX-1 [1]-10, Throwing (A) DX-1 [1]-10, or Whip (A) DX-1 [1]-10.

Orcish Commander template

55 points

The commander of a troop of orcs is much like his subordinates, only a little bigger, a little smarter, and able to shout a little louder.

Attributes: **ST** 12 [20]; **DX** 11 [20]; **IQ** 10 [0]; **HT** 12 [20]

Advantages: Acute Hearing 2 [4]; Hit Points +3 [6]

Disadvantages: Intolerance (Total) [-10]; Social Stigma (Barbarian) [-10]; select one of Bully (12) [-10] or Overconfident (6) [-10]

Primary Skills: Broadsword (A) DX+1 [4]-12, Axe/Mace (A) DX+1 [4]-12, or Spear (A) DX+1 [4]-12; Intimidation (A) IQ [2]-10; Leadership (A) IQ [2]-10

Secondary Skills: Brawling (E) DX [2]-12; Shield (E) DX [1]-11; Survival/TL (A) Per [2]-9

Background Skills: Two of Bow (A) DX-1 [1]-10, Stealth (A) DX-1 [1]-10, Throwing (A) DX-1 [1]-10, or Whip (A) DX-1 [1]-10.

The Ophiuchus Collection

by Nick Grant

Ponce de Leon arrived in the New World in 1513. Ferdinand Magellan circumnavigated the globe in 1522. King Philip II launched the Spanish Armada in 1588. Of all Spain's seafaring adventures, none has received as much occult attention and as little mainstream notice as the quest of Don Juan de Santandres.

After serving as the Apprentice Seaman on Magellan's ill-fated voyage, de Santandres returned home with a mysterious chest which he obsessively guarded. It stood perhaps two feet tall and three long. Nothing at all seemed remarkable about the chest, except perhaps that such an old box survived termites and weather for so long. The young mariner refused to answer any of the many questions about the chest though, usually launching into fanciful tales of high seas adventure to change the subject.

De Santandres continued his seafaring career, eventually becoming the captain of his own vessel, *Isabella Dulcinea*, and pursued a treasure-hunting career. His crew never seemed willing to discuss the details of any of their voyages, a behavior that's been attributed both to the jittery anxiousness characteristic of his ex-crewmembers and the rumors of lavish wages to buy his men's silence.

After an untimely death in 1562, the Inquisition reclaimed the de Santandres estate. Claiming that the secretive nature of his voyages smacked of some well-covered heresy, they plundered his house and ship. Abundant baubles and curios from far corners of the globe were auctioned off at exorbitant fees, and the ship was bought by the Captain's one time first mate, Miguel de Huelva. The only thing confiscated and kept by the Inquisitorial powers was a strange wooden chest locked in a secret compartment of the Captain's cabin.

The five books locked in the chest have become known as the Ophiuchus Collection, named after the cult that created them. These mystic tomes contained the secrets of the true history of the universe . . . or so they claim. Whether the information they present is accurate or not, each book has peculiar magical properties in its own right.

The Ophiuchus Cult

A mysterious cult of undetermined origin, the Ophiuchus cabal comprised some of the most terrible magical intelligences of the 14th and 15th centuries. Perhaps the only reason that the cabal didn't completely dominate world politics at this time lay in its intense religious fanaticism. By this point, most of the higher-ups in the cabal genuinely believed in their aberrant philosophies, and this obsession barred any useful interaction with society.

Originally, the cult was primarily a political entity. Similar to the more modern freemasons, it was an elite institution in which connections were forged and deals made. However, as it began to attract mystics and magicians, and as the powerful books were introduced, the focus shifted away from political domination toward spiritual enlightenment. At its height, the cabal spanned four continents, with important temples in Southeast Asia, Western Europe, the Arctic, and Northern Africa. However, the fascination with alternate spirituality led to the slow decline of the cabal over the ages. By the time de Santandres got to them, only the final vestiges of the mystery cult remained, with a few of the books having been completely abandoned and a few having become the focal point for splinter cults.

Their secrets were dictated to each generation of neophytes by introduction to their five holy books. After mastering one, the young cultists were allowed to begin study of the next. Each book detailed a phase of the universe. According to the mystics in Ophiuchus, history can be broken down into creation, meaninglessness, the rise of intelligence, the echo of magic, and death. Cynics have been quick to note the rather tenuous link between the actual content of a few of the books and the purported meaning. Whether historical documents or occult curios, the impact that these books have had on magical philosophy since their composition is undeniable.

Book One: Liber Origo

Known under many titles -- Liber Origo, Narcissus' Creation, and Livre Blanc -- this book attracts the widest range of occult scholars and curious investigators. The book of origins always seems to be a blindingly white tome full of crisp blank pages . . . at first. As the curious bookworm chews through the creamy pages he starts to see some traces of patterns and notes. More intense study further fleshes out the lines and relationships which the book outlines. Each time the scholar comes back to the book he finds everything he previously saw in the book, and a little more.

No one has quite been able to agree on the text of this book. The dominant theory is that there's no precise text written on those crisp white pages, but that it acts as a sort of mirror for the reader. Intuitive and creative expressions of the universe fill the pages, and the scholar discerning it can read his own thoughts unabashed by psychological blocks and wards which might normally block his creativity. Naturally, hermeticists and other high magic advocates generally disagree.

As the sorcerer falls deeper into study of this book, he grows less willing to part with it. The obsessive effect is exponential, quickly growing from a preference to a desire to a necessity. However, so long as he has the book and actively studies it, the spellcaster's knowledge of magic grows more powerful. Stealing the tome from a mage, or forcefully removing it from him generally results in depression and, in severe cases, psychological withdrawal for the previous owner. The symptoms of this are various, but generally include sweating, panic attacks, and in severe cases logorrhea.

Book Two: Liber Null

This second tome appears at first identical to the Liber Origo. An egg-shell white leather cover pads this hefty tome from the anxious gripping and sweaty hands that have handled it throughout the ages. This, combined with the initially blank pages have fooled many uninitiated into the cult into actually believing that this was the famed Liber Origo. Nothing could be further from the truth though, as the worried wizard discovers on his third fruitless night searching through Liber Null for any hope of pattern or word.

If not the entirely enlightening, it is the most precise to define the second book of Ophiuchus by what isn't. It's not a spell list, or a system of invocation. It's not a history, a treatise, a theory or a factual account of any set of events. It's no allegory, no drama, and certainly no fable. However, it *does* impart the sense of all these things.

This book has been the source of much contention. Blasphemers (or, if you prefer, realists) reject it as a significant magical work. They write it off as some minor glamorous enchantment that has little to no effect on the tapestry of magic. They prefer not to discuss the disturbing visions and unusual deaths associated with the book -- sfilng those under "unsophisticated illusion traps" and moving quickly on. Its proponents however, dwell on these elements and read further into them.

Specifically, on the third day spent studying this book the reader is overcome with an intense sense of ennui. Usually taking the day off from whatever he was doing, he goes home and retires for an early night. Fitful sleep, night terrors, and occasionally delirium for several minutes after waking have all been reported to be connected with this first night. The situation grows worse as the book owner spends more and more time flipping through those blank pages, usually hovering near a catatonic stupor. The individual becomes entirely incommunicative. As study continues, they do less and less -- skipping meals, staying awake, and seemingly slipping away into an entirely interior world.

After a month (dictated by the lunar cycle, not the calendar), the spell dissipates. If the book is removed before that time is up (which is more common outside the rigorous confines of the cult, as it is very hard for a catatonic to defend themselves from the sort who could find this tome) the magician generally takes some permanent insanity -- paranoia, night terrors, and a whole host of phobias are fairly common. However, a wizard who can complete the ordeal gains mastery of a chilling daemonology. Among successful readers of the Liber Null are the writers of *Grimoire Qlippah*, *Shadow Daemons*, and *Other Monsters: Entities With Whom it is Unwise to Deal*.

Book Three: Liber Atrox

The Book of Consumption has a peculiar history. In the Ophiuchus, the keepers of the holy books held one of the most esteemed positions. Their original responsibilities only required them to keep the cult's secrets away from the public eye. However, a natural outgrowth was that whoever held one particular book would be the one to teach its secrets to supplicants. Teaching methods, as they often do in occult circles, grew stranger and more intricate as time passed, and as the keeper's job became more focused on teaching they brought on younger cult members to help maintain secrecy and assist them in menial activities.

In the case of The Book of Consumption, this grew to a critical point 20 years before de Santandres landed in the Filipines with Magellan -- a splinter cabal formed around the book, claiming it was the only key necessary for human perfection. The temple of the flesh nested itself within the jungles prevalent on the islands, and there practiced its rituals in solitude until Magellan came, bearing with him a treasure: a hungry and discontent crew. Official cult doctrine stated that it documented only the rise of intelligences as part of the universe's natural cycle. It took the warped mind of the cultist though, to see any actual connection between mental evolution and this volume.

The Book of Consumption (or Liber Atrox, as it is sometimes known) is a large volume bound in some unidentified scaly skin. Perfectly smooth along the back and spine, a grotesque face screams, frozen on the front cover. A hand arising out of the scales clasps the book shut with a rigor mortis stronger than any attempts yet made to dislodge it. A drop of warm blood into the curiously deep mouth is all that can coax that hand open, and this must be applied every time that the reader hopes to access its contents.

Cannibalistic rituals are the focus on this book. Through particular rites, the initiate learns to consume not only the physical mass of a person, but also (depending on the spell used) their strength, knowledge, and even their identity. These rituals are highly dangerous to practice for more reasons than kuru. If the initiate prepares a sample wrong, utters an incorrect syllable in an incantation, or even deviates from the proscribed thought patterns, he runs the risk of channeling the spirit he's trying to incorporate. There are also very few places in the world that value freedom of religion highly enough to allow the power-hungry (literally) sorcerer to continue his craft. Even more so than normal, secrecy is of the highest priority for devotees of this book.

Book Four: Liber Sapientia

The most straightforward of the five books, the Echo of Magic (Liber Sapientia) is an ordinary spell book. It outlines the processes behind creating second- and third-generation intelligences (that is, creatures with will, and creatures with will that can create other creatures with will). The flexibility of the system explained in the fourth book gives the wizard startling range to work with, allowing him to forge physical vessels for individual ideas or create spirits out of physical phenomena like plagues. Form, idea, and consciousness are seamlessly integrated as the lines between different parts of reality break down and bleed into each other.

The bizarre factor of the book lies not in its contents, so much as how it is used. Experiences within the cult form the adept into a unique (and often quite mad) individual who, by this point, will employ creative magic in a very strange way. Documented projects that sprang from study of the Liber Sapientia are the foundation of the cult of Garganosh (an Ophiuchus elder who fancied himself akin to a god), the creation of more than 200 magical diseases (including new strains of lycanthropy that combine animal life with plants, fungi, and bacteria instead of the traditional wolves and bears) and intelligent colors who converse fluently in all languages.

Book Five: Liber Decessus

The highest honor for a cultist was to read from the Liber Decessus. Very few of the already sparse cultist population ever reached this tome, even among the higher tiers. The book is bound in simple black leather, with its title illuminated in silver letters on its cover. Found by de Santandres in an ice cave beneath the North Pole, the contents of this book were one of the only things more inaccessible than its physical location.

To this day, no one is sure what topics the Livre Mort touches. A few cases of cultists reading it have been documented, and a generally predictable series of events transpires in each case (save one -- the infamous occultist de Roch had a very peculiar reaction to this book). Initially, the volume is always found in shadow. Even in places that generally wouldn't cause a shadow, the book seems to find some inky darkness to dwell in -- bent light rays and morphed shadows always manage to envelop the book somehow.

The physical texture of the book is cold and usually slick, though whether this is a magical effect or due to the fact that light seems to have trouble hitting it is only a matter for speculation. The next recurrent event occurs when someone starts to read it: It is impossible to stop. The reader's eyes are compelled onward to the next word and the next word and so on until they flip the page. No one who has caught glimpses of the pages can seem to recall any of their contents, only that they were psychically appalled and could not bear to view it for more than a second or two.

The individual reading it, though, can't seem to get enough. As he continues on, his breathing slows and a pallor spreads over his face and hands. His heart rate gradually drops through the first half of the book until it finally simply stops. (Note that this process usually takes around three days. This fact has led many occultists to conclude that the book not only has the deteriorative effect described here, but also some sustaining effect as the mage reads on with no sleep, food, or water.) Through the second half of the book the reader's skin starts to sink and recede, eventually cracking to show dry veins and muscles underneath. Around the final fifth of the book most of the skin has shriveled away, and the cursed man's muscles start to fall apart, and his bones to deteriorate. By the end of the book, all that remains are a thin network of muscles clasped around chicken-like bones, supporting two withered eyes. After the reader finishes the final page, he collapses in a heap of dust and blows away.

This has happened each time the book has been read, save one. de Roch took it upon himself to go search for the complete collection. He found and read each of them in order, except for the Liber Decessus, which took him several more decades to locate and read. A certain scribe accompanying him described his final hours thus:

"The master is nearly completely gone. All he's left is some vague outline of his eyes and enough willpower to turn the pages of this accursed book. I am surely damned that I've watched this detestable ritual . . . [missing text here] fascinating! In his final hour before collapsing I saw some fantastical indigo glow from the book pierce through his eyes. In some final triumphant rush a whole outline of his body appeared in the glow, before disappearing in a flash of light! What may this portend? Surely I may read this book and discover some beautiful reunion with my master!" This log has, naturally, become hotly sought after itself. It sheds no light on the book, but does give it some strange overtones.

Adventure Seeds

The Ophiuchus collection leaves itself open to a lot of adventure opportunities, from campaigns centered around assembling the set of five to a single session that includes the Liber Null as a particularly nasty piece of loot. Some possibilities include:

- **A Mad Mentor:** One way to drive home the psychological effects of the first tome is to put it in the hands of someone close to the adventurers. If a mentor came into possession of it, he could at first easily convince the investigators of its value. However, as time passes, he falls deeper under its spell, eventually refusing to see anyone and even putting up defenses against people trying to get near the book. How long will the party allow this obsessiveness to continue?
- **Nihilistic Nepotism:** A young sorceress has gotten a hold of the Liber Null and is spending a suspicious amount of time whispering in the shadows of her house while her quiet parents stay locked in their bedchamber.
- **The Atrocities of Atrox:** A cannibalizing cult has gotten its hands on the Book of Consumption, and are using the foul magic within to perfect their physical forms. Gruesome murders, eery lackeys, and power-mad cult leaders run amok!
- **The Marquis Magician:** A certain hedonistic nobleman has come into a copy of the Liber Sapientia and has begun using it to create mischievous imps and sprites that are wreaking havoc in a small town.
- **de Roch's Disguise:** The notorious arcanist gained new insights into death and magic in his adventures after

surviving Liber Decessus. Only recently has he returned to the material plane, manifesting as a glowing entity in the vicinity of the book. The locals are aware of its significance and hire the heroes to deal with the problem.

Pyramid Review

Infinifield

Infinifield

Published by [Infinifield, Inc.](#)

24 plastic blocks in various colors, five pawns, & rules (in Spanish, English, and Russian), boxed; \$19.99

Making your own playing surface is no new idea for gaming. There are plenty of "build your own board" games, and several where the construction changes things from one iteration to the next. *Infinifield* takes its name from the fact that it has a nearly endless arrangement of pieces.

The object of the game is to score the most points by being the last pawn standing.

Your battlefield is a series of plastic boxes in various colors and sizes. Each one is about half an inch thick and an inch and a half wide. Length varies from a couple of inches to almost a foot, depending on the piece in question. Each round, someone is chosen to be the field builder; it's their job to construct the board for that round of play. There are certain rules to putting it together, but most of these are either obvious or are needed to make the game work. There must be space on each block to place a pawn, the tiles cannot be tilted, they must all be part of a single pile, etc. Beyond that, it's open season. You can stack all the pieces next to one another to create an orderly little pyramid, or stagger them and leave them all over the table like pieces of metal in a junkyard.

Infinifield

The white blocks are a kind of connective tissue for the game. They have to be spaced out a bit, and no single colored block may touch more than two of them. Everyone starts the round sitting atop their own white space, and on their turn the player moves his pawn to an adjacent block. This is a chase, and if you land your pawn on another pawn, you capture them and eliminate that counter from the game. There is a fifth pawn, used on a printed diagram included with the rules, showing a circular pattern. Every turn after taking his move the player moves the pawn on this little roundabout. It's five spaces, and the fifth space is marked with an X. Whoever moves the tracking pawn onto the X removes a block from the pile (circumstances dictate this generally won't be the same person every time). There are certain rules here as well . . . you cannot take a piece if it splits the board in two, for example.

As pawns get hemmed in like this, it becomes harder to evade other players, and someone will make the final tag to win the round. The next player then builds a new field. After playing a few rounds and adding all the scores (there are a couple of different ways suggested for scoring), someone will be the overall winner.

This may be one of the sturdiest games ever made. The box is tough enough (it has to be) to hold all the heavy-duty pieces, and those pieces should be able to weather any kind of damage shy of gunfire. They seem like rejected segments taken from a construction site or art project. The pawns are the sort anyone can buy from a game supply shop.

The mechanics are simple, and offer just enough tweaks along the way to make what seems like a simple game a little better. Unfortunately, it just isn't enough to really hold the interest. This isn't chess, but there's a certain feeling of mathematical certainty that suggests the outcome is all but predetermined once the pieces are set down. The only thing keeping you from knowing who's going to win may be those algebra classes you skipped out on in high school.

Although advertised as a game for two to four players, one should limit one's games to three and four players. With only two, the moves become predictable, and it's just as likely those two will continue to bounce back and forth on the same two blocks endlessly, waiting for the other to make a mistake. The whole thing will probably be decided when the missing blocks close out an escape route, not when someone pulls out an amazing and wholly unexpected move.

Infinifield's small pawn diagram is printed on the rules themselves, so you have to keep the sheet where you can see the picture and the rules or else you have to photocopy the diagram. Since the pawn on the picture has to be moved every single turn, it's easy for the group to forget who has or hasn't moved it, or whether it's been moved at all. The whole thing is a great idea that sounds better on the box than it feels in play. Lacking the variety, spice, or punch of other such games, the genius in absentia of this pastime leaves you wanting just a little bit more.

Pyramid Review

Worlds of Cthulhu #2 (for *Call of Cthulhu*)

Published by [Pegasus Press](#)

Edited by Keith Herber & Adam Crossingham

Written by Anne Abelein, Adam Crossingham, Samar Ertsey, Adam Scott Glancy, Joachim Hagen, Florian Hardt, Daniel Harms, Mark Harris, Frank Heller, Steven Kaye, Christopher Maser, Mike Mearls, Andreas Melhorn, Matthias Oden, & Tina Wessel

Translated by Robert Maier, Calum McDonald, Alexandra Velten, Hans-Christian Vortisch, & Bill Walsh

Cover by Francois Launet

Illustrated by Koen Goorickx, David Lee Ingersoll, Francois Launet, Natalie Sandells, & Taschira

Cartography by Allyn Bowker, David Conyers, Kostja Kleye, Björn Lensig, & Chris Schlict

130-page perfect bound black & white book; \$18.00

The publication of [Cthulhu Dark Ages](#) opened up the possibility of source material and support published in Germany by Pegasus Spiele being translated into English, rather than the other way around. Unfortunately, this is something that Chaosium has yet to exploit, leaving room for Pegasus Spiele to take advantage of this as Pegasus Press. Not with supplements like *Malleus Monstrorum*, *Berlin -- im Herzen der grossen Stadt*, and *Wales*, but with material taken from their magazine, *Cthuloide Welten*. Now appearing in an English edition, *Worlds of Cthulhu* bridges the gap between magazine and supplement, appearing only twice a year and being only 130 pages long. The idea is not just to reprint some of the best articles from the German editions, but to eventually accept English language submissions as well.

Worlds of Cthulhu is edited by Keith Herber, the author of such classics as *The Fungi From Yuggoth*, and by Adam Crossingham, the editor of the *Cthulhu Now/Delta Green* fanzine, [The Black Seal](#). The translation work for this issue has been handled well, and the writing is both engaging and informative. The magazine is laid out in neat and tidy fashion that makes it a far better looking affair than many of Chaosium's official releases. The cover is a suitably disturbing depiction of Y'golonac, whilst the internal art is at least reasonable. Where appropriate, the articles make use of period photographs, whilst the various handouts and maps are all done to a decent standard.

Worlds of Cthulhu #2 opens with a *Cthulhu by Gaslight* offering. Frank Heller's "The Good, The Bad, And The Utterly Insane" provides everything necessary to run a campaign in the Wild West except, essentially, the background.

For this it recommends several other sourcebooks, including *GURPS Old West*, *Sidewinder Recoiled*, [The Knuckleduster Firearms Shop](#), and [The Knuckleduster Cowntown Creator](#). Instead, it adds several new skills, such as True Grit ("I ain't dead yet . . ."), Quick Draw (modifies an investigator's Draw! rating), and Spit. New rules cover combat Old West style, cinematic rules for the Keeper that wants them, and a guide to "Goin' Plum Loco." All of the expected occupations are present, as well as a number of Backgrounds, including Chinaman, Immigrant, Indian, and Mexican, purchased with a character's skill points. Each gives attribute and skill modifiers, in addition to being a very nice method of customizing characters to the setting. Unfortunately, what is a very solid article is let down by the scenario, "The Hunt for Kid Richter," which -- although providing a reason for the characters to be together -- is really just an opportunity to test out the combat mechanics. It does hint at a more occult-themed scenario to come, but the lack of one now is deeply unsatisfying.

"In the Grip of Madness" by Joachim Hagen and Samar Ertsey appears to be just another article on mental disorders, but it goes beyond the theoretical to suggest how both Keeper and players should portray them during the game. Adam Crossingham and Daniel Harms continue their exploration of Clark Aston Smith's Averoigne begun in issue #1 as an alternative setting for *Cthulhu Dark Ages*, with a gazetteer and a list of its occult and Mythos tomes, while Tina Wessel offers a look at an archetypal figure of the 1920s with "The Flapper -- The New Generation of Women in the 1920s." This is an informative and interesting piece whose use stretches throughout the decade.

In absence of continued support for Pagan Publishing's *Delta Green* setting, the magazine contains a regular column, "Directives From A Cell" by Adam Scott Glancy. This issue extends the previous column's discussion of the game's foreign audience's penchant for creating home-grown agencies devoted to fighting the Mythos. The effect of this is to have too many agencies similar to Delta Green, but what of an *ad hoc* government groups set up to deal with conspiracies (with a small "c")? Modelled from the South African Police Service's "Occult Related Crimes Unit" established to deal with witchcraft-related crimes, the idea is to have a small group brought together to investigate crimes like slave trafficking, smuggling, and so on, which could have links to the occult or even the Mythos at a very low level. The column provides a good starting point for a more downscale campaign with a grubbier edge. The second column supports [Cthulhu d20](#), Mike Mearls offering several original feats. A new type is the Stress Feat, which only comes into play when an investigator is in danger. For example, Adrenaline Rush gives a bonus to a pre-selected attribute when triggered, while Heroic Sacrifice lets a character swap places with another who is in great danger and take some of the damage they would have suffered. The other new general feats provide benefits when an investigator is conducting research or has been driven insane. Statistics for all of the magazine's scenarios and articles for *Cthulhu d20* is available from its website.

The first of the issue's three scenarios is one of two one-shots. Florian Hardt's "The Singer from Dhol" is designed for four to five players and is set on Oyster Island, off the coast of Maine. Inspired by an M.R. James short story, the players take the role of members of the Gullson family, island farmers ill liked by the other inhabitants. The story at first concerns a squabble over the will of the family late matriarch, but dark secrets and histories soon come to light. The second one-shot is "The Icarus Project: An Adventure in the Far Future" by Christoph Maser and Matthias Oden. Set in the 27th century, it is again designed for five players with pre-written characters who awaken aboard a seemingly abandoned ship that was sent to rescue its sister ship. Her maiden voyage and testing of a new FTL drive involved a journey to the center of the universe. In a universe where the Mythos is a reality, this of course, can only be a bad thing. Like all three scenarios, it is well written, and comes with good staging advice for the Keeper.

Because these two scenarios are one-shots, the issue suffers for it. Of the two, "The Singer from Dhol" is the more adaptable, easily transposed to other times and places. More useful then, is "Super 8," a modern-set scenario that takes place in New York. Written by Andreas Melhorn, it is also suited for use with *Delta Green* as it delves into the dark and seedy side of the city's underworld. It shares thematic similarities to the scenario "Love's Lonely Children" from the recently reprinted anthology *The Stars Are Right!*, but this a far more easily run affair, one that provides a Mythos tainted twist upon the snuff flick.

It is fair to say that the contents of this issue are far more interesting and possess far more of an edge than the material in Chaosium's releases of late. Unfortunately it suffers because two of its three scenarios are one-shots, making it less useful to the Keeper wanting scenarios and articles to support his own campaign. That said, the articles on mental disorders and the flapper are both helpful support, and the scenario "Super 8" will be sure to please both the *Cthulhu*

Now and the **Delta Green** referee. And while "The Good, The Bad, And The Utterly Insane" is a fine article in its own right, the lack of a good scenario to support it, is both a shame and an opportunity missed. Still, this second issue of **Worlds of Cthulhu** further showcases some of the more than excellent material appearing in the German language.

Pyramid Review

Federation Commander: Klingon Border

Designed by Stephen V. Cole

Published by [Amarillo Design Bureau, Inc.](#)

Boxed game; \$59.95

Federation Commander: Klingon Border is the latest in the Star Fleet Universe family of games from Stephen Cole's starshipyard at Amarillo Design Bureau. Should you reach up on the shelf to take this down for inspection, beware! The box is densely packed and much heavier than you might expect. What do you get for your hard-earned cash and muscular exertion?

The second thing I noticed after sliding off the full-color slip cover and opening the plain white box underneath was the map panels. Gone is flimsy black hex map sheet. Instead you get six thick letter-size panels with full-color space photography (care of NASA), marked in 5/8" hexes on one side and 1-1/4" hexes on the other. Space wargamers who deal with hexagons probably just got their investment's worth right there. These are also being sold separately as the "Deluxe Space Battle Maps" (\$29.95), which includes these same six panels plus two more with planet art.

The game also includes two six-sided dice, a grease pencil, a pinch of paper clips in a zip-bag, two sheets of counters (one in the 1/2-inch size, color-keyed by government, for use on the small-hex map; the other with full-color ship art on 1" counters), a pair of helper sheets for using plastic or metal miniatures with the game, two laminated reference cards (full-page size, both sides used) and sixteen laminated half-page cards for the ships. The 52-page staple-bound rulebook presents a very complete set of rules in a very concise manner.

The ship cards are what you tend to notice first. Each ship is represented by a single card. On one side, the "Squadron Scale" representation is the very familiar ship display from **Star Fleet Battles**. On the other, the "Fleet Scale" version has all its features reduced by half: power produced, shield strengths, number of weapons, etc. One new feature is the vigorous use of color to key system types and other game information. One gets used to the riot of hues after a while. The lamination allows easy marking and reuse without resorting to photocopiers. (Only one card for each type of ship is provided, leaving players using multiple vessels of the same type to head for the copy shop or scanner-printer anyway.) The Fleet Scale is intended for introductory or faster play, or for use in large multi-ship actions; the Squadron Scale for the hardcore highly-detailed ship combats.

Playing **Federation Commander: Klingon Border** will be very familiar to those acquainted with the **Star Fleet Battles** game, yet with some very new wrinkles. The Ship Log, for recording energy use, is gone (and won't be missed). Instead you have freeform allocation using tokens, or the provided counters or running paper clips along the Power Track on the edge of each ship card. The turn begins by establishing a "Base Speed" (movement eats the most reliable chunks of your energy reserve, so it's better to front-load that decision). During the eight phases of the turn, you pay as you go to modify your speed, fire weapons, operate ship systems, and so on. At the end of the turn, a few housekeeping chores set you up for the next turn.

While some of the movement rules have changed, the overall principles are still the same: proportional movement through the turn, restrictions on turning and slipping (moving forward but into a hex to the side) and so on. Markers are now provided to help the captain remember when he last turned or slipped; this makes abiding by the rules much less taxing on the player's memory.

The combat rules are likewise slightly streamlined but still familiar: weapons can only fire in specific "arcs" relative to

the ship's heading; tables and die rolls determine total damage points; and rolling on an allocation table converts those points into specific damage. Damage allocation takes about one-tenth the rolls that it used to, and the table itself is smaller than it was. Options to "target weapons" or "target engines" shift the damage table used, giving a very clean approach to a very traditional element from starship battles in the television shows and movies.

After trying out some basic duels at both the Squadron and Fleet scales, I can report that this rules set works as advertised. On the simpler scale, a basic shootout took a little under an hour and didn't feel skimpy. That matches the best time I had for a duel in ***Star Fleet Battles***, using extensive automation (a self-written computer aid) to help with movement and damage. A multi-ship action in the smaller scale progressed smartly with no confusion from loss of momentum during turn changes or other chores. The duel at the squadron scale was still involved, but managed to be smoother than previous experiences with the older game.

I find only a few drawbacks to the set. As mentioned earlier, the coloring takes getting used to. Over a dozen tints may be on any given document. Also mentioned earlier, while the laminated ship cards are nicely reusable, they don't quite free the players from the tyranny of the copier. The other weak component of the game is the rulebook. There is no cover; it is basically 26 11×17 sheets, printed and then folded and stapled. This gives it a flimsy feel. The table of contents only lists the rules chapters and sections. Discussion of the in-game history (and such niceties as the publisher's credits) don't appear there or in the reasonably thorough index. I would have appreciated a fully-worked example, say watching a classic duel step-by-step with rules cross-references, as an aid to familiarization and morale.

When I first opened this game and read it, I was faintly disappointed. The early press information had suggested that the Federation Commander series would be a very different critter from ***Star Fleet Battles***, much more abstract and higher-tempoed. Instead, it seemed to me just ***Star Fleet Battles*** respun. After some more reading, I accepted it for what it was and did some playing. With the generally higher production values, sturdy and reusable components and optimized rules, ADB is able to keep their invested starship library and put it to work inside a better, friendlier (but still serious) game. ***Star Fleet Battles*** is not going away, but if it did, ***Federation Commander: Klingon Border*** would be a worthy heir and a solid foundation on which to expand farther into the final frontier.

--Bob Portnell

You Say "Anarchy" Like It's a Bad Thing . . .

Last week we looked at some burning questions that face practically any RPG campaign world, such as ["Are there mashed potatoes in heaven?"](#)

One of the underlying questions that remained untouched in that column, mostly to leave another 1,000+ words unwritten for the next installment due 168 hours later, is how to make a different societal construct truly understandable . . . or at least different-feeling.

As one example that came up last week, I was trying to think of a (Classic) *Star Trek* episode or movie (or even novel or comic) where the audience was supposed to think Spock was a ripe bastard. As a Vulcan, his species that has dedicated itself to logic above all else. Really, that should time and again rub humans (the majority audience for the various *Star Trek* series) the wrong way. I mean, if Spock is in command of the *Enterprise* and he concludes with a 67% probability that the only way to save 70% of the ship is to feed the other 30% of the crew to a Mr. Horrible Gelatinous Monster, then I'm guessing he'd be at the front, tossing redshirts into its maw. And if it would add an extra 0.5% probability of success to marinate the crew first, then he'd be cracking open the Lea & Perrins.

Roleplaying games are chock full of alien mindsets and cultures that, too often, don't end up *feeling* alien; by reclaiming that alien-ness, you can add more freshness and interest to a campaign than a hundred splatbooks or Ultimate Collections of Geegaws. Continuing our example on logic, in one *In Nomine* game I was playing my Elohite (think "supremely logical angelic Vulcan"), and the other player was running a Malakite (think "warrior Angel").

Our super-fast human-looking quarry had escaped out the window of an apartment, and the police were pounding down the door, reacting to a commotion. Thinking quickly, my character handed his gun to the other PC and said, "Shoot me." After protesting, I told him more insistently, "Shoot me!"; he did. After that, I snatched the gun from him and shot *him*; I then proceeded to wipe down the gun and toss it out the window.

The police barged in, and -- still profusely bleeding -- I explained that some guy shot us before escaping out the window. I then offered a description of our prey.

When the GM asked why I did that, I explained: "Well, as I perceived them, the problems we faced were: 1) Chasing our quarry, and 2) needing to escape or deal with the police, 3) without having to answer a lot of strange questions. We were incapable of doing #1 with #2 looming over us. So, by shooting ourselves and fingering someone else, we almost certainly send the police searching for the bad guy. And the ambulance ride should take care of #3 while we think of a new plan." The GM nodded and obliged us with an ambulance ride (our characters, that is . . . it'll be one goofy plan too many if the GM ever obliges me as a player with an ambulance ride).

Of course, all this talk of alien cultures doesn't even begin to touch upon one of the most potentially alien societies: other eras of humanity.

In last week's column I posited a society where there wouldn't need locks on doors; the notion simply wouldn't occur to them. Now, while some folks scoff at this idea (including, I confess, myself on some level), I note that humanity has always acted -- or *not* acted -- in certain ways because the idea of doing otherwise was inconceivable; social inertia is a powerful force.

As one example, envision asking modern people, "Why aren't you wearing armor?" The answers to this could fill a column on its own (probably a very dull column, but still . . .); nevertheless, I suspect most versions of this Socratic dialog would ping-pong along the line of:

- "I'm not in danger." (Is the modern person in less day-to-day danger than your average fantasy city-dweller?)
- "It wouldn't do any good against modern weapons." (Depends on the armor; regardless, some protection would be better than none.)
- "It's against the law." (I don't think so, but who knows *what's* illegal nowadays?)

And so on.

Of course, for most folks the *real* answer would probably be along the lines of, "I never even thought of it." And, even if someone *did* think of it, it would probably be a fleeting "Why the heck did I just think *that*? kind of thought. (Of course, if you hang around with people who *do* wear armor daily, then that speaks more to your choice of friends than the general state of the world.)

Many eras of humanity have ideas about what's right and wrong that can make modern folks scratch their heads. (Of course, so do some other cultures.) As a minor example, my stepfather recently went to India to train some folks in their early 20s. He was showing off pictures from my recent wedding, and they were all appreciative and interested. However, one thing that they found very strange was the notion of the husband and wife kissing during the service, in front of their families; a few of the women he was teaching said that their parents (who were in their 40s) would have fainted in church at such a display!

Of course, I'm amused at the notion of American churches being thought of as such dens of depravity (insert your own joke here) because they actually permit kissing on holy ground. But, on reflection, it's not like kissing is a biological necessity or mandate from the heavens; it's just something we do.

Many RPGs sidestep the notion of alternate or advanced social development; even my beloved **Torg**, which has one of its four core axioms devoted to the social development of a society, provides almost no fully-fleshed examples of cultures more socially advanced than modern Earth. (The only one from the Core Set, the corporate espionage Nippon Tech, basically waved away its one-point improvement over our Earth by saying, "Well, sure, it *would* be more advanced, but Evil People are repressing the society . . .")

Of course, from a conceptual point of view it's pretty obvious that one of the biggest problems with trying to describe a more socially advanced society is that, if you could conceive it, it could probably be done by the "real" world. But as satisfying as it can be to visualizing whirled peas, the more fruitful option (at least from an RPG point of view) is to think of the desired conclusion, and work toward that.

Why? Because practically anything you can envision can be argued for as being correct, and -- more to the point -- could probably be thought of by a society as the *only* correct option. Usually this notion of "That's just the way we do things" is used to hand-wave away things from the modern society's past: infanticide, permitting 12-year-old girls to marry, legalized slavery or racism, and so on. But the same hand-waving technique of "How would we do things any other way?" can be used to visualize more advanced or better societies (or at least alternate ones).

One memorable episode of the *New Twilight Zone* series was called "To See The Invisible Man"; it was adapted from a short story of the same name. Basically, a criminal is sentenced to a year of being "invisible": He has a mark placed on him that signifies the rest of society is supposed to ignore him, but otherwise has no other punishment imposed. On the surface, this strikes us as odd. But look at it from the point of view of the story's society: The criminal isn't taking resources in the same way that expensive prisons are, and it quite possibly places more of an emphasis on the rehabilitative aspects of punishment.

So, as a worked example, we would probably envision a society without laws to be much less advanced one. However, it's possible to turn that around and visualize it as a positive: What if local communities simply relied on their own judgment of right and wrong, exerting social pressure on those who threatened to step outside the order and taking more aggressive action for those persistent transgressors? The members of that society might find notions of codified laws to be quaint and baffling, since if you aren't doing anything wrong then you don't need laws. (There are a handful of *Star Trek* tales that deal with this concept to varying degrees.)

As another worked example, what if the notion of privacy was eliminated? While it's possible to cast this in a dystopian "the government can watch everyone" light, it's also possible to say that society has evolved beyond such notions: If you know enough not to go poking around in others' business if it's no business of your own, then what does privacy matter? If everyone is equally open and vulnerable, then it's possible to envision that everyone will leave everyone else alone. (One modern analogy of this that can be extrapolated is the idea of property rights. For most of

Western society, the notion of land ownership was an infinite three-dimensional construct: If you own a 100-acre square of land, you own everything below to the center of the earth and everything above to the infinite heavens. However, the invention of the airplane required a rethinking of this idea, since the need to get permission from a zillion different landowners to make one transcontinental flight would be impossible. Therefore, people in the modern world just accept that planes can fly over "their" land, even though they've lost a right they used to have. Same thing with privacy: By permitting everyone access to "your" space, you trust society to use that space responsibly.)

Mind you, I don't think I could handle living in either society, since I rather like law and order and privacy.

The notion of a more socially advanced society is a difficult one to grasp, but I think it's one of those things like pornography: Folks know it when they see it. And it's especially useful in an RPG to start with the effects of the more socially advanced society, and work backwards to why people believe that way. Because, looking at the way we muddle along in the real world, trying to advance our thought processes from now to a more perfect society is going to take a *long* time.

There Was a Trilogy From Nantucket

The Nantucket Trilogy

Written by S.M. Stirling

Published by Roc

The Nantucket Trilogy, by S.M. Stirling, consists of the books *Island in the Sea of Time*, *On the Oceans of Eternity*, and *Against the Tide of Years*. These books are one of the best sources for those interested in time travel or interdimensional gaming. This review will describe the plot in broad outlines, with only minor spoilers, then will move to gaming applications.

In these books the island of Nantucket is transported, through unexplained means, to the year 1250 B.C. The repercussions of this, and how the inhabitants handle it, forms the plot of the story. The Nantucketers (called "Eagle People" by the natives of 1250 B.C.) first have to deal with the psychological shock of being separated from all they know and then the even more pressing matter of how to feed themselves. Stirling manages to handle the psychological element in an interesting manner by making the reader an observer of the shock's outcome, rather than slowing the pace of the story by focusing on someone's inner pain.

The search for food brings the Eagle people (on the Coast Guard sailing ship the *Eagle*, which was also brought along to the past) to England, to trade for grain and animals. This trip eventually draws them into the politics of the Old World. It does this by planting ideas into the head of a Coast Guard officer, William Walker, who eventually leads away a small group of Nantucketers to found a European empire using 20th century technology.

This rebellious splinter group creates most of the rest of the plot as the Eagle people form an army and navy to fight a protracted war against a growing number of adversaries, as knowledge of gunpowder and other advanced technology begins to proliferate throughout the world. We eventually follow the soldiers and sailors of Nantucket into battle in Mexico, England, all across the Mediterranean, around the Horn of Africa, and across the Middle East. There are politics, spying, trade, and war involving Olmecs, Babylonians, Assyrians, Mycenaeans, Hittites, Trojans, Egyptians, and others.

We also follow non-military characters as they explore (including an expedition across North America), run spying operations and plan policy. The books are accurate and include facts and details that add a realistic feel to this inherently unrealistic genre. They do so without being tedious and usually maintain the pace of the story. They have a great balance of plot, setting, and characterization. The battles are detailed enough to be visualized, but not so long as to be boring.

There are a few hand-to-hand combat scenes which are easy to follow and brief enough to remain interesting even to those uninterested in the choreography of fights.

The Nantucket Trilogy would serve as an excellent setting for a roleplaying game. It could be lifted entirely without modification and provide ample scope for character development and adventures of all types. The reader should be warned that these books are fairly savage and also contain scenes that include sadism, rape, and sexual torture. They are not described in detail, but are definitely present.

One thing that a GM could do would be to have players make characters from the 1990s (giving them a little help with skill selection), then send them to Nantucket on vacation or whatever, then spring the transition on them the same way that it was sprung on the characters in the book. How will the characters cope? How will they fit into the new society? How will the character with the wealth advantage cope with its sudden loss? (Here the GM should probably subtly reimburse the player with other advantages.)

As the story progresses, the characters can become involved in soldiering or sailing in the military. They could club together to buy a boat and trade across the oceans, fighting the growing number of pirates and opening new markets. The first group to get trade established in China, India, or the Persian Gulf would make a fortune. They could become spies, matching the tradecraft they have learned through modern spy novels against the best counterintelligence of the Egyptians. Alternatively, they could join the bad guys, if the players are so inclined, or form their own splinter group. There are many parts of the world that lie unclaimed by modern technology that would fall to a new Cortez and his followers.

The feel of such a game would be whatever the group likes. However, the books are definitely gritty and realistic. A creative GM could twist the story a little and add elements of the supernatural to give a different feel. Adventurers could match their firepower and wits against the magic of the early Cabal, or battle a Shaman and his spirits over a powerful artifact or important trade concession. The whole event that brought Nantucket back in time could be the center of a secret history campaign. Was there someone on Nantucket when it was transported that knows the answers? Did a group there know too much and cause their enemies to banish the island as part of a greater game? Perhaps it is the characters themselves.

The other way in which these books will help the roleplayer is by being a great illustration of how world building is done. Stirling is obviously very knowledgeable and includes a lot of information in throwaway lines here and there. Together these add up to a lot of facts about history, war, economics, manufacturing, and other subjects. These are easily taken out of this context and used elsewhere.

GMs and players interested in a campaign where they build up a primitive area to a higher tech level will see this illustrated here in some detail. Those who would like to have a hand in roleplaying in the setting realistically would be well served to use these books as a reference. The problem of scrounging among what is available to make the tools to make the tools is seen. The often undealt with issue of cultural dilution becomes a real problem. The Nantucketers need far more workers than they have; how many can they take in before the group loses what it is that makes them who they are?

In short, the Nantucket Trilogy by S.M. Stirling would be a very useful source for anyone interested in roleplaying crosstime or dimension campaigns.

--*Stephen Coney*

Dork Tower!

Dork Tower!

A Polyphony of Mermaids

"[S]he pines sometimes, I think, for her great grey ocean. I hate to keep her penned up in this tank, but I know of nowhere else to put her. I think I shall turn her loose some day when we are showing along the seacoast. . . . And I shall stand there . . . waist-deep in the water, mourning over the beauty I have just let slip away from me, mourning over the beauty I could touch and see but never completely comprehend"

-- Dr. Lao, in *The Circus of Dr. Lao*, by Charles Finney

In April of 1964, the Situationist "anti-artist" Jørgen Nash cut off the head of Copenhagen's most beloved statue, Edvard Eriksen's 1913 "Little Mermaid." The "who" of it remained unclear until his 1997 confession; the "why" remains murky today. Her head was never recovered, and had to be replaced. And it gets worse -- in 1984 two drunks cut off her right arm, on Epiphany of 1990 she again suffered decapitation, and on September 11, 2003, she was blown off her stone perch with explosives. What is the rage that swirls, like the whirlpool of Charybdis, around this most iconic of all mermaids? Another dip into the waters of the bestiary, into the ocean of strangeness. Let's find out.

"The mermaid is a sea beast wonderly shapen, and draweth shipmen to peril by sweetness of song . . . And Physiologus saith it is a beast of the sea, wonderly shapen as a maid from the navel upward and a fish from the navel downward, and this wonderful beast is glad and merry in tempest, and sad and heavy in fair weather."

-- Bartholomaeus Anglicus, *On the Properties of Things* (c. 1240)

That, intriguingly enough, is the earliest unambiguous written description of a mermaid, as such, that I can find. There are plenty of pictures of fish-tailed beings predating the 13th century, of course, going back to our old acquaintance [Oannes](#) in Babylonia around 1600 B.C. By the Middle Assyrian Kingdom a few centuries later, fish-people had become generic, with the wonderful appellation *kulullu*. The fish-tailed Philistine goddess [Derceto](#) made quite an impression on Greek visitors to Syria, and caused a wave of depictions of Aphrodite with a fish tail; Greek depictions of the Tritons as fish-tailed go back to the 6th century B.C. or so. One occasionally reads hints in Ovid or other classical writers of fish-tailed beings of one or another sort, and Pliny describes Nereids as fish-people, albeit green and scaly all over. But the word "mermaid" is a medieval one (despite the Anglo-Saxon *merewif* or "sea witch") coming from the French *mer*, meaning "sea," and so is the concept.

Said concept includes not just the upper body of a beautiful woman and the lower body of a fish. The mermaid has specific attributes, both physical and moral. She has long hair, which she combs or examines in a [mirror](#) or both. She tempts sailors, either by her beauty or by her cries. And should they yield to such temptation, she and her fellow mermaids "ravisheth" them, and once the fun of that wears off, "she slayeth him and eateth his flesh." Mermaids can predict the weather, and their moods mirror it (happy in storms, sad in calms), and they lure ships into squalls to destroy them. And thus, says the Church triumphant, they represent temptation and lust. Or at the very least, the importance of paying attention to the sails and winds instead of thinking about girls.

"This morning, one of our companie looking over board saw a mermaid, and calling up some of the companie to see her, one more came up, and by that time shee was close to the ship's side, looking earnestly upon the men: a little after, a Sea came and overturned her: From the Navill upward, her backe and breasts were like a woman's . . . her body as big as one of us; her skin very white; and long haire hanging down behinde, of colour blacke; in her going down they saw her tayle, which was like the tayle of a Porposse, and speckled like a Macrell."

-- entry in the log of Henry Hudson, June 15, 1608

But the Church had more than moral example on its side. It had first-hand testimony, and the occasional captive. Mermaid encounters go back to the 6th century, and even before -- Pliny describes Nereids seen off Cadiz in the era of Tiberius Caesar. We have three medieval sightings in Ireland (and two captured in 1018 alone), a shipful of Crusaders subjected to merfolk "jeering" them in the Bay of Biscay in 1147, a web-fingered mermaid spotted off Greenland in the same century, and so forth. There are first-hand reports from authorities like Columbus (who saw mermaids in 1493), Ambrose Pare (in Rome in 1523), and Henry Hudson's 1608 sighting noted above. Captain John Smith saw a mermaid in 1614 and almost fell in love despite her ears being "a little too long" and large eyes "rather too round." Scotland had a rash of mermaid sightings in the 19th century -- at Caithness in 1809, Kintyre in 1811, Port Gordon and

Banff in 1814, Benbecula in 1830, the Isle of Yell in 1833, and Cruden Bay in 1870. A Dr. Chisolm reports mermaids from the Caribbean in 1797, and one Jacinto Fetalvero admits to a mermaid encounter in the Philippines in 1978.

"It's a mermaid!" Conseil exclaimed. 'With all due respect to Monsieur, it's an actual mermaid!' That word 'mermaid' put me back on track, and I realized that the animal belonged to that species of marine creatures that legends have turned into mermaids, half woman, half fish. 'No,' I told Conseil, 'that's no mermaid, it's an unusual creature of which only a few specimens are left in the Red Sea. That's a dugong.' 'Order Sirenia, group Pisciforma, subclass Monodelphia, class Mammalia, branch Vertebrata,' Conseil replied. And when Conseil has spoken, there's nothing else to be said."

-- Jules Verne, *Twenty Thousand Leagues Under the Sea*

The overwhelming consensus among serious naturalists is that such mermaid sightings are mostly sightings of manatees or dugongs, two tropical species of water-mammals that can -- in fog, at night, from a distance -- occasionally resemble a dumpy bald mermaid with flippers. You will perhaps have noted that an awful lot of those mermaid sightings come from non-tropical waters blissfully free of manatees or dugongs, to which objection serious naturalists mutter something about "monk seals" or "Steller's sea cow" and change the subject. The notion that a Scottish fisherman doesn't know a seal from a mermaid is perhaps less likely than the notion of mermaids. The Roman skeptic Lucretius had a far better explanation: mermaids come from "films" of fish and maidens floating in the air, or in other words, people see weird stuff and make up stories about it. In "The Prevalence of Mermaids," Avram Davidson makes an excellent point that feral children found near water were likely to be recorded as "mermaids" -- a surprising number of mermaid sightings describe the mermaid as "identical to a human" -- but doesn't quite let us know where he thinks the notion of mermaids came from in the first place. Like Lucretius, I'm inclined to think the notion came from the poetic imagination.

*"First to the Sirens ye shall come, that taint
The minds of all men, whom they can acquaint
With their attractions. . . .
And then observe: They sit amidst a mead,
And round about it runs a hedge or wall
Of dead men's bones, their wither'd skins and all."*
-- Homer, *Odyssey*, Book XII (tr. George Chapman)

And specifically, it seems to have come in no small part from Homer's poetic imagination, although his Sirens are not described as fish-tailed, or anything-tailed. In fact, in Apollonius' *Argonautika*, and in a staggering number of Greek vases and paintings, the Sirens are depicted as *bird*-women, which makes sense once you realize that their key feature is their song, not their oceanic habitat. The Sirens, whose name comes from *seirao*, "to bind," were daughters of the river-god Achelous and one of the Muses (stories vary), and we can already see the fish-tails coming back, can't we? And indeed when we look on those handy vases, we see Achelous sporting a long, sea-monster tail (and the horns of a bull, to screw things up further). Indeed, the word *sirene* or its cognates is also used in most Romance languages for mermaids as well. The two are, at the very least, kissing cousins. The depictions of Sirens in bestiaries and art can be visibly caught between bird- and fish-form in the 12th-century bestiary translated by T.H. White, where the entry on "Sirens" describes them as fish-tailed alongside an illustration showing a Siren possessing both wings and fish-tails.

The Sirens, regardless of parentage and appendage, sat on rocky islands and sang, and their songs lured sailors to their deaths in virtually all known cases. Only two heroes got past the Sirens with their ships intact. Orpheus saved the Argonauts by singing a song still more beautiful and enchanting, drowning out the Sirens' song. And Odysseus, by stopping his crew's ears with wax and chaining himself to the mast, got his ship past the Sirens' rocks and heard their song on the way by. Enraged by this defeat, later authors said, the Sirens threw themselves off their cliffs and into the waters below to drown -- or, perchance, to become mermaids.

*"The doomed in his drifting shallop,
Is tranced with the sad sweet tone,
He sees not the yawing breakers,
He sees but the maid alone:*

*The pitiless billows engulf him!
So perish sailor and bark;
And this, with her baleful singing,
Is the Lorelei's gruesome work."*
-- Heinrich Heine, "The Lorelei" (tr. Mark Twain)

And from "drowned women" the road back to mermaids is straighter than you might think. The clearest case is Liban, a pagan girl drowned in Ireland who became a mermaid (or technically a merrow, from the Gaelic *muir-oigh* or "sea maid") until she was converted by St. Comgall. Jenny Greenteeth, Peg Powler, and other river-spirits have similar origins -- girls drowned who become underwater temptresses and destroyers. Likewise, the nixie of Germanic lore, the Russian rusalka, and the Scandinavian havfrau. In a slight variant, the Norse goddess Ran catches drowned men in [her net](#) beneath the sea. The combination of water, death, and haunting song leads us likewise to the *bean sidhe*, or banshee, and to her Mexican cousin [La Llorona](#), who weeps by the water for her drowned children. In other versions of the story, the mermaid emerges onto the land to seize a mate -- usually by her beauty. The French mermaid Melusine married Raymond of Poitou (shades of the oceanic Quinotaur spawning the Merovingians) but the marriage fell apart for the standard fairy-tale reason (a broken promise, in this case not to spy on her in her bath). Looked at through this lens, the Lady of the Lake has some mermaid features, too. She raised the infant Lancelot, who would destroy the Round Table, and when she gave Arthur Excalibur she demanded the head of Sir Balin in exchange.

*"We come from the mind, Of humankind,
Which was late so dusk, and obscene, and blind;
Now 't is an ocean, Of clear emotion,
A heaven of serene and mighty motion . . .*

*From the dim recesses, Of woven caresses,
Where lovers catch ye by your loose tresses;
From the azure isles, Where sweet Wisdom smiles,
Delaying your ships with her siren wiles."*
-- Percy Bysshe Shelley, *Prometheus Unbound*, IV:93-110

This bargain -- death by water in exchange for power -- was the bargain of the Sirens. Odysseus, you'll recall, wanted to hear the Sirens sing, and they promised to reveal to him the knowledge of the gods, "the sorrows of the Argives and Trojans." Tiberius Caesar, in whose reign Pliny's sources saw "Nereids" off the coast of Spain, spent his last decade on Capri drowning in sexual perversion and books of forbidden lore, the provinces of the mermaids. You think that's a stretch? Well, Capri was originally named Leucosia -- which, as it turns out, was the name of one of the Sirens. Yes, Capri was the original Siren rock, but it gets better. At the sordid and sorcerous banquets of his debauched retirement Tiberius habitually asked his guests riddles, such as "What name did Achilles take when he hid among the women?" and "What song did the Sirens sing?" Tiberius was after something; after the power of the mermaids.

We know the song the Sirens sang, because Odysseus tells us -- the song of the sorrows of the Greeks and Trojans, in other words, the *Iliad*. And Odysseus bore that song away from them, stealing it from them as Prometheus stole fire from the gods. At that point, the Sirens fling themselves into the ocean and drown, becoming mermaids. Odysseus' capture of the song changes them -- a phase change from air (the realm of the [superconscious](#), the unimaginable) to the sea (Jung's unconscious, the universal deep). In a different myth, the Sirens challenge the Muses to a singing contest, and when they lose, the Muses pluck their feathers and hurl them into the sea -- another sort of phase change. Similarly the Irish legends of St. Patrick changing the recalcitrant pagan women (worshipers of the raven-goddess Morrigan?) into mermaids point to such an alteration. Ovid's Nereids, as it happens, are born from the burning timbers of Aeneas' ships, destroyed off Capri, I note smugly. But [Cybele](#) (you knew she was coming, didn't you?) saved her sacred trees, turning them to water-women. Another shift, likewise associated with the Trojan War, the first song of the West.

*"I have heard the mermaids singing, each to each.
I do not think that they will sing to me.*

I have seen them riding seaward on the waves

*Combing the white hair of the waves blown back
When the wind blows the water white and black.*

*We have lingered in the chambers of the sea
By sea-girls wreathed with seaweed red and brown
Till human voices wake us, and we drown."*
-- T.S. Eliot, "The Love Song of J. Alfred Prufrock"

Are mermaids, then, the embodiments of song, the core beings of the cantosphere that manifests in the oceans around us, in the great sea of stories? Perhaps some were originally women sacrificed to the water, like Iphigineia at Aulis, whose death begins the Trojan War. Perhaps [Poe](#) was more right than he knew when he insisted that all great stories, at their heart, must be about the death of a woman. (Poe, of course, thought his tale "Ligeia" to be his best -- and Ligeia was, of course, the name of a Siren.) Perhaps such deaths, like that of Liban in Ireland, served as the seed pearls around which the "sea-change into something rich and strange" occurred, around which Lucretius' "films" can wind themselves. The selfhood of the drowned girl becomes the core of the living poem, and the mermaids propagate by driving stories themselves (note Lancelot, surrounded by women and water) or by seducing poets. [Swinburne](#), Byron, and Yeats, for example, all obsessed with the sea and swimming. And as mermaids will, they devour their lovers -- [Shelley](#) drowned in the Gulf of Spezia, Li Po fell into the Yangtze river, Hart Crane jumped into John Smith's Caribbean, Virginia Woolf walked into the waves. Sometimes, the mad and the drunken -- poets in potentia -- fight back, as in Copenhagen, but their vandalism is washed away. The song drains the singer and moves on, and the uncaring mermaids comb their hair.

Differences Big and Small

by Heather Barnhorst

It is once again the season of the Grinch, a time when I find myself reflecting on the achievements of my life and my expectations for the upcoming year. Some of my friends tell me that I've reached middle age and I'll leave you to decide what kind of friends delight in telling you these kinds of unpleasant truths. Their logic goes, "You are 41, you've probably reached the halfway point in your life -- you are middle aged." My logic says that I don't plan to die before I reach 100. I have found, though, that my Forties are more of a time for contemplation upon the direction of my life than my Go-Go Thirties ever were. Reaching a birthday that might throw you into that category of over-the-hillness does make you ponder your personal history.

In all of this thinking and pondering and mulling over, I have to come to the conclusion that my number one achievement, at least business-wise, is that I manage a game store. I will further admit that many people would not consider managing a game store to be a career move. It is something more akin to marking time until a better gig presents itself, a job taken while you attend college or to supplement an income. I have to tell you that no matter how much any of you believes that owning a game store is the coolest job in the world and no matter how many retailers will tell you that what they do is important because they sell "fun," the sad fact of the matter is that most people do not consider running a game store to be an adult occupation. I'm not sure that I believe it to be an adult occupation.

I attended my husband's company's Christmas Party last Friday evening. His VP hosted this Christmas soiree at his beautiful, million-dollar house located in the same gated community that hosts the International here in Denver every August. There was valet parking and catering and open bars located throughout the house. Most of the people I mingled with (all right, networked with) were corporate flunkies being paid three times as much as I make in a year. Nice corporate flunkies, I should hasten to add, but they surely did not know what to make of my occupation.

"A game store? How nice for you. So you sell . . .?"

"Have you ever heard of *Dungeons & Dragons*? Or toy soldiers?"

"You do that? Exactly what is that?"

"I sell board games, too. You know *Scrabble* and *Monopoly*?"

"Sure. I played those when I was a kid." Whether they were Tony the Marketing Analyst or John the Vikings Fan and Associate VP or Marissa the Brand Manager, they would wander off looking for better fodder to further their careers.

I did bond with Jack, a lawyer and the new boyfriend of my husband's manager. We geeked over *Law & Order*. He works in the oil and petroleum business. He does important things for important clients who pay him bucketloads of money. I sell *Yu-Gi-Oh!* to eight-year-olds who do not pay me bucketloads of money.

This point in my narrative is probably a good time for me to admit to being a trifle feminine -- I've always possessed a secret, envious desire to work a job that requires that I wear beautiful clothing as well as do good in the world. I am known for taking a great many pairs of shoes when I attend industry trade shows, but shoes doth not make complete outfits that can be worn to the office on a daily basis. The sad fact of the matter is that while I wear the titles of manager and buyer at the store, I am expected to wear many more invisible hats. I'm the person who receives the shipments (number one reason for not wearing nice clothing, because FedEx will deliver your boxes with the maximum amount of grime attached), I'm the janitor (yes, I've cleaned baby vomit from the carpet), also the publications manager (someone has to make the signs and print the monthly schedule of events), clerical help, event manager, and customer service representative. I talk to moms about games and I tell small children to stop running in the store. Yet the truth is that there are parts of me that love every aspect of this job.

The question I keep asking myself, though, is how important is this job that I do. I mean in the grand scheme of things.

How do I change the world? How do I contribute to the betterment of humanity? Some people would tell you that the minute kindnesses, the incremental movement toward connection are what continue to buoy us all up. Some people would tell you that this worldview is a steaming pile of horse manure. I yo-yo between the two positions depending on how trying my Best Customers have managed to be on any given day.

There are other people who will tell you that games are important because they express the human desire for expression. That each book, each collection of paper and ink and plastic, is an attempt towards some truth that the creator understands and needs to transmit to the rest of us. Most publishers created their first game out of pure love. Most retailers carry games not because they love retailing but because they adore games and they cannot imagine that any other line of work could make them happier.

Let's face it folks, games really are just bits of nothingness wrapped in pretty pictures. They don't create world peace. They don't solve the issues of hunger and disease or how to protect our fellow human beings from the ravages of natural disasters. If I, the purveyor of this paper crack am engaged in meaningless activity at least I can say that I make my living off of it. You, my friends, play them. Your involvement in terms of creating a worthwhile life could be considered highly suspect.

Games do not make a difference in this world.

Or do they?

I had a friend who went into the hospital rather suddenly and wound up staying there for a week. Normally someone who inhabits a hospital bed for that long is gravely ill and wishes for nothing more than to rest while scads of concerned people take care of him. My friend was indeed seriously unwell. His blood pressure spiked so high that several blood vessels in his eye popped and he lost part of his eyesight. He could have stroked out any minute but he didn't feel sick. Hospitals are fairly faceless affairs where everything and everyone become part of the automated system and there he was stuck in voluntary confinement bored out of his mind while nurses and nutritionists and doctors ferried him from one appointment to another like a piece of inventory that needed to be merchandised properly. I took pity on him and gathered up the games that I thought he would like and which didn't take a lot of room to play and I visited with him several times. For three or four hours each day, we played Cribbage and Tsuro and Quiddler and any number of other pleasant, social games. I doubt that my visits changed his life but I don't question that those games helped him to pass some of his time more pleasantly.

One of my most treasured memories. Right after 9-11, a number of gaming organizations and retailers in the Denver area decided to hold an auction in support of the Port Authority victims of the attack. Attactix wound up serving as the receiving and processing center for the donations. We put out flyers announcing the event and soliciting donations in all the participating stores and we contacted publishers begging for whatever they could send. The game convention organization that I volunteered with convinced one of our host hotels to provide us space for the auction. Everyone pulled together to create an event within the very short time of three weeks. I remember worrying that the gamers would not respond and that all that effort made by so many people would not make a difference. I remember standing in that hotel ballroom as I realized that the gamers were digging deep into their pockets to help. I remember crying. We raised thousands of dollars and I've never been prouder of my community as I was then.

Many other game industry professionals have embarked on similar projects. Steve Creech recently posted to an industry forum information about a fundraiser called Project: Jamaica. Get this -- this organization needs only \$4000 to build a library in Jamaica. He asked for retailers to send overstock books to help fill the library. Many retailers house collection cans for foodbanks or sponsor blood drives or raise funds because their Best Customer's child has brain cancer.

What I am saying is that retailers can make a difference when we recognize our connections to our community. We are not the order taker in the drive thru at the local burger joint. We are not the cashier at the Big Box retailer down the street. We are people who encounter you every day of our lives. We work hard learning about you so that we can understand your preferences and find you the games that you want. Some retailers revel in these opportunities while others feel that they impose unfair duties on them. I leave you to surmise which ones survive.

Is community that important? Don't we all crave a Cheers for our own? A place where everybody knows our name? Where there is a seat reserved just for us and everyone is happy to see us? Where people care about our fate? Absolutely. And having a place like that can change a person's life. Finding that acceptance can become meaningful to people who have been outsiders all their lives or who suddenly experience overwhelming crisis. It is what you are so good at -- accepting people despite their race, class, gender, abilities or age. You simply require enough intellect to understand the rules, and [sometimes not even that](#). Game stores are often sanctuaries and safe havens and spots of joy in lives suddenly filled with burdens. It is here, in this space, that my Best Customers can relax and talk about a hobby that gives them delight. Retailers are the hubs of your community. We listen, we synthesize, we connect, we zig so that someone doesn't zag out of control. Not a part of our job description but perhaps this connection is what draws us into this profession. When we see ourselves as important parts of the community (no matter how small) then we make differences in ourselves and in the lives of our customers.

Perhaps not everyone cares about achieving the worthwhile, and perhaps these matters seem trivial to the non-gamers who never darken our doorways, but I suspect that most game retailers do care. Perhaps our community is no different than the RC community or the model-train community or the cookie-cutter-collectors community. Perhaps the activity that brings us joy isn't the point, perhaps it is the community that we create that makes the difference in our lives. We live in a small industry where many of us know each other by first names. We can make a difference. These changes in each other's lives may not be earth-shattering but perhaps they don't need to be.

As I leave the Season of Thanksgiving, move through the Season of Giving and look toward the Season of Resolution, perhaps I should not be so worried about my achievements. Perhaps I should better appreciate the community that we have all found and wish you all the joy that you have brought me.

From the bottom of my heart, Happy Holidays to you all.

Agricultural Calendar

by S.E. Mortimer

Introduction

Although there is plenty of literature available on the importance of the peasantry in medieval society, it is surprising how little regard the typical roleplayer gives them. Considering that up to 90% of the population was directly involved in agriculture, one should expect almost every encounter the PCs have in a low-tech world to be related to this enterprise in some way. However, it is understandable why most GMs place little emphasis on the agricultural nature of their game world. Consider a random encounter table: "Roll the dice; okay, you encounter . . . a farmer." A little later. "Roll again . . . oh, another farmer." Repeat *ad infinitum*.

However, with a little imagination and the dismantling of some stereotypes, one would be surprised how rich and varied these encounters can actually be. There is no reason why the typical roleplaying staples of warfare and political intrigue could not be set aside for a few sessions for a diversion into the rural countryside where one might encounter anything from an obscure and entertaining local holiday celebration to the devastation and suffering caused by famine or excessive taxation. This work is designed to be used in conjunction with ["Tilting at Windmills,"](#) ["Horse Sense,"](#) and ["On Inns, Taverns, and Alehouses"](#) to create a more complete picture of rural life in low tech societies.

The Working Day

Contrary to popular opinion, the medieval peasant did not work constantly from dawn to dusk. He might have been poor, but he seems to have had a lot of leisure time. Even the serf, who was considered particularly poorly treated, only needed to work half a day (around five hours) to fulfill his feudal labor obligations. Manorial records indicate that if a serf actually worked for a full day, then it was counted as two days' labor. During summer, a day in England or northern Europe might last 16 hours, but not all of this was spent working. The peasant had many breaks during the day, including an extended nap in the afternoon. It has been calculated that the average amount of work done each day was between seven and nine hours, but it depends on the time of the year. A peasant might work from dawn till dusk during peak times such as planting and harvest, but only work till noon during slacker times.

Also, workers celebrated a number of holidays each year -- both religious ones and local traditions. England had the longest work year, with rest days and holidays taking up about four months each year. Spanish peasants seem to have had the easiest life, with around five months of holidays each year. During times of labor shortages (after the Black Death, for instance), higher wages meant that peasants could (and often did) work significantly less time for the same amount of income. One estimate indicates that during these times peasants worked as little as 120 days per year. Given the choice of working less hours or earning a higher income, it seems that many peasants chose to have more leisure time. This work ethic would be completely alien to many members of today's post-industrial revolution workforce.

A Sample Calendar

Even if the players don't want to bother with the mundane day-to-day activities of a medieval village, it is important to know what is happening at any particular time of the year. If the PCs arrive in town for a night of drinking and debauchery only to discover that the inhabitants are observing a particularly solemn religious holiday, then there would be serious repercussions if the heroes attempted any frivolity. The travelers might urgently need a hireling only to discover that every able-bodied person is bringing in the harvest and nobody will be available for several days. What will the players do if, just prior to the harvest, they need to buy some food only to find that, in every village, food stores have run too low for any to be spared? Perhaps one of the PCs has a debt he can't settle -- it might be best to skip town before it fell due on Michaelmas.

What follows is a brief discussion of the major events of the agricultural year along with the most common religious holidays and festivals. On top of these holidays are other rest days including the sabbath (every Sunday) and other, sometimes quite bizarre, local traditions. There are also rest days for special occasions such as weddings and funerals. The typical medieval peasant combined hard work with a good deal of recreation. During the Reformation, many of the Saints' Days were gradually whittled away until only the most sacred (such as Christmas and Easter) remained to be celebrated in more modern times. The following calendar is split into seasons so that the GM can use it even if his game world doesn't follow the Medieval European calendar. Most holidays can be categorized into one of two types. They are either feastdays, which involve lots of eating, drinking and merrimaking; or they are solemn days of religious observance, involving vigil, fasting, and introspection.

Winter

Plough Monday. Celebrated on the first Monday after Twelfth Night (January 6th). This holiday marks the beginning of the working year following the Christmas break. Ploughmen ("plough bullockers") kept "plough lights" burning in front of the church. All the ploughs were blessed and decorated before being dragged through the streets by cheering villagers. During this procession, money was collected for the support of the plough lights. Ale was drunk to the success of the coming year's harvest.

Work began the following day. It included clearing ditches; fertilizing the soil (plowing under burnt weeds and spreading manure); cutting wood; and breeding sows. Lambing sometimes begins in late January.

Candlemas (February 2nd). Also known as the "Festival of Lights." This holiday commemorates the ritual purification of the Virgin Mary 40 days after the birth of her son. In Jewish tradition a woman was considered unclean after giving birth and could not enter a temple until she was purified. The holiday was called "Candlemas" because this was the day in which the annual supply of beeswax candles for the church was blessed. This was a solemn religious occasion involving mass and a procession.

St. Valentines' Day sometimes gets combined with Candlemas due to the old calendar and all of the haphazard rearranging to which it was subjected. St. Valentine's Day (February 14th) was celebrated similar to today (though with less commercialization) and there was much foolery.

February work included additional fertilizing (adding chalk, lime, and more manure); pruning trees, vines, and hedges; mending fences, etc. Lambing continues and calving begins.

Spring

In March, as soon as the ground has thawed enough, ploughing begins. Calving continues.

Shrove Tuesday. Also called *Shrovetide*, it occurs exactly 41 days before Easter. It involves feasting and over-indulgence before Lent -- the Church's most solemn period of fasting. Some called it "Fat Tuesday" because all meat and animal products had to be eaten before sundown (Lent began that night).

Ash Wednesday occurs 40 days before Easter and marks the beginning of *Lent*. This is a 40-day period of fasting in which no meat other than fish was to be eaten. The faithful were encouraged to go even further in their abstention. Lent was the most important period in the medieval church -- a time for introspection and acts of piety. Traditionally, palms left over from the last Palm Sunday were burnt to produce the ash which the priest used to mark each parishioner with the sign of the cross. No marriages could take place during Lent without special dispensation.

Lady Day (March 25th). Commemorates the announcement of the Incarnation made by the angel Gabriel to the Virgin Mary.

After Lady Day, work begins in the fields in earnest. Spring crops (barley, oats, peas, beans and vetches) are sown in the recently ploughed fields. Children use slings to defend the newly sown seed from birds. Onions, leeks, hemp, and flax are planted in household vegetable plots. Calves are weaned and dairy work gets underway. Farrowing (birthing of

pigs) begins.

Palm Sunday (seven days before Easter). A solemn occasion where parishioners would bring "palm leaves" (usually willow, box, or yew) or rushes into the church in honor of Christ's procession into Jerusalem.

Maundy Thursday (four days before Easter). Great acts of charity were often done on this day, and a special Mass was held where all the candles were symbolically extinguished one by one during the liturgy to symbolise the coming darkness of the Crucifixion.

Good Friday (three days before Easter). This commemorates the day that Christ was crucified on the cross. Parishioners follow the custom of "creeping to the cross" where they approach a special cross barefoot or on their knees to kiss its base. One of the Hosts consecrated the night before is then placed, along with this cross, in a special sepulchre in the north side of the church, and a sentry stands guard until Easter morning.

Easter Sunday. Commemorates the day of Christ's resurrection. The calculation of the date of Easter has been a source of much contention within the early Church, but Roman Catholics celebrate it on Sunday after the first full moon following the vernal equinox (between March 22nd and April 25th).

Hock Monday (Monday after Easter). The following weeks are a time of great merriment. Lent is past and the toil of planting is over. On Hock Monday the young women of the parish would capture young men on the streets and refuse to release them until a small "ransom" was paid into parish funds. On the following day, Hock Tuesday, the custom was reversed and the men had their revenge.

St Mark's Day (April 25th). The Eve of St. Mark (April 24th) was a holiday in which many divinations were performed by rural folk. It was an ancient pagan tradition.

May Eve (April 30th): Also known as *Walpurgisnacht*. People light bonfires and leap through the flames in ceremonies that predate Christianity. Celebrations continue into *May Day* (May 1st) which is the Festival of the Apostles Saint Philip and Saint Jacob. This holiday dates back to pagan times when *Beltane* was celebrated. May Poles are erected, hawthorn blossoms are gathered, and there is a day of feasting and merriment.

Rogation Sunday (Five weeks after Easter). The parish priest, along with his parishioners, would "beat the bounds" -- walking around the boundaries of the parish, accompanied by bells, offering prayers to protect the crops from various disasters; a heavy session of communal drinking usually followed. The following Thursday was called Ascension Day.

Whitsunday (Seven weeks after Easter). This solemn occasion was also called *Pentecost*. A vigil was kept the night before followed by a day of fasting.

Whitsuntide (the following three days after Whitsunday). Also known as the Days of Solemnity.

In May, the winter crop is weeded; thatched roofs are maintained; vegetables like carrot, cabbage, and beets are planted. Cows come back into full milk as they graze more on pasture and less on winter fodder.

Summer

In June, sheep are washed and sheared. In the meadow, hay begins to be mowed with long-handled scythes -- it is a communal activity. Weeding is performed between the days of haymaking and grain harvest. The second ploughing of the fallow field(s) was performed.

Corpus Christi Festival (12 weeks after Easter). A traditional time for the presentation of pageants and plays commemorating the life of Christ and sponsored by town guilds. The occasion focuses on the consecrated Host of the Mass.

Midsummer (June 24th). Also known as the Feast of St. John the Baptist. Huge bonfires are popular and it was common to stay up all night on Midsummer Night's Eve. There are military parades, civic processions, and many fairs.

Wrestling and races (including gambling on these events) are also popular.

Hay continues to be mowed in July, and livestock are not permitted to graze on the meadow for one month after haymaking to allow the grass time to recover; flax and hemp are harvested. July was known as the "hungry month" when grain stores were at their lowest, awaiting the coming harvest.

In August, harvesting of the winter grain (wheat and rye) is performed; straw is gathered; livestock is released to graze upon the stubble; turnips are planted.

Feast of St. Peter (August 1st). Commemorates the birth of St. Peter. A day of feasting and merrymaking.

Lammas (August 2nd). The Festival of the First Harvest. Loaves made from the first bushel of wheat to be harvested are consecrated in church. A traditional time for great fairs and celebration.

St. Laurence's Day (August 10th). A solemn day of vigil.

Assumption Day (August 15th). The Feast of the Assumption of the Blessed Virgin Mary. A vigil was often held on the Eve of Assumption Day. It commemorates the reception of the Virgin Mary into Heaven. Often this was also a harvest festival, providing relief from hard labor during the harvest. Morality and mystery plays were performed.

Feast of St. Paul (August 30th). Commemorates the birth of St. Paul. A day of feasting and merrymaking.

Autumn

Feast of the Blessed Virgin Mary (September 7th). Commemorates the birth of the Virgin Mary.

Holy Rood Day (September 14th). Also called Holy Cross Day -- the Festival of the Exultation of the Holy Cross. A solemn day of fasting. It was traditional to harvest nuts on this day.

Mabon (September 21st). The Autumnal equinox is the traditional time of the Second Harvest -- the harvesting of Spring grain, although this harvest usually begins earlier. It is also the transitional day between light and dark -- from now on, days get shorter and darker.

Michaelmas (September 29th). The Feast of St. Michael. The first day of the financial year and the day that many debts, rents, and taxes are due.

In September the Spring grain is harvested; cattle is bred; the winter grain field is ploughed; winter grain is sown (wheat and rye); fruit and berries are harvested; beans and peascods are dried for storage over winter; excess produce is taken to market. Threshing and winnowing of grain begins and continues through to the winter months. Grain is milled when necessary.

In October the rest of the winter grain is sown; grapes are harvested and wine is produced; sheep are bred; pigs forage in the woods for acorns and beechnuts (called pannaging). Wheat stubble was gathered and mixed with hay for winter fodder. The third and final ploughing of the fallow field(s) was performed. Threshing and winnowing continues.

All Hallows' Eve (October 31st). Hallowe'en is the night when ghosts and evil spirits haunt the living. A vigil is held all night.

Feast of All Saints (November 1st). This holiday dates back to pagan times when Samhain was celebrated. It is the time of the Final Harvest. All surplus animals were slaughtered for winter. Traditionally this was the Festival of the Dead, when deceased ancestors were remembered.

St. Martin's Day (November 11th). *Martinmas* was another traditional date for the slaughter of animals. The rest of the livestock was brought in from pasture and stalled in barns. Poorer peasants kept animals in their homes over winter for warmth. This is the traditional date for beginning (and ending) contracts with hired help.

Advent begins after Martinmas. This is a solemn 40-day period of introspection and fasting similar to Lent but not usually as strict.

St. Catherine's Day (November 25th). A very popular feast day in which women performed various obscure rituals to predict the name of their future husband.

In November pigs continue to forage in the woods; firewood is gathered; reeds and sedges are cut and dried for thatching; bracken is gathered for winter bedding for livestock; threshing and winnowing continues.

In December pigs are slaughtered and meat is salted; any remaining grain is processed. Most labor is now performed indoors -- women spin and weave, men perform handicrafts. Other winter work includes performing maintenance, caring for livestock, and carefully stockpiling manure from animal stalls to be used as fertilizer.

St Nicholas' Day (December 6th). A day of role reversal in the schools. One of the boys would be elected Bishop and he would preside over a court of misrule and mayhem.

Yule (December 20th). The Winter Solstice. The main festival occurs on this day, but celebrations continue until Twelfth Night (January 6th).

Christmas (December 25th). The Nativity of Christ commemorates the birth of Jesus. A vigil is held the night before (Christmas Eve).

St. Stephen's Day (December 26th). A day of role reversal for lords and servants. Those in service receive their yearly gift of clothing or livery.

Roleplaying Suggestions

- The lord has taken most of the men of the village with him on a summer campaign and has not returned in time for harvesting. The women and remaining men are working long hours but will not get the majority of the crop harvested in time.
- A distant noble has decided to spend the winter with part of his army in this village. All his men require billets among the local residences and the inn has been commandeered for the noble's personal use. Particularly honorable nobles might pay adequate compensation, but most won't. If you have a problem with that, go complain to the King.
- During the sowing of crops, children use slings to keep marauding birds (crows, etc.) from eating the freshly sown seed. However, it is prohibited to kill the lord's doves, and these nuisances regularly flock to the fields at this time of the year, causing much hostility among the peasantry. Unfortunately, a young boy has accidentally killed one of these doves and is being taken before the lord for trial. He is likely to impose a penalty that the child's parents cannot afford.
- It is illegal to gather firewood for sale (it is only permitted for personal use) but it doesn't stop people from trying. The lord has caught one person too many and has decided to make an example of her.
- A great evil has possessed the village. Ever since the last harvest, people have become possessed by demons. Symptoms include hallucinations, convulsions, and sensations of excruciating pain or burning. An old woman is being accused of witchcraft. A scientifically minded PC might trace the "demonic influence" to the grain stores. Some of the rye is afflicted with a hallucinogenic fungus (ergot).
- Famine! The great fear of every person is upon the land. For the second year in a row there has been a poor harvest, and all will know hardship and starvation this coming year. If the heroes can arrange the importation of foodstuffs from distant markets, they will profit greatly. Keep in mind, however, that few will be able to afford the inflated prices, and the chances of encountering brigands will be high.
- Because of the famine, the number of incidences of poaching in the lord's wood has increased dramatically. The PCs are hired to patrol the woods and keep out riff-raff. They are told to assume that anyone caught in the woods are poachers. The penalty for first time offenders is a heavy fine. Repeat offenders are usually maimed or killed.

For other roleplaying ideas in a rural setting take a look at ["Harvest Festival: When Greenery is more than Scenery."](#)

Bet On It

for *GURPS*

by Keith MacKenzie

British secret agents in casinos, American secret agents at horse tracks, gunslingers in saloon card games. Gambling has an air of mystery about it and many players have given their characters skill in this area. These rules, presented for *GURPS Fourth Edition*, allow the skill to mean something beyond flavor text. They do not encompass cliché things such as betting everything on one roll of the dice or betting on one's favorite team no matter how poor they play. While the first is a gambit, neither is gambling. Gambling is playing a series of games with the intention of coming out ahead.

Lottery Games

Lottery games are games where gambling skill does not apply. This would include Roulette, Bingo, and the ever popular slot machines. For each hour of gambling, the character determines how much he is willing to lose. With the stake determined, the player then rolls against a 10. The margin of success times 10% of the stake is the profit (the stake is not lost). If the roll failed, the character loses 10% of the stake per point of failure. On a critical failure, the character loses their entire stake, and must make a Will roll. If the Will roll is successful, no further losses occur this hour. If the roll fails, the character loses all currency with him and on a critical failure will lose anything else of value with them, such as jewelry, vehicles, or weapons, if the venue will take them in trade (the character gets no cash value, but some establishments will not accept anything besides cash).

House Games

House games are games where skill comes into play, and the house wins or loses to each player separately. Examples include Blackjack, Craps, Horse Racing, Sports Book, and Video Poker. If the game has a dealer, the dealer will always be the house. The house may have a stake maximum and most tables will have a minimum (usually 10 times the minimum bet, so a \$5 table would require a \$60 stake). As with Lottery games, each player decides his stake for that hour and rolls against his Gambling skill. The House rolls against 14. The player's margin of success minus the house's margin of success times 10% of the player's stake is how much the player wins or loses. The stake is still kept. If the player loses more than 100% of his stake, a Will roll must be made. If it succeeds, only the stake is lost. If the roll fails, all currency the player has is lost; on a critical failure, other items of value are also lost. Sports Book and horse racing may use appropriate skills instead of gambling if they have actual recent experience with all the competitors.

Casino Option: If a player stake is more than the cost of a room, and the player scores a critical success, his room will be free (comped). If a player gets two critical successes in a row or four in an evening, the dealer will be replaced with a ringer (House skill becomes 16) or a cooler might be sent (cancels luck advantage for one hour). If a player gets three critical successes a row or 6 in one night or more than 10 in a week, the gambler will be shown out of the casino and may be beaten. Note that it is better for High skill gamblers to play zero-sum games.

Racing and Sport Book

This is gambling on athletic competition. It is essentially treated as house games except that players may use other appropriate skills, if they can show that a skill is applicable. A gambler who has Riding and has visited the stables and seen all the horses personally could use that skill instead of Gambling. A sports fan with sufficient study of recent games and Strategy: Football could use that skill.

Zero-Sum Games

Zero-Sum games are games where players win or lose among themselves. The house gets nothing (although in many games the house gets an entrance fee). The stake may be set ahead and each player starts with the same amount of money, or may be open to whatever people bring. Poker is the most common game for this sort of gambling, but other games do exist. Billiards also falls into this category, except Hobby: Billiards is used instead of gambling.

If the game has a fixed stake, each player wagers that amount each hour. Each player rolls against his Gambling skill. The margins of success and failure are averaged, and this number is subtracted from the margin of each player. Each player then wins or loses 10% times his adjusted margin of the stake. When a player does not have enough to cover his loss, the players who lose will pay their losses first and then pay extra until all the winners are paid. The winners are paid off in margin order.

Example: Adam, Bennie, Carlos, and Dieter gather for their weekly \$100 stake game. Their skills are all 12. For the first hour their rolls are 5, 10, 11, and 7. Their margins of success are 7, 2, 1, and 5 which average 3.75. Adam wins 7 (his margin of success) 3.75 (average margin of success) $\times 10\% \times \$100 = \$32.50$. Bennie loses \$17.50, Carlos loses \$27.50, and Dieter wins \$12.50. They now have \$132.50, \$82.50, \$72.50, and \$112.50 respectively.

The next hour the stakes are still \$100, and the rolls are 8, 17, 12, and 8. The margins of success are 4, -5, 0, and 4 averaging .75. Adam and Dieter each win \$32.50, Carlos loses \$7.50, and Bennie loses \$57.50. After two hours their individual totals are \$165, \$25, 65, and \$145.

It's now Hour Three, and the rolls are 7, 16, 13, and 6. The margins are 5, -4, -1, and 6, averaging 1.5. Because Bennie will not have enough to cover his loss of \$55, Dieter will collect his \$45 first. Carlos loses \$25 for his roll, and \$25 comes from Bennie's remaining stake, providing Dieter's \$45. This leaves \$5 left over for Adam who still has \$35 coming; Adam's remaining \$30 will be paid by Carlos, because he had the next smallest margin of success. At the end of hour three, Adam has \$205, Bennie has nothing, Carlos has \$5, and Dieter has \$190. If Carlos did not have enough, then Adam would have had to make up the difference, but it would have been to himself.

In a variable stake game, the players with larger stakes will essentially play more hands. Each player's stake is divided by the smallest stake and the player will make that many rolls. Each roll is resolved independently, in the same manner as fixed stake games. If Ernie is staking \$20, Fred is staking 100, and Gregory stakes 60, Ernie will make 1 roll, Fred will make 5 and Gregory will make 3. All nine rolls will be normalized and the payoffs will be relative to Ernie's \$20 stake.

Cheating

Players may cheat if they wish. They should roll each hour before their skill roll against Sleight of Hand (or whatever skill they are using) at -1 per point of Gambling skill adjustment. The cheater may adjust his own skill or another player's, and the adjustment may be made up or down. Other players and the house will roll against perception with a bonus of the same amount. The House has Per 14 at TL5, 16 at TL6, 20 at TL7, and 30 at TL8. The house will also use methods to catch magic or psionics if those things are common in the world. If a cheater is caught, the repercussions range from being thrown out to being killed. If a cheater is raising another player's skill, that player will suffer the same fate. If another player's skill was being lowered, that player will be encouraged by the house to call it a night and his room comped.

Gamblers may wish to pull their punch, or play at a lesser level, either to avoid too many critical successes at table games, as part of an elaborate set-up, or just a hustle. A character pulling his punch must make an Acting ($\frac{1}{4}$ the skill reduction) roll, or the other players or the house will know the player is more skilled than he seems. Critical success and failure are calculated from the played at skill.

Notes

- Bingo is rolled per night or per 3 hours, not per hour.
- Horse Racing is per afternoon or per evening.
- Sports Book assumes bets on multiple events during a day or weekend depending upon the sport.
- In parts of the world, some forms of gambling are illegal or considered immoral. Cheating in these areas will seldom be brought to the attention of the law.

Pyramid Pick

Ars Magica Fifth Edition

Published by [Atlas Games](#)

Written by David Chart with Tom Dowd, Jörg-Peter Friederich, Rich Gentile, Andrew Gronosky, Mark Shirley, Andrew Smith, Kevin Sours, & David Woods

Cover by J. Scott Reeves

Illustrated by J. Scott Reeves with Dave Allsop, Liz Danforth, Brian Dugan, Neil Edwards, Charles Gillespie, Josh Hoops, Eric Hotz, Janine Johnston, Alexis Liosatos, William O'Connor, Dom Reardon, John Scotello, & Jock Simpson

242-Page Full Color Hardback; \$35

When it comes to RPGs that focus on magic, *Ars Magica* has always been at the fore. Originally published by Lion Rampant in 1988, its history found it at White Wolf and associated with the World of Darkness -- particularly *Vampire: The Masquerade* and [Mage: The Ascension](#). More recently it has found a home with Atlas Games.

The publisher heavily supported the *Fourth Edition*, but more recently has published a slimmer *Fifth Edition*. More than a cosmetic makeover, the reworking has been carried out by the game's line editor, David Chart, who is also the author of several well-done campaign supplements for the *d20 System*, including [Splintered Peace](#) and the [Medieval Player's Manual](#).

The setting for *Ars Magica Fifth Edition* remains unchanged -- the Mythic Europe of 1220. This is a version of the Middle Ages in which the Church of Rome still dominates, but in which magic is real, the power of the infernal is very much a dangerous threat, beasts of myth and legend stalk the lands just beyond the bounds of civilisation, and those of the faerie realm dance in the woods or visit man to taunt him. Magic is governed and studied through the Order of Hermes, a centuries-old organization housed in 13 Tribunals across Europe, each cell often acting as a beacon against dogma and superstition.

Likewise the game's style and play remains unchanged. It was innovative in 1988, and for many, the concept of Troupe play is still too radical, asking as it does to play multiple characters. These come in three types: the Magus, the Companion, and the Grog. Magi are the focus of an *Ars Magica* saga, possessing The Gift that enables them to work magic; this marks them not only as a member of the Order of Hermes, but also gives them an unsettling air to others. Yet this emphasis leaves them unskilled elsewhere, which is where Companions come in, providing more generic and social skills. Companions lack The Gift, but skilled roles include the Female Scholar, the Priest, the Rogue, the Witch, and the Knight. Finally, the Grog is the game's equivalent of the Red Shirt and is almost a throwaway character. If he dies, he will be remembered, but survive heroically, and the humble Grog might grow to become a Companion. A player usually controls a Magus, one or more Companions, and any number of Grogs, though not all at the same time (rather, fitting the needs of the campaign).

Mechanically, *Ars Magica* also remains unchanged and employs a roll of 1d10 plus skill and attribute to beat an assigned Ease Factor. It becomes slightly more complex when a situation is stressful, with a greater chance of rolling a Botch, the game's equivalent of a critical failure.

Yet the most obvious change for the *Fifth Edition* is cosmetic. The hardback has been given a makeover, the aim being to make it match its early medieval milieu. Dominated by red and ochre tones, the graphic reworking keeps the text tidy, but many will find much of J. Scott Reeves' similarly colored illustrations little to their liking, and it is fair to say it works on the small scale better than on the large. Fortunately, the rest of the artwork does not suffer from this problem.

The first of the Edition's changes to its concept is a reorganization of the over arching body in *Ars Magica*. The Order of Hermes is organized into 12 houses that define its members' philosophies and areas of study. All but one of the 12, Ex Miscellanea, is descended from the founders who created the Order in the eighth century. The Houses have now been categorized into three groups. The first four can claim to be true lineages, their Magi being trained by someone who was trained by someone and so on, right back to each house's founder. Of the 12 houses, it is not possible to join these four; a Magus must be apprenticed to them. The second four are Mystery Cults, the initiated learning its secrets as they progress; the third four are organized around particular interests. It is possible to join Mystery Cult house or an Interest one if a magus is unhappy with his current house.

The major change to character generation is a simplification of the virtues and flaws, *Ars Magica's* equivalent of advantages and disadvantages. Where they previously assigned a value, now they are simply rated as either major or minor. A reorganization of the system sees the introduction of the Story Flaw, many of which had been virtues. An example of this is Mentor, who will give aid and advice, but can be used by the storyteller to involve the character in a story.

A further story hook is the troupe's covenant -- their base of operations. Outfitted with a library, laboratories, and other resources, it is the equivalent of a character, but designed cooperatively by the players. Again the rules have been simplified, but the age and feel of a covenant elegantly are defined as spring, summer, autumn, or winter.

At the heart of the game lies magic, still working around the combination of Technique and Form, or verb and noun. It's still in Latin to give it that medieval ambience. For example "Creo Ignem" translates as "create fire," and lists several spells from the simple *Palm Of Flame* to the *Ball Of Abysmal Flame*. The long list of spells is tempered with clearly explained rules on how magic works and the types available. As expected, Spontaneous Magic is free form and flexible, but still weak; Formulaic adheres to the lists provided; and Ritual Magic is expensive in terms of effort, time, and resources but is also the most powerful. Further, laboratory use rules enable a Magi to research new spells, as well as adapting others, enchanting items studying, and gain himself a familiar or apprentice. That said, the bestiary lacks the type of animal useful as a familiar.

Besides the dangers of adventuring and magical duels known as the Certamen, in the long term a Magus can suffer from prolonged exposure to magic. Known as Warping, it increases his chances of entering Wizard's Twilight, where in effect a Magus is placed in suspended animation for as short as two minutes or as long as forever. The experience of being in Twilight marks a Magus with increased or decreased knowledge, an extra flaw or virtue, or just a minor scar. Another danger for a Magus is aging, campaign or saga play being measured in seasons or years. This can be staved off with longevity rituals, which also have to be researched. Also rewritten is the game's combat mechanics, still kept simple, as it is not the focus of *Ars Magica*. Combat isn't overly simple, and it also encompasses group combat for the easier handling of Grog.

For running *Ars Magica*, the storyteller is well served by the advice of running Mythic Europe, which can be as historical as the storyteller demands, and on running stories and sagas. In particular, the explanation of group play is well done, which -- supported with nice examples -- should alleviate any worries that both player and GM might have.

This being a new edition means that existing *Ars Magica* players are going to find things that they dislike over previous versions. Such is the nature of the beast, but I cannot be counted among them. Yet what is obvious is that the *Fifth Edition* has been very much streamlined, not necessarily to make things simpler, but instead to enable understanding and accessibility. Yet despite all of these changes, the game remains unchanged either in terms of feel

and setting. The result is not only an improved version for the devoted fan, but also the perfect "jumping on point" for anyone looking for the game in which magic is a mixture of art and science.

--*Matthew Pook*

Holidays: Society's Swiss Army Knives

A couple of weeks ago, I saw an item on [CNN.com](#) that locked up my brain into a bluescreen of death, requiring reinstallation of the Master Brain Record. According to the article, some megachurches would be [closing on Christmas](#). Yes, some large Christ-worshipping churches have apparently decided that, since Christmas falls on a Sunday (the usual day of worship for many of said churches, I'm presuming), attendance would be too low to justify keeping the churches open. My original assumption was that this was due to some kind of programming bug in the churches, akin to scoring too high on Centipede and having the score roll back over to 0, or getting to the [256th level of Pac-Man](#); there becomes a point where the obligation to go to church becomes so great, it rolls over back to 0 and you don't have to go at all.

But actually, according to the article, the truth is even a bit more interesting: ". . . pastors are canceling services, anticipating low attendance on what they call a family day."

What I find most interesting is that we have a holiday pulling double-duty as both a religious (communal) and family (individual) holiday, giving it an identity crisis even among some who I'd've thought would be most adamant about affirming one duty for the day. Christmas' double duty isn't new; satirical newspaper *The Onion* has offered Easter cards in years past depicting the Easter bunny on a cross, Jesus hopping with a basket, and so on. The Christian Easter holiday, of course, inherited the symbolism of eggs, bunnies, and the like from older pagan rituals. (As such, I blame pagans for [Marshmallow Peeps](#).)

In fact, looking down the lists of major holidays, most of them (at least here in the States) serve more than one role. For example, Halloween is the holiday of kids dressing up and going door to door to beg for candy. However, in recent years it's also grown into a huge holiday for adults . . . one which doesn't involve going door to door, and generally involves a fair bit more partying and alcohol than most of the kiddie celebrations. In fact, in the United States, Halloween is second only to Christmas in terms of dollars spent. (Among some Christian groups it's also All Saints' Eve, the day before the feast of All Saints.)

Looking over our own itinerary for the Christmas break, I note that there are three distinct celebrations that the holiday is being divided into:

- **Familial:** We're gathering with a few different families over the course of three days.
- **Religious:** We're going to church on Christmas Day.
- **Consumerist:** We're going shopping the day after, taking our lives into our hands.

The evolution of a holiday isn't limited just to times long past (such as the case of Easter). For example, [Hanukkah](#) was a relatively minor holiday (in terms of spectacle, if not significance) in the Jewish calendar that assumed greater importance in the 20th century, when Jewish households in America were looking for something to parallel the Christmas experience (both secular and religious) of their friends and neighbors. And Christmas itself was more of a drunken revelry up until concerted efforts were made to transform it into more of a stay-at-home family holiday.

From a roleplaying game standpoint, this realization can be useful in either fabricating new holidays or recasting new ones. After all, it's pretty logical to assume that most alien or alternate cultures would have holidays of some sort to break up the monotony of day-to-day life.

One of the biggest problems with most descriptions of holidays is that it's easy to describe what a holiday is; it's much harder to gauge how *significant* a holiday it is, and for what reasons. For example, in the United States the Fourth of July and Martin Luther King, Jr.'s birthday are both federal holidays, but the former is much more important (and celebrated) to more people than the latter. Likewise in the Catholic tradition the Feast of the Ascension and Christmas are among the few non-Sunday holy days of obligatory church attendance, but Christmas is much more "important" to most Catholics than the Feast. (And Ash Wednesday, a holiday that is more significant to many Catholics than the Feast of the Ascension, is *not* a day of obligation.)

As an intellectual exercise, then, I've tried to create a scale that can be used by those trying to come up with their own holidays. Using a 10-point scale, you can give fabricated holidays a rank of 0 to 10 in five categories (0 meaning that aspect isn't important at all in the holiday, 10 meaning that it is one of the most important holidays in that aspect):

- **Family:** The significance of the holiday to family, family gatherings, and fostering the notion of the nuclear and/or extended family
- **Religion:** The importance of the holiday from a religious standpoint
- **Consumerism:** The importance of the holiday to (gift-giving, cards, going out to eat, and so on . . . basically, all non-essential usage of money or trade)
- **Government:** The significance of the holiday to the government
- **Community:** The importance of the holiday to the community (spending time with friends and members of the community who *aren't* family)

Of course, these ratings would probably vary from region to region, and even to different aspects within a community . . . although high ratings on Consumerism, Governmental, and possibly Community might indicate wider acceptance.

So, as an example, here's a write-up of the American notion of New Year's Eve/Day.

Family: 3 (Some people spend New Year's close to home, but the popular notion of the holiday doesn't factor family greatly.)

Religion: 2 (Some religions might acknowledge the new year, but it isn't celebrated in any real sense.)

Consumerism: 6 (Some people spend a lot of money on parties or going out, but it's not omnipresent. In addition, some stores use the opportunity for New Year's sales; it's a busier-than-normal shopping time, but it isn't all-consuming.)

Government: 7 (The government is closed for New Year's, and many governmental bookkeeping functions -- such as taxes -- use the New Year to reset, but otherwise the holiday doesn't have any great significance)

Community: 8 (New Year's is one of the biggest party days of the year.)

Now, let's look at St. Patrick's Day, here in the U.S.:

Family: 2 (Outside of presenting an opportunity to celebrate a family's Irish heritage, it's not a significant family holiday)

Religion: 4 (St. Patrick's Day is significant to the Catholic and some Anglican holidays, but otherwise not widely celebrated)

Consumerism: 3 (People may drink or celebrate, but otherwise this isn't a huge spending holiday)

Government: 3 (Some local governments, especially those with large Irish populations, are involved in St. Patty's Day celebrations, but most government functions go on as normal)

Community: 6 (Those in the community will probably celebrate it in some way, and regions with a large Irish community are bound to get caught up in celebrations. In addition, St. Patty's Day takes hold in the larger imagination, with many people trying to remember to wear green. However, it's otherwise a fairly trivial holiday.)

Have we got the hang of it? Good. Let's look at three fabricated holidays in a Near-Future Fascist Cyberpunk World:

Black-Out Day

Family: 3

Religion: 4

Consumerism: 3

Government: 0

Community: 9

"Celebrated" on January 10th, Black-Out Day has become a confounding problem for the government; for the past 19 years, hackers have used this day to tear down or disable all government surveillance, starting at 12:01AM on the morning of the 10th. Although no promises are made by the hacking community, the government's grid has generally

remained off-line for at least four hours; one year, the government's surveillance was disabled for almost three days. Although an annoyance for many, Black-Out Day has nevertheless become a de facto holiday, complete with parties and limited drunken revelry. In addition, those who would strike against the government use this day to plot their activities for the coming year, knowing that it will probably be their safest time to do so. Finally, in the past few years many religions have started incorporating Black-Out Day into their services, either to speak out against those who would strike the government or to subtly encourage those who fight against oppression.

V-Time Day

Family: 0

Religion: 0

Consumerism: 6

Government: 2

Community: 5

Created 31 years ago by the Synthplug SkinSuit corporation, this holiday takes place on February 15th, the day after Valentine's Day. On this day, people are encouraged to enter the VirtuaNet, looking for love (or, more often, one-time interfaces); the focus is on meeting someone new and interesting for one day, and to let nature take its course . . . virtually. This holiday is traditionally intended only for single people, as a counterpoint to Valentine Day's focus on couples. However, many people in supposedly dedicated relationships still "celebrate" this day (called Vee-Vee Timers); this holiday has also given rise to a new tradition of dumping or getting dumped on Valentine's day, leaving V-Time Day as a consolation prize for these Re-Vee-Booters. The government doesn't officially acknowledge this event, but it's traditional to plan for February 16th to be a less-than-productive day in most offices. This holiday is also the most popular time to introduce and purchase new interface gear, making it one of the most popular tech-shopping days of the year.

Petition Day

Family: 4

Religion: 6

Consumerism: 5

Government: 9

Community: 4

Established on May 22nd by the government three years after the Great Restructuring, Petition Day is the one day of the year where the government sweeps away much of the bureaucracy that exists in the rest of the year. On this day, the government will strive to resolve all issues within 20 minutes of meeting with a government agent (as opposed to the days or months it can take at other times). Of course, the long lines to see a government agent on this day takes six to eight hours to transverse, but the queued individual still almost always comes out ahead (in time spent, if not result). Enterprising merchants have begun targeting these long lines, cycling parallel to them and offering sales and specials. (The lack of oversight and guarantees is the origin of the phrase "buggy as a P-Day chip," although many people still look forward to these savings events.) Many religions have begun trying to encourage those members who don't have P-Day matters themselves to wait in line for the church's affairs; as such, these churches have begun treating Petition Day obligations as holy and fruitful work. Other interest groups have begun following suit.

Holidays are an important part of almost every culture, and with a bit of thought you can convey to players (and yourself) the import and interest of a holiday. Now if you'll excuse me, I need to get ready to drive for 10 hours to partake in my own revelry . . . since, according to my notes, this holiday ranks pretty high on most scales.

Happy holidays to all!

--Steven Marsh

Tanir Aesayya

by Matt Riggsby

Though some elves live in towns and cities immediately recognizable as such, with marble spires and thick stone walls, the majority of the elven population lives in settlements deep in the forests of the world. Many are small settlements, little more than extended households, but a few rise to the size of towns and cities. Tanir Aesayya is one of the largest.

Geography and Land Use

Tanir Aesayya lies a few miles inside a large ancient forest in a relatively warm part of a temperate zone (with summer highs in the 90s and winter lows in the 30s). The closest land beyond the forest is poor for farming but good grazing land, so it is occupied mostly by shepherds with a few small villages scattered here and there. From the edge of the forest, it is perhaps a day's travel from Tanir Aesayya to the nearest small stronghold or town of more than 2,000 people, and four or five days to the nearest human city. The land on which the forest grows is fairly smooth, with only small hills and a gentle slope falling down towards the edge.

Past a relatively thin border zone, the forest itself is remarkably dense and multi-layered. At ground level, there is thick but patchy shade-loving undergrowth: ferns, scrubby bushes, ivy-like vine plants, and the like. Rising above them, particularly closer to the edges of the forest, are smaller trees (50 feet or less), mostly gnarled oaks and a few other hardwoods but with a large minority of firs and a small number of others. Towering over those is a taller layer of unusually tall, thick oaks, with a minority of various evergreens and a few unusual trees seen only in elven forests. Aside from the elves, the forest is inhabited by small animals: birds, rabbits, squirrels, and the like. There is a handful of bears and small deer, but the density of the vegetation means that one is unlikely to encounter anything bigger than a moderately sized fox or boar. There are also a few more unusual animals, including a number of unicorns and the like.

Because of the great density of growth, a number of paths through the forests are kept clear by the elves. Many of them, though, are at least partially hidden or require the people following them to climb up into the trees for part of the way, so those who don't already know their way around and don't have a good eye for detail may stumble onto paths that appear to lead nowhere. Other breaks in the growth include a number of streams cutting through the forest, although many are hidden by particularly tall trees spreading their branches overhead and a few intentionally cultivated clearings.

The town itself has a population of about 10,000. The most densely populated core section covers about a half of a square mile, although a ring of sentry posts -- inside which just about all the elves spend most of their time -- defines an area about three times as large, with several streams running through it.

History

There have been elves in the forest for as long as anyone cares to remember (which, among a population of immortals, is saying something), although not always large settlements. Originally, it appears that the elves lived in extended households in groups of up to 50 or 60, although most were much smaller. Occasional market days, held at a particularly large clearing, brought larger numbers of elves together temporarily, sometimes with the addition of humans and others who had come from the outside to trade.

About a thousand years ago, the edges of the forest came under pressure from increasing numbers of orcs: hunting, cutting trees for construction or the sheer joy of destruction, and so on. The orcish incursion was causing human kingdoms to collapse around the forest, but the elves, largely disconnected from and unconnected with the outside world, managed to hold their own line. In order to do so, they had to spend more time near the edges of the forest and increase coordination among what had previously been completely independent households. This coordination took the

form of adopting the old marketplace as a meeting place and central headquarters and appointing war leaders to coordinate the defense of the forest. The institution of the dukedom originated at this time, as did the use of the clearing at Tanir Aesayya as a settlement ("Tanir" is a word in the local dialect for "marketplace").

For the next several centuries, the forest was cut off from direct contact with the outside world, since the region around it was occupied by orcish hordes. Apart from a small handful of notably brave individuals venturing in or out, communication with the outside was largely magical, and the few attempts to find allies against the slowly advancing enemy failed. The forest itself slowly shrank under constant if somewhat desultory assaults, although a spirited elven defense combined with a lack of coordination by the orcs prevented the shrinkage from becoming severe.

About 600 years ago, the situation began to change as a growing human presence began to push back against the orcs. Ambitious new kingdoms, with superior weapons and coordination, rolled back the orcish occupation. Ciaranon, the duke at the time, struck an informal alliance with some of the humans, lending out archers to support the humans, whose forces were lacking in that department. A number of elves resented Ciaranon's drawing what little strength they had away from their borders, and during this period they did suffer some grievous losses both in terms of elven lives and ancient trees, but ultimately Ciaranon's judgment seems to have proven sound. About 300 years ago, after a climactic battle, a last united horde of orcs was smashed by a combined human-elven army, effectively ending the orcish presence (although mopping up took a few extra decades). Ciaranon, who personally led the elves into battle, was killed, and was succeeded by his nephew Tylaleas.

With the outside world once again opened up, Tylaleas set about instituting more outward-looking policies. He retained his uncle's alliances, justifying increased dealings with the (to elven minds) unpredictable and transient human dynasties by the belief that a united front would be necessary to prevent future orcish incursions. Tylaleas has also actively looked for elves displaced from their homes by similar misfortunes and invited them to Tanir Aesayya to help repopulate the forest and cultivate replacements for ancient trees destroyed during the centuries of orcish wars. These "refugees" now constitute about 15% of the town's population.

In the years since the end of the wars, Tanir Aesayya has largely retained the form it had at that time. Since habits die hard among the immortal elves, the move to "stand down" from a war footing has been slow. Patrols around the borders of the forest are still maintained, even though orcs haven't been seen for nearly two centuries; they mostly prevent poaching and illicit wood cutting. Because of the casualties suffered during the wars, a majority of the current population has only known life in the town, not in the widely separated "tree-holds" which preceded it, so there was little pressure to move back, although older elves do tend to spend longer periods of time walking through the woods. The elves have made accommodations for increased visitors from the outside, but difficulties in communication persist, and outsiders can often feel slightly uncomfortable even though they find nothing but smiles and courtesy.

Society

Imagine a small town. Everyone knows everybody else, their families, their business, their stories about the great flood of aught-six. Now extend that knowledge to a small city. That, more or less, defines society in Tanir Aesayya. Sooner or later, everyone ends up dealing with everyone else, and after a century or three, that adds up.

Humans often see elven culture as complex, sometimes incomprehensibly so. But though elves do seem to have fondness for ceremony and elaborate social displays, part of it is simply that elven communities tend to build up a great deal of social shorthand: private jokes that are repeated so often that they can be communicated almost by vague allusion, social conventions invented to take into account this or that individual's personal preferences, shifting hierarchies of social precedence which only make sense if one knows all the players intimately. Dealing with the elves of Tanir Aesayya might be compared to dealing with members of a devoutly religious society who have a relevant passage from the Bible or the Qur'an on their lips for every occasion. You may speak the language, but you may not have to context to understand the nuances of what anybody says.

Another ramification of immortality is that the conflicts and prejudices of the past are still there in the present. Refugees are still refugees despite having lived in Tanir Aesayya for multiple human lifetimes, some elves hold Tylaleas as responsible for the deaths of family members as his predecessor, and a few elders still privately grumble

that the office of duke was supposed to be temporary, lasting for centuries rather than millennia, and should be dissolved now that the war is over and the orcs are gone.

So, then, society at Tanir Aesayya is more or less egalitarian, with no legally recognized classes, but there are nevertheless social divisions and political factions. The main division is between natives and refugees. Neither can really be said to have higher status than the other, but they tend not to socialize with one another as much as they do within their own groups. Although they've had enough time to learn one another's ways and customs, there's still social friction expressed in varying degrees of accommodation. Subtleties of dress and language are used to express solidarity with one group or another. For example, just about anything can be said using a relatively neutral expression or one from either native or refugee dialect. While the statements have approximately the same meaning, the one chosen indicates a preference for one side or another. Outsiders, of course, have a very hard time picking up on the subtleties.

There is a lesser generational division as well, between pre-war elders, elves born during the wars, and those born after the war. The first group is relatively conservative and increasingly solitary, the second is slow to make friends but prizes personal loyalty, and the third is split between isolationist conservatives and more worldly wanderers. However, all of these differences are largely just faint tendencies. Because of the low elven birth rate, children tend to be assimilated into the culture as a whole rather than identifying with very rare age-peers.

Trade, Industry, and Economics

Though they have great love of all manner of plants, the elves around Tanir Aesayya are mainly interested in the cultivation of trees, although cultivation may be too strong a word for it. They watch the development of trees, encouraging their growth in various ways, but do no planting or harvesting. Rather, they adapt themselves to the trees as much as they adapt the trees to their own needs.

Over slow centuries of management and subtle magical alteration, the elves have perfected their environment. The tall trees bear sweet acorns (sweet, in the sense that they aren't laden with the tannins which render ordinary acorns toxic), nuts, fruit, and edible flowers, a favorite item in the elven diet, all rounded out with herbs and edible mushrooms. All grow in superabundant quantities. That, and the fact that the tall trees allow the elves to take advantage of a third dimension in their subsistence strategy, gives the elves the ability to support many more individuals on far less land than the societies around them. These foods are occasionally supplemented with birds and game shot in the forest. Meat is not eaten frequently, and when it is, it's usually used in small quantities, smoked or otherwise preserved, to provide flavor more than substance.

Most of the goods the elves export are fine woodwork: furniture, ornaments, musical instruments, and high-quality bows. They also produce high-quality textiles, some from vegetable fibers harvested inside the forest, others from imported wool. Tanir Aesayya produces small quantities of a unique, extremely fine and durable fiber believed to be derived from spider silk and enhanced by mystical means. Important imports include metal tools and glass objects. The elves have returned to the custom of weekly market days, but those now mark peaks in commercial activity; traveling merchants and craftsmen are allowed to visit at any time. Most exchanges are barter rather than cash, although the elves will accept money if they can't trade for goods. They are exceptionally patient bargainers with a good eye for quality, but they do ultimately offer fair exchange.

The internal economy of Tanir Aesayya is rather different. The elves know the value of a gold piece. Among themselves, however, they don't see the point of using them. Goods are rarely transferred in reciprocal exchanges. Rather, they're given to whoever appears to need or desire them. Chalk up another one to immortality, perhaps, but after centuries of contact between individuals and families, the elves are disinclined to keep close track of every jot and tittle. Goods change hands like resources in an extended family, moving around fairly freely as needed with the expectation of eventual reciprocation. However, dealings between natives and refugees are often characterized by actual bargaining.

Government and Politics

The town is officially ruled by a noble whose title probably translates best as "duke." There have been seven dukes so far, six of whom have died in battle. Tylaleas has been in office for longer than any of them, and at this rate may be duke longer than all of his predecessors together. The duke's primary duty is as defender of the forest realm. He commands the guards and may call up additional forces when necessary. In that capacity, he also has executive authority over external affairs, negotiating alliances with outsiders, serving as the sole court for affairs concerning outsiders.

The duke also acts as a judge for internal disputes, but here his power is that of an administrator or moderator rather than a ruler. When parties to a dispute cannot settle it themselves, it becomes a matter for public debate. Regular "courts" are held in which the parties involved present their cases and the neutral parties present attempt to come up with a solution. The duke, who must hear all such cases, imposes discipline and formality on the process through elaborate ceremonies (calling the disputants to be heard, asking certain ritual questions, imposing traditional oaths, and so on). He has the power to impose a solution of his own if the disputants can't agree on one themselves after a period of time, traditionally from one full moon to another, although that power is rarely used.

This process seems to serve the elves well, and internally they seem quite content, except for the lasting division between natives and refugees. The problem here seems to be one of natives being reluctant to accept the refugees as equal residents of the forest and refugees reacting negatively to that. Many disputes which must be settled publicly are between natives and refugees. Since the duke granted new homes to the refugees, they tend to be his supporters politically, so the duke has been at pains not to display any favoritism towards them in his pronouncements.

There are also external issues which fall outside of the process which cause considerable dispute. Formally, no outsider is allowed to enter the forest without the duke's permission, although these days there is a blanket grant of permission for merchants traveling to the market. Anyone not entering the forest through approved routes and submitting to inspection by guards is presumed to be a spy, thief, or poacher and will be apprehended and brought before the duke. A controversial exception to these general rules allows a certain amount of timber harvesting at the edge of the forest by the humans living nearby. This has caused endless quibbling both with humans and between elven factions about its allowable extent. The humans seem somewhat blind to the markers the elves have set up indicating which trees may be taken, and many elves, particularly those who survived the war, don't want *anyone* cutting down trees. At the moment, the discontent is just grumbling, but it is quite widespread.

Military and Law Enforcement

The town keeps a standing force of 100 guards who patrol the forest and man the sentry posts. On reaching adulthood, every resident of the town is required to take one-year turns as a guard on a rotating basis. At present rates, that's about once every century. This is less a standing army than a first line of defense. In the event of war, everyone is expected to do their duty (although it may be the duty of some not to fight) whether it's their turn or not.

When the elves do go on the march, they're a formidable force. For one thing, the long, slow growth of the trees doesn't need constant tending; thus, as long as they're defending their own territory, the elves can put the majority of the city's adult population into the field, which is in turn the majority of the city's total population. Where a human civilization can rarely keep more than one or two percent of its people in the field for any length of time, elves can, if need be, hit the high nineties.

Second, though few have the temperament of professional warriors, most elves have several human lifetimes of experience with bows, stealth, and living off the forest, and most can bring some sort of useful magic to bear. It takes a brave outsider to face an elven guerilla war, and a foolish one to face it for very long.

Architecture

Unlike some other elves, the wood elves of Tanir Aesayya don't go in for building in a big way. Their homes are constructed flexibly in and around trees. The elves describe their building technique as a negotiation between tree and inhabitants. The trees grow without cutting, but the elves coax the tree's limbs to grow in ways making them easy to

build in. Except for a few small grass-covered plazas, there is little visible sign of habitation at ground level. Inhabited trees mostly have ladders and spiral staircases, with steps fixed around the trunk of the tree, leading up into the branches.

Living and working spaces start only where substantial branches begin, and at any rate at least twice the height of a person above ground level. At that level, the platforms start. Livable spaces are built on platforms made from plank and beams individually cut to fit on and around the limbs of the trees. Elven carpenters make heavy use of dovetail joints which lock structural members around supporting limbs, never resorting to metal nails. The platforms work their way up and around, with many small patches of floor arranged in a step-like fashion spiraling up the tree, and they are frequently reworked as the tree grows. Walls, such as they are, are likewise placed to take best advantage of the tree's limbs, although given the relatively warm climate during most of the year, the tree's canopy of leaves is sufficient to provide privacy. It's often difficult, therefore, to say whether one is inside or outside in a tree occupied by elves. Only during the coldest days of winter do enough walls and tapestries go up that rooms, in the conventional sense, can be distinguished. Many of the inhabited trees are hollow, and those spaces are frequently used for storage of particularly vulnerable goods such as books and alchemical ingredients.

Though most of the construction the elves do is inside each tree's canopy of leaves, and therefore invisible to most observers, they do provide external decoration. The fashion in Tanir Aesayya is to make brightly colored banners and ribbons and fasten them to a tree's outer branches. When the wind blows, densely inhabited trees become a riot of motion and color as the banners unfurl themselves.

The only piece of "permanent" architecture in Tanir Aesayya is, some elves would say, the only part of the settlement which really should be called Tanir Aesayya. At the center of the settlement is a large clearing surrounded by some of the tallest trees in the forest, the ancient marketplace which was pressed into service as a military headquarters. Once again, it serves its original purpose, hosting foreign merchants who have come to buy and sell. The permanent installation here is a large paved mosaic covering about a hundred square yards, decorated with a variety of scenes from elven history and legend. At one edge is set a tall marble throne, occupied by the duke when he holds court. Academically inclined visitors may come from hundreds of miles away to see the exquisite but unidentified workmanship.

Tanir Aesayya in the Campaign

Tanir Aesayya is a pretty nice place. The GM may want to emphasize the quiet (but not dead silence; there will always be bird sounds, leaves rustling, and the like), the usually warm weather, the lush greenery surrounding the small patches of well-kept meadow, and so on. There's plenty to eat, and the natives are generally polite. The forest is not a bad place to rest and recuperate if the PCs can behave themselves.

However, many PCs should feel a little uncomfortable. There are few if any physical threats present in the town, but PCs are likely to feel that they don't belong there. The lifestyle will be unusual and either boring or frustrating for faster-paced mortals, and all the residents clearly know a great deal that outsiders don't. Visitors will often feel that they're being condescended to, although they might not be able to say exactly why.

Tanir Aesayya, therefore, is more likely to be a stop along the way than a permanent base of operations. It makes a very good destination for trade, particularly to find items which are unusual but are not, say, powerful magical artifacts. The market is a good place to pick up high-quality mundane goods, all of which are likely to have a unique charm, and the occasional enchanted object. Knowledge would be another commodity PCs could acquire there. Centuries-old elves may remember lost secrets, know the answers to historical riddles, and have personally met ancient heroes.

The town would also be an interesting "x-factor" in a diplomatic setting. Outside PCs might have to appeal to the elves for extraordinary aid to gain the upper hand in an otherwise purely human dispute, attempting to sway the elves to favor an alliance with them instead of a different kingdom. For their part, the elves are likely to have a very different set of priorities in the usual give-and-take of gold and power over territory, making them difficult to negotiate with.

Here are some other adventure possibilities:

Forest Rangers: In this scenario, the elves might oppose PCs, or at least be an obstacle, without necessarily being enemies. The PCs need to gather rare herbs and mushrooms, unicorn horns, or other semi-mystical materials for reasons of their own. The forest around Tanir Aesayya is probably the most accessible source for such materials, but there's a problem: the elves don't want anybody taking them. Natural-born conservationists, they take a dim view of anyone baiting meadows with virgins or clear-cutting roads into the forest in order to find the rare purple mandrake root. PCs have the choice of either trying to talk the elves out of a few remarkably rare plants and animals, which is hard, or trying to sneak around them, which is harder.

Monsters, Monsters: After centuries of guarding their borders, the elves are safe from attack from the outside, which makes an apparent attack from the inside that much more terrifying. The deep, dark center of the forest has been ignored for centuries, and something has appeared there which doesn't like elves any more than the orcs do. A number of elves who have tried to cross the forest lately have not returned, and some have been found bloodily killed. Perhaps a nest of demons has established itself in the depths of the forest, or perhaps a group of trolls, to many minds little more than the cousins of orcs, have come out of tunnels deep under the forest to establish themselves above ground. What is at the root of the problem? And more importantly, what can the PCs do to help?

Return of the Orcs: It's been a few quiet centuries, but no more. News has arrived that a vast new orcish horde is advancing from what was once a safe distance. Can foresighted elves rally the complacent humans around them in time to undo the long work of rebuilding? PCs could act as scouts and "special ops" fighters sent to evaluate and delay orcish progress, ambassadors and messengers for the elves sent to try to convince the humans to forget their own squabbles, or humans whom the elves are trying to convince of the need for unity with their untrustworthy neighbors.

Forest Rebellion: The silent majority has finally had enough. They're staging a coup d'etat against Duke Tylaleas. Will they replace him with their own candidate for the office? A ruling council rather than a single ruler? Or dispense with the office altogether? The insurrectionists will probably have factions favoring each solution. Tylaleas, of course, won't take this lying down (unless they kill him, but his supporters will still be around). The coup will bring all the factions hidden underneath layers of ceremony and etiquette to the surface, and it won't be pretty. PCs could be rebels against the duke, loyalists (probably refugees, possibly able to call on aid from outside), or outsiders, probably caught up in a new wave of isolationism and anti-mortal sentiment.

Pyramid Review

Dos Rios

Published by [Mayfair Games](#)

Designed by Franz Benno Delonge

Graphics by Franz Vohwinkel

Translated by William Niebling

18 board pieces, 40 river tiles, 15 harvest cards, 44 player counters in four colors, 40 dams, 50 money bills, & rules sheet; full-color, boxed, for two to four players; \$49

Seems like every other game on the market sees players securing land, hunting on that land, or pulling crops from that land. Mayfair's ***Dos Rios*** ("two rivers," if you haven't gotten at least the *Sesame Street* crash course in Spanish) goes the farming route, putting you in the role of hidalgo as you try to keep the water flowing to your precious crops.

The object of the game is to be the first to complete your buildings.

The setup phase entails laying out the initial path of the two rivers, called the Rio Verde (Green River) and Rio Moreno (Brown River, though watch with amusement as people try not to become confused and call it by actress Rita Moreno's name). The top of the board shows the mountains and the bottom, the city and its surrounding river-fed lakes. The river, represented by several short blue pieces, has to follow certain rules as it meanders down the board, going from higher elevations to lower-lying land. Hills and forests also dot the landscape, separated into hexagonal spaces. The rest of the playing field has crops of corn, grain, and tobacco.

The pawns are called campesinos, and they're the only unit players have to start with. These fellows trek across the board to occupy river spaces. Once moved, your "meeples" can build structures for you. You can place buildings on the same spot as one of your workers, or construct a dam. Dams will channel the water in new directions, allowing you to irrigate different crops or draw the flow away from your opponents' farms. A series of harvest cards show which crops are due to bear fruit. Once you've finished moving and building units, you must choose whether to start or delay the harvest (the latter usually because others are in a better position to make use of it than you).

Anyone occupying fields through which the rivers currently run may benefit from the harvest. Some cards specify a crop, i.e., the corn card pays off for anyone in an irrigated cornfield; others may stipulate an entire river (anyone along the entire length of the Rio Verde scores for their crops). A paying field scores 100 rio, money that funds your buildings, while occupied forests provide new dam counters. Buildings don't move, obviously, but they pull in a harvest just like campesinos. Players must be wary not only of shifting waterways but of the desperados who sweep down from the mountains and send meeples back into the unproductive city; and of campesinos maneuvering to push your counters off their spaces before they pay off. You win the game if you're the first to put up all five of your buildings anywhere on the board. If you build four structures along the rivers, you win an early victory.

There's a lot going on across the map, so things get crowded in no time with four people vying for property. Fortunately the map and components are broad enough that you're not fumbling with thick fingers to push things about. Everything's bright and colorful, as God intended European games to be, and the wooden pieces are pleasingly substantial. The only real physical drawback is, like Mayfield's [La Strada](#) entry, the center of the board is composed of several smaller pieces that can be switched and rotated to create a new board every game -- and the pieces won't all fit.

You end up with a piece here or there hanging over its neighbors by maybe an eighth of an inch.

For all the building you must do and strategy you must employ, this product is refreshingly free of slow, numbing procedures. Movement across the board is fast; getting a new strategy into place can be done in a turn or two; and making the money you need can happen quickly, even on someone else's turn. There's plenty you can do in a round, but once you've settled on a plan you can employ it in short order. The flip side of this is the fluid nature of the game. Four people are jostling each other for success, which means the river snaking around the board isn't just an expression . . . all your hard work can be undone in a single round. But since it's easy to line your ducks up in a fairly tight row, it may just be a question of waiting for your turn to come back around again.

At the speed the game moves, it's not an all-night affair (unless you want it to be, and you may), but it is a lot to take in. The rules aren't without moments where you have to put your own two and two together, but it's all rather straightforward in the end. With plenty of last-minute reversals of fortune, ***Dos Rios*** may not be the sturdiest example of strategy gaming, but players don't have to sweat that a few mistakes at the start of the game spell doom. It offers an equal footing to all comers, and the built-in handicaps level the playing field. Now if only the die-cutting machine that stamps it would do the same.

The Sorcerer's Impediments

Converted to an *In Nomine* "Hevvy" Adventure for Angels

by Elizabeth McCoy

Prologue

[*The Sorcerer's Impediments*](#) was designed as an introduction to [*In Nomine*](#) and edited down to a stand-alone file containing all the rules (many simplified or glossed) needed to actually play. For those who would like to use that adventure in their regular *In Nomine* "Hevvy" campaign (instead of the "Lite" one the adventure was originally designed for), here is everything that was stripped out of the e23 adventure. You *will* need to download [*The Sorcerer's Impediments*](#) for the rest!

While pre-generated player-characters for *GURPS* and *In Nomine* are included, the concept is simple enough to be dropped in the laps of just about any group of angels -- or hostile demons!

For that matter, nothing's stopping the Game Master from inflicting the situation on mundane investigators . . .

* * *

There are angels and there are demons; there are Archangels and there are Demon Princes. Long ago, God and Lucifer had a discussion about Free Will; now, there's a secret War between Heaven and Hell. Angels work toward the betterment of the universal Symphony; demons want to impose their personal symphonies on everyone else. Angels prefer selflessness, thinking of the group above the individual. Demons, naturally, want to be the one on top and to Hell -- or somewhere -- with everyone else on the bottom.

And then there are the humans -- some serve knowingly, Soldiers of God or Hell. Some are servants and minions. And some . . . are sorcerers, who conjure up spirits and demons. Most of those are damned by Hell-tainted rituals, seduced by the promises of the Demon of Sorcery, who serves the Prince of Fate.

Naturally, that tends to upset the angels, and they try to . . . contain the problem.

GM's Notes

As a fast adventure, a certain amount of handwaving may be required. Places where the GM should decide details, based on the group's playstyle, will have GM's Notes with suggestions.

Act One: Target Acquisition

This section is short and straightforward, so that the GM and players may get a sense for what their resources and objectives are.

It is sad but true that the practice of sorcery tends to require Essence expenditures, and then there's the demon-summoning aspects -- both of which the Symphony tends to protest in the form of disturbance which the Aware (celestials, Soldiers, sorcerers) can perceive.

Thus disturbance has come to the attention of the player characters, the local agents of Heaven. As they are the only characters in the near vicinity, it falls to them to find out where the disturbance came from, and do something appropriate about it. E.g., if the disturbance is caused by a friendly angel or Soldier, chide him for being noisy and

trade phone numbers for later use. If the disturbance is caused by one of the forces of Hell, smite -- or, as there is a Seraph of Destiny in the group -- assess for redemption potential.

Therefore, when discovering agents of Hell or ethereals, the pre-generated PCs have the options of "turn them to the bright side," kill them, frighten them away, or capture them, as appropriate.

GM Notes: Aiming the PCs

There are three ways characters could get involved in a plot such as this. The fastest way is to assume that the group already knows what to do when they detect disturbance, they know each other, and they all meet in the closest coffee house or fast-food place because they were in the right place at the right time to hear and investigate.

Another common tactic is that a passing celestial, Soldier, or Saint detected disturbance, and called up whichever Seneschal has jurisdiction over the area. This would mean that one of the PCs (probably the Seraph) would talk to someone higher-ranking, and get to pass the rest along to his associates in the area.

The third way is direct Superior intervention. The matter has come to an Archangel's attention -- don't bother asking how, because if it were important, he'd have mentioned -- and he's contacted the PC(s) directly.

Some players enjoy meeting their PCs' Bosses. Others get twitchy about being pushed around by authority figures, and would rather ferret out plots by themselves. Some GMs prefer a less "special Servitor" model of player characters, and emphasize the hierarchy with supervisors and Seneschals. Pick which model the GM and players are most comfortable with.

Act Two: Target Disposal

In which the player characters and the non-player characters encounter each other and determine their conflicts of interest.

The location is an older house, on the outskirts of town, with no near neighbors. While the player characters and their target are *probably* the only Symphonically aware people in range, they can't be sure of that. Best to try to minimize disturbance for as long as possible. Good thing they have a Soldier to help.

Here are the additional complications that were omitted from the Lite version.

GM Notes: Longer Adventures

Just because this is designed as an introductory adventure, to be played quickly and give everyone a taste of the system and setting, doesn't mean that it couldn't be an incident in an ongoing campaign -- or that the players might not decide to make meticulous plans and preparations. If this is what the group finds *fun*, and there's enough time to get through it . . . let them!

Aside from spying (with the Kyriotate and bird-hosts or mundane cameras), PCs might research the property the disturbance came from. If this is the case, the players might want to take more time on it than a fast game might need - or the GM might want to give this information to the players immediately, as part of the prior off-screen investigation.

If the GM wants to skip all the research, instead provide information that a toddler has been kidnapped at a time corresponding to Song-disturbance in the area -- and let the angels rush to the rescue.

Alexandre's Office

Here is a more detailed version of what the PCs might find in the office on p. 6 of *The Sorcerer's Impediments*. Use

this data if the players enjoy solving puzzles, or if they've managed to break in when both sorcerer and demon are out of the house and the GM needs to stall to increase tension.

Aside from the methods listed in the Lite adventure, the desk's lock may also yield to a straight Lockpicking roll, which causes no disturbance.

Inside the desk are Alexandre's sorcerous notes. He keeps two sets -- one in plain text, and one in code: fractured Latin and Greek, riddles, backward handwriting, and the like. The stolen ritual (see Ummah's background, p. 8 of *The Sorcerer's Impediments*) is also here. A sufficiently extraordinary roll on a suitable skill (Knowledge (Occultism), Sorcery, etc.) or a default may find a key to undoing the bonds that link the demonlings with their vessels, which can be exploited by the PCs! If the angels can't figure out that trick, though, they can always try to . . . persuade . . . Alexandre or Ummah to assist them.

The computer contains the start of a (rather dreadful) manuscript which appears to be in some kind of esoteric code, with information in riddles, parables, and metaphors. (It is based from the coded notebook, if the PCs have seen that.) The computer's files also contain pornography, written and photographed. Some of it is in the same style as the manuscript. Some of the pictures are of a stunningly sexy woman -- and use of resonance through media (*In Nomine*, p. 57) on *those* could give interesting information indeed, as they are of Ummah herself.

Where's Who?

As noted above, the PCs might spy on the occupants and plot to break in at some point when the human (and "human") occupants are absent. In a short session, use the material in "Where's Who" section the e23 document. For random choice or longer plotting . . .

Alexandre Darkmoon spends most of his time in one of three places, depending on time of day and the GM's sadistic whims. For random choice, roll a d6: 1-2, basement; 3-4, office; 5-6: bedroom. He avoids the kitchen save when he notices he's hungry, and usually eats in his office or bedroom.

Ummah is ostensibly a demon familiar, so her location depends on where Alexandre is. If he's working in his office, she is probably in the basement, tormenting the demonlings for her own amusement, or in the bedroom, preparing it for her "master" (flip a coin if undecided, or roll a d6 for evens or odds). If he's in the basement, she's there too, aiding Alexandre in preparing more vessels. If he's in the bedroom, then she's keeping her pet (and herself) satiated there until he has to sleep -- then it's back to the basement for demon torment, or library for reading up on taxidermy or trashy fiction.

The **Demonling Horde** is kept in the basement in the day. At night, with strict instructions not to stray for long, they are set loose to find more vessel parts. This could pose a problem for small, furry Kyriotate hosts who are spying on the area.

If the GM has spurred the PCs into action with a kidnapping, the child is in a cage in the non-demonling side of the basement -- alive, if without food, drink, or a diaper change. (On the plus side, a 3-Force toddler is a potential host with some communication ability . . .)

And What Do We Do With Them?

With access to the "going celestial" rules, Ummah has another tactic besides using her resonance or talking her way out of things . . . celestial combat. Her potent Will makes her highly dangerous in that arena, even without considering her Calabite nature.

Meanwhile, capture of the sorcerer may be easier with a Kyriotate on the team -- though that will bring the dissonance conditions of the Domination into play, for longer term complications.

Characters

A large part of the appeal of an *In Nomine* game is the characters and their interactions. Situations may be violent or peaceful based not just on supernatural abilities, but on approach and personality. The most aggressive angel of War may have a meeting of minds and hearts with a demon of the War, and the most peaceful Servitor of Flowers might say the wrong thing and find himself fleeing sniper fire. The Words, Choirs, and Bands certainly suggest the bell-curve of how interactions are likely to proceed, but they're not straight-jackets.

These are the complete character sheets for the characters listed in [The Sorcerer's Impediments](#), plus an additional player-character angel. Where the descriptive information is entirely duplicated in the Lite adventure, it has been omitted here.

Player Characters

Here are four pre-generated characters for use in this adventure. As Servitors of Yves, Blandine, and Gabriel -- and one of Eli's, in service to Blandine -- they could also be used in many of the adventure seeds from [Superiors 3: Hope and Prophecy](#), which details the Archangels of Destiny, Dreams, and Fire. ([In Nomine Superiors: Eli](#), from [e23](#), expands on the powers, personality, and Servitor culture of the Archangel of Creation.)

The characters are arranged in order of Choir, from most holy to most worldly. While they have default names and genders, players may adjust either.

JONATHAN

Seraph of Destiny

Corporeal Forces - 2	Strength 4	Agility 4
Ethereal Forces - 3	Intelligence 7	Precision 5
Celestial Forces - 4	Will 6	Perception 10

Vessel: Human/4

Skills: Artistry/1 (Painting), Computer Operation/1, Detect Lies/2, Emote/1, Knowledge/5 (Literature), Languages (English/3*, Spanish/1), Singing/1

Songs: Healing (Corporeal/5, Ethereal/2, Celestial/1), Shields (Corporeal/5)

Attunement: Seraph of Destiny

* Jonathan gets one Language/3 for free; *In Nomine*, p. 75.

Jonathan is a young Seraph of Destiny, recently assigned to the corporeal realm, Earth. He has faith in his Archangel's faith in him, and this makes him confident and assured. It also makes him take his job very seriously, and he will push for the obvious rightness of any tactics that advance the Word of Destiny and foil the Word of Fate.

As a young Seraph, he still takes conversation very literally; beware of using euphemisms around him, for he has a tendency to use his resonance to figure out what the Truth is, and blurt it out.

(This is Jonathan from [Fall of the Malakim](#), p. 69. GMs may decide that this is part of his "past," "future," or simply an alternate reality to the events which occurred in that book.)

MERARI

Malakite of Fire

Corporeal Forces - 4 Strength 8 Agility 8
Ethereal Forces - 2 Intelligence 4 Precision 4
Celestial Forces - 3 Will 6 Perception 6

Vessel: Human/4

Skills: Acrobatics/1, Climbing/1, Dodge/2, Escape/1, Fast-Talk/2, Fighting/4, Running/1

Songs: Claws/1, Healing (Corporeal/2), Shields (Corporeal/6, Celestial/4)

Attunement: Malakite of Fire*

** Merari's assigned targets are those who cruelly raise false hopes in others. She may recognize anyone who does this, though only the one currently in her "target" slot will be dissonant to ignore.*

Merari is not so new to Earth as Jonathan, but she is no expert at corporeal life. Fortunately, she tempers her urges toward violence when around Servitors of Destiny, and Seraphim she feels she should obey.

Though a bit slow of thought in celestial society, Merari is not *stupid* -- her intelligence is human-normal. She's perfectly capable of coming up with reasonable plans, and is not so lazy or careless as to insist on jumping in with hands flaming. Of course, if the plan should happen to involve flaming hands and mayhem, she's the Virtue for the job and happy to do her part.

HASADIAH

Kyriotate of Creation, in service to Blandine

Corporeal Forces - 3 Strength 7 Agility 5
Ethereal Forces - 2 Intelligence 3 Precision 5
Celestial Forces - 4 Will 9 Perception 7

Skills: Dodge/6, Emote/3, Escape/2, Fast-Talk/2, Fighting/1, Lockpicking/3, Lying/2, Move Silently/3, Ranged Weapon/2 (Pistol), Savoir-Faire/2

Songs: Entropy (Celestial/3), Healing (Corporeal/6)

Attunement: Kyriotate of Creation

Hasadiah is a Kyriotate, who refers to itself as "they," giving rise to such mangling of language as "we am the Kyriotate in the squirrel, the mouse, and the librarian." Fortunately, most other people call Hasa "it," or whatever gender its host of the moment is. (This can also cause confusion; as a Kyriotate of Creation, Hasa is able to modify the host's form nearly as well as a computer expert modifies a CGI model.)

Like Merari, Hasadiah is human-normal intelligence -- the lower end of it. This makes the Domination an unlikely match for the Archangel of Dreams and the realm of sleeping minds, but teamed with a Soldier, Hasadiah can keep things running smoothly in the corporeal realm, while the Soldier works on the ethereal plane.

KRIS MURPHY

Soldier of Dreams

Corporeal Forces - 2 Strength 3 Agility 5
Ethereal Forces - 2 Intelligence 3 Precision 4
Celestial Forces - 2 Will 5 Perception 3

Status: 2

Skills*: Dodge/3, Dreaming/4, Driving/2, Knowledges (Local Area/3, Psychology/3, War-games/1), Lying/2, Medicine/1, Ranged Weapon/2 (Pistol), Swimming/1, Tactics/4

Song: Dreams (Corporeal/1)

Advantage: Toughness/1

* *Kris has the free skill package for humans, from p. 24 of the **Corporeal Player's Guide**.*

When in the Marches, Kris has a habit of telling hostile dream-spirits, "I'm Murphy, and I'm the worst thing to go wrong for you." On Earth, Kris is a bit less showy. Still, someone's got to keep the angels from being too openly supernatural, remind them to go to the bathroom, take baths, and eat pizza now and then . . .

Since a Soldier's life can be full of emergencies, Kris tends to drift from job to job, but mostly looks like a college student and does take a few classes now and then (especially Psychology, which helps when trying to understand and explain humanity to non-humans). Kris works closely with Hasadiah -- when the Kyriotate is in control, Kris is in the Marches, which is a fine place indeed for a Soldier of Dreams.

Non-Player Characters

If the GM uses a kidnapped toddler to spur the PCs into action, the child has have 3 Forces and negligible characteristics; assign a 2 for any resistance purposes unless the Game Master has plans for a follow-on adventure.

ALEXANDRE DARKMOON

Sorcerer

Corporeal Forces - 1*	Strength 3	Agility 3
Ethereal Forces - 2	Intelligence 4	Precision 4
Celestial Forces - 3	Will 7	Perception 5

Status: 2

Skills*: Computer Operation/1, Command/2, Driving/1, Focus/2, Knowledges (Local Area/3, Sorcery/3, Taxidermy/1), Ranged Weapon/1 (Pistol), Small Weapon/1 (Knife), Swimming/1, Summon/2

Rituals: Suggest (Command), Create Vessel† (Focus), Summon Demonling (Summon)

Advantage: Toughness/2

Disadvantages: Damaged Sense/1 (Sight), Lustful/2, Slothful/1

* *Alexandre has the free skill package for humans, from p. 24 of the [Corporeal Player's Guide](#). He has also bought two characteristic points, giving him Strength and Agility 3 despite having only 1 Corporeal Force.*

† *Create Vessel is the ritual he uses to bind demonlings into dead bodies. See his background and Ummah's, below, for more details about this adventure McGuffin.*

UMMAH

GM Notes: Malakite Resonance Results

It is very probable that Merari will use her resonance upon the NPCs (and the PCs). This may be a good thing, if the Kyriotate winds up possessing someone -- its state of honor will be very different from that of a demon, demonling, or sorcerer.

Here are resonance results for the NPCs, by check digit.

Alexandre

1-2: Noble: Hung up his own clothes in the closet *or* did not abandon the kidnapping plan, if the GM is using that plot twist. Didn't do the dishes *or* kidnapped a child.

3-4: Noble: Mastered a difficult skill (the vessel ritual), did not flinch from putting the skill into practice, helped build something (the cage). **Ignoble:** Has not finished his book, has not deciphered a promising code in one of his reference works, has spent time

Calabite of Fate

Corporeal Forces - 2 Strength 4 Agility 4
Ethereal Forces - 3 Intelligence 7 Precision 5
Celestial Forces - 4 Will 10 Perception 6

Vessel: Human/4, Charisma/3 (Sex Appeal)

Skills: Dodge/3, Emote/3, Fighting/2, Lying/1, Savoir-Faire/2, Seduction/1

Songs: Charm (Celestial/4), Entropy* (Ethereal/1, Celestial/1), Light (Celestial/3)

Attunements: Calabite of Fate, Infernal Pact

** As an entropic Calabite herself, Ummah has a +1 to the check digit of any successful performance of the Songs of Entropy.*

Combat Tactics: Ummah, like her pet sorcerer, is not the sort to seek out brawls. She's capable, but would rather spread confusion with her Songs of Entropy, her entropic resonance, and the demonlings. If pressed corporeally, she will shift to celestial form, where she is *much* more potent! (Her Fighting skill is suddenly based on Will, for instance, and her Dodge on Perception. *And* she still has her resonance.) She'd be willing to stall angels to let Alexandre (her meal ticket) get away, but would rather descend to her Heart than risk losing more than 1 Force, rather Trauma than soul-death, and rather let her human dupe die than experience Trauma herself. And, of course, the demonlings are totally expendable to her; let them deal with the PCs, help them mop up if they're winning, and flee with Alexandre otherwise.

DEMONLING HORDE

Corporeal Forces - 1 Strength 2 Agility 2
Ethereal Forces - 1 Intelligence 1 Precision 3
Celestial Forces - 1 Will 3 Perception 1

Vessel: Dead Body/1

Skills: Fighting/2, Move Silently/1, Running/1

Since the bodies decay and require maintenance, the number of demonlings in the horde is restricted by how many Alexandre and Ummah can keep intact; they're at about maximum now, but the PCs don't need to know that. They can discover that the bodies are fragile on their own, but the sheer numbers of the little horrors (as many as the GM feels like running in combat) makes them a threat. The dead-body vessels that the demonlings have *are* vessels, and as such, may be possessed by a Kyriotate . . .

Combat Tactics: These are not sophisticated fighters, looking for openings or tricky ways to get behind enemies. They just attack, or just run, very simply. To avoid bogging down the action, the GM may wish to roll once and require Dodge once per "sub-horde" of demonlings (making any damage a small multiple of the check digit), or use only eight to ten as the total horde. Operate on mob mentality: if more than one or two attack, they all attack. If more than

photographing his servant instead of working. (If using the kidnapping thread, insert those results as appropriate instead of the last entries.)

5: Most Noble: Alexandre did not give up when he was bullied and abandoned, but instead picked himself up and kept going. **Most Ignoble:** He sold his soul to Hell. (Alexandre does not consider this ignoble; he found the ritual and made it work, did he not?)

6: Alexandre aspires to be a secret ruler of the world, an immortal mover and shaker behind the scenes, able to control the lives and happiness of others -- and a knowledgeable and potent mastermind. And indeed, he has that dark potential! If he turned his abilities to selfless ends, he could be a leader of others, bending his remarkable will toward the greater good with impassioned and inspired speeches. He is, obviously, closer to the darker end of this.

Ummah

1-2: Noble: Has *not* slaughtered a half-dozen of the annoying little creatures, despite provocation. **Ignoble:** Has neglected several opportunities in her work to pursue recreational activities.

3-4: Noble: Obtained the experimental ritual and helped her "junior partner" complete it, thought of using small animals for vessels instead of robbing graveyards, has not slaughtered the creatures despite provocation. **Ignoble:** Has neglected opportunities to pursue recreation instead, wasn't able to figure out how to

one or two flee or are killed, they all flee.

***GURPS In Nomine* Appendix**

Nothing says that this adventure could not be a sampler -- or introduction -- for ***GURPS In Nomine***, or simply dropped into any other supernatural-tinged campaign with minor changes. Here are the ***GURPS*** character sheets for the pre-generated player characters and NPCs.

GURPS In Nomine

GURPS In Nomine uses ***GURPS Third Edition*** rules; all references to ***GURPS*** in this section mean the Third edition, not the Fourth. Converted characters have been "normalized" as if they had been created in ***GURPS***. The only exception is in levels of Discord; in a normal conversion, an adapted Frequency of Submission table (pp. CI10-11) would be used. For simplicity, Discord has been taken "straight," with the default ***GURPS Basic Set*** or ***GURPS Compendium I*** mechanics. Note that Songs have had the -5 applied for use outside the celestial realm. If these characters go to Hell or Heaven, they will have +5 to all Songs. The default Tech Level for ***GURPS In Nomine*** is TL7.

Extra Hit Points and Reduced Hit Points

Many converted ***GURPS*** characters have Extra Hit Points for physical, mental, and celestial combat. The physical advantage is written as Extra Hit Points for the vessel in question. Extra Hit Points (Mind) are bought with the -50% Limitation, "Only for mental combat," and Extra Hit Points (Soul) are bought with the -20% Limitation, "Only for celestial combat." Reduced Hit Points for Mind Hits and Soul Hits have the same Limitations. See ***GURPS In Nomine***, pp. 27-28, for more information.

Power Investiture and Essence Control

The ***GURPS In Nomine*** advantages Power Investiture (p. IN27), and Essence Control (p. IN31) are both included in the Basic Celestial Template (pp. IN9-10). Celestials are assumed to have the default 9 levels of Essence Control, and have allocated their initial Power Investiture levels to Power Investiture (Corporeal) 3, Power Investiture (Ethereal) 3, and Power Investiture (Celestial) 3. Any totals listed in the descriptions include these levels plus any additional purchased; lower levels than 3 will be treated as disadvantages.

Page References

Rules and statistics in this article are specifically for the ***GURPS Basic Set, Third Edition***. Any page reference that begins with a B refers to the ***GURPS Basic Set*** -- e.g., p. B102 means p. 102 of the ***GURPS Basic Set, Third Edition***. Page references that begin with CI indicate ***GURPS Compendium I***, M is for ***GURPS Magic***, and IN refers to ***GURPS In Nomine***. For a full list of abbreviations, see p. CI181 or the [updated web list](#).

make the ritual work *better*, had to grovel and beg to get the utilities turned on.

5: *Most Noble*: Ummah has served her master with devotion and zeal, nearly selfless in her belief of the rightness of his cause. ***Most Ignoble*:** She is plotting to overthrow her immediate superior . . . eventually . . . and take her place. (Ummah considers both of these noble.)

6: Ummah aspires to be a secret master of the fates of others. Her true depths are not so grand -- she is more a secret middle-manager of the fates of others -- and her possible heights would have her a sympathetic counselor, healer of the emotional wounds of others.

Screaming Demonlings

1-2: *Noble*: Won a fight!
***Ignoble*:** Lost a fight!

3-4: *Noble*: Won a fight, caught a small furry thing, blamed something on someone else and got away with it.
***Ignoble*:** Lost a fight, tore a small furry thing so much it wasn't very useful for making vessels, got caught doing something.

5: *Most Noble*: Got to Earth!
***Most Ignoble*:** Got summoned and enslaved.

6: The demonlings aspire to gain power (over others, via more Forces, etc.) so that they can hurt what they don't like and escape bigger things. They are paragons of stupid selfishness, and their darkest depths would make them

Player Characters in *GURPS*

Though starting characters by the rules on p. IN16 -- the Basic Celestial Template, Choir, and Choir Attunement are "free," and the remainder is built on 100 points plus disadvantage and quirks -- total character points have been listed for each of the pre-generated PCs.

powerful as well -- but as demonlings, they do hold the unlikely potential to seek redemption and become angels. The *very* unlikely potential.

Most of the characters have few, if any, Disadvantages, and some undefined Quirks. If the GM permits, players may customize their characters appropriately.

Jonathan, Seraph of Destiny

631 points

ST 12 [-15]; **DX** 12 [-15]; **IQ** 16 [20]; **HT** 14 [0].

Speed 6.5; Move 6.

Dodge 6.

Advantages: Alertness +4 [20]; Basic Celestial Template [480]; Choir (Seraph) [26]; Choir Attunement (Seraph of Destiny) [25]; Power Investiture (Celestial) 4 [10]; Vessel (Human, Extra Hit Points +5, Zeroed) [60].

Disadvantages: Power Investiture (Corporeal) 2 [-10]; Servitor of Destiny [-7].

Quirks: Confident in his Archangel's estimation of him; Takes slang and euphemisms literally; 3 to be chosen by the player [-5].

Skills: Acting-14* [1/2]; Area Knowledge (Yves' Library)-14 [1/2]; Artist-13 [1/2]; Computer Operation/TL7-15 [1/2]; Detect Lies-14 [1]; History-13 [1/2]; Leadership-14 [1/2]; Literature-17 [6]; Mathematics-13 [1/2]; Musical Instrument (Violin)-13 [1/2]; Research-14 [1/2]; Singing-15 [2]; Typing-11 [1/2]; Writing-13 [1/2].

Songs: Healing (Corporeal)-17 [12]; Healing (Ethereal)-14 [2]; Healing (Celestial)-13 [1]; Shields (Corporeal)-17 [12].

Languages: Angelic (native)-16 [0]; English (native)-16 [0]; Spanish-14 [1/2].

* Jonathan cannot use his Acting skill to lie. However, he can use it to remain poker-faced, or to emphasize *true* body-language.

Merari, Malakite of Fire

650 points

ST 14 [0]; **DX** 16 [20]; **IQ** 12 [-15]; **HT** 15 [10].

Speed 7.75; Move 9.

Dodge 9.

Advantages: Alertness +1 [5]; Basic Celestial Template [480]; Choir (Malakite) [35]; Choir Attunement (Malakite of Fire) [35]; Combat Reflexes [15]; High Pain Threshold [10]; Power Investiture (Corporeal) 4 [10]; Strong Will +1 [4]; Vessel (Human, Extra Hit Points +1, Zeroed) [40].

Disadvantages: Power Investiture (Ethereal) -1 [-10]; Servitor of Fire [-12].

Quirks: Enjoys Mayhem; Defers to Seraphim and Servitors of Destiny; 3 to be chosen by the player [-5].

Skills: Acrobatics-14 [1]; Brawling-17 [2]; Climbing-15 [1]; Escape-14 [1]; Fast-Talk-12 [2]; Running-13 [1].

Songs: Healing (Corporeal)-10 [2]; Numinous Corpus (Claws)-10 [2]; Shields (Corporeal)-12 [8]; Shields (Celestial)-12 [8].

Languages: Angelic (native)-12 [0]; English (native)-12 [0].

Hasadiah, Kyriotate of Creation, in service to Blandine

780 points

ST 13 [-10]; **DX** 13 [-10]; **IQ** 13 [-10]; **HT** 16 [20].

Speed 7.25; Move 7.

Dodge 8.

Advantages: Alertness +2 [10]; Basic Celestial Template [480]; Choir (Kyriotate) [175]; Choir Attunement (Kyriotate of Creation) [25]; Combat Reflexes [15]; Power Investiture (Celestial) 4 [10]; Servitor of Eli, In Service To Dreams [29]; Strong Will +6 [24].

Disadvantages: Power Investiture (Ethereal) -1 [-10].

Quirks: Refers to itself as plural; Doesn't like the Marches; 3 to be chosen by the player [-5].

Skills: Acting-14 [4]; Brawling-12 [1/2]; Escape-12 [2]; Fast-Talk-12 [1]; Guns/TL7 (Pistol)-14 [1/2]; Lockpicking/TL7-14 [4]; Savoir-Faire-13 [1]; Stealth-15 [8].

Songs: Entropy (Celestial)-12 [4]; Healing (Corporeal)-14 [12].

Languages: Angelic (native)-13 [0]; English (native)-13 [0].

In **GURPS In Nomine**, Hasa relies far more on IQ to be a "social spy" concept than it does in **In Nomine**, and designing "them" as a **GURPS** character reflects this.

Kris Murphy, Soldier of Dreams

100 points

ST 9 [-10]; **DX** 13 [30]; **IQ** 12 [20]; **HT** 9 [-10].

Speed 5.5; Move 5.

Dodge 6.

Advantages: Combat Reflexes [15]; Soldier of Dreams (Essence Control 6, Power Investiture (Corporeal) 1, Symphonic Awareness) [46]; Toughness +1 [10].

Disadvantages: Duty (Dangerous, quite often (12 or less)) [-10]; Struggling Wealth [-10].

Quirks: Trademark: Refers to "Murphy's Law" in various ways; *Likes* being possessed by a Kyriotate; 3 to be chosen by the player [-5].

Skills: Acting-10 [1/2]; Area Knowledge-12 [1]; Driving (Car)-12 [1]; First Aid/TL7-12 [1]; Guns/TL7 (Pistol)-15 [1]; Lucid Dreaming-15 [6]; Hobby Skill: War-games-11 [1]; Psychology-12 [4]; Swimming-12 [1/2]; Tactics-13 [6].

Songs: Dreams (Corporeal)-10 [2].

Languages: English (native)-13 [0].

* Kris' Hobby Skill might be useful enough to be full price -- as it is listed here -- or the GM could rule it a true *hobby*, with the effective points counting double, and say Kris has it at 12 instead.

The Game Master might also allow Kris' player to assign up to twenty more points in Disadvantages, which could purchase Ethereal Connection (p. IN19) and an Ethereal Song (such as Ethereal Shields), or raise Kris' IQ.

Non-Player Characters in *GURPS*

Like the pre-generated player characters, the NPCs have been "normalized," as if they were created in *GURPS In Nomine* to begin with -- and Alexandre and Ummah are both now starting-level characters.

Alexandre Darkmoon, Sorcerer

100 points

ST 9 [-10]; **DX** 13 [30]; **IQ** 13 [30]; **HT** 10 [10].

Speed 5.75; Move 5.

Dodge 5.

Advantages: Alertness +1 [5]; Sorcerer (Essence Control 6, Power Investiture (Sorcery), Symphonic Awareness) [46]; Strong Will +4 [16]; Toughness +1 [10].

Disadvantages: Bad Sight (Nearsighted) [-10]; Laziness [-10]; Lecherousness [-15].

Quirks: Budding megalomaniac; Dislikes cute, furry animals [-5]; Hates his real name; Writing a Grand Occult Book [-4].

Skills: Area Knowledge-12 [1/2]; Computer Operation/TL7-12 [1/2]; Driving (Car)-11 [1/2]; Guns/TL7 (Pistol)-14 [1/2]; Knife-12 [1/2]; Occultism-13 [2]; Professional Skill (Taxidermy)-11 [1]; Research-11 [1/2]; Swimming-12 [1/2].

Spells: Create Vessel-11 [1]; Loyalty-11 [1]; Planar Summons (Ethereal Realm)-12 [2]; Summon Demonling-12 [2].

Languages: English (native)-13 [0].

Ummah, Calabite of Fate

613 points

ST 12 [-15]; **DX** 12 [-15]; **IQ** 16 [20]; **HT** 14 [0].

Speed 6.5; Move 6.

Dodge 7.

Advantages: Band (Calabite) [28]; Band Attunement (Calabite of Fate) [5]; Basic Celestial Template [480]; Combat Reflexes [15]; Power Investiture (Celestial) 4 [10]; Servitor Attunement (Infernal Pact) [10]; Strong Will +5 [20]; Vessel (Human, Very Beautiful, Zeroed) [60].

Disadvantages: Power Investiture (Corporeal) -1 [-10]; Reduced Alertness -3 [-15].

Quirks: Devoted to Fate's service; Enjoys tormenting lesser beings (e.g., demonlings); Indulges in corporeal pleasures; Lousy housekeeper; Plots to overthrow her immediate superior, Hatiphas, Balseraph Demon of Sorcery, and take her Word [-5].

Skills: Acting-17 [4]; Brawling-12 [1]; Research-15 [1]; Savoir-Faire-17 [2]; Scrounging-16 [1]; Sex Appeal-15 [4].

Songs: Charm (Celestial)-16 [8]; Entropy (Ethereal)-13 [1]; Entropy (Celestial)-13 [1]; Light (Celestial)-15 [4].

Languages: English (native)-16 [0]; Helltongue (native)-16 [0].

Infernal Pact is the Servitor Attunement of Fate (and Sorcery) which grants the advantage of Power Investiture (Sorcery) -- and incidentally damns the human who accepts it. *Infernal Pact* is a new power, costing 10 points.

Despite not being a starting character in ***In Nomine***, Ummah can be made easily enough as a starting character in ***GURPS In Nomine***.

Demonling Horde

140 points

ST 6 [-70]; **DX** 5 [-80]; **IQ** 4 [-90]; **HT** 6 [-70].

Speed 2.75; Move 3.

Dodge 3.

Advantages: Basic Celestial Template [480]; Strong Will +2 [8]; Vessel (Dead Body, Ugly, Zeroed) [25].

Disadvantages: Bad Temper [-10]; Bestial [-10]; Bully [-10], Dead Broke [-25]; Duty (Involuntary, Quite Often (12-)) [-20]; Essence Control 3 [-6]; Power Investiture (Corporeal) -2 [-20]; Power Investiture (Ethereal) -2 [-20]; Power Investiture (Celestial) -2 [-20]; Reduced Alertness -3 [-15].

Quirks: Cowardly individually, bold in packs; Glad to be out of Hell [-2].

Skills: Brawling-8 [8]; Running-6 [4]; Stealth-5 [2].

Languages: English (native)-4 [0]; Helltongue (native)-4 [0].

Individually, they are revolting, but not that terrifying. Add demonlings until they are suitably threatening.

Getting the Job Done

for *GURPS*

The alley, down which they had chosen to make their escape, was a dead end. A 30-foot brick wall matched those to either side. They turned to see to see that the flesh-eating zombies had spotted them and were already coming down the alley. The undead didn't move fast, but they were relentless and much more durable than the movies had implied. Murdock pulled out his picks and started working on the locked door. If they could get through in time, they might make it to safety and better weapons.

"How long?" asked Johnson as he locked his last magazine.

Sadly for Murdock, the Basic Rules for **GURPS** is 1 minute minus 5 seconds per point by which the roll was successful. If the attempt was a failure, then after the first minute, the clock starts again, even though Murdock's player knew after 1 second that he would fail. Meanwhile Murdock's player sits there during the combat with the zombies and each round says "I'm picking the lock."

Long actions in RPGs are boring and not terribly realistic. In the Lockpicking example, the roll is made at the beginning of the action, so the player probably knows if he was successful and how long it will take or if he was unsuccessful and will just be out of play for the minute, then roll again for another long wait. If the GM rolls (to keep the mystery of the length of time) then the player has no clue that he's hopelessly botched it until the minute has elapsed. Additionally, picking a lock will never take more than a minute per attempt. This steals from the drama and excitement of the scene. If combat were handled this way, no one would play.

"Roll versus your weapon skill."

"I made it by 3."

"Good roll; you will kill him in 45 seconds. Let's see how he does. The bad guy only made it by 1, so he'll kill you in 55 seconds, if you decide to do anything besides combat."

Basic Theory

Instead of a fixed amount of time for a task, a variable amount of time determined by the luck of the player and skills of the hero could be used. Because of the nature of **GURPS** in keeping all skills along the same rules, tasks are easily integrated into combat. Each round there is an attack, damage, and possibly regeneration. Each task has a number of Task Points which correlate to hit points; when the points are gone, the task ends.

Attack the Task

For any given task a PC has a skill; it might be a default, but there is a number that may be rolled against. The character may also have advantages and equipment to make a job easier or some disadvantages to slow him down. Some equipment will only apply to skill, some only to progress. A power drill will make the job go faster, but a laser guide on the saw only adds to skill. Each round the player makes a roll against his skill with the appropriate modifiers. On a success, progress is made. On a critical success the progress roll is maximum. On a failure, no progress is made. On a critical failure a setback has occurred (see below). Some skills, such as digging a hole or bailing out a boat, do not require a skill roll. Use a margin of 0 for these cases.

Make Progress

Each task has an attribute associated with it. This may be the primary attribute for the skill or a different one. Lockpicking is a mental skill and IQ would be the base for the skill roll. Actually picking the lock is a DX event so DX would be the affecting attribute. Perception or other derived values may also be used. The margin of success is added

to the affecting attribute and any other pertinent bonuses, and the thrust damage value from the basic damage table is determined. This is the amount of progress made. Note that a failure does not allow progress at a lesser value. If the total progress made exceeds the Task Points of the project, the long action is a success. If not, the PC continues next round.

Regeneration

Some tasks are not straightforward. Bailing water out of a leaky canoe is an example. No matter how fast the bailing is happening, water still comes in until the canoe capsizes. In this case the Task Points might recover 1 to 1d per round until the canoe capsizes or the leak is repaired, at which point the bailing would continue until everyone relaxed.

Setbacks

When a task goes horribly wrong setbacks occur. The following list is not comprehensive.

- Tools broken or dropped out of reach (into water or off ledge).
- Task becomes impossible (jammed or hopelessly destroyed).
- Progress lost. Work must be restarted from 0 or some earlier breakpoint.
- Something related goes awry adding to the total TP required.
- End results are not exact (research reveals incorrect answer).
- Related distraction occurs (alarms are activated, or high pressure fluid leak).

Task Points

In this system a task needs Task Points . . . but how many? Like hit points, PCs should not know how many they need for any specific task, but may know the neighborhood. The number of TP for a project can be calculated from the amount of time the GM would like the task to take or thinks is reasonable and multiplying it by the average progress for the character. For instance, a skill 12, attribute 12 PC will generate 3 points of progress each round. If the GM wants it to take about a minute, that's 180 TP. If a different PC (skill 10 attribute 10) tried the same task, it would take just over two minutes on average.

Average Progress per Round

Affecting Attribute									
	8	10	12	14	16	18	20	22	24
Skill									
8	0.5	0.7	0.9	1.1	1.4	1.6	1.8	2.0	2.3
10	1.1	1.4	1.9	2.3	2.8	3.2	3.6	4.1	4.5
12	1.9	2.4	3.1	3.7	4.4	5.0	5.6	6.3	7.0
14	2.7	3.5	4.3	5.0	5.8	6.6	7.4	8.2	9.0
16	3.6	4.4	5.3	6.1	7.0	7.8	8.7	9.5	10.4
18	4.4	5.3	6.1	7.0	7.8	9.7	9.5	10.4	11.2
20	5.3	6.1	7.0	7.8	8.7	9.5	10.4	11.2	12.0
22	6.1	6.9	7.8	8.7	9.5	10.3	11.1	11.9	12.8
24	6.5	7.4	8.2	9.0	9.8	10.5	11.3	12.2	13.0

A Look at Longer Long Actions

Not all long actions can or will be resolved within a stretch of combat. Gathering information, designing and building a vehicle, or performing surgery are examples. These tasks might be rolled for hourly or daily with the TP adjusted accordingly. A character in a strange city might need to find a controlled or restricted item. Using Streetwise hourly, using perception at the affecting attribute might require 30 TP. A carpenter and his crew might need 300 TP to raise a

house, and roll daily.

Teamwork

Some tasks can be accomplished faster by having more people working on it. Some are better with only one or two people. Lockpicking is slower with two or more. Surgery would peak at around three surgeons. Searching the countryside for a fugitive or missing person is better with many. The benefits of teamwork are that progress accrues faster and critical failures are rerolled, and counted as normal failures if the reroll is successful, somebody prevented the error.

If a task uses more than five people, one must be a leader. If the leader fails his Leadership roll, all other workers count half their normal progress (rounded up). The leader may, but does not have to, contribute to the progress. A leader may supervise up to his Leadership skill level of persons, with a -1 to his skill for each person over that. A manager with a 14 skill could supervise 18 people but would roll against 10, rather than 14. Reaction modifiers affect the roll, not the number of people supervised.

Shiftwork

Some tasks can be picked up by new workers as others tire, for instance building a wall around a town. If fewer than 1/3 of the people are replaced during any hour there is no change in the method, If more than 1/3 are replaced, then the leaders of each group must confer for 30 minutes or lose 1 hour of progress as workers try to figure out exactly where in the task they are. If there is no relieving shift, but the same workers will return after a rest (or the next day) no conference is needed.

Multi-Tasking

Some work can be done concurrently. A character could combine efforts to find restricted weapons, controlled drugs, illegal gambling, and a house of ill-repute using streetwise. If the goals and skills are appropriate a portion of points share. In the above example, the character would need 10 points for each of the 4 things, but after accruing 10 (enough for 1 goal) ¼ of those points would apply toward the second goal. When that was completed, ½ of the points for the third goal would be applied, and ¾ towards the fourth goal after the third was accomplished. The GM, not the player, should determine which goal is found first, second, etc.

Sample Task Points

These are included as a reference and should be adjusted to the GMs wants and specific circumstances and tasks.

Task	Skill	TP	Affecting Attribute	Roll Increment
Training an Animal	Animal Handling	100/Animal's IQ	IQ	Hour
Repair Leather Armor	Armoury	50	IQ	Minute
Repair Metal Armor	Armoury	30	ST	Hour
Conceal position	Camouflage	10/hex	IQ	Minute
Gather Information	Carousing	10/clue	IQ	Hourly
	Streetwise	10/clue	Per	Hourly
	Research	20/find	IQ	Hourly
Disguise	Disguise	150	Vision	Minute
Escape (1st try)	Escape	200	DX	Second
Escape (later tries)	Escape	30	DX	Minute
Pick Lock	Lockpicking	180	DX	Second
Repair vehicle	Mechanic	200 (simple)	DX	Second
		200 (complex)	DX	Minute
		200 (body work)	DX	Hour

Evaluate weapon	Weapon skill	60	IQ	Second
Haggle	Merchant	100	Per	Second
Salvage	Scrounging	40	Per	Minute

* * *

Johnson: *I club the zombie with my gun. I hit and 2 points of damage.*
Murdock: *Still working that lock. Success by 2 and 4 progress.*
GM: *Murdock, you hear a click and feel the bolt slide open.*

Pyramid Review

Monkey, Ninja, Pirate, Robot: The Roleplaying Game

Published by [Atomic Sock Monkey](#)

Written & Illustrated by Chad Underkoffler

64-page 2.1 MEG PDF; \$6

One of the best games of 2004 was Chad Underkoffler's [Dead Inside: The Roleplaying Game of Loss & Redemption](#), the RPG in which each character has lost his soul and must redeem himself in the spirit world in order to get it back. While that game was thoroughly thoughtful and serious, his **Monkey, Ninja, Pirate, Robot: The Roleplaying Game** is anything but. The title should be enough of a clue for that, and if not, the fact that all of this game's illustrations are done by the author as monkey/ninja/pirate/robot stick figures should be.

This is a very cartoon world, so logic gets diced and thrown out with the banana skins. Thus we are in the territory of Steve Jackson Games' **Toon** and Z-Man Games' [Cartoon Action Hour: The 1980's Action Cartoon RPG](#), more the latter than the former, and definitely within the realms of a single setting rather than the many. In fact, the setting is that of the author's earlier card game, [Monkey, Ninja, Pirate, Robot Deluxe](#), itself an *Origins*-Award-nominated entry for *Best Abstract Board Game*.

Players take the titular roles and, to quote from the board game, each is "*Bathed in atomic radiation, these champions fight to the death in order to claim the sweet, sweet Uranium for the people . . . and Victory!*" Not only that, but each type also battles for the Mojo that will only make them stronger, and while not everyone likes each other -- monkeys dislike robots, but like pirates; ninjas like robots, but dislike pirates, and vice versa. Everyone hates the "evil" mysterious aliens.

Using the author's PDQ -- or Prose Descriptive Quality -- system, characters in the game are described by a Type (see the game's title for the ones available), and several Qualities that are assigned a rank which provides a modifier during game play from -2 to +6, applied to a 2d6 roll. Each character possesses a gift determined by Type, and a player gives his character some kind of a goal for which Mojo will be gained for achieving. Thus a Ninja character might be described as Gift: Adept (Physical); have the Goal: be an Über Guitarist, and possess the Qualities of Average [0] Ninja; Good [+2] Deliver Fast Food; Good [+2] Play Guitar; Good [+2] Kung Fu; Good [+2] Oriental Philosophy; and the weakness Poor: [-2] Sense of Honor.

The simple mechanics involve nothing more than rolling 2d6 adding in an appropriate quality to beat a target number. To this can be added an upshift bonus for being a badass and describing a character's actions. On the other hand, a downshift or penalty can reduce the effect of a quality, whether from a weakness or the situation. Skill rolls become more difficult if a character is hurt in combat. Damage is not taken in terms of hit points or wounds, but damage or failure ranks that are directly levied from the character's qualities. This can be damage inflicted from physical and social conflicts as much as environmental. In general this damage is temporary and characters recover lost quality ranks at the end of a scene.

In their favor, character types possess a gift that gives them a simple upshift per gaming session. For example, Robots gain a mental upshift, while Monkeys have a social upshift. They can also gain an upshift per session if it relates to their goal. And then there is Mojo. This comes in multiple flavors, one for each type as well as universal. In general, Mojo can be spent to gain an extra die before a roll, reduce damage or failure ranks, or to inflict them; with the universal Mojo powers and another pie per character there is a lot to remember . . . perhaps *too* many. Of course, Mojo can be saved and spent to increase the rank of any quality, including a character's Type.

Mojo is gained for playing to your character type, good roleplaying, and for winning challenges. A loser in a challenge always has to give the winner some of his Mojo, or he *dies*! The danger for the loser is if he has no Mojo to give, in which case he suffers "breakdown," and reduces his highest quality by a rank. Within the game, challenges are handled like duels and a judge is appointed in case Breakdown occurs. Challenges can be anything from air guitar duels to chili cook offs to wrestling bouts to racing in order to impress that certain girl.

Advice for the GM covers everything from finding players and the types of game possible with ***Monkey, Ninja, Pirate, Robot: The Roleplaying Game*** to setting up, writing adventures, and running the game. This advice is both clearly thought out and explained, surprisingly so for a game with no pretensions as to complexity and depth.

One final source of Mojo is Uranium, which converts into a single point of universal Mojo. It can also be used to heal damage and failure rolls and to buy things with.

Buying things in ***Monkey, Ninja, Pirate, Robot: The Roleplaying Game*** gets players the good things they want -- toys. Some of those listed include the Advanced Alien Ray Gun (AARG), the Mojo Monocle, or the One True Floppy Hat; vehicles, from an economy car to a speedboat; and even an HQ for the characters to hang about in.

A few scenario seeds are listed in a side box, but the game comes with a ready-to-play adventure "Invasion of the Mojo Snatchers." Strange things are going on with the Golden Pagoda Ninjas. Anyone who has lost or won a challenge against them has disappeared shortly after. Of course, it is up to the player characters to investigate. This is actually a nicely detailed adventure, offering up an evening or two's worth of entertainment as the characters discover that the Ninjas are messing with things that Ninjas were not meant to know!

For a simple game, ***Monkey, Ninja, Pirate, Robot: The Roleplaying Game*** is not a slapdash affair. It is fast, it is furious, and it is fun, with the mechanics for conflict offering up a pleasingly direct method of inflicting and taking damage. It is very cartoon like and should be played as such, but the system offers greater room for character development in the long term than most games of its ilk. It does mean that ***Monkey, Ninja, Pirate, Robot: The Roleplaying Game*** has less of a pick-up-and-play quality than other games, but for long-term, less-than-serious gaming ***Monkey, Ninja, Pirate, Robot: The Roleplaying Game*** is a well-developed alternative.

--Matthew Pook

Pyramid Pick

[Perplex City](#)

Published by [Mind Candy](#)

Six Perplex City puzzle cards, full color; \$4.99

In the dimension next door, the Receda Cube, the most valued relic they have, has been taken. By whom, and for what reason, none can say. What they do know is that it has been taken to Earth, and that's where we come in. The people of **Perplex City** are offering a substantial reward for the Cube's return, and everyone here is invited to play (at five bucks a pop, natch). They cannot travel here, but they can fling noodle-scratchers over our dimensional wall, and the truth is hidden inside the puzzle cards created by their prestigious Academy.

The object of the game is, well . . . that depends. The whole game is incremental. At its simplest, the idea is to solve the poser on a card. If you want to become 200,000 very real dollars richer (apparently they can do bank transfers across the dimensional gulf), you need to suck as much information as you can out of as many sources as you can, including the cards, some scattered websites, and even real people (or their cell phones), to unlock where on Earth the Cube has been hidden.

Each packet contains six Perplex City puzzle cards, all coded into various sets of four, such as the red hex set, the green hex set, the yellow circle set, and so on. On each card is a challenge, set forth by scribes of the Perplex City Academy. Solve a puzzle, and it's worth points at the website; solve all four puzzles from that particular set and there's a bonus in it. There's a panel reminiscent of the "scratch and wins" one gets at fast food joints or on lottery tickets that, when removed, lets you enter your unique code and the correct(?) answer into the website's database. Your score and points are tracked on the site's leaderboard.

Like anything collectible these days, some cards are common and others less so. The harder puzzles are limited to the "rare" extremity. A puzzle may be a simple maze, a not-so-simple maze, a logic problem, a math quandary, a chemistry quiz, or any of several other mind-benders and brain teasers. Stylized drawings on playing cards ask you to identify the pictured "kings and queens of rock." Another asks you to figure out children's ages based on a number, an unknown apartment designation, and one kid's eye color. Still another just requires that you label different forms of argument from a brief snippet of conversation.

The backs of the cards don't waste a lot of space either, some having pieces of a map of Perplex City (others have instructions on what to do with all your cards). The activities they offer aren't always limited to a single card, either. They promise appearances at conventions and some cards even give hints if you text-message Von the puzzle scribe. Along the way, the hope is that someone is going to piece together the mystery of who took the Receda Cube and why, and when they do there's a few thousand bucks in it for them.

Every card is a virtual explosion of color and creative graphic design. Some effects are photorealistic, others computer-generated, and some just hand-drawings. A lot of the work done by hand looks to be going for outright flair or practicality over pleasing aesthetics, but the player's big concern is whether it helps or hinders one to solve the puzzle. Since nothing can be easily overlooked or dismissed in this broad and spanning endeavor, it's unnerving to see that sometimes something is done in tiny script like an artist's name or the puzzle's inventor, but few entries are burdened thus.

With 256 cards in the series, there's plenty to see and do, and a lot to figure out. It's the sort of thing that's going to plague you on the way to work, and you may sit bolt upright during lunch to shout, "It's Wichita!" Even if you don't make a lunge for the brass ring gestalt, the game's bits and pieces are habit-forming. It's like a crossword puzzle . . . you get enough stuff right on the initial go-round to want to fill in those obstinate last few empty squares. It's a

solitaire game unlike any other you're likely to have played, but you can still get together with friends to try your collective wits against the scribes. Tying it to the collectible market is enough to send a shiver up the industry's spine, and a stroke of genius all by itself. **Perplex City**, an endlessly clever enterprise, presents the sort of tough mental thrashing most modern dungeon crawls can only dream of, and does so at a great price. Unless you're some sort of super-genius, you're going to get your five dollars worth of time from the six puzzles, and you can go in for a penny or a pound as your wallet allows.

Oh, and: Bone up on your Hebrew.

--*Andy Vetromile*

New Campaigns for a New Year

The New Year is almost upon us, and with it comes . . . well, heck, darned if I know. I may have some predictions coming up, but suffice it to say I pretty much scored an F on [last year's crystal ball gazings](#), so I'm feeling a bit gunshy.

Anyway, for something a bit different, I decided to write down the first three campaign ideas I could think of that incorporate the New Year in some interesting fashion. This might give the column a freer feeling, and will hopefully leave me with a few more minutes for working on another writing project that's coming due Real Soon Now.

Idea The First: They Say You Want a Resolution

What if, one New Year's, people realized that a New Year's resolution made at the stroke of midnight (their time) would automatically come true, within the confines of humanity? People who say, "I resolve to lose weight" or "I resolve to quit smoking" would find their urges to overeat or smoke evaporate. If someone were to say, "I resolve to train my body to peak physical condition," he'd find himself with the focus and energy to do so. If someone says, "I resolve to becoming dictator of the world," he would develop the power and ability (within human limitation) to have a go at it.

Of course, time zones being what they are, this realization would probably be stumbled across early on and reported, leaving those in later time zones with the edge.

As envisioned, this could play out as a universal origin story for a low-level Supers game; character creation would consist of asking, "What did you resolve to do?" (In fact, a clever GM with open-minded players might do well to ask them this question *before* telling them what the premise is.) The tricky part would be to sort out what, exactly, the limitations of the one-second wish are, and how much they can affect other people. ("I resolve to stand on the corpses of the entirety of humanity" probably wouldn't work, but "I resolve to kill as many people as I can" might give the person near-inhuman abilities to carry out that wish.) Regardless, none of the resolutions should be "show stoppers"; a resolution should give the person the edge, but it shouldn't do all the work. And if two resolutions conflict . . . well, that's what cool fight scenes in subway stations are for.

PC opportunities could revolve around trying to figure out what happened, stopping those whose resolutions make them a danger to society, and trying to channel the influx of (mildly) empowered people to a grander purpose.

Idea The Second: One Year Left . . . Pass the Bubbly

Okay; this one plays out roughly the same way as my internationally acclaimed *d20 Weekly* article "[The Least Year of Your Lives](#)," only without the cool power. (Article summary: A group of dungeon-crawlers learn that they've been bathed in a magical force that renders them invulnerable, but makes it so they only have exactly one year to live.) Basically, the world somehow learns on New Year's Day that *next* New Year's Day is going to be the last day for the Earth. The justification for this is up to the Department for Blowing Up the Earth, but whatever is chosen should basically leave the planet intact until the cataclysmic event; of course, if twitchy people destroy the planet ahead of time, that's hardly Cataclysm X's fault. In fact, the exact *reason* may not be known . . . only the certainty that all life (or, at least, all human life) will be gone come the next New Year's.

This campaign is envisioned as a sort of ***Twilight: 2000*** gritty post-apocalyptic setting mixed with some *Y - The Last Man*, only the planet is still working fine in the meantime. Who do the world's nations do? How do the various religions react? PC opportunities include trying to prevent or forestall the cataclysm, trying to keep world peace on a planet on the brink of premature collapse, and trying to get the "most toys" or power before the end.

The basic premise assumes a purely realistic campaign, but this could also serve as the basis for a more intense limited

series. Do those chanting *Call of Cthulhu* cultists have a point? How, exactly, does this turn of events fit in with the Boss' plan in an *In Nomine* campaign . . . and does this provide the impetus to consider the alternative's standing offer? Forget blowing a cardboard horn; Gabriel's got the real thing coming up.

Idea The Third: Can't Get Then From Here

A group of four to six friends met for a party one New Year's at the stroke of midnight . . . and vanished. They awoke to find themselves at 12:01 AM in 1977. At the stroke of midnight on New Year's Eve of that year, they found themselves in 1984. And so on.

This is a group-based time-travel campaign, where the "mechanism" for getting from place to place is the New Year, and the PCs have a reason to stick together. It's sort of crosses the "time tourism" aspect of *Quantum Leap* with the group-leaping notions of *Sliders*. Of course, the notion of "time travel" is stretched somewhat here, since the bulk of the campaign will be spent *not* time traveling. (A year's a long time, really, although I suspect a year in the 840s would go faster than one in the past few centuries.) This would be a different type of wish-fulfillment campaign. If you were a big John F. Kennedy fan and awoke to find yourself on the morning of 1963, how would you go about trying to stop the JFK assassination? Is it even possible?

In a campaign that runs long enough, this could pose real moral questions for the PCs . . . especially if any meddlings don't go as planned. ("Yeah, some folks stopped the Kennedy assassination in '63, but some more loons went ahead and did it anyway in '67, in response to his pulling out of Vietnam . . .")

Alternatively, this could be an interesting spy campaign, hovering somewhere between the gritty and fantastic. Imagine that the PCs travel to 1955 and got recruited by a government; their knowledge of the future might be a significant edge (especially if they can figure out clever ways to use it), but if they're just normal schmoes caught up in this game, they may find themselves more than matched by agents who've actually spent more than 20 minutes training.

Regardless of what Earth-ending cataclysms or strange abilities the New Year's brings you, I wish you all a happy and safe holiday, and best wishes for a new year . . provided your wishes don't involve standing on my looted corpse.

--Steven Marsh

They Are But Shadows: *A Midsummer Night's Dream*

*"Over park, over pale,
Through flood, through fire,
I do wander everywhere,
Swifter than the moone's sphere;
And I serve the fairy queen,
To dew her orbs upon the green."*

-- William Shakespeare, *A Midsummer Night's Dream*, II:i:6-11

We're halfway around the sky from midsummer, just past Yule. But as we do every year [at this time](#), we look back to [Shakespeare and the magic](#) he worked in verse and meter. This year, we look back an extra six months, is all, enjoying a Midsummer Night's dream on Midwinter Day. Are there other connections, besides the calendrical counterpoints? Such questions must remain mysteries. After all, as Shakespeare's rival Ben Jonson has Puck declare in a 1628 ballad, "I answer nought, but ho, ho, ho!"

*"But all the story of the night told over,
And all their minds transfigur'd so together,
More witnesseth than fancy's images,
And grows to something of great constancy,
But, howsoever, strange and admirable."*

-- William Shakespeare, *A Midsummer Night's Dream*, V:i:25-29

Duke Theseus of Athens is preparing to marry Hippolyta, Queen of the Amazons, and in honor of the wedding, a group of "rude mechanicals" plans to perform the play *Pyramus and Thisbe* for the Duke. But not all is well in Athenian love. Although Hermia, daughter of Egeus, is promised to Demetrius, she loves (and is loved by) Lysander. To escape Athenian law (which requires her to marry Egeus' choice instead of her true love), Hermia plans to flee into the woods with Lysander. Demetrius' ex-girlfriend Helena tells Demetrius about the scheme, hoping to sabotage his courtship of Hermia. The two couples enter the woods, where likewise love is strained between Oberon, King of the Fairies, and his Queen Titania.

Oberon and Titania are arguing over a changeling boy from India who Oberon wants in his court rather than in Titania's. He orders his servant Puck to find a magic flower with the power to compel love at first sight, and uses it to anoint Titania's eyes as she sleeps, hoping to trick her into loving a wild beast. For good measure, he also orders Puck to restore Demetrius' love for Helena, but Puck mistakenly anoints Lysander instead, sending Lysander into a passion for Helena. He then gives the leader of the "rude mechanicals," Bottom, the head of an ass, which is (of course) the first thing Titania sees upon awakening. After many hijinks, Oberon sorts out the four lovers and, having now acquired the changeling boy, restores Titania and Bottom to their wonted states. Theseus returns to the wood the next morning, gives the two couples his sanction, and watches with good humor as Bottom and company make a hash of *Pyramus and Thisbe*. As the hour grows late, Theseus dispenses with the customary epilogue, leaving Puck to deliver it.

*"The poet's eye, in a fine frenzy rolling,
Doth glance from heaven to earth, from earth to heaven;
And, as imagination bodies forth
The forms of things unknown, the poet's pen
Turns them to shapes, and gives to airy nothing
A local habitation and a name."*

-- William Shakespeare, *A Midsummer Night's Dream*, V:i:14-19

The first printed text of *A Midsummer Night's Dream* appears in the First Quarto in 1600, but almost all sources date it earlier than that. Possible topical references include the death of Shakespeare's rival Robert Greene in 1592 ("Learning, late deceased in beggary"), and the terrible wet summer of 1594, which the play seemingly blames on Titania and Oberon's quarrel. The general wedding theme of the play, and the tone of arch condescension, indicate that

Shakespeare may have written it for a grand wedding -- specific fetes in 1594, 1595, and 1596 have all been put forth as dates for the play's debut. Since it shows some internal signs of revision (a good bit of the dialogue is in thunky rhymed couplets, characteristic of Shakespeare's work before he was inspired by [Marlowe's](#) "mighty line"), it may have "debuted" at more than one wedding. In however many revisions it took, *A Midsummer Night's Dream* is one of the only three plays with plots entirely original to Shakespeare (along with *Love's Labours Lost* and *The Tempest*). That said, Shakespeare took some supporting details from Plutarch's "Life of Theseus" and from Chaucer's "Knight's Tale," and *Pyramus and Thisbe* from his favorite Roman source, Ovid's *Metamorphoses*. The [fairies](#), of course, came from the woods.

*"Now it is the time of night
That the graves, all gaping wide,
Every one lets forth his sprite,
In the church-way paths to glide,
And we fairies, that do run
By the triple Hecate's team,
From the presence of the sun,
Following darkness like a dream."*

-- William Shakespeare, *A Midsummer Night's Dream*, V:ii:10-17

More specifically, Oberon came from French romance. "Auberon" (a name cognate with the Wagnerian "[Alberich](#)") was the fairy knight in the 13th-century *Huon of Bordeaux*, which Shakespeare probably encountered in a (now lost) play, *Hewen of Burdocize*, performed in 1593. Shakespeare took "Titania" from his beloved Ovid, who uses it as a synonym or title for Diana, the virginal moon and wood goddess. (Since Diana's mother, Leto, was a Titan, "Titania" may also refer to her parentage.) The conflation with Diana, or at least some goddess, becomes still clearer, since the changeling boy's mother is described as one of Titania's "votaresses," a queen in India who died in childbirth. (Left unspoken is the hint that Titania may have caused the death -- virginal votaresses aren't supposed to have children, even changeling ones.) The other fairies are your basic nature- and flower-spirits, named for natural phenomena -- Peaseblossom, Cobweb, Mustard-Seed, and [Moth](#). And then there's Puck. Whether he began as the Welsh *pwca* or the Norse *púki* remains appropriately contentious; he is a tricky, shapeshifting spirit often associated with dogs, horses, and Hell. In the 16th century, "the Pouke" was synonymous with the Devil, which may have been why his placatory pseudonym "Robin Goodfellow" began to come in around then. In the play, Puck describes himself, perhaps archly, as "that merry wanderer of the night," and indeed by Shakespeare's era, the great fear of fairies was distant enough that they could be played for laughs. During the daytime, at least.

*"Now, fair Hippolyta, our nuptial hour
Draws on apace: four happy days bring in
Another moon; but O! methinks how slow
This old moon wanes . . ."*

-- William Shakespeare, *A Midsummer Night's Dream*, I:i:1-4

Of course, the action of the play is mostly at night, either on Midsummer Eve (by the title) or [Walpurgis Night](#), May Eve (by the dialogue). Theseus seems to believe the lovers have only entered the woods to perform the "rites of May" (or at least that's what he says, gentleman-like, when Egeus is listening), which would imply that May Day is the next morning. Both nights are nights when spirits abound and the doors of the otherworld swing open. The fairies openly claim allegiance to "triple Hecate's team," and Oberon must sharply remind Puck that "we are spirits of another sort," when Puck becomes nervous with the approach of dawn. Indeed, the description of the time indicates that Hecate's power is in the ascendant indeed, as Theseus and Hippolyta are to be married "four days hence" at the new moon's first appearance. Thus, the play takes place in the dark of the moon, despite the constant allusions to full-moony "lunacy" that overtake the lovers, and despite Oberon's greeting to Titania, "ill-met by moonlight." The word "moon" appears constantly (almost 40 times) throughout the play. Theseus threatens, for example, to force Hermia to become a nun, "chanting faint hymns to the cold fruitless moon," and Oberon describes how Cupid's arrow missed the moon (in an apparent allusion to Queen Elizabeth's virginal lunar persona Cynthia) and struck the magic flower instead. The rude mechanicals check an almanac to see if there will be a moon, and go so far as to cast one of their own as Moonshine in order that *Pyramus and Thisbe* can take place by moonlight. Is this more of Shakespeare's time-twisting, a "moonlit

revel" on a moonless night? Perhaps it helps answer the question of the missing three days in the play -- Theseus' wedding was "four happy days" away when the lovers enter the wood, but when Theseus arrives the next morning, it is his wedding day after all.

"I have had a most rare vision. I have had a dream, past the wit of man to say what dream it was: man is but an ass, if he go about to expound this dream. Methought I was -- there is no man can tell what. Methought I was, -- and methought I had, -- but man is but a patched fool, if he will offer to say what methought I had. The eye of man hath not heard, the ear of man hath not seen, man's hand is not able to taste, his tongue to conceive, nor his heart to report, what my dream was."

-- William Shakespeare, *A Midsummer Night's Dream*, IV:i:192-197

The other fraught question of the play is -- who is the hero? (It's not Demetrius or Lysander, both of whom are interchangeable drips.) Is it Theseus, whose alchemical marriage to Hippolyta theoretically frames the play? Oberon, who actually wins something -- the Indian changeling boy, and Titania's return to his bed -- for his efforts? Or is the hero Bottom the weaver, who after all gains Titania's love for a night, despite (or perhaps because of) being transformed into a donkey. During his transformation, however, Bottom does not react with Dionysian madness, but with simple English good humor -- afterward, he knows he has had "a most rare vision," which his jumbled, almost synaesthetic speech compares to St. Paul's vision of Christ (1 Corinthians 2:9; "things which the eye of man hath not seen"). But he cannot recall it; it is not accessible to him. Bottom is, however, the only human who has seen the fairies, even on this Midsummer Night -- he has traveled up into a moonlit world and returned. Bottom's transformation also seems to mirror the metamorphosis of Lucius into a donkey in Apuleius' *The Golden Ass*, a 2nd-century picaresque novel often read by occultists as an initiatory text. Lucius is restored by appeal to Isis; Bottom, rather, dallies with Isis-Titania while an ass, and is restored by Oberon. Lucius becomes an initiate of Isis; Bottom goes placidly back to weaving. If Shakespeare is using *The Golden Ass* as a model, he seems to be rejecting the parallel, or inverting it somehow.

*"Are you sure
That we are awake? It seems to me
That yet we sleep, we dream."*

-- William Shakespeare, *A Midsummer Night's Dream*, IV:i:181-183

He uses similar inversion with the inclusion of *Pyramus and Thisbe*, which deals with lovers who flee to the wilds for a rendezvous but kill themselves in the confusion brought on by a lion attack. In the rude mechanicals' version, the "lion" is half-lion, half-man, and his part "nothing but roaring," though Bottom suggests it should "roar as . . . any nightingale." (Is this a hint of [manticore](#)?) This "play within a play" has more than a whiff of [Romeo and Juliet](#) about it, but it draws out the venom from the four lovers' story. They enter the woods, full of dangerous spirits, but suffer nothing more than embarrassment and disenchantment. *Pyramus and Thisbe* thus becomes the tragedy nestled snugly within the comedy, the "dark twin" of the play we're watching. Oh yes, [twins](#) again. Demetrius and Lysander are often played as twins on stage, and Helena and Hermia are clearly interchangeable as well. But it goes deeper. Both Oberon and Titania are mythically twins (Alberich is twin to Merovich, Diana is twin to Apollo), and their contest reflects in the twinned lovers' disharmony. Shakespeare is using his twin symbolism as he often does, to indicate (or open?) a gateway between worlds, made clearer by his trickery with the moon and with the date of the play. Speaking of dyads, Theseus is often portrayed as having two fathers, Aegeus and Poseidon -- whose Roman counterpart, Neptune, is mentioned repeatedly in the play. Alberich's twin is "sea-born" Merovich, implying that Theseus is also twins with Oberon in some fashion. And indeed, Theseus' semi-divine parentage would logically imply that Theseus (like Heracles and Pollux) has a "mortal" twin, as well. Robert Graves speculates that Theseus' "missing" twin is his best friend, the Centaur-fighting [Peirithous](#), who remains trapped in the underworld, which is to say Hecate's realm, which is to say Faërie. Is Oberon Peirithous returned?

Or is Oberon using Theseus' marriage-by-conquest to Hippolyta to play up those similarities and work his will on Titania thusly? Is Oberon working his own midsummer alchemical marriage of solar hero and lunar [Amazon](#), aided by Mercurial Puck, to produce an (androgynous?) "changeling boy" from India as his golden prize? Is *A Midsummer Night's Dream* a dramaturgy within a dramaturgy, then? The changeling boy has been raised with girls in Titania's court; is he an alchemical androgyne? Or something even more powerful? [Dionysos](#), half-divine, associated with

lunacy, comes out of India, after all. And his mother "being mortal, of that boy did die." He might well be considered a changeling -- and, as we have it, he invented dramaturgy. A dramaturgy within a dramaturgy within a dramaturgy? Is it an ultimate containment, a powerful mask of defanged manticores and incoherent initiates? We cannot know, by Shakespeare's design. Everything in this play is hidden inside another layer, an endless Klein bottle of nesting Russian dolls. It has, as the bully weaver assures us, "no bottom." Not merely the play, but the players (and by extension the audience, who have been watching an audience watch a play) are "but shadows." As Puck assures us, all involved have "but slumbered here, while these visions did appear." And if something still doesn't seem right to you, if you still toss and turn in your dreams, Puck "will make amends ere long. Else the Puck a liar call: So, good night unto you all."

The Malus Masks

for *GURPS Fourth Edition*

by [Royce Easton Day](#)
Illustrations by [Sarah E. Bentley](#)

Background

Objects of twisted genius, the magical artifacts known as the Malus Masks were the creation of the Magistra Lillae Malus, a twisted artisan and mage who lived some 1,800 years in the past. Why she felt compelled to create and inflict these terrible creations on the world is not known for certain. It said the Magistra herself was once a woman of great grace and beauty with many suitors, who was scorned and defiled by the one person she truly loved, filling her with a terrible hate and vengeance. Others claim that the masks are actually tools teaching morals, though anyone who has had their curses inflicted upon them would be hard pressed to agree.

What is known for certain is that the Masks are unique items, not yet duplicated by any enchanters, and carry a few common characteristics. The individual Masks are made from a variety of materials, usually expensive, and are designed to fit an adult human's face. Though there is no obvious means to keep the Mask in place, once one puts it up to a face, he will find the Mask sticks to the skin as if were glued there (Hex, cast with a Power of 20). A sufficiently skilled surgeon *could* remove one of the Masks (at a -3 to any Surgery rolls), but at the cost of removing the wearer's skin as well, giving him Hideous Appearance. Smashing it is an equally bad idea. Not only is it likely to result in serious injury to the wearer, it won't do a thing to release the curse, leaving the broken bits of Mask still stuck to the wearer's skin. Unless otherwise noted, each Mask also has holes for the mouth, eyes, and nostrils, allowing the wearer to eat, breathe, and speak without difficulty.

There are a couple of small compensations for wearing a Mask. For one, despite completely covering the face, it isn't at all uncomfortable to wear, and the skin underneath will not be harmed, despite the pores being blocked. Most importantly, while wearing the Mask, the wearer has the advantage of Unaging (included in the point total for each Mask). There are tales of some victims of the Masks wandering for centuries looking for a cure for their affliction, only to return home triumphantly to find everyone they have known and loved long dead.

Each Mask's curse *can* be overcome by the wearer. The solution is unique for every Mask, and will never be easy, but a sufficiently determined person should be able to discover it, either through research or insight into the Mask's effects. Solving the mystery of the Mask's curse can be the springboard for an intense roleplaying arc for any player worth their salt.

The Mask of Sorrow

Appearance: The Mask of Sorrow appears to be made of fine white porcelain, a single black tear painted below the right eye.

History: The Mask of Sorrow was reputedly first worn by the wife of Lillae's first lover, who rejected Lillae in favor of the woman who would be his bride. Within a year the woman's husband was dead by an unfortunate accident, as was most of his family and her own. The wife committed suicide shortly after her first anniversary of marriage.

Game Effects: The wearer suffers from Unluckiness, Area Effect/2 (100%), Emanation (-20%). [-3 Pts.]

Breaking the Curse: The Mask of Sorrow's curse may only be broken if the wearer is able to save his greatest love from a seemingly certain death.

Facestealer

Appearance: Facestealer barely looks like a mask at all, being merely an oval-shaped piece of honey leather dyed the color of light skin. Only when applied to a victim does its true nature come out. It adheres closely to the face for a few moments, and then falls away. On the inner surface of the mask is a reversed image of the victim's face. The victim's features have quite literally been stolen, leaving a horrific blank space where his features once were, only broken by a small slit that is the victim's mouth. The next person who wears Facestealer will have the victims' features overlaying his own.

This is the only mask that may be removed voluntarily by the wearer.

History: It is said the Lillae used this mask to steal the face of her former beau's love, to sneak into his bedroom and murder him. As this contradicts many other accounts of what happened to both Lillae's ex-lover and his wife, the truth is probably considerably different.

Game Effects: When wearing Facestealer after stealing another features, the wearer effectively is under a permanent Illusion Disguise spell. Meanwhile the victim of the theft is effectively Mute, Blind, and has No Sense of Smell/Taste. [-65 pts.]

Breaking the Curse: The effect can be reversed by persuading the person who is now wearing the mask to *voluntarily* remove it, and then transferring the mask back onto the victim's face, restoring their features. Of course by this time the victim may be quite mad, having been denied sight, speech, and smell for who knows how long. Attempting to surgically remove it would likely destroy it, along with any chance of the victim's face being restored to him.

The Hermit's Mask

Appearance: The Hermit's Mask looks to be woven of fine reeds, interweaved with dried flowers and leaves.

History: Little is known for certain about this mask, though it is claimed that Lillae inflicted it upon a potential suitor who dared to try and take the place of her first love. It is said that he fled into the woods when the mask was placed upon him, and shunned all human

Hermit's Mask

contact. Supposedly he died from an infection that could have been easily cured, if there had been anyone nearby.

Game Effects: The Hermit's Mask inflicts the disadvantages of Loner, and Phobia (Crowds), both with a self-control number of 6. However, in what must have been a rare moment of compassion for Lillae, it also grants the wearer Animal Empathy [-20 pts.]

Breaking the Curse: The curse of the Hermit's Mask may only be broken by the wearer finding true friendship with another person, despite his revulsion of human contact.

The Maestro's Mask

Appearance: The Maestro's Mask is another porcelain creation, covering the right half of the victim's face. Though he will not be able to explain it, a person who looks at the wearer of the Mask will be faintly reviled by them, suspecting terrible disfigurement underneath its surface.

History: Another Mask designed to destroy her enemies, Lillae sent the Maestro's Mask to a famous composer, who thought to use her terrible legend as the basis for an opera he was writing. As this was at least 300 years after Lillae's story first appeared, either it was truly created by someone also inspired by her story, or Lillae was keeping herself alive by unknown means.

Game Effects: Despite nothing being truly the matter with their features, the wearer of the Maestro's Mask will appear to onlookers to be of Monstrous Appearance. [-5 pts.]

Breaking the Curse: Much like the Hermit's Mask, the Maestro's Mask may only be removed by someone who truly loves victim, despite his "surface appearance."

The Stranger's Mask

Appearance: The Stranger's Mask takes the form of a hood made of black silk, and embroidered with intricate spiral patterns.

History: Nothing is truly known about this Mask. Given its nature, anyone who wears it is unlikely to be remembered. Why Lillae created it, and who its first victim was, is unrecorded to history.

Game Effects: The wearer now has the Spirit template, with the Apparition trait (F134). [151 pts.]

Breaking the Curse: The victim must be noticed by someone long enough for the corporeal person to remove the Mask. Given the fact the victim cannot be seen, heard, or touched without spending Fatigue, this may prove somewhat difficult.

The Monster's Mask

Appearance: Before the Mask is donned, it appears to be an elaborate beast mask of the sort used in royal masquerades, specifically that of a wolf, made of a genuine wolf's pelt.

History: In a rare moment of fairness, it would appear that the first victim of this Mask actually deserved wearing it. It belonged to one of Lillae's personal guards, who had a reputation for bestial behavior and abuse of women. Once it was given to him, he was quickly hunted down as a werewolf and killed.

Game Effects: Once donned, the victim now must add the Werewolf template to his character sheet (p. 112 of *Fantasy*), though it lacks the Infectious Attack disadvantage. [23 pts.]

Breaking the Curse: Any of the standard methods of curing a victim of lycanthropy will work, except (obviously) for killing the person who originally bit the victim.

The Songbird's Mask

Appearance: Another half mask, this one covers the upper part of the wearer's face, and is made in the shape of a robin's head, with genuine robin feathers and a yellow ivory beak used in its construction.

History: In another act of revenge against entertainers, this Mask was first placed upon the head of a mocking bard that dared sing about Lillae's crimes after her arrest, but prior to her execution. It is unknown how Lillae could have constructed and placed it upon the victim while she was imprisoned, though accomplices are one obvious avenue. Another might be that there was another mage in the world who was equally skilled at mask making, and who might be at large still.

Game Effects: The wearer Cannot Speak, though he can verbalize in bird songs (the sounds however, will not be

translated by any sort of Speak With Animals spell, since they're just nonsense). [0 pts.]

Breaking the Curse: The curse may be broken if the wearer becomes sufficiently skilled in Performance that they can tell their sad tale of imprisonment without the use of words to an audience of at least a dozen people (effectively gaining a high level of Gesture . . . writing it down won't help).

The Mask of Silence

Appearance: The Mask of Silence is actually a half-mask for the lower face, made of brown dyed leather inset with brass that has been shaped like Celtic knots, centered over the victim's covered mouth.

Mask of Silence

History: It is said that the Mask of Silence was placed over the face a servant who spoke out to a local magistrate about Lillae's creations of these dark enchantments. Unable to speak, and illiterate, he was prevented from bearing witness concerning the Magistra's use of dark magic.

Game Effects: The wearer of this Mask is effectively Mute, but they also gain the Doesn't Eat/Drink Advantage. [5 pts.]

Breaking the Curse: The Mask of Silence's curse may only be broken if the wearer is able to bring a great injustice to the attention of someone capable of correcting it (not the simple injustice of having the Mask inflicted upon them).

The Prisoner's Mask

Appearance: The most fearsome-looking of Lillae's creations, the Prisoner's Mask is made of beaten wrought iron, and fastened together with numerous rivets and magical welds. Tiny bars block the eyeholes and mouth of the Mask, though there is enough room for the wearer to eat, if he is content with small bites. The Mask does not merely cover the head, but extends down across the shoulders, permitting some distribution of its fearsome weight.

History: It is unknown for whom the Prisoner's Mask was originally intended. Ironically, Lillae herself was the first one to wear it, in the cell where she was imprisoned for her crimes, and where she remained until her reported execution.

Game Effects: The primary curse of the Prisoner's Mask is simply its formidable weight. At 50 pounds, only the strongest of men can bear it unimpeded. Most folk of average strength will quickly become fatigued from merely sitting or standing up unless the Mask is given exterior support. There's no matching disadvantage, though with the Unaging advantage the mask is worth 15 pts.

Breaking the Curse: The only way to remove the Mask is for the wearer to serve out their sentence or be pardoned from whatever crime they committed before the Mask was put into place. If the wearer is innocent of any crime, theoretically the Mask will not seal to their face.

Theoretically.

Malus' Mask

Appearance: A simple black and white linen face mask, with a large pearl in the center of the forehead.

History: Little is known about this Mask, except that Lillae herself wore it, after she was rejected by her love. After her execution it was removed from her face and placed within the personal museum of her judge, where it has remained.

Game Effects: This final mask acts as a Soul Jar, centered on the pearl, which contains the spirit of Lillae herself, who did indeed survive her execution by cheating death with it. Any unfortunate who places the Mask on their face must immediately enter a series of Contests of Will with Lillae (Will 17) to prevent his own soul from being shunted aside and his body taken over by her vengeful spirit. The Contest occurs once a day. If the wearer wins, then he stops Lillae from gaining further control over him that day. If he loses, he will have a negative penalty equal to all the contests he has lost so far. If/when he finally rolls a critical failure, Lillae takes over the body completely. Until then, his personality will gradually become more and more like Lillae's, centering on her obsession with masks, and gaining vengeance on all that slight her. In addition to roleplaying effects, with each lost contest, the wearer gains one of the following disadvantages: Bad Temper, Callous, Jealousy, Obsession (mask making), until they finally make a critical failure and Lillae's personality takes over completely.

Breaking the Curse: The only means to break the curse is for the wearer to either get a Critical Success during the daily contest, or force Lillae to roll a Critical Failure.

Adventure Seeds

Taking It Off: As mentioned at the beginning of this article, just trying to get rid of Mask is worthy of a full campaign arc. A PC who begins a game wearing one of the Masks must pay its point cost, despite the fact that whatever benefits gained by the Mask will be far outweighed by the costs. One of the most important things for a GM to keep in mind is the reason *why* the Mask was inflicted on the character. Perhaps he put it on out of curiosity, not understanding its malefic nature. Perhaps it was inflicted upon him by an enemy, in which case it may be vitally important to find out where the enemy found it in the first place, to prevent the other Masks from destroying the lives of innocent victims.

Putting It On: Of course the alternative is that the heroes find one of the Masks, and make plans to inflict it on a

deserving opponent. Why they might want to do this is open to question. Certainly an item like the Stranger's Mask or the Hermit's Mask would be useful to neuter an otherwise powerful enemy, and the Mask of Silence would be quite effective at stopping any mage who depended on voice to cast spells. The other Masks, however, are far less benign, and any adventurers that attempts to use them against an enemy should ask themselves if it would just be kinder to kill them instead.

Haute Tor'ture: In a week's time, the King will be hosting a Royal Masquerade. The capitol's nobility have been preparing themselves for the grand event for a at least month, but a shortage of properly skilled mask makers is leaving many of the high nobles worried that they might be forced to wear *last year's* mask. Fortunately, a new mask maker has come to town -- a woman of remarkable skill, and even more remarkably cold demeanor.

However, an illiterate street urchin known to the heroes sends a friend with a verbal message that the woman is not to be trusted. Before they can speak with the boy directly, they find that the Mask of Silence has been inflicted upon him. Could the new mask maker be Lillae herself, or is there another hand behind it entirely? And can they discover what is really happening before half the nobility of nation puts on this woman's masks?
