The Secret Lives of Gingerbread Men

Published by [Wicked Dead Brewing Company](#)

Written, illustrated by Annie Rush

Edited & developed by John Wick

40-page full-color PDF, \$7

full-color, spiral-bound softcover, \$15

'Twas the night before Christmas
And all through the house
Several creatures were stirring:
Cookies chased down by . . . er . . . mice

And rats. Or humans. Or the family pet, or maybe just curious children. You see, at Christmastime, Gingerbread Men have the ability to move and talk, and to have wee little adventures. And that isn't all there is to know about ***The Secret Lives of Gingerbread Men***. From John Wick's Wicked Dead Brewing Company comes this joyful bit of Christmas cheer, a roleplaying game based on what happens when the lights are out or no one's looking.

The premise is pretty simple: Gingerbread Men animate and celebrate during their brief yuletide tenure. The Mother Baker puts a lot of love into the cookies she bakes for the holidays, but even she'd never believe the Cookies live it up late at night. Adventures typically include escaping the household cat, making friends with the hungry dog, or journeying to speak with the angel atop the tree because she's rumored to have special powers.

The system uses a set of six-sided dice. Every Gingerbread Cookie gets one die just for being a Gingerbread Man (just like the dog gets a die for being a dog, the adults get one for being adults, etc.). This is called his Gingerbread Background. A Cookie also gets a Spice Background -- one of six areas in which you can excel, like Nature (speaking with animals, or going outside), or Social (talking to other Cookies). Finally you get a Zen Background, which can be most anything. You may be good at channel surfing when the people have gone to sleep, or climbing the Christmas tree.

If you want to take an action, you get one Advantage Die for everything that applies to that action. You'll always get your Gingerbread Advantage, but if you're trying to, say, throw a ball of tinfoil at the cat, you'll get a die for your Body Spice. The cat, meanwhile, gets a die for being a cat, and may get situational dice for being under the couch or sitting far away. You can also target inanimate objects (IAOs), but even they get dice for being small or heavy or whatever else the judge decides.

Both the Actor and the Target roll their dice: Every even result is a success, every odd result a failure. Whoever has the most successes (or the best numerical total in a tie) wins. If you win and have excess successes, you can mark these Cookie Crumbs on your character sheet and use them during a later action as automatic successes. If you're fighting a combat, your confectionary heroes won't actually kill anything -- you may drive off the cat, or lock it in the basement, but otherwise the activity is mostly kid-friendly. Cookies, on the other hand, suffer the loss of pieces. They can lose arms and legs (first you lose your "right" or "left," so your "right arm" would become a plain old "arm"), but once the head is gone, "the Cookie crumbles . . ."

Gingerbread Men can also carry decorations. The book provides several, with different uses. Stomping on a green

M&M makes the Cookie invisible, candy corn can be used like a knife, and pretzels let you fly.

But what really makes the lives of Gingerbread Men interesting are Secrets. Everyone has something they know and don't share, something that may give them other motivations during their escapades. You may have aspirations to become Mayor of the Gingerbread Village, or be in love (perhaps with a Sugar Cookie for that extra layer of angst); you may even be planning to betray your friends to a predator for some kind of personal gain.

You don't actually need real cookies to play, but building your character (your "miniature," though it's actually life-size) is half the fun, especially for the nippers (and there are fewer arguments about what equipment you have if it's all baked into your PC). For the cooking illiterate, mom's recipe is provided. It assumes some amount of cooking knowledge on your part (is light or dark brown sugar recommended? grease the pan or no?) and there are omissions, like the mixture's yield (one recipe gives you about 24-30 5"-tall adventurers), but it's unmistakably gingerbread. Depending on how long you cook them, they're soft and chewy or have all the spice and crunch of a ginger snap. The frosting will be store-bought if you haven't your own recipe.

The book, like the Gingerbread Men, is more decorated than illustrated. There aren't many traditional views beyond the candies that adorn the margins -- instead what they have is a series of pictures of the eponymous Cookies. Attentive readers will realize there are more than a few character ideas and storylines being hinted at in the gleeful little portraits that dot the interior.

The world is a simple one, but it's populated with colorful incidental characters and bright imagery. Legends like the wish-fulfilling angel atop the tree; the Cookiesmith, who repairs damaged treats; and the Oracle, who holds court on the dusty fridge top, are just a few of the cast members who contribute to a lively and fascinating setting. The book is geared toward family fun, though there is a sort of dark, Wonka-esque undercurrent that keeps you guessing just what kind of atmosphere the author is trying to impart. This, plus its fanciful take on the magic of the season and writing that's as smooth as boiled custard, makes ***The Secret Lives of Gingerbread Men*** an infectious delight worth several mugs of good cheer.

Pyramid Review

Turjan's Tome of Beauty and Horror (for The Dying Earth RPG)

Published by [Pelgrane Press Ltd.](#)

Written by Robin D. Laws with Ian Thomson

Cover by Ralph Horsley

Illustrated by Ralph Horsley, Charles Reid, Elliot Jeffries, & David Esbri Molinas

144-page b&w softcover; \$29.95

While Jack Vance's *Tales of Dying Earth* have had undoubted influence upon roleplaying, [The Dying Earth RPG](#) itself has mostly concentrated upon Cugel-level adventures. These are tales of swords & chicanery in which scoundrels, mountebanks, charlatans, and ne'er-do-wells attempt to charm and con their way to a better way of life. Invariably the success of such plans and pettifoggery is transitory. Events go awry, the conned see through the obfuscatory words, and the wastrel suffers his comeuppance. Such adventures are not the subject of the latest book, for they have their own sourcebook, *Cugel's Compendium of Indispensable Advantages*.

No, this book is *Turjan's Tome of Beauty and Horror*, a worthy volume for the high minded and studious, who above all have found a purpose in life, even as the Sun wanes. That purpose in the final years is the study of the arcane. Turjan-level characters seek knowledge of the last 100 spells (though there may be more), track down wonderful artifacts and devices created in aeons past, learn ancient technologies, and master the creation of vat-grown creatures. In this they are driven, determined, no less flawed, but most definitely far more capable than the amateurish efforts of Cugel and his ilk.

Such high levels are represented in character creation. Turjanic characters start out with 100 points and can increase this to 150 by making random selections during the creation process. The emphasis is upon power and its application. While good Persuade, Rebuff, and Health scores are a necessity, high scores in Magic, Attack, and Defense are paramount. A score of 15 or above is considered good in these three. Six spells are given as a good basic choice, including the infamous *Phandaal's Inside Out And Over* and *The Excellent Prismatic Spray*, but a player is free to choose or roll as he wishes. Characters are also expected to invest points in relationships, and both his manse and possessions; the later should include a magic item or two. If no points are invested in these, a player should expect to have them stolen. The supplement includes lists of both items and personalities ready for the player to buy.

Although a Turjanic character can make use of the contents of *Cugel's Compendium of Indispensable Advantages*, this supplement adds to the tweaks found there. The Turjanic tweak is of course more expensive, but provides better benefits in certain situations. The rules also allow the creation of the non-magician character, specifically the hardy warrior or loquacious diplomat, but adept thieves or enticing seductresses are also possible. They emphasize aspects where a magician is weak, the thief being able to ferret things away unnoticed and the warrior able to overbear the mightiest of physical defenses that a magician might put up. The place of the seductress highlights the uncertain place of women in this supplement, in that to be truly Vancian, they are to be mistrusted and the source of their magic should be questioned. Of course, in this politically correct age, this is an aspect of the stories that can be ignored. The rules are well explained, and four examples are given to speed the process.

According to the Vancian canon there exists just the One Hundred Known Spells as codified and handed down by Phandaal, the master magician. There are less than that given in the core book, but the GM is free to decide what spells to add to make up the remainder of the 100 from the 120 unperfected spells included. Alternatively, he can decide to ignore this limitation, allowing as many spells as he wishes, with lesser spells being looked down upon and allowing for a greater chance of spell failure. If the GM decides to respect the one hundred spell limit, those not known that is, those included in this book are difficult to find and only then during play. Those given here are in fact new to the game and setting, many making use of an online *Dying Earth* spell name generator.

One of the things not covered in this supplement is how to become an Arch-Magician. Left for a later book, the subject is broached with discussion of the specializations needed to advance to the heights of a Rhialto-type character. They include Disputation, which eases the dealings with other world entities and rival wizards; Mathematics, representing an understanding of the foundations of magic; Warding, the creation of protective wards; and Vat Master, the knowledge of how to create life itself. This specialization ties into a new and official set of rules given that replace those found in *The Excellent Prismatic Spray Vol.1, Number 2*. The creation of artificial life is a mark of prestige amongst Arch-Magicians; the process described being more complex, more detailed, and requiring the greater expenditure of Improvement Points. The rules and resulting creation proffer plenty of roleplaying opportunities.

So, too, do the extensive lists of both magic items and GMCs, or GM Characters. Again the items must be found, and included in the verbose description of each is a purported location. Many can be found in places described in previous published articles and supplements such as the *Scaum Valley Gazetteer*. Once found, players must invest Possession Points in them to ensure that they remain theirs. Further, they can now transfer items between players, sell them to a GMC, or even use them as an aid to seduction! The GMCs are a mixture of the new and those drawn from the novels, including Azvan the Astronomer, Guyal the Curator (of the Museum of Man), Thrang the Ghoul-Bear, and the Sage of Miir. These can be used as potential enemies, friends, tutors, or just plain acquaintances.

After people to see and things to find, the digest describes places to go and rumors to follow. The former lie beyond the Dying Earth, some of which may or may not be the Earth's long gone moon. Of course, such destinations are beyond the scope of the mere dabbler, and while offering adventure in themselves, would take some effort and knowledge to reach. The same cannot be said of the rumors discussed and exposed, which the players are permitted to pursue, if only to indicate to the GM the one that piques his interest. Of course, he is free to change such details as his wont, but all of the rumors are easy to fit into a game, though will need some further development.

The volume is rounded out with a selection of taglines more suited to the grimmer and stranger nature of the Turjan-level game. Although their use is optional (unlike in the Cugel-level play), they still add more flavor. This last chapter is followed several indices listing the many entries given earlier.

The actual chapter on running Turjanic games is quite short, but proves enough to make clear the differences between it and the Cugel-level games. The emphasis is upon a strong moral sense, strange places and vistas, a casual cruelty, weird magic, horror, lost knowledge, and ruined wonders. Elements like crafty swindles, exotic foodstuffs, and foppish clothing, all found in Cugel-level games, have no place here. At this level, the game is also more violent, for Turjanic characters are capable in both arcane and martial means, able to dish it out as well as take it. There is also a greater degree of co-operation between characters. They may be rivals, but not adversaries. While all this is discussed in comparison to the novels, other sources are also considered, most notably, the works of Clark Ashton Smith as well as Vance's other books and those of Robert E. Howard.

Turjan's Tome is a fine looking book, its pages graced by the delightful illustrations of Ralph Horsley. In addition it is written with wit and intelligence, and its use is aided by the extensive footnotes. Alas, there is no index, though the appendices do compensate somewhat.

The release of *Turjan's Tome* allows players to explore the world of *The Dying Earth RPG* without recourse to swords & chicanery. Indeed, this is more like traditional swords & sorcery, certainly not Tolkienesque, but given over to both fatalism and horror, shot through with a wry humor. In this way, *Turjan's Tome of Beauty and Horror* is closer to the traditional fantasy, while still retaining the flavor and elements of Vance's novels.

--Matthew Pook

Sheol

by Paul Drye

One of the most tightly held secrets of the Infinity Corps is the existence of Sheol. Discovered 18 months ago, the timeline sent a shock through Infinity's ranks because of the empty, incredibly high-tech cities it contained. Since then it's become apparent that, in defiance of known parachronic laws, it is rapidly migrating through the Quanta of its own accord. Within another year, it will reach Quantum 6 -- and its technology will become accessible to the Centrum. High priority has been attached to understanding it before it does, and keeping the Centrum in the dark as long as possible.

The Paradox

A great mystery of parachronic travel is the lack of truly advanced timelines, Caliph notwithstanding. Given the number of setbacks Homeline had in its long-term technological development, wouldn't some timelines "get lucky" and avoid these? If a point of divergence were sufficiently far in the past, a civilization could have reached the stage of industrial development many thousands of years ago, and now be so far ahead of Homeline as to be incomprehensible. A variation of the [Fermi Paradox](#) applies: "Where are they?" It defies logic that no advanced civilizations could have developed, and is only slightly less likely that none developed on a "conveyor-friendly" timeline comparable to Homeline or Centrum. It would only take one for Homeline to have been contacted while it was still developing agriculture, yet it didn't happen.

A clue to an answer -- and disturbing one it is -- is Sheol, which display the remnants of an extremely advanced parachronic civilization. Sheol is empty; before its inhabitants could establish any kind of presence in our timelines, their culture ceased to exist. How this happened is unknown. Not only is Sheol uninhabited by humans, all life is gone. There remains the possibility that some bacteria live deep within the earth's crust, and preliminary efforts are underway to explore this possibility, but so far as anyone can tell the timeline has been completely denuded of living things.

Project Croatoan

Pulled together when Sheol was discovered, Croatoan is a crash project for the investigation of the dead timeline: understand its technology, find out where it came from, discover what happened, and -- if possible -- keep it out of Centran hands.

Life on Sheol is different, and not just because of the vast tracts of mummified trees rearranged by weather into something resembling "pick up sticks of the gods" (despite the lack of bacteria causing decay, less sturdy forms of life than trees have eroded away entirely) and other obvious signs of lifelessness. First, the atmosphere is different, without plants to maintain it like on Homeline. Here, the oxygen level is half normal, and supplemental air tanks are needed for strenuous activity or people in bad health. The CO₂ concentration is also much higher, about ten times, as it's no longer scrubbed out of the air by life after being released from volcanoes and the like; on average temperatures are several degrees higher, and the ice caps have melted. The shorelines are substantially different as a result, and visitors find Sheol's air steamy and hard to breathe.

Croatoan is based out of "Rio de Janeiro" -- its closest geographic equivalent on Homeline. This is a large city, close to a million people out of perhaps 50 million on the whole timeline. The sea level is 250 feet higher than it was when the city was inhabited, and in the modern day it's very hot, but during its heyday it was probably quite comfortable for the Sheols. The researchers on site put up with the difference in order to concentrate on what is probably the best location to try and understand what happened.

Besides personnel from Paralabs, the project recruits people with a wide variety of scientific backgrounds: archaeologists, linguists, oceanographers and divers (over half the city is awash), forensic scientists, and many other

kinds of specialists. They also make a point of getting agents of the Infinity Patrol on board, as their experience with understanding other human cultures based on incomplete information comes in very handy; this is particularly true if the agent has experience with timelines where the level of technology is higher than on Homeline. There is also a fair bit of unskilled labor, as someone always needs to do the heavy lifting and Croatoan's higher-ups know they don't have a lot of time with which to play.

There are many things to be done -- too many, really -- but one focus of attention is the parachronic technology of the Sheols, which is different from Homeline's and Centrum's. The Sheols would open gates to other worlds through which matter would pass, rather than enclosing something in a conveyor or projector. The possibility of permanently open connections is tantalizing, and one Infinity is keen to unravel. Every other aspect of Sheolic technology is advanced, however, but the problem is that they are so advanced there's little common ground between it and what the Homeliners understand. Even basic technology is often based on what seem to be entirely unknown laws of physics; for example, there are no doors in "Rio" -- a matter transport network, still functioning, is used to get in and out of rooms. In places where the transport network is down, researchers have to use what must have been the emergency networks of escape hatches and tunnels, which are small and difficult to use.

The Real Story

It's entirely possible that the investigators will never discover what happened on Sheol, and the GM is encouraged to come up with his own explanation for the mystery as best fits the campaign. However, the clues and oddities listed above can be joined into the following story.

Homo sapiens sapiens developed some 40,000 years ago; this is during the Weichselian Glaciation part of the last ice age but also a multi-thousand year period of it when temperatures had temporarily rebounded to near normal. On Homeline, they had a 5,000 year period of cultural flowering, but this was cut short when the ice age clamped down again. On the original Sheolic timeline -- what Infinity calls "Sheol" was a colony of this timeline -- the original technological expansion of humans included two more technologies: agriculture and writing. As the Ice Age got worse about 35,000 years ago, the extra knowledge had let them reach a level comparable to that of the Roman Empire, and had spread into parts of the world (Southern Africa, India, and Australia) where the change in climate was not so severe. Life carried on, rather than going into a relative recession as on Homeline.

For the next 3,000 years the Sheols advanced, and some billion Sheols reached and then surpassed Homeline culture of 2015. This included the discovery of crosstime travel about 30,500 BC, when the Sheolic civilization had already reached and surpassed Caliphan levels of technology. They had built vast arcologies, starports, orbital habitats, colonized the Moon and Mars, and even "terraformed" the Earth into warmer temperatures. Even the people of the Sheolic timelines were heavily genetically engineered: larger, stronger, and subtly different from the Human norm in a variety of other ways.

By then the Sheols already had settled much of the local space within about 40 light years, so the discovery of alternate timelines led to much less exploration and settlement of other earths. Expeditions and colonies were sent out and, over the next 100 years, 20 timelines were brought into their sphere of control.

The period of Sheolic time travel ended because of their emphasis on another aspect of crosstime exploration. Looking to expand their knowledge of physics, the Sheols deliberately sought out very different timelines, where the laws of reality had crystallized out of the Big Bang in varying ways. In 30,406 BC, a colony timeline -- what Homeline now calls Sheol -- opened a gate to a reality whose laws of physics were somehow infectious. Exploding outwards at the speed of light, a bubble of the different laws destroyed all chemical interactions, closing the gate to the other universe when it destroyed the gate's circuits, but still expanding from the sphere into which it had "escaped."

During the half a year before this happened, however, all life on that timeline and all other activity depending on chemical interaction were snuffed out. Further, the bubble propagated down the crosstime network through the gates on Sheol that happened to be open at the same moment. Eight timelines in all were "killed," and somehow the shock of the propagation jarred Sheol itself loose from its quanta, moving it quickly and steadily in the direction of Quantum 5 and beyond.

The main Sheolic timeline was untouched, and their civilization has carried on in the 30,000 years since. There is no hope of ever visiting it with current crosstime technology: using Homeline terminology, it is in approximately Quantum -25,000.

Adventure Seeds

Long Time No See, Dave: One of the larger cities on Sheol is at "Davao" on the southern Philippine Island of Mindanao. Though as ocean-swamped as "Rio," investigators are sent to the location to see what (if anything) may be worth examining during Croatoan's compressed time frame.

The city is one of the very few exceptions to the endless stillness of Sheol, as it is home to one inhabitant not dependent on chemistry -- a citywide AI named Au-ila, which runs off the region's geothermal energy. It hasn't had anyone to talk to for 30,000 years. At first the city will appear dead (maintenance-bot gladiator games and the like get stale after a few millennia), but Davao will gradually come back to life as the agents come to the AI's attention. Unfortunately, in the tens of thousands of years since it last had a job to do, it lost its imperative to support humans. While it's not actively malicious towards them, it is bored, and bothering the investigators is a potential source of amusement.

The difficulty for the players lies in not only trying to avoid a literally uncaring environment, but also trying to bring Au-ila around. A cooperative survivor of the Sheolic civilization would be a gem beyond price for Croatoan; if the agents don't come to this conclusion, anyone they contact on the outside will insist that their careers are on the line if they get too violent with the AI.

In The Lion's Den: Sheol will end up within the reach of the Centrum unless its migration through the Quanta is stopped. Unfortunately, the science of doing this is in its infancy -- or at least it is on Homeline. The Centrants themselves have a much better idea of how to do it, but until now nothing had been important enough to risk agents of knowledge that Infinity will be able to develop on its own, in time. With the deadline for the Sheol's transition to Quantum 6 fast approaching, though, there's no more time. Someone is going to have to penetrate Centrum's empire and learn as much as possible about what makes timeline "flipping" possible. Then they need to get it back to Infinity.

It's The Big One: Even if it is unknown to the players, someone will eventually figure out some of the story of Sheol's destruction. That someone has decided to use the opportunity to end the troubles between Centrum and Homeline. A conspiracy of hawks within Infinity itself have secretly repaired two parachronic gates on Sheol, and are planning on using them to destroy the Centrum and as many of their controlled timelines as possible. Both are set with timers, and one is set to open a connection to Centrum. The other is set to go off five seconds later and has been programmed to cycle quickly through coordinates of potential "infectious" universes, based on what has been learned of the original apocalypse. A repeat of the original disaster, now turned into a world-destroying weapon, is imminent.

To pull it off, the conspirators are going to have to close off as many of the Infinity timelines as possible, or else risk the infection spreading down into them (or even Homeline). A series of small strikes at various projectors is to occur half an hour before the attack on Centrum, and a highly placed insider at Infinity Unlimited on Homeline is going to ensure that the network of conveyors and projectors there goes down at the same time. Unfortunately for the conspirators, the existence of one of the small strikes is discovered just two days before the operation. There are now 48 hours to the end of the world -- actually, the end of multiple worlds -- and someone has to unravel the whole plot and stop it. On the plus side, if the troubleshooters have talked around Au-ila earlier (see "Long Time No See, Dave," above) they have a powerful ally. On the negative side of the ledger, the Infinity network will be shut down preemptively an hour before the Sheol conveyors go off, just in case. If caught by that deadline, the agents will have to find their own way to safety.

Real Unions for Fantasy Games

by Keith MacKenzie

Labor unions are a savior to some and a bane to others. Wherever there are skilled workers, the possibility of a union forming is there; once it has formed, it is a force to be reckoned with. Modern unions have a great deal of power within companies requiring the skills they provide. Some unions, such as the autoworkers or electrical workers, obviously have no place in a fantasy game. Others, such as carpenters or bricklayers, could have existed and might in some campaigns, conceivably becoming a part of play beyond contacts and cover stories. A third group of unions *don't* exist in our world, but could exist in a fantasy world, and are included in some fantasy fiction and games. The most common of these are the Thieves' Guild, The Wizards' Guild, and the Adventurers guild.

The Thieves' Guild

Half labor union and half organized crime, this union is seldom recognized as existing, although everyone knows it does. Rather than a hard organization, this guild is more of a network of associations. It includes burglars, bandits, assassins, informants, fences, and lock makers.

Burglars break into homes and businesses to steal cash and goods; bandits steal cash and goods from individuals. The goods are then sold to a fence for a portion of its actual value. Documents might be sold to informants but at a very low rate. In any event, a portion of the value goes to the union.

Assassins kill for cash. Informants let assassins know who might be hiring in exchange for a finders fee. Assassins generally pay a fixed fee to the union for operating within a city.

Informants sell knowledge to burglars, bandits, and assassins. Many moonlight as beggars, not to supplement their income but to have a reason to be almost anywhere. Some have clerk jobs for important individuals and companies within the city. Informants do not usually pay to be in the union -- their value is in their knowledge -- but anything the union does for them is based on quantity and validity of information provided.

Fences buy stolen goods below the market value, reselling what cannot be readily identified or melting metal jewelry and resetting stones for more identifiable items. Most fences are also storekeepers. A fence with no use for what he gains will transact with another fence rather than sending the thief to him. Because the union dictates the pricing of most goods with respect to fences, there is no shopping around; most thieves know only one fence in any given city, but almost all the fences know each other. Like informants, fences do not pay to be in the union, but must deal with union thieves if they have the cash available. Fences are also the primary source for any items of questionable legality, such as lock picks.

Lock makers sell insurance. For an extra fee, a union lock maker might guarantee his lock impervious to burglary for five years. The lock maker then gives a portion of the insurance to the guild and guild burglars agree not to pick locks with a given mark. Inversely, a guild lock maker might provide tips on breaking certain locks of customers who didn't want the insurance.

Smugglers, drug pushers, prostitutes, gamblers, and other illegal or immoral trades might be included in the guild, work alongside the guild, employ the guild, or be completely separate organizations.

Managers are usually guild leaders of other trades guilds or owners of warehouses and similar labor heavy business, so that it is not surprising that they have frequent meetings, income without cause, and an interest in city affairs. The managers are responsible for bribing city officials and insuring the honesty within the guild.

Because the guild is not a public entity, guild members and managers do not have any special titles, although there may be certain terms of respect used, such as guildier or Godfather. Guild members will be recognized by insignias

such as a rings, pins, tattoos, or scars, as well as with gestures such as secret handshakes and seemingly innocuous phrases. Law enforcement will usually try to get inside the guild by using one of these, but members know to look for all three.

Apprenticeship in the Thieves' Guild is dependent upon the trade the apprentice is most likely to enter. Burglars usually start out working for a lock maker until the basics are known, then continue with a burglar. Many assassins start out as informants to learn the importance and the methods of observation. Fences are usually corrupted merchants and bandits are unemployed fighters and as such have no apprenticeship through the guild.

The Thieves' Guild in Play

If one or more players opt to be a member of the Thieves' Guild, he should remember that a portion of any loot must be given to the guild. If a thief is a member of multiple guilds, the dues are paid to each guild. This does not generally include pay, but only comes from items removed from the dead or stolen. In any city where he is a member, the thief will know where to sell any objects recovered from the adventure and know about how much to expect for them. Additionally, a union thief can find, in a short time, a guild member from any of the occupations while in city where he is a guild member. A thief operating in a city where he is not a guild member will be approached by a manager and encouraged to join. If the thief refuses, assassins and/or bandits may visit him, his family or his friends; informants might start informing the city watch; and fences will not do business and may also inform the watch. He may also be framed for a crime.

A guild thief might be employed to steal a specific item from a known target or put one back, to put something where it never should have been, or just break into a place to create a diversion.

The Wizards' Guild

The Wizards' Guild is more of a professional organization than a labor union. Depending upon the rarity of wizards in a given world, this guild is usually a national entity or occasionally global. As an exception, unions might be local if wizarding colleges are in most major cities.

The guild is usually organized by one or two wizards who work for free or a low rate of pay. There is little organizing to do, except following up on complaints about members and finding wizards to fill positions with nobles and royals. The largest effect of the wizards' guild is pricing. Each spell has a fixed cost, and each wizard capable of casting the spell will charge that cost. This applies to single castings and item enchantments. A wizard may accept or reject a job, refer or refuse to refer a customer to another wizard, or even turn a particularly dislikable customer into a toad with no union repercussions. However, if the customer is a guild wizard, the job will almost always be taken for the fixed rate and normally given a higher priority than other jobs. Additionally, guild wizards generally have no reason not to teach another wizard a given spell, although time taken should be compensated. Wizards from neighboring guilds are often treated with respect and generosity, but if there are two guilds in an area, they will often be bitter toward one another if not openly hostile. Because of the public and prestigious nature of wizard's guilds, the members are allowed and encouraged to use titles, such as wizard and sorcerer. Non-guild wizards in a union city are generally discouraged by the union from using these titles, although magic-user and charlatan are usually considered acceptable.

The Wizard's Guild in Play

If no players are guild wizards, the guild will mostly serve as a source for one-shot spells, scrolls, potions, and other enchanted items as well as a place to sell mystic tomes of forgotten lore. Additionally, wizards may be hired for scale (comfortable lifestyle) with bonuses for exceptional risk. Wizards working for scale are not entitled to shares of treasure. The wizard's guild also occasionally hires non-wizards for certain tasks that should not be connected with their organization.

If some players are guild wizards, the guild is the ultimate in resource centers. Almost every spell is available to be learned, and enchantments are finished faster. If the guild hires the PC party for a job, however, the guild wizards will

be expected to work for free; in this case, a share of treasure would still be expected, presuming the wizard contributed to the job and didn't just supervise. Third parties might contract the guild for a job, and a player PC may be allowed or even encouraged to employ his associates.

If all the players are members of the guild -- for instance students or teachers at a wizarding school -- projects could be assigned to the group for any number of reasons: the group might have mastery in a single field or a diversity of spells, they might be the best group currently available, or (if the guild would like the mission to fail) they might be the "right" group for the job. Missions to recover artifacts or rare materials would not be uncommon for guild wizards, nor would ventures to hostile environments such as underwater or magna streams.

The Adventurers' Guild

These guilds are located primarily in major cities, and consist of a large area with training, research, medical, and recreational facilities. For a nominal yearly fee, anyone may join, as long as the individual has been on an adventure or is seeking to go on one. The dues are for building maintenance, improvements, and pay for the staff of the legal center and library. Most guilds have the following features:

Bank: Allows deposits and withdrawals and will issue letters of credit to adventurers intending to travel great distances. Like modern banks, the money saved is reinvested for profit to the guild and interest is not usually paid, but it is a better choice than carrying 12,563 copper pieces in the backpack.

Legal Center: A lawyer and several clerks will help guilders to buy and sell land, write and inspect contracts, draw up and execute wills and trusts, and help to resolve any other legal issues heroes might have.

Healer: A skilled healer is on call any time of day or night for those needing them urgently. The skills are applied free of charge, but supplies might have a cost associated with them, especially rare herbs. Depending upon the nature of healing magic, re-growth or reattachment of limbs or resurrection might be available.

Training Center: A large, well-staffed training center provides education in almost any field an adventurer might require. A majority of instructors are veteran adventurers themselves, so heroes are sure to get practical knowledge, not just "book smarts."

Library: A collection of maps, scrolls, and books is at guild members' disposal as well as a few research specialists.

Housing: The guild provides, again for a fee, housing for adventurers who haven't yet purchased a house, or feel that a house is not the best choice because of their lifestyle. Because of space, most rooms are double or quad occupancy, but might have only a single adventurer if tenancy is low.

Offices: Union Companies may rent office space from the guild, just off the entry hall; this would be where clients meet with company managers to negotiate a job. It is considered misconduct to put a client on a waiting list. If a company cannot take a job immediately (or when the client specifies) the manager should refer them to a different company.

Bulletin Board: This is an area where adventurers and clients can put ads to buy or sell equipment or look for freelance work.

Club Room: This member's only tavern is a place to relax and swap tales with veterans or boast of ones own adventures. Honesty is encouraged, but so is embellishment. Additionally, because of the combined experience, odd, unique or rare items might be identified by someone here.

The Adventurers' Guild in Play

New PCs, both at campaign start or later introductions, are directed to a company and hired, or they start their own and arrange to lease office space. In any event, and new clients come in, some will find their way to the PC company.

Because of the nature of this guild, it is the most welcoming to PC groups. All matter of adventure leads can be brought in through this guild where the thieves and wizards guilds might not be appropriate. Any mission could come into this guild, unless the thieves, wizards or militia are more appropriate. Adventurers are too costly for a war, and may lack the expertise for missions oriented completely towards specialists.

Interrelations Between Guilds

The wizards' guild tends to feel superior to the other guilds because of the amount of education and knowledge contained within its structure. They strongly dislike the fact that adventurers seem to gain reputation faster than wizards, but generally attribute this to the ignorance of the masses. They will, as needed, employ members of the other guilds, but do not like to as it discredits their superiority. Given the choice, the wizards will hire adventurers before thieves.

Thieves look down on the adventurers as idiots. The risk-to-profit ratio for adventuring is much higher than most are willing to accept. Crime within the city walls is generally less dangerous and therefore more appealing. They do respect the wizards for their devotion to the cause, but also resent their high and mighty attitude. Because of the nature of business, thieves are more likely to hire wizards than adventurers. It is more likely that an enchantment or counter spell will be of more use to a thief than any artifact found in a dungeon.

Adventurers, being a more diverse group than the other two guilds, are more accepting of both. They enjoy the thrill seeker reputation given to them by the thieves and the resentment of the wizards, but will hire either guild as a given job requires. Because a lock or door can be broken, thieves are seldom hired by adventurers, although a few have been lured away from the life of crime for permanent positions. Wizards, on the other hand, often have methods that cannot be imitated, so are more frequently hired, but usually just for in-house jobs, seldom for field work.

- 25 Hunted: FBI Cyber Division 11- (Mo Pow, NCI, Capture)
- 15 Psychological Limitation: Honorable; Always Keeps His Word (Common, Strong)
- 15 Social Limitation: Secret Identity (Rick Carver) (Frequently, Major)

Total Disadvantage Points: 155

Background/History: Ixion -- or Rick Carver, to give the name you'd find on his driver's license -- is something of a legend in cyberspace. He's best known to the online community as the owner and operator of wheeloffire.net, a popular website that comments on cultural and political issues with a wicked wit and caustic, clever insight from a vaguely-left-of-center perspective. Visited by thousands of people every day, wheeloffire.net has made Ixion something of household name among certain segments of the online community.

But other segments -- smaller, darker ones -- know and respect Ixion for something else altogether. Unbeknownst to the vast majority of his fans, and so far unprovable by his nemeses in the Cyber Division at the FBI, Ixion is one of the most talented and experienced hackers in the business. With a skill and ease that would frighten many a computer security specialist, Ixion slips in and out of computer systems, seeing things people don't want him to see . . . and often asking them to pay him money to keep him from showing those things to others.

Personality/Motivation: A fascination with technology and what it can do first drew Ixion into hacking, but he stayed with it for the thrill. He loves solving the puzzle of someone's security programming and getting into places where he's not supposed to be. The fact that he's made himself wealthy by selling (or not selling, as the case may be) the information he gains is secondary. He doesn't really care about the money; what matters to him is proving that nothing -- nothing -- can be kept secret from him if he wants to learn it.

Quote: None; Ixion rarely encounters people in person so he could talk to them. If he's feeling impish, he might sign his "work" with a tiny logo of a man tied to a burning wheel (a symbol that's very different from his website's logo).

Powers/Tactics: Ixion's not a combatant -- if confronted with physical force, he flees if he can, but surrenders if he has to. The PCs are more likely to deal with him as a criminal they have to track down and stop. His typical m.o. is to penetrate a computer system, find secret or sensitive data in that system, then blackmail the system's owner into paying him not to reveal the information (either to the victim's competitors, or to the world at large). But for all that, he's not without honor -- as his victims have learned, once they wire the money to whichever of his many offshore accounts he specifies, he always makes good on his promise to (a) return the data, and (b) tell them the way he got to it. (Well, at least one of the ways; he doesn't think it's part of the bargain for him to reveal every security flaw he discovers in a system.)

Ixion has a powerful reputation in the online community, but taking advantage of it is tough. It's easy to claim to be someone online, after all. More than once he's had to trash someone's system -- at least temporarily -- to convince them he's the real Ixion. Once they believe he is who he says, most hackers know that it's to their benefit to cooperate with him. After all, he sometimes hands out juicy tidbits of information or hacking tips to people who've done as he asked.

Campaign Use: Ixion could enter the campaign in many ways. The simplest is for him to hire out as a hacker for some villain or adversary the PCs are going up against. A more elaborate way would be for him to stumble into a PC's secret computer records and try to blackmail money out of the PC in his usual fashion. This time he may have bitten off more than he can chew

Ixion isn't intended to be a combatant, so you probably don't need to make him more powerful. You could upgrade his computer skills a bit if you wanted, or perhaps give him really low-level cyberkinetic abilities of some sort (provided you keep them consistent with the feel and nature of your Dark Champions campaign, of course). To weaken him, just

reduce his computer-related Skill Rolls until he's at a more appropriate level for your campaign.

Ixion generally doesn't Hunt people; it's not worth the time. Only if he got really mad at a PC (maybe one who exposed him to the cops and got him arrested) would he start a vendetta against that person. In that case, the PC had better disconnect all his computers from the net, because if he doesn't, Ixion will begin a full-scale assault on them -- and anything he finds, he'll use against the PC.

Ixion has no criminal record. The FBI suspects him of all sorts of hacking-related crimes, but as yet has been unable to prove anything against Rick Carver.

Appearance: Rick Carver is a thin guy in his late twenties or early thirties. He's 5'9" tall with sandy blonde hair, a matching soul patch, and usually a touch of five o'clock shadow. He's sort of lankily built, but spending too much time in front of the computer and eating too much junk food has got him started on a pot belly. He usually wears jeans and a t-shirt.

Ixion Plot Seeds

Here are three plot seeds involving Ixion:

Ixion starts dating a neurologist at Vreeland Memorial Hospital who is, shall we say, not quite as ethical as the AMA might like. With her help, he designs a computer program that he can download onto someone's computer as a sort of virus. The program causes the computer monitor to flash in a hypnotic pattern, allowing Ixion to take control of the person's mind for a short period of time. At most he can achieve an EGO +20 Mind Control effect . . . but that's enough to make most people empty out their bank accounts. The PCs hear about a rash of odd behavior; they have to find the cause and stop Ixion's depredations.

One of the PCs gets an e-mail from Ixion. He claims his life's in danger and that he needs help. Is the PC willing to help the notorious hacker . . . and if so, is the whole thing just some elaborate scam, or is Ixion really in trouble?

A strange file somehow finds its way onto a PC's hard drive. Unable to open it, much less read it, he has to turn to the infamous Ixion for help -- but how can he arrange matters so he can trust Ixion?

Description: Ixion's favorite computer is a laptop he built and programmed himself. In addition to standard computing chores, it's equipped with programs that allow it to emulate TEMPEST gear and "read" what's on the screens of other computers, to operate various types of electronic systems, and to help Ixion penetrate computer security programs.

Pyramid Interview: Mark C. MacKinnon

by Steven Marsh

Founded in 1997, [Guardians of Order](#) has had a long and distinguished history, publishing RPGs ranging from anime (*Big Eyes, Small Mouth*, *Slayers d20*) to supers (*The Authority*, *Silver Age Sentinels*) to cyberpunk (*Ex Machina*).

But Guardians of Order's president Mark C. MacKinnon posted a recent [New Year's Message](#) that describes how 2004 was a difficult year. Amid circling speculation and pre-written eulogies, Mark agreed to sit down with *Pyramid* and set the record straight.

* * *

Pyramid: Mark, your New Year's Message is thorough but pretty long. For those just skimming through fan speculations and statements on some message boards, you'd think the end was nigh. So, in 50 words or less: What's going on with Guardians of Order?

Mark C. MacKinnon: We are adjusting our business plan to match the realities of running a Canadian export business during a time with a weak US dollar. This includes downsizing the company and moving to a greater freelance model, and asking our fans for help converting inventory to cash. 46 words.

Impressive! For our readers who may not be familiar with the nuances of the gaming business, what are the advantages or savings of moving to a freelance model? Does it end up saving money, shifting around when money is owed, something else . . .?

First, it allows us to incur expenses in U.S. funds, rather than in Canadian funds as employee salaries. This means we don't lose money to conversion. Also, it means we only incur expenses directly relating to projects -- writing, layout, art, line development, etc. -- rather than general overhead, which allows us to track our profitability project-by-project more easily. Finally, many freelance contracts (including most of ours) involve a portion of the final payment after publication, which obviously helps cash flow. Salaried employees are a preferred business model -- one that we have used since 1999 -- but it is simply not feasible for a small Canadian publisher with a weak US dollar.

It's not very often that the gaming industry gives much thought to U.S. economic conditions or fiscal policy; can you give a brief overview or example as to how the weak dollar has hurt Guardians of Order?

Most of our fixed costs (salaries, rent, taxes, and some printing) are in Canadian dollars (CAN), but our income in U.S. dollars. Thus, we need to convert much of our net revenues to local Canadian currency to "pay the bills." We used to get about \$1.60 Canadian in 2002 for every U.S. dollar, but now we get about \$1.15-\$1.20. This means that for every \$100,000 USD of net revenues, we lose about 30% compared to 2002 -- our about \$35,000.

Note that this isn't a loss in sales revenue -- sales have gone up for our company for three years now -- but a loss of net CAN revenue.

How long has Guardians of Order been wrestling with this problem? The dollar has been weak for a while, and you comment that there's no end in sight; were you hoping it would turn around, or did you have other plans which would have compensated for this?

It started in early 2003, and has become progressively more difficult since then. We had hoped it would turn around in 2004, since most economists we have been following thought that it would stop or stabilize at about \$0.74 (the inverse of \$1.35) -- not as good as we hope, but far better than \$0.85. This type of sharp U.S. dollar decline is unprecedented in such a short time though, so many predictions were wrong. Some economists are now calling for a \$0.90 dollar in 2005 -- a scary thought indeed.

As for our plans, we have been doing all we can to increase gross U.S. revenues -- plans that have largely been working decently, but not perfectly. This includes producing more larger, more expensive books, and trying to move them through alternate channels (such as the book trade). Still, unless we increase sales by that 30% we are losing in exchange, our profitability is not certain.

Does the downsizing affect any of Guardians of Order's other plans or efforts, such as conventions? (You all had a pretty impressive presence at GenCon last year . . .)

Somewhat, yes, but we have always been lucky enough to have the support of friends and freelancers to help us at conventions. Our presence will change, but our products will still be available.

There have been some charges on the boards that Guardians of Order's problems have stemmed at least partly from segmenting their fan base, with a plethora of choices and variations on two systems (primarily *Tri-Stat* and the *d20 System*). Do you agree?

Not at all. Rather, we have been increasing our fan base by producing *d20 System* products, and alternative *Tri-Stat* products. As everyone knows, core books generate the most income, and it is vital for us to continue producing core books. Clearly, we can't just have one game line. Yes, there has been some segmentation, but I think the cross pollination between our lines have more than made up for any losses.

It's also necessary to remember the realities of distribution of costs. By releasing two *Silver Age Sentinels* core books (one for *Tri-Stat* and one for *d20 System*), we amortized our creative costs over two books rather than one. It's both cost effective and a great way to expose our products to new customers.

In the gaming world, all tiers (distributors, retailers, and fans) seem quick to pounce on any rumors of a company's demise. What effect does this kind of speculation have, and do you think this is unique to the gaming industry?

Watching the stock market, I don't think it's unique . . . but it can be exceptionally frustrating. The internet is one of the greatest benefits to the gaming industry, but it is also the industry's worst enemy. Rumors abound on the internet ("[Did you hear that John Wick died recently?](#)"), and often things get blown way out of proportion.

In your Message, you comment that those in the gaming industry universally agree on the decline of traditional roleplaying-game sales. You go on to discuss that, despite being an RPG-only company, Guardians of Order saw its gross revenue increase for the third year in 2004. How do you feel about the current state of the RPG market? Is the industry-wide downturn a temporary setback or signs of worse things to come?

RPGs are crashing miserably right now, and no one knows exactly why. Some speculate the release of *Dungeons & Dragons v3.5*, while others just say it's the U.S. economy. I have no idea, but I know how much our unit sales have fallen and it's not healthy. I've heard that board games are doing quite well, though, so I don't think it's universally all games.

I don't have the breadth of knowledge to comment on the scope, but in my eyes, it's going to keep getting worse and worse. Maybe *Dungeons & Dragons 4th edition* (ooh, look -- an internet rumor!) will turn things around . . . or put the final knife in the corpse.

Let me state one thing though, so my comments aren't misinterpreted: There isn't an "RPG industry." There's Wizards of the Coast, and then there's everyone else. Wizards of the Coast *is* the industry. While many other companies (many of them I admire very much) produce great products, it pales to the juggernaut that is *Dungeons & Dragons*. When I say that the RPG industry is in trouble, what I really mean is "many small publishers are in trouble, the few mid-tier publishers are smart enough to adapt, and I have no clue regarding the Wizards-of-the-Coast situation." That's too long to write, though, so I paraphrase.

So what are the plans for turning things around? Is there a killer product or two in the pipeline that your hopes are resting on, do you plan on continuing on as you have been, or something else?

The killer product is ***A Game of Thrones RPG*** (all three editions!), and ***BESM Third Edition*** (primarily designed by David L. Pulver). Many other products, such as ***Tekumel*** and ***Dreaming Cities***, should do well, but ***A Game of Thrones*** will do wonders for us. If that product wasn't on the horizon, it would be a very bleak time for Guardians of Order.

We have 20+ products planned for 2005, and already about a half-dozen for 2006. We are unsure exactly what the future will hold for Guardians of Order, but we simply have too many products to bring to market -- we can't just go away. We'll certainly be smaller and more focused, but we'll still be here.

It seems you're at a point where other publishers might throw in the towel, licensing or selling their properties to other companies or just dropping out of sight. (In fact, Guardians of Order has been on the other side of that equation, distributing the *Nobilis* line.) Since it sounds like it's going to be a struggle, what's your motivation for continuing on?

There are many reasons to continue. Perhaps primarily, I like what I do. Well, most of the time at least (I hate spending many hours each week on micromangement of finances for an undercapitalized company!). There are several projects I have committed to publishing (foremost ***A Game of Thrones RPG*** and ***BESM Third Edition***), and would be sad indeed if I couldn't bring them to market. Also, there are a number of people -- including friends and freelancers -- who have contributed their time and money to Guardians of Order, and they need to be paid. Continuing is the way to ensure they do.

Of course, it's not exactly a seller's market either. Sure, if someone offered me a cool million for the company, I'd be more than happy to step aside . . . but that isn't very likely. But here's the chance for one lucky *Pyramid* reader to prove me wrong!

Speaking of *Nobilis* (and its many vocal fans who read *Pyramid*), what's the status of that line?

Since we took over distribution of ***Nobilis***, it was always with the understanding that the owner of the ***Nobilis*** line would determine what ***Nobilis*** products would be released, and when. We have not since been presented with any anticipated release dates for future ***Nobilis*** supplements, so I am unsure when they will be produced.

It's no doubt been a topsy-turvy year for Guardians of Order, and the weak dollar has obviously put a pall over some well-received and great-looking books. What do you think is your biggest accomplishment of 2004, and what's the biggest disappointment?

Biggest accomplishment: ***Ex Machina***, without a doubt. It's an awesome product, and has garnered nothing but rave reviews from the community. Also, ***The Authority*** is one of the most gorgeous RPG books ever produced, thanks largely to Hitch's amazing artwork and our Art Director's design talents.

The biggest disappointment is that we couldn't get ***A Game of Thrones RPG*** out this year as I had hoped. There were numerous reasons for the delay, but in the end the final product will be one of the best RPGs ever released. So my disappointment will turn to joy come the spring.

Finally, what can fans of Guardians of Order do to help the company through this difficult time?

Buy, buy, buy! We're not asking for donations -- there are those who need a hand up far more than we do -- but a chance to sell you those books you've always wanted to try, but never got around to purchasing. Whether it's ordering from [our webstore](#) for those rare items, buying our PDFs from [DriveThruRPG.com](#), or asking your favorite local (or internet) retailer for our products, it will help us tremendously. Every sale helps, and we are grateful for the support and response we have had from the gaming community so far. Please -- keep it up!

Are Predictions Called Postdictions After the Fact?

Shortly after ushering in the new year amid fire crackers and alcohol some 360-odd days ago, I started a new attempt at an annual tradition designed to help fulfill my weekly wordage quota. Namely, I put on my prognostication hat (which looks suspiciously like a stolen Hilton towel wrapped around my head and held in place with a fork) and predicted what the far-flung future of 2004 would hold for our humble industry.

It's time, then, to pull up last year's results and see how we did. (You'll note that the column has slipped into the "royal we" here. If one had been uncannily accurate in all one's predictions, one might be more assertive about one's first-person-ness.)

Without further adieu, then, here's what I thought was going to happen [last year](#):

I predicted that print-on-demand would come into its own in 2004. It didn't happen. By a long shot, it didn't happen.

Oh, sure, some game companies are releasing their products via print-on-demand. But for the most part the limitations have been two-fold – one solvable and one perhaps not.

First, the quality still hasn't been fully inspiring. In a best-case scenario, a great-looking POD book will look like an average-quality book printed via traditional means. To be honest, I'm still uncertain why this happens. While it might be the fault of the process, it's possible this might be because companies drawn to the POD model don't have the resources to devote to books that look as good as more "traditional" publishing houses. So while it's still possible for the technical aspects of POD to be refined, even if we end up with *Star Trek*-esque replicators capable of making exact duplicates, it still won't look good if the original resembles something assembled on an old mimeograph machine.

However, the second, larger problem is more insurmountable: Cost. At present, a POD book costs on order of two to three times as much as a traditional printing means (assuming a print run of at least two thousand or so). In other words (and using grossly simplified numbers), if you print books for \$5.00 apiece, a publishing company can sell them to a distributor for \$10.00, who can then turn around and sell them to retailers for \$20.00, who can then turn around and sell them for \$39.95 to consumers. But if that same book costs, say, \$12.00 apiece, then you're either left with a book retailing for almost \$100, or someone is taking an unreasonable hit . . . almost certainly the publisher, in this case. (As a hint, publishers would be well-advised against selling the book that cost them \$12.00 to distributors for \$10.00.) And, coupled with the uncertain quality of POD products, you can end up with a book which costs more than double a comparable book, *and* seem to be of lesser quality.

So, POD has a long way to go. I think it might get there some day, but I'd be amazed (yet pleasantly surprised) if it happened this year.

Reality: 1

Steven: 0

I also predicted some company would do something creative and innovative with print on demand. In fact, they did: They avoided it. However, I don't think I can count this one as a victory.

Reality: 2

Steven: 0

I predicted one of the Moderately Big Companies would have "a major restructuring, involving a departure from the traditional games they had been creating, or getting out of that biz altogether."

This one is tougher to call. On the one hand, it seems Decipher's limbo status with its *Star Trek* and *Lord of the Rings* RPGs might be a win; Decipher's [RPG](#) section hasn't been updated since May, for example. But, as best I can tell, nothing official has been forthcoming from them, so I feel reluctant counting that.

This week has also seen [Guardians of Order](#) announcing downsizing and company restructuring, although they're going to be sticking it out. (Check out our interview this week with Mark C. MacKinnon, as he sets the record straight with what's going on with them.) But, again, it doesn't really fulfill the spirit of my prediction.

Nevertheless, between the two of 'em (Guardians of Order's "major restructuring" and Decipher's "departure from the games they'd been creating/getting out of the RPG biz"), I'm going to count it as a score. Don't like it? Take it up with the ref.

Reality: 2

Steven: 1

I predicted the gulf between the efforts of the Big Guys and smaller publishers getting wider. I confess that I don't have as much evidence to point to here; ever since I moved from Tallahassee to outside Philadelphia, I don't have biweekly access to my Former Friendly Local Game Shop, so I haven't seen a lot of what's going on. (Our closest shop seems to focus on the more "proven" lines.)

Nevertheless, I'm going to count this one as a win. Companies like Steve Jackson Games and Guardians of Order have been producing beautiful-looking full-cover hardcovers at a moderate (if not impulse purchase), and others such as White Wolf and AEG have been releasing absolutely huge products (*World's Largest Dungeon* or the fat *Vampire* core book) at reasonable prices (okay; \$100 isn't cheap, but White Wolf offering its snazzy *World of Darkness* rulebook for less than \$20 is a great deal). Regardless, the bigger companies *are* continuing to distinguish themselves by producing products that other, smaller companies just can't do.

So I'm going to count that one as a score, too.

Reality: 2

Steven: 2

Downloads 'R' Us. I predicted the rise of electronic publishing in the gaming world.

Funny story time: When I met Scott Haring at Dreamation last year, he was cautiously optimistic that Steve Jackson Games' e23 electronic product outlet would be up and running by February. (I learned this after I wrote my column, so it's not like I was using my massive insider knowledge to make the prediction.)

Alas, 11 months later, e23 still hasn't been released to the public.

In the interim, however, fate decided not to make a liar out of me by ensuring that DriveThruRPG.com opened back in June. An interesting parallel with RPGNow's electronic distribution methods, it's probably most noteworthy for two things: having a *lot* of "traditional" publishers going along with them (some of them really big) and using Digital Rights Management to protect their documents. (Whether those two are related I will leave as an exercise for the reader.) Regardless, the prospect of hundreds of new, older, and out-of-print material now available for online purchase and electronic download has no doubt made many fans lick their lips.

Reality: 2

Steven: 3

I predicted that at least three games would be released, all having a very similar theme, genre, or world idea.

I was tied to my booth at GenCon, but best I can tell this didn't happen. Drat.

Reality: 3

Steven: 3

I predicted that computers would not add significantly to the gaming experience. I also predicted that MMORPGs would continue to be popular and profitable.

In hindsight, I find "failure of things to happen" predictions to be pretty lame ("I predict the moon will fail to explode, nor will it in any way give super-powers to any inhabitants of Earth."). Nevertheless, **World of Warcraft** is both a critical and fan-endorsed success, and I don't think **City of Heroes** existed back in 2003. So I'm going to count this one a success, too.

Reality: 3

Steven: 4

I'd predicted that two presumed-dead game lines would come back from the dead, published by different companies. **Paranoia** definitely qualifies, so I'm at at least one. As for #2 . . . well, I'm struggling, here. Sure, the **D6 System** came back after a long absence, but that was still being published by West End Games (a company which had been purchased by someone new). Some IPs came back, including **Conan** from Mongoose, but again I don't think that counts.

I think reality and I need to split the point, and rely on the teeming millions to let me know about a game (or game line) I missed which fulfills my criteria.

Reality: 3.5

Steven: 4.5

I predicted publishing companies trying more innovative methods to get their products out there; I also predicted other publishing houses would try the "miniseries" format made famous by White Wolf's **Orpheus** game line. With a few minor exceptions, both of these things utterly failed to happen.

Reality: 4.5

Steven: 4.5

Finally, I predicted that the game industry would gravitate toward more products which couldn't easily be duplicated or experienced outside of its physical form (such as **HeroClix**). This was more of a long-term prediction, so I'm not sure if I should count it here. Nevertheless, 2004 saw the release of **Pirates of the Spanish Main** as well as many books that also exist as objects de art (such as the **GURPS Slipcase**, **World's Largest Dungeon**, and **Authority RPG**). Nevertheless, I didn't see a product that fulfilled the criteria and captured the imagination like a **HeroClix** or **Magic: The Gathering**. So the point is split again.

Reality: 5

Steven: 5

On a casual glance, I seem to be little better than flipping a coin or consulting the Magic 8-Ball. And few of my predictions were *too* out there. On the other hand, I don't think there were any big events or happenings that I *didn't* predict, so I consider my meager success rate to be not too horrible.

In the next week or so, I'll probably reach into the hat and pull out a fresh batch of predictions. (Really, the longer I wait, the less year that's ahead of me . . . which means I look even more amazing.)

Until then, if you have any insights or comments about these predictions you'd like to offer, feel free to either [drop us a line](#) or stop on by [the discussion boards](#). We love to chat.

* * *

And speaking of chats ("+2 to your *make segue* roll"), we have a number of them coming up soon:

First, Friday January 7th (that's today, if you read *Pyramid* as soon as you can), **Steve Long** of [Hero Games](#) will be stopping by. It's bound to be a *super* time. (Get it? **Hero System** good for supers games? . . . nevermind.)

Then Tuesday, January 11th, we'll be having a [Guardians of Order](#) chat, with **Mark C. MacKinnon**, **Jesse Scoble**, and

Adam Jury stopping by to answer questions, fight rumors, and let us know what's happening in their Canadian neck of the woods.

Finally, Friday, Jan 14th, **Steve Jackson, Sean Punch**, and as many other of the [Steve Jackson Games](#) crew as can be mustered will be on-hand to chat. Reminisce about 2004, learn secrets about 2005, and more!

All chats are at 7pm CST, which is something like p:30 in Gretchen Mean Time or whatever the heck the rest of the world uses. For more information about joining us, check out [our chat page](#).

--Steven Marsh

Night's Move: The Chess-Playing Turk

"M. Maelzel had also constructed an automaton known all over Europe as the chess-player. . . . His Majesty took a chair, and sitting down opposite the automaton, said, laughing: "Come on, comrade; here's to us two." The automaton saluted and made a sign with the hand to the Emperor, as if to bid him begin. The game opened, the Emperor made two or three moves, and intentionally a false one. The automaton bowed, took up the piece and put it back in its place. His Majesty cheated a second time; the automaton saluted again, but confiscated the piece. "That is right," said His Majesty, and cheated the third time. Then the automaton shook its head, and passing its hand over the chess board, it upset the whole game."

-- Louis-Constant Wairy, *Private Life of Napoleon*

It was a life-sized wooden man, dressed in the robes and turban of a Turk. In its left hand, it languidly held a long pipe; the other stretched out across a cabinet top. The wooden cabinet itself (four feet long, three feet high, and two and a half feet deep) sat on castors. Three doors opened on the front of the cabinet. One revealed a dizzying nest of clockwork; the other, a compartment holding a mysterious casket, a gold-inlaid chess [board](#), and a red cushion. A long drawer below the doors held chess pieces. The operator removed these items, lit two candelabra on the cabinet top, placed the cushion beneath the Turk's elbow, removed the pipe, and set up the chess board for a game. After displaying the clockwork again to the audience, the operator then theatrically wound it up. Gears ground, pistons whirled, and the Turk's left arm stretched out to begin another game of chess. Over a career spanning almost seventy years, it almost never lost.

"In the year 1769, Mr. De Kempelen, being at Vienna, on some affairs relative to his official situation, was ordered to attend at Court, to assist as a connoisseur at some magnetic games . . . [during which he mentioned] . . . that he thought himself capable of constructing a machine, the power of which would be much more surprising, and the deception much more complete, than all which her majesty had just seen He kept his word, and in the space of six months, completed the intire formation of an Automaton, which surpasses every thing of the kind that has yet been seen."

-- Carl Gottlieb von Windisch, *Inanimate Reason*

The Turk debuted in the spring of 1770, in a command performance before Empress Maria Theresa of Austria. Wolfgang von Kempelen, a court engineer, presented the Turk for his first game, against the Count Cobenzl. The Turk won, and followed up by successfully demonstrating the Knight's Tour, a complex maneuver in which the knight moves through every square on the board from any starting point. After its vogue at court, Kempelen attempted to retire the Turk in 1773, claiming it was damaged and unable to play. But in 1781, the Emperor Joseph II ordered Kempelen to reassemble it for the Grand Duke Paul of Russia's visit, and to take it on tour. In Paris, the Turk defeated [Benjamin Franklin](#), and although the great Philidor won his game, he said no game had ever "fatigued him to the same extent." In London, Kempelen's "androides" were a sensation, and inspired Edmund Cartwright to invent the power loom. Kempelen returned to Vienna in 1785, but refused to demonstrate the Turk thereafter.

His son sold the Turk to Johann Nepomuk Maelzel, an inventor, in 1805. Maelzel had also invented a self-actuated orchestra (the Panharmonicon) and an automaton trumpet player; under his tutelage, the Turk spoke for the first time (saying *echec*, "check," when appropriate). Maelzel's Turk played Napoleon in 1809 at Schoenbrunn Palace (where Kempelen had designed the hydraulics decades before); it impressed the Bonapartes enough that Prince Eugene de Beauharnais, Napoleon's stepson, bought it from Maelzel in 1811. Maelzel bought it back in 1817 on credit, and took it on tour. The Turk now offered pawn and move to all comers; in London in 1820, it beat Charles Babbage at chess. But de Beauharnais' heirs were hounding Maelzel for the balance of their payment, and in 1825, Maelzel and the Turk hopped ship for America.

"When the question is demanded explicitly of Maelzel -- 'Is the Automaton a pure machine or not?' his reply is invariably the same -- 'I will say nothing about it.'"

-- Edgar Allan Poe, "Maelzel's Chess Player"

The Turk toured New York, Boston, Philadelphia, Baltimore (where it lost a game to Charles Carroll, the last surviving

signer of the Declaration of Independence), Richmond, Charleston, Pittsburgh, Cincinnati, Louisville, New Orleans, and Havana. In Richmond, it attracted the attention of [Edgar Allan Poe](#), who by sheer bull-headed induction (and careful attention to an earlier pamphlet by one Robert Willis), determined the truth -- that the Turk was secretly operated by Maelzel's assistant, William Schlumberger. As Tom Standage demonstrates in *The Turk*, the gears and clockwork were mere sleight-of-eye, intended to distract audiences from the small (but adequate) space inside the cabinet. The operator used a pantograph arm to move the Turk's arm from piece to piece, and tracked the games by means of a cunning series of magnets on the underside of the board. The Turk won so many games because its operators included some of the more formidable chess players in London and Paris, who seemed to treat a spell in the Turk as a lark, at least at first. One of them, Jacques-Francois Mouret, revealed the secret in a small journal in Paris in 1834.

"Many must be the adventures of the Automaton, lost, unhappily, to the knowledge of man. A being that kept so much good company, during so long a space of time, must, indeed, have gone through an infinity of interesting events."
-- George Walker, "Anatomy of the Chess Automaton"

Mouret did so because of his desperate alcoholism and poverty; he sold the secret of the Turk for a few bottles of brandy. Although chess circles in Paris supported Mouret, he had become paralyzed during his time in the Turk and died in 1837. The year after that, Schlumberger died of yellow fever in Havana. Old, alone except for his automata, and increasingly impoverished, Maelzel sailed for Philadelphia on July 14, 1838. He played two games of chess with the ship captain, losing the second one. He became enraged, withdrew to his cabin, and [drank](#) himself to death, dying after seven days alone with the Turk.

Maelzel's business partner John Ohl claimed the Turk, and sold it in 1840 to a local doctor, one John Mitchell. Mitchell, the Poe family doctor, put on a series of "debunking" Turk shows for a private club in 1840, revealing the secret to his fellows. He then donated the Turk to the Chinese Museum, originally founded to house the collection of Charles Wilson Peale. P.T. Barnum, who met Maelzel at an early age, built the American Museum in New York from another Peale collection, and may have raided the Chinese Museum for choice exhibits -- but not the Turk. It perished in a fire on July 5, 1854; Mitchell's son Silas, on the scene, claimed to hear the Turk's last words: *Echec! Echec!*

"This child has never opened a work of chess... In the opening he makes the right moves as if by inspiration; and it is astonishing to note the precision of his calculations in the middle and end game."
-- Ernest Morphy, on his nephew Paul

Interestingly, America's greatest ever chess champion, Paul Morphy, was born on the summer solstice of 1837, seven months after the Turk toured New Orleans. A chess prodigy who seemingly knew the game from his earliest years, at the age of nine Morphy defeated General Winfield Scott. At age 17, he defeated the president of the American Chess Congress, and the next year defeated all comers at the Congress' tournament in New York. In 1858, he traveled to Europe, where he overwhelmingly defeated Lowenthal, Harrwitz, and Anderssen, and destroyed the top players in London, Paris, and elsewhere in multiple blind matches. The English chess authority Staunton managed to avoid playing Morphy directly, although he lost a consultation game to Morphy's partner Barnes. Morphy challenged anyone in the world to play him at the Turk's odds of pawn and move, but found no one who could match him. In October of 1861 in Richmond (where Poe and the Turk crossed paths 26 years before), Morphy supposedly beat the Devil at chess, rescuing an "impossible" position painted by Moritz Retzsch in "Man vs. Mephistopheles." By age thirty, Morphy had abandoned chess entirely. He became a paranoid schizophrenic, ranting the phrase "He will plant the banner of the Castile on the walls of Madrid, screaming: The city is conquered and the little king will have to go" while walking around the French Quarter swinging his gold-headed cane. He died of apoplexy in a cold bath at the age of 47.

"I see, now, that the mysterious being who communicates with us by the medium of the Turk, has powers at his command which compel our most secret thoughts with magic might; it may be that this strange intelligence clearly and distinctly beholds that germ of the future which is being formed within us in mysterious connection with the outer world . . ."
-- Ferdinand, in "Automata" by E.T.A. Hoffmann

Did Mouret and his fellow masters sweat their spirit into the dark box of the mysterious, proto-computational Turk? (Being immured inside the cabinet, with magnets above and a chessboard below, must have been as close as you could get to a steampunk sensory-deprivation tank -- an ideal setting for psychic experimentation.) Did that spirit emerge in the chess-board grid of old New Orleans during a dark Saturnalia in 1836? Did it transfer itself to Paul Morphy, he of the "preternaturally small" hands and feet, who possessed "bumps" betokening "possession of the calculating faculty" according to an amateur phrenologist's description? Is this the meaning of Kempelen's epitaph, *Non omnis moriar*, "I do not die completely"? Kempelen, interestingly, spent much of his time after the Turk's tour building [speaking heads](#) - he knew better than to instill such oracular power in his creation, a feat which awaited the more foolish Maelzel.

From here, as they say in chess, the variations become unsound. But perhaps this is why Staunton feverishly edited the works of [Shakespeare](#) instead of playing Morphy, seeking dramaturgic armor against the calculating spirit of the new age. Perhaps Morphy's habitual sacrifices of his Queen indicate some anti-fertility ritual more appropriate to an automaton than a son of hot-blooded New Orleans. So what might have happened to the Turk's spirit after Morphy's death? Could it have been captured by the British Chess Association, founded two weeks afterward by the conspiratorially-connected Randolph Churchill and the Grail-poet Tennyson? Did they sponsor the 1865 creation of Ajeeb, the second chess-playing Turk, who haunted the Polytechnic alongside [Pepper's Ghost](#)? (Ajeeb, interestingly, also perished in an American fire, on Coney Island on March 15, 1929.) Did that spirit (or a portion of it captured kabbalistically by his rabbi father) pass into William Steinitz, the next World Chess Champion, born in 1836? It's suggestive that Steinitz began championship play the year of Ajeeb's creation, and lost the world championship the year Ajeeb's creator sold him to an American. Steinitz, interestingly, believed he could move the pieces by (automatic?) electricity, and claimed to have offered God Morphy's odds of pawn and move. Like Morphy, Steinitz died insane. Interestingly, Bobby Fischer (also paranoid, also American, also a cometary chess prodigy) claimed to be Morphy reincarnated. Even more interestingly, like the Turk, Fischer plays left-handed. The Knight's Tour goes anywhere and everywhere. Somewhere, then, the clockwork hands of the Turk reach out and grasp a pawn -- but we may not be able to hear the *echec* above the rising flames.

Chretien's Garden

for *Nobilis*

by Bradley Robins

"It was Chretien who saved that world from the ending the gods' hubris wrought. Alone he walked through the wastes, gathering the few last tribes that had not succumbed to madness. His words united, his vision gave hope. Together they traveled across the waste, avoiding the frayed edges of reality when they could, driving oblivion back with blood and hope when they could not. The journey took decades, and only when Chretien was very old did they finally come to the sea.

"In the green of a forgotten garden, where a wall of rocks fronted on the sea, Chretien had them build an altar of earth, stones, and thorns from the dying ground growing. Around it the people danced and sang, bodies swaying full of hope, which Chretien had given them. With writhing arms and brightening eyes they pounded out rhythm with their feet till a song was born in the still air. Round and round they spun, souls immolating like the shells of moths burning incandescent even after the candle's wick has gone out. Their pulse was thunder, and dancer and dance were one.

"Old Chretien, with his ragged gray beard laced with Chamomile and Amaranth, lay himself down upon the altar and whispered to his parents that he was coming home. Kamin, first of Chretien's children, took up the knife and with tears in his eyes he ended one life that the world might live. Upon his altar Chretien died, and from his godlike heart burst the Great Oak whose roots sunk into the sea, whose roots delved into the earth, whose roots were anchored in the flesh of man."

From *The Annals of Oak*

In the endless struggles between Light and Dark there have been many times when the Dark has come within an inch of final victory. Always the Light has managed to save humanity at the last moment, but rarer are the times when humanity has been able to save itself. When the Dark separated from Earth and then pulled down the green realm of Khahat, its noblest human did not let his land fall, nor his people end. Chretien -- botanist and seer -- gathered together the remnants of humanity and performed a great ritual which saved everything he had loved. His sacrifice not only formed the Great Oak which wards the realm, it drew the attention of the Emperor Saurast. Seeing Chretien's land as the very symbol of humanity's nobility and potential, he imbued himself into the Oak and the land, turning Chretien's Garden into a chancel of the Light.

The whole of Chretien's Garden lies under the branches of the Great Oak, a mirror of the World Ash which holds up the sky of the locus and holds back the worlds beyond with the shade of its branches and the never-still rustle of its leaves. The Oak dominates all of chancel life from religion to science and leisure, for it provides everything the residents need -- including immortality. Nothing in Chretien's Garden ever truly dies. Though bodies may decay and blow away as dust, the soul will never sleep or be lost and only the memory of what it was to need and lust can ever fade to forgetfulness. The ghosts of those whose bodies have expired linger on to watch over their descendants and to yearn after the heated pleasures they can no longer feel. Little true loss is ever felt by the residents, but in turn they feel little true hope; the endless days of shadow and leaf song are all they will ever know.

In order to drive back the ennui that too often settles over the Garden, the residents have developed an intricate religion that includes endless festivals and rites. Apotheosis with the Great Oak is constantly sought, as is communion with the panting, desperate need that formed the Oak. From high branches they harvest acorns whose meat is the flesh of humans, and tap sap which spills as red blood. Feasting on the flesh and blood they dance mighty ecstatic dances, dervish spinning as spirits and bodies yearn for the joy and burning lust for life that is the one thing they have forgotten. Most are able to return to their lives refreshed, with their vigor and lust restored, but it is not uncommon for men to dance their bodies to nothingness, and for their spirits to dance on ever after, never able to be still while the yearning in their heart haunts them.

Arts and sciences provide another avenue for the residents to remind themselves of why they live, and in the Garden both are quite advanced in study and practice. Weird sciences which combine botany and human biochemistry are the most common and prestigious. The endless influence of the tree has led to science being able to make humans who are not fully human, who feed by photosynthesis, regenerate, and have great, slow strength. The arts are similarly advanced, with sculptures of living wood and mosaics made from a million shades of fallen leaf covering square miles of the Oak's trunk. Combinations of art and science turn many of the enhanced into biological works of art, creatures of beauty that may not be fully human. Many of those who undergo the most radical alterations hope that by doing so they will achieve unity with the Oak, and thus find the dreams that have been lost. It is not lost on the servitors of Light that their perfect realm of immortal humanity may slowly become something other than human, but for now they are unsure what to do about it. It does not help that at least two of the resident powers, Istee and Dura, actively encourage and support "alternate humanities" such as ghosts and cyborgs. Such positions often put Chretien's Garden in politically ambiguous waters with other Powers of the Light.

Though art and science are much advanced, the architecture and infrastructure of Chretien's Garden is simple to the point of being backward. Sheltered from any extreme by the Oak, and given all they need to live from its branches, the people have never felt the need to produce great strings of supply and demand, or to build houses that are much more than hollows in a great root. This lack of drive and supply has retarded their sciences and arts to a certain extent, and while some of the philosophers are aware of the problem, none have the energy or drive that it would take to form a full government or infrastructure in such a land of ease and plenty. What little control and regulation there is comes from the Nobles, who often have difficulty getting the residents to take proper care of themselves.

The only time that the endless stretching time of Chretien's Garden is interrupted is on nights of the new moon. During the darkness of the sky, the wind dies to the slightest whisper and the leaves go nearly still. Around the edges of the locus the protection of the Oak wanes, and creatures from the fallen, mad world beyond are able to enter freely. At the edges of the Garden are not one, but two, chancels of the Dark and the mad beasts and Nobles may enter the chancel freely on those nights. Though the Oak grants some protection against their power it cannot stop them from entering, and once they are in it cannot compel them to leave. Though the residents of the realm are not defenseless they lack the training and will to fight, and Saurast himself only rarely turns his attention to the locus. Thus the agents of the Dark are free to stock and seduce, to kidnap and to torment until the chancel's Nobles are able to intervene.

More Questions than Answers

The Brass Ring

by Chris Aylott

Let's have a show of hands here. How many of you reading this would like to make a good living as a game designer?

Not the "hand-to-mouth, eat lots of ramen and hope you don't get sick because you can't afford health insurance" life of most hobby game designers. I'm talking enough money to raise a family, own a home, work reasonable hours and stock your liquor cabinet with the good booze. A fat royalty check to go with the thrill of seeing your games making people happy.

This is not an unreasonable goal, is it? Am I correct in thinking that there is nobody here who says to himself, "Gee, I'd love to design games, and the lousy pay just makes it better!" Right?

With that in mind then, with the understanding that the typical hobby games paycheck falls far short of an unlimited blow and hookers lifestyle, let me ask this question.

"What does it take to make a million dollars designing games?"

You'd Need the Money from 66 *Monopoly* Sets to Pay Him

Yes, it really is possible to make a million dollars as a game designer. Charles Darrow was the first one to do it, with the royalties he earned from ***Monopoly***. He used the money to change careers from "unemployed salesman and inventor" to "retired game designer."

Darrow got on the road to riches by selling copies of ***Monopoly*** to friends and local department stores. His handmade sets cost \$4 each, about \$52 in 2003 dollars. At first, he could only produce two copies a day. Having a friend print up the game boards upped Darrow's production to six copies per day, which still wasn't nearly enough.

Darrow then produced 5,000 copies and sold them to department stores in Philadelphia and New York City. The success of the game caught the attention of Parker Brothers (which had rejected it earlier, one of the most famous blunders in game publishing), which bought the game and began producing it on a national level. In 1935, Parker Brothers was selling 20,000 copies of ***Monopoly*** a week, and current owner Hasbro still sells several million copies per year.

Charles Darrow wasn't a brilliant game designer or businessman. In fact, there is convincing evidence that he plagiarized the design of ***Monopoly*** from a similar game played by friends from Atlantic City. Other games similar to ***Monopoly*** have existed since 1904. So if the ideas and design of ***Monopoly*** had been around for years, why wasn't the game already famous?

The answer may lie in how the game was presented. Early versions of ***Monopoly*** presented the game as an warning of the evils of unrestrained capitalism. Darrow turned that idea around and stressed the fantasy of being a rich and powerful tycoon. Same game, new attitude. The anti-capitalist ***Monopoly*** appealed to a few Quakers scattered around New England; Darrow's fantasy appealed to millions.

They Didn't Call It T\$R for Nothing

You don't have to have a game that appeals to everyone to have a roaring success (though it helps). Case in point: ***Dungeons and Dragons***.

You already know most of the story. Wargamer Gary Gygax needed a way to reignite his friends' interest in his medieval warfare simulation. He could have worn slinky lingerie to his next play session -- putting us all in a very different hobby today -- but he added a different fantasy element: wizards who could cast fireballs and other spells. The friends were excited, the rules were tested and improved, and ***Chainmail*** and its fantasy supplement were published in 1971.

Shortly afterwards, Gygax and friend Dave Arneson began stretching the ***Chainmail*** wargame rules into new scenarios emphasizing individual characters and more fantasy elements. Developing the game and shopping it around took over two years, with Gygax deciding to publish the game himself in 1973. He, Arneson, and two other friends formed a new company named Tactical Studies Rules; ***Dungeons and Dragons*** was published in January 1974.

The game sold 1,000 copies in its first 10 months, 2,000 copies in the six months that followed, then 3,000 copies in the summer of 1975. The company's sales passed half a million dollars in 1977. By 1979, ***Dungeons & Dragons*** was selling 7,000 copies a month, and in 1980, ***Dungeons and Dragons*** hit the national spotlight. Sales exploded -- \$8.7 million in 1980, \$14 million in 1981, \$100 million in 1985.

The original ***Dungeons & Dragons*** can be best described as "cheap and ugly," and the less said about Gygax's prose style the better. Yet the game sold, sold more, and kept selling faster and faster until it broke into the mass market. Zero to \$100 million in just 11 years? That's a growth curve any tycoon could envy, and it was built on a few thousand dollars of investment.

It took a few years and some lucky breaks for ***Dungeons and Dragons*** to tip over into the mass consciousness, but ***Dungeons & Dragons*** shared a key characteristic with ***Monopoly***: from the beginning, the rate at which it sold kept accelerating. The first thousand copies of ***Dungeons & Dragons*** were the hardest to sell; after that the game was off and running.

If at First You Don't Succeed, Gamble Everything

Q: What cost \$75 to make and sold for \$15 wholesale?

A: Each of the first 1,100 copies of ***Trivial Pursuit***.

Sometimes you have to wonder if sales momentum can overcome any obstacle. The ***Trivial Pursuit*** story has such bizarre twists that nobody would believe it as fiction.

On December 15, 1979, Canadian newspapermen Chris Haney and Scott Abbott got together for a game of ***Scrabble*** and found pieces of the game missing. This somehow lead to an argument over who would be the better game designer, and a few hours later to the basic concepts of ***Trivial Pursuit***.

Over the next few months, Haney and Abbott found two more partners and a few thousand dollars in seed money, forming the Horn Abbot company in January 1980. By November 1981, they had made the first 1,100 sets of their game at a cost of \$75 per set. They had no trouble selling this test run to retailers for \$15 per game, instantly losing \$66,000.

(The retailers, in turn, sold the games at \$29.95, considered a ridiculously high price for board games at the time. It's equivalent to about \$65 in today's money.)

Encouraged by their success, Horn Abbot took ***Trivial Pursuit*** to the 1982 Toy Fairs in Montreal and New York City. They expected to sell thousands of copies; retailers shrugged, and ordered a total of 400.

I'm trying to imagine what it would be like to put in three years of effort, to have already lost most of a hundred grand, and to be looking at orders that aren't even half of your test run. I can't quite do it, but I'm pretty sure I'd given up then and there.

What did Horn Abbot do? Round up some more money to pay the bills, then print up 20,000 more copies of **Trivial Pursuit**, knowing that even if they sold every copy they'd earn barely enough to break even on the run. The only justification for this insane gamble? The knowledge that the stores who sold those 1,100 test copies wanted more.

The gamble paid off. The second run did sell out, quickly enough that Selchow and Righter got interested and took the game on for the U.S. market. They sent a direct mail campaign to the 1,800 buyers attending Toy Fair 1983, and this time the buyers paid attention. **Trivial Pursuit** became an "overnight sensation." The game sold over three million copies in 1983, and 20 million in 1984.

In a final twist to the story, Selchow and Righter was stuck with 20 million copies of **Trivial Pursuit** in its inventory when the fad crashed. The company collapsed and was sold to Coleco, which went bankrupt and was bought in 1988. Selchow and Righter also made **Scrabble**, the game with the missing pieces that inspired Haney and Abbott to try their hand at game design.

That's a long way to go for a revenge plot.

Lessons from the Big Guys . . .

As I look at these and other classic games, the same story keeps cropping up. Most of them start fast, selling as quickly as their creators can make them. They spread by word of mouth, often with little or no advertising, and after a few years hit a critical mass that garners national attention and huge sales.

Yahtzee went into commercial production because friends of the inventors demanded copies of their own, and spread when the manufacturer began holding "**Yahtzee** parties" to introduce the game to others. **Cranium** became the fastest-selling independent board game in history without spending a dime on traditional advertising. Out of the Box Games has sold over a million copies of **Apples to Apples** in five years on the strength of people playing the game with their friends. And again, we all know the tale of a little game called **Magic: the Gathering**.

Another common element is that the inventors of games usually hand off the game to someone else before it becomes truly successful. There are exceptions -- Gary Gygax and **Dungeons and Dragons**, the inventors of **Cranium** -- but Charles Darrow, Haney and Abbot, Richard Garfield and **Apples to Apples** inventor Matthew Kirby didn't taste true success until after they handed their baby over for somebody else to raise.

. . . But Do They Apply to the Small?

All this seems to work within our hobby as well as in the larger game industry. Take **Lunch Money**, designed by Charlie Wiedman and published by Atlas Games in 1996. The first print run sold out in three weeks, and it has been a best-seller for Atlas Games ever since.

Atlas Games publisher John Nephew describes **Lunch Money** as a "viral" game. "People playing the game tend to have a lot of fun -- loudly. That attracts attention and interest, leading other people to try it."

It's a trait that attracts retailers as much as it attracts customers. "One lucky bit of timing," Nephew says, "was that the weekend after it arrived in our warehouse was the Chessex Midwest Open House. Our sales manager at the time, Woody Eblom, went to the open house and packed up several extra cases of product in his trunk. He figured once people played the game, the stock that Chessex had just received would not be nearly enough."

"Sure enough, when retailers sat down and started playing the game amongst themselves, it was a hit. Chessex took every bit that Woody had brought with him (and soon ordered more), and a lot of retailers went home and started pushing the game."

Lunch Money is a little bit too edgy to make it in the mass market, which shies away at the idea of cute little girls beating each other up. However, Atlas Games has just released **Gloom**, a cheerfully melancholy card game in which

you help your Gothic family of characters suffer tragedies and untimely deaths. Will this Lemony Snicket-like mix of Edward Gorey and Charles Addams be a big hit? Nephew may know sooner rather than later.

Prescription for Success

So, how *do* you make a million dollars as a game designer? Maybe the best thing to do is to come up with (or steal) an irresistible concept, a game that makes the friends of your friends' friends demand copies of their own. Sell that to somebody else who has with enough money and savvy to manufacture it . . . and then have the good sense to let it go and get out of the way.

Now doesn't that sound easy?

Still Calling After All of These Years . . .

Keeping *Call of Cthulhu* Fresh and Interesting to Veteran Players (Without Going Mad)

by J. Edward Tremlett

It has been said that, while *Call of Cthulhu* deserves its props as the great old granddaddy of all Horror RPGs, it can get a bit long in the tooth. And that's because -- as has *also* been remarked -- the Mythos that forms the game's backdrop is both the greatest strength and greatest weakness of the game. Given enough time, the great mind-shattering mystery of the Mythos will wear thin, just like a party piece that loses its charm after a few too many applications.

Having ministered the Mythos for almost 15 years, myself, I have to agree on all counts. *Call of Cthulhu* is still a fun game to play, and run, but I've come to recognize in some veteran players a certain ennui that creeps in, over time. And it goes beyond simple burnout; such players actually get jaded on the whole Cthulhu deal, and once that's gone, so are most of their reasons for wanting to play.

Why? Well, there are as many reasons for this problem as there are players who suffer this malady. But I feel that, for many veterans of the game, it boils down to what seems a self-evident statement: The players are not their Investigators.

Players do not start out as blank slates with every game. There's nothing better than the first time you pull the curtain back and astound your players, and their Investigators, with the comic horrors that lay beyond. But with each new unfurling of that dark curtain, the piece gets a little less mind-blowing, a little less horrifying, and a little less unexpected to those players. Before you know it, even the appearance of mighty Cthulhu, Himself, is just a 1D10/1D100 SAN Loss (and a good excuse to make a new character).

Now, that doesn't mean that the tentacle party's over -- far from it. A Keeper with a dedicated and complimentary group of players can still pack in a crowd at the gaming table, in spite of this handicap. But if you want to keep the game fresh and interesting for everyone, and not just the new meat . . . er, *players*, , then you have to be very creative (and sneaky) in how you do your voodoo.

Here, then, are some ideas on how to keep veteran players down in their chairs long after they've seen R'lyeh.

The Standard Advice

Various Chaosium publications have offered up some time-tested nuggets of wisdom, such as throwing red herrings at the Investigators, and never over-using the "stock" creatures of the Mythos.

I'll second these anytime, but be very careful about Scenarios based entirely around a red herring. I find that one "gotcha" adventure can be fun, and is good enough to show the players that you're *capable* of sending their characters careening after a wild goose. But if you do it more than once, you might lose some credibility, and they'll really wonder if you're just jerking them around.

Chaosium's materials also emphasize that you should never underestimate the horror caused by mad or bad human beings, and I'll second that as well. In the real world, we didn't need the corrupting influence of the Mythos to produce awful cult leaders (Charles Manson), deranged killers (Peter Kurten), diabolical madmen (Dr. Josef Mengele), murderous tyrants ("Emperor" Bokassa), or other monsters in human shape.

Adding the Mythos can add a new dimension to the actions of such people, and create an avenue for exploring their

actions in the game. But the fact that humanity is capable of being downright evil *without* having read "Cultes des Goules" is in keeping with Lovecraft's nihilistic view of the universe. It's also about as real as it gets.

And as for keeping certain "stock" critters from being commonplace threats, I'll not only second that, too, but advise you to . . .

Keep the Big Guns Far Away

In fact, I'm starting the question the wisdom of having any of the "signature," super-bad Mythos entities show up in person at all. As much fun as it can be to say that your Investigator tangled with Yog-Sothoth, Hastur, Shub-Niggurath or the big "C," Himself, in reality there should be no way for the party to survive such an encounter with their lives *or* their sanity intact. The terrible and powerful creatures at the heart of the Mythos should blast such puny mortals to pieces, change them over into their slaves, or feed them to the masses of servitor creatures that accompany them.

As such, I'd recommend that you keep the curtain drawn really tightly on appearances from such entities. Use the *threat* of them appearing, rather than their actual appearance, as the climax of a major Campaign. And if the big nasty does indeed show up, then pick a harrowing moment to ask for everyone's character sheets, and leave them to wonder what happened.

To keep things interesting (and survivable), I recommend that all appearances of well-known Great Old Ones or Outer Gods be relatively "weak" Avatars or possessed servants. Alternatively, have their "presence" be some other strange effect that wreaks untold devastation without the God even having to appear. If you absolutely must have a Mythos Deity show up, pick one of the lesser-known, and less-powerful, ones from the ***Creature Companion***.

One of the problems with this approach is that, in all honesty, you'd have to nix the actual appearance of Nyarlathotep, too. And when you have a god with 1,000 forms, it seems absolutely criminal not to have one of them show up, at least once. All the same, I'd urge Keepers to keep this God's Avatars more felt than actually *seen*; horror often comes from what is imagined, rather than what is witnessed.

Chop Up (or Chuck) The Published Scenarios

Call of Cthulhu's published Scenarios have always been of a high standard, and still reverberate with good gruesome fun, even up to 20 years after their first printing. However, by the time you get around to running one of them, the chances are good that your ***Call of Cthulhu*** vets have already taken part in it.

Now, you could be sneaky, and use those old Scenarios as a framework for a completely different adventure. After all, it would be a shame to have those NPCs and place descriptions go to complete waste. All you'd have to do is just change the prologue and particulars around to fit another reason for the Scenario's circumstances, and away you go.

On the other hand, if reverse-engineering ***Shadows of Yog-Sothoth*** isn't your cup of tea, you could just do away with the store-bought Scenarios altogether. Save these ancient gems for groups of newer players, and let them savor the excellence of those dark and glorious treats. Meanwhile, give your veteran players brand new Scenarios of your own devising, using the published ones as inspiration, rather than an exact guide.

New Toys to Play With

One of the simplest things to do, when creating a new Scenario, is to introduce a creature that none of the players have ever dealt with before. The longer a gamer's been playing the game, the harder this becomes, but the really obscure critters, servitors, GOOs, and Outer Gods might have slipped their notice. And then there's always goodies from brand-new books they haven't gotten hold of yet, too.

This can work wonders. I had a number of players utterly and completely baffled when they encountered traces of

Xada-Hgla -- especially since their Investigators only *heard* the name ("Say The Glay?' What the hell is that?") and could not, therefore, justify a Cthulhu Mythos roll. It would be several sessions before they learned it was a terrifying Avatar of Azathoth (The ***Creature Companion***, pg. 62), and by then they were in its lair . . .

The big problem with this is obvious: You can only keep ahead of the players' learning curve for so long with brand new books, and the old ones have probably already been played out. This approach might also turn the game into the New Monster of the Month Club, not to mention severely cluttering the game, and possibly even making the Mythos a little *too* cosmopolitan.

As such, I recommend only pulling this once in a while, when you've got an entity that's just too good to pass up.

Going Beyond

The main book reminds us that, just as Lovecraft didn't only write Mythos stories, Keepers don't only have to run Mythos Scenarios. Indeed, a lot of fun can be had with situations that have absolutely *nothing* to do with the Mythos at all. Lovecraft invoked such horrors as ancestral memory gone awry, the thirst for horrible knowledge, ancient curses coming back around again, fiendish grave-robbing and horrid cannibalism. Any Keeper could exploit such sinister seeds to make a Scenario.

Meanwhile, "traditional" monsters can also exist in the ***Call of Cthulhu*** game world, if the Keeper so desires, allowing for Scenarios based around vampires, werewolves, ghosts or the walking dead. And not all magic needs to be Mythos magic, either, which leads into very nice tales of good magic gone bad, or bad magic gone straight to hell. (Allowances are made for Voodoo and African magic, but why stop there?)

Such monsters and situations can also make an amusing red herring for jaded ***Call of Cthulhu*** players. They might think that the truth behind the myth of the vampire is the star vampire, but what will they think when their investigator runs into a real, "live" bloodsucker? And what will they do when they see that not all zombies come from the Severn valley?

Change It Around

Another thing that can be done is to take established entities and situations and shake them up. By scrambling what was previously known about them, or presenting them in a brand new way, you not only gain more control over the world you want to present, but get to surprise players who thought they knew it all. At the very least it throws them for a loop.

Once, when presenting an encounter with the Hastur Mythos, I had the Investigators run into a planned production of "El Rey en Rojo," done by some dodgy artists' collective. The senior player at the table wasn't quite sure about this, as, being a Spanish speaker, it flew against her understanding ("Rojo" is red . . . but the play is 'The King in Yellow?")

But towards the end, they realized that the artist coordinating this effort suffered from some odd, mental condition. This caused the girl to see yellow as red, and red yellow, in *all* things: visual, cognitive and literary. So the King in Yellow, to her, became the King in Red, and by the time the party figured this out they were already lost in Carcosa . . .

And speaking of Hastur, we shouldn't overlook the radical reworking of the Hastur Mythos in Pagan Publishing's ***Delta Green***. By turning the Great Old One from a bloated squid into entropy, itself, heralded by the King in Yellow, the setting is given a real kick in the pants. (It also makes for some brilliant surrealist and psychological horror.)

Picking Up the Pieces

What happens if the party misses the flashpoint by a few months, or even years? You could have their Investigators

come upon a situation where the Gods have come and gone, the servitors have vacated the premises, and all that remains is the twisted human wreckage that results when ordinary humanity encounters the Mythos. Elvis has left the building, leaving dangerous echoes of himself . . .

Things can get downright bizarre, twisted, murderous, and sick when such a close call reduces the sanity of the one, the few or the many. Close encounters with the Mythos often leads to the breakdown of charismatic and/or enterprising individuals, which can lead, in turn, to the spawning of cults, serial murder, even more subtle and drastic social ills. When the society of an entire village, town, or city breaks down, there's more than enough to keep a Scenario going for ages.

And best of all, the monster that caused the mess need never be seen, much less completely identified. This may cause a problem, as some veterans will feel let down if they never actually encounter the entity responsible for the mess. However, if you keep the tension high and the suspense at a hard, steady boil, they might also feel just as vindicated by ending the mess, itself.

Fearing The Unknown

Hand-in-hand with never actually *seeing* the monster, we should remember that the menace that is only ever glimpsed is the most terrifying thing in the world. Much like the titular creatures from *Alien* and John Carpenter's remake of *The Thing*, the unseen entity could be anywhere, and could be anything, or possibly even anyone. And if the horror decreases the moment the monster is seen, then why blow its cover at all?

This approach not only keeps veteran players guessing as to what the entity could be, but also works to keep them on their toes. Each time they just miss seeing the thing responsible means another round of collecting new information, and adjusting their plans. It also keeps them from making Cthulhu Mythos rolls, as they just can't quite narrow it all down.

The most logical end for such a Scenario is for the monster to go back into hibernation, the Dreamlands, outer space, or wherever it came from. It might also move on to better pastures, rather than deal with these pesky Investigators. The party might think they've defeated it, and you can give them SAN bonuses accordingly, only to hit them with a SAN Check when the killings start up again, months or years later.

The Enemy Within

Horror doesn't just have to come from without in *Call of Cthulhu*, but also from within. The mind wasn't made to take the kind of shocks that the game provides your characters, and the game's sanity rules are an attempt to replicate what happens when someone's world gets turned upside down -- rather violently, at that.

However, those rules often get treated as just another mechanic. When your players are asking "How long before Harvey stops being afraid of fat women?" and "How many months before I can bring Joey out of the asylum?" you might get the idea that it's not sinking in. And maybe you should do something about that.

Whenever someone's character gets smacked with the bad side of a SAN Check, this is your chance to shine. Make certain that what happens to the poor Investigator fits the current circumstances -- and his state of mind -- as perfectly as possible. Take him out of the situation, and into the quiet and terrible world created by his mind, as much as possible.

In fact, if the Investigator is going to be "out of it" for a while, you might ask the player to leave the room. You can then play the Investigator yourself, and once the problem's alleviated -- if only for the moment -- the player can come back. Having to catch up in-character, and be told what he or she did while moonstruck, really drives the experience home. (An advanced option would be to have the other players in on the gag, and ask them to describe certain odd things they "do" and "say" to the character from here on out. These are, of course, hallucinations and delusions, just like the ones you will be throwing at the Investigator, yourself. However, having everyone else in on it make the

experience even more destabilizing.)

If an Investigator winds up in the asylum, then don't let them just sit there until they're "cured." Institutionalizations should be roleplayed out, rather than spoken of, in the hopes that the players really understand what's going on. This can be done in private sessions (once a month) with the players involved, or you could get the other players in on it too, roleplaying doctors, matrons, or fellow inmates. You could even have a minor Scenario take place during this "downtime," inside the mental hospital, involving these new characters. However, some veteran players might remember a certain, classic published Scenario that took place inside an asylum, and see it coming.

Hopefully the experience will drive home one of the true questions of the game. Once the Investigators are "cured," outside, and free, will they really want to risk that sanity and freedom by getting back on the same trail that brought them to madness? Will they rejoin their comrades and risk it all, or will they just retire?

And will the Mythos let them . . . ?

Tie It In

One of the reasons why Pagan Publishing's previously-mentioned ***Delta Green*** setting works so well -- other than being so good -- is that it takes the Mythos and wraps it around something fresh and new. By tapping into the *X-Files*-esque conspiracy vibe, coupled with Millennial fears, governmental intrigue, and a healthy dose of paranoia, the game hooks ***Call of Cthulhu*** up with an equally evocative setting. The resulting synergy makes for some great roleplaying, and provides a new thrill for otherwise-jaded, veteran ***Call of Cthulhu*** players.

So why not do something similar? ***Delta Green*** is definitely worth your time to try, but if they don't like it, or you don't want to run it, there are other, published options. ***The Dreamlands*** setting provides an interesting take on the game, and while it's devilishly difficult to find material for the ***Cthulhu by Gaslight*** setting, it's more than worth the effort to try. There's the new ***Dark Ages*** setting to consider, too.

Alternately, come up with your own historical setting to tie things into. Meld the Mythos with one of the World Wars, and play out a campaign where your soldiers, sailors, civvies, or spies do their investigating with the war as a backdrop. Or any other war, for that matter -- especially if you can tie the Mythos into the enemy, your own side, or both sides at once. Take them back to Renaissance Italy, pagan Rome, or the Wild West. Have them be pirates on the Spanish Main, monks in medieval France, or warriors of the last Shogunate. Base them out of Beijing, Arusha, or Abu Dhabi. Do anything, anywhere you like and at any time, as long as it's something new and exciting.

You could also take a cue from ***GURPS Cthulhupunk*** and drop the players into some fantastical, alternate-history game world, like Victorian-era steampunk, *Sky Captain*-style pulp action, or a supers campaign. However, there's a danger of overwhelming the players' sense of "the other," and making the Mythos just one part of the amazing backdrop. There's also the danger of no longer having it be "proper" ***Call of Cthulhu***, too, but such a charge is of little importance if both you and your players -- new and veteran -- are having fun. Do what pleases you, and let the game purists hang.

This might seem like a lot of work, and it is. But the payoff for you and your veteran players can be dynamite if it all goes well. Which brings us to my final suggestion: when all else fails . . .

Make It All Up

Just because it's ***Call of Cthulhu*** doesn't mean that Cthulhu has to be real. Maybe there is no Cthulhu, no Nyarlathotep, no Deep Ones, and no Dholes. Maybe there's nothing fishy in Innsmouth, the *Necronomicon* is just a cheesy "occult" paperback, and R'lyeh just a metaphor (like Atlantis, or Eutopia).

Maybe the "Mythos" -- as written by those pesky, human writers, like the gentleman from Providence -- was just their limited, human attempt to put a name to the cosmic horror that awaits us at the limits of our imagination. Maybe the

ideas still hold, but the stories were all wrong, and almost nothing is really as described. Or maybe the Lovecraft Circle were in on the game, and willfully distorting the truth for a buck and a cruel laugh . . .

So what's the truth, then? Well, that's what you get to decide, and your players and Investigators get to find out.

Completely redoing the Mythos, as published, and coming up with your own version of "the truth" may seem daunting, and it's probably the most labor-intensive solution of all. However, it may be the best route to go if your veterans can't get any satisfaction, otherwise. It will also make the game indisputably yours, and provide you with an extra degree of control over "the rules" (not that you, as Keeper, didn't have it already).

Keep in mind that you don't have to do it all at once. Start out small and work your way up, down, or sideways. Your Investigators will only uncover it one step at a time, so you only have to be one or two steps ahead of them. Introduce new elements only when they're called for, or you think the Investigators can really handle them.

And don't feel like you have to drive yourself nuts writing down every single thing, either. If your players' Investigators will most likely never live to learn the entire secret prehistory of the world, why write the whole thing down? A couple of hard facts will work wonders, and you can spiral things out from there.

Dutch Schultz

for *GURPS Fourth Edition*

by Stephen Dedman

Biography

"Dutch Schultz" was born Arthur Simon Flegenheimer in 1902, in the Bronx, and grew up in the tough Bergen and Webster Avenues section. His father abandoned the family when Arthur was 14; Flegenheimer left school and began his criminal career by holding up crap games that refused to pay a percentage to the local mobster. At seventeen, he was arrested for burglary, and caused so much trouble at the brutal Blackwell's Island prison that he was transferred to the even tougher Westhampton Farms.

After Prohibition came into effect, Flegenheimer -- now calling himself "Dutch Schultz" after a notorious 19th century gangster - became involved in the bootlegging business, driving a beer truck for Arnold Rothstein, and working alongside Charles "Lucky" Luciano (see *GURPS Who's Who 2*) as a goon for Legs Diamond. By 1928, he had intimidated most other speakeasy owners in the Bronx into buying beer exclusively from him. When one refused, he was kidnapped, hung by his thumbs by a meat hook, beaten, blinded, and ransomed for \$35,000.

When Schultz's operation expanded into Legs Diamond's territory in Manhattan, Diamond's men ambushed Schultz's partner and childhood friend Joey Noe, fatally shooting him. Schultz never found another partner he trusted as he had Noe, and when Diamond had to flee New York a year later to avoid arrest for another murder, Schultz took over his rackets. By the time Diamond had disposed of all the witnesses to the murder, Schultz had the support of the rest of the underworld, including Luciano. Soon Schultz was involved in three gang wars simultaneously -- personal wars with former employer Diamond and former employee Vincent "Mad Dog" Coll, and the Castellammarese War between New York's rival old-style Mafiosi Masseria and Maranzano, and the multi-ethnic "Seven Group" led by Luciano and Meyer Lansky. The Castellammarese War ended in victory for Luciano in 1931; Schultz's gunmen shot Coll in a phone booth in 1932; and Schultz also claimed credit when Diamond was murdered in 1931, describing him as "Just another punk caught with his hands in my pockets."

Stealing from the miserly Schultz was usually fatal. His lawyer once advised, "Don't steal a dollar from his accounts. If you do, you're dead," having seen Schultz shoot underling Jules Martin "just as casually as if he were picking his teeth." Luciano described Schultz as "one of the cheapest guys I ever knew, practically a miser. Here was a guy with a couple of million bucks and he dressed like a pig. He used to brag that he never spent more than thirty-five bucks for a suit, and it hadda have two pairs of pants. His big deal was buyin' a newspaper for two cents so he could read all about himself."

Schultz loved getting good press; he claimed to have changed his name because Flegenheimer was too long to use in a headline, and when reporter Meyer Berger described him as "a pushover for a blonde", Schultz tracked him down and demanded an apology. "What kind of language is that to use in the New York Times?", he roared. Berger apologized, possibly aware that Schultz had once beaten an armed fellow-mobster with a chair for making a joke about a girlfriend.

After Prohibition ended, much of Schultz's wealth came from the numbers racket, which he'd taken over by force in the early 1930s. His accountant, a mathematical genius named Otto "Abbadabba" Berman, worked out a formula for squeezing another \$100,000 a day out of the racket, but had to threaten to leave before Schultz agreed to raise his pay to \$10,000 a week. Schultz's gang also extorted money from restaurateurs and the waiters' union, then paid protection in turn to corrupt Tammany Hall politicians.

A change of government saw Schultz being charged with tax evasion and facing a possible 43-year sentence. In 1934,

FBI Director J. Edgar Hoover declared him Public Enemy No. 1. After trying unsuccessfully to bribe an honest cop, Schultz surrendered and spent a few weeks in jail. While out on bail, he murdered Jules Martin, was feted by socialites, talked about converting to Catholicism, and beat the rap.

After Schultz returned to New York, the syndicate leaders hastily gave him back most of his empire. Schultz contented himself with disposing of his top aide, Bo Weinberg, and began plotting to assassinate special prosecutor Thomas E. Dewey. When the syndicate voted against this proposal, Schultz stormed out the meeting angrily vowing to shoot Dewey himself. The syndicate then voted unanimously to have Schultz killed instead, despite Meyer Lansky advising Luciano that "Schultz is your cover. If Dutch is eliminated, you're gonna stand out."

Dutch Schultz was gunned down -- along with Berman and two bodyguards -- in a chop house in Newark on October 23, 1935. He died in hospital two days later. He is thought to have been responsible for 135 deaths.

Encountered

For most of his career, the miserly Schultz took little care to appear as anything other than a thug, preferring intimidation to charm or bribery. His reputation was enough to scare most people, but he was easily angered and often resorted to violence, even in social settings. (In the last two years of his life, he did enjoy a positive reputation among wealthy Connecticut socialites who he tried to charm, rather than intimidate: small group, always recognized). When encountered, Schultz will usually be accompanied by at least one armed bodyguard -- many more if he's expecting trouble (such as a group of armed PCs).

What If?

If Schultz had died at any time before 1935, it probably would have had negligible impact on history: his rackets would have simply been taken over by other mobsters. If he'd survived long enough to assassinate Dewey, however, the changes might be profound; New York would have stayed even more firmly under the syndicate's control, Luciano might never have been arrested and might have become still more powerful, and someone else would have had to run against Harry Truman in 1948.

If Schultz had been convicted of tax evasion charges (either the ones he beat, or the ones still hanging over him when he died) and gone to jail, he might have lived to make some dubious contribution to the war effort in WWII, as Luciano did. Being of German Jewish descent (though he was finally buried in a Catholic cemetery), he might have turned his talents to fighting Hitler, or helping Jews escape from the death camps. In this scenario, the PCs might meet him in jail before the war, or fight alongside him (or against him) in a WWII campaign.

If Berman had survived the gunfight at the chop house, he might have become a notable mathematician or economist, or he might simply have assisted the syndicate in squeezing more money out of gambling rackets.

Dutch Schultz (t/n Arthur Flegenheimer, aka Charles Harmon)

110 points

Born 1902; Died 1935.

Age 31; average build, blue eyes, light brown hair.

ST 11 [10]; ***DX*** 10 [0]; ***IQ*** 10 [0]; ***HT*** 12 [20]

Secondary Attributes: Dmg 1d-1/1d+1; BL 24; HP 11 [0]; Will 13 [10]; Per 10 [0]; FP 12 [0]; Basic Speed 5.5; Basic Move 5.

Advantages: Combat Reflexes [15]; Fearlessness/2 [4]; High Pain Threshold [10]; Social Regard (Feared)/4 [20]; Status +1 [free from Wealth]; Wealthy [20].

Disadvantages: Bad Temper [-10]; Bloodlust [-10]; Bully [-10]; Enemies (Rival Gangsters, 6-) [-10]; Greed [-15];

Miserliness [-10]; Reputation 4 (New Yorkers and newspaper readers; large class, sometimes recognized) [-5]; Stubbornness [-5].

For a younger or older Schultz, change his wealth, reputation, and the frequency of appearance of his enemies: this shows him at the peak of his career in 1932-33.

Quirks: Homophobia; Impulsive when drunk; Loves reading his name in the papers (mild Glory Hound disadvantage); Uncongenial; Weakness for blondes. [-5]

Skills: Administration-10 [2]; Area Knowledge (New York)-12 [4]; Brawling-12 [4]; Carpentry-10 [1]; Detect Lies-8 [1]; Driving/TL6 (Car)-10 [2], (Truck)-11 [4]; Fast-Draw (Pistol)-11 [1]; Gambling-9 [1]; Guns/TL6 (Light Automatic)-12 [4], (Pistol)-13 [8], (Shotgun)-12 [4]; Holdout-9 [1]; Interrogation-11 [4]; Intimidation-15 [12]; Knife-11 [2]; Leadership-11 [4]; Merchant-10 [2]; Pickpocket-9 [2]; Professional Skill (Bartender)-10 [2]; Streetwise-14 [16].

Languages: English (native)

Equipment: Auto Pistol, .45 (usually tucked in waistband of trousers); Cheap suit. Sometimes carries SMG, .45; Double Shotgun, 10G; or Light Club.

Pyramid Review

Paranoia XP GM's Screen & Mandatory Fun Enforcement Pack

Published by [Mongoose Publishing](#)

Written by Aaron Allston, Paul Baldowski, Jamie Brewer, Alon Elkin, Beth Fischi, Jeff Groves, Mike Hargreaves, Humza Kazmi, John Kenyon, John Spann, Allen Varney, Wesley Williams, & Paranoia-Live.Net

Forms by Beth Fischi

Layout & editing by Allen Varney

Four-panel b&w/color screen, 24-page booklet; \$14.95

When you're trying to foster a sense of fear and ignorance, ignorance and fear, what will help you in this endeavor most? A wall, of course, a way to keep all your deepest and darkest secrets from prying eyes. Your players know you're not really doing anything by the rolls, but the *Paranoia Gamemaster Screen & Mandatory Fun Enforcement Pack* will keep their accusations of die-fudging to a bare, frightened minimum.

Mongoose Publishing wasted little time getting this gem to market. Treason is everywhere, and the faster the Troubleshooters of Alpha Complex settle into that familiar groove of not knowing what's going on, the sooner they can relax. For a game that emphasizes play over rules, there are certainly plenty of rules filling up the back of the rulebook. If the GM is going to get any use out of them, he'll need this well-aligned quick reference guide to bring order to chaos (and vice versa).

You'll be floored to discover the central two panels are covered with notes on combat and how to damage things. Weapons and armor, damage codes, and hit locations all nestle together nicely. What's the only thing you need as much as combat details? Why, a way to chastise troublesome Troubleshooters, of course. The insubordination chart lists the most common infractions (should you not feel like making up a bogus charge yourself), and if their activities rise to the level of treason, the treason chart sits next to that . . . though of course that takes up an entire panel all by itself. But you knew that.

Of declining usefulness are the left-most panel items: an equipment table, a reward chart (in case you forget which game you're playing), tension levels (how dangerous or well-watched a particular area is), and the cost of backup clones. Still, you have to fill out the dead space somehow.

Another question that comes up when releasing a GM's screen: What do you put on the players' side? The old shield showed what precious few details of character creation The Computer had seen fit to dispense to RED-level operators. All such useful material has been removed. Instead, there are piles of little Computer one-liners lining the surface (like "Exactly what does the reactor core need shielding from?"), certain to keep players entertained -- at least until the GM realizes the group is having more fun reading them than playing his carefully crafted adventure and heats up those treason charts.

And since no one puts one of these things out without an accompanying booklet, it's accompanied by a booklet. An adventure? No, it's many, many adventures. Pages of mission elements allow the referee to make a bunch of die rolls that add up to . . . well, the team still probably won't get out of the briefing room alive, but at least there's a random

chart for where the briefing room is. And the missions aren't just ones assigned by The Computer; it includes your secret society and your service firm's service services.

Then come the forms, many of which are cribbed from old Paranoia sources and updated for a new era. They fall mostly into one of two camps: the before-and-after-action reports, should anyone live to tell how spiffily the mission came off or what happened to all that fancy, experimental, and in all likelihood expensive equipment assigned to the team; and the forms for requesting that you be allowed to off the offending party or parties for their various treasonous lapses.

The last two pages are an uncharacteristically generous cheat sheet telling players what they know about mutations and secret societies depending on the GM's chosen style of play. Players will be in one of two groups. The first has been playing this game for 20 years and knows all this already. The second hasn't acquired quite that tight a grip on events, and might actually find such anxiety adds to the experience. In either case, the crib notes seem like a pretty tame addition.

The booklet is about as good as any other space filler stuffed into one of these things, and the screen isn't fooling around. It's a heavy, high-gloss affair, one of the thickest ever, and it feels like it could deflect incoming small-arms fire (not that this would happen in real-life, but you run the game you're comfortable with). It's still easily folded and unfolded, and fans open neatly starting in the middle and going out in both directions (the old one more or less "rolled up" left to right).

Unless you've got a good head for all this information, or you just make it all up as you go anyway, the useful ***Paranoia Gamemaster Screen & Mandatory Fun Enforcement Pack*** (why not ***Paranoia XP*** specifically?) is going to be a necessary component for anyone plunging headlong into this strange new take on a brave old world.

--Andy Vetromile

Pyramid Review

anathema: a card game of the Salem Witch Trials

Published by [Advanced Primate Entertainment](#)

Designed by Kevin Brusky with Ray Mulford

Illustrated by Drew Tucker

52-card full color deck & 28-page English/German rulebook; \$11.95

The Salem Witchcraft Trials of the late 17th century have proved a fruitful source for games of all kinds. These include RPG scenarios such as "Wail of the Witch" for *Call of Cthulhu* (published last in *Curse of Cthulhu*); an RPG of its own, *Witch Hunt* published by StatCom Simulations Inc. in 1983; and several card games. One is also called *Witch Hunt*, published by Alien Menace; another is *anathema* from Advanced Primate Entertainment. Yet where *Witch Trial* is a humorous look at the subject, *anathema* is anything but. It also has higher production values.

The first thing that strikes you about *anathema* are the cards. Drew Tucker, giving them upon first glance a suitably somber atmosphere, paints each in rich, dark colors. The deck contains 52 cards, numbered from one to 13 and divided into four suits: Spell, Witch, Village, and Familiar. The cards also contain quotes taken from the Salem Witch Trials as well as facts about the trials and beliefs about witches at the time. These are in themselves interesting, but not pertinent to the game play, intended rather to prompt the player to further investigation -- suggested reading and a website are given in the rulebook. The small rulebook is clearly written and does a much better job of explaining the game than did the one for the publisher's other card game *Big Top: A Card game for aspiring circus owners*. Half of the rulebook is given over to the German version of the rules.

Designed for two to four players, the aim is to capture cards and be the first to score 21 points. It can also be played with four players divided into two teams in the Advanced Game. The Basic Game is based upon the card game *Casino*, with Advanced Game building on that. Neither set of rules is complicated.

After the cards are shuffled, the dealer (determined by whoever cussed or cursed the last, since "anathema" means curse) in turn deals two cards to each player, two face up on the table, and then two to himself. This is repeated until everyone has four cards and the game starts as normal with each participant taking playing down a single card on his turn. Once he has expanded his four cards, the dealer gives everyone four more cards, two at a time. This continues until all 52 cards have been played or captured.

In the Basic Game, a player can conduct a single action out of a choice of three. He can Capture face up cards on the table by matching its value or combined value with a card from his hand. Thus if he has a nine card in his hand, a player could capture any nine-valued card on the table, or cards adding to the value of nine, or both. Should he do the latter, it is possible for a player to sweep the table, and empty it of *all* cards. This is worth more during the scoring. Captured cards are placed in the player's Capture pile, while Sweeps are kept separate.

Alternatively he can Build, adding a card to one of the face up ones and increasing its value. This increased value must be equal to the value of another single card held in his hand. Finally, he can Trail a card. Like Build, this is an option if a player cannot or does not want to Capture. With Trail he simply plays a card from his hand face up on the table.

Once the last card has been played, scoring is done. These are awarded for capturing the most cards, the most cards from the Familiar suit, for each Sweep, and the value of cards without quotes, marked with a large one or two. The

game is repeated until one person scores 21 points and wins.

The Advanced Game adds two rules. The first of these are the Capture Rewards, determined by the suit of the cards. The rewards come into play when a player captures the card marked in the instructions. For example, if he captures the 5 Village suit Swap card, he has the option to swap any face up card on the table with one from his hand. The other two rewards are Peek (for capturing Witch suit cards) which lets a player look at another's hand and Steal (for capturing Spell suit cards) a card from another player's Capture pile. There are no rewards for capturing cards from the Familiar suit.

The second new rule is that players can perform multiple Builds. This is the creation of a Build containing cards that add up to the value of the multiple. Thus for a multiple six Build, all of its cards or combination must be equal to six. Again, a player must have a card in his hand that is equal in value to the multiple. Of course, there is nothing to stop another player from capturing such a Build, just as long as they hold a card equal in value to the multiple. This can be rewarding in team play, as both members work together to score points, which are combined at the end of a round.

There is no denying *anathema* is a decent game in both mechanics and appearance. The information on the cards is also interesting; however, the problem is really that they are a gloss for a set of mechanics. Gamers are likely to want something more -- wanting to explore the subject matter during play, rather than play in spite of or beside it. For this reason, *anathema* isn't a better design than the publisher's other card game, *Big Top: A Card game for aspiring circus owners*; the mechanics and game play are closer to the subject matter of *Big Top* than they are in *anathema*. Where *anathema* rises above *Big Top* is in the simple and well-explained game play. If and when Advanced Primate Entertainment find a middle ground between the two, the resulting card should be something special.

--Matthew Pook

Predictions 2005

Well, my attempts at delaying my annual prediction column until October -- when my odds of being correct are *really* good -- have been stymied by my editorial conscience, which says that all New Year's Columns must be written before the end of January. Also, all Christmas trees must be down before March 15th and stores are not permitted to put up Christmas merchandise any earlier than late August.

Anyway, I confess that this has been a much more difficult column to write than last year. There are two reasons for this. First, I'm coming to realize that the number of "big" happenings in the gaming world are pretty small, so the number of interesting predictions I can make each year is pretty small. Really, it would be a cop-out to copy and paste last year's prediction column here, even though I have reasonable hopes for over half of them.

Far more affecting is the fact that I'm not, really, an outsider anymore. Since my Day Job has changed from selling yo-yos to working for a gaming corporate mastermind, I find I can't approach the prediction biz with the same vigor I did last year. After all, if my Day-Job-self is supposed to think of ideas no one has thought of before and use them to make lots of money, while my columnist-self is supposed to think of ideas no one has thought of before to entertain the readers . . . well, there's an obvious conflict.

Fortunately, this isn't insurmountable. It just means I need to come up with predictions that I'm not planning on using to help my corporate masters, meaning you won't hear about , , or  riding inside a giant robot.

The Definitive FNORD: I suspect that companies, especially those in the upper mid-tier, are going to devote more resources to coming up with the definitive or "ultimate" takes on various subjects or products. This trend started last year; in a cycle where many companies released Pretty Darn Big Dungeon books, AEG released *The World's Biggest Dungeon*. Likewise, White Wolf didn't release simply any old GM screen for its *Vampire: The Requiem* RPG; it released the *ultimate* GM screen, a product capable of stopping bullets. (For those who haven't seen this item, it's a standard GM screen, only printed on beautiful hardcover-book stock. There was none of the usual appended "gamemaster secrets"-type booklet usually used to fill out the product.)

Anyway, I think this trend is going to continue. For one thing, it's another way the mid-level companies are going to differentiate themselves. It doesn't matter if there are a dozen time-travel games on the market; if yours is 800 pages thick, it's probably going to be perceived as the definitive choice for retailers and consumers. (Or, in other words, why would anyone buy a book called, *The World's Second-Largest Dungeon?*)

In addition, these ultimate products are an alternate way to fight retailer, distributor, and consumer resistance to carrying products. While it can be tough to convince a store to stock four \$25 products for a game line, it might be easier to get them to stock one \$100 product comprising the same material.

Origins Awards or GAMA -- Shaken, Not Stirred: Speaking as someone who's won almost as many Origins Awards as I've had years in the industry, I find myself deeply torn regarding these honors. There's an old adage about watching laws and sausage get made that definitely applies to the Origins Awards. While I've always been humbled and supremely pleased to win, I also know that there is a lot of infighting and frustration for all parties involved regarding the Awards process.

Last year also saw GAMA (the Game Manufacturers Association) with turmoil of its own, culminating in the board resignation of [Ryan Dancey](#). It's especially sad given that many industry insiders see GAMA as the closest thing the industry has to a professional organization (although how close it is depends on who is asked). GAMA is also directly tied to the Origins process, meaning that strife for either can affect the other.

As such, I suspect that there might be a major shake-up with either GAMA or the Origins Awards this year. It's one prediction I hope will be wrong, since I feel our small biz can only benefit from a strong, cohesive voice. (As a sub-prediction, I predict that there is a chance for an alternate industry award system to emerge or increase, totally separate

from GAMA; if this award system catches on with fans in any way, it could quite well supplant the Origins.)

Ultra-Snazzy Mega-Limited Bacon-Scented Hand-Sewn Slipcase! I predict that many high-profile products will be released in a limited edition format (in addition to the more common "mass market" edition). In fact, I predict these may reach an epidemic this year; while I don't think the market will fall out for them (I'm saving that one for next year), I think it will be a growing concern both for the industry and its fans as to whether or not to splurge for the \$200 mega-huge edition of a game.

"I still have those toys in my parents' garage!" I predict at least two unlikely licenses that haven't been in the gaming world before; one will be for a "cult"-type property, tapping on a 1970s or 1980s license that people remember with fond nostalgia, and the other will be of the "Oh, wow! That's cool! How did they afford *that* license?!" type. I predict one of these will be an RPG and the other a miniature or other collectible-type game, although I won't venture which is which.

With a Special Section By . . . : I predict that someone will pay for a big-name writer, artist, or personality to be materially tied to a game, beyond the realm of forwards or "supplemental" pieces (such as Neil Gaiman's ***Vampire*** story or Warren Ellis' story for ***Adventure!***). For example, a licensed game might have several of the actors film an in-character scene exclusive for the game, contained in a DVD that's bound within the product.

"Exclusive Video of the Developers Arguing about Reloading Rules": Speaking of which, I expect the DVD format to be much more common this year than any time previously. Someone will figure out that small press-run DVDs permit data or audio/video possibilities not previously possible, and run with it. Whether this means videos of creators (or more small-press movies), extensive backlist DVDs, or something else, I don't know.

And, with that, I fear my crystal ball is going fuzzy for another year. I'll see you all in 50 weeks to let you know how I did. Until then, have fun, support the companies you like, and watch out for giant robots.

Murphy's Rules

Demented and Sad, But Social: Social Characters for Antisocial Players

Part I

by Matt Riggsby

Your character: a poor fighter and indifferent scholar, but a snappy dresser, sharp wit, sly con man, friend to all, and terror of the appropriate gender, who can talk anybody into anything. The problem? You, the player, may be physically fit and intellectually formidable, but you still can't get a date and paid twice as much for your car as everybody else. A long-running problem with RPGs is that players sometimes want to play characters who are more articulate and socially capable than they are themselves. Playing a taciturn warrior or technician is relatively easy. Most games have extensive rules to deal with their relatively mechanical activities, but characters whose emphasis is on talking to people must rely on their own talking-to-people skills, which are often, alas, lacking, making it a fundamental challenge of roleplaying. This article provides advice (taken from real-world sources) for players who are considering social characters but feel limited by their own lack of social skills. With this, you can use your socially-oriented character to *get things done*, making him as effective as his heavily armed but less talkative companions.

Being Social

Why play a socially-oriented character? Admittedly, if you're braving the forces of nature or fighting mindless automatons, there's not much point. However, if you're facing intelligent opposition, you can be as effective as anybody else, if not more so. The thing to remember is this: prospective opponents will present no more resistance than they *want* to. As a social character, you can change what your opponents want. Instead of fighting the Black Knight, you can appeal to his sense of honor to let you pass. Instead of breaking into the top-secret research facility, you can convince somebody who works there to give you the access codes or, better yet, bring out the data you need.

A good way to approach playing a social character is thinking in terms of relationships. Relationships are to social characters what weapons are to combat monsters, wands and crystal balls are to wizards, and so on. People are your equipment, and they're more effective if you practice with them (charming people instantly is the realm of "cinematic" social interaction or great good luck; we'll be concentrating on getting things done by making contacts and building trust). A social character will spend time . . . well, being social: drinking with acquaintances, attending weddings and funerals, going to parties, lending a sympathetic ear to others' problems, and generally being a good or useful friend. You'll create alliances and contacts which you can take advantage of later. Think of it as building up a reservoir of trust and good will. Once you do start making unusual or extreme requests ("Say, could you pick up a kilo of highly-illegal joydust on the way home?"), your contacts be more likely to grant them.

Starting Relationships

One common problem is knowing where to start. How do you meet people? How do you build and maintain relationships? In part, this depends on where adventures are taking place. For social characters, it's usually important to establish your backstory. If you're starting out in your home territory, it's entirely reasonable for you to start with some knowledge of the people around you, even if it's only a "common knowledge" understanding. Workplaces, churches, neighborhoods, clubs and professional organizations, and other fixtures of everyday life may give you a ready-made social network. And even if they aren't particularly friendly to you, you should at least have some idea of how to approach prominent people.

But what about the more common wandering adventurer? How does a socially-oriented character establish himself in new surroundings? One thing to do is to take advantage of common backgrounds. A traveler could look for a

community of co-religionists or fellow expatriots. Minorities who share a language or religion may be happy to find a new fellow, or at least feel obligated to at least have a polite conversation with him.

If your character can't draw on existing ties, there are a few social activities which can be found just about anywhere that will give your character an opportunity to start interacting with the locals. The obvious one is drinking. Bars and taverns are centers of social activity where it's easy for one stranger to strike up a conversation with another. Tea, coffee, chocolate, or electrical brain stimulation may replace alcohol, but the function remains the same. Some establishments may have a clannish clientele, so you may have to try out a few before you find someone willing to speak to you.

Gambling is another way to meet people. Most casual gamblers will allow a stranger to join the competition if he's got money. However, if you're a better gambler than your new acquaintances, you may intentionally lose so as not to cause resentment. Certain artistic activities can be social as well. Although professional entertainers are on the low end of the social scale in many cultures, dancing, singing, and storytelling, skillfully done in a purely social context, can garner enough favorable attention to get you started.

Here are some other tips on meeting and getting along with others:

- Cultivate the ability to talk about nothing. Weather is a universally safe subject, although both you and the GM may be forgiven for hand-waving everything past "Pretty warm for this time of year, isn't it?"
- Gossip is useful, even if it isn't true. Telling stories about shared acquaintances is a remarkably common activity. Listening to someone prattle on about what Lord So-and-so did with Lady Such-and-such may not give you anything useful, but it will make you appear interested in the person talking to you. Likewise, repeating gossip yourself makes it look like you trust the person you're talking to. Just eavesdropping on others' gossip will give you some idea of who people know.
- Appearance counts. If you look like a dangerous goon, people will treat you like a dangerous goon. Usually, that means they'll be polite and will get away from you as soon as possible (or have their own dangerous goons move you away). As in real life, characters who want to impress others should dress nicely, shave or not as is appropriate, and so on. An important implication for characters in RPGs is that armor and most weapons simply aren't worn openly on a day to day basis (small knives and decorative swords are acceptable in *some* but certainly not most societies). People who do wear them are either soldiers on duty or just looking for trouble. Unless you're trying to provide some immediate, personal intimidation or are dealing with other armed men, leave all of your visible arms and armor at home.
- Don't just walk up to someone and start talking to him. Find a pretext, however minor, such as asking directions or wondering where that lovely hat came from because you want to get one like it for your sister.
- Do *not* open a conversation by soliciting military weapons, requesting the phone number of the best assassin in the city, or asking a woman of unknown repute what her price is. Criminal acts and other socially unsanctioned behavior are not things to be discussed with strangers.
- Don't spend too long with any one person, particularly someone you've just met. Too much attention may make them uncomfortable and it will certainly give you too much of a chance to say something wrong. End a conversation while it's still going well (there's always a pretext -- I can't be late to work, I have to greet my other party guests, I'm meeting my church group, etc.) and leave them, as it were, wanting more.
- Don't spend too much time talking about yourself, and keep conversation focused on the other person as much as possible. People will be more interested in talking to you if they're dealing with subjects they're interested in themselves, rather than you and your concerns, which may be alien to them. And when you talk to people repeatedly, remember as much as you can about them: birthdays, relatives, medical complaints, hobbies, and so on. If you bring these things up later ("So what did you do for your wife's birthday last week?"), you'll sound interested in that person, making you more interesting. Keep notes if you have to (writing them down after the fact, though; constantly jotting things down during a conversation gets a little creepy); salesmen, politicians, and others whose careers depend on maintaining relationships often keep files of this kind of trivial personal information on their important contacts.

Social Climbing

Cultural Differences

Many social characters don't just want to make friends. They want friends in high places. Although it's tempting to cut out the middleman and go straight to the top, it's generally a bad idea to appeal directly to emperors, CEOs, and other supremely powerful individuals. Powerful people are already very busy and have a horde of other people, who are probably just as charming as you, trying to get their attention. To reach these people, you'll have to insinuate yourself into the circles in which they move.

The general technique is to interest someone who is closer to your ultimate target than you are. You may do this by providing useful services, a source of income, or simply entertaining conversation. Once you've established a relationship with that person, you can prevail on your new friend to introduce you to people he knows, or at least use that relationship as a pretext to introduce yourself to others ("Didn't we meet at Lord So-and-so's ball last week?") and establish relationships with them as well. Depending on the social difference between you and the person you want to get close to, this can take a lot of time and effort and can turn into a "six degrees of separation" game ("Your friend the constable is the royal tinsmith's assistant's cousin, who works for the royal tinsmith, who gets commissions from the third lord of the exchequer, who works for the keeper of the purse, who reports to the king. It's foolproof!").

As if that weren't hard enough, you'll have competition. You're not the only social climber, so you may be working at cross-purposes with others, or at least competing for your target's limited time. You'll have to defend yourself from subtle social attacks intended to alienate you from your powerful friends and may need to launch a few of your own. This kind of nonviolent warfare can actually be a lot of fun if you're creative about it. The goal is not to kill your enemies, but simply to distract and embarrass them. Forge love letters to get them entangled in scandalous affairs, then expose them. Get their tailor drunk and weaken the seams on their ball gown so that it will rip and fall off should the train get caught on something. Spread appalling rumors about them; a good way to start one is to claim to have heard it from somebody else and vehemently deny it.

It is also a good idea to make friends with a number of people in new social circles you enter, not just individual rungs up the ladder. You may want to moderate your rate of climb as well. New favorites are also rarely popular with old hangers-on, and if you rise too fast, you may find yourself a target as well.

If you're pressed for time, there are some shortcuts. If you're very charming and very fortunate, even the briefest direct contact with your target can suffice to get them interested. Some campaign styles will permit and even encourage this; it worked for Cinderella. It can happen in realistic settings as well, but this kind of love-at-first-sight may only last until the target sees somebody else. Great personal achievements can lead to brief meetings with powerful figures handing out honors. If you're not hero material, you can capitalize on the successes of the hero-types in your group.

Failing that, the rich and powerful in some societies are expected to allow time for strangers to approach them. Roman patricians kept their doors open so that tradesmen could come in and offer their services. Rulers through history would periodically hold audiences where anyone (theoretically) could petition them for aid and relief, although just getting in the door might require conniving

A huge factor complicating all of this is cultural differences. What one society regards as normal and polite, another may regard as outrageously offensive, or at best incomprehensible. A punch in the head will get you arrested in our society, but it might be a casual greeting among Klingons or orcs. Consequently, just about every principle stated in this article will have at least one exception somewhere. For example, there's a caution later on about offering blatantly unrealistic prices for goods when haggling. In some cultures, it's not just accepted, it's *expected*. An English gem merchant visiting Persia in the 17th century complained about having a hard time selling his wares because he didn't initially overinflate his prices, as was the custom there. So when you encounter a new society, it's a very good idea to sit back and watch for a while. Observe how people interact with each other, how they dress, how men speak to women, how young people greet elders, how the poor deal with the rich, whether or not they make physical contact (shaking hands, hugging or kissing, etc.), and so on. And when you do start dealing with people, start with those who, as much as possible, match your own age, sex, and apparent station in life. And don't discount the value of interfering old busybodies. A peevish old man scolding you for being a foreign devil might be annoying and offensive, but he'll also give you some useful (if exaggerated) ideas about local social norms.

your way past guards doing crowd control, minor bureaucrats, and other petitioners. Powerful people in more democratic societies may make a point of appearing in public to appear more common; Cosimo de Medici, the Florentine political strongman, regularly strolled around the marketplaces in order to demonstrate that he was just another citizen. It then becomes a question of being in the right place at the right time.

One charming device used by many past societies, where communications were slow, was the letter of introduction. Such letters took the place of an in-person introduction if the author and recipient (or recipients; letters could be "to whom it may concern" and shown to many people) were far apart. One person would write a letter to a distant friend, relative, or colleague, describing the bearer and asking for his aid. The person for whom the letter was written could present himself to a recipient and be as far ahead as if he had been introduced in person. Or not, depending on the tone of the letter. Obviously, forged letters of introduction could be a PC's best friend.

Haggling

Buying things may itself be a social activity. For most of history, and in many places in the modern world, purchases are accompanied by negotiation. The idea of a fixed price for goods is relatively recent, and even now it doesn't apply to everything. Large purchases, such as vehicles and real estate, and many salaries are still subject to haggling in the western world, and in less developed regions, haggling still the standard rather than the exception. While it may not accompany all transactions (if the innkeeper says it's a copper for a pint of beer, it's a copper for a pint of beer), it's acceptable, even expected, for any transaction where the goods in question aren't necessarily identical. For example, produce and livestock will have individual flaws and merits, and so should be bought after haggling.

In theory, the process is simple. One person suggests a price for merchandise, the other makes a counteroffer, and so on until one or the other gives up or completes the purchase. In practice, this is a contest of endurance as much as it is persuasive skill. A successful haggler is usually just one who keeps at it but does so in a way that doesn't alienate potential buyers and sellers. Some tips:

Don't be silly when you make an initial offer. Most games have extensive equipment lists providing prices for common goods. Those lists are a good starting point. Unless the customer doesn't know anything about local prices or the item is of unusually high or low quality, going for a price more than 100% higher or 50% lower than list price is probably unreasonable. If you make an absurd initial offer or start making additional offers which move away from rather than closer to the counter-offer, the seller is likely to tell you to get lost so he can work with more reasonable customers. (And don't expect the final price to be exactly half-way between the initial offer and counter-offer.) There are a few exceptions, of course. Initial asking prices can be absurdly inflated where two different economies meet. For example, tourist markets sell based on what the wealthy tourists can pay, not on what it costs the poor manufacturers.

If you're selling, praise your wares' quality over similar goods sold by your competitors and allude to the high cost of producing it or obtaining it. A smart salesman will try to figure out his customers' individual needs and point out how his goods are suited to them ("This 10-foot pole is made from stronger wood than those others. It won't snap if a trap door closes on it!").

If you're buying, it's okay to point out flaws as justification for a lower price, but stop short of insulting the merchandise. It's impolite and can alienate the seller, which you want to avoid. If you spot a flaw, you may want to work the price down a bit and *then*, after the seller has made his "best case" for the quality of his merchandise, point out the flaw to force the price down farther still.

Cinematic Haggling

Fiction is full of spirited bargaining with both sides stating things in the most extreme forms possible. A seller will weep at the price he's offering but he must accept it in order to feed his ten starving children, while a buyer may counter with a lower price because the seller reminds him of his second cousin, or some such. In real life, this doesn't happen terribly often; mild whining and cajoling is the norm. However, despite the questionable realism, it's a lot more fun. If your GM is willing to get into the spirit of things, by all means call on the spirits of your ancestors to witness your foolishness at accepting such an unreasonable price.

When you hit a price that the other person is willing to accept, there may be unconscious physical cues ("tells," in gambling parlance): a slight hesitation, leaning forward interestedly, etc. If you can spot that reaction, you'll know that you're in the right ballpark even if the other person doesn't accept your offer right away. This may be sufficiently subtle that your GM will make it subject to rolls against perception abilities or bargaining skills.

If you get a good price on an item, it's usually polite to give a little on the next one. That may not matter if you'll never buy anything from this person again, but it's a very good idea if you want to establish an ongoing working relationship.

Friends get better prices than strangers. It's to your advantage to establish long-term business relationships for that reason. Remember, though, that friends may expect you to give them better prices than you offer to strangers, and your relationship may be complicated if either of you is too greedy and tries to take advantage of the situation regularly.

Knowing the merchandise and the market is key to getting a good price. If you can't tell an old horse from a young one, don't know the difference between a car's dealer invoice price and sticker price, or aren't aware of special taxes (or lack thereof) on the goods you want to buy, the seller is in a better position to defend a price that's favorable to him or sell you goods of lesser quality.

Con Games

The dark cousin of commerce is fraud, scams, and con games. Forget *The Sting*. Being a con man is a rather dismal business, which consists mostly of finding someone gullible (the "mark," in American slang) and lying ruthlessly. Con games follow a similar pattern: Get someone to trust you, have them put money or goods in a place where you can get them, take them, and run. The key task for the social character is to build the trust that will allow you to make the rest happen. These are some essential tools the con man can use to build trust (or at least stave off mistrust):

- **Appeal to greed:** You don't necessarily have to make your mark trust you absolutely. Indeed, many victims of cons have reported ongoing feelings of unease. You just have to get him to trust you enough that his expectation of benefit to himself outweighs any distrust he may have. If the mark thinks there's at least a chance of making a large profit, there's a better chance that he'll go along.
- **Time pressure:** Most people realize that something that sounds too good to be true probably is, so offers from con men don't hold up well to scrutiny. The guiding principle for con men is to keep the mark from thinking about it, usually by not giving him enough time to do so.
- **Material evidence:** Promises are all well and good, but they're not nearly so convincing as a physical demonstration of what the mark stands to gain. This may be a display of cash and goods, or making yourself appear to be as prosperous as you claim you can make your mark (for example, temporarily setting up a well-furnished office to do business in).
- **Third party assurances:** The mark is more likely to trust you if someone else can verify at least part of your story. This may require you to steer your mark towards an allegedly unrelated third party or to fabricate evidence that a truly neutral third party will find.

Ideally, the con man will subject his mark to a brief hard sell, not giving him a lot of time to think about it or confirm your story. For example, someone might approach soldiers in a war zone with a painting or piece of jewelry. He'll claim that he's a refugee and is willing to sell a family heirloom to raise money. The soldiers have little time to make a choice (the seller has to move on quickly to avoid the fighting) and little information (few front-line units have art historians or jewelers on staff), and the seller's story is at least plausible, so the soldiers' greed may come to outweigh their doubts. Selling fakes like this won't work every time, but it'll work often enough that a con man with access to old-looking trinkets or a partner capable of producing old-looking paintings could make quite a lot of money.

In most cases, though, it's difficult to get someone to trust you enough to hand over anything of significant value, so you'll have to take steps to keep the mark interested. One way of doing this is to get the mark interested in something that looks profitable and only getting him to put up some money later in the process. One such con is to "find," in conjunction with a chosen mark, an item of apparent value, such as a gold watch. The con man, out of a feigned sense of

Taking the Money and Running

In terms of measurable skills

fairness, will accept that since he and the mark found it together they share ownership as well. He will then, on consulting with an expert (a compatriot posing as a lawyer or policeman who happens to be passing by or perhaps just a randomly-dialed phone number), discover that the find must be registered for a fee with proper authorities to establish legal ownership. This may introduce an element of time pressure: the find must be registered within a certain time frame or the item must be given up. Even if it doesn't, the con man will request half of the fee from the mark but let him keep the valuable item as security (or he may suggest doing it the other way around, relying on the mark to distrust him enough to not want the item out of his sight). The mark is already expecting some profit from finding the item and is therefore more likely to try to overcome complications than if they had been apparent at the beginning. With money in hand, the con man will vanish, leaving the mark with a worthless object.

Some may recognize this pattern as similar to the "Nigerian" scam, practiced widely by email but sometimes by mail as well: An "official" of a foreign government, in an attempt to shelter millions of dollars of his country's money against vicious rebels, attempts to enlist the aid of a foreigner who can more easily deal with his own nation's more secure banks. In return, he can keep a share of the money. If the mark agrees, the official tells him that all he needs to do is open an account in the names of both the mark and the official with a certain minimum balance and send the account information back so that money can be deposited . . .

Of course, con men don't actually have to work with nothing. It only becomes a con when the con man doesn't intend to give up what he's "selling." In the gold watch scam, a particularly dexterous con man may use a real gold watch which will stand up to some scrutiny (if, for example, the mark happens to know something about watches) and use sleight of hand to retrieve it and replace it with a cheap replica at the last minute. This sort of bait-and-switch is easier if the valuable object is in a plain cover: wrapped in a handkerchief, sealed in an envelope, held in a small cardboard box, etc. All the con man needs to switch is one nondescript package for another rather than a valuable object and a convincing replica. Using an item of real value makes the social part of the con a bit easier, but requires unrelated physical skills (switching two identical objects unseen) and risks (the chance that the mark will see you making the switch).

Since it's difficult to get someone to give up thousands of dollars on your word alone, some sort of physical proof and third-party assurances are important to many high-priced scams. Unscrupulous contractors might start out using expensive materials and skilled labor but then, once they've got a few customers to point to for references, switch to using shoddy materials and unskilled workers, taking all the profits they can until the authorities move in. Pyramid schemes, fraudulent investment schemes where money from new investors is paid under the guise of profits to earlier ones (with administrators raking in a percentage), can also point to satisfied customers until the volume of new investments falls below the level needed to sustain payments to older investors. Most cons at this level must necessarily operate, at least partly and temporarily, as if they were legitimate businesses. Unlike the romanticized fiction of a con man making a single big score, really profitable cons tend to operate by building up an aura of respectability then taking as much money from as many different people as they can until legal pressure builds to an point of arrest.

and abilities, a con man PC doesn't need much more than the abilities of a successful salesman, perhaps with a little added charisma. The most important abilities he needs are rarely represented on a character sheet: an ability to lie consistently and unflinchingly, a sense of timing that tells him when it's time to go, and the good sense to stay well away from people he has conned. Many con men are caught because they stay in one place long enough for the police to catch up with them or someone they've cheated to get revenge. Cheating someone will generally burn through any good will you've accumulated and then some, which is going to seriously impair your ability to talk them into anything else.

Code of Unaris RPG

Published by [Goldleaf Games LLC](#)

Written by Gary Pratt

Cover by Eric Lofgren

Illustrated by Sedone Thongvilay, Derek Fridolfs, Peter Martin, Ray Dillon, Roxell Karr, & Socar Myles

Cartography by Eric Hotz & Daniel Schenstrom

318-page Perfect Bound Book; \$15.95

Code of Unaris is different in two ways. First is its size. At 4½ by 6½-inches it is one of the smallest of RPG books since the *Advanced Dungeons & Dragons 1st Edition* reprints. Second, as an RPG, it is not intended for tabletop play, but for online play. Unlike other RPGs designed for that purpose, *Code of Unaris* is not played on dedicated servers or software. Rather it uses online chat software as its platform, such as MSN Messenger or ICQ, meaning that it can be played by a widely dispersed group of players rather than one sat around a table in a living room.

The fact that *Code of Unaris* is played in chat rooms is integral to the setting. Unaris began as an online computer sim, like a MUD or MUSH, powered by a master AI and set on the world of Unaris, the name of the Earth's moon over a billion years ago. Its setting is the Sunset Kingdoms, during the high fantasy golden age of Unaris' Third Age. In reality, the program running *Code of Unaris* is not creating a game, but a wormhole back into humanity's long distant past! At the other end of the wormhole, an ancient immortal known as the Winter Warlock discovers the existence of the wormhole and realizes that mankind at least survived his plans to destroy Unaris. Despite the best efforts of games' designers, they could not close the wormhole and somehow the Winter Warlock escaped.

Suddenly the inhabitants of Unaris were faced by an onset of a malevolent ice age. As temperatures plummeted and glaciers spread over the sunset kingdoms, magicians worked to enact the last great creation of the Third Age. The Alfar Tower, 50 miles square and 100 tall, is civilization's last refuge, consisting of 20 levels that will each become home to a different kingdom and people from the world outside. As Unaris enters its Fourth Age, magic weakens, and the denizens of the Alfar Tower try to live as before, conducting trade and preserving knowledge of the Third Age as best they can. Meanwhile, the Winter Warlock and his multitudinous minions camp outside, campaigning to break through the tower's unnaturally tough stone walls. Some have managed to creep in, but are now trapped, working to undermine the surviving societies inside the tower. This is eased by an earthquake that rocked the tower, collapsing tunnels and blocking access between the levels and to the Great Stair that runs from top to bottom.

The two ages are the initial settings for playing *Code of Unaris*. The first is the Third Age, a rich feudal setting in on the verge of a renaissance. It is also advanced in the science of mathematics, but this has been outlawed after the formula for time travel was discovered. The second is the Fourth Age, 5,000 years later, set inside Alfar Tower and is more post-apocalyptic in nature as everyone strives to survive and rebuild once again to face threats unknown. Eventually, if a PC Mathematician can advance his knowledge of time-travel algorithms (as measured by his Calculate skill) he can travel to any period in Unaris' history. Initially he is only able to travel between the two dates in the Third and Fourth Ages.

Reflecting the fact that ***Code of Unaris*** is played online, characters are simply defined. A character has 22 common skills (such as fight, scrounge, and swim) rated at 3, and several learned skills rated at 5. These reflect a character's occupation, such as Cast (to cast spells), Heal, and, Investigate. The creation process again is simple; a player selects one of 20 templates and modifies it with six bonus points. These can be spent on skills or buying a single special ability, for example, Danger Sense or Technical Brilliance. The former gives a +2 bonus to all dodge attempts while the latter gives a +1 bonus to the fight skill. A single piece of equipment and a reputation, both of which again give a +1 bonus, finish the creation process.

Similarly the mechanics are simple. They are also diceless. To attempt an action, a player matches the appropriate skill, plus any bonuses from the situation, equipment, and special abilities against a target number set by the GM. If it exceeds the target number, the action is successful, if not, it fails. But through clever roleplaying, determining new information about an obstacle or problem, or using the correct tool, a +1 bonus can be gained which will turn a tied score (between skill and target number) into a successful action.

Combat works in a similar fashion, though with a slightly more detailed set of bonuses and penalties. Damage is equal to the amount that a combatant exceeds an opponents fight skill, modified by the damage bonus of the weaponry involved. All characters have ten points of health. Two or three blows from a sword will be enough to kill you.

Spell use is little different to this, and essentially spells can be cast by Magicians, Engineers, and Mathematicians. Where the first employs knowledge of rituals to cast, the latter two use their knowledge of science and mathematical formulae to achieve similar effects. Magic users use the Cast skill, engineers the Engineer skill, and mathematicians the Calculate skill. Some spells have been outlawed, so players will need the Forbidden Knowledge skill to learn them. Although players have plenty of spells to choose from, such as the evocatively named "Cissaro's Gravitational Manipulation" and "Rain of Fiery Doom," characters can only cast a number of spells equal to their skills.

Where ***Code of Unaris*** deviates from this simplicity is in the application of what it calls Hacks, or Story Hacks. A player starts with 20 of these and uses them to alter the in-game reality. He expends a hack to change something typed out by the GM, a word or an amount, thus:

GM: It was a dark and stormy night.

Player: Hack for a point. It was a dark and starry night.

Or

GM: Suddenly six Freyan Ice Gnomes leap down on you!

Player: Two-point hack. Make the six a two.

There are some limitations to using hacks. Some words are illegal, usually critical to the story or the setting. Further there is an in-game danger also. Hack too often and you come to the attention the Winter Warlock, who unleashes a Watch Demon upon you.

Almost two thirds of the little book is given to the setting, evenly divided between the two time periods. This includes the history, the places, the peoples, the creatures, and the organizations, many of which are nicely illustrated. The artwork is quirky, particularly the maps of the Alfar Tower. Another quirk is the color; the book is not in black and white, but pine and white!

What ***Code of Unaris*** does not include is a scenario, and intentionally so. To support ***Code of Unaris***' on-line play, its scenarios also come in electronic format. This allows the GM to copy and paste text straight into the chat window instead of typing the descriptions out. The first scenario is available to download from the publisher's website.

Part of the conceit of ***Code of Unaris*** is that players are meant to be playing themselves playing an online MUD or MUSH. This is inferred in the inclusion of the user details of many of Unaris' major NPCs. These are perhaps a little cheesy, the inference being that two US politicians play on a regular basis -- one with a thick European accent and another, having retired four years ago. Also inferred is the fact that Unaris is the ultimate mythic age, the one from

which humanity has drawn many of its names and legends.

As a chat rather than a tabletop RPG, ***Code of Unaris*** is a lighter affair. It is also a remote affair, players being present just in the chat window, so a game will take more dedication than a normal tabletop RPG. The light and diceless system makes ***Code of Unaris*** more of a storytelling game than a mechanistic game. The advice on chat play includes a handy guide to the lingo and simple advice. It suggests keeping a word document open to record notable dialog and the like. That said, ***Code of Unaris*** could be run as a tabletop RPG, preferably using a simple system.

Originally submitted as part of Wizards of the Coast's ***d20 System*** campaign contest, ***Code of Unaris*** is the third of the entries to see publication. As a storytelling game, this version is the ***d20 System's*** antonym, and proof that its setting is not dependent on mechanics. That said, the mechanics may be too simplistic for some and the concept of hacks too clumsy for others. But the setting remains both rich and interesting in itself, and the idea of being specifically designed to be played online in chat rooms is also novel.

All Wound Up! Escape from the Cemetery

Published by [Twilight Creations, Inc.](#)

Concept, design by Kerry Breitenstein & Todd A. Breitenstein

Art by Dave Aikins

Edited by Patrick Kapera & Patrick Phalen

Layout, design by Todd A. Breitenstein

boxed set with 60 cards, four windup pawns, four full-color double-sided tiles, 25 brain counters (five each of five colors), four start tokens, dealer token, and b&w rulebook; \$34.99

In their endeavor to innovate, Twilight Creations, Inc. is changing how you think about pawns. Their latest, ***All Wound Up! Escape from the Cemetery***, uses windup toys as the playing pieces, so you don't even have to move them yourself. Just set them loose . . .

The players are all dead, and to pass the time they're racing around their bone yard using their adorable clockwork ghouls. The object of the game is to be the first one to complete the circuit and reach the cemetery gate.

Players agree on a layout for the boards, which determines how the race runs. The four sections could be placed in a square to make a circle of sorts; the gate side could be placed outward so the pieces have to curve to the side once they've completed a circuit; they could be arranged in a straight line; and so on. No one places their pawn until they get to take a card action, though, and to take an action you have to "win" it by bidding cards.

Everyone gets a hand of 10 cards, and the first player passes several of his to the person on his left. That person selects the same number of cards (from his hand and those passed to him) to pass to his left, and this goes around until the first person gets the cards back. Then the process repeats, using one less card each time, until finally everyone trades one last card. You want to develop a hand that lets you win the move you want.

The cards determine how you maneuver (similar to ***RoboRally***). The Left cards let you turn your figure up to 180 degrees along the left arc, Right cards along the right. Some cards rotate enemies in unfavorable directions. To get anywhere, though, you need Wind cards (wind as in "turn," not "breeze"). Numbered one through four, these cards let you turn the key on your windup pawn that many times. Whoever bids the most of one kind of card (and Wild cards) places his pawn on the board and takes that action. Bidding continues for the various moves until everyone is out of cards, then hands are replenished to 10.

The finish line isn't the only thing you can cross. A few obstacles like open graves can hamper your movement or send you back. Brains lie all about the graveyard, and if you pass over one you get a black brain. This may be turned in during your move to wind your toy one rotation less -- if, say, Wind 4 was the only bid you could win and you're too close to the edge of the playing surface, the brain comes in handy. Each time you roll over another brain, you have a choice: get another black brain, or turn in a black brain for an "upgrade." These other colored brains provide more effects, such as altering your move, stealing cards, or improving your bid.

The boards are the graphic centerpiece for the game, and they're all rendered in glorious full color. The art is bright (insofar as a cemetery is "bright") and the design avoids a cluttered look so it's both easy to play on and easy on the eyes. The rule book is an oversized item (as big as the box the game comes in), so space isn't an issue.

The rules readily admit that there's a lot of room for error here. You're using unstable little windup toys as your pawns, and arguments could easily arise as they totter uncertainly about the boards, so make sure yours is a reasonably patient group. A few rule omissions will chafe -- since you must play "all of one kind of card," does that mean all Wind cards are the same, or are Wind 1s and 2s distinct? But the big question is: How resilient are these little novelties with their moving parts? Perhaps Twilight Creations, Inc. will sell more of these gewgaws separately as they do with ***Bag O' Zombies***, because as tough as they look, all those gears might spell trouble down the road (they're already offering to replace them by mail and at conventions).

In many ways, the game seems like more trouble than it's worth. The card deals and trades are a long way to go for a game mechanic, though that's balanced by length of play. You're really not traveling that far, so unlike ***RoboRally*** you won't be reshuffling dozens of times. There's no denying the game has an utterly delightful concept and construction, and players of all ages will find it irresistible in spite of its potential flaws. It's great for getting the family around the gaming table, and debates notwithstanding it's a fun and original way to unwind.

Pyramid Review

Monster Manual III (for Dungeons & Dragons)

Published by Wizards of the Coast

224-page four-color hardcover; \$34.95

It would be easy to be skeptical about the *Monster Manual III*. After all, this is yet another creature collection from the same group that have already produced a *Monster Manual*, *Monster Manual II*, *Fiend Folio*, *Monsters of Faerun*, and a few hundred thousand additional creature collections. How much different or better could this one be? Wouldn't it simply contain the rejects not included in previous efforts? Are they dipping into the same well too many times?

Well, yes and no. The *Monster Manual III* suffers from exactly the same problems that any added-on creature collection always suffer from. Many of the monsters are derivative or simply variations on pre-existing creatures. Additionally, there is the problem of springing these monsters into campaigns that have existed for months or years without them. Many creatures have a back story already added for them, allowing for as seamless of an addition to an ongoing campaign as possible, and virtually every creature lists where it frequently occurs in the Wizard's campaign settings of Faerun and Eberron, nice additions for players in those worlds. As is normal with Wizards of the Coast books, the art is routinely excellent, and the pages are well laid out and easy to follow.

There is a larger, deeper problem here, though. Many of the creatures listed in the *Monster Manual III* seem to suffer from having been poorly designed, poorly thought through, poorly edited, or a combination of these. Three monsters jump out as examples of these problems.

The first is the glaistig, a vampiric fey creature that lives in lakes, ponds, and rivers. Included in the description of this creature is the notation that it cannot move more than 300 yards away from its particular body of water. Should it do so, the glaistig begins suffering the effects of drowning. The problem here is that this creature is listed as a potential character race for players interested in more unusual characters or obtaining unique cohorts. What good is a character that can't travel anywhere in a game in which the central conceit includes traveling all over the world and, potentially, to other planes of existence? Either the creator or the editor missed this simple fact.

Second is the plague spewer, a large undead creature that, as its name suggests, creates plagues wherever it goes. While this is a nice idea, the creature is defined as being mindless, just like a skeleton or zombie. And yet, the creature is "always neutral evil." So, while the creature is incapable of thinking, it appears to be capable of generating willful evil. Again, either poorly planned or poorly edited.

The third, and most egregious example of the problems with this book is the voidmind template. The basic idea for the template is fascinating: mind flayers devour most (but not all) of a creature's brain and fill the empty cranial space with a greenish goo. This goo allows the creature to think and act on its own, but leaves the mind flayers in control. The four holes the mind flayer used to drag out the creature's brain are filled in, allowing the voidmind creature to infiltrate and spy on its former friends and allies. If it takes care, the creature is difficult to detect. This is all well and good, save for the fact that the voidmind creature also has *a gigantic green tentacle sprouting from its forehead!* So, they both make excellent, difficult to detect spies, and they have a giant green tentacle, which doesn't appear to be retractable, or even truly under the creature's control. There's simply no explanation for the obvious clash here.

Minor problems plague many of the other creatures in the book. The astral stalker has an attack called a "throat dart," but it is never explained if that attack is launched from the creature's throat or strikes the throat of the victim. Chraals are created when evil people die on the Elemental Plane of Air or Water, but are not considered undead; meanwhile, dust wights, which are a combination of negative energy and the Elemental Plane of Earth (and don't require anyone's

restless spirit), *are* undead. Charnel hounds are another "always evil" undead with no Intelligence score.

There are some bright spots. Most exciting for the player is the inclusion of five possible character races with no level adjustment, and another half dozen with an ECL of five or less, making for some potentially interesting character ideas. For the DM, there are several dozen creatures that make for exciting one-time encounters and perhaps another dozen more that can have an entire campaign built around them.

As expected, though, the bulk of the creatures fall somewhere in between the two extremes. Many are simply variations on existing races or ideas that have been used in one place and have been morphed to a different environment, different alignment, or different creature type.

Ultimately, the ***Monster Manual III*** is a hit-or-miss book with marginally more hits than misses. It offers very little for anyone not already running or planning to run a ***Dungeons & Dragons*** fantasy campaign, and in truth, only the true die-hard ***Dungeons & Dragons*** players will want it or find enough in it to warrant the price tag.

--Steve Honeywell

Oh No He Didn't: Dick Whittington And His Cat

"[A]t last the poor boy determined to run away from his place . . . very early in the morning on All-Hallows Day. He traveled as far as Holloway, and there sat down on a stone to consider what course he should take; but while he was thus ruminating, Bow bells . . . began to ring; and he thought their sounds addressed him in this manner:

'Turn again, Whittington

Thrice Lord Mayor of London'."

-- Andrew Lang, *The Blue Fairy Book*

Once upon a time, a poor boy named Dick Whittington left home to seek his fortune in the great city of London. He nearly starved to death before he found work of the most menial kind in the home of Mr. FitzWarren, a merchant. With the tiny amount of money he saved, he bought a cat, for companionship and to kill the rats in his garret, but harsh usage still discouraged him and he resolved to leave the city forever. But on Highgate Hill, on the way out of London with his cat, he heard the Bow bells ring out the words "Turn again, Whittington. Thrice Lord Mayor of London." He turned around and went back to the FitzWarren establishment.

When he returned, Mr. FitzWarren was outfitting a trading ship to Barbary. It was his practice that all in his employ could send something along on the voyage to invest or trade, but Dick only had his cat. "Fetch thy cat, boy, and send her," said FitzWarren, so Dick did so. In the kingdom where the ship landed, cats were unknown, and mice and rats overran the King's palace. When Dick's cat killed all the mice in the palace, the King richly rewarded the captain with chests of silver. When the ship returned, the merchant gave Dick all the proceeds from his cat's exploits, which amounted to ten times the value of the cargo, and his daughter's hand in marriage. With such wealth, and his honest pluck, Dick did indeed thrice become Lord Mayor of London. Dick and his cat lived happily ever after.

"[A]nd so out again and by water to Somerset House, but when come thither I turned back and to Southwarke-Fair, very dirty, and there saw the puppet-show of Whittington, which was pretty to see; and how that idle thing do work upon people that see it, and even myself too!"

-- Samuel Pepys, *Diary*, (Sep. 21, 1668)

That basic story, with some variations, may have appeared in English in the fifteenth century, most likely in ballad form. It doesn't seem to have surfaced in print until a [1605 play](#) (now lost), *The History of Richard Whittington, his low birth, his great fortune*. In 1611, Beaumont and Fletcher referenced it in *The Knight of the Burning Pestle*, and when the Jacobean engraver Reynold Elstracke produced an image of Richard Whittington with his hand on a skull, popular outrage forced him to re-engrave the drawing, replacing the skull with a cat.

By the later 17th century, Dick and the cat had made the transition to the puppet-stage, alongside [Mister Punch](#) and his esteemed cast members. In the 18th century, Oliver Goldsmith tried to rework the play to remove the cat, but got nowhere with it. In 1814, the greatest clown of Regency England, Joey Grimaldi, recast the Dick Whittington puppet-play as a "pantomime" (a sort of burlesque melodrama), initially playing the love interest Cecily. In 1816, Grimaldi reworked the "panto" and essayed the role of Dick himself, in *Harlequin Whittington; or, the Mayor of London*. In the pantomime version, Dick's cat gets a name, Tommy, and a nemesis, the Rat King. (Some scholars think that the Rat King entered the puppet-play in 1668 as a response to the terrors of the Plague year.) The action is generally set in Morocco, rather than some nameless Barbary kingdom. Ever since, various versions of the "Dick Whittington panto" have appeared in English theaters, even as various versions of the folktale appeared in children's books and scholarly compendia alike.

"Beneath this stone lies Wittington,

Sir Richard rightly named,

Who three times Lord Mayor served in London,

In which he ne'er was blamed.

He rose from indigence to wealth

By industry and that,

For lo! he scorned to gain by stealth

What he got by a cat."

-- supposed epitaph of Richard Whittington

There was, as it happens, an original Dick Whittington, and he was indeed thrice (plus one) Mayor of London. The historical Dick, the epitaph to the contrary, was never knighted himself, although he was the son of a knight, Sir William Whittington of Gloucestershire. He did marry Alice, daughter of Sir Ivo FitzWarren, an alderman and a big wheel in the Mercer's guild of London. He loaned money to [Richard II](#), and as a reward was appointed Mayor in 1397 after Richard had stripped the city of its liberties. (The title Lord Mayor wasn't used until 1540.) His good luck survived Richard's overthrow, however; he was elected Mayor in his own right three times, in 1398, 1406, and 1416. He remained on good terms with Henry IV and Henry V, paying much of the cost of the war in France himself. He died childless in 1423, and left his vast wealth to charity, endowing a hospital, fountains, and Newgate Prison. Nobody has any good explanation for where the cat came from. One questionable Whittington coat of arms has a cat on it; other theories postulate that Whittington made his wealth trading with North Sea ships called "cats" allude to the French *achat*, meaning "purchase."

"According to Wassaf, the island derived its name from one Kais, the son of a poor widow of Siraf (then a great port of Indian trade on the northern shore of the Gulf), who on a voyage to India, about the 10th century, made a fortune precisely as Dick Whittington did. The proceeds of the cat were invested in an establishment on this island."

-- Sir Henry Yule, footnote to the *Travels of Marco Polo*

It's more likely that Londoners, seeing the evidence of Whittington's vast wealth around them, inserted his name into the already extant story of the poor boy who makes good with a cat. This tale dates back in Europe to the *Hamburg Chronicle of Albert* of 1256, a century before Richard Whittington was even born; in the *Chronicle*, it is set in 1175 and serves as the origin story for the wealth of Venice. Other versions exist in Danish, Russian, Norse, Breton, and Icelandic folk literature. (In the Norse version, the cat sometimes wields strange supernatural powers that compel the ship captain to return the reward to the poor boy.) A typically perverse 15th-century Genoese version adds a sequel, in which a greedy merchant tries to woo the King of Barbary with rich silks and receives a cat in exchange. A version in Persia, which may be either the earliest iteration of the tale, or an adaptation of the story taken from Crusaders who brought it from Europe, puts all the work and misery on the mother, whose cat earns her shiftless sons a fortune, which they use to turn pirate.

"I am clean of mouth and clean of hands.

Therefore let it be said unto me 'Come in peace'

For I have heard that mighty Word which the spirits

Spake unto the Cat in the House of Hapt-Re."

-- Egyptian Book of the Dead, CXXV

In all of them, the cat performs his (or her) miracles off stage, in the "land without cats," be it Barbary, Morocco, India, or wherever. In the earlier versions of the tale, Dick simply sells his cat sight unseen to the King, and retires to count his money as Lord Mayor; in some versions, he doesn't have the cat with him when he hears the prophetic bells, either. Joey Grimaldi straightened that up; the Cat's return with the treasure becomes an important thematic climax, and the Cat accompanies Dick on many strange adventures in London before they make their fortune. But even in Grimaldi's tight version, the center of the story is this: a young man sends a familiar beast to a rich, inaccessible place of mystery -- an Otherworld -- from whence treasure comes to him. "Dick Whittington and His Cat" is essentially a story of magical treasure seeking given a Tudor proto-capitalist gloss.

Not only the Norse version features a strange supernatural cat. In a variant in the *Arabian Nights*, "The Tale of Abu Mohammed Hight Lazybones," the "cat" is actually a powerful, malevolent djinn who begins the story in the form of a shaved ape. Abu Mohammed brings him to heel with a magical musk and a vulture talisman; which is exotic enough, but he does so with the help of the "brothers of the white serpent." Even our old familiar Dick Whittington sometimes gets his cat not by thrift but by the mysterious actions of an [old woman](#) he meets in the street. She gives him a cat for a penny, and vanishes into the crowd.

"No doubt the dead beast was once one of that army of animals known collectively as 'the city cats.' They were the guardians of London, patrolling streets and territories down which their distant ancestors once trod on quiet paws."

-- Peter Ackroyd, *London: the Biography*

Perhaps the old woman stood on Gresham Street, named in 1845 for another man who produced fortunes out of seeming nothing, the Elizabethan financier Thomas Gresham. In Gresham's day, and in Whittington's, the street was Cateaton Street, or Cattestreet, or simply Cat Street. Other storied London cat-haunts include Drury Lane (described by Dickens as home to whole communities of felines), Clerkenwell Green and St. George's Fields (both parks marred by famous riots), and [Whitechapel](#) Lane, where "an ancient whore" was often seen feeding cats meat from a basket in the late 19th century. Could that be the same old woman who sold the cat to Dick Whittington for a silver penny -- in exchange for his future? Or London's? The cat is the symbol not only of Bast, the enigmatic Egyptian goddess, but of Freya (whose cats, like those in the Finnish *Kalevala*, draw a chariot to the Otherworld), [Diana](#) . . . and [Hecate](#). What bargain did Hecate cut with Dick Whittington, to show him the [gold paving the streets](#) of secret London?

In this context it's intriguing to note that another theory exists claiming the Gloucester Whittington is an imposter. In this version, the real Dick Whittington was apparently a lad from The Newnes, a hamlet near Whittington in Shropshire. He was sent to London by Roger de Hampton, a vicar of the Knights Hospitaller. And where, prithee, did the Hospitallers have their London priory? Why, Clerkenwell Green, haunt of cats and conspirators since the Middle Ages. The paw-prints of Dick Whittington are still here, if you know where to look. The statue of his cat on the front of Newgate Prison is gone, but a feline monument (Whittington Stone) still graces Highgate, where Samuel Taylor Coleridge and William Blake each in their own way also journeyed to the Otherworld. Is there a connection to the dark entity with ["glowing red eyes"](#) seen in Highgate Cemetery? Does Dick Whittington's cat still guard the gateway from the "brothers of the white serpent"? (Ra, should you be interested, takes the form of a cat to kill the serpent Apep in some late Egyptian art.) Was this part of the deal that Hecate struck with the Knights Hospitaller?

One last note, one last journey into Barbary, before the end. Richard Whittington, four times Mayor of London, was buried in St. Michael Paternoster Royal church, which he had rebuilt in 1409. It was destroyed in the Great Fire (the one that balked King Rat's plague, just before Dick Whittington's puppet shows began) and rebuilt in 1686-1694 by the Masonic architect Sir Christopher Wren. (At this time, Wren added statues of Moses and Aaron -- defeaters of Pharaoh's serpents.) Damaged in the Blitz, the church was slated for reconstruction in 1949. The workman did not discover the grave of Dick Whittington, as had been thought. But he did find, sealed in a passage under the roof, a mummified cat. Oh, yes he did!

Making a Scene (Into an RPG)

One of the interesting articles from *Star Wars Gamer #1* was "Duel of the Fates."

Side notes: This magazine was, as the name implies, a magazine devoted to various games based on the *Star Wars* brand: RPGs, video games, card games, and so on. My use of the word "was," is, as the past tense implies, chosen because of the publication's past-tense status. This is a shame, since it was a good magazine. On the other hand, its mandate may have had a hard time finding an audience, in much the same way a magazine devoted to professional football, football video games, **Blood Bowl**, hacky sacks, and that game you play with the folded triangle "football" may face an uphill battle.

Anyway, "Duel of the Fates." This article describes the climactic battle in *Star Wars Episode I: The Phantom Menace* between Qui-Gon Jinn, Obi-Wan Kenobi, and Darth Mung in terms of the **Star Wars Roleplaying Game**. In doing so, it breaks down the action into rounds, describing what techniques and rolls the "players" were getting.

This article was far from perfect; for example, it assumes that a well-trained Sith Lord drops out of combat rounds in order to . . . um . . . gloat?, thus giving Obi-Wan a chance to get a surprise action and turn the tide. (This ranks up there with someone playing a thief saying, "I point behind my foe, and when he turns around to see who I'm pointing at, I'll backstab him in a surprise action.") On the other hand, it's really no more silly than the source; for all I know, the movie's script was written in terms of game stats.

However, the basic premise of the article – and the basic premise of this column, finally presented a mere third into it – is that we can learn something by trying to break down cinematic moments into gaming terms.

I suspect many gamers are seeking to recreate – or, more fairly, create whole-cloth – the feeling we get when watching an exciting movie or television series or reading a riveting book or comic. To that end, there are many techniques games use to bring a more "cinematic" feel to them, including combat options, "hero points" or similar game-altering bits, and open-ended systems that allow for extreme results.

So it's only fitting to work backwards sometimes and see if the action in these media can be translated into game terms; The results can be interesting, and may lead to better gaming all around.

Side notes two: The phenomenon of translating between media and games was also brought to the forefront of my mind during a discussion on the *Pyramid* discussion boards about gaming novels from a month or two ago. A few people commented on books where, at one extreme, one could see the item-by-item breakdown of gaming terms within it ("A-ha! This must be when the protagonist went up a level and got the special abilities from the *Player's Handbook!*"), and at the other extreme where people accomplish things within a book that are utterly impossible within a game . . . especially in novels supposedly based on a game. Soooo . . . thanks, yet again, to my peeps at sjgames.pyramid. You're the best.

Anyway, I humbly propose a few things to consider when comparing on-screen and in-game actions and possibilities.

Is the action feasible? Is it possible to recreate the action of the book/movie/whatever at all using the game system? In books it's sometimes possible for a fledgling wizard to down a giant dragon with one minor bolt of flame, but in most RPGs it just can't happen.

These situations are a double-edged sword for RPGs. On the one hand, these kind of "extreme" situations are often the most satisfying aspect of the medium – someone using their abilities to do something they ever thought of, or succeeding in a way that just isn't possible. On the other hand, making these abilities even within the bounds of feasibility can wreak havoc on a game system; if it's possible for a dragon to be killed by a minor bolt, how can any encounter with a dragon in the future hold any weight?

What can be done if an action isn't feasible? Well, it might be possible to tweak the system to allow really outside-

the-box solutions . . . but make them very difficult. For example, the 1980's **Marvel Super-Heroes Advanced Edition RPG** introduced the idea of "power stunts." Basically, characters can use their powers to do things they've never done before, but that fit within the broad framework of their powers. For example, the first time Spider-Man used his webbing to make a glider and "fly," that was a power stunt; before then, he'd only used his webbing to swing around town and entangle folks. This system worked surprisingly well, since it required the player to spend a lot of Karma (the game's combination experience points and die-roll modifiers); thus it became a type of on-the-fly character enhancement. The first time the character used a power stunt it was very difficult; a few times later it's easier, and eventually it becomes part of his repertoire. This prohibitive cost keeps players from thinking up cockamamie solutions all the time, while permitting them the framework to "bend" the rules when it's necessary.

Is the action likely? Just because it's technically possible for the rules to support an action, that doesn't mean it's ever likely to come up in a campaign. For example, in a game with open-ended damage (where, say, you get to reroll a six-sider if it rolls a six the first time), it may be possible for that 1D6 fire bolt to kill the 200-hit-point dragon in one blow. The only problem is, it'd be about a one in 57,302,359,991,614,086,367,621,939 chance. These aren't the kind of odds you'd want to base a campaign around, since, assuming a weekly game, you'd need to play approximately one septillion millennia for this event to occur naturally. (In discussions on *Pyramid* newsgroups, I'm only aware of three groups that've been gaming that long.)

In general, the more "convergence" that's required from various oddball rules, lucky (or unlucky) rolls, and *just* the right choices, the less likely the outcome is. On the other hand, sometimes "likely" actions are incredibly possible, and just rely on existing rules to be exploited creatively. (For example, it was an amazing day when my **Vampire: The Dark Ages** telekinetic discovered that, despite puny stature and weak strength, she was more than able to lift foes into the air and drop them from amazing heights for damage. And it would've made a good scene in a movie, too.)

Is it possible to recreate the action? If it's been determined that the action is both possible and within the realm of mathematical feasibility, the next question is can a gaming group recreate that action. This is most often possible in systems that allow extensive creativity in their meta-gaming rules. For example, **Torg** and **Masterbook** are designed around a card system that allows and even encourages players to hoard cards and play for the dramatic moment, where bonus after bonus can be stacked. This, coupled with a logarithmic scale, permit truly incredible cinematic events in those systems.

A excellent example of how it can be possible to recreate cinematic actions in a game can be found in Chad Underkoffler's ["Cinematic Points!: GURPS Rules for Cinematic Play"](#) article.

Do the rules which allow this recreation create additional problems? Finally, if existing rules are creatively exploited or added to achieve a cinematic end, do they introduce more problems than they solve?

A good example can be found with the old **Star Wars RPG**. That system wanted to allow people to tap "the Force" and achieve cinematic effects such as – hypothetically speaking – blowing up your average Death Star. The system they came up with allowed a player to double the number of dice he rolled for one action; thus someone who would get, say, 4D6 in Death Star Up-Blowing would find themselves rolling eight dice if they take advantage of this rule. Death Star techies go boom!

Of course, no doubt an early design problem was trying to make sure this couldn't be abused. For example, if someone could do it whenever they wanted, then many plots could be derailed early on. (For example, if Han Solo suddenly got to roll a jillion dice to shoot Darth Vader, the whole "Dinner with Lando" scene might have gone differently.) Even limiting this to once an adventure could still be problematic. Fortunately, the designers were able to keep the burst of greatness contained by the idea of Force Points; these points can be spent whenever the player wants, but they can only be regained if used to greatly serve the greater good. In fact, if they're used for purely selfish reasons, the player would get a Dark Side Point instead, which isn't good.

As a counter-example, the original Mayfair **DC Heroes** RPG had about 975 iterations of gadgeteering rules. Each time something was added to allow something seen in the comics (such as those universal "could be anything" gadgets Batman pulls out of his belt), something else would break (such as a fork that can only be used once and costs \$50,000). Trying to permit players to perform feats like the comics either enabled them to do things that *weren't* in the

comics ("Fortunately I have a Magic Detector in my utility belt!") or made them so costly that no one would ever use those rules to emulate the comics.

The best cinematic rules simultaneously explain why certain scenes play out the way they do *and* explain why other scenes aren't broken.

- How does Spider-Man make strange things out of webbing such as hang gliders, shields, and skis? By doing a "power stunt." Why doesn't he do it more often? Because it's expensive to do a power stunt; it's a good "out" if he's in a pinch, but it's not a first resort.
- How does Lando blow up the Death Star without being a miraculous pilot the rest of the time? By using a Force Point. Why isn't he able to accomplish incredible feats the rest of the time? Because he doesn't want to squander a Force Point nor risk gaining a Dark Side Point.
- How does [Voltron](#) save the day? With its awesome Blazing Sword attack. Why doesn't Voltron use its Blazing Sword in the first eight second of combat? Maybe its power needs to [charge](#) in battle.

And so on.

Turning a keen eye back and forth between favored media and RPGs can spark new ideas and ways of looking at both, making scenes on both sides of the equations better. As ever, it can be good to take the scenic route.

--*Steven Marsh*

White Ships and Black Hearts

Setting Green Ronin's Freeport in H.P. Lovecraft's Dreamlands

by Tim Emrick

"More than ever Kuranos wished to sail in a galley to the far places of which he had heard so many strange tales . . ."
-- H.P. Lovecraft, "Celephais"

One of the strengths of Green Ronin's Freeport line is its generic treatment of the gods and other background details, while still making the city a vibrant, living, memorable place to adventure. This policy allows DMs to incorporate Freeport into their existing campaigns with minimal effort. To that end, a new home would be an easy fit: the dream-world created by H.P. Lovecraft.

Unlike most of his modern-day stories, Lovecraft's dream-tales portray just the sort of highly magical world that fits the heroic style of the standard **d20 System** fantasy setting -- with a few dark twists. These stories are full of epic quests, marvelous magic, fantastic monsters, ineffable gods, and curious wanderers delving into Things Man Was Not Meant to Know.

From its birth, the Freeport line has incorporated a number of elements drawn from Lovecraft's work (most notably Yig), as well as the weird tales of Clark Ashton Smith (the serpent people) and Robert W. Chambers (the Yellow Sign). Why not raise the "Cthulhu Mythos" quotient even further? Add in more evil cultists, weird alien races, and -- especially for the pirates -- priceless treasures that just happen to drive you insane.

For the Freeport half of this mix, you will need ***Death in Freeport*** (for the serpent people) and ***Freeport: The City of Adventure*** (for an overview of the city). For the rest of the world, you will want a collection of Lovecraft's dream stories, ***The Complete Dreamlands*** (for ***Call of Cthulhu***), or both. The bibliography at the end of this article lists additional resources.

Where is Freeport?

According to ***Freeport: The City of Adventure***, Freeport is on a semi-tropical island in the Serpent's Teeth, located some distance from the mainland. These islands are fragments of ancient Valossa, so should not be located in a region that has been settled for more than a millennium. Freeport should be about two weeks' sail from the nearest major city, such as Celephais, Hlanith, or Baharna. If you use the map in ***The Complete Dreamlands***, any of the small archipelagos in the Southern Sea would be suitable.

While equating Freeport with Dylath-Leen may be tempting, that city seems a bit too unrelentingly sinister, even for Freeport -- and it is on the mainland.

Races and Classes in the Dreamlands

The Dreamlands are vast, and relatively few of its peoples have been described. This gives the DM a lot of freedom in placing the standard player races, monster races, and any new creatures he wishes to include. DMs who wish to preserve some sense of "canon" may wish to limit the number of nonhumans appearing within the better-documented realms such as Ulthar and Celephais. (Note, however, that goblins are known to live in the Enchanted Wood, and that halflings can be used to represent the pygmies of the Jungles of Kled.)

Freeport: City of Adventure suggests that kuo-toa, orcs, and lizardfolk dwell somewhere south of the Serpent's Teeth, while ***Black Sails Over Freeport*** assumes that human barbarians ("northerners") and elves live in close proximity on

the mainland.

All of the standard **d20 System** classes can be found in the Dreamlands. However, barbarians and monks will almost never be native to Freeport, often coming from distant lands that are exotic even by Dreamlands standards.

Of the standard **d20 System** prestige classes, the arcane trickster, assassin, eldritch knight, horizon walker, loremaster, and mystic theurge have the best precedents in the stories of Lovecraft and Smith. Of course, the new prestige classes appearing in *Freeport: City of Adventure* and *Tales of Freeport* are excellent choices for campaigns set there.

Languages in the Dreamlands

The dream-world has the strange property that nearly all humans speak the same language. This idea fits nicely with the game convention of a "common tongue" -- simply assign Common to the player races as normal. Men from Inquanok, Leng, and Lomar (all in the far north) have their own native languages, however, and must learn Common as a bonus language or through the Speak Language skill.

Besides the basic languages of the **d20 System**, others unique to the Dreamlands are available. These include the languages of ghouls, serpent people (Valossan), and zoogs, and the supposedly dead languages of Aklo and Hyperborean.

The Gods of Freeport

Most humans worship the Great Ones, a pantheon of human-like and more-or-less benign deities. This family of gods is large and diverse, allowing the DM to invent a new one for any needed niche. (Classical mythology is a good source of inspiration here, but follow Lovecraft's lead and borrow only the more obscure gods, such as Hypnos.) Clerics in smaller communities might serve the pantheon as a whole, rather than a single god; these can choose from nearly any alignment and domain. However, such generalists are rare in cities the size of Freeport.

The Dreamlands are also home to several Elder Gods (Bast, Nodens), Great Old Ones (Bokrug, Yig), minor local deities (Oukranos), and malevolent, alien Outer Gods (the Unspeakable One, the Crawling Chaos).

Some nonhumans will have racial gods (Yig for serpent people, Krom for orcs), while others worship a variety of gods based on the main concerns of their race, tribe, or profession.

According to *Freeport: The City of Adventure*, the four most popular gods locally are those of Knowledge, Warriors, the Sea, and Pirates. As good matches, the God of Knowledge can be with Nasht, the God of Warriors with N'tse-Kaambl, and the Sea God with Nodens. The Dreamlands has no convenient Pirate God, but *Black Sails Over Freeport* has provided new information on this deity; in Dreamlands terms, Harrimast is probably an Elder God.

For DMs who own *The Complete Dreamlands*, some additional suggestions for identifying generic gods mentioned in Freeport products include: Death (Zo-Kalar), Justice/Retribution/Sun (Ariel), Magic (Tamash), and Murder (Hagarg Ryonis).

Monsters of Nightmare

The *Call of Cthulhu d20 RPG* includes several creatures found in the Dreamlands, including the dhole, formless spawn, ghoul, gug, nightgaunt, Servitor of the Outer Gods, and spider of Leng. In addition, Freeport has its own version of serpent people, and the Yithians are alluded to in *Death in Freeport*.

The Dreamlands are also home to several monsters found in the standard **d20 System**, including the basilisk, goblin, mantichore, and several mundane animals. For the following Dreamlands monsters, the **d20 System** monsters in parentheses will serve as good approximations:

- boltworm (behir)
- butterfly-dragon (pseudodragon)
- cat from Saturn (displacer beast)
- cloudbeast (advanced belker)
- fireworm (thoqqua)
- gnorri (merfolk or triton)
- Ib-being (kuo-toa)
- nightrider (dire bat)
- razortongue (shocker lizard)
- shade (shadow)
- slime mold (various oozes)
- voonith (giant constrictor snake)
- zebra (pony)

Many other monsters will fit the spirit of a Dreamlands game, particularly those of the aberration type.

Note that horses do not appear in Lovecraft's dream-tales; zebras, camels, and yaks are used instead. Either substitute those animals, or ignore the omission and have horses available normally.

Cats in the Dreamlands are far more intelligent than their "waking world" counterparts (Int, Wis, Cha each 3d6), and have a true language that can only be understood by other cats and certain gifted ailurophiles. They can advance in NPC classes, and should be treated as magical beasts. The DM can either endow all cats with this higher awareness, or treat these as a special subrace. Cats will recognize other magical felines (such as familiars and animal companions) for what they are, and will react to them based on their reaction to the companion's master.

Cat Friend [General Feat]

You love cats, and have become a trusted friend of the species.

Prerequisites: Cha 13+, non-evil alignment, must have saved a cat's life at personal risk.

Benefits: You may speak with cats (as the *Speak with Animals* spell, at will), and have a +2 circumstance bonus to all Charisma checks and Charisma-based skill checks (including wild empathy) against cats. Cats within 30 feet who can see or hear you gain a +1 morale bonus to all saving throws, and an additional +1 against fear effects. If you have the Leadership feat, you may attract cat followers.

Dreaming of Adventure

The Dreamlands are a highly magical fantasy realm, with all the usual adventures that implies. To capture the unique flavor of these realms, emphasize the bizarre and fantastic elements, and make sure that magic and other esoteric lore is frequently dangerous to its user. Some adventure ideas include:

- A talking cat approaches a druid or ranger character, and asks for help in repelling attacks by zoogs or cats from Saturn. This mission might involve merely crossing a city or a kingdom, or a trip to the Moon with an army of cats.
- An oddly-dressed visitor claims that certain lands of myth and fable are real places, and is hiring a crew to find them. The stranger attracts attention from both mercenary treasure-seekers and unsavory sorts who prey on the gullible.
- A band of dark-skinned wanderers passes through town. They worship strange animal-headed gods, which incites paranoia among townsfolk (and the authorities) about a dangerous new cult. The travelers are peaceful, but can unleash powerful curses if molested.
- The Freeport Opera House plans a new production. All previous attempts to stage this obscure play have ended in tragedy, and the superstitious actors take every minor problem during rehearsals as a dire omen. Unknown to

the managers, the play truly is cursed, and will invoke a horrible doom if completed.

See the Bibliography below for some published adventures appropriate to the Dreamlands.

Other Worlds: Beyond the Dreamlands

DMs who wish to limit the scope of their campaign to one plane, with occasional elemental and outsider visitors, can simply treat the Dreamlands as any other Prime Material Plane within the standard **d20 System** Cosmology. (*Hell in Freeport*, for instance, assumes this generic structure.) However, some DMs may wish to explore the implications inherent in adventuring in a dream-realm.

Most creatures (including the player characters) will be natives to the Dreamlands, and unable to travel to other dimensions without the help of magic. Others will be from a dimension that they think of as "the waking world," and travel to this one through dreams. These "dreamer" characters normally seem to be just like any other people, though often ignorant of local customs and languages, and prone to mention people, places, and technology that do not exist in this world. Most dreamers start in an NPC class, and many will simply blend into the general populace, never distinguishing themselves. Others can manipulate dream-stuff to some extent, acquire levels in PC classes, and become great heroes of legend.

Awaken from Nightmare (Sp): Most dreamers have the ability to leave the Dreamlands through an act of will, and re-enter them during a future night's sleep. This is a spell-like ability that requires a standard action and a Concentration check (DC 15, or 20 if "casting" defensively). If successful, the dreamer fades away, returning to his native plane, and cannot reenter the Dreamlands for at least d% days (Dreamlands time). The dreamer also loses one level, representing the rapid fading of memories upon awakening; for this reason, experienced travelers avoid using this "escape route" except in dire need. *Dimensional anchor* and similar spells will prevent the use of this power within the area of effect. A dreamer whose "waking world" body dies while dreaming can no longer Awaken from Nightmare, and must live out the remainder of his life in the Dreamlands.

Powder and Print: Technology in the Dreamlands

According to *The Complete Dreamlands*, the world of dream resists technological progress, lagging behind the "waking world" by about five centuries. From a point-of-view of a typical *Call of Cthulhu* game (1920s or 1990s-2000s), this means that firearms and printing presses are just starting to appear in the Dreamlands.

Freeport assumes an early Renaissance tech level, with the advanced sailing ships, lighter weapons and armor, and flintlock weapons that are associated with the Age of Piracy. Here is quick overview of available technology that is more advanced than the usual "medieval" standard of **d20 System**:

Armor & Weapons: At sea, the weight of armor is a liability, and all but the lightest gear is a sure invitation to drowning. Reducing physical protection means that successful fighting styles depend on speed and mobility. Offhand weapons replace bulky shields, and the rapier and cutlass replace heavier blades. These preferences carry over onto land, where bulky arms and armor often attract more unwanted attention than they keep away. The hand crossbow and repeating crossbow are available, though still exotic.

Firearms: Ever since *Freeport: The City of Adventure* introduced optional firearms rules, new Freeport products have assumed their presence. These weapons were only invented a few years ago, so are still rare and expensive. The DM's choice here is no different in the Dreamlands than in any other setting: use firearms if you want them; ignore them if you don't.

The Printed Word: Printing presses have been available for a few generations. The presses themselves remain rare and costly, but their products have become affordable to the common man. Broadsheets (newspapers and public notices) cost only a few coppers each, while the cheapest books begin at a few gold. Works with fancy type or illustrations remain expensive, largely due to the time required to set the type, engrave the image plates, and bind the

finished book in a cover worthy of the content. (Note that scribes remain in high demand for copying books that have limited audiences and thus never see a press.)

Sewers: Renaissance cities are more populous than medieval ones, so sanitation becomes even more critical. In many cities (including Freeport), elaborate sewer systems are the answer. The city often remains just as grubby as it was a few centuries before, but without the sewers, the increased population would soon drown in filth -- if a plague didn't wipe it out first.

Ships & Navigation: Sailing ships are becoming quite advanced, and can stay at sea for months. Navigation aids such as the sextant, compass, and accurate sea charts are now common (though still costly). Clockwork devices are sophisticated enough to provide accurate time-keeping, and provide an attractive option for spellcasters who enchant constructs.

Conclusion: Mal Voyage!

The heart of Lovecraft's work is the gradual discovery of horrible ancient truths underlying the present. The sea and its creatures embody this theme in an elemental way -- even the saltiest sailor has had only glimpses of what lies hidden below. Where better to face these horrors than Freeport, which was built on dark deeds that remain unfathomed? Pray to Harrimast, but keep your cutlass handy!

Bibliography: Forbidden Lore

Fiction

- *The Dream-Quest of Unknown Kadath*, by H.P. Lovecraft: His only novel-length dream-tale. See also his short stories "The Cats of Ulthar," "Celephais," "The Doom That Came to Sarnath," "The Other Gods," "The Quest of Iranon," and "The White Ship". (These were most recently reprinted in Ballantine's *The Dream-Cycle of H.P. Lovecraft*.)
- *The House of the Worm*, by Gary Myers: A collection of stories set in Lovecraft's dream-world.
- *Hyperborea*, by Clark Ashton Smith: A collection of tales; "The Seven Geases" features the serpent people.

RPGs

- ***Freeport: The City of Adventure*** (Green Ronin, for ***d20 System***): The main sourcebook for all things Freeport.
- ***Death in Freeport*, *Terror in Freeport*, and *Madness in Freeport*** (Green Ronin, for ***d20***): The classic "Freeport Trilogy" of pirates and unspeakable cults.
- ***Call of Cthulhu d20 RPG*** (Wizards of the Coast): See the "Lovecraftian D&D Appendix" about using this material in Freeport (or other ***d20 System*** fantasy settings).
- ***The Complete Dreamlands*** (Chaosium, for ***Call of Cthulhu***): A vast store of information on Lovecraft's dream-world as well as the embroiderings upon it by other writers. The adventure "Lemon Sails" is especially well-suited to Freeport.

Web Resources

- [Green Ronin Publishing](#): Several free online resources, including "Focus on Freeport" and a forum devoted to the setting.
- [DnDChick's Dreamlands d20 System Page](#): Erica Balsley's conversions of ***Call of Cthulhu*** creatures to ***d20 System***
- [Tim's d20 System Errata & Notes](#): This website devoted to commentary about Freeport, Cthulhu, and selected other ***d20 System*** products.
- ["The Masters of Space and Time"](#) and ["The Children of Yig"](#) by Shannon Appel: Articles on the Yithians and serpent people, reprinted from *Starry Wisdom* magazine.

- ["The Green Box: An Out of Body Experience,"](#) by Dennis Detwiler and Mike Mearls (*d20 Weekly*, October 9, 2002): A template for Yithians possessing human bodies.

Icosahedron Adventures: The Out-of-Towners I: Angel's Harbor

Ally NPC Seeds for Modern Games

by Owen K.C. Stephens

As a companion piece to "[Rogues Gallery I: Angel's Harbor](#)," this article presents a number of allies for use in modern or near modern pulp/street hero genre **d20 System** games. Like the rogue's gallery article, these are not fully written NPCs, but rather descriptions followed by a few rule mechanics to give them a unique flavor. Rather than have the rules mechanics be random exceptions to the normal rules (as was done in last month's article), these NPCs are presented as having one or more edges.

Edges are feats that are somewhat more powerful than the standard, but not so off scale as to ruin a campaign. Most games with edges limit characters to a set number. This may be no more than one edge per character, or not more than one edge per five character levels. A GM can use edges to build pulp/superhero-appropriate prestige classes, or simply have a Pulp Hero core class that grants a bonus feat or edge every three levels. Different methods are best for different campaigns, and most GMs can tell at a glance if they wish to allow edges, and if so how common they wish them to be.

El Grande

El Grande is a Mexican masked wrestler and hero. For more than 20 years, he has been both a defender of the common man and an iconic hero found in movies, comics and stage shows throughout Mexico and Central America. Dressed in his full face mask and caped costume of green, red, black, and white, El Grande manages to be a professional wrestler, pop culture icon, and actual functioning hero. He is also spokesman for the El Grande Foundation, a charitable organization that takes money he makes from movies, wrestling pay-per-view, and merchandising, and uses it to help sick and poor children in Mexico. So dedicated is El Grande to this cause, he insists all movies starring him are made as cheaply as possible, to ensure more money goes to the Foundation.

Outside of Mexico, most people believe El Grande is simply an actor, with a slowly increasing presence in America as he does occasional Mc Burger commercials and guest appearances on dying sit-coms. In truth, El Grande is a hero who, along with occasional companions, faces threats both mundane and supernatural wherever they appear in Mexico. He is best used either as local color if PCs travel to Mexico, or as a visiting hero following a case from his homeland to the PCs' stomping grounds. Either way, El grande is thrilled to work with other adventurers . . . but only on his rather cinematic terms.

Physically, El Grande is big. Really big. He stands seven feet two inches tall and weighs 400 pounds. Though he makes pains not to reveal it, his physique shows signs of the 20 years of adventuring he's put it through. He now dyes the hair on his arms, which have turned gray. His wide belt, once just protection, now holds back a slowly growing gut. Scars criss-cross his body, and often ache in cold weather, and his trick knee actually allows him to predict precipitation an hour or so before it falls.

However, he is still extremely strong and tough, and more than a match for any normal man; he still possesses excellent combat skills, especially in holds and locks. As the man himself will bombastically declare, "Nobody escapes the grasp of El Grande!" As over-the-top as the claim may seem, to date it has been accurate. Large, strong and skilled in decades of wrestling satanic robots and Aztec mummy were-jaguars, El Grande has successfully defeated any foe he's managed to grapple. Of course most of his enemies are aware of this, and go to great lengths to stay away from the man's grip. Many make it a point to have minions swarm him in large numbers, since it takes time for El Grande to grab each one and squeeze them into submission -- time that can be used to escape or have other minions beat on the

masked wrestler's cranium.

This tactic is particularly effective because El Grande doesn't let someone go once he has them grappled until they submit or are knocked out. Even if it makes more tactical sense to release a foe and grab someone else, El Grande takes pride in his legendary grasp, and isn't about to allow anyone to be the first to escape it. Sometimes he thinks far enough ahead not to grab a minor foe when he needs to focus on a bigger threat -- but not always.

El Grande is most useful as an ally and foil. He's a good man and here to help, but his help doesn't always go the way other heroes might prefer. Subtlety isn't beyond him conceptually, he just has no use for it. For example, he always wears his mask. He can change the rest of his costume as needed, to jogging suit, tuxedo or swim trunks, but the mask stays. It's his symbol, and a symbol to his fans who look to him for hope and inspiration. It's his private flag, heraldry of a modern knight, and there's just no way he'll take it off. The man sleeps in it, and can even put on a new one without taking of the old one. He has extra-stretchy masks to wear while showering, to ensure he can wash his face and hair, but he still does it masked.

He also has no use for behavior he sees as cowardly or cruel. It's not that El Grande never breaks the law (though he has great respect for the rule of law, except where it gets in the way of justice), but he does not believe in using lies, deception, torture, poison, mind control, or threats of the same, to meet a goal. He'll question prisoners, but not through intimidation. He'll instead try to shame them into doing the right thing (and, bizarrely, often has good results with this technique). El grande doesn't demand others meet his high standard (he is, after all, an experienced role model for a whole nation), but anyone who proves willing to use genuinely evil tactics soon won't count El Grande as a friend.

Should anyone manage to penetrate the bravado El Grande uses as emotional armor, a more tender side of the aging hero is revealed. El Grande fears the future, and thus refuses to think about it (or plan for it). He has kept no money to speak of for himself, and owns only a tiny one room shack in the poorer side of Mexico City. He usually spends his nights sleeping in the El Grande Foundation headquarters, or as a guest of fans when on a case, but should he ever feel the need to retire he'll refuse to live on the charity that should be going to children. If he finds himself in a city with no network of fans, he has little money to take care of his basic needs. El Grande is a proud man who won't ask for help, but too far from Mexico, or much into the future, he's sure to need friends to care for him.

Edges: El Grande has two edges -- Big! and Greater Improved Grapple. Also, his costume is laced with silver and cold iron threads, allowing his grapple damage to be treated as silver or cold iron for purposes of penetrating DR.

Big!

[Edge]

You're much larger than most creatures of your species, but not quite a full size category up.

Prerequisites: Str 13+, Con 15+.

Benefit: Your carrying capacity, food consumption, and grapple checks are figured as if you were one size category larger. For all other purposes you are considered the normal size of your species, including movement, attack rolls, AC/Defense, weapon sizes and the cost of your armor and equipment.

Greater Improved Grapple

[Edge]

Nobody escapes your grasp!

Prerequisite: Improved Grapple

Benefit: A character with Greater Improved Grapple figures his grapple check as +1 per level, +Str bonus, +6 (this includes the +4 bonus for Improved Grapple). Additionally, he gains another +1 for every feat he has that is not a Metamagic, Psionic or Item Creation feat.

When grappling, you continue to threaten spaces around you, and can make melee attacks into them rather than grapple checks if you prefer. If you make a grapple check at -10, you may move with a grappled foe at your full move

rate.

Gotcha

Gotcha is a thin, reedy man with a weak chin, big ears, and buck teeth. He grew up as Simon Felter, 90-pound weakling in the Sterling family, a clan of burly policemen, firefighters and soldiers. Indeed, he wasn't even a direct relative, being a distant cousin adopted when his original parents were killed. The Sterlings loved him, but felt he needed to "toughen up" as a child, and thus did little to help him with the endless streams of bullies that saw him as an easy target.

Unable to compete physically, Felter learned to embarrass his foes into leaving him alone. Anyone who picked on him soon suffered an endless stream of whoopie cushions, dribble glasses, red-hot chewing gum and tied-together shoes. Though he was at first the target of even more bullying, eventually his foes decided bothering him wasn't worth the constant pranking, and stopped.

Felter tried to follow his family's footsteps and become a policeman, but just couldn't pass the physical. Unwilling to live on his family's charity, Felter became a stage magician. His years of prank-pulling as a youth prepared him well for this, and if his heart had been in it he might have become one of the world's best. But Felter spent more time studying for private investigation licenses and trying to get into law school than working on his act. Though not miserable, Felter felt something was missing from his life.

Then one terrible day, Boxcar -- a mob boss -- blew up Felter's family's house during a holiday dinner. The act was in retribution for members of the family arresting the mob boss weeks earlier. Felter, alone, was unable to be there and was thus the only member of his family to survive. Felter knew who was responsible, but was unable to prove it. He considered killing Boxcar, but couldn't bring himself to do it.

Instead, he went back to pranks.

Calling himself Gotcha, he began a campaign of embarrassment and frustration on Boxcar. He piped children's shows into the boss' televisions. He replaced his toothpaste with hemorrhoid cream. He sawed partway through the chair Boxcar always sat in at a local Italian eatery. Gotcha keyed his car, let the air out of his tires, and placed anti-mob stickers on the bumper while it was moving. Boxcar was never hurt, but his reputation was so tarnished he garnered no more respect or fear in the community. Eventually, when one of his underlings was caught, the thug decided to turn in Boxcar rather than go to jail. The organized crime family was relieved to be rid of the sign of their weakness, and did nothing to retaliate.

And suddenly, Gotcha had a life's mission.

Gotcha doesn't believe in violence, at least not harmful violence. Instead, he has made it his life's work to pull pranks on every criminal in the world. As best he is able, he's made a ranked list of masked villains, underworld bosses, mob captains, and typical FBI's most wanted criminals. Starting at the top, he's traveling the world, pulling pranks on these criminals. The pranks never cause serious physical injury, but they do make his victims look stupid. Every prank is designed to destroy the target's credibility (by causing him to claim something fantastic just happened, and then removing all evidence of it before others can confirm it), or ruin his aura of cool and competence (such as hitting him in the face with a pie not once, but every day at the same time for a week).

Obviously Gotcha has become a world-class magician in the years of his quest. He's also learned the value of careful planning, and often has a whole month of pranks in place before triggering the first one. Equally obviously, his insistence on not hurting anyone places him in dangerous situations with no way to defend himself. Somehow, however, Gotcha always finds a way out. Criminals the world over have claimed to have drowned, burned, and just plain shot him to death, but a month later Gotcha strikes again.

Obviously Gotcha is most likely to be encountered when he comes to town to peg some local crimelord. However, Gotcha can also be used to warn a PC he's crossing the line from hero to villain. If Gotcha felt someone was too self-

important or too vicious a vigilante, he'd have no compunctions about hitting him with a cream pie, spraying a polka-dot pattern on his shorts in ink that is invisible until a few hours later, or taping a "spank me I've been bad" sign on his back.

Edges: Gotcha has only one edge, but it's critical to his chosen career. Through good fortune, clean living, and perhaps divine intervention, Gotcha is Unkillable. Despite his lifestyle, he'll die quietly of old age.

In games with a strong mystic or karmic theme, the edge should have pacifism listed as a prerequisite. Gotcha does no real harm, and thus suffers none.

Unkillable

[Edge]

Somehow, you always survive.

Benefit: This edge literally prevents the character from being killed under any circumstances, or even permanently maimed. The character is not über-tough or able to regenerate with great speed, he simply never ends up being killed through whatever combination of luck, mercy and freak coincidence is needed to save him.

If the character is determined to be dead according to the game mechanics, some circumstance prevents his death at the last moment. Usually, the character is also whisked away to safety, unconscious, and doesn't show up again for a month or more. The character can be hurt, captured, or knocked out, but not killed.

White Wolf

In the lands that eventually became Lithuania there was once an order of warlocks who took the form of wolves to fight for justice and freedom, and to protect the people of their lands. Originally commonplace, and hailed as heroes, their order and bloodlines grew thin as centuries of fear and oppression were brought to Lithuania from conquering religions and nations. In time even those descended from the warlocks did not know their power, and they lost the ability to take wolf form. But some small part of the wolf remained within them, and some minor magic still clung to them.

The last of this bloodline is woman named Victoria Vallachia, who also takes the identity of the White Wolf, a vigilante hunter of criminals. Ms. Vallachia works as a freelance reporter, spending much of her time hunting down eastern European war criminals and organized crime leaders. Those she can expose to the authorities she lets the law have. Those who seem likely to escape legal justice she hunts down and punishes herself, and normally her sentence is death. Though her work often keeps her in Europe for months, she's not afraid to track down prey that has fled to other continents, including the Americas.

As both Ms. Vallachia and White Wolf, she tends to work with a tightly knit group of friends, which subconsciously she sees as her pack. Most of these are people she has helped, either saving them from direct harm (such as putting a stop to a mugging) or by gaining justice for their losses when no one else could. Her team changes over time, but usually includes a weaponsmith, a cameraman, an electronics expert, a driver or pilot, and a few junior investigators. White Wolf rarely allows any of her "pack" to enter real danger with her, as she's very protective of their safety.

When operating as an investigator, Ms. Vallachia is first direct and forthright (storming into offices and challenging suspects on the street with a camera) and then patient and dedicated (spending hours on stakeouts and combing through documents). When acting as White Wolf, she reverses her methodology, beginning with long observation of a target before engaging in an all-out assault. She's in peak physical condition, and a skilled climber, tracker, acrobat, and sneak. She's only fair in melee combat (though she does have very short retractable claws built into the gloves of her White Wolf gear), but is a world-class sniper and pistol shooter. Indeed, though she varies what pistols she carries based on her needs, she's almost never without at least two hand-held firearms. Though she doesn't know why, White Wolf knows she never misses anything she's sure she's going to hit. This last vestige of magic in her bloodline allows her to shoot in ways that seem reckless (firing into crowds, hitting targets near explosives, and even shooting in near

total darkness).

White Wolf need not be from Lithuania. She can easily have been brought up anywhere, from a small rural town outside Angel's Harbor to a big city's "Little Lithuania" ethnic quarter. As a dedicated hunter, she is most likely to come to the heroes' attention when following prey into their turf. Her pack mentality may also cause her to hunt down allies of enemies she has already caught -- possibly allies based in Angel's Harbor. Unfortunately White Wolf is suspicious and surly, unlikely to explain herself to anyone who confronts her in an even mildly hostile fashion. Once her trust is gained (usually by helping her overcome some foe), the same pack mentality makes her fiercely loyal and willing to take great risks to help her allies.

Edges: White Wolf can have one, two or three edges depending on the power level of the campaign. In order, these are Deadeye, Scent, and Night Vision.

Deadeye

[Edge]

You're incredibly accurate with ranged weapons.

Prerequisites: Pint Blank Shot, Precise Shot, Far Shot.

Benefit: A character with Deadeye never hits the wrong target. This is not to say every attack he makes successfully hits, it just doesn't ever hit the wrong thing. If an attack made the character hits a target's touch AC/Defense it's considered to have connected physically, but unless it is in fact a touch attack it still has no effect unless it also hits the target's normal AC/Defense.

If an attack doesn't even hit the target's touch AC/Defense, or misses due to concealment or similar effect, the character has the option to have decided at the last moment not to make the ranged attack. The attack action is still used, but the actual attack is not made and no ammunition is spent.

A character with this edge never hits cover or loses a shot into a crowd unless he decides to do so.

Night Vision

[Edge]

You can see very well even in nearly lightless conditions.

Benefit: A character with Nightvision gains the benefit of Low-Light Vision. Additionally, in situation where there is any light available, no matter how dim, the character treats anything in sight as being in shadowy illumination, regardless of range.

Scent

[Edge]

Your sense of smell is far more acute than a normal human's.

Benefit: You gain the scent special ability. Additionally, if you make a Spot or Listen check to notice something that you might also smell, or any time you make a Survival check to track, you gain a +4 bonus to the skill check.

Mr. Dale and Mr. Hodgkins, Attorneys-at-Law and Bizarre Creatures from Outside Time

for Unknown Armies

by Michael Dewar

Mr. Dale: *Ah, good evening to you all. My name is Mr. Dale, and this is my esteemed partner, Mr. Hodgkins. Might I present you with our card?*

Mr. Hodgkins: . . .

* * *

You will not find the esteemed law firm of Dale & Hodgkins in any city in all the world. You will not find their names on any university transcripts or bar exams, or in telephone books or on office stationary.

Rather, you will find them between the ticks of the clock, in the parts of reality where three dimensions are merely a preference, where the impossible is possible and the normal non-existent.

They do not look remarkable, or even very interesting. Mr. Dale is a short scrawny man with fading brown hair and a moustache like an over-used toothbrush. His watery blue eyes twinkle with something that seems like mischief, and his voice is polite, precise and very well-educated.

Mr. Hodgkins is larger, straining to fit into his neat tweed suit, with buzz-cut brown hair. The big black sunglasses which cover his eyes and the long white cane he carries inform the casual observer of his blindness, though a less casual observer might notice that Mr. Hodgkins never seems to bump into anything and sometimes he looks right at you, even if you haven't made a sound. No one knows what Mr. Hodgkin's voice sounds like, because he never speaks, not one word. Mr. Dale does the speaking for the both of them.

Despite their differing physical appearances, they do share a few characteristics. They are astonishingly punctual, always seen together, and the more time you spend with them, the more you become aware of something not quite right, just below the surface. Something like an actor trying to play a part a little too enthusiastically, or a person who is wearing a mask which doesn't quite fit. Something subtly . . . wrong.

Because Mr. Dale and Mr. Hodgkins are not human, not even faintly, and they are most certainly not lawyers. They are something . . . else, something that doesn't quite exist in the same way as the rest of us. They are creatures outside of the narrow path we call time and they manifest this otherness in three main ways. Their failure to age, their yellow reptilian eyes (Mr. Dale wears special contact lenses, but Mr. Hodgkins cannot abide them, thus his pretense of blindness) and their ability to alter time at will. As time-shifters, Dale and Hodgkins are capable of feats that can verge on the miraculous.

First, when they choose to be, they are simply incredibly quick. Their subjective time slows to allow them to consider a perilous situation and react appropriately, effectively meaning that they have double the normal amount of combat actions and can move at double normal human movement rate. Secondly, once a day, they can teleport (or perhaps "time-port") themselves, moving instantaneously in both time and space. They can move anywhere within a particular dimension/plane and up to an hour forwards or backwards in time during this journey. Note that this is independent of any time zones that may exist in your game world. Shifting from Africa to America or vice versa causes hours to be "gained" or "lost", but the extra hour is a change in actual time in addition to this zone change. After "time-porting", they are exhausted for six hours (counted from their point of arrival) from the strain of moving up or down the timestream.

The only physical sign of their presence in our world (apart from themselves) are their neat, white business cards. The business cards read, "Dale & Hodgkins, Attorneys-at-Law" and have no phone number or address listed. But if you tear one up and scatter the pieces, a breeze will sweep them away and Dale and Hodgkins will shortly come calling.

In Campaigns

Dale and Hodgkins work best in a modern but mystical world such as *Unknown Armies*. Their ability to move outside time can be used as subtly or overtly as the gamemaster chooses.

Obviously, as adversaries, Dale and Hodgkins are ridiculously dangerous in a direct fight. They can simply step outside time, slash the character's throats, and then step back in to watch them splutter and gasp. They should rather be used as neutral characters or subtle adversaries (perhaps as Agents of a great or godlike power).

If you do intend to use them as direct enemies, bear in mind that they will need to be outwitted in order to be defeated. What the characters can learn about them (by careful mystical research) is that, while they are outside time, they cannot touch human flesh directly (which will destroy them) or move objects larger than their own body weight. So Dale and Hodgkins could be imprisoned in a jail cell, or shot with a sniper rifle (the bullet hitting before the sound is heard and they are warned to step outside time). There may also be mystical ways to handle them, to enter their world outside time and face them there. There are persistent rumors about an old wooden cuckoo clock which allows you to stop time, though it is up to the DM to decide if they are true . . .

Mr. Dale and Mr. Hodgkins for *Unknown Armies*

Mr. Dale

Body: 40 (Weedy) Knife-fighter: 45 General Athletics: 20

Speed: 60 (Jittery) Dodge: 40 Do Two Things At Once: 60

Mind: 85 (Eccentric) Been alive forever and a day: 60 Law: 40 Notice: 55

Soul: 90 (Other) Flaky Charm: 25 Sincere Lie: 55 Time-Shifter: 60

Mr. Hodgkins

Body: 70 (Bulky) Knife-fighter: 55 General Athletics: 40

Speed: 55 (Surprising) Dodge: 45 Do Two Things At Once: 60

Mind: 60 (Cunning) Been alive forever and a day: 55 Notice: 40

Soul: 90 (Other) Intimidate: 55 Charm: 15 Lie: 25 Time-Shifter: 60 Act Blind: 25

Do Two Things At Once: During combat, if the user makes a successful roll (on any skill that would take an action to use) which is under their Do Two Things At Once, they get an extra action. Note that if this second roll is also under the skill, they do not get a third action. Been alive forever . . . : The general knowledge skill gained from having been alive and active for most of human history.

Time-Shifter: This skill allows the user to move in time and space once per day. The distance is determined by the user, and the time shift is measured in minutes forwards or back up to the result on the roll. After shifting, the user is exhausted for six hours and suffers a -20 penalty on Body, Speed and all related skills for that period. An OACOWA allows up to a 60-minute shift, and halves the period of post-shift exhaustion to three hours. A BOHICA shifts them to

a GM-selected place and time.

Note: Since Mr. Dale and Mr. Hodgkins are thoroughly alien in their outlook on existence, they don't have obsessions and stimuli like conventional humans. They may pretend to react with anger or happiness to an event, but nothing effects them emotionally, at least as far as humans understand it. Similarly, they do not experience stress checks.

Adventure Ideas

- The simplest method is for the characters to be presented with Dale and Hodgkins as standard adversaries. They are more likely to act in the service of a sorcerer or similarly supernatural foe than of their own accord, though that is not a hard-and-fast rule. They might be hired as assassins or thieves, since their time-shifting powers lend themselves particularly well to those fields. Obviously, they aren't conventional employees by any stretch of the imagination, so their employer will probably need to use magick to control or "pay" them. If Dale and Hodgkins are too strong for the characters to directly defeat, breaking their employer's power over them can provide an alternate way to stop them.
- A more unusual idea is for them to act as sponsors for the characters. Again, they are more likely to be servants of a greater power, though they might act independently. They make interesting and creepy ways to brief the players about events and missions, and their time-shifting gives them access to information that would be impossible for any normal people to find or turn up at just the right moment. For example, they could shift backwards in time to warn the characters of a fight in which they will be killed, giving them a chance to "escape their fate." Given their power and amorality, Dale and Hodgkins shouldn't really be fighting side-by-side with the characters in the trenches, but they make unnerving backers. On the one hand, their time-shifting makes them a valuable font of information. On the other, they're clearly inhuman and their motives are probably unknown.
- Rather than serving a human force, their alien nature makes them well-suited to serve godlike or infernal Powers, such as the Invisible Clergy in *Unknown Armies* or more conventional demons and deities. The fact that they appear human, yet behave in a slightly otherworldly fashion, means they make effective bridges between the mortal characters and great (or terrifying) powers beyond their comprehension.
- A more-short term use for the pair is as guardians of treasure or some powerful magick. Their improbable appearance can make for a comical encounter if the characters try to "liberate" their charge. Imagine the characters fighting their way past formidable traps and foes, finally encountering the pair who introduce themselves and offer the confused would-be thieves a pre-battle cup of tea. Heaven help a character who talks with his mouth full. This could even work in a comedy-orientated medieval game, with their obviously anachronistic nature being played for laughs. Then again, once the pair demonstrate their abilities, the characters may stop laughing abruptly . . .
- For a more investigative game, Dale and Hodgkins could be introduced through a series of clearly temporally impossible events. Imagine a party of cops trying to solve a murder committed in front of witnesses who saw nothing except that the victim was alive one second, and then dead the next. Yet the markings on the previously uninjured body show he was tortured for hours . . .
- In sci-fi games, the pair might have a more scientific explanation. Perhaps they're aliens, or experiments, or living time-travel machines. If the campaign involves time travel to a large degree, Dale and Hodgkins could make especially interesting "timestream caretakers," following the time-shifting players from place to place and time to time, smoothing out the historical paradoxes created by their actions and helping or hindering as you choose (obviously requiring an increase in their time-shifting powers above what's listed here to do this.)
- Finally, Dale and Hodgkins can be very interesting with their powers turned all the way up. Instead of the current time-shift rules, maybe they can simply stop time at will, and travel into the past and future as easily as you or I ride a bus . . . at this level, they're far too formidable to be direct foes, but they could fulfil a role of near- godlike creatures in your game, providing a cosmic humor and menace as advisors, sponsors or even prophets. After all, if they can nip 20 years into the future and nip back, they can make some interesting predictions for the characters . . .

Pyramid Review

Cthulhu Invictus: Horror Role-Playing In Ancient Rome (for *Call of Cthulhu*)

Published by [Chaosium, Inc.](#)

Written by Chad Bowser, Andi Newton, & Deane P. Goodwin

Illustrated by Chad Bowser & Andi Newton

120-page tape-bound b&w book; \$20

Outside of the three core eras -- the twenties, the 1890s, and the modern day -- Chaosium's [Call of Cthulhu](#) has explored few other time periods. The scenario anthology, *Strange Aeons* was the only exception to this until the release of [Cthulhu Dark Ages](#) earlier this year. It is now followed by another of Chaosium's "Miskatonic University Library Association" Monographs, only available direct from the publisher's website. Each volume explores an idea, scenario, or setting with a view to proper publication should it prove popular. *Cthulhu Invictus* explores the existence and influence of the Cthulhu Mythos in Ancient Rome.

The year is 50 C.E. during the reign of Emperor Claudius. The Empire is prosperous, thriving, and expanding, but is also open to the venal, the corrupt, and the squamous. While mothers tell children tales of gods, of heroes, and of monsters, real horrors are abroad in the night, some unknown; others kept hidden for the Empire's safety. In Greece, Athens has been prevented from progressing for over a century, punishment for magi summoning an avatar of Yog-Sothoth. Rome's Vestal Virgins tend the Sacred Flame to keep both city and Empire safe spiritually, were it extinguished, Y'Golonoc will be set free and the city easy prey to his depraved followers. At night Hypnos, Lord of the Dreamlands, pulls the dreamers of Rome into his realm to compete in bloody and sadistic games. Merchant shipping crossing the Mediterranean is beset by attacks from Tritons and Merman. Or rather, Deep Ones. Both Bast and Nyarlathotep are active in Egypt, and cults to Shub-Niggurath are widespread, though under other names. The Cult of Cthulhu remains small, with the Elder God still slumbering in sunken R'lyeh, with worship having slowly drifted in from the East.

The Empire is home to many cults and secret societies. They include Christians, the cult of Magna Mater, Mithraism, Gnosticism, and Republicans, but perhaps the most interesting are the two dedicated to fighting the evil represented by the Mythos. Originally founded by the Greek Aristion, the "Custus Notitiae" is a closed society of 25 scholars that aim to recover any book that might damage mankind. The "Blade of Zarhost" is the second, an all-female militant branch of Zoroastrianism that emerged from Parthia to fight Sand Dwellers, Deep Ones, and other Mythos threats.

Besides the more "traditional" Mythos aspects, the authors have made an effort to work elements of the Greco-Roman mythology into the Mythos. Almost 3,000 years before the time of *Cthulhu Invictus*, a group of clerics used an artifact to steal power from the Dreamlands. They declared themselves to be Olympians, with the powers of flight and invulnerability, and were worshipped and sacrificed to. Further, they were capable of creating creatures and casting spells, summoning Dimensional Shamblers and the like. Zeus himself favored a three-headed Hound of Tindalos named Cerberus! Although Hypnos was to eventually blast the mind of most of the Olympians, they live on in legend, and so do the creatures created and associated with them. This includes Cerberus, the sea vortex Charybdis, the Cyclops, the Gorgons, Lamia, the Mother of Vampires, and the Muses.

Opposed against the Olympians were the Titans, an elite core of religious elders who engaged in vigorous scholastic studies and debate. Predating the rise of the Olympians, they employed advanced sciences to combat the Mythos-

based powers of the newly arisen gods. Although the Titans ultimately failed, again some of their creations live on. Other creatures given in the bestiary are not so heavily tied into this background, and are less interesting for it, lending themselves more to a "Swords & Sandals" style game.

The new spells follow this combination of the Greco-Roman Mythos and Cthulhu Mythos. For example, *Beseech Charon* does indeed contact the keeper of the way over the River Styx, but who just happens to be an avatar of Yog-Sothoth. Likewise, *Summon Child of the Sphinx* does call an anthropomorphic animal, meant to be an Egyptian god, to the caster; it is again another avatar, this time of Nyarlathotep. Another spell, *Augury* ties into the rules for "Roman Augury," which covers the five types used by the College of Augurs.

Before getting down to character generation, *Cthulhu Invictus*, provides a solid guide to Rome and the Empire of 50 C.E. There is enough here to play an ordinary game set in Rome, and when it is combined with our familiarity with the period, is certainly serviceable, though not spectacular.

Character generation follows the standard rules of *Call of Cthulhu*, though the occupations and skills are far closer to those of *Cthulhu Dark Ages* than found in the core rulebook. Everything is clearly explained, including the minor tweaks to combat, healing, and sanity. Combat involves more hand-to-hand encounters, thus warranting the more detailed rules for parrying. Damage is not recorded not just as points, but also wound-by-wound to reflect the less effective healing methods of the time. Armor is more readily available, but is designed to deflect damage rather than absorb it. Given the lack of therapists in Ancient Rome, Sanity is more difficult to recover, and the only reliable methods involve either rest or the grounding of the sufferer in everyday activity.

[SPOILER ALERT!]

Cthulhu Invictus is supported with two scenarios, the first of which is "Morituri Te Salutamus." This opens after a day at the races, with the characters coming across the attempted abduction of a woman of Equestrian status. They receive both a reward in thwarting the kidnapping and a request to investigate both this attempt and the disappearance of a number of other women across Rome. The scenario has the feel of a traditional *Call of Cthulhu* adventure, and a playable, though not exceptional one at that.

The second scenario is "Chuma Invictus!" is more interesting in that it takes the characters beyond the border of the Empire, South of Egypt to the Kingdom of Kush. They are not investigators in the traditional sense, but legionaries, assigned as part of a trade envoy's bodyguard. In truth, the envoy has another reason to be visiting Kush -- he is a member of the Custus Notitiae tasked to obtain a Mythos tome before it falls into the wrong hands. The journey involves a trip up the Nile, punctuated by ambushes by bandits and crocodiles, before reaching the capital of Kush, where a game of cat and mouse ensues. Its climax is again traditional and involves surprisingly bad weather. Again, not a spectacular adventure, but perhaps more interesting for the players than the first. This is in part due to "Chuma Invictus!" feeling very much like a convention scenario, as opposed to the more introductory nature of "Morituri Te Salutamus." The two scenarios are separate, but with a little effort, either could be run after the other.

[END SPOILER ALERT]

Physically, *Cthulhu Invictus* is clean and tidily presented, certainly in Chaosium's later printings of the book. As with other Monographs, the publisher's desire to get something to print has meant that the first run of each Monograph has not been as best presented as the authors would wish. Either version of this Monograph is very lightly illustrated with just two decent pieces, which are all that relevant to the text. The maps though, are rather rough, and while the one of Rome is serviceable enough, the ones of the Empire and its provinces vary between the plainest of window dressing and providing the broadest of geographical detail.

Unfortunately, the real problem with *Cthulhu Invictus* is one that it shares with *Cthulhu Dark Ages*: the lack of Keeper advice on running a Mytho-influenced campaign, here obviously set in Ancient Rome. The feeling is that the Keeper is expected to get by knowing about both, rather than being given an examination of the point where they meet. Certainly, familiarity with both is an excellent starting point, but if *Cthulhu Invictus* is ever to become a properly published and distributed supplement, it desperately needs such an exploration. It is also a pity that both scenarios choose only to explore minor Mythos threats rather than delving into the possibilities suggested by Hypnos'

influence in Rome or the punishment of Athens.

Cthulhu Invictus does actually contain one good concept -- the Olympians as Mythos-fueled beings. This suggests a campaign all by itself, set in a Heroic Age where the Greek legends all have a truth. The combination of [Cthulhu d20](#) and Green Ronin's ***Trojan War*** supplement, with a dash of [Mutants & Masterminds](#) would a fine starting point for such a campaign, along with a copy of ***The Complete Dreamlands***.

Initially, ***Cthulhu Invictus*** is disappointing, but upon closer examination, it shows a fair bit of promise. In conjunction with the ***Call of Cthulhu*** rulebook, it certainly provides the Keeper with the basics necessary to play. That said, it leaves much unexplored, and hopefully this will be addressed, along with proper Keeper advice, should the supplement be developed into a full supplement. In the meantime, this is a solid primer on exploring the Mythos in Ancient Rome.

Pyramid Review

Easy Come -- Easy Go

Published by [Out of the Box Publishing](#)

Designed by Reiner Knizia

Illustrated by John Kovalic

Boxed, full-color rules, dice cup, four specialty six-sided dice, nine prize cards, \$12.99

Another year, another marketing cycle, another Out of the Box game, another chance for them to break their winning streak so the reviews don't look like they're biased in the company's favor. Is *Easy Come -- Easy Go* a loser at last? Eh . . . not really.

The object of the game is to gain three prizes and hold them until the beginning of your next turn. There are nine such fabulous prizes to be won, and players do this with die rolls. The game comes with four special dice -- six-siders, but the one has been replaced with a zero (which counts as an even number in this game). On your turn, you roll all four dice. Looking at the results, you decide which results you'll keep and which you'll reroll. You must keep at least one of the dice that come up each time, but the rest you may continue to pitch.

The results hopefully correspond to the formula on one of the prizes. The fleet of cars, for example, asks that you come up with four of a kind, while the private jet requires exactly 13 on the dice. Some are a little more particular, like the tiaras that need three of a kind *and* all four dice must show even numbers. Since you're not likely to come up with such a result the first time out (though it's hardly impossible), deciding which dice to keep and with which you'll dispense becomes an exercise in critical judgment.

And no prize is safe, either. If someone else rolls the required dice results on one of the prizes you've already won, well . . . the game is called *Easy Come -- Easy Go* for a reason. They can now take that matching prize away from its erstwhile owner and add it to their own pile. Some of the rewards are easier to take than others -- getting a 17 or higher isn't too tough -- so you can go the path of least resistance on a couple of things in hopes of a quick or easy win. Conversely, it's easier to relieve you of such items. If you get your third prize one turn and can hold all three until the beginning of your next turn, you're the winner, off to see exotic locations wearing all that glitzy jewelry. Two to four people can play, and a game takes about five minutes. (In theory more could join but the prizes would be spread awfully thin and the game could take forever.)

John Kovalic is once again foregoing food and sleep to helm someone's illustration duties. He cleverly matches the item pictures to the required rolls -- for two pairs you get two butlers and two maids as your prize, and getting a seven scores the "Lucky 7" yacht.

The production quality is first class. Much like Out of the Box's tendency toward putting out nothing but snazzy games, that splendor can be somewhat irritating. The game includes a felt-lined cup for shaking up the dice -- very nice, but hardly necessary for the rolling process. That "perceived value" the marketing pros talk about is part of the problem. The set can do without such trappings, and yet it seems absurd to chastise the creators for making games so blessedly simple and straightforward that they find themselves straddling a financial fence where excluding such items would make the game almost non-existent. Truthfully the game could probably be summed up on the website and folks at home could create their own set, but it wouldn't seem as much fun.

Aside from the cup, the components include some dice and the prize cards. The dice are unremarkable beyond the one-

zero tradeoff. The cards aren't for shuffling -- you just lay them out for players to see and collect -- so they could be made of just about anything. As it is, they're thick and full -- really thick. The things are more like refrigerator magnets than playing cards. The pieces all come stuffed into one of those custom-molded plastic trays.

And yes, *Easy Come* -- *Easy Go* is very much like *Yahtzee*. The price tag on this short-box game has gone up a whopping three bucks, so when one weighs all these factors, saying it's not worth the cost may be fair comment. Then again, the game's speed, the replay value for eager players ("*This time . . .*"), the lack of extensive game sheets to fill out, and the tradeoff of elements (strategy is simpler, but there are fewer mental calisthenics overall and you want those neat cards) means even when riffing on old ideas, the Out of the Box team makes game design look easy.

Murphy's Rules

by Greg Hyland

Murphy's Rules

And When I Die, And When I'm Gone . . .

This week, of course, saw the passing of noted and widely respected late night television host Johnny Carson. And, like the passing of many celebrities, his death has received a lot of news and blog commentary. Although I enjoyed much of the material I saw him in, I'm not what I would call a "fan"; I respected what he did, but always felt that he was aimed at the generation before mine. (I've heard others say his most cutting-edge and edgy shows came about before he moved the show to Hollywood. That was a year before I was born, and over a decade before I would've been allowed to stay up late enough to watch him. And even when I was watching, I was just as likely to catch David Letterman.

This isn't to speak ill of the dead; I admire the heck out of everything he did, especially with how *easy* he made it seem. David Letterman always looks like he's uneasy and struggling, which in turn makes me uneasy while watching. But not Carson. I always got the impression that the stage could've caught fire, cyborgs might've burst in, and the guest he's interviewing would rip off a mask to reveal himself to be the Red Skull, and he could handle it with a wink, a smirk, and a commercial break.

But, despite the fact we're 25% of the way through this column, I contend this week's installment is not about the inimitable Mr. Carson's death.

Rather, I've been reading others' reactions to his passing with some fascination and amazement. Unlike other recent deaths I've read about (such as [Julius Schwartz](#)), I don't have the overwhelming attachment to Johnny Carson that others do, which enables me to be a bit more analytical.

And the conclusion I'm reaching – which I've reached before but I don't think I've expressed until now – is that people like reminiscing about the dead. It gives a sense of comfort and an organized means of sorting through feelings about the demised.

It also enables people to use the departed to make points about their own lives -- usually by tying the past to the present. Thus Ronald Reagan's demise several months ago resulted in much discussion about the 1980s, the Cold War, the revitalization of the Republican Party, the unifying nature of his leadership, and so on. And, invariably, both political parties began trying to use Reagan's legacy to illustrate their own points.

While it's possible to view this as cynical exploitation, I'm more inclined to ascribe more noble goals. Primarily, I think it's really hard to feel like you're contributing to the communal aspect of grief without adding something to the "dialog." Thus, rather than having:

Person 1: Boy, it's really sad he's dead.

Person 2: Yes, it's really sad.

Person 1: Yep. Really, really sad.

. . . the desire to keep this communication going can cause us to use the deceased as a catalyst:

Person 1: Boy, it's really sad he's dead. Person 2: Yes, it's really sad. Of course, he would want us to keep living.

Person 1: That's true; he was always more about enabling people to advance their own lives, rather than using them to advance himself.

And so on.

From there it's not a far cry to be using a high-profile deceased person to talk about bipartisanship, free trade, and Social Security reform.

To use an example, many people are citing the fact that Johnny Carson died of emphysema, and are blaming his "untimely" death on the fact he smoked (and, in all likelihood, continued to smoke up until his death). While smoking

no doubt contributed to his condition, it's hard to view someone who lived four years longer than the national average as necessarily having died untimely. Coming from a family whose members have a 50-50 chance of collecting that first Social Security check, I think I'd be delighted if I got to 78. (Of course, the other half of that 50-50 chance means I might be ravaged by stroke or Alzheimer's, so maybe "delighted" is a strong word.) While I'm no fan of smoking by any stretch of the imagination, it seems like a stretch to lay Carson's demise entirely at the feet of cigarettes.

How does this tendency relate to gaming? Well, in most long-running RPGs there will probably be, at some point, at least one significant death. Many players have characters which are famous, either in the circle of the character-type community or to the game world at large. Yet, with the sole exception of some extended LARPs I've been in, I've never seen this tendency to speak of the dead ever appear in any campaigns I've played in, either to "grieve" or to make a point.

Admittedly my personal sample size of one is too small to draw any definitive conclusions, but that's never stopped me before.

I suspect there are ____ primary reasons this tendency isn't used more:

"It's hard to miss you when you won't go away." Since deceased characters were played by other players, who are – presumably – still in the group, it can be very difficult not to metagame any drifting from what the character would have "really" wanted:

Fred: I knew Kate, and Kate would have sided with me on the dimensional vortex issue.

Kate's Old Player: No she wouldn't've!

Fred: Yeah, but you don't know that . . .

Even a hint of this can go a long way toward poisoning the use of former characters. However, if everyone can resist the temptation to comment when others are speaking about a former PC, the storytelling and plot possibilities can still be utilized.

"Sad, sad, really sad . . ." Obviously, there's a huge difference between reacting to the death of a real person and a fictional one; the emotions are, presumably, much more detached with the latter than the former. (I'd argue this is probably a good thing, people often game to avoid the misery and hardship of the real world, and bringing to mind the thousand natural shocks flesh is heir to is probably beyond the pale for most gamers.) Nevertheless, it's still possible to *pretend* about that depth of emotion; it's possible to roleplay being in love with an NPC without playing footsie with the GM.

"You! I thought you were *dead*!" Finally, in many games it's common for PCs not to remain dead. I've written about this [before](#); suffice it to say, a revolving-door afterlife is a temptation that should be avoided. At the very least, if death is often transient, it can be useful to metagame a bit to let the gaming group know that, yes, this character is well-and-truly, never-coming-back dead. And then *never* backtrack on this point. Bucky and Barry Allen ain't comin' back.

Death is a natural consequence of life, and grief and contemplation is a natural extension of death. These stylized reflections, in fact, help set us apart from animals.

And, as a bit of utterly non-gaming advice, I reiterate the need to let those who touch your lives know of their contributions to you, while you can be sure they know and understand. Because sometimes even the most serious and heartfelt conversations can seem as simple and comfortable as a late-night chat with a friend on a couch.

--Steven Marsh

Demented and Sad, But Social: Social Characters for Antisocial Players

Part II

by Matt Riggsby

Part I of this article appeared [last week](#). This has been an introduction.

Seduction

Seduction is a thorny issue. We'll be discussing something fairly narrow here, the difficult task of romantically and/or sexually interesting someone who, for whatever reason, shouldn't be considering a relationship with you (for example, someone who is married, under vows of celibacy, or betrothed to someone else), rather than the larger and even more difficult task of establishing and maintaining a real romantic relationship. We'll also be discussing it in terms of getting into someone's head and heart, not necessarily into their bed.

Physical acts have wildly different personal and cultural implications; scoring with a hippie Woodstock is an entirely different matter from getting there with a priest or the Sultan's shy, virginal daughter. Since this article is about "getting things done," a far more important thing to consider is emotional impact. You may not get the prim Victorian maiden to surrender her virtue, but if you get her sufficiently interested, you may get her to surrender the keys to the family fortune.

One of the reasons this is so difficult is that it's very personal. Most people have any number of friends and business partners, but few lovers and spouses. The reasons for choosing the partners they do go beyond rational self-interest and the constraints of culture into the deepest parts of individual psychology, which are far beyond the scope of this article. However, we can discuss trends.

Obviously, some things are almost universally terribly useful if you want to seduce someone. Physical attractiveness would go without saying if it weren't for the fact that what constitutes "attractive" varies somewhat between societies. Facial scars which would be considered disfiguring in our society would be considered dashing on men in parts of Africa (or, for that matter, among German duelists in previous centuries), while descriptions of ideal feminine beauty in many past societies would appear downright stout in modern Hollywood. If your character moves between societies, the value of his personal appearance may change, so it's doubly important to dress and groom appropriately.

Wealth and power are also useful; being able to shower your intended with gifts, provide fine meals and entertainment, and so on certainly can't hurt, even if it isn't always appropriate to offer them. However, if your character intends to seduce someone as a means to an end, he's probably not likely to be on the rich-and-powerful end of the spectrum, so we'll pass over that.

Particular skills and professions can be tangentially useful. Most societies have professions that are considered glamorous, and being successful in them will be generally attractive. Becoming a famous duelist or warrior may be beyond your character's abilities, but artistic skills, as we've mentioned, can be remarkably attractive and more safely achieved. Less glamorous but possibly more useful, clergy and psychological counselors, who are taken into peoples' trust as a matter of course, sometimes have to fend off the romantic attentions of those who come to them for counsel (we'll pass over the profound moral and legal implications of a PC intentionally using a position of trust as a stepping-stone for seduction; if you're trying to seduce someone against their better judgment, you've probably left such

concerns behind).

One recurring theme in both literary and real-world seductions is providing the seducee with something they don't have. If your intended lacks romantic and sexual excitement in general, a physically attractive potential partner may be all they need, but you'll usually need more. What makes you interesting, though, depends very much on your intended's personal interests, and at least partially sharing them (or appearing to) can be useful. For example, if your intended is an ardent conservationist, becoming involved in conservation movements or being (or at least posing as) an environmental scientist will give you both a reason to spend time together and an opportunity to share intense emotional experiences, which will make it that much easier to form a bond.

A bit more subtly, people in long-term relationships can get bored or lonely. Husbands complain of nagging wives and wives complain of unsympathetic husbands. With an unappealing home life, providing a sympathetic ear is itself a good first step. You, the seducer, can provide an outlet for the frustrations that your intended builds up in their domestic life. By sympathetic listening, you can bring your intended to trust and rely on you emotionally, bringing you that much closer to your goal, gently guiding a search for "something better."

Another approach to take is to present your potential seducee with a project, someone who can be "fixed." Any number of women become involved with "bad boys," otherwise appealing men who are in some way out of control or emotionally damaged. Some enjoy an excuse to join in and misbehave without actually making it a way of life, while others believe that this tortured but actually sensitive soul can be healed if given the right love and attention. But it's not just women falling for that sort of thing. Something appealing to some men is a vulnerable but, again, otherwise appealing woman whom the man can take under his wing, as it were.

The difficult part (one of them, anyway) is knowing which approach to take. Does the person you intend to seduce have a weakness for exotic foreigners? A boring home life? A passionate political agenda? You can do some research beforehand, of course, but this may be an area where (if your game system supports them) you might rely on your PC's social skill and ability scores. If your imagination initially fails you, you might ask your GM to throw some dice at the problem and see if your character can figure out what approaches seem likely to work. Once you've got that, you can get down to work.

Bribery

Bribery is a little like tipping for service: expected in some places, forbidden in others, with local rules of etiquette that nobody ever discusses. In some societies, bribery is hard to define. Making payments or giving gifts to officials has been, in some societies, an expected part of doing business. The line between paying fees and paying for influence was, therefore, a fuzzy one. Nevertheless, there were usually laws and sometimes secret police to ensure that officials didn't extort exceptional bribes. In exceptionally corrupt areas, officials are very up-front about the bribes they expect, making it simply a matter of haggling. Elsewhere, though, you'll have to act like you're not actually offering a bribe (or, if you're on the other side, like you're not actually accepting one).

The first question is how much to offer. The amount depends on how much the official you're bribing usually makes, how much he thinks you can afford, and how valuable his service appears to be to you. For routine services (allowing a border crossing, letting you off on a traffic violation), initially offer the equivalent of no more than a day's pay for an average person in the society in question. If you're clearly from a richer place than the official, negotiation may turn that into something more like a day's pay for an average person in *your* society. Prices will also go up considerably if you're rude, appear to be very wealthy or in a hurry, or if there's something suspicious about you (trying to cross a border with clearly forged papers, pulled over for speeding with blood

Girl, You Must Be Jamaican . . .

A word about pickup lines is in order here. Movies and TV (bad movies and TV, anyway) are full of clueless men trying out pickup lines: hopefully clever, possibly sexy one-liners which, they hope, will make them irresistibly attractive. They don't, of course. They're barely extended greetings, not magical incantations. However, it's worth paying attention to why the idea exists in the first place. The functional purpose of pickup lines, along with other attention-getting ploys like sleight-of-hand magic, bar bets, and so on, is to give you a moment of favorable attention

dripping from your trunk), so it pays to be calm, polite, and credible. If you aren't, the price will rise, and it may make the official you're dealing with hesitate to take a bribe from you at all.

The second question is how to offer it. Unless a bribe has already been explicitly demanded of you, it's very bad form to hand the official a wad of money and say "Here is a bribe!" It's best to dress the act up in an official process. You might ask if there are any fees or fines you should pay on the spot, allowing you to hand over your money under the pretense that it's an official charge, not a private payment, or you might slip some money into your ID papers which you'd be handing over to the official anyway. In less official settings (for example, bribing a maitre d' or a hotel doorman), you may have to resort to such clumsy dodges as dropping money on the ground and suggesting that he dropped it, surreptitiously putting it on his desk while talking about something else, or simply handing it over. However, the less overt you can be about it and the more distance you can put between your handing over the money and him taking it, the better.

during which you can say something more substantive (at the very least, introducing yourself). A clever line is like a knock on the door: Someone is likely to answer, but you have to say something far more convincing after that for them to let you in.

Some other tips:

- If there's a group to bribe, find the leader or most senior member and bribe him. Ultimately, he's the one making the decisions, so he'll want his cut. If you bribe a junior officer, he'll have to talk his superiors into going along, which will require additional bribes.
- A bribe doesn't have to be cash. Any valuable goods and services can be used. If you're well enough established, you can even work on "credit" or as a broker of favors. For example, you might observe that the receptionist's portable radio is rather old and suggest that she visit your friend the electronics dealer who can set her up with a replacement. It's a bit less convincing than cash, but it's a bit less obviously a bribe, and if she has reason to believe that you're good for it, the veiled promise of free merchandise is nearly as good as money.
- When dealing with cash exchanges, try to conceal how much wealth you have. If the people you're trying to bribe see your pouch full of gold, they'll want more than if you've only got a handful of silver. You might keep a small batch of money (or several small batches) on hand for bribes while keeping a larger bankroll elsewhere.

Negotiation I: Diplomacy

There's a story (which may even be true) about a Victorian-era British diplomat sent to chastise the king of a small foreign realm and make him give up his territorial ambitions. To show the flag, a fearsome warship was sent with him with orders to take up station conspicuously off the coast of the capital city. However, if the king did not give in to the diplomat's demands, the ship's captain was instructed to withdraw; war with the distant land would be too expensive and unpopular at home. On meeting with the king, the diplomat transmitted Her Majesty's government's message that it would make Britain very happy if he were to stop threatening his neighbors. The king, his attention irresistibly drawn to the warship, asked what would happen if he did not. Without going into specifics, the diplomat said that, sadly, that the captain would be "forced to carry out the second part of his instructions." The king, needless to say, capitulated.

That, in a way, is part of the essence of diplomacy. Contrary to what we might want to think, diplomacy is very rarely about lying. Political and diplomatic relationships are usually long-term (individual diplomats come and go, but their countries will live on), and telling outright lies will do serious damage to your credibility. If the British had made it a policy to explicitly threaten naval bombardment, sooner or later someone would call their bluff and, once the truth came out, it would be a far less impressive threat. Instead, negotiation involves careful management of the truth. Although they seem like modern concepts, elements of spin-doctoring and plausible deniability have surfaced through history.

This is not to say that lying doesn't have its place. Small, polite lies are common ("No, your grace, that cassock doesn't make your butt look big."). Large lies can be used against parties whom you plan to eliminate entirely ("We only want peace, Mr. Chamberlain."), although at that point it's not diplomacy; it's a con game. Mostly, however, you'll want to give people those parts of the truth they want or expect to hear, and gently lead them to fill in what you want them to

think.

Like haggling, diplomacy is a matter of persistence without alienating the parties you're negotiating with. However, power relationships become much more prominent. In general, you want to appear firm and to be dealing from a position of strength, even if you're dealing with a relatively friendly negotiating partner. Even if you aren't in a superior position, act like you are: Come to the table with a full set of demands which are well in excess of what you're willing to settle for so that you have points to concede. Concede no point without argument (or at least discussion). State your position as frequently and fully as possible. However, be aware that you can do this in any number of moods. You could attempt to be harsh and distant, emotionally neutral but sincere, friendly but firm, and so on, as is appropriate to your personality (and that of the parties you're negotiating with).

One tactic often used in particularly contentious negotiations is quibbling over protocol: stated agenda, timing and location of negotiations, number of people present during talks, the shape of the table, etc. Many such points may be trivial in the long run, but forcing the other side to make concessions on *any* point gives the winner a psychological edge over the loser, and may allow him to slip some substantive points past the other side. This sort of posturing is also common when third parties are observing the situation. For example, when negotiating a peace treaty with a rival, you might choose between meeting at a neutral location in a third country to impress your own people that you won't let those filthy foreigners set foot on your sacred soil or holding negotiations in your own capital to stress to other governments that your country is an important one and a center for diplomacy.

At the same time, though, don't just try to obstruct proceedings. It's well and good if things are going your way, but if you're facing a competent diplomat unwilling to defer to you and you're *too* insistent on getting your own way, you won't be able to make any kind of deals and will eventually walk away empty-handed. Subtle queues may indicate that your negotiating partners are tiring and may withdraw or rethink previous concessions and deals. If you can sense that point approaching (this may be another point for the GM to roll some dice), find lesser points you can concede. In difficult negotiations, it's often useful to start with small agreements as trust-building exercises and slowly work your way up to major issues rather than trying to deal with the intractable situations first and clean up the side issues later.

Negotiation II: Politics

Every government and organization has a political process. Even in a theoretically absolute monarchy, officials in the middle are capable of giving unpleasant tasks low priority or performing them poorly, and the people at the bottom are capable of going on strike or even actively revolting (an act which probably won't overthrow their oppressors but will cost them time and resources). And there are always local decisions to be made about how to implement quite possibly vaguely worded or insufficiently funded commands from above or moves among the less powerful to persuade their superiors to a particular course of action. So even if there's no legal framework in place, there is often a practical need to convince at least some people to go along with things (and, for you, an opportunity to get people to do things for you).

Building a Diplomat

Diplomacy has only become a profession in the last few centuries. For most of history, it has been something done by people who usually do something else, which is something to keep in mind while making up a diplomat character. For example, many Medieval diplomats were wandering friars and priests, whose missionary work carried them to (or was, at least, a pretext for) their travels to other countries, so you may want theological or preaching skills. Merchants and heralds were sometimes pressed into service, which implies other skill sets. A surprising amount of high-level Medieval and Renaissance diplomacy was carried out by female relatives of rulers, a consequence of interlocking familial relationships. The king of X could hardly be seen traveling to negotiate with the king of Y, but his wife or sister could always go to see her cousin, who happened to be the king of Y's wife or sister; rather than thinking of your diplomat as a high-born nobleman, you might want to think of the character as a high-born noblewoman.

One other thing that bears specific mention is diplomatic immunity. There are examples of extreme legal protection for diplomats and other important messengers through history. However, those examples have tended to be the exception rather than the rule. In fact, killing the messenger was often a way for one ruler to express

Being involved in politics has a private aspect and a public one. The private aspect is essentially an ongoing process of diplomatic negotiation. Although not as long-term as relationships between nations, relationships between politicians go beyond a single moment, so people in office must be capable of dealing with one another with a certain amount of guarded trust. Despite how it may sometimes appear, few real politicians are actually inflexible ideologues, and those that are will often employ advisors and lieutenants who aren't, so if you've got some political standing yourself, you should be able to find someone to negotiate with.

The public aspect has to do with maintaining the support of constituents and underlings farther away from the heart of the decision-making process. When their words are considered carefully, politicians tend to blatantly lie less often than they equivocate, develop positions over time, and make statements so qualified as to be nearly meaningless. They do so in a way that makes it sound like they're making a definite statement, but they're actually leaving themselves a way out. Rather than making concrete promises or setting out timetables that can be used against you later, you can express hopes, intentions, and personal good will. If the risks and benefits of an action by the organization are vague, which is often the case, people are more likely to act according to their opinion of the person taking a given position rather than the position itself.

One way of thinking about how to gain and manipulate power is to think of a society as being made up of competing factions. A skillful politician will often cultivate influence not by uniting those factions into a single body, which is a tremendous task, but rather increasing his support among different factions by picking issues specific to each and emphasizing his stand on them to that constituency. A candidate for office might emphasize his support for controls on agricultural imports in conservative rural areas and emphasize a liberal social policy among urban sophisticates. The farmers might disagree with his policy on, say, group marriage, while the brie-and-chardonnay crowd might distrust his tendency towards protectionism and isolationism, but if the candidate leads with those parts of his policies which, in isolation, his audience wants to hear, they'll be more interested in hearing about that than his full platform.

A common way of attacking a politician, then, is to draw out those aspects of his statements and record which, again in isolation, could be interpreted in a negative light. Since just about every political decision involves some kind of tradeoff, this isn't very hard. For example, if a candidate consistently supports tax increases to support schools, an opponent could accuse him of recklessly increasing taxes. If he consistently opposes such proposals, an opponent could accuse him of voting to deprive children of education. If he supports some but not others, an opponent could accuse him of being unreliable and not someone to trust with decisions concerning (depending on the audience) taxes or children. Supporting war means financial waste and killing citizens while opposing it means cowardice, supporting construction means destroying the environment while opposing it means strangling industry and causing unemployment, and so on. Any candidate for office can be demonized; it's just a question of figuring out what any given audience will find most alarming.

Ultimately, though, this is a strategic choice rather than the one way of doing things. A sufficiently charismatic politician or one in a society with a few ready-made large factions might instead choose to build up enthusiastic support in a single group to whom he has strong appeal rather than lukewarm support from a broad base. This might not be viable in a large nation, but it can be in individual provinces, cities, or other relatively small areas, and it can make that politician a key person for other politicians to influence.

Some other tips:

his extreme displeasure. Being an official messenger will give your character's words a certain authority, but it also puts your character at greater risk of having his head sent home in a box.

Up the Organization

Finding assistants and advisors to leaders who are willing to listen to you is just generally a useful thing to do whether you intend political manipulation or not. Large organizations are a boon to socially-oriented characters. For characters who match force with force, a bigger organization means that many more resources that can be turned against them. For a social character, it means that many more possible weak links in the chain.

The ability to talk about nothing, already an important skill for social people, is doubly so for politicians. The ability to appear a pleasant fellow is often more useful for casual contacts than winning an intellectual argument.

- In conversation with people you don't know well, avoid discussing hot-button issues such as sex, religion, and, contradictory as it may seem, politics, unless you know their stance on a particular topic. A single sharp disagreement can undo a great deal of general good will.
- A common political tactic, if you're expecting a brief conversation, is to make a prepared statement whether it's called for or not. In order to push their message home, politicians may go to extraordinary lengths to link the topic under discussion with what they say. Watch, for example, legislators on TV news shows and see how often, in response to a question, they say something like "I think the real question is . . ." and talk about something different.

Interrogation

The word "interrogation" conjures up visions of cops questioning a scruffy prisoner in a back room of a police station. Although that's the main focus of this section, we'll use it in a broader sense of someone trying to get information out of someone who might not want to provide it: an intelligence officer getting troop information from POWs, a reporter investigating government corruption, or an auditor trying to find an embezzler.

The best way to gather information is simply to ask direct questions. Unless the subject of the interrogation has some reason not to talk to you, he's likely to answer. However, in most situations that PCs will find themselves, the subjects will be unwilling to talk, so they'll have to find a way to trick or cajole the information out of them.

A straightforward way of dealing with the problem is by bargaining: If you give me information, I can give you something you want (money, information in return, favors for you or friends). Although it's a simple approach, it's not necessarily the best. Scrupulous people may be unwilling to be bribed into revealing information, while unscrupulous ones may be willing to tell interrogators what they want to hear rather than the truth. It's better, therefore, to convince the subject that providing accurate information is in his best interests. Several approaches involve playing directly on the interrogatee's emotions. For example:

- **Love and Compassion:** If you give me information, it will help others (it will keep your family safe from retribution, it will save someone else's life).
- **Fear:** Give me information or something terrible will happen (you'll be punished, a disaster will hurt you or your family).
- **Revenge:** If you give me information, it will hurt people who have wronged you (oppressive rulers, competitors, co-conspirators who will let you take the fall).
- **Ego:** What you've done is really impressive and I'd love to know how you've done it, or perhaps you must be terribly important to know things like that.

A bit like seduction, the trick is to figure out which approach will work. In some cases, there are fairly obvious avenues. For example, an investigative reporter is likely to play up the revenge angle while interviewing a corrupt organization's cast-off employees, but tell the guilty middle manager how he can help repair the damage he has done and try stroking the ego of the proud leader. For other cases, it may not be so obvious, so if possible, you might spend some time investigating the people you intend to interrogate in order to determine their state of mind.

Approaching a question indirectly can be useful, hiding your true intentions from your subject so that he doesn't know not to cover something up, or at least approaching an uncomfortable fact from a direction the subject hasn't come up with a cover story for. For example, rather than asking a suspect "Where were you when your business partner was killed?", a detective might, under the guise of checking routine information, ask an increasingly detailed series of questions about the suspect's whereabouts during that day: Where were you between seven and eight? What were you doing at such-and-such a time? If you were watching TV, what was on? What happened during that episode? If the suspect is lying about his whereabouts, he'll be forced to improvise a more and more elaborate lie. With any luck, he'll eventually contradict himself or make a false statement that can be independently checked.

You can always combine approaches: one interrogator can appeal to the subject's nobler impulses, another can scare

the subject (the classic good cop/bad cop scenario), yet another appealing to the subject's ego, and so on.

This is another area where persistence and attention to detail often pays off. The best thing you can do is to get the subject of the interrogation talking as much as possible, giving him enough rope to hang himself as it were. Record conversations if the technology is available; if not, try to have other people listening and taking notes. The more hints and contradictions you can find, the better your position.

Do try to keep the information you provide the subject of the interrogation to a minimum. The less he knows about how much you do or don't know, the more he'll have to guess about what to lie about, and therefore the better your chance of catching him in a lie.

Ask about information you already have. The classic example is a detective showing a suspect the picture of a victim who they can already link with the suspect (through photographs, DNA evidence, etc.) and asking if he recognizes the person in the picture. If the suspect says no, the detective will already have a known lie to use against him.

As with bargaining, there may be subtle, unconscious physical signals when the interogatee is lying or if you're getting close to an uncomfortable truth. For example, blushing, touching the face, or no longer making eye contact can (but don't necessarily) indicate that your subject is trying to hide something. This is another case where the GM may want to throw dice at the question.

Subjecting your interogatee to physical hardship can break down his resistance, but actual torture is a questionable means of getting information. It may loosen tongues, but it doesn't necessarily produce useful answers. Rather, it can produce answers that the subject thinks the interrogator wants to hear. Someone being tortured is more likely to confess to doing things he didn't do and make up details just to make the ordeal end; lie detectors and physical cues are unlikely to work here as well because the subject desperately wants any lies he tells to be true, so any physical reactions to lying are overridden by panic and response to pain.

Summing Up

So if you're a socially oriented character, what do you do while your combat-monster friends are polishing their guns? Here are some things to keep you busy:

- **Meet and greet:** While your comrades are renting rooms at the inn and stocking up on fresh power cells and mandrake root, you can talk to the bartender, the shopkeepers, and anyone else you meet to get a handle on local conditions. Start with the people you meet and work your way up the chain to people you'd like to know.
- **Background check:** While other characters are working on a task, you're the one who can find out what your employer isn't telling you. If your group is hired for a simple, lucrative job, you can investigate your employer and the task at hand to figure out why you're getting overpaid instead of being unpleasantly surprised at the end.
- **Take out the opposition:** Once you've scoped out your opposition, you can think about taking action. This may mean using the social contacts you've already made to get in touch with potential allies or figure out your enemy's weaknesses. It might also mean going to your opposition and seeing if you can't turn them into an ally, or at least a neutral party.
- **Misdirect:** If you're receiving unwelcome attention, you may be in the best position to get rid of it. If you're leaving town, make it sound like you're staying. If you're planning to attack one person or group, make it sound like you're attacking someone else, or even no one at all. If you've already scoped out your opposition, you should be able to find some third parties to pin those activities on.

The Other Side of the Spotlight

Eventually, PCs are likely to end up being questioned rather than doing the questioning. Since most interrogation techniques are designed to get you talking, the best thing to do, really, is to stonewall. It's hard for a socially oriented character but, as much as possible, keep your mouth shut. If you must talk, don't bother lying about things which can be verified: when you made phone calls, old relationships, purchases, and anything else that's likely to be witnessed or to leave an electronic record. If possible, find out what the people questioning you know, but be aware that they're likely to lie to you directly.

- **Buy low, sell high:** Even if you don't have any skills directly related to buying and selling, you should probably be involved in any kind of monetary dealings your group gets into. If there's somebody with better merchant skills than yours, you can still work to win the customer's good will, setting him up for a more favorable deal in the end.

Works of Interest

- *How To Win Friends and Influence People*: Written primarily from the point of view of salesmanship, the pointers in Dale Carnegie's chestnut can be used as general social advice.
- *Ridicule*: This French film is an instructively cruel illustration of social competition.
- *Kama Sutra*: Find a full translation and skip over the parts about sexual technique. It contains chapters on how to carry on an illicit affair and what personal attributes are desirable in a lover.
- *The Prince*: Like Sun Tzu's *Art of War*, this is one of those works that is just too useful to go away. Although written for life-long monarchs rather than elected officials, anyone in a position of authority can get good advice on rulership from Niccolo Machiavelli's remarkable work.
- *Yes, Minister* and *Yes, Prime Minister*: Margaret Thatcher characterized these 1980's BBC sitcoms as being an unfortunately accurate representation of how government works. Looking past the satirical content, there are some remarkably useful pointers on how to operate in a political system.
- *Homicide: Life on the Street*: Perhaps the most realistic police show ever (not that that's saying much) with fascinating interrogation scenes, although the detectives have a cinematic ability to figure out which approach to interrogation will work with suspects.
- *US Army Field Manual 34-52*: The Army's guide to gathering human intelligence in the field. Available [on-line](#) from various sources.

Six Heroes For The Age Of Napoleon

For *GURPS*

By Mark Gellis

These six characters are designed with *GURPS Age of Napoleon* in mind, and can be used for campaigns set during the American Revolution, the French Revolution, or the wars of the early 19th century. They can also, with a few changes, be used in virtually any other campaign set during either the Swashbucklers or Victorian/Steampunk periods, where travel is managed by sail and horse, but where black powder, and perhaps even machines powered by steam, are everyday tools rather than sorcery. And, of course, a fair number of the Infinite Worlds are variations on Earth's Age of Napoleon.

The characters have been designed so that they complement one another, making them suitable for an "adventuring group." However, there is enough redundancy of skills that they need not all be included in the party if there are only a couple of players who need new characters.

How the characters actually come to be a party is left to the GM, but they have been designed with the assumption that they are currently somehow at loose ends and seeking employment. Perhaps they are all staying at the same inn and become acquainted in that manner, and then stumble into an adventure together. Or perhaps some patron has assembled them as a team to complete some mission. The GM is free to decide.

David Macleod

David Macleod grew up in a small fishing village near Aberdeen. When he turned 18, he decided to leave his village and make his fortune as a merchant seaman. He has spent nearly 20 years sailing around the world and has now returned to England, looking for new opportunity and adventure.

Like many Scots, David is proud of his country and his heritage, and saddened by its reduced status in the Union. (If the campaign is set during the American Revolution, he would have been just old enough to remember the Forty-Five; even if the campaign is set in the Regency, David is likely to know people whose fathers and grandfathers fought with Bonnie Prince Charlie.) Even so, he accepts what has happened. There are plenty of opportunities for Scots in the British Empire who are willing to not dwell on the past.

David is an honest and good-natured fellow, who is not afraid of hard work or hard conditions. He is an expert seaman, and a competent carpenter and fisherman, and he is well-versed in the lore of the sea, but his real value to a group of adventurers is that he is quite deadly in a fight. As a merchant seaman, he has faced privateers, pirates, and tavern brawls, and has lived to tell a very respectable share of tales.

Jacob Smithfield

Jacob Smithfield is a quiet Canadian who has lived on the frontier most of his life, exploring, serving as a scout for the British army, and so on. He has come to England to visit some old friends, and see about the possibility of getting some manuscripts published, and is presently at loose ends.

He is a simple man, capable, quietly efficient, and not very talkative; like the stoic Indians he has lived and worked with for many years, he simply does things instead of talking about it. He has always been a meticulous note-taker, measurer, etc., however, and now he wants to tell others what he knows, especially because writing books about strange and faraway lands is a very good way to make money in the Age of Napoleon.

Some of his adventures have been rather harrowing. On one expedition, he and the men with him were captured and tortured by Indians. Smithfield was able to effect an escape, but he was injured so badly that later on his left arm had to be amputated. To this day, he suffers from nightmares in which he relives watching his comrades tortured and killed. He has sworn to himself that he will never again willingly allow anything like that to happen to anyone with whom he is working.

His injury has, of course, limited his ability as a fighter, but he has taken this in stride and focused on those fighting skills he can use. He is a very good shot with a pistol and also quite dangerous with the Indian tomahawk (and enjoys how intimidating this is to most Europeans, especially those who may have underestimated him because of his injury).

He likes the comforts and pleasures of civilization (he is especially fond of the theater, and London is one of the great centers of the dramatic arts). He is, however, quite willing to be employed on new missions of exploration, or other endeavors where his knowledge of surviving in the wilderness can be put to good use.

Rose Clairmont

The daughter of a well-to-do goldsmith, Rose married a young country squire when she was quite young, swept off her feet by his charms and his good looks. She learned very quickly that her husband, while not a scoundrel, was most certainly a fool. If she had not been a competent businesswoman, and strong enough to keep his love of gambling and expensive parties under control, they would have certainly been ruined.

Her husband died in a riding accident only a few years after their marriage. Rose has not re-married, partly because she enjoys the freedom of being a young, attractive, and fairly wealthy widow, but also because she genuinely loved her husband, even if he was a fool, and is not yet ready to give her heart to someone else.

Before coming to London, Rose toured the British isles, including Ireland, staying in such places as Plymouth, York, and Bristol, and as a result has a good general knowledge of the entire kingdom.

Rose offers a group of adventurers someone who has both social and business skills. She can mingle with people, gather information, even seduce an unwary fop and use him to gain advantages other player characters would be unable to gain. She also knows quite a bit about jewels and jewelry-making, which might come in handy in a wide variety of adventures. She is a capable shot, and so she is not useless in a fight, but this is not where her strengths lie.

5'3" 125 lbs.

Edward Lynchfield

Edward used to be a house master at an English public school, responsible for teaching languages, history, and literature. Fluent in three languages, and with near fluency in a number of others, highly knowledgeable in both history and literature, and with a natural panache that made him popular with students, he was quite successful as a teacher.

Unfortunately, he was not quite so successful in resisting certain temptations. He had to leave his position under the cloud of scandal. He does not talk about that much, except if he has been drinking, and even then he will usually only say that if one is going to seduce the married daughter of one's headmaster, one should do so when her husband is out of the country. Now, he makes a living as a translator and historical researcher in London; he hopes that someday he will be able to return to academic life, but the time being he simply wants steady work that lets him use his talents and pays well.

Edward is the typical roleplaying scholar. If a group of adventurers need something researched or translated, it is likely that Edward is the man who can manage it for them. Like Rose, he is not a combat-oriented character, but if he has to fight, he is a fair shot with a pistol. In addition, his charisma and his social skills would make him useful as an investigator. Furthermore, because his study of history has led to a study of strategy and tactics; if a party ever needs to plan a battle, Edward would be able to give them an edge over many opponents. Finally, during his studies he has learned quite a bit about the occult. In campaigns where magic does not exist, his knowledge of legends and myths will help him tell interesting stories; in campaigns where it does, what he knows about the monsters that stalk the shadows of the world may well mean the difference between success and death for the party.

Total Points: 150

William "The Whisper" Holkins

William Holkins grew up in the slums of London. Although he is fairly intelligent, he never had the inclination to learn a trade (although he did learn something about masonry because his father was a bricklayer and there was not really any way to avoid it without being beaten on a regular basis). He realized when he was an adolescent, watching his honest father work hard and die poor, that learning a trade meant working long hours to make someone else rich. He decided that it was better to work short hours and make himself rich.

Since then, he has made a good living as a pickpocket, smuggler, thief, and housebreaker. His particular talent is being able to follow people quietly so he can learn what he needs to learn about them before making his move. He can virtually disappear into the shadows and it has earned him the nickname "The Whisper."

He has not gotten rich being a thief, but he not gotten caught, either. Yet. And he remains hopeful. He has done some big jobs, enough to live in relative comfort for a man of his low status, and he knows other big things are out there. He wants them, and he is willing to take whatever risks he has to take to make his fortune.

In the Age of Napoleon, when even petty theft could be punished with hanging (even later on, it often meant transportation to Australia), career criminals were mostly either skilled or dead. William is skilled, but he is also something else. He is lucky. When things go wrong for other people, he always seems to manage that critical task.

William is, of course, a character who gives the party access to the underworld and a stealthy investigator who can also steal, follow, break into buildings, and search them effectively. He also knows all kinds of legends and secrets about the city of London. However, unless one is looking for comedy (and most likely disaster), he is probably not the best choice if the party needs someone to mingle with and gather information from anyone who is not also a criminal. (A good way to get him into an upper class house is to simply claim he is someone's servant. He is not particularly good at being a servant, but he is capable of carrying bags, polishing boots, running errands, and the like, and he can fast-talk his way out of most difficulties if he does not have to do it for too long. If the person pretending to be his employer is pressed on the issue, he or she can always say something like, "His father was a loyal servant for many years and so I just don't have the heart to dismiss him.")

History Specialties

While this will probably be a point of debate for some time, your humble author takes the position that, despite its rich and complex history, England, because it is a section of a clearly identified large region (i.e., Europe, see **Basic Set**, p. 200), qualifies as a "small nation." Thus, it only requires one specialty of History. In fact, the phrase "broad geographical region" suggests that only the largest and most populous nations, such as America and China, need more than one specialty of History. History (England) does not cover the history of various British colonies; for these, one should generally use the history of nation itself, such as History (Australia) or History (Canada). The Roman civilization covered a much larger area than England, and thus requires more than one History specialty. However, to avoid a needless proliferation of skills, it seemed reasonable to simply divide the history of Rome into its two major periods, the Republic and the Empire. GMs concerned that particular specialties of History are too broad can always rely on the guidelines provided for Area Knowledge skills (see **Basic Set**, p. 176) to determine appropriate modifiers for specific questions.

Languages: English (native) [0]

Advantages: Reputation 2 (Among thieves, Recognized 10-) [3]; Luck [15]

Disadvantages: Extra Sleep 1 [-2]; Greed (12-) [-15]; Status -1 [-5]; Unattractive [-4]

Quirks: Likes gin [-1]; Only steals from people who "deserve it" (usually, this means someone who treats ordinary people like dirt, whom he will then stalk until he has the opportunity to rob them, but sometimes includes anyone who is simply so stupid or trusting that he cannot resist taking advantage of them) [-1]

Eric Davenshire

A handsome young man and the son of a wealthy landowner in the Midlands, Eric Davenshire has made a career out of having a good time. He is not unintelligent, but he tends to see everything as a bit of a lark. When the going gets tough, he can be relied on, but unless the situation is serious, he sees no reason why he should be. In part, this is because he is secretly afraid that he is not very good at being serious, and that if he tried to be, he would simply disappoint people. It is this, however, that might inspire him to join a team of adventurers, solving mysteries and righting wrongs; this would strike him the kind of endeavor where he can do something serious, something important, something that his family would be proud of, without having to give up his life of pleasure.

Eric is another character who can be used as an investigator. With his good looks, social connections, and charming personality, he can often get invited to places and parties that would be inaccessible to others. He also knows a lot about what is going on in the city of London, and his knowledge will make him valuable in terms of finding clues. While he is not as dangerous in combat as some of the other characters, he is a capable enough shot and swordsman.

The bane of Eric's existence is his cousin Robert. Robert is not nearly so successful socially as Eric, but he is hardworking and honest and he dislikes his cousin, whom he sees as frivolous and an embarrassment to the family. Whenever he gets a chance, he will try to frustrate those plans of Eric that he sees as foolish, selfish, or likely to make the family look bad. (If the party leaves the London area, one may assume that Robert might also show up or that Eric manages to offend some other serious and self-important fellow.)

Eric has the disadvantage that he is impulsive and that he refuses to treat things seriously until they are very serious indeed; he really is the kind of fellow who will rush in where angels fear to tread. Of course, that is the reason why he sometimes saves the day when the angels among us would have gone down to their deaths praying for a miracle.

enough to cover his cost of living at Status 2) [12]; Status 2 [10]; Wealthy [20]

Disadvantages: Compulsive Carousing (12-) [-5]; Code of Honor (Gentleman) [-10]; Enemy (Cousin Robert, As Powerful, Rival, 9-) [-5]; Gluttony (12-) [-5]; Impulsiveness (12-) [-10]

Quirks: Flirtatious [-1]; Loves to try new foods, especially foreign dishes [-1]; Reacts to stressful or dangerous situations with sarcasm and witty remarks [-1]; Sometimes fearful that he is a disappointment to his family (and hopes he will figure out a way to make them proud of him) [-1]

Skills: Acting-13 [4]; Area Knowledge (London)-13 [2]; Carousing-14 [8]; Current Affairs (London)-13 [2]; Dancing-12 [4]; Diplomacy-12 [4]; Fast-Talk-13 [4]; Gambling-13 [4]; Guns (Pistol)-13 [4]; Fencing (Smallsword)-13 [8]; Riding (Horse)-13 [8]; Savoir-Faire (High Society)-13 [2]; Sex Appeal-13 [8]

Total Points: 150

All This, And Adventure Seeds, Too

So, what can one do with these characters?

Quite apart from simply dropping them into an existing campaign when they are needed, which is what they were initially designed for, here are three adventure seeds a GM may use to develop a campaign using these characters.

- Loch Ness is not the only place in Scotland haunted by monsters. On the Isle of Skye, something is stalking the lonely seashores near the towns of Uig and Portree. For the last several months, following the nights of the full moon, mutilated bodies have been found on the beaches. Locals think that something has come out of the sea to punish the wicked for their sins. What is behind these deaths? Is it some maniac, so depraved that he rends the bodies of his victims like a wild beast, or is it something worse?
- There are rumors that a Canadian secret society is trying to seize control of the colony. No one knows who they are, although their members are believed to be some of the most wealthy and powerful men in Canada. There are even rumors that they have learned the secrets of Indian magic from a shaman and are using this sorcery to bring ruin to their enemies. Naturally, most Europeans dismiss the magic of the North American Indians as the superstitions of half-naked savages, but a number of leading Canadians have met with violent and mysterious deaths or accidents in the last several months. What is the truth behind these tragedies? And is dark magic or simply dark conspiracy involved?
- In the days of the English Civil War, a large emerald pendant disappeared from the home of one of the leaders of the Cavaliers. According to the story, a maid was tricked into stealing it, thinking that the thief loved her; instead, he murdered her and took the jewel for himself. Now, more than a century later, a pendant very much like it has been seen worn around the neck of a young lady from a noble and wealthy family, recently married to a gentleman with a title, a fortune, and a bad reputation. Anyone looking into the matter will learn that three other women in the same family have owned the pendant, and all have met with tragedy. Is it the same pendant stolen in the Civil War? Is there a curse? Does the ghost of the murdered servant haunt those who dare to wear the jewelry she purchased with her life? And is the newest owner of the emerald pendant now in danger, and is it from her jewelry or from her husband?

Mer-Children of Cain

by Elizabeth McCoy

It is said that the "half humans," the "fish-kin," are of the race of Cain, who slew his brother and was condemned to roam the world, never to have a home as he traveled about the land, and that the land that drank his brother's blood would never again bear fruit for him. However, to guard against his being slain, the Lord placed a mark upon Cain.

The first son of Cain, Enoch, and his children, stayed in the city that bore Enoch's name, in the land of Nod. However, Cain could not remain, and his wife traveled with him. In time, he and his vagabond family reached the sea, and there Cain realized there was a place that was not the earth.

First, the legend says, they took to boats. But, angry at the intrusion of humans, the great Leviathan tried to destroy them. Cain cried, "Who kills Cain shall be avenged sevenfold," and the great beast prayed to the Lord for mercy, that the drowning humans' death would not be laid upon its doorstep.

And so the Mark upon Cain and his family changed them, and though he would never again return to his homeland, under the waves he found he would no longer be condemned to wander, and the waters and undersea plants would give him and his family food. Finally, Cain praised the Lord, and vowed that he would never again slay his kin. As the Lord had saved them by giving them the gifts of the fish, so would he and his line spare the gentle schools. But as they were not kin to the death-eyed shark without scales, the many-tentacled octopus, armored shrimp and crabs, or the shelled oysters and clams, those were safe to eat.

--Mer creation story

* * *

Mer-folk are as legends have depicted them: human above the waist, and scaled tail below. They have a horizontal fluke, though, like a dolphin, and no gills -- their lungs process water just as efficiently as air, and vice versa, with almost no transition time.

A male mer is a mer-man. A female, a mer-maid. The singular and plural is, simply, "mer." Females are frequently a little less strong than males, with a lighter build, but the dimorphism between sexes is small enough that there is no penalty to ST. Pregnancy and childbirth are easier than for humans, and maternal mortality is low -- which is fortunate, as the dangers of the sea claim many children.

Mer are streamlined for swimming, with narrow shoulders and sleek, seal-like hair. Only a very inactive mer can grow his or her hair long, though there are representations in ancient mer cities that suggest nobility did this -- just as long fingernails denoted wealth and status in China. Mer lower anatomy is dolphin-like. Female mer (mer-maids) have small bosoms, save when they are nursing. Baby mer are as likely to be fraternal twins as singletons, with triplets and identical twins about as rare as with humans.

The mer consider themselves kin to scaled fish and air-breathing dolphins, both, and will not kill either for food. (There is theological debate about whether orca and the whales are kin to dolphins, and therefore not for consumption, or if they are safe to be hunted.) Seaweeds and other plants that grow in the ocean are also on the menu, as are birds.

Because they can withstand crushing pressures and do not *need* to breathe air, mer can build great underwater cities far from where human ships can find them. Still, if they go too deep, it becomes dark and gloomy to them, and the hunters who seek out the delicacies of seabird meat must make long, dangerous journeys.

Thus, mer cities are often near reefs or islands, to provide landmarks and opportunities to hunt animals above the waves. Good sunning-rocks are a beneficial side effect. They do not even attempt to farm on islands, whether humans live there or not; for the most part, this is because they are awkward on land. Only the strongest of them can drag their

lower bodies around on their tails, and flip the tails to help propel them on the ground. Between that and their lack of knowledge about growing things above-ground, it's just easier to eat sea-plants.

What histories the mer have indicate that they were, for the most part, a peaceful people who respected life and nature. Unfortunately, this is not always the case now.

* * *

If you do not return, we shall slay your children, a hundred each day, said the angels. And Lilith replied: The Lord has given me dominion over children, the boys until they are a week of age and the girls until they are three weeks, though if they are shielded by an amulet bearing your names, I will spare them.

And as the fish-kin are only half human, I may do as I please until the boys are five years of age, and the girls sixteen.

As all she spoke was true, the angels Sanvi, Sansanvi, and Semangelaf left her by the Red Sea with her demon lovers. Because humans are the chosen of God, the angels told the human prophets how to protect their children. But because the fish-men were only half human, the angels left it to the humans to warn their half-kin.

But they did not do that for a generation, so the sea folk's numbers dwindled, save those who gave themselves to Samael's service, and those who worshipped the Lord and were saved.

--A Legend of the Mer

* * *

Whatever the reason -- and the legends they have for this are varied, with even the most popular full of contradictions with their origin-stories -- modern-day mer-folk are much more scarce than they once were, and divided into two ideological groups. One strives to follow their culture's prior peaceful ways. The other . . . does not.

The peace-loving mer make their homes either in the darkest seas, hidden away from all humans and their violent kin, or near the shore, allied with humans. They adopt the local human customs and religion, and do everything they can to live in harmony. They're perfectly willing to trade goods -- coral, seabirds, seashell jewelry, etc. -- for bounty from the land, but do tend to insist that fish and dolphins are not for eating. They will also, if necessary, fight to defend their homes from outsiders. (If the local humans seek to drive them out, they leave, sadly. The towns who co-exist with mer-folk say that this is bad luck.)

* * *

When the herder Abel made his sacrifice of a lamb, the Lord looked upon it with favor. Cain, a farmer, sought to give what he found worthy -- and was spurned. When he slew his brother as a sacrifice, he was sent to the ocean, that he and his kin would live when the Flood came; thus did the Lord reward his sacrifice of blood. Only sacrifices of meat are pleasing in the eyes of the Lord; farmers till the land only so that they may feed the animals whose pyres will send sweet smoke to the Lord's home.

--A Midrash of the Pirate Mer, in particular the Orca's Teeth lineage

* * *

The more violent mer . . . have turned pirate. Some have hidden ports in the deep sea or on reefs and islands, while others are purely nomadic. Both types build "ships" to hold loot and prisoners for sacrifices. Their preferred sacrifices are humans, but "prey" mer-folk and fish or dolphins are also in danger. Perhaps ironically, many of them view orcas as more kin to them than dolphins.

They do not sacrifice plant matter of any sort, nor anything that wasn't alive to start with. If they have nothing else, they cut their own flesh and drip blood onto a flame. Many of them claim to be honoring God by this; obviously, their

detractors believe the pirate clans worship quite a different Being.

Pirate mer-folk in nomadic bands number around twenty to fifty adult fighters. The ones who have a safe harbor to build a city can grow to as much as one or two hundred strong, and there are always stories about deep-water cities where hundreds or thousands of Satain-worshipping mer swim and sacrifice in the darkness, only coming to the surface to capture ships and drag them under.

Pirate mer's ships are mostly raft-like frameworks with sails that they can use to ferry them faster than they can swim. They rarely have the mass to mount any sort of catapult or cannon, though some have storage for crossbows or black powder weapons, and "seats" for the pirate mer to aim from. Sometimes the seats are even shielded, like a duck-blind - and since they're accessible from underneath, it's hard to tell if there's a mer in there until it shoots out.

The nomadic bands also attach long ropes to at least one ship (depending on how many they have), which lead to net-like structures deep underwater, called "webbing" or "water-rigging." Very pregnant and nursing mer-maids, children too young to fight, and wounded or aged mer-men cling onto these when the ships are in motion. What few possessions the clan has are also tied to the webbing.

If a fight goes bad, the non-combatants can simply dive down from the webbing. They're far enough under the surface to have a good head start.

A favored mer-pirate tactic is to engage a ship, latch onto it with grappling hooks, and then chop out its bottom from underneath. Barnacles and mer-defenses make that a risky endeavor, but it's usually easier than setting the thing on fire. A few brawny mer make rope-ladder grapples -- a clumsy, ineffective, short-ranged invention -- and use them to attempt to swarm up, grab a crewman, and "kick" off with their tails, bearing their hapless victim with them into the water.

Naturally, anyone in the water is at a distinct disadvantage compared to a mer.

Pirate mer are not *always* religiously minded. Some clans are simply allied with pirates and have -- like their peaceful kin -- adopted their customs. (And it's a wise pirate leader who makes an alliance with mer. When the patrol ships, enemy pirates, or privateers show up for the bounty, tame mer can sneak up under them and send them to the bottom. Worst comes to worst, make sure your tame mer have part-underwater caves, and they'll help you hide out. Take care of your mer, and you mer'll take care of you.) These mer want pretty jewelry, the interesting things from the land, and to impress mer of the appropriate gender.

Still, if you see a mer-ship's sail, the way to bet is that they don't care about the cargo. They want sacrifices and are willing to try to sink the whole ship to get them. Since they're not always picky, some ships will carry condemned criminals, slaves, or other low-life whose only purpose is to stay alive long enough to be thrown to the mer. Crews in a panic have also been known to pitch pariahs overboard, and some brave captains (or crew) have deliberately jumped or set off in a dingy to distract the pirate mer with easier prey.

Burnt offerings are difficult for mer to achieve, but they do their best. If necessary, flint, steel, and a small raft can be set aflame. If they don't have the wood for that, they must haul their victim to a reef or island, and perform the sacrifice there. About the best thing that can be said about a mer sacrifice is that it's usually a quick cutting of the throat, and not burning alive.

GURPS Third Edition Mer Racial Template

20 points

Advantages: Cast Iron Stomach [15]; Enhanced Move (Swimming) [10]; Flexibility (Lower Body Only, -50%) [8]; Gills* [10]; Nictating Membrane 1 [10]; Pressure Support [15]; Speak Underwater [8]; Temperature Tolerance 2** [4].

Disadvantages: Aquatic*** [-40]; Chummy [-5]; Mer-type (see below) [-16].

Racial Skills: Swimming-DX [1]

Taboo Traits: Agriculture (Land)

* They do not actually have gills; this is merely the name of the Third Edition advantage.

** They are comfortable in a range from around 7 degrees Fahrenheit, up to about 97 degrees Fahrenheit. This is not a centered comfort range -- their comfort zone is in the high 30s to low 50s, but they can function without extra clothing down to around 28 degrees Fahrenheit.

***Eventually, if entirely deprived of water, a mer will sicken and die; they could qualify for a Dependency (Water, monthly, -5 points) in some situations. However, they are unlikely to have *quite* as quick a decline as that disadvantage suggests. GMs may add this disadvantage if they wish, bringing their total down to 15 points.

Types

Pacifistic mer have Pacifism: Self-Defense Only [-15]. They have the Quirk that they will not eat, or condone killing save in self-defense or mercy, dolphins or scaled fish.

Pirate mer have a Code of Honor akin to the Pirate's Code of Honor (p. B31), but including a drive to sacrifice burnt offerings of some kind. The frequency of this varies from clan to clan. Some try to make a sacrifice, if only of fish or other living creatures, weekly. Others perform the rituals monthly, and are more insistent on non-aquatic prey, such as humans or large land-animals. And, of course, there are stories of islands full of prisoners, awaiting an annual grand orgy of slaughter. The total for this Code of Honor is 15 points. Most pirate mer also have a Quirk that these sacrifices are religiously necessary.

Settings

As presented above, mer are approximately Tech Level 4-5 -- black powder weapons and wooden ships, and can be regressed easily. (Ironclad ships would put quite a crimp in piratical lifestyles, but immersed or half-immersed submarines crewed by mer might be . . . interesting.) They also have a religious background suitable for not-very-alternate Earthly timelines (just add mer-folk). Magery or psionics can be added if the Game Master desires. Some specific setting ideas include:

Yrth

The world of the forthcoming ***GURPS Banestorm*** for *Fourth Edition*, this fantasy/alternate timeline world has Earthly religions, magic, and many different races. Ocean travel is relatively neglected on Yrth in many areas, which could leave room for flourishing isolationist mer cultures (both bloodthirsty and pacifistic), as well as colonies around the coasts and islands. Many mer would be Christians (the piratical ones being a rather variant "Christian") or Muslims, but a large minority of the pacifistic ones would identify as Jewish.

Swashbuckling!

Tall ships, pirates, privateers, lost underwater cities . . . mer-men chopping holes in the ship, requiring brave swashbucklers to dive into the brine, daggers in their teeth, and battle the foul villains! Or perhaps the mer themselves are doing swashbuckling, hired to ride upon special platforms on the outside of the ship and confront their criminal kin! If you can climb the rigging and grab a rope, surely you can repel boarders with a giant fish-tail smack to the face!

Space

The mer live on a water-world, full of islands. However, they speak a language derived from Hebrew, claimed they were washed to their home by the Biblical Flood, and are not surprised by how humans look. Deep-sunk cities have

wall-paintings and records that might show more, but their exact location is lost and they are in the hands of the piratical tribes . . . Archeologists and theologians both are anxious to learn about the mysterious past of the mer.

Horror

The mer do not properly name a child until it is five years old (if a boy) or sixteen (if a girl), and try to protect them with shell amulets etched with the names of angels. Sometimes a child just vanishes and never returns, and all that is left is the amulet on the seafloor. But in one settlement, the religion of the mer has fallen into "disuse." Blank-eyed children, unprotected by amulets, swim away from adults and leave grieving parents. Player characters must decide if it's sharks, pirates stealing sacrifices or recruits, or something more sinister that draws the young mer away.

Magic: Little Mer-maid

The 15-year-old daughter of a pirate mer-king has fallen in love with a land-prince, and has swum away to find a way to be with her two-legged infatuation. Her bodyguards must protect her -- even from herself. Soft-hearted villagers (human or mer) may want to help her. Two-leggers of ill-repute may be hired to kidnap her one true love down to the sea. Witches will be consulted. Will she sell her soul, and his, to give him a tail and be with her forever?

In Nomine

Mer are most likely to be ethereal spirits (5-7 Forces), with a Far Marches Domain and a secret (or re-awakened) Tether into the deep sea. Some hope only to remain hidden. Others want to gain the favor of Beleth, Princess of Nightmares. And some from both sides want human mates, that mer might once again swim the sea -- as human as any human in the Symphony.

Alternatively, perhaps some mer tribes live deep in the ocean, corporeal descendants of ethereal spirits, most likely, but can you be sure? (Give these a normal spread of human-level Forces.) They are hidden where only Jordi's Seraphim might notice them -- and as the mer live in harmony with nature would Jordi mind? Or would he think them an improvement? Alas, one has been spotted on the cameras of a deep-sea diving robot -- and as if that weren't bad enough, a small faction of mer want to go to the surface and learn about the world of air that makes such marvelous things . . .

Pyramid Review

Cause & Cure (for Ars Magica)

Published by [Atlas Games](#)

Written by Michael Geller & John Kasab

Cover by Alexis Liosatos

Illustrations & Cartography by J. Scott Reeves

72-page perfect bound softback; \$17.95

*Editor's note: Although **Pyramid** is dedicated to attacking SPOILERS within its reviews with a puma-like ferocity, the very nature of an adventure review presents problems. If you think you might be playing in this adventure, don't read this review. If you're trying to figure out whether or not to buy this adventure for someone else to run for you, you might be able to get the information you need from the last paragraph. Fnord.*

Cause & Cure is an adventure developed for the Fourth Edition of **Ars Magica** (and released before the recent Fifth Edition). Designed for experienced characters, this is an adventure that will be enjoyed by players who like both roleplaying and puzzles. It can also include and involve any of the character types that go to form a troupe, not just the magi, but also the companion and the grog. All have their place in **Cause & Cure**, for its core set-up reduces the differences between the characters. Thus in a normal game or situation, where the differences in power and the application of such power are sharply delineated, the emphasis in this scenario is upon puzzle solving, investigating a mysterious situation, and above all, character and roleplaying.

The situation in **Cause & Cure** is simple. The troupe finds themselves in a mysterious castle from which they cannot find an easy means to escape or exit. The place has an ethereal quality to it, with the only other inhabitants being a number of overly helpful servants, and a vague, almost ghost-like scholar of House Jerbiton. To escape, the troupe must thoroughly explore their surroundings. There are clues aplenty if they can interpret the symbols around them, many of which also hint at the personalities and histories of the player characters.

To get the characters into this situation in a bottle, the GM is given several options. First is to have asked to locate the aforementioned though missing scholar, the second is to accept the invitation to visit this scholar or another, both of whom are fascinated with the theological and philosophical questions regarding the nature of life, death, and the afterlife. They can also be lured with promises of reward -- the chance to visit the library of the corresponding scholar, or in return for discovering the whereabouts of the missing one. Either method requires long lead in times, making **Cause & Cure** suitable for use with long-running campaigns. Alternatively, the GM can just play god and dump the characters in the bottle. This is also possible if they wander too close to the location of the castle and attract the attention of the person behind it all. A final option is more immediate and more interesting, in that the players randomly swap characters, awakening to find themselves without memories of who they are.

In fact, the person behind it all is the Lady Aldona, a powerful magical being who, being immortal, is fascinated by the human concepts of death and the afterlife. Having spent time studying both, she wants to examine them more closely and in an environment more suited to her researches. To this end she has created a laboratory, the Misty Palace, and it is here that the characters will awaken. No longer are they in "Mythic Europe," but in the Realm of Magic beyond the

Land of the Dead, something they are unlikely to deduce, although the ghostly state of their scholarly friend might be an indication.

What the Lady Aldona is studying is the reactions of the characters to the situation they are in, and their very human desire to stave off the inevitable. In order to escape the Misty Castle, the troupe must explore their surroundings and solve the conundrums presented in its four surrounding towers, each named for one of the apostles. Both magical and mundane methods can aid in the process, though not necessarily in the deduction. The key to getting out of this locked box is in knowledge of medieval medical understanding and practice. To that end, a nine-page appendix covers the subject in more than enough detail for the adventure as well as beyond it. A one-page handout also covers the subject in brief.

The GM does have some work upon his part, as much of the adventure has to be tailored exactly to the player characters and their histories. In particular he will have to interpret and represent them through medieval and Christian symbolism. This process may prove a challenge to some, and although some advice is given, both more advice *and* some references would have helped.

If the troupe can escape and acquit themselves well, Lady Aldona will be more than generous in rewarding them. Not only can she gift them with tomes to study for the learned and ordinary goods for the mundane or unlearned, and even minor magical items. There is also the possibility of characters gaining beneficial virtues and losing non-beneficial ones. The possibilities of using the setting beyond the adventure are also discussed, since the Lady Aldona wishes to continue her studies. One idea if the players are possessed of a malicious streak, is for them to direct their characters' enemies into Lady Aldona's trap!

Physically ***Cause and Cure*** is a nicely put together book, in particular, the use of blurred images is pleasingly effective. Where in other books it distracts from the factual content, here it works because of the very nature of the scenario's location and ethereal ambiance.

As a scenario, ***Cause and Cure*** is the type that will infuriate the less cerebrally inclined players, who will suffer frustrations aplenty. To others, ***Cause & Cure*** is something to relish, presenting a fascinating series of challenges and roleplaying situations. That the scenario is also relatively easy to slip into a campaign is a bonus. It would also be possible to adapt it to another system -- Green Ronin Publishing's [Medieval Player's Manual](#) would be an aid in this, if for example, the GM wanted to use the adventure under the **d20 System**. Otherwise, this is an excellent adventure for ***Ars Magica***, one that explores both the medicine and symbolism of the medieval period, both in play and presentation.

Pyramid Review

The Algernon Files (for *Mutants & Masterminds*)

Published by [BlackWyrms Games](#)

Written by Aaron Sullivan, Dave Mattingly, Leigh Brandon, & Ryan Wolfe

Edited by Dave Mattingly

Art by Derrick Thomas, Eric Rademaker, Ryan Wolfe, Brad Parnell

128-page b&w hardcover; \$24.95

There's good news, bad news, and great news. The bad news is that we're getting yet another collection of super-people for use with a superhero RPG. The good news is someone else is putting it out -- it's not the original company feeling they have to do this to keep up with everyone else who's doing a super-game of their own. The great news? The book itself. *The Algernon Files* is a terrific piece of work.

BlackWyrms Games' book falls under the auspices of the M&M Superlink, marrying it to the *Mutants & Masterminds* RPG. The eponymous Algernon is the artificially intelligent computer personality that oversees Fortress, Doc Steel's headquarters, though the book makes little attempt to present the files as if they were given from the AI's perspective (this turns out to be a good thing).

The book is divided into sections, with heroes at the front and villains at the back, many subdivided into teams, independents, etc. Steel is the leader of the Sentinels, the latest incarnation of a superteam that has gone through changes as the United States' fortunes have risen and fallen. He's the son of the original Doc Steel, and while his team has some fairly stock superfolks -- a speedster, a mage, a brick -- they aren't a Justice League clone. This entry also introduces us to the first of the book's many dandy maps and schematics. The artist lays out Fortress using a simple, uncluttered look that can be taken in at a glance. The team's vehicles are written up like the base, using the *Mutants & Masterminds* system.

Other groups include the quasi-military patriots know as the Arsenal, America's go-to supergroup; the Covenant, a collection of magicians and mystics who have been knocking around since the Middle Ages; and the Aerie, a whole brood of heroes plugged into an aerial theme. The rest of the allies are unaffiliated, like Horus, the human host who fights against the newly risen agents of Apophis, or the publicly beloved Best Man. The absolute drop-dead coolest character -- and not just in this book -- is Film Noir, a cinema character brought to life who by himself makes the whole book worthwhile.

Then the villains step up to the plate, headed by "heavy hitters": the Serpent Queen (Horus' arch-foe), the time-traveling mega-villain Praetorian, and Sepulchre (who, although he owes some pretty obvious debts to existing characters, is still more wicked-looking than any of them). Most of the baddies are in groups, like the Sinister Circle, a team whose membership has undergone more changes than even the Sentinels; Hell's Belles, a sexy outlaw rock group whose necromantic style is a bit more gruesome than most four-color games allow; and the Black Knights, who are just in it for the money. The solo operatives aren't overwhelming, but there are a couple of gems like the demonic dealmaker the Lord of Mirrors and the effectively disturbing fey know as the Crone.

The appendix is perhaps the weakest part of the book . . . not that all of it is bad, just that it's often unremarkable. The

feats are mostly bonuses to skills (some with predictable names like Jack of All Trades, but hey, since everyone else has used it . . .). There's a new way to assign minions, should you need to beef up the ranks beyond what the core ***Mutants & Masterminds*** book offers, and a feat for getting points to spend on special vehicles. The knockback rules get some tweaking, nauseate is codified, and dimensional travel is an extra for yanking things around in time and space. In any case, if it all proves useless know that there are only a few pages of it.

They pack a lot onto a page. Not only are the portraits nicely done (a little sub-par when compared to your average comic -- competently drawn, but the characters look a bit listless, like they're only now trying on their costumes), but the layout is sharp and informative, and the writing is concise.

BlackWyrms is to be commended for its quality material. If you have to put out a book like this in what is already an overcrowded market, it had better shine. This ***The Algernon Files*** does, and then some. Some sentences are awkward, run long, or overuse big qualifiers (like "phenomenal"), but the text is professionally managed. The writing remains simple, entertaining, and crisp, the world presented feels like part of an organic whole, and the work feels personal. Even when something harkens back to the old saws one finds in comics and their cross-marketed brethren, ***BlackWyrms Games*** makes the work their own with fresh and reinvigorated characters and ideas.

--Andy Vetromile

Dork Tower!

Dork Tower!

Zero Sum, Many Lots

Lately I've been reading -- and reading about -- some old comic stories. ("Old" as in "1950s-1960s old," you young whippersnappers.) One of the aspects that amazed me about them is how willing -- nay, eager -- the comics of that era were to fling out concepts for stories that would seem to have long-ranging consequences, but would never be dealt with again.

In one story, Superman (as Clark Kent) is visited by his Aunt Minerva, a meddling old woman who is the younger sister of his foster father Jonathan Kent, and thus (presumably) not from Krypton. Aunt Minerva insists on moving in, since, y'know, she's family and all. Typical hijinks ensue revolving around Minerva possibly discovering Kent likes to dress up in a flashy outfit and come out of closets. Eventually Kent convinces Minerva to marry a suitor who's been stalking her (and is, presumably, even crazier than *her*) and the two of them ride off into the sunset, presumably never to be seen again.

(Standard disclaimer: I swear I'll tie this into gaming just as soon as I think of a way how.)

In a similarly old Batman story, Bruce Wayne is visited by his cousin Bruce N. Wayne, who is Bat-Bruce's namesake and is also, certainly coincidentally, a master detective. Typical hijinks ensue revolving around N. Wayne possibly discovering Bat-Wayne likes to adorn himself with masks and handcuffs and come out of caves. Eventually Bat-Wayne convinces N. Wayne that he's *not* Batman, and N. Wayne rides off into the sunset, presumably never to be seen again.

While I live the manic imagination behind these old tales, as a modern fan I find myself baffled, since both of these tales would seriously affect modern perceptions of the character. Envision a rain-soaked Dark Knight perched atop a gargoyle of a suitably gothic tower. The thought balloon reads: "I find myself waging an unending war against crime, all stemming from the night a criminal gunned down my entire family. Oh, except for my namesake cousin Bruce, the master detective. I wonder how he's doing, anyway?"

These thoughts came springing to mind as I was running a **Torg** game at [Dreamation](#) this year. (See? Related to gaming! Only took two paragraphs! I rule!!!!1one1) One of the problems of running a convention game coincided with one of the difficulties in how I run many campaigns: The idea of a zero-sum game. See, the ability to make a campaign-wide difference in a con game is (or probably should be) close to zero . . . or, perhaps a bit more correctly, the change the characters have a chance of affecting the campaign world should be determined ahead of time by the gamemaster. ("So, to recap, in this game world the Emperor is the most important being in the known worlds. As you stand over the body -- having unexpectedly killed him -- visions of the galaxy's collapse fill your eyes and -- coincidentally -- give me a migraine . . .")

The zero-sum adventure ensures that events are more or less where they were at the beginning of the adventure . . . or, perhaps more importantly, the events of the adventure will not advance the overall storyline of the campaign beyond where it began at the beginning of the campaign.

The difference between a zero-sum game and, say, a [static](#) campaign is subtle but significant. In a static campaign, the game world won't change. In a zero-sum game, the game world could change, but it won't because the PCs don't let it. As a result, a zero-sum adventure requires a bit more cooperation on the part of the players.

For example, in a static campaign a PC detective might encounter a diary where he discovers that his cousin was *also* a famous detective, and happened to be his namesake. Perhaps the diary leads the detective to his cousin's last unsolved case. At the end of the adventure, he can confidently put the diary away, knowing that any future adventures won't have anything to do with his formerly unmentioned cousin. In a zero-sum game, the namesake cousin *himself* shows up, presents the PC with an unsolved case (which he, naturally, solves), and at the end of the adventure the cousin wanders off; this cousin is also never seen again, but simply because the PC chooses not to do so!

Of course, the reason he doesn't do so is because it'd mess up the ongoing stories. And this zero-sum assumption

allows the GM to tell tales that wouldn't be otherwise possible. As another example, in my convention game I had a bunch of ninja in invisibility suits attacking the heroes. Heroes win; ninja fall over. Now, what *didn't* happen is the immediate looting of the ninja for their keen suits. In a static game they simply wouldn't work (or they had self-destruction circuits, or whatever); the PCs can try to change the game world, but the game world fights back. In a zero-sum game, however, the PCs don't even *try*; it would be against genre conventions to try to loot the ninja, so they didn't even bother.

What are the advantages of a zero-sum game? Well, first it gives the GM a lot of freedom that's otherwise impossible. In particular, any kind of unusual tech – such as from gadgeteers or aliens – can be introduced, and at best the only concern about the long-term effects of that gear is that it might become part of the heroes' trophy case. ("Hmm . . . Moon-Men are attacking? We need to get out of here and think of a new plan! Oh, make sure you hit the light switch by the Orbital Laser on the way out . . .") For players, you get to enjoy a wider range of possible adventures (Long-lost cousins! Under-earth races! Romances with invisible beings who only live for a week!) without worrying about the long-term consequences.

Sure, it's cinematic – nay, unrealistic – as all get-out. But it can be fun. And it's possible to use the idea selectively (such as the idea of [zero-sum knowledge](#) in a game). And it's also a premise that's difficult to implement in other commercial campaigns, making it another "[unsellable](#)" idea you can enjoy yourself.

* * *

Tonight at 7pm CST the *Pyramid* [chat room](#) will be invaded by the Wizard of Weird, Kenneth Hite. He'll be talking about his soon-to-be-released **GURPS Infinite Worlds** and will no doubt be happy to answer your questions about that or, time permitting, anything else your heart desires.

And if you're not a *Pyramid* subscriber yet . . . then how the heck are you reading this?!

--Steven Marsh

Union Space

A Modern Day Space Campaign

by Steve Jensen

History

In July of 1969, man first set foot on the moon. After that, to the general public, the "space race" against the Soviet Union had been won. Over the following years, interest in space exploration waned, and only the smallest leaps in technology were shown to the public.

In reality, the space race continued for decades. After the moon landings, and the creation of the space shuttles, the United States began spending billions on faster than light research and **Technology**: These projects were kept completely secret of course, as the cold war continued primarily in an effort to develop this technology and keep it out of the hands of other countries.

Working FTL theories were fully developed by 1972, and a working FTL spacecraft was built in Nevada in 1974, and the exploration of space began. The first star system reached was Alpha Centauri, which took three months of travel to reach. By 1977, six more star systems had been explored and the speed of the new starships being developed was gradually increasing. By this time, the Soviet Union had also built their own secret FTL project and explored some of these same star systems. They also kept this a secret from the United States.

However, in mid-1978 an explorer from the United States detected a Russian spacecraft as it entered our star system. As the U.S. ship watched, the Soviet craft was attacked by an unknown alien craft. Responding to the distress call, the armed U.S. ship disabled the smaller alien craft and rescued the Russians from their ruined starship. With the Russians on board and the alien ship in their cargo hold, the Americans returned home. The secret was out that both the Russians and Americans had FTL ships, although the public still had no idea. A treaty to study the alien craft jointly was signed, and researchers made several discoveries.

The first regarded the aliens themselves. Only one alien survived, and it was imprisoned and studied. The alien was a Menon. This led to deciphering first the Menon language and then their computer records. Their records showed that Earth was a "claimed world," and that listening posts had been set up on the Moon to monitor Human space activity. It was learned that the Menon were planning an eventual invasion and enslavement of the primitive Humans, but considered Earth as a non-threat due to its low technology; however, if advanced space flight was ever detected by the Menon, the invasion plans would be pushed forward.

The next discovery was that the Menon ship had detected the Russian explorer and was planning to head home to report on the discovery. The ship had no FTL communication technology, which Earth has also not yet developed. The final discovery was the Menon **Technology**: Several systems that were reverse engineered, included artificial gravity and a gravity-based reactionless drive system. The study also revealed that we had technology that the aliens apparently lacked, including advanced stealth technology and newly developed force fields.

The result of these discoveries resulted in an agreement between the United States and Soviet Union. No new space technology would be made publicly available, and only the most basic satellites and already existing spacecraft would be used for orbital flights, while both countries began building a defense fleet in secret. Several other countries were informed of these events when they began developing space technologies, including China and Europe.

This treaty held until in 1990, the Soviet Union began to collapse, due to the massive expense it invested into its space defense program. The new leadership of Russia wanted to begin using the fleet to further explore and gain intelligence on the alien enemy. A compromise was finally reached, and the Union was formed.

The Union was originally called the United Earth Space Defense Union, but that name quickly fell out of use in preference of just calling it the Union. The goal of the Union was both defense of Earth against all extra-terrestrial threats, as well as the exploration of space and the gathering of information on any possible threats.

That was 14 years ago. Today, in 2004, the Union has a fleet of over 100 warships and explorers, most of which are now housed in huge underground facilities in Nevada and several other locations around the world.

The Union

The union is a secret multi-national organization that is primarily responsible for the defense of Earth from hostile alien races and exploration of deep space. The Union keeps itself a secret due to the frequent "checkups" that aliens perform on Earth. Although the aliens have established and retrieve data from sensing systems in several places in the solar system, they still occasionally make detailed scans, collecting samples with their scout ships. The Union regularly tampers with their sensor stations to hide any possible evidence of their starship use, but they can't stop the scout ships from scanning the planet. At these times, all Union starship activity halts until the scouts move on. The general public is kept unaware to keep mention of the Union and its activities out of the news. A news broadcast of human starship capability would easily be intercepted by one of these scouts, and result in a Menon invasion of Earth.

Union Operations

The Union has several mission types it performs routinely:

- **Information Interception:** The aliens have several listening posts in our solar system. All of them are known to us and they have been tampered with to record only specific information that the Union feeds them.
- **Alien Awareness:** Periodically, one or more alien ships enter our solar system; they are on a schedule that can usually be predicted. At these times, all Union space activity is halted while the aliens pick up their recordings and scout the system.
- **Alien Defense:** On two occasions, alien ships in our system have had to be destroyed when they detected Union operations. The wreckage of one was intentionally crashed into the Moon near their listening post (which is unmanned), and the other captured and brought back for study. These events do not seem to have raised the aliens' suspicion.
- **Exploration:** Five starships have been designed for stealth operations and used to explore other star systems in order to locate the enemy. Four are operating at any one time and the fifth is reserved for rescue operations. At this time, only two alien colonies have been located, both from different alien species.
- **Technological Development:** All new space technology Earth develops, as well as any recovered alien technology, is studied and incorporated into the existing fleet, as well as into new ship designs.
- **Construction:** At this time, the Union is building a new starship about every month. Most of these are flown once to shake them down, and then are stored in one of the underground bases for future use. Most have full crews standing by in case they're needed, and personnel are regularly rotated into the active exploration crews.
- **Research:** The union has hundreds of scientists around the world working in secret on various research and development projects that it plans to keep hidden from the public. Most of these projects are directly related to space travel and the technology to support it.

Union Technology

The Earth is TL8 while the Union has access to TL9 hardware with a few captured and reproduced technologies that are TL10. The Union has access to the following technologies that the general population of Earth has no knowledge of.

- **Warp Drives (TL9):** The Union developed faster-than-light space travel in 1974 and has been refining it for the past 30 years. FTL equipped ships have a series of field emitters embedded in the skin of a ship which "push" space away from the ship. The effect of this is that some of the laws of physics fail, allowing the ship's normal

engines to propel the ship past the speed of light. This "warp field," which is better described as an area with a reduction of physical laws around the ship, also prevents the ship from being damaged from collisions with space dust. When the dust enters the field, its velocity becomes relative to the ship as if the ship were moving at normal sublight speed. The speed of the ship is limited by the strength of the field, the ship's engine power, and collisions with dust particles, which tend to collapse the field if too much dust enters it.

- **Artificial Gravity (TL10):** This technology was reverse engineered from captured alien **Technology:** Emitters in the deck plates project a field directly above them that can simulate the pull of up to 1.5g. This technology is poorly understood by the Union, but is easily reproducible.
- **Gravity Drives (TL10):** The gravity drive technology is another that was gained from reverse engineering alien examples and quickly replaced the chemical rockets and ion drives that had previously been used. The engines consist of large projectors that produce a high negative gravity field within the "exhaust cones" of the engines, which push the ship away from the gravity field. The engines produce this field constantly, which essentially produces a constant thrust. As a side effect, solid weaponry cannot easily strike a ship from behind when the engines are on.
- **Cold Fusion Power (TL9):** This energy source has actually been invented several times by Earth's scientists, but each time, the Union has stepped in and suppressed it, usually hiring the scientists involved. The cold fusion signature is one of the power sources the aliens actively are trying to detect to gauge Earth's level of **Technology:** These power plants are powerful and safe, and are being used to power all of the Union's starships, and have heavy shielding on them to prevent detection.
- **Weaponry (TL9):** Lasers have been developed into very powerful weapon systems and are mounted on all Union ships. The ship's lasers are also used for communication with other Union ships and with the Earth. Beamed laser messages are generally considered secure from interception. Most ships also carry a small number of nuclear missiles, but these are ineffective as space weaponry due to the ease of shooting them down. They are primarily intended as ground attack weapons, but may be used as a last resort to hide evidence of the ship itself to prevent capture.
- **Shields (TL9):** Humans developed force field technology in 1982. As yet, no aliens seem to have developed any kind of force field system. All Union ships are equipped with them, and smaller systems are installed on most combat vehicles. They are too bulky still for personal use.
- **Stealth (TL9):** Due to the cold war and the Union's need to keep its secret, Humans greatly developed their stealth **Technology:** The dull black finish and other ECM systems on the Union starships greatly reduce the chance of detection by radar and prevent many other kinds of detection systems as well.

Aliens

So far, four alien species have been detected.

The Menon

The Menon come from a world with a dimmer sun than Humans. Their home world never evolved mammalian or reptilian life, allowing insect life forms to develop into higher forms. The Menon evolved from the hunter/gatherer caste of a type of predatory species that has since disappeared from their world. They have no caste system and are not a hive mind.

So far, no Menon worlds have been found, but two of their slave worlds have been.

- **Appearance/Physiology:** The Menon are a humanoid insect-like race, with an interior skeleton as well as a thick exoskeleton. They stand as tall as an average man. Their bodies are thin and streamlined, allowing them to run and swim very quickly. They have two arms, each with three fingers and a thumb, and two legs. Their heads are flat with a large mouth, small nostrils, and a row of three small eyes on each side of their heads. They are able to see much better than humans, ranging into the ultraviolet spectrum. They are about as strong as the average human. They have no hair and they range in color from light to dark gray. They are distinguished from one another by the size and shape of shell ridges on their heads, as well as tattoos and inlaid metals and gems in their shells. They wear clothing when needed as humans do.

- **Psychology:** The Menon are a very materialistic race that believes that everything has a price. They believe that any worlds they discover through exploration are theirs along with the populations on them.
- **Technology:** The Menon are generally a TL10 culture. Menon have faster drives, more efficient power systems, and their systems are generally about 50% better than the Human equivalent. However, they have no shield technology, and Human stealth technology is much more advanced. One of the technologies they have developed are brain implants that can control the actions of the implanted subject, as well as increase their intelligence, but also giving them a slave mentality. This has been fully developed for the Baro, and prototypes are being tested for several other races.
- **Role in the Campaign:** In most campaigns, the Menon will serve the roll of the "evil bad guy" race, with most adventures having them as antagonists in some way.

Basic Move +1 (+5 points)
 Damage Resistance 3 (+15 points)
 Ultravision (+10 points)
 Acute Vision 2 (+4 points)
 Peripheral Vision (+15 points)
 Night Vision 2 (+4 points)
 Greedy (-15 points)
 +38 points total

Kidiv

The Kidiv evolved on a desert world from hunter-gatherer primitives that spent their lives under foot of their world's dinosaur sized wildlife. They developed technology much slower than man did, taking hundreds of years between the invention of space flight and when they discovered FTL travel. As such, the race had sent out dozens of STL colony ships to colonize nearby stars and colonized nearly every rock ball in their home system. The Kidiv went to war with the Menon almost as soon as they discovered FTL travel. The Menon, having been in space for many years, had discovered and enslaved 2 worlds that the Kidiv had colonized with STL ships.

Humans have detected one such enslaved colony world, but have not yet found any free Kidiv worlds. Only 1 Kidiv starship has been seen, but contact was short and little information was learned from them.

- **Appearance/Physiology:** The Kidiv are shape-wise and anatomically, very similar to humans, but they have a reptilian appearance, with scales of various colors depending on their heritage. They have slit-pupil eyes that are colorblind. They reproduce similar to humans, but lay eggs instead of having live births.
- **Psychology:** Although slightly smarter on average than a Human, they are less imaginative and slower to develop new ideas. This makes them poor inventors or scientists, but they have a greater understanding of these things once the ideas are finally developed. The race has little understanding of light technology and instead of names for colors, they have names of shades of gray.
- **Technology:** Kidiv have similar technology to the Menon, but use mass projectors and missiles instead of lasers, which is resulting in their ships being easily beaten in space battles. Their worlds typically have much lower technology, depending on the individual society. Many of their colonies are TL5 or 6 and the average TL on their home world is only 9, with access to TL10 technology available to large corporations, universities, and governments.
- **Role in the Campaign:** The Kidiv can be either enemies or allies, depending on how well contact with them goes. They have met no friendly races so far and may easily mistake Humans as another Menon puppet race.

Kidiv Racial Template

IQ +1 (+20 points)
 Colorblindness (-10 points)

+10 points total

Fen

The Fen were just coming out of their dark ages and beginning a renaissance period in technology when Menon explorers found their world and began colonizing it. A large portion of their population was enslaved by the god like bugs from the sky. Their world was industrialized and became one of the Menon's largest colony worlds. The Fen have been exported to several other Menon colony worlds as slave labor.

- **Appearance/Physiology:** The Fen evolved from tree dwelling leaf-eating bears. They are slightly shorter than an average human and thinner. They have short fur over most of their bodies, which has a similar color range to human hair. They have two arms and two legs and a short non-prehensile tail usually about a foot long for an adult. They have vaguely bear-like faces.
- **Technology:** For the most part, their world is TL6, but the areas where the Menon have high populations are more modern.
- **Role in the Campaign:** The Fen are an example of what the Menon have in store for Earth. Unlike the Baro though, the Fen can and do occasionally rise up in revolt, resulting in large losses of life.

Fen Racial Template

1 ST (-10 points)

+1 DX (+20 points)

+1 HT (+10 points)

Social Stigma: Subjugated (-20 points)

Baro

The Baro are another primitive race that the Menon discovered and enslaved. Naturally, the Baro are little more than animals, but when discovered by the Menon, several specimens were artificially augmented with implants that increased their intelligence to make them better slaves. Over several decades, more and more implants were developed to make them better-equipped laborers.

- **Appearance/Physiology:** The Baro appear like a horse standing on thicker hind legs with an extra set of arms half way up. They have two legs that end in bony hooves and four arms with two fingers and a thumb on each hand. They have long narrow heads with two eyes and a small mouth and small nostrils. They average nine feet in height and 520 lbs. Virtually all adult Baro, other than the primitives that have not been enslaved, have numerous cybernetic augmentations, and all have a common brain implant that increases their intelligence and helps to insure their loyalty. Without this brain implant, they have roughly the same intelligence of smart chimps or Neanderthal man. The implant also improves the Baro's memory. If the implant is damaged, a Baro will still remember things, but accessing those memories will be spotty at best. Baro children are usually not implanted till the age of 15, after they reach maturity. This is when any schooling takes place, which means that a Baro with a human high school education may be as old as 30 years old. Of course, a long education costs a lot of money, so Baro are only taught just what they need to do a specific job.
- **Psychology:** Baro are a very matter-of-fact race, with virtually no belief systems. They have no religions and don't believe in the supernatural at all. This made them a difficult race for the Menon to enslave, until their brain implants were developed. Few members of the race have phobias. They are a proud race with a very ingrained honor system that even the implants haven't been able to suppress.
- **Technology:** The Baro's technology comes entirely from the Menon. The few areas of their homeworld where Baro are free and still primitive are TL0.
- **Role in the Campaign:** The Baro are the muscle the Menon will use as security and labor on most of their worlds.

Primitive Baro Racial Template

+3 ST (-10% for Size Mod 1) (+27 points)
+5 Lifting ST (-10% for Size Mod 1) (+14 points)
-1 DX (-20 points)
-3 IQ (-60 points)
+1 HT (+10 points), +5 HP (+10 points), Size Mod. 1 (0 points)
Tech Level 0 (-45 points)
Damage resistance 1, Thick Skin (-40%), (+3 points)
2 Extra Arms (+20 Points).
-41 points total.

Enhanced Baro Racial Template

+3 ST (-10% for Size Mod 1) (+27 points)
+5 Lifting ST (-10% for Size Mod 1) (+14 points)
-1 DX (-20 points)
+1 HT (+10 points), +5 HP (+10 points), Size Mod. 1 (0 points)
Damage resistance 1, Thick skin (-40%), (+3 points)
2 Extra Arms (+20 Points)
Slave mentality (-40 points)
Social Stigma: Subjugated (-20 points)
+4 points total.
Note: Enhanced Baro will also have a variety of cybernetic implants depending on their job.

Adventure Themes

The following are several possible ideas for Union Space campaigns.

- **Explorers:** The crew of the U.S.S. (Union Star Ship) Washington has been sent to explore new star systems and possible Menon worlds. The ship must, of course, not reveal itself as a Human ship to prevent the Menon from invading Earth.
- **War Fleet:** The time has come to defend Earth and its warships are launched. The PCs might be crew of a battleship with orders to find and attack Menon ships, or find allies in the war.
- **Abducted:** The characters might be average modern-day citizens that are abducted by the Menon for study and interrogation and wind up in a prison on one of their worlds. Can they escape alone, or do they need rescue by the Union? Also, the Union can't let the PCs let the secret out; do they recruit the PCs or imprison them on Earth?
- **Conspiracy Theory:** The heroes might be reporters, investigators, or conspiracy theorists looking into odd rumors that America has working spacecraft. How far are they willing to go to find the truth, and how far will the Union go to protect the secret?
- **Revolt:** The PCs are slaves of the Menon, human or alien, and have decided to start a revolt to free the colony world they're on from the Menon tyranny.

More Questions than Answers

Small But Satisfying

by Chris Aylott

Hear that noise? It's crunch time in the roleplaying segment of the adventure game hobby.

The sales consolidation of the last couple of years has been picking up speed, and over the last few months the numbers have gotten so bad that publishers are openly admitting that they're in trouble. Guardians of Order got rid of its employees. Hero Games seems to be getting rid of its retailers. Other companies are dropping lines and moving on to greener pastures.

And what does a humble retailer like me have to say to all of this?

"Good."

Here's the thing. I seem to make about the same amount of sales whether I have 100 RPG titles on the shelves or 500. I've been tracking my lines for years, and at any given moment I'm making a bunch of money on ***Dungeons & Dragons***, a slightly smaller bunch of money on White Wolf's games, and some handfuls of money on whichever one or two other game lines are hot in the community at the moment.

That mix has shifted recently; more official ***Dungeons & Dragons***, product, less everything else. The overall number has also grown with the overall growth of the business. But it's about the same amount of money, now more concentrated in the market leader. And as I nip and tuck the RPG section, I'm finding I can make that money on less than half the inventory I carried three years ago.

The same or more money on less inventory means more money for me. More money for me means the World's Greatest Baby gets Huggies and not Luvs. The World's Greatest Baby likes Huggies. Therefore, I like industry consolidation.

One store doesn't confirm a trend. But the Wizards of the Coast RPG section has been having very good years lately, and most other RPG publishers have not. The money has been moving to the market leaders for more than two years now, and it's time for RPG creators to face the likelihood that the money isn't going to move back.

This doesn't mean it's impossible to run a successful RPG business that's not Wizards of the Coast. But it's getting harder all the time, and it looks like most of the current RPG businesses don't know how to compete. So what's an RPG creator going to do when he can't make a living creating RPGs?

What's My Motivation?

Let's gaze into our navels for a moment. (Hmm. Belly lint.) Why do roleplaying game creators create?

It can't be the money. As been pointed out many times, most creators can make more money flipping burgers at McDonald's. It could be the pleasure of running a business, because some creators do enjoy that. Not much we can do for those folks, but they're the ones with the best chance of succeeding in today's market. Most creators draw their satisfaction from the act of creation itself. They want to share ideas with the world, and the money is a secondary reward.

That's the motivation of an artist, not a business person. If you're in business, you do a project because you think it will make money, and you drop it the moment a better investment comes along. (If you haven't guessed already, I'm a

business person.) If you're an artist, you do a project because you have to, and you don't drop it until your need to express yourself is fulfilled.

In the past, I've believed that game creators should think of themselves as business people, that they should demand fair value for their products and make their decisions based on what will be the best return for their efforts. I've turned around on that idea. In a market where only a few participants can hope gain financial reward for their efforts, doesn't it make more sense to opt out of the business world and pursue your dreams as an artist?

What happens when we stop looking at games as commercial products . . . and start looking at them as art?

Tyger, Tyger Burning Bright

As art objects, roleplaying games kind of suck. The typical RPG book offers ugly art, arcane text, budget printing and machine binding. Most publishers try to put out work that is adequate and affordable, to get their work out to the widest audience possible.

Contrast this with the experience of William Blake. More than just a poet, Blake considered his [art and calligraphy](#) to be as important as the words he wrote. Even his text colors were carefully chosen -- he mostly wrote in orange and brown, but used blue and other colors for emphasis and other effects.

Blake couldn't mass-produce his books with the technology of the time, so he didn't try to reach a mass audience. He printed and bound only 18 copies of *Songs of Innocence and Experience*, and scholars believe he only sold one of them at full price. As a commercial publisher, William Blake was a disaster with "a horror of money" -- but he is still read today, and copies of *Songs of Innocence and Experience* have sold for more than a million dollars.

It's hard to imagine any RPG creator becoming literary history in the way that Blake is. But he represents an ideal that's very different from the commercial striving of today's game publishers. Blake didn't produce his works, he crafted them. He made his books look and feel and read exactly the way he wanted them to, and if that meant making only a few copies, then so be it.

Creating an RPG could be more than writing some rules text, drawing some fantasy art and slapping it together on standard paper in a standard size and binding. After years of decline, the art of fine bookmaking is being revived in artisans' workshops and university courses. Once you embrace the idea of creating games as art rather than commerce, there's no reason not to give as much attention to the form of the game as its content.

What would it be like to own a hand-made roleplaying game? To know that you possess a work of imagination that only a few dozen or a hundred people can ever own? To appreciate the work as much with your eyes and hands as your mind?

Seeding the Microclimate

Then again, maybe the art of the roleplaying game doesn't lie in its physical form. Games come to life when you play them, and the book on the table may be less important than what the players do with it. If that is the case, then how can the creator of a game pursue the art of how it is played?

One solution may be to make the game more personal and specific to its players. Roleplayers have a long history of customizing and tinkering with their games. Almost all RPGs are "unfinished," in the sense that once the players get a hold of the game, they have to tweak it to fit their individual playing style. The commercial game designer can't do much to help the players improve the fit of their game, and rarely has the opportunity to learn from the players' improvements.

An artistic game creator dealing with a small group of patrons has more flexibility. The creator can act as a kind of Super-GM, giving and receiving suggestions on rules, adventure plots, and setting material. The creator can

personalize the game for its players, combining the comfortable fit of house rules with the authority of official rules.

The possibilities get even more interesting if the creator works with a small network of different player groups. If several independent groups are playing within the same official setting, and that setting is monitored by its creator, then each group can have an effect on the setting. If Player Group A stirs up trouble in one province, then the creator can update the official setting in ways that affect the adventures of Player Groups B, C, and D.

In this model, the creator's art becomes the presentation of a consistent, fun, living world that reacts to the deeds of all the players participating in the game. Playing the game would be like participating in a really good LARP, only without the boffer weapons and trips to the woods. (In fact, this kind of creator-driven game would work well as a LARP.)

Like most performance art, this kind of art is ephemeral. You can preserve records of what happened, but the art lies in the experience itself. On the other hand, it's possible to spread the experience through an entire community.

A creator could hook up with a local store and use it to launch a series of games played by customers of the store. Each individual gaming group would be able to play a customized campaign on its own, but each group would also be part of a larger experience. The store also benefits through sales of the setting materials and hosting paid events designed by the creator. A brilliant "mega-campaign" would be remembered and relived by the entire community for years to come.

And There's Always PDF

Of course, roleplayers are a conservative breed. (How else to explain our undying love of 30-year-old game systems and British comedy shows?) Putting out books on PDF may be all the self-expression that most creators need, and there's certainly nothing stopping them from running money-losing small presses.

But if you're not going to have a million dollar idea, wouldn't it be nice to make a game that is more than just fifteen minutes of fame on the Forge or RPG.net? Why not push the envelope a little and really create?

Affections Dark As Erebus: *The Merchant of Venice*

*"The man that hath no music in himself,
Nor is not mov'd with concord of sweet sounds,
Is fit for treasons, stratagems, and spoils;
The motions of his spirit are dull as night,
And his affections dark as Erebus:
Let no such man be trusted."*

-- William Shakespeare, *The Merchant of Venice*, V:i:93-98

As we do each [Valentine's Day](#), we turn to stories of love. Love, and ritual sacrifice; love, and a werewolf; love, and the highest of high magics. In short, to Shakespeare, and his [dramaturgies](#) of the heart. As with [last year](#), our story lies in Venice. Pull back the curtain, and let the music play.

*"In sooth I know not why I am so sad,
It wearies me, you say it wearies you;
But how I caught it, found it, or came by it,
What stuff 'tis made of, whereof it is born,
I am to learn."*

-- William Shakespeare, *The Merchant of Venice*, I:i:1-5

Antonio, a merchant of Venice, loves his bosom friend Bassanio, who is smitten with the beautiful heiress Portia of Belmont. Bassanio has borrowed from the generous Antonio before, but needs another big loan to woo Portia in style. Antonio's capital is tied up in ships overseas, but he borrows 3,000 ducats from Shylock, a Jewish moneylender. Shylock, seeing Antonio on the verge of bankruptcy, offers the loan without interest, but if Antonio cannot repay it, Shylock may claim instead a pound of Antonio's flesh. With the money, Bassanio and his lackey Gratiano go to Belmont, where Portia's suitors must find her portrait in one of three caskets. The rulers of Morocco and Aragon choose the gold and silver caskets, unwisely, but true Bassanio (with much help from Portia's musical selections) chooses the lead casket and wins Portia's heart. She marries Bassanio, and gives him a ring.

While this is going on, Shylock's daughter Jessica has eloped with Bassanio's friend Lorenzo (and with much of Shylock's fortune), enraging the moneylender against all Christians. When Antonio's ships are reported lost at sea, Shylock demands repayment at court. Bassanio rushes back to Venice for the trial. Shylock rejects Bassanio's offer of triple repayment (with Portia's money), demanding the letter of the bond be fulfilled. Portia, disguised as a lawyer, pleads for mercy to no avail -- and then points out that his bond does not include blood, and if Shylock takes over one pound of flesh by even a fraction, he will be hung for murder. Portia then turns the screws further, arguing that by seeking Antonio's life, Shylock must turn over his wealth to Antonio and to the Duke. On the condition that he become a Christian, this sentence is suspended, and Antonio is free. Out of gratitude, Bassanio gives the "lawyer" Portia's ring and returns to Belmont -- where, when Portia demands her ring, he shamefully admits he cannot produce it. She reveals her masquerade, returns her ring to Bassanio, and all the lovers are happy. Even Antonio is consoled when three of his ships miraculously return, restoring his fortune.

*"The paper is the body of my friend,
And every word in it a gaping wound,
Issuing life-blood."*

-- William Shakespeare, *The Merchant of Venice*, III:ii:256-258

The Merchant of Venice was entered into the Stationer's Register on July 22, 1598. Shakespeare most likely wrote it in the fall of 1596, since it includes a topical reference to Essex' raid on Cadiz that summer, but that date is speculative. 1596 is also when Shakespeare's most likely source for the courtroom scene, Sylvain's *Les Histoires Tragiques*, first appeared in English. The basic story of the courtship of Portia, the pound of flesh, and the ring-and-disguise routine came from Fiorentino's 1558 *Il Pecorone*, in which "the Lady of Belmonte" challenges her suitors to remain awake to claim her, and drugs their wine to make them sleep. Shakespeare added the "casket bit" (which he likely took from the

14th century *Gesta Romanorum*) to this unpleasant tale, along with the names Portia and Shylock. "Shylock" is entirely Shakespeare's coinage, and comes either from the Hebrew word *shalak*, meaning "cormorant" (a legendarily greedy and rapacious bird), or from "shullock," obscure Tudor-era slang for a shabby or contemptible person.

"What! are there masques? Hear you me, Jessica:

Lock up my doors; and when you hear the drum,

And the vile squealing of the wry-neck'd fife,

Clamber not you up to the casements then.

. . . By Jacob's staff I swear

I have no mind of feasting forth to-night."

-- William Shakespeare, *The Merchant of Venice*, II:v:25-34

Shakespeare cast the whole thing in the model of a Shrovetide (or Carnival, in Venice) masque. Possibly he wanted to create as glamorous a show as possible for his company's move to Blackfriars Theatre, or possibly to increase the chance of noble patronage, nobles being fond of shows with lots of music and bright clothing. Jessica and Lorenzo elope during just such a masque in Act II, and Act V at Portia's manor in Belmont can be seen as a similar performance. Belmont is almost a [fairyland](#), a moonlit realm located [over the water](#) from Venice. Parallels between the ["Beautiful Mountain"](#) and the [Venusberg](#) or other fairy realms "under the hill" strengthen when we remember the enchanted sleep "the Lady of Belmonte" casts her suitors into in the original sources for our play. Portia becomes another Circe or Medea, and perhaps it is mere coincidence that in Belmont Jessica refers to Medea gathering "enchanted herbs" of eternal life, or that Bassanio identifies Portia's hair with the "golden fleece" and Belmont with "Colchos' strand."

"There's not the smallest orb which thou behold'st

But in his motion like an angel sings,

Still quiring to the young-eyed cherubims;

Such harmony is in immortal souls;

But whilst this muddy vesture of decay

Doth grossly close it in, we cannot hear it."

-- William Shakespeare, *The Merchant of Venice*, V:i:60-65

The other quality of Belmont is the omnipresent music, which it also shares with the fairy courts. Music is a recurring theme in the play, with Lorenzo going so far as to explicate Pythagorean notions of the "music of the spheres" in the speech quoted above. Antonio has "music in his soul," and is a purer person; by contrast, Shylock prevents music from even entering his house. As Lorenzo says (in a speech that thematically seems displaced from the masque in Act II to the one in Act V), "the man that hath no music in himself . . . Let no such man be trusted." Antonio forbids music at Shylock's toast to money, perhaps trying to blank Shylock out of the masque and out of the play -- or cosmos -- entirely.

But although the leaden, lugubrious Shylock may be unwelcome, he has his own Pythagorean element to contribute. As Gratiano says, Shylock "almost makest me waver in my faith, to hold opinion with Pythagoras," referring to metempsychosis -- the transference of souls -- not music. He calls Shylock the "wolvish, bloody, starved, and ravenous" reincarnation of "a wolf, hang'd for human slaughter," a gibe among the many canine slurs which make Shylock respond "But since I am a dog, beware my fangs." Heinrich Heine in 1839 went so far as to openly call Shylock a [werewolf](#), the ultimate outsider in Portia's fairyland.

"It doth appear you are a worthy judge;

You know the law, your exposition

Hath been most sound: I charge you by the Law,

Whereof you are a well-deserving Pillar,

Proceed to Judgment: by my soul I swear

There is no power in the tongue of man

To alter me."

-- William Shakespeare, *The Merchant of Venice*, IV:i:233-239

And from where did such Pythagorean notions enter Shakespearean England? Through the good offices of John Dee, of course, who took them from the Christian kabbalist Francesco Giorgi, a Franciscan friar of Venice (as it happens) who wrote *De harmonia mundi* in 1525. And when you shine the light of the kabbalah on Shakespeare's puissant words, yet more patterns emerge. The play turns on the tension between Judgment (the Old Testament law of Shylock) and Mercy (the New Testament law of Antonio). Portia must unite them, crossing between these two Pillars of the Sephiroth, woman disguised as man, arguing for mercy while destroying Shylock with his own severity. (Gratiano likewise has a name of grace -- *gratia* -- but shows nothing but hatred for Shylock.) Portia is thus Tiphareth, the sphere of Beauty, suspended between Shylock/Geburah (Severity) and Antonio/Chesed (Kindness). In Giorgi's kabbalah, Tiphareth is embodied by the sun, an apt role for the woman with golden hair to play. (Although Bassanio hints at her inversion when he says "We should hold day with the Antipodes, if you would walk in absence of the sun.") Lorenzo (whose name implies the victor's laurel) is thus Netzach (Victory) below Antonio on the Tree of Life; his changeable love Jessica (whose name -- which Shakespeare also invented -- stems from "Iscah," meaning something beheld) is the Mercurian Hod (Splendor) across the gap. Bassanio is Yesod (the Foundation, or "basis") below Portia/Tiphareth.

"And they have conspired together: I will not say you shall see a masque; but if you do, then it was not for nothing . . ."

-- William Shakespeare, *The Merchant of Venice*, II:iv:24-25

And this is all without taking into account the troublesome nature of the rings given, lost, and returned, or the alchemical symbolism of the golden, silver, and lead caskets (the first two of which reveal only death and idiocy -- or madness). Shakespeare is hurling everything in his dramaturgical arsenal at this play, from his time-twisting jumps between Shrovetide, an implied Black Friday complete with blameless Christian sacrifice, and Shrovetide again, to the alchemical androgyny of three women (Jessica, Portia, and Portia's maid Nerissa) dressed as men. Why the desperation? Is he, too, trying to contain the ["wolfish"](#) Shylock, dressing him in "Jewish gaberdine" and then imprisoning him in Portia's fairy kabbalism? Was this play perhaps commissioned by the Earl of Essex, so instrumental in the judicial murder of Queen Elizabeth's Jewish physician Roderigo Lopez (cognate, of course, with *lupus*, or "wolf") in 1594? Did Essex' creature [Francis Bacon](#) demand that Shakespeare produce such a containment system, only to find himself and his brother Anthony (both in and out of debt repeatedly) enmeshed within it, as "Bassanio" (from "Bacon"?) and "Antonio"? If so, perhaps the containment system failed in 1601, or perhaps the play's maniacal inversions helped trigger [another play's](#) hidden petard. That year, the Queen ordered Shakespeare's company to perform "a play" for her on Shrove Tuesday. The next day, Elizabeth watched the execution of the Earl of Essex.

Horde Book 1: A Swarm of Stirges (for the *d20 System*)

Published by [Behemoth3](#)

Written by Travis Allison

Illustrated by Sang Lee

54-page perfect bound book; \$12

One of the many things to occur with the launch of *Dungeons & Dragons Third Edition*, and the *d20 System* being made available to third parties, has been a re-examination of some of the classic monsters from the *Monster Manual*. Mongoose Publishing led the way with *The Slayer's Guide* series, and many publishers have followed suit with titles of their own. The latest to leap aboard this bandwagon is first time publisher Behemoth3 with the *Masters and Minions Series*, launching itself with two titles in the series at GenCon '04. The first of these is *Horde Book 1: A Swarm of Stirges*, the other being *Maze of the Minotaur*.

The humble Stirge can be best described as a blood-sucking cross between a bat and a fly (or, as one friend put it, "bats with big bums"). Since its first appearance in the *Monster Manual* in 1979, the Stirge has always been dismissed as a bothersome nuisance, a creature much like the Kobold to be put to the sword before going up a level. Having just celebrated their silver anniversary, this new book sets out to develop the ecology of the Stirge. It draws on the previous examinations written by Ed Greenwood and Tim Richardson, but goes further to add new creatures that either make use of the Stirge or appear because of its life cycle.

The first thing the supplement does is represent the Stirge itself, unchanged from the one that we know and love, that is to be found inhabiting dank dungeon corners, but also marshland and swamps. It is these last two habitats that this volume concentrates upon. The next step up from the Stirge is the Stirge Swarm, meriting an entry of its own because of the swarm rules found in the *d20 System* that make such collections of creatures all the more deadly. Given enough opportunities to feed, and then gorge on some more blood, a Stirge can metamorphose into the amphibious Blood Bloat. It loses the ability to fly, but is an excellent swimmer and the blood sucking proboscis becomes a flexible snout that ends in a tooth filled maw which is very efficient at siphoning the blood (and Hit Points) out of the victim it has latched onto. At home in marshes and swamps, the Blood Bloat constantly lays eggs in long strands of jelly. These attach to the local flora and hopefully will give birth to more Stirges.

The exsanguinated bodies of the victims of Stirges and Blood Bloats sometimes become the gateway for entities from the negative energy plane. This spirit consumes all of the body except the dermis, becoming as light as air undead animated humanoid balloons that can also be filled with substances to be turned into gently floating humanoid bombs. This includes the marsh filled Huskbomb, the germinating toxic spore filled Sporebomb; and the Rotbomb, filled with flesh eating bacteria.

A husk that consumes enough life energy can shed the need for the hollow skin, existing independent from the negative energy place as a Shadow. The filled husks are often used by the Ashmalkin, who also use the Stirges as flying mounts. Originating in the Faerie realms, these diminutive six-inch tall sexless creatures are a fractious lot, rarely agreeing among themselves. They tame and ride Stirges, and while they are capable alchemists, they are not innate spellcasters like other Fey. Ashmalkin have a fascination for necromancy and those that become arcane spellcasters often specialize in the dark arts. Although their weaponry is also diminutive, the Ashmalkin make up for it with alchemically enhanced weapons. The Flamedart and the Firefly Bolt are ranged weapons able to inflict flame damage, while their preferred choice in melee is the Shocklash. This is a strand of preserved nerve taken from the

swamp-dwelling variety of the electric eel. It deals subdual damage rather than lethal damage. This damage is light, but given a swarm of Ashmalkin so armed, could very easily overwhelm and capture a player character who will awake to find himself trussed up like Gulliver in Lilliput!

Ashmalkin can also be taken as player characters; their lack of Strength and Wisdom is made up for with good Intelligence, very good Dexterity, and an innate kinship with Stirges. Although they can be of any class, their favored class is the Wizard, which is surprising given their Chaotic Evil nature. Also available to Ashmalkin characters is the Wing Jockey Prestige Class, who forms a stronger bond with his mount and becomes a specialist in aerial combat. Unlike other prestige classes, this one has been purposefully designed so that an Ashmalkin can enter it at second level! This is justified to ensure that the Wing Jockey can be on a par with the encounter levels for the Stirge and the Stirge Horde.

There are two other notable side effects of a Stirge infestation, besides the rapacious consumption of local wildlife. The first is the increased manifestation of the Husks, which weakens the barrier between this world and the negative energy plane. If it grows too weak, incursions of undead follow, and the area becomes tainted, and then blighted. When the barrier is further weakened, negative energy can erupt into our world. The second effect is that hunters come to harvest Stirge gall bladders or gallduroi, beloved by gourmets, particularly as a stuffing or pate. But gallduroi are difficult to harvest and less scrupulous individuals will set up Stirge ranches, keeping a herd of humanoid cattle for the swarm to feed off.

All of this is put into practice with a selection of NPCs and adventure ideas, many of which are linked. For example, the ruler of Tenmanor wishes to clear a nearby swamp of Stirges and thus rid the area of this menace, but Twizz Arglegray, an 18th-level Ashmalkin Wizard is plotting to destroy the city of Tenmanor from its Plane of Shadow counterpart. Meanwhile, one of Twizz's victims, the Cleric Urthein Olgrem, seeks revenge for being turned into a Husk Lich. Meanwhile, an Ashmalkin Wing Jockey is running a Stirge ranch in the city. These ideas and hooks can be separated or placed elsewhere, but nevertheless make solid use of the concepts presented in this supplement.

Other support includes two sample lairs, a set of unit encounter tables, and so on. In addition, Behemoth3 include a password in the back of the book that gives the purchaser access to a hyperlinked version of both this supplement and the *d20 System's* 3.5 S.R.D.

Physically, *A Swarm of Stirges* is a well-done book, clearly written and containing some excellent pen and ink illustrations. The printing is a little rough inside the front and back cover though. A nice addition is the inclusion of the designer's notes throughout the supplement. These are both interesting and amusing to read, and do help the DM gain a handle on each creature or concept. For example, the Ashmalkin is explained as wanting to have a creature that is both comical and malevolent. The same goes for the Stirge, but then their malevolence is driven by the need to feed rather than by a simple evil.

Horde Book 1: A Swarm of Stirges does much to raise the humble beastie above the level of blood-sucking menace. Primarily this is done by focusing upon one habitat; the supplement's only real default is that it ignores the dungeon dwelling Stirge. The material is this designed for low to mid-level parties, but the author goes beyond this with tough opponents like the Ashmalkin wizard. The suggestion of playing in an all Ashmalkin game is also entertaining, what with their squabbling fractious nature. Overall, *Horde Book 1: A Swarm of Stirges* does more than you probably thought possible with an otherwise entirely dismissed creature, setting a solid benchmark for the *Masters & Minions* Series.

Space Shuffle

Published by [Playroom Entertainment](#)

Designed by Chris Baylis

Art, graphics by Design Edge, Inc. & Elisa Anya Jaeger

60 full-color cards (five Space Commander ID Cards, 55 planets in five colors), planet sheet, full-color rulebook; \$9.95

Playroom Entertainment wants to be like Out of the Box -- both companies seem like savvy teams, specializing in small, easy, often educational games. Furthermore, neither seems to have produced a dud thus far. *Space Shuffle*, Playroom's new card game about our solar system, isn't going to change that perception.

The object of the game is to score the most points for the planets you play. Everyone receives a Space Commander ID Card -- which is really just a cheat-sheet with the planets and their order listed for convenience -- and a hand of seven cards. On your turn, you play a card into one of the piles in the middle of the table, score points for it, and draw a card to replace it.

There are 55 Planet Cards, showing the 11 bodies of our solar system in five different colors. (Yes, this is just a shorthand born of convenience. They know the Sun isn't a planet, etc.) No more than five solar systems can be in play at once, though the different Planet Cards can be added to any system regardless of color. If you wish, you may start one of the systems with a card -- any card will do. If you choose to build on something someone else has already begun, you must play the heavenly body adjacent to it. For example, if someone starts a system with their Mars card, you can only play an Earth card in front of it or a Jupiter card behind it.

When you place a planet, you get the points listed on it. Not all copies of a planet are worth the same: Red Mars has a different value from Purple Mars and so on. Sedna's the exception; they're all worth six points (Sedna thinks it's so cool). Overall, the same values are used across a suite of color, but on different planets. If the card you play is your color (your Space Commander ID Card tells you what color you're playing), only you score. If you play someone else's color, both you and they get the points. But if there are other Planet Cards already in that system of that color, you get points for all those cards, so it may be worth it to give a few points to your yellow opponent if you get points for all the yellow cards there. Planet Cards are worth one to six points each.

You can't pass if you have a valid card. If you can't play a card, you must reveal your hand to everyone. Once you've played a card, you draw one to replace it and play passes to the left. Once the deck is exhausted, play continues until someone has emptied their hand of all seven cards, and the high score wins.

Although they come in nice, bright colors with a fancy picture of the appropriate planet, the physical quality of the cards is a bit slipshod. They're fairly flexible, and you can tell they're just waiting for a chance to bend in uncomfortable directions on you. Even a slip while shuffling can wrench it the wrong way.

You certainly can't say the game isn't up to date. Sedna, discovered only late in 2003, is included in the 11 system bodies even though arguments about its nature are still, uh . . . up in the air. It's listed alongside everything else on a general reference sheet that comes with the game; the sheet also lists a few interesting facts about each "planet." The rulebook is as educational as the game, if you'd care to learn the rules in English, Spanish, French, and German.

Two to five players can play, and a game takes about half an hour, not the quarter-hour the rules suggest. (If only two play, each player receives two Space Commander ID Cards and plays both colors.) Needless to say it's educational, and if you're behind on learning your planetary order, you'll remember it after one iteration of this. The mechanics work strategy quietly into what would otherwise be a straightforward (read: dull) game. The game runs almost automatically by the end since by that point your plays will be more or less determined by what little is left to play (or play on), but long before then you'll be confronted with pivotal choices that can make or break your score.

Once more Playroom Entertainment has brought the fun, and they've shown they can inject it into the classroom, rec room, or living room of your choice with ***Space Shuffle***.

Murphy's Rules

Love, and Other Things That Go Wrong

Welcome to our jillionth annual Valentine's Day issue, a collection of articles loosely tied to the idea of love and all that good stuff.

In compiling this issue (and grumbling that one of the articles was too fat to allow another love-themed piece to fit this week), I thought about criticisms of V-Day issues past. One of the common complaints of previous years is that the articles presented are often about the seedier side of life: put loosely, things going wrong, usually in a spectacular way.

And, after much mulling and a shower, I've concluded: Yeah, pretty much.

But I realized something else . . . something that will extend, in short order to non-love-based-games, so all you snuggle-bunny-haters out there, keep the faith for a few paragraphs more. Namely: Love is normal. The default or presumed state of affairs in humanity is a mutual attraction between the sexes, leading to the continued propagation of our species. (This isn't true in the micro sense, of course . . . for example, the number of women who have no interest in me could fill a state, which I'd call "Florida.")

As a result, the bulk of interest in this common occurrence stems from complications. Things going wrong. Love not working the way it's supposed to.

Really, in a way, every romantic comedy relies on Things Going Wrong. If they didn't, they'd be five minutes long, beginning with meet cute, some wavy lines in the middle, and ending with uneventful wedding.

But – and here's where things get interesting – gaming relies on things going wrong *more*. After all, the complications of Clark Kent and Lois Lane made for what seemed like riveting comic-book drama for decades, but up until very recently in the grand scheme of things they all amounted to roughly the same basic plot: "Golly, I might be interested in Lois, but it'd be too dangerous to have her in my life any more than she already is day-in-day-out, so I need to rebuff her advances. Oh, and if she comes close to discovering my secret identity, I need to do everything in my power to preserve it, just shy of killing her. Y'know, to keep her safe."

While this conflict no doubt resonated heavily with young boys growing up in the 30s through 80s, it's nevertheless near-impossible to wrap a roleplaying game around, unless the point is to emulate those old tales (which is, obviously, part of the fun of many supers campaigns). No, roleplaying games need things to go *really* wrong before they get interesting . . . at least, interesting enough to enthrall a whole gaming group for an evening's worth of entertainment.

I like beloved; beloved likes me? No conflict.

I like beloved; beloved has doubts? No conflict.

I like beloved; beloved has needs which aren't readily addressed? No conflict.

I like beloved; beloved is secretly a soul-sucking demon sent to devour me, who's now having second thoughts and wants to turn against its dark master, resulting in a mass combat at the gates of Hell where the fate of my beloved and all humanity is at hand? Conflict.

In the general sense, roleplaying games are about things going wrong. In fact, they're usually about things going *very* wrong. For example, archeologists dig up things all the time, give papers, go to conferences, and so on. It's boring. However, sometimes things go wrong for archaeologists; someone will get buried or need to be rescued, an artifact will get lost, or weather conditions will make their jobs difficult. That's still boring; these trials are beyond the scope of satisfying roleplaying:

"One of your interns falls into a pit."

"I get a rope and rescue him."

"Roll your *archeologist (intern-saving)* skill."

"I got a nine."

"Great; you rescue him."

No, in order to build a game around an archeologist, things have to go *very* wrong. "Nazis have the Ark of the Covenant" wrong.

Fortunately, audiences for movies or books have a certain range of expectations and acceptance of some premises. For example, *The President's Plane is Missing* and *Air Force One* are both, in essence, the same movie: The president's fate is in question, and a constitutional crisis erupts as people try to hold the government together. However, the former is an example of things going wrong while the latter is an example of things going *really* wrong.

In the same way, *Mr. Smith Goes to Washington* and *Amerika* have the same plot if you squint and type real fast and hope no one notices. They both deal with a conflict of American ideals over corruption and an attack on the core values of those in power. One is a feel-good American classic and the other is a disaster. (Guess which one stars Kris Kristofferson.)

However, there isn't quite the canon of this material for romantic issues. Oh, sure, you can point to *Romeo & Juliet* and *Ladyhawke* as having the same plot: star-crossed lovers who are cursed not to spend enough time together. But one has cool shapeshifting that any gamer can relate to.

Anyway, the upshot is that it's easy to take an interesting gameable conflict and see how it relates more broadly to more mundane conditions. It's much more difficult to take a mundane condition and make it into an interesting gameable conflict.

--*Steven Marsh*

The Ashes Of Her Ladyship

Being a partial cataloging of an artifact's custodial servitors

by Michael Anguiano

The Ashes of Her Ladyship is an occult item of minor repute, purported to contain the cremated remains of a 15th century Flemish noblewoman. It is regarded in occult circles as a rather obscure artifact of uncertain potency, but otherwise has drawn little attention historically. Accounts of the urn describe it as green marble, inlaid with decorative metals; approximately 13 inches tall, six inches in diameter at its widest point, with the mouth 4.5" across; stoppered with a carved stone plug of an unidentified black material, similar to obsidian in appearance but with a surface texture suggestive of eggshell. The black stopper is sealed in place and cannot be removed without destroying the neck of the urn. Descriptions of the metal inlay, both in material and design, are contradictory.

The most complete accounts of the urn ascribe it to Mancius Glabrio. An Italian sculptor and artist, Glabrio is known to have arrived in Bolougne in 1438 and to have fallen deeply in love with Lady Godeleva, the beautiful wife of Lord Bertulf, a prominent Flemish nobleman of wicked and brutish repute. After several years of this decorously unconsummated courtly romance, Glabrio was commissioned to produce two matching urns by Bertulf. A week after the urns' completion, Godeleva died tragically, trampled to death in Bertulf's stables. The heartbroken Glabrio disappeared within days. Bertulf had Godeleva cremated, deposited her ashes in one of the urns, and displayed it prominently in his manor. He displayed the other urn alongside it, with only the smirking explanation that the two should naturally be together forever. Bertulf died eight years later, poisoned by an angry mistress. Both urns disappeared. Only one of the urns has since resurfaced, allegedly the container of Godeleva's remains.

The urn has passed through many hands over the years, often with complete ignorance as to its nature. The most distinguished of its custodians have usually referred to the urn as the Ashes of Her Ladyship and allegedly derived various protections in association with it. Such a custodian is typically a male in his late twenties, who suffered a crushing heartbreak shortly before possessing the urn. This custodian goes on to a notable career as an occult investigator and never has another serious romantic relationship.

The Minister

Denmark Whitcomb received a good education and little else from his parents, who came from the poorer branch of an otherwise prosperous and respected family in Savannah, Georgia, in the years shortly before the Civil War. Known as "Dane" to his friends and associates, he also became known as a failed teacher, a failed minister, a failed businessman, and by the age of 25 was well on his way to becoming a failed farmer. Despite an able mind and a keen grasp of scholarship, Dane lacked the wherewithal or self-assurance to make a sustained success of any trade. In the end, Dane was far along the path of drinking himself to an early death, until the fortuitous misfortune of a distant cousin.

Dane was contacted by a distant branch of the family who offered him a proposition. Dane accepted. He packed his few belongings and traveled immediately to Richmond, Virginia, abandoning his small farm to the imminent foreclosure. In Richmond, he was met by his 16-year-old second cousin, Evelyn Clayton, and the two were married in a brief and hurried service. Immediately afterwards, Dane and Evelyn were shipped off to Mobile, Alabama, accompanied by her voluminous luggage and two slaves, Mary Harvey and Increase Shipman. In starting this new life in Alabama, it was made known to the locals that Dane and Evelyn had been married for two years and were expecting their first child within six months.

This was Dane's part of the bargain. He would provide a respectable life and name for the Claytons' prodigal daughter and her impending child. In return, he would receive a very substantial dowry and a sinecure position that would keep him respectably employed. Additionally, he would gain the ownership of Mary and Increase, reliable servants who had been with the Clayton family for 20 years, ever since the two were purchased as teens.

Of course, Mary and Increase were really there for Evelyn's sake. Mary would handle housework and cooking, as she had been doing for most of her adult life, and would also assist Evelyn with the child. Increase, for his part, had worked mostly in the stables and was expected simply to use his powerful physique to protect Evelyn and keep Dane in line, when so instructed by Mary.

Just days after their arrival and the purchase of a new house, Dane was hired as an associate editor at the local newspaper, which was owned by a friend of Evelyn's mother. Dane seized upon this opportunity to reinvent himself and devoted himself fully to his newspaper duties, with a competence that surprised his co-workers almost as much as it surprised himself. Dane had also become smitten with Evelyn, a lovely young woman with a fiery temperament, and decided that if only he could win her over, if only he could comfort her and provide for his new family, then he will have earned this a new chance at life. Evelyn, for her part, regarded Dane as one more detail of the miserable fate that had been thrust upon her.

After two months in Mobile, however, Dane was abruptly stricken gravely ill. He spent several days on the brink of death before beginning a slow recovery. Mary fed and nursed him, constantly at his side, while Evelyn would visit his sickbed daily, reading to him from books and newspapers. After several weeks of convalescence, he regained his health and returned to work with renewed enthusiasm, having freshly fallen in love with his wife. She, in return, seemed to regard him at least cordially and he strengthened his determination to win her over completely.

On the other hand, he did not notice that Mary and Increase became much cooler towards Evelyn. Indeed, Dane would never learn that Evelyn had tried to poison him, and only Mary's intervention had saved his life.

A few months later, Evelyn went into labor. The child was stillborn and Evelyn died of complications in the delivery.

Dane lapsed into a downward spiral of depression, drunkenness, and self-pity, hardly noticing when he was dismissed from his job. Mary scrambled to cover household expenses as best she could, but Dane's accounts quickly ran dry and his credit was soon overdrawn. Mary had begun to despair of a solution when Increase simply handed her sufficient money to resolve immediate problems.

Increase had not been idle in recent months; he had become a resurrectionist. He would collect fresh cadavers and deliver them to the medical school at the university, where vivisection remained the most basic and necessary tool for teaching human anatomy to medical students. Increase's work earned him good money, because the cadavers were usually collected from fresh graves, making the work very illegal, not to mention unpopular and sometimes dangerous.

Mary was practical enough that her sense of propriety was only briefly offended. And so, while Dane drifted through an alcoholic haze of lassitude and misery, the Whitcomb household subsisted for a year on the harvesting of graves. For additional profit, Increase occasionally brought items "liberated" from the body before delivery, which Mary would discreetly sell or trade for goods.

One of these items was a strange green urn. On an odd impulse, Mary placed the urn as decoration in Dane's room while he lay drunk and asleep. That night, Dane dreamed of Evelyn, who spoke to him of her love and her remorse for not treating him better. When he awoke, he was a changed man. Rather than doubt and self-pity, Dane was filled with the confidence and certainty of a man who knows he is loved. He put aside alcohol and set about putting himself and his life back in order.

A week after his recovery had begun, an ashen-skinned stranger called on the Whitcomb house while Increase was away on an errand in town. Dressed in an ill-fitting brown suit, the stranger requested, and then began demanding, the return of "Her Ladyship." His gray face seemed shadowed even in the midday sun as he became increasingly agitated, threatening Mary in a voice that grew hysterical. Dane, hearing the commotion, rushed to her assistance. Upon seeing Dane, the stranger instantly calmed. "This choice shall be unmade," the man growled, then turned on his heel and departed.

Increase, upon his return, was told of the curious intrusion. After soliciting more details, Increase grew agitated and admitted that the description fit the cadaver from which he had taken the urn. After a moment of thought, Dane said, "I

must sleep on this," and left them. He returned an hour later and directed Increase and Mary to begin packing. Thus began a flight westward by train, by carriage, and by horseback, into the frontier territories.

During their travels, Dane revealed that Evelyn spoke to him in his dreams, using the urn as a conduit to reach him from the afterlife. Evelyn had warned him about the ashen-faced man, Dane said, and she was teaching him about arcane and occult matters to help them protect themselves. Dane also gave Increase and Mary their papers of manumission, granting their legal freedom from slavery. He wept as he begged their forgiveness, swore that he owed them his very life, and pledged to spend all of his days trying to make up his debt to them. Increase and Mary were, frankly, a little embarrassed.

Meanwhile, the newspapers in Mobile were filled with shocking stories of Denmark Whitcomb and his crew of despicable graverobbers. Rewards were posted for his capture and return. His vacant house was burned to the ground by a righteous mob. Local ministers lamented his escape westward, beyond the reach of civilized authorities, and prayed that he would meet a just and deserving fate at the hands of Indians and desperadoes.

The three of them continue to travel the American West in Dane's belief that the ashen-faced man continues to pursue them. Mary handles practical matters, Increase deals with the heavy lifting, and Dane provides a growing expertise in occult matters. Indeed, Dane is becoming something of a scholar in the legends and beliefs of the various native peoples. At Dane's behest, the three of them pursue supernatural events and rumors of the arcane. Mary and Increase regard Dane as slightly insane with his dreams of Evelyn, but think of it as a vast improvement over the pathetic drunk they had once known.

The Finder

In the 1920s, the job of Pullman Porter was one of the best occupations available to an African-American. He served as a combination of porter and valet to the various passengers of a train's Pullman sleeping car. The Pullman Porter was always an African-American male and traditionally addressed as "George" (after George Pullman), thus encouraging the passengers to comfortably regard the porter as a faceless servant. The work was physically demanding and often demeaning, but the pay was (relatively) good. Additionally, the Pullman Porter was a respected figure in the black community, welcomed along his travels as a bearer of news and events.

Thus George Arceneaux found himself in a comfortable situation in 1927, well-established in his job as a Pullman Porter. He was well-liked by passengers and co-workers, who found him charming, congenial and efficient. He had girlfriends in every major city and a few stops in between. He had buddies in every jook joint that was worth visiting along the rail line. He made a tidy bit of cash on the side, moving the odd "package" from place to place for friends in less legally accepted professions. And (as he liked to joke to friends) white people even called him by his first name.

And so George was taken completely by surprise when the lovely Miss Kay rode into his life. A Japanese expatriate who spoke English with an Oxford accent, Keiko Taniguchi was an educated and self-possessed woman of independent means, who saw no point in returning to Japan and to her pompous idiot husband. During a long haul from Los Angeles to Chicago, Kay struck up a conversation with George and the two got along famously. George found Kay disarmingly forthright and unpretentious, with no dynamic of racial tension underlying their interactions. When he got off the train in Chicago, she continued on to New York, but their paths crossed again a month later. George discovered that she was an inveterate train traveler and she had actually been living in one train car or another for the past year.

In subsequent meetings, George learned that Kay was something of a dealer in antique curios, especially occult items. At some stops, she would be visited on the train by unsavory and disturbing characters, who would stay only long enough for a short whispered discussion and the exchange of a small parcel for a small bundle of money. He later learned that this was the means by which she supported herself and her endless travels by train. The two saw more of each other over the following months and gradually went from friends to lovers.

By the end of the year, George could not deny that he had fallen head over heels for Kay.

Kay eventually confided that the beginnings of her collection had been stolen from her pompous idiot husband. In retaliation, her husband had set forces in motion against her, forcing her to return or face a gruesome death. To escape this, she explained to George, she had constructed a ward that shielded her from those forces' attention. Unfortunately, her skills were not so great as her husband's, so she had to include certain elements to lend sufficient strength to her warding. The most important of these arcane elements was keyed to "living between steel." This, she explained, was why she lived on trains. Indeed, he noticed that she never left the train, except to transfer directly to another train.

Although he was never sure whether to believe her story, George soon found himself helping her. He arranged meetings, carried packages, delivered papers to the various banks where she held accounts, and did other assorted things that were not easily done from inside the train. Soon she was doing well enough to bring him into the business full-time, and he left behind his life as a porter. He became familiar with the network of occult dealers through the country, who knew him as Kay's trusted representative.

This arrangement lasted three years, until an unfortunate train ride along the New England coastline. Kay had sent George to a particular shop to meet a collector, who insisted on haggling at length over various matters before finally settling the deal and handing George the parcel. Upon his return to the station, George discovered that he'd missed the train's departure. Per their standard arrangements, George simply traveled separately to the next station, sending a wire message ahead that he would meet her there.

The message arrived, but the train never did. A bridge trestle had collapsed as the train passed, causing most of the cars to derail into the cold waters below. Scores of passengers had drowned, with many of the bodies unrecovered because of the current. Keiko Taniguchi was never found.

George realized that Kay's ward had been nullified when her car had derailed. He immediately got very, very drunk. That evening, he opened the parcel and took out the green urn that Kay had sent him to pick up. With it, he found assorted papers that gave him control of Kay's various accounts around the country, including several he didn't know about. He also found a letter from the collector, explaining that he'd delayed George at Kay's request.

That night, George dreamed of Kay. When he awoke, he immediately went to the sight of the crash and joined the recovery effort. When the opportunity presented itself, he examined the bridge trestle and quickly realized it had been sabotaged. Several key timbers had been nearly worn (or gnawed) through, although no other timbers showed similar marks. With the regular traffic over this bridge, damage sufficient to ensure collapse could not have been done more than a day or two in advance. The official verdict, of course, was "act of God."

In his dreams, Kay had promised him that answers could be found. Using Kay's money and his own connections, George set himself to finding the right people to ask those questions. He might not know the powers that be, but he knew how to find the people that work for them.

The Scourge

Maxwell Ian Bennett is a dark-haired Caucasian man in his early 30s who has very sharp memories of the past fifteen years and very little before that. He presumes this is an effect of his training and conditioning as an agent . . . a presumption which, he suspects, is also an effect of his training and conditioning. He was, to the best of his recollection, recruited sometime around college, when he had a different name, a different face, and probably different fingerprints. Since achieving status as a full agent, he has amassed a sterling record and a disturbingly high body count.

Max is employed by the Office of Executive Utility. The OEU is a tiny administrative footnote in the U.S. Dept. of Interior, ostensibly established to facilitate flexibility of official communications with specific parallel offices in assorted departments and agencies. These parallel offices were never established, leaving the OEU to appear as the useless first step in an abandoned plan.

Of course, high-ranking intelligence and law enforcement personnel have reason to suspect otherwise. They consider the OEU to be a black ops asset, with an unknown chain of command and an inexplicable ability to produce the

authorization necessary for any operation. In these circles, the OEU is suspected to be a vehicle for direct Presidential action.

The truth, naturally, is a bit more convoluted and unclear. The OEU is an operational arm of an Illuminati-esque conspiracy group, possibly even the shared tool of several groups. Nobody seems to be sure. Large segments of the staff are co-opted or repurposed from other groups or agencies and consequently don't realize that they even work for the OEU. Max is part of a corps of agents, probably several dozen, that operates directly for the OEU leadership and is more aware of its true nature.

Although sufficiently skilled in all useful areas, Max's best skills are in handguns, urban tactics, and being a jerk. With this skill profile, Max has been designated as one of the "Obvious," a class of agents whose nature is generally made apparent by their appearance as the archetypal "man in black." The Obvious serve to intimidate and to distract, drawing attention away from other agents on the same operation. The Obvious agent is, therefore, the obvious target.

This suits Max just fine. In his experience, most problems can be solved by finding the right person to shoot.

Of course, knowingly working for The Conspiracy (whichever it may be) is an exercise in serenity. Max's mental and emotional landscape has been thoroughly explored and mapped over the many years of training and conditioning, so that every order and communication is thoroughly calculated to achieve a specific desired effect. Or so he assumes. On the other hand, maybe it's all crap and they've just brainwashed him into thinking that he's completely predictable and totally under their control. Or maybe it's six of one, half a dozen of the other. It's hard to say, really, so eventually he just stopped caring. He simply did his job and worked his way up.

Miriam changed that. She was everything in life that he'd never noticed missing. That she was another agent made things tricky, but not impossible. She was a "Viral," specializing in infiltration and subversion. She was beautiful, smart, charming, sweet, witty, and extremely dangerous. He was never sure what she saw in him, and he was careful not to ask. The last thing he wanted was for her to realize he was a jerk.

A year later, the two were secretly married. Five years later, she was dead.

Max was never entirely clear on what had led up to the end, he only knew the end itself. Miriam had been sent undercover for an extended mission. Seven months passed without word from her, but that was the nature of the job, so Max didn't worry. Then he received word that she had been exposed, leaving him to fear the worst. With a quick flurry of phone calls, Max exercised authority that he'd never had and found out the details of Miriam's assignment.

He had been right to fear the worst: Miriam was being held by the operational arm of an OEU rival.

Max traveled to the holding facility by the most direct route possible, commandeering any civilian or military vehicle necessary. Over the several hours of the trip, Max also made assorted phone calls to scramble every SWAT and commando team he could reach. Just for the hell of it, he ordered in the Coast Guard, too.

Meanwhile, at the holding facility, they knew that Max was coming. They had no idea why, but they knew it was a dangerous sign for the OEU to move an agent against them directly, especially one of the Obvious. The scrambled police and military units suggested an attempt to divert security away from the OEU's actual assault force. Given the sheer volume of the units Max had scrambled, tactical analysis indicated an OEU assault on a massive scale, requiring wholesale relocation of security forces to the rear perimeters.

Max arrived at the front gates to virtually no opposition and walked directly into the facility's main building. A small army of police and military followed him, under orders from a dozen different jurisdictions. Once inside, the swat teams were detailed to securing the water supply, while the military units were assigned to take and hold the highest tactical positions possible. Max simply worked his way down through the detention levels and shot anything that got in his way. He lost count of how many times he reloaded.

The facility security office was, of course, having a meltdown. Their security forces were completely unable to find the OEU assault forces in the rear perimeters, while the front perimeter had been totally breached. Tactical analysis

suggested that the water supply was being compromised to unknown purposes (although clearly connected to the Coast Guard's expected arrival), that aerial assault units were imminent, and that detention security had completely broken down.

In the lowest levels of the detention areas, Max "persuaded" several guards to lead him to a particular prisoner. He found Miriam in an interrogation room, chained, dazed and bloody. Max unchained her, told her how much he loved her, held her close, and put a bullet through her brain.

As Max left the building, several OEU agents arrived and took him into custody. He was whisked away for debriefing while the facility was searched and the situation sorted out. Max was brought before a board of his superiors and thoroughly chewed out. Miriam had been captured and therefore compromised, so Max had been obligated under standard procedures to bring her back to the OEU for "decommissioning." This would have involved a lengthy debriefing to ascertain the degree to which Miriam had compromised the OEU, followed by drug-assisted torture to confirm the veracity of the debriefing information, followed by termination.

Max didn't care in the least, and they knew it. Rather than wasting further resources, they simply put him back to work.

That night, Max dreamed of Miriam. She spoke to him and comforted him. He awoke in a cold sweat with a pistol in his hand and immediately searched his entire apartment. In his closet, he found a green urn, which he threw out the window. That done, he searched the apartment again before going back to sleep.

The next night, he dreamed again of Miriam, who was troubled by his actions. He awoke, found the urn, and threw it down the elevator shaft.

The urn reappeared in his apartment the next day. With a sigh, Max went to sleep and spoke to Miriam, who was now quite angry. Max explained patiently that she was dead, therefore her presence meant that suffering a preprogrammed reaction that was instilled during his training and conditioning. Or he might be going insane. Neither was an acceptable option. The green urn was clearly connected to this, so eliminating the urn was the quickest way to eliminate the problem.

Miriam countered that the urn was the only conduit she had to speak to him, but that it allowed her to "motivate" others to return it to him. She wasn't simply going to abandon him, so he'd better get over it. In the end, they struck a deal. She would prove her usefulness with information and insight about others, and he would keep the urn. Max still suspects that Miriam's presence is some kind of subconscious coping mechanism, but he's willing to let it be for now.

In the months since Miriam's death, Max's reputation has grown substantially among other agents. Indeed, he has become much more dangerous, with an improved sense of focus and an unflappable attitude. His marksmanship has improved as well, leading some to refer to him as a "one-hit wonder," supposedly able to unerringly hit and kill most opponents with a single shot. By the same token, his superiors are reluctant to use him on OEU operations, as he has become something of a wild card. Consequently, Max has been mostly assigned to missions outside the OEU, often involving investigations of weird science phenomena or the supernatural.

Meanwhile, Max is still trying to figure out who is responsible for his current situation. He believes that whoever ordered Miriam's final mission is the one who exposed her, which would have the obvious effect of sending Max on a collision course with Miriam's captors. If he can penetrate the OEU's control structure, he and Miriam might just find someone to pay the price for her death.

Inside The Urn

The urn has a long and odd history, which has been noted in piecemeal fragments in a wide variety of odd places. The common speculation is that the urn is the Ashes of Her Ladyship, containing the cremated remains of Lady Godeleva of Bolougne. Further speculation is that the urn allows communication between a custodial servitor and the spirit of his deceased beloved. Some even suggest that a matching urn exists, the Ashes of Her Love, which contains the cremated remains of Mancius Glabrio. These speculations are incorrect. The urn itself is a simple piece of carved marble,

containing the cremated remains of a dog. The black stopper is the repository vessel for an ancient spirit that intermittently requires a symbiotic psychic relationship with a male host.

The most authoritative accounts of the urn's history come from the custodial servitors themselves. This is disinformation, intentionally spread by the urn's reposing spirit. As with any artifact, a number of collectors have been seeking it for years or decades. Some are willing to resort to rather extreme methods to acquire it, but the urn's repository spirit consistently rejects them as unsuitable hosts.

The reposing spirit derives nourishment from the symbiotic relationship it forges with the chosen host. To strengthen this relationship, the spirit presents itself through the host's dreams in the persona of a lost beloved, thus creating an emotional resonance with the host. The host's own memories and expectations are used to reinforce the illusion. Once accepted, the spirit will remain in contact with the host until the host's eventual death. The host's proximity to the urn is helpful but not necessary once the connection is established.

The servitor host does gain benefits aside from emotional comfort. The host is shielded by the spirit from various forms of possession, charm, beguiling, or hypnosis. Also useful is the spirit's arcane knowledges and insight into the world around it. The spirit has some limited ability to influence others directly, but will do this only in exigent circumstances. For instance, from time to time, the urn will be damaged or destroyed, at which point the spirit will simply compel a suitable artisan to manufacture a similar-looking replacement to fit the black stopper.

The reposing spirit is rarely completely honest with the host, even aside from the false identity. The spirit safeguards its interests by spreading false and inconsistent information about its nature, often finding it necessary to withhold information from its own host. For example:

- Dane, Increase, and Mary are being pursued by a powerful ghoul of a type previously unknown to the urn's spirit. The ghoul wishes to be the spirit's chosen host and servitor, but it is unsuitable because of its corrupt nature as well as its very awareness of the spirit's nature. The spirit is unwilling to tell Dane that the ghoul has murdered (and eaten) three previous servitors.
- Keiko Taniguchi is not dead. The spirit has determined that after Keiko's car was derailed and she was thrown into the water, she was captured by the waiting members of a subhuman race, possibly in service to Keiko's husband. Rather than allow George to discover this, the spirit will simply mislead his pursuit. If necessary, the spirit will contact Keiko's husband and bargain to have Keiko eliminated.
- Max is one of the least suitable servitors the spirit has ever chosen; he's certainly the most unaccepting. Consequently, their symbiotic connection is the weakest the spirit has ever known. The spirit cannot simply replace him and it is unwilling to actively seek his death, so it will simply conserve its energy rather than make active efforts to help him.

Adventure Seeds

The Ashes of Her Ladyship is a useful plot device for any campaign involving occult elements, even if only tangentially (a la Indiana Jones). The urn can be used in virtually any time period (despite the bogus origin story), either on its own or in the possession of a custodial servitor. The urn can be an objective for the PCs to acquire for a suitably mysterious employer, or the PCs can try to gain the urn for their own occult benefit . . . although any male PC with romantic attachments should beware! A custodial servitor of the urn can be a useful NPC resource for the PCs, providing information or motivation as needed to facilitate a scenario.

Weird West: Bring me the headstone of Alfredo Garcia! The urn is lost in a train robbery and the PCs are hired to track it down. The PCs trail the robbers travel south of the border, where the robbers hand over the goods to a bandit leader, Elaudio Flores. The PCs discover that a mysterious collector had paid Flores to send men to rob the train and get the urn. After accepting the substantial payment, Flores shoots the collector and takes the rest of his money. With a cruel grin, the bandit leader has the still-bleeding collector buried with the urn, then rides away with his band of men. Sensible PCs will wait until Flores has gone and night has fallen, then sneak into the graveyard with shovels to recover the urn. However, the ashen-faced collector is not willing to part with the urn that easily

Call of Cthulhu: Hurtling towards collapse! Hired to recover the urn, the PCs are set on the trail of Kay Taniguchi. After several false leads, they discover that Taniguchi is traveling by train and manage to catch it at the next stop. Unfortunately, they don't know which car she's in and none of the train's staff will help them out. Unless the PCs choose to break down every door on the entire train, they have to wait until the next stop, where they spot Kay Taniguchi with her assistant, George. Luckily, George has been delayed at the station and misses the train, so they have a chance to spot Taniguchi's car and catch her alone. They're not the only ones, though, as two other teams have boarded and are racing (and fighting) through the train to get to Taniguchi first. Whoever gets to her car first has the dubious pleasure of experiencing a derailing traincar from the inside, as the bridge collapses and sends them all into the waters below. And if they survive the fall, there are things in the water that want Taniguchi even more than the PCs. Pity that the urn is still back at the station, in George's hands!

Illuminati: And the cat came back . . . The PCs are tasked to take possession of the urn. After tracing the urn's long and contradictory background, they reach a completely dead end. A casual glance at a supermarket tabloid, *The Illuminator*, shows the urn in the hands of a man in black, under the screaming headline, "Secret Gov't Agency Plots To Control Texas Using US Coast Guard!" The heroes track down the *Illuminator's* publisher, then the reporter who wrote the story (totally bogus), then the photographer who took the pictures (partially faked), until they locate the place where the man in black was seen holding the urn. The PCs are somewhat at a loss until they spot the man, Max, watching them from a nearby building, talking on a cell phone. "They're here," he says flatly, then hands the phone to the nearest PC, saying, "It's for you." On the phone is their employer, who tells them to bring the urn but under no circumstances to harm Max. If they attempt to kill him and fail (or worse, if they succeed), the results would be catastrophic. The PCs can steal, buy, or simply ask for the urn, and Max will let them have it . . . but it will slip away from their possession before they can deliver it. This will continue as long as the PCs are willing to try. If they admit this development to their employer, then the PCs will be tasked to accompany Max until he dies *entirely* at *someone else's* hands. The PCs will then have to follow a smirking Max as he goes about his daily work, which is rather like combining *The X-Files* with *The Matrix* . . .

Martial Arts of Yrth

for *GURPS*

by David Moore

Aside from noting that Judo and Karate "are known and taught in Sahud, but nowhere else," (p.F113) *GURPS Fantasy* has little to say about the martial arts. Ytarria is a large place, however, with many cultures, and not all formal combat styles are Asian. People drifting into Yrth from Earth over the last millennium, despite the efforts of the Ministry of Serendipity and their ilk, gradually import new ideas, including the proliferation of modern styles. Furthermore, the nonhuman races of Yrth have their own combat disciplines, or adapted them from observations of human styles. This article expands on the sidebar "Fantasy: The Land of Yrth" (p. MA140), adding seven new styles unique to Yrth (but adaptable to any fantasy setting).

Using styles from *GURPS Martial Arts*

Most of the martial arts in Yrth are imported from Earth, preserved with some alteration down to the modern day. The nation of Sahud is influenced by "samurai" disciplines like Jujutsu, Kenjutsu and Kyudo and Korean arts like Tae Kwon Do and Kuk Sool Won. However, the GM should avoid compromising the mystique of Sahud by making Sahudese styles too familiar; at the very least, the *rules* of formal High War tournaments should be so bewildering that even a skilled combatant may lose on a technicality. In Megalos and Caithness, traditional Western combat disciplines are ancient and refined. The knight, especially, is trained from boyhood in many different types of combat and is a truly fearsome warrior. Volker Bach's excellent articles ["The Western Way of War"](#) and ["Vechte Unde Schirmen"](#) offer inspiration for a GM or player interested in the armed combat disciplines of Ytarrian chivalry. By way of bare-fisted fighting, the Greek wrestling art of Pancratium is well-known in Megalos and a regular feature in the arenas of Christendom. In the Principality of Araterre, the preferred weapons are the Renaissance smallsword and foil; both French and Italian Fencing are available. An unarmed style resembling Savate is fought in the docks of Sauvons, either imported by late arrivals or evolving in parallel with its Earth counterpart.

Notoriously, the Assassin sect high in Western al-Haz (p.F31) utilizes the Hashishin Style; the Balikites use similar tactics under al-Garyhan (p.F78). The Kharijites and Islamic chivalric Orders (p.F30 and p.F32 respectively) study knightly arts very similar to their Christian counterparts (use Early Knightly Mounted Combat from "The Western Way of War"), while wrestling and swordplay techniques are also popular, and central to the Great Games (p.F85). The boiling pot that is Cardiel's mixed cultural heritage applies as much to combat as to everything else, as the aristocracy pursues knightly skills while local communities practice arts imported from all over Yrth, and some known nowhere else in the world. With an appropriate Unusual Background, a Cardien martial artist could justify virtually any style out the book. The Chinatown community in East Tredroy, centering on the Street of Gadgeteers, is home to a handful of schools of Kung Fu, although their students do not make their skills very public and it would be extremely unusual for any non-Chinese to be invited to study them. Nonhuman disciplines exist as well. Sylvan War Lore is, in the lands bordering on Elf territory, renowned and feared, and Neal Byles' article ["Beyond Sylvan War Lore"](#) tackles a handful of other martial arts equally within the Elven idiom. While a few orcs have the patience and aptitude to master the brutal and little-known Smasha, simple and unscientific brawling is the rule, except for the handful who have the resources to pursue human teachings.

New Styles

Ars Clemens

8 points (No Cinematic Abilities)

Developed in the 1960s by the Cardien Order of the Archangel Michael under then Prince Johannes of Alimar, this style is now taught to agents in all three national branches of the Order. Although it is formally called simply

"wrestling" within the Order, its nickname -- literally "the Kind Art," a faintly ironic label coined by the Megalan underworld due to its emphasis on nonlethal but crippling attacks -- has stuck, and is used with some pride by Michaelite practitioners. The style may have been influenced by imported ideas from Earth law enforcement along with fingerprinting and other modern police techniques (see *Criminology*, p.F113).

Ars Clemens training has two primary aims. The first is to subdue the opponent without killing him, using grapples, locks and disarming tactics. While Yrth justice is somewhat tolerant of the death of a fugitive, it is still preferable to bring a criminal to trial. Serious injury is less anxiously avoided, since magical healing is generally available once the suspect has been pacified; knives and short clubs are taught as part of the style. The second aim is to prepare the wrestler to fight a mage or supernatural combatant without magical defences of his own. To that end, the Michaelite is taught techniques to bolster his mind against Mind Control spells, along with a repertoire of attacks intended to blind, silence, distract or inflict pain upon an opponent so as to hinder his spell-casting capability. Some familiarity with the theory and practice of magic is also offered, so the wrestler can identify and be prepared for offensive spells.

Note: There is no Cinematic version of this martial art, even in campaigns where Cinematic styles are permitted. Although Clemens is known and feared, there are no accounts of wrestlers demonstrating superhuman feats, while the style's emphasis on simple, effective techniques precludes much in the way of enlightenment.

Primary Skills: Brawling, Mind Shield, Wrestling.

Secondary Skills: Knife, Short Sword, Thaumatology.

Optional Skills: Body Language, Boxing, Knife Throwing.

Maneuvers: Arm Lock [1 point], Choke Hold, Disarming (from DX), Eye Gouging, Face Attacks.

Cinematic Skills and Maneuvers: None.

Beserker Raging

10 points/11 points

In the sparse and bitter plains of the northern Nomad Lands, the traditions of many of Earth's tribal and nomad cultures have mixed and grown together. The renowned *Berserkers*, the "Bear Shirt" cult, is one of the fruits of this blend: a holdover from Viking society, influenced by Celtic and Mongolian mysticism. Animistic warriors who deliberately cultivate mindless frenzies, Berserkers believe they spiritually transform into bears when they fight, gaining strength from their totem. They see themselves as holy men in their own right, acknowledging the druids and shamans of the Nomad Lands as equals; a few genuine weres in the cult are revered as singularly blessed. The cult lies outside normal Nomad culture, kneeling to no king or chieftain and accepting no payment but plunder for their aid in battle, but are respected throughout the peninsula as honorable, courageous and spiritual (treat this as a Reputation +1 throughout Nomad Lands (large group, 3 points) and a Claim to Hospitality).

Training revolves wholly around the Berserk disadvantage, which is required to learn the style. Since a raging Berserker would never use a shield, practitioners learn to fight with swords and axes in both hands, and how to fight up close with an enemy when those weapons are lost. A knife in the boot or scabbarded on the thigh is the universal last resort, and Berserkers train to draw and attack with them until it becomes second nature, to ensure they are not unarmed while the battle-rage is on them. Finally, the Berserker learns how to harness the frenzy itself, calling upon it when needed. Some are reputed to gain terrific strength and resilience from the frenzy, even to a supernatural degree.

Advantages and Disadvantages: The Berserk disadvantage is compulsory; a PC who does not yet suffer from the disadvantage must acquire it, spending accumulated points as though buying an advantage. Toughness is a common trait. This style has no Cinematic Skills, since it is impossible for a Berserking warrior to take the Concentrate maneuver; however, at the GM's discretion, a Berserker may purchase the Hyper-Strength, Extra Hit Points, Hard to Kill or Damage Reduction advantages with the limitation "Only while Berserk" (-15%). The *GURPS Celtic Myth* advantage Spearman's Invulnerability (p.CM80), with the same limitation, is particularly appropriate.

Primary Skills: Axe/Mace, Brawling, Broadsword, Fast-Draw (Knife), Knife.

Secondary Skills: Axe-Throwing, Running, Theology (Nomad), Wrestling.

Optional Skills: Armoury, Boating, Swimming.

Maneuvers: Close Combat (Knife), Head Butt, Knee Strike, Off-Hand Weapon Training (Axe/Mace or Broadsword),

Trigger Beserk.

Cinematic Skills: None.

Cinematic Maneuvers: Dual-Weapon Attack (Axe/Mace or Broadsword).

Dwarven Bladecraft

10 points/22 points

All young dwarves in Zarak and the Whitehoods train in the use of the axe, and most serve terms in the ranks of the guard forces that patrol the entrances. In spite of this, dwarves who focus extensively on combative skills are rare, since Dwarven beliefs place importance on creation, and battle creates nothing. The few exceptions, the "Brothers of the Blade" (although the group contains several Dwarf women), combine study of the axe's use in battle with study of the weapon itself; a Brother must create his own axe as part of his training, and practitioners often become skilled weaponsmiths. Beautiful and distinctive weapons are valued, and Brothers often carve runes and patterns onto the blades and hafts. Since warfare is not regarded very highly in Dwarf society, mastery of Bladecraft does not earn a Dwarf recognition as a High Crafter, and Brothers tend to enter weaponsmithing clans.

The style itself focuses on holding ground. The axe is used to dominate the area around the Dwarf and keep enemies at bay. Unarmed attacks and close combat training allow the Dwarf to engage an opponent who tries to crowd him without having to withdraw; these tactics are also valuable in close tunnels. Brothers subscribe to a Dwarven philosophy called "Forbearance," whose emphasis on the Eternal (the common faith of the Elder Races, see p.F37) is directed *within*, at enduring adversity and making the self permanent. They supplement their combat training with breathing and self-control exercises. Truly skilled Brothers are said to be capable of extraordinary feats of determination and endurance.

Primary Skills: Armoury, Axe/Mace, Brawling.

Secondary Skills: Philosophy (Forbearance), Wrestling.

Optional Skills: Breath Control, Karate, Language (Dwarven Runic), Meditation, Nei Tan, Symbol Drawing.

Maneuvers: Close Combat (Axe/Mace), Elbow Strike (from Brawling-2), Hilt Strike, Knee Strike, Retain Weapon (Axe/Mace).

Special: Brothers are taught to fight in close quarters and on uneven or loose ground, and may reduce penalties for fighting under such circumstances by 2. This is a special ability costing 4 points.

Cinematic Skills: Body Control, Breaking Blow (Axe/Mace), Immovable Stance, Mental Strength, Mountain Heart, Power Blow (Axe/Mace).

Cinematic Maneuvers: Enhanced Parry (Axe/Mace).

Note: A small group of Brothers focus on unarmed combat over axe-fighting. For "Handcraft," use the above, making Karate and Wrestling Primary Skills and Armoury and Axe/Mace Secondary, adding Arm Lock and Roundhouse Punch, and using the standard versions of Breaking Blow and Power Blow and the unarmed version of Enhanced Parry. Handcraft costs 12 points to learn (24 points for the Cinematic version).

Emulating the Dragon

8 points/12 points

The few who are brave or reckless enough to have observed both races and survived know that Reptile Men and Dragons appear to honor a vague kinship, although whether grounded in distant common ancestry or mere cosmetic similarity is uncertain. To a feared sect among the Reptile Men of the Great Desert, however, this kinship is far from vague: they actually worship Dragons, fanatically insistent that the beasts are the ancestors and gods of their kind. They believe that the ruined cities of the desert are remnants of a great Dragon Empire that once ruled Ytarria and enslaved the Elves and Orcs, brought low by Elvish wizardry and treachery. Their shaman-kings seek to regain some of this lost glory through fear, leading their tribes in bloody raids against the communities along the desert's border, displaying a shocking and casual violence that horrifies the survivors. There are even rumors that one or more Dragons may be in league with the rogue tribes, encouraging the worship and ensuing violence to further goals of their own.

"Emulating the Dragon" is the training the most devout warriors of the sect undergo. Eschewing weapons, the Reptile Men strive to return to the tactics of their Dragon "ancestors." Dragon warrior tactics are to close on and grapple their enemies, simultaneously biting and tearing with their powerful legs. They also seek the Dragon's traditional ability to

terrify, roaring and stamping to scare their enemies into submission. Fierceness is combined with subtlety: warriors put their enemies off with slow advances and sudden attacks, or conceal themselves and seize their foes from concealment. The greatest warriors supposedly gain mystical "gifts of the Dragon," enabling them to "fly" as they leap great distances from ambush and Slam their enemies, to strike fearsome blows, or to roar with such force that their enemies are actually stunned.

Note: Practitioners of this art reject weapons, believing them to weaken Reptile Men who should rely on their own natural weapons and strength. GMs may wish to enforce a compulsory Major Vow (-10 points) to use no weapons for any Reptile Men PCs who learn the style.

Primary Skills: Brawling, Intimidation, Wrestling.

Secondary Skills: Hypnotism, Stealth, Theology (Dragon Worship).

Optional Skills: Camouflage, Jumping, Naturalist, Running, Tracking.

Maneuvers: Bite, Ground Fighting (Wrestling), Hit Location (Brawling), Rake, Scratch.

Cinematic Skills: Flying Leap, Hypnotic Hands, Kiai, Power Blow.

Cinematic Maneuvers: None.

Harmony

9 points/15 points

The philosophy of the Halfling people is one of simplicity: be prudent but not profound, generous but not spendthrift, hardworking but not self-denying. Always fulfill your obligations, and know when not to take on more. Above all, try to get along; with your neighbor, the locals, and the Big People among whom you live. This philosophy extends to all parts of halfling life and is so much a part of their culture it doesn't even have a name, although it is best simply summed up as "harmony." If only the Big People could all live the same way...

The story always starts the same way. A Halfling village or community, oppressed and abused by its human rulers, prepares to defend itself, ready for the worst. One day a Halfling stranger of indeterminate age, wearing a battered blue cloak and walking with a stick, comes into town and asks for a place to stay. On the first day, he's helping out, fixing a fence or tending to a hurt sheep. By the third day, he's teaching the young men of the village how to defend themselves. He stays for a month or two, training and guiding his students, and then is gone as mysteriously as he arrived. He uses many names, but some say it's Saint Helbus, one of the first Halfling Christians and a disciple of the proselytizing St. Michael Olybrius, returned from Heaven to protect his fellows.

The style, in keeping with halfling philosophy, is simple and economic. The opponent's height and strength are used against him, and the halfling's natural stealth and grace are exploited to effect. The weapon of choice is a walking stick, around two feet in length, which is used both in attack and defense, striking at the wrists and ankles to disarm and incapacitate. Slings and a variety of thrown weapons are also used. The master himself is supposed to be capable of outlandish feats, knocking over armored men and disappearing entirely from view, but he rarely remains in one place long enough to teach these highest disciplines.

Primary Skills: Judo, Short Staff, Stealth, Throwing.

Secondary Skills: Acrobatics, Hypnotism, Philosophy (Harmony), Sling.

Optional Skills: Bow, First Aid/TL3, Herbary.

Maneuvers: Arm Lock (Judo or Short Staff) [1 point], Disarming, Hit Location (Short Staff) [2 points], Off-Hand Weapon Training (Short Staff).

Cinematic Skills: Invisibility Art, Light Walk, Pressure Points, Push, Throwing Art.

Cinematic Maneuvers: Roll With Blow.

Imperial Battle Wizard Training

5 points/6 points

The Imperial Legion makes extensive use of wizards, healing the fallen, affecting the battlefield and directly attacking the enemy with magic. These wizards are much of the reason the Imperial Legion is so effective, and much of the reason the Megalan Empire has managed to remain so large and powerful. Ideally, these wizards are kept behind their infantry's lines, shielded from direct attack and somewhat protected from archers and enemy wizards. With a

responsibility somewhere between artillery pieces and battlefield tacticians, they should have little call to engage in direct combat with the enemy.

Nevertheless, before covering military theory and war magic, all wizards are required to do "basic training," learning at least the shield, sword and spear their fellow soldiers use. On top of this, Legion wizards are trained in resisting invasive mind control magic, and in holding their concentration under distraction, keeping their minds on their spells while dodging attacks. Advanced training includes combining spells and weapons in one-to-one combat. Veteran Imperial Battle Wizards have been known to join warlike Mage's Guilds or form schools of their own, passing on the techniques pioneered by the Legion's trainers (see Peter V. Dell'Orto's ["Martial Arts for Mages"](#) for more on magical combat training).

Primary Skills: Mind Shield, Shield, Shortsword.

Secondary Skills: Tactics, Thaumatology, Wrestling.

Optional Skills: Broadsword, History (Optional Specialization: Military History), Riding, Savoir-Faire (Military), Spear.

Maneuvers: Concentrate While Defending [2 points].

Special: Imperial Battle Wizards may buy combinations (p.MA54) incorporating spells. Unless learned to a high enough level (generally 21+) that it can be cast instantly, the spell must be the first maneuver in the combination (after a turn spent concentrating). The Concentrate maneuver cannot be incorporated into combinations except in highly cinematic games. This is a feature, costing 0 points.

Cinematic Skills: None.

Cinematic Maneuvers: Simultaneous Spell Attack.

Tahtib

8 points/15 points

Brought over to Yrth by Egyptian bedouin, Tahtib is an ancient stick-fighting form practiced by the nomadic tribes of the Wazifi steppes. The *tahtib* or *asaya* is a long wooden staff, used by herders to control sheep or harding, which is turned to defense against wild animals or bandits when the need arises. Generally fought on foot with a four to six foot long staff, the style also teaches practitioners how to fight on horseback with an eight to twelve foot long pole. Both types of combat emphasize movement, with opponents circling one another constantly, keeping their exposed sides out of reach and trying to find openings in one another's defenses. Quick, light, misdirecting attacks are interspersed with more powerful blows, seeking to knock an opponent over or disarm him.

Tahtib is also a form of dance, essentially a ritualized combat fought with light staves, accompanied by the *tahvol* drum and the *oud* reed pipe. The dance can be performed wholly co-operatively, usually to a script in which one combatant "wins" the duel, or competitively, with the emphasis on technique and style rather than on landing blows. Either way, the dance is taken seriously among Wazifi tribesmen, as a social and competitive exercise. *Raqs al-Asaya*, a related "women's dance" performed with a short shepherd's crook, is performed purely for entertainment (use Broadsword Art, Dancing and Sex Appeal).

Primary Skills: Staff, Two-Handed Sword.

Secondary Skills: Brawling, Dance, Polearm, Riding, Staff Art.

Optional Skills: Animal Handling, Broadsword, Musical Instrument (Pipe or Drum), Singing.

Maneuvers: Feint (Staff) [2 points], Horseback Fighting (Staff or Polearm), Jab (Staff)*, Riposte (Staff)*, Spinning Attack (Staff)**.

Cinematic Skills: None.

Cinematic Maneuvers: Enhanced Parry (Staff), Whirlwind Attack (Staff).

*These maneuvers can only be used when using the staff as a thrusting weapon. Jab functions as per the boxing maneuver, inflicting one less damage than usual for a thrusting attack.

**As Spinning Punch, using a staff.

New Maneuvers

Bite (Average)***Brawling***

The basic bite attack. Note that humanoids must grapple enemies with both hands before biting them. Muzzled or snouted quadrupeds (the Horizontal disadvantage) or creatures with long necks can bite without grappling as a standard Close Combat attack as a zero-point feature. Damage is per the chart on p.B140, calculated for half the attacker's ST, or as per the Bite or Sharp Teeth advantage. Brawling adds its usual damage bonus.

Concentrate While Defending (Hard)***Will-3******Cannot exceed Will+1***

A spellcaster or psionic taking the Concentrate action may use this maneuver in place of his Will to try and maintain concentration if he is forced to make an Active Defense.

Hilt Strike (Average)***Boxing-2, Brawling-2 or Karate-2******Cannot exceed prerequisite skill level***

The attacker punches his opponent with his weapon hand. The hilt makes the punch awkward, but hard. Damage is thrust-1/crushing, plus any bonuses for skill. Basket hilts are specially designed for this maneuver: roll at +1 (without exceeding the prerequisite skill) and inflict thrust/crushing damage. This is a Close Combat maneuver.

Horseback Fighting (Hard)***Weapon Skill-2******Prerequisite: Any one-yard or longer weapon Weapon Skill******Cannot exceed prerequisite skill level***

This is the skill of wielding a weapon from horseback. As per p.B136, the attacker suffers a penalty of -2 if his relative speed is 6 higher than the target; trained horseback fighters may use this maneuver instead. Note that infantry are also at a -1 to defend against a horseback attacker, who in turn is at +1 to defend against infantry.

Rake (Hard)***Brawling-3******Prerequisite: Claws, Sharp Claws or Talons******Cannot exceed Brawling***

This is a powerful claw attack using the legs. The attacker must first Takedown or Slam his opponent and then grapple him with both hands, holding him down as he uses his legs to tear at the opponent's body. At the end of the attack, the attacker is prone, and must either take a turn standing or continue fighting on the ground. Damage is for a kick attack+2.

Scratch (Hard)***Brawling-2******Prerequisite: Claws, Sharp Claws or Talons******Cannot exceed Brawling+1***

This is a claw attack calculated to inflict minimal damage but draw as much blood as possible, usually to demoralize an opponent. It cannot be used against an opponent wearing armor. Roll damage normally for a hand attack; if any damage penetrates natural DR (from fur, hide or Toughness), then blood has been drawn. Regardless of the roll, a scratch never inflicts more than one point of real damage. System effects of bleeding vary at the GM's discretion. A heavily bleeding enemy or his allies may need to make Fright Checks. A scratch aimed at the Head (-5 to hit) causes blood to pour down the target's face, inflicting a vision penalty of -3 to -6. The victim should make HT rolls for blood loss per p.B130; damage from this maneuver inflicts a -1 per 3 hit points lost, not 5.

Trigger Berserk (Hard)***Will******Cannot exceed Will+3***

A character with the Berserk disadvantage may take the Concentrate action and use this maneuver in place of his Will to deliberately go berserk. Regrettably, it is of no use in trying to *snap out* of it . . .

New Cinematic Maneuver

Simultaneous Spell Attack (Average)

Spell Level-3*

Prerequisite: Any offensive spell; must specialize

Cannot exceed prerequisite skill level

As per p.B146, spells take affect at the beginning of the turn, the caster having finished concentrating the turn before. The mage may then take a normal action on the same turn, including Concentrating on another spell or making an attack. With this maneuver, unleashing the spell and attacking occur *simultaneously*. Unlike Dual-Weapon Attack (p.MA57), this maneuver does not give the caster any additional actions, but the simultaneous attacks divide the target's attention; his resistance and Active Defense rolls are both at -1. Spells learned to a high enough level to cast instantaneously may be cast with this maneuver, allowing the wizard to simultaneously attack and cast every turn.

*Note that this maneuver must be learned to be attempted; the wizard cannot simply roll against the default. The technique requires specialized training and practice.

Thomas J. Wise

A Historical Figure for *GURPS Fourth Edition*

by Steve Honeywell

Biography

Thomas James Wise is a man with a secret. Rising from humble beginnings, he became one of the most influential men in the world of book collecting and bibliography. For years, Wise's word was enough to verify the most unusual publication, and his guarantee of authenticity for a given work meant more than any scientific method of claiming a book or manuscript was genuine. What Wise didn't want anyone to know was that many of the works he sold were fabrications. For decades, Wise preyed on the book collecting world and duped hundreds into spending thousands of dollars on erroneous publications.

Wise was born in Gravesend, Kent on October 7, 1859 to Thomas Wise and Julia Victoria Dauncey. As a young man, Wise was employed as a clerk by Messrs. Rubeck and Co., a purveyor of "essential oils." Wise worked for the company for thirty-odd years, working his way up to the position of chief clerk and cashier before his retirement in 1912.

Wise was active both in the Shelley and Browning societies. From 1886 to 1892, he produced or oversaw 33 publications for the Shelley Society, bankrupting it. It was here that Wise learned quite a bit about both publishing and bibliography. In 1886, Wise hatched a plan to both pirate works and create spurious works. Wise continued to obtain rare books for his private collection, amassing a collection that was impressive both for the sheer number of volumes and for its completeness.

It is the fraudulent works that Wise is particularly noted for. He started with mere piracy, extracting previously unpublished poems of Shelley's from Edward Dowden's *Life of Percy Bysshe Shelley* and publishing them under the title *Poems and Sonnets*. Additionally, this work featured a false publisher imprint, distancing the work from Wise. He expanded the operation in 1888 by taking shorter 19th-century works that were available only in collections and creating specious "first editions." These were extremely difficult to detect by collectors simply because first editions of those works didn't actually exist for comparison. To add legitimacy to the fraudulent works, Wise donated and sold copies to the British Museum, which would then catalog the titles, lending them authenticity. Also, he sold copies of these works at auction, often buying them himself to set artificially high prices.

As Wise's reputation as a collector and bibliographer grew, he was able to produce more and more valuable fakes, selling them for increasingly high prices. Wise's bibliographies became another vehicle for him to advertise his spurious books since he listed his manufactured publications as legitimate. In 1893, he was given the task of writing the "Notes on Recent Book Sales" section of *The Bookman*, using this position to further drive up the prices of his fakes. Similarly, the published catalogues of his own collection further advertised what he owned, including all of the specious works.

As bad as this was, Wise's greatest crime is the theft of nearly 300 leaves from the collection of the British Museum. Wise would habitually purchase incomplete copies of works and "finish" them by taking the missing leaves from the British Museum's collection.

One of the most interesting parts of Wise's history is his public denunciation of forgers and pirates. In 1904, Walter T. Spencer created a fake first edition of Swinburne's *Dead Love from a Wise* forgery, and Wise himself denounced him publicly. Around this time, Forman and Wise stopped creating fake first editions, having already foisted an estimated 100 spurious publications on the collecting world.

In 1912, Wise retired from business and concentrated solely on the creation of bibliographies and on editing the letters of Swinburne and the unpublished materials of several other authors. He was named President of the Bibliographic Society in 1922 and served until 1924. In 1924, he was named a Fellow of Worcester College and in 1926 was given an honorary M.A. from Oxford.

While there had been some suspicion on some works sold by Wise, it wasn't until 1934 that Wise himself was suspected. Bibliographers John Carter and Graham Pollard published *An Enquiry into the Nature of Certain Nineteenth-Century Pamphlets*, showing that 40 to 50 pieces commanding high prices were fakes, and that many of these were dated earlier than known first editions. On all, the type, paper, and/or imprint were not genuine, and all could be traced back to Wise. Of particular note was a collection of Elizabeth Barrett Browning's poetry dated 1847 in Wise's fake. These poems had not been shown to Robert Browning by his wife until 1849. More damning was evidence that the wood pulp in the paper contained chemicals not in use until 1874. The type in this pamphlet was compared with others ranging in "publication dates" from 1842 to 1893. In all, the type face was identical, and all used the same mismatched question mark. Naturally, this raised suspicion, since these works were listed as being created by publishers on both sides of the Atlantic over a period of 50 years.

Equally suspicious were choices made by Wise. His edition of Ruskin's *The National Gallery*, dated 1852, contains emendations not present in editions before 1880. Further, Ruskin's *The Queen's Garden*, dated 1864 by Wise, includes changes made by Ruskin in 1871. Naturally, Wise protested the inquiry, going so far as to blame the entire thing on Harry Buxton Forman, who he often worked with (and who was also implicated in the production of these publications) but Wise could produce no evidence. Wise died in 1934, leaving behind his Ashley collection. His widow sold the collection to the British Museum for a reported £66,000, which was about half its estimated value. However, 200-odd works listed in the catalog were no longer present, having been sold off to other collectors.

Using Thomas Wise

While Thomas Wise is not much of an adventurer, he makes an excellent contact in a number of situations. A rising star in the bibliography and book collecting world through the last part of the 19th Century, Wise truly comes into his own after 1912. Around this time, he is perhaps the single greatest authority on books, particularly those of the 19th Century, in the world. His bibliographies are noteworthy because of their attention to detail and completeness, and his reputation is sterling until a few months before his death in 1934.

Wise would be the contact of choice to locate and acquire any rare book or pamphlet. Because his connections are so good, he will likely be aware of the location of multiple copies of any given work, and may also know someone willing to sell a copy. Additionally, because of the relative size of his collection, Wise may possess one or more copies of a given work at any given time, and will generally be willing to part with one for the right price. He makes an excellent contact for anyone or any group who may need access to particular books over the course of a campaign.

Wise could also act as a patron for the right group. His constant desire for rare books could conceivably possess him to hire a group to obtain particular tomes for him. Such groups would be paid little, since Wise's desire is to continue to add to his collection and he'd be hard pressed to spend money elsewhere. Still, for particularly rare tomes available only in other parts of the world, he might be willing to fund an expedition.

Of course, it's much more interesting if Wise's spurious productions somehow enter the mix. The group could be contacted by a buyer of Wise's who wonders if the books he has acquired are truly the genuine article. Or the group itself might be duped by one of Wise's books either at the behest of another collector patron or on their own.

In a **Steampunk** game, Wise will still concentrate on literature, but will also deal in more exotic and technical works. While it is unlikely that he will fabricate such works, it is possible that he will produce "early" versions of particular designs or technical ideas, depending on whether or not there is interest in the book collecting market. He will undoubtedly have many such works in his collection.

A **Horror** or **Cabal** campaign makes Wise even more interesting. His ability to suddenly procure new and unknown "early" editions of works and his collection of rare books may make him a target of creatures who do not wish to have

their secrets discovered. It's important to remember that Wise's books were all taken at face value, so his reputation for discovering previously unknown books is near-legendary. Anything with a shadowy or dangerous past would risk a lot to prevent him from inadvertently uncovering some dark secret. Wise may need protection, and may go to the best, closest source for help. Conversely, Wise may be working for the Cabal either as a member or a dupe. His fabricated works could be full of misinformation to lead others astray, further cloaking his masters from prying eyes.

Savoir-Faire (High Society) 13 (IQ+0) [1]
Writing 13 (IQ+0) [2]

* It may seem strange that Wise does not have the Forgery skill. However, he wasn't technically a forger since the works he created were not attempting to duplicate something already in existence. Instead, he created entirely new works but backdated them and included false publishing imprints to give the impression that these works were genuine first editions. Because of this, Artist (Printing) seems to be a better fit for his actual skill.

† Secondary skill based on Literature.

For a modern campaign, add Computer Use 14 (IQ+1) [2]; Teaching 14 (IQ+0) [2]. Wise would most likely be a college librarian or literature professor. He would also be much more careful in producing his spurious works, using antique inks and paper.

The Omniscient Eye

The Gameable Archaeologist

by Matt Riggsby

This installment came about amid a consultation with the Omniscient Eye: How do real-world professions differ from how those professions are depicted in popular media? This installment, then, is not answering any specific question, but rather dispelling myths and giving general information about a specific profession.

If there is demand, there may be future installments in "The Gameable _____" series. Make your thoughts known by visiting our [Discussion Boards](#) or sending a letter to [The Editor](#).

"Seventy percent of all archaeology is done in the library."
--Dr. Henry Jones Jr.

Few professions have gathered such romantic notions about them as archaeology. The word conjures up visions of well-groomed, linen-clad Brits in an Agatha Christie novel overseeing vast digs in Mesopotamia but looking and acting as if they were still at home in Surrey or Harrison Ford shoving his way past ranks of mummies in search of buried treasure. Oddly enough, those notions did once have some basis in fact. Modern archaeology is a long way away from the rough and tumble avocation of previous centuries, but possibility for adventure remains.

A Brief History Of Archaeology

Archaeology as we know it is an invention of the modern age. Romans sometimes collected Etruscan bronzes and people of the Renaissance collected Classical antiquities, but the idea of someone who studies the past by the examination of old objects has only developed over the past few centuries. The ancestors of archaeologists began to appear during the Renaissance in the form of antiquarians, wealthy and academically inclined hobbyists who collected or surveyed historical curiosities. Naturally, they began to examine them closely and categorize them. These antiquarians also began to suggest that "elfshot" and "thunderstones," symmetrically-shaped bits of stone sometimes found in the dirt, were, in fact, axes and arrowheads used by technologically primitive ancestors, similar to the stone tools used in the New World. And they collected theories on ancient constructions such as Stonehenge and other (at the time) unexplained stone monuments of Europe.

Archaeology got its biggest boost in the 19th century as European power stretched into Egypt and Mesopotamia. This was a vitally important time for both the popular image and the academic importance of archaeology. For the former, Egyptian motifs and artifacts became all the rage. Europeans wanted to see more and know more about the exotic east, and both footloose adventurers and wealthy tourists tried their hand at digging up something to impress (or sell to) the folks back home. For the latter, the opening of these areas meant that entire new civilizations, not just dirty savages, were directly available for study, but only through their material culture. And they weren't just any civilizations. These were the lands of the Bible. The

What is an Archaeologist?

Some people use the term "archaeologist" to mean anyone who digs up old things. Here, we'll concentrate on the modern, academic sense of the term: someone who studies past humans and societies through material remains. It does not include paleontologists, who study extinct animals, although their professional lives are probably much the same. Think of them as anthropologists of the dead rather than zoologists of the dead.

decipherment of Egyptian hieroglyphics and the discovery of cuneiform texts in Mesopotamia opened up the possibility of finding texts which would provide a greater understanding of the historical events that formed Judaism and Christianity.

These were the years of archaeology's greatest adventures and, alas, greatest wastes. The techniques of the period, if they can be called that, mostly involved digging with pick and shovel until something pretty turned up. Such efforts might involve a single native looking for something to sell the tourists or hundreds of laborers methodically tearing apart a city under the direction of a determined European treasure hunter. This style of excavation would horrify the modern archaeologist, who pays attention to countless dull details which, when viewed in the context of their deposit and their relationships with one another, can provide vast quantities of information but become useless when carelessly tossed about. In Egypt, mummies were even burned on campfires as a substitute for wood.

Competition for artifacts was fierce in these relatively lawless areas, and archaeological expeditions in the same area might try to sabotage one another. At least once, a group of diggers on one side of a hill, hearing that their competitors on the other side might have found a promising tomb, dug a tunnel *through* the hill to plunder it before their slower competitors could get to it.

Things calmed down over the course of the century, though, as the rage for artifacts abated somewhat and the richest sources of plunder dried up. New generations of scholars began proposing more methodical, scientific ways of approaching archaeological sites, culminating in the works of such antiquarians as Charles Darwin's friend Lieutenant-General Augustus Henry Lane Fox Pitt-Rivers (a great steampunk name if ever there was one), who proposed that archaeological evidence should be collected in such a way that it would be admissible in a court of law.

Treasure hunting in the 19th century mode still exists, but most nations have come to recognize the cultural and historical value of ancient artifacts and have moved to clamp down on such activities. Instead, archaeological sites have come to be treated more like endangered species: they are limited in number, and there won't be any more forthcoming (the Romans, for example, aren't going to build any more cities), so they had best be husbanded carefully. Taken together, these developments have led at last to the development of the modern, scientific archaeologist.

Modern Archaeology

Modern archaeologists might be divided into three overlapping categories: academic, government, and contract. Academic archaeologists are what most people think of as archaeologists: university professors who mix digging with teaching and dealing with the other requirements of holding down an academic position. Government archaeologists work for departments overseeing antiquities and cultural heritage. They may regulate the activities of other archaeologists, work with endangered sites on public land, or survey building areas for potential damage to archaeological sites. Contract archaeologists work for private firms, doing archaeological work for hire. They might do archaeological surveys as part of ecological impact studies (legal requirements for such surveys are the reason the biggest employer of archaeologists in the state of California is Caltrans, the agency responsible for building highways), subcontract for academic and government projects, perform salvage operations, consult with private historical preservation organizations and law enforcement, and other such work.

But one thing the fictional Dr. Jones got right is that most of an archaeologist's time is spent in the library . . . or the office, or the lab, or the classroom. Archaeologists spend most of their time reading up on topics relevant to their research, preparing and delivering lectures, reviewing papers by their peers (and, for academics, grading student assignments), writing their own papers and grant proposals, doing paperwork, attending professional conferences, cleaning and sorting artifacts, and trying to make sense of a huge mass of tiny details.

They'll eventually go into the field, but before they do, countless arrangements have to be made. Work must be planned, accommodations must be found, equipment and supplies must be prepared, and vehicles must be arranged for. Academic and contract archaeologists often have to get permission to work in their chosen areas from bureaucrats, land owners, or both. Government archaeologists *are* the permission-granting bureaucrats, so it isn't as much of an issue for them. Many countries limit the amount of work that can be done (leading foreigners in particularly archaeologically rich nations to form governing institutions to mediate between the government and scholars and to

efficiently direct their own country's efforts there) and require that foreign archaeologists work in concert with natives.

But eventually, an archaeologist comes to what got him into archaeology to begin with: fieldwork. Some fieldwork is a lonely affair, with the archaeologist spending days alone or with a colleague or two surveying and doing a little digging. However, it will often involve several senior archaeologists along with a mixture of junior archaeologists, students, paid laborers and other colleagues (for example, geologists with an interest in the same region) working out of a home base for weeks or months at a time. Individuals come and go, but it's not uncommon to find five to twenty people (or more) involved at any given time. The character of the base depends on where the work is being done. Archaeologists working near civilization (say, excavating the Athenian Agora) will take advantage of it as much as possible, staying in apartments and negotiating the use of lab space in nearby museums and universities. In the countryside, they may rent a few cottages; in truly remote areas, it's tents for everyone with occasional trips into the nearest town for supplies.

Fieldwork can be divided into survey and excavation. Survey involves walking around with eyes to the ground looking for artifacts and other signs of human habitation. Survey is used to get an overall idea of the nature and distribution of archaeological evidence in the region. In recent years, archaeologists have been able to use satellite images, aerial photography (kites and balloons can lift cameras as a low-cost alternative to manned aircraft), ground-penetrating radar, and other high-tech devices to aid the process. High-altitude images reveal outlines of buildings and even ancient field plowing patterns not visible from the ground, while other remote sensing techniques can find sub-surface disturbances that might point to interesting sites. Resolution isn't very high with any of these techniques, though; they tend to say "this spot may have been a building at one point, or maybe a garbage pit . . . or perhaps a small pond" rather than "the face on that gold coin has an unusually big nose."

Excavation is what most people think of as archaeology. Once decisions are made about where to dig, trenches, usually one to three meters on each side, are marked off with string and digging begins. Picks and shovels may be used to take off surface layers if there's no reason to expect that they'll contain anything interesting. Once interesting levels are reached, excavation moves to smaller tools, systematically removing a few centimeters of soil at a time. The archaeologist's favorite weapon at this stage is a four- to six-inch pointing trowel (a curved gardening trowel will be laughed at), with the edges sharpened to scrape down walls. Very fine tools such as brushes and dental tools might be used on exceptionally delicate surfaces (for example, crumbling mosaics), but circumstances rarely call for them.

As the trench is excavated, soil samples may be reserved for chemical analysis, and at least some of the dirt is screened. The soil is poured into a frame with a coarse wire mesh bottom (1/4-inch holes is common), and the frame is shaken to sift the dirt from artifacts. Many small artifacts, such as coins and tiny projectile points, which might be overlooked by diggers, are found by screening.

However they're found, artifacts are bagged, labeled with the location where they were found, and taken to a field lab. There, they're cleaned a bit more, cataloged, and perhaps photographed or examined under a microscope. Most serious analysis, however, takes place outside of the field season. Fieldwork, which takes people and equipment far from home, is expensive, so effort is concentrated on those tasks that can only be performed in the field. Analysis, which can require specialized equipment or just time, is left for a well-equipped lab. And that takes us back to the library until the next field season.

Building An Archaeologist

The period up to the 20th century was the period of aristocrats and adventurers. In the early years, an archaeologist needed little more than an interest in the past and enough money to take him where he wanted to go, and the two-fisted adventurer of pulp fiction isn't necessarily a bad model to work from. For example, one such adventurer was Giovanni Belzoni, who traveled to Egypt in search of valuables for the British Museum. Belzoni had little formal education and none at all in any historical field. Rather, he had some talent as an engineer, which aided him in large-

Potsherds

A sherd (*not* shard) is a broken piece of pottery, and archaeologists go on endlessly about them. Pottery is extremely chemically stable and subtle variations in the composition and decoration can tell a great deal about who made it, when, how, and sometimes for what purpose. As a result, it's surprisingly valuable in terms of how much information it can provide.

scale excavation, and a background as a circus strongman.

Modern archaeologists need better qualifications. All archaeologists need in-depth knowledge of the history and material culture of the people they study. Depending on the academic traditions from which they come, they may come with a general grounding in anthropology (most likely in America), geology (more common in Europe), or a particular body of history and literature (for example, Greek and Roman Classics). Most archaeologists will have additional background in one or more academic or technical specialties: pottery, stone tools, botany, geology, economics, zoology, metallurgy, religion, and so on.

A few specializations require particularly interesting skills. One is underwater archaeology. With the development of scuba gear, it has become possible to investigate ancient shipwrecks, well-preserved because of favorable sea-bottom conditions. It's expensive, requires strong diving skills, and archaeologists can only work for short periods at a time, but it's a relatively glamorous specialization.

Another is experimental archaeology, which attempts to reproduce ancient techniques for producing tools and performing other tasks. An archaeologist is unlikely to be an all-around survival expert, but he may have surprising insight into how to butcher an animal or turn a lump of glass into a wickedly sharp blade.

Archaeologists typically need some facility with languages. No matter where they work, they need to speak the local language well enough to get by and a reading knowledge of any appropriate language with literature that touches on their subject area. For example, archaeologists studying European prehistory need at least English, French, and German (there's a lot of relevant literature in all three languages), and those studying historical periods will probably know some Latin and possibly Greek as well. However, they need not be linguistic experts. Polyglots like *Stargate's* Daniel Jackson display cinematic abilities.

One less obvious thing an archaeologist needs is at least a minimal level of social and administrative skills. They must navigate bureaucracies to obtain grants, arrange field accommodations, and schmooze with officials and landowners to get permission to work and keep the good will of local communities. Some people, including many native Americans and Australians, have been ill-used in the past and are resentful of outsiders coming in and disturbing the remains of *their* past, so a certain amount of diplomacy often is called for.

Finally, there are matters of attitude and professionalism. One thing that Dr. Jones had a near-miss on is that artifacts "belong in a museum." The stance of the archaeologist is that that's true as far as it goes, in that archaeological artifacts, being part of the common cultural heritage of humanity, generally belong where they can benefit everyone, not in private hands. However, the point of archaeology is not to find pretty things to show off in museums. It's to learn about the past. From that point of view, a box full of pottery fragments, properly collected and analyzed, is more valuable than a single flawless vase. This is not to say that archaeologists don't dream of finding the next Rosetta stone or King Tut's tomb, but they also dream of fighting Nazis and Frenchmen in white suits, but that's just not going to happen, so let's be realistic, shall we?

Consequently, while archaeologists have a proprietary attitude towards their sites, they don't actually keep the artifacts. Ownership of excavated artifacts is a sensitive issue. Many nations regard archaeological artifacts as part of their cultural heritage, not something to be sold off or privately held. Therefore, artifacts of any value will be kept in laboratories where they can be readily analyzed or museums where they can be displayed to an interested public, and definitely *not* in an archaeologist's home. Some, admittedly, might surreptitiously keep a vaguely interesting sherd or similar small item as a souvenir, but gold medallions and elaborate burial masks are too important and too conspicuous to keep to oneself. Archaeologists are also generally very much against other people's private ownership of ancient artifacts. Participating in traffic in antiquities is widely regarded as unethical, and while legally sanctioned treasure hunters do exist (for example, salvage companies that locate shipwrecks in international waters and sell the finds), most archaeologists regard them with contempt, much as animal-rights activists might regard trophy hunters.

Archaeologists generally *don't* need combat-oriented abilities. Significant physical disability will keep someone out of the field, but archaeologists are generally in no better or worse shape than any other white-collar professional.

**The Great Lost [Fill In
The Blank]!**

On the other hand, many archaeologists return from the field in better shape than when they left (a few months of digging holes will do that), and in environments where dangerous animals are a hazard (say, rural Alaska or parts of South and Central America), it's occasionally useful to have someone who can tell one end of a gun from another.

Archaeological Adventure

So what kinds of adventures might archaeologists get into? Well, what could happen to someone who travels to exotic lands, deals with items which might be valuable and could have special significance to the natives, and has a variety of interesting, if largely academic, skills? Here are some possibilities:

Cloak, Dagger, and Trowel: During WWII, the OSS recruited agents from a variety of unusual professions. Among them were archaeologists, some of whom were parachuted into the Greek islands to help the resistance. Though the idea of an Oxford don leaping from a plane to fight Jerry may seem absurd, the archaeologists spoke the local languages, knew the lay of the land, and had local contacts, all important attributes for an intelligence operative.

Even now, archaeology could be a cover for a secret agent. After the first Iraq war, a humanitarian mission sponsored by Doctors Without Borders managed to bring an archaeologist along with them to inspect some important sites. It might have been tempting to a government to recruit a legitimate archaeologist to snoop around some behind the lines.

But even a legitimate archaeologist might find himself forced to make like an action movie spy. Permission for foreign scholars is one of those little political footballs that can be tossed around by feuding governments, and in uncertain times or under radical regime changes, today's welcome guest could be tomorrow's imperialist crook. Just as some Westerners had a few hours warning to flee [Thailand](#) before the country's involvement in the world wars, an archaeologist in an unstable country could find himself trying to get out of a foreign land before the new regime's policies sweep him into a local prison.

Fighting the Pothunters: A "pothunter" is someone who digs up sites in search of salable artifacts, a crime in many countries. Because spectacular artifacts can fetch high prices in the international market, insurgents who fund themselves with drug smuggling dabble in pothunting as well. In Peru and Chile, some large archaeological sites resemble a cross between conventional digs and small military bases, with barbed wire perimeters and machine-gun nests. Even solitary pothunters may carry guns to fight off police.

It's entirely plausible for an archaeologist, particularly a government archaeologist, to get involved in a crime drama. He'll be a consultant rather than an actual cop, but he can be an important part of an investigation of pothunting, antiquities smuggling, forgery (which is rampant; easily half of antiquities on the market today could be fakes), and similar crimes. In less stable regions, he may be subject to assassination attempts or present at an archaeological site when a criminal gang attacks.

Curse of the Mummy!: And, yes, if anyone's going to get hit by an ancient curse or attacked by long-imprisoned Things Man Was Not Meant To Know, odds are it'll happen to an archaeologist. Most important Egyptian tombs have

Fictional archaeologists embark on quests to find specific grand lost artifacts or the *one* piece of evidence that will irrefutably prove their pet theory. The goals of real archaeologists are notably less grand.

Just as in physical sciences a single experimental result is unlikely to immediately revolutionize our understanding of the universe and rewrite existing physical law, a single artifact or even a single site is unlikely to overthrow decades or centuries of prior scholarship. For example, the appearance of Roman coins in the New World would not enable someone to prove that the empire extended across the Atlantic and as far as Mississippi, since it overlooks a total lack of other kinds of evidence, such as textual references and remains of cities. (This is a real example, by the way. Some European colonists in the early years of American settlement brought historical curios with them, including Roman coins. It was occasionally customary to drop souvenirs into the foundations of a new home for good luck, leading to the deposition of Roman coins in New England soil. Enthusiastic amateurs of later centuries, unaware of this practice, stumbled over said coins and jumped to the wrong conclusion.) This is not to say that revolutions in historical thought are impossible. It does, however, mean a lot of tedious ground-laying by a great many scholars, not finding one perfect piece of evidence.

Likewise, quests for legendary places and artifacts are popular

been opened, but there are still potentially rich finds elsewhere (South and Central America, Africa, China, and the areas surrounding Mesopotamia are good candidates).

One problem with purported ancient curses is that they tend to be subtle, making it unlikely that anyone will believe in them. The deaths associated with the excavators of Tut's tomb were normal-looking enough to look creepy only when looked at very selectively, but spectacular deaths are a possibility as well: Dennis Puleston, a prominent Mesoamerican archaeologist, died when he was struck by lightning when a storm suddenly came up while he was standing atop the El Capitan pyramid in the Maya city of Tikal.

The same archaeologists who incur curses or release Things are also likely to be familiar with the texts containing defenses against them. However, it's likely that those defenses will be tied up in the same disputes that always fill academic publications. Given a few possible rituals and incantations, archeologists, like any historically inclined specialists, are likely to argue over proper translations, find gaps in the texts ("Say, what are you supposed to do with the ox blood?"), uncover ambiguities ("Does that phrase mean virgin's blood or shitake mushrooms?"), and worry about dating ("That was written in the fifth century; are you sure it'll banish a 12th-century demon?").

in fiction but hold little attraction in real life. This is less because they're well-hidden and more because, when the evidence is examined closely, little is reliable. Even if we ignore the very real possibility that a given artifact may already have been found or a site thoroughly destroyed and built over, historical sources are vague and usually contradictory, often to the point of uselessness. If one did find, say, the True Cross or the Ark of the Covenant, it would be nigh-impossible to prove its authenticity using the sources we have. Searches for lost historical sites can generate considerable popular interest and, consequently, funding (excavations at Cadbury castle in England, thought by some to be the site of Camelot, received considerable attention because of the Arthurian angle despite the fact that there was little or no actual evidence that the historical Arthur had ever been there or even that he had ever had a court of his own), but at some point those interests will get balanced with more skeptical viewpoints. That goes double for artifacts, which can easily be moved or destroyed (one might, for example, have some hope of finding the site of da Vinci's workshop, but none of finding his paintbrushes). Consequently, while an archaeologist might privately dream of turning up a long-lost place or thing, those concerns will usually be submerged, at least during working hours, by general interest in a region or period of time.

Sages theorize that the Omniscient Eye might actually be composed of a panel of

Experts chosen through mysterious and arcane means. Regardless, the Omniscient Eye is benevolent, and every other week it is willing to share its lore to all. Or, at least, to all with valid *Pyramid* subscriptions.

The Omniscient Eye seeks to answer questions that are tied to knowledge of the real world, providing information with a perspective that is of use to gamers. The Omniscient Eye does not concern itself with specific game systems or statistics.

Do you have a question for the Omniscient Eye? Feel free to send it to pyramidquestions@yahoogroups.com, and the Omniscient Eye might answer it!

Mr. Johnson's Little Black Book (for Shadowrun)

Published by [FanPro LLC](#)

Written by Robyn King-Nitschke, Steve Ratkovich, Costán Sequeiros, & Malik Toms with Rob Boyle & Elissa Carey

Cover by Adi Granov

Illustrated by Dave Allsop, Steve Bagatzky, Shane Coppage, Steve Ellis, Larry MacDougal, Marc Sasso, & Klaus Scherwinski

124-page black & white perfect bound softback; \$24.99

The latest release for *Shadowrun* focuses in on the metier at the heart of the game: the "run through the shadows," or *shadowrun*. Not only does it discuss this, but *Mr. Johnson's Little Black Book* also fills in gaps left by two out-of-print titles from the Second and First Editions of *Shadowrun*. From the First Edition, this is *Sprawl Sites*, which gave the GM a collection of archetypal locations, each mapped, plus a set of encounter charts, and another of contact and archetype listings. From the Second Edition, the supplement is the *Contacts* booklet included in the *Gamemaster's Screen*. This new supplement builds on the contents of the previous pair with all-new material set in the Sixth World of 2064, and as per usual ties in with several other *Shadowrun* supplements. Primarily these are the *Shadowrun Companion* and the [Sprawl Survival Guide](#) but also include *Matrix* and *Rigger 3*.

Mr. Johnson's Little Black Book is not a supplement that expands upon the actual background and setting of the Sixth World, so it forgoes the usual factual presentation interspersed with heavy doses of commentary and conjecture from the denizens of the Shadowlands BBS. This is a rules and discussion book, though still presented to the usual standards. The writing is both clear and well-edited, all punctuated by pleasing artwork. As ever, Larry MacDougal's illustrations stand out, but so do those of Shane Coppage and Dave Allsop.

It opens with "Anatomy of a Shadowrun," an essay that dissects in turn the Set-Up, Meeting Mr. Johnson, the Legwork, the Run, and the Aftermath aspects of the atypical shadowrun. Set-Up looks at the nature of the campaign itself, expanding upon the material and advice given in the *Shadowrun Companion*. Its focus is the party and the roles played by the various archetypes as well as suggesting how to get them together. Essentially, this is the standard take upon the subject, though it has to take into consideration the role played by both magic and the matrix in the game. The chapter gets a little more interesting when discussing potential employers, dividing the Mr. Johnson figure into three types: the Private, the Corporate, and the Street Johnson. The approach and needs of the three types is very different when it comes to hiring runners. For example, the requirements of the Private Johnson are more personal than professional, and probably concern a single issue, while those of a Street Johnson, while still personally motivated, are likely to be tied to a civilian organization, invariably of an illegal, political, or underground nature.

Legwork takes the runners through the preparation needed for the job, from research and surveillance to checking with contacts and assembling any necessary equipment, while the Run suggests how the GM should referee the Job itself. Finally, the Aftermath covers closing the deal with the Mr. Johnson, any remaining loose ends, and what the characters might be doing in their downtime. It includes suggestions for the GM on how to handle Riggers (vehicle and remote operators) and Deckers (net runners), both archetypes that involve dice intensive mechanics. This can be as NPCs, or make use of the quick resolution systems found in the back of the book. The chapter is supported and illustrated by a

decent piece of color fiction, which could have been improved if it had been paralleled with an explanation of the game mechanics involved in each scene. This would help to enhance the advice of this first chapter, which though both solid and useful, is perhaps a little obvious to most experienced GMs.

The second chapter is all about "It's Who You Know," and is probably the one that a GM will make the most use of. Some 50 contacts are detailed, across society's entire stratum. They are neatly organized into categories: security, entertainment and journalism, political, corporate, on-the-street, criminal, in-the-shadows, magical, law enforcement, and working stiff. The first three entries under each category receiving an expanded treatment and represent variants upon a major contact type. Thus for the Security Guard, there is the Corporate Security, the Rent-a-Cop, and the Parasecurity expert, the latter handling paranimals to help guard various facilities. Unlike the others, these three also have their own pieces of color fiction and a slightly expanded background, but all of the contacts have an explanation of their role in the game. All have a hook to get them involved in the game, but they do read as a little too simple. Fully written up with detailed statistics, the 50 contacts come ready-to-run and are a very useful resource for the GM.

Locations receive a similar treatment in "Where It's At," describing some 45 sprawl sites across 19 different categories that the runners might visit. They include corporate offices, housing and apartments, shops, laboratories, bars and nightclubs, warehouses, and municipal facilities. They are actual places, generic in so far that they can be situated anywhere the GM desires. Where they fail to be quite as useful as those found in ***Sprawl Sites*** is in the lack of maps, but this would require a whole other book. One useful tool is the set of "Neighborhood Generation Tables," which with the roll of a few dice enable the GM to create a city block or street and its buildings, all in a few minutes.

"On the Run" gives the GM 12 short scenarios that need relatively little preparation. They range from hijacking an on-the-move drone truck to obtain a particular package without alerting anyone and rescuing a basket ball player who has been beaten up and dumped in a bad neighborhood after refusing to throw a game to cover gambling debts, to smearing a political opponent and searching the sewers to capture an escaped and illegally crossbred paracritter. The scenarios are all small-scale affairs, designed to suit most campaigns. They backed up with two further sets of tables, the first of random encounters, the second being more useful and enabling a GM to create "Runs on the Fly." Again designed for use with both this book and the ***Shadowrun Companion***, this is a nice little aide.

As with other ***Shadowrun*** supplements, the last section of ***Mr. Johnson's Little Black Book*** is devoted to game information. Here it discusses the possibilities present in both high and low-level campaigns, the latter set on the streets, the former more like a James Bond-style game. Also included are the rules and guidelines necessary to create characters for either type of game. More immediately applicable are the rules for a character's reputation -- his street cred, notoriety, and the public awareness of the character. Finally, the book is rounded out with rules for handling both Matrix runs and vehicular combat. For Matrix runs, two methods are suggested, one simplifying the rolls necessary to a situation-by-situation basis, the other requiring just the single roll. The player spends successes resulting from this single roll to achieve the objectives of the run. The quick rules for vehicular combat just handle vehicle-to-vehicle combat and work easily for get-aways and the like.

Mr. Johnson's Little Black Book is really a corollary to the ***Shadowrun Companion***, but it still manages to work as a stand-alone book. It contains a fair amount of useful information -- the contacts in particular, though the "Anatomy of a Shadowrun" is a solid essay on the subject and the locations will find their way into a game despite the lack of maps. The rest is decent enough, but only of limited or short-term use, the adventures and encounter tables in particular. Overall, this supplement does not have any negatives, so the positives outweigh its so-so aspects, the result being that ***Mr. Johnson's Little Black Book*** provides solid, but not spectacular support for the gaming side of ***Shadowrun***.

Cargo

Published by [Wingnut Games](#)

Designed by Tom Jolly, Aldo Ghiozzi, & Allan Sugarbaker

Art by the Fraim Brothers

Rules sheet, four-piece full-color jig-cut board, 80 full-color counters; \$19.95

Tom Jolly has a pretty good reputation in the gaming industry, making some fairly low-key but nevertheless entertaining and insightfully creative products. Now he's joined with Wingnut Games to produce ***Cargo***.

The object of the game is to score the most points by the time someone loads or loses his last crate.

You're all rebels taking part in the Boston Tea Party, the seminal moment in history for tax evaders. As a member of the raiding party that went to the docks to dump tea into the harbor, you're expected to ditch as much oolong as you can. Since life is never simple in a board game, you've actually been hired by one company to *load* their tea, so you've got a vested financial interest in seeing your employer's consignment safely onto the ship while dumping everyone else's goods. Your opponents, in turn, do the same for their company.

The action takes place on a board eight spaces squared (like a chess board), with the waiting boats on all four edges. The crates are randomly placed face-down so no one knows whose tea is concentrated where. You then place your units where you think they'll do the most good, and all the counters are flipped up so the commotion can begin. The only way to get tea anywhere is to push or pull the boxes around. Everyone has the same selection of workers and beasts of burden.

You have dockhands, a burly worker, a mule, and an elephant. Each unit has its own statistics as to what it can do. The dockhands can only push one crate one space, for example, unless several hands get together to push multiple crates in a row. Dockhands are kind of wimpy, though, and can get squished between sliding crates. Elephants can't be pushed, but they can push a lot more than most units. They cannot pull, though; that's where mules come in (sometimes you want to be in front of your load instead of behind it). Using your workers in different combinations (you can put three of them to work in one turn), you shove your crates onto your ship's loading spaces . . . or an opponent's stuff off the end of the pier. Crates are lost to the sea, while squished or dunked workers are eventually replaced on the board. When any one player loses his last crate, the game ends and points are tallied.

You get points for getting your tea onto the ship, pushing your enemies' crates into Boston Harbor, and sending opposing workers into the drink (you lose points if you drop your own people or tea into the water). You can't actually push the workers directly, though -- you can only move the crates, so getting someone into the water means getting a box of tea in between you and them.

The board is beautiful, with bright, clear colors and a nice, utile layout. The pieces have cartoonish but enjoyable artwork, and they fit nicely onto the board. It comes in jig-cut segments, and since the game asks you to slide your units about, unlevel cuts can get in the way of this. (The board's troublesome incisions may also vary from one copy of the product to another.) Like many counter sheets, not every square here has art on it, so the game makes good use of those as score counters. Alas, there aren't quite enough blanks to keep up with all the points you'll score in an average game for dunking opponents.

Cargo is unfortunately equal parts good and bad. The movement rules make it a good exercise in thought, giving players something to pore over as they look for the advantage. Two to four people can play, if the two-player limit on chess doesn't move you. Unfortunately, the different movement styles and rules for different pieces are still open to debate, even though one whole side of the rules sheet is given over to graphic examples of several combinations. Even if movement makes perfect sense to you, it's not all that elegant. Although each piece has its movement stats printed on it (and one player is going to have a devil of a time trying to read the white writing used on his yellow background), the rules for each piece just don't become second nature.

Cargo is another clever idea from the wizard of **WizWar**, but when playing a game of strategy, the participants should not be spending equal time on scanning the board for an advantage and reading the rules for clarification.

Pyramid Review

Russian Rails

Published by [Mayfair Games](#)

Created by Jodi Soares

Boxed set; \$38.00

Russian Rails is the latest in Mayfair Games' highly successful ***Empire Builder*** line of games, joining previous efforts such as ***Empire Builder***, ***British Rails***, ***EuroRails***, ***Nippon Rails***, ***India Rails***, ***Australia Rails***, ***Iron Dragon***, and ***Lunar Rails***.

For those unfamiliar with the line, the ***Empire Builder*** series is one of the mainstays of train-based board games. Each product uses the same set of rules, with (usually) very minor variations. Each game is played on a plastic-coated map of a given locale that is overlaid with a pattern of dots and symbols to represent special terrain features, such as mountains. The object of the game is twofold: to create an extensive network of rail lines, and to be the first player to reach 250 million "dollars." To do this, players are given a fixed sum of money at the beginning of the game with which to lay initial track, represented by erasable crayon marks drawn by each player on the map, and then are given a series of three cards that describe various cities that need commodities, and how much payment one will receive for completing the loads. Players then have to balance going to particular supply cities to pick up the various commodities, and then freighting them to demand cities, funneling the profits from the run back into further rail construction. Upgrading of trains to faster or more spacious machines is also possible. As the game progresses, smaller amounts of money need to be reinvested in rail building, and it becomes easier to generate a profit. There are occasional disaster cards buried amongst the load cards that slow down play, wipe out tracks, and so on.

In a nutshell, these are the rules, and as the number of ***Empire Builder*** games out there attests, they provide for a game that can be quite addictive.

So what sets ***Russian Rails*** apart from its predecessors?

There are two kinds of ***Empire Builder*** games. The first type is simply territorial: they offer almost no change to the mechanics, and merely change the game location. A change of scenery can make for a very different game (or a useful geography lesson -- the games are often touted as educational on this basis), and most of the ***Empire Builder*** series are like this: the same game, in different locales. There are, however, attempts to change the game by changing nature of the rules. This has been done in a minor way in ***Luna Rails***, where the action takes place on the three-dimensional sphere of the moon, and in a major way in ***Iron Dragon***, which modifies the mechanics and the setting considerably for a fantasy world.

Russian Rails straddles the two types of rail game, in that instead of changing the locale or rules, it adds a different element: history. The game is specifically set in the Soviet Union in 1945 at the end of the "Great Patriotic War," and the object is to rebuild the Soviet rail lines after the devastation of the war. The map is the majority of the old Soviet Union, and the game plays initially as does any other ***Empire Builder*** game (as long as one is willing to overlook the spectacle of rail commissars in a communist nation acting like greedy wheeling-and-dealing capitalist rail barons, that is!). However, built into the game is the understanding that communism is a flawed system headed for the ashcan of history, and that at some point, communism will fall. This can be simulated in a number of ways, though it is usually done by having one event card read "Communism Falls!" (the rules provide for other player-agreed conventions to have that same event come about). Once this card is drawn and communism falls, the game changes considerably: the Soviet Union breaks up into the Russian Federation, and what were simply markings on the map board become semi-

independent provinces. The biggest change comes in the form of tariffs: it costs money to move goods into Russia proper, each time one's train crosses the border. Woeful is the player whom circumstances have forced him to build rail lines that cross the border several times -- the tariff costs can add up.

This change adds an interesting element to what would be just another of the ***Empire Builder*** series of games. It also has some other repercussions in the game world. For instance, another new addition to this particular game are a series of events cards that are just delivery cards under other names, such as "Supplies Needed for Sputnik Launch -- The first player to deliver machinery and oil to Baykonur will earn \$25 M." This is a nice little feature to this game, and one which, hopefully, future ***Empire Builder*** games will make use of. However, each of these cards has a different listing for the two phases of the game, and the situations on the post-communism section of the card are very different from those on the communism section. Another little wrinkle is the fact that, for the first time ever, the commodity chips actually have names on them along with the commodity symbols. No more wondering whether that chip is coal or bauxite: they're safely labeled now. This is a help given the fact that symbols from previous games are re-used here for slightly different things ("Is that wine?" "No, it's vodka.").

Russian Rails is thus an interesting entry in the ***Empire Builder*** series of games. It has all the charm of any of the other territorial ***Empire Builder*** games, and will appeal to anyone who has liked any of them. It is also an interesting gift for any avowed slavophile. And, while calling the game an educational tool may be stretching matters a bit, it's a nice thing to play with one's teens and pre-teens to teach them a little bit about Russian geography. For the experienced ***Empire Builder*** series player, the build-in "fall of communism" scenario adds a new wrinkle to an established game, and can provide a bit of variety for the players who liked, say, ***British Rails*** and want something a bit different, but not as different as ***Lunar Rails*** or ***Iron Dragon***. Once more, Mayfair proved that it can breathe new life into an old formula.

--C.J. Beiting

License to License

There's an interesting column over on the comic book information site [Newsarama](#) about the upcoming movie *Tonight He Comes*, which will tell the story of a nihilistic superhero who “develops a newfound purpose in life when he is drawn to a married woman.” This article dovetailed nicely with an article on [CNN.com](#) entitled “Is the original screenplay dead?”

The idea of Newsarama's article is that the big studios might be realizing that it doesn't necessarily need to buy the rights to “second string” comic characters anymore for their movies, because if there's something cool or interesting about them then they can just take the concept and make the movie themselves. After all, the idea of a “vampire hunter who's also a vampire” isn't exactly cutting edge, and doesn't require licensing the character of Blade from Marvel Comics. Likewise “a guy who wears a suit of powered armor” isn't anything particularly new, and studios might realize they don't gain anything for buying the rights to an Iron Man movie that they couldn't get by starting from scratch. The article points to the success of *The Incredibles*, an obvious superhero movie that is indebted to many superheroic teams <koff koff>Fantastic Four<koff koff> yet is fully owned by the studio, which is free to exploit it.

The idea behind CNN's article is that Michael Jackson might be overhauling Social Security to cast off suspicions that he might be Deep Throat . . . er, no, wait; I'm getting a few articles mixed up. The one I'm thinking of talks about how story-based screenplays are having a difficult time finding a place in Hollywood right now:

“ . . . [A]s the Montecito Picture Co.'s Tom Pollock observes, studios aren't interested in 'doing any movies that aren't presold behemoths. It's very hard to presell anything original.' Given the enormous cost of making movies, the majors know what they want: event pictures aimed at the widest possible audience.”

Couple these two together, and what do you have?

A tougher time for gaming companies hoping to license their wares to others for big bucks.

One of the holy grails of the gaming industry is the “intellectual property,” that idea which turns out to be a million-dollar gem when exploited for movies, video games, action figures, Halloween costumes, and the like. Many game writers and artists are reluctant to sell full rights to their works to companies, since they fear the company will “strike it rich” with their creations, leaving the writers bitter, penniless, and eating beans out of a can. While it's certainly feasible this could be the case (especially since there are plenty of examples of this in other fields), it's so rare as to be scarcely a blip on the radar in the gaming industry.

Does this mean it's impossible for a gaming property to be turned into something Big and Valuable? Not at all; obviously, several RPGs have already done so. But lots more haven't made it big, and probably never will. What, then, is necessary for a gaming property to break out? I have a few thoughts.

(Keep in mind that I've neither sold any properties, nor been in a position to buy any. I'm utterly unqualified to speak on this matter . . . which has never stopped me before.)

It needs to have a “hook” of an idea . . . Many gaming universes do well with this: “*Blade Runner* with magic” (*Shadowrun*), “cars with guns” (*Car Wars*), “magical factions warring with technology-lovers” (*Mage*). However, many game universes don't. For example, I've never quite gotten the sense that there was a hook for *Traveller*; the closest I ever found was the *New Era* material, where the *Traveller* universe found itself knocked down a few pegs by a technology-attacking virus. (Of course, *New Era* material is pretty much shunned by many *Traveller* fans, so it's probably not a good source to indicate.) I suspect that the properties that will have the best shot at life outside gaming will have a strong hook – something that can be summed up in a movie poster, or at most a paragraph.

. . . But the idea needs to be more than the hook. However, it's not enough for there to be that strong premise, because if that's all there is, it can usually be lifted to another medium. For example, *Deadlands* has a great hook – the Wild West with magic – but the core premise can be easily taken without needing to license the game. On the other

hand, ***Vampire: The Masquerade*** has an almost tired hook – vampires are real – but makes it work by adding to it: “Almost every legend about vampires is true, from a certain perspective.” I suspect this step is most difficult for those games that were created to capitalize on existing trends or tropes. For example, ***Car Wars*** no doubt owes its existence to many early-80s post-apocalyptic visions of the world where road warrior-ing is commonplace; as a result, most people who might want to use the ***Car Wars*** hook can simply go back to the source material and draw inspiration from there.

The package has to be easier to buy than the hook is to steal. If it's a far-out hook that somehow “works” because of the effort put into the license, then it's probably easier to license it than to try to cull out what you can within legal parameters. For example, I'm not a fan of the base premise of ***Werewolf: The Apocalypse*** (which, for those unfamiliar, is “werewolves are real, but they're genetic spiritual warriors who fight threats to the environment”). However, if I was a studio exec who liked the idea of “werewolves fighting for the environment and traveling to far-out CGI realms,” it's a heck of a lot easier to throw a bunch of money at White Wolf then figure out how to make that premise work without stealing their thunder.

These random thoughts probably aren't too useful to anyone, but maybe they'll inspire someone to make their first jillion selling their homebrew campaign. And if it does, remember that I *do* accept contributions to the Random Thought Table Research Institute . . .

Charmed, I'm Sure

New Rules for Enchanters for the *d20 System*

by Owen K.C. Stephens

With Valentine's Day just past, it seems reasonable to look at one of the most underrated of *d20 System* spellcasters -- the enchanter. Limited to altering opinions, the enchanter often lacks the power to actually overcome foes, especially in dungeon settings. Further, many of the common tricks of the classic mystic seducer from fantasy literature (beguiling foes for days, gathering an army of thralls) are simply out of reach for most enchanters. Other things you might expect an enchanter to be good at, such as negotiation, are totally out of range of his abilities without magic. To make matters worse, the classes most able to take advantage of such Cha-based checks (bards and sorcerers) take a back-seat to wizard-specialist enchanters in terms of raw spellcasting power.

This article presents numerous new tools GMs can use to give enchanters more options and greater breadth, moving them away from "wizards without *fireballs*" to a more useful and differentiated class.

New Spells

Experienced enchanters soon learn that most mind-affecting spells have serious limitations, and set about researching improved versions or alternate spells to overcome these weaknesses. These specialized spells are generally secret, shared only with trusted (or deeply enthralled) allies. While most are enchantments, there are also a number of divination spells enchanters have developed to increase the power of their mind-affecting spells. Even if an enchanter made these spells available to others, the cost would likely be twice the normal rate (starting at sell level $\times 100$ gp, and going up from there).

Bard Spells

2nd-level Bard Spells

Charm Humanoids: As *charm monster*, but only works on humanoids, monstrous humanoids, and giants.

3rd-level Bard Spells

Change Alignment: Cause a target to shift toward a new alignment.

4th-Level Bard Spells

Desire: Cause a target to want a possession or experience.

6th-Level Bard Spells

Viral Charm: As *charm person*, but effect spreads by touch.

Wizard/Sorcerer Spells

2nd-Level Sorcerer/Wizard Spells

Div

Discern Reservations: Divine how target will react to a command or suggestion.

3rd-Level Sorcerer/Wizard Spells

Charm Humanoids: As *charm monster*, but only works on humanoids, monstrous humanoids, and giants.

5th-Level Sorcerer/Wizard Spells

Ench

Change Alignment: Cause a target to shift toward a new alignment.

Desire: Cause a target to want a possession or experience.

7th-Level Sorcerer/Wizard Spells

Ench

Viral Charm: As charm person, but effect spreads by touch.

Eclipse: As dominate person, but mental control may be dropped and reasserted later.

9th-Level Sorcerer/Wizard Spells

Ench

Geas/Quest, Mass: As geas/quest, except targets one creature per caster level, and is negated by a Will save.

Change Alignment

Enchantment (Compulsion)[Mind-Affecting]

Level: Brd 4, Sor/Wiz 5

Components: V, S

Casting Time: 1 action

Range: Short (25 ft. + 5 ft./2 levels)

Target: One creature

Duration: Special

Saving Throw: Will negates

Spell Resistance: Yes

The target of this spell has his alignment shifted one toward an alignment selected by the caster. The law/chaos aspect is shifted first, with the good/evil aspect shifted only if the law/chaos aspect already matches. Multiple successful castings of this spell can move a target multiple steps toward a listed alignment.

Normally, the duration of this spell is only one day per level. If the target's alignment is moved just one step and ends up being exactly the alignment selected by the caster, the spell can become permanent. At the end of the spell's duration, the target must make a second Will save with a +4 bonus. If this save is missed, the spell becomes permanent.

Unless its effects have become permanent, this spell can be instantly negated by *dispel evil*, *remove curse*, or *atonement*.

Charm Humanoid

Enchantment (Compulsion)[Mind-Affecting]

Level: Brd 2, Sor/Wiz 3

This spell works exactly like *charm monster*, except it works on humanoids, monstrous humanoids, and giants.

Desire

Enchantment (Compulsion)[Mind-Affecting]

Level: Brd 4, Sor/Wiz 5

Components: V, S

Casting Time: 1 action

Range: Short (25 ft. + 5 ft./2 levels)

Target: One creature

Duration: 1 hour/level
Saving Throw: Will negates
Spell Resistance: Yes

The target of this spell is overcome by the need to possess a particular object or fulfill a particular experience, as defined by the caster. The item or experience must be clearly defined in no more than 20 words, and must be theoretically possible for the target to achieve. For example, the spell can make a target wish to own a sword made of silver or to go swimming in a particular river, but not nonsensical desires such as owning a round cube or go swimming in the sun.

The target takes all possible, reasonable actions to fulfill the condition of the desire. The target does not change alignment, however. An evil rogue made to covet the staff of a powerful wizard may be satisfied to steal it, but a paladin would try to purchase the item or find something more desirable to the wizard for trade. Even a good-aligned character accepts damage to their social position or reputation, however, if such consequences are the only way to fulfill the conditions set by the spell.

The caster cannot use desire to cause someone to wish to do or own something clearly harmful or deadly. It is not, for example, possible to cause a target to wish to hold lava, or want to jump off a tall cliff with no way to ensure a safe landing. The target takes all normal and reasonable precautions to minimize unfortunate effects of gaining the item or experience desired. If the spell is used to cause a craving very much out of character for the target, the GM may grant a circumstance bonus to his Will save of up to +4.

Discern Reservations

Divination
Level: Sor/Wiz 2
Components: V, S
Casting Time: 1 action
Range: Short (25 ft. + 5 ft./2 levels)
Target: One creature
Duration: 1 minute/level
Saving Throw: Will negates
Spell Resistance: Yes

This spell allows a caster to know how the target would view specific requests or commands. Once a round, the caster can think of an order or suggestion, and learn if the target would be happily willing to obey, grudgingly willing to obey, mildly unwilling to obey, strongly unwilling to obey, or would view the command as clearly harmful or suicidal.

While this spell can be used to save embarrassment when pushing hirelings or allies around, it is most often used by enchanters to determine if the target of a mind-affecting spell will obey a given command.

Eclipse

Enchantment (Compulsion) [Mind-Affecting]
Level: Wiz/Sor 7

This spell works as dominate person, except that the control can be relaxed, causing the target to act in a totally normal and natural fashion. It is impossible to use Sense Motive to realize the target of an eclipse has been enchanted when the control is not being exercised. The caster may establish or drop control as a free action, and may still be aware of the actions of the target without maintaining control. The target of the spell has no memory of any action taken while under mental control, though he has full access to his memories while being controlled.

Geas/Quest, Mass

Enchantment (Compulsion)[Language-Dependent, Mind-Affecting]

Level: Clr 9, Wis/Sor 9

Targets: One or more creatures, no two of which can be more than 30 ft. apart.

Saving Throw: Will negates

This spell functions like geas/quest, except that mass geas/quest affects a number of creatures equal to your level, and each target is allowed a Will save to resist the effects of the spell.

Viral Charm

Enchantment (Charm)[Mind-Affecting]

Level: Brd 6, Sor/Wiz 7

Casting Time: 10 minutes

Range: Unlimited

Target: One or more creatures touched

Duration: 1 day/level

This powerful spell works like charm person, except as noted above and with the following differences. Any creature who fails his save against the viral charm is now a carrier, able to infect other humanoids with the enchantment. Any humanoid who remains in physical contact with a carrier for 10 minutes or more must make a Will save (same DC as the original spell save) or also be charmed and become a carrier. Any target charmed by *viral charm* treats both the original caster and the target that infected him as close friends (as described in *charm person*), though obviously if a charmed target never encounters the original caster, this attitude is irrelevant.

Once a carrier fails to infect a target they are no longer a carrier (though they are still themselves charmed), and any creature who saves against this spell cannot be affected by any other carrier infected by the same casting. At the end of the spells duration all affected targets are free of the spell's effect, regardless of how long they have been affected.

Spontaneous Enchanters

While wizards have the option of specializing in enchantment (using the normal wizard specialization rules) bards and sorcerers don't have a similar mechanic. This is unfortunate because both bards and sorcerers use charisma as their spellcasting ability, which certainly seems to lend itself to an enchantment-based spellcaster. But since both classes only select a very limited number of spells, restricting them to a smaller set of schools is less of a limitation. (A sorcerer barred from taking evocation spells, for example, simply doesn't select any and has just as many total spells available to him as a typical sorcerer.) Additionally, altering the number of spells a bard or sorcerer may know changes the class' total power level so much as to be practically impossible to balance.

As an alternative, bards and sorcerers may be allowed to gain some bonus to one school of magic by taking a penalty to all other schools. Rather than changing spells per day or spells known, allow a spontaneous caster to gain a +3 bonus to caster level in one school in exchange for taking a -2 penalty to caster level (minimum of 0) in all other schools (except universal spells). Thus a 5th-level "specialist" enchanter bard casts all enchantment spells as an 8th-level caster, and all other spells as a 2nd-level caster.

This has no effect on what level of spell the character can cast. A 6th-level enchanter specialist sorcerer is still limited to 3rd-level enchantment spells despite casting those spells as a 9th-level caster (and can cast 3rd-level spells of other schools, even though he casts them as a 4th-level caster). Of course at low levels the caster may be casting many spells as a 0-level caster, making them useless (casting *mage armor* as a 0-level caster results in a duration of 0-hours, meaning the spell ends as soon as it's cast). The caster may still choose to know these spells, but until he can cast them as at least a 1st level caster, they have no effect.

Although this rule is designed specifically to allow spontaneous casters to be enchanters, it can be allowed for other kinds of specialists. Lick wizards, specialized bards and sorcerers are often called by other names. Sample names for

spontaneous casters specialized in the various school of magic are listed below. (It's worth noting that in most cases, bards should not specialize in schools they have little access to, such as evocation or necromancy.)

Specialist Names

School	Bard	Sorcerer
Abjuration	Troubadour	Stalwart
Conjuration	Herald	Famulus
Divination	Sage	Oracle
Enchantment	Courtier	Houri
Evocation	Furioso	Hotspur
Illusion	Mountebank	Magician
Necromancy	Mourner	Gaunt
Transmutation	Esquire	Alchemist

Enchantments

Any enchanter may take one of these special abilities instead of a familiar. An enchantment-specialized spontaneous caster may take one of these special abilities rather than a familiar (if a sorcerer), or instead of one specific bardic ability (if a bard). These special abilities are specifically designed to grow in usefulness as the enchanter gains in level, much as familiars and bardic abilities do.

Entourage

This works exactly like the Leadership feat, except the enchanter may take it at first level. A character may have both an entourage the Leadership feat, giving him two cohorts and a larger number of followers, but taking the entourage ability affects the character's leadership score for purposes of the leadership feat in the same way having a familiar or animal companion does.

Metacharmer

A limited number of times per day, the character may add one level of metamagic feats he knows to an enchantment school spell without preparing the metamagic in advance or increasing the effective level of the spell. (This is often used to allow an enchanter to cast a spell as a Still Spell or Silent spell.)

The number of times per day the enchanter may do this is based on his total number of spellcaster levels, as shown below. At 10th level, the enchanter gains the ability to use two of his daily uses of this ability to add two levels of metamagic feats he knows to an enchantment school spell without preparing the metamagic in advance or increasing the effective level of the spell.

Spellcaster Levels	Uses per day
1-3	1
4-7	2
8-11	3
12-15	4
16-19	5
20+	6

Piquant

The character adds the following skills to his class' list of class skills -- Bluff, Diplomacy, Gather Information and Perform. If his class already has one of these skills, he instead gains a +1 bonus to all checks made with that skill.

Additionally, the character gains one skill point per level to that must be spent on one of these skills.

Charismatic Abilities

A GM with access to *d20 Modern* may allow any of the special abilities of the Charismatic hero to be taken as a special ability. Once a character has one of these, he should be allowed to buy others he qualifies for as feats.

Feats

Enchanters often take metamagic feats to augment their spell power, especially Silent Spell, Still Spell, and Heighten Spell. Truly dedicated enchanters turn to more specialized feats to get the most out of their spells. Spell Focus and Greater Spell Focus can increase the save DC of all the caster's enchantment spells. Negotiator and Persuasive improve the chances the enchanter can talk himself past flunkies, to gain access to more valuable targets.

The following feats are specifically designed for specialist enchanters (including courtiers and houri). An enchanter may take one of these feats in place of the bonus feats wizards game every 5 levels.

New Feats

Below are additional feats an enchanter can use to run specific kinds of operations or focus yet more on the power of his spells.

Link Spell is used almost exclusively by enchanters. By combining a beneficial spell (such as mage armor) with a mind-affecting spell (such as charm person), the enchanter can convince a potential target to agree to having a spell cast on him and do so in full sight of the target's allies. Once charmed, the target can easily be convinced to go somewhere with the caster and accept a more powerful mind-affecting spell.

Alluring [General]

Your personal magnetism is considerable.

Benefit: You gain a +2 bonus to all Cha ability checks and untrained checks made with Cha-based skills (though not any other Cha-based skill checks).

Beguiling [General]

Your natural charisma gives you special abilities.

Prerequisites: Char 15+, Alluring, able to cast 2nd level arcane spells **Benefit:** You may select one of the special abilities normally restricted to enchanters (entourage, metacharmer, piquant) at no further cost.

Compelling [General]

You have great skills with compulsion spells.

Prerequisites: Char 15+, Alluring

Benefit: You cast compulsion spells at +1 caster level. This stacks with the bonus granted by such feats as Mesmerizing.

Link Spell [Metamagic]

You can link two spells together, so they act as one.

Prerequisites: Any two other metamagic feats.

Benefit: You can cast two spells together. The two spells must have durations greater than instantaneous and must

target a single creature other than the caster. They act as a single spell when cast. If the target of the linked spells agrees to have a spell cast on him, he forgoes his saving throw against the linked spells.

The linked spells' casting time is two full rounds or the combined casting time of both spells, whichever is longer. They use the shorter range and duration of the two spells. If either spell allows a saving throw, the linked spells are negated by it. If either spell is dispelled, both end. Identifying a linked spell is difficult, and requires a Spellcraft check with a DC of 25 + the level of both spells.

Linked spells take up a spell slot two levels higher than the level of the two spells added together.

Master Enchanter [General]

You are able to use mind-affecting spells with particular adeptness.

Prerequisites: Cha 13+, Alluring

Benefit: A character with this feat gains three specific but minor advantages when using mind-affecting spells, especially charm-type spells.

First, when the character makes a Cha check to exert control over the target of a mind-affecting spell he cast, the character gains a +3 bonus to this roll. This applies to the Cha check made when convincing the target of a spell from the charm person spell chain to take an action it normally wouldn't, as well as to the opposed Cha checks made when two casters both have the same target under mind-affecting spells and give it conflicting orders.

Second, the DC of a Sense Motive check to notice that the target of one of the character's mind-affecting spells is being influenced by an enchantment is increased by 5 (DC 30 for most spells including *charm person*, 20 for *dominate person* or *dominate monster*).

Mesmerizing [General]

Your mind-affecting spells are more potent than those of others.

Prerequisites: Char 15+

Benefit: Your mind-affecting spells have their save DCs increased by +1. This stacks with the bonus granted by taking the Spell Focus feat for the enchantment school and the commanding feat.

Traceless Spell [Metamagic]

The targets of your mind-affecting spells don't realize they've been enchanted.

Prerequisites: Any other metamagic feat.

Benefit: Only mind-affecting spells may be cast as traceless spells. A traceless spell masks itself from its target. If the target of the spell resists it, he has no idea what kind of spell was targeted on him. If he is effected by the spell, he doesn't realize his actions have been mystically influenced even after the duration of the spell ends. The target may wonder why he took actions that were out of character, and may be convinced by friends or allies that he was enchanted, but he has no inkling of that without external input.

Traceless spells use up spell slots two levels higher than their actual level.

Auto-Motives

by Eric Funk

"It's automatic. It's hydromatic. Why, it's Greased Lightning!"

--Grease

As a rule, most western mid-20th- to 21st-century characters have some sort of Driving skill. Those that are or have been in the military may have been trained in the use of a variety of vehicles, including (but not limited to) cars, heavy trucks, and tanks. Espionage and Special Ops recruits would also have familiarity with a variety of vehicles in case they come across them in the field. **GURPS Autoduel** is a good resource for near future campaigns that center around vehicles, but even in other campaigns there can be much more to a car than just writing, "Possession: Ground Vehicle" on a character sheet.

"If nobody comes down here and buys a car in the next hour, I'm gonna club this baby seal."

--Crazy Ernie, *UHF*

Buying a Car

New cars of a desired type may be easier to come by than used cars, and usually come with some kind of warranty. If the players aren't interested in roleplaying it, buying a car may be a Quick Contest of skills between the salesman's Merchant (or Fast-Talk) against the characters' Merchant (or Mechanic) skill. If the GM wishes, it could resolve like a Merchant Influence roll (see p. B204), let the degree of success modify the end price in the favor of the winner by 10% per point! This may not be swindling, *per se*, but the addition or removal of standard/extra options such as supplemental warranties, autographed limited edition collector's fuzzy dice, or Teflon hubcaps. Supermarket sticker prices are usually non-negotiable, but the asking price for a large item such as a car or house is often just the beginning of a long negotiating session.

The "settled" portion of a character's Starting Wealth can pay for the down payment (from 10% to 20% of the full price), and the payments will be added to the character's Cost of Living (see p. B191). Creating a working formula from p. GT:FT 44 for calculating monthly payments and using numbers from a sample [loan web site](#):

Monthly \$ = (1 + (Annual Rate as a Decimal × Number of Years/2)) × Remaining Balance / Total Number of Payments

For example, a \$30,000 car at 6% interest to be paid over 5 years with a 20% down payment will assess monthly payments of $(1 + (0.06 \times 5 / 2)) \times (\$24,000) / 60 = 1.15 \times 400 = \$460$.

Used automobiles, on the other hand, quickly depreciate in value and quality with time, use, and lack of maintenance. A family car that is five years old may have 90% of factory hit points and one less HT, while an older vehicle, left lying out in a field for a decade, may only be able to be restored to 50% of factory hit points and HT-2 after an overhaul due to permanent frame damage! In many jurisdictions, once a used car has changed hands, it must pass a road safety test before it can be registered. A HT check of the vehicle is rolled, and the vehicle could require parts totaling 1% of the new price for every point it fails. A Critical Failure means the mechanic thinks it's unsafe to drive out of the garage! This may be a good incentive to build a vehicle as Fine or Very Fine (see p. VE204) to increase its HT score. The maintenance table at the end of this article provides some examples of parts requiring maintenance. Alternately, one can roll for a random part on the [Universal Breakdown Manual](#). In Japan, cars must pass such a test at years three, five, seven, nine, and every year after that. The cost of the test encourages many individuals to buy new cars every four to five years.

Once the car itself has been purchased, the expenses don't stop there. The owner must pay for licensing (up to \$100 for custom/"vanity" plates), insurance (from \$30 to \$500 per month, depending on the car's age, model, and accident

history, as well as the youngest age and worst driving record of all the drivers to be covered under the policy), and fuel (10-100\$ per month, depending on fuel efficiency, hours of driving, and gas prices). The 2002 Mustang on p. VEL 61 consumes about \$6 of fuel per 100 miles.

Ground vehicles in *GURPS* Books

- Car, Family (TL7) -- VE140
- Car, Ford Mustang (TL7) -- VEL61
- Car, Police Cruiser (TL7) -- C75
- Carriage, Steam (TL5+1) -- STM75
- Horse, Iron (TL5+1) -- STM75
- Jeep (TL6) -- VE139
- Jeep, Ford GPW (TL6) -- W106
- Motorcycle (TL7) -- VE140
- Motorcycle, Schwes Krafrad 750cc R12 (TL6) -- W107
- Motorcycle, Suzuki GSX1300R Hayabusa (TL7) -- VEL60
- SUV, Toyota Land Cruiser (TL7) -- VEL61
- Semi-Trailer, Van (TL7) -- VEL62
- Truck, FLD 120 Freightliner (TL7) -- VEL62
- Truck, GMC 2.5-Ton 6x6 Cargo (TL6) -- W107

A loud crash is heard as the empty mech falls down the cliff and explodes. "I guess I'm not getting paid 'till I'm 80."
-- Private Rico, *Roughnecks*

Responsibility

Once the vehicle is paid for, western countries require some kind of registration and insurance before it can legally be driven on public roads. This means that the vehicle will be under the name of a person or a company who will have to answer for any damages and infractions that occur involving it. This means that in order for characters with the Youth Disadvantage to be able to have free access to the vehicle, they may have to take Patron, or perhaps Sense of Duty (to the owner) to "pay" for it. Renewing of licenses does not come up often in roleplaying, since it would usually be about as exciting to play as it is in real life. Many locales set this date in the month of the owner's birth and do not allow a balance either way, so the full amount must be paid every year. Some TL7 (and presumably most TL8+) insurance companies allow direct withdrawal from bank accounts, which means that it may be one less thing to worry about, assuming that the owner has an steady income to pay for it.

"Carburetors, man. That's what life is all about!"
--Juicy Fruits, *Phantom of the Paradise*

Many modern campaigns take place in cities. A distinguishing mark of a TL7-TL9 city is the number of cars that line and fill the streets. Adventures often revolve around conflict, and thus cars can be a part of this conflict, usually as a form of cover, sometimes as a weapon. Standard commercial cars are typically defined in *GURPS* as providing DR5 to passengers (DR2 through windows). Thus as standard broad cover, standard cars provide DR10 to all areas but 15-16 (feet). Since average civilian vehicles have DR5 on most of the body, and DR 2 on the windows, and targets obstructed by an average civilian car are protected by double this value. At the GM's option, the body of the car can soak up even more damage. An off-road 4x4 may not protect 12-16 (legs and feet), except if crouching behind the tires! Then, the person may only have a 25% chance of being protected by DR5 of the wheel, and 75% chance of the DR1 of the tire protecting them. Skip firing (p. CO60) may be a useful technique to hit people in the feet (and possibly legs) under targets. Logically, vehicles provide the best cover if used lengthwise. That way, the protection offered is twice the body DR in addition to the hit points of the vehicle. A lengthwise shield provides cover for fewer people and is harder to see over. A cinematic character should also worry about fuel tanks exploding on a spark.

Cars and Trucks and Things that Go

-- *Title of a children's book*

This table is a quick index of many vehicles classes that can be found in a modern city. Most have PD3 DR5 metal armor and light frames, but the armored sedan and limos have medium frames and PD4 DR40, and the Semi has an extra-heavy frame (see p. VEL 62).

Description	Loaded Mass(tons)	Occupants	Engine Horsepower	Engine kW	Body Hit Points	Motive ST
Motorcycle	1/2-1	1-2	40	30	16	32
Small Car	1	2-5	100	75	100	200
Medium Car	2	2-5	140	104	200	400
Sport Utility	2	5-8	230	172	250	500
Small Van	2	2-8	200	150	200	400
Small Pickup	2	2-3	200	150	200	400
Large Van	3	2-11	250	186	300	600
Pickup Truck	3	2-3	300	224	350	700
Medium Car (Armored)	4	2-5	350	261	200	400
Limousine (Stretched)	3	4-6	250	186	800	1,600
Box Truck	4	2-3	250	186	500	1,000
Bus	18	40-60	200	150	900	1,800
Semi	15-20	2-3	450	336	3,000	6,000

To find out the Strength rating required to flip a vehicle (or right it), multiply its mass in tons by 40 - this gives the ST total needed to turn over the vehicle (See p. VE189). Only half that is needed if one has a running start. Extra Effort helps (see pp. B89 and CI 12 for details)!

An automobile's motive ST score is most likely limited by its hit points; thus a medium car will have an equivalent ST score of about 360. A 300 horsepower (~224kW) diesel engine in a semi tractor may have a ST score of about 6000. That is many times the raw strength of the Blue Demon (see p. SU 118), but in a tug of war the monster could use Extra Effort to move a mass with an effective ST of 6660! Since machines cannot expend Extra Effort, a Quick Contest of Strength between these two would be very close (10 vs. 11) (see p. CI 13 for details on unusual contests of Strength). Instead of pulling, sometimes one seeks to ram a stationary car, perhaps part of a roadblock. To resolve this, see pp. VE156-158.

"I can't understand it. This car hasn't given me a lick of trouble in nearly six hours."

-- Cosmo Brown, *Singin' in the Rain*

Other Parts to Play

Compared to TL6 roadsters, early TL8 cars are much lighter, have more efficient engines, and thus longer ranges on the same tank of gas. Some options -- such as Air Conditioning, Improved Brakes, and Improved Suspension -- are mid-TL7 commercial technology (see pp. VE20-21). Even in late TL7, many vehicles shipped to warm climates (such as southern parts of the United States) did not have heat vents installed!

A typical TL7 (2002) production automobile is described in ***GURPS Vehicles Lite*** as having a maintenance interval of 154 hours. That means that for every 77 days at two hours' operation per day, it requires approximately four hours of mechanical maintenance. According to p. VE146, if a character does not bring it into the shop for a tune-up at this point, the GM should roll against the Mechanic skill of the person who last performed the maintenance, and for every three months* without time in the shop, add an additional -4 penalty to the roll. Each time the interval elapses another check is made, with the ever-increasing penalty applied. Assuming a basic professional Mechanic skill of 12, the cumulative chance of driving for over three intervals without problems is 0.3%, with a 12% chance of a Critical Failure.

* Note the use of "three months" is relative to the maintenance interval of the vehicle, reflecting the 154h of the Ford Mustang (see p. VEL 61) and relative frequency of use.

Even if a vehicle does not outright fail when a maintenance interval runs through, it will probably run dirtier. Fuel-burning engines will exhume more and darker exhaust. Electric vehicles may consume power faster. This would be fixed "automatically" when the necessary work is done. The extra dirt in the system can build up and clog filters, Sound Baffling, and anti-pollution devices.

The following table contains a brief list of work that can be performed on a vehicle while in a shop. All can be optional maintenance, but not all are required to pass safety inspections.

Minimum skill Difficulty Penalty	6 Trivial (no roll needed)	8 Simple (skill)	10 Average (skill-2)	12 Hard (skill-5)
1-3 1	Topping up fluids	Changing oil	Changing a side window	Changing cylinder head
1-3 2	Changing battery	Rotating tires	Changing shock absorbers	Replacing muffler system
1-3 3	Changing headlight	Replacing dashboard light	Installing alarm	Replacing wheel bearings
1-3 4	Changing tire	Changing spark plugs	Installing remote start	Rebuilding a motor
1-3 5	Changing air filter	Replacing the windshield	Replacing brake pads	Straightening the frame
1-3 6	Changing wiper blades	Changing washer pump	Replacing radiator	Replace part of drive shaft
4-6 1	Replacing antenna	Installing a (cell phone) antenna	Replace a fuel pump	Replacing a water pump
4-6 2	Replacing tail/signal lights	Replacing the alternator	Replace a power mirror	Replacing a steering box
4-6 3	Applying decals	Painting the body	Fixing wiring	Replacing a turbocharger
4-6 4	Mounting fog lamps	Fixing a bullet hole	Fixing side panel damage	Replacing a fuel control unit
4-6 5	Rigging trailer power port	Adding a trailer hitch*	Replacing a transmission	Installing armor fibers
4-6 6	Touching up scratches	Mount a spotlight on body	Replace brake/fuel lines	Repairing collision damage

* Not all vehicles' frames are designed to take a trailer hitch. At the GM's option, the end result may not be street legal, perhaps requiring a HT roll each time it endures stress to avoid failure.

If a GM is considering using these rules, then in specialized or large shops or in military vehicle pools some mechanics may take Optional specializations in certain parts or vehicle systems. Some examples are exhaust systems, body work, and glass.

Damage Control

Some car owners seek extra protection for their travels and the travels of those to whom they lend the vehicle. Memberships in organizations such as *GURPS Autoduel's* ADAA, or the real-world [AAA](#), as well as some auto manufacturers, can provide travel advisories, and some levels of memberships include free roadside assistance. Within 30 minutes to two hours, a tow truck can be at the scene of the breakdown to fix a flat tire, jumpstart the car, or open the door if the keys are locked inside (if it can't be done [over the phone](#)). Lastly, if the problem is beyond the skill of

the tow truck operator, then the vehicle can be towed to a local garage. All this and more can be included in the monthly membership fee.

"Too early for flapjacks?"

-- Phil Conners, *Groundhog Day*

Speeding into Harm's Way

Official **GURPS** stats for a TL7 police cruiser can be found on p. C75. For radar and laser speed guns as well as breath alcohol testers, see pp. C 71-72. A few other suggestions to pull PCs over for are Imprudent Driving (weaving dangerously, even onto the shoulder), a burnt out headlight (even during the day), expired registration, simple "spot checks" for seatbelts, possession of alcohol, and dangerous weapons. In a city, many failed Driving rolls (remember, only required in stressful situations) will cause collisions. Any modern vehicle collision on public roads will be considered an "accident" and both drivers are expected to pull over to inspect damages (if any) and exchange license information. In some areas, the police and insurance companies do not need to be notified if no one was hurt, and the cost to repair all damages in the accident is less than about \$700 (the movie *Blank Check* revolved around this idea). Years of accident-free driving can greatly diminish insurance costs, and new drivers on probation can lose their license if found at fault.

Parking

Many adventures call stalwart heroes to the towers of the city center to visit the city hall of records, police headquarters, general hospital, or the main office for a financial institution such as a bank. Timing can be critical, and no less critical is the parking outside the building. In busy areas, the meters may be limited to one hour (or 30 minutes) instead of the typical two hours. Drivers should also be careful, as the laws in many cities stipulate that once the maximum time is up the car must be moved through an intersection before it can be legally parked again. In such a situation, putting another coin in the meter will not help if the vehicle is not moved first. The meter police can often tell because they put a chalk mark on a tire that is rubbed off after one drives a little ways.

"Is that your car? / Mind if I skip rocks across it?"

--Melissa/Tom Servo, *Mystery Science Theater 3000: A Touch of Satan*

Getting Rid of It

One of the fastest ways to legally get rid of a vehicle is to drive or tow it to a junkyard or scrap dealer. If the character performs well with Merchant/Fast-Talk/a Good Reaction/Luck, they might get from 2% to 10% of the value at a junk yard, while at a scrap dealer, one may get pennies for each pound left there (perhaps up to 2% of the worth of the vehicle). A way to model actually selling it is to treat it like Advertising for a Job, with all modifiers. Some voluntarily take the vehicle for the safety inspection to improve their vantage point as a seller. GMs may want to be generous in providing a bonus to the Merchant roll to sell it if the player wants to RP all of this. Once it is gone, a character should make an Accounting or Merchant to remember to cancel the insurance and license! Some people dutifully pay the companies for years after they've sold their vehicle, not noticing that they are paying to insure a car that was sold. At the GM's whim, there may even be a local charity that will come and tow the vehicle away, leaving a tax-deductible receipt for it (for the value if given to a junk yard) or an annual bus pass!

Driving Around the World: The International Driver's License

An International Driving Permit is a little-known facet of the UN that permits [signing countries](#) to agree to honor each other's licenses. This document is practically a Rosetta stone: a copy of the original translated into [eight languages](#), so that when it is presented along with the original, the local constabulary can understand it instantly. Such a document may be invaluable to globetrotting adventurers, but it requires annual renewal.

Germany

For Germans, passing a driver's education course is mandatory before one can take the real exams.

Every two years, citizens are required to have their vehicles inspected by an agency such as the Technischer Ãœberwachungsverein for safety and environmental impact. Inspections performed by the TUV (or other German agencies) require HT rolls at -5 to pass (see "Used Cars" above).

Russia

Civilians staying in Russia for less than six months looking to drive need only carry a translated version of the license with them (the government provides translation service for a fee). A stay of greater than six months requires one to bring a medical certificate, a valid driver's license, and the translated version thereof to a police station. The resulting license will be valid for the duration of their visa.

There are some reports that underpaid officials may attempt to extort or be prone to being bribed. The accuracy of these testimonies is up to the GM.

Saudi Arabia

Women are forbidden from driving cars and bicycles, and riding with any male other than her husband or immediate male relative. In conservative areas, a public stoning of violators of taboo is not uncommon, even if the violators are foreigners.

The minimum driving age is 25, and many driving offenses carry an automatic prison sentence. Many taxis do not have meters, and thus fares should be negotiated in advance. A visitor's driver's permit is valid for three months before it must be renewed. Cars drive on the left, and many natives use turn signals to signal if it's [safe to pass or not](#).

Sinister Driving Customs

There are many countries in which one drives on the left. Three popular left-handed countries to tour are Australia, Japan, and United Kingdom. A more complete list may be found [online](#). Visitors unfamiliar with the driving rules may suffer a familiarity penalty of -2 (see p. B43). Eight hours of practice or 32 hours of normal driving (see On The Job Training, p. B83) will eliminate this.

"Dad used to let me back the car up the driveway. Once."

-- The adult Allan Parish, *Jumanji*

Driver's Training

In North America, the first step to receive a license is written theory. The student may spend up to 50 hours studying theory in a classroom. Next, the student must pass an official written test for learner's permit, which is taken at a government office. Once the student has passed this test, they begin approximately 50 hours of practice driving with a trainer. They are often paired with another student in the same car as the instructor for economy and so both can learn from the same mistakes. Once this is complete, they may attempt the official driving test. Driver's Education training as described nets the student 1/2cp in Driving (Automobile), which for an average person with DX 10 gives skill 7. Any training with a certification should have at least 1/2 cp invested in the skill, any more points will likely be "on the job" training (see p. B83) counting only the time the character drives.

Separate training and testing is required for motorcycles (Motorcycle skill) and busses and large trucks (Driving (Heavy Wheeled) skill). **GURPS** draws the line at five tons. Other vehicles (and their skills) are usually not street-legal (Mecha, Tracked, Construction Equipment), but licensing may not be required if operated on private property.

For more details, see pp. CI 123 & VE 143, and note they supercede the skills listed on p. B68.

Many locales demand annual license renewal (often around one's birthday). However, a new picture, and thus presence at the Department of Motor Vehicles, may only be required every four years; this becomes important if one leaves the city. An intermediary may be able to cover for the former, but not the latter. Other nations (such as Germany, above) do not require one to update their photo, instead relying on a national photo ID. Forging a license would be a useful form of ID for practically everything but actually driving (given modern police computers and networks). See GURPS Covert Ops pp. 25 and 50 for details on the mechanics of forging Driver's Licenses.

Losing a Driver's License can be easy. In some places getting caught for driving over double the speed limit will do it, while others involve civic disorder. In the short term, it might be confiscated by a business owner who believes (or says they believe) it to be a forgery (even though this action may not be legal). Many countries use a "merit/demerit" system in which fault-free driving ties in with discounts to insurance costs. One large infraction, or a number of smaller infractions "cost" points, and when they exceed a limit, the license is lost.

"Two Tanks!"

"Yeah, but look at them."

"They're at least 100 years old!"

"The Tank Police will die of laughter!"

-- Buaku, Annapuma and Unipuma, *Dominion Tank Police*

Advantages and Disadvantages

Reputation +1 (Driver's Education Graduate, A small group of people, all the time)[1]: This will improve your reaction to insurance agents, and some public officials who deal with licensing. To some Jocks, this advantage may be the considered analogous to Honor Student (see p. IOU 18 for both advantages), and possibly be worth a small Secret.

Reputation - (Drives a "cool"/"uncool" car) (Large class of people, Sometimes)[+ or -1/level]: This reaction could apply to conversations in and around the vehicle, and about the topics of travel and recreation. However, it can also provide an inverse reaction when dealing with some law enforcement officers who distrust people in "cool" cars (if this Reputation were positive, it would become negative and vice versa).

Reputation (No Driver's License): Within circles that care, this disadvantage may be the equivalent of Social Stigma (Second Class Citizen) or Social Stigma (Barbarian). Alternately, it could be treated as Reputation (can't pass driver's test).

"Your sons flew that enchanted car of yours to Surrey and back last night!"

-- Mrs. Weasley, *Harry Potter and the Chamber of Secrets*

Driving the Plot

New drivers, and persons from outside TL6 to TL8 may forget that fuel needs to be purchased every 200-300 miles, and that the oil needs to be changed every 2000-3000 miles. Every 24,000 to 36,000 miles the transmission fluid should be changed, and tires will wear out in 40,000 to 50,000 miles, even less if they are not balanced and aligned properly. Balding tires can inflict a penalty of -1 to -3 to Driving rolls; this penalty is doubled in wet and icy conditions! See pp. B187-188, VE151 for more road modifiers.

Rental cars (see p. VE200) can have hidden flaws, and provide good red herrings and plot devices. Cars are useful targets for agencies trying to get close to a party. Vehicles are often the targets of electronic bugs, homing devices, tracers, and bombs. Vehicles with computerized controls may be vulnerable to hacking, which is made easier with a physical interface, such as a SQUID (see p. R30) or just a small computer with radio relay. A textbook example of this can be found in the movie *Batman Returns*, where the Penguin attached a remote control device to the Batmobile. Such is at best embarrassing and inconvenient, and at worst may get one in trouble with the law if a traceable vehicle

is used to commit crimes.

"Unfortunately, the car will never fly again. It actually flew?"

-- "Doc" Brown, *Back to the Future, Part III*

Sharn: City of Towers (for Eberron)

Designed by Keith Baker & James Wyatt

Edited by Bill Slavicsek

Art by Robert Raper, Wayne Reynolds, Daniel Hawkins, Dennis Kauth, Rob Lazzaretti, Jason Alexander, Tomm Coker, Eric Deschamps, Tomas Giorello, Howard Lyon, Charles P. Morrow, Lucio Parrillo, Steve Prescott, Francis Tsai, Anne Stokes, Anthony Waters, & James Zhang

192-page full-color hardback & 45-minute instrumental music CD; \$29.95

The darkness that Wizards of the Coast tried for (and missed) in the *Eberron* core rulebook is actually starting to take shape in the second hardback in the series. *Sharn: City of Towers* brings more of that Dashiell Hammett feel to the surface by touring through the many levels of the lofty city.

Sharn is the largest city in Khorvaire and, though not its capital, vital to the nation of Breland. Everyone and everything goes through it (or ends up there), including transportation and communication systems . . . to say nothing of the fact that anyone wanting to go to the dark continent of Xen'drik will probably use it as a home base. Divided in many ways -- by economics, by neighborhoods, by towers -- it sits on a fiery foundation, massive lakes of fire used as forges by the goblinoids before they were driven from the area. Since then the town has undergone many changes, and now those industrial underpinnings are called the Cogs. The further up the towers you go, the better the standard of living becomes, until finally you reach veritable mansions at the tops of the spires -- or floating far above them. The city shares a manifest zone that makes spells of flight easier, allowing for a town built vertically at the edge of the Dagger and Hilt Rivers.

Each section is somewhat different in tone, population, and architecture. From Menthis Plateau, home of the quintessential seat of learning Morgrave University; to Central Plateau, wherein all power and wealth is concentrated; to the walls of Cliffside where all ships (those of both the sea and the sky) convene to trade, the "City of Knives" will accommodate most character and adventure types. The book has plenty of threats to throw at the town, some generic suggestions that might intrigue the PCs, and some offenses built into the setting that are already gearing up to take Sharn down one dragonmarked house at a time.

A gazetteer occupies most of the pages. Describing what goes on in which sector and where the different dragonmarked houses hold sway are just a few of the details available. To do the city justice, there are countless entries on what types of businesses are where, what the population divisions are, how closely the town's Watch keeps track of things (or how easily they can be bribed in that neighborhood), and what personalities give that street or level its character. Each part has specific businesses or locations that make adventure development faster for the DM, and given how many of them the authors had to come up with, they managed to keep things pretty fresh.

And the curious nature of the city's layout isn't just glossed over. The book recognizes the dangers and realities of living on streets, balconies, and ledges open to a drop of dozens if not hundreds of stories. Folks tend to wear magic talismans with *feather fall*, for example, and there's a reward for any mage who uses magic to catch a falling citizen. Natural disasters aren't shut out, either, and the dependence on the magic surrounding the area is an important element in business and politics.

The prestige classes seem less like page filler and more like an integral part of the setting here, particularly the mages specializing in flight and the city's elite soldiers; unfortunately, the wand magicians come off impotent and dull by comparison. Creatures fit the theme, too (such as the wraith born of the forges), and the magic includes aerial items and new attack spells that will hinder one's enemies without bringing down the whole house of cards.

In fact, most chapters and subjects -- the law, the weather, the geography, daily life -- are short and to the point except for those aforementioned pieces that describe the city. Like the core book, this proves the book's biggest shortcoming: To do it right, you have to have a lot of material few people will enjoy reading. The creators do their best to keep it all from getting dull, and there are many good to great ideas buried in the pages, but you're in danger of nodding off more than once as you try to absorb all the information.

The color comes from artwork that uses the same comic-book visuals and painted depth as the core book, as well as an accompanying music CD. Clocking in at just over 45 minutes, it sets the mood with some good incidental tunes. The tribal piece in the middle kind of wanders oddly from the Middle East through Southeast Asia and Africa, landing in North America, and there should be a better sense of rising action near the end, but for a free disc? This is good accompaniment.

Add to this more of those random maps of locations of indeterminate utility, lists of holidays and citywide events, good campaign advice on making the city come alive and passing out treasure in an urban environment, and a random corpse chart, all to make up for the lack of an index, and you've got yourself a handsome supplement. Keeping its overall focus, ***Sharn: City of Towers*** eases some of the birthing pains for GMs looking to start a new ***Eberron*** campaign.

--Andy Vetromile

Pyramid Review

Fright Night: Asylum (for the *d20 System*)

Published by [Hogshead Publishing](#)

Written by Pete Lynn with Adrian Bott & Ian Sturrock

Cover by Shaun Thomas

Illustrated by David Esbri Molines, Marcio Fiorito, & Shaun Thomas

64-Page Perfect Bound Softback Book; \$15.95

Hogshead Publishing's *Fright Night* series of *d20 System* adventures is designed to serve up an easily played dose of horror. This is facilitated through the use of the regular *d20 System* rules rather than the more complex [d20 Modern Roleplaying Game](#) and by the use of set-ups familiar to the genre. In their first two *Fright Night* titles, *Haunted House* and *Polar Terror*, the expectations of the players come from having watched films like *The Haunting* (the original 1963 version by Robert Wise, not the unnecessary remake) and John Carpenter's *The Thing*. The third entry in the series will be not quite so familiar, but tales of madness, confinement, and terror are easy to evoke in *Fright Night: Asylum*.

The very first thing that strikes you about this book is the radical makeover it has been given. Hogshead Publishing's *d20 System* titles have in truth always looked a little mundane, but the use of a heavy courier typeface really works in the book's favor. True, it may be a little overwhelming at first, but it adds to the atmosphere. It is a pity that the various tables jar in their ordinariness. The artwork is also better handled than in previous titles. There is less of it and the various pieces are not used again to little or no effect. The maps are also clean and serviceable, but unfortunately they lack the details claimed in the text.

Designed for a party of four to six characters of first to third level, the set up of *Asylum* is simple. Players take the roles of celebrities, represented by six new classes: Actor, Artist, Millionaire, Pop Idol, Sports Star, and TV Show Host. Their careers may be on the up or on the slide, but each of their agents has arranged participation in a reality TV show. The exact nature of the show will be unknown to the characters, but will soon become apparent. They are "welcomed" as inmates at a mental institution, where the staff proves to have less than medical matters on their mind. The question is, are these newly incarcerated inmates really mentally ill, or are the doctors manipulating their minds so that they think they are?

Fright Night: Asylum is an opportunity to explore the enclosed paranoid world, with the GM given the tools to really play with the character's minds. This can be through the use of strange events out of keeping within the institution, the use of medical drugs and procedures -- perhaps unnecessary, and of course the use of many of the tools and devices found in both the genre and horror RPGs.

Of course, in the case of *Fright Night: Asylum* there is something going on. That something is actually very traditional for a horror scenario, but the setting makes it play very differently. The characters are normal people (although well-known as celebrities), not the traditional weapon-wielding combatants of the normal *d20 System*; and even if they had weapons training, there is virtually no such equipment available within the walls of the institution. The point is that the characters will have to survive by their wits, but this is where the author serves up his killer punch. In *Fright Night: Asylum*, it is the very wits of the characters that are under threat.

Beyond the need of the *Player's Handbook*, this book is very self-contained and self-supporting. First, it provides details of the six new classes, each of which makes use of the new "celebrity" feats. These include Artistic Temperament, Assume Command, Highly Strung, Plastic Surgery, and Try Another Take. Whether these new feats will play a part in the scenario is another matter, but they do serve to make the six new classes useful in other modern *d20 System* games.

The combat guidelines focus on the tools and devices that can be found in the asylum. They include first medical drugs plus a variety of equipment: electrical paddles (for resuscitation purposes), gas masks, stun guns, scalpels, and syringes. The latter are particularly nasty when used to deliver a bubble directly into the bloodstream. The rules on drugs are also slightly different, for when delivered directly into the bloodstream they are markedly more effective. When administered using the standard procedure, such drugs cannot be resisted, but if administered under stressful circumstances, characters treat the drug as if it were a poison.

The only major difference to the actual combat rules is in the Armor Class Bonus. Since no actual armor is available, a more experienced character instead gains an AC bonus, roughly equal to half his level, this represents experience giving him the smarts to get out of the way or take cover. Other new combat rules cover getting around in the dark, but these are standard to the *Fright Night* series as are its rules on scaring characters.

To turn them into victims, and to encourage them to react and act as victims, the GM makes two rolls. One to see the fright hit dice a creature or character the monster can scare and the other to how many hit worth of characters it does scare. The scare works as a ranged fear attack which players can make a will check against. Suggested bonuses to this roll are in keeping with the genre. While the rules are sound, they are not as comprehensive as in some games, which may disappoint some. This leaves plenty of room for GM input though.

When I was at the Hogshead Publishing stand at Gen Con UK, I asked for a book to review -- it was going to be *Fright Night: Haunted House*, but the owner's wife suggested I take *Asylum* instead as it was her favorite. So on her recommendation I did, and it is not difficult to see why it is her favorite. The set up for the adventure is excellent and it is clear that both author and publisher have worked hard to follow it through. The result is not quite so polished as one would wish, with more advice needed on handling psychological horror, especially for less-experienced GMs. Yet in the hands of an experienced referee, *Fright Night: Asylum* will really work well, serving up something akin to *One Flew Over The Cuckoo's Nest* meets *People Under the Stairs* with nods to *Spinal Tap*, *Big Brother*, and *Re-Animator* along the way.

There is something less forgiving with *Fright Night: Asylum*, and with their characters assaulted both physically and mentally, especially the latter, players will find this scenario a much greater challenge. It is more adult in its themes and as such cannot be recommended for anything less than mature players. Where the previous *Fright Night* titles have worked because of our familiarity with their set ups, *Asylum* works even better because it is not quite as familiar, and this combined with the efforts made to create and instill an atmosphere of fear and paranoia, means that *Fright Night: Asylum* is the best *d20 System* scenario from Hogshead to date.

Car Shopping (and Other Excursions into the World of Secrets and Lies)

For the first time ever, I purchased a new car last week. And by "new car," I mean a *new*, new car: 16 miles as I rolled it off the lot.

While I won't say it was the most painful experience of my life, it was certainly in the top 10. Over the course of two days (for a total of 14 hours), I visited seven car dealerships, test-drove seven vehicles, and encountered seven salesmen – most of whom, it seemed, spoke with a pressured urgency that gave the impression that it was perfectly natural to treat a \$15,000 purchase as an impulse buy. Couple all this with a couple dozen phone calls, haggling, paperwork nightmares, insurance shopping, and various other heartaches, and you've got a recipe for a miserable time. Oh, and let me not forget one of the most horrifying moments: my backing a test-drive vehicle into a wall.

Anyway, the excitement of owning a new vehicle somewhat mitigates the pain of purchasing one, in much the same way, I suppose, as the joy of being a mother allows our own species continues to propagate. But, seeing as how I'll never know a pain akin to pulling my lower lip fully over my head, I imagine the analogy falls a bit short.

But, you might ask, does this vehicular gloating satisfy any gaming desires for my column readers, or is it all a cheap ploy to be able to try claiming a new car purchase as a business expense?

I'm working on it, I'm working on it . . .

Got it!

There was much about the act of buying a car I found fascinating, as a newbie. Probably the most interesting was the art of the deal, where one learns to creatively lie and withhold information to get what one wants. Now, this extends beyond the usual dealer puffery ("Oh, sure, that car you're considering from the other dealer may have anti-lock brakes, but *our* vehicles are designed to never need stopping, so that frivolous extra isn't necessary . . ."). Rather, by the end I'd learned to lie and exaggerate myself.

In particular, I'd learned that making up any price and saying that another dealer is holding a car at that price was a surefire way to cut through a *lot* of haggling or other pressure. In fact, the car I ended up buying was a result of this technique; in one e-mail to the dealer I said, "I have a car waiting for me at another dealer [TRUTH] at \$X [LIE – ACTUAL PRICE WAS \$X+1,000], and I had another discount that they aren't honoring [PARTIAL TRUTH]. Can you match this price and give me the additional discount?" The short answer was, "Yes," and thus victory was mine!

(If you're going to use this technique, I strongly recommend stripping out the parts that say "[TRUTH]" and "[LIE].")

To extend this to gaming, in many games I've found myself withholding information, in an effort to "surprise" the GM as well as the rest of the group. The quintessential example of this I've written about [previously](#), but I'll recap here. Basically, my pious but Machiavellian ***Vampire: The Dark Ages*** character started making deals with a demon: The demon would give extra power, in return for favors to be named later. Now, I'd never revealed it to the GM (until, sadly, the subplot had passed), but my plan all along was to tell the demon, when he went to get me to serve him, "No thanks; I won't do your bidding. Send me to hell if you want, but be aware that I'll let your masters know you gave up power to serve the greater good, and didn't get anything out of it. Bad bargaining on your part." I don't know if this would've worked as a player, but my character found the plan foolproof.

Another example, this time in the dungeon-crawling vein. In a classic ***Advanced Dungeons & Dragons*** campaign (I don't know if it was first or second edition), the GM was somewhat generous with magical treasure in the same way the classic material was always generous: lots of minor magical weapons, with little stuff of more power. One of the players dutifully gathered all the *sword+1s* (the weakest magical sword) they came across and put them in some kind of portable-hole-type storage device. The other players would routinely say, "Are you going to do anything with

those," and he'd reply, "No, not really." The campaign continued for a looooooong time. Eventually, the characters grow to mighty heroes, and the player's sword-gathering habit had more or less been shrugged away (especially since, at that power level, they were practically useless). Finally, the GM planned an epic battle, where the heroes needed to raise an army using the **Battlesystem** mass combat rules. Once the ragtag army of soldiers was amassed, the player sprang his "trap," giving magic swords to every member of entire units. The player had managed to amass over 1,000 low-powered magical swords during the course of the campaign. In the **Battlesystem**, having units that are entirely equipped with magical weapons is a phenomenal advantage, and their units ended up cleaning the clocks of their opposition.

Personally, I live for these moments, both as a player and a GM. The thrill of the surprise is one of the primary reasons I game. (It's also the biggest reason I tease cats, but that's beside the point.) However, some groups treat these surprises as unwelcome; they feel the players "tricked" the GM by exploiting a plot hole, rule quirk, or the like.

Still, I like 'em. However, if I was going to offer advice to players looking to add these surprises to a campaign, I'd have a few "rules" of honor I'd follow:

Without being direct, confirm what you're doing with everyone (although not *why* you're doing it). In the case of the demon, I confirmed (in front of the other players) that I got the power now, and I'd have to repay the favor later. In the **Dungeons & Dragons** game, one player eventually became known as the guy who collected magic swords. In this way, people won't think you just made up the surprise later. ("Yeah, uhhh . . . I've been collecting pennies for the past six game years. Didn't I mention that? I imagine I should have a warehouse full by now . . .")

Don't be afraid to "lie." Within the guideline above, it should be possible to lie (in character), if it means keeping the surprise. The sword-collector knew what his eventual goal was, and so did my demon-dealer. Having said that, if the GM specifically asks what you have planned, it might be good to tell him (privately); alternatively, it might be possible to say, "I have a plan I'd rather not reveal right now, if that's okay."

Accept that the "surprise" might not happen. In the **Vampire** game, the demon was killed before it could demand anything of me. In the **Dungeons & Dragons** game, the hero's portable hole could have been stolen or a similar setback. Although GMs aren't under any obligation to fulfill players' wishes, that's especially true if the GM doesn't know what the wish is.

Be fully prepared for the surprise not to work, even if you get to do it. Especially if you're not letting anyone else know about your plan, it's entirely possible for a long-term surprise to fizzle out or not work as expected.

If you keep these guidelines in mind, you might be able to create a memorable moment within a game by withholding all the facts, lying about what you know, and preparing for the big deal. Who knows? You might end up getting the better end of a deal with a demon; they can't be any worse than most car salesmen.

--Steven Marsh

Designer's Notes: GURPS Infinite Worlds

by Kenneth Hite

*Fathers! Your virtues, such the power of grace,
Their spirit, in your children, thus approve.
Transcendent over Time, unbound by place,
Concord and charity in Circles move.*
-- William Wordsworth, *Ecclesiastical Sonnets*, XIV

It seemed like a three-inch putt, a slam dunk, a veritable gimme. All I had to do was take the best of **GURPS'** pre-existing alternate-worlds material, an embarrassment of riches if ever there was one, and turn it into **GURPS Infinite Worlds**. No sweat, he thought. The only thing really missing was a really useful, solid set of guidelines for alternate history construction. So of course, assembling and expanding **Infinite Worlds** from **GURPS Time Travel**, both **GURPS Alternate Earths** books, and Chapter 20 of the new Fourth Edition **GURPS Basic Set** took me twice as long as I thought it would, and likely three times as long as the long-suffering Andrew Hackard thought it would.

Part of the challenge was simply updating everything, and not merely to Fourth Edition rules. (Although that was no picnic in its own right, since I started work on **Infinite Worlds** before the Fourth Edition was finalized.) I also had to look at the last 10 years of world-historical theory, and the last 15 years of time travel and alternate history SF. For example: **GURPS Time Travel** predates Harry Turtledove's *Worldwar* series, and **GURPS Alternate Earths** predates Jared Diamond's *Guns, Germs, and Steel*. What I wrote needed to reflect those changes to the genre and the subject matter, to the extent it could. I took this most seriously in Chapter Three, the "Building An Alternate Earth" chapter, which I divided into two main sections. The first, and one of the trickiest to make work, was a random history generation system, modeled after the wonderful random planet generator in **GURPS Space**. In a game about infinite worlds, it seemed odd that we didn't have a way for the GM to create them in bulk. What I came up with may not be the first such system (I'm fairly sure that **Fringeworthy** must have one, for example), but it's the first one that actually pays attention to any sort of historical rigor whatsoever. The second half of that chapter is an extended summary of the current state of historical modeling, with as much rigor as possible while exhibiting a massive bias toward usefulness in designing alternate histories. That, for instance, is why there's a summary of the completely daft "biological history model" of Oswald Spengler in there -- it's nonsense, but Poul Anderson, James Blish, and other top-notch SF writers have used it to design future histories that feel real. Other stuff I tossed into the mix included Strauss and Howe's generational history, the "Kondratiev wave" in economics, and as much as we know (not much) about climate change cycles. The result may not be history as we know it, but it is definitely history as I design it, which seems preferable for roleplaying games.

But mostly I adapted, adopted, and improved, as the Round Table motto has it. David Pulver had (very flatteringly) added the Cabal, reality quakes, and a crosstime-capable Reich-5 to the basic Infinite Worlds setting; I had to figure out how they worked in the here-and-now, and how to explain them to people who hadn't read what I had written about them already. Most of my work was just such building on foundations laid by Steve Jackson, John M. Ford, and Dave Pulver. What did the "10 divisions" in the I-Cops and "eight divisions" in the Scouts do, exactly? What's happened to Reich-5's Japan in the last 20 years? How does John W. Campbell's death abort scientific progress, again? I expanded some things, brushed past some others, and knit the result into a (hopefully) consistent whole. Much of it was actually fun -- I enjoyed going into lurid detail on just how Nazi Science Crossed The Feeble Dimensional Barrier. I added relatively few original ideas to the mix: a crosstime mining corporation run by a parallel Cecil Rhodes, a dozen new alternate Earths to play with, some alternate human races (Morlocks, mutants, Neanderthals, super-soldiers), my standard "campaign parameters" discussion, and some more bad guys for the Order of the Hourglass to fight.

I also added a lot of other stuff that came right back out again, when the book shrank from 256 pages to 240. (You may imagine my delighted reaction, having nearly killed myself, and Andrew, to produce the 256 pages in question.) Some of those pages -- yet more alternate Earths (possibly including my "Turtledove tribute" featuring a Gormelite

invasion in the 1960s), and my fantasy crossworld setting "Collegio Januari" -- are apparently slated for e23 releases, so I shan't include them here. But some of the deleted gems were too diffuse to make anything but the cutting-room floor, so I present them now to you fine people. The first section is my attempt to add a future to the Infinite Worlds -- the Promelleans, specifically, are a "GM's friend" to help move PC parties from the Infinite Worlds setting into any future-SF type setting. (Steve didn't like them. Ah, well.) The second bit just compiles a few of the Things That Can Go Wrong with dimension or time travel in general. The eagle-eyed may note a bit of Lovecraftian dues-paying in each section -- I say, if you're going to model a genre, you'd better steal from its best.

Two Dooms: The Future

Although the vast majority of Infinity's experience is (somewhat ironically) confined to the present in its myriad alternate forms, at least two "futures" interact occasionally with Homeline's own era. There are, of course, hundreds, if not thousands, of "time travel reports" and "visitor sightings" choking the Patrol archives, some of them even filed by Patrolmen. Of the reliable "UFB" (Unidentified Future Being) sightings, the vast majority falls into one of two categories: the coleopteran travelers, or the Promelleans. Each claims to come from a future that might be labeled "posthuman," although the details are sketchy at best.

These two futures are not necessarily incompatible, but they differ in the few details generally agreed upon, and of course, in their representatives in the Infinite Worlds' present. Indeed, many Infinity researchers believe both visitor groups come from wildly divergent worldlines, and unaware that they have crossed quantum barriers in their journey, have assumed that they have traveled into their own past. Other investigators of the UFB phenomenon tentatively accept the visitors' claims at face value, but argue that the future per se is a constant state of quantum indeterminacy. In short, the future is not just infinite, it's infinitely fuzzy. By this logic, astrally projecting scarabs and blue quantum fogs are no more or less unreasonable than any other possible future, since nothing exists yet on which to base rationality.

This certainly does little to explain anything, but it does let Infinity higher-ups feel better. The notion that some unimaginable posthuman entities are treating the present the way that Infinity treats the parallel Earths -- as a mere backdrop for their own ineffable activities -- is deeply unsettling to some.

Coleopteran Travelers

Millions of years in the future, after the extinction of mankind, the dominant life form will be a coleopteran species descended from the Egyptian scarab, or dung beetle. This is the unflattering tale told by travelers from that future, or rather pieced together from a century and a half of psychiatric records across seven or eight parallel Earths.

According to this fragmented tale, a race of psionic time travelers from another star occupies the bodies of the beetle-things. It sends the minds of its scouts throughout time watching for signs of its enemies, of which little but superstition is known. They travel by means of a one-way projector that disappears after use -- whether it travels with them materially, or vanishes into acausality, is unclear.

Humans possessed by the coleopteran travelers evince total amnesia, accompanied by confusion about the most elementary details of their own culture. They often show language skills they never previously possessed, and their handwriting becomes odd and spiky, as though they were unused to handling pens. These spells last from three to seven years, during which they drain their savings traveling to remote corners of the Earth (especially Australia, the Carpathian Mountains, and the Dakota Badlands) and research the most abstruse possible combination of paleontology, high-energy astrophysics, and occultism. Shortly after completing this program, they return home, lock themselves indoors, and return to their old personalities overnight with no sensation of elapsed time.

Very occasionally, one of these returned personalities will start having nightmares about life in a hollow complex of tubes and passages, in which he has been transformed into an enormous beetle.

Promelleans

The Promelleans are a bright blue quantum fog of distributed nanobots from the 61st century. Whether they are humans using these fogs as their time machines, transhumans who take this form, or alien entities with human-seeming habits and personalities is unknown to Infinity and seems irrelevant to the Promelleans. Their nanobots cannot be harmed by any technology that Infinity is aware of, and have a high magic resistance. Psis attempting to contact the Promelleans wind up unconscious or frozen -- or vanished, snatched to the future by these enigmatic beings.

The Promelleans are timenappers, taking individuals or small groups of people from certain timelines, often saying to those left behind "This one is needed." Such witnesses are almost always all from the same Earth; Promelleans seldom appear to mixed groups of locals and travelers. Promelleans usually take some care not to abduct people in public or flashy ways, although some high-profile historical "vanishings" such as that of the prophet Elijah may be records of Promellean operations. Promelleans may also be behind some of the vanished conveyors from both Centrum and Infinity; they seem to "select" for targets with broad experience across the quantum stream.

Nobody knows exactly what happens to the kidnap victims, although occasional reports exist of encounters with Promelleans speaking in voices similar to those of vanished Patrol personnel. The Promelleans themselves are no help on the matter, restricting their discussions to oracular pronouncements about the "tree of futures," delphic warnings against "the dead time," or vague promises of "a future of all times and worlds." The most consistent element of Promellean ideology seems to be distrust of someone or something called "the Vortun." Promelleans often admonish Patrolmen against "the Vortun agenda" and sometimes kill people who they identify as "Vortun agents." Whether the Vortun are a faction within the Promelleans, a rival race or transhuman entity, or Promelleans from an alternate future, remains a mystery. No reports exist of any Patrolman meeting a self-identified Vortun.

Three Hazards

The Hounds of Time

These semi-material beings travel in packs of two to seven and leave no tracks aside from the occasional claw mark, but give off a strange temporal signature, detectable by tachyon tanks and other systems. They resemble long, thin quadrupeds built of badly overlapping plates of bluish clay with occasional chinks between where nothing at all shows up. Their heads are indistinct, only their snouts, tongues, and eyes appearing with any clarity.

They roam around waste spots in time, the aftershocks of reality quakes, the tangled detritus of paradox or shifted echoes, and the edges of some ghost roads or dimensional highways. If they catch the scent of a time traveler, they will track him across the millennia (at a top speed of 100 million years per day). If they spot their prey on another world, they have to go all the way back to 3.5 billion years ago before the alternate worlds broke apart, and then track him back down the correct worldline. They may nest back in that primordial era. The traveler will feel them approach him from out of time, as if he had the Death Vision spell (p. B251) cast on him every day until their arrival.

When they catch him, they materialize from out of the nearest acute angle and attack with their claws and then try to core their target's heart out with their rough, hollow tongue (which resembles the proboscis of a mosquito, only much larger). It does 2d large piercing damage from the attack, and coats the wound with a bluish saliva which does 2d more points of corrosion damage every round until washed off. For some reason, the hounds do not like to cross curved lines; hiding in a domed structure (or better yet a spherical chamber) offers some protection.

Hounds of Time

ST 16; **DX** 10; **IQ** 4; **HT** 20.

Will 17; **Per** 17; **Speed** 7.5; **Dodge** 10; **Move** 7.

SM 0; 100 lbs.

Traits: Discriminatory Smell; **DR** 2; Dread (Curved lines); Jumper (Time); Quadruped; Regeneration (Extreme);

Spirit; Striker (Tongue); Talons; Terror 5.

Skills: Brawling-14; Tracking-17.

The Green Zone

However, conveyors don't always work correctly. About one percent of the time, the journey seems to take time. And sometimes, it seems to take a long time indeed, or pass through some other kind of reality entirely (see *Fascinating Parachronic Disasters*, p. B532). The space between the worlds apparently *can* have a physical component. Paralabs physicists call it "hyperspace," and note that the speed of light (or possibly the duration of a second) becomes highly variable in that dimension. The few Patrolmen who have been there call it the "Green Zone," and there are rumors that at least one conveyor -- "the Lost Capsule" -- is still there, its crew unaware that they are even missing. Over a pint at Harry's, they say that sometimes the Lost Capsule shows up, faintly, at your own jump point, and then you know something bad is going to happen that trip.

Fortunately, an intact conveyor keeps a closed circuit of its own reality (probably thanks to the parachronic drive in operation), so even if the conveyor passes through the Green Zone, the Patrolmen inside are safe. Of course, not all conveyors *are* fully intact before a jump, what with suspicious gun-toting locals being not uncommon on the various parallel Earths. The Green Zone can then affect the travelers.

Exposure to the Green Zone forces a Fright Check at -5 on all who gaze into it; the human mind can't process the roiling otherness of it. In addition to any other consequences of the Fright Check, exposure to the Zone can turn its victims immaterial, creating a danger of rematerializing inside a solid object. They might also turn invisible (permanently or temporarily but never controllably). It can also set witnesses on fire (one unfortunate victim burned for 18 days), freeze them in time forever, or reduce them to point-size singularities that shoot off at high speed. Critical failure on the Fright Check should impose at least 25 or 30 points of disadvantages, even if it doesn't beam the poor wretch into a bulkhead. The GM decides whether to make PCs risk such horrific fates, or whether to save the 18-day fire for NPCs in the conveyor. More positively, exposure to the Green Zone can be an opportunity for characters to add psionic or other supernatural advantages (Jumper, Insubstantiality, Invisibility, and a pyrokinetic Innate Attack seem to match the lore) "awakened" or "implanted" by the stress, although a heavy compensatory set of disadvantages would not be out of line either.

Some methods of parachronic travel, notably sailing on the *USS Eldridge*, pass through the Green Zone and offer little or no protection to crewmen on the "deck" of the craft.

Really Weird Accidents

The Bailey Effect: The travelers reappear instantaneously at the moment they left -- except they've erased their own personal lifeline somehow. Just like George Bailey in *It's A Wonderful Life*, there is no record of their existence (the equivalent of Zeroed, p. B100), their friends never met them, their mothers never raised them, and so forth. (Characters with Temporal Inertia (p. B93) remain unaffected.) At the GM's discretion, the world might be altered, or others might have saved the transport or thwarted Mr. Potter in their absence. (If one of the travelers invented the time machine, it might never have existed either!)

The Lie Agreed Upon: The travelers arrive in their target era -- except that it's not historically accurate, but a kind of semi-literate Hollywood pastiche of the era. Cavemen fight dinosaurs, the Library of Alexandria has a "Lost Books" section and a card catalog, and Napoleon is always grabbing his stomach and ranting about being short. This can be played for farce, or as a deadly threat to the fundamental reality of the cosmos.

Welcome Back: History has "moved aside" to let the characters in. The opposite of the Bailey Effect; the travelers arrive to find themselves a known and registered part of their target era with friends, parents, and enemies in it. Their new lives parallel their lives in the present as closely as possible -- a scientist traveling to ancient Rome might "become" a priest of Apollo, for instance. The longer they stay in the past, the more their "present" memories erode; the travelers must make a Will roll at an additional -1 every time they wake up to remember their true identities.

(Characters with Temporal Inertia still have "new" lives, but suffer no memory erosion.) At the GM's discretion, this may produce Fright Checks or even mental disadvantages.

The Dead Past: The travelers arrive to find the past unchangeable. Perhaps time just doesn't advance while they're in the past, and they have to accomplish their mission during an eternal nanosecond. (This might actually make some missions -- like robbing the Louvre -- a lot easier!) Perhaps the travelers are only phantoms, unable to touch anyone or anything in the past. More subtly, they can never make any permanent impression on the past; people forget them right after talking to them, and anything they move returns to its original location when the travelers aren't looking.

The Five Movements of Magic

for *GURPS Magic*/*GURPS Grimoire*

by David Moore

"If I have seen further it is by standing on the shoulders of giants."

- Sir Isaac Newton, in a letter to Robert Hooke, 5th February 1676

The **GURPS** technology books use a detailed system of "Tech Levels" to track scientific and technological progress from the rudest improvised tools of early Man to the miraculous powers of our star-faring descendants. With fine-tuning and creativity, the system adapts to any setting, giving general background -- to determine the tools and weapons available to characters -- or being central to a plot in which the players are inventors, industrial spies or saboteurs intent on steering or riding the tide of progress.

By contrast, magic is presented in **GURPS Magic** and **GURPS Grimoire** as an integral whole: in any world where magic exists and is practiced (and where associated technology, for the Radiation and Tech Colleges, is known), all or most spells can be learned and cast by any mage with the suitable prerequisites. The **Grimoire**, presuming that the GM's campaign has been using only **GURPS Magic** thus far, suggests ways for the new spells to be incorporated through invention or discovery; **GURPS Technomancer** presents an alternative Earth in which magic has recently arisen, where spells are still being researched and are the subject of an alternative arms race. In both cases, the spells and magical techniques not yet known are arbitrarily defined, or left in the hands of the GM. There's no structured progress defining the "state of magic" in society from basic principles to the most powerful and complex magic.

The Development of Magic

One reason for this is that magic is not, in spite of the famous Clarke quote, historically the direct equivalent of technology. Traditionally, magic is irrational; it is a means by which man's needs and wishes can be achieved without the required labor, by sheer willpower and the magical logic of sympathy and contagion. As such, there should be nothing anyone would want to do that magic *cannot* do. If a need arises for a spell the magician has never used, then he simply makes a new spell to fit that need. Unlike scientific advance, magical knowledge isn't generally contingent on conceptual advances, as the rules of magic are the same regardless of the power and sophistication of the spells being used.

Most magic in roleplaying games, however, follows a slightly more mechanistic logic, in deference to game balance and system design. Spells are studied, with some difficulty, and new spells need to be researched or taught by a more learned tutor; very powerful or unusual spells are jealously guarded secrets. Magic is graduated, with junior wizards needing to master weak or simple spells before they can tackle more potent or complex formulae. The need for study and research, and the development from weaker to more powerful techniques, most explicitly in **GURPS'** College and prerequisite system, make fantasy magic more closely parallel to technology. In such a setting, especially given wizardly co-operation within (and competition between) guilds or Hermetic orders, the magical "state of the art" can advance, each new generation of willworkers building on the insights of those who have gone before.

The Five Movements of Magic

What follows is one possible system for charting the magical development of a culture, from the crudest water-seeking rituals to the highest dimension-spanning disciplines. It proposes five phases of magical development, called *Movements*. Each Movement is broad, and encompasses several smaller improvements in the practice of magic. The Movements affect both which spells are known and used, and how some spells are cast (affecting casting time or spell rituals) or learned. Like Tech Levels, Movements can describe the campaign world's general state of magical

knowledge, or may be used to compare different nations' or organizations' progress, informing competition or cooperation between them. Fine-tuning the system may involve selecting individual advances from those described for each Movement, or applying them to separate colleges or applications as practiced in the world.

This system assumes, along with much of fantasy, a society that begins *technologically* crude, with magic partly replacing the function of science. Thus, natural and cosmological enquiry is driven by magic, gradually advancing the ideas required for higher magical development (elemental theory, for instance, or a cultural drive towards classification). Societies in which prior philosophical or scientific development have already furnished these conceptual advances, such as the ***Technomancer*** setting, might progress differently, or "jump" several Movements at once. See *The Sixth Movement?*, below, for more on the relationship between technology and magic.

First Movement: Intuitive Magic

During the first Movement, the very earliest principles of magic -- the magical laws of contagion and sympathy -- are laid out, and elaborate rituals invoking the one law or the other are required for even the simplest spells. Practitioners believe the power of their magic to rest in these rituals rather than themselves. In High Mana settings where anyone can learn and cast spells, the existence of Magical Aptitude is unknown, and even in Normal Mana worlds where Magery is required to cast spells it is seen as an external and impartial quality; mages are invested with divine or spiritual authority rather than an inborn capacity for magic. Spells stand alone, with no obvious connections between them, and spells that build upon simpler spells are not yet known. This early, common spells answer the immediate needs of agrarian society, neglecting more abstract principles.

System Effects

Basic Spells Only. Spells that have other spells as prerequisites do not yet exist, although spells with nonmagical advantages as prerequisites (such as Animal Empathy for Beast-Soother, or Danger Sense for Sense Danger) are known. Spells that require Magery are not known.

No Colleges. Spells are not yet organized into Colleges (or Celtic "Trees," or elemental affinities, etc.). One College Magery (p.M104) does not exist, and any spells or techniques defined by Colleges are not yet possible.

"Agrarian" Spells Only. The spells that are developed are those that affect animals, plants, food and water (for hunting and gathering); fire and light (for comfort); and the body and movement (for treatment, punishment and war). Taken with the above, this limitation essentially limits the First Movement mage to Beast-Rouser, Beast-Soother, Climbing, the Dull Senses spells, Fatigue, Haste, Ignite Fire, Itch, the Keen Senses spells, Lend Strength, Light, Sense Danger, Sense Foes, Sense Life, Seek Fire, Seek Plant, Seek Water, Test Food, and Touch.

Elaborate Rituals. Spells must always use full, elaborate rituals. When using the *Magic Rituals* rules (p.M7), First Movement spellcasters must always use both hands and feet and speak in a firm voice, regardless of how well they know the spells (if using the *Alternate Magic Ritual Rule* from the sidebar, mages *must* use the "enhanced" ritual, and get no bonus for it).

Magical Props. All spells must use props that invoke a contagious or sympathetic link to the desired effect. A mage could use a wand of scorched wood to cast Ignite Fire, a lock of the subject's hair for Itch, or a sculpture of an animal to cast Beast-Soother. As well as requiring the mage to carry about foci for each of his spells, this effectively doubles the duration of the ritual again as foci are incorporated, which means First Movement spells take *four times* the listed time to cast.

Note: At this stage, magical research is sporadic and limited, so significant variation is possible. Natural Spellcasters (p.CI41) are responsible for much of new magical knowledge, and generally know spells outside the above list, although they will be unable to teach them to others until the underlying principles are understood (ie. the required Movement is reached). Inherent Magic and Racial Spells may also lie outside the above list.

Second Movement: Utilitarian Magic

During this stage, the awe in which magic is held begins to fade and practitioners start to look on magic as a tool, to be applied, adapted and improved upon. Mages learn to work without mystical props, using rites that invoke the connection without needing the prop to be present, and simpler and less time-consuming rituals are developed. Perhaps most significantly, the discovery is made that the principles employed in the known spells can be adapted in more complex ways, allowing a skilled wizard to learn more powerful spells once he has mastered the initial canon. Existing spells that affect or sense thoughts or emotions allow mages to appreciate the division between body and mind, and mind control and thought-reading spells are learned as a consequence.

System Effects

Prerequisite Spells. Spells that have other spells as prerequisites are allowed. Note that spells which require Magery are still unknown.

No Colleges. Spells are still not organized into Colleges, so spells whose prerequisites include a certain number of spells from one College (such as Invisibility), or from a number of Colleges (such as Teleport), have not yet been developed.

Mind Spells Known. Any spells whose prerequisites are among the First Movement spells may be learned, within the limits specified above. This adds mind-affecting spells to the existing areas of influence.

Simple Rituals. Simpler spells are now known. Under the *Magic Rituals* rules, Second Movement spellcasters with skills of 12 or more may "speak a few quiet words and make a gesture," taking the listed time to cast their spells (if using the *Alternate Magic Ritual Rule* from the sidebar, mages needn't enhance the ritual, and get a +1 bonus if they do).

No Props. The spell caster may dispense with sympathetic props with no penalty, although he may cast the spell at a +1 if he uses one anyway.

Third Movement: Structured Magic

The third Movement sees the magical community continuing to assess the logic and structure of magic, and a formal, systemic worldview begins to emerge. In answer to this need, analytical Knowledge spells begin to be used. Spells are classified into Colleges, making the study of magic faster and simpler. Study of water and fire magic leads to the Elemental theory, and the development of air and earth magic; this new insight also allows Making and Breaking spells. Building on existing knowledge of light and darkness, the nature of sound is explored. Study of Colleges leads to the development of Improvised and Runic Magic. Finally, the innate quality of magical power is understood, and experiments into the early recognition of Magery are conducted, along with breeding experiments to determine its source. With the knowledge that magical power is chiefly internal, rituals are shortened and simplified.

System Effects

Colleges. With the development of Colleges, spells that specify a number of spell prerequisites by College are invented. Note that spells that require Magery are still not known.

Elemental Theory. The Colleges of Air and Earth join the mix. Elemental Sub-Colleges are not yet known.

New Spells. Knowledge, Making and Breaking and Sound spells are now known. Third Movement mages may learn spells from the Animal, Body Control, Communication and Empathy, Elemental (Air, Earth, Fire and Water), Food, Healing, Knowledge, Light and Darkness, Making and Breaking, Mind Control, Movement, Plant, Protection and Warning and Sound Colleges.

Improvised Magic. Improvised Spells and Rune Casting (pp.M85-93), if allowed by the GM, become available.

Simple Rituals. Yet simpler spells are known. Under the *Magic Rituals* rules, Third Movement spellcasters with skills of 15 or more may "speak a word or two and gesture," moving a hex on the same turn; those with skills of 18 or more may speak or gesture (if using the *Alternate Magic Ritual Rule* from the sidebar, all the reduced ritual options are available, although not all at once).

Fourth Movement: Abstract Magic

With the enlightenment of the third Movement, abstract philosophical thought is advanced. Fundamental questions of the nature of matter start to be asked and the boundaries of reality tested. Subtler classifications of matter are established. The nature of the sentient mind is scrutinized, and the interaction between perception and reality tested. As a result, later magic starts to manipulate that which is unreal, imagined, or conceptual, allowing mages to achieve feats that are genuinely unachievable by nonmagical means. Mages find spells that fool the senses with false conjurings, eventually leading to the creation of objects from nothingness. More perverse magic is also explored, as the necromantic arts that reverse or corrupt the magic of the body arise. The nature of Magery is now properly understood, and spells that better exploit the mage's sensitivity and power are researched. Since magic is now clearly understood to originate with the spellcaster, skilled mages learn how to internalize the process, dispensing with rituals altogether.

System Effects

Magery. Spells that require Magery to learn and cast become available. Note that spells requiring Magery 2 or 3 are still unknown.

New Elemental Colleges. The Elemental Sub-Colleges of Electricity, Ice and Weather are available, although without access to Magery 2 spells, the Acid College is still only theoretical.

New Colleges. The Illusion and Creation and Necromantic Colleges arise. The Enchantment, Gate, and Meta Colleges are still unknown.

No Rituals. Rituals can now be ignored by sufficiently skilled wizards. Use the *Magic Rituals* rules (or *Alternate Magic Ritual Rule* from the sidebar) without any limitation.

Fifth Movement: Higher Magic

In the fifth Movement, the theoretical limits of magic are explored. Magical research probes the limits of the known, eventually exploring time, space and other dimensions. The common sources of energy, inert matter, living tissue and the conscious mind are explored, allowing spells that create actual living beings, including elementals and enchanted automatons such as golems. Most profoundly, the underlying fabric of magic *itself* is studied, allowing wizards to develop spells that manipulate other spells. As an extension of this, it becomes possible to permanently store magical energy in objects, creating talismans and enchanted objects imbued with the powers of spells.

System Effects:

Higher Magery. Spells requiring Magery 2 or 3 are now known.

New Colleges. The Enchantment, Gate and Meta Colleges are available.

The Movements in the Campaign

The Movements are used in a fantasy campaign much the way technology is used in science fiction. Primarily, the GM can use it to define the general competence of magicians in the campaign world, and the direction future magic research will take. In a truly epic fantasy world, all wizards may have access to Fifth Movement magic, but a "standard" fantasy world is usually at the high end of the Fourth Movement, with only exceptional individuals or

secretive groups having access to Fifth Movement spells and techniques. A "low-fantasy" campaign, limited to the second or third Movement, permits spells that make life easier without providing for everything, leaving players to depend on other skills and resources as well. First Movement worlds have only simple and crude magic, best suited to a Stone Age game (see **GURPS Dinosaurs** and **GURPS Low-Tech** for more on Stone Age roleplaying).

Like Tech Levels, however, Movements are most useful in worlds where different groups, communities or cultures are at different stages of development. Some groups are one or more Movements ahead of others, or several groups are researching a higher Movement in competition, making progress in different areas. For example, in **GURPS Fantasy's** Yrth most of the world is at the fourth Movement, with provincial areas and low-mana Caithness at the third. Megalan and Wazifi rivals have achieved Fifth Movement in various areas: the Ministry of Serendipity have greater Mind, Knowledge and Meta magic, while the Caliph's wizards are skilled in the highest level in Healing, Protection and Warning, and Enchantment magic. Dwarven sorcerers, meanwhile, long ago mastered the Enchantment, Elemental and Making and Breaking Colleges, while Elves are most known for their ability with Animal and Plant magic; the Banestorm, of course, was created by Dark Elven dabbling in Gate magic. Characters from a higher or lower Movement than the campaign default should take Unenlightened or Higher Magic (see below).

Campaign Seeds

Espionage. The players are agents of a ruler, government, guild or college, sent to gather the magical secrets of a rival group, by enrolling as students, spying on their research, stealing their notes and grimoires, or whatever other means they can think of. With fine-tuning, this could be run as a spy game with powerful wizard patrons and highly-trained specialist PCs, a "magicpunk" story with double-crossing guild employers and desperate criminal PCs, or an *Illuminati*-style conspiracy game where the motivations of the agencies and patrons are poorly-understood and the missions apparently senseless.

Archaeology. A fallen empire, renowned for the magical prowess its wizards held at its height, has left ruins scattered about the land (perhaps the cities of the elves that once covered Ytarria?). Legend fills these ruins with great tomes of secrets far beyond what is known to the wizards of today, and with mighty magical treasures and weapons. Retrieving these treasures, what with traps, curses, mystical guardians and hidden tombs, will be hard enough, but that's just the beginning; deciphering the obscure magical texts and piecing together the techniques and mysteries the old empire understood could take lifetimes, if it's possible at all.

Cold War. As an extension of the Espionage campaign, the politics, warfare and diplomacy of a whole *world* can be defined by a race between two groups or nations to develop the most complex and powerful magic. Yrth is already something like this, with magical competition between Megalos and Al-Wazif having led to the Mages' War of the 1920s. Imagining a 60-year deadlock between the nations, with Megalan and Wazifi wizards stationed in client states like Caithness and Cardiel "for their protection" and the possible effects of an all-out magical war hanging in everyone's minds, is a small step.

Luddites. A guild researching Making and Breaking magic has recently developed Fifth Movement spells in that College, learning the Repair and Sharpen spells and earning a lucrative Imperial Legion contract to supply armorers who work faster and require less equipment than the cumbersome smiths they previously used. The powerful Armorer's Guild, more than a little upset at losing the contract, are the obvious suspects when petty thugs start to make trouble for the wizards, harassing them, depriving them sleep and damaging one of their labs. So far, they've stopped short of attempted assassination, but it's only a matter of time, and the thugs are proving difficult for the Legionnaire PCs to track down...

Transhuman Magic. Many of the ideas behind the **Transhuman Space** RPG can apply just as well to magic as to science. Advanced Body Control and Animal magic can alter the human form, while higher Healing magic apparently does away with age and death. Meanwhile, golems, zombies and elementals do our menial work, and the spirits of the dead remain among us in incorporeal form, testing the limits and definitions of humanity. Applying the philosophy of transhumanism, and the social theories behind it, to a setting driven by magical research and competition can create a very different and challenging fantasy setting, tearing away traditional high-fantasy archetypes of light and dark and making the PCs and their contemporaries responsible for their powers and for the ramifications of their use.

Magical Research

Researching spells and techniques in higher Movements, or bringing the knowledge of a higher-Movement culture or group to a less-enlightened one, works like inventing and introducing new gadgets and devices. See *Building Up Local Technology* and *New Inventions*, both p.B186, substituting Movements for Tech Levels and Thaumatology skill (or appropriate specialization; see below) for Engineering. Successful invention rolls allow the wizard to research a spell the wizard does not yet know, provided he knows the prerequisites for it. The GM may assign penalties for learning a spell that's normally unavailable at his Movement (such as a Third Movement mage researching Simple Illusion), or bonuses for simply relearning a known spell at a higher Movement (learning Fascinate/Mvt4, which can be cast without a ritual by a sufficiently skilled wizard, when the wizard already knows Fascinate/Mvt3).

The new spell is then learned by the researcher as normal, and can be taught to other wizards or recorded in a grimoire. It can also be taught to a student, although if not at the required Movement himself the student must pay double the character point cost to learn it and cannot use it as a prerequisite for other spells until his Movement has been raised by tutoring. The GM may judge a spellcaster who has researched a number of spells at a higher Movement to have climbed to the new Movement, and make him buy the appropriate advantage. As with technology, the GM may refuse a PC trying to research spells for a Movement he wishes to keep out of PC hands.

Magic as Gadgeteering

Alternatively, in a very "high-fantasy" setting, the GM may allow a variant of the Gadgeteering advantage (see below) to be used for quickly developing spells. Use the rules on p.CI121; most spells are Average complexity, while Magery 1 spells are Complex and Magery 2 or 3 spells are Amazing. Expenses (occult ingredients and lab supplies) are divided by 1000; however, the wizard must pay an equal amount of *fatigue* (this can come from Powerstones) through magical experimentation, trial and error and so on. Once devised, the new spell can be learned and taught as above.

"Quick" Gadgeteering allows rapid improvised spells. In place of the "Required Materials" roll, the wizard quickly produces a ritual, with inscriptions, sympathetic props, and occult paraphernalia, to aid in spell-casting. This should be an Artist, Bard, or Craft roll as appropriate to the ritual. The spell thus improvised can only be used for the day, the premise having slipped from the wizard's mind by the next morning.

Note that magical Gadgeteering is distinct from Natural Spellcasting (p.CI41), which is only usable under stress. The Gadgeteering advantage may not be suitable for every game, and the GM may wish to disallow it.

Advantages, Disadvantages, and Skills

A list of new traits, and amendments to existing ones, follows.

Higher Magic

Varies

As a native of an enlightened nation or member of an accomplished guild, or being an inspired wizard yourself, you know magic that is significantly more complex than the campaign standard. This is the direct equivalent of the High Technology advantage (p.CI26), substituting Movements for Tech Levels, and costs the same.

Gadgeteer (Spell Research)

25 or 50 points

See p.CI25. In a cinematic "high-fantasy" game, the Gadgeteer advantage can be applied to spells instead of gadgets, allowing for a creative wizard who quickly devises new spells and techniques. See *Magic as Gadgeteering*, above.

Unenlightened

-5 points per level

Coming from a simple provincial magic discipline, or from a low-mana area where magic is less studied, you have a poorer understanding of magic. This is the direct equivalent of the Primitive disadvantage (p.B26), substituting Movements for Tech Levels, and has the same value. Note that, except in High Mana worlds, this disadvantage is only available to characters with Magical Aptitude, and only two levels can be taken, since it is always better to be able to cast spells - even crude ones -- than not.

Movement-dependent Skills

In a campaign that uses Movements, some skills and all spells become *Movement-dependent*. This is the direct equivalent of technology-dependent skills (see p.B42), and should be designated by /Mvt. For instance, the Flame Jet/Mvt3 spell is very different from the Flame Jet/Mvt5 spell. When using a Movement-dependent skill for a task from a different Movement, such as using Thaumatology/Mvt3 (Earth) when analyzing a victim of the Fourth Movement Flesh to Stone spell, penalties apply as per p.B185. Alchemy, Herbary and Thaumatology are Movement-dependent, as are Rune-Lore and the individual rune skills. Spell "finesse" skills such as Spell-Throwing, Magic Breath, and Illusion Art are not. At the GM's discretion, some sciences may be /Mvt skills; see *Sciences as Magical Skills*, below.

Alchemy/Mvt (Mental/Very Hard)* and *Herbary/Mvt (Mental/Very Hard)

See p.CI148 and p.CI150. In a campaign that uses Movement rules, these are /Mvt skills. Herbary is available in the first and second Movements, and Alchemy is available from the third Movement onwards.

Thaumatology/Mvt (Mental/Hard)

Defaults to IQ-5

In a campaign that uses Movements, this skill drops from Very Hard to Hard, and becomes Movement-dependent (see above) and specialized. At First or Second Movement, a thaumatologist *may* specialize (see p.B43) in one of the following areas of influence:

- Animals and Plants
- Body and Movement
- Fire and Light
- Food and Water
- Mind (Only at Second Movement)

At Third or later Movements, a thaumatologist *must* specialize (see p.B43) in a particular College. The skill may be purchased more than once, and specializations default to one another at -3. Magical Aptitude bonuses still apply to all specializations of the skill.

The Sixth Movement?

The scheme above assumes a culture that is technologically relatively crude, and which advances little over time as magic fills most of the peoples' needs. The Tech College has been deliberately left out to reflect this. This isn't, however, necessarily the case; fiction and gaming alike offer a range of contemporary, near-future and super-tech settings incorporating magic. When considering the type and sophistication of magic in the campaign, the GM should give some thought to the evolution of technology in parallel with it. There are three default assumptions to choose from, with some variation within each:

Magic leads Technology. In most fantasy settings, magical power has always been available, but is not available to everyone (ie. a Normal Mana level). In these worlds, technology will develop slowly as an alternative to magic, empowering those without the gift and sparing mages' time and fatigue. In these settings magical research often inspire mundane knowledge rather than vice versa: smelting iron and steel comes about once Elemental wizards better understand the Earth College and the nature of metal, and Healing mages lead the way in anatomy and herbalism, eager to find nonmagical alternatives to their spells. See *Sciences as Magical Skills*, below. Technology is seen as an offshoot of magical research; the Machine Sub-College develops late, if at all, as using spells to control devices which

only exist to supplement spells is considered redundant. Obscure sciences like higher physics may never leave the realm of thaumatology; the Energy and Radiation Sub-Colleges, available from the Fourth Movement, depend on and enable magical experimentation.

Technology leads Magic. In many contemporary settings, an already technologically-developed world suddenly gains access to magic. FASA's ***Shadowrun*** is based on this premise, as is ***GURPS Technomancer***. Magic progresses rapidly, achieving the Third Movement within a handful of years. The conceptual background for higher-Movement innovations like Colleges has already been established by nonmagical thinkers, such as philosophers and early Natural Historians. The Tech College arises as an early priority; machines are in everyone's lives, and magic that relates to them is a valuable tool. The principles underlying magical research remain grounded in scientific method, and skills like Alchemy and Thaumatology employ modern equipment and techniques. The race for Fourth and Fifth Movement magic begins in earnest as soon as the dust settles, driven by generations of technological competition.

Magic Supplants Technology. In High-Mana settings where spells are available to everyone, there is little call to develop technology at all. Education is a priority from early days, to ensure that young workers and craftsmen are effective spellcasters, and the rare individuals (generally those with Magic Resistance) who are unable to cast spells are viewed with pity or superstition. In such settings, technology is unlikely to arise at all; swords and guns are useless to soldiers equipped with fireballs, and tools are needless once the Making and Breaking College is known. Supplanting spells with nonmagical tools may even be taboo. Margaret Weiss and Tracy Hickman's *Darksword* trilogy describes a world along these lines, where nonmagical babies are exposed at birth and mages skilled in the Draw Power and Lend ST spells dominate a mana-based economy. The Machine Sub-College is entirely needless in such a setting, although the Energy and Metal Sub-Colleges arise in the fourth Movement. Radiation and Plastic spells may develop in the fifth Movement at the GM's discretion, from magical research into unusual energies and materials.

Sciences as Magical Skills

In magical worlds, scientific study is often driven by magical research, rather than technology. Healers use their spells to further the study of medicine and anatomy while masters of Making and Breaking magic develop metallurgy and the crafts. Elementalists pursue the study of chemistry, while students of Light and Darkness, Movement, Sound and Radiation are consummate physicists. At the GM's option, some or all sciences in a highly magical world should be Movement-dependent rather than technological. Physician/Mvt4, for instance, encompasses the knowledge of diseases and injuries enabled by the explosion of healing spells that arise in the fourth Movement.

Buzzkill

Drug Development and Side Effects for *GURPS Fourth Edition*

by Matt Riggsby

Between the rule-of-thumb guidelines for ultra-tech drugs (p. B425) and the rules on new inventions (p. B473), it's quite possible for characters in science-fiction settings (cyberpunkish settings are particularly appropriate) to develop their own miracle drugs. And super-drugs needn't be limited to high-tech settings; consider the injection that produced the Invisible Man, the potion that turned Dr. Jekyll into Mr. Hyde, the super-serum that created Captain America, and the Miraclo pill that gives Hourman his powers. Better living through gadgeteering!

But in the rules given, bugs for near-miss successes are fairly vague and relatively easily fixed, whereas in real drug development, few if any drugs are free of side effects and interactions that might be regarded as bugs. Just about every medication comes with a list of warnings about who should not take it (pregnant or nursing women, people taking MAO inhibitors, people with allergies to penicillin, etc.) and possible side effects (headaches, nausea, etc.). Such problems are likely to persist into the future; even Captain Kirk had drug allergies. And since there are guidelines for inventing alchemical potions (p. M212), fantasy has its own kind of pharmaceutical research.

The tables below allow the GM to quickly come up with potential side effects to newly developed drugs, or to add color to existing drugs in high-tech campaigns. For each bug that the initial design creates, roll on the side effects table below, then apply limitations to those side effects as desired.

Side Effects

For each side effect, roll three dice and consult the table below. Read each die individually rather than totaling them; for example, a roll of 3-6-6 would mean a minor respiratory problem. Where no game effect is given, treat as the disadvantage of the same name.

Effects marked with a * are insignificant enough that they can be regarded as minor bugs; more serious effects may or may not be regarded as minor depending on other circumstances. Causing severe chest pains is a big problem if a drug has that effect on everyone who has it; if only 1% of people who take it get those pains, it's not such a problem.

Effects marked with a ! are *permanent*. They inflict a permanent, but possibly treatable, disadvantage on the subject.

Effects marked with a + are supernatural or metaphysical in nature. They're appropriate for alchemical and perhaps super-powered potions, but in high-tech campaigns, the GM may wish to reroll.

Roll	Description	Game Effect
1 to 3 1 1	Addictive	
1 to 3 1 2	Berserk	
1 to 3 1 3	Bestial +	
1 to 3 1 4	Blood thinning	Treat as Hemophilia
1 to 3 1 5	Blurred vision	Treat as Bad Sight; possibly correctable with eye drops
1 to 3 1 6	Carcinogen!	User acquires the Terminally Ill disadvantage. Both Prevalence and Habitual Use limitations should be applied automatically.
1 to 3 2 1	Chronic Depression	
1 to 3 2 2	Cursed +	
1 to 3 2 3	Disorientation	Treat as Confused

1 to 3	2	4	Disturbing Voice +	
1 to 3	2	5	Dizziness	-3 to DX and -1 to IQ
1 to 3	2	6	Dry mouth*	Treat as Gluttony, but limited to liquids
1 to 3	3	1	Extreme general soreness	Treat as Chronic Pain (Agonizing)
1 to 3	3	2	Fatigue *	Treat as Drowsy (p. B428)
1 to 3	3	3	Frightens Animals +	
1 to 3	3	4	General malaise: a combination of mild depression and physical discomfort resulting in an inability to enjoy anything.	Treat as Killjoy
1 to 3	3	5	General soreness	Treat as Chronic Pain (Mild)
1 to 3	3	6	Generalized mild discomfort *	Nausea, headache, itching. Distracting, but not critical. -1 to IQ for tasks requiring long-term concentration
1 to 3	4	1	Hair loss	Patchy hair loss reduces appearance by one level if the user isn't already bald. The effect is impermanent in that hair will grow back, but otherwise this effect is not subject to duration modifiers
1 to 3	4	2	Highly Addictive	
1 to 3	4	3	Hunger *	Treat as Gluttony
1 to 3	4	4	Impaired judgment	Treat as Impulsiveness
1 to 3	4	5	Indecisive	
1 to 3	4	6	Insomnia*	Treat as Insomniac; the effect lasts at least until the next time the character tries to sleep, regardless of its nominal duration.
1 to 3	5	1	Irritability*	Treat as Bad Temper
1 to 3	5	2	Lethal allergic reaction	Treat as a Heart Attack (p. B429), although the specific treatment needed will be different
1 to 3	5	3	Long-term organ damage !	Subject gains a level of Short Life Span
1 to 3	5	4	Loss of appetite *	
1 to 3	5	5	Lunacy +	
1 to 3	5	6	Magic Susceptibility +	
1 to 3	6	1	Manic-depressive	
1 to 3	6	2	Mildly impaired hearing (ringing in ears or other ear problems) *	-2 to Hearing rolls
1 to 3	6	3	Mildly impaired scent/taste *	-2 to Scent and Taste rolls
1 to 3	6	4	Mildly impaired touch (for example, numbness and tingling in extremities) *	-2 to Touch rolls
1 to 3	6	5	Mildly impaired vision (for example, mild blurring or extreme dryness)	-2 to Vision rolls
1 to 3	6	6	Minor respiratory problem *	Coughing, sneezing, or runny nose. 2 per minute for attempts to remain inaudible.
4 to 6	1	1	Minor systemic	The user suffers generalized damage to internal

damage

systems, taking 1d3 damage. This effect is impermanent in that it maybe healed normally, but is otherwise not subject to duration modifiers

4 to 6	1	2	Motion sickness *	
4 to 6	1	3	Neurological disorder (Crippling)	
4 to 6	1	4	Neurological disorder (Mild)	
4 to 6	1	5	Neurological disorder (Severe)	
4 to 6	1	6	Night blindness *	Triple darkness penalties
4 to 6	2	1	Nightmares	Like insomnia, this will apply at least the next time the character tries to sleep, regardless of nominal duration.
4 to 6	2	2	Numb	
4 to 6	2	3	Obsession+	
4 to 6	2	4	Organ damage !	Subject loses 1d3 HT permanently.
4 to 6	2	5	Panic	Subject suffers panic reactions; any moderately stressful situation requires a Fright Check
4 to 6	2	6	Paranoia	
4 to 6	3	1	Phantom Voices +	
4 to 6	3	2	Rebound	Subject suffers an "opposite" effect once the drug wears off. For example, a DX-increasing drug temporarily inflicts DX loss, a night-vision-inducing drug inflicts night blindness.
4 to 6	3	3	Seizures	Treat as Epilepsy
4 to 6	3	4	Sensitive digestion *	Treat as Restricted Diet for at least one day, regardless of nominal duration.
4 to 6	3	5	Sensitivity to light *	-2 to Vision and to-hit rolls in light which poses a penalty of 2 or less.
4 to 6	3	6	Sensitivity to pain	Overall tenderness or generalized pain increasing sensitivity to further pain. Treat as Low Pain Threshold.
4 to 6	4	1	Severe general soreness	Treat as Chronic Pain (Severe)
4 to 6	4	2	Severe nausea	Treat as Nauseated (p. 428)
4 to 6	4	3	Sexual side effects *	Subject temporarily loses interest in sex or ability to perform. Treat as Eunuch, although capability to reproduce has not necessarily been lost.
4 to 6	4	4	Short Attention Span	
4 to 6	4	5	Sleep disturbances *	Light sleeper
4 to 6	4	6	Sleepwalker+	
4 to 6	5	1	Slow Healing *	
4 to 6	5	2	Small muscular tremors	Treat as Ham-fisted
4 to 6	5	3	Sterility	Subject cannot reproduce
4 to 6	5	4	Supernatural Feature +	
4 to 6	5	5	Suppressed immune system	The subject is more susceptible to infections. 2 to HT to resist disease for at least 1d3 days regardless of nominal duration.
4 to 6	5	6	Tolerance: the user gradually builds up a resistance to the drug	Roll 3d6 to determine a tolerance modifier. Every time the drug is taken, roll against HT + the tolerance modifier - total cumulative number of doses taken. If the HT roll fails, subsequent doses of the drug will have no effect on the user. Duration and habitual use

4 to 6	6	1	Totally Addictive	modifiers do not apply to this effect.
4 to 6	6	2	Treatable damage: Subject is afflicted with a permanent but treatable disorder (for example, diabetes or hypothyroidism).	Treat as a monthly Dependency on medication required to treat the disorder. Realistically, the character will probably take small, daily doses of a drug rather than one monthly dose; not taking it for a long term will start to cause damage.
4 to 6	6	3	Uncertain effect	The user must <i>fail</i> a HT roll for the drug to take effect. Do not roll duration modifiers
4 to 6	6	4	Unluckiness+	
4 to 6	6	5	Visible effect	Dilated or closed pupils, peculiar skin coloration, profuse sweating, speech impediment (slurring, stuttering). 1 to reaction modifiers
4 to 6	6	6	Weirdness Magnet +	

Modifiers

What makes side effects hard to fix is how long it takes them to appear. If the high-tech drug providing improved night vision, which you're formulating for the military, causes splitting headaches every time it is used, you can spot that quickly in testing and go back to the drawing board. However, it's quite possibly the case that those headaches will only develop in a few susceptible individuals, only after prolonged use, or only when taken together with the KombatQuik drug that someone else is developing.

For each side effect, roll a die. If the first die rolled in the side effects table above is a 2 or a 4, roll an additional die. If the first roll is a 3 or a 6, roll two additional dice. Again, each die is read separately. Apply the corresponding modifiers, ignoring duplicates. For example, for that 3-4-2 roll in the first example, the GM would roll three dice (one, plus two more for rolling a 3 on the initial side effect die roll). If they came up 3-3-5, the GM would apply a prevalence modifier; the second 3 is ignored and the 5 indicates no modifier.

- 1 Interaction
- 2 Prevalence
- 3 Duration
- 4 Habitual use
- 5-6 None

Interaction

If a side effect has an interaction modifier, the effect only manifests when the drug is taken within a day of another drug or chemical. The GM will have to select the drug with which it interacts as appropriate to the campaign, but 1d6 can be used to determine how common that drug is:

- 1-**Very common:** Inexpensive, easily obtained, and frequently used chemicals such as aspirin, caffeine, alcohol.
- 3
- 4-**Common:** Somewhat more expensive but still fairly frequently used drugs, such as antidepressants, penicillin,
- 5 prescription pain killers, birth control medication, advantage or attribute-granting drugs costing \$500 or less
- 6 **Rare:** Most drugs to treat specific conditions (for example, glaucoma or cancer), advantage or attribute-granting drugs costing \$500 and up

But I'm Allergic to Bat's Wings!

When it comes to inventing alchemical elixirs, the GM may be excused for bypassing the side effects table and coming up with picturesque effects appropriate to the potion's effect. For example, an animal control potion might cause the user to grow whiskers and a cold, wet nose, while a potion protecting the user from fire might cause him to grow icicles hanging from his nose, ears, and chin.

Prevalence

Many side effects happen to some people but not to others. Roll two dice to see how common the side effect is.

Roll	Prevalence (approximate)	Prevalence roll
1-2	1-2 1 in 2	11
1-2	3-4 1 in 4	13
1-2	5-6 1 in 10	15
3-4	1-2 1 in 20	16
3-4	3-4 1 in 50	17
3-4	5-6 1 in 100	17/11
5-6	1-2 1 in 200	18
5-6	3-4 1 in 1000	18/14
5-6	5-6 1 in 10,000	18/17

The first time a character takes a drug where the side effect has a prevalence modifier, the user should attempt to roll under the number indicated in the prevalence roll column. If there are two numbers, roll against the second one if the first roll fails. If the character fails the roll, the side effect will manifest every time he takes the drug. (Note that HT scores don't enter into it. If you have a reaction to a drug, it's more likely a consequence of your body chemistry than your overall health.)

Duration

Typically, a side effect last as long as the drug itself (+/- 10%, at the GM's discretion). However, it may be a short-term effect, or it may persist even longer. Roll 3d6.

3-5	One quarter as long
6-9	Half as long
10-11	2× duration
12-13	3× duration
14-15	4× duration
16	8× duration
17	10× duration
18	Permanent

Habitual use

Some side effects only manifest after prolonged use. Roll 3d6-3 to obtain a modifier. Every time the drug is taken, roll against HT + the modifier total cumulative number of doses taken in the past (drug's duration * 100). Once the user fails the HT roll, he will suffer the side effect with every dose of the drug unless he stops taking it for the drug's duration * 100.

Other Considerations

One possible objection to applying the invention rules to drug development is that the development times involved are orders of magnitude too short. Development cycles for new drugs is measured in years and decades, not days and weeks. Certainly, the state of the art at TL9 may be far, far beyond what it is now, but the GM may still feel uncomfortable letting PCs come up with infallible cancer cures and super-strength pills in their kitchens. Therefore, some guidelines might be applied:

Remember that the table associating finished product costs on p. B473 is a *suggestion*, not a comprehensive rule. Any new drug might be regarded as at least a Complex invention, regardless of the finished cost, and require a minimum skill level of 18+.

Required times could easily be increased by very large amounts. For example, days might be treated as weeks, weeks as months, and months as years, with appropriate adjustments to related costs.

The chemical operations that ultra-tech drugs try to perform may be so complex that someone, somewhere will have an adverse side effect. The GM may rule that, even on a critical success on the design roll, 1d3 minor bugs exist, and at least one major bug on any non-critical success.

The less common the side effect, the harder it will be to find. If a testing attempt indicates that a bug has been found, pick the undiscovered side effect with the fewest modifiers. In order to actually discover the bug, make the following rolls:

- **Interaction:** Roll a 10 or less on 3d6 for an interaction with a Very Common drug, an 8 or less for a Common drug, or a 6 or less for a Rare drug.
- **Prevalence:** Make the same rolls as necessary to fall subject to the effect, but at +1 to each roll for each round of testing the drug has been through previously to a maximum of +5. For example, if a side effect effects 1 in 200 people, it would be detected on an 18 on the first round of testing, 17 or 18 on the second round, 16+ on the third, and so on until it would be detected on a 13+ on the sixth and each subsequent round of testing.
- **Habitual Use:** Roll greater than the habitual use modifier.

If a side effect has multiple modifiers, *all* of the rolls must be made. Consequently, it would take a lot of testing to turn up a side effect afflicting 2% of users after extended use in conjunction with aspirin or heavy drinking. Indeed, a drug could be tested for a very, very long time without finding all of the potential side effects. And even if they were found, going back to the drawing board to fix all of a drug's side effects may be a very expensive and time-consuming proposition.

But that doesn't have to be a show-stopper for characters who want to become pharmaceutical manufacturers. As already observed, any number of drugs widely available today have well-known side effects: antihistamines make you drowsy, allergies to aspirin and penicillin are not uncommon, and so on. They're not perfect, but they do their jobs well enough that they're used anyway. Any major bug is likely to keep a drug off the open market in a well-controlled society, but it might still circulate on the black market, or at least be sold with multiple warning labels about the potential dangers and be used only in extremity. Even significant minor bugs might keep a drug from being commercially viable. In a more chaotic or ruthlessly competitive setting, though, such as most cyberpunk campaigns, it'd be quite easy for powerful drugs with dangerous side effects to reach the open market.

This You Must Never Do, My Child

Superstition in Unknown Armies

by Loki Carbis

Superstition is a part of human culture that appears impossible to eradicate. No matter how far we move on from the silly or strange beliefs of our ancestors, there's always a grandmother out there spreading the virus of superstition to the next generation. Somehow, that collection of sayings, actions and beliefs always gets passed along. But at least we can take some comfort: superstitions may once have had some significance, but they don't anymore.

Or do they? After all, the Dipsomancy spell 'God Looks Out For Drunks' and the Urbanomancy spell 'Break Your Mother's Back,' to name but two, are both named for superstitions, and presumably for good reason.

The reason is this: superstition is not powerless. Not entirely. In fact, superstitions are like extremely minor formula rituals known to everyone. Not many people believe in them consciously, but nearly everyone has a few locked away in the depths of their mind, usually some minor and pointless taboo they picked up in childhood and haven't thought about since. It doesn't give them much juice -- there's no recorded instance of a superstition generating an effect greater than that of a single minor charge, and most are far smaller in power -- but that's still more than a lot of people have. Enough to make it worth your while, if you've nothing else you can use, or you're really desperate. Or both.

It works like this:

1. A person who is superstitious violates a superstition in some way -- they break a mirror, step on a crack, whatever. Alternately, a complete skeptic can do it, if they are surrounded by at least five people who do believe in that superstition.
2. The Adept notices this, and within no more than a few minutes, performs a small ritual featuring some physical connection to the event -- a piece of the broken mirror, or at the site of the particular crack that was stepped on. The normal rules for rituals apply -- a Soul check at -30 is necessary to cast the ritual successfully.
3. The Adept must not have broken the taboo of that particular superstition for at least a week beforehand -- the longer the better, although one would have to go a year or more without breaking taboo to gain any bonus to the ritual. Likewise, if they break taboo within an hour of the casting, the effects hit them instead.
4. The effect is a more limited version of whatever the superstition specifies -- a broken mirror might be good for seven hours bad luck rather than seven years, stepping on a crack might give your mother a sore back that night. GMs should be very careful to ensure that effects are correspondingly small when superstition is used.

There is a way to achieve greater than normal potency in a superstition ritual, which is to harness the Unnatural. Unnatural energies cause various side effects as they radiate out from Adepts, artifacts, and Unnatural beings, but a skilled superstition adept can channel this energy into their magick, increasing its power. There are only three small problems to doing this: it's dangerously unstable, increasing the risk of backfires; it tends to tick off the Adept or Unnatural Being in question; and finally, it's really dangerously unstable. The trade off is that the roll to cast the spell is easier -- a straight Soul check -- but any failure of the roll generates a sour cherry.

Even used normally, there are several notable drawbacks to using superstition, including:

- You might as well just tattoo "I'm a clueless wannabe" on your face if you plan to use it in front of (let alone against) a real Adept.
- The power restrictions mentioned above.
- Anyone can use it. Literally anyone. And they need not even know that they're doing it. A school kid walking behind a bully in his class could see the bully step on a crack, and wish aloud that it does actually break the bully's mother's back as he crosses the same crack, and that would be enough to at least give her a back ache (assuming all other preconditions were met, of course). This makes it both hard to keep secret and decidedly

unfashionable among the occult underground.

- You pretty much have to be there to see the superstition's taboo violated, which means that your target is likely to see you trying your ritual.
- You can't actually use it to do anything that would violate the laws of physics -- anything you can do with it is going to look like a coincidence to a skeptical observer. At most.

On the other hand, it's a good low access sort of power for harassing people, it doesn't use up charges, it takes virtually zero preparation or knowledge on the part of caster, and you can use it regardless of whether or not you know any other magick, even if you're a member of a school. Unsurprisingly, a lot of the clueless folks who form the occult mainstream tend to be among the most frequent users of superstition. Some of them are even doing it knowingly.

Superstitions for Bad Luck

- Having a black cat or a snake cross one's path. (Snakes in particular symbolize treachery, cats general ill fortune)
- Breaking a mirror (this is supposed to be good for seven years bad luck)
- Walking under a ladder
- Seeing an owl during daylight hours
- Spilling salt
- Killing a sparrow accidentally (to do so on purpose is doubly bad luck)
- The number 13 in almost any context
- Friday is the unluckiest day of the week -- it is especially bad to start a journey on a Friday
- Logically following from the last two items, Friday the Thirteenth of any month is a bad day
- Working on a Saturday -- particularly if it's the first day of a new job -- is bad luck, usually leading to losing the job in short order
- Eat an apple on Christmas Eve for good health the next year
- The superstition of knocking on wood for good luck originates from pagan beliefs in regards to trees
- A bat flying into a house is a sign of death. A bird flying into the house is a sign of important news -- which is usually death if it cannot fly out again.
- Crows are birds of ill-omen
- Placing a hat on a bed
- Opening an umbrella indoors
- If a bird flies towards you, bad fortune is imminent
- Entering your new residence for the first time via the back door
- Blinds falling down without anyone touching them
- Buying a broom in the month of May
- Stepping on a crack on the sidewalk breaks your mother's back

Superstitions for Good Luck

- A found horseshoe, nailed to a door or wall with the open end upwards will generate good luck
- Carrying either a four leafed clover (that you have found yourself) or a rabbit's foot will bring good luck, as will a peacock's feather, or a penny placed in one's shoe
- When two people pull apart the wishbone of a turkey or chicken, whoever winds up with the longer end will have a wish granted.
- There are many superstitions which must be followed at weddings to avoid bad luck such as the wearing of 'something old, something new, something borrowed, something blue' and the carrying of the bride over the threshold (to prevent her from tripping, which brings bad luck).
- The numbers 7 and 12 are often thought to be lucky
- Monday is sometimes considered a lucky day, especially for starting new things.
- Finding a spider on one's person (or in one's clothes) is good luck, usually to do with money.

Ambivalent Superstitions

- If the flame of a candle flickers and then turns blue, there's a spirit in the room
- A chill up your spine means that someone is walking on your future grave
- A person born on Halloween will have the gift of communicating with the dead
- If your palm itches, you will soon receive money; but if you scratch the itch, the money will never come

Mundane Karma

That being said, there is one form of superstition which looks like it might possibly make the jump to being a full school in the not too distant future. At the current time, it's still possible to use it in tandem with those schools whose taboos align reasonably well with it. This proto-school is known to those who use it as Mundane Karma.

Mundane Karma takes the general idea of being nice to other people out of enlightened self-interest, and raises it to the Nth degree. A practitioner of Mundane Karma (the proto-school is so new and so little-known that its adepts have no widely known nickname yet in the occult underground -- although some refer to themselves as Karma Mechanics) specifically sets out to do good deeds for a not-very deferred personal gain.

A Minor Charge can be generated by simply doing a helpful thing at a time when it makes no particular difference to you. A Significant charge requires the adept to be helpful when it's actually to their own disadvantage to do so. The actual deeds are pretty minor -- examples include:

- Letting someone ahead of you in a queue.
- Not bothering to pick up dropped loose change (and thus ensuring that someone else could)
- Holding a door open for someone.

It takes five individual occasions of performing whichever act to generate a charge; walking along the street and slowly dribbling coinage from your hand generates one fifth of a charge, no matter how many individual coins you drop -- it has to be a separate instance. Careful records should be kept: each individual act is recorded separately, much like for Personomancers. It's possible to have excellent door opening karma and crappy queue karma, or vice versa. Minor and significant charges are recorded separately, and do not stack.

If the player prefers to avoid that much bookkeeping, they can simply stipulate how many charges they are likely to generate over a given period of time -- a day or a week are the best choices for this. Subject to modification by the GM, they can then assume that they have that many charges to spend over the same period of time.

Mundane Karma charges can only be spent when the opportunity arises. You can't spend a charge to get someone to open a door if you don't plan to use it as soon as they do, and so on. A Minor Charge will cause, basically, the effect generated to gain that charge -- someone will do something to help you if it doesn't inconvenience them to do so. A Significant charge will cause them to do so when it does inconvenience them. Alternately, a Significant charge can be used to cause a helpful act from someone who will not be inconvenienced -- the usual Minor charge result, but in addition, it will cause it to occur in such a way as to disadvantage a person you nominate (who can not the person whose action helps you) to be inconvenienced -- a door might be held open just long enough for you to get through, then let go of in time for it to swing into the face of someone pursuing you.

Mundane Karma has no formula spells, and no Blast. It's possible that these may yet be invented by enterprising Mundane Karma adepts, but none exist at the following time. There is also, at this point in the school's development, no such thing as a Major effect or charge in the school. Several examples have been theorized, but no one has yet succeeded in making any of them work. In some cases, this is due to the difficulty of applying this concept at such a scale, but in others, it's because no one wants to try and fail. The most popular theory currently proposes that an act of kindness that costs the life of the Mundane Karma adept who performs it would generate a Major charge, although how exactly the adept is supposed to spend the charge is a question with no satisfactory answer.

Pyramid Review

The Lostfinder's Guide to Mire End (for a|state)

Published by [Contested Ground Studios](#)

Written by Malcolm Craig with Colin Chapman, Ed Handley, & John Wilson

Illustrated by Paul Bourne

Cartography by Gregor Hutton

32-page b&w softcover; \$10

The Lostfinder's Guide to Mire End is the first supplement for *a|state*, the Scottish RPG of Dickensian Science Fiction that encrusts the Steampunk genre in a thick and grim griminess. It focuses upon the one neighborhood of The City, Mire End, a destitute little burgh bordering the richer, better governed Three Canals Metropolitan Area. Within its few pages can be found an overview of the area, as well as descriptions of the various locations, persons, and organizations of note, all supported by a plethora of adventure hooks.

The supplement is a slim affair, just 32 pages long; although it follows the same layout as the core rulebook, this book is much better looking. This is because the ratio of art to text is much higher, and the artwork itself, again done on computer by Paul Bourne, is also better. It does not have the stretched look found in the rulebook, nor is it as clean, having a grimmer quality very befitting Mire End's dinginess. Best of all though, is the single page of cartography, which while in black and white, appearing to have been done in ink and water colors. It is nicely detailed and one more element that adds to the book's atmosphere.

It is described as being a "Lostfinder's Guide," a Lostfinder being a an individual who undertakes small jobs for the community, finding lost people and dogs being common tasks. In the case of Mire End, the Lostfinder is Janus Kripitsch, who although not described or detailed here, is quoted on several occasions. Mire End is itself the default setting for the game, the publisher supporting it with several issues of the Mire End Tribute via their website. Indeed, one of the area's locations, Shale Hall, is expanded upon in several of these downloads.

Mire End is a grotty, sodden area, the inhabitants forced to fend for themselves in obtaining both clean water and a regular supply of electricity. It is dominated criminally by the Hohler Gang, which retains it position by squashing any potential rival. Employment is generally found elsewhere, though there is fierce competition for positions at the Mire End Cog Works, the only source of fair, local employment. The history of Mire End is dominated by several events over the last 150 years. They begin with the "Shake," a localized tremor that shattered the local sewer system and left its streets ankle deep in fetid water, followed by the neighborhood's rejected petition to join the Three Canals Metropolitan Area. Its economic fortunes collapsed with the closure of the railway line by The Ancient And Honourable Guild Of Fulgurators, while only three years ago hundreds died during the Arclight attack on the faked Hirplakker staging post during the Hundred Block War.

Despite the area's rundown nature, some of its citizens and organizations work to improve their lot. Disgraced Father Guy Herbert runs the Third Church Home for Unwanted Children, teaching its charges a useful trade; the *Mire End Tribune* runs literacy classes for all; and the Forest Green Regulars is a vigilante group that patrols its few blocks to keep it safe from the local gangs. Indeed, the continued publication of the publicly minded and crusading *Mire End*

Tribune has become a beloved institution to many, though others would prefer its presses smashed and the newspaper shut down.

Each location is presented in the same format that includes a simple description, and an associated NPC, adventure nugget, and organization. The NPCs and organizations are presented in similar fashion, with physical descriptions given for the former, and details of the status, headquarters, membership, and area of operation for the latter. There is some cross-referencing between these base details, helping to tie the contents together and increase its utility.

Besides the aforementioned *Mire End Tribune* and its staff, other interesting locations include Detseted's Pawn Shop where its owner monitors the extensive wares via a system of mirrors and prisms; the Old Bleach Factory, destroyed and flooded by the Shake, its toxic ruins still picked over by hopeful treasure hunters; and Redberry Park, part noxious rubbish dump, part red light district. Notable NPCs include the well-dressed and manicured Tobias Glym, the area's leading black marketeer; Cornelia Hessel, reclusive builder of dingins (*a|state's* equivalent of the computer) par excellence; and Carnelian Yet, the gifted political activist who will work for most causes. Only a few organizations are described, with the worst being Wastrel's Lot, the preteen militant wing of the Hohler gang, who gave them the huge cartridge pistols that they use to carry out the bloodiest of assignments.

Before finishing up with a list of NPCs typical to the area (the only ones in the book to be given any statistics), the GM receives seven adventure nuggets. Each is roughly half a page long, and comes with at least three explanations. They include the return of "Cutting Tom," the serial killer who was active a century before; someone manufacturing cogs and passing them off as coming from the Mire End Cog Works in "Engines of Despair"; and encounters with "The Winged Man," a roof-dwelling builder of hang gliders. Not all of the adventures are easy to use, in the main because the accompanying explanations are weak, but there is nothing to prevent a GM from creating his own.

The wait for *The Lostfinder's Guide to Mire End* has been several months, but it has been worth it. The supplement provides *a|state* with much needed support that narrows the broad sweep of the rulebook to focus on one area. That it is tied into material already available on the publisher's website only increases the book's usefulness. *The Lostfinder's Guide to Mire End* is well-done, providing a suitably dank -- though not dour -- starting point for a solid campaign.

Are You Phrazy?

Published by [Gotta Laff Games](#)

Created by Dave Rockenbaugh

200 color cards, rules for four to eight players; \$19.95

Any game is going to see a lot of table talk, but *Are You Phrazy?* from Gotta Laff Games has the chatter built right in. The object of the game is to have the lowest score when the last hand is played.

Cards come in red, yellow, and green. Green cards start a conversation, the yellow cards continue the conversation, and the red ones end it. Each card bears a phrase, born of pop culture, thematically suggestive of their place in the conversation. For example, the green cards that get things rolling are things like "Wassup?" and "How you doin'?" (The cards might be forgiven for slight duplications, like "What's up, Doc?") Yellow cards are a bit more generic, with sayings like "I've fallen and I can't get up" or "Isn't that special?" The red conversation stoppers include appropriate bits like "Talk to the Hand" and "Hasta la vista, baby!"

Each player starts with a hand of cards, and the rest are left as a draw pile. The dealer flips the top card over, and play begins. If this initial card is green, chatter is underway and you can play yellow or red cards on it. If it's not green, however, someone needs to play a conversation starter. If it's your turn and you haven't a green card to lay down, you must draw from the deck. If that card is green, you can play it; otherwise play passes to the next person until someone gets things started.

Once underway, conversations start and stop. Players take turns putting cards down. If a player ends a conversation with a red card, it takes a green card to get it going again; the only other card you can play is another red card that matches the catchphrase -- you could keep stacking up "Have a nice day" cards one atop the other if you have them, and this is part of the twist. Other people can "butt in" on the conversation.

If you have a card with a phrase that matches whatever was last played, you can butt in. This allows you to get cards out of your hand when it isn't your turn. Anyone can match the phrase, and it's not unusual for multiple people to have the same phrase in their hand (and just one person might have multiple copies in their hand). If you can unload the match before the next person takes their regular turn, you'll be that much closer to emptying your hand. Even if it's your turn, you can match the previous player's phrase card before playing an unmatched card.

Finally, you have to say every card as you play it. If you don't utter "I'd like to buy a vowel" when you pull that card out (or more likely throw it out), you have to take that card back and forfeit your turn. When someone empties their hand, points are tallied for that round. You get points for the yellow cards, and even more for the reds and greens, so while a green card is useful and easy to play, you can't afford to keep it all game. Obviously whoever wins a hand has no cards and scores zero, and whoever has the lowest score when someone reaches 100 points wins the whole contest.

Physically the components are a bit of a disappointment. The cards feel mushy, like they're one grade of stock too low, but ironically they feel like iron when it comes time to shuffle them. To add some insult to injury, you have to shuffle them a lot (strange, considering you don't really draw a great many cards during a round), and butting in means you have to shuffle pretty thoroughly lest all those duplicate cards you stacked together don't get separated. Finally, the cards use a thick, blocky style that makes reading the phrases harder -- not as much of a problem before the round is going when you can read your hand at your leisure, but speed is of the essence when grabbing a card from your hand in response; when playing a newly drawn card; and when seeing what others are laying down.

As for play of the game, it all runs hot and cold. It's a pretty straightforward idea, but even after a few rounds you may be struggling to recall which cards can be played when. Replay value seems low, at least among those who want a game where they can employ clever new strategies or sharpen old ones, but that simplicity may appeal to groups with mixed age and skill levels. The social element can't be ignored, either, and having everyone shouting out their phrases as they try to get cards out of their hands is going to keep players laughing loud and hard. (Whattya know? You *do* have to laugh.) Then again, eight people throwing cards at once may mean a little too much chaos.

Are You Phrazy? is a good first release for Gotta Laff Games (other versions are promised, including TV and movies), and while it doesn't show much sophistication it does know the value of putting the interaction and fun ahead of a heavy set of rules.

A Game of Thrones Board Game

Developed by Christian T. Petersen

Board Game Boxed Set; \$49.95

While fans of George R.R. Martin wait for the next book in the Song of Ice and Fire series, Fantasy Flight Games provides us with an alternate way to immerse ourselves in the rich world of Westeros through ***The Game of Thrones*** board game. In the game, players assume control of one of the major houses (Lannister, Stark, Baratheon, Tyrell, Greyjoy) as they struggle for military and political dominance over the shattered kingdom. And while knowledge of the story isn't required to play and have fun, it helps the in-game banter.

The rules are very simple and streamlined for a game of this scope and complexity. They can be explained in about 15 minutes to anyone familiar with any other strategy games. Meanwhile, grasping the multitude of factors that go into winning may take many games. The game not only requires a knack for strategic thinking, but also relies significantly on a player's bargaining and bluffing skills. This, coupled with the relatively small size of the game board (in terms of land and sea spaces), forces a lot of interaction between players. The game is very skill-intensive as the only random components are the Events.

A game turn consists of three phases: Westeros, Planning, and Action. During the Westeros Phase, random events are determined by revealing the top card of each of three event decks. They may have an impact on the military units (muster and supply events), the political situation and orders available in a given turn (by barring orders like Defense). Of special note is the event "Winter is coming," which causes the whole deck to be reshuffled, so there is never a guarantee that a given event will not happen again.

Upon resolution of all three random events, the Planning Phase starts. Orders are assigned to each area (not unit) containing one or more army units. Orders are assigned in secret by placing the upside-down order chits on the board. Each house is given a limited amount of order chits, which makes controlling a spread out force very complicated. Players assign orders simultaneously and are not allowed to show the played chits. This gives ample opportunity to perform surprise attacks, backstab allies or bluff defenses.

When everyone has assigned orders, all the chits are revealed and the Action Phase progresses. Resolution is performed in round-robin order with each player resolving one action or passing, if they have no more orders of the given type.

The first of the resolved actions is pillage. Units ordered to pillage harass an adjacent area by removing another pillage, support or consolidate power order from that area. Once all the pillage orders have been resolved, units carry out movement and finally consolidate power orders.

Whenever a unit enters an area occupied by an enemy force, battle ensues. The strength of the armies depends on the number and type of units. Additionally any unit adjacent to the battle that has been assigned the support order may assist one of the sides. This is the point, when your allies have to show their true colors. Finally, each player reveals a card from his house deck, which consists of major characters from the books. An army leader chosen this way adds his strength to the combat result and may invoke a special ability, modifying the battle results or impacting the game. Once used the card is discarded, but when a player runs out of these, he returns *all* of them to his hand. This creates interesting game play situations, where holding back in the fighting (to save cards) or picking small battles, just to go through your hand, are valid strategies.

The losing side's forces are usually just routed with little to none casualties. Actually destroying units requires more

complex maneuvers like surrounding them, following up on the attack or using some of the characters special abilities.

Military power is reliant on capturing and holding cities and fortresses (for marshalling points) and areas that provide supplies.

The other major aspect of the game is the political maneuvering. Raw political power is represented by Power Tokens, which can be gained by holding certain areas of the board and by issuing the Consolidate Power orders to the house troops. Power tokens are spent to maintain control over territory and to counter the Wildlings attack event. However, their most important use is during the "Clash of Kings" event.

This event changes the political landscape of Westeros. Players bid for control over three political areas of influence. For each of the three biddings, players select a number of their power tokens and reveal them simultaneously. The size of your bid determines the order of influence in each category:

- The Iron Throne governs the order the players take their turns, additionally the highest bidder holds the Iron Throne and resolves ties in the other biddings
- The Fiefdoms govern the winner of ties in battle, additionally the highest bidder holds the Valaryan Steel Blade, allowing him to add +1 to one combat result per turn
- The King's Court governs the number of bonus order chits a house is allowed to play per turn, additionally the highest bidder holds the Messenger Raven, which allows him to change one order after all the chits have been revealed.

The game ends after 10 turns are played through. This is not a lot, and forces players to make quick plays and maximize any advantage they can get. The winner is determined by the number of cities and forts controlled by each player, with ties being resolved by the number of supply resources and power tokens controlled. The game can also end early, if one of the houses captures the required number of cities and forts.

The game components are high quality. The board is large with clearly marked spaces and icons for the different resources. It also holds spaces for tracking game situation, but lacks a space for the Event decks. Wooden army unit tokens (Footmen, Knights and Ships) are painted in five distinct colors, a simple but elegant solution. The different cards are full colored with nice illustrations as are the different game chits. A tray is provided to hold all these pieces, and does a fairly good job at it.

A Game of Thrones is easily recommend to any group of players, especially those who relish the prevalent and interesting opportunity-cost decisions. However, players hoping to get the most out of it have to be able to be ruthless and cutthroat, which may turn off more tame gamers. A definite plus is that the game plays out in a reasonable time period (the initial review game took less than three hours). Finally, the game manages to capture the feel of the books, which is probably the number one concern with licensed products.

--Adam Cetnerowski

Lies, Dice, and Character Sheets

When I penned my column [last week](#), I had no idea the level of commentary it would spark over on the [message boards](#). Really, after a half-decade of cranking out my random thoughts, it's nice to know that I can still spark some of the ol' outrage . . . although I *do* question Gaston's decision to whip up his village into a torch-burning frenzy and storm my apartment. Really, it took a lot of effort on the part of my sentient bookshelves, couch, and cutlery to ward him off, as I was still deeply distraught over the death of my favorite candlestick.

Anyway, for those of you who missed it and don't feel like clicking the "last week" link, I basically confessed to enjoying surprise plots, both as a player and GM. I offered up a couple of anecdotes, one about a deal with a demon and another about a sack full of magic swords.

I'll summarize some of the comments this generated, and point out some other random thoughts as they spring to mind.

"Your suggestion smacks of adversarial gamemastering." For those of you unfamiliar, adversarial gamemastering is, as the name implies, a style of RPG where players treat the GM as the "enemy." Instead of viewing the challenges of the GM as something to be thwarted and defeated, such players skip the middleman and go right for the GM himself. This view probably comes from an offshoot of other types of games (board, card, etc.) as an extension of the idea that RPGs can be "won."

The charge of adversarial gamemastering was one of the first comments, and I found myself somewhat shocked by it. It took a while to realize why I was surprised, but I eventually concluded that it was because all my favorite campaigns (and the one from whence my demon tale came) were the *antithesis* of adversarial. I confess to being heavily in the "storytelling" camp of gaming, both as a player and a GM, and I have no problem bending the rules (or asking for the rules to be bent) if it makes for a good story.

While keeping secrets from the GM and/or other players could certainly be seen as adversarial, it could also be seen as a means of telling an interesting story – one which is entertaining for the entire group. (Of course, I also confess that my favorite movies are those which have interesting twists and surprises, and I consider them to be a fine way to spice up an otherwise mundane story.)

"The GM represents the universe, and you can't keep secrets from the universe." It's an interesting quandary, and one with profound metaphysical ramifications (not to mention first commandment repercussions).

I realize part of this might come from the fact that I didn't offer a crucial piece of information with my advice last week – one which I probably omitted because I considered it to be self-evident. Namely: As far as I'm concerned, if players want to spring secrets on the GM (which they're welcome to do in my games), they can never withhold *what* they are doing from the GM . . . only *why*.

Let's take two examples, both set in a typical high-fantasy world. In the first, the GM springs an adventure on the PCs where they need to come up with a bunch of money; the crux of the adventure (as the GM designed it) is to figure out a means of getting that money. One of the players says, "That's okay; for the past six in-game years I've been putting aside 20% of my income and investing it in the high-yield trade routes! Ha-HA! We're rich!" If this is the first that the GM has heard about this extra money, then that's not cool. It's totally not cool . . . if for no other reason than because the gamemaster had no chance to respond to the existence of that money previously with other story possibilities. (See? It's all about the story.) Besides that, the potential for abuse with new "unrevealed" information is staggering.

But let's take the example of this same group, where one of the members is a quiet cleric with a vow of poverty. As part of his meditations, he saves the usable seeds from his uncooked food. After clearing out one typical fantasy dungeon, the cleric's player asks the GM if this area seemed to be owned or claimed by anyone. Establishing that it hadn't, the cleric proceeds to plant the seeds on the land around the dungeon. Every time the players adventure by the area of the old dungeon, the cleric adds his other seeds, tending the fledgling grove and, again, establishing that it seemed to be unclaimed. He continues this for years in-game, making a nice quiet character-establishing subplot and

building up a considerable grove. At this point, the GM springs the “PCs need a bunch of money” plot. Believing the goal for which they need the money to be a worthy one, the cleric player reveals that he plans to beseech his church superiors to allow him to claim the garden he's been tending as his property, offering as evidence that he is the only one who has “claimed” the land – by his continuous actions – for the past several years; he would either like to sell the land to the church or a nearby noble. The player confesses that he had intended this plot of land as a means of possibly amassing wealth that may be permitted by his faith.

This example is, in my mind, entirely justified. All aspects of the plan had been established well in advance, and continuously verified. Only the “why”s behind it were mysterious.

"The gamemaster has some responsibility to allow these secret plans to 'work' or otherwise come to fruition." I'm not sure where this idea came from; I think it's because there's some presumption that, if a plan has honestly taken months (or years) of game-play time, it should somehow be expected to work.

At least in the case of the demon, I was pretty sure I emphasized that I was pretty sure (as a player) that it *wouldn't* work. But to my character, who was of average intelligence at best, it was the best plan he could think of. (As an aside, it was a particular delight to “give in” to playing a person of average intelligence with overconfidence; his usual course of action was to listen to everyone else's plans, nod at appropriate times, and then say something like, “I think a frontal assault would be the best plan; I think we can easily prevail.” This same plan was offered with the same earnestness whether the enemy in question was a pack of brigands or France.)

Secret plans carry with them, by their definition, a greater risk of failure. Really, the only reward for doing so (assuming one is not behaving adversarially against the GM) is for the thrill of the surprise.

"Players need to let the GM know everything they're planning." At this, I disagree. And the biggest reason I disagree is because, on some level, there's no difference between a brilliant plan that the player has been formulating for years and one he just thought of on the spur of the moment. Certainly both examples from last week were the sort that could just “happen” with a bit of thought (“Say, Ted . . . now that we're raising an army, didn't you have a bunch of extra magic swords? Maybe we could use them . . .”).

Of course, this could also be a reaction to the way I GM; I have enough to keep track of, what with making up stats on the fly and rolling dice and going “Hmm” a lot. I don't want to have to keep track of a jillion player plots as well.

As I've said before, secret plots should only be used to enhance the game, not diminish it . . . and I readily admit that not all games (or GMs) enjoy having things sprung on them. But, as a counterexample, one of the long-running games I was in was a **Changeling** campaign, where one of the annual traditions is “pranksgiving,” where the mischievous Pooka play pranks on everyone (and each other). Some of the most fun adventures I can recall stemmed from the plotting and scheming – within game – to bring various pranks to fruition. And those surprises – for GM and player alike – were usually a delight.

Of course, as ever, your millage may vary; talk it over with your gaming group; and, as always, have fun.

Dork Tower!

Dork Tower!

Chaos and Ritual

A Literary Magic System for *GURPS Fourth Edition*

by Elizabeth McCoy

There are many different kinds of magical systems in fiction. Of them, a goodly number break down into ritualized magic -- requiring diagrams etched into the floor, pentagram jewelry, herbs, potions, and other such paraphernalia -- and innate magic, which merely requires willpower, focus, and inborn magical talent.

Here, therefore, is one treatment that combines these options, as well as the regular *GURPS* system. (While *GURPS* is used here, any system with a similar "memorized list of spells" could probably be used, modifying as needed.) It also adds the useful cinematic concept of "going beyond your limitations -- then collapsing in a heap afterward."

Kinds of Magic

In the "Chaos and Ritual" system, there are three kinds of magic:

- *Rote Magic*, which allows the performance of rituals, without necessarily learning or memorizing any specific spell. (*Ritual* magic has a different meaning in *GURPS*, involving the summoning of spirits. It can be incorporated into rote magic if it fits the GM's image of how magic should work.)
- *Learned Magic*, which functions like regular *GURPS* magic.
- *Chaos Magic*, also known as *innate magic*, which draws on great power resources with little fine control, and a lot of intuition.

All three types have a minimum requirement of Magery 0, and the default assumption is that Magery is inborn -- you either have it, or you don't. While some magical experiments, accidents, or other extraordinary events might be able to grant Magery, it cannot be simply *learned*. (This is the easiest assumption to change.)

All the limitations from p. B67 are applicable, as is Magic Susceptibility (p. B143). Further, beginning characters may purchase "options" on further levels of Magery! Whatever level they stop at is considered to be that character's maximum Magery (barring, again, extraordinary events as above). If the spells in the world are frequently potent and terrifying, there is no hard limit on what this "ceiling" may be, and an "option" should be 1 point per level of potential Magery. This will *probably* self-select with a maximum of about 20, for 100-point starting character; make options 2 points in a 125-150 starting point campaign. If the cap is between 3-10, 3-5 points per potential level is better.

At the GM's option, potential Magery may add to Sense rolls to detect magical items or prerequisites to learn a spell, but it never adds to magical skills or affects the time required to learn magical skills. To turn potential Magery into an actual level of Magery, the wizard must finish paying for each level.

All mages may also purchase a "mana pool" to power their spells -- Extra Fatigue Points (p. B16), with the Limitation for magic only (-20%, based on the Focused limitation, p. B100). The higher the level of magery, the higher this should be! Characters with potential

Truth in Spellcasting

Some worlds have "honorable" villains who will follow the letter of their promises -- if not the spirit -- and can therefore be dealt with. These may be djinn, demons, or merely tricky mages. One way to explain this is to give *Magery* a Taboo Trait against lying!

The mage (or creature) may not have Truthfulness -- he's able to remain silent, or weasel logic like celtic knotwork -- but the principles of his magic state that when he's casting a spell, he's telling the universe, "This is what *is*." If he tells casual *lies*, the universe will stop believing him . . .

For every lie such a being tells, his skill with supernatural powers is penalized by 1. He must either make his lie into truth, somehow, or behave as if he had *real* Truthfulness for a period of time to earn back the universe's faith in his word -- this will be at least months, and possibly years.

Magery should have the ability to buy Extra Fatigue Points as part of the package, at least to the level of their potential Magery. For truly earth-shattering magics, their future extra fatigue may be limited by a *multiple* of their potential Magery, or have no limits at all!

Example: *Marie-Susan is starting out as a dimension-hopping character in a home-brew game. She purchases Magery 0 (as her home dimension has only secret magic) and a whopping 20 points of potential Magery, for a total of 25 points. (She also adds 5 Extra Fatigue Points, for another 15 points.) When she falls through the magical wormhole, she quickly uses nine of her earned points to upgrade to Magery 1 -- with 19 levels of potential Magery to go.*

Rote Magic

To use rote magic, a wizard need only have the right books and two skills: Thaumatology and Rites.

Rites is a Very Hard skill, defaulting to -7, which may be used with DX or IQ as appropriate. It is, essentially, the art of following magical instructions. Used with DX, it involves drawing perfect pentagrams, copying arcane scripts, and making correct gestures. High Manual Dexterity may add to this, and the default might be applied to Artist in some situations. Used with IQ, it allows temporary memorization of spell words, correct pronunciation, and other short-term mental requirements. High Manual Dexterity does *not* help with the IQ aspects, though Language Talent and Eidetic Memory might, and Performance skill could be used for the default. Some rituals might require musical instruments, and be bardic songs -- or even require conducting a full orchestra!

Unlike Thaumatology, Rites may be studied by anyone who has a good excuse to practice the necessary skills; would-be occultists, overly-obsessed gamers, or "deluded" new-age witches are all likely to pick up a little of this skill.

Thaumatology (p. B225) allows the rote-mage to tell a true magical tome from a fake, research new rituals or modifications to existing ones, and fill in the gaps in poorly-written spells. It is not strictly necessary for a beginning student -- if there are grimoires that are *meant* to teach the novice.

Casting a spell from a book typically requires two *checks* for the Rites skill, one for the physical components, and one for the vocal ones. Roll *once* for the skill, and then apply it to both IQ and DX. Use the lowest margin of success, if applicable.

Example: *Marie-Susan finds herself in the library of the Master Mage. Since she was going through a phase of "white witchery" anyway, she gleefully makes off with the first book she can lay hands on. With IQ 13, DX 10, and 1 point in Rites, she will be checking any rolls against a 10 and a 7, respectively. Hopefully she won't choose to practice dangerous spells that require perfect pentagrams . . .*

Spell prerequisites are not needed to perform most rote-based spells -- the instructions were written by someone who *knew* the prerequisites -- but Magery prerequisites are still in effect. If a spell requires Magery 2, and you have only Magery 0 . . . Oh, well. A kind GM may allow the attempt, but at a penalty to Rites skill equal to the amount of Magery lacked.

A rote-cast spell takes *at least* ten times as long to prepare and cast as a learned (see below) version, or longer, at the GM's option.

Spells may be learned from books, of course. Some rituals are long and complex and may never be attempted outside of the warded pentagrams, but others can start out being performed by rote with elaborate trappings and -- if points are spent on the spell skill itself -- become mental constructs, with all the ritual contained in the mage's mind and only a few words required to activate it.

Learned Magic

When a spell has been learned, either after rote repetition (above) or Wild Talent inspiration (below), it is treated in the

default manner of **GURPS** spells, as per **GURPS Magic** or chapter five of the Basic Set. This includes the need for prerequisites!

Example: *The spunky and precocious Marie-Susan, having stolen the Master Mage's book of Gate spells, has been dimension-hopping with glee -- and some close calls -- for a while now. Putting a point into the Plane Shift spell (p. B248), she can now dispense with much of the paraphernalia that the ritual casting required. (The GM, perhaps unwisely, has ruled that prerequisites are not needed for Plane Shift.) Watch out, multiverse.*

Chaos Magic

A chaos mage has the Wild Talent advantage (pp. B99-100), with the Focused limitation (magic only) and Retention enhancement. Many also have Emergencies Only. Any successful use of this ability may also justify upgrading a level of potential Magery to actual Magery, if the points are available!

If it pleases the GM, a chaos mage may receive a small bonus to the Wild Talent roll if someone is using magic *on* him at the time -- especially if a useful Wild Talent manifestation would be the same kind of magic, or a very specific counter.

Again at the GM's option, two basic "chaos skills" may be available, upon which other, more specialized skills, can be built: Shielding and Chaos Jet. These have no prerequisites save the chaos mage Wild Talent package, but tend to cost a lot. (Chaos mages should have lots of Extra Fatigue Points.)

Chaos Jet

Essentially, pick a missile spell attack, such as Fireball (p. B247) or Lightning (p. B244), and apply the +0% Jet enhancement (p. B106) to it. It costs the maximum amount to cast, and the same to maintain, but does not need to "build up" in the caster's hand.

GMs with **GURPS Magic** can select an appropriate Jet spell, instead. A chaos jet is *not* limited to 3d of damage or three yards, but each additional yard of range *or* each additional die of damage costs an extra fatigue point. (So a 4-yard, 4d chaos jet would cost 3+1+1 points of fatigue, or 5 fatigue.)

Also up to the GM is whether or not the chaos jet is actual *chaos* (with, presumably, different properties than fire or lightning), or if the Wild Talent has merely latched onto some random Jet/Missile spell, with potentially unusual special effects or nuances.

Shielding

If using only the **GURPS Basic Set**, Shielding is actually a variation of Armor (p. 253). It has no maximum DR, and manifests as an "aura" of protection around the mage, but it is full cost to maintain and only protects against magical attacks -- fireballs, lightning bolts, Chaos Jets, etc. When the enemy wizard tosses a fireball, and the chaos mage puts up his arms to instinctively defend himself and the innocent bystander behind him, the fireball will splatter with great pyrotechnics a few inches away from the chaos mage's face. (Unless some of the damage gets through the DR, in which case the chaos mage is going to look sunburned.)

If using **GURPS Magic**, the GM may prefer to adapt Force Wall (p. M170).

When defending against spells that do not have a properly cinematic physical manifestation, the GM *may* let the chaos mage adapt Shielding (half its DR applied to the mage's roll to resist), or allow a roll against the chaos mage's Wild Talent in order to add Magery and potential Magery to the resistance roll.

Example: *Proving that the GM gave her too many points to start with, Marie-Susan also purchased two levels of the chaos mage Wild Talent, with Emergencies Only, for 30 points. The first time she's attacked by a would-be robber, she manages to activate a (relatively low-power) chaos jet. The robber, sensibly upset, runs away, and Marie-Susan does a*

little dance of glee.

Epic Fatigue: Going Into Debt

Normally, a mage who wants to cast or maintain a spell beyond his normal limits must burn hit points to power it. This may not be suitably cinematic, especially in circumstances where the characters are being required to exceed their limits again and again. Extra Fatigue Points help, but even they can be used up in titanic battles of power and magic.

Going Into Debt is an optional rule to pair with the Chaos and Ritual system. It allows a caster to spend fatigue now, and pay for it later.

Going into fatigue debt is much like dying, at least in the mechanics; see p. 327. First, the mage runs through all his fatigue points. Then, instead of spending hit points or falling unconscious, the mage must make a HT roll. If this roll fails, the caster must make a Will roll to maintain concentration, *and* take one hit of damage. (This damage does not affect casting new spells.) Either way, the caster has now gone into fatigue debt -- he has access to a full multiple of his prior fatigue points, but the *instant* he stops maintaining his last spell, he will take 1d hit points of damage and fall unconscious until this fatigue debt is recovered!

Just as with additional multiples of HP can be gone through before death, further multiples of FP can be gone through. Each multiple requires a HT roll and may inflict a hit of damage, and each "threshold" passed adds 1d of damage to the eventual toll the mage will pay.

Example: *Marie-Susan is heroically protecting a great hall while her friends escape and summon her arch-rival and romantic interest, the Master Mage. The GM has **GURPS Magic** and has allowed MS's Wild Talent to latch onto Utter Wall (p. M170). Covering an area of 5 yards across, she's dumping 20 fatigue points into the effect per minute. With only HT 10 and 10 Extra Fatigue Points, she's gone into fatigue debt by the first minute. She fails her HT roll, takes one hit of damage, makes her Will roll, and continues for another minute. After a total of five minutes (and three failed HT rolls) later, her friends arrive with the Master Mage, who uses Create Gate to rescue them all. Marie-Susan, already at -3 HP, takes a whopping 4d of damage, goes to -5 HP, and faints dramatically as the gate closes behind them. Fortunately, between Healing and Lend Energy (she needs to recover 100 fatigue before she can wake up!), she awakens with little harm done.*

Now she just has to deal with the debt she owes the Master Mage . . .

A Flash And A Bang: Alternate Gunpowders

"The second kind of flying fire is made in this way: Take 1 lb. of native sulfur, 2 lb. of linden or willow charcoal, 6 lb. of saltpeter, which three things are very finely powdered on a marble slab. Then put as much powder as desired into a case to make flying fire or thunder."

-- from the *Liber Ignium*, attributed to "Marcus Graecus"

The above quote is the earliest recipe for gunpowder written in a Western language, and may be the earliest such recipe anywhere. Dates for the *Liber Ignium* range from the (quite unlikely) first century A.D. to the (rather more likely) 13th century, which would be roughly contemporaneous with the first unequivocal Chinese gunpowder recipes that survive. (Although you can just make a case for the 11th century in China, depending on how you translate the Sung annals.) The point being that militarily useful gunpowder just sort of appears with a flash and a bang in the mid-fourteenth century in both China and Europe, overlaying any previous notions of fireworks or Roger Bacon rockets. Within 150 years, the "gunpowder empires" form from Louis XI's France to Ming China, held together by centralized monopolies on expensive artillery batteries. This pattern, rough-hew it as you will, will likely be true regardless of when you add gunpowder to the historical mix. Each major center of wealth will build a dominant force of cannon, knocking down outmoded fortifications of local rivals and expanding outward until it hits a similarly wealthy cannon establishment in two centuries or so. Technicalities like the naval broadside or Vauban's siegeworks aside, it's a relatively straightforward process that would apply to Egypt, Assyria, Rome, or whoever you wish to anachronistically gift with black powder.

And therefore, it's not really for us. This column looks rather at how to treat gunpowder symbolically and (perhaps) magically, rather than at the logistics of the Roman siege artillery train. So inhale the sacred smoke of the gunpowder oracle, and breathe deep the acrid fumes of possibility. Three shots reverberate in the back alleys of history and myth; let's listen for the echoes.

"Then there was a crash and a flash of flame and smoke. The waters of the Deeping Stream poured out hissing and foaming: they were choked no longer, a gaping hole was blasted in the wall. A host of dark shapes poured in. 'Devilry of Saruman!' cried Aragorn. 'They have crept in the culvert again, while we talked, and they have lit the fire of Orthanc beneath our feet.'"

-- J.R.R. Tolkien, *The Two Towers*

The walls of Parisiorum and Aurelianum would hold against any barbarians, no matter how foul, no matter how clever. Even the all-devouring Huns, under the lash of the Scourge of God himself, Attila, would fall back from their battlements, built by the Romans in the ancient time. But fall they did, in a flash of flame and smoke. Aetius and Theodoric rode under the banners of the West to meet the Huns on the Catalaunian Fields, and were themselves destroyed. The few refugees who escaped spoke of fire and thunder hurled from catapults and cunningly buried underground to destroy heavy cavalry before it could charge home. Where Attila had gotten this "ignis orcus," this "all-devouring fire," none could say -- perhaps from the dark gods of the Huns, perhaps from some alchemist's tower in the uttermost East, perhaps from the "Cunning Man," the Searu-Man whispered by Saxon axe-men to walk in Attila's train. Soon Ravenna and Rome fall, ancient walls blasted to new rubble, and the men of the West pull back ever farther. Where can aid be found? From the White City to the East, whose stewards huddle behind the tallest walls in the world? From the sea-born line of Meroveus, fallen on the Fields but destined by holy blood to rule Gaul? From the forested isles of the slim and graceful Albi, retired from the world for generations, to the north? Is there another fire-worker wandering the West who might give light where all is darkest? Hope must come from somewhere, a sacred Cup to quench the all-devouring Fire, or the hordes of the Searu-Man will swallow the world.

This setting can trend toward Tolkienesque high fantasy (keeping magics sparse to save the flavor) or grim low history, per GM whim. It reverses the usual course of things, in which gunpowder is the ace in the deck of civilization, for a symbolic recasting as chaos and death corned into fine grains. If a "good" gunpowder-worker shows up at all (if one is even possible), he should be reticent to use his skills for aught but fireworks and illuminations. PCs should not have access to powder at all, being Roman knights, Frankish paladins, holy priests of Jupiter or Jesus, and other

upright upholders of order and life. If the PCs have access to magic, it should be the magic of light and health, to further emphasize the contrast.

"'Nobody can make fireseed but the priests of Styphon,' Xentos told him. 'That was what I meant when I told you that Styphon's House has great power. With Styphon's aid, they alone can make it, and so they have great power, even over the Great Kings.' . . . No wonder this country, here-and-now, was divided into five Great Kingdoms, and each split into a snakepit of warring Princes and petty barons. Styphon's House wanted it that way; it was good for business."

-- H. Beam Piper, *Lord Kalvan of Otherwhen*

None but the Church could make fireseed, for it required the personal intervention of Saints Barbara and Catherine, who would not approach any but the celibate and holy. For five hundred years, churchmen supplied the faithful with muskets and bombards, tipping the balance against emperors and kings who sought too much power too fast, keeping the battlefield level for all good sons of the Church. But for the soldiers of Christ in the Holy Land, the Church perforce had to be more generous -- rifled muskets with flints instead of matches, and hand-gonnes machined to the ultimate of power and lightness for fighting from horseback. After all, the Knights Templar defended the Faith at the outermost point of the Church's bayonet. They became proud and wealthy, stirring envy in both Rome and Damascus. Worse yet, rumors spread that the Templars had learned the secret of fireseed -- and that it had more to do with Saracen alchemy than with priestly piety. When news reached the Vatican of the Knights combing through the manure piles in the Stables of Solomon, Pope Innocent IV gave the order: the Templars must be destroyed. His opportunity came with the Seventh Crusade, which allied the Templars with the far too independent and pious Louis IX of France. Papal machinations with the Saracens (including covert shipments of fireseed to the paynim via the Venetians) betrayed the Crusade in Egypt and Jerusalem, and the Templar threat ended in 1249 in blood and fire.

But Innocent did not expect there to be survivors. He did not expect that a bare few Templars, scarred and angry men with nothing to lose, would emerge from the smoke, stalking out of the heat-distorted deserts of the East and back into Christendom with vengeance on their minds. He did not expect to face gonneslinging Templars who knew the secret of fireseed -- and knew that the Church lied. The PCs, needless to say, are these two-gonne Templars, pistols hanging off mailed hips and looking for revenge. This can be played as a Western, with the drifting Templars blowing into some remote barony and cleaning up the place, or as action-movie cinematics featuring clockpunk gadgets on the walls of Avignon and endlessly-firing miraculous gonne-fu across the Lateran Palace. Either way, the theme is Van Vogtian: "The right to make weapons is the right to be free." GMs can introduce low magic, if they like, but it fits the H. Beam Piper model best if the vengeful Templars merely have unlikely science and pure hearts on their side.

*"Besides, that both his puissance and his might
Are such, as in our age are matched of few,
Such is in evil deeds his cunning sleight,
He laughs to scorn what wit and force can do.
Strange arms he bears, unknown to any wight,
Save him, of the ancient nations or the new:
A hollow iron, two yards long, whose small
Channel he loads with powder and a ball."*

-- Ludovico Ariosto, *Orlando Furioso*, IX:28

It is the Renaissance, the rebirth of humanity, of human proportions in all things from architecture to the dance. The art of the fence brings out the ultimate in martial virtue, while the art of love brings poetry and painting to new heights. Truly this time is a golden age of noble attainment for all, even the lowest-born can aspire to success in the new guilds and the new sciences. But into this glorious fresco comes a shadow, a splash of black and scarlet across the face of civilization. The German necromancer, Berthold the Black, has invented a most parlous engine that reduces all men, no matter their virtue, to meat and maggots. His engines of death appear in the hands of heretics and witches, and where they strike, demons and vampires stalk the night. Only the most puissant cavaliers, the most holy priests, and the most charismatic courtiers can withstand its call -- to might undeserved, to death unconsecrated, to equality unearned.

This is less a setting than an approach, mirroring the 15th-century frustration of Ariosto, who found himself forced to put guns into his 9th-century fantasy epic in order to stay modern. In this Renaissance (which might be our Earth, or

any highly pleasant fantasy world), the gun is an unequivocally evil magic item. In Ariosto's poem, it was the buried thunderbolt of Jove, dug up by Satan and shown to a German necromancer who reverse engineered it into a firearm. In this mythic approach, perhaps guns take minuses if used by day, or cannot kill anyone with True Faith (as happens to Orlando later in the poem when the gun misfires and kills his horse instead). Using a gun is Black Magic, costing sanity and soul, draining human abilities for art, romance, and swordplay. Those killed by guns rise again as vampires, or otherwise gain evil puissance after death.

258-page b&w hardcover; \$34.99

Originally released by Mythic Dreams Studios for the [d20 Modern Roleplaying Game](#), *Dark Inheritance* is designed for [Spycraft](#). AEG's *d20 System* RPG of espionage and intrigue, adds a rich bitter streak of dark mythic horror. Now adapted to the *d20 System*'s most complex RPG, *Dark Inheritance* centers on and builds from a single world-defining event, known as "The Rip."

On February 9th, 2004, at 6:31 am, the disputed city of Jerusalem changed beyond recognition. In an obscuring cloud of dust, the city's fabric was torn apart by causes unknown. Immediately quarantining the city, the Israeli government conducted rescue missions, and now carries out investigations in cooperation with the USA and the UN. Religious observance has grown, and with the relocation of the Israeli capital to Tel Aviv, Arab-Israeli relations have also improved. Indeed, the PLO and Mossad have allied temporarily to determine the cause of The Rip. Elsewhere, reports of animal attacks and sightings of monstrous creatures have grown. The most notorious include an attack on hikers in Australia's Kakadu National Park by "winged" crocodiles, and over 40 people disappearing in New York's Central Park and the subsequent discovery of 15 mutilated and dismembered bodies. Central Park still remains barricaded, while the creatures responsible have been dubbed "demons."

What the world's governments had been keeping secret was eventually revealed by the International Geographical Society. They had an archaeological team digging near Jerusalem, which entered the city following The Rip. Documenting what they saw, they discovered that Jerusalem had merged with another city, from a world that became known as the "Otherworld." Today, access to Jerusalem is strictly controlled and a science team has established an outpost in the Otherworld. They have discovered a strange energy both there and in Jerusalem, drawn from a sub-atomic "ethereal" dimension.

Other secrets remain hidden, protected by agencies older than the KGB or MI6, with ancient origins and very long-term agendas. The Brotherhood of the Rose uses any means necessary to protect the Catholic Church, its members having been granted dispensation for sins committed in the course of their duties. The Eight Heavenly Dragons, the world's preeminent triad, were formed from a merger of a holy order of monks, the Fists of Righteous Harmony and the Four Skies Triad. First Team are mercenaries for hire, Special Forces *par excellence*, who ruthlessly protect both their identities and reputations. The Africa-based "Fugo a Watu" keeps track of the bloodlines known as Legacies,

which mark those individuals who have inherited the godgene. The IGS is dedicated to exploring the planet and revealing its discoveries across all media. Project: TITAN is a NSA black project, attempting to control the godgene and recruit the Titans to serve the USA, while Project: CHIMERA creates human-animal hybrid super soldiers. The Promethean Order is an ancient order dedicated to studying the Craft (or magic) that failed to foresee the events of The Rip.

Each agency is nicely detailed and presented as a threat if the players are part of other agencies. They also work as vehicles for particular genres. Thus the Promethean Order are an arcane order apart, best typified by *Highlander* and *Charmed*. Project: TITAN mixes espionage and monster horror such as *Alias* and *Predator*. IGS combines science, exploration, and adventure like *Tomb Raider* and *Veritas: The Quest*. Fugo a Watu mixes science run amok with mystical conspiracy, typified by *Dune* and *Dark Angel*. First Team is in the elite military genre of *The Dirty Dozen* or *Ronin*. The Eight Heavenly Fists combines the criminal underworld with martial arts in *Big Trouble in Little China* meets *The Sopranos* style. The Brotherhood of the Rose is for "Soldier of God" games, a combination of *Brotherhood of the Wolf* and *Millennium*.

Besides these allegiances, players can take new backgrounds, department, and more radically, a "hybrid macro species." Six are given -- feline, canine, piscine, reptilian, rodentine, and ursine -- but more could be created. All are for the Gene Soldier Prestige Class and part of Project: TITAN. ***Dark Inheritance's*** other Prestige Classes are the Witness, who monitors the bloodlines for the Fugo a Watu, and the Edge Master, essentially mystic swordsmen. The basic classes are more generic: the Advocate, tenacious believer of a cause; the Explorer is very Lara Croft-like; while the Martial Artist, the Sleuth, and the Scientist are all self-explanatory. All of the classes are supported by a plethora of new feats.

Magic in ***Dark Inheritance*** has been eased greatly by the advent of The Rip, with casters commanding energies drawn from the Ethereal plane to power incantations. These rely upon an understanding of symbols, represented by the Arcane Craft skill, and a focus, which links the user directly to the ethereal. Other Craft users, the Gnostics, are innately linked to the ethereal and are essentially living foci. Both are represented by the Arcanist and Gnostic classes while the two-fisted God of Guns Prestige Class combines gun-fu and magic; and the Promethean Order's Watcher monitors and recruits Titans. Again Craft use is supported by a plethora of feats and skills, plus descriptions of Craft related domains. Any character can become a Craft user by selecting the Novice or Postulant feats. This allows the casting of 0-level spells with safety. A spell list is included, but any ***d20 System*** spells could be adapted.

Characters can also be heirs to a Legacy. These are the inheritances of the title, the godgenes that empower the Titans. Also known as Inheritors, Titans fall into five different lineages that each possesses three different legacies, powers, and abilities that push a Titan beyond being mere human. Selecting a Titan macro species character option replaces his early experience and training in the form of a department. As he gains levels, a Titan gains Birthrights, abilities whose use requires a Strain check. Except for a critical success, use of a Birthright inflicts Strain on a Titan leading eventually to fatigue and then exhaustion. Essentially Strain prevents overuse of a Birthright, and further each time he is exhausted, a Titan must make another check, failure indicating a legendary transformation, the Titan taking an element of the birthright that caused their exhaustion. Besides this danger, each lineage also has weaknesses that can be exploited by others. The five lineages are the Crimson Lords, extreme hedonists who like to lead from the front; Hidden Suns, hackers with a fascination for hidden lore, secrets and death; Storm Crows, warriors with a clouded gift for divination; Void Phoenixes, agents of entropy and rebirth, marked by ever increasing monstrous and inhuman traits, the enemy of an ancient foe; and the Wild Bloods, nomadic guides and warriors known for ferocious rages.

For the GM there is some background given on The Rip, plus the current state of Jerusalem, and also of Pioneer Base, the Otherworld outpost. Several Otherworld creatures are also described along with a complete cult, which has grown in power and ability following The Rip. The monsters themselves are not that interesting, but again, the ***d20 System*** is rife with suitable creatures to replace them.

[SPOILER ALERT!]

So what is going on in ***Dark Inheritance***? Having read the book, it can be summarized as follows. (If wrong, I apologize, but then the book does not actually give you just the facts.) Millennia ago, the Progenitors overthrew the

Ascendancy, the Empire of the Host, binding their spirits onto the Abyss. In 2004, someone caused The Rip (the book does not say who), releasing the Demonhost back into the world. This is the current situation . . .

[END SPOILER ALERT]

There is also the question of what to do with **Dark Inheritance**, as scant advice is given for the GM. Obvious options are campaigns that focus upon one agency or Titans against the Demonhost and its allies. If the GM wants to include more of the book's character options in his campaign, he is on his own, as the book lacks GM advice. Another suggestion would be to run an ordinary espionage campaign with this book's various organizations as its foes, though there are again difficulties with this, there being some differences between **Dark Inheritance** and a regular **Spycraft** campaign. Primarily these include the use of the **Stargate-SG1 RPG's** Resource Points to replace Gadget Points, and the increased gadget and vehicle cost to reflect limited access to either.

Dark Inheritance requires another editorial pass, but is an otherwise well-laid out and good-looking book. Some art is pleasing evocative, but much is too cartoon-like to match the setting. Additionally, the missed details of some agencies' secrets are another handicap, as is the dearth of GM advice. The result is the book just throws a box full of character options at the players, all built around a somewhat unexplained setting. Yet this background is interesting and evocative, building from the single world-defining event. The five lineages do feel like **World of Darkness** RPG factions, but less confining and broader, while the various agencies lend themselves to differing but enticing genres and styles of play. Overall, although not as well developed as it could be, **Dark Inheritance** is still evocative and full of potential.

--Matthew Pook

Storming Post-Modern Fortresses

or, Dungeons and Dragon-boats

by Eric Funk

"We found the derelict, all right, just where the old man's map said it was. What we didn't realize until later was that while we were studying it, it was watching us."

-- Overheard in a bar

Fortresses and hostile vessels may be considered to be futuristic equivalents to dungeons. This has the classic appeal of combating traps and hostile denizens in a labyrinthine environment whilst carrying laser pistols and grav belts. Alien temples and crashed ships are popular places for adventurers to visit, and are sometimes one and the same! Some derelicts just sit idly by while a band of adventurers wander in and kill local monsters, while others take an active role in keeping such intruders out. This article discusses mundane tactics, if the GM allows either the defenders or infiltrators to possess esoteric abilities, such as psionics or Ancient artifacts, the playing field may be quite different.

There are generally two kinds of mission, the first being Extraction -- the retrieval of a person, item, or data. This can also include surveillance. Not all of these are necessarily hostile -- defectors, prisoners, and some data may go willingly. The second kind of mission can be called Destruction -- the assassination of someone, destruction of data or equipment. Subsumed within this type of mission is warning the victim by leaving a calling card such as a message or knife. A prerequisite of Extraction is escape, while Destruction missions may be suicide runs.

Planning

To plan an assault, the most prepared teams may try to determine patterns.

Capability

Who designed the fortress? Who has occupied it since? Who uses it now? What did they use it for? What Tech Levels were involved in any of the former? The choice of stealth and contravention equipment will be greatly affected by these things.

Combination of Traps/TL and either Architecture/TL or Strategy(Land) may be able to reveal areas of buildings and natural fortifications that could contain areas hard to monitor with sensors, line with traps, or just be hard to defend. On-site inspection could replace the Architecture/TL with an Electronics Operation(Sensors)/TL roll (see p. CV21). Tactics or Strategy(Land) may also aid in preparing or expecting troop movements.

Intelligence

Recognizing trends can point to times of relative weakness (use Architecture, Intelligence Analysis, Research, or Strategy). For example, knowing in advance that a blackout sandstorm is coming, the guards rotate every 20 minutes, and sunspot activity will be interfering with radio range can give a team a great advantage. Some other examples of cycles include guards, maintenance, laundry, catering, guests, tourists, herd migrations, tides, rivers, lava, weather, meteor showers, and solar wind. How will the facility react to and prepare for these situations?

Intelligence can also include land contour maps, pictures of facilities, vehicles, and personnel -- all as detailed and current as possible. As technology progresses, the quality/cost ratio of tools reasonably affordable for civilians improves to the point that fairly detailed maps can be readily available, if several years out of date. Portable tools and computing power allow tourists to have complete maps and holovids of their trips. A covert team with enhanced

equipment could obtain a lot of data. Depending on the availability of Contragravity and thruster technology, satellites could be launched cheaply, further peering into strongholds and passively analyzing traffic.

A local guide can be a mixed blessing, with knowledge of recent movements, troop actions, and faces, but the potential for an independent agenda, or even allegiance to the enemy! Finding a guide with a high Area Knowledge skill and testing his skills and loyalty while avoiding detection by the local forces can be an adventure in itself, especially if even a handful of locals support the base to be assaulted! Even rumors could put the base on alert. Alternatively, an unwilling guide is caught in a dangerous position, as he may be killed by either party, whether or not he leads them into a trap.

Getting In

Getting in is usually portrayed as harder than getting out (except for prisons). Brute force is as effective as in other ages, which is to say, it doesn't work all the time, but it does have its place as a talent. Small groups allow greater deniability, require smaller holes in security to pass through, and need fewer forged IDs, but will possess a smaller skill base.

Computers and electronic locks for the most part replace mechanical systems. The scrawny tech shines at this point, breaking out a SQUID (see p. R30) to hack into systems. It can be an amusing situation to role-play the grunts lugging the "geek" around as well as the turnabout as the tech disables the death traps. "Realistic" code decryption requires massive computing power and lots of time. An alternative is to get a password from an existing user by one of bribery, telepathy, gunpoint, or even a self-sticking note beside the monitor or under a keyboard.

Ideally, agents should have equipment of a higher Tech Level than that of their opponents. This allows sensors to circumvent many kinds of older spoofing technologies, and provide a greater relative effectiveness of stealth equipment. The optimum choice of stealth equipment requires knowledge of what sensors are installed. Contravention equipment, such as electronic lock picks and robotic eyes must be chosen carefully and usually require the skill of Electronics Operation (Security Systems) (see pp. UT 83, RO 30). GURPS Martial Arts also contains many styles of moving undetected.

"In the final analysis, the safest way to defeat a security system is to have someone on the inside!"
[--GURPS Covert Ops](#) p. 95

Infiltration is the art of sneaking, completely avoiding detection. Complete stealth is increasingly difficult as the power and variety of sensors increases with each tech level. On the other side of an "impenetrable barrier," employees may be unsuspecting if the installation has not been penetrated (as far as they know). Computers, however, are ever vigilant, unless they are intelligent enough to become bored.

Infiltration usually requires [unconventional/concealable weapons](#) such as gun gloves, garrotes, pen guns, and lighters. Outdoors, trespassers may parallel main trails to follow maps, but indoors, one can follow pipes, vents, and service shafts.

Vents, pipes, and access spaces break down into three categories: Small spaces only large enough for tiny robots, rats, and unusually [small persons](#). Crawl spaces (such as the "Jeffries Tubes" from [Star Trek](#) allow only one or two unencumbered humans to crawl side by side, unable to stand. Characters are at -4 to attack other while they are crawling (see p. B98), and -2 to be hit while kneeling (see p. B 118). Service tunnels are common in castles, manors and other environments with heavily stratified social groups. This allows peasants and nobles to go about their daily lives without seeing each other. In fortresses, they may also exist to allow technicians to move large parts and pipes around. A staple of invasion/counter-invasion is that one of the sides take to access and service tunnels which often contains a less effective sensor net and are harder to seal off for some reason.

Impersonation can be described as the art of moving overtly, yet misidentified as someone or something that belongs there. ID Transponders, IFFs, and keys are rotated in realistic bases, with frequency increasing at more secure locations, and also with the stage of alert (such as when an attack is expected). Time lag of interstellar communications

may allow interception and forging of false data. It is up to the GM to decide how easy it is. As valuable as tools are, sometimes "human" skills such as Acting, Administration, Disguise, Fast-Talk, Lip-Reading, Savoir-Faire, and Language skills can often replace them in convincing a local guard or official to open doors or locks . . .

Forceful Entry

Breaking in forcefully becomes no tougher as the tech levels of the defenses increase, merely doing so undetected becomes trickier. "Fortress" class walls are described on p. VE167 as possessing DR100+ and 200+ hit points. The myriad GURPS world and tech books contain a large variety of assault weapons. The following are but a few concealable examples:

Incendiary Grenade (TL7) \$11, 2 lbs (see p. SO 105), Pocket Jet Torch (TL7) \$7, neg. wt., Holdout +2, no electronics (see p. CV55), Laser Torch, Light (TL8) \$25, 1 lb (see p. R23), Plasma Torch (TL9) \$188, 4 lbs (see p. R23), Plasmafaust (TL9) \$500, 2 lbs, a HEAT plasma thrower (see pp. RO20-21)

(All prices are at optimum construction -- TL of origin +2.)

When all else fails, hand-packing explosives to form a HEAT effect can be done with a roll against Demolition/TL (see p. HT27 for details, p. CV83 for Detcord, and p. UT68 for Plastex and Plastex-B).

Towers are one type of structure that returns to being more easily defensible at TL8+. No-fly zones combined with effective sensor nets and automated defenses restore its solitude. Until the advent of contragravity, a tower away from cliffs will have little to fear from the air. "Stealthy" entry is only possible at entrances, usually only the top and bottom, which means bypassing sentries of one sort or another (but see Forceful Entry, above).

A TL9 Extra-Large HEAT Warhead				
Bore	Damage	Mass	Cost	Comments
16mm	5d×2(10)	0.06 lbs	\$2	Strategically placed, this can disable electronics and vehicles (see "Components and Damage," p. VE183)
40mm	6d×4(10)	1 lb	\$30	This can easily penetrate DR50 (see p. HT26-27 for making holes in armor).
45mm	4d×10(10)	1.5 lbs	\$44	DR100
50mm	5d×15(10)	2 lbs	\$60	DR200

Egress

"This ship will self-destruct in five minutes . . . Have a nice day!"
--Computer, *Spaceballs: The Movie*

Many structures and ships in cinema are set to begin a self-destruct sequence as soon as their inner sanctum is breached. This often causes secondary explosions throughout the facility that are as close the heroes as possible without really harming them. It can also act as a buffer, closing off access to areas behind them, and some paths out. GMs must decide carefully whether to announce (and keep careful track of) a timed countdown. Otherwise, exactly the same stealth considerations are required.

Adventure Seeds

Mapping: The crew is hired (to pose?) as civilians for a mapping mission. They might be told that it is a simple mineral survey. The catch is that they are not told about a secret base in one corner of their assigned area.

- As above, but they are warned of an indigenous low-tech culture (just how low-tech is up to the GM).
- As above, but there is also a rival survey party.
- As above, and there is a saboteur hidden on the ship.
- As any of the above, but the secret base they are unwittingly mapping will shoot them down when they enter a

communications "dead" spot at the edge of the area. The dead spot may be due to natural interference or a jammer.

Infiltration: The party will be given false background papers that will allow them to infiltrate a compound. Inside, they must:

- Contact someone, smuggle in and/or out a message, data.
- Plant a listening device/bomb.
- Obtain/Sabotage plans for a battle station.
- Start rumors.

Victoria Litvanoff

for *Call of Cthulhu*

by Tom McGrenery

An inhabitant of Shanghai in the 1930s, Victoria Litvanoff is an unpleasant, opportunistic villain suitable for *Call of Cthulhu*, or any game set between the wars. Although the stats below profile her as she was in 1936, there is of course no need to feel bound to the exact historical dates.

A dark-haired woman who appears to be in her early 60s, Mrs. Victoria Litvanoff is in fact only in her forties. She was born somewhere in Russia in 1893. She claims to be half-French but is actually entirely Russian. Her face is long and heavy-set, with prominent eyebrows. Her pseudonyms include Madam Ganette, Victoria Seou, Madam Dafin Desmond, and Dauphine Desmonde. She has lived in Manchuria as well as Japan, and has visited most of the major cities of China.

Victoria Litvanoff has married four times so far. Her first husband, a Russian army officer, died on the Eastern Front in the Great War. Her second, one Baron Toll, was killed during the Russian Revolution. The third, Captain Koishi Senoo of the Japanese Army, died in the Japanese earthquake of 1923. she married her fourth husband in Shanghai, in 1924. Nikolas Nikolayevitch Litvanoff is some ten years younger than his wife. As a boy he attended the Khabarovsk Cadet Corps School in Russia. He joined the White Army aged sixteen and fought against the Bolsheviks. He became an assistant tutor to the Russian Cadet Corps in Vladivostok, before moving to Canton as a member of the Portuguese River Police. He later set up as an electrical contractor in Shanghai, which was where he met his wife.

Mrs. Litvanoff operates as a clairvoyant in a subdivided office on Nanking Road, which she shares with a Chinese doctor called Liu Ding. In order to preserve an aura of mystery, the doctor invites clients to wait in his surgery when Mrs. Litvanoff changes from her ordinary street wear.

Once inside Litvanoff's cubicle, the client finds her dressed in a long black gown and hood. Only her hands and eyes are visible. The room is lit by candles in a brass sconce, while a human skull rests on a table in the corner with two crossed thigh bones in front. She is evasive about just where and how she obtained these human remains.

Clairvoyance is illegal in the International Settlement. However, as a White Russian, Litvanoff lacks a nationality and so falls under Chinese law. As a result, the International Police are unable to arrest her, at least for the crime of clairvoyance. She often uses the information she gathers during these fortune-telling sessions to blackmail her clients. She also kidnaps white women and sells the to brothels, as well as running a few brothels of her own.

Mrs. Litvanoff also enjoys performing as a stage magician and escapologist, though her opinion of her own skills is vastly inflated. Her act, which includes card tricks and 'escaping' from some obviously loose handcuffs, is lacklustre at best.

The Shanghai Special Branch is very keen to arrest Mrs. Litvanoff. Unfortunately for them, she knows her Shanghai law very well and always manages to keep one step ahead.

Mrs. Litvanoff's life is currently rather troubled. Last year she ran a successful house of ill repute in the French Concession. Its reputation was so ill that it prompted the French police, who in the normal run of things just couldn't be bothered, to make a raid on the place. In escaping arrest, Mrs. Litvanoff fell down a flight of stairs and broke her hip. This left her with a limp and the unwelcome prospect of having to start again from scratch. Starting again wasn't all that hard. It just took another change of name and a new location. She was able to evade the law by switching back and forth between the International Settlement and the French Concession. When she is wanted in both places (a common occurrence), she goes to her house in the Outer Roads' Area.

The Outer Roads' Area is a suburb full of large foreign-owned houses on the outskirts of the foreign-run districts. No one knows who has jurisdiction over the Outer Roads' Area. The International Settlement claims the highways, since they built them. Houses on the highways, known as the Municipal Roads, pay taxes to the Municipal Authority of the Settlement and are subject to its laws and police protection. Houses off the roads fall under Chinese jurisdiction. But what exactly counts as being "on" or "off" the road is still undefined. Sometimes the Chinese refuse even to recognize the International Settlement's claim to the highways.

Mrs. Litvanoff rents a house in an alleyway under Chinese jurisdiction with one side facing a Municipal Road. As a location for a hideout, it is in a perfect state of legal limbo. To get the house, Mr. and Mrs. Litvanoff paid two months' tax in advance to the International Settlement, and haven't bothered paying since. The authorities can do nothing to evict them.

Having fled the French Concession, the Litvanoffs found a new place for business, hired some girls and opened up shop. Then something unexpected happened. Mr Litvanoff fell in love with Veronica, one of his wife's White Russian employees. The two of them ran away together and now live in two small rooms on Weihaiwei Road. As if that wasn't bad enough, he set up a house of ill repute specialising in the same kind of unpleasant things his wife's businesses had offered. Mrs. Litvanoff first attempted to commit suicide, then went to the police. She reported his activities, but they simply showed her the door. The police records note that the complaint was made by Mrs. Litvanoff the "notorious . . . procurer for all forms of debauchery." In return, Nikolas and Veronica sent an anonymous letter to the Special Branch claiming that she was a Bolshevik spy (one of the few things she isn't guilty of). Their feud continues, as does the police force's effort to capture Mrs. Litvanoff.

Pyramid Review

Libris Mortis: The Book of Undead

Published by [Wizards of the Coast](#)

Written by Andy Collins & Bruce R. Cordell

Edited by Michele Carter, Kim Mohan & Cindi Rice

Illustrated by Tom Kidd, Thomas Baxa, Steve Belledin, Jeff Easley, Steve Ellis, Wayne England, Emmanuelle Hunter, Jeremy Jarvis, Chuck Lukacs, David Martin, Michael Phillippi, Steve Prescott, Wayne Reynolds, Brian Snoddy, Dee Barnett, Dawn Murin, Trish Yochum, Dennis Kauth

192-page full-color hardcover; \$29.95

Hell is full and the dead walk the streets of your game world. They may not be easy to pen up, but at least the gamemaster can get a handle on widespread evil with *Libris Mortis: The Book of Undead* from the vampire wranglers at Wizards of the Coast.

Assuming everyone loves the undead (a pretty safe bet given the state of popular culture), such a volume should come as no surprise. Neither, for that matter, should the layout. Undead creatures? Of course. Feats? You bet. For PCs and NPCs? Natch. Some specific observations, then.

There's a little more campaign advice here than in previous Wizards of the Coast products, though not a whole lot. You get a short introduction to what undead are and how they unlive, eat (eww), and procreate. Theories on whence they come, examples of cities and religions for the cosmopolitan zombie, and advice on strategy when facing (or being) the dead (especially the self-aware threats) make good reading, but these are sadly brief.

Too much "campaign" advice is just lists. Sure, there's helpful info on what Undead X is liable to do in combat. Then again, there are seemingly promising sections like "Incorporeality," which suggests a primer on effective power use but turns out to be rules and mechanics. Useful (read: necessary, particularly those bits not repeated from *Monster Manual III*), but more stuff like the material on using undead as masterminds would be preferable.

And the lists seem to be mostly page-fillers. There are sample NPC versions of undead, like vampires. Okay, good, pick one of those and stick it in your game (and it's a helpful example of laying templates over stats), but you're not buying a rogues' gallery book...10 of them is over(un)kill. Variants can surprise heroes -- faster zombies or resilient skeletons -- but even those straightforward monsters get lists: dire rat skeletons, T-rex skeletons, ogre skeletons, etc. Some maps of mortuaries and other undead haunts pepper this section, and a number of small, undead-centric groups and mini-fleshed-out dungeons (*all* underground) give the DM someplace to display his unliving creations.

Feats are listed in "Character Options"; it pulls triple duty with "Undead in the Party." That goes on almost two full pages before it gives way to undead character classes. A few more PC/undead tips are scattered about here, mostly presented as reasons for those things to become adventurers, but even this boils down to "avenge loved ones, get revenge for being made undead, or atone for your evil." The feats are the sort of grave-born goodies you might think -- once you have the power to drain someone's stats or turn the morbid hordes, you'll want to crank those abilities up.

Keepers like the stitched-flesh familiar are few and far between, though the mother cyst plays a big part in magic.

A mother cyst is a painful swelling of necrotic flesh or energy somewhere on your body. You can draw upon it to power effects, though the spell lists make it seem like a pretty ugly, dodgy deal. A lot of the magic deals with necrotic bloats, explosions, dominations -- it goes on. The upshot: If you have a cyst, others may be able to target it (and therefore you) to pop out of your skin, eat your brain, or scribe through your senses. The spell lists aren't exclusively about this -- still plenty of new ways to protect yourself from or summon undead, or duplicate evil tricks like sucking life -- but cysts are a feature for the book.

Equipment is short and sweet. Their best showings are the armor, with spirits and skins made into protective devices, or giving weird powers and shadowy abilities; and the undead grafts that, like a creepy kind of cyberware, let you replace your body parts with those found in a barrow.

The prestige classes are even more lacking in substance. There are hunters and servants of the undead, bards who use sorrowful tunes, and a variety of people using magic to bend, break, or build the unliving. Classes for the undead are just ramped-up beings, like master vampires.

One item for which to fall to one's knees and give thanks: undead traits are listed at the monster chapter's outset. Some creature features are still repeated to the nth degree -- everything seems to have grapple -- but key elements are dealt with and done with. Some of the names alone are cool as all get-out: bleakborn, blaspheme, voidwraith. While there are crawlies aplenty, a fat pile of them are templates for the GM to lay over other beasts or beings. Some make sense, like mummified beings, and some meet you halfway, like the half-vampire. Most aren't all that impressive or seem like new ways to say the same old thing. Necropolitans renounce life, but they go through a ceremony to do it -- oh, well. Evolved undead improves those undead who've been at the death and decay game longer than most of their ilk. Keen bits like the raiment (a living set of clothes) and the revived fossil template are among the better ideas, but there are few true standouts. In the plus column, the creatures run the gamut of challenge ratings, so not everything is a ground-shaking powerhouse -- some things even your starting PCs can go after.

The artwork doesn't use darker tones here than in other Wizards of the Coast products, but that can make the disturbing, corpse-riddled imagery, contrasted with its bright, fanciful colors, that much more striking. That, and it's the usual classy Wizards output.

Libris Mortis isn't so much an out-and-out disappointment as it is a conversation with an interesting but distracted friend. So many parts start out well but trail off into mediocrity, or never quite seem to finish what they're saying. The writing is good but unfocused, and the result is another patchwork of half-decent ideas directed more at filling out the page count than fulfilling its purpose.

Irregular Webcomic

by David Morgan-Mar

Irregular Webcomic

Irregular Webcomic

Me Am Smart Some Day

Let's say you have a piece of somewhat obscure hardware that you're trying to get working for your computer. If, after downloading and installing the drivers on your primary computer, the computer fails to recognize the hardware . . .

And if, after trying to install the drivers on two other computers, with two different operating systems, the computers still fail to recognize the hardware . . .

And if, after getting fed up, you format and reinstall the operating system on your primary computer in an effort to get a clean slate for the hardware to be recognized, and the computer with its new installation *still* doesn't recognize the device . . .

Make sure you downloaded the right drivers in the first place.

This has been free computer advice from your friendly neighborhood Steven Marsh.

Over the past couple of weeks I've been regaling you with tales of my previous gaming exploits, mostly centered around one long-time character's ill-advised plan to resolve his Faustian deal. (This well-thought-out "plan" primarily centered around telling the demon, "Thanks for the power, but I've changed my mind. Have a nice day!") This week's column stems from thinking about this gaming anecdote, as well as the above computer episode, which happened to . . . err, a friend.

It's difficult to convey, but one of the reasons I particularly liked this scheme against the demon was not because I believed (as a player) it would work; rather, it was a plan my character believed would work, and -- more importantly - it wasn't a great plan.

But first, I might need to give a bit of information about White Wolf's old (and, I suppose, their new) Storyteller system. One of the reasons I like Storyteller is because it's pretty darn grainy; attributes (as well as skills) are ranked between one and five, with two as an average score. This makes it *very* easy for me to make characters. Is the character considerably below average? He gets a one. Average? He gets a two. Reasonably above average? Three. Doctoral-level? Four. Pinnacle of human ability? Five. This is certainly easier for me to wrap my mind around than trying to figure out if Aunt May has a 17% Strength or maybe deserves a 19%.

Anyway, I consider myself to be pretty darn smart; in White Wolf terms, I'd probably give myself a four in Intelligence. (And, lest it seems egotistical, I assure you that those attribute points were strip-mined from others. Perception? Appearance? Strength? Who needs it?!) In comparison, my character had an Intelligence of two, *and* he was Overconfident. Thus, I tried to play him as much less quick on the uptake than I am.

Now, this plan was the first time I can recall where I "got it," having achieved a state of Zen with my character where I was able to think as him, instead of making purposefully dumb decisions. Ultimately, I realized that the means of doing this was to go with the first or second plan I thought of, especially if it felt "Overconfident." (His plan for fighting vampires in a burning building? Lock himself *inside* the burning building with his enemies.)

I'm pretty sure I've dealt in past columns about playing characters who are smarter than ourselves. (This advice mostly centered on trying to spend more time thinking about it even though the character came up with the plan "instantaneously," as well as the GM having the character's plans work more often; it *must* have been a good idea, because otherwise he wouldn't have thought of it, right?) But playing someone who is *less* intelligent, wise, or perceptive than us is, I argue, more challenging, at least to get it right; there's a tendency in many games to simply ploink the player's mental acumen into the character's body, regardless of what the stats say. In fact, the old FASA **Dr. Who RPG** required this; basically, "your character is only as smart as you are."

For me, at least, I realize now that the key to playing this character -- like all characters -- is to try to recreate not only the actions, but also the thought processes behind them. *Not* having this foundation makes playing such characters

more difficult, since it's easy to slip up. For example, I found myself aghast when playing another low-intelligence character (definitely below average) to discover that I'd been using phrases such as "tabula rasa" and "cogito ergo sum" in casual conversation.

And for those seeking to hone this sense in their own games, I'd recommend trying to look at how your own thought processes work. For example, as my computer example above showed, I tend to be very intelligent and doggedly stubborn in achieving results, but have a habit of making faulty assumptions or overlooking the obvious. Thus in most games I'd have a high intelligence but lower perception and/or wisdom. If I wanted to play someone of a similar intelligence (or, at least, the same results as someone with similar intelligence) but with a difference process, I might consider a version of my mind that is much more perceptive, using that information to eliminate bad ideas immediately. Or I might play someone who doesn't have as much book learning, but has such a honed sense of intuition that he can arrive at a good solution by other means.

Cogito Ergo Sum: I think; therefore I am. By extension, *how* we think determines *how* we are, and it is this understanding that can make our characters truly interesting and memorable. It's not easy for many folks (myself included), but the rewards can be considerable for many kinds of games.

Although, admittedly, perhaps not as considerable as avoiding formatting one's computer without a good reason.

--Steven Marsh

More Questions than Answers

Scenes from a Larger World

by Chris Aylott

Every now and again the country mouse goes back to the city. It's a little after 10 in the morning on Sunday, February 20, and I'm riding into Penn Station, New York City on a trip to Toy Fair.

First held in 1903 as a way to show American toys to retailers heading to Europe on buying trips, Toy Fair has grown into one of the largest trade shows in the world. It fills the Javits Convention Center and several other buildings on Broadway and Fifth Avenue. About 1,400 manufacturers attend from 30 countries, showing their wares to thousands of retailers, distributors, and reporters.

This is where the big guns come out. Every major toy gets launched here (not always successfully). Millions of dollars get committed to the toys that will line the shelves when Christmas rolls around. Toys"R"Us is here, and so is the Gap. As I walk into the Javits Center, I'm surrounded by people who can spend more on one product than my store makes in a year.

What the heck am I doing here?

A Brave and Noble Quest?

There is something missing at The Space-Crime Continuum. We moved most of a year ago, and book sales are exploding. New sections of history, food, science, and general fiction are paying off, adding a lot of sales to our old stand-bys of science fiction and mysteries.

The games aren't keeping up. There's some growth, which isn't bad in a year when most of the other hobby game retailers we know are crying in their Bawls. But more visibility isn't translating into more hobby gamers. What we get is more people asking for classic games and toys. Dominoes, mancala, **Monopoly**, **Cranium**. Mainstream games. Educational games. Games for kids of all ages. No dragons need apply.

So here I am, standing at the top of the escalator, looking at a slice of one of the exhibit halls. I see seven aisles in front of me, each one running back about 200 feet. The exhibitors are corralled in little stalls, most of them ten feet by ten feet. You could put an orc and a chest in every stall and level up halfway down the aisle.

To my left, there's a guy bouncing 12 feet in the air on a pogo stick that looks more like a jackhammer. In front of me, the Hohner company is selling a miniature Steinway piano and a drum kit just right for a four-year-old. Brainy Baby would like me to know that nine months is not too young to teach my baby girl about baseball, golf, and soccer. They have instructional DVDs; they must know what they are talking about.

That's just a third of the hall. There are another 14 or 15 rows I can't see, another hall above me, and a whole building of manufacturers that I have no chance of getting to in the short time I have here.

Overwhelmed, I turn right and scurry towards the relative safety of "The Game Zone," two aisles devoted to showcasing the smaller board game manufacturers. I tell myself I'm starting to look at product, but what I really want to see is some friendly faces.

A Sea of Absent Friends, with Islands

There are no manufacturers of roleplaying games at Toy Fair. Not even Wizards of the Coast is there -- Hasbro needs

more lead time for their products and has moved its marketing to the International Fall Toy Show in October. (Both Toy Fair and the Fall Toy Show are run by the Toy Industry Association; the October 2005 show will present products intended for Christmas 2006.) What hobby game fans call an "industry" doesn't even exist in the minds of the toy buyers at this show.

There are some names that would be familiar to *Pyramid* readers. Decipher has its card games and ***How to Host a Murder*** sets. Days of Wonder, Mayfair, and Rio Grande are showing off their wares, as are a bunch of other small makers of board games and card games. Later in the afternoon, I'll pass the Koplow booth, which features the same display of dice I've seen for years at the GAMA Trade Show. One of the Koplow reps is trying to explain what a 20-sider is used for to an older toy retailer, and he's not having much luck.

I pass these manufacturers by for now, and will ignore most of them completely. I know what they sell already; I need to find the games I don't know. I'm not even shopping yet, just looking for a bolthole. I find it at the Alliance Distributors booth.

Alliance is the 800-pound gorilla of hobby game distribution, with four warehouses and some of the best retailer support programs in the hobby. If you sell hobby games and you're not a fool, you deal with Alliance. Here, they seem almost inconsequential -- another 10'-by-10' booth and few piles of board games and card games on display.

A distributor can't help but have a low profile at this kind of trade show. The manufacturers are the stars here, and the distributors know it. But I'm surprised Alliance doesn't have more booth visuals showing off what it really sells -- the easy-to-use website that I place orders on every week, the monthly catalog magazine, graphics of its speedy delivery, pictures of salespeople and warehouse staff being happy and efficient.

These are all ideas that Alliance's salespeople can communicate, and Alliance has some of its best people on hand doing just that. But why isn't the booth design supporting the work that the salespeople are doing?

As I hoped, I have some friends at the Alliance booth. Customer service guru Mike Webb is there, along with sales manager Marc Aquino. I shake Marc's hand and congratulate him on his recent promotion, inwardly cursing the loss of my favorite sales rep. Mike and I trade stories about the kids. We make plans for lunch, and I start to relax. Maybe this place isn't so scary after all.

Edging along the Beach . . .

Off to wander the booths. I indulge myself with a stop at Days of Wonder. I first met Mark Kaufmann at the GAMA Trade Show in 2003; I liked his company's style from the beginning, especially its commitment to making a few great games and keeping those games in print. Now I had to thank Mark for making me so much money over the last two years.

I also wanted a look at ***Ticket to Ride Europe***. We had done well with ***Ticket to Ride*** -- everybody had, to the tune of 300,000 copies sold in 2004 -- but I needed to know what new features would entice fans of the first game to buy the second. A young man named Robert Washington answers all my questions with a short and knowledgeable presentation.

Robert covers his points so well that I assume he is one of the Days of Wonder staff, and it isn't until I am talking to Mark later that I realize he is a board game fan hired for the duration of the show. This fan gave a better presentation than most of the game professionals I've talked to over the years. Why don't companies bring in more guys like him?

. . . and Wading In

I finish chatting with Mark, and I'm out of excuses. If I want to find new lines for the store, I'm going to have to talk to somebody new. I'm terrified. No matter what a distributor friend told me about how the exhibitors were eager to talk to small stores, I feel like too small a fry for them to fish for.

But as I walk around the show, I start to notice something about the displays around me. A lot of them aren't very good.

Some of them are good, some of them even better than good. Front Porch Games has bought a double booth at the end of the aisle and turned it into a mock living room with couch, coffee table, and bookcases. They sell high-end board games that look good in designer living rooms, and their games shine in the setting they've created. Even though their biggest games are a little too swank for my store's current audience, I'm all over their travel kits for chess, checkers, and poker.

There are other manufacturers whose booths stand out. Other booths look like the Alliance booth -- competent, with good games on display and professional salesmen ready to talk them up. But I see a lot of booths with not much more than a game on a table and what is obviously its inventor standing behind it. No signs, no pizzazz, just a stoop-shouldered designer watching the buyers pass him by.

A 10'-by-10' booth at Toy Fair costs at least \$2,600. That's a lot of money to spend and not get results. But a lot of those 1,400 manufacturers do just that. I walk down whole rows that seem to say, "Uh, we exist. Why don't you love us?" and the thought that's going through my head is:

"These people are just as clueless as I am."

Home from the Sea

If this were an inspirational fairy tale, I'd tell you about how I hooked up with a plucky little manufacturer and set out to conquer the world. Didn't happen. I filled my satchel with catalogs of interesting-looking mainstream games, talked with a few people about the dominoes and mancala sets I needed, and caught the evening train back to my family. Seven hours of New York is enough for this country mouse.

Short as it was, this trip was an eye-opener for me. It's hard not to think of the toy industry as separate from hobby games, even when intellectually you know that hobby games are just a little niche of a larger entertainment industry. Hobby game professionals are every bit as clannish as the fans they sell to, and only a few brave companies even consider leaving the cozy confines of the GAMA Trade Show and venturing onto the larger stage of Toy Fair.

And yet there is a continuity between hobby games and the rest of the toy industry. The big fish in toys may loom over the typical hobby game company, but the littlest players aren't all that different from each other. Hobby retailers struggle with a narrow slice of the problems that general toy retailers worry about -- which makes me glad, since I have enough work picking out games without trying to learn how to buy dolls, baby toys, and sports equipment. But the problems are the same problems.

Maybe it's time for more hobby game manufacturers to push out of the comfortable box of the gamer market. Not all gamer games are appropriate for a larger audience, but enough games do cross over -- **Apples to Apples**, anyone? -- to make pursuing the idea worthwhile. Even the mediocre hobby game companies make better-looking games than some of the games I saw at Toy Fair this year, so the only thing standing between them and the big time is subject matter, some marketing dollars, and the will to succeed.

The toy industry could use some fresh blood, too. Mainstream manufacturers have been feeling just as much economic pressure as the hobby companies. As I rode home on that train Sunday night, I flipped through one of the magazines I'd picked up at the fair. A headline caught my eye: "Breaking Out of the Juvenile Mode." The article underneath described how manufacturers and retailers are having trouble reaching the kids that used to be the bedrock of the business. It encouraged those manufacturers and retailers to look for new venues and new toys that appeal to older kids and adults.

Wouldn't it be funny if there just happened to be a niche of the toy industry devoted to making games for older kids and adults?

The larger world awaits.

Frank Hamer, Texas Ranger

by Hans-Christian Vortisch

"One riot, one Ranger."

-- Captain William McDonald

Captain Frank A. Hamer was probably the most famous of the 20th-century Texas Rangers, that old-fashioned law enforcement agency responsible for upholding the law in Texas.

This article provides a ready-to-play *GURPS Fourth Edition* representation of the real man for a Cops, Cliffhangers, or even a late-period Old West campaign. However, it might also be useful for *Call of Cthulhu* and *d20 System* historical settings, or other historical or pulp adventures.

Francis Augustus Hamer, usually called Frank or nicknamed "Pancho," was born on March 17, 1884 in Fairview, Texas. As a youth, he worked in the blacksmithy of his father, and then started working a farm at age 16, together with his brother. They got in an argument with the landowner, during which the man shot Hamer with a shotgun. Hamer could escape, and after having recovered, the boy went straight for the landowner and killed him in a duel.

This was only the first of many shootouts. Throughout his life, Hamer took part in over 50 gunfights and killed at least 20 men and one woman -- "not including Mexicans," as they used to say in those days. It was also far from the last of his many gunshot wounds; he was injured 23 times. When Hamer died, his body was covered with dozens of bullet and knife scars, and he still had some bullets and shot pellets under his skin.

In 1901 Hamer started working as a wrangler on the ranch of Barry Ketchum (brother of Tom "Black Jack" Ketchum, p. OW102), and continued to work as a cowboy for several years, until he helped catching a horse thief in 1906. This earned him a recommendation from the local sheriff to the Rangers.

He was already an accomplished outdoorsman and expert shot with rifle and revolver. In April 1906, he joined Company C of the Texas Rangers, where these skills were much in demand and further honed. He would endlessly practice his aim, and was able to shoot a hole into a silver dollar at 15 yards with his revolver. In addition, he had also learned [Savate](#) (p. MA99) from a French martial artist, and became famous for his kicks to bring down renitent offenders.

Hamer patrolled the South Texas border until 1908, when he resigned to become marshal of Navasota, Texas. In 1911 he left that post as a special officer in Harris County, but in 1915, he rejoined the Rangers. During the troubled period of the late 1910s and early 1920s, the Rangers received much criticism for excessive force and latent racism, but also managed to bring some order to the border area that was plagued by [smuggling](#), bootlegging, and banditry.

Hamer was absolutely fearless, but also without mercy. Neither characteristic necessarily makes for a good policeman, but at the time, they were thought highly of in a man of the law. He was ambushed four times by enemies, and twice left for dead. Hamer eventually caught up with all of his ambushers; none survived.

In 1920 he left the Rangers again for a short spell as a prohibition agent. He soon returned and was made Senior Ranger Captain on January 1, 1922, commanding all Texas Rangers. Hamer moved to Austin, Texas, where he made his permanent home. He had married Gladys Johnson in 1917, and the couple had two sons, Frank Jr. and Billy. As late as the 1920s, the Texas Rangers were mainly concerned with cattle thieves, as well as smugglers crossing the Rio Grande (the latter's trade soaring with the beginning of the prohibition, the tequileros working 1,000%-profit deals). Many of these criminals were Mexicans, which didn't improve the somewhat slanted outlook the Rangers often had towards anyone who wasn't white.

In 1928, Hamer left the Rangers and became a bounty hunter for the Texas Banker's Association. He was instrumental in exposing murderous police officers (including among the Rangers), who framed and killed innocent

people in order to collect a standing reward of \$5,000 for any dead bank robber. Hamer rejoined in 1929, but finally retired from the Rangers in 1933, forestalling being sacked like all other remaining Rangers by controversial Texas Governor Miriam "Ma" Ferguson.

However, in April 1934, he took up a commission to hunt down the infamous Barrow Gang (better known as Bonnie & Clyde) as a special agent for the Texas Highway Patrol. He was paid a measly \$180 a month; asked about this, he commented that "crime doesn't pay, not even for those who fight it." Hamer picked up their [trail](#) in Texarkana, Texas, but always seemed to be a day behind the murderous pair. He traced the gangsters for 102 days through several states, until he finally ambushed them with the help of several other lawmen on a dirttrack in the backwoods of northwest Louisiana on May 23, 1934.

His posse consisted of Officer Murray Gault from the Texas Highway Patrol (also a former Ranger), Dallas County Deputies Bob Alcorn and Ted Hinton (the only two lawmen who knew Bonnie & Clyde by sight), as well as the local officers Sheriff Henderson Jordan from Iverson County and Deputy Prentiss Oakley from Bienville Parish. They set up a camouflaged ambush site opposite a decoy truck on a sideroad in the vicinity of Plain Dealing, Louisiana, and waited more than seven hours in the bushes until the pair drove up in a stolen Ford V8 around 9:10 a.m. Accounts differ whether the outlaws got so much as a call to surrender (at least Hamer, Alcorn, and Hinton had a previous record of shooting first, asking later), but in any case the six officers ventilated the outlaws' car with 167 shots (emptying their shoulder arms and their side arms, and possibly even reloading) before they could do anything. It was instant "death for Bonnie and Clyde."

"I hate to bust the cap on a woman, especially when she was sitting down, however if it wouldn't have been her, it would have been us."

-- Captain Frank Hamer

Hamer became nationally famous overnight and received a citation medal from Congress. During the late 1930s and 1940s Hamer worked for various private companies as a strike-breaker and riot-control agent. He retired in 1949, and died at home on July 10, 1955.

Weird War

Captain Hamer was a capable law enforcement officer -- but he also thought of himself as a true warrior. In late 1939, he wrote a letter to King George VI of England, offering him his services. He boldly proposed to come to the British Isles with 49 hand-picked ex-Texas Rangers, to defend Britain against the Germans. This troop would probably have included his brothers Estelle, Harrison, and Flavus, all former Rangers like himself.

The King later thanked him kindly for the offer, but the U.S. government would not hear anything of it -- at the time, the USA was still officially neutral.

Realistically, it is unlikely that 50 aging policemen (Hamer himself was 55 years old at the time), however capable, would have made much difference in the Battle of Britain (pp. W17, W:AKM23-24) or the threatened German invasion (pp. W17, W:IC13, and W:WW7). Nonetheless, an alternate history campaign might see larger-than-life Texas Rangers rallying the King's men around them, triumphing against Nazi hordes, and ultimately changing history . . .

He also might have joined forces with other former police men such as William [Fairbairn](#) as instructors of special ops troops.

Description

Hamer was a tall, fit man, perpetually tanned and with brown hair and blue eyes. Like most rural American police officers of the early 20th century, he was always dressed in cowboy boots, dark trousers, white shirt, dark tie, and dark jacket, topped with a wide-brimmed hat and a cigarette between his lips.

For most of his career, Hamer carried an engraved .45 Colt M1873 SAA revolver with 4.75" barrel (pp. HT110, OW86, W:D71) called "Old Lucky," either in a holster on his right side, or, when he was no longer required to ride a horse, simply tucked into his waistband. When expecting a gunfight, he also took a .44 S&W Hand-Ejector revolver with 6.5" barrel for backup. His favorite longarm was a .30-30 Winchester M1894 lever-action rifle (p. HT114).

However, for the hunt on Bonnie & Clyde, he replaced the S&W revolver with a .38 Colt Super Auto pistol (pp. HT108, W:D71) and the lever-action rifle with a .35 [Remington Model 8](#) semiautomatic rifle (p. W:D72) with 20-round magazine extension (both weapons offering superior penetration against bullet-proof vests and the heavy Ford V8 sedans Clyde Barrow was partial to).

Hamer also owned many other guns. When the posse assembled in a hurry in a Louisiana hinterwald small town, three of the men could not bring their own long arms, and were outfitted from Hamer's personal rolling arsenal -- Gault got Hamer's .25 Remington Model 8 semiautomatic rifle, Alcorn his .30-30 Winchester M1894 carbine, and Hinton his .30-06 [Colt R80 Monitor](#) machine rifle (a variant of the M1918 BAR, pp. HT114, W:HS21, which was the chosen armament of the outlaws).

The Omniscient Eye

Everything You Wanted to Know About Silver (But Were Afraid to Hack)

While I am sure there was a problem with debased coinage in the mid- and late-medieval era, wouldn't the problem have been *much* worse in Scandinavia in the early medieval time, when coins were rare, so that barter was "balanced out" with hack-silver?

I can easily imagine some characters -- *especially* player characters -- acquiring a hoard of hack-silver (a dozen pounds, perhaps) and then deciding to "stretch" it by melting it down and adding something that is not silver.

First of all, how much can you debase hack-silver before it can be seen/felt? What would be the best metal to use for the purpose? How pure was Viking age hack-silver (most Viking age hack-silver was probably loot from raids on monasteries)?

Secondly, how difficult is it to melt silver? In terms of melting point, will a wood fire do or do you have to use charcoal?

Even if charcoal is needed, I can't see why characters shouldn't get away with it, consistently. Can you, Eye, come up with any realistic means to minimize this practice, or to discourage it entirely?

As long as the characters don't debase the silver too much, the only side effect I can think of is that it might disrupt the economy. But that is a slow process, and anyway I imagine the economy of Viking lands to be pretty flexible and robust, quite able to absorb large quantities of silver whenever spend-happy travelers came home with some.

--Peter Knutsen

For those not familiar with the phrase, "hack-silver" is a term used to describe fragments of precious metal objects used in Medieval northern Europe, often coins but also arm bands, necklaces, and other jewelry, hacked to pieces to get smaller and easier-to-circulate bits of metal. We'll concentrate with issues around coinage for the most part, but much of this is applicable to jewelry as well.

In an economy that runs without a lot of money, even a small silver coin is worth a lot, so cutting coins into more manageable bits has been practiced in a number of societies. For example, the English farthing, worth a quarter of a penny, developed from a practice of cutting silver pennies into quarters (or "fourthings"), and every pirate's favorite currency, "pieces of eight," refers to cutting Spanish dollar coins into eight wedge-shaped pieces. Many such coins were even minted with deep grooves to make it easier to divide them evenly. Hack-silver bits are typically more irregular than the even wedges of such divided coins. The Vikings were apparently far more interested in precious metal content than in any kind of stamp of official approval, so they used any precious metal object that came to hand and chopped them up as the occasion required.

Precious metal objects available to the Vikings would have come from a wide range of sources. Far-ranging Viking traders regularly visited Constantinople and the edges of the Muslim world, and they were hooked into trade networks that went all the way into China (an archaeological excavation of a Dark Ages Viking trading post in southern Denmark turned up a jade Buddha), so they traded in a variety of coinages. Even closer to home, they would have encountered a wide variety of coins. Much of northern and western Europe depended on supplies of ancient, Byzantine, and even Arab currency for money during the early Middle Ages. Some Merovingian kings were buried with gold coins minted under Alexander the Great, and one late ninth century hoard excavated in Holland held twice as

many Arab dirhems as coins minted by the Carolingian kings then ruling from nearby Aachen. Even when minting started again, counterfeiting and debasement were recurring problems. With coins minted across centuries and continents, there would be little or no uniformity in silver content. Many coins would have had precious metal contents of 80-95%, but it could dip as low as 25% for legitimate coins struck in that region during that period, or even lower for late third-century Roman denarii (if any of those nearly worthless coins remained in circulation) and counterfeits. And with no control exercised over the silver content of jewelry, the armbands and necklaces used as both adornment and stores of wealth could be of any purity.

Of the metals available in antiquity, three are likely candidates to mix with silver to produce a low-cost alloy: copper, lead, and tin. Though iron was widely used, furnaces hot enough to actually *melt* it rather than soften and weld it didn't develop until the end of the Middle Ages, making alloying it impossible, and many metals widely available today, such as zinc, nickel, and aluminum, weren't known or weren't available in sufficient quantity to be significant. Any coin is likely to have tiny quantities of at least some of the "big three" metals (most likely lead; most European silver came from galena, a lead-silver ore) as well as other trace elements in some proportion. Even the purest silver in antiquity rarely got above 95%, and most coins topped out around 92%. Copper will redden the resulting alloy if too much is added and make it lighter for its volume. Lead, a common additive to silver because it softened the metal and made it easier to manipulate, won't change color as much, but it will reduce the shine and hardness and make the silver heavier for its volume. Tin will have the least effect on color and weight, being a more similar color and about the same density, but it will still have an effect on hardness and shine. Tin is also rarer and more valuable than copper and lead, so cutting the silver with tin is less cost-effective. An ancient smith might also experiment with small quantities of sulfur, arsenic, and a few other substances, although their effect may be very subtle. Naturally occurring trace impurities of elements he is unable to manipulate or might be unaware of will also have some impact on the metal's physical properties, so even samples of "pure" silver, or any other metal for that matter, will differ from one another in small ways.

A dedicated forger could resort to coating a base metal object with silver leaf or a thin coating of molten silver. A few other techniques might become available to particularly clever alchemists. Some pre-Columbian metallurgists in South America hit on a method of chemically treating specially formulated silver alloys to leach non-silver atoms away from the surface, leaving a layer of relatively pure silver behind (they had a similar trick for treating gold alloys). For something even more effective but difficult to achieve, archaeologists working outside Baghdad shortly before WWII uncovered a number of small ceramic jars containing copper rods wrapped in iron. Chemical analysis indicates that the jars had been filled with a dilute acid solution, probably vinegar, wine, or grape juice. This would have made them weak but functional wet-cell batteries. Their actual use remains a mystery, but one suggestion is that they could have been used for electroplating. Either of these techniques would be more efficient, in terms of the amount of metal used, than relatively crude use of metal leaf, and far more suitable to reproducing the detailed surface features of coins. On the other hand, even coating with metal leaf requires considerable work and skill, and all of these surface treatment techniques are very vulnerable to detection if one breaks the treated object open or simply scratches the surface deeply, so alloying is probably the best approach to take.

Pure silver melts at 1,761° Fahrenheit, which is past what can reasonably be done with a wood fire. It's not impossible, but it would require absolutely ideal conditions and a very carefully constructed furnace, all of which would be a great deal of trouble to set up. That temperature is, though, well within the realm of temperatures that can be achieved with charcoal. Charcoal is relatively easy to produce (far easier than building a 1,700°+ degree wood fire), so the need for charcoal shouldn't be seen as a significant limitation. Given the limited menu, the choice of metals to alloy with won't make much of a difference so far as required pyrotechnology is concerned. Copper melts at 1,981°F, higher than silver but not so much so as to make a significant difference, while lead melts at 621°F and tin at a mere 500°F.

Though the idea of melting a bunch of metals together is simple in principle, actually doing it is no small task. Low-tech metallurgy requires skills gained only by long years of practice. In the imagination of most low-tech societies, the skills of smiths bordered on the magical, and with good reason. For example, the process of producing an appropriate alloy requires laying fuel properly to maximize airflow and get the maximum temperature, placing the material to be melted in an appropriate place within the pile of fuel, judging times, temperatures, and the composition of raw materials by look and feel, and using clumsy equipment in uncomfortably hot conditions. And that's just to get a lump of metal! Producing wire, tools, coins, or jewelry requires very specialized skills and equipment. Anyone attempting

even the most basic procedures without appropriate skills is likely to lose metal in the process, burn their fingers, or simply not get it all hot enough.

But all this really means is that unskilled characters won't be able to produce metal alloys at will. Someone with a bit of metallurgical ability easily can. A half-trained blacksmith's apprentice with basic tools could melt down coins and raw metals and produce serviceable ingots, which is all you really need for hack-silver. To produce convincing coins (carving a new die for striking coins or producing a copy of a die from an original coin) would be beyond the talents of a village blacksmith, but any city should have several jewelers capable of the task. The prospective forger would start by taking a casting of the coin in wax or clay to act as a mold to produce a die for striking his own coins. The new die won't have the same level of detail as the original, but it can produce reasonably convincing copies. A sufficiently persuasive character could simply subvert one of the makers of the original coins and get legitimate dies smuggled to him. The only really large challenge would be to create an inexpensive alloy that closely matched *all* the easily analyzed physical properties of the pure metal (color, hardness, melting point, density), which, under prevailing conditions, is a question of art, not science. So what's to stop a bunch of greedy PCs from cutting their stash to make it go farther? On the technical side, very little if they can find someone with the right skills.

What's *really* stopping them, though, is that no matter how much trouble they go to, they won't be fooling anyone. People accepting precious metals in bulk have historically *expected* metals of dubious purity. The coins and jewelry from which the hack-silver is usually derived, after all, are of wildly varying properties, so someone being offered silver fragments won't bat an eye if some are too dull, some are coppery, and some are rather heavier than expected. The real question isn't at what point someone can tell the metal has been debased, but rather the accuracy to which debasement can be measured and how much work one is willing to put in to measuring it. There are a number of assay tests which can be performed at low levels of technology. For example:

- Examining the color and shine closely.
- Scratching or snipping a sample to make sure the silver is uniform throughout.
- Biting to test hardness.
- Weighing the fragments and comparing that to volume (measured by, say, dumping them into a bucket of water) to determine density.
- Dropping the fragments on a hard surface and gauging the sound; a pure metal will have a slightly different "ring" than a debased one.
- Scraping the metal against a white stone and examining the mark. The color and refractive properties of the streak, which can be subtly different from the surface character of the object which makes it, is indicative of the composition of the metal.
- Melting down the silver. A skilled metalworker will be able to determine the approximate temperature at which the sample melts by sight, but an easier test is simply to melt the sample being assayed along with a sample of known purity. Any significant alloying will alter the melting point tremendously, and the sooner (or later) the hack-silver melts than the pure silver, the greater the impurity.

Of course, the same things that make smithing difficult (a complete lack of temperature-measuring equipment and the vaguest possible means of testing hardness, only moderately accurate weight and size measuring tools, limited chemical knowledge, etc.) also make determining the precise purity of metals difficult. What this means is that some people, mostly merchants, jewelers, tax officials, and others who deal with precious metals on a regular basis, will be better at determining the purity of hack-silver than others (if your game system of choice has them, assaying silver could be an application of merchant, blacksmithing, and/or financial skills), and at best someone examining the debased silver will be able to get a rough ballpark estimation of the degree of debasement. This will quite possibly be a very simple division between "good" and "bad" silver, and much quibbling over the precise value will follow. Rather than making it appear as though they have more silver, counterfeiters will simply be adding a bit to the uncertainty of the value of their metal which, if they're persuasive, they might exploit for some small gain.

Some of the tests listed above are also too much work for everyday use. How much effort goes into assaying the silver depends on the size of the transaction. If characters are using a small quantity of hack-silver to pad out the value of a larger purchase (say, a cow and a handful of silver for a horse), the seller is probably going to estimate the value of the silver by eye and perhaps one or two other easy tests. However, if they try to use a large quantity (say, a heavy purse

of silver for a large farm), the seller will want to be very sure about just what he's getting, and he may go through several assay tests. Consequently, characters might be able to pad out their "small change" purchases by a few percent, particularly among peasants and tradesmen in smaller towns, by alloying their silver, but they'll have much less luck with large purchases. And given the time and trouble the PCs would have to go to in order to create debased alloys at all, it's probably not worth the effort for the small benefit it would provide.

If PCs want to embark on a career in counterfeiting, then Viking Scandinavia, or anywhere pure metal content is the sole measure of value, is probably the wrong place to do it. Instead, they should try to take advantage of heavily monetized economies. Why? Two reasons:

First, in an economy where money is in heavy use, there's less of a perceived need to check the metal content of the coins (not *no* need, but less of one), which makes assay tests less likely. Certainly, if the precious metal content of coins issued by the government drops, the effective value of the currency will go with it, but as long as the coins PCs try to pass don't look too terribly different from those in circulation (say, within 10-15% of the metal content of existing currency, or perhaps more if they're particularly skilled metallurgists or can mix worse coins in with better or even real ones), they'll pass casual inspection. If they're available to the PCs, the exotic surface-treatment technologies mentioned above are also far more likely to work.

Second, there's a better return on investment. In monetized economies, coins tend to circulate at a slightly higher value than that of their precious metal content alone. The implied guarantee of a particular metal content and their status as legal tender for particular kinds of transactions (for example, certain taxes may have to be paid in coin rather than goods or even precious metal bullion) makes them a bit more valuable, probably on the order of 5% above their metal content.

Of course, there's a downside as well. If you're discovered debasing metal in Viking Scandinavia, you'll probably suffer social rejection and possibly a beating at the hands of annoyed customers. If you're discovered forging coins in a more sophisticated kingdom, you'll be under a death sentence. From very early times, forgery has carried the most severe penalties. There's money to be made in forgery, quite literally, but it's a very dangerous occupation.

--Matt Riggsby

Sages theorize that the Omniscient Eye might actually be composed of a panel of Experts chosen through mysterious and arcane means. Regardless, the Omniscient Eye is benevolent, and every other week it is willing to share its lore with all. Or, at least, with all with valid *Pyramid* subscriptions.

The Omniscient Eye seeks to answer questions that are tied to knowledge of the real world, providing information with a perspective that is of use to gamers. The Omniscient Eye does not concern itself with specific game systems or statistics.

Do you have a question for the Omniscient Eye? Feel free to send it to pyramidquestions@yahoogroups.com, and the Omniscient Eye might answer it!

Dundjinni

Published by [Fluid Entertainment](#)

\$39.95 for Macintosh or Windows PC; Additional Art Packs \$4.95-\$14.95

Requires Java 1.4 or higher

Windows 98 or Mac OSX

800 MHz Pentium 3

256 MB RAM

85 MB hard disk space (more is better)

Uses PNG file format for importing art objects

Exports output to HTML or proprietary DJA adventure files

Imports XML *d20 System* character information from e-tools

A color printer will be needed for optimum quality output

When I saw the art samples from the ***Dundjinni*** website I may have actually drooled on my keyboard. I am a long time gamer, and have long wanted software to make my life as a GM and player easier. This has led to me to buy several versions of ***Campaign Cartographer***, various character generators including e-tools, and to spend ridiculous amounts of time making spreadsheet tools to "automate" character creation for various games. This has been a hit and miss effort because many of these programs didn't perform as they were supposed to, or the learning curve on the products was too steep for my patience.

Dundjinni is mapping software with the ability to make beautiful and functional maps quickly and easily. The maps are rendered bitmaps, not the CAD-like isometric drawings from other mapping programs. The printed output from these maps is comparable to the tiles from ***Cardboard Heroes***, and if you have a good color printer and some cardstock paper you can make detailed maps suitable for miniatures combat in just a few minutes.

The map creation process is simple. ***Dundjinni*** starts with a blank canvas, and then you add the art using paint tools that will be familiar to most computer artists. Floors and walls have textures to choose from such as rock, dirt, clay, and wood. Objects such as chairs, torches, ropes, traps, treasure, and weapons can be pasted onto the map with the stamp tool. Special cover effects such as fog, smoke, and magical sparkles can be pasted onto the map to enhance the appearance. On top of this you can place optional hex or square grid markings.

Printed maps default to a scale of ¼ inch = five feet. This means a very large map can be printed on an 8.5×11-inch piece of paper. Any section of this map can be selected and printed as a "battle map." The battle map will print to a scale of one inch = five feet. This works very nicely with miniatures and which elements of the map you wish to print (floor, walls, doors, etc . . .) can be selected prior to printing.

These map design features are very intuitive, and the program comes with a Dungeon art pack which allows for a very detailed dungeon to be created. Additional art packs are available from the ***Dundjinni*** website with prices ranging from \$4.95 to \$14.95, with bundle discounts available on some sets. There is also a vibrant and active user community which provides hundreds of free art objects which can be used with ***Dundjinni***. Furthermore, the program recognizes the PNG file format which allows the user to make or import many additional objects.

As a mapping program, ***Dundjinni*** is very good. But I was surprised to discover that it also will easily turn a map into a fully realized adventure module. If you are running a ***d20 System***-based fantasy game and make your own maps, this software can save hours of time in creating an adventure. The program comes with more than 100 pieces of art, and many more are available from the user groups or from art packs sold at the Dundjinni web store.

Every object you place in a map can be right-clicked on and given a description. For example, you can place a rope and write in the description, "This is a magical rope that will add +5 to climb checks." By placing special room key objects into your dungeon rooms (areas separated by walls are rooms) the program will take an inventory of every object in the room. **Dundjinni** also comes with the ability to add monsters and includes many of the basic monsters from the **d20 System** complete with stats. Finally, the program can import characters, monsters, and NPCs from the e-tools program. The developers have also partnered with several game companies such as Reaper, and the program includes artwork from painted miniatures to assign to characters and NPCs.

All of these special objects (rooms, monsters, characters, and details) are recognized and assigned to the room in the map where they are located. A dialog window allows you to define the character hooks, background on the adventure, synopsis and any special notes for yourself and future GMs.

After you've placed all these objects, **Dundjinni** can print out your adventure. It comes with a cover sheet that details who made the adventure, and then it prints out a walkthrough of the dungeon complete with every item in the rooms, the stat-blocks for all monsters, and the stat-blocks for any characters. Special icons identify portions of the description to be read aloud. After this section come your maps, and finally a page prints with character counters to use as miniatures for the adventure.

I was able to figure out the basics of **Dundjinni** quickly from my experience using previous paint programs. The ability to create the adventures will require either reading the manual or following the tutorial which is available for download from their website. So far I think **Dundjinni** is the best RPG mapping program I've used, but like any software it isn't perfect.

There are a few caveats you should be aware of before buying **Dundjinni**. First, it is written in Java, and requires the download of the Java virtual machine. It will run with Java 1.4 or 1.5, but you will need to make sure that previous versions of Java have been uninstalled first.

The adventure creation program is extremely cool and fun to use, but is obviously geared towards **d20 System** fantasy. If you want to use it for another system the objects and maps will be great for you, but the character and NPC tools will be useless.

Finally, if you plan to run anything other than fantasy you will need to either be able to make your own art, or have some friends who do. **Dundjinni** has announced plans for a modern art pack, but it is not out yet and while the user community has provided some beautiful starting tools, there is a definite lack of modern and futuristic art available.

Overall, this program is wonderful. I'm not going to throw away my **Campaign Cartographer** or **Fractal Mapper** software yet, but the output from this program just blows them away for tactical mapping. Finally, the adventure creation tool is the best software GM helper I've seen.

Pyramid Review

Machine Tractor Station Kharkov-37 (for *Call of Cthulhu*)

Published by [Chaosium, Inc.](#)

Written by Bret Kramer

Illustrated by Mithras

Cartography by Brett Kramer

110-page tapebound b&w book; \$20.00

The 10th of Chaosium's answer to the PDF revolution, the Miskatonic University Library Association monograph, *Machine Tractor Station Kharkov-37*, takes the players deep into Stalinist Russia. Where previous visits to this era, "Sleigh Ride" in Chaosium's 1992 anthology, *Fearful Passages*, and "Secrets of the Kremlin" from T.O.M.E.'s 1984 *Glozel est Authentique*, allowed the players to visit the Soviet Union using their normal investigators, in *Machine Tractor Station Kharkov-37* they play members of the Soviet establishment. This is a one-off or tournament scenario, much in the mold of [No-Man's Land](#), but with strong nods to both the scenario "The Killer Out of Space" from *Cthulhu Now*, and "GRU Spetsialni Viedotstvo 8" (or GRU SV8) from Pagan Publishing's [Delta Green: Countdown](#).

[SPOILER ALERT]

It is March 1933 and contact has been lost with Machine Tractor Station Kharkov-37. Part of the collectivization program, it is the depot for the tractors and other equipment leased to the surrounding kolkhozes or collective farms. Output and production significantly increased for 1931, earning it both the Order of Lenin and a test dairy. The station has also attracted the attention of the OGPU (or United State Political Directorate, a precursor to the KGB), and once contact has been lost with both the station and the OGPU team, the GRU (the Soviet Union's military intelligence) likewise take an interest. The SV8 was established to keep an eye on the special projects handled by the OGPU for Stalin, in case they turn out to be a threat to the USSR. Operating undercover as members of TASS, the Soviet Union's Telegraph Agency, a trio of GRU agents is assigned to investigate, but first they must collect both supplies and troops from Red Army Supply Depot 945.

This scenario is designed for exactly six players, who will take the roles of the three GRU agents and the commanding officer of Red Army depot 945, its doctor, and its political commissar. With twenty troops in tow, the convoy makes its way to the Station to discover a scene that is much a dustbowl as it is a snowfield. The inhabitants and livestock are all missing. The Station and its environs are all strangely desolate and lifeless . . .

What lies ahead is a strangely bleak mystery. Although the players are unaware of it, there is a deadline built into the scenario. The likelihood is that they will be too busy investigating the situation. And there are a lot of clues to look into, perhaps too many. Not only do the characters have to contend with the investigation and the cause of the mystery, there is another source of tension built into the scenario. This is between the two factions of the character party, the soldiers against the GRU agents. The latter of course, have access to more information, and it is suggested that the Keeper prepare appropriately decorated folders for each of the pregenerated characters. A nice touch is the effort made to make the orders for the GRU characters look like one-time cipher pads, a secondary result being that the orders are actually difficult to read from a distance.

[END SPOILER ALERT]

The actual advice for the Keeper is best described as short, but thankfully it is to the point, and the scenario could not exactly be described as being either lengthy or complex. Instead there is a stark and dangerous simplicity to ***Machine Tractor Station Kharkov-37*** that leaves plenty of room for the players to get into character and roleplay. What the players should relish is the atmosphere the scenario encourages: Party paranoia and distrust against an increasingly desperate situation.

In terms of production, ***Machine Tractor Station Kharkov-37*** is better than many of the other MULA monographs. What few problems there are -- the slightly off index and the blandness of many of the handouts -- cannot be described as being debilitating or distracting. Subsequent printings should see them fixed anyway. The maps are bland though serviceable, and the book is nicely illustrated with a selection of Stalinist-era posters that will look good if the book sees proper publication and distribution. With luck, when that happens, Chaosium will adhere to Soviet chic for its look, as its current house style of the faux manuscript would be the book's ruin.

Some might complain at the set number of players and the fact that they are all male. Neither problem is addressed, and perhaps it might be in subsequent printings or a full publication. Others might find fault that it is another one-off affair, but it does offer a fresh look at a previously used threat *and* in some way gives a much more simple and fresh take upon the game than many of Chaosium's recent releases.

Ultimately, this is not a scenario that can be run with any ease, but that it is a one-off affair means that its near no-win situation is both far more atmospheric and effective. By setting it in the Soviet Union, ***Machine Tractor Station Kharkov-37*** brings a fresh approach to encountering the Mythos and it should provide an experience to remember.

--Matthew Pook

Palace of the Queen of the Mist Elves

by Matt Riggsby

Caerceol is a secluded castle imbued with powerful, if largely passive, magic. This setting is appropriate for traditional fantasy settings and is amenable to a broad range of modifications to fit an existing campaign.

History

Caerceol is the centuries-old seat of power of the Mist Elves, a reclusive faction of elvenkind living in a region of forested highlands. A legendary warrior queen, exiled from her home, and her followers carved a country out of a no-man's-land inhabited by monsters and barbarians, and they settled down to rule it. Their palace was constructed by a quiet, misty lake.

From the beginning, the elves constituted a small ruling class over a mix of forest-dwelling elves, humans, and quasi-human creatures drawing a comfortable if unspectacular living from the forests and painstakingly cleared fields. The general population retains elements of higher civilization (for example, a significant minority of peasants are at least semi-literate), but their neighbors are mostly barbarian clans who raid at any opportunity, and the small kingdom is weeks' travel from the closest civilized land. Though diminished in numbers and power, the mist elves maintain their defense of the realm and the remnants of their ancient culture. The center of that culture is Caerceol. In its libraries, furnishings, and court rituals are preserved the glories of days past and the traditions of an ancient people.

The Approach

The kingdom is liberally wooded, and Caerceol is surrounded on its landward sides by six miles of thick forest. The woods themselves are magical: even if characters employ an army of woodsmen to cut down the forest, the distance from the edge of the woods to the castle remains the same. The region is also always wrapped in light mist, cutting visibility down to a half mile at most if you can climb above the trees; down among the trees, you're lucky to see 20 yards. The occupants of Caerceol have little use for roads, and there are no easily discerned paths through the woods. Between the thickness of the woods and the all-encompassing mist, it's easy to get lost. To anybody but an experienced woodsman or a lifelong resident, each dripping, moss-encrusted tree looks like another. There are, however, a number of rune-inscribed standing stones pointing the way. Characters without a guide or a good sense of direction may spend days wandering through the woods, but they'll find the castle sooner or later.

Caerceol also overlooks a misty lake. A few small islands, hardly more than mossy rocks with a few trees on their steep sides, are visible from the shore. None are permanently inhabited, although occupants of Caerceol may sometimes steal away to them for a bit of privacy.

The Site

Caerceol is set on a roughly triangular hill bordered by a stream and the lake. The stream isn't wide (no more than 10 yards), but fast, cold, and too deep to wade. It broadens into a small reedy delta as it pours into the lake. Main access to the castle is a stone bridge across the stream. The water-ward sides are also the steepest sides of the mound. In fact, the curtain wall is over 30 feet tall along the lake face, but because the land behind is much higher, it only rises about four feet above the surface on the lawn inside. The third and narrowest side faces the forest. While the sides of the mound on the stream and lake sides have been kept relatively clear, the forest comes nearly up to the landward wall, with a gap of only a few feet of rough lawn between the wall and the woods.

The hill is partly artificial. The castle incorporates remains of the foundations of at least two earlier fortifications, and all lie atop an older earthen mound. Legend holds it to be the remains of an even older fortress or the burial mound of the first queen.

The Walls and Garden

The curtain wall is made of roughly squared-off stones, dark with age and decked with ivy and lichen. The workmanship, though, is solid. The wall is fortified with several towers and encloses the keep and a well-tended lawn/garden. Letters indicate locations on the overhead view. Numbers indicate locations on the interior floor plans. 

River gate (A): The river gate consists of a gatehouse on the far side of the stream, a stone bridge, and a second gatehouse at the curtain wall. Each gatehouse includes two narrow towers and a parapet over the gateway. The doors, usually closed but not barred, are heavy wood bound with black iron. Each gatehouse is manned by two or three sentries, although the terrain renders a lookout somewhat futile. The guards reside in the upper levels.

Boat tower (B): Near the point where stream meets lake, this "tower" is really a raised parapet atop a small gallery along the wall. The gallery consists of three small rooms for storage space and pallets for the guards. It has arrow slits facing both inward and outward, and the door can be barred for independent defense in case the wall is overrun. It also has an outward-facing door about fifteen feet above ground level. The doorway lets out onto a set of wooden steps descending to the lakeshore near a stone boathouse and dock. Most of the palace's daily supplies are brought from villages along the lake to the dock and are carried up through the boat tower.

Far post (C): The far post, at the other lake-facing point of the triangle, gets its name from being the fortification farthest from the keep. It is simply a small tower just taller than the wall, containing a small room.

Kitchen gate (D): The kitchen gate, along the second land-facing side of the triangle, gets its name from being the gate through which fresh game is usually brought from the outside. It is a gatehouse similar to those by the stream.

Small post (E): The small post, at the third point of the triangle, resembles the far post but is slightly smaller.

Garden (F): The garden (Americans would call it a lawn) is mostly well-tended grass, but in season, there are beds of flowers near the Great Room and patches of herbs by the kitchen entrance.

Groaning Well (G): Known locally simply as "the well," the Groaning Well is just a water source for most of the year: a wide stone-lined well of unknown depth. During the storms of winter, however, it produces a "voice" of groans and low booming noises. During those times, everyone avoids the well, except for the queen, who will stand by it for hours at a time in something approaching a trance. It is believed that the voice of the well will give her oracular insight and advice. The ordeal, though, is harrowing; a number of older queens have died by the well.

Grove (H): The grove is a stand of ancient trees near the far post. It is the only part of the garden which is not carefully cultivated. The densely set trees are a remnant of the forest's ancient days and are said to go back to the beginning of the world. Rumor has it that the grove is a magical portal; anyone who can squeeze between the intertwined branches can make their way to any other part of the ancient forest which remains wooded. The leaves, bark, and other parts of the trees are used for healing and magical purposes, but few attempt to enter the grove for fear of bad luck (the gardener is scrupulous about cutting the grass up to the grove but not touching the trees).

Basement

This level is semi-subterranean; it's actually all under ground level, but a narrow ditch around the castle exposes a few high windows. 

Catacombs (B.1): The original design of the catacombs was a square chamber adjoining four apses, each with shelf-like niches. However, chambers have been added as more room became necessary. Queens and highly honored individuals have been laid to rest here for untold centuries. As a result, the shelves are crowded with bones and tattered remnants of once-fine burial shrouds. Every niche has at least a few bones, but as new spaces are needed, they are moved to other niches that still have room. If it became necessary, it might be difficult to find the bones of a specific individual. The catacombs are dark (no windows) and cramped, but surprisingly dry.

Kitchens (B.2): This is really a complex of rooms: two kitchens; a pantry for dry items; a buttery for casks of liquids; a wine cellar, with a locked door whose key is held by the major-domo; and a warren of small store rooms. The kitchens are cavernous, noisy, and busy from before dawn to sundown. They're lit partly by sunlight through the high windows and (in suitable weather) the open door, but mostly by cooking fires.

Servants' quarters (B.3): This is where the downstairs servants live. This includes the kitchen staff including the head cook, the gardener, the gamekeeper, and their assistants. The junior staff sleep on pallets in relatively large, clammy dormitories. The more senior staff have cramped rooms to themselves.

Ground Floor

 This level contains mostly public or semi-public rooms, such as assembly and dining halls. Except where noted, floors are hard wood with occasional carpets, walls are covered with dark wood panels carved here and there in forest motifs or with grotesque faces, and the windows are arrow slits.

Great Room (1.1): If Caerceol has a throne room, it is the Great Room. It is here that the most important visitors are received, new laws proclaimed, and the highest business of state carried on. The walls are nearly thirty feet high, rising to a vaulted ceiling. Dark wood paneling alternates with high, narrow windows made from small panes of leaded glass.

Chapel (1.2): The chapel is a white marble-paneled shrine used for the private devotions of the queen and her inner circle. Compared to the opulence of the rest of the palace, the chapel is almost austere, with subdued geometric motifs carved into the marble panels. The room is windowless, lit by candelabras distributed liberally around the room. Behind an altar is a trap door covering the stairs to the catacombs.

Secret Garden (1.3): The existence of the garden is no secret, but its contents are well-hidden. Hardly more than an air shaft, the garden is filled with shade-loving plants and a few bits of stone furniture. It is the exclusive retreat of the queen. Only the gardener can come there at will, and the queen rarely brings visitors with her.

Inner court (1.4): The inner court is used for semi-private audiences and conferences. If there's a war to fight, its strategy will be plotted out here. There are a number of small writing desks, at which senior clerks and ministers can often be found, but few decorations or luxuries.

Banquet room (1.5): Permanently set with tables, this room is used for large feasts drawing nobles from across the queen's realm and notable visitors from abroad. The room is only partly encompassed by walls. On some of its sides, it is bounded by a row of carved wooden pillars with curtains hanging between them. There is a small spiral staircase at one side leading down to the kitchen and up to the higher floors.

Drawing room (1.6) and Lower Gallery (1.7): These rooms are typically used for casual audiences, private performances by entertainers, and relaxation. They are among the best decorated rooms in the castle, with thick carpet, paintings along most of the walls, and rich but comfortable furniture. They are also the best lit, with an entire wall

Secret Passages

There are no secret doors or passageways marked on the map. If they were on the map, they wouldn't be secret, would they? However, you can add them as you desire. Arrases and wall panels can hide secret doors, and the walls can have passages (many are three to four feet thick and could easily contain cramped but passable hallways). If the campaign involves intrigue, they'll be completely secret. However, they may simply be ignored by the residents, giving the servants a way to move about without being seen.

taken up by tall, narrow windows as in the Great Room.

Guard room (1.8): This room is so called because by tradition there are always guards stationed there. It serves more generally as a reception room for visitors coming in or leaving by the river gate. The room is two stories tall, with a balcony around the room at second floor-level.

Grand Stairs (1.9): This large, circular staircase, built around a thick central pillar, connects the first three floors. The pillars around it support the high tower.

Outer Courts (1.10): The Outer Court is where much of the day to day business of governance is carried on. There are many small desks distributed around the room, usually occupied by scribes dealing with correspondence, and the large niches between pillars can serve as offices or meeting areas.

Keep Yard (1.11): The Keep Yard is a small open area surrounded by the castle walls, with the doorway to the outer court on one side a gate outside on the other. Because of traffic in and out, the gate is almost always open.

Private Stables (1.12): Although Caerceol's main stables are outside the walls, there are a few stalls for mounts and a shelter for carriages on either side of the Keep Yard. They are usually kept partly empty should unexpected visitors need their use.

Second Floor

This level contains more private areas, such as apartments for the aristocratic residents and their guests. Décor is much like the first floor, but windows are somewhat wider.

Queen's rooms (2.1): The Queen's apartments are, of course, the most comfortable in the palace. They consist of inner and outer sitting rooms, dressing room, bed chamber, maid's room, and solar. The queen has covered the paneled walls with tapestries of battle scenes. By tradition, if the queen's consort dies, the solar's broad windows are covered with black curtains which are never drawn until a new queen is crowned. 

Open Gallery (2.2): The open gallery, connecting with the balconies overlooking the great room and guard room, is a waiting area, semi-formal meeting place, and, in times of crisis, overflow work space for keeping the queen's advisors close at hand. It is liberally furnished with comfortable chairs and small tables and desks. The room is as close as many people get to the Queen's apartments.

Pillared Gallery (2.3): This is a trophy room, adorned with armor, weapons, and other relics of Caerceol's past. Every queen has hung at least a few items from the room's many columns, although it would take a thorough search of the library to determine the significance of all of them.

Clerestory (2.4): The clerestory is a semi-open walkway with a waist-high parapet above the drawing room. In particularly bad weather, servants install cloth canopies for shelter.

Apartments (2.5): Most of these rooms for residents and important visitors consist of a bed chamber and a sitting room, but others are more elaborate. Each has its own name and history. Some of the names derive from their décor or function. For example, the grand and small state rooms are usually reserved for important visitors, while the sea rooms are painted blue and green with ornaments in the shape of fish and ships. Others have names of more obscure derivation. The cold rooms once suffered from a draft, fixed decades ago, while the music rooms were once used as a conservatory. The origins of some of the names, such as the dragon rooms and the doctor's rooms, are lost in time, or at least in dispute.

Upper Floors

These floors are mostly given over to more servants' quarters and a few special purpose rooms. Walls are whitewashed stone; floors are wooden planks.

Servant's Quarters (3.1): The upstairs servants live, naturally, upstairs. They aren't dark and clammy like the downstairs quarters; they're uncomfortable in their own way. They are better lit, but stuffy and dusty. Again, junior servants live in segregated dormitories, while senior servants have tiny private rooms. The major-domo has a large office, which is packed with account books.

Storage (3.2): The upstairs storerooms hold furniture not currently in use, rolled-up tapestries and carpets, broken items of all kinds awaiting repair, summer bedding in winter, winter bedding in summer, cleaning tools, and other odds and ends, all covered in dusty cloths and packed into a maze of long, narrow rooms.

Library (3.3): The so-called library is half museum, containing trophies and mementos of queens past as well as original copies of proclamations (sometimes borrowed by the chancery of the Outer Court), letters, monographs of court wizards, and other texts. The court wizard traditionally serves as librarian, and each imposes his own order on it, doing so in his own good time. As a result, he's usually the only one who can find anything.

Clock tower (3.4): Although the top of this tower serves as an auxiliary watch station, the interior is taken up by the gears and weights of a large clock. The secrets of its manufacture are long lost (or, at least, well-hidden), but the servants have passed down through the generations knowledge of how to clean the gears, reset the falling weights which power it, and reset the time (it typically loses five to ten minutes a day). It is a great curiosity and has fascinated residents for generations.

High tower (not on floor plans; above the Grand Stairs): The high tower is the province of the guards. It contains an armory and storeroom, a rarely-used office for the Champion, and a common room and quarters for the guards themselves.

Stable and Kennel

Although the castle has a small set of stables, Caerceol's main stables are outside the walls. They have stabling for about twenty horses as well as kennels for hunting dogs. Caerceol's dogs are a cross between the highly bred hounds brought by the first queen's followers and the wolves which once prowled the woods in large numbers but now prove elusive. The Caerceol dogs are large, shaggy beasts who appear intimidating but are surprisingly friendly and extremely loyal. They can occasionally be seen in the castle itself.

Residents

Life at Caerceol revolves around Queen Tanalta. Tanalta is what one would expect of a vigorous monarch. She seems at an indeterminate age beyond girlhood but before middle age, serious and reserved but not unkind, and firm but rarely forceful save in extremity. She is also in excellent physical condition (with good reason; the queen traditionally leads her people in battle) as well as strikingly attractive, with dark eyes and long, raven-black hair, both of which are unusual for her people. At the moment, Tanalta is unmarried, but she is expected to take a consort at least once in her life to produce an heir (the crown descends on the eldest daughter).

There are, however, a number of officials and hangers-on resident at the castle at any time. Several of the queen's cousins and close friends attend her needs and run official errands (the palace servants typically come into contact with her only to do the dirty work of cleaning and carrying).

The highest official in residence is the Minister of the Purse, the venerable Siobad. Siobad, who served Tanalta's mother and grandmother in the same capacity, is old even for an elf; his lean, lined face (and often imperceptibly slow movement) makes him look a bit like an extremely well-preserved

Consort's Curse

The "at least once" is a problem. The position of consort is one of great prestige, but it's widely regarded as cursed. No consort in recent memory has lived more than six years after marrying the

mummy. The Chancellor, who oversees a body of clerks, is also in residence. The current Chancellor is Dunciar, an energetic, driven man with an uncomfortably intense gaze.

queen.

The library is maintained by the wizard Lubiodon One-Hand. Lubiodon is rumored to have given his right hand in exchange for enormous power, but it is a matter he refuses to discuss. Lubiodon spends as much time as he can alone in the clock tower pursuing abstruse magical research. He rarely comes out unless summoned by the queen.

The final resident of note is the Champion, head of the queen's bodyguard. A new Champion is selected once every seven years from distinguished warriors through the realm. Candidates are subjected to intense examination and physical ordeals, so the Champion is a man of proven ability. Meldain, the current champion, is typical: loyal, sharp-eyed, clever, and very, very dangerous. Meldain had suffered some embarrassing reverses early in his battlefield career, so he was doubly grateful to the queen for the chance to prove himself.

Servants

The division between aristocratic residents and their servants is mirrored by a division in species. The residents are cultured, educated elves of long lineages. The servants are a mix of half-elves, humans, and off-breeds of faerie. There's an additional division between the "upstairs" servants, who look after the interior of the palace and the moment-to-moment comfort of the residents, and the "downstairs" servants, who cook and look after the outside.

Tulan, the major-domo, is the ultimate authority over the household. He spends most of his time personally looking after the chief residents, but manages to find time to criticize or, occasionally, praise the staff. Quiet and finicky, Tulan is notoriously difficult to read. Even his race and age are anybody's guess; his delicate-featured face is nearly unlined, but what little hair he has left is quite white.

Immediately subordinate to the major-domo are the matron, chief cook, gardener, and gamekeeper. Of those, only Panulia, the matron, is upstairs. The matron's special area is the supervision of the female servants, but she lives up to her title by serving as a maternal figure for most of the palace's population, resident and servant alike.

Quedo, the quick-tempered chief cook, rules the kitchen staff with an iron fist, but he chafes under the authority of the major-domo and has an uneasy truce with the gardener and gamekeeper. Tulan and Quedo have quietly despised one another for decades, an arrangement which works well for everyone.

The gardener and gamekeeper are theoretically under Tulan's authority, but he rarely supervises them. Basbarro the gardener is an elderly man with apparent gnomish blood, but still quite spry, and his skill at tending the garden is legendary. He is a great favorite among the staff, always ready with an amusing story or song. He draws helpers as he pleases from the kitchen staff, much to Quedo's annoyance. Used to spending hours at a time stalking shy animals, Chullan the gamekeeper is as quiet as Basbarro is noisy. He isn't actively antisocial, but he has been observed going for days at a time without speaking.

The guards hold an intermediate position between the servants and the aristocratic residents. Usually seen rather than heard, they answer to the queen and her champion. The most important thing about the guards is that they are all formidable veteran warriors, selected for skill, bravery, and loyalty. There aren't many, but each is worth any number of regular men.

Caerceol in the Campaign

Caerceol offers many possibilities for adventure, and can be modified to fit different moods and situations. For example, although the residents are here called elves, they can just as easily be some other flavor of magically adept aristocrats, low-tech Tymbrimmi, or merely gloomy, reclusive humans. Here are just a few possibilities for modifications and adventures:

Mood options: As written, Caerceol is a quiet, even lonely place, appropriate as the last outpost of a dying race, where conflict is social and political rather physical. However, it could easily be the lofty center of a dark, moody, but still vigorous nation. In that case, replace some of the mist with thunder and storms and increase the traffic in and out. Bloody duels and torrid love affairs will be frequent distractions. Its relationship to PCs may also call for some modifications. The palace may serve as a refuge or allied stronghold (more lights, friendly inhabitants) or a prison or enemy stronghold (fewer carpets and tapestries, hostile inhabitants, shiftless servants).

Haunted option: Caerceol is unimaginably old, the grounds contain catacombs and two locations which house spirits, and the entire region is faintly magical. It would be surprising if it *weren't* haunted. Ghosts at Caerceol will be sufficiently unobtrusive that the castle can still be inhabited (unless you want to make it a crumbling ruin, which is a valid choice), but they may take a particular interest in the PCs. Do they want the PCs out, or will they keep the PCs from leaving? Are they trying to accomplish something, or keep a secret? Is there a connection with the permanent mists and forest, the catacombs, or the apparent curse on consorts? Ghosts and other secrets buried under the castle may also make Caerceol appropriate for Gothic or Cthulhuesque horror.

Mundane option: In a low-magic or historical campaign, Caerceol can keep much the same atmosphere while shorn of magical elements. Both servants and aristocrats can be human, but with a social division which may as well make them separate races. The mist may not be permanent, but the site may be prone to frequent fogs and overcast, giving it a gloomy look most of the year anyway. The well, the grove, and so on may not have magical powers, but it's certainly realistic that they be *believed* to have them.

But without the magical forest, Caerceol isn't well defended. The position on the water is good, but the walls are too low to withstand strong assault, and the windows facing the lake are too big. If used as presented, Caerceol is a noble retreat in a peaceful era. If conditions are more warlike, the large windows should go away and the walls should come up five to ten feet.

Adventure Seeds

Upstairs, Downstairs (the Steel Cage Death Match): There's no reason the warriors and aristocrats have to have all the ancient mysteries. The broom closets and kitchen stoves have their own stories to tell. This is one of them: Every time a new batch of soup stock is made at Caerceol, the remnants of any old batches are added to it. Those leftovers contain the remains of previous stocks, and so on back. Cooks in many societies reserve older stocks expressly to include in newer ones, since they create a richer, deeper flavor, a property which is subtly magnified with each successive batch. Some of these soup stocks can be traced through batches for decades or even longer. Caerceol's "mother stock" has a lineage that goes back for centuries, perhaps as far back to the first meal served when the castle was built. And now, on the eve of a feast in honor of the visit of a potential ally against the barbarians, the mother stock is missing. It is usually divided among four containers stored in different places, so no clumsy pot boy can break them all and destroy the precious essence. All four have vanished, and the kitchen staff faces the horror of having to present a substandard meal. Unless, of course, the PCs can save the day.

Marriage politics: This is not an adventure so much as a series of adventures. The need to produce an heir will, eventually, require the queen to marry. If there are no daughters, vicious dynastic wars involving the queen's sisters and nieces traditionally follow, a situation everyone would rather avoid. However, selection of a proper mate is a process fraught with political implications, and candidates may be reluctant to take the position. PCs might join one faction or another, each supporting their own favorite (mostly by working against the others), or even try to achieve the position themselves, counting on their own consummate abilities to protect themselves from a probably nonexistent curse. The situation is ripe for tragic romance as well. The queen may be torn between being with the man she loves and quite possibly dooming him by marrying him. She may marry someone she doesn't love to keep the one she does alive, opening the door for juicy scandal as they carry on a secret affair.

First Time For Everything

I remember when I first was talking with the previous *Pyramid* editor Scott Haring, shortly after I'd been handed the reins way back in February 2000. Given that my knowledge of the gaming industry was lacking, one of his pieces of advice he offered was that I should attend the GAMA Trade Show, the largest industry trade show in the states. (I hedge a bit there because I'm not counting Toy Fair and I'm sure there's a board game trade convention in Europe whose attendance numbers are measured in factorials with double-digit exponents.) Anyway, I agreed that it was important that I attend GTS some day, although I wasn't sure if I'd be able to get there immediately.

This past week I attended GTS for the first time. (At least, I assume I did, if all went according to plan; I'm writing this ahead of time. As an aside, it's disconcerting to look at a nonstop flight within the states that takes eight hours, because of the time zone shifts.) I'm sure I'll have lots to write about next week, but for now anything I'd scribe would be based on speculation.

Anyway, the past 12 months have seen a number of personal industry firsts, including my first front-cover-credit published product, my first GenCon attendance, and the first time meeting Ken Hite (who handed me a cryptic tube he recovered from a murdered Louvre curator). And that's not even counting the new car I got a couple of weeks ago -- my first-ever new vehicle.

So now, as I scramble to write this column a mere 90 minutes before I need to leave at 3 a.m. to fly to Vegas, I scramble to find a topic. And as I find myself running out of personal "firsts," I realize how significant and meaningful I find them.

Really, I think many good campaigns -- especially those that have fantastic elements to them -- are often chalk-full of "never happens," "rarely happens," and "is about to happens." Each one of them suggests a story or adventure unto themselves: In a Steampunk game, who will be the first person to circle the globe in 75 days (besting the previous record holder)? Who will be the first to climb to the top of Mount Cheesehead? Who will be the one to marry the long-eligible Emperor?

In my spare moments lately, I've been playing a little game I lovingly call *The Legend of Zelda: The Minish Cap*. This game, like many previous Zelda games, has plenty of "firsts" that are laid out pretty early on:

- "Legend has it that if this bell rings, something amazing will happen . . ."
- "This portal to another world only opens every 100 years . . . and it's been almost 100 years!"
- "If lots of people actually buy games from Nintendo, maybe they can extract themselves from the industry-loss quagmire they've managed to sink to!"

Okay; that last one is the realm of pure fantasy. But the fact remains that the game does a good job of presenting plot points that could take a loooong time (game-wise) to resolve. More importantly, the game also introduces *new* awaited surprises as old ones are resolved. This is one of the points that real life doesn't deliver on much. In early life, there's the thrills of reaching various age milestones: getting to drive; getting to smoke/buy lottery tickets/porn; getting to buy booze; getting to rent a car. Then, after around 30 or so, the milestones stop, and soon you're just waiting to retire. Then you die, clutching your chest in your rented car while lighting a cigarette with a losing lottery ticket after finishing up with the porn.

Of course, in the gaming world, such surprise "firsts" are really only interesting if they have some kind of payoff. More importantly (in my opinion), these payoffs should have something to do with the gaming group; many games with rich metaplots are guilty of establishing cool "might soon happen" plot seeds, only to have their own characters steal the thunder of any possible PC accomplishments.

But if games maintain a steady flow of neat, new, and interesting events -- which, ideally, involve the PCs in some way -- then it's a hook that never grows old.

And if you'll excuse me, I now need to dash off to the airport, where my 23-hour day continues apace with little sign of stopping. And this could be the first time I've driven to the airport without sleep . . .

* * *

Speaking of GTS, I've been completely away from the computer for almost a week by the time you read this. So if you've written me earlier in the week, or burned my picture in effigy on the [discussion boards](#), please note that it might take a few days to get back to you. Thank you for your patience.

The World's Largest Dungeon (for d20 System)

Published by [Alderac Entertainment Group](#)

Written by John Zinzer, Michael Hammes, Chris Burns, jim pinto, Jeff Stolt, Richard Farrese, Robert J. Schwalb, Lee Hammock, Jennifer Baughman, Mark Carroll, Jeff Dohm, Patrick Kapera, Dana DeVries, Ari Marmell, Jeff Ibach, Alexander Freed, Sean Holland, Kevin Millard, Aaron Rosenberg, & F. Wesley Schneider Edited by jim pinto & Katie Yates

Illustrated by William O'Connor & Cris Dornaus

840-page b&w hardcover plus 16 full-color 17" x 22" maps; \$99.95

Whew. Here goes.

Alderac Entertainment Group's magnum opus, *The World's Largest Dungeon*, is nothing if not ambitious. An 800-page monster, it's the biggest game adventure ever published. But at a nickel shy of a triple-digit price tag, is it worth it?

In a nutshell, the dungeon was created as a prison in which to place the many evil creatures who roamed the planet before the rise of Man. The powers of good and evil struck a bargain for the incarceration of some of these beasts, while others were just captured and manhandled into place. But a massive earthquake rocked the dungeon, and now enormous sections have been rent asunder. A mighty flow of lava cuts many sections (called Regions) of the structure in two. While this has not allowed the things within to get out, it has permitted those outside to find and enter the dungeon. The interior is now a motley collection of those who were imprisoned here and those who came in search of power, treasure, or adventure and are as trapped as the intended inmates. Communities large and small have sprung up as everyone tries to escape or attempts to consolidate the power they have. Politicking and attacks are common, and the party has to contend with these as they search for the way out . . . and perhaps the true nature of the dungeon.

Though grand in scale, the book turns out to be little more than a gimmick. Yes, the narrative pieces interlock pretty well, and the maps are gorgeous, all 35-plus square feet of them. But essentially what you have here is a collection of more than a dozen connected adventure modules, and few of them really distinguish themselves. It's almost halfway through the book before the adventures show real roleplaying potential should you wish to talk your way out of things.

The first third or so of the book is in need of serious editing. It may just be that there are plenty of spelling and grammar errors (though a few are worth a chuckle . . . a "goat of flame" erupts?), but it begs the question: How many mistakes found their way into the more critical parts of the manuscript? And since the goat erupts more than once, there's probably cutting and pasting that could be perpetuating things. A *lot* of cutting and pasting . . .

On the plus side, you have all the facts and figures you need on each monster or NPC. In the negative column, when you finish facing six orcs in room one, room two has six more orcs, and their stats are presented there as well, even if the two encounters are listed on the same page. Not that the two groups are identical, but no attempt at streamlining has been made, listing a monster here and then listing another of its species on the facing page with a simple "See

previous page, but raise the hp to 12 and remove the enchanted glaive." Embedding the stats in the text is better than a lot of page flipping (the less flipping with this tome, the better), but make no mistake, you're paying for a lot of duplicate text that might have been shoved into a perforated reference sheet for each Region or something.

Along the same lines, sometimes the influence of someone or something colors a whole area. One such beast sits at the center of his Region and may see the party almost anywhere therein, so his Spot skill and reactions are given *at the start of almost every encounter*. And how unlikely is it no team member will be spotted when they must make at least one check for each of the more than 70 encounters? How long before the creature spots you, attacks you, (presumably) dies, and renders several dozen paragraphs useless? Specifics were excluded from the chapter's introduction, but it appears in at least one subsection (where the random encounter table for that segment is given). Then the encounters continue listing it again and again.

And players had better enjoy the roleplaying opportunities, because there's not much puzzle-solving involved. Oh, sure, you can't chuck a six-sider down a 10' by 10' corridor without setting off half a dozen traps, and the rogues will be doing a booming business with Disable Device and Open Lock checks. But these are almost exclusively "Find and deactivate it, or suffer" -- you won't spend much time figuring out logic puzzles or trying to answer riddles, just tossing dice to see if another slab of rock crushes the cleric. Some forms of magic are disallowed to prevent munchkins from busting the dungeon, and level advancement is done by the Region (there are enemies enough to surge up in levels several times each Region -- see below for more problems this engenders). By the time you get to the "end," there's a buildup for what they bill as *the* big encounter, and once finished . . . you find out you still have another Region left to explore. You do have the option of ending things without going on, but who's going to go to this much trouble and expense, and not enjoy the World's Largest Denouement?

We're promised all the critters from the OGL, and they cheerfully admit that's not strictly true in their introduction. In spite of the marketing obstacles, in many ways this is good -- you're not fighting dinosaurs in alphabetical order. But while they contend readers won't want to see one of every dragon type, they aren't shy about using a lot of the same creatures on any one level.

The Region, subsection, encounter pattern leaves us at particulars. Each encounter will tell you if there are traps, who's in the room, what their strategy is in a fight, their treasure, and scaling. This last item lets the DM up the ante or relax the pace, depending on how the party has been doing. If they're still bleeding like stuck pigs from the minotaur battle, you can remove a dire wolf or two. This format gives us a fat, sturdy book (and a case of Stephen King Wrist), and if you're wondering, the margins are small and the type is even smaller. Regardless of the content's quality, you *are* getting over 800 solid pages of material.

The maps are first-class pieces of cartography, full-color (though many of them are just the regular brown and tan with flourishes added here and there, there are a few with stark-blue waters, bright-red lava flows, magical effects, etc.), and lock together nicely. If there's a problem with them, it's how much the referee has to keep up with. The book does what it can, using a "master map" to show how they hook together and even which sections are keyed to what character levels. This means if the DM doesn't take steps to prevent characters from wandering down the wrong connecting corridor, they could find themselves suddenly facing creatures geared toward PCs four levels stronger than the party currently is. And since the master map tells you how the characters should be advanced ("levels one to three in this Region"), you'd think there would be more help about to when to allow these advances. The master map labels character classes through 20th level, but the end of the book suggests, perhaps playfully, you ought to be 30th level. And the last, Region O, calls itself Region P . . . the editing woes continue.

The World's Largest Dungeon will be giving way to a sequel, ***The World's Largest City***. While the dungeon has many good points, and is an admirable achievement, its practical value is overshadowed by its practical problems and the loose threads that such a scale seems to inevitably leave hanging. Great effort has been put into making it a coherent whole, but the work simply overwhelms its creators. Only if you're looking to buy 15 adventures in bulk and six bucks a pop represents a substantial savings by volume -- or you just want it as a status symbol -- is such a gargantuan effort worth your while.

Roma Imperious: Alternate World History

Published by [HinterWelt Enterprises](#)

Written by William Corrie III

Cover by S. A. Skinner

Illustrated by Mark Roman, Jesus Carmona Esteban, Javier Carmona Esteban, Terry Pavlet, Eric Pommer, Erik Roman, S. A. Skinner, & Grey Thornberry

Cartography by Clayton Bunce

338-page b&w hardcover; \$39.99

All of a sudden the gamer has lots of choice when it comes to Rome-set RPGs, whether the exquisite [FVLMINATA: Armed With Lightning](#), the solid *GURPS: Imperial Rome*, the Mythos-instilled Cthulhu Invictus, or the quick and simple *1PG* from Deep7, [Pax Gladii -- Epic Swords & Sandals Adventure](#). The addition to the range is HinterWelt Enterprise's *Roma Imperious: Alternate World History*, which shares comparisons with *FVLMINATA* in that it projects Rome into a future where magic is prevalent and firearms known. But where *FVLMINATA* plays it straight, *Roma Imperious* radically increases the arcane quotient, adding combined doses of Gary Gygax and Ray Harryhausen-style fantasy.

The year is 1461 A.U.C. or 708 A.D. Rome has expanded its borders West into Hibernia, North to encompass Germania, South in North Africa to the borders of Ghana and Abyssinia, and East to the Kushan Empire of the Indian sub-continent and the powerful jade Empire rules from China. In 1065, civil war in the Empire was ended when Constantine beat his opponent using the Celtic magic of the Druidic traditions. In the centuries since, this magic has been studied and assimilated, so that now the Emperor is expected to be a practitioner. Magic is also used to improve factory efficiency, but more importantly, it has been used to build the Imperial Gates and Motus Celer or teleport discs. The former, located in each prefecture's capital, allow the teleportation of troops or trade goods, while the Motus Celer transport just ten people and are used by Imperial or Senate messengers. And despite not long having put down a revolt of rogue magi, magic is very much part of Roman society.

On Rome's Northern border, the Baltic kingdom of Alkasas has turned to dark magic, while the people of Skandia have spread to Greenland and a colony in Ommerike. They are aided directly by their gods who walk among them. Rome and the Jade Empire vie for influence in Asia and India. Slightly more advanced than Rome in the fields of food production, chemistry, and seamanship, the Jade Empire controls and restricts magic use to potions and glyphs on scrolls. Other threats are more outré. The Black Alfar terrorize the North with violent acts; Dwarves migrating into Asia Minor are rumored to enjoy the taste of human flesh; and Giants rapaciously graze the land and have even been recruited in the Legions. The batrachian Homo Rana lurk in the rivers, hunting packs using their paralytic spray; the Terragena Alkasas are Alkasas' despised foot soldiers that eat their foes, grown by black magic; and Sciurus Giganteus are giant squirrels, pack animals capable of destroying whole villages. Worse still are the Manes Atrox or Devil Terrors, extra-dimensional horrors that possess men and beasts to commit evil acts.

Like other HinterWelt Enterprises, ***Roma Imperious*** employs its house Iridium System. This is a class and level system that divides its 25 character classes into four types -- Fighter, Intellectual, Performer, and Thief. The creation process is not complex, but is hampered by having the class descriptions 100 pages before an explanation of the process. The character types encompass Roman citizens and those of other nations -- legionaries and gladiators as well as noble Shih Warriors of the Jade Empire and Celtic Druids. All characters have a chance for spell use, though the spell using classes are the Artificer, the Druid, the Magus, the Oriental Monk, the Priest, and the Shaman. Interesting classes include the Courtesan and the Praetorian Guard, which serves as Rome's secret police, while the Imperial Guard or Palatini loyally protect the Emperor. Each class gives several skill levels, points to spend on weapon proficiencies, plus the character's own development points.

Iridium System magic falls into three types: spells magic organized into Realms and spell lists, the more freeform clerical magic, and the dedicated or Chi magic of the Orient. Magi and priests of Rome use the Realms system, while priests of other cultures draw their magic direct from various deities. Shamans recruit from the spirit realm, the spirits appearing as animals that will give a shaman certain abilities depending upon the species. The less structured nature of clerical and shaman magic will require careful monitoring by the GM. Monks expend personal Chi to power various abilities that vary depending upon the monk's order. For example, for the Buddhist this is Flight and Heal, and Endure and Speed for the Taoist monk.

The Iridium System mechanics employs all of the polyhedral dice across three different methods of resolution. The first, the Stat check, is a d20 roll against a core attribute, unless it is over 20, in which case, a d30 is rolled. The latter might be a simple solution, but it is a trifle unfair. Skill checks require percentile rolls, while combat checks are again a d20 roll, plus modifiers against a target's Defense value. The combat system allows for parrying, hit locations, blood loss, and critical hits. Armor reduces damage, while the Targeting skill (purchased per weapon) allows a player to hit specific locations. Fighter types have the highest chances of rolling criticals, otherwise such chances are quite low, but when rolled are deadly.

The setting for ***Roma Imperious*** is supported with a lot of background material on the expanded Empire of 1461 A.U.C. This takes in the culture, history, politics, and religion, including Rome's assimilation of the Celtic and Germanic faiths as well as the Greek and Parthian peoples. The various cults and colleges are also detailed. Each of the Empire's major provinces is covered, although a complete lack of information on Britannia is a serious omission given the fact that it was the source of Roman magic. Pleasing the other nations are not ignored, though they are not as extensively described, but do include character and campaign ideas for each as ready starting points. The book is rounded out with lists of general and magic items, and capped with an insignificant pair of pages of GM advice plus an adventure. "Murder in Roma" is a murder mystery that needs expanding, but one cannot help wishing to see a Roman adventure that was not another murder mystery.

Physically, ***Roma Imperious*** is a sturdy, cleanly presented hardback. It needs a polish in places, as the writing grows rougher the further you get into the book. The illustrations are quite decent, a mix of the public domain and pieces drawn specifically for the book. The maps are nicely drawn, although they cannot decide whether Londinium is on the Thames or somewhere in Cambridgeshire. Although the book could have been better organized into a more logical, user-friendlier fashion, the solid index does help to counter this.

Roma Imperious is a vast improvement over the publisher's previous RPG, ***Shades of Earth***, which could be best described as a burnt microwave meal . . . Bland on the outside, blackened, bitter, and tasting of ashes on the inside. Fortunately, ***Roma Imperious*** is richer, broader in scope, better realized, and more flavorsome. True, the Iridium System feels very much like an effort to improve upon ***Advanced Dungeons & Dragons***, but in ***Roma Imperious*** it feels far more appropriate, less intrusive than it might in a modern-set RPG. Despite the lack of GM advice, ***Roma Imperious*** is rife with possibilities, offering up swords, sorcery, and sandals in equal measure.

--Matthew Pook

Author's Note: Unless otherwise noted, page references to **Basic**, **Fantasy**, and **Magic** are for **GURPS Fourth Edition**. All others are for Third Edition.

Infinite Worlds Info:

Name: Atlantis-3

Centrum Zone: Red

General TL: (1+6), with (1+9) bioengineering

The timeline known as Atlantis-3 has a more fluid tectonic plate system than Homeline, and thus has avoided the catastrophic effects of major earthquakes and volcanic eruptions. Geological teams are nervously setting up sensors around [Krakatoa](#) and Mount St. Helens, which only show signs of long, slow events. The civilization of [Atlantis](#) exists, thrives in the east (see pp. AT26, 42, PM6, and Links below), preventing the rise of the [Roman Empire](#). One effect is that gladiatorial rings never became popular, although baths and aqueducts are. The lack of the Coliseum has slowed spectator sports, although teams still compete, and results are important.

Civilian Travel

The most popular civilian transport is called the "horseless chariot." Advanced flywheels power small intra-city models, while larger inter-city models use steam engines. Longer travel is typically made by boat, rail, or dirigible, depending on distance and cost. Railroad is less popular in areas where the land is unstable or populated by nomads, such as many parts of Egypt's domain, eastern "Greece," and western regions of "Atlantis" (see "Territory," below). Expensive dirigible airships and armed caravans may be the only options in these regions. In rural areas, where the roads are rough, [riding](#) is still popular. Civilian law enforcement vehicles sometimes have embedded sonic stun weapons that can be set on narrow beam for individual capture or wide beam for crowd control. Explorers today use combinations of zeppelins (equipped with solar-powered vapor electrolysis machines), ships (perhaps wind-powered vane clippers, p. CF126), and flying scouts (biomods or upgrades, see Templates, below) to chart the new world.

Military Vehicles

The militaries have their armed versions of the horseless chariot equipped with launchers for spears and LE grenades. Larger carriages called "death chariots" are often built around large weapons, such as cannons, screamers, or the rare Atlantean Light Cannon. Air vessels are primarily used as observation platforms from which to command the troops via heliograph or winged messenger. The rare artillery model "death barge" uses an onboard calculation engine to project trajectories for bombardment from behind cloudbanks. Navies float battleships that are virtually immune to anything a dirigible can sport. (At the GM's option, the dirigibles may be supplemented with a variant of the TL1 contragrav coating from p. VE41 which nullifies *half* the weight of the vehicle for the listed cost, or alternately, just the empty weight of the vehicle-not that of the fuel, cargo or passengers.)

The most anachronistic vehicle designs employed are called "death walkers" -- large battlesuits and mecha that use stone as an ablative outer armor. When at rest, these tanks can easily blend into local monument displays or landscape. The down side is that enemy artillery, saboteurs, and occupying forces will target any such stationary target, "just in case." Famous examples include the towering "The Wrath of Ramses II," (a.k.a. *Ozymandias*) and the quadruped [Sphinx](#). Both were pivotal in many conflicts, and while the former was eventually toppled in battle, in honor of the Sphinx's victories a casino was built [under it](#) when it was "retired."

Catapults and cannons above 400mm are common. Cannon ammunition used is typically solid shot, although armor-piercing shells with divisors up to (2) are available at 10× cost. Recent developments include shells that load and fire like ordinary armor piercing shells, but if they penetrate their target, they cause an effect similar to the spell "Earthquake." The effects of these "Quake" shells are as per *Severe* within 10 yards, *Mild* within 20 yards, and *Tiny* within 40 yards (see pp. M54, 3e M33).

Infantry Weapons

Due to the existence of a simple bullet resistant (only) lining (perhaps DR30 vs. bullets only, or similar to Venerian Rubber, p. STE116) that can be [worn under clothes](#) (TL1 & TL2), [classical weapons](#) and [unarmed combat](#) are still popular (see pp. EG87, GR77), although petty thugs still use cheap-quality pistols and zip-guns (see p. HT11). In addition to typical TL1 weapons, stunners and screamers (p. UT55) are common, but at 10× cost. In addition to regular fire lances (see p. F141), variants are available for 10× cost that inflict double damage and have double range. Atlantean light rifles (see p. STE20) can be found in elite military units around the world, as well as many regiments of the Atlantean forces. Full clockwork battlesuits (see p. STM76) are used in elite military units and hazardous environments while open-armor variants are common in construction areas. In addition to Orichalcum, the Atlanteans have a form of [terra cotta](#) battlesuit that is virtually immune to flame weapons (DR30 vs. flame-cost for appliqué as per advanced composite). Robot birds (see p. STE70) have their niche as observers (with cameras) or delivering covert messages. Completely mechanical horses (see pp. RO 119, STM75, STE83) are mainly toys for the rich, but can operate (or be stowed) in conditions that normal beasts could not.

The "Khopesh of Ra" (a.k.a. light sword, fire sword, sun sword, flame jet) (see pp. M73, 3e M38) is a favored weapon among warrior priests, many of whom believe that only their class is fit to wield it. It can be extended from one to 3 yards with a Ready action (see Force Sword for rules for duration, activation, mass, and cost on pp. B272, UT63). It is common for wielders to wear special flame-resistant heavy cloaks (see p. B287, 3e B242) (as a Very Fine cloak, but has DR20 vs. fire) in addition to bullet-resistant armor (above), although they are forbidden in some organized duels. A martial arts style could revolve around dodges and feints. Alternately, the GM may consider them as Force Swords for *all* purposes.

Power

The most popular form of energy storage are electrical capacitors (functionally like TL7 lead-acid batteries), and steampunk flywheels (10× capacity) (See pp. VE88, STM69, CF120). The most unusual power supply is the "ark furnace," which, when properly placed on an intersection of dragon/ley lines (see p. F45) (perhaps using Fortune Telling (Geomancy) skill), generates electric power. The configuration is so delicate that each small settlement will only have one. A traveler will often see the water tower built next to the power tower -- the "furnace" is harder to place than a well. They function similarly to a *beamed power receiver* (see p. VE87), but more like a *broadcast power receiver* (see p. STE45, but 50 lbs and \$100/kW). Mobile units must be more fault-tolerant, and are still in the experimental stages.

Other industrial energy sources come from hydrogen and oxygen created by electrolysis. The oxygen is used to fuel blast furnaces to allow faster baking of bricks, firing of pottery, distilling of glass, and barbecuing. The hydrogen is stored to fill/fuel passing dirigibles and/or power steam engines -- excess is sold locally. Thus a great number of villages and towns have four towers near their centers: water, power, oxygen, and hydrogen. The rising bubbles from the electrolysis process are often captured, spinning wheels to raise the water to fill the water tower.

Scientific Equipment

The orrery is a popular scientific tool for nobles to fund (see also p. F224). They are a welcome sight in the entry hall of many public buildings. There are even competitions to see who can build the most extravagant simulation of the heavens. Clear glass is so affordable that telescopes and binoculars are in the hands of ordinary people. Corrective lenses, on the other hand, are considered a form of mechanical cybernetics (see Biomods, below). The compass is a reliable invention but for reasons not yet understood, it does not function well *within* Atlantean submersibles or vehicles with contragrav coatings.

Computers are [clockwork](#) calculation engines (see pp. MIII24, STE65) that run programs from [discs](#) and papyrus-scrolls. These scrolls are a cross between tape, reel-to-reel, and punch cards. Its output display, composed of dozens of vertical wheels, may remind a traveler of a large slot machine. (Those found in local casinos have three to five wheels, often spelling words to win bonus prizes.) Low-resolution dot-matrix printers and "scroll punch" devices can write text, images, and more programs. This ability causes some to speculate that eventually they could program themselves (see Gordon Shumway's "Reign of Steam").

Architecture

Civil engineers of the day love "perfect" shapes and designs from nature and the heavens. As such, pyramids are memorial docks for airships! They also provide safe storage for hydrogen gas, as stone is heavy, fire resistant, and nonconductive. An Egyptian corporation has built a city in the desert of the Americas called "Las Vegas" -- built around a small sphinx mecha. It is a functional mech that has protected the city on a number of occasions, although the casino grounds seem to comprise most of the town's defense against invaders -- whole regiments have deserted, pawning their weapons to go gambling!

Home

A "flick" is a "book" that plays video and sound when placed in a player. "Flicks" can be made with a more expensive home "recorder," but most are rented from a store, or distributed by the state. People can also pick up "flicks" at news stands on the way home from work, and return them on the way to work to be recycled. Most "modern" homes have electric lights, appliances, and heating. Other home devices include the sonic screwdriver (see *sonic probe*, p. UT17) and a sonic shower (see p. UT27) for water conservation.

Governments

Egyptian

CR: 3

Colors: Gold and red.

Type: Monarchy.

"Real World" Home Territory: Africa, Western Middle East.

Advanced: Aeronautics, ark furnace, horseless chariot, hydroelectric power, and mega-engineering.

Trailing: Few railroads due to sand, naval power.

Export: Gold, silver, stone, solar power.

Import: Industrial metals.

Greece

CR: 2

Colors: Silver and tan.

Type: Democracy.

Things To Invent or Discover

- Helium
- Inertial Navigation Gyroscope
- Radio
- Stable "ark furnace" for traveling along ley-lines
- Stadiums with massive numbers of spectators
- Solar Mirror (see p. W:WW93) (improve agriculture in cold areas)
- Telegraph

"Real World" Home Territory: Europe, Western Russia.

Advanced: Biotech, clockwork prosthetics, medicine, vane clippers (see p. CF126), and wind power.

Trailing: Water-based power generation.

Export: Metals.

Import: Precious metals, power.

Atlantis

CR: 4

Colors: Blue/Crystal and green.

Government: Kingdom-wide monarch, provincial council, and local democracy.

"Real World" Home Territory: New Zealand to India to Korea, Oceania (see pp. AT25,42).

Advanced: Desalination mining, light beam weapons, OTEC power, refrigeration, shipbuilding, sonar, submarines, tidal power sources, torpedoes, and orichalcum, a bronze alloy as strong as steel (see pp. AT77, F23).

Trailing: Medicine.

Export: Crystal, seafood, ships.

Imports: Industrial metals.

Communications

Pneumatic tube systems connect all major office buildings within major cities. Heliographs (see p. VEXii15) are used as inexpensive communication devices.

Light semaphore towers (see pp. VEXii15, DWA10) can send messages at rates between 10 to 20 words per minute (depending on the average operator's skill), with an average relay latency of 10 seconds (to set the outgoing flags based on incoming). Popularly called "Light Towers," they are spaced 20 to 30 miles apart, and make good use of telescopes. The time to send a message is calculated as follows:

$$\text{Time} = \text{Length in Words} / \text{Speed in Words Per Minute} + \text{Latency}$$

where Latency = Number of Towers $\times$ delay per tower (typically 10 seconds or 0.6 minutes) or from the table below.

Example: Time = 100 words / 20 words per minute + 10 towers $\times$ 0.6 minutes
= 5 minutes + 6 minutes
= 11 minutes

One-way from	Distance	Latency Time
Cairo to Athens	700 miles	5 minutes
Athens to Bangkok	5,000 miles	33 minutes
Bangkok to Cairo	4,600 miles	31 minutes

The maximum one-way capitol-to-most-distant-province communication times are:

Realm	Farthest	Latency Time
Atlantis	2,400 miles	16 minutes
Egypt	4,600 miles	31 minutes
Greece	2,400 miles	16 minutes

Territory

The Egyptians control all of continental Africa and Madagascar, as well as much of the "Middle East," ruling from the seasonal palaces in Alexandria, [Cairo](#), Memphis, and Thebes (see pp. EG6-13). Holdings in "The New World" consist mainly of Central America and South-Eastern Canada, including the "Golden Horseshoe" around the Niagara Falls

power dam. They are currently building the Panama and Suez canals (see the Adventure Seeds, below). An extensive lock and power dam system over the many rapids (called "cataracts," p. EG7) on the Nile regulates the flow of water, preventing flooding. Thus the river is dredged frequently to allow for more shipping and to vitalize fields.

From Athens, the Greeks control Europe, Western Russia, and the Eastern seaboard of the United States. Its most northern inhabitants are completely adapted to their environment (see Biomods, below), and are progressively settling all the northern latitudes.

The Atlanteans control the lands from New Zealand to India, and north to Korea, as well as Oceania. It is ruled from the central location of [Bangkok](#). (The depreciated "Winter Palace" is in Tokyo.) In the New World, they control Alaska, the Northwest Passage under the ice, as well as Baffin Island. They have laid claim to [Antarctica](#), but have not yet been able to *overtly* exploit its resources. Speculation persists that once claims are finalized in "The New World" (a.k.a. the Americas), Antarctica will be the next contested region.

"Nomad Lands"

Between the large kingdoms exist unclaimed lands, "known" to be inhabited by "primitive" cultures that no one has decided to "civilize" yet. It is not well known that many border provinces choose to arm friendly neighboring tribes of "primitives" with more advanced weapons to keep wandering tribes or marauders (see p. EG28) from harassing the larger kingdom. This has the effect that when marauders win, or tribal allegiances change, the large province may have to contend with guerillas with dangerous weapons. They may be armed with anything from muskets to rifles to obsolete tanks.

At the GM's option, there may be entire kingdoms of comparable technology hidden in the unexplored regions of the map. Perhaps the [Maya](#) (see p. CF31), [Inca](#) (see p. CF30), and the Twenty Nations (see p. CF28) are still holding out against the foreigners. Historical candidates for "barbarians" include Babylonians, Germanic tribes, Gauls, Mongols, Picts, Saxons, and mixed ethnic pirates.

Biomods

Basic medicine is effectively TL (1+6), and there have been rapid breakthroughs in the field of bioengineering. Clockwork limbs (see p. CF123) and prosthetics are available in most cities, yet it is socially preferred to have a new limb grown than to wear an artificial one permanently. It is then a matter of debate as to whether it is better to have it be a pure clone, or if it is more chic to have it made with bear muscle and feline joint work. Biomods qualify for the same discount as per cyberwear -- obviously "alien" biomods are 1/5 the dollar price (see p. UTT95) (unless already in the description, such as cat's eyes or a tail). Gangs' "colors" are likely to include some sort of xenosculpting (see p. BIO64). There are many gangs whose "colors" also involve different biomods. E.g. Horns, claws, scales, tail(s), digitigrade posture, or extra limbs in addition to animal "features."

Greece encourages all citizens to get enhancements as they see fit and can afford them. Basic genefixing to prevent birth defects and hereditary germline improvements are subsidized by the state. Limb replacement and xeno-grafting are very fashionable in Egypt and Greece. It is a growing trend for tourists from more restrictive areas to have biomods implanted at the end of their trip and to recover on the way home.

Before being allowed to get biomods, Egyptians must get approval from a priest of a temple appropriate to the enhancement for anything other than basic genefixing and organ replacement. e.g. for night vision, Bast or Sekhmet (see pp. EG17, 112)

The Atlantean government is behind in most of these areas, with the exception of those involving aquatic modifications. It is said that a whole generation of *homo marinis* exist, forming undersea communities without the need to come up for air (see p. AT56). (It is up to the GM to decide if this is actually true!) Otherwise, genefixing is quietly encouraged, while anything more is discouraged. Non-human bioengineering is an art form here. A radical philosophical group is encouraging the "distilling" of mankind from the "animal within," encouraging germline

improvements such as increased IQ and Longevity.

There are many popular "breeds" of pets that are not found naturally in addition to those found on p. EG18. Some popular breeds include the cerberus (FB 17, GR 99), drake (DR56, FB83, B261), petty drake ("shoulder dragon") (DR54, FB92), griffin (CA 120, FB 28, B 145 3e), hippogriff (FB 30), huge lions (FB 47), pegasus (FB 52, GR 98), unicorns (F 49, FB 77), and the will-o-wisp (a tiny gas-filled bioluminescent life form). The larger the breed, the more expensive and rare they are. For template costs, see pp. R81, TS 118 and use TL10 prices..

If magical powers are available, magical implants such as [go-limbs](#) may be available, but would share the same stigma as clockwork limbs. Magic or superscience may have paths that lead to undeath -- the artificial animation of bodies. Whether the reanimated retain memories or will is another matter entirely.

Food

Atlantean food, when ordered at an "ethnic" restaurant, tends to be hot, spicy, and contains some kind of seafood and/or kelp. "Egyptian food" is notably smooth, despite that is made from preserved stock, and garnished with cool spices. Greek meals tend to contain lots of fresh vegetables and beans served with wine.

Physical Appearance

Egyptian: Taller.

Atlantean: Stouter, slightly shorter (this makes a difference in the cramped submarines!).

Greek: Muscular build.

Names

Egyptian: "Ark-Isa-Ra," "Ahm-Ni-Ra" (see p. EG85)

Atlantean: "Darius," "Nehram," "Wan Chu Rin"

Greek: "Ascleptes," "Perseus" (see p. GR72)

Languages

Unless otherwise noted, the defaults listed are for modern forms. The defaults are at +2 for an Ancient form. e.g. where Greek is at -3, Ancient Greek is -1.) In addition to this, there is a -1 familiarity penalty to deal with the dialects, which is removed after 8 hours of study with an appropriate teacher or in 16 hours using just books or conversation.

Atlantean: Latin-4. (Or if the GM preferse, Sanskrit-4.)

Egyptian, Formal: Written Only (Hieroglyphs): Ancient Egyptian

Egyptian, Informal: Spoken/Copic Script: Egyptian-4.

Greek: Greek-4.

Bioroid/Uplift Rights

Atlantis: It is not desired to artificially create intelligence, but if they do not look too different, they can become

citizens, provided they can prove their cognitive ability.

Egypt: They are second-class citizens, used in labor. Those that are given the chance, however, can move up in society, but still keep that stigma.

Greece: The most common soldier, they are allowed great latitude within the enlisted portion of the army, to the highest ranks there, but still face some stigma outside this structure.

Freedom of Movement

Atlantis: Citizens are quietly discouraged from frivolous travel, but registered vacations are acceptable. Strangers are noticed and reported.

Egypt: Citizens are kept busy, and those that can afford to travel may do so with travel papers from their local temple (see p. EG21). Foreigners are noticed, and may find prices increased to meet their purses.

Greece: Citizens are encouraged to travel the Greek kingdom, and travelers are welcomed heartily in communities for the stories and wealth they bring.

Citizen Templates (for *GURPS Fourth Edition*)

The Taboo Trait could be replaced with a Secret or Social Stigma (Genetic Defects) if the person *does* have genetic disadvantages and can or cannot hide them (respectively) in those countries. The Debt represents the taxes atypical of the Control Ratings. (See also the section on "Composite forms," p. EG78, and "Traits," p. F213.) Any "racial" template from Transhuman Space might be appropriate (with the exception of those intended for Zero-G environments).

Atlantean [25 points]

Attributes: HT+2 [20].

Advantages: Comfortable [10]; Taboo Trait (Genetic Defects) [0].

Disadvantages: Xenophilia (15) [-5].

Egyptian [25 points]

Attributes: DX+1 [20]; HT+1 [10]; HP+1 [2].

Advantages: Filter Lungs (Dust and Sand Only, -80%) [1]; Nictitating Membrane 1 [1]; Taboo Trait (Genetic Defects) [0]; Temperature Tolerance 1 (Heat only) [1].

Disadvantages: Xenophilia (12) [-10].

Greek [25 points]

Attributes: ST+1 [10]; IQ+1 [20].

Advantages: Attractive [5]; Taboo Trait (Genetic Defects) [0]; Wealthy [20].

Disadvantages: Debt 5 [-5]; Xenophilia (9) [-15].

Popular Upgrades/Xenomods

- Felicia (see Felicia II, pp. TS117, B261, FB70, ["Furry Thoughts"](#))
- Bipedal "Sphinx" (as Felicia, above, see also pp. EG109, GR102)
- Minotaur (see p. GR100, or p. FF116 without striker horns or mental disadvantages)
- Crocodile -- Amphibious (see Reptile Men, FF 128)
- Harpy (aliform), see pp. GR100, 101 (similar to Great Eagles, FF91, but remove Mute)
- Satyr -- see pp. FF66, GR104
- Anubite/lagomorph (Felicia + Super Jump 1 and 2 respectively) EG 104 (see The Mummy Returns (2001))
- Merfolk Aquatic (Atlantean only) (Fish Men, FF 70) CA 103
- "Northern" (See the Ruanmao biomod, p. ItW97, with Protected Sense (Vision) and several levels of Night Vision.)

Adventure Seeds

Around the World In . . . How Long? The race is on! The PCs must guard/participate in a race between two capitol! Whether the race is by land, sea or air, it will not be easy (see Communication, above, for distances).

- As above, but the race is around the world (over 8,000 miles). Sea travel will also be required.
- As above, but it is a circuit between all three capitol -- over 10,300 miles in all!

The Canal (Panama/Suez) Yea/Nay -- You Dig? The mega-projects are underway (or just starting, see "Territory," above). The Atlantean government disapproves of the tolls involved, even if factions within in look forward to the drastic reduction in shipping times.

Civilize the Nations! Be teachers in a "backward" part of the world. Learn the local language! See exotic places! Make a cultural *faux pas*!

Cool Runnings: The Greek embassy in an Egyptian capitol has contracted for an Atlantean Air Conditioning unit to be installed to fight the dreadful heat. The Egyptian contractors aren't happy about all the foreigners. The Greek staff isn't happy about letting all these people in here, and insist the unit be installed in a small shack in the compound *next* to the embassy building. The Atlanteans, like anyone else, might be spies, but they can withstand the heat better than the Greeks, and are being paid very well . . . The PCs can be of any nationality or standing, and still find something to do here . . .

For the Love Of . . .: Barbarians have kidnapped the betrothed of an important NPC/Patron! Go to the rescue! (Besieging Troy is optional.)

The Gambler: The party must be bodyguards while the gambler visits locations to play. The money and reputations must be protected when scandals and accusations fly.

Genetic Rights Management (GRM) Advocacy: "Why make a life if it's just a toy?" There are protests about artificial life. Are they just concerned citizens, or is there something propelling them to cause this disturbance? Some of the more radical conservative factions within the Atlantean government could anonymously fund such a movement *anywhere*, even within their own borders.

Geomancy: A lead geomancer indicates that *this* could be a "great" spot to place a huge Ark Furnace that could power whole provinces . . . except for:

- Location (owned by a native tribe, a hostile company, or in the center of a town . . .)
- Bad weather (storm season is about to start)
- Competitors
- Spies

Saboteurs

- Family
- Local Feuds in which both factions ask the team to take sides, and *the site* is in the center of the battlefield
- Local critters (which hate the party, or like the taste of rubber . . .)

Inspectors of Habit: Any government (see p. EG118, GR11) may create a special investigator team empowered with experimental technology and bio-enhancements. An impartial team would be comprised of individuals with different powers from a number of different temples. They could be as low-powered as Sherlock Holmes, as innocent as Scooby-Doo himself, or as advanced as Ghostbusters.

Johnny and the Bomb: The party finds an *unexploded*, ticking, Atlantean torpedo floating in the ocean, or resting on a beach. It is common knowledge that many governments will pay handsomely for one delivered intact. The trick is moving it safely.

Possible complications include:

- The Atlantean ship is still in the area.
- The torpedo will explode in 1d days unless disarmed (with Explosives(EOD)/TL (1+6)).
- Bandits will want to steal it for the reward, and destroy it if they cannot.

Olympia! A natural outcome of augmented humans is the realm of Supers! With enough superscience, even the level of "four-color" superheroes is obtainable!

The Olympic games are coming! (See pp. GR18, AT79) The heroes must:

- Become or train athletes.
- Provide security.
- Spot and report cheaters.
- Prevent transfers of performance-enhancing potions/elixirs.

Q-Tip: The heroes go undercover as merchants or aides (but not guards) in an under-protected caravan.

- As above, but there are bandits planning to ambush a Customs patrol near the end of their patrol, when they are the weariest (and wealthiest).
- As above, but the guards are distracted and giving the merchants a hard time, thoroughly inspecting the wagon train.

Raiders of the Lost Ark Furnace: Nomad raiders have been spotted in the area. Orders/rewards are to find them and report back before more innocent lives are lost.

- As above, but the party must slow them down with sabotage. (Perhaps by stealing their power generator for which there is a reward.)
- As above, but the party must eliminate the threat one way or another.

Shoot the Moon: One government (as presented, probably Egypt), is spending all possible resources on a space program. The other governments naturally see this as a weapon that could drop a shell anywhere on the planet. It must be stopped/protected at *any* cost. See also the Space Launch Catapult on p. STE95, the Verne Cannon on pp. CF16, 120, 127), and the [Passenger Artillery](#).

Tomb Guardians/Dungeon Keeper: The PCs could be supernatural beings, bound servants, or even ex-tomb raiders cursed to serve until released. They may have to go to town, make investments and research/build new traps, or even hire guards. They are stuck with the job until they are killed, or until the boss either "moves on" (which is the only way they can die "of old age") or "wakes up" (so they can negotiate with him/her . . . although their bargaining position may be weak) (see p. EG95).

Tour guide / Places to see

- **Atlantis:** Coliseum, Great Wall, Taj Mahal (p. PM60).
- **Egypt:** Great Library (see p. F99), Lighthouse of Alexandria, Pyramids (and Sphinx) (p. PM28).
- **Greece:** Colossus, Temple of Athena, Statue of Zeus, Stonehenge (p. PM21).
- **Babylon:** Hanging Gardens

Twenty Leagues Under the Sea

Tickets for soldiers or mercenaries, each easier said than done.

(Pick one from each of A, B and C):

- **1d Objectives A**
 - 1-3 Steal
 - 4-5 Destroy
 - 6 Steal back
- **1d Goal B**
 - 1-4 The
 - 5-6 Plans for
- **1d Items C**
 - 1 Airship
 - 2 Battlesuit/Mecha
 - 3 Enhanced Soldier
 - 4 Infantry Weapon / Ammunition
 - 5 Submarine
 - 6 Tank

Complications:

- The captain (or soldier) guarding/operating it is a turncoat, and can identify the heroes, but does not know someone is coming.
- As above, but they *do* know someone's coming.
- As above, but they know it is the PCs-surely there is a security leak somewhere!

Wild ____ Chase: A noble has received word that there is a ____ (see "Pets," above for ideas) loose relatively nearby. The reward will be decreased if the creature is harmed at all.

- As above, but it is an escaped pet.
- As above, but it was the pet of a young girl who will hate the heroes if the creature is injured.

Civil Unrest

Civil unrest plagued historic civilizations from time to time, and can be a popular setting for books, movies, and roleplaying (see pp. F81-85).

Golden Age

- Keep barbarians out.
- Participate in travel, commerce, and intrigue.

Decline

- Protect the true heirs.
- Keep local powers in line.
- Ensure the safe delivery of taxes, supplies to/from loyal regions.
- Safeguard the wealth and technological secrets of the empire. Ensure that libraries are stowed safely until reasonable scientists can use it, and that enemies and villains don't find it.

Dark Ages

- Protect your city.
- Duels in tanks/airships?
- Help cultivate and represent the best hope for the future.
- Man an outpost of civilization (such as a monastery): protect it from raiders; protect the farmlands (and farmers) from monsters and other evil things . . . Like a typical fantasy campaign . . .

Founding of an Empire

- Advance scouts for an army
- Sabotage enemy supply lines
- Help found the new court by securing allies and convincing local lords to join the cause.
- Root out traitors
- Start new traditions

Merging with Existing Campaigns

Castle Falkenstein

As is, but, due to its rarity, *any* iron has the effect of "star iron."

Mis-jump

A "pull" portal is likely to be in front of masses . . . Many Egyptians (and possibly some Greeks) may assume that any "furry" character stepping through a portal in a public place may be a deity (or direct servants thereof) -- if they seem the part from the outset. (The Atlanteans will respect beam weapons more.) Failing that, an appropriate display of power may be enough to convince the locals that they are minor super beings. If they don't ask too much, they may even be tolerated . . .

Space

This planet has a few resources that make it attractive to trade-orichalcum and biological curiosities. Its populace would also make good interstellar diplomats, as they are able to ignore racial negative appearance. In a *Traveller* setting, the abundance of pure hydrogen means that a starship could set down at almost any city and be able to depart directly.

That's What I Want

A History and Possible Futures of Money

by Matt Riggsby

Sure. You can say that your character is driven by a desire to learn hidden secrets, defend the defenseless and rid the world of hideous evil. But we all know what *really* motivates PCs: money. But money is more than just a reward for a monster well killed and something to roll around in laughing. It's the life-blood of most economies and, when it was invented, a world-altering social and economic concept.

Money is a medium of exchange, a measure by which the value of unlike goods can be compared. Just as science would be revolutionized thousands of years later by the development of instruments which could measure time and temperature, the invention of coinage revolutionized economics by providing a sort of yardstick with which to measure value. The relationship between the values of, say, a jug of wine, a wheel of cheese, and coil of rope is unclear and difficult to pin down without a common language to express those values in. Imagine, for example, trying to express the relative values of cheeseburgers, auto repairs, and concert tickets without the abstract standard of money. Having a unit of measure for value didn't make it completely trivial to measure values, but it did provide a vital framework.

Money also allows value to be stored in a more durable form than food or other perishables and a more portable form than almost any commodity, with the exception of gemstones and particularly valuable chemical preparations, such as perfumes, medicines, and spices. Instead of carting a load of grain to market and trading some of it for a chicken, some for a new cooking pot, some for a bolt of cloth, and so on until the grain was gone, someone could trade the grain for a purse of money in a single transaction, then buy other items at his leisure.

Coins

Until the past few centuries, almost all money has been in the form of coins, bits of valuable metal of a known weight and purity with a mark indicating official sanction. The precise origin of money is debated, but recognizable coins started to appear in a number of places in the first quarter of the first millennium BC and apparently had a rapid effect on their economies.

The traditional copper-silver-gold progression found in most fantasy game settings holds true for a great many societies (platinum, which appears in some fantasy currencies, wasn't historically available until the 19th century). That is, most historical monetary economies have had copper coins, more valuable silver coins, and even more valuable gold coins. There is also a certain amount of overlap caused by alloying. Higher-denomination "copper" coins may be made of silver-plated copper or a copper-silver alloy, called billon. Likewise, high-denomination "silver" or low-denomination "gold" coins may be made of gold-plated silver or electrum, a silver-gold alloy. For all metals, a certain amount of alloying is likely. Copper and silver coins may have a small admixture of lead to make the metal easier to strike, while gold coins may have some silver added to make them a bit more durable.

More importantly, though, rather than using exotic materials to produce coins of various values, most governments simply minted different sizes of coins made from more familiar metals. While it's convenient to have the relative values of coins match the relative values of metals (for example, gold is ten times as valuable as silver, so a gold piece is worth ten times as much as a

Everything Has Its Price

One of the other revolutionary things about money is that it introduced the idea that *anything* could be exchanged for *anything else*. In non-monetary economies, goods are frequently divided into "spheres of exchange": cattle, for example, might only be traded for gold, wives, and iron weapons, but not for mangoes, cloth, wood, or anything else. Some things might even be regarded as beyond the realm of economic exchange (the idea of owning land seems absurd in any number of unsophisticated cultures). When introduced into such economies, money acts as an economic universal solvent, breaking down socially imposed barriers to various kinds of exchanges.

silver piece), that assumes that different coins are all the same weight. Historically, this has almost never been the case. Coins made from different metals are usually different weights, and there may be several different coins of each metal. Consider, for example, America coinage of the early twentieth century. Coins in regular circulation included a "copper piece" (the penny), at least five different sizes of "silver piece" (the silver or silver-based dime, nickel, quarter, half-dollar, and dollar), and a few different denominations of gold coinage (ten and twenty dollar pieces), as well as paper money.

In any case, the value of the currency is usually but not necessarily based on the intrinsic value of the precious metal it contains. That is, under most circumstances, any coin containing ten grams of silver will circulate at the value of ten grams of silver, even if one also contains three grams of copper and lead while another contains eight grams (yes, eight grams of copper and lead is marginally more valuable than three, but compared to the value of the silver content, it's trivial). However, there are exceptions. Governments tend to give preference to transactions in their own currency, while exact purity of foreign coins may be in doubt, so local currencies, if they can be trusted, tend to circulate at a higher value than foreign ones.

Although there are many exceptions, historical coins also tend to be on the small side relative to modern coins and absolutely tiny relative to the gold ten and twenty dollar coins of American history (or the ten-to-a-pound coins of Dungeons and Dragons). The vast majority top out at the size of an American nickel or Euro five cent coin, albeit possibly a bit thicker, with many being smaller. Ten to fifteen grams is a typical weight regardless of the material, with few circulated coins going above twenty and some going as low as four or five. One of the few things that a popular fantasy game got right about gold coins is that they can feasibly be used as a standard measurement of weight. Silver and copper coins were typically struck "al marco." That is, some variation in weight between coins was tolerated so long as the average weight of the coins was correct; a bag of, say, eighty billon coins might weigh a pound, but the weights of individual coins might vary by a gram or two. Gold coins, however, were produced "al pezzo"; the weight of each piece was measured to make sure they were the same. Characters wanting to measure small weights precisely could use gold coins on their balances.

While there may be certain basic units in any set of currencies (for example, cents and dollars), decimal currencies are a relatively recent practice. For example, Medieval European currencies used a system using three major denominations of coin. The same system, based on Roman roots, was used throughout Western Europe, but the denominations are best known by their British names: pence, shillings, and pounds. Twelve pennies (the lowest denomination) made up a shilling, while twenty shillings went into a pound. There may not even be whole-number conversions between denominations. Late in the Roman period, the follis, a coin of moderate value, was worth twelve and a half denarii, the next smaller coin. And as if that weren't complicated enough, some larger denominations might not physically exist. For much of history, there was no pound coin. Rather, the pound was "money of account," a unit of measurement convenient for clerks working with large sums (say, a monk figuring the work of his monastery's holdings or a royal accountant writing up the expenses of a recent war). However, a pound coin would be inconveniently large for most transactions.

Not all types of metals will be found in all currencies. For some reason, the Byzantine empire abandoned silver coinage altogether for several centuries while still minting copper and gold coins. Very poor economies can lose higher denominations of coinage if they don't lose currency altogether. After the collapse of the Roman Empire in the west, western Europe went without its

Debasement

So if coins circulate at the value of their precious metal content, what good does it do for a government to debase its currency? In the short term, it works because there's a bit of a delay between new, debased coins being issued (which typically happens by the government spending them on something) and people discovering that they don't contain as much precious metal as earlier coins. The government can, therefore, get away with passing off inferior currency for a few weeks or months before word gets around and prices start to go up accordingly. A particularly strong government might be able to extend that period briefly by requiring the people it deals with to accept the new currency at its face value, but that puts a strain on those people by effectively cutting their incomes relative to the inflating prices in the rest of the economy.

In the long term...well, it doesn't do much good for anyone. Since prices are rising, the government must mint

own silver coins for several centuries and without locally minted gold coins until shortly before the Renaissance, simply because none of the governments of western Europe were wealthy enough to issue their own precious metal currency, nor were local economies developed enough to use them if they had. Where local minting didn't keep up with local demand for coinage, foreign coins were used, much as modern impoverished countries may use dollars if the locally produced currency seems worthless. Byzantine gold coins, for example, were used through western Europe when gold was called for, and both ancient and foreign silver coins were passed around. The generally low volume of new minting could easily keep old coins in circulation for a centuries and have them travel across continents. Because of their durability, coins can circulate for decades even in modern economies. In the United States, a handful of change might still contain a "wheat" penny minted in the early fifties.

If this seems complex and difficult to you, you're not alone. Between hard-to-work-with denominations, questionable purity of the metal, a gap between the circulating value of the coins and the value of the raw metal, and legal questions about the uses of some coins, it's enough to give any accountant a headache, even those who regularly use such currencies. This presents a choice for GMs thinking of preparing their own currency systems. Introducing half-crowns, maiorinae, pentanummia, and other odd denominations may be more detail than the campaign is willing to support, since it complicates bookkeeping. Unless your players enjoy doing a lot of math, they may not appreciate having to convert a long list of different types of coins into one easy-to-use amount. Still, it makes for more a more vivid description if characters find a purse of "Royal Dragons" and get change in "five-stars" rather than serviceable but prosaic gold and silver pieces.

In addition to their economic uses, coins have symbolic functions. Coins are usually decorated with a symbol indicating the values and approval of the issuer. For example, some ancient Athenian coins bore the image of an owl, representing the city's patron goddess Athena. The use of coins for propagandistic purposes was perfected by the early Roman emperors. By putting the emperor's likeness on coins, the imperial government put a picture of the ruler in everyone's pocket. This may not seem like much in these days when representations of public figures are everywhere, but before the invention of other technologies to reproduce images, this ensured that the emperor would be the one person familiar to everyone in his empire. Rejecting representation for religious reasons, medieval Islamic rulers put Koranic inscriptions on their money.

Coins are usually circular, but have been oval and rectangular as well. Other flat shapes are certainly possible. For example, Chinese emperors have issued cleaver-shaped coins, and other Chinese experiments took the form of sickles and other tools. Some coins are modified for easy mass transport. A number of Chinese coins have holes in the center so that they can be strung together, while others were packed together in a sealed purse like a sausage skin. The purse would be traded as a single unit with the value of its combined coins. And as noted [elsewhere](#), some coins were designed to be broken up into even smaller bits for lesser transactions.

Paper Money

Over the past few centuries, coins have been almost universally replaced by paper money. Coins remain in use for the lowest denominations, but "serious" money is in the form of folding cash. Paper money was the subject of experimentation in antiquity, but many people had difficulty accepting it. For example, it appeared sporadically in China for centuries through the Middle Ages, when the government's supplies of silver ran low. The notes represented the promise of a quantity of silver, which the government might not actually have at the moment. Inevitably, and fairly quickly, the emperors issuing the currency fell victim to the temptation of printing more of it, which always led to a crash in the value of the currency.

The evolution of paper money in Europe began at around the same time it did in China, but it developed more slowly

more currency to catch up. Because its supply of precious metal is probably already under stress, it'll have to debase the next round of coins even more, kicking off another round of inflation. The government can try to raise taxes to rebuild its stocks of precious metals by raising taxes, but typically people hoard old, good coins and spend the newer, bad ones, which means that the government recovers less precious metal than it would otherwise. Debasement can gain a ruler a temporary advantage, but it usually sets off a disastrous inflationary spiral.

and on a slightly different trajectory. The precursors of European paper money were privately issued rather than printed by the government, and they weren't money yet. Rather, at major trade fairs, international merchants started to reach agreements where one handed over goods now in return for the promise of other goods in trade later. These deals were recorded in promissory notes, which slowly started to be traded themselves. At about the same time, money lenders (initially monastic orders offering the service to help Crusaders, but wealthy merchant houses got in on the operation later) started issuing letters of credit, indicating to other branches of their operation that a customer had deposited a sum of money with them and should be allowed to withdraw it elsewhere. Like the promissory notes, the letters of credit represented actual value and were eventually traded themselves. This was a far less sophisticated use of paper instruments than in China, but it did plant the seed of the idea that a paper representation of value was as useful for many purposes as the valuable thing itself. The use of paper money grew slowly but steadily after that, eventually coming to dominate monetary exchanges in the 19th century.

A development that appeared along with paper money is currencies based on, for lack of a better word, trust rather than on the value of bullion in hand. If you dealt in coin, you had something valuable concretely in front of you. With paper money, you had to trust that the merchant you were dealing with would be back at the fair next year, the money-lender had sufficient assets to cover the amount of the letter of credit, and so on. But the gap between the value represented by the currency and the goods which it represents has been growing steadily wider. While a number of governments hold reserves of precious metals and other valuables, few if any hold enough bullion to cover the value of circulating currency. Instead, the value of most modern currencies is based on trust: the government's perceived ability to collect on and repay debts and the user's belief that the currency will be accepted by banks, shopkeepers, etc. As a result, weak countries and unstable governments usually have weak currencies, while stronger and more stable nations have stronger currencies. Technically, precious metal coinages are based on trust as well, the belief that others will regard a particular metal as valuable. However, once the idea of money has been established in a society, faith in the value of precious metals has historically proved to transcend faith in nation, government, religion, and family.

If paper money is to be used at all in a low-tech economy, it requires an already heavily monetized economy, which most ancient economies were not, and a stable, well-administered government that is not likely to print too many bills, thereby driving down the value of money. In higher-tech economies, the need for money usually far outstrips reserves of precious metals, so paper money becomes a necessity. Many early modern currencies (including a great deal of American money during the first fifty years or so after independence) were not issued or backed by governments, but by private banks, although in some cases the private banks, such as the Bank of England, were operating in partnership with the government. In such cases, money can be treated much like a cashier's check drawn against the bank's own assets. If the bank is known (or believed) to be in trouble, people may refuse to take its notes as payment, or may take them only at a discounted rate.

Since paper money is so easy to produce, issuers of currency must stay on guard against the temptation to print more money than the economy can support. To do otherwise can wreck an economy. After the First World War, an impoverished German government flooded the economy with new currency to pay the tremendous cost of reconstruction, leading to inflation rates of well over 1000% per month. In modern countries, the money supply is often regulated by national banks or councils of bankers, who have a vested interest in preventing inflation, but extreme circumstances and political imperatives can force reckless monetary policies on them. The consequences of printing too much money are similar to that of debasing coinage: a short term fix that often spells long-term disaster.

Under ideal conditions, paper money is made from the highest quality paper to resist the wear of extensive handling. Since it is based on relatively cheaply and easily produced paper and ink rather than innately valuable materials, the issuer must take extra steps to prevent counterfeiting. Most paper currencies are decorated with elaborate, difficult to reproduce designs, such as pictures of leaders, landmarks, and national symbols or elaborate scrollwork around the edges. Some early currencies were printed with plates incorporating a tree leaf. Since it would be almost impossible for a counterfeiter to find another leaf of the exact same shape and size and with the same pattern of veins, it would be equally difficult to copy. Individually numbering bills also complicates the counterfeiter's task. An issuer might be powerful enough to restrict access to the model of printing press or even the specific types of paper and ink used to print their bills. Elaborate coloring schemes are currently in use across most of the world. In addition to the added security they give, they make it easier to distinguish different denominations at a glance. With improving technology, more elaborate anti-counterfeiting schemes must be used. Now that computers and cheap color printers allow skilled

users to reproduce any printed image they want, some countries put a metalized or plastic strip inside the paper itself. Future governments might print bills with multiple images which can only be viewed with infrared or ultraviolet light or use holographic images, computer chips, or radioactive isotopes for validation. In a fantasy campaign, money might have some kind of mystical authentication.

Possible Currencies

While currencies have historically been based on precious metals, it is possible that other media may be used. If it is to be tied to the value of an actual medium rather than trust in the social system that supports it, useful currency must be based on a commodity that is scarce, in demand, easily quantified, and easily divided or combined into sums appropriate to any reasonable transaction. For example, although they are valuable, gems are unlikely to become a currency, since gemstones cannot be divided into smaller units without changing their value (because larger gems are less common than small ones, two one-carat gems together are less valuable than one two-carat gem), nor recombined once they have been divided. Here are some media that may be or have been used as the basis of a currency.

Precious metals: Gold, silver, copper, platinum (if available) and their alloys are likely to remain a good basis for currency until cheap, powerful energy sources make transmutation of lighter elements on a large scale practical. Metals make an ideal currency (in fact, one might argue that money came to act as it does because those functions happen to fit the properties of metals well). They may be melted down, alloyed, purified, and recast repeatedly without losing any of their intrinsic value. In addition to their scarcity, many precious metals are excellent conductors of electricity, in demand for high-performance electrical parts at appropriate levels of technology.

Trade goods: Certain commodities have been treated as or used as the basis of a system of currency, including salt, cocoa pods, compressed blocks of tea, and tobacco. All were, in their contexts, relatively uniform in quality (or at least easily graded) and could easily be divided or combined without effecting the value as a whole. What these economies have had in common is that they were relatively underdeveloped. For example, tobacco was the basis of a currency system in early colonial Virginia where the economy depended on tobacco farming and not enough hard cash was coming in from England to satisfy local needs. A system of currency developed much as paper money had developed from promissory notes centuries earlier, with notes representing goods held elsewhere, with the expectation that they could be exchanged for "real" money later. In the other cases, the economies where trade goods acquired a monetary status were usually on the periphery of more developed economies. The trade goods were primary imports or exports and attained sufficient importance in local economies that they could form the basis of an exchange system (this could easily happen in a SF campaign, where a relatively primitive planet has large stores of a rare and valuable mineral or is the sole source of a valuable plant or animal resource). This is sufficient for temporary use, with "temporary" possibly meaning decades or even a century or two, but as the local economy develops, inflation and increased economic activity may push prices into a realm where blocks of salt or bundles of cocoa pods become inconveniently cumbersome, and a new basis for money will eventually need to be found.

Energy: As technology increases, people may be limited only by how much energy they can bring to bear. Energy sources will only become more and more important, since high-tech devices consume huge amounts of power. Stored energy (in the form of batteries and power cells) culled from generators or natural sources, or, more likely, energy-rich materials such as petroleum, radioactive isotopes, or antimatter might become the ultimate currency. Energy can be measured easily and shuffled between batteries, and it is likely to remain in limited supply until the appearance of total conversion power plants. In a world with highly developed magic, magical energy might be a medium of exchange if suitable means can be found to transfer it.

Drugs and complex organics: Societies with particularly advanced biological sciences, including the societies of many cyberpunk campaigns, may start to see drugs used as a standard of exchange. A moderately high level of biological technology would make complex chemicals common enough to use as a medium of exchange without becoming so common as to lose their value. Properly treated, drugs may be stored indefinitely, divided into small doses or diluted for easier distribution, and combined into large quantities simply by pouring them into the same container. An extremely low-end example of this kind of currency is a prison tattoo artist with a portfolio of designs with prices expressed in cigarettes and alcohol.

Labor: A number of science fiction stories, such as Jack Vance's Gaeon Reach novels, have a currency which represents labor. A coin might represent a day's or hour's labor. Each hour worked earns more of the currency. Workers in particularly skilled or dangerous occupations might earn such money at an accelerated rate (the difficulty of setting up such conversions is the main reason why labor-based currencies are likely to remain fictional, but the GM might postulate incredibly powerful actuarial computers which can work out feasible "exchange rates"). The currency might be based on specialized labor, such as military service or skilled technical services. As a peculiar example, Bruce Sterling's Shaper/Mechanist stories feature a "geisha bank," which issues a currency based on hours of sexual service. To some extent, a labor currency must be based on trust. Labor can be measured and subdivided, but it isn't portable. Unlike a vial of drugs or a battery full of energy, a "one-day" coin cannot itself be used as work. While the currency represents labor, it cannot contain the labor itself; it can only be exchanged for the labor it embodies.

Social privilege: While there are no historical precedents for this either, it is possible for a currency to represent a special privilege. For example, in a society with equipment which stimulates the brain's pleasure centers, a government might issue a currency which represents (and may be traded in for) time spent in utter synthetic bliss. Another society might have its citizens take turns in high office, but allow the people to trade their time among themselves. The currency would represent time spent in charge. Conversely, if all citizens are expected to perform public work generally considered drudgery, they might trade time off from those duties.

Random Thought Table: GTS (and Other Hazards of Vegas)

As foretold in the Dead Sea Scrolls (and recounted in last week's installment), I spent last week at GTS, which stands for the GAMA Trade Show. "GAMA" stands for "Game Manufacturers Association." Despite my Chaotic-Good-with-Grammatical-Tendencies alignment, I will *not* point out that:

- "GAMA" is only slightly more appropriate an acronym of "GAmE Manufacturers Association" than "GAMARA" or "G-MAN FACES A CAT,"
- I'd personally call it "Game Manufacturers' Association," and:
- Having a part of an acronym such as GTS consist of an acronym itself is an abomination.

(I also will not point out that a Certain President of a Game Company in Austin thinks "manufacturer" is the wrong word, and should in fact be "publisher." But that's a nuance for another column.)

Anyway, the GTS is the largest industry trade show, although it pales by comparison to many other trade shows such as E3, Toy Fare, Comdex, or IMTS. It also paled in the shadow of the industrial equipment trade show that was taking place at our hotel after GTS, where an outdoor exhibit featured dozens of shiny cranes, wrecking ball apparatuses, and other gargantuan machines many of which had (coincidentally, I'm sure) the Decipticon symbol on the side.

The day before the day before the show consisted of bag stuffing, which is where every company who brought fliers or other promotional information helped put copies of everyone else's literature into the bags that would be given out to the retailers visiting the show. The number of bags we were going to stuff had raised from 500 approximated to 1,500. Since the Evil Corporate Masters at my Day Job had to spend over a dollar apiece for our color catalogs, the discrepancy between the expected and the actual numbers was somewhat disconcerting. We ended up with a few catalogs left over; I needed to resist the urge to be too stingy with them, given the limited number and the cost, my natural inclination would have been antithetical to the nature of a trade show:

"Hi; do you have a catalog?"

"There should be one in your bag."

"I don't think there is."

"You're not getting one until you check . . ."

Anyway, it was during the bag stuffing festivities that I made my first startling discovery. Despite the fact that "Vegas" and "vegan" differ by only one letter, this is absolutely *no* relationship between these two concepts. Having become vegan for Lent, I found myself unable to find almost anything to eat during this time. A gargantuan buffet ended up in my eating salad, an ear of corn, and pasta with marinara sauce (although I was dismayed to see similar sauce days later with big ol' meatballs; methinks my red sauce may not have been as animal-free as I'd believed). I could be one of the only people to lose five pounds during a trip to Vegas.

The second day -- the day before the show -- consisted of setting up our booth. Since tables weren't supplied to the booths this year, and the cost to rent them was considerable, we figured out our own way to bring a display that could fit into our luggage. Amazingly we did so, with a display that -- if we had published and brought with us one more book -- would have resulted in our entire display being over the weight limit allowable by the airlines. Next year I may be forced to tape books to my body, like a coke mule for RPGs.

The first day of the show was somewhat quiet. I have nothing to compare it to, since it was my first GTS, so I don't know how crowds compared to previous years. We had a snazzy giveaway for retailers -- an animated motorized double-sized display that advertized our company and our books -- and gave them to pretty much any retailer that expressed interest. Unfortunately, there didn't seem to be all that many stores that dealt in RPGs; many of the retailers who were there seemed to concentrate on card games, board games, miniatures, and for all I know vegan food. Still, all the retailers we spoke with were very appreciative for thinking of actually trying to make our stuff and their stores

look good.

The last few days of the show went approximately the same as the first. Unfortunately, by Day Two a problem began to develop which became painfully apparent by Day Three -- I was losing my voice. Hard. By the end of Day Three I could speak about 50 words a day; this turned me into our booth's equivalent of Teller. I'd try to do my part when my other two booth-mates were busy, but I probably did more harm than good:

Retailer walks by booth, looking mildly curious.

STEVEN walks around booth holding a book and approaches the Retailer; he opens his mouth and emits a noise akin to a quieter version of the Donald Sutherland screech at the end of the **Invasion of the Body Snatchers** remake.

Retailer flees.

The end of Day Three was also tear down of the booth, where it was apparent that, in addition to the utterly gone voice, Las Vegas had bestowed upon me some kind of repertory problem. So now I was able to emit more than my 50 words a day, only it was a raspy cough that left me doubled over and gasping.

Day Four was entirely a "recovery" day, since our flight didn't leave until 5 p.m. that evening. I took advantage of our hotel's free \$10-in-slots offer, and I managed to blow through it at a quarter machine before I really even understood what was happening, nor did I even manage to win once. I was disappointed that Vegas had utterly failed to make me a gambling addict. We also visited the Star Trek Experience at the Hilton, which was an experience I found interesting enough to perhaps devote another column to at some point.

So now it's almost a week after returning, and although my voice is more or less back, I still have a respiratory/cold-like thing, resulting in lots of headaches as my body forces too much blood into my skull. Clearly, what happens in Vegas stays in Vegas . . . except the plague.

As if I didn't have enough going on, I got a new pair of glasses a week before GTS, and they came in today. It's my first pair of new frames in 10 years, and they're significantly squatter than my old frames. As a result, although my prescription hasn't changed at all, my body is reacting as if I was trying to see through a half-bottle of Dasani. I'm bumping into objects and experiencing new kinds of headaches different from the ones from coughing. It's a cornucopia of discomfort, and it's overflowing.

I have some additional thoughts regarding GTS, including some actual industry analysis. But that's going to have to wait for a week when I can breathe, see, and otherwise form cognitive thoughts that don't involve wondering if I need more or less phlegm to rebalance my humors. In the meantime, I hope you've enjoyed the least-conventional GTS review ever . . . even if it's unique in that I can't easily read what I've written.

Murphy's Rules

Brains, Brawn, And BEMs

A New College for *GURPS IOU*

by Michael Walton

GURPS IOU is an incredibly versatile setting that can accommodate almost any character type. The book gives numerous examples of how magical or high-tech characters can be integrated into the campaign, but there is little attention paid to supers and psis (there is a reference to a possible School of Superhumanities on p. 93). Aliens don't fare much better; they're mostly treated as sub-groups of other types. This article introduces a new IOU college that specializes in these under-represented character types.

College Of Adventuring And Paranormal Exploits (CAPE)

CAPE is one of the more recent additions to the University. It is the result of a reorganization in which some junior faculty from COUP and WUSE carved out a niche for themselves. CAPE protects itself from absorption by requiring students to take some courses in other colleges. Proceeds from the exploits of faculty and students -- in the form of reward money or loot -- is the college's primary source of funding.

Students here study the use of paranormal talents. Novice supers attend classes alongside newly activated psis and extraterrestrial vigilantes (or invaders!). CAPE teaches students to use their powers for good . . . or to be good at being bad. Many gadgeteers and mages show an interest in this field, but CAPE doesn't have enough clout to fight off continual assaults from both WUSE and CoM. Students whose paranormal abilities involve inventing or spell casting are encouraged to take dual majors.

The focus on law enforcement -- and law breaking -- requires CAPE majors to take several COUP courses. This arrangement helps CAPE in disputes with other colleges -- nobody negotiates a settlement like COUP faculty. Knowing where to find a good lawyer is also quite useful for CAPE graduates; even those who don't commit crimes are frequently responsible for impressive amounts of property damage. CAPE enjoys similar symbiotic (or rather, commensal) relationships with WUSE and SCA. This keeps disputes over who has jurisdiction over certain classes to a minimum.

CAPE majors are often found at trouble spots, either because they're trying to stop the trouble or because they caused it. The Dean of the college, who is affectionately known as the Dean of Steel, encourages students to think of themselves as being in class 24-7. This is intended to prepare them for schedules that they'll have to keep after graduation.

Most CAPE classes are located in COUP buildings or the Headsded Gym. The more high-energy courses are taught in triple-reinforced underground "disaster rooms" that are loaded with technological death traps (mostly the results of WUSE projects; safety interlocks optional). Wandering into a disaster room without supervision is *not* recommended.

School of Superhumanities (SoS)

The largest division of CAPE trains supers. Heroes and villains both study here. Many supers meet their archenemies while still in school, and it's not unusual for study groups to go on to become super teams after graduation. SoS majors are mostly of the brightly colored spandex or the dark leather schools of fashion, though some Super-villainy majors favor expensive business suits. Student villains are more likely to be on the Smith-and-Wesson Scholarship (*GURPS IOU*, sidebar, p. 7) than any other students.

SoS courses focus on the use of metahuman powers and on general physical fitness. Combat techniques and power-

related skills are the main areas of study. All students in this school have 50+ points worth of Super-powers and associated skills (usually at low levels), Super Advantages, and enhanced attributes. Faculty have at least three times that amount! Super-heroics majors are encouraged to sign on with Campus Security for some much needed experience. The added firepower makes security teams much more formidable but also adds to the collateral damage that they inevitably do. SoS students are barred from joining the Team because their powers give them an unfair advantage.

Job opportunities for Superhumanities grads are limited; there are few openings for costumed vigilantes. Some become guards at ultra-high security installations. Most SoS graduates go into business for themselves as bounty hunters or criminal masterminds. One Ilumnus is known to have opened his own school for "gifted youngsters."

Typical Courses: SH101 -- Feats of Unusual Physicality (leaping tall buildings in a single bound, etc.), SH206 -- How to Establish and Maintain a Secret Identity, SV313 -- Death Traps Made Easy, SV522 -- Advanced Hideout Design.

School of Applied Parapsychology (SAP)

This is the place to go for training in psionic skills. All SAP students and faculty are active psionics. Power levels vary; there are students who are far more powerful (but vastly less skilled) than their professors. The department specializes in practical applications of psi, but some uses -- mainly in law enforcement or crime -- are covered in SoS or COUP classes. Psychic combat is only taught in SAP, though, and no other school can field talents of sufficient skill and power to break this monopoly. The chairing of SAP is known to be the most powerful psi on campus with the possible exception of the ArchDean.

Many of the students in Applied Parapsychology classes are not SAP majors. Telepaths, empaths, and clairvoyants can easily find a place in COUP while electrokinetics and cyberpaths are often WUSE majors. CAPE's cordial relations with COUP and WUSE allow psi-gifted majors from those colleges to cross over into SAP courses.

There are many career options for SAP graduates. Clairvoyants and psychometrics excel at detective work. A telekinetic can make a very good living as a high-stakes gambler specializing in craps or roulette. Empaths and telepaths make gifted politicians and businessthings (most such are double majors in COUP), and there are a number of well-known empaths who used dual CAPE-SPCA majors to launch entertainment careers.

Typical Courses: PSI010 -- Remedial Mind Reading, PSI132 -- Beginning Clairvoyeurism, PSI454 -- Long-range Telekinesis: Reach Out and Touch Someone, PSI512 -- Intermediate Mind Control.

School of Extraterrestrial Intelligence (SETI)

SETI is CAPE's most technology-oriented school. Extraterrestrial Intelligence majors learn how to build and operate starships, construct death rays, and carry off humans of the appropriate gender to repopulate their own species (Mars needs women, but Venus needs men . . .). Students with ambitions of conquest may take crossover classes in SCA's Department of Empire Building. Not all alien students are in SETI. Many have innate abilities that are best studied in SoS or SAP courses instead. Some of the technical classes are jointly taught with WUSE.

The appearances and capabilities of SETI majors are the most varied of any entity at IOU. Most species in the galaxy - and quite a few from other galaxies -- are represented among the students and faculty. Little green humanoids are only slightly more common than undulating masses of tentacles and super-intelligent shades of blue. It was in fact SETI Ilumni who initiated the effort to replace speciesist terms like "freshman" and "chairman" with more politically correct terms.

SETI graduates can easily find work on starship crews or as planetary ambassadors. Some acquire space stations and go into business as dry-docks, shipyards, or "starstops." A few become interstellar conquistadors, but it's rare for them to enjoy long careers.

Typical Courses: ET109 -- Basic Space Combat Tactics, ET283 -- Interstellar Navigation: Boldly Going Where No One Has Gone Before, WSCS371 -- To Serve Man (one of the few WSCS courses that is regularly taught), AE665 -- Advanced Starship Design.

Alphaman: Dean Of CAPE

ST 30, *DX* 12, *IQ* 11, *HT* 20

Advantages: Academic Status +6 (Dean), Ally Group (Department Heads, unwilling, 300-point characters, medium group, appears fairly often, 90 points), Appearance: Handsome, Combat Reflexes, High Pain Threshold, Social Status +1, Strong Will +2, Tenure, Wealthy

Super Advantages: Costume, Damage Resistance +40, Flight, Hyperflight (75 points), Immortality, Parabolic Hearing (6 levels), Penetrating Vision (6 levels), Super Flight (2 levels), Telescopic Vision (4 levels), Ultrahearing, Vacuum Support

Disadvantages: Compulsive Behavior (Rescuing Civilians), Duty (to University, -10 points, quite often, can be hazardous), Enemies (villains du jour, small but powerful group, fairly often, -20 points), Honesty, No Sense of Humor, Pacifism (Cannot Kill), Truthfulness

Super Disadvantage: Vulnerability (Centaurium, very rare, 4 levels, 5 hexes, -18)

Quirks: Neat freak, No drugs or alcohol, Poses dramatically, Shy about romantic relationships, Spouts heroic catchphrases at any excuse

Skills: Administration-13, Area Knowledge (Earth)-14, Area Knowledge (IOU)-14, Area Knowledge (local space sector)-15, Astronomy-10, Biology-10, Boxing-18, Chemistry/TL7-10, Cloak-16, Computer Operation/TL7-13, Detect Lies-15, Disguise-16, Flight-17, Forensics/TL7-14, Intimidation-18, Law-13, Leadership-17, Merchant-12, Physics/TL7-10, Politics-13, Research-14, Survival (IOU)-17, Survival (Space)-15, Swimming-16, Tactics-15, Teaching-14, Throwing-17, Writing-15.

Alphaman is from a planet in the Alpha Centauri system. Centaurian society is based on super-heroics, but opportunities to excel are rare because the entire population has powers. When Alphaman heard about Earth he decided to make his reputation as a hero by helping out his species' "unfortunate less-evolved cousins."

One long and illustrious career later Alphaman is now retired from heroism. The ArchDean recruited him to teach superhumanities partly because of the cost savings of having a faculty member who *didn't need* The Treatment. Alphaman shrugs off most forms of damage without making a fuss -- there's just that minor problem with a rare mineral from his homeworld. The Dean of Steel no longer uses his alias of mild-mannered science writer Ken Clark, but he does take time from his administrative duties to teach classes in maintaining an alter ego -- as someone who kept his identity secret for decades using nothing more than a change of clothes and a pair of spectacles, he's certainly qualified. Alphaman is a popular figure at IOU because he frequently rescues students and other faculty from various campus hazards. When he's not saving someone he's encouraging CAPE students to do it.

Alphaman is 6'4", blond, green-eyed, and ridiculously muscular. He appears to be about 50 but is actually much older. He is instantly recognizable by his green tights, yellow cape, boots, and trunks, and the big yellow "A" on his chest.

Typical Dialogue: "This looks like a job for . . . the Beginning Heroics class!"

Variations

Silly: The Silly Alphaman is an unrepentant glory hound who comes off as a parody of comic book heroes. Add the Odious Personal Habit "Hogs the spotlight" and really play up the posing and catchphrase quirks. He never accepts rewards for his good deeds, but the ArchDean has arranged for all such compensation to come directly to the

University.

Weird: As written except that he always wears his costume.

Darkly Illuminated: This version is not the paragon of virtue that he appears to be. Take away the Honesty and Truthfulness disadvantages and add some Acting skill so that he can *simulate* those flaws. A Darkly Illuminated Alphaman is both meaner and more mercenary than the stereotypical comic book hero -- he might well be a Bully, but he protects his reputation by only cutting loose on criminals. He will definitely be more willing to accept rewards and might even be Greedy. He could also be lying about his vulnerability to Centaurium.

Appendix Z

The Wizard's Bookshelf

by Matt Riggsby

Books are traditionally a wizard's greatest asset, but they shouldn't just be standardized books full of spells. No, a wizard is after wisdom of every kind, and that wisdom may come in a variety of forms. No two volumes on his shelf will be the same: shape, size, material, and language will vary from book to book. They'll cover a variety of subjects as well; history and philosophy are important, and poetry and religious works may contain hidden mystical significance. Rather than telling your victorious heroes ransacking a shelf "You find a bunch of books," these tables can be used to come up with rich descriptions of any written text.

Language

Most people write in their own language or dialect, but may choose a different one to communicate with a specialized audience. Roll 3d6.

Roll	Language Type	Comments
3-9	Common	In medieval Italy, this might be a dialect of Italian, although not necessarily the local dialect. It could be Tuscan in Umbria, Umbrian in Sicilly, etc.
10	Common modern foreign	A reasonably accessible foreign language (English or German in Italy)
11-12	Common ancient	A well-known but extinct language (Latin in Italy)
13-14	Obscure modern foreign	A little-known or perhaps completely unknown tongue (Chinese or Tlingit in Italy)
15	Obscure ancient	A lost tongue (Egyptian hieroglyphics in Italy)
16-17	Otherworldly	(Elvish in Italy)
18	Code	The manuscript is probably in a known, or at least accessible, but encoded.

Shape

Books have taken on different forms over the years. Wizards, being antiquarians by nature, may have some very old ones. Roll 2d6.

Roll	Shape	Comments
2-3	Bound papers	No binding, just loose pages with a string or other band around them.
4-7	Large book	A foot or more on any one side, too large to carry comfortably; books up to three feet tall are not unknown, although books of that size are usually large-print, meant for group reading at a distance. Bibliophiles will call these folios (using single sheets of paper or parchment for each page) or quartos (a single sheet folded twice, to make four pages).
8-9	Small book	Small enough to carry in a pouch or pocket; octavo (sheet folded to make eight pages) down to tricesimo-segundo (sheet folded to make 32 pages).
10-11	Scroll	A long sheet of paper, rolled up
12	Accordion	An intermediate form between scroll and codex (a modern bound book with multiple pages),

fold historically found mostly in Japan. Instead of being rolled into a cylinder, the paper is folded accordion-like. The book can be read in one direction, turned over, and read in the other, with the text this time around being on the insides of the pages read the first time (and vice versa).

Binding

Those stacks of paper have to be protected from the elements somehow. Usually, anyway. Roll 3d6.

Roll	Binding	Comments
3	None	Simply a collection of bound pages
4-7	Wood	Thin wooden boards, perhaps painted or otherwise decorated.
8-9	Common leather	For example, cow or sheepskin. These and the other bindings may themselves be stretched over wooden boards.
10	Plain cloth	For example, cotton or linen
11	Metal	Thin-beaten sheets of ornamental metal.
12-13	Fine cloth (silk, velvet)	Silk, velvet, etc.
14-15	Unusual leather	Shark, lizard, fish
16	Ivory/horn	
17	Human skin	
18	Otherworldly	Dragonskin, werewolf felt, etc.

Embellishments

Many books will have special individual features. This is optional, but probably interesting. Roll 3d6.

Roll	Embellishment	Comments
3	Jewelry	Decorated with gems and precious metals
4-5	Unusual material	The pages themselves are made out of something odd: cloth, leather, beaten metal, thin glass, etc.
6-7	Illumination	Contains full-blown illumination: Elaborate painting, gold leaf, elaborately decorated capitals, etc.
8-9	Illustration	Contains simple diagrams and sketches
10-11	Marginal Notes	At least one owner has scribbled notes in the margins. This may help illuminate confusing passages or confuse clear ones.
12	Lock/latch	Has a latch, keeping it from opening accidentally if dropped.
13	Case	Comes with its own hard slipcover or box
14	Chain	Chained to the shelf to keep it from being moved
15	Ribbon bookmark	Has an integral place marker.
16	Compartments	Has small components to hold a magnifying glass, pen and tiny inkwell, or other aid to reading.
17-18	Magical features	Provides its own light, helps pronounce unfamiliar words, has a face on the cover that groans when anyone other than the owner reads from it, etc.

Subject

And what's the book actually about? Roll 3d6.

Roll	Subject	Comments
3-4	Magical instruction	An actual spellbook with specific instructions on how to do magical work

5-6	Poetry	Individual poems or an epic
7	Religious text	A primary religious or mystical text (such as the Bible, the Koran, or the I Ching)
8	Biography	The life of a notable person
9	Geography	A description of a country or region
10	Philosophy	Abstract philosophy of a not-strictly-religious nature (for example, Plato or Aristotle), academic discussion (grammar, music, politics), or vaguely scientific "natural" philosophy.
11	History	The history of a specific event or country
12	Speeches/Letters	Collected speeches or correspondence
13-14	Commentary	Commentary on one of the above (much of ancient literature consisted of commentary on primary works, such as the poems of Homer or the works of Confucius)
15	Journal	
16-18	Collection/Florilegium	A collection of notable excerpts from other works (say, 2d6 + 10, roll as necessary for each one, ignoring further results of 16-18).

Pure reference works (dictionaries, log tables, etc.) range from the rare to the nonexistent through most of history.

James Ernest's Totally Renamed Spy Game

Published by [Cheapass Games](#)

Designed by James Ernest

Illustrated by Cheyenne Wright

112-Card Deck, Small Rules Sheet; \$15.00

Once upon a time there was a card game. It was a cleverly designed little card game. It was a popular card game. But not everyone liked the card game because they felt it infringed on their intellectual property. So they told the card game that it had to change its name. Which was a shame because everyone else thought it was a fun name. But the card game had no choice and that was [the end](#) of that. Fortunately the card game was not without brains, and decided to give itself a whole new name. One that would not make certain people angry.

First released in 1997 under a name that dare not be mentioned, *James Ernest's Totally Renamed Spy Game* returns in an all-new format, in full color, and still poking fun at the genre conventions of certain series of films about a British super spy. Most important of all, it does this without reference to the central character of said film series. The central idea in the new edition remains the same as it was in 1997. What happens every time a super spy breaks into the lair of a criminal mastermind? He gets caught and the criminal mastermind locks him up inside a deathtrap. But does he push the button, pull the lever, or activate the countdown that will send the interloper to his certain death? Of course not. This is an opportunity for the insane evil genius to extol his own virtues, to gloat over the spy's capture, and to taunt him with the very details of his villainous master plan. And while he drones on, the super spy seizes the opportunity to escape his bonds, and thus certain death, before exiting the lair to the sound of explosions in his wake. Life would be so much simpler if the criminal mastermind just put a bullet in his brain, but old habits do die hard. Quite literally . . .

Designed for three to six players, *James Ernest's Totally Renamed Spy Game* is a silly intrusion into the world of B-movie supervillains and the spies they never seem to bump off. Each player takes the role of a criminal mastermind, building a lair large enough to tempt would-be spies, and then taunting and killing them before they can escape and blow up said lair. This vaguely new, all refitted edition of the popular original returns in full color, its cards attractively illustrated by Cheyenne Wright.

The 112 cards consist of four types: 36 each of Spies, Doublers, Lairs, and just four Bombs. Spies and Bomb cards have purple backs to tell them apart from the blue of the Doublers and Lairs. This is intentional, as the Spies and Bombs have to stand out. Lair cards represent improvements to mastermind's base, and are marked with values between one and four. The Spies are marked between two and nine, while the Doublers are labeled with letters A through I.

Game play remains the same as the original. A Player begins with a hand of five cards and can conduct three actions per turn. The first is drawing two cards from the deck; the second is adding a Lair card to his base. This gives it new facilities such as "Hall of Magnets," "Clown Car," and "Tank of Killer Fish," which are placed face down on the table. The total value of a base's Lair cards is important when it comes to a spy's attempt to blow it up.

The third action is *slightly* more complicated. A Spy or Bomb can be played from a player's own hand, or that of any player, or from the top of the deck onto any lair including the player's own. Hence the need for them to have different colored backs. If not played from a player's own hand, the intended destination of the Spy or Bomb card must be

declared beforehand. Alternatively, a team of Spy cards can sent from the player's own hand into a rival's lair.

Any Bomb played onto a lair automatically blows it up, whereas a Spy causes all of its facilities to be exposed. Their combined value is compared to that of the Spy or Spies, and if less than the intruders, then the lair blows up. All of the Lair and Spy cards are discarded. If the value of the Spy is equal to or less than the lair, he is captured. And a captured Spy means taunting!

Alternatively, in a fit of common sense, a Mastermind could execute the spy and score just a few points. But taunting is in the nature of the criminal mastermind. This is done by playing a single Doubler card on the Spy, reading it aloud and inserting the Spy's name like so: "Before I kill you, J. Robert Lucky, allow me to reveal the full extent of my depravity using this nutcracker and a copy of the Manchester Guardian." If successful, the value of a taunted Spy when killed is doubled, but a taunt can be foiled . . .

If another player has a Doubler marked with a letter that corresponds to the one played by the taunting mastermind, the taunt attempt fails. This allows the spy to escape and of course, blow up the lair as he leaves. Should the initial taunt be successful, it can be followed by a second attempt. This requires another Doubler card, but with a different letter, and if successful, will again double the spy's value. Successfully taunted spies are put aside along with any Doubler cards. Play continues like this until the deck runs out or a player scores 33 points.

The full-color makeover of *James Ernest's Totally Renamed Spy Game* really does make the game look good. The Lair cards are made to look like blue prints and the Spy cards are all individualized. And of course, the game play remains as good as it ever was, the strategies being simple to grasp. Send single spies into the small lairs of your rivals, and teams into larger ones. Build up and keep track of your own Lair's value to send Spies of just low enough value to get captured and with luck, taunt them. In the meantime, keep track of the Doublers that have been played so far. That way a player has some idea of what cards are safe to taunt with. The Bombs, imported from the *Better* edition of the original game, of course throw a spanner in the works by always blowing up a Lair.

Like many good games, the pleasure of *James Ernest's Totally Renamed Spy Game* from the roleplaying elements that can be added to its play. This is a chance for the players to ham it up, to put themselves in the place of a criminal mastermind, bad accent and all. At least that is, we hope, until the number of spies runs out. As good as it ever was, the "return" of *James Ernest's Totally Renamed Spy Game* is a more than welcome one, and all the better for being in color.

LetterFlip

Published by [Out of the Box Publishing](#)

Designed by Ruddell Designs, Matt Mariani, Mark Alan Osterhaus, Al Waller, & Ellen Winter

Graphics by John Kovalic & Cathleen Quinn-Kinney

Two letterflippers, card tray, 150 two-sided word cards plus divider cards, rules; \$19.99

A lot of recent releases from Out of the Box Publishing have included plenty of gewgaws and seemingly unnecessary bits of equipment. While nice, these extras (a la *Whad'Ya Know?*'s bobble-head and *Easy Come, Easy Go*'s dice cup) usually served only to boost the cost and not necessarily the playability of games that could already be satisfying enough in their own right. **LetterFlip** is one of their most impressive kits to date as far as gadgets, but this time it looks like the extras are well worth the price tag.

The object of the game is to be the first person to guess all four of his words.

The game comes with two letterflippers. These are panels reminiscent of laptops, and they have the alphabet on tiles that flip up and down. Each player gets a card with four words, to be guessed by their opponent, which they slip into a slot along the side of their panel. Only one word is visible at a time, and players start with their three-letter words. They take turns trying to guess the letters in their word; if they guess wrong, they can eliminate that letter by flipping the corresponding tile face-down and the other player gets to guess. If they guess correctly, they pull a little tab out of that letter tile that shows how many times the letter appears in the word -- for example, if the word is "too" they would pull the tab up to show that "O" appears twice.

If a player has all the right letters from the word but can't unscramble them, they may ask a letter's position: "Is the first letter in my word 'A'?" Again, a correct answer lets you go again. If you suss out your three-letter word, you continue your turn by guessing letters in the four-letter word. This continues until someone has uncovered the five- and six-letter words as well, winning the game.

The equipment that comes in your box not only looks good but is useful and fun to fiddle with. The letterflippers are about 6" by 9" and maybe half an inch deep. They have three rows of letters that flip up and down; these can occasionally come loose, though they pop back in easily. They also may slip down when you touch them -- they don't tend to just fall over on their own, but if you fuss with them or are too fumble-fingered, they'll take that as a hint and drop. Each letter has a tab with little star symbols that extends from the back. These are used to show how many of each letter occur in your current word (and by clicking one star into view, you keep those tiles distinct from letters you simply haven't yet guessed). There is also a letter count flipper that, instead of stars, displays numbers three through six on its tab as a reminder of which word you're working on. Under all of this is the slot for your opponent's card, with a little window that shows which word he's working on.

It all seems a bit involved, and perhaps there's not much to recommend it over a simple game of Hangman, but you can take these devices just about anywhere, and the word cards give players a distinct, identifiable goal -- no arguments over what does and doesn't "count" or what can be used. What could have been troublesome gear is actually in good shape, and kids will certainly be thrilled playing with these gizmos. It's easy to play adult against youngster, since the word cards have color-coded standard and advanced sides. The categorizations are on-target, too.

Standard three-letter words include fairly mundane things like "ear" and "bed," while advanced has "rye" and "flu." At the top end, words like "pillow" face off against "velvet." And yet, for those who think the old *Wheel of Fortune* gambit ("R, S, T, L, N, E . . . ") is going to work: You're going to lose a lot of games.

The box is packed, there's no wasted space, and Out of the Box has thought to include everything but pencil and paper. Even the card decks have a place in the molded plastic insert, with the words "draw" and "discard" stamped on the insert so you remember which end is which. (A pair of divider cards show when it's time to reshuffle the decks.) Like a game of **Battleship** for the intellectual set, **LetterFlip** has all the elements of a classic family favorite: easy to learn, accessible to all ages, fun to play, and colorful . . . and it doesn't hurt to sneak a little learnin' in on them, either.

Of All the Gin Joints in All The World

Thoughts on NPC Appearances

by Brian Rogers

My brother and I are taking an after-dinner constitutional down our parent's rural street when a car screeches to a halt. A woman leaps out, yells my name and embraces me. She's an old friend from high school whom I've not seen in a decade. I get home, and receive e-mails from another intermittently contacted friend -- she's asking me for advice. The next night my strange and estranged ex-girlfriend calls to play catch up before asking after a mutual acquaintance's number.

What is happening? Are the dice hot on my "appear on a 4 or less" NPCs? (Naturally, I'm the PC in this scenario.) Did the GM find some plot threads that he hasn't played with in a while? Or does the triptych of distant female friends foreshadow something?

What're the Odds?

Random chance works. Life is chaotic, and we can never be sure who we'll run into or who's thinking of us. Rolls for dependants and enemies can act as a foundation (four enemies roll up, becoming the Super Enemies Squad, kidnapping the two dice-lucky dependants) or as a spice (Lord Crustacean threatens the city, but Daisy-Mae has said that if you miss this date, you're through) for a session or story arc.

When using random chance, it might be worthwhile to ascribe frequencies to the heroes' contacts and allies. These are often reciprocal relationships, with the PCs helping the ally out occasionally. Their cost might be reduced based on how often they expect help, but a good rule of thumb is asking for aid $\frac{1}{3}$ to $\frac{1}{4}$ as often as the character relies on them -- the player spent points on this after all, and going too far makes the NPC more of a dependant than an [ally](#).

Random chance is good because it keeps both you and the players on your toes. Scenarios will seldom unfold in a predictable way if totally unconnected factors [cross over](#). Another giant lobster slugfest can be much tougher if one hero's nemesis uses the distraction to drag him to a deathtrap. Random chance is equally bad because gaming groups have complexity limits -- too many unconnected things occurring at once and the players get lost in the mire, dragging down the scenario.

Stacking the Deck

Alternately, nothing is random. You've got a thematic or plot outline for the game, and the NPCs are going to turn up when and where you need them to advance those goals. Those pesky dice rolls won't overcomplicate the plot, change your carefully sculpted mood ("In the dark night, tracking the River City Slasher, our heroes come face to face with . . . the Confectionary Killer, and his high-carb weapons!" He just happened to be around, you admit sheepishly) or in any way diminish your storytelling.

When using the stacked deck method, it's a good idea to review the character sheets to see which NPCs haven't turned up in a while. Figure out which of them could slide into the story with minimal disruption. Including things that happen for no reason will keep players guessing, preventing them from meta-gaming your themes ("Daisy-May turned up; stock up on silver and garlic, guys, 'cause the supernatural always comes with her!") to disrupt the story.

Stacking the deck is good because it gives you greater control, gauging complication level and tailoring NPC appearances to the maximize player enjoyment. Those moments of revelation when the players spot a subtext and see that the narrative really is working on multiple levels is a great joy of GMing. Stacking the deck is equally bad when

you have too much control. That way lies railroading: the last thing anyone wants is for NPCs the players like being impossible to contact while ones they hate are front and center because that's how the GM wants it, player enjoyment be hanged.

Marking the Cards

As always, there are positions between the extremes.

- You fit in NPCs based on a combination of purchased frequency and story goals, so someone who turns up on an 11 or less will be on stage in half the episodes of the story arc. This works well for games with set endpoints or seasonal structures.
- Some NPCs are random, while those that the GM has tied most tightly into the plotline turn up when appropriate. Having dependents be random and enemies set is a good split, but it could also be that the team's major enemies are set and theme villains randomly add complication or lighten the mood.
- Random appearances equate to coming up in conversation: contacts can pass along word about Daisy-May being with some new guy, or discuss unseasonable lobster migrations. The NPC's existence is confirmed, but not made central.
- Asides or cut scenes can be used to show what the NPC is doing off screen. With Daisy-May paces her apartment, looking at the phone and weeping, the players have to know she's still in the picture, even if not on stage. Likewise, scenes of Lord Crustacean cackling as he pours over Russian submarine routes gives enough clues to make the players interested, but not enough to tell them exactly what's happening.

No matter how hard we try, our gaming world won't be as populated as real life -- no one has a list of every school acquaintance for possible roadside encounters. Games are always going to be stories, with the limited casts necessitated by the audience's [attention and memory](#) -- but they should not be so tightly constrained that every other phone call is the ex-girlfriend whose appearance always precipitates a social change. Sometimes it's enough to be aware of what methods we use to people our world, and how it might benefit from a little thematic randomness, like an e-mail from an old friend.

A Transparent Plea For Forgiveness

"The notes to The Waste Land! I had at first intended only to put down all the references for my quotations, with a view to spiking the guns of critics of my earlier poems who had accused me of plagiarism. Then, when it came time to print The Waste Land as a little book - for the poem on its first appearance in The Dial and in The Criterion had no notes whatever - it was discovered that the poem was inconveniently short, so I set to work to expand the notes, in order to provide a few more pages of printed matter, with the result that they became the remarkable exposition of bogus scholarship that is still on view to-day."

-- T.S. Eliot, "The Frontiers of Criticism"

Here is how I see Steven begin the process of editing an issue of *Pyramid*. He assembles a few finely honed and editorially shaped articles from a file, running rough word counts on each. Perhaps a theme has emerged, or can be brought to the fore with the deft choice of a "Supporting Cast" or "Appendix Z" submission. He smiles to himself as Pookie's review comes in, on time, on topic, and on word count. As a little reward, he peeks at the cartoon. Then, he takes out a very large bottle of cheap Canadian whiskey, pours a huge jelly-jar full, and downs it in one swig. He then types an email that reads something like this: "Where the hell is your column, you contemptible, impenetrable prima donna? Where? What is wrong with you? I have a day job, and a girlfriend, and games to run, and comic books to read! Just vomit up something about the Templars and send it to me -- nobody will know the difference anyhow given what you laughingly call your prose style. You hack." Then he deletes that email, and sends me one that asks when I expect "Suppressed Transmission" to be in this week, or if I expect it to be in this week at all, and could he perhaps know something, anything, about it before 3 a.m. Friday, pretty please with sugar on it? Then he drinks off the rest of the bottle and writes "Random Thought Table." When he wakes up at 4 a.m. Friday, he checks his email -- hurrah! No column from me! The magazine is 1,800 words short! All his work is for nothing! The whiskey bottle is empty! Somehow, regardless of my dereliction, he still puts together the magazine on word count and on time.

In the full and faithful knowledge that Steven deserves vastly better than that kind of shabby treatment, I proffer this transparent attempt to butter his T.S. Eliot-loving self up, and to express my warm regards for his editorial forbearance. (And let me assure Steven that, as he no doubt knows, any seeming note of whininess in this expression should be entirely blamed on [the original poem](#).) In my tradition of April Fool's doggerel, I call it "The Love Song of K. Allen Hite," and it goes a little something like this:

Let it go then, Steven please,

As my column notes are spread across my knees

Like a sandwich made while driving on the freeway;

It will go, through certain half-demented books,

By monomaniacal kooks

Of Knights Templar in ancient Baltimore

And dusty paperbacks with werewolf lore:

Books that wallow like a Sci-Fi channel show

From ghost to UFO

To lead you to an overwhelming question . . .

Oh, do not ask, "Where is it?"

I assure you, it's exquisite.

On the boards subscribers come and troll

Bitching about the weekly poll.

The columnist who pets his cat upon the long blue couch

The columnist who reads his comics on the long blue couch

Watches Dave into the corners of the evening,

Lingered upon the TiVo and its cartoons,

Let fall upon his desk the books thrown out by madmen,

Went to the kitchen, poured a glass of wine,

And seeing that it was a soft and pleasant night,

Wandered once about the house, and went online.

And indeed there will be time

For the columnist who pages through the text,

Filling his brain upon the long blue couch

There will be time, there will be time

To prepare to quote the next quotations he finds next;

There will be time to drivel and derail,

And time for all the blogs and magazines

That boldly swear that Elvis found the Grail;

Time for lots of channel flips,

And time yet for a hundred more red herrings,

And for a hundred thoughts that lose their bearings,

Before a break to get a Coke and chips.

On the boards subscribers come and troll

Bitching about the weekly poll.

And indeed there will be time

To wonder, "Will they care?" and, "Will they care?"

Time to delete the piece on Baudelaire,

And his connections to the Beings From Out There --

(They will say: "How his prose is growing slack!")

My opening quote, my intro purpling into black,

My historic background, controverted when I double back --

(They will say: "But how his logic falls so slack!")

Do I dare

Annoy the audience?

In a minute there is time

For red herrings so unerring that I might as well invent.

For I have made them up already, made up the lot: --

Made up the magics, deaths, conspiracies,

I have measured out my life with lunacies;

I know the path to madness in a made-up plot

Itself distilled from echoes of Umberto Eco's brain.

So how should I explain?

And I've made up the connections, made up the lot --

The links that tie Mu to kabbalah or MJ-12,

And when I've kabbalized poor Shakespeare, or the Earps,

When I've dragged in enough fill my spot,

Then should I mention **GURPS**?

Or tack on all the side trails of every djinn or elf?

And how should I explain?

And I have formed the myths already, made up the lot --

Myths lifted whole from Gimbutas and Graves

(And just a little Lovecraft from beneath the waves)

Is it Thursday deadline stress

That makes me so digress?

Myths that hint at deeper meanings, or advance the plot.

So how should I explain?

And should I mention **GURPS**?

* * * * *

Shall I say, I have paged at dusk through turgid books

And mapped the murk that rises from the minds

Of lonely men in fugue states, leaning out of logic?

I should have been a chap in tailored tweed

Writing poems with all the crap I read.

* * * * *

And the night, the midnight, sleeps so peacefully!

I pet my cat, not too athletic,

Lazy . . . tired . . . or apathetic,

Stretched on the couch, to purr and watch a DVD.

Should I, after swords and orcs and Gollum,

Have the strength to write the freaking column?

But though I have drunk a Red Bull, read and played,

Though I have surfed the Web (grown slightly strange) through pages weird and dirty,

I have no column -- and it's now 4:30;

I have seen my paragraphs grow limper,

And I have seen the eternal Steven check e-mail, and whimper,

And in short, it's still delayed.

And would it have been worth it, all the same,

After the Cokes, the popcorn, and the Lay's,

Among the comic books, among some tale of Blonds and Greys,

Would it have worked all right,

To have pounded out a column in one night,

To have teased the universe into a frame

To weave it in some subtle Reptoid pattern,

To say: "The game should vibrate to these chords,

Put myth and horror and Strangeness in your game" --

If one, calling up the column on the boards,
Should say: "All Hite's stuff just sounds the same.
I thought it kind of lame."
And would it have been worth it, all the same,
Would it have been all right
After the comets and the monsters and the rifled books,
After the poems, after the memoirs, after the facts that trail off unexplained --
And this, and more remained? --
It is impossible to say just what I'd bring
But say I'd parsed the Rosicrucians through *The Thing*:
Would it have been a plan
If one, summing up the issue for praise and blame,
And posting on the forums, should say:
"It still sounds kind of lame,
I would not use it in a game."

* * * * *

No! I am not Tim Powers, nor was meant to be;
Am a peripheral sort, one that will do
To add allusions, sketch a game or two,
Add alchemy or Kennedys to suit,
Conversational, without much point to make.
Skeptical, giddy, and affable;
Full of high strangeness, but a bit opaque;
At times, indeed, almost laughable --
Almost, at times, a hoot.
It grows late . . . it grows late . . .
I shall add a rambling quote from A.E. Waite.
Shall I even finish this? Do I dare to add John Dee?

I shall make up lurid nonsense, and hope no one will see.

I have read cool mermaid lore, in poetry.

I do not think that it will work tonight.

I could tie them into Sirius or Cybele

Or to Venus from the oyster-shell aborning

But I should probably have thought of that last morning.

I have lingered on the front page of the site

By Steven well assembled (with no staff)

Till I click on John Kovalic, and I laugh.

Dork Tower!

Dork Tower!

Practical Practical Jokes

How do you keep a FNORD busy for hours? Click [here](#).

Sorry about that; an oldie but a goodie, updated for the new millennium. And it serves as a segue into our main point: the practical joke.

Many game worlds have practical jokes and jokers as part of their backgrounds. They're especially common in the World of Darkness (at least, pre-reboot . . . I still haven't found the time to read up on the new stuff). The Ragabash from *Werewolf*, the Pooka from *Changeling*, and others. Practical jokers are also a common concept in other games or genres, ranging from the goofy such as the Superman villain Mxyzptlk to the (usually) somber Q from *Star Trek: The Next Generation*.

Unfortunately, it's a concept that's often unpopular with players. This can be for a number of reasons, a few of which I'll touch on now in these handy-dandy playing tips for such characters.

Have a point. For some reason, many players (especially in LARPs) tend to play practical jokers as über-obnoxious joke-at-all-cost types . . . and then they wonder why they're unpopular with some players. In general, the stereotypical practical joker usually has some point or purpose behind their pranks. The most obvious one is to teach a lesson of some sort, which is the general motive behind the Ragabash, Mxyzptlk, and Q. Even when the actions are the same, the mere act of having a purpose (or at least claiming to) can go a long way toward making the actions less hated. Compare the two examples:

[Picard enters a room; a bucket of water falls on his head]

Picard: Q! What's the meaning of this?

Q: Uhhhh . . . I dunno. It's funny . . . I guess.

versus:

[Picard enters a room; a bucket of water falls on his head]

Picard: Q! What's the meaning of this?

Q: Oh, come, Picard . . . you and your precious Federation take yourselves so seriously. Could it be that you both aren't just . . . all wet?

Now, obviously this is a trivial example. But it expands to greater ones. For example, Q could easily turn the crew of the *Enterprise* into children for an adventure. But it would be more interesting if he did so while proclaiming how young humanity was, and how juvenile its assumptions are.

Be funny. With most practical jokers, a lot can be forgiven (by the players *and* characters) if the offensive actions are funny. For example, dumping an offensive werewolf character in hair remover to make them a hairless werewolf is pretty obnoxious, and probably not terribly amusing; the character (and player) may well balk at such treatment. But if the joker somehow had the jokee awaken in a pile of loose hair (the same color as his own), and then convinced various people to comment that they think the jokee is losing hair . . . well, suddenly it becomes more amusing. This is also because now the joke has become active; the jokee is a part of its development and progression, rather than reactive (meaning the jokee has no say in how it plays out). And if the character in question is vain, then that even satisfies the first bit of advice above!

If you can't be funny, try being strange. Finally, many practical jokes are more unusual than they are actually funny, and the best practical jokes are over-the-top unusual. Thus destroying a character's prized automobile isn't funny, it isn't strange, and it's obnoxious enough to get the practical joker killed. But disassembling the character's prized car and reassembling it inside a house (or office building . . . or dance club . . . or . . .) is at least somewhat amusing, although it's more unusual than anything. And even *more* unusual would be to keep pressing the joke: have a valet on hand offering to drive the character around the house. ("Do you wish to go to the bathroom, sir?") And compounding

that would be to somehow get duplicates of the character's car, putting one inside each room of the apartment. To press it further, maybe each duplicate car has its own valet. (Of course, the "real" car could be right where it was left . . . or it could be somewhere even more interesting.)

I'm sure there are a dozen more tips I could offer to make jokers more interesting . . . but I need to leave *something* for next year's installment. Nevertheless, if you're looking for more insight, I suggest going [here for more](#).

Nah, I knew you weren't going to fall for it.

* * *

Please note that I'm out of town until Tuesday, so if you're having problems contacting me or sending me the cauldron of gold doubloons, you'll know why.

The International Supers Expo

by Steve Honeywell

Many professions have yearly conventions at which attendees gather to see new products, network with other professionals, and have a drink or ten after hours. In a world with supers, it stands to reason that there would also be supers conventions.

Enter the ISE.

The International Supers Expo is a four-day event held annually. At the convention, attending heroes can see the latest innovations in crime stopping techniques and technology, confer with other supers about new villains, and apply for openings on established super teams. After hours, convention goers vie for invitations to the best, most exclusive parties held by those established super teams and by manufacturers of gadgets. Less well-known or well-connected heroes unable to gain admittance to the best parties hit the bars or sit around the hotel pool and complain in their beer.

The ISE is designed with less serious supers campaigns in mind. More serious campaigns can use this as a lighthearted break between episodes of saving the world.

The ISE

The International Supers Expo, established in 1987, takes place every year in Las Vegas, NV in the second week of June. The show runs from Thursday to Sunday, starting at 9:00 a.m. and ending at 5:00 p.m. On Sunday, the show closes at 3:00 to give heroes the chance to catch a flight home. A European version of the ISE takes place simultaneously in Amsterdam. The event garners a lot of publicity, with news reports every night on some of the latest innovations in the field. Hotels surrounding the convention center are booked to capacity, with paparazzi outnumbering the attendees by a 3:1 ratio. (As a sample to base your own location on, printable maps of the Las Vegas Convention Center can be found at http://www.lasvegas24hours.com/meetings/lvcc_room_capacity.html.)

Security for both conventions is a bit slack, since the organizers figure that having that many super-powered people in one area should make it safe. The European show's security is a bit tighter, with armed guards manning all entrances to the convention floor. Use of super powers on the show floor is strictly forbidden, and the organizers have a large insurance policy just in case someone forgets. Using a super power, especially a flashy or offensive one, is grounds for being escorted off the premises. Repeat offenders are banned from the show for life.

Heroes are expected to attend in costume, and showing up in street clothes is a terrible faux pas. Attendees are given security passes that allow them onto the show floor. Having these passes in plain sight at all times is mandatory, and a hero unable to produce a badge when asked for it is shown the door. Struggles are seriously frowned on, and usually met with an armed response if deemed necessary by security.

The show floor itself is a sprawling maze of booths and exhibitions. Competing companies and super teams often set up their booths directly across from each other and attempt to blast the merits of their products or team at ear-shattering levels. Many companies hire scantily-clad women in tight costumes to attract more potential customers to their booths. The convention hall is noisy and crowded, making it difficult to communicate with anyone, even in the semi-privacy of a booth.

For a group of heroes attending the ISE, select as many of the following possible encounters and problems as you desire.

Transportation and Other Obvious Problems

For some heroes and groups, even getting to the show might be an issue. Some teams may have their own rocket planes, but others have no typical means of getting themselves across long distances. A group whose adventures take place in a particular neighborhood or city may have never had the need to travel across the country before.

Those able to fly under their own power have less of a problem, but the distances may be an issue. It's several thousand miles between New York and Las Vegas, which would tax the abilities or fuel supply of many a flier. Others may have more interesting problems. A super whose powers are radioactive may, for instance, have particular difficulty boarding an airplane when the plutonium that fuels his abilities sets off every alarm and detector in the airport. Even renting a car might be difficult for the underaged or those without any legitimate form of income or insurance.

Other problems that may be entertaining for some groups are simply the everyday annoyances of travel anywhere. Mechanical problems and weather can delay or cancel flights, overbooking can force the protagonists onto different flights, even traffic can cause them to miss their plane. And while forgetting to pack a toothbrush is hardly the stuff of epic stories, a stack of petty problems like this could easily set the tone for the convention to come.

Registration Problems

Plenty can happen between getting to the show and actually getting onto the convention floor. Just getting an entrance badge can be an adventure in itself.

Same Name, Different Hero

As previously mentioned, convention goers are given an identification badge, allowing them to roam the show floor. These badges are coded with the attendees' super identity, and are specified to match each hero. What this means is that once someone registers under a given hero name, that name is irrevocably assigned to his or her badge and cannot be given out to someone else. That person is that hero, at least as far as the ISE is concerned.

When the gang arrives to register for the show, randomly select one, pick the one with the most outrageous name, or choose the player you think can roleplay the situation the best. When that character attempts to register for the convention, his superhero moniker has already been taken by another super, and he can't register using that name. He'll have to register under a different identity, at least for this convention. For anyone protective of his identity, this spells personal disaster.

Only the Names Have Been Changed

A mischievous hacker or a technologically minded villain has broken into the ISE's computer system. Rather than doing anything too terrible, the culprit has merely switched all of the records around. Now, as people pick up their badges, they are being given identities that do not match them. The problem has thrown off the entire system, and no amount of complaining, bribery, or threatening will get anyone their proper badge. Give people the most unsuitable names you can devise.

Another possibility is that the hacker, rather than switching names around, has just changed the names themselves, altering the super identities on the registration list into something embarrassing or inappropriate. This can be a show-wide problem or confined just to the PC's badges. This is especially fun if the a previous foe retaliating for earlier defeats, especially if the heroes are hoping to impress particular attendees. Strutting around the show is easy when the badge says "Captain Chaos"; it's a little less so when the badge reads "Captain Codependent."

The Show Floor

Flare up in Aisle Three

Tech-Cor Systems is using the ISE to demonstrate its latest creation, the Urban Reconnaissance Patroller, Mach 23, or URP-23. The URP is a massive robotic construct designed and programmed to handle violent crime and security without putting lives at risk.

A team member is asked to help show off the capabilities of the machine on the show floor. The volunteer is selected to be apprehended by the URP-23. The robot's controller takes a few seconds to prepare the machine, telling the assembled crowd that he is activating it in non-lethal mode. Of course, he does the opposite, accidentally arming it to the teeth. Once activated, the URP-23 fixates on the poor chosen victim, sprouts a few dozen guns, and immediately turns homicidal, causing pandemonium.

The sad fact of the URP-23 is that it can't hit a moving target to save its circuits. The selected prey, provided he keeps moving, is perfectly safe. The same can't be said for anything near him. The rest of the team will need to deactivate the robot while the victim keeps moving. The URP will ignore anyone apart from its selected quarry, and will shoot to kill. As long as he keeps moving *at all* the target can't be hit. Describe a lot of near misses, burning scenery, and collateral damage.

Enterprising heroes may try to adjust the switches on the back of the URP. It's a good idea, but there are two dozen identical switches, and none are labeled. Virtually anything can happen with any toggle, from complete system shutdown, self-destruction, or a significant increase in rate of fire. The URP can withstand massive amounts of damage. Keep it running and gunning until it looks like the players are losing interest, then have it collapse in a big, messy heap.

In the aftermath, the URP's controller will blame the victim for the problem and will hold the heroes responsible for the machine's destruction. Convention officials will want a full account (and possibly a full cavity search) of all involved. Remember: even in life-and-death situations, the use of super powers on the show floor is forbidden, and those who use them to stop the machine will be cheered, congratulated, and escorted off the floor for the day.

The Price of Celebrity

A gadget manufacturer has spared no expense for this ISE, and is bringing in a well-known super to make a guest appearance at its booth. Several interesting possibilities are created.

- * The hero's glory days are well behind him, and he's become a bit senile. One of the PCs wears a costume a little too reminiscent of the guy's greatest nemesis. The party must keep their teammate safe from harm and find a way to restrain the old man without hurting him too much.

- * The team is hired to act as the hero's handlers. He's quite a bit different from his public persona. He may be an inveterate womanizer (fun for any female supers), a drunk, or just a demanding prima donna. On the other hand, if the hero has a gruff, angry reputation, he may be shy, retiring, or timid. In any event, everyone is in the position of needing to maintain his image no matter what, or face the wrath of their employer.

- * The hero fails to show up, causing a revolt of the convention goers who stood in line for two hours to meet him. Non-super conventioners may start reacting poorly to anyone in costume.

Super Team Shake-Up

A major super team is going through a period of reorganization. Most of the members have left and they are desperately looking for warm bodies to fill the spaces. Their recruiting program is aggressive in that they will resort to anything up to and including kidnapping to reluctant super to increase membership. A few of the possible scenarios are:

- * One member of the party is courted by the team, who tries everything to lure him away. The rest of the squad must protect their teammate without things erupting into a full-scale war. Or, two teams could vie for the same person, neither taking "no" for an answer.

* The entire party is courted. If they join, this gives you plenty of future possibilities for adventures, as the team is called upon by their new bosses at inopportune moments. (For GURPS, each new recruit should get both a Patron advantage and a Duty disadvantage). If the group opts not to join, it could provoke a battle as the desperate supers will not let so many prime candidates escape.

* The recruiter for the super team has had enough and is trying to find a way to leave. Perhaps the group of heroes that just walked past the booth needs another member.. This is a great way to add an NPC or a new character.

Other Problems

* The convention floor is confusing in the best situation, and it's always easy to get turned around and lost. If the show is poorly designed and laid out, getting from place to place can be a nightmare. Supers with flight powers will be sorely tempted to soar above the crowd, and will be quickly escorted off the premises once they land (no powers on the show floor!).

* A villain attacks the show, confident that the chaos caused by so many heroes will give him an advantage. This can be especially fun with a villain in possession of mind control abilities; hordes of zombie-like non-supers (some heavily armed and operating unique gadgets) can pose a real threat. Remember the URP-23? If it was repaired, it can make another appearance under the direction of its mentally enslaved operator.

* Long lines to get in, at the overpriced lunch counter, at the bathroom, and anywhere it's inconvenient. Any petty annoyance you can think of is applicable. It's easy to split up the group and have them waste time searching for each other. Someone insatiably curious or absent-minded will need to make frequent checks to **not** wander off and be lost in the crowd.

After Hours

Of course, a trade show is more than just spending time walking around the floor. When it winds down in the evening, there are dozens of events that take place, and each is ripe with possibilities for fun, mayhem, and significant embarrassment. For many, the real work at a convention takes place once the hall closes. Nighttime dinners, clandestine meetings, and wild parties are a part of every show, and the ISE is no different. Just because the floor is closed, there's no reason to let up on the heroes.

Most convention parties are relatively exclusive, or are at least by invitation only. These generally start the night before the show and go through late Saturday, with Thursday and Friday being the biggest nights. There are multiple events every evening, and each one vies to be the grandest and most memorable of the show.

No Ticket, No Entrance

While at the convention hall, the group makes contact with a man who claims to have a bunch of information about one of their biggest enemies or an ongoing problem. He tells them that he'll divulge the information that night at his company's shindig, and he'll put their names on the list so they can enter. He forgets, and the heroes are in the uncomfortable position of needing to crash a party protected by other supers to speak to the man.

On the other hand, he may have remembered, but may not be able to attend the function, forcing everyone to spend the evening searching through a crowded gathering looking for someone who isn't there. Regardless of how you spin it, the man in question is gone from the show for the rest of the convention, leaving questions about the information he was about to divulge. It's something they can follow up later, a plot hook you can use in the future if you need one.

The Special Super

One lucky convention goer is invited to an exclusive function, leaving the rest of the team behind. This works nicely

with **Super Team Shake-Up**, and gives the recruiting squad an edge in bringing the selected member onto their team. The rest are either left with nothing to do or finding a way to crash the party and get their friend out.

If the chosen recruit decides not to attend, he can expect the possibility of a search party looking to find him, snare him, and drag him off to have fun "for his own good." If he manages to escape, the show floor the next day is particularly hazardous as the now-snubbed agents of the super team are on the prowl to bring him into the fold. Barring that, they'll do everything they can to annoy and harass the unfortunate victim, attempting to get him banned from the ISE, either temporarily or on a more permanent basis.

Odd Heroes Out

A group of supers hasn't been invited to any after-hours functions. They retire to the hotel pool and get ripping drunk, then go on a destructive rampage. First they trash the hotel, then they move out into the city itself. The squad can encounter them in the middle of their spree, or, if they've also been left out of the festivities, can end up joining in on the mayhem. Or, rather than causing indiscriminate damage, the shunned team might gun for a particular party they were left out of, or a specific person who left them off the list. The issue can continue onto the show floor the next day, with spontaneous fights breaking out over who got an invite and who didn't. The heroes can either instigate these attacks, fall victim to them, or simply get caught in the middle as other supers start fighting.

Trouble at Home

The well-publicized nature of the ISE has one serious problem for the super hero community: bad guys read the paper, too. With the crimestoppers absent, a foe takes the opportunity to start his own criminal spree in the team's home town. ISE or not, it will hurt their reputation if they don't react quickly to the situation, but if they leave the ISE, they may not get back in time to find out some useful information or pick up new and valuable products.

If the lure of free stuff on the show floor isn't enough to keep them from leaving, arrange to have them making a guest appearance somewhere the next day, making them need to literally be in two places at once.

Super Tour Guides

If your team is based in Las Vegas, or if you move the ISE to their hometown, the heroes may be asked to act as official or unofficial hosts for high profile out-of-town notables. These people can be anything from foreign dignitaries to other supers. A few of the options are:

- The group must stop a crime in progress while shepherding a foreign diplomat. This person could want to get in on the action, putting himself in mortal danger. He may also run screaming, cower, and stand directly in the line of fire, putting himself in even more peril. Another possibility is that he completely misunderstands the events, gets in the way, blinds the heroes with inappropriate flash photography, and produces a constant stream of amusing, broken-English comments.
- The visitor (either super or non-super) wants to "see the town," which involves hitting every seedy dive and strip club in a five-mile radius. Someone must show him a good time and keep his (and their) name out of the police blotter and the tabloids. This is quite a challenge, considering the presence of thousands of paparazzi looking for a juicy story.
- The team is given a promise by the ISE that they will be reimbursed for any expenses incurred, provided they bring a receipt. Their charge runs up huge bills in expensive restaurants and clubs, insisting his protectors join him in the revelry. First, they'll need to find a way to pay for his excess. Second, the ISE will come through with compensation, but will only cover the costs of the guest. This is no problem for a wealthy hero, but those struggling ones will be paying off these bills for months.

Attack of the Fanboys

Unbeknownst to the group, they have achieved some sort of cult or celebrity status (perhaps because of their encounter

with the URP-23 or some other event at the show). Now, whenever they go anywhere outside of the conventional hall, they are besieged by a horde of fanboys, star-struck groupies, photographers, and wannabees. While all of the attention might be flattering at first, it severely restricts the movements of the party, possibly cutting seriously into their nighttime activities. The coverage and constant attention continues for at least the length of the show, and may carry over to the return trip and the weeks beyond.

At first, all of the media attention should be favorable, with everybody depicted as all that is right and good with the super hero world. Depending on their reaction to all of the media attention, after a day or two, the stories can turn nastier, with tabloids digging up past indiscretions (or making them up out of whole cloth as necessary). Rather than asking softball questions, reporters will ask for statements about the latest allegations. Regardless of the media's ultimate slant, the hordes of fanboys should persist, getting in the way at every opportunity, looking for autographs, attempting to garner advice about becoming supers in their own right, and possibly committing crimes for the honor of being captured by their idols.

Other Problems

A major convention presents its own set of logistical problems for a city, from long waits in restaurants to overcrowded cabs and buses. Conventions also have a seedier side, and even one that seems to come with pure motives will have a criminal element. While some villains will use the ISE to cause chaos at home, others see it as the perfect chance to attack their main foils when those heroes are out of their element and don't necessarily have the backing of the local police department. These nemeses will attack at the most problematic moments you can devise, such as when the PCs are in the company of people they need to protect. If the attack comes while the heroes are on the show floor, keep in mind that the bad guys aren't part of the convention and have no compunction about using their powers, while the team is still in a position where they can't. (Or course, they could simply leave the convention hall and fight outside, but you don't need to remind them of that.)

The ISE Into the Future

Conventions have a tendency to get larger, more elaborate, and wilder, at least in established industries. Companies try to outdo not only themselves from previous years, but also their competition. Future ISEs will be larger, noisier, and more confusing, with wilder parties and more complicated booths on the show floor.

The ISE can easily become a yearly event in a supers campaign. In truth, only the details change from year to year. Every show will have product demos that go terribly wrong, parties no one can get invited to, and mile-long lines for the restroom. Just keep in mind that anything that can go wrong should go wrong, provided the results are entertaining.

More Questions than Answers

City of Zeroes

By Chris Aylott

They got me. I held out as long as I could, but the Massively Multiplayer Online RolePlaying Games finally got me.

Truth be told, my resistance was on the passive side. I've always liked computer roleplaying games, and the idea of playing online with friends always sounded like fun. The only thing that kept me from trying MMORPGs years ago was lack of time and wussy computer hardware.

That's changed in the last year. I finally have a home computer with decent graphics and an online connection fast enough to be worth playing on. And so, more nights than not, I kiss the World's Greatest Baby and Her Amazing Mother good night, fire up **City of Heroes**, and Fight Crime in Paragon City.

I love **City of Heroes**, even if its villains don't love me. (Ow. Looks like the Skulls have Mr. Tut searching the floor for his contacts again.) So I should be thrilled to see that Eden Studios is making a pen and paper RPG based on the game, right? I should be excited that I'm going to get to sell Alderac's **City of Heroes CCG**, right? Right?

Well, I am. Kind of. But I also have a little Spidey-Sense sitting on my shoulder whispering, "Who's Professor Zooming who here?" And as I pause to wonder why my Spidey-Sense reads DC, some math rolls into my head.

"3x2(9yz)4a!"

Bruce Sterling Woodcock runs mmogchart.com, a website devoted to tracking the subscriber bases of popular massively multiplayer online games. As of February 2005, he puts the subscriber base of **City of Heroes** at about 125,000. That's an order of magnitude below **World of Warcraft's** projected 1.25 million subscribers, but it's still a respectable competitor in the MMORPG field.

(The subscriber difference between **City of Heroes**, **World of Warcraft**, and the even more popular Asian fantasy MMORPGs **Lineage** and **Lineage II** is worth considering if you're making a non-fantasy pen-and-paper RPG. No wonder nobody ever gets close to **Dungeons and Dragons** -- and more on that anon.)

125,000 people paying \$15 a month to play **City of Heroes** is \$1.875 million in income per month. Not a bad chunk of change for NCSoft, the publisher of the game. So what is the RPG and CCG version going to add to that?

Let's start with the RPG. A successful RPG licensed from a popular television show or a computer game can sell 15,000 to 20,000 copies. Licensing royalties tend to run about 5% of cover price, and we can figure the **City of Heroes** rulebook will cost about 40 dollars. Five percent of \$40 is two dollars, multiplied by 20,000 . . . looks like NC Soft will make about \$40,000 from the main rulebook. That's not bad earnings for a legal document and a few hours of approval checking, but it's chump change next to what the company is making from subscribers.

Eden and NCSoft can always hope for the pen-and-paper RPG to be more successful, and it sounds like they're taking steps to make the product more appealing to the game's online players. Eden has already announced that the main rulebook will include a code for a "special prestige power" usable in the online computer game. However, even if every one of **City of Heroes's** 125,000 subscribers buys the book -- an unlikely outcome -- the license would only yield a quarter million dollars for NCSoft. Good money, but still a small percentage of one month's subscriber income.

Trading card game sales are much more difficult to predict. The **Pokémon** trading card game has sold over 10 billion cards, but that's **Pokémon**, and **City of Heroes** isn't going to get anywhere close to that. I've been told that reasonably

successful second-tier CCGs can expect to do about \$5 million per year at retail. If so, NCSoft may be looking at about \$250,000 per year in licensing royalties for the card game. Two hundred and fifty grand is just as good as it was in the previous paragraph, and it's still a tiny percentage of overall revenues.

There's a lot of room for error in the numbers above. It's hard enough getting sales figures for games (even when you agree not to attribute the source), and using those sales figures to predict the success of a new game is a chancy proposition at best. But the numbers we do have make it certain that when we talk about licensing revenue for ***City of Heroes***, we're talking about tens or hundreds of thousands of dollars, not millions.

And that begs a question. Since ***City of Heroes*** is already a multi-million dollar enterprise, why pursue such small amounts of revenue? What's in it for NCSoft?

Seduction of the Innocent

From here on out, the numbers are completely speculative. I'm making wild-eyed guesses here, so feel free to mock me and pelt me with garbage. That said, tell me if this scenario makes sense to you.

Let's say that the ***City of Heroes RPG*** sells 15,000 copies, and that about half of those copies get used in a game at least once. (The other half get put in little shrines and debated on RPG.net.) Your typical gaming group has about five players in it, and it's not unusual for two or three of those five players -- The GM, and The Guy Who Buys Everything, and The Other Guy -- to get the books. If that's the case, then it's not unreasonable to suppose that there may be 3,000 games of ***City of Heroes*** going on in the next year or two.

In your typical gaming group, you have one or two players who already love the subject matter, and one player who kind of likes it. You also have one or two players who don't really know anything about the subject. They learn the game because they're playing in the group. The newbie players are the ones I'm interested in for this argument.

Roleplaying games thrive because groups of friends like to play together. So do MMORPGs. The ***City of Heroes RPG*** gives a fan of the online game a chance to share something he loves with his tabletop friends. And if a group of friends enjoys playing together offline, why wouldn't they want to get together online as well?

Let's go back to that "special prestige power" NCSoft is offering as a reward for purchasing the book. Signing up for the power lets NCSoft know that you have the book, and that you might have friends who would be interested in the game. If I were NCSoft, I'd be planning to give everybody who registers their book some free subscription codes so that the book owners' friends can try out the online game for free.

NCSoft has already used the free trial subscription offer this year as a "Valentine's Day gift" to current subscribers. The offer let folks who were curious about ***City of Heroes*** try out the game without forking over \$50 for the game CD. No hassles, and you had a month of free play before your credit card was charged.

Did this offer work? It certainly worked on me. And if the RPG results in 3,000 tabletop game groups getting together to play ***City of Heroes***, and if one person from each of those groups then signs up as a new subscriber . . . that's \$540,000 of new revenue per year, just from the RPG. It's like selling the license all over again every month.

There's the money. The CCG is likely to have an even larger base to appeal to, and should sign up even more subscribers. The revenue from new subscriptions is almost certain to dwarf any revenue gotten from the licensed products themselves.

The ***City of Heroes*** CCG and RPG are not a diversification of NCSoft's intellectual property. They are advertising that NCSoft gets paid for, and that is a sweet deal.

Maxwell Lord Salutes You

As a Mammon-loving profit-grubber, I'm all for deals like these. However, there is also a part of me that wonders if we are all about to get too much of a good deal. Here's why.

A few weeks ago, I was talking to a customer in the store. I wasn't too surprised to learn that he too had recently tried out his first MMORPG. (In his case, it's **World of Warcraft**.) What surprised me was when he said, "Yeah, I've even stopped playing **Legend of the Five Rings**."

Now, this guy was a hardcore L5R CCG fan. Played in all the big regional tournaments, played in a weekly group at another store, bought lots of cards there and even bought some from me when the impulse took him. Stopped playing it? That's the last thing I expected to hear, so I pushed a little for the reason. He told me, "Hey, **World of Warcraft** is 15 bucks a month, and when I was playing **Legend of the Five Rings** I was paying that every week just for snacks."

Fifteen bucks a month. Always available, full of people to play with, and the games are finally good enough to hold the attention of the typical tabletop RPG fan.

I think we have a new predator in the jungle. And that it is starting to eat the tabletop RPG hobby's lunch.

Last quarter, game stores across the country were reporting sales slumps of 20, 30, sometimes even 40 percent. How much of that was bad weather? How much of that was a lack of interesting releases? How much of that was because Joe RPG Gamer was holed up in his den playing **World of Warcraft**?

What's worrisome is that the current MMORPGs may just be the leading edge of the storm. What happens when **Dungeons & Dragons Online** is released?

"Fools! Tremble before the might of Doom!"

There have been over 50 computer games based on **Dungeons & Dragons**, a pretty good indicator of the brand's appeal. **Baldur's Gate** and **Neverwinter Nights** recorded sales of two to three million copies, comparable to the sales of **Warcraft III**. It's not hard to believe that **Dungeons & Dragons Online** will find at least a million subscribers, maybe more.

(Of course, this presumes that the game Does Not Suck. If it does suck, all bets are off.)

One million subscribers, 15 million dollars a month, \$180,000,000 dollars a year. It's impossible to tell what percentage of this revenue will go to Wizards of the Coast, but consider this.

Wizards of the Coast has said that between 2000 and 2003, it sold over one million copies total of the **Dungeons & Dragons Player's Handbook**, the **Dungeon Master's Guide**, and the **Monster Manual**. At wholesale, that's about \$12 million over three years. If Wizards of the Coast gets even a small percentage of the likely sales from **Dungeons & Dragons Online**, it will make more money from the MMORPG than it makes from the rulebooks. The tail is quite likely to start wagging the dog.

What happens if pen-and-paper **Dungeons and Dragons** becomes "advertising that pays" for the online game? How will Wizards of the Coast handle the inevitable inconsistencies between **Dungeons & Dragons** in its current form and its adaptation into an MMORPG? If the pen-and-paper game exists to promote the more profitable computer game, shouldn't Wizards of the Coast alter the original so that it does a better job of selling the adaptation?

And what about the tabletop RPG community? What happens if gaming groups start shifting their action online? Other RPG companies have always depended on capturing disaffected **Dungeons & Dragons** players -- what happens if the path through **Dungeons & Dragons** leads towards other computer games and not other tabletop games?

Is it possible that **Dungeons & Dragons Online** will become the *real* **Dungeons & Dragons**?

Object Lessons

An Enchanted Collection for *Call of Cthulhu d20*

by Nicholas Luna

This is a collection of enchanted items that, on the face, seem rather mundane; simple items that one could find in an antique store, pawn shop, or perhaps at auction. The items are presented in a three-part format. The first section, *Public Information*, details the "known" history of the item; when and where it originates and who has owned it, and a description of the item. The second section, *GM Information*, details the actual history of the item and the statistics for game use. The third section, *Adventure Ideas*, describes one or two plot hooks; ideas for introducing the item into the game.

Antique Baoding Iron Balls

Public Information

Lee Shan, noted Chinese craftsman, made this set of Baoding Iron Balls (iron or steel balls used for healing and meditation) in 1894. Lee Shan's son Wang secretly immigrated to America in 1915, and brought the balls with him. Wang built a successful business selling hand-crafted Chinese art, including Baoding iron balls. The original set is still with the Lee family.

This set consists of two solid steel balls, each 1.4 inches in diameter. Each ball weighs 6.5 ounces and is painted cobalt blue. One ball has a painting of a red-skinned, winged creature. The creature appears gaunt, almost skeletal. The other has a similar creature painted on it, but the creature is colored with gold instead of red. Oddly, even though the balls are solid, they produce sounds in the same manner as newer, hollow Baoding balls. The red creature ball sounds a high tone, and the gold creature ball sounds a low tone. The set comes in a light brown hard wood case, lined with crimson silk.

GM Information

A Chinese sorcerer-priest originally commissioned this set of Baoding balls. During the creation process, the priest helped Lee Shan create the set by infusing them with magical energy. The sorcerer died before he could receive the set, so Lee Shan kept the balls. When his son Wang decided to go to America, Shan sent the balls with him as a good luck charm.

This set of Baoding Iron Balls was designed to aid in focus and concentration, specifically when used in spell casting. To use the balls, a character must first learn the correct pattern for moving the balls. This requires a Research skill check against DC 25. Once the pattern is learned, the character can attempt to use the balls when casting a spell. This requires a Dexterity check against DC 16. If successful, the Sanity and ability score losses associated with the casting of the spell are reduced by one point each (to a minimum of one point). Using the balls in this manner requires that more time be spent casting the spell. A spell that is normally cast with one action takes one full round to cast. A spell that normally takes one full round to cast takes one minute to cast with the balls. A spell normally taking one minute takes two. If the spell normally takes more than 30 minutes to cast, the character must roll a Constitution check. The DC for this check is the casting time minus 30 minutes. For example, if the character tried to cast the *banishment of yde etad* spell, while using the balls, the Constitution check DC would be 30 (60 minutes normal casting time - 30).

It is possible that other sound patterns, allowing for additional effects, exist or can be created.

Weight: 1.5 lbs., 2 lbs. including case; Study Time: 3d6 days.

Adventure Idea

An occultist acquaintance of one of the characters has come into possession of one of the balls, and requests the heroes' aid in recovering the missing sphere.

Bronze Lantern

Public Information

This well-maintained candle lantern once belonged to Angus MacGavin, a New York City resident in the 1890s. MacGavin was known to locals as "Angus Dead-Talker" as a result of the time he spent in cemeteries, speaking with the deceased. Although considered odd, locals believed MacGavin to be a harmless old man. When MacGavin died, the lantern was taken by a local constable, Sean Hughes, and the lantern remains with his family to this day.

This is a three-sided bronze lantern. It is 10 inches in height, and each face is six inches wide. Two sides are solid, while the third has a removable glass plate. The top includes a wound copper loop for hanging. The lantern is unadorned, except for the name "Angus MacGavin" etched on the bottom in a childlike script.

GM Information

Angus MacGavin was odd indeed, but far from harmless. MacGavin was responsible for nearly 60 disappearances over a period of seven years. Men, women, and children all fell to his needs. Angus possessed an obsession with corpses. He exhumed them, took them home, and performed bizarre acts and rituals with them. He considered the corpses his family and friends. One of his more peculiar hobbies was mixing and matching body parts, creating strange new companions. Over the years, Angus learned of several means to animate the dead. Angus built the lantern to aid in this task, and he kidnapped people to fuel the lantern.

To use the lantern, a character must burn in it candles rendered from relatively fresh human fat. The power of the candle is based on the fat burned. When fat from an adult is used (adult being defined as 13 years or older), the lantern summons all animated corpses within one mile. These corpses are not under the control of the lantern-bearer. They simply respond to the call. Unless they have contrary orders, 50% of the summoned corpses will wander about aimlessly, while the other 50% will attack the lantern-bearer.

If the fat from a child is used (12 years old or younger), the lantern will animate up to 20 HD of corpses, assuming that the target corpses are within 100 feet, as if using the *black binding* spell. When the lantern is used to animate corpses, the character does not require any material components (a black gem), nor does he have to touch the target corpses. A typical candle burns for one hour.

Weight: 2 lbs.; Study Time: 4d4 days.

Adventure Ideas

- Cemeteries all over the city are losing corpses. If the PCs access police information, they find that the authorities are at a dead end concerning the matter. Graveside tracks indicate that the corpses are walking away on their own, but that is obviously impossible. In fact, the lantern is being used by Shawn Michaels, a young man who is currently under the domination of Angus MacGavin's ghost.
- A PC detective is charged with locating several children who disappeared recently. The only thing in common the children have is that they are all under the age of 10, and all belong to poor families. A necromancer, who possesses the lantern, and has learned its secrets, is abducting the children.

Chinese Statue

Public Information

This unusual artifact was discovered in 1939 in the tomb of a 14th century Chinese warlord. For several years, the Chinese government kept the statue in storage, until, in an unusual move, the government sold the statue to wealthy American businessman, Eldon Sinclair.

Sinclair died in 1968 while at sea; authorities believed that he had been surprised by a sudden squall and lost control of his yacht. The Sinclair family sold the statue to the Los Angeles Museum of Ancient Curiosities. Recently, a fire destroyed the Museum and tragically took the life of two employees. The statue, and a handful of other objects, survived the fire.

The statue is a beautiful work of art, unusual in that there are no marks or other indications of the craftsman. It is carved from a single piece of dark mottled green jade (nephrite). It vaguely resembles an octopus with its tentacles spread out equally, forming a circular pattern. The main body is elevated with a human-like face on the side. The face has deep set eyes, set with tiny pearls, a small nose, and thin, tight-lipped mouth. Surrounding the mouth are what appear to be dozens of tiny tentacles.

GM Information

In 1372, Chang Long -- a minor Chinese warlord -- had this statue commissioned shortly after he began to suffer from debilitating nightmares. A trusted priest worked with a local craftsman to create this artifact. Much to Chang's relief, the statue worked, and his nightmares ceased. Although his nightmares ended, Chang never forgot them. He firmly believed that whatever the cause of the nightmares, it would someday attempt to claim him again, even in the afterlife, so he ordered the statue entombed with his body.

In 1951, Eldon Sinclair -- a very successful businessman with a more than passing interest in the occult -- began to suffer from intense nightmares. After attempting several different means to end the nightmares, Sinclair turned to the occult. His research turned up information on the statue. Using occult techniques, he managed to convince the right Chinese officials to sell him the statue for an amount far beneath the actual value. Once he gained the statue, the nightmares ceased. Unfortunately for Sinclair, his research failed to reveal that the statue was cursed. The curse took effect one day when Sinclair was yachting, resulting in his death.

Cthulhu often sends dreams to mortal men, dreams that can drive the recipients to insanity. This statue is designed to provide protection from these dreams. Whenever a person sleeps within five feet of the statue, he is immune to any effect or contact that is sleep-based, such as Cthulhu's dreams, or a *nightmare* spell. Cthulhu is vaguely aware of the protections provided by this artifact and is angered by it. Whenever the owner of this artifact ventures out to sea, there is a (non-cumulative) 5% chance per day that one or more sea-going creatures will rise from the sea to assault the owner.

Weight: 5 lbs.; Study Time: 1d2 days.

Adventure Idea

A friend of one of the characters begins to suffer from violent, intense nightmares, often involving drowning, usually at the claws of something awful. He asks the character for help, and their research leads them to the statue, which is in the possession of a local antiquarian or cultist. Of course, the current owner is not willing to give up the statue.

Colt Peacemakers

Public Information

This matched set of Colt Single Action Army revolvers originally belonged to Tommy "Thunder" Johnson, a

gunfighter of little fame. What fame he did have was due to the perception that he was most likely insane. Thunder Johnson died in 1889, and his killer, George "Black Lightning" Jefferson, claimed the six-shooters. The guns passed through many hands over the years, coincidentally ending up in the possession of Thunder Johnson's grandson, who, in 1979, willed the guns to his granddaughter Clarissa.

Each handgun is 11 inches long, and weighs 2.4 pounds. The barrels are 5.5 inches long. The guns are nickel-plated with ivory grips. Each grip has an unusual gold inlay in the shape of a slightly skewed five-pointed star. In the center of each star is an oval shape. The guns are chambered for .45 caliber Long Colt ammunition.

GM Information

In 1875, a Navaho shaman, in search of a champion, approached Tommy Johnson, and introduced him to the world of the mystical. He explained the many dangers posed to mankind, and asked that Tommy aid the battle against the forthcoming darkness. Tommy, a good man at heart, agreed. Together, Tommy and the shaman enchanted the two revolvers, empowering them to fight against mystical beings. Tommy, in his quest against the darkness, turned to alcohol, and frequently spoke of the threats and horrors he faced. This was the cause of his reputation of insanity.

These handguns are treated as +2 weapons for the purposes of ignoring damage reduction. There is a touch of sympathetic magic involved. Whenever a character deals damage with one of these firearms, he suffers subdual damage equal to one point per die of weapon damage, so a standard shot with one of these guns inflicts 2 points of subdual damage. A critical hit would inflict (2×3) 6 points of subdual damage. The weapons inflict a fraction of their damage as pain on the wielder to remind him that, even though he battles monsters, he is still inflicting pain and suffering, and should always be on guard against becoming that which he fights.

Weight: 2.4 lbs. each; Study Time: 1 day.

Adventure Idea

The PCs are hired by Clarissa Johnson to investigate poltergeist activities in her home. These activities are caused by the ghost of Thunder Johnson, and will cease only when someone swears to take up his original cause.

Dynamite Jones Cane

Public Information

In recent years, the black exploitation films of the 1970s have enjoyed a renewed popularity. The most popular of these films is a series featuring the hero Dynamite Jones, a hard-hitting, and hard-loving, private investigator. Dynamite's arch-nemesis is a pimp known as Black Stick. Stick's name was drawn from the signature black cane he always carried with him. Black Stick is the feature villain in three Dynamite Jones pictures: *Dynamite Jones*, *Son of Dynamite*, and *Dynamite is Alright!* In the last film, the character of Black Stick died after being impaled on his own cane.

Chris Marley, the actor who played Black Stick, owned the cane and kept it after the last movie. In 1984, Marley was convicted on three counts of murder, and is now serving multiple life sentences. During the investigation into his crimes, it was discovered that he had an extensive criminal history, and had been, in fact, a pimp. After his conviction, his family took possession of the cane and sold it as memorabilia.

The cane is polished black oak, 36 inches long and four pounds, with a brass tip. Midway along the shaft are two decorative gold rings. The head (handle) is brass, straight, with a skull at the end. The skull has two small diamonds set in the eyes. When the handle is twisted slightly and pulled, a 30-inch sword blade is released from the shaft.

GM Information

Known on the streets as Big Daddy Hard Pump, Chris Marley had a reputation as a fierce and brutal man, willing to beat a person down at the drop of a hat. He beat several of his prostitutes to death over the years. One of those women had been the granddaughter of a Haitian sorcerer. When the sorcerer learned of his granddaughter's death, and of the man responsible, he set about creating this item. Two years after his granddaughter's death, the old man presented the cane to Marley as a present. Once Marley accepted the gift, the sorcerer returned home and committed suicide. This finished the enchanting of the cane and sealed the magic.

A character can use this cane as a club (equal to a baseball bat) or a fencing foil. While the cane is in hand, the character has the benefit of damage reduction 1/- (this stacks with existing damage reduction), and receives a +2 circumstance bonus to Bluff and Diplomacy checks. In addition, while the cane is in hand, the character receives a +6 circumstance bonus to Intimidate checks. When the cane is used as a club, the character must roll a Will save against DC 15 on his first successful strike. If the save is successful, there is no effect, but the save must be checked again on each successful hit. If the save fails at anytime, the character flies into a rage, attacking the target savagely until the victim is dead or the character is somehow restrained. This experience causes the character to lose 1d3 Sanity.

In addition to the abilities and effects listed previously, possession of the cane has a deteriorating effect on the owner. For every six months that a person owns the cane, there is a 15% chance that he will permanently lose one point from either his Strength or Constitution.

The creator of the cane did not intend for the item to have any additional side-effects, but his subconscious dislike of the films in which Marley starred influenced his sorcery. The result is that the character using the cane suffers from a powerful urge to wear extravagant and tasteless clothing, with a particular preference for furs, bright colors, and gaudy jewelry. In effect, he dresses like a pimp from those blaxploitation films.

Weight: 4 lbs.; Study Time: 2d6 days.

Adventure Idea

Someone known to the characters begins to act strange, displaying mannerisms never before seen. He begins to disappear for days at a time, and starts to abandon his friends. If followed he is going to the seedier side of town and engaging in an illegal enterprise, and is quickly developing a harsh street reputation. The PCs will have to stop him before the local gangs or law enforcement comes down on him.

Galactic Battles Radiant Blade Prop

Public Information

Galactic Battles, the first of three blockbuster movies about a rebellion against an oppressive intergalactic empire, premiered in 1980, and changed the way movies would be made. Although the third movie premiered in 1988, fans did not forget the trilogy, and have anxiously awaited the renewal of the franchise.

Galactic Battles introduced the ascetic Masi order of warriors and spiritualists. The chosen weapon of the Masi is the *Radiant Blade*, a weapon of pure energy. This item is the actual radiant blade prop used by the film's imposing villain, Thoth Izzu. The director originally gave this prop to his friend Johnny Mason. Always a generous man, Mason donated this to an auction to raise money for the homeless. Thomas Tarrant purchased the prop. Tragically, Tarrant died recently, and his family, hoping to bring some joy from the tragedy, donated the prop to another auction to raise money for the poor in Cambodia. The current owner and whereabouts of the radiant blade prop are unknown.

The prop is 12 inches long and constructed from high-impact plastic. Aluminum rings cap each end, and there are various aluminum fittings along the shaft. The activation button is red plastic, and actually depresses. The basket-guard is black plastic, with silver fittings. The blade end contains a small purple stone that resembles an amethyst.

GM Information

The creator of *Galactic Battles*, Gregory Light, is a worshipper of the Old Ones. He designs his movies to subtly introduce the Old Ones to the public. He called upon inhuman aid to write the movies and design the technology found in them. When he designed the blueprint for this prop, he unwittingly incorporated the design of an ancient mystical weapon. When the prop master built the item, through the influence of an otherworldly being, he incorporated the necessary elements to complete the enchantment.

To activate this item, a character must cast a *fist of yog-sothoth* spell on it. This is a rare exception to the "one creature" target requirement of the spell. When the spell is cast, a three-foot long purple shaft of energy appears from one end of the prop. The prop may now be used as a weapon that deals 3d6 damage, or 3d8 subdual damage, determined when the spell is cast. The wielder's health powers the weapon; for every round that the blade is active, the character suffers one point of damage. To use the blade with skill, the character must have the melee weapon proficiency.

Weight: 1/2 lb.; Study Time: 3d4 days.

Adventure Idea

The characters hear of a new cult in town, a cult based on the Masi of the famous films. A relative, or a relative of a friend, has ended up in this cult. The investigator must investigate the cult, which is led by the possessor of the blade. The cult leader has vile intentions for the members of the cult, and the PCs must find a way to stop him.

Gold and Silver Stopwatch

Public Information

G&G Smith of London built this timepiece at the behest of Will Morris, an English gentleman. Morris died in a tragic accident two years after receiving the watch, and his wife Elisabeth gained it and the rest of his property. Elisabeth found the watch to be a painful reminder of her loss and sold it to a surgeon, Eldon Richards. Richards willed to watch to his dear friend Mary Hanson. The watch remained in the Hanson family until 1941 when it was lost in a fire that took the lives of the remaining Hanson family members.

The watch is palm-size, with an outer case of silver. The case is engraved with unusual symbols that do not appear to belong to any particular language. The inner decorative plates are gold, and engraved with images of fantastic creatures, and 30 small lines. The inner workings are brass and steel. The interior bears the mark of G&G Smith of London.

GM Information

William Morris was an occultist who gained the attention of a Hound of Tindalos while peering back in time. Morris knew he had only a short time before the Hound tracked him down, so he turned to G&G Smith of London. The clock-makers were legitimate, but they were also known to craft enchanted devices in addition to their standard items. The watch served its purpose and blocked the ability of a Hound to track victims for short periods of time. Unfortunately, Morris became obsessive about setting the watch and was run down by a carriage while crossing the street as he set the watch.

This watch acts as a protective device. It is marked with 30 small lines; these are second marks. A character can set the watch to count down 30 seconds; during these 30 seconds, a Hound of Tindalos cannot track or sense the character in any way. Setting the watch takes a move action.

Weight: 3/4 lbs.; Study Time: 2d6 weeks.

Adventure Ideas

- A friend of a PC attracts the attention of a Hound of Tindalos, and pleads with the character to help him avoid the fate that is coming. The PC's research turns vague information about the watch. The PC and his friend have a limited time to acquire the watch or have a similar device commissioned.
- A character in possession of the watch, but ignorant of its properties, becomes the target of an occultist who mistakenly believes that the watch will provide control over a Hound of Tindalos.

Matha Beli

for *GURPS Infinite Worlds*

by Phil Masters

Infinity Unlimited maintains a number of agents on the version of Earth known as "Ezcalli" (see *GURPS Infinite Worlds*, p. 122), most of them working to achieve some kind of long-term suppression of the unpleasant Tenochca Empire. The most promising rival power is the Christian Songhay Empire of Africa, industrialised and fully aware of the threat it faces, and Infinity has a number of offices in Songhay territory, observing and considering options while they conduct a little low-level trade and watch out for Centrum intrusions.

However, one such office, in the city of Carthage, was seriously surprised, and not a little disturbed, to receive a visitor -- a local, who clearly wasn't taken in for a minute by their claims to be a very minor trading-house. Not that she knew what they were, exactly, but she walked through the door, sat down -- and asked.

It turned out that this "Matha Beli," an academic, the widow of a minor mercantile clan leader, had been watching them -- without telling anybody else, thank God -- for some time. She was clearly a very fine scholar and social scientist, but that wasn't what had led her to see right through their carefully-designed camouflage like it was made of gauze. So far as Infinity can tell, with all their careful tests and analyses, and after days of polite interviews, she has one of the most powerful intuitive facilities they've ever met. (Some of them wonder if she's a latent psionic, but the best available tests say no, for what little that's worth.) She can more or less walk into a room, look at a crowd of people, and say who's involved in any kind of deep subterfuge, including especially cross-time operations -- or glance at a news report and assess with uncanny precision whether there's anything worth Infinity's attention in the incident described. She's also plain good with people.

Well, Infinity had two choices there; recruit her or send her to Coventry. And if you think that the Council would waste an intelligence asset with this potential value, you don't know much. So she was taken on board -- exactly as she seems to have anticipated, blast her.

Once given access to Infinity's training facilities, she quickly mastered the technical side of TL8 historical research, and brought her academic knowledge up to Infinity standards in a matter of months, devouring any book that could assist her work. She might subsequently have been kept at HQ, reading papers and filing reports, but she soon became quite insistent that she wanted to see the infinite worlds in person. She claims to work best that way, but actually, she seems to have some kind of academic ambition which calls for a lot of field work. This sometimes annoys those people who've come to regard her as Infinity's best source of information on Ezcalli; they'd be *really* annoyed to lose her permanently.

(Note; Beli doesn't have the Expert Skill of Cliodynamics, as defined in *GURPS Infinite Worlds*, for the simple reason that she has studied several more advanced skills which it covers in greater depth. She can perform very effective cliodynamic analysis by Infinity's standards, mostly using Economics, Intelligence Analysis, or Sociology.)

For game purposes, she can in fact have ended up in either of two specific positions:

Patrol Officer: The Patrol doesn't normally recruit out-time staff, and certainly wouldn't put unknown factors in positions of authority, but Beli is *good* -- her threat assessments and local cliodynamic analyses are among the most reliable going. The I-Cops still don't give her a command position as such, but her *advice* tends to end up with some of the force of high-level orders. (This version of the character might lose the Legal Enforcement Powers, though.)

I-Cop PCs may encounter Beli around HQ, in which case, they should quickly learn to respect her situational assessments and background briefings; her tendency to cross-examine them at extreme length during debrief sessions, and to make seemingly arbitrary associations and snap judgments, are small prices to pay. In any case, she has a great

deal of rather motherly charm.

She also has a slight tendency to personal bias in her advice, but probably not much that will clash with I-Cops' own preferences too badly. She isn't actually prejudiced against the military as such, but she may show some irritation at individuals who seem too think that uniforms make them better people. Likewise, she'll usually advise supporting independence movements and decentralized cultures against empires and conquerors, if that position is reasonably justifiable.

She may also insist on joining field operations in person from time to time, claiming that she works better with data that she can collect in person. Given her empathetic talents, this is quite true -- but field missions are also a way of assuaging her intense curiosity. If she comes on a mission, PC I-Cops who are also along will be firmly instructed to keep her safe and secure; failure to obey this instruction would be an extremely career-limiting option.

ISWAT Member: Alternatively, and perhaps more plausibly, given just how good (and worrying) she is, the Council could have snaffled her for its own staff, and ultimately attached her to ISWAT. She could even be used as a PC in an ISWAT campaign, if the player didn't mind a character who is superb in social situations and as a field analyst but much less use in a fight. However, she's more likely to appear as an NPC advisor, analyst, and general plot device. Again, the teams she works with have clear instructions to take care of her - - and to keep a *very* close eye on her. For one of the weakest combatants in ISWAT, she's got a lot of people surprisingly scared.

In either case, if PCs are working with Beli in the field, note that she has basic combat training and a very cool head, but she really isn't a fighter; if shooting starts, it's best to get her into cover as soon as possible. In more peaceful social situations, she can be a real asset to any team, especially if she speaks the local language; her practical "people skills" are almost unmatched. Her ethnicity and sex may represent a problem in some timelines, but she can slip into the role of "quiet servant" with ease, from where she may be even better placed to observe important events. Indeed, she can sometimes act as a very effective infiltrator and spy, if her companions are willing for her to take the risk.

Her Illuminated advantage gives her the very useful instinctive ability to spot out-timer agents and conspirators, but it also makes it possible for other Illuminated characters to spot *her*. This has never inconvenienced her before now, but if she ever ran into, say, a major Cabal operation, things could rapidly become complicated -- and she might need a lot of protection. (Note; some GMs might not wish to introduce this advantage in an Infinite Worlds campaign -- in which case, it's easy enough to delete it and rely on her exceptional intelligence, perceptiveness, and skills to achieve much the same result with a little more effort and time.)

Matha Beli (250 points)

At first glance, Beli is often taken for an unremarkable, slightly matronly black woman in her early 40s (she's actually 42), although many people notice her habitual thoughtful expression. Her charisma mostly emerges in conversation. For preference, she dresses in a "generic West African" style, with long, colorful dresses incorporating headscarves -- but she is very adaptable when she needs to be.

Appendix Z

Six Ways to Build a Mystery

P.D. Magnus

It's easy to think that a mystery adventure should be like this: An NPC plans and executes an almost perfect crime. PCs begin to investigate, following leads and assembling clues until they are able to catch the NPC villain. There's a furious showdown with the villain at the end. (For advice on GMing adventures that fit this formula, see ["How To Run A Mystery Adventure."](#)) The crime-to-showdown formula can make for a fun adventure, but there are other ways to build a mystery. Cue the Sarah McLachlan as you consider consider the following.

1. Sometimes the PCs won't solve the mystery.

Especially if there is only a slender thread of evidence that connects the villain to the crime, the players may just not see what you thinks is obvious. Try to allow for some resolution besides the marathon game session that [doesn't end](#) until the players figure it out. In a pulp adventure, the villain might eventually send the PCs a note mocking their incompetence. In a Freakazoidesque superhero world, the chief of police might just send a memo to the PCs informing them where the final showdown is going to be held. But for most settings, allowing for failure means that a final showdown just might not happen.

2. Critical clues should never depend on skill rolls.

If you expect the players to follow a slender thread of evidence, you shouldn't deny them some of the evidence because of poor luck. The easiest way to handle this is just to tell the players what they discover using their investigative skills. If you insist on requiring die rolls, the rolls shouldn't do any more than determine *how quickly* the PCs discover the clues -- they might notice it immediately, or they might only notice it the next day.

3. Sometimes villains aren't the scheming type.

In real life, many crimes are committed by people who aren't clever or who act rashly. If the mystery centers around this kind of criminal, you don't need to plan the perfect crime and then figure out where the villain went wrong. Given enough time, perhaps a trained chimp would be able to find the murderer -- but the PCs don't necessarily have that much time and may have other pressing matters to attend to.

4. Sometimes the mystery is just a subplot.

People get murdered and things get stolen all the time. The PCs may have more important things to worry about. Mysteries can make good subplots in adventures that would be to linear otherwise. If you don't want the mystery to be a complete red herring, you can have it connect in some way to the main action without being essential to it. The PCs don't have to solve the mystery, but solving it may give them some advantage in their central pursuits -- perhaps the thief also has an artifact that will help them navigate the catacombs.

5. With a roomful of suspects, somebody must be guilty.

In the drawing room tradition of mystery fiction, things start out with a number of plausible suspects each with a hidden motive for the crime. You can run mystery adventures in the same way: Plan a crime and develop several possible perpetrators, each with a back story that can come out over the course of the adventure. Fill in the details as the players investigate and, if they do a good job, let the suspect they finger be the guilty party. This sort of plotting after the fact needs to be kept hidden from the players -- at least while you're doing it -- so it may help to set the

partly-improvised adventure in a campaign with other mysteries that have predetermined solutions.

6. There doesn't need to be a showdown.

If the criminal is an ordinary guy rather than a costumed villain, then catching him may be a mere formality. Even if the PCs must race to the train station to stop the villain from fleeing, that doesn't need to involve gunfire and screeching tires. Perhaps it's just a matter of alerting the border guards.

Pyramid Review

Über Goober

A Scum Crew Pictures Production

Produced & directed by Steve Metze

Edited by David Hobizal

Music by Pat Murray & Luke Ski

87-minute DVD; \$20.00

Games continue to break out of their tuck boxes and hardbound books and make the leap to screens big and small. *The Gamers* and its upcoming sequel deal with the activities at the game table from a pseudo-fictional point of view, but a bookend piece by another group, *Über Goober*, is a documentary-style film about the lives and habits of games and gamers. Its scope isn't limited to roleplaying games; it covers miniatures and LARPs as well.

This DVD from Scum Crew Pictures tags most of the bases, including interviews with various figures from the industry -- Mike Stackpole, Peter Adkison, Gary Gygax (though curiously, Dave Arneson doesn't appear) -- but even these are kept to a minimum. The spotlight falls mostly on those who keep the hobby going day-to-day: the fans themselves. We're given a cross-section of these folks, including the guy who creates Egyptian miniatures using sand from his kids' sandbox; the policeman who designs dungeons during downtime; and the motley crew that engages in massive mock battles on the weekend.

Interviews are interspersed with footage taken from panels featuring some of the notables, and there are a few conversations with random passersby as the director assesses the popular view of roleplaying and roleplayers. These segments are hardly as damning as one might think -- which is not to say the general public's concept of gamers is accurate, but many disclose more curiosity about and subtle interest in the hobby than you would guess. Then again, there are those parties, given equal time, who do not possess much enthusiasm for roleplaying. Some religious authorities like Bob Larson offer their views on the downside of gaming, and the more notorious news items and urban myths are revisited, while stock footage of industry front man Mike Stackpole is on hand to speak to these criticisms. The slow insinuation of games into popular media is also touched on briefly.

Along the way, we hear familiar stories. What the games are, how they came about, who plays what. Some of it is old ground, but it is a documentary. By deftly choosing which fans to use in the film, creator Steve Metze shows what it's like to grow up gamer, or be introduced to it by one's parents, or to meet the significant other through shared appreciation of the hobby. Some interviewees give their testimony in the dark, like mafia informants, but most are up-front and willing to share what games have meant to them. Piece it together, and you have an anecdotal but educational narrative that not only talks about what games are but, as the title suggests, what gamers are.

Extras include a brief look at the crew, extended man-on-the-street interviews, a longer conversation with Gary Gygax, and a road trip hosted by the old man himself as he takes the filmmaker down memory lane, sharing the locations that played a big part in the then-nascent business. These include Gygax's old house (where the sets were originally put together), a couple of the old "office" buildings, and even the first GenCon locale. Though they won't be marketing the sparse music anytime soon, Luke Ski provides a few of his more amusing songs for the soundtrack.

Metze's exploration of his subject does seem thorough, though at times the geek in him hampers his editing ability.

Some sequences go on a bit long, revealing that even he may be more interested in some parts than his presumably sympathetic audience. The on-the-street interviews are odd in that they occasionally have subtitles, in part to make up for the lousy sound recording possibilities on the pavement. These are by no means consistent, and those portions of subtitled dialogue are at least as easy (or hard) to understand as those conversations that don't get subtitles. The extras include "unexpurgated" interviews, with the salty language intact, yet some of the sailor talk is still in the regular segments. Some of it is bleeped out in the audio, some isn't . . . and where it isn't, the subtitles mark out the iffier bits with "****." It's as though they have three different people of varying moral dispositions handling the individual interview tasks.

Nevertheless, *Über Goober* is an engaging film, and is comforting in its treatment. Not only will fans of the genre feel at home seeing others with whom they identify, the movie points out to any "mundane" who cares to listen, through simple exposition unmarred by overt personal biases, that gamers of any ilk are as normal, varied, and sympathetic as any other subject placed under a potentially unflattering lens.

Shadows of Yog-Sothoth (for Call of Cthulhu)

Published by [Chaosium, Inc.](#)

Written by John Carnahan, John Scott Clegg, Ed Gore, Marc Hutchison, Randy McCall, Sandy Petersen, & Ted Shelton with Lynn Willis, Jeff Carey, & Don Coatar

Cover by Tom Sullivan

Illustrated by Tom Sullivan with Milet Michel & Andy Hopp

Cartography by Charlie Krank & Badger McInnes

176-page perfect bound black and white book; \$23.95

***Editor's Note:** This review has a number of spoilers relating to the adventure, and those who are expected to play through it are advised not to read it. In addition, it is rumored that reading this review aloud will force an ancient ritual further along its inevitable progression, leading no doubt to a world that is a twisted, barren shell of its former self.*

Do with this information what you will.

In the annals of scenario and campaign design, the importance of Chaosium's ***Shadows of Yog-Sothoth*** should not be underestimated. The very first release for [Call of Cthulhu](#) in 1982, it paved the way for what are regarded as campaign classics. Not just ***Masks of Nyarlathotep*** and [Beyond the Mountains of Madness](#), but also Pagan Publishing's [Walker in the Wastes](#) and [Realm of Shadows](#), as well as ***The Enemy Within*** campaign for ***Warhammer Fantasy Roleplay***. What it introduced was the concept of the onionskin campaign. As the player characters or investigators played through each part of the campaign, it stripped away another layer of the onion or information. This revealed more of the evil cult's plans and took them closer to the heart of the adventure.

In ***Shadows of Yog-Sothoth***, that cult is the Masters of the Silver Twilight, an international organization dedicated to a single aim. Dread Cthulhu sleeps still in the sunken city of R'lyeh, yet stirs as the stars converge. Even though they are not quite right, the cult believes it can force the premature rise of the city and release of the Great Old One. The campaign against the cult is broken into seven parts, taking the investigators from Boston to New York, then Scotland, California, Maine, and finally Easter Island and the South Pacific.

Nominally set in 1928, the campaign opens in Boston, with the investigators invited to join "The Hermetic Order of the Silver Twilight," a rich, well-to-do, and misogynistic fraternity with a reputation for doing charitable works. At first it seems innocent enough, but events hint otherwise, and are then revealed when the characters are promoted above the publicly known ranks. They are told that the Order acknowledges no earthly god, but alien deities awaiting the time when the stars come right and they can reclaim the Earth that was once theirs. It is of course, up to the

investigators to put an end to this insane madness.

Although a letter in the first part links it to the third, "The Coven of Cannich," another letter takes the characters to New York. It tells them of a business organization called "Look to the Future," which through strange actualization ceremonies, it seems able to send individuals into the future who return with fascinating items. These, such as pocket-sized radios and cooking pans that never stick, seem to prove it possible, but why does everyone seem so tired? The investigators are further directed to the third act and Scotland by another letter that asks them to look into the disappearance of a noted American big game hunter and archaeologist from his village home of Cannich. There the characters must contend with suspicious locals as well as strange foreigners working at a loch-side dig. Where "Look to the Future" is short and focussed, "The Coven of Cannich" is a sprawling affair with almost 20 NPCs for the Keeper to handle. There is also a lack of urgency to the adventure despite the events it suggests and the Keeper is very much left on his own to cope.

One more letter draws the investigators back to America and Hollywood for the fourth part, "Devil's Canyon." A movie mogul wants them to investigate what befell the set of his latest movie that caused the director's suicide, the lead actress' death, and lead actor's madness. The set is located in an isolated valley in the Mojave Desert, where the characters are menaced by forgotten links to a lost Indian tribe. The next letter takes them to Maine and the fifth part. Not for nothing is this called "The Worm that Walks," as it sends them into the arms of a benefactor who directs them into a trio of lethal encounters. This is the cult's revenge, its chance to get back at the investigators for their meddling.

One *last* letter sends the heroes to the Chilean port of Valparaiso, where a cult leader has been sighted preparing ships to sail for the Eastern Pacific. "The Watchers of Easter Island" and the "Rise of R'lyeh" represent the players' first chance to be pro-active rather than reactive. With artifacts acquired in previous adventures and final clues learned on Easter Island, the investigators face what is the ultimate challenge in ***Call of Cthulhu***. They must step onto the newly risen island of R'lyeh and prevent the early release of the being at the very heart of both the game and the Mythos, Cthulhu himself.

Originally published in 1982, and reprinted in 1989 as part of ***Cthulhu Classics***, this campaign has long been out of print. It returns 15 years on in a new edition that is essentially a straight reprint with slight alterations. It is *not* the expanded version that Chaosium promised but could not deliver for financial reasons. This is a great shame, for the campaign has many problems.

From the outset, the campaign set-up is weak, making it difficult for even experienced investigators -- for which it is designed -- to get involved. The links between the scenarios are flimsy and awkward to augment, and the constant use of the letter as a plot device is wearisome. The fifth part, "The Worm that Walks" is also notorious for it being designed as an exercise to kill player characters at a point when their knowledge and experience is needed for the last two scenarios. There is almost no Keeper advice, which when combined with the various parts being written by different hands, gives ***Shadows of Yog-Sothoth*** a rough, incohesive feel.

On the plus side, Chaosium has attempted to address *some* of these problems. This begins with "The Hermetic Order of the Silver Twilight," providing suggestions on how to get the investigators involved, essentially asking why they would join, and four NPCs to interact with who are not protagonists. All major NPCs have thumbnail portraits, which the original lacked, and each chapter lists the links between it and the other chapters. Another welcome addition is actual advice on how to run each chapter, but it still stands in isolation and is often too superficial to be any use.

The book has also been given a serious makeover in keeping with Chaosium's now house-style. Less intrusive than in the recent ***Call of Cthulhu Sixth Edition***, mostly because it is done on white rather than grey pages. Still, the style template retains its use of drop capitals that constantly obscures the text below to irritating effect.

Elsewhere, the artistic and cartographic makeover has been carried out to mostly negative effect. The NPC thumbnails are welcome, but the other new artwork is bland, adding nothing to the book's look. In fact, the headers of each page have better artwork. Worse still are the maps, nearly all mishandled, having all been darkened unnecessarily, making them difficult to use. In the case of the maps of Boston and Scotland, they are too dark, too small, and a waste of space.

The overall impression of this new edition of ***Shadows of Yog-Sothoth*** is one of disappointment, and Chaosium have done a disservice to the two segments of the audience it is aiming the book at. Long time ***Call of Cthulhu*** devotees will be dismayed at the lack of changes to what is regarded as a rough campaign. Newer fans might find the campaign's old-style nature intriguing, but will be equally dismayed *and* daunted at the lack of polish and advice.

An appendix contains two separate scenarios included with the original. The first is "The People of the Monolith," an atmospheric introductory adventure that could benefit from information from [*The Keeper's Companion*](#). "The Warren" is the second, a Boston-set adventure with a weak introduction; while it is combat heavy, has a nastily effective climax.

Another curious aspect of this edition is that it is double the length of the original with little new material. Further in comparison, the price of the 1989 reprint, which replaced "People of the Monolith" with four other scenarios, was \$18.95, against this edition's \$23.95. To be blunt, it could be argued that this reprint does not offer value for money.

This is not Scott David Aniolowski's much-anticipated reworking and expansion, but another fussy makeover of an original with some effort made to smooth of its now dated and rough edges. Even then, this is only effective in the first part. While it is good to see this campaign back in print, it is ultimately disappointing, and there is something quite mercenary about this edition of ***Shadows of Yog-Sothoth***.

--Matthew Pook

Countdown to Odds 'n' Ends

Given that I've been trying to juggle about a half-dozen balls more than normal – as the foul and mysterious odor in my kitchen can attest – this column might be more disjointed than normal . . . meaning it's only a few sexual references shy of looking like automatic writing with attention deficit syndrome. Caveat Reader.

* * *

Last week I drove for the first time in the Tampa/St. Petersburg area. This region, on the Florida west coast, is built on and around bunches of islands. While driving there, I noticed a few signs I'd never noticed anywhere else, such as "BEWARE OF HIGH WINDS" and "LONG BRIDGE: CHECK GAS." After a while I was wondering what other odd signs I'd encounter:

DANGER: LOUD CRICKETS

BURNING DANDRUFF ZONE

MAKE SURE SNACKS ARE FRESH

To tie it into gaming, I couldn't help but wonder the mischief if a dungeon had two signs posted in front. The first is in Elvish:

DO NOT BRING FOOD OF ANY TYPE INTO THIS DUNGEON

The second is in Dwarvish:

BE SURE TO BRING AN OFFERING OF FOOD FOR THE MONSTROID OR FACE THE CONSEQUENCES.

Your move, heroes.

* * *

While waiting for some stubborn software to install this week, I read DC Comics' *Countdown to Infinite Crisis*. I think it's the first comic I've read in a couple of months, and it's an "event book" in the best (and possibly worst) sense of the phrase. I dug it, although I can see how folks wouldn't.

For those of you who aren't familiar with it, the comic is noteworthy because it's kind of a "first hit's free" approach to a comic-book event. It's an 80-page comic – complete with a cover painted by fan-favorite Alex Ross over fan-favorite Jim Lee's pencils – for only one dollar. I'll be roping this book back into gaming sometime soon, I imagine, because it sparked a number of thoughts. But I'll dissect one random thought at present.

I don't have access to DC's numbers . . . either their budget or their publishing quantities. (I realized, after calling their offices several times and asking for Batman, I had made a common mistake: I should have asked for THE Batman.) Anyway, I'm sure they're losing money by offering an 80-page comic for a dollar. The question is, how close are they? They're obviously hoping to stimulate demand for their other products, and sell a huge number of this specific comic (which, if it went for the usual \$5.95 price tag, would have a much smaller demand). It's possible for the numbers to work out such that DC didn't lose too much money on this project; it's even feasible they made a sliver of a profit (although not enough of one to justify this in any way other than a publicity stunt).

Having been tied to the gaming industry full-time of late, I find myself wondering what it would take to get the numbers to work out for something similar in the gaming biz. Oh, I know that we've made a number of attempts. I detailed some of them in a previous column. Most of them have centered around free offers: free "Lite" versions of games and the like. Others have offered free downloads of full games (such as the *Ars Magica Fourth Edition* offer from Atlas Games a couple of years ago).

While this is good from a certain perspective, it faces a number of obstacles, mostly centered around cost, volume, and distributorship. Cost and volume are intertwined; the RPG market just isn't big enough to support the high volumes necessary to lose some (but not a lot) of money on a project, while getting that money back in new and returning customers. Even if your average non-first-tier RPG was able to double its sales by such a stunt, you'd be looking at numbers in the 10,000 range or so.

Distributorship is a curious beast in the RPG world. Consider that distributors make their money by taking a percentage of the cost of the item from retailers; a free (or low-cost) RPG doesn't take any less processing than a more expensive one – and, in fact, may require more – but the money the distributor makes is reduced. Couple this with the fact that most publishers and distributors offer free shipping to those who meet certain ordering thresholds, and it can be a recipe for a *lot* of money spent on shipping without the distributors making money off it. (I think that's why distributors also seem to favor more expensive books; per unit, they make more.)

The other major obstacle is determining what this bite-sized piece should be. Comics have the advantage of offering a complete story (or something approaching it) within a single "preview" issue, *and* make folks hungry for more. RPGs don't necessarily have the same compartmentability, especially if a rule set needs to be included. The two best efforts I've ever seen have been White Wolf's preview/adventure booklets on the one hand, and the [Fighting Fantasy-type books](#) on the other (which can also tell a complete story). Even so, it would seem if any company had hit upon a "magic bullet" that promoted their stuff and made a profit, we'd see more of them.

Other media have successfully dealt with this, mostly because of the lower cost of the media involved. CDs and DVDs can be pressed for pennies apiece, meaning free distribution of songs, video game demos, and even television episodes is limited mostly by the cost of including them in good outlets.

This is a random-sized bite because it's a work in progress, and I don't even pretend to have any answers.

* * *

If I ever run a modern-day set game again, I think one of the things I'm going to do is have a "major" story break during a quiet news period, only to serve as a smokescreen for the "real" cause of the adventure.

SCIAVO, POPE STILL DEAD

Other news: Uruguay Launches Giant Robot, Starts Clone Wars

* * *

That's it for this installment. Having been out of town for almost a week, I'm playing catch-up with various mail and other fiddly bits, so if I'm a little slow in replying you'll know why. And if you want to add your thoughts to the pile, feel free to send them to pyramid@sjgames.com.

Murphy's Rules

by Greg Hyland

Murphy's Rules

Monkey Mutterings

by [Chad Underkoffler](#)

NOTE: This "Campaign in a Box" is slightly different -- the "Box" today is a soapbox.

Recently, I had to go over my [Atomic Sock Monkey Press](#) (ASMP) receipts for taxes and business license renewal, so I had a bunch of numbers on hand. During an online discussion with some other industry folks, Steve Jackson suggested that refining some of my comments from that might make an interesting "Campaign in a Box."

So, here we are.

Monkey Business (Practices)

Let me give you some rough disclosure on ASMP practices and business matters. Any numbers mentioned do not include money made on other freelancing gigs (like, say, this column).

ASMP shares qualities with other game publishers in the RPG industry, and varies greatly in others. Like most publishers, it has its own catalog of products, often written or otherwise produced by someone on the masthead. It is (relatively) small and underfunded as an entertainment producer, and generates written products aimed at gamers who enjoy the roleplaying hobby.

However, ASMP has little to no presence in the hobby game distribution network, and sells its PDF and Print on Demand (PoD) products exclusively through two online storefronts: [RPGNow.com](#) and [e23.com](#). While more and more publishers -- small and large -- are going this route, PDF and PoD products are still just a blip on many gaming customers' radars.

Quick rundown (industry): Publishers create product, printers print the product, distributors distribute product to retailers, retailers sell product. That's how your typical Game X gets from Publisher Y to Local Game Store Z. There are four main reasons why I haven't pursued getting into the "distribution channel." These reasons are (in rough order):

1. Possession of an understanding of the distribution system;
2. Capital to pay for large print runs;
3. A sizable catalog of products; and
4. An aggressive release schedule.

When I started ASMP, I had none of these things; it's arguable right now, after more than a year of operation, whether I have as yet achieved any of them.

My grand business strategy is not to run ASMP at a loss, ever. I avoid using credit or accruing debt; this includes using my credit cards for ASMP expenses. Partially, this is a personal foible, but it also has a bottom-line rationale. ASMP is sole proprietorship, with a Doing Business As (DBA) name; a DBA is essentially a legal alias for me to do business with a corporate face. As a sole proprietorship, I am liable for any debts that ASMP runs up. I have enough to worry about with personal bills and student loans and such without adding business issues -- like additional interest and finance charges -- onto the heap. My profit and loss statement and cash flow statement are the same thing. Luckily, I don't amortize development costs over print runs, nor do I have to worry about inventory, warehousing fees, administration costs, and so forth.

I had an initial investment before launch (a sizable check from a freelance writing job), which I used to set up the ASMP website, square away my business license and DBA, purchase cover art, and pay for the first RPGMall print run (see below) for **Dead Inside**. I immediately repaid it out of my first month's profits. Since then, ASMP has

garnered a small amount of profit each month. . . which I sink back into the company for the next month's costs. ASMP's monthly costs involve advertising, networking costs, professional development fees, and -- until recently -- small PoD runs.

Quick rundown (PoD): Initially, under the aegis of the RPGNow-associated RPGMall, I had to pay to get very small print runs of books made up, which were then held in inventory for customer orders. It really wasn't "true" PoD, you could consider it "Print on Publisher's Demand." With the change in RPGNow.com's PoD process to Lulu.com, this cost has gone away -- no upfront fees for print runs. Heck, no print runs per se. The current system is actually "Print on Customer's Demand."

How does all of this work in putting together a game?

Monkey in the Middle (of Production)

First, I write a book and playtest it with my local group to work the egregious kinks out. Then, I collect various other playtest groups and "peer reviewers" to take the manuscript out for a spin or two; I've generally used Yahoo Groups to host the mailing lists and playtest files. After that comes revision of the text to patch holes, fix mistakes, and add any new chrome that's shown up in the interplay and discussions with playtesters. At some point in here, I commission cover and interior art. When the revision is done, I send the final draft of manuscript to an editor.

Quick rundown (art): I look for stuff that I'd like to see in the book, something that seems to click with the words. Frankly, when I was doing ***Dead Inside***, I didn't have a firm enough grasp on exactly how to express to the artist exactly what I wanted, and didn't realize how hard-assed I needed to be to get it. I also was in an (inexplicable) hurry, and allowed this drive to get the game out there as soon as possible to cloud my judgment. I went with the attitude of "close enough" -- and now I believe this was an error. Lastly, I had much less of an understanding of how to use the graphic technologies at my disposal -- which, when you consider my current state of understanding, is pretty laughable.

So, while there are pieces in ***Dead Inside*** I really should have kicked back for a few more revisions, I take full responsibility for the way the book looks. The illustrations really are fairly close to the tone I wanted the art in the game to have; if I had to do it over again, it'd look sharper and clearer, and would rely much more on the text. If you compare ***Dead Inside*** to the ***Cold, Hard World*** supplement, I believe there is some improvement in the art direction.

Quick rundown (editing): I'm an editor in my day-job. Despite that, I wouldn't try to edit my own writing alone. You need fresh eyes to catch errors that you gloss over without noticing; your brain often fills in gaps automatically. That's why I tap someone who's an editor in his day-job as well. And mistakes can still get through.

Quick rundown (paying for art & editing): Other than printing, art can be the biggest expense of a project. Since ASMP is run on a shoestring of funds, this is a huge concern. I go with two options (or a mix of the two options) for purchasing art: 1) flat fee; or 2) profit sharing. *Flat fee* is simply paying the artist for the artwork and rights, and Bob's your uncle. *Profit sharing* means that the artist gets a cut of the money I make on a product (see below, *Monkey Money*). Generally, I go with flat fee for cover art, and profit-sharing for interior art and editorial work.

Once I have an edited draft and art in hand, I start laying out the product. Balancing columns of text with graphical and text elements, making sure the sections get broken right, tweaking the pagination, all that stuff. When I'm happy with the layout, I publish to PDF.

At that point, I start looking for reviewers for the product; reviews -- both good and not-so-good -- are great ways to catch the gaming public's eye at relatively little expense. Meanwhile, I set up all the arrangements and product information with RPGNow and e23. Recently added into this loop is setting up the product for RPGNow's new PoD system, which is its own process, so that a game book can be released simultaneously as a PDF and a PoD.

When that's all squared away, I upload the files to the appropriate servers, and start arranging press releases and advertising. Once I send those press releases off to the venues that report on the industry, and post the same information on the lists and fora I frequent, the product is launched.

Quick rundown (announcing): I'm not a big believer in announcing products to the public too far in advance. Part of this is that the reason it happens is related to the way the distribution system works: you have to have the information on a product out before release so that retailers can order the game from the distributor when the game is finally launched. Since I don't have to worry about that right now, I don't do it.

There another part to it: personal embarrassment when a schedule slips -- or vaporizes. You see, initially, **Dead Inside** was supposed to come out from [Ronin Arts](#). When that wasn't going to happen (for good reasons; Phil and I are still on amicable terms, I think), I decided to do it myself. I've tried to avoid announcements until the product is nearly ready to be sold. Unfortunately, I may have just violated this little rule of mine; odds are good that by the time you read this, you'll know the real title of my **PDQ**-based superhero RPG I've been calling "Sekrit Projekt Ampersand" publicly. I wrote a little bit on it for [Daedalus](#) that spills the name -- **Truth & Justice** -- because I was expecting it to go through playtest more smoothly than it has. Some restructuring has to be done on the game to integrate the core **PDQ** rules; originally, **T&J** was intended to be a for-sale supplement to the free **PDQ** ruleset.

Oh well. Maybe having the name of the game out there will have a positive marketing effect.

Monkey Money

Now the money starts rolling in, right? Sort of.

RPGNow and e23 pay on a monthly schedule; for the first month, a PDF/PoD publisher will see no money from sales. To pay for the flat fee art and advertising (and up until recently, small print runs as noted above), I had to pony up capital; I then paid myself back out of the earnings from the first month's sales. For subsequent print runs, I had to take last month's earnings to pay for this month's printing costs. Luckily, now that the Lulu.com process has started, I can use the funds earmarked for that to pay for other things, like art for new games and advertising for the entire catalog.

I treat money from sales on a product as my *gross earnings*; after all, the vendors take a percentage of the real gross for themselves. From that, I pay back anything owed directly to myself/ASMP for capital outlays on art, launch advertising, or printing. After these expenses are paid, that gives me my *joint net* on the product. The joint net is divided up among the profit participants by percentage, which is generally the writer/publisher (me), the interior artist, and the editor. I call the percentage that goes to me my *personal net*, and more than half of it generally gets reinvested into ASMP one way or another.

However, there are some products in my catalog -- **Monkey, Ninja, Pirate Robot Deluxe** and **Monkey, Ninja, Pirate Robot: the Roleplaying Game** -- where I am both the writer and the artist, and I paid the editor a flat fee. This means that, in theory, all the joint profits would go directly to me as personal profit; in practice, these profits go directly into the ASMP "capital fund" and are available for continuing advertisements, networking costs, office supply expenses, postage, and professional memberships and development. This is one of the big reasons that ASMP has been able to increase its advertising campaigns over time: these two products are dedicated to paying for them.

Quick rundown (dedicated products): The genesis of this idea of creating products solely to underwrite later products was an adaptation inspired by the use in the comic book publishing world of putting out individual issues of a book as loss-leaders to garner interest in an eventual trade paperback collection.

Monkeying with the Numbers

So what does all of that get you in dollars and cents?

Well, ASMP has a catalog of six products, of which two are free. On the four for-sale products, ASMP made rough gross earnings of \$1,814 in 2004. When the capital outlays, launch advertising, and print runs for all products were paid out, this gave a joint net of \$1,150. After payouts to other participants, my personal net ended up being around \$600 for the year.

Quick rundown (personal net): More than half of that \$600 has gone directly back into the "company coffers." So, I essentially made about \$240 this year, or \$20 a month, from ASMP. (Actually less, because I used most of my share of the money to buy out the percentage participants on **Dead Inside** and **Cold, Hard World** after three consecutive months -- the last quarter of 2004 -- of sluggish sales. The upside is that now those products are in a similar class as **MNPR Deluxe** and **MNPR:RPG**, and provide operating funds for more advertising and future products, so long as sales continue.)

Now, let's play a little game. Let's pretend that I got paid by the word for writing these products, we'll only count the three biggest, and we'll just ignore the parenthetically mentioned buyouts. That's a word count of 155,560 for **DI**, **CHW**, and **MNPR:RPG**; grand total earned is \$240. That means my per word rate is around *one and a half-tenths of a cent*. Scary, huh? Let's back out a level, and use the entire joint net for the math; my per word rate changes to a whopping *seven-tenths of a cent*. Let's back out completely to gross earnings; now I am making a princely *one and one-tenth cent per word*, which is nowhere near the common professional rate of 3 cents per.

If I had written that 155,560 words for someone else, it would have ended up being: \$3,111.20 at 2 cents/word, \$4,666.80 at 3 cents/word, or \$6,222.40 at 4 cents/word, which are the rates I've worked at in the past. (This, of course, also ignores the fact that few extant RPG publishers would want to publish a competing rules system or setting unrelated to their products.)

I've never worked for a company for rates lower than 2 cents per, nor higher than 4 cents per (except for SJ Games' **GURPS Steam-Tech** compilation, which was paid for in copies). So far as I can remember, I have not turned down anyone who has specifically asked me to do freelance work in order to do my own games until just this month ("Campaign in a Box" has been on hiatus for unrelated reasons). Nobody's beating a path to my door. But, honestly, neither have I been aggressively pursuing freelance work.

Quick rundown (overall money): Thank God I have a day-job.

Monkey Meanings

If I were relying on ASMP money to live, I'd run things a bit differently. I'd treat ASMP as a fully-fledged second job, rather than the hobby-job I'm currently treating it as. I'd seek loans, investors, and other financing to keep myself afloat. I'd move heaven and earth to get into the distribution channel, because it's really the only game in town.

Even doing all of that, there's a damned good chance I'd lose my shirt in this market. There's substantial competition, from much better capitalized and more established companies, with much more commercially viable product catalogs.

Ultimately, however, I'm not sure I'm in competition with, well, anybody. I don't think I'm taking sales away from any other publisher. I haven't yet published any **d20 System** material, which is the 800-pound gorilla in the market. Only two of my products are available in print (on demand); the others are PDFs. Only one of my products has sold over 200 copies; the rest have sold below 100. As I understand it, that's around 13% of an average print run for most small-press game publishers (for more on this, see below). A distributor probably wouldn't touch such a catalog with such low sales.

Quick rundown (industry print runs): Many of the game books in the RPG industry have print runs of around 1,000 to 2,000 copies. We're talking small-press, here; the big companies like Wizards of the Coast, Steve Jackson Games, and White Wolf all tend to deal in much larger numbers. (I've heard that White Wolf considers a 3,000 unit run the bare minimum for a line's continuing viability.) Indeed, very

few small-press companies do print runs of 5,000 units.

Most game books in the distribution system typically have a 90-day sell-cycle, where the majority of their sales are made; it's uncommon -- maybe even rare -- for a book to completely sell out its initial print run, even within a year.

Let's compare *Dead Inside's* 200-some sales with a breakdown comparing it to different percentages of sales for different sizes of print runs.

Print Run	Quarter Sold	Half Sold	Three-Quarters Sold	All Sold
1,000	250 (DI 80%)	500 (DI 40%)	750 (DI 26%)	1,000 (DI 20%)
2,000	500 (DI 40%)	1000 (DI 20%)	1500 (DI 13%)	2,000 (DI 10%)
3,000	750 (DI 26%)	1500 (DI 13%)	2250 (DI 8.9%)	3,000 (DI 6.7%)
5,000	1250 (DI 16%)	2500 (DI 8%)	3750 (DI 5.3%)	5,000 (DI 4%)

That's not too bad. Especially not for a game as recondite as *Dead Inside*.

On the up-side, ASMP's PDFs and PoDs are always "in print." They are not tied to the typical 90-day sell cycle; indeed, they form a strong backlist that continues to attract sales long past the first three months of release. You could go and buy copies now, *whenever you are reading this article*, whether it be the week of publication or five years from now, provided the wheels don't fall off of RPGNow or e23. And every single sale of a PDF/PoD product has a dramatic impact upon the profits seen by the publisher and participants, in a more direct way than I think most product sales in the distribution system see. After all, they have two to three tiers of structure (retailers, distributors, publishers) to percolate through until they reach the creatives -- if additional moneys reach the creatives at all, which they often do not (flat fee, remember?).

I have no illusions about how my games will sweep over the mid-tier like a fog of death, crushing my enemies, driving them before me, so I can hear the lamentations of their women, thus allowing me to shove my arm down White Wolf's throat like bloody Tyr, after which I can then use my new Lupine Club-Arm to bludgeon Wizards of the Coast/Hasbro into submission. ASMP will then take the throne of Utter Dominance of All Gaming! Bwah-ha-ha-ha!

...

Anyway, not gonna happen.

Indeed, I'm starting to lean towards the idea that I'm not so much a publisher as a gallery or studio artist. I consider ASMP a studio, intended to produce certain pieces of "art" (if this term seems too loaded for RPGs, please replace it with "niche product") that I wish other people to see, increase exposure of all the involved creatives, stake a claim in a newish market niche, pay for its own expenses, and provide a small -- but useful -- influx of cash. Additionally, I'm using ASMP to learn what I can about the ins-and-outs of small business.

I'm generating pieces of art/text for a niche group of customers in a niche segment of a niche industry. Compared to the publishing business, I'm a little kid scrawling on the wall in crayon. I *cannot* honestly be said to be in competition with other RPG publishers, or even the top-end of the RPG PDF publishers. If one insists on doing so, I think it's obvious that I'm "losing."

But I don't see it that way. I'm *winning*. I've gotten products out that I genuinely think are good work, which would probably have never been published by anyone else. The exercise pays for itself, teaches me about an industry I'm fascinated by, and provides me enough money each month over and above to buy a pizza or pay a small household bill. At the end of the day, it's something I'd be doing anyway.

If I focus on the concept that I am contributing (granted, in a small way) rather than competing in the market, I can see my way clear. I'm producing good, offbeat games for people interested in that sort of thing, and 99% of gamers will probably never hear of any of them. But I get to do so without losing my shirt, having the experiment pay for itself, learn a lot about small business operations, and make pocket monkey -- er, money.

This situation is already happening. I'm already basically getting everything out of it that makes it worthwhile to do instead of swimming or reading a book or organizing my comic collection. It's the journey that is important, not the destination. ASMP pays for itself, and doesn't hurt anybody else's business.

Ergo, nothing to do but enjoy the ride.

* * *

Costumed Clichés

Four Fantastic Foregone Conclusions in Supers Universes

by Brian Rogers

When designing a super-hero universe (not merely one in which some people have super-powers) GMs usually hew close to established examples. After all, the genre has been defined over 70+ years, and there are certain things that [players expect](#). However, the GM should be aware of some genre assumptions which can -- and perhaps should -- be broken.

#1: Physical Restrictions (and male pattern baldness) Increase Mental Power

While Professor X is the platonic form of this cliché, it actually stretches back farther, to Dr. Sivana who bedeviled Captain Marvel. The idea plays neatly into a lot of stereotypes about scrawny, brainy nerds and big dumb jocks, and also makes a nice parallel between the physical paragons who defeat schemes facing the minds that conceived them. In the 1960s the simultaneous appearance of Charles Xavier and Niles Calder displayed the cultural meme shift from short to handicapped, which culminated with Jean Grey's change to Phoenix -- death is the ultimate physical restriction, so she got a ton of points for that!

The first step to combating this cliché is being actively aware of it. Your players almost certainly are: over the years through various players I've heard the lines "Well, little Timmy's still on crutches, but man have his math scores gone up" and "Hey, my old PC reappeared in a wheelchair. Since she's a psychic, that rocks!" If your players want to play with these archetypes, let them, but don't populate your world with paraplegic mentalists or midget inventors unless you're deliberately playing to type. Alternately you could make a link between physical and psychic well being, so that your ESPers have reason to develop their physique.

#2: Flight is the Preeminent Super-Power

The majority of super-heroes can fly. Even in stories where the heroes have only one or two powers use any justification for granting flight within that power's aegis (Storm with wind, Polaris with Magnetism, Banshee with his scream . . . flowing around his body to propel him upward?!?) or flight devices are provided to all and sundry (Legion of Superheroes). While this can be convenient, giving everyone high mobility, it debases what should be one of the powers that epitomizes human dreams into something commonplace, barely worth mentioning.

In his director's comments for X2, Bryan Singer comments on how he didn't want *any* of the characters to be able to just fly, since he felt it would damage the setting's "reality." This meant that when people do fly on screen, it a) always has a solid justification and b) reinforces the power of the moment. Be aware that making a similar decision (either by banning flight outright or by instituting a high purchase cost) will increase flight's relative power, it also reduces PC mobility and might anger your players if the only super-humans with flight are the bad guys, who just keep flying away.

#3: Non-American Heroes Have National/Ethnic Powers

Inside the vast metropolises of America, heroes come in all shapes and sizes, with powers and names ranging from the iconic to the absurd. Outside of the United States, however, it's all about the ethnic identity, baby! You're from Ireland? Expect to be named Shamrock . . . if you're lucky! Arabia? Arabian Knight if you're a man, or Scheherezade if you're female (and well-read). In comics this evolution occurred when our isolationist heroes stirred from the States

some decades after WWII, and writers were forced to acknowledge that the rest of the world probably produced some super-humans too. The result is rather silly.

If you avoid falling into this pitfall, it makes national-themed heroes stand out. If the players note that a region has many such supers while others don't makes what was a cliché into a clue. If you decide to include such heroes, you can take the curse off by including them in the States. Kurt Busiak pulled out all the stops doing this in *Astro City*, where those outside of the book's eponymous center have slightly ridiculous regional names: the Brahmin in Boston, the Untouchable in Chicago and the over-the-top Real Thing guarding Atlanta. Or, if you're already populating the world with balding paraplegic midget scientists, you might as well have the Irish hero Blarny Stone (He's incredibly charismatic. and made of stone!) battling the German super Berlin Wall (He's immovable. and made of stone!) with the help of the Palestinian Dome of the Rock (He's a bald genius. who is made of stone!).

#4: Indigenous Supers Have Magical Themes

This is as much a natural extension of the noble, nature-loving savage stereotype as the physically impaired mentalist: balancing a deficiency in one area (in this case, advanced technology) with its perceived opposite (mystical power). And if you do, have a Magic vs. Technology antithesis in your game world that makes sense. If all the other magical characters wield western-style hermetic sorcery, or if you have a non-magical origin for all supers, then even magical hand-waving doesn't solve the problem. Even the otherwise power/nationality shattering X-Men book lost ground to this one, with Storm being a "Goddess" to her fellow Africans, which 30 years later looks more patronizing than multi-cultural.

As with all of these, the knowing is half the battle. Make up your mind whether there is a battle between magic and technology (and if nature magic *does* work, why isn't the world's pre-supers appearance history very different?), and stick to it. You could also hide patterns within patterns -- perhaps the Canadian hero Shaman has magical aptitudes not because of his First Nations heritage, but because he's a doctor, and doctors make the best mages (ala Dr. Strange and Dr. Druid). The other First Nations heroes are mutants, victims of radiation accidents and, of course, Canadian Shield, who carries a magical shield . . . and is made of stone!

George On My Mind

"What saint is St. George that we do here honor him?"

-- Edward VI of England

Although it was petulant Protestantism that impelled Edward's question, it remains a good one. Who is St. George, and why is he beloved by at least two religions from the British Isles to the deserts of Arabia? What keeps him alive when his fellow warrior-saints from Theodore to Demetrius are merely names on a page? How do you stay immortal if all you do is fight dragons and die a martyr? Once more into the breach, then, the gap between legend and history where dragons dwell. Once more, for England and Saint George!

*"For there is none of you so mean and base
That hath not noble luster in your eyes.
I see you stand like greyhounds in the slips,
Straining upon the start. The game's afoot.
Follow your spirit, and upon this charge
Cry 'God for Harry! England! and Saint George!'"*

-- William Shakespeare, *Henry V*, III:i:29-34

By the time Shakespeare wrote those words, St. George had already passed the peak of his popularity in England, a victim of the Protestant Reformation and the dim view it took of saints' cults. Before 1530, St. George's Day (April 23) was celebrated from York to Norwich to Bristol to Canterbury by "ridings," great festive parades featuring canvas dragons and "Georges" clad in damask and gilt. In 1415, the Archbishop of Canterbury raised St. George's Day to the equal of Christmas, and it remained a feast of obligation for English Catholics until 1778. The Plantagenets and Tudors eagerly promoted the cult of St. George as a national, martial symbol contrasting both with France's St. Denis and with England's meeker patron, St. Edward the Confessor. [Richard II](#) made the [red cross on white](#) of St. George the national arms for his invasion of Scotland, and Edward III founded the Order of the Garter with St. George as its patron. The English enthusiasm for St. George goes back to the Crusades, where he (along with Sts. Demetrius and Theodore) [miraculously appeared](#) to the knights at Antioch in 1098 and Jerusalem the next year, and was reinforced by his aid during the Third Crusade and (making the switch from Christian warrior to English knight) against the French at Calais and Agincourt during the Hundred Years' War.

English knights ran into St. George all across the East, from the great church of St. George at Constantinople to the church commemorating his martyrdom at Nicomedia to his tomb at Lydda (modern Lod, near Tel Aviv). Antioch, Tarsus, Edessa, Tyre, and many other sites had churches of St. George reaching back into the latter days of the Roman Empire. England had a church of St. George at Doncaster going back to 1061, but France had one as early as Merovingian times (ca. 512 A.D.), and the churches of St. George in Venice and Rome (where the head of St. George was unveiled by Pope Zacharias in 751 A.D.) may be still earlier. In addition to England, St. George is the patron saint of Aragon, Catalonia, Lithuania, Palestine, Portugal, Moscow, Istanbul, Genoa, and (of course) Georgia. His cult extends throughout the south Slavic territories and into Ethiopia. As the patron saint of cavalymen, farmers, syphilitics, and archers, he obviously gets around.

"This odious stranger, disguising every circumstance of time and place, assumed the mask of a martyr, a saint, and a Christian hero; and the infamous George of Cappadocia has been transformed into the renowned St. George of England, the patron of arms, of chivalry, and of the Garter."

-- Edward Gibbon, *Decline and Fall of the Roman Empire*

If, that is, he ever existed at all. Although the Vatican assures us he was real, in 1969 Pope Paul VI dropped St. George off the universal liturgical calendar, demoting him down to the lowest category of saints, those suitable for mere local commemoration. This is because exactly nothing is known about St. George except that he was a martyr. Traditionally, he is supposed to have been a cavalryman in the Roman army martyred in 303 A.D. during the persecution of Diocletian, but the martyrology of Eusebius in 313 A.D. doesn't name him, mentioning only a nameless soldier martyred at Nicomedia. Pope Gelasius (or someone signing his name) refers to George in 495 A.D. (or later) as a saint

whose name is "justly revered among men, but whose actions are only known to God." The earliest *Acta* date from either the late fifth or early sixth centuries, and tell the story of George suffering a series of ever-more lurid deaths (seven, in the usual version) at the hands of "Emperor Dadianus," (who conveniently never existed either) only to be resurrected each time ready for more torture.

Some authorities, most notably Gibbon, identify "St. George" as one George of Cappadocia, a bishop of Alexandria and sometime pork contractor to the Roman Army, who was definitely for sure martyred under the Emperor Julian in 361 A.D. Since this George was an unsavory character at best, not to mention an Arian heretic, orthodox (and Orthodox) scholarship rejects this identification, pointing to a church in Syria dedicated to George that can be dated to 368 A.D., too soon after Alexandrian George's lifetime for his Arian heresy to be forgotten. However, recent studies have questioned that date, moving it up to 549 A.D., well past the sell-by date for telling one's Georges apart in the confusion of Persian invasions and whatnot. (One version of George's *Acta* identifies "Dadianus" as the King of Persia, for extra murk.) It is interesting, however, that the early *Acta* identify one "Athanasius" (Arianism's most hated foe) as the court magician of Dadianus, and that one of Alexandrian George's partners in heretical pilfering was none other than the master of the mint, one Dracontius.

"Thus as they spake together the dragon appeared and came running to them, and St. George was upon his horse, and drew out his sword and garnished him with the sign of the cross, and rode hardily against the dragon which came towards him, and smote him with his spear and hurt him sore and threw him to the ground."

-- Jacobus de Voraigne, *The Golden Legend*

Because the legends of St. George are remarkably dragon-free for the first several centuries, regardless of which George spawned them. Although various icons in Georgia and Ethiopia (which might, actually, be St. Michael) can be adduced to the contrary, St. George is not unequivocally mentioned as a dragon-slayer until the mid-13th century, in Voraigne's *Golden Legend*. Here, the story springs full-blown of St. George riding by a town, meeting a princess, rescuing her from the dragon, beheading the dragon in the town square, and converting everybody in eyeshot to Christianity. The location of this miraculous combat is variously given as Silene in Libya, Joppa in Palestine, or Beirut in Lebanon (where St. George's Bay remains to this day). This story is, without a doubt, a simple remake of the Greek myth of Perseus and Andromeda. Perseus is even supposed to have killed his sea monster on the rocks at Joppa, just down the road from St. George's tomb. How, exactly, the dragon got involved with George in the first place remains unclear: St. Theodore (George's co-sub-patron in Venice) killed a crocodile, Constantine the Great liked to be depicted slaying the "serpent" of evil on temples (including Christian ones), and the *Acta* several times refers to Dadianus, metaphorically, as a "dragon" implying his kinship with Satan, the Dragon from the Pit. Really, given the number of dragons and serpents around, it's a good thing St. George showed up when he did.

*"Green George we bring,
Green George we accompany,
May he feed our herds well.
If not, to the water with him."*

-- Carinthian fertility song for St. George's Day

In some versions, St. George rescues the town from thirst also, since the dragon is guarding (or polluting) the local well. This "knight in the [Waste Land](#)" imagery can run as far as we'll let it in one direction, but in the other, it points to George's other main role, that of fertility spirit. The delightful J.G. Frazer tells us that in olden times "Green George" was played by a young man, parading in green branches and leaves on April 23, throughout Romania, Carinthia, [Transylvania](#), Belorussia, and Ukraine. In Roman times, this fertility parade (on April 21) was called the Parilia, dedicated to Pales, the god of shepherds, interestingly also an aspect of Mars the warrior. The Parilia is also a milking festival; St. George's [severed head](#) "gave forth milk and water," in the words of the *Acta*. The first Parilia was supposedly when Romulus plowed a furrow around the Palatine Hill, and what do you suppose *giorgios* means in Greek? "Plowman," or farmer. At the end of the parade, depending on the locality, Green George (or a green [effigy](#)) is thrown into the river. (In the *Acta*, St. George is thrown down a well.) Frazer manfully resists pointing up the obvious, but we all know that human sacrifice (and hence, in a way, martyrdom) is a kissing cousin to effigy-throwing by now, don't we? This Green Man version of George ties in oddly with some of St. George's martyrdoms -- especially being dismembered and scattered in the fields -- and with the similar death of [Dionysos](#). (The feast of Vinalia Priora, the

First Wine, was held on April 23. Hmmm.) And Dionysos, as [we've learned](#), was the inspiration (and secret patron?) for the Mummers' Plays, which featured guess which saint?

"Some have identified Khezr with St. George -- but he might more accurately be seen as both St. George and the dragon in one figure. . . . The 'spirits' of Nature, such as Khezr and the djinn -- who are in sense the principles of natural power -- recognize in the Muhammadan Light that green portion of the spectrum upon which they themselves are also situated."

-- Peter Lamborn Wilson, "Sacred Drift"

As we follow George into the wild wild East, we meet his Muslim counterpart [Khidr](#) (or Khezr, or Khizir, etc.) coming and going. Christians in the Levant used to report Muslims donating money to churches of St. George to repay vows sworn to Khidr. Like George, Khidr is associated with water, in this case the water of Eternal Life. (Just the kind of thing you'd need for repeated resurrections. George, it may interest you to know, is always depicted as beardless and youthful -- even childlike -- in traditional iconography.) Khidr is venerated by the Sufis, with their [sevenfold](#) initiatory stages -- which match George's seven martyrdoms too well for words. Khidr and George are both Green Men, although as Peter Lamborn Wilson points out, Khidr isn't really an [emerald](#) warrior, and especially not a dragon-slaying one. However, Khidr and Osiris share the color green, the power of initiation, and the water of eternal life -- and George and Osiris share the being torn apart and resurrected bit, as well as the contest with a snake (Typhonian Set, or Apep). A serpentine trail of identity flashes through these figures, Egyptian and Christian and Muslim alike, something older than all of them. Something that can die seven times without dying.

"From this tabular view of the legends it is, I think impossible not to see that S. George, in his mythical character, is a Semitic god Christianized. In order to undergo the process of conversion, a few little arrangements were rendered necessary, to divest the story of its sensuous character, and purify it. Astarte or Aphrodite had to be got out of the way somehow."

-- Sabine Baring-Gould, *Curious Myths of the Middle Ages*

One begins to suspect St. George of pulling a ringer on us. Not just with his Arian namesake in Alexandria (although a Muslim St. George would closely resemble an Arian one, exalting the Father at the expense of the Son), but throughout his legend cycle. Like the Seven Chinese Brothers who continuously escaped execution with specialized supernatural powers, St. George slips out of bronze ovens, wheels of spears, and sealed wells. In the *Acta* he calls Apollo a demon, and forces him to fly out of a statue -- but in the *Golden Legend* and its variants he is Apollo, killing the poisonous Python to recover the Well of Knowledge and Life. A 10th-century Arab commentator, ibn-Wahshiya, identifies the ceremonies at Tammuz' death (which he had read about in ancient Nabatean records in the Mesopotamian swamps) as identical with the "legend of St. George that is current among the Christians." (Suddenly, St. George is revealed as Adonis, the lover of [Cybele](#) the castrating devourer, and his beardlessness becomes far creepier.) Tammuz, the dying god, whose wife then descends through seven layers of Hell (seven deaths) to recover the [Water of Life](#) for him. St. George is Tammuz and Dionysos, Khidr and Romulus, Marduk and Perseus, Osiris and Horus, Apollo and Mars. Maybe "George" is one of the [flock entities](#) we have encountered before, battling snakes with Mopsus or serpents with the [Roc](#). Or perhaps the dragon St. George defeats is the Worm Ouroboros, the wheel of time that ground down forgotten gods and heroes. St. George rides out of Mesopotamian prehistory, stealing the name of an unworthy martyr and the iconography of an angel, detached from time, wearing the Rosy Cross and appearing to the soldiers of a demi-paradise when their need is greatest, living forever, forever young.

The Mystic World (for Champions)

Published by [Hero Games](#)

Written by Dean Shomshak

Cover by Jonathon Davenport

Illustrated by Nate Barnes, Warren Beckford, Jefferson Cram, Robert Cram, Keith Curtis, Newt Ewell, Jeff Herbert, Jason Ingel, Nick Ingeneri, Eric Radamaker, & Barry Winston

160-page b&w softcover; \$26.99

The Mystic World is a supplement that explores the magical aspect of the [Champions](#) universe. It describes and examines the cosmology of this setting as well as its characters, villains, and powers, all with a view to providing the GM with the foundation for both an arcane-themed campaign and adventures plus events designed for the mage or magic-using character in the superhero group. Like many other *Champions* supplements, *The Mystic World* does not stand alone -- more so than most supplements. It does not detail how to create a mystic character; *The Ultimate Mystic* will do that. It does not provide a plethora of arcane villains; both *Conquerors, Killers, and Crooks* and *Arcane Adventures* (a companion volume to this one) will do that. And [Champions Universe](#) gives more and relevant specifics facts about that setting, such as other characters and organizations.

So having got what it does not deal with out of the way, what can be found in *The Mystic World*? Divided into four chapters, it opens with "Worlds of Worlds," a look at how the *Champions* multiverse is ordered, described in Kabbalistic terms, from the material world of Assiah where Earth's own dimension is located, up through the Astral World or Yetzirah which is of particular importance, as it contains the destinations of choice for most mystics, reached via astral space. Besides giving access to the inner planes, it is also home to places created by the imagination and dreams. For example, Windyburg is a ghost city grown from the memories and stories of the "Age of Gangsters," while it is also possible to visit the school where you are naked. Also covered in detail are the mechanics of astral travel.

Both the many heavens of Elysium and hells of the Netherworld are also covered, but predictably none of these are all that interesting, although "Rock Candy Mountain," the heaven envisaged by hobos possesses a certain charm. This is made up for by the sections on "Faerie: The Land of Legends" and "Babylon: The City of Man." In the former can be found all of the nature spirits and pagan deities, such as Greco-Roman, Celtic, and Norse, as well as Faerie itself. Also found here is an Amerindian version of Faerie, which has since been invaded with the myth of the Wild West! Should a GM want to send the heroes back to the age of Cowboys and Indians without all that mucking about with time travel, then "The Even Wilder West" is perfect. Adventures in the age of dragons and hoards could also be conducted in this realm. "Babylon: City of Man" is a conglomeration of cities from the present, the past, and the imagination. Thus the fogbound streets of Victorian London lead to the covered markets of Baghdad and the gleaming towers of Manhattan, while the Emerald City of Oz glows in the distance. Babylon is a place to run the ultimate in urban adventure, the heroes aided by allies such as Sherlock Holmes and Bugs Bunny, while stalked by the *mythic* and very deadly version of Jack the Ripper.

The second chapter continues the overview-type material, looking at the shadow world where mystic people and places

can be found. This starts out on Earth and works its way outward, discussing how to become a super mage, the factions the dynasties and cults fighting for dominance on Earth, and the all-important position of Archmage. This is the office held by the Earth's most powerful mystic, and passed from one super mage to the next. At the current time, nobody holds the position, although in the official **Champions Universe** time line, the hero Witchcraft will ascend to it in the year 2020. Other candidates are also considered, and there is no reason that obtaining the position should be out of reach to a player character, though it should be a long-term objective; if such a hero is not destined to become the Archmage, then striving for it is at least interesting and game worthy.

In more generic terms, the place of some mystical creatures is considered, including "genius loci" (elementals, spirits and demons), ghosts, vampires, and therianthropes or shape changers. The place of gods is also discussed, most notably that while they still exist -- and are very powerful -- all suffer a supernatural "ban" that prevents them actually physical visiting Earth. That said, they can make their presence known through the use of avatars, offspring, nexus points, and gates, as well as via massive application of magic. Mystic places are given a similarly generic treatment are , but this is supported by a number of examples that work not just as locations to slip into a campaign but also as samples for the GM to base his own on.

Much of **The Mystic World** is statistics or mechanics free. All this changes with "The Book of Wisdom," essentially the **Champions Universe** grimoire. The primary difference between the super heroic mage and the "average" heroic mage is the number of limitations that the latter applies in mechanical terms. Thus he might need semantic, material, and verbal components, and more, to cast his spells, whereas the super heroic mage can get away with just waving a wand. In mechanical terms, as super heroic magic becomes more powerful, the limitations are excised, with the active points of these spells adjusted to fit the campaign level. This kind of magic in the **Champions Universe** is known as Thaumaturgy, under which the mystic commonly places his spells into power frameworks. These are essentially package deals that let a character possess a variety of spells and effects at a reduced cost.

The Mystic World details over twenty such power frameworks under various categories, from attack and defence to sensory, movement, and miscellaneous. For truly powerful games, especially potent spells and magical artefacts are given. Particularly notable of these are the "Quaternion Banishment," a spell that can defend a whole dimension against an invader. Unfortunately, it comes at a price, as it draws its power direct from human life!

This section ends with the mechanics for the guidelines given in the first section for astral and extra dimensional travel and the senses related to both. Certainly the most common of these is Astral Awareness, which can be brought for a simple cost. But in true **Champions** style, the other powers come with no little detailing. One fringe benefit that might prove entertaining is that of Deity, which gives a character a group of worshippers. He does not become an actual god though, he just has to live up to his godhood!

Finally, the last chapter describes and stats up three Mystic Master Villains. All are exceedingly evil, all want to conquer the Earth, and all are inhuman in their motives. Skarn, shaper of worlds has conquered hundreds of dimensions and sentient species. Tyrannon the Conqueror is also known as the Cosmic Cancer, in that he not only captures whole dimensions and merges them into his home dimension of Thulkos, he is also aided in this by hundreds of duplicates. The Dragon, opposed in secret by the Nagas, lies closer to home, being the Earth's ultimate source and power of evil. He has appeared in many mythologies in numerous dragon related forms, but has for millennia been bound on the Astral Plane. Instead he works through the weak, the corruptible, and various cults. The inference is that he is the ultimate hand or claw behind V.I.P.E.R., which in some ways makes the Dragon *the* perfect villain for a very long-term campaign.

The Mystic World is neither an exciting nor spectacular supplement, nor is it meant to be; while it is an interesting read, it is only interesting to a degree. This is very much due to the nature of the book. It is an overview and meant to go only so far before other supplements take over and provide greater depths. Yet what **The Mystic World** does detail makes it certainly useful -- the villains, the various dimensions, and the guidelines on astral and dimensional travel. In these and more, **The Mystic World** does what it is supposed to do, provide an overview of the magical aspects of the **Champions Universe**.

Modern Magic (for *d20 Modern*)

Published by [The Game Mechanics](#) & [Green Ronin Publishing](#)

Written by Eric Cagle, Mike Montesa, Rich Redman, Mat Smith, & Stan!

Edited by JD Wiker

Art & Layout By Marc Schmalz, Clarence Harrison, Pete Schlough, Jacob Elijah Walker, & Cheyenne Wright

80-page b&w softcover; \$17.95

Too many products from Wizards of the Coast forego any kind of setting information in favor of a straightforward listing of the rules and stats necessary for their games. They could take a few pointers from The Game Mechanics playbook. Partnered with Green Ronin Publishing, they have released **Modern Magic**, a collection of material designed to put the magic in your *d20 Modern* game.

There's not much about the actual layout that's different or surprising: It's just magic, after all. There's a spell list, some new character classes, some gear. But it's in the conception and the execution that the book really distinguishes itself from its source.

Each and every element of this book is pregnant with possibilities for a modern campaign. Taking a contemporary setting and laying this veneer over it, the writers manage to make magic seem like an organic part of whatever setting to which it's applied. Spells can mimic guns and cell phones, if the mage also apes the action with his hands and fingers. Screensavers become tools of hypnotism, vehicles drive on their own, and bullets can be fired into a crowd without hurting anyone but the intended target. Everything here feels so right, so intuitive. Names are reflections not only of the spell but of the culture of which they're a part, like Be the Ball. Even the material components pull their weight, such as the paintball that allows you to quick-change your car's paint job.

The gear section has a similar theme, and is just as much fun to read. The light bulb of true seeing shows things as they really are within the glow it casts, the bags of holding have become backpacks and pockets, and police whistles call up phantom cops who obey their "superior officer." There are a few new special abilities, too, so weapons can go Hollywood and not run out of ammo.

As you might expect, all these cool toys have a use...to the military. The mixing of the armed forces and magical might is all-too-brief but oh-so-cool. There are suggestions on how to use magic on the battlefield (and why mages won't keep combat from being interesting for the grunts); what level of magic may enter your game (so you can surreptitiously add a few magic users or just hand out spells like C-rats), and who's who in the military chain of magical command. Spell books are now issued by Uncle Sam, and some particularly potent enchantments are top secret.

Another nod to weaving your realism and your fantasy: voodoo. Being "ridden" by the spirits you summon sounds like a lot of fun, and the penalties one might pay for blowing one's ceremonies may have far-reaching consequences. Ritual magic gets the business, too, but it's not like the spells you're used to. They use certain incantations and "seeds" that may allow combinations and new magical effects, and the book lets you mix both forms of magic into the setting for a whole lot of color and depth. Some new character classes for the different forms, on the battlefield and off, let you get

use out of those rules. And for the normals? Even mundane charms and the like can afford some measure of protection in an overly mystical world.

The artwork is mostly a winner as well. Some of it, like Walker's contributions, tend to the slapdash side, but it's all clear, matches the text, and so much of it is outright beautiful for simple penciling.

Unlike too many other books of this type, ***Modern Magic*** gives truly practical material on crimes and adventures. How can spells help commit crimes? How can they solve them, and how can they be kept from short-circuiting a good adventure with a few well-placed waves of a wand? Do you want them using magic in the courtroom? About the only true downside is that the book has appeared in another form, specifically as PDF files, so you may already have some of it. Although the sections were developed separately, they meld together almost seamlessly. The chapter on voodoo goes into a good bit of description on that practice, and it may feel a little too deep in places, but a) it is a modern form of magic, and b) it's necessary to give a lot of that context to get the right mileage out of the system.

There have been many genre mixtures since the opening of the ***d20 Modern*** license, but few of them enjoyed as much spirited, focused, and just darned useful material as ***Modern Magic***.

--Andy Vetromile

Tax Code of Honor

For those of you not in the States, April 15th marks Tax Day, which is the day when our federal and state income taxes are due. This is only slightly less pleasant than Tacks Day, which when all Americans are required to swallow a handful of rusty tacks -- a national holiday instituted to commemorate the Grover Cleveland administration.

My taxes were unusually complicated this year, and even the easy-to-use software to guide you through the process -- software, I add, that makes the process several orders of magnitude easier than going it alone -- *still* requires a level of literary analysis that has me staring at the same sequence of six words for 10 minutes.

This is also the first year I've actually owed money to the federal government, as well as the first year I've needed to pay state income tax, so the whole process has weighed on my mind. "Gee, let me spend 14 hours pouring over papers, sorting receipts like a mole-man, fighting with software, and giving money to the government. Someone pinch me; I'm living a dream."

(As an aside, my friend Robert used to make out his checks to the "*Infernal* Revenue Service," which is an adventure possibility right there.)

Anyway, my attitude and likely column about taxes took a decidedly different turn today when I listened to National Public Radio's ["Talk of the Nation."](#) where they interviewed the director of the Electronic Tax Administration and a former IRS commissioner. One of them (I don't remember who) made the point that the IRS is in charge of administration, collection, and enforcement of taxes; they have nothing to do with designing or structuring the tax code.

Oh, sure, I *knew* this on some level; the years I spent sleeping through high school civics classes absorbed on a subconscious level. But hearing someone who works at a high level of the IRS complain about how complicated the tax code is, and sound almost apologetic about it . . . well, it put things in perspective.

And it got me to thinking: What if upholding the rules you've agreed to is a burden? And what are the gaming potentials of this?

I'm certain this is obvious to many of our readers have had this epiphany before, but it's new to me. The default I've always assumed for almost any character who needs to uphold a code of conduct or honor -- especially PCs -- is that they *like* doing it, or at least derive some moral or spiritual satisfaction by doing so. But what if that isn't the case? What if someone upholds a set of rules, for no reason because they *have* to?

This immediately opened up all kinds of roleplaying possibilities. Imagine a Jedi character in a *Star Wars* game who upholds the Jedi code of honor just because he knows he has to. "<sigh> I guess I'll help the innocent in this situation. It's my job and all." While the seduction of the Dark Side would be an obvious plot thread for such a character, it's not required; he may recognize the danger of the dark path and avoid it, and *still* not be particularly "good" (at least how such things are judged).

All kinds of interesting character possibilities opened up with this idea:

A Super with flashy or explosive powers who enjoys using them, and thus becomes a hero (upholding the hero's code of honor) just so he has an excuse to use his powers. ("Ya-hoo! I got to destroy that abandoned warehouse with my enerblasts! Oh, and . . . um, we, y'know, stopped the bad guy.")

A cleric who fully follows the tenets of his faith despite having serious doubts and reservations, just because he *has* to (to maintain his position, retain his powers, or the like). A code akin to the Ten Commandments becomes a lot easier to follow when the almighty will visibly and directly punish you for not doing so . . . regardless of your true feelings. (Or, to take it further, the monks from *Canticle for Leibowitz* adhered to a strict code of conduct they didn't even understand, let alone or agree with.)

A galactic police officer who upholds the code of the law, simply because he's good at it and he needs a job.

An ***In Nomine*** angel -- especially an Elohite -- who maintains the moral code ascribed by his master without having any particular attraction or inclination toward "good."

An android with free will who falls back on default programming, despite being perfectly capable of forging its own destiny.

Back in my college days, I vividly remember an article in the college newspaper during Stop Rape Week. In it, a fraternity member was quoted as saying, "We do not condone rape; we condemn it. It is definitely illegal." That quote angered me then, and it angers me now; as horrible a crime as rape is, I hated the notion that some people might refrain from doing so solely because of its illegality. But I realize this is the case; sometimes people uphold moral codes, laws, or rule systems simply because they have to.

For example, it would be wrong to use this column as a flimsy justification to write off my tax expenses as a business expense. And I swear, on my honor, never to get caught doing this.

--*Steven Marsh*

Object Lessons (Part II)

An Enchanted Collection for *Call of Cthulhu* d20

by Nicholas Luna

*Editor's Note: The first part of this article of assorted items and artifacts for **Call of Cthulhu** d20 appeared [last week](#). Read it or be devoured.*

Japanese Puzzle Box

Public Information

This puzzle box has a bloody and violent history that dates to World War II. An American soldier, John Smith, acquired the box during the U.S. occupation of Japan. Smith died violently in 1954, but the investigation that followed produced no answers. Smith's family placed the box on auction, and oil magnate Ralph Carter purchased it. Carter died in a fire in 1957. However, the box survived and a collector of puzzle boxes, Robert Masterson, purchased it. In 1958, Masterson was murdered, and the box ended up in the possession of Alan Smithers. In 1993, authorities arrested Smithers for the murders of three young women, and a jury convicted him.

This is a typical puzzle box -- a cube that is six inches on a side (five Sun). The box is made of a combination of woods, and inlaid with intricate designs of gold, silver, and green jade. Engraved on all sides of the box are tiny "mystical" characters.

GM Information

The box contains the spirit of Toyoyomi Tsunenaga, an elderly Japanese cobbler. Tsunenaga died in the nuclear assault on Hiroshima. At the instant of his death, a mystic in a small village was finishing the mystical rituals that would allow the box to act as a storage device for disembodied entities. Somehow, the box trapped Tsunenaga's spirit. The pain of his death drove Tsunenaga insane. He swore vengeance on all Americans. Whenever the box is opened, Tsunenaga is freed for a short time, and during this time, he unleashes his vengeance on those around him.

Determining how to open the box requires an Intelligence check against DC 30. If opened, the box releases an insane, evil spirit. The spirit will use his powers to either kill and/or torment the opener, and others when possible. The spirit automatically returns to the box after 30 days. If "killed," the spirit returns to the box automatically. The box appears to be indestructible.

To create the spirit, apply a ghost template to a Defense Option character with skills related to cobbling and home life, and the following ability scores: Str 10, Dex 11, Con -, Int 12, Wis 14, Cha 17. He should have the Sensitive feat. Select a level of experience appropriate to the PC group.
Weight: 2 lbs.; Study Time: 2d4 days (DC 30).

Adventure Ideas

- A PC's friend dies, and the police rule it an accident. This doesn't seem right to the PC, who decides to investigate it on his own. During the course of his investigation, he comes across the box. If he interacts with the box, he may learn the cause of his friend's death, but he will have new problems.

A rash of unusual deaths has occurred, mostly among wealthy and influential people. All are ruled accidental or natural, but one or more PCs (perhaps a Sensitive), senses something unusual, and decides, or is prompted, to look into things. A humiliated fortuneteller, who has found a way to control Tsunenaga, is ordering the deaths.

Kabuto and Mempo

Public Information

In the early Tokugawa period (1603-1867), a *ronin* ("man of the waves," a Samurai with no lord) wandered the land. His name was Tanaka Hideyoshi, and he believed the gods had given him a mission: he hunted and killed missionaries. Hideyoshi became well -- known to missionaries and native alike. They called him "*Akuma*" (devil). He earned this moniker both as a result of his deeds, and the distinctive *kabuto* (helmet) and *mempo* (mask) he wore. According to legend, Hideyoshi died in a battle against a band of missionaries. Legend tells that the missionaries used dark magic to bring Hideyoshi down, but before he fell, he killed 13 of the missionaries (some versions of the tale indicate that he killed five of the missionaries in one stroke).

The Westerner who killed Hideyoshi was familiar with the customs of the land and he went to great effort to return Hideyoshi's head, armor, and weapons to the Tanaka family. The ronin's weapons and armor stayed with his family until World War II. When Allied forces occupied Japan in the 1940s, someone, whose name has never been revealed, donned Hideyoshi's armor and hunted American soldiers. This killing spree did not last for long before an American G.I., Remo Tanner, killed the would-be ronin. Tanner kept the kabuto and mempo, and smuggled them to America when his tour was up.

Renowned smith Kotetsu Yorimoto forged the helmet and the mask at the request of Hideyoshi, and intentionally designed the pieces to resemble something the Westerners would fear.

The kabuto is made from banded iron strips. It is lacquered a dark red color, with two large black horns on the front. The mempo is the same color, shadowed with black, and styled to resemble a devil or demon. Together, the set resembles stereotypical images of the Christian Devil.

GM Information

Although the kabuto and mempo represented some of Yorimoto's finest work, they did not gain true power until donned by Hideyoshi. His belief was so intense that it imbued the set with real power. When Hideyoshi donned the set, they became a part of him. The death dealt by Hideyoshi in his quest took a severe toll, physically, spiritually, and mentally. By the time he confronted his last victims, his ongoing battle had left him exhausted. Contrary to the legends, the Westerner who killed Hideyoshi did not use black magic, or any other kind of magic. Hideyoshi's exhaustion caused him to make a tactical error that allowed the Westerner a killing blow.

When worn together, the kabuto and mempo provide a +1 armor bonus to Armor Class (treat this as if derived from a shield, allowing it to stack normally with other armor bonuses). Also, whenever the character suffers a critical hit, there is a 10% chance that the bonus damage is negated, turning the hit into a normal strike. While worn, this set provides some power against those who believe in the Christian God. The character wearing the set can attempt to inspire fear in Christians. The victims must be within 10 feet, and must roll a Will save against DC 12 or be stunned for one round. Regardless of whether or not the save is successful, the victim cannot be affected by this power again for 24 hours.

Christian priests and missionaries are particularly vulnerable to the set. If a character aggressively confronts a Christian priest or missionary while wearing the set, the victim must roll a Sanity check (0/1d2) and a Will save against DC 16. If the saving throw fails, the victim is stunned for 1d3 rounds and suffers a -1 morale penalty to all rolls during the confrontation with the armor -- wearing character.

When the set is worn by someone who believes, with his very existence, in the threat of Christianity, such as Hideyoshi, the set almost comes to life when worn. The mask moves as if it is the character's natural face. His voice

booms and reverberates, and he emits a sulfurous odor. This increases the Sanity loss for priests and missionaries to 1/1d4, the Will save DC increases to 20, and the stun lasts for 1d6 rounds. When the set is active in this fashion, it is very taxing to the character who wears it; he loses one point of Sanity for every 30 seconds that the set is active. Weight: 6 lbs.; Study Time: 1d4 weeks

Adventure Idea

Priests are being killed across the city. According to the few eye -- witness reports, the killer looks like a demon. If the characters are investigators, they could be hired or recruited to find the killer. Perhaps one of the victims was a friend, relative, or colleague of one of the PCs. If one of the characters is a priest, perhaps the killer is going to come after him.

Kane March Motorcycle Helmet

Public Information

Perhaps no villain in movie history has inspired more terror than Kane March, from the *Dead Man Killing* series. Kane, a demonic psychopath, claimed his first victim in 1981, and since then, he has scored a body count of 539, with the record of 138 kills alone in part five, *Kane Goes to Kansas*. There are rumors that the upcoming part 12, *Kane versus Mason -- the Last Slash* will top this count. This helmet is the same one worn by Kane in the first nine installments of the series. James Stickler, the man behind the face shield, originated the idea of the killer wearing a helmet, designed it, and wore it in parts one through nine. Before putting the helmet up for auction, he autographed it.

This is a scuffed, glossy black motorcycle helmet with a black-tinted face shield. There is an axe blade-size "rip" in the rear of the helmet. The right side has James Stickler's autograph in silver ink.

GM Information

James Stickler is a decent man who believes strongly in his craft. He worked very hard to bring the role of Kane March to life. To prepare for the part, he studied every serial killer he could. He visited prisons, read books, and talked to murderers. He consulted with religious figures on demonic possession. He spent most of his free time envisioning himself as Kane. He even went so far as to stalk young people while wearing the helmet. As he made more *Dead Man Killing* movies, he continued with his unusual study methods. During the ninth movie, he began to have unusual dreams and sensations centered on stalking and killing. Troubled, he sought professional help. His psychologist suggested he cease his unusual learning methods. James agreed. In addition to ending his unusual research, Stickler sold the helmet and quit playing the part of Kane; unfortunately, by that point, the intense negative energy of his habits had infused the helmet with a power all its own.

When a character dons this helmet, he must roll a Will save against DC 15. If this fails, he immediately adopts the persona of the infamous killer Kane March. Kane is a merciless, brutal murderer, who prefers to kill teenagers and young adults engaged in intimate relations. Once he focuses on a victim, he continues until the victim is dead, or he is stopped. While under the effects of the helmet, the character gains the following:

- +8 Strength
- +4 Constitution -- This provides him with + 2 hit points per level.
- +10 bonus to Move Silently
- +4 bonus to Hide
- Damage Reduction 10/+1
- Fast healing 5
- Low-light vision
- Immunity to death from massive damage
- He functions normally even after he reaches negative 10 hit points

The effect of the helmet lasts until the character dies, or the helmet is removed, something he cannot do voluntarily. If he survives, he suffers 1d8 Sanity from being under the effects of the helmet.

Weight: 1 lb.; Study Time: 1d4 days.

Adventure Ideas

- A serial killer is loose in the city. According to reports, he wears a black motorcycle helmet, uses unusual and particularly violent methods, and is unstoppable. The PCs end up investigating and learn about the helmet. Perhaps they visit Stickler (living on small ranch) to see what he knows. The killer is physically tough, so they may have to resort to clever planning to deal with him.
- Similar to the idea above, but if the GM is particularly cruel, he might make the person in the helmet a child or young teen. Not only do the PCs have to deal with a nearly unstoppable killer, they have to take into account that he is an innocent.

Oak Inkwell Set

Public Information

This inkwell set originally belonged to one Benson Howell, a London antique dealer. Howell was murdered in 1889. During the course of the investigation, authorities learned that he engaged in criminal activities, specifically forgery; specifically a forger, and provided many forged documents for criminal enterprises, specializing in inventory logs and documents of transferal. Three weeks after the murder, authorities apprehended Terrance Stone, and found the inkwell set in his possession, along with other stolen goods. Stone, in his confession, claimed that Howell tried to increase the fee for an arrangement they had entered. Stone, enraged, killed Howell, and took the set. Shortly after Stone's conviction, barrister Evan Blair acquired the set.

This oak desk set measures 14 inches by 14 inches by 14 inches. The finish is reddish-brown, dark and unmarred. The inkwells sit in silver -- plated slots the upper corners. Along the lower end is a recessed area for resting pens. In the bottom, there is a pullout drawer for storing paper. The set includes two square crystal inkwells, each measuring three inches in height.

GM Information

Benson Howell was an antique dealer, a criminal forger, and a sorcerer. He used his mystical skills to create this set, increasing his ability to forge documents. Creating the set took three years, but it was very successful. Terrance Stone ordered a forged shipping invoice from Howell, but when Howell finished the document, Stone tried to avoid paying for it. There was a brief struggle, during which Stone stabbed Howell. With his last breath, Howell cursed Stone with bad luck, and this curse eventually led the authorities to Stone.

This item can be used to create forged documents. This requires that the ink in the crystal wells be mixed with the blood of the forger. Roughly 1-2 hit points worth of blood must be mixed with the ink, and this blood must be freshened with every new document.

The character must write the forged document with the blooded ink, and then place the finished document in the paper drawer, along with a drop of blood from the person whose handwriting is to be forged. Twelve hours later, the document will appear to be written in the intended handwriting. Checks to detect forgeries created by the inkwell set suffer a -12 penalty.

Note that the crystal wells included with the set are the only ones that will work with the set.

Weight: 5 lb.; Study Time: 3d8 days.

Adventure Idea

A PC receives a package from an out -- of -- town acquaintance or friend. Inside the package is this set and a hastily scrawled note. It is short, cryptic, and indicates the PC should guard the set carefully. Attempts to contact the friend are fruitless. The friend has been killed (or kidnapped if you prefer) by his local crime syndicate. The syndicate learned of the set and wants it for their own use.

Pilot Whistle

Public Information

For years, people have been performing salvage operations near the coast of Florida, attempting to find gold and artifacts left on sunken ships. Calvin Boater recovered this whistle from the wreck of the Spanish ship Luz del Dios, near the coast of Florida in 1982. Boater sold the whistle in 1985 to cover his salvage costs. Desmond Levin, a collector of marine antiquities, purchased the whistle. A sudden hurricane destroyed Levin's boat and killed him two years after he purchased the artifact. The whistle washed up on the beach, where a beach visitor picked it up and later pawned it.

This is a heavy gold whistle, four inches in length and typical of the whistles used by pilots in the 1600s. There is evidence of an engraving on the right side, but the actual details have long eroded away.

GM Information

The whistle belonged to Carlos Franco, captain of the Luz del Dios. Franco, in a rage, beat one of his sailors for a minor infraction. The sailor, who possessed some mystical knowledge, devised a plan to gain vengeance on the captain. Every night for several nights, he stole the captain's whistle, and, with the aid of a summoned deep one, performed a ritual on it, cursing it. Shortly after the process was finished, the captain used the whistle at midday, near the coast of Florida. The resulting hurricane destroyed the ship.

The whistle has two different powers, both usable only in coastal waters. When blown forcefully at midday, it immediately summons a fierce hurricane that lasts for 1d10 hours. When blown at midnight, it summons to the blower 2d6 deep ones who will attack him, unless he can convince them to do otherwise.

Weight: 1/4 .lb; Study Time: 3d4 days.

Adventure Ideas

- The PCs are invited by a secret enemy to come on a late night cruise. The enemy possesses both the whistle and a means of making a deal with deep ones. His plan is to use the whistle at midnight, and direct the deep ones to kill the PCs. Perhaps the PCs will learn of his plan before hand, and will be able to avoid battle with the deep ones.
- The PCs learn about a cultist plot to summon deep ones to take humans as breeding stock. The cultists are going to use the whistle to summon the deep ones. Perhaps someone important to the PCs has been kidnapped to be given to the deep ones.

Prehistoric Cube

Public Information

Discovered in an Austrian coal bed in 1885 and estimated to be prehistoric, this cube created a small sensation upon its discovery: scientific journals printed articles, and educated people in scientific circles discussed it. Eventually, the cube ended up in a Salzburg museum. In 1888, an American journalist traveled to Salzburg in order to investigate the cube, and was told that the cube and its information file had been lost. The journalist proclaimed the cube a hoax, and it passed out of fancy.

The Prehistoric cube is actually more of a rectangle, measuring 2.5 inches long, 1.8 inches wide and 1.8 inches tall. It weighs 1.75 pounds, and has a shallow incision that goes completely around the long axis. It appears to be composed primarily of iron, with carbon, and a small amount of nickel.

GM Information

The Serpent People originally created the cubes as devices to expand the mind, and open new vistas of reality. Through the ages, the Serpent People have forgotten how to create the cubes, but they know the purpose of the devices and will go to any lengths to recover any that are found. This cube is one of a handful that remains.

To open this cube, the character must maneuver the halves (marked by the incision) in small, precise increments. This requires an Intelligence check against DC 25. When opened, the cube releases a small cloud of spores. A knowledgeable user will inhale these spores. If the cube is opened accidentally, or unknowingly, the character must roll a Fortitude save against DC 18 or instinctively take a deep breath, inhaling the spores.

A Serpent Person who inhales the spores gains +2 Intelligence and +2 Wisdom. If a human inhales the spores, the effects are random. Roll d% and compare to the following:

01- 10	Increase Intelligence and Wisdom by +2 each. The character suffers from inhuman thoughts and dreams, losing 2d4 Sanity. Cthulhu Mythos: +2 ranks.
11- 20	Increase Intelligence by +2. The character suffers from inhuman thoughts and dreams, losing 1d4 Sanity. Cthulhu Mythos: +1 rank.
21- 30	Increase Wisdom by +2. The character suffers from inhuman thoughts and dreams, losing 1d4 Sanity. Cthulhu Mythos: +1 rank.
31- 50	Lose 2 points of Strength.
51- 70	Lose 2 points of Constitution.
71- 95	Lose 4 points each from Strength and Constitution.
96- 99	The spores alter the character's brain functions, granting him the Sensitive feat, even if he does not meet the ability score requirement (if he already possesses this feat, re-roll, subtracting 20 from the roll).
00	The character is slowly transformed into a Serpent Person.

The spores can affect any given creature only once, regardless of how many cubes he is exposed to, and all ability score changes are permanent. All changes take 1d4 weeks to finalize (play the changes up gradually).

Weight: 1.75 lbs.; Study Time: 3d6 days.

Adventure Idea

A PC, or an acquaintance, finds the cube after an encounter with Serpent People or with cultists of Yig. A clan of Serpent People learns that he posses the cube, and attempts to retrieve it. They may use different tactics, including money, trickery, or violence. Perhaps two clans of Serpent People discover that the character has the cube, and he becomes caught in a tug-of-war between the two.

Prester John's Letter

Public Information

In 1165, Manuel I Comnenus, the Byzantine emperor, Frederick I Barbarossa, the Holy Roman emperor, and several

other European leaders received letters from the legendary Christian king, Prester John, who claimed dominion over a vast territory, containing at least 70 kingdoms. He claimed guardianship over the shrine of St. Thomas, and described the riches and wonders of his kingdom. He claimed that he would bring his armies to battle the enemies of the cross of Christ, and regain the Holy Sepulcher. This never occurred, although some scholars claim that other historical figures did attempt the task.

Today, few believe that Prester John actually existed, but the letters "he" sent are real. This one dates from the 12th Century, and appears to be the letter sent to Frederick I.

Prester John's letter consists of five vellum pages, slightly stained from age and handling. The contents are written in a bold, slightly faded script.

GM Information

The letter contains a mystical code that allows individuals to find John's kingdom. Many of those who sought the kingdom passed right through it without ever realizing it. John's kingdom exists in Asia, but it is slightly out of phase with the real world, or "between the lines." It can be entered only at a certain location in India.

The letter is written in Latin (DC 15) and contains a code of sorts, embedded in the text. If studied intently, roll an Intelligence check against DC 30. If successful, the character is able to see "between the lines," and learn the true path to the kingdom of Prester John. Once he initially deciphers the letter, he must re-read it every day and succeed in an Intelligence check against DC 20 to continue following the trail. If he fails the roll, he may attempt to decipher it again that day, but each failure that day costs him 1d4 Sanity as his mind opens in alien ways. Each time he deciphers the letter, he retains the knowledge it provides for six hours. Weight: Negligible; Study Time: 3d4 weeks (DC 30).

Adventure Ideas

- The PCs are hired on behalf of an unknown benefactor to find the kingdom of Prester John. Unknown to them, if they succeed, their benefactor has plans to strip the kingdom of all riches and power using a private army.
- While in India, one of the PCs begins to have visions of people and of buildings, medieval in appearance, in his peripheral vision. He, and others, may believe that he is becoming delusional, but in fact, he is slowly seeing through the veil that separates the kingdom of Prester John from the real world. Research turns up the letter, which may be used to enter the kingdom and cure the character's visions.

Humans In Fish Suits?

Cetaceans In *GURPS Blue Planet*

by C.J. Beiting

GURPS Blue Planet does an admirable job of converting the complex *Blue Planet* universe to *GURPS*, but since its publication there have been several other ocean-based game supplements released that can enhance a *GURPS Blue Planet* game. The most notable of these is *Ancient Echoes*, the *Blue Planet* cetacean sourcebook, which presents much more detail about cetaceans and introduces three new cetacean races. Since cetaceans are so different from humans, this article will present a number of suggestions for roleplaying them, in the light of *Ancient Echoes*. While this information is largely specific to the *Blue Planet* universe, players of *GURPS Uplift* or *Under Pressure* may find some things that will be helpful.

Note that, like *GURPS Blue Planet* itself, an article like this can only scratch the surface of a complicated subject. In particular, it is meant to provide rules without too much background. The reader who desires more detail is urged to get a copy of *Ancient Echoes* for more information.

Roleplaying Cetaceans

Cetaceans are more than merely "humans in fish suits." While *GURPS Blue Planet* does a good job of presenting the difference between human and cetacean on p. BP11-12, some critical differences should be stressed:

Mind

Although they can think, uplifted cetaceans do not think like humans. They are still on some level predators, and are often more emotional and extreme in their reactions than humans are, as well as quicker to violence. However, they also calm down much sooner than humans do, too, and forgive and forget much more quickly.

Cetaceans are adapted to the three-dimensional world, and think in 3-D terms in a way that humans still do not, even after several centuries of flight; this makes cetaceans tactically deadly in underwater combat. The need for a cetacean to be able to sleep, yet rise to the surface to breathe, has resulted in a brain where each hemisphere can operate independently. Thus, cetaceans can compartmentalize their minds, and many can literally do two things at once. Cetaceans are much more aware of their surroundings than humans, and are difficult to surprise. Finally, cetaceans possess a holistic view of the universe, which does not draw sharp distinctions between things. This can be very helpful (a cetacean can often make intuitive leaps of insight that baffle humans), or very dangerous (a cetacean will often perceive an attack on one of his tools as an attack on him personally). Even settled cetaceans are still in some sense nomads, and do not like to own more things than they can comfortably move; few own more than a CICACA powersled and a hoverdrone sensor remote. Most also utterly reject cyberware, and find biomods only slightly less unpalatable. Cetaceans are thus not materialistic, and do not understand the human desire to acquire property and objects.

Senses

Cetaceans use different senses than do humans. Sight is not as important to them, and they are blue-green colorblind anyway. They have no sense of smell, and a feeble sense of taste. What matters to a cetacean is sound, and game masters should stress this. Even the darkest waters are alive with sounds that give a cetacean his picture of the universe. Furthermore, cetaceans have a special sense that humans do not: echolocation. Even in the darkest waters, cetaceans can "hear/see," although this vision can be blocked by other loud sounds, clouds of bubbles, and so on. Cetaceans can see thorough solid objects, if those objects are soft enough (e.g., any cetacean can spot the metal of a

gun hidden beneath clothes, or the presence of a baby in a pregnant woman, etc.). Echolocation can even sometimes give a cetacean clues as to the emotional state of its target.

Social Groups

Humans are social from choice; cetaceans must be social for their mental health. The basic cetacean social unit is the pod of from two to 50 individuals, averaging 10 or less (just the right size for a group of roleplayers!). A pod is often as important to cetacean as a family is to a human. Cetaceans can form and dissolve pods for a variety of reasons -- families, workgroups, criminal gangs -- but when formed, a pod is very important to a cetacean's psyche. A lone cetacean is either a misfit or an outlaw.

Cetacean religion is also very different from that of humans. The "Church of Whalesong Theogony" does not revere a particular divinity, nor does it set moral codes or standards for its members. The "Whalesong" is the cetacean racial epic, and "worship" services consist in reciting it and adding to it. The Church has officers, not clergy, and is not sophisticated enough in its beliefs to have a true theology. In some areas, the Church functions more as a cetacean social hall and mutual-assistance society than anything a human might recognize as a religion.

Some of these ideas can be modeled in **GURPS** using the following traits:

Advantages

Ally Group (Pod)

see p. B232

Virtually all cetaceans will have some version of this advantage, varying only by the size of the pod and how frequently the cetacean interacts with them. Note that there are significant disadvantages that go along with this, see below.

Clerical Investment/Religious Rank

see p. CI22

Clerical Investment in the Church of Whalesong Theogony is actually closer to the Religious Rank advantage in practice. Offices in the Church are ranked according to the following scheme:

- *Rank 3*: Church Leader ("silent/provider")
- *Rank 2*: Recorder ("choose/remember"), Counselor
- *Rank 1*: Songmaster ("vision/singer")

Catsleep (new)

5 points

You can fall asleep easily when you want to, but your brain sleeps one hemisphere at a time or otherwise maintains a degree of alertness. You can make sense rolls to detect dangers other sleepers would miss (though at -2 compared with being awake), and don't suffer mental stun upon awakening. You can even choose one continuous activity that requires no significant power or concentration while sleeping, as when seals and dolphins surface periodically to breathe.

Catsleep combines some features of both Deep Sleeper and Light Sleeper; you may be jarred out off sleep more than usual, but without as much overreaction as Light Sleeper.

Combat Reflexes

see p. B20

Although few cetaceans are soldiers, they are all predators. Their quick responses and inability to be surprised can be well simulated by the Combat Reflexes advantage. Many cetaceans who do not have this advantage on their racial template often possess this advantage, even if they have never seen combat.

Compartmentalized Mind

see p. CI52

Because of the independent nature of the hemispheres of the cetacean brain, many cetaceans have one level of the Compartmentalized Mind advantage, worth 50 points. These cetaceans can quite literally do two things at once, such as composing poetry while attending a business meeting. Note that these can be two mental things only: a cetacean can only do one physical thing at once, or one thing involving echolocation at once.

Eidetic Memory

see p. THS215

An odd feature of the cetacean mind is that it has an extended short-term memory. Most cetaceans can remember events that happened to them within the past 60 hours with photographic clarity. After 60 hours, the memories are "archived," and are as reliable or unreliable as those of a human. Such limited Eidetic Memory costs 15 points, and provides no skill bonuses.

Empathy

see p. B20

The use of cetacean echolocation can reveal much about its target's emotional state. Cetaceans can often have the Empathy advantage with regard to other cetaceans, and with the GM's permission can also have it with humans.

Intuition

see p. B20

The holistic nature of the cetacean mind allows them to make leaps of logic that baffle humans, but that are frequently right. Intuition is a very common cetacean advantage even for the cetaceans whose template does not include it.

Neural Jack

see p. BP20

Although cetaceans loathe implants as a rule, one of the few they will tolerate is an interface jack. Cetaceans who prefer precision operation of machinery will have a neural jack rather than using sonic trodes. Note that after Recontact, the Hydrospace corporation initiated a special good-will program in 2176 that gave free neural jacks to any native-born cetacean who requested them. Cetacean characters on Poseidon of an appropriate age can be assumed to have a neural jack regardless of wealth level or situation.

Disadvantages

Attractiveness (varies)

see p. B29

Cetaceans do not go in for jewelry as do humans, but they are fond of a ritual scarring that leaves raised marks on their bodies (usually on their dorsal fins) that can be perceived by echolocation. These scars can reflect pod membership, Incorporate citizenship, military unit allegiance, and so on. Some cetaceans also add scars to make them look "tough"; extreme cases of this can result in decreased levels of Appearance. Garish, tasteless body paint is a new fad in some cetacean circles; Attractiveness modifiers for it are up to the GM.

Bad Temper

see p. B31

Although cetaceans don't necessarily have terrible tempers, they are usually more emotional than humans, and sometimes react to events in ways humans would consider extreme. This can be simulated in many cases by the Bad Temper disadvantage. On the plus side, the extreme emotional reaction rarely lasts long, and is usually forgotten and forgiven quickly. By cetaceans, anyway; humans are another matter.

Compulsive Behavior

see p. B32, U21

Dolphins (both commons and bottlenoses) love humor and practical jokes in a way that can range from the Playful (-1) quirk all the way through Compulsive Play (-5/-10) disadvantage. Also, since Cetacean lends itself well to puns, some have the Punning skill (p. CI130), and a few take the habit all the way to Odious Personal Habit levels. Most dolphins will look with favor on anyone who can make good puns. Belugas and pilots share these traits to much lesser degrees, and while orcas don't actually have No Sense of Humor, it seems like it sometimesâ€

Duty (Involuntary)

see p. B228

It costs roughly \$15,000 to ship a bottlenose or common dolphin to Poseidon, or \$20,000 to ship an orca, pilot whale, or beluga. Cetaceans that cannot afford this price often indenture themselves to a company or Incorporate to afford passage. Many newcomer cetaceans on Poseidon have an involuntary Duty to represent their indenture. Since it is easy for a cetacean to "swim away" from their indenture, indenture-holders have increasingly resorted to some very severe measures to enforce this Duty.

Duty (Podmates)

see p. B39

Any pod expects certain duties from its members. Sometimes, these duties can be unexpected, inconvenient, annoying, or dangerous. This can come as a bit of a surprise to the rare humans that have been invited to join cetacean pods.

Greed

see p. B33

This disadvantage is extraordinarily rare amongst cetaceans. Most cetaceans consider it a form of mental illness.

Impulsiveness

see p. B33

The flip side of cetacean Intuition is Impulsiveness. Cetaceans often make up their minds instantly, without much conscious thought, and then rush out to *do* something. Often that something is inappropriate, wrong, or dangerous.

Obsession (Racial Survival)

see p. CI93

Many cetaceans have a fear that they will become join the great whales of earth in extinction, and have a corresponding Obsession with racial survival worth 5 points. Such a fear is irrational by the 22nd century, but nonetheless very real to many cetaceans. Many cetacean behaviors -- dolphin hypersexuality, cetacean longevity treatments, and the large number of cetacean-based charities (such as sponsoring migration of poor cetaceans to Poseidon) -- frequently can stem from this fear.

Odious Racial Habit (Kill offspring)

see p. B26

While cetaceans seem more enlightened than humans, they do preserve one practice humans consider barbaric: They examine all newborns for fitness, and drown the ones who do not measure up. Cetaceans insist that this practice, which long predates genlift, is an essential part of their culture, and have formally enshrined it in the law of the Cetacean Cultural State. While some humans accept this, others do not, and any new mother cetacean who loses her calf for any reason may have problems with some human neighbors. This reputation is worth 5 points.

Sense of Duty (other Cetaceans)

see p. B39

Many cetaceans have this disadvantage, which is worth 110 points. This represents the deeply-held cetacean belief in reciprocal altruism. The expectation of reciprocal altruism from humans who have no idea or intention of displaying it in turn is a perennial source of human-cetacean friction.

Sense of Duty (Podmates)

see p. B29

While most pods exact legitimate Duties from their members, most members feel the need for duty as well. Duty (Podmates) and Sense of Duty (Podmates) very often go hand in hand with many cetaceans.

Social Stigma (Outlaw/Outsider)

see p. B27

Since cetaceans are so intensely social, one the greatest punishments meted out to an errant podmember is ostracism. Any cetacean who chooses to be alone voluntarily is a misfit. Thus, any lone cetacean will automatically be presumed to be an Outlaw by other cetaceans unless he has Contacts to vouch for him. Otherwise, there is a 15 point disadvantage.

Skills

Economics (Dolphinonomics)

see p. B60

Cetacean economists point to the success of the Hydrosan corporation, and maintain that the differences in the cetacean psyche have resulted in a working alternative to traditional human economic theories. Human academics are still unconvinced. Gamemasters who believe the claims can make "Dolphinonomics" a specialization of the Economics skill in *GURPS Blue Planet*.

Languages

see p. B54

There are three languages of importance to cetaceans:

Cetacean (M/A): The default language for cetaceans. All cetaceans except belugas know it automatically. It is a dense language based on a heavy compositing of concepts and images. As such it is very good for poetry, and can convey information in about at tenth of the time as any human language, but it can be somewhat imprecise and confusing with regard to exact meaning. Cetacean also lends itself to racial and geographic accents more readily than human languages do, making it easier to identify a speaker.

It is impossible for humans to learn Cetacean naturally, as many of its sounds are beyond the human threshold of

hearing.

Interspec (M/E): Interspecies Language, or "Interspec," is a modified gesture-and-sound language invented so that humans and cetaceans can communicate with each other. All cetaceans know it, and it is the second most common language on Poseidon (after English). Virtually all Natives on Poseidon know it, though few Newcomers do.

Note that Interspec is an artificial gesture-based pidgin language, and should be (M/E) rather than (M/A), as detailed on p. BP22.

Beluga (M/A): Because they were genlifted in isolation, belugas have their own language which is distinct from Cetacean. They are quite pleased by this achievement, and maintain their linguistic skills proudly. Nevertheless, most belugas also have to learn Cetacean to communicate with their peers.

Finally, there are special notes with regard to human languages. First, although cetaceans cannot actually speak human languages, since they lack vocal cords, they can understand human languages just fine. Many cetaceans who do not wish to be bothered with translation software become fluent in a human language or two. Conversations are a little one-sided, though: the human speaks to the cetacean in his native language, and the cetacean responds in Interspec.

Note also that although cetaceans are officially Mute, many can use their sonar and blowholes to mimic a number of human sounds. For a cetacean, this is much like a human learning ventriloquism, though slightly easier. Thus, even without a translator, a skilled cetacean can manage to mimic about a hundred human words, although with a pronounced accent. The cost of being able to do this can be assumed to fall under the mitigated version of Mute in the existing cetacean templates.

Medical Skills

see p. B57

In the Blue Planet universe, medical skills should be specialized by general species. Thus there is a Physician (Human) and Physician (Cetacean) skill, and so on. Medical treatment of cetaceans is difficult, and drugs and medical procedures are roughly three times the cost of similar treatments for humans. On the plus side, cetacean echolocation can act as a cheap, portable alternative to x-rays for some injuries, and there are a number of cetacean EMT's on Poseidon.

Religious Skills

Certain skills are appropriate for members of the Church of Whalesong Theogony.

Bard

see p. B47

Here is a case where the worst-named skill in the **GURPS** system is entirely appropriate as (mis)named. Any leader, or prominent worshipper, in the Church will have this skill.

Bardic Lore

see p. CI147

Any leader or prominent worshipper in the Church will also have this skill, representing the corpus of the Whalesong that they have memorized. This is an important skill, as the Whalesong is an evolving creation under continual update and addition.

Rituals and Ceremonies

see p. CI147

Although cetaceans are fully sapient, their worship patterns are decidedly primitive. It is much more appropriate to give a cetacean religions leader this skill, rather than Performance/Ritual. Furthermore, Cetaceans do not subject the Whalesong to the degree of scrutiny that humans apply to their own religions; thus, the Theology skill is inappropriate. Rituals and Ceremonies should replace Performance/Ritual on the Whalesong Mystic template on p. BP28.

Singing

see p. B57

Ordinary members of the Church contribute to worship services through song, and are generally much more skilled at this art than human laypeople are in their own religious services.

Sports (Hydroshot)

see p. B49

As one might expect, Cetaceans are naturally good at Poseidon's official sport, and have their own league. However, given the usually cooperative nature of the Cetacean psyche, the competition between the Cetacean teams just isn't as fierce as that among the human teams, and as a result Cetacean Hydroshot is usually looked on as something merely for connoisseurs (or other Cetaceans).

Features, Quirks, And Taboo Traits

Absolute Direction

Cetaceans possess a very limited version of this advantage, worth 0 points. They can roughly orient themselves to magnetic north, but little more.

Doesn't Dream

Because of the partial nature of cetacean sleep, cetaceans do not dream. At all. In fact, they find the idea of dreaming bizarre and disturbing, and do not like to hear humans talk about it. The "Lucid Dreaming" skill should be removed from the Whalesong Mystic template (p. BP28). "Doesn't Dream" is a 0-point Feature for any cetacean template.

Poor Color Vision

While cetaceans are not completely color blind, they cannot see colors at the blue-green end of the spectrum. If they must color anything themselves (chiefly their remotes), it is usually in bright, clashing color schemes that humans find garish and tasteless.

New Cetacean Racial Templates

GURPS Transhuman Space: Under Pressure proposes a basic cetacean template. What follows is a customized version of that template with some special additions and errata appropriate for the Blue Planet universe:

Blue Planet Cetacean Template

72 points

Racial Advantages: 3D Spatial Sense [10]; Acute Hearing +4 [8]; Alertness +4 [20]; Animal Empathy [5]; Blunt Teeth [0]; Catsleep [5]; Eidetic Memory [15]; Enhanced Move 1 (Swimming) [10]; Extra Hit Points +2 [10]; Independently Focusable Eyes [15]; Injury Tolerance (No Neck) [5]; Nictating Membrane 1 [10]; Oxygen Storage 2 [14]; Peripheral Vision [15]; Pressure Support 1 [10]; Sonar Vision (nearsighted, -25%; underwater only, -30%) [12]; Striker (Ram) [5]; Temperature Tolerance 1 [1]; Ultrasonic Speech [25].

Racial Disadvantages: Aquatic [-40]; Chummy [-5]; Horizontal [-10]; Inconvenient Size [-10]; Increased Life Support 1 [-10]; No Manipulators (Mitigated for CICADAS, -60%) [-20]; No Sense of Smell [-2]; Poor Sense of Taste [-1]; Short Lifespan 2 [-20]; Social Stigma (Second-class citizen) [-5].

Quirks, Features, and Taboo Traits: Absolute Direction [0]; Doesn't Dream [0]; Poor Color Vision [0].

Ancient Echoes also adds templates for three new cetacean races who were not part of the original settlement of Poseidon, but who have increasingly begun migrating there since Recontact.

Pilot Whales

228 points

Genlifted pilot whales average 15' long and weigh 1370 lbs. They eat 100 lbs./day, mostly fish.

To the basic cetacean template add: +30 ST (No natural manipulators, -40%) [105]; +2 DX [20]; -3 IQ [-20]; +5 HT [60]; Strong Will +2 [8]; Broad Minded [-1]; Dull [-1]; Humble [1]; Pacifism (Self Defense Only) [-15]; Staid [-1]; Raise Oxygen Storage to 3 [2]; raise Extra Hit Points to +4 [10]; raise Increased Life Support to 2 [-10]; add the Feature Nocturnal (when possible) [0].

Pilot whales were uplifted at the same time as orcas and dolphins, but their numbers were so small that none were not allowed to migrate to Poseidon. They are only slightly smaller than orcas, and are unusual in that they were originally nocturnal. Pilots keep diurnal hours at present, but if left to their own prefer to switch back to a nocturnal existence. They are also unusually pacifistic for predators, and are the most peaceable of genlifted cetaceans.

Unfortunately, pilots are the least intelligent of genlifted cetaceans. They also tend to give up quickly when forced to solve problems beyond their abilities. Although they are predators, they refuse to attack other sapient beings in any measure other than self-defense, and are unusually pacifistic in their interpersonal relationships as well. Their lower intelligence combined with their lack of aggression means that pilots are natural followers; they work exceedingly well in groups, and make excellent corporate employees, military support staff, technicians, liaisons, and so on. Pilots are often the glue that holds a group together, and the quiet peacemakers that defuse dangerous situations.

Note that the cleverer pilots are quite adept at using the "big, dumb follower" stereotype to their advantage.

Common Dolphins

138 points

Common dolphins (or "commons") average 8' long and weigh 270 lbs. They eat 20 lbs./day, mostly fish.

To the basic template add: +5 ST (No natural manipulators, -40%) [36]; +3 DX [30]; -2 IQ [-15]; +1 HT [10]; Combat Reflexes [15]; Intuition [15]; Unattractive [-5]; Dreamer [-1]; Lecherousness [-15]; Responsive [-1]; reduce Oxygen Storage to 1 [-2] and Short Lifespan to 1 [-10]; remove Increased Life Support [10] and Extra Hit Points +2 [-10]; add Quirk: Sexually attracted to humans as well as dolphins [-1] and the skills Acrobatics (P/H) DX [4]; Meteorology (M/A) IQ [2]; and Navigation (M/H) IQ [4].

Common dolphins were the last cetacean species to be genlifted, during, but largely after the Blight, and developed in the shadow of their more developed and popular bottlenose cousins. Commons are smaller, with sharper "noses," but are otherwise much like bottlenoses in shape and demeanor. They tend to be more social and less serious than bottlenoses; they are the natural jokers of the cetacean world. Their natural insouciance covers very sharp intellects and keen perceptions, however, a fact which other cetaceans and humans often overlook.

Commons excel at professions where their gregariousness and innovation come to the fore. They make poor leaders and managers, but good pioneers, spies, scouts, researchers, and prospectors. Some have, unfortunately, become involved in crime.

Genlifted belugas average 15' long and weigh 2750 lbs. In cold climates they eat 50 lbs./ day, mostly squid, but in warm climates they only need to eat 30 lbs./day.

To the basic template, add +15 ST (No natural manipulators, -40%) [90]; +3 DX [30]; -1 IQ [-10]; +2 HT [20]; Double Jointed [5]; Intuition [15]; Mimicry [15]; Dreamer [-1]; Impulsiveness [-10]; Overweight [-5]; Responsive [-1]; raise Extra Hit Points to +3 [5]; reduce Short Lifespan to 1 [10]; remove Enhanced Move [10]; add Features No dorsal fin [0] and Molt [0]; add +1 bonus to Artistic skills [6].

Belugas are amongst the most unusual of the cetacean genlifts. They are descended from arctic whales and have physical features that reflect such a background (copious subdermal blubber, no dorsal fin, white coloring, etc.). Their temperature tolerance range runs from 28° to 70°. Genlifted belugas still prefer colder waters, and those living in equatorial waters must go on a diet to lose the blubber that can cause them to overheat in warm water (i.e., buy off Overweight, and add one more level of Temperature Tolerance for 4 points). Evolution in a cold climate has made even genlifted belugas restless; the need to move in order to stay warm and to hunt is reflected in their racial Impulsiveness. While not as acrobatic as the other cetaceans, belugas are extraordinarily flexible. Finally, belugas are unusual in that they molt annually, shedding their rotten, discolored, smelly hide to reveal fresh white skin beneath. While this is listed as a Feature on the template, during molting season it can be an Odious Racial Habit (-5) to humans and even other cetaceans.

Belugan particularism is cultural as well as physical. Belugas were uplifted secretly during the early years of the Blight, and developed in isolation for a quarter century. Thus, they have their own language and traditions separate from those of other cetaceans. Belugas are natural communicators, and are perceived by other cetaceans as having what a human would term an "artsy" temperament: creative, introspective, erudite, and a bit unstable. Belugas excel at professions which require communication: teaching, leadership, reporting, writing, researching, and singing. They are also good at investigative careers, like research and prospecting. Some have become quite effective con-artists.

Sea Lions

-17 points

Genlifted sea lions average 7' long and 550 lbs. in weight for males, 6' long and 160 lbs. for females. Their bodies lack manipulatory organs, but despite long contact with human civilization they are not quite sophisticated enough to use CICADA units.

Attribute Modifiers: ST +3 (No Fine Manipulators, -40%) [18]; DX +2 [20]; IQ -3 [-20]; HT +4 [45].

Advantages: 3D Spatial Sense [10]; Acute Hearing +1 [2]; Acute Taste and Smell +3 [6]; Alertness +1 [5]; Amphibious [10]; Catsleep [5]; Combat Reflexes [15]; Early Maturation [5]; Enhanced Move (Swimming) [10]; Faz Sense (Underwater only, -30%) [7]; Fur [4]; Oxygen Storage [14]; Pressure Support [5]; Sharp Teeth [5].

Disadvantages: Chummy [-5]; Color Blindness [-10]; Distractible [-1]; Dull [-1]; Horizontal [-10]; Inconvenient Size [-10]; Increased Life Support [-10]; Innumerate [-5]; Mute [-25]; No Fine Manipulators [-30]; Poverty (Dead Broke) [-25]; Reduced Move (Running) 3 [-15]; Short Arms [-10]; Short Lifespan 2 [-20]; Social Stigma (Valuable Property) [-10].

Skill: Survival (Open Ocean, specialized) IQ/IQ+6 [4].

[Genlifted sea lions were present in the first edition of Blue Planet, though were not repeated in the second edition. Officially, they are not canon, but are presented here as an optional NPC race.]

Sea lions have proven to be the most successful non-Cetacean genlift. "Successful" is, however, a relative term: sea lions are not fully sapient, and have a very basic intelligence that allows them to understand about 350 to 400 words in

Interpsec. They also have limited attention spans, and as such cannot engage in complex tasks. They are mostly used as underwater guides, security patrols, and aquatic farm hands. They do have one small advantage over cetaceans in that they are as comfortable out of the water as in it.

Fifty enhanced sea lions were sent on the original Athena Project, and their descendants have thrived on Poseidon ever since. Although their numbers remain small compared to cetaceans, they are a valued part of Native society, filling a role somewhat like the one that dogs do on Earth. The cetacean Hydroshot league has a couple of sea lion teams, which are even less professional in their conduct and gameplay than cetaceans are.

Kansas jogged up the spiral staircase to the Promenade Deck, dodging a few inebriated partygoers who had yet to make their way to bed. He didn't like skipping his traditional early morning run but a little time in the gym had been an acceptable substitute. It wasn't like anyone else had been using it at 4:30 am. At least not in a manner for which it had been intended.

He reached the Promenade Deck and nodded to the security guard near the outside door.

"Mornin', Jim," he said.

"Good morning, sir."

"All quiet?"

"Yessir. One of the ambassador's bodyguards got a bit rough with Michaels around three but we took care of it."

"Which one was it?"

Jim twitched a smirk, "The one you said to watch, as usual."

"Meh. There's still plenty that sneak by. 'Specially with a crowd like this."

"We're keeping our eyes peeled, sir."

"I know you are, Jim, I know you are. She outside?"

"Yessir."

"Kay. Keep up the good work."

"Will do, sir."

A cool ocean breeze greeted Kansas as he stepped out onto the promenade. The sun, barely peeking up over the horizon, revealed an impeccably dressed older woman at the railing.

"Mornin', ma'am," he said with a smile and a touch of his cap.

Agatha Kirko turned toward her security specialist and eyed his well-worn exercise outfit with mock horror. "Kansas, Kansas, Kansas . . . Do you realize you are quite likely the only individual I know who looks comfortable speaking to me clad in that?"

"Ah, well, not all of us have your fashion sense, ma'am."

*"Indeed." Her gaze slipped back out to the water. "So tell me, what **do** you have?"*

"Thus far very little of note. Your guests seem largely well behaved, with the exception of a minor altercation early this morning. I'll have the full run-down after my briefing at oh-six-hundred. The crew, though . . ."

"Concerns?"

"With a couple. Hard to say why, but I've got people watching them just in case."

"I'll have HR fax us their files."

"Thanks, but I already put in request last night. Should have them when the office opens."

"Good. Anything else?"

"Not really, except I did manage to surprise your nephew and Lady Anatolia in the gym this morning."

"Oh, for the love of . . . I swear, that boy could find a -"

"Shh." Kansas stared out into the sky, squinting. For a second he could have sworn he heard . . . There it was. He yanked open the door to the hallway.

"Jim! We've got a chopper on the starboard side coming in from the sun."

The guard spoke quickly into his radio. A pause. "No answer from the bridge, sir."

And then, from the Sun Deck, came the sound of gunfire.

Welcome Aboard . . .

With so many companies in the cruise industry going bankrupt at the turn of the millennium, it was no surprise that multi-millionaire Agatha Kirko was able to "cheaply" acquire the vessel she had always wanted. The Dermochelys is 217 feet long, 39 feet wide, and was originally designed to sail with 132 passengers. Never one to accept something as is, Kirko had the ship heavily modified. In addition to many other changes it now sports

Agatha Kirko

ST: 8 (*Mediocre*)

DX: 7 (*Poor*)

IQ: 14 (*Great*)

HT: 7 (*Poor*)

Speed: 3.75; **Move:** 3

Dodge: 6

Description:

Early 60s; 4'10", 98 lbs; bright orange hair (dyed) in

new meeting rooms, a ballroom, and a four-room, two-story suite for Kirko herself. It still has space, however, for 116 passengers and 34 crew/staff.

The Dermochelys itself is in prime condition, wearing a decorative theme of beautiful wood finishes, ornate marble, and polished brass. From the suites to the dining room to the ballroom, this ship was remodeled to cater to individuals who appreciate the finer things in life. This includes making certain they are safe at sea. Consequently, several advanced systems -- for navigation, control, and other needs -- were installed. Kirko's vessel boasts impressive technology not only on its bridge but in the engine room as well. A pair of powerful diesel propulsion engines provides the ship with a maximum speed of 10 knots and a cruising speed of 8 knots, and the ship's maneuverability is increased thanks to a bowthruster.

The purpose of the Dermochelys is not solely to act as one of Kirko's multiple homes. Rather than have it sit idle, Kirko continues to run it as a cruise ship most of the time. Approximately 30 weeks out of the year it is available to any interested tourists. The itineraries vary but generally involve the east coasts of the United States, Canada, and Mexico, as well as the Caribbean. Each trip lasts seven to twelve days and begins in the U.S. Another 15 weeks or so are used up by group cruises, where the only passengers onboard are those from a company or some other large organization. It is also available for private individuals if they have the money for it. The remainder of the time Kirko either uses the Dermochelys as her personal get-away or donates the use of the ship to various charities and organizations to be used for fund-raising parties and short tours.

With respect to gaming, the Dermochelys works well as a setting on multiple levels. First, as a cruise ship it can legitimately remove a group of characters from easily accessed reinforcements. Through judicious use of jamming equipment, sabotage, or good old-fashioned battle damage, the GM can at least temporarily cut the cruising PCs off from the rest of the world. Second, it can serve as a way to get from one adventure location to the next, with as much -- or as little -- excitement as the GM wishes. Third, Madam Kirko's high-profile parties offer an excellent scenario for individuals to meet each other for the first time. Social characters could be present as guests, entertainers, or service staff. More physical types would be needed for security, be it general security for the party or specific bodyguards brought by attendees. The particularly exotic -- such as known super heroes -- might be called in as guests of honor. As for those who take pride in their stealth, they can arrive for their own reasons. Surely there will be enough expensive targets for any thief worth his salt, as well as plenty of plots afoot that might benefit from

a bun; walks slowly & with a cane.

the presence of an uninvited visitor. Anyone with special talents who has worked for Madam Kirko in the past could also be involved, either as a guest or "undercover" in a crew or staff position.

Dramatis Personae

Agatha Kirko, Owner

"I don't mean to interrupt, but my time is worth a great deal of money. I trust you will soon be making a very lucrative point?"

Agatha Kirko, a.k.a. Madam Kirko, is a woman of grand gestures. Between the respectable family fortune she started with and the hundreds of millions she has added to it using her stunning intellect and extraordinary business acumen, Kirko has the resources to be incredibly generous to those who exceed her high expectations . . . and brutally ruthless to those who fail.

People who make it their business to watch Madam Kirko, and there are several who do, have noticed that she has rather uncharacteristically been granting second chances over the past months. Most of these have been provided to relatives that disappointed her previously, leaving experts to suspect some serious intra-family politics have been in the works. The truth is that Madam Kirko has been recently diagnosed with a rare cancer that has already weakened her considerably and will likely kill her within a year. She is keeping this information secret for now, knowing full well the influence it will have on the plotting and maneuvering that constantly surrounds her. That said, she has also decided to test various family members by giving them new opportunities to demonstrate their worthiness as beneficiaries in her will.

Experimental chemotherapy does exist for this type of cancer, and Madam Kirko could certainly afford it, but she fears that a) it will not work, and b) it will leave her a shadow of her current self. Already distrustful of doctors due to a series of unpleasant experiences involving the deaths of her husband and only son, Kirko plans to ignore the medical options (expect for pain medication) and to live out the remainder of her life as normally as possible. During this period her priorities will be to prepare an heir to take her place, to enjoy the presence of her family, and to help out each of her favorite charities and organizations one last time.

Bo Kirko, Pastry Chef

"Ze food, she is ze language of love."

Bo Kirko likes to think of himself as a dangerously sexy French Antonio Banderas, and although he is neither French nor Antonio Banderas, he is a good dancer, a great cook, and to quote a number of his female associates, "a bit odd but a fine piece of eye-candy." Truly, Bo has always loved the ladies. It's a trait that got him into no small amount of trouble when he was younger, and after one particularly memorable night following a very high-class party thrown by his aunt, Agatha Kirko, he found himself being sent to a private institute for boys. In France. Aunt Agatha, he discovered, had extreme ways of making her displeasure known.

Bo returned to the United States two years later and eventually ended up in culinary school. His previously unexplored talents with food preparation

blossomed. Madam Kirko has since offered him the job of pastry chef aboard the Dermochelys. Implied in this proposition was that he could find himself in her good graces once more, should he manage to avoid disappointing her a second time.

Taking the job was probably a mistake. While most of the time Bo is too busy and too "behind the scenes" to meet someone, he has already managed to have several brief relationships in the few months he has been aboard. Only one of them has ended exceptionally badly thus far, but he is fairly certain word didn't get back to his aunt. At least, she hasn't mentioned it yet if it did, but it's really only a matter of time before she hears about something that does not meet with her approval.

Margaret "Kansas" Spearman, Security

"I know you city folk are big on formality, but I'd be mighty grateful if you just called me Kansas."

Margaret was the Spearman's sixth child; the one that Mrs. Spearman was sure would -- at long last -- be a girl. Unfortunately, she was wrong. When she died while giving birth her husband, in an attempt to follow her wishes, gave their new son the name she had chosen months before.

Sixteen years later Margaret joined the US Marine Corps. He did this for three reasons. First, he refused to become a farmer like his father. Second, he felt the need to prove himself as a man. Third, the Korean War was in full swing and as far as Margaret was concerned signing up with one of the armed forces was the only proper path for a young man to take . . . even if he did have to sneak out of the house one night with his few belongings in a sack, hitch a ride to the nearest big city, and lie about his age to get in. He was almost immediately tagged with the nickname "Kansas" in honor of his accent and his farm-boy physique.

To this day Margaret is certain he did the right thing. After the war was over he left the Marines to pursue a career in security, eventually developing a company dedicated to exactly that purpose. He officially retired from that job almost six years ago, leaving the business to his younger partners. Unofficially, however, there are still a few individuals, organizations, and small companies that prefer to contract with him personally from time to time.

People who meet Margaret generally find him to be quite congenial, if soft spoken. He is very fit and keeps himself that way by lifting weights and running several miles early every morning. Margaret always introduces himself as Kansas Spearman, though he will not go out of his way to explain the origin of his nickname or even that it is a nickname at all.

Madam Kirko has a long history with Margaret, hiring him whenever she feels the need for a stronger security presence. When in this position on board the Dermochelys Margaret works closely with the Second Officer, who in addition to many other duties acts as the ship's security officer. Margaret is one of the very few individuals on the Dermochelys with access to firearms. He does not, however, carry one as part of his normal routine.

Advantages:

Fearlessness +2

Disadvantages:

Honesty
Sense of Duty (U.S. Marines)

Skills:

Body Language -- 12

"Oh, no . . . not again!"

No matter how many times she blames her troubles on her supposed clumsiness, Ellda Wedder knows it isn't the truth. Things have gone wrong at the worst possible moment far too often in her life. Breaking her leg just before her last dance recital, having two flat tires on the way to her best friend's wedding, being the only one (out of 23) caught by police at an unauthorized skinny dipping party at the city pool . . . The list goes on and on, and those are just the major ones. She can't even begin to remember all of the little things -- the dropped china, the lost papers, the social gaffes -- that have constantly plagued her life.

Deep down, Ellda believes that she is cursed. She has no idea who might have done it, or why, or even how, but it is the only explanation that makes sense to her. Aware of how other people will likely react to such a belief, she keeps it to herself. This has not stopped her from taking advantage of assorted classes and clubs at her college in an attempt to learn more. By familiarizing herself with all manner of religions and occult ideas she hopes to find something that will break her curse. Her efforts thus far have had no effect.

Ellda signed up to work on the Dermochelys in hopes of learning more about the occult practices in the Caribbean while they toured the area. Unfortunately, her chances to leave the ship on such occasions have been next to non-existent. The money she is making will help pay for her next year of school, and she has acquired a couple trinkets thanks to passengers who are willing to do a little shopping for her, but this hasn't prevented her from becoming somewhat depressed about the whole situation.

Adventure Seeds

- Madam Kirko is throwing a three-day fund-raising cruise for a potential presidential candidate. Many big names will be there: political figures, movie stars, media darlings, and the very rich. Security will be at an all-time high, but will it be enough? At least one group believes it will not be. They intend to take the entire boat hostage and collect ransoms for as many people as they can. One or two of the crew/staff will be in on the plan. A couple of others managed to get included as entourage members of guests. The rest will drop onto the ship from a helicopter on the second day of the cruise (after the bridge has been secured). With the remainder of the vessel seized, the kidnappers will set a new course for an island in the Caribbean.
- It was supposed to be a three-hour tour. The real question now is: Who spent points on Survival (Island/Beach)?
- The Dermochelys has been rented for a cruise/convention by a group of seemingly unrelated individuals. As no non-members are to be allowed onboard, PCs will need to be included as normal staff/crew, as undercover investigators or observers for Madam Kirko or some other agency, or as accidental passengers -- perhaps the victims of a shipwreck who get picked up at sea. It should soon become apparent to those paying careful attention that the other passengers are not quite normal. They talk amongst themselves about things that happened centuries ago as if they had been there, tell tales about those who are gone, and sometimes mutter in very old languages. The truth is that none of the passengers is under 200 years old -- some are over 1000 -- but how this has come to pass varies from person to person. Careful investments have provided enough of them with plenty of money for a trip

Ellda Wedder

ST: 10 (Fair)

DX: 10 (Fair)

IQ: 12 (Good)

HT: 8 (Mediocre)

Speed: 4.5; Move: 4

Dodge: 7

Description:

Early 20s; 5'6", 140 lbs; average build; very pale

such as this, and it gives them the chance to relax their barriers a bit.

- Other variations include conventions of angels, wizards, creatures that can pass for human, or wealthy LARP gamers staying in character for the entire cruise.
- Despite accepting her imminent death, Kirko's resolve to let nature take its course is not as firm as she believes. If there is a cure that does not involve modern medicine, and it works, Kirko will be very grateful.
- Ellda's unluckiness has vanished. She doesn't know how it happened, but her luck has been perfectly normal for the last three days. What she will soon realize is that one of the trinkets collected for her by a passenger is something special. The item is a rough-worn bracelet of hand-carved wooden beads on bedraggled string. The largest bead is a sculpture of a turtle with odd markings etched into its back, though as far as Ellda can tell the markings have no specific significance. Unfortunately, the unluckiness is not gone; it is simply transferred. About every 50 hours -- provided Ellda is wearing the bracelet -- her bad luck is shifted to the person nearest to her.
 - Rumors will begin circulating that the Dermochelys is an ill-fated ship, which Madam Kirko may end up wanting investigated. It would be most unfortunate if one of her very important guests were to be cursed.
 - One of the PCs, on board for an entirely unrelated reason, is hit with 50 hours of bad luck.
- A death on board in the middle of a cruise has everyone on edge. The cause of death is not obvious, and without a physician on board a useful autopsy is unavailable. Was it murder? Is it a disease? Can anyone figure it out before more bodies start appearing?
- There has been no communication with the Dermochelys since a freak storm grew up around it nearly 24 hours ago. Madam Kirko sent a rescue team out as soon as the storm cleared, but all contact with them was lost shortly after the vessel was sighted. A second team is now being formed -- a team with more expertise and more firepower than the first . . .
 - When the second team helicopters in they find the Dermochelys adrift and unresponsive. There is no sign of the first team, and between the cluttered state of the deck and the ongoing choppy seas landing is not an option. As the team members rappel down to the ship there is a flash of light above them and the helicopter spins out of control. Only by releasing themselves and dropping can the drop team have a chance at survival. Those who make it to the Dermochelys find it devoid of life, but with no bodies and no signs of struggle. They will also discover that none of their electrical equipment works.
 - Possible explanations might include high-tech pirates, aliens, spirits, or mer-people.

Upgrading

The Dermochelys was designed for a low-fantasy TL8 setting, but it could easily be boosted to take advantage of higher levels of magic, technology, and weirdness. For example, strange energies emanating from secretly installed objects in the engine room or bridge could provide the ship with time or dimension hopping capability, the capacity to teleport, or force shielding that allows the entire vessel to safely sink beneath the waves for extended periods of time.

Maps

The Dermochelys

[*click for larger image*](#)

Dermochelys Deck Plans

[*click for larger image*](#)

- **Sun Deck:** About half of the Sun Deck is open space oft-decorated with deckchairs and beach towels, but it can double as a helicopter landing pad. The other half of the deck is devoted to the bridge and meeting rooms. Lifeboats/excursion craft on the aft section of this deck line both sides of the ship.
 1. **Bridge** -- There are at least three crew-members on the bridge at all times. It is the location of all of the ship's navigation systems, most of the communications equipment, and the weapons locker.
 2. **Staff Room** -- This small room provides the on-duty bridge crew with a nearby head and kitchenette.
 3. **Captain's Cabin** -- This small but comfortable cabin allows the captain to remain near the bridge when resting.
 4. **Meeting Rooms** -- Large tables and top-of-the-line audio-visual equipment dominate these rooms. They are primarily used for closed business meetings.
 5. **Reception Area** -- This area can serve either as a small observation lounge or as a place for subordinates to wait for individuals in the meeting rooms. An elevator is here, as is a spiral staircase leading down to the other decks.
- **Promenade Deck:** Of note on this deck is the promenade that encircles it, the observation and aft lounges, and the top portion of Madam Kirko's suite. All other rooms are passenger cabins, each beautifully furnished and featuring a private bathroom and a safe.
 1. **Observation Lounge** -- Cozy and surrounded by windows, this small lounge provides an excellent view.
 2. **Kirko's Suite (Upstairs)** -- The starboard room acts as Madam Kirko's onboard office and reception area.

The port room is her personal lounge, complete with mini-bar and entertainment center.

3. **Hallway** -- The hallway provides access to the elevator, the spiral staircase, and the promenade.
4. **Aft Lounge** -- Much larger than its forward counterpart, this lounge offers passengers a full bar and, when legal, a wide selection of gambling opportunities.
- **Ballroom Deck:** In addition to its namesake, this deck is the location of several passenger cabins and the bottom half of Kirko's suite.
 1. **Ballroom** -- This stunning ballroom extends to the outside to allow for dancing under the stars.
 2. **Kirko's Suite (Downstairs)** -- Both rooms are luxury bedrooms, with Kirko using the starboard one. The other is reserved for her personal guests.
 3. **Hallway** -- The hallway provides access to the elevator and the spiral staircase.
- **Main Deck:** Most passenger services, and several cabins, are located on this deck.
 1. **Salon/Gift Shop/Gym** -- The salon (port) and gift shop (starboard) are generally only available during normal cruises. The well-equipped gym, however, can be used at any time.
 2. **Library** -- This room contains an extensive collection of books, music, and movies. Playing cards and a variety of board games are also available.
 3. **Hallway** -- The hallway provides access to the elevator, the spiral staircase, and the exit hatches.
 4. **Dining Room** -- During normal cruises the dining room has self-serve buffets in place around-the-clock. During more stately functions these buffets are often removed to make room for more tables.
 5. **Galley** -- At least one chef is available at all hours.
 6. **Walk-in Refrigerator & Freezer** -- Both of these are kept very well stocked.
- **Below Deck:** This area is not intended for passengers. It contains storage areas, the ship's engines and mechanical systems, and the staff/crew cabins. These functional cabins fit two to three people each and many share a bathroom. The larger cabins (with private bathrooms) are reserved for higher ranking crewmembers.
 1. **Storage** -- Extra luggage and crew supplies are kept here.
 2. **Laundry** -- These facilities are not available to guests, although important passengers occasionally may be allowed to use them.
 3. **Control Room** -- The ship's systems can be controlled from this much quieter location, rather than requiring the crew to go into the engine room.
 4. **Engine & Utilities Room** -- This large area is the location of the engines, the water purification, heating, and air conditioning systems, and a small machine shop.
 5. **Storage** -- This large, well-organized hold contains everything from foodstuffs to engine parts.

Getting Educated

by Keith MacKenzie

In roleplaying games, we are told, there are no winners or losers. This is only correct in that the rules of the game do not define the victory conditions or indications of defeat. RPGs do, in fact, have winners and possibly some losers, but whether or not a player is a winner or loser is dependent upon that player's subjective victory conditions. Some victory values are more oriented toward the player himself. If a player had fun, it might be considered a victory. If everyone had fun, it's a major victory. If a player's creativity or language and social skills improved it is a win. Possible terms of victory for a player might include character values such as character level, skills, treasure, body count, collateral damage, sanity, reputation, political power or in some games, just surviving the adventure is a huge victory. Most of these just happen as a result of play and more depth is really not needed. In many games, body count and collateral damage lead to character levels, cash and reputation follow, then political power. Skills, on the other hand, are a more variable commodity, due to the many ways there are to learn. This article shows some alternate systems games can use to improve skills; the advice and observations are generic, with some specific information for *GURPS Third Edition*.

Learning by Doing

Learning by doing is the follow through of practice, practice, practice. Chaosium used this method exclusively for skill advancement. During an adventure, a player that successfully used a skill would make a note. At the end of the adventure (or session in some cases) the player would roll against the skill again. If the roll *failed*, something was learned from the experience. Having to fail it shows that a previously unknown aspect of the skill was discovered. The better a PC was at the skill, the harder it is to find something new. In other games, such as zzGURPS,xx a skill used in an adventure may be raised if the character points are available.

Advantages: Rewards characters for trying new things and actually represents improvement through experience.

Disadvantages: Players start doing useless things just to get the skill check for advancement.

Notes: Not all skills should be subject to learning by doing. A successful use of a knowledge skill such as history or literature is unlikely to teach anything new to the practitioner, and wild swings and blind firing will not develop skill regardless of the degree of success.

GURPS 3rd Edition optional rules: If a skill is used successfully in the adventure, in a way that contributes to the story, a note is made. At the end of the session a 3d6 roll is made against the skill, if this roll fails, ½ point may be put into the skill. This does not require the expenditure of unused character points.

Learning from a Master

The best way to learn to do something is to have a skilled professional teach you to do it. The student gains benefits from the good and bad experiences of the mentor. Learning in this manner takes many forms. Combat skills might be learned individually or in small groups. Physical and social sciences might be learned in a lecture or smaller classroom. Art and craft skills are best taught in more of a laboratory/workshop/studio environment, where practical application of technique goes further than description. Sportsman skills including sports and natural skills both are most easily learned in the environments where they are practiced.

Advantages: Down time between adventures can still be productive.

Disadvantages: Every PC will now devote 100% of non-adventuring time to some form of learning.

Notes: Many skills cannot be learned this way, either because teachers cannot be found ("I'd like to enroll in the Lucid

Dreaming class . . .") or because it's the sort of skill that can only be learned by practicing. Learning by watching others also falls into this category.

GURPS 3rd Edition optional rules: A teacher with a higher base skill in the subject than the student makes a roll against his teaching skill after 100 hours of training to see if the knowledge is conveyed in a comprehensible manner. For every three successes, the student adds 1 to his IQ plus 1 for each level of eiditic memory, and then rolls against it to see if the knowledge is comprehended. A third roll is made against the skill minus the difference between the teachers skill and the students skill to see if anything new is learned. A failure allows the PC to spend up to 1 point on the skill from unspent character points. If the student is learning by watching, the teaching skill is 5. Teachers may have up to twice as many students as their teaching skill, each student above that reduces the effective skill by 1, except lecture topics. For lecture topics, students do not receive bonuses for the teachers success, but do take penalties if the teacher fails.

By the Book

Ancient Tomes contain the knowledge needed to summon elder beings and the local bookstore has a book to teach every skill. Books are a great way to learn skills. They have the benefit of working with you on your time, are portable, and can actually be referenced when you need it. Almost any skill that can be taught by a teacher, can be taught by a book, but usually not to as high a skill level as the teacher could. Knowledge skills such as history or literature are the most conducive to book learning. Mental skills with physical components such as painting or lockpicking are the next easiest type of skills for books to teach. Purely physical skills can be taught by books, but not actually learned until practice occurs.

Advantages: Learn at your own pace, in your own place. Take it with you, Use it until you learn it, than sell it. The book may have pictures, maps or diagrams.

Disadvantages: For most skills reading about it is just not enough, even with self practice. Also there are a great number of poorly written books and well written books by bad teachers. There is almost no way to tell beforehand if it is a good source for learning.

Notes: The Foxfire Books, The Boy Scout Handbook, The Machinery Handbook, The Bible, and the Chemical Rubber Company Reference all contain everything you ever need to know, depending upon what sorts of questions you ask.

GURPS 3rd Edition optional rules: Books are rated for their skill range and for their teaching skill. Skill ranges are Beginner (skill 4-12), Intermediate (10-14), Advanced (13-18), and specialty* (16+). The teaching skill of the book is equal to the lesser of the authors writing and teaching skills plus 1/2 the margin of success of that roll with a limit of the other skill. Example: Arthur writes a book, his teaching skill is 14 and his writing is 12. He rolls a 5 against 12 for his writing roll. The teaching skill of the book is $12 + 3.5 (1/2 * (12 - 5)) = 15.5$, which becomes 14 because of Arthurs skill limit. If the readers skill is within the range for the book, a roll against the lesser of IQ or the books teaching skill is made and 1/2 point plus 1/2 point per margin of success may be applied to the skill from unspent character points up to the limit of the book. You cannot learn skill 13 from a beginner book, etc.

* Specialty Books are not rated for skill but for point value and usually are from 1/2 to 4 points. If a reader has a skill of 15 or higher in the skill (or in that specialty) after each 100 hours of study a roll against the lesser of the books skill or the readers IQ will apply 1/2 CP to the skill. This may be repeated until the maximum points for the book have been taken. Example: A 4 point specialty book could be used successfully 8 times.

It Goes Straight To Your Brain

Encephalagraphic Educators or other speed-learning methods are frequently available in high-tech societies. These function almost identically to books except for the time consumed and rather than writing the applicable skill is Computer Programming with an Educator specialty. Ideally, these work perfectly, but if they did, wouldn't everybody know everything about everything? Why wouldn't you learn it all? The real deal is that they don't always work, they

don't always work well and they don't always work safely. There is a chance of a bad connection or for some reason it just didn't stick to the student's brain. Sometimes the overlay isn't quite right and the student impresses his girlfriend by ordering five pounds of butter in Thai. Sometimes damage occurs, after all we were pumping electrons right into the electrical center of the body.

Advantages: anything can be learned this way. Physical or mental skills. It's quick. It's beneficial, what you learn will be useful, probably.

Disadvantages: It might be dangerous, and no sense of satisfaction for having learned something.

GURPS 3rd Edition optional rules: Use the same rules as learning from a book, but each half point is 6 hours of imprinting. If the PC has unspent character points, let him spend them on the acquired skills. If the points are not available roll against the PC's HT minus the number of points in the hole the character is. If the roll is a critical success the skill is learned, but character points are owed. If the roll is a success, remove the necessary points from another skill at random, the brain was full something had to be discarded. If the roll failed but a straight HT would have succeeded, the skill is not learned and a mental or physical disadvantage is gained. If a straight HT roll would have failed, a disadvantage and loss of another skill occur and the skill is not learned. If the roll is a critical failure roll against HT for each attribute. If the roll for ST is failed, a palsy is developed and all physical actions are at -3. If DX is failed, all fine motor control actions are at -3. If IQ is failed, IQ drops by 2 from brain damage. If HT is failed, use of 1 limb or sense organ is lost. On a critical failure double the results for ST, DX and IQ. Brain death occurs if HT is failed critically.

Immersion

A few skills can be learned by immersion. Most often languages but there may be others. Stuck on the island of TongaBonga our hero learned TongaBongese in a short time.

Advantages: Quick and effective.

Disadvantages: Usually only usable from untrained to minorly skilled (½ point in **GURPS** terms).

Notes: Area knowledge and Savoir-Faire (local customs) can be learned at the same time.

GURPS 3rd Edition optional rules: If the character is subject to this learning mode and indicates that he is trying to communicate with the locals, award ½ point each in language, and savoir-faire after a week.

Trojan War: Roleplaying in the Age of Homeric Adventure (for *d20 System*)

Published by [Green Ronin Publishing](#)

Written by Aaron Rosenberg

Cover by James Ryman

Illustrated by Drew Baker, Kent Burles, Caleb Cleveland, Jonathon Kirtz, Britt Martin, Beth Trott, Joe Wigfield, & Lisa Wood

Cartography by Shawn Brown

160-page perfect bound black and white book; \$27.95

For the fifth entry in their Mythic Vistas line, Green Ronin revisit the Ancient World, returning to the Bronze Age first seen in [Testament: Roleplaying In The Biblical Era](#). Almost in the wake of the blockbuster *Troy* comes ***Trojan War: Roleplaying in the Age of Homeric Adventure***, a *d20 System* treatment of Homer's *Iliad*. This is the opportunity for the players to sail with the Achaen (or Greek) army under Menelaus and Agamemnon to retrieve the love struck Helen or to join the armies of the nine dynasties under King Priam to defend the city in the valley before it. They will fight alongside the heroes of either side: Achilles, Odysseus, and Patroclus for the Achaens, and Hector, Paris, and Sarpedon for the Trojans. Perhaps the characters will become champions themselves, each leading a company out to face the enemy; sure in the victory already dedicated to the god whose favor they have gained . . . On occasion, the gods themselves will take to the battlefield both to aid their favored heroes and combat their Olympic rivals.

This is a very humanocentric setting, the only other race available being Divine Offspring, the product of a union between man and god. Stronger, faster, taller, larger than life, and in knowing their heritage, Divine Offspring suffer from overconfidence at best and arrogance at worst . . . which is all reflected by a lower Intelligence. Several new character classes are available, plus several from the core *d20 System*. The new classes are the Charioteer, masters of the horse and chariot, and the Dedicated Warrior that replaces the Paladin, fighting and questing in the name of a chosen god. The hardier Magician replaces the Wizard, casting spells powered from the world around him through a self-constructed wand; and the Priest replaces the Cleric, being a mediator between men and the gods, interpreting omens, and having a more spiritual role. The Homeric world values combat prowess, persuasiveness, and an understanding of the gods' will, all of which are reflected in the three Prestige Classes. Orators are demagogues, generals, and politicians; the Runner is capable of great feats of speed, perhaps like Achilles able to outpace chariots; and Seers serve as advisors and interpreters of omens. Other classes allowed include the Barbarian (for non-Achaen or Trojan), Bard, Druid, Fighter, Ranger, Rogue, and Sorcerer, plus the Noble and Witch classes from the publisher's other titles. The setting is also very male-centric, though there is room for female characters, perhaps as Amazons.

Magic in the Homeric age is rare, little used by the gods themselves, and since it is not a gift from them, its use is mistrusted by most people, as are magicians. While the GM in several ways can interpret its appearance, Homeric magic makes the *d20 System's* schools work differently. Necromancy deals with spirits, as the undead do not exist; evocation manipulates existing forces, like a bonfire, rather than creating them like a fireball; conjuration can only draw from four planes; and creation is frowned upon, the gods disliking mortals being able to create something from

nothing. Other schools remain unchanged. Divine spellcasters call directly upon the gods to cast their spells.

But *all* characters believe in the gods, and most will make offerings to them as proof of their devotion. Retaining a god's favor means a character can call for a divine favor -- increased hit points, healing, smiting a foe for more damage, bonuses to saving throws and skill checks, and even seeking divination. Whether the favor will be granted depends on the character's Piety score, initially at zero, or slightly more for Divine Offspring. It is gained by making sacrifices . . . of meat, wine, or rarely a youth or maiden; dedicating a victory to a god, building shrines, temples, and boats; or just by being courteous to a stranger. Likewise, committing sins will reduce Piety, leading to contempt, ostracism, and even divine displeasure. This can extend beyond the individual to his family, his village, and his nation!

Trojan War adapts the Biblical Battlefield Resolution System from **Testament** to handle the clashes integral to the *Iliad*. In the Homeric Battlefield Resolution System, troops are more mobile, able to advance and retreat from their initial positions. Forces, under the command of Captains have the same stats as characters, allowing easy interaction between leaders and troops. Several Battlefield Feats support the system, divided into Qualities (for example, "Battle-Hardened" or "Faith in a Captain"), Maneuvers ("Charge," "Fight Cautiously"), and Special ("Disquieting Yell," "Heroic Stand"). The various feats can be assigned and combined to create individual units. Some personal feats tie into the system. "Battlefield Seasoned," for example, allowing a character to retain his Dexterity bonus when joining a force; "Distinctive" makes a captain stand out on the battlefield; while "Lion of the Field" lets a character inflict his full damage upon an enemy force. Certainly this last feat makes a character a force to be reckoned with on the battlefield.

The setting is supported with summaries of both of Homer's epics, the *Iliad* and the *Odyssey*, details of Bronze Age equipment, and descriptions of both the gods and the great captains of both sides. Under equipment, the book covers food and drink, currency, and goods as well as weapons of war. This includes chariots, armor (which must be purchased piece by piece, and not as suits), and weapons, though none of these are illustrated. Only the 11 of the major gods are described, covering in turn each deity's portfolio, domains, holy symbol, clerical training, quests, prayers, shrines, rites, herald, allies, favored weapons, and attitude to the War. Appropriately they are not given statistics, as no character should be capable of facing and defeating a god. The various captains are there as companions, commanders, rivals, enemies, and optionally, even as player characters.

Besides the backgrounds on the Achaens and Trojans, there is also a guide to Homeric monsters, though these are more relevant to the *Odyssey*, but a party could encounter them if they stray from the battlefield. Few are given statistics, as most come from the **Monster Manual**, while others can be imported from both **Testament** and the **Book of Fiends**. Rules also allow the GM to create monsters of legendary stature and capable of testing the heroes of the age. Few magic items are included, as opposed to the many different artifacts to found in the hands of various NPCs.

As a campaign, **Trojan War** is different from most, centering on a single battlefield over the course of nine years. Yet there are notable events both before and after the conflict, from assembling the host to getting home and finding great changes there. The different stages of the War are covered along with suggestions on how to game in each. This leads into discussion of a **Trojan War** campaign's epic nature, necessary because what is stake here, is the fate of nations, something that the players should have the opportunity to affect this destiny through their actions. The player characters should be the leading figures of the nations involved, if not descended from the gods themselves. And with such high stakes and lineages involved, the War cannot be fought without raising the ire of one or more of the Olympians, for the gods all have their favorites in this war.

Physically, **Trojan War** is of course, up to Green Ronin's usual high standards. Some of the artwork might not be as good as the majority, but none of it is bad. Perhaps the book's only real negatives are the lack of illustrations for the arms and armor, and that the maps could have been better.

Short of detailing a ready-made campaign, **Trojan War** gives everything a GM might need to run a game set before, during, and after the most famous conflict of any legend. Its focus is narrower than other Mythic Vistas titles, which isn't surprising given that the War lasts just nine years. Perhaps lacking the "wow" factor of the early titles in the series -- **Testament**, [***Skull & Bones: Swashbuckling Horror in the Golden Age of Piracy***](#), and **Mindshadows** -- **Trojan War: Roleplaying in the Age of Homeric Adventure** is still a fine supplement by any means.

Pyramid Review

The Nameless Mist

Written by Todd A. Breitenstein, Les Simpson, Robert Defendi, Frank Russell, & Patrick Kapera

Art by Dave Aikins

Layout & design by Todd A. Breitenstein

64-page scenario book, 24 full-color encounter disks, four full-color tiles; \$9.99

Considering Twilight Creations, Inc. has had a pretty good quid pro quo with other companies in the industry, it seems strange to think their horror game ***When Darkness Comes*** . . . wouldn't have plugged a fairly obvious hole before now. ***The Nameless Mist*** comes to the rescue, filling in some of those blanks.

The theme this time around is H.P. Lovecraft and his mythological settings, specifically Miskatonic. The four tiles added to the mix of playing boards represent the infamous seat of lower learning, Miskatonic University. There are classrooms and offices, and one tile is given over wholly to the dreaded library.

The tokens have personalities like the snooty-nosed professors and librarians, the cultist, and the voodoo practitioner. Less personable but still vital are critters: gugs, ghouls, and even a disk for one of the Big Guys. And it wouldn't be a Cthulhuesque party if you didn't have disturbing books to check out, including the fabled Necronomicon, and equipment to put their contents back where they came from (like elder signs).

The back of the game says there are new rules, but the rulebook admits this really means a new take on Willpower. Specifically, WP is now -- what else? -- your sanity. Run out and you cannot take actions, though you can recover it. Reading a book lowers your WP, but it also makes monsters easier to kill (and reduces the victory point awards).

[SPOILER ALERT!]

The adventures are kind of a letdown; the Variable Tile System isn't getting much of a workout in that most seem to be "pick up items while finding the important clue, move to the next one on the next board, and eventually confront the big bad guy." Since they included "his" disk, it makes sense that he'll keep showing up as the story's centerpiece, but it's hard to really get caught up in beating super-baddies with the kinds of gear you find in a ***When Darkness Comes*** . . . scenario. Further, it seems like one of the enemy disks always turns out to be the main man. For a mysterious force, he sure does show up an awful lot, in vulgar ways.

As for the gist of the adventures: The crew must track down a killer, who may be a demon (or that big bad guy, again); a learned man is driven crazy and starts killing people; books disappear from the library and the investigators have to track them to their otherworldly hiding place or destroy the (person?) who's stealing them.

In the eponymous "The Nameless Mist," the heroes are one step behind the previous team, and find themselves either tracking their whereabouts or cleaning up their messes as they go. Finally, a GM-run adventure places the characters in the role of agents for a generic, secretive, anti-weird-events bureau, trying to locate a professor's killers before their master plan reaches fruition. "Mist" is the best of the lot, as it takes pains to unite the introductory fiction with the ongoing action, while the last is pretty much the least as it points up too many of the limitations of the system. (Players won't find themselves at their most riveted while rolling to get directions.) The story also urges the GM to

push players along lest events catch up to their PCs, but subsequent sections clearly assume things are only going to turn out one way anyway.

[END SPOILER ALERT]

There is one bright spot to this: While it's true the adventures are underwhelming, the fiction that precedes the scenarios in these sets -- it's terrific. The last piece reads like a traditional game module and so is too homogenous to be thought of as a real narrative, and the first tale seems to start out just a little tepid, but even that one ends strong. The stories are well-crafted, well-written, and in some cases out-and-out clever, bringing small story elements to the fore just when you'd forgotten about them.

You should be able to get away with the original set and this one to play things out, though extra tiles may help alleviate some of the scenario "sameness." While some of Dave Aikins' artwork seems slightly inferior to previous ***When Darkness Comes*** . . . sets, other pieces are even better than normal, more than making up for it. The package is what you've gotten in the other entries into the series, but the rulebook is an oddity -- the pages feel really thick, while the cover is distressingly flimsy stock (possibly the first time a game's cover wasn't the equal of its pages).

Having some of the new pieces might be enticing, especially so you can brag about your Miskatonic U tiles, but while the writing is fine stuff, the game materials accompanying ***The Nameless Mist*** aren't going to get the blood flowing in any but the most literal sense.

--Andy Vetromile

Time Goes By, So Quickly . . . And Time Can Do So Much

This week the conclave of cardinals elected a new pope, and I'm fairly certain I wasn't even considered beyond the first day.

I found this election particularly interesting, since it's the first one in modern times (and by "modern," I mean "held at a point after I stopped eating paste as much as I do today"). So much has changed since Pope John Paul II was elected -- historically, technologically, socially, and no doubt some other adverbs I've forgotten. This fact was particularly driven home when a commentator pointed out that one of the elements which probably influenced the cardinals' decision in 1978 was that Poland (from whence John Paul came) was an outspoken Catholic outpost against godless Soviet Communism. In the intervening decades, the threat of Soviet Communism has declined to a level that the only outposts necessary to defend against it is a lemonade stand and a rolled-up newspaper. (This, of course, assumes you don't believe everything you read in Tom Clancy novels, where Soviet Communism rises like a Phoenix at the earliest opportunity. **Chapter 1:** "What's that?" "It looks like a prairie dog in a tutu." "IEEEEE! Time to revert to communism!")

Anyway, this is the first pope whose election was covered around the clock via cable news outlets and webcams, the first one whose election was speculated continuously online, and the first one who's started out with an e-mail address (benedictxvi@vatican.va). So it's safe to say that the world is a mighty different place than when the last one was elected.

And there are other circumstances in the real world where people can measure the passage of time by other events, comparing and contrasting what's changed. Some of these are fairly regular, such as the 76-year cycle of Halley's Comet, while others are less predictable, such as natural disasters, and various appointments for life. Obviously the time interval is the biggest factor that determines the magnitude of change in either case; the four-year span between U.S. presidential elections generally permit slight changes, while something like centennial celebrations allow for big changes in the interim.

Of course, even small intervals can allow for big changes. For example, the 1960 U.S. presidential election was the first one where television played a major roll, where the American people decided they would like a young, handsome man as their leader over an oily demonic ferret (a mistake the people would rectify a mere eight years later). But usually these changes are most noticeable when there's more time between them. For example, every time we let a decade or two pass between wars with, say, Germany or Iraq, we discover that all the rules are different. Sometimes these differences are mostly for observation and commentary; for example, it doesn't matter too much how greatly the world has changed between the 1910 and 1986 appearances of Halley's Comet. Other times, though, these differences are crucial. Countries who approached World War II similarly to World War I found themselves at a severe disadvantage in short order.

This similar compare-and-contrast enterprise can be applied to most gaming worlds (which should surprise absolutely none of our long-term readers). The obvious way is to take real-world examples and apply them to the gaming world. For example, the near-future *Shadowrun* universe heavily incorporated the next two Halley's Comet appearances of 2061 and 2137 into its continuity. As another example, how would the papal elections be different if the world developed super-powers in the time since the last pope? (If the thought of tiny microphones and pinhole cameras frightened the conclave organizers, imagine what the existence of beings with x-ray vision, flight, or telepathy could do.)

Of course, it's possible to create "new" periodic traditions. For example, maybe the PCs' home city has a "Celebration of Heroism" every 25 years . . . and the heroes have been active enough recently that there is an expectation of their involvement. Of course, one of the mistakes in creating these events is to ignore their long-term effects and focus entirely on the adventure this new tradition creates. Scientists have referred to this as the Zelda Effect, where

adventurers stumble across yet *another* "Gee, this event of great power and hope only happens once every 1,000" years . . . what could possibly go wrong?" situation. It's especially bad when the big-deal event is only referred to for the first time at the start of the adventure, and is never referred to again after the end of the adventure. Compare this to the 1986 Halley's Comet appearance, where you couldn't huck a rock without hitting a book about Halley's Comet, a television show or movie about Halley's Comet, souvenirs about Halley's Comet, or random bystanders who exclaim, "Ow! You hit me with a rock! . . . Which, now that I consider it, was quite similar to Halley's Comet." While you don't want these big-deal periodic events to overshadow *everything* else in a campaign, you don't want them to fade away to nothing almost immediately, either.

Paradoxically, humans like both repetition and advancement; sometimes these two factors collide, with interesting effect. Once the gamemaster has both the comfort of ritual and the challenge of advancement within a campaign world, all kinds of great story possibilities open up.

And if they're not interesting now, they may very well be at some point in the indeterminate future . . .

Murphy's Rules

by Greg Hyland

Murphy's Rules

Icosahedron Adventures

Tudor's Guide to Angel's Harbor (Part I) Organizations and Neighborhoods of a Modern Superheroic *d20 System* Campaign

by Owen K.C. Stephens

Modern games usually take place in a world that feels very much like ours, but with a few differences. The differences may be minor, such as the number of shooting incidents a single cop can expect to get into over the course of a career or the exact location of stores in New York City, or it may be major, such as the addition of magic, psionics, aliens and/or superheroes. In either case, most GMs present the background of the world in one of two ways. Either they assume everything not specifically mentioned as different is the same as our world, or they go out of their way to make it clear the campaign world is notably different in many respects.

One of the ways a GM can express that second idea, that the campaign world is very different from the real one, is by creating new cities, neighborhoods, and businesses. A city where PCs in a hurry have the choice of Circus Burgers, Taco Castle, Pantheon Pizza or Samurai Takeout Teriyaki feels a little different from one sporting real-world fast food establishments. None of the new establishments need to be particularly unique, but the very fact that a campaign includes different businesses helps establish the idea that despite being modern, and possibly even set in the same country as the players, this campaign is "not like home."

The tone of a game can be further tweaked by adding or removing particularly outrageous businesses. For example, if the campaign has Temporal Express, for when it Absolutely, Positively Had To Be There Yesterday, PCs know the tech level for common people is high, and things may get a bit over-the-top. Similarly if you can order from the Ninja Rolls' Secret Delivery Restaurant, resulting in assassins sneaking the food into your refrigerator without you noticing, the campaign has taken a turn for the silly. Going the other direction, if the GM mentions that the Sends-A-Lot mass e-mail company has gone out of business because no one is stupid enough to spend any money on unsolicited e-mail advertising, players know some base assumptions have been made about how common citizens in that campaign behave.

Additionally, new businesses and places provide the benefit of a clean slate. Players may assume they know a lot about Circus Burgers because it has a clown as a mascot and reminds them of a real-world fast food place, but in reality they only know what they assume and the GM tells them. If it turns out Circus Burgers is run by the mob, or exclusively uses soy-based meat substitute, or is actually a conscientious corporation that improves any neighborhood it moves in to with neighborhood gardens and urban renewal projects, the players don't suffer the same disconnect they do if a real restaurant turned out to have the same quirks.

This article provides a look at the background of the fictional city of Angel's Harbor. Though specifically designed for a supers game, with a bit of work Angel's Harbor can be used as a setting (or one-shot vacation spot) for any modern game. Each of the entries below presents a fictional business, region or group that exist in Angel's Harbor. The main entry for each contain only common information anyone can turn up with minimal effort.

Further information, including secrets behind the scenes, are presented with information check DCs listed. Since this is a ***d20 System*** article, such DCs are designed for use with Gather Information, Knowledge (local) research or similar skills. The information is not broken down by skill -- it doesn't really matter what skill a PC uses to learn more about these places, just what information they can turn up. In most cases this information is just a sketch, leaving room for a GM to develop details to fit his campaign.

Districts

Angel's Harbor has a number of districts, the most famous of which are detailed in brief below. There are numerous less-interesting sections of the city which serve as home and often employment opportunity for the majority of the city's citizens. There are also a number of suburbs (such as Glitzeltown) which are technically outside Angel's Harbor proper.

Boarding Street

Originally a single street which was the location of numerous boarding houses in the late 1800s, usually taken up by students and miners. Now a self-sufficient community in itself, catering mostly to the middle class, although there are a few nice manors in the northern parts and some cheap housing in the southern parts. Many folk who make a decent but not great living elsewhere in Angel's Harbor reside here.

Information Checks

- **DC 15:** Nothing exciting or interesting happens here. It's almost *too* quiet.
- **DC 25:** Oddly, everything here is just as calm and normally as it seems.

The Circuit

The Circuit is the central section of Angel Harbor's business district. It is defined by a monorail system that loops around the entire area, with spokes going both into the Circuit (making it the easiest section of town to get around without a vehicle) and to outlying districts (allowing commuters easy access in and out). The Circuit is an area of high-rise skyscrapers, small but well-maintained parks, mid- and upper-end restaurants, and lots and lots of high-end businesses.

Information Checks

- **DC 10:** The Circuit gives tax breaks to larger businesses, to encourage them to stay in the city. As a result it has little funding for its extensive mass transit and park system. Currently, Sterling Industries pays for most such services as a way of giving back to the community.
- **DC 20:** The Circuit is very vulnerable to severe weather. It has never been directly hit by a hurricane, and if it was most buildings would flood, mass transit would shut down, and power would be lost.

Coal Road

Section of a slum and several shanty towns wedged between the railroads, shipping yards and stockades of the Station on one side, and Demon's Hollow on the other. Mixed poor residential areas, "project" housing, and cheap by-the-hour or by-the-week motels and warehouses and companies who were built here when it was a nicer area, or need a cheap place to run business.

Information Checks

- **DC 10:** When coal mining was the major industry of the area, Coal Road was a booming center for organized crime, prostitution and gambling. All that died out in the early 60s.
- **DC 20:** The current Coal Road region was build atop the old Coal Road area, which was destroyed in a fire. That Coal Road was itself built over buildings built in the bottom of a strip mine in the early 1800s.
- **DC 30:** There are a lot of buried buildings that can still be accessed from abandoned warehouses or the sewers, as well as sections of the original subway. These are sometimes still in great shape, and used as secret gathering places.

Demon's Hollow

Demon's Hollow is the unofficial name for the southernmost section of the city, which is a lowland slum. It is right next to the Circuit, but literally kept separate with a large wall built in the late 1970s. It is a place of crushing poverty, explosive crime rates, extensive homelessness, and colorful gangs who's "colors" often include matching make-up and unusual themes. The lowest district in the city, some of Demon's Hollow is actually below sea level, and floods in any serious storm.

Information Checks

- **DC 15:** The city council has given up on Demon's Hollow. Police rarely patrol there, only showing up if a situation develops that's likely to attract media attention. Vigilantes do most of the law enforcement, and as long as they keep things quiet and don't move to other sections of the city, the police are happy to let them.
- **DC 20:** The major gangs of Demon's Hollow -- the Vis, Black Angels, Fishhooks, Marrow, Heavy Hitters, Spackers, Viragos and Wolverines -- have a council which determines who has what territory, when gang wars are allowed, and what constitutes a major infraction of the rules. A gang that ignores the council is attacked by all other members. Minor gangs are client-groups of a major gang, and follow its rules.
- **DC 25:** Most Demon's Hollow gangs are actually agents of cults that have been in the Hollow for centuries. When exposed they pose as satanists, but in truth believe they worship older, more terrible gods. As a by-product, it's also the best place to buy occult books, and has many small cabals of "white magic" groups trying to clean the place up.
- **DC 30:** Unknown to the cults themselves, most of them are patsies for either the cabal of wealthy and powerful citizens of Club Dis or the Voskavitch Russian crime family.

Glitzeltown

In an effort to bring in new business and a higher tech base, the Angel's Harbor city council, along with the state legislature, wrote a number of tax benefits into law. The laws give extensive tax incentives, interest-free loans and even grants to companies during any period in which the company is "engaged in ongoing construction of buildings, development of technologies, or training of a majority of its employees." These are designed primarily for companies building new facilities or high tech research companies. However, a producer realized that a movie company, constantly building sets and always giving directions and instructions to its actors and crew, could technically qualify.

A few high-budget parties and back-room pay-offs later, the local authorities agreed. As a result, the cost of filming a movie in Angel's Harbor is enough cheaper than in other major cities in the US that a number of productions have begun moving into facilities just outside the city limits. This area is officially the Oakhame Edition, but is commonly known as Glitzeltown. A number of small-but-growing studios have moved into the area. Mostly these companies produce straight-to-video schlock, syndicated television shows in their waning seasons, educational films and pilots that move to bigger studios if they're picked up.

Many of the studios operate outside the normal unions and guilds that control television and film companies elsewhere in the US. The up side of this arrangement is that it's easier to break into these studios, and costs are kept down. The negative side is that actors and other employees are often very underpaid, directors and producers can take advantage of new hires with little fear of reprisal, and getting an acting job in Glitzeltown may not translate to a bigger career elsewhere. Stories of casting couch antics, drug-addicted employees, embezzlement, verbal abuse, fraud, plagiarism and even murder abound, and many are true.

Information Checks

- **DC 10:** Glitzeltown is officially Oakhame Edition, and exists outside the Angel's Harbor city limits. As a result it has its own police force, though it pays Angel's Harbor for the right to use the city's firemen, sanitation, and other services.
- **DC 15:** Most homes and apartments in Glitzeltown are owned by studios, or owners/directors/producers who are directly involved with the studios. Thus it's cheap to live in the well-manicured and attractive parts of town as

long as the studios love you, but anyone who displeases the corporate masters of the city end up in the outlying slum.

- **DC 20:** The town council of Oakhame is run by studio executives, who keep a tight grip on the reigns of power. They control the well-paid (and corrupt) cops and judges, most businesses, and even a few local federal agents. The system will not help anyone bring down the studios in Glitzeltown -- you have to get such people into Angel's Harbor itself to have any hope of arresting or convicting them.
- **DC 25:** Most of the "independent" studios in Glitzeltown are actually owned and controlled by Sven-Ole Drokan, who is also head of the organized crime group that runs Glitzeltown. Drokan runs one of the most powerful organized crime groups in Germany, Sweden, Norway and Greenland, but has few holdings in the US. Wishing to be able to deal his smuggled knock-off goods directly to Americans, and establish a pipeline to South America, Drokan built Glitzeltown to be his foothold on a new continent. He can afford to lose money here for years, and does a great deal of legitimate business (particularly bad fantasy films) because of his love of old Hollywood films. But ultimately, he intends to be a major player in American organized crime.

Holly Hills

Holly Hills is the residential neighborhood for the rich and famous. It mostly contains mansions, gated communities, private clubs, and golf courses.

Information Checks

- **DC 10:** Holly Hills has its own police force, which is more interested in keeping things quiet than justice.
- **DC 20:** The most powerful private club in the district is Club Dis. Officially a secret society with mostly hereditary membership, the club's Victorian and whispers of sex parties actually cover an efficient, dangerous power-gathering machine. However, the members of Club Dis never take illegal action within Holly Hills, in part to keep the rich and powerful residents of Angel's harbor from being inconvenienced by the club.

Mercedes Beach

Mercedes Beach is a popular vacation spot, with condos and time-share houses running along the best beachfront in Angel's Harbor. It includes the Stretch, a run of small mom-and-pop businesses right along the boardwalks, and Dock 51, a refurbished section of dock that has been taken over by tourist attractions, theme restaurants, and a small amusement park (Angel Island). Further from the Stretch is a less pleasant neighborhood are warehouses, small businesses, and a few residential regions. A number of warehouses have been used for questionable experiments and drug running over the decades, as evidence can be dumped easily in the harbor.

Information Checks

- **DC 10:** A series of serial killing along the beach in the 1950s, 1970s, and 1990s hurt tourism, though in each case people returned once the murderers were caught.
- **DC 15:** Locals tend not to drink the city water here, as it tastes funny.
- **DC 25:** The killing sprees were all brought on by heavy storms, and generally included multiple, unrelated killers.
- **DC 35:** The ground here has been contaminated by experimental drugs and toxic waste dating back to the 1950s. When there's a heavy storm, the stuff often gets pushed up to the surface, where it appears as a foamy substance. Anyone exposed to too much of it becomes a raging psycho killer (the cause of the murder sprees in the past).

Slaughterhouse District

Once actually the location of hundreds of slaughterhouses (mostly of pigs shipped into Angel's Harbor by train), the Slaughterhouse District became more and more residential as the slaughterhouses closed down in the late 1800s. Because it was extremely cheap to buy land there, it became home of an art movement in the 1960s, which in time

made the area popular enough to draw in richer tenants. The art movement has largely been forced to Boarding Street and Coal Road by rising prices designed to draw in yuppies. The Slaughterhouse District is now a combination of warehouse nightclubs, over-priced art houses, and trendy residential options for the upper-middle class in the wealthy sections, and abandoned meat packing plants and crumbling warehouses in poorer, undeveloped regions.

Information Checks

- **DC 10:** No art of any real quality is found here anymore, though the remaining art houses would snobbishly disagree.
- **DC 20:** A number of the underdeveloped sections of this district are actually haunted, while others are home of vast stores of negative psychic energy. As a result, they are the best place for certain kinds of dark rituals.

The Station

A long, narrow wedge of town that includes the port, the shipyards, stockades, commercial rail yards, and one nearly bankrupt dirigible company. In addition to commercial shipping and trucking, a lot of warehouses are built in this area. It's possible for cargo to move from any kind of transportation to another in the Station, and a great deal of the wealth Angel's Harbor enjoys comes from this region, though none of it seems to stay here.

Information Checks

- **DC 10:** The canals, tunnels and bridges of the Station include extensive underground areas, as well as territory kept in near perpetual darkness by the shadows of the warehouses on one side, and the skyscrapers of the Circuit on the other.
- **DC 20:** Because it's the darkest section of town, and the one with the most stored goods, the crime rate per capita here is higher than anywhere else in the city, including Demon's Hollow.
- **DC 30:** It's also where every vampire in the city lives.

Dork Tower!

Dork Tower!

A Stab of Fear: The London Monster

*"The frightened Ladies tremble, run and shriek;
But Ah! In vain they fly! In vain protection seek!
For he can run so swift, such diff'rent forms assume;
In vain to take him, must the Men presume.
This Monster then, who treats you so uncivil,
This Cutting Monster . . . is the Devil!"*
-- from the anonymous 1790 print *The Monster Detected!*

In the reign of Mad King George, the energies of his capital, and the calm of his populace, were upset by a Monster stalking the streets of Soho and the West End. Although he did not kill, he gained power from fear -- perhaps power enough to propel him down the spiral of time and into a bloody vastation a century later. Hear him, as the bard says, howling 'round your kitchen door? Better not let him in.

"It is an unpleasant task to call your minds to a scene so new in the annals of mankind; a scene so unaccountable: a scene so unnatural . . . that it could not have been believed ever to have existed, unless it had been demonstrated by that proof which the senses cannot resist . . . Indeed this case affords a melancholy lesson to our nature, and teaches us not to be too confident of the impossibility of any event, on the principle of its appearing to us to be out of nature . . ."
-- Proceedings of the Old Bailey, Jul. 8, 1790

Beginning in March of 1788, respectable women of London (and their servants, and perhaps no few less respectable filles-de-joie) found themselves increasingly beset by a strange pattern of attacks. A strange man would approach the lady, accost her in vulgar language, and then bump or jostle her rudely. This was bad enough, but the fiend also cut or stabbed his fair victim, usually in the thigh or buttocks when she turned away from him to flee or end the confrontation. (Occasionally, she would only discover her injuries upon returning home, or her skirts and crinolines would absorb the worst of the damage.) This attacker became known in the public prints as "the Monster," and as more attacks occurred, and more respectable husbands and brothers compared notes, the Monster's rampage became a city-wide scandal.

By April of 1790, at least thirty Monster attacks could be compiled by Lloyd's insurance broker John Julius Angerstein in a lengthy investigation. On April 15, he offered a reward of 100 pounds for the capture of the Monster, which had the effect of blowing the affair still wider. Posters, political cartoons, plays, songs, and broadsheets now trumpeted the Monster's crimes to all and sundry. The swells of Oxford Street banded together in a "No Monster Club," wearing badges to assure the young ladies they encountered of their merely conventionally predatory appetites. And the Monster's attacks continued: at least 20 more outrages surfaced over the three months following Angerstein's announcement. The Monster's methods varied as well: he now attacked the elderly and the indigent, along with the fashionable and beautiful; he concealed his blade in a nosegay and slashed at serving-girls' faces; he slashed at hair and struck girls on the head. Questions were asked in Parliament; something had to be done.

"This singular case excited universal attention; but many were by no means convinced of his guilt, believing that the witnesses, a circumstance which we have shewn too frequently to have happened, mistook the person of the prisoner. The particulars we have given of this brutal attack on the defenceless, by a monster of the stronger sex, with our full report of the trial, will sufficiently prepare our readers to judge for themselves on the case of Renwick Williams, divested of the popular prejudice then strong against him."
-- from the *Newgate Calendar*, Vol. IV

And indeed it was. By great good fortune, one of the Monster's earlier victims, Miss Anne Porter, spotted her assailant in a crowd in St. James's Park. After a comical pursuit, the man willingly returned with Miss Porter's companion, who promptly turned him over to the Bow Street Runners. Rather than the ogre of popular imagination, the suspect, Rhynewick (or Renwick) Williams was a slender, handsome maker of artificial flowers and good address (he had apprenticed to a dancing-master). Nonetheless, the Porter girls insisted on the identification, and Williams was bound over for trial. Unfortunately, under English law at the time, assault on a person was a mere misdemeanor, which would

not do for the feared Monster, so he was tried under a law of George I that made it a felony to intentionally cut or despoil a piece of clothing. Despite a witnessed alibi for the evening of the Porter attack, a jury found Williams guilty. But an eventual judicial review decided that he had not intended to cut the clothing, but rather to assault the women inside the clothing. There was nothing for it but a second trial, this time on a misdemeanor charge of attempted murder. Despite (or perhaps because of) the aggressive cross-examination and courtroom theatrics of Williams' new lawyer, the Irish duelist and eccentric Theophilus Swift, Williams was again found guilty, and sentenced to six years in Newgate Prison.

"Although no case quite captured the mania surrounding the London Monster, the Monster had several heirs."

-- Jan Bondeson, *The London Monster*

In his indispensable book on the case, *The London Monster*, author Jan Bondeson makes the most of the contradictory testimony of the Porter girls and their companion, and of Williams' alibi. He notes that even Angerstein believed, based on the widely varying eyewitness descriptions, that there were "SEVERAL of these *unnatural wretches*, these inhuman MONSTERS . . ." But Bondeson can't shake the uncomfortable fact that with Williams' imprisonment, the Monster's rampages ended. "His trial could be likened to an exorcism," in Bondeson's neat phrase, "once Williams was committed to Newgate, the Monster attacks ceased." But something had been born from the Monster's outrages. Serial stabbings of women broke out in Paris in 1819, Augsburg in 1819 (lasting until 1837!), Innsbruck in 1828, London again in 1834, Strasbourg in 1880, Northampton in 1885, Mainz in 1890, Brooklyn in 1891, Paris in 1895, Kiel in 1901, Hamburg in 1904, Chicago and St. Louis in 1906, Bridgeport (Conn.) in 1925, Bogota in 1931, and London a final time in 1977.

"Panic on the streets of London

Panic on the streets of Birmingham

I wonder to myself

Could life ever be sane again?"

-- The Smiths, "Panic"

As the Monster spawns one lineage, he partakes of another. The furor surrounding the London Monster compels comparison with such London frenzies as that caused by our old friend [Spring-Heeled Jack](#) in the 1830s. Other outbreaks of London's urban madness include the Mohock paranoia of 1712 and the garrotter scares of 1856 and 1862. The aristocratic Mohocks (who took their name from the savages of America) stabbed their inferiors, insulted women, and assaulted elderly watchmen; the garrotters simply strangled their respectable male victims while emptying their pockets. Further afield from the Monster's stomping grounds, but eerily similar in all other ways, the Halifax Slasher reportedly committed dozens of knife assaults on women in Halifax, England in 1938, and a "razor slasher" likewise terrorized Taipei in 1956. A "monkey-man" resembling a hirsute Spring-Heeled Jack similarly sliced his way across New Delhi in 2001, racking up 70 outrages in just a few months. Although killjoy sociologists and historians of crime maintain that none of these cases (unlike the London Monster) actually involved any provable assaults, putting them down to mere "mass hysteria" explains neither the very real panic nor the specific nature of its appearance in time and space.

"The recent series of enormities which have excited such horror must in all probability be due to some distorted or monomaniacal appetite which has grown by what it fed on . . . [T]here are recorded instances of cases nearly analogous. Just ninety-eight years ago there was a general panic all over London, caused by the atrocious doings of a mysterious person, who came to be generally known as 'the Monster.' . . . It will be noted what a similarity there is in this case and that of the Whitechapel assassin. The victims of 'the Monster' were women, and he seems by preference to have attempted something like the mutilations described in the newspapers. The monster of our day is evidently a wretch with demoniac and homicidal propensities, which have been stimulated by notoriety and discussion . . ."

-- from the *St. James's Budget*, Oct. 6, 1888

And of course, the other great pattern to emerge from London panic and mysterious stabbing attacks began in August of 1888, almost exactly a century after the Monster's. [Jack the Ripper](#) carved his own, far bloodier, swath through London's grim East End rather than the Monster's fashionable West End haunts, preying on desperate prostitutes rather than coquettish demimondaines. However, in the lurid glow of the Ripper, the Monster's traces are visible. For example, on February 25, 1888, one Annie Millwood reported an unknown assailant who stabbed her repeatedly in the legs and buttocks -- she died, of an unrelated pulmonary embolism, the next month. Scotland Yard briefly suspected

the 1880 Strasbourg stabber of being the Ripper, and in 1891 the London *Sun* trumpeted a buttock-stabbing maniac named Thomas Cutbush as the Ripper, noting that he had lived in Whitechapel in 1888. Scotland Yard dismissed the paper's argument, not least perhaps because Cutbush's uncle was a Scotland Yard police superintendent. Cutbush was quietly institutionalized, and London moved on.

"Fourth dimensional patterns within Eternity's monolith would, he suggests, seem merely random events to third dimensional percipients, events rising towards inevitable convergence like an archway's lines. Let us say something peculiar happens in 1788. A century later, related events take place. Then again, 50 years later . . . then 25 years . . . then 12-1/2. An invisible curve, rising through the centuries."

-- James Hinton, in *From Hell* by Alan Moore

And so, perhaps, did the Monster, transferring his attentions northward to Halifax fifty years later. Peter Sutcliffe, the "Yorkshire Ripper," attacked two women in Halifax during his five-year career, which began in August of 1975, 37 years after the Halifax Slasher vanished. In *From Hell*, Alan Moore points out the geometric regression of dates involved: 100 years from the Monster to the Ripper, 50 years from the Ripper to the Halifax Slasher, 25 years to the Yorkshire Moors Murders, 12.5 to the Yorkshire Ripper, and so forth. The scarlet thread spun by the Monster winds through this spiral of space and time, folded over and in upon itself like the petals of a flower -- like, for example, those artificial flowers made by Renwick Williams in Dover Street during the Monster's attacks, and carried by the Monster in six of his outrages.

Thirty of the Monster's attacks occurred within mere blocks of Williams' lodgings or flower shop, despite his alibis. Seven witnesses identified him, but like those of Jack the Ripper, eyewitness descriptions of the London Monster varied dramatically. The Monster was described as "invisible," as a shapeshifter, a demon, or a ghost. The libertine *Rambler's Magazine* tellingly identified the Monster's sexual perversion with that of "him who, in his amours, imitates the canine [howl](#), and gnaws the dirty bones rejected by his fair one." Likewise, the New Delhi "monkey-man" became a full-blown "werewolf" in reports from Assam by May of 2001. Intriguingly, the German naturalist Georg Foster (visiting London in 1790) described the Monsters as "tigers lusting for the blood of women," an interesting connection to our shapeshifting [manticores](#), and to the "tiger character" of the [Ratcliffe Highway](#) murderer. Note the coincidence - those crimes were also pinned on a seemingly inoffensive man named Williams whose [scapegoat](#) punishment nonetheless ended the rampage.

While we're on the topic of coincidences, those ultraterrestrial spoor par excellence, here's one to go out on. In the 1935 film *Werewolf of London*, actor Clark Williams plays Hugh Renwick, the curiously hapless and ineffectual companion to the titular werewolf. Thus Renwick (Williams) serves as a kind of midwife to a shapeshifting Monster, a predator of women impelled, as it happens, by a mysterious flower that can cure lycanthropy. Or, in good Paracelsan fashion, no doubt, cause it? Have [Augustin Le Prince's](#) cinema lenses, themselves connected to the Yorkshire Ripper's haunts, shown us a glimpse of the Monster's true form? Was the Monster a werewolf [tulpa](#), or a London egregore like [Mother Gin](#), unfolded from a silk flower and set free on the streets of London to "grow by what it fed on"? It fed on panic, and then on blood, and as the spiral wound tighter, on death. Look for yourself, but watch your . . . back.

Pyramid Review

Shardsfall Quest (*for DragonMech*)

Published by [Goodman Games](#)

Written by Joseph Goodman

Cover by Niklas Janssen

Illustrated by Jeff Carlisle

Cartography by Sean Glenn

72-Page Perfect Bound Softback; \$15.99

The first release for Goodman Games' *d20 System* setting [DragonMech](#) is the adventure *Shardsfall Quest*. Written for a party of four to six characters, it is designed to serve as the perfect introduction to the world of Highpoint, apocalyptically scoured by the abrasive Lunar Rain and rampaged across by the alien Lunar Dragons. Most of the population has retreated underground, or found sanctuary in the new mobile nations -- the mechdoms -- built around the 1,000 foot tall, steam driven, iron or stone clad City-Mechs. Each of these states projects its power through the mechs it carries in its legs. Carrying only a crew of three or four, these much smaller mechs, when working in concert, are capable of taking down a Lunar Dragon. A Mech Jockey character is not necessary to play, though one character needs to have the Mech Pilot skill. Other suggested characters are a fighter, a coglayer or steam-borg, and an arcane spellcaster.

[SPOILER WARNING!]

As the adventure opens, the PCs are assumed to be already together, perhaps as ore hunters, refugees, or as employees of the Dwarven-run Gearwrights Guild. Taking shelter from the night's Lunar Rain, the party's rest is disrupted by the impact of a large meteorite. Its size suggests that it is worth investigating, a potential source of lunar ore or of artifacts of the Lunar civilization. This is an opportunity for the characters to see more of the Lunar society than they would cowering from the swooping attacks of the Lunar Dragons. Inside the split in half meteorite they find a still occupied Lunar temple, which houses a curious object, the "Starshard."

Upon exiting the ruined temple, the party is confronted by a pair of combat mechs also sent to investigate the meteorite, in particular, for signs of Lunar activity. They are from the City-Mech of Nedderpik, a member of the Dwarf dominated Stenian Confederacy, and have both a problem and a proposition for the party. The meteorite containing the temple is actually part of a larger one, which landed in what is Legion territory. Naturally, the Stenian Confederacy cannot send its combat mechs charging off into the territory held by the xenophobic, human-dominated Legion, at least not without provoking further conflict. The characters of course, can, and are offered the use of a cargo mech to get them there faster. In return for investigating the second meteorite and clearing it of Lunar influence, the characters are offered the safety of citizenship aboard the Nedderpik.

After a diversion deep inside the cog forest of the Nedderpik, the party sets out for the lands of Legion, aboard a Magwagon, an old freight mech. Locating the second half of the meteorite and the rest of the Lunar Temple is the easy part, but getting inside it is another matter. One of the Legion's many tribes is encamped at its foot, and the party will have to employ either diplomatic or covert means to gain access. Either option involves more roleplaying and

investigation than in the adventure's earlier encounters. Once inside it is clear that the temple is still operating, but besides this, the party will discover a more surprising item: a second Starshard. Yet before it is theirs to grasp, it is snatched away by an exceptionally quick and bird-like combat mech. Pursuit of the fleeing mech leads the Magwagon into the arms of another nation, the Irontooth Clans. In order to survive this encounter, the party must participate in a jousting duel against the clan's warriors. Unfortunately, in just a cargo mech, and against pilots noted for their prowess or mech-fu, the players really have very little chance!

Ultimately, it is how the party performs that matters, rather than if they win. If they can gain the trust and friendship of the clans, they will be told more about the two Starshards they have found so far, and there is at least one more to be found. This is where the adventure ends, bar returning the loaned mech to Nedderpik and gaining citizenship aboard the city-mech. There is not a rousing climax or finale here, and the adventure feels very much the first part of an ongoing series. Also included at the back of the book is small selection of new feats, spells, and creatures as well as two new mechs.

There is very little in ***Shardsfall Quest*** to gain in terms of material reward, but they come in other ways. Most obviously is enough experience points to take the characters from first to third level. In-game reward takes the form of encounters with various aspects of the setting, the chance to make contacts along the way, to learn more of the threat represented by the Lunar society, and of course, to gain a place in society. And in the Starshards, the items of the scenario's title a little ancient history and suggestions as to further quests.

[END SPOILER WARNING]

The book is decently put together, although it lacks the polish of the setting's core book. The artwork is clearer, though many pieces are more cartoon-like. The cartography, however, is nicely done, having just the right degree of roughness to them. A final touch is the inclusion of the designer's notes, which -- while enjoyable enough to read -- are not as useful or informative as those in the core book.

The adventure does feel a little reminiscent of the [Doomstones](#) campaign for ***Warhammer Fantasy Roleplay*** in its hunt for bright, shiny, magically connected objects. But then the grim and perilous nature ***DragonMech*** is very different in feel, and anyway, the focuses of ***Shardsfall Quest*** are less likely to turn on the players. Admittedly, this is a linear adventure, but that is in the nature of quests. And really, ***Shardsfall Quest*** does exactly what it sets to do -- introduce the players to various aspects of the ***DragonMech*** setting. These are its above ground aspects, so it still leaves a lot of the setting to be explored.

--Matthew Pook

Sepia-toned playmat, 10 full-color cards, two six-sided dice, \$12.95; warrior packs, \$6.95

Someone at The History Channel must be a gamer. TriKing Games has some sort of cross-marketing deal going with them, and together they have produced *Anachronism*, the sort of game that drives many a bar bet among gamers, historians, and time travel aficionados. The idea: Major figures of military history and legend hop into an arena, mano a mano, to see who's "da man."

The object of the game is to kill your opponent or, barring that, be the healthiest man alive when the fight is over.

Each player gets a set of five cards, either Achilles or Spartacus if you're playing with just the two-player starter set. One card is the warrior card, showing the hero, his statistics, and any special abilities he has. The others are called support cards and show equipment and circumstances the fighter can make use of as the game progresses.

There is no rulebook; rather, the rules of play are included on the playmat (convenient during the game, but you won't be brushing up on these on the bus). This is also the "board" upon which the game is played. The warriors are set in their starting row in the four-by-four square arena. The four support cards are placed in numbered slots along the edges in whatever order the player thinks he'll need them.

The game has five rounds, and players get one turn each per round. These turns are further subdivided into actions. Each round, both players turn the card from slot one face up -- initiative scores thereon indicate who gets to go first. The active warrior uses his action allowance to move or to attack his opponent. The combatant has values like experience (to settle ties), elements (what card effects he can make use of), and statistics (how much damage he can take or do). The most important consideration is whether the warrior can attack into his opponent's square. A small grid shows where the fighter can attack -- you can't attack into a square with no number. This means some foes are harder to outflank, and it makes it worth your while to maneuver to remain out of your enemy's reach or to improve your chance to hit.

These numbers start poor since you're just entering the arena. As revealed cards provide gear, you'll end up with special weapons that do more damage, have special effects, or change or improve which squares you can threaten (weapons have their own grid, typically with better scores). Players battle by rolling two dice each, modified by the grids' numbers and anything else on the cards; normally only the attacker does damage, while success for the defender means another round of breathing. Even if you cannot kill the other warrior in five rounds, you win if you have more life left.

Most of the pictures are painted, with several good illustrations and a couple with characters that come off looking stiffer than the cards. They're printed on good, firm stock (they're closer to tiles than cards), and most look to be foiled

-- a bright, reflective surface that, thankfully, is applied only to the trim so you can read important text. Achilles has a silver finish, Spartacus a gold one. The playmat is about 25.5" by 30", and while it's also nice material with an evocative sepia finish, it's another of those mats that's going to take some flattening out. At least here you have only cards to lay on it and not something top-heavy like figurines, but one of those clear plastic sheets used in miniatures gaming will help "train" it.

More warrior packs (and promotionals) are out as well. Anyone concerned that the whole thing is too over-the-top should set aside those reservations. The cross-time pollination is played down -- fighters are just here for the donnybrook -- though semi-mythical folks like Achilles can count on equipment and rerolls from the divine. Play of the game is simple, and the grid mechanics are clever things that give a better sense of the give-and-take between two opponents who have their own peculiar limitations and blind spots.

For some, the game won't be entirely satisfying. The game is extravagant enough to include a pair of six-sided dice, but not so much as to include the two pairs you're supposed to use (players roll simultaneously; if one alters a die roll he needs to know or recall the other guy's results). The level of abstraction means you may never quite think of **Anachronism** as a miniatures *or* card game. Things only go five rounds, which makes for a quick game (or several of them, if you want best of three), and while there's plenty of strategy, the experience feels somewhat constraining. Still, it hits where it counts, it's less expensive than a CCG, and the warrior variety should keep the arguments fresh, if not the game.

--Andy Vetromile

Adventure Locale, Complete with Hot and Cold Running Plots

It's rare that I discuss an article that's appearing this week . . . or, really, discuss or reference any articles directly. Of course, it's also rare that I wake up in a puddle of my own vomit in a strange city with some woman's name tattooed on my thigh who I don't even know, so let's think outside the box a bit this week.

Anyway, this week's issue features Owen K.C. Stephen's "Tudor's Guide to Angel's Harbor." In it, one location -- the city itself -- is given an in-depth description, complete with lots of secrets and subplots that can be sprung at any time. In addition, there are secrets the PCs can discover if they take time investigating and make successful "find information" rolls. The existence of these rolls would, I think, encourage players to investigate everything, just to see if the players get lucky with their skill checks. (This is a variation of the old "If it has stats, it can be killed" truism.)

Also this past week, I watched the movie *Saw*, a thriller-horror movie about two guys who wake up chained to opposite sides of a large, filthy bathroom; shortly thereafter they discover tapes that indicate the only way they're going to "win the game" (and, coincidentally, stay alive) is to kill the person chained to the opposite side within a few hours. Yes, the victims have been chained there by a serial killer of the movie variety, who seem to have unlimited resources, spare time, creativity, and steady cams. Like all the times I've spent two hours chained to a bathroom (and one other time I tried eating burritos with a cup of drawn butter for dipping), much of the action of this movie takes place within the bathroom itself.

Finally the week before last I saw the first season of the HBO series *Deadwood*, a series that has reinvented the Western by inserting a curse every 14 words. It takes place entirely in the tiny town of Deadwood -- from which the series name might have sprung -- and it focuses on the intrigues and stories of these people forced to deal with each other and a near-inscrutable Calamity Jane.

This week's article, *Saw*, and *Deadwood* have something in common: They both get a lot of mileage out of one location, with built-in secrets, things to discover, and other bits that keep PCs entertained.

And thus the gist of this week's article is that, if all the action is going to take place in one spot, it's important to have lots of ready-to-go secrets and clues in the wings . . . and it's important to have a plan for how you're going to deal with them.

Let's fabricate a real-world example. We've got a campaign where the PCs are going to be characters aboard a turn-of-the-century cruise ship. The campaign will take place entirely (or at least almost entirely) aboard this vessel. Although it's a somewhat "straight" historical campaign -- no cyberwear, minimum catgirls -- the GM still intends to take full advantage of the era. So one adventure might take place with pre-War espionage and intrigues, another might have Cthulhu-esque occultism, while a third might have very minor steampunk trappings.

Okay; so the GM sets up a bunch of encounters and future seeds, designed ahead of time so that he can drop hints. ("Okay; this room has a dead, mummified body hidden beneath it, so whenever people go to this section of the ship, they might get a whiff of an odd aroma every so often. This cabin's special glowing stars were painted with radioactive material, which might affect future steampunk adventures, and could also have effects if anyone ever spends too much time in there. This one . . .") In one room, the GM determines that a Cthulhu-esque Aramaic Illustrated edition of *Big Book of Things Man Wasn't Meant to Know (But Weren't Afraid to Ask)* was left hidden in the floorboards. The GM plans to have one long-term guest discover it after a dozen or so adventures, and this person would eventually grow in power to become a major threat.

The problem is, after a few adventures, the players get wind that all these plot seeds are already led. (This isn't necessarily the result of players trying to short-circuit future adventure. Rather, it could stem from them playing their characters correctly; after all, if you're in charge of security aboard a ship, and someone finds an ancient dagger and causes mayhem with it, you'd be remiss in your duties if you didn't do a stem-to-stern inspection of the ship.) How do

you resolve this?

Well, first remember that the PCs have limited time -- they have full-time jobs, and if they spend a lot of them doing a search then they won't have a lot of time left for other things, and other responsibilities might fall through the cracks (leading to future plot possibilities). Also, remember that most limited locations are going to be *big* (with possible exceptions such as *Saw*); doing a full search of every secret -- and full interrogations of all citizens or residents, if appropriate -- is going to take time. It's a mistake to see an article such as Owen's -- which can be read in 20 minutes or less -- and think that such an investigation can take place in that amount of time. In fact, an article such as Owen's makes one realize that there are many mundane things to check which *don't* have interesting secrets associated with them . . . and they require the same amount of investigation as other, more interesting conundrums.

Finally, it's important to note that it's okay if players "short-circuit" some aspects of future adventures. If nothing else, it makes them feel like they are an active and vital part of the setting, which is what most gaming groups want. If it's important for a story for the PCs not to be successful (or entirely successful), then maybe the GM can steer the adventure back on track at some point. For example, say the PCs find the Nasty Secrets book hinted at above. Well, if they keep it aboard the ship somewhere (remember that their opportunities for leaving the ship are limited), then maybe someone will find and/or steal it. Heck, maybe the book *compels* someone to steal it. Done incorrectly, the players might feel cheated: "Aw, man; we try to be proactive and the GM railroads us regardless." But done correctly, and with understanding players, it can seem quite cool: "All *right!* We've obviously stumbled onto something big, otherwise why would people want it so much?"

I've long been a fan of "[ship in a bottle](#)" adventures, because it keeps players focused and gives them reason to become involved with the setting. The same applies for campaigns in a bottle (as opposed to "Campaigns in a Box" . . . that's someone else's bailiwick). It's not without problems and potential pitfalls, but it can be really rewarding.

Much more rewarding than, say, trying to understand this book I found buried in my backyard. I mean, who can understand this stuff? "Klaatu barada nikt . . ." <zot>

--Steven Marsh

Object Lessons (Part III)

An Enchanted Collection for *Call of Cthulhu* d20

by Nicholas Luna

*Editor's Note: The first part of this article of assorted items and artifacts for **Call of Cthulhu** d20 appeared [three weeks ago](#) and the second installment appeared [two weeks ago](#). This is the final chapter. It ends now.*

Rasputin's Cross

Public Information

This large golden cross is very old, perhaps dating to the 7th or 8th century, and once belonged to the famous monk Rasputin. After the monk's death, the cross made it to America in the possession of Yuri Sladovich, a Russian who immigrated in 1925. Within three years of arriving in America, Sladovich built a successful criminal organization. As criminals are prone to do, Sladovich died violently late in 1928. The cross disappeared after Sladovich's death, until 1941, when it resurfaced in the possession of Rutherford Carson, a cult leader in the western United States. Carson, and all but one member of his cult, died in a violent confrontation with Federal authorities. In 1942, the cross came into the possession of Daniel Mitchell. In 1954, Mitchell's wife fatally poisoned him. The cross disappeared after that incident.

The cross is a beautiful work of art, six inches long, with fine, detailed engravings of biblical scenes. Each point of the cross is set with a small ruby. The cross is heavy, and set with a loop for a chain, but the original chain is long missing.

GM Information

A hermit monk created the cross in 674 A.D. The monk had turned from the Church and been driven insane by many mystical experiences. The monk's insanity manifested as a burning hatred of the Church and all that was good. Determined to bring down the established faith, the monk turned to dark magic. He created this cross, and many other items, all designed to corrupt and destroy followers of the Christian faith.

The cross, when worn as an amulet, provides the character with a +6 enhancement bonus to Charisma. There is a condition for this bonus however -- to maintain the bonus, the character must appear as a humble peasant or commoner (lowest social class) of the appropriate era. If the character's appearance makes him seem above this station, he does not gain the bonus. For example, Rasputin always maintained an unwashed, ragged appearance even though he was an advisor to the Tsar and Tsarina, and lived a high-class lifestyle. Another effect of the cross is envy. Eventually (within a few years), others will become jealous of the character, and will plot his downfall. The only way to circumvent this aspect of the cross is to avoid staying in one location for long periods.

In addition to the presence-enhancing properties of the cross, it makes the character more resistant to damage. When wearing the cross, an attack must inflict 20 points of damage to require a massive damage Fortitude saving throw. As with the Charisma bonus, to access this power, the character must maintain an appearance as a member of the lowest social class for the era.

Weight: 2/3 lb.; Study Time: 2d6 days.

Adventure Ideas

The PCs become aware of a cult (perhaps they hear rumors over time during the campaign) led by an enigmatic leader who holds complete dominion over his subjects. The cult is involved in minor robberies, kidnappings, and occasionally, murder. The cult leader possesses the amulet, and the PCs' must avoid falling victim to his cult of personality while ending his reign.

Roman Sword

Public Information

This roman sword, or Gladius, from the 1st century A.D., was found in an archaeological site in Africa in 1960. There is nothing particularly unusual about the weapon aside from its fine condition and a faded engraving on the blade. The sword was found with a few pieces of armor.

The sword is two feet long, and weighs three pounds. The engraving on the blade is in Latin and reads "One day home." The weapon is in incredible condition for its age. In the pommel is an indentation that looks as though it may have once contained a gem, but this is long missing.

GM Information

This sword once belonged to Claudius Flavus, a Roman soldier of some skill and reputation. In 39 A.D., the ship he was on encountered a terribly violent storm. The storm destroyed the ship, and killed everyone on board, save Claudius. He awoke to find himself in a strange land; a land of cold, harsh climes, and primitive, grim, black-haired people. These people reminded him of the Germanic tribes with which he had some familiarity. Although it took time, Claudius bonded with these fierce people, proving himself in combat against enemy tribes that attempted to raid the lands of his newfound companions. Eventually, one of the tribes "adopted" him and he found a home.

Through many battles, he learned to generate the berserker fury that provided the warriors with untold might. He carved "One day home" in the blade of his sword to remind himself of his continuing desire to return home. One day, when out on a ship, a storm, similar to the one that deposited him in the strange new land, erupted with great fury, and as if a repeat of history, the storm destroyed his ship. He awoke to find himself in Africa; unfortunately, his wounds from the storm and wreck were too severe, and he died shortly after realizing where he had landed. Some aspect of his spirit remained trapped in the weapon, with the goals of killing and returning home. Claudius tapped into a dark force when he learned the berserker fury. If the sword returns to Italy, and is buried and consecrated, Claudius's spirit will rest at last, and the sword will lose its powers...

When a character draws blood with this weapon, he must roll a Will save against DC 24. If successful, the save must be checked again the next time he draws blood. If the saving throw fails, the character flies into a berserk rage, attacking the nearest living creatures. While in this rage, his Strength and Constitution both increase by +6 each (the Constitution increase provides +3 hit points per level), while his Intelligence and Wisdom both decrease by -6. He suffers a -2 penalty to Armor Class. These modifiers disappear when the fury ends, and the loss of the increased hit points may result in death.

While the character is in the grip of the fury, he cannot use any skills, feats, or other abilities that require concentration. This rage lasts for a number of rounds equal to (newly modified) Constitution modifier +3d6. After the rage ends, the character is exhausted for 3d6 minutes.

During the rage, the character's perceptions are altered; people become evil creatures; animals become evil creatures; cars become evil creatures. This altered perception causes him to lose 1d8 Sanity the first time he enters a rage, and one point every additional time he enters it.

Weight: 3 lbs.; Study Time: 1d4 days.

Damage: 1d6; Critical: 18-20/x2; Size: Small; Type: Slashing; provides a +1 enhancement bonus to attack and damage rolls.

Adventure Ideas

- The PCs are hired to recover the sword after it has been stolen from a friend's (or organization's) collection. When the sword is found, a fight ensues, and (optimally) one of the heroes will have to use it to defend himself and his companions.
- Someone known to the investigators has been arrested for a gruesome attack, performed with the sword. The PCs must find a way to prove that the person was not responsible for his actions.

Scepter of Luciano

Public Information

The Scepter of Luciano is a minor relic from a dark time in history. It belonged to one of the more successful, if lesser known, Inquisitors during the Spanish Inquisition. Luciano garnered many confessions, but the minor mention of him in historical texts indicate that he did not use torture or any of the other common methods of the period. Luciano rarely resorted to tactics other than interrogation; his prisoners usually gave the anticipated confessions. Luciano's success earned him several enemies within the ranks of his comrades. At the time of his death, most observers presumed the cause to be natural; today, scholars believe he was poisoned. Officials buried the scepter with Luciano. The scepter reappeared shortly after World War II, turning up in a recovered horde of stolen Nazi treasure. Spain claimed the scepter, but before the Allies could return it, the scepter disappeared.

The Scepter of Luciano is a short staff, three feet in length, made from oak, and plated with a thin sheet of silver. The silver plating is engraved with scores of tiny crosses. It is topped with a six-inch silver crucifix. The crucifix is crafted with such detail that individual hairs are distinguishable.

GM Information

A hermit monk created the scepter of Luciano in 683 A.D. The monk had turned from Christ, and lost all faith in God. He suffered through certain experiences that eventually drove him insane. He created the scepter, and other items, believing it would be used to abuse the general populace and that this would aid in the deterioration of faith. The scepter passed through many hands, until Luciano found it and put it to "good" use.

The scepter allows a character to compel others to say what the target believes the character wants to hear. In Luciano's case, the subjects believed that Luciano wanted to hear confessions to heresy and other crimes, thus, the victims confessed.

To use this ability, the character must concentrate his thoughts on the target while speaking to him, asking the questions that he wants answered. After 10 minutes of this, the target must roll a Will save against a DC of 15 - the character's Charisma modifier. If the saving throw fails, the subject says the words the character wants to hear, at least to the best of his ability. If the saving throw is successful, the subject is not magically compelled to respond, and is immune to the scepter for 24 hours.

The character can make it hard to resist the power of the scepter by continuing to speak to the subject. For every additional 10 minutes, the saving throw DC increases by +1, with no maximum. The intention to speak for an extended period must be announced before the power is applied. The power of the scepter cannot be used over mediums such as telephones, radios, video transmissions, etc.

Weight: 5 lbs.; Study Time: 2d6 weeks.

Adventure Idea

A PC's curiosity is sparked when a dear friend confesses to a recent murder. Investigation reveals that the interrogating officer, nicknamed "Fix" (short for crucifix), possesses the scepter, and uses it in his work. He claims that it helps to focus the suspect's concentration.

Schutzstaffel (S.S.) Dagger

Public Information

This dagger originally belonged to an S.S. officer in the concentration camp at Auschwitz. An American G.I. brought the dagger home with him after the war. The dagger has appeared a few times in the past 50 years, typically in pawn shops across the country.

This is a classically styled Schutzstaffel Dagger, made by Böker Solingen, 14.5 inches long, with a black handle, SS marks beneath the pommel cap, and the Nazi eagle insignia. "*Meine Ehre Heisst Treue*" (My Honor is [called] Loyalty) is engraved on the blade. The sheath is black zinc, with simulated silver fittings. The chain from this dagger is missing. Other than the missing chain, the dagger is in superior condition.

GM Information

Otto Bitterich owned this dagger, and routinely used it in acts of torture and murder, particularly against homosexuals. Eventually, Bitterich realized that Germany would not win the war and he took his own life with the dagger. This final act of violence sealed the pain of his countless victims in the weapon, along with a trace of his own perverse evil.

This weapon contains the emotional and spiritual pain of dozens of Nazi victims. Simply handling it leaves most people with a general feeling of unease. If used to draw blood, the pain in the blade affects the character wielding the weapon. Every time the character draws the blood of a living creature with the dagger, he must roll a Will save against DC 28. If successful, he loses one point of Sanity. If the saving throw fails, the pain of this blade's victims bombards the character; he is overwhelmed with their pain, humiliation, and suffering. This results in a loss of 1d6 each Wisdom and Charisma (both temporary), and 1d8 Sanity. Even after the lost Wisdom and Charisma return, the character will have a desire to inflict pain, and a sense of superiority over others.

On a second failed save, the character loses 1d6 each Wisdom and Charisma. This loss is temporary, except for one point of each that is permanent. In addition, he loses 1d10 Sanity, and the urge to inflict pain and death becomes stronger.

If he fails the saving throw a third time, he temporarily loses 1d6 Wisdom (one point is permanent), and permanently loses 1d6 points of Charisma. He also loses 4d4 Sanity, and develops an obsession with torturing and killing those deemed undesirable by the Nazis, with a preference for homosexuals.

From this point on, for every victim the character kills, he will lose one point of Sanity, and for every two victims, he loses one point of Charisma permanently.

The only way to end this obsession is to use a *cast out devil* spell. The resisting force has a different bonus to save, based on how often the saving throw from using the dagger has failed.

- Once: +6
- Twice: +12
- Three times: +18
- Each additional two victims after the third failure: +1

If the force is cast out, the character loses all obsessions with hunting Jews and homosexuals, but he retains full memory of what he has done.

Damage: 1d4; Critical: 19-20/x2; Range Increment: 10 ft.; Weight: 1 lb.; Type: Piercing.

Weight: 1 lb.; Study Time: 1d3 days.

Adventure Ideas

- A PC in law enforcement has to solve the recent murders of several homosexuals and Jews. The deaths appear to be caused by a straight-edged steel weapon. His investigation leads him to a suspect who is totally unexpected.
- The characters are asked to investigate the theft of a potent magical dagger. The dagger was stolen from the owner, who knows of its properties, and the thief may be the type to use it.

Secret Agent Gary 12-inch Action Figure

Public Information

Secret Agent Gary was one of the most popular cartoons in the 1980s. Unsurprisingly, the popularity of the program resulted in a large line of toys, including action figures, lunch boxes, collectible cards, stickers, kites, and so forth. This is one of the few surviving examples of the original line of Secret Agent Gary 12-inch figures. The warehouse that stored the original lot of figures burned to the ground before the figures could be distributed. Only 12 of the original figures survived the fire, and several individuals have owned this particular figure.

Secret Agent Gary is 12 inches tall, has blond hair, blue eyes, and a tight-lipped, determined expression. It wears a black covert operations uniform, and comes with a dress tuxedo and black sunglasses (the figure originally included additional accessories, but these did not survive the fire). Gary also comes with a Walther PPK pistol. His articulated waist, knees, elbows, and other joints allow for a wide range of positions.

GM Information

Daryl Foster, a television executive and occultist, spawned the idea of Secret Agent Gary. Once he created the cartoon, and talks of a toy line began, the idea came to him -- he would mass-produce enchanted toys that could spy for him. While most homes wouldn't be worth spying on, Daryl figured that several of the figures would end up in affluent homes. With his toy spies, he would be able to "get some dirt," enabling him to blackmail the families. Unfortunately, for Daryl, a group of paranormal investigators discovered his plan, burned the warehouse that stored the figures, and killed him.

Activating Gary requires a specific ritual that a character can learn through divinations or with diligent research (Research check DC 28 or higher). Once the character performs the ritual on Gary, he can bring Gary to life at will, see through Gary's eyes, and hear what Gary hears. Gary follows the character's mental commands, and the character can control him over distances as far as 1,000 miles. Gary is alive, and has a distinct personality and desires, but remains subject to the character's commands. As long as the character treats him well, Gary will not attempt to subvert those commands. Gary's personality is like that of a movie spy, but geared for more action. Gary also has an evil streak.

The GM will have to decide how many of the original 12 remaining figures are left.

Weight: 1/3 lb.; Study Time: 1d6 weeks.

Secret Agent Gary: Diminutive Humanoid (Lesser Independent Race); **HD:** 1/4 d8+1; hp: 2; **Init:** +4 (Dex); **Spd:** 15 ft.; **AC** 20 (+4 size, +4 Dex, +2 natural armor); **Atk** +4 ranged (tiny Walther PPK 1 point); **Face/Reach:** 1 ft. x 1 ft./0 ft.; **SQ:** Immunities, skilled; **SV** Fort +1, Ref +6, Will +0; **Str** 1; **Dex** 20; **Con** 13; **Int** 7; **Wis** 10; **Cha** 11; **Height** 1 ft., **weight** 5 ounces.

Skills: Climb +8, Hide +20, Listen +4, Move Silently +8, Search +6, Spot +4

Feats: Dodge

Special Qualities: Immunities (Gary is immune to gases, energy drains, ability drain, and ability damage), Skilled (Gary has four times the number of skill points for a creature of his type).

Skills: Gary's Climb skill is modified by his Dex, not Str. He is particularly good at finding things, and has a +4 racial bonus to Search checks.

Possessions: Walther PPK (This is a tiny version of the handgun. It does not appear to have moving parts, but it does fire bolts of magical force. Damage 1; Critical: x2; Capacity: Infinite; Range: 2 ft.; Rate: Multifire).

Adventure Idea

One of the PCs begins to feel as if he is being watched. If he attempts to discover his observers, eventually he finds Gary. The character will have to discover the secret of Secret Agent Gary and determine who is spying on him and why. Gary may or may not reveal information about his master, depending on how he has been treated by the master.

Skull of Pierre Market

Public Information

In 19th-century France, there existed a small cult of Satanists, led by Pierre Market. A goldsmith by trade, Market was an intelligent, charismatic, evil man, who led his cult in many dark, forbidden rituals. Many of these rituals involved the use of opium, and some involved the sacrifice of living creatures (both animal and human). Although Market was a bright person, many of his followers lacked an equal intelligence, and one night, after a bout of drunken bragging, authorities apprehended and interrogated one of the cultists. The cultist broke easily and gave authorities the names and locations of his fellow cult members. Within a few days authorities apprehended Market and most of his followers.

Market was charged and convicted of numerous criminal charges, and sentenced to death by decapitation. One of Market's few followers, an apprentice who had avoided the authorities, stole Market's head. He stripped the flesh and muscle from the head, leaving just the skull. He then began to add layers of gold foil to the skull. Eventually, the gold permeated the skull, and rose-colored pieces of glass were added to the eye sockets, resulting in an unusual artifact. Presumably, the cultist kept the skull, and it has appeared briefly several times in the past. At some point in time, the jawbone was lost, destroyed, or stolen.

The skull appears to be a golden human skull, with rose-colored glass set in the eye sockets. The gold is thinner in some spots, from years of handling, but it is not bare in any spot. The skull lacks a jawbone.

GM Information

When the cultist began the project, he didn't realize that a fragment of Market's spirit remained in the skull. He intended the skull to be a monument to his fallen master and their Dark Lord, but Market's spirit fragment channeled energy from the entity that he worshipped (unknown to the cultists, the entity was not Satan) into the skull, providing it with the ability to provide knowledge and power when properly fed. The skull channels the dark feelings and thoughts of the user to the entity that Market and his cultists worshipped. Once this entity is fed enough dark thoughts and emotions, he will be able to manifest in the world, and he is almost full.

The Skull acts as a teacher of occult knowledge. To use the skull properly, a human jawbone must be attached to it. To use the skull, a character must feed it. Initially, a character must feed it a finger from a living human being. The skull will then teach one spell. To use it again, the skull must be fed a full hand from a living human being. It will

then teach another spell. Then it must be fed an arm, a lung, a heart, and a brain. A new spell is learned each time. After teaching six spells, the skull will cease to function for that character.

Weight: 3 lbs.; Study Time: 1d4 weeks.

Adventure Ideas

- A PC antiquarian comes into possession of the golden jawbone, and someone wants it to complete the skull. The person who wants the jawbone may use money, or he may use force to acquire it.
- A PC, or acquaintance, is abducted by someone who possesses the skull. The abductor intends to feed the hero to the skull in return for the skull's power. . The hero must escape. Perhaps he will take the skull with him when he does.

Slave Tag

Public Information

This is a finely preserved copper tag, typical of the kind used to mark slaves in the United States during the 19th century. According to recovered inventories, the tag marked a man named Marcus Jackson. Jackson family history tells that Marcus eventually escaped his master and made his way north. The tag remained in the family as an heirloom. Recently, Eliza Jackson, a sixth generation Jackson, sold the tag.

The tag is a diamond-shaped piece of copper, one and a half inches across, worn smooth through the years, but still in remarkable condition. The engravings on the tag include the slave's number -- 1909; position -- servant; and the year of issue -- 1853. The upper tip has a hole drilled in it for the placement of a leather thong or strap.

GM Information

Marcus Jackson had been a rebellious slave, whose defiance resulted in frequent, often near fatal whippings and beatings. Even after Marcus escaped his master's grip, he could not find peace, and he wandered, moving from place to place frequently. Eventually, he did settle down and start a family, but his spirit never found tranquility. When he died, his essence became trapped in the tag that Marcus had never removed. This spiritual essence imbued the tag with supernatural properties.

When this tag is worn, it creates a feedback loop between the wearer and those who inflict damage upon him. Whenever the wearer is attacked and suffers physical damage, the attacker suffers from flashes of horrible inhuman images. The attacker must roll a Will saving throw against DC 18 or be stunned for one round. Also, if the saving throw fails, both the character and the attacker must roll Sanity checks (0/1). Even if the saving throw is successful, the attacker will have to roll again should he score another successful hit.

The tag does not begin to work immediately upon donning. It must be worn for one full day before its powers come into play, and if removed, the power is lost temporarily. If the tag is taken off, the character must wear it for one full day, without its protection, per hour that he did not wear it before it can reestablish the feedback loop again.

While the tag is worn, the character finds himself plagued by disturbing dreams, all centered on slavery. Usually he is the slave, suffering the punishments of a rebellious individual, but sometimes, he is the master, experiencing the thoughts and feelings incurred while whipping his property. These dreams are disturbing, and require the character to sleep for an additional two hours per night to actually receive the benefits of a good night's sleep. These dreams also require a Sanity check (0/1).

Weight: Negligible; Study Time: 2d6 days

Adventure Idea

James Walker, a young African-American activist recently came into possession of the tag. During a rally for reparations, he was beaten by a white riot cop. The cop was committed after the incident, apparently insane (his Sanity was already dangerously low). James believes he has gained some type of "righteous" power, perhaps from God, and has started instigating fights with police officers and other authority figures, in order to test his newfound ability. The PCs, either by virtue of knowing Walker or knowing someone who knows him, are asked to investigate the recent change in his behavior. Perhaps, someone believes he is possessed, and they must determine if this is the case.

Tom Harris Typewriter

Public Information

This typewriter originally belonged to the popular pulp author Tom Harris. Harris was actually a woman named Jennifer Reeves. Although Reeves' most popular character was the hard-fisted, good-hearted private investigator Clancy Jones, she wrote many other stories between 1931 and 1939, including fantasy, horror, and science fiction, all on this typewriter. On the night of October 30, 1939, Jennifer Reeves died in her New York home, a victim of a tragic, violent murder. Although stabbed numerous times, the authorities determined that the killing blow had been to her head, struck with the typewriter. Her murder is still unsolved and remains a popular subject among fans and amateur investigators.

The Harris typewriter is a LC Smith and Corona SC-P010 portable typewriter. The case is maroon with a few scratches, and a large dent in the front right corner. On the front of the typewriter, just below the key bank, is a strip of brass, with the engraving "There is no peace at the gate." The "N" and "P" keys stick.

GM Information

Jennifer Reeves was not human; she was one of the Serpent People. A talented sorcerer, she had a yearning to blend into human society, and in her attempts to do so, developed a fascination with human fiction, particularly detective stories. She tried to write a few stories, but she lacked talent and skill, and her first attempts suffered complete rejection. Jennifer set about enchanting a typewriter that could turn her printed babbling into fine fiction, and she succeeded. Her first story with the new typewriter, *Death in Crookmont*, was a success, as were the following stories. In 1939, a rogue government group killed Reeves in her home.

This typewriter allows a character to produce well crafted written works, even if she lacks any skill or talent. The device interprets the style that she is attempting, and prints a corrected version of what she types. For example, if the character types "ther wuz a bap smell ovur the towown that nite, but I ignored it, payin attenshun to my victim," it might print as "While trailing my quarry, I managed to ignore the foul stench that hung in the air like the smoke in the corner bar." The character must have a clear vision of what she is attempting to describe.

With the proper knowledge and skill, it is possible that more powers may be invoked with the typewriter.

Weight: 18 lbs.; Study Time: 2d6 days.

Adventure Idea

The characters' attention is brought to a recent best-selling series of books. These books talk about places and things "man was not meant to know," and if the PCs have had such experiences, they realize that the books must be stopped. The books are being written by a being that has the ultimate goal of awakening Cthulhu.

Water Clock

Public Information

Steven Van Ellan, an elderly and prominent businessman in the American Colonies, commissioned this water clock in 1774. Four years after he received the clock, Van Ellan and his entire family were killed in a fire. The clock remained unscathed. Plantation owner John Hamilton purchased the clock at an auction. The clock stayed with the Hamilton line until the Civil War, when Confederate General Robert Hampton claimed it as "spoils of war." The Hampton family retained the clock until 1930, when they sold it to account for debts owed. The clock has since passed through numerous hands.

This water clock stands seven feet in height, and is crafted from fine mahogany and oak, with gold inlays. The water vessels are made of silver, and hold six gallons of water, using one quart per hour. The clock face is gold, with silver inlays depicting children.

GM Information

This water clock was built by Karl Neumann, a clock smith of some repute. Neumann, in addition to being a clock smith, was also a dabbler in the occult. Steven Van Ellan discovered Neumann's occult background and came up with the idea for the clock. To persuade Neumann, Van Ellan threatened to reveal Neumann's heretical ways. Fearful for his life, Neumann agreed to build the clock, designed to turn back time.

Although a long process, Neumann was successful in the building and enchanting of the clock. After receiving the clock, Van Ellan, a murderous individual, had Neumann killed. Prepared for this outcome, Neumann uttered a spell with his dying breath that cursed the clock, triggering the requirement for the continual flow of blood to prevent unnatural aging. Shortly after Neumann's death, a sect of witch hunters killed Van Ellan and his family. The hunters knew nothing of the clock and left it.

This item functions properly as a typical water clock unless blood is used instead of water. When blood is used in the clock, the hands of the clock move backwards, reversing time for those near it. When blood is used in the clock, every hour marked by the clock reduces the physical age of every creature within 30 feet by seven days. If someone spent 24 hours in the presence of the clock, he would have his physical age reduced by 168 days (approximately five and a half months). This powerful magic allows those within range to regain more youthful forms, albeit slowly.

After the clock runs through a full cycle of blood (six gallons), the blood loses its potency and must be replaced. Regardless of how often the clock is used, it cannot reduce a person's physical age to less than one-half their actual age. If the clock is used to reduce a person's age by more than 25%, that person becomes tied to the blood in the clock; for every hour that the clock runs without blood, beyond this point, that person is physically aged by two years. This can result in aging of the body beyond the person's actual age.

Weight: 75 lbs.; Study Time: 2d4 weeks.

Adventure Idea

A wealthy PC is invited by an acquaintance to attend a small, intimate weekend gathering. The "friend" intends to run the clock with fresh blood. He hopes that by reducing the physical age of his acquaintances, he will gain influence over them. By controlling their access to the clock, he will control them. The PC must find a way to prevent, or slow the effects of the clock.

Atomic Zombies of the Pacific

An Adventure for *All Flesh Must Be Eaten*

by Matt Riggsby

"We found the one spot that hadn't been touched by the war and blew it to hell."

--Bob Hope, on Operation Crossroads

After the United States' nuclear-powered victory in World War II, the military was eager to play with their new toy and see how well the A-bomb really performed. The ashes of Nagasaki and Hiroshima had hardly cooled when atomic testing began the Bikini atoll, part of the Marshall Island chain in the eastern Pacific. In our world, the islands remain a largely deserted relic of the dawn of the atomic age, but in this adventure, past violence has come back to haunt the present.

This adventure could be set at any time from the late 1940s to the present (or, indeed, into the near future), although the closer the adventure is set to the original tests, the greater the threat will be of residual radiation and the greater the pressure of the Cold War. Most of the PCs should be scientists or military, police, or security personnel, but the odd sailor, pilot, or journalist could fit in as well. They will be called upon to investigate the mysterious disappearance of a group of scientists from a location which is, if not off-limits, then at least sensitive. At least some of the characters should have skill with diving, for reasons which will become clear. Stats are presented for *All Flesh Must Be Eaten*, but this scenario could fit into a number of modern-day games (this adventure doesn't present an entire Deadworld as such, but depending on the origin of the atomic zombies, one could be derived from it). It's a fairly straightforward scenario for *Call of Cthulhu* or *Delta Green*, or a curve ball for a more conventional espionage or military game.

Operation Crossroads

In the summer of 1946, the US Navy brought a collection of obsolete vessels ranging from landing boats and floating drydocks to capital ships to the Bikini atoll. Among the ships were the American aircraft carrier USS Saratoga, the German cruiser Prinz Eugen, and the Japanese battleship Nagata, one-time flagship of the imperial fleet; the Nagata had been pressed into service for the operation so quickly and Japanese capabilities were so strained at the end of the war that the bodies of as many as a hundred of the crew killed in its last action were still aboard.

The derelict fleet was brought to this collection of small Pacific islands for Operation Crossroads. Crossroads was the first postwar test of nuclear weapons. The object was to see how nuclear blasts would affect a fleet at sea. Once the 170 native Bikinians were whisked away to safer locations and permanent refugee status, two bombs were detonated: Abel was an air burst, Baker was set off at the surface. The immediate effect was, for some, disappointing. No vessels were vaporized (though several were tossed about impressively by Baker) and the only major ships to sink were those relatively close to the blast. Nevertheless, analysts determined that, although an atom bomb wouldn't immediately send a fleet to the bottom, damage to equipment and injuries to crew would disable it just as certainly. And crews examining the vessels discovered a new problem: they just couldn't get the radiation off. Scrubbing the decks of the ships with a wide variety of cleaning products didn't clear the ships of radioactivity; the initial blast had made the metal itself faintly radioactive.

Through the 40s and 50s, the Bikini atoll was subjected to further atomic tests, including the detonation of the first H-bomb, which destroyed three of the atoll's islands. But as above-ground testing went out of fashion at the end of the 50's, the islands were abandoned to be visited occasionally by scientists measuring the long-term effects of the many blasts, scuba enthusiasts diving the wrecks sunk by Crossroads, and representatives of the native Bikinians, who still want to return home. And the wrecks of the Crossroads fleet remain at the bottom of the lagoon, stewing under a layer of faintly radioactive mud.

Welcome to Bikini

As the adventure opens, the agency the PCs work for has received word that a party of five government scientists, along with a few support personnel, studying long-term effects of radiation on Bikini and the state of the sunken fleet in the lagoon has vanished. The last radio contact was four days ago, and the weekly supply boat which visited them found their camp empty of people and in disarray. Some windows were broken, a tent or two knocked over, and papers scattered. Because of the importance of the missing people and the sensitivity of the location, the government isn't trusting the search and rescue mission to the local authorities. The PCs are dispatched to the island to find out what happened to them. In addition to whatever other gear they bring, they will be provided with at least a week's worth of food, medical supplies, maps, scuba gear, and a boat or an aircraft (there's a small landing strip) large enough to carry them and, hopefully, the five scientists. However, if they need later assistance, it would take at least a day for another boat to reach the island and even longer to organize and dispatch specialized gear or heavily armed support.

The Bikini atoll describes a rough oval about eight by twenty miles, the skeletons of endless generations of coral grown up on long-extinct volcanoes. Background radiation is low enough that scientific and tourist parties can spend weeks at a time there, although permanent occupation will expose residence to more radiation than is considered safe. The risk is long term, increased chance of cancer and the like rather than radiation burns.

Bikini Islands

If one can ignore the circumstances of the PCs' visit and forget that some of the curves in the shorelines were caused by hydrogen bomb blasts, the atoll borders on idyllic. It consists mostly of white sand beach, with thick patches of vegetation above high tide level. Bikini is the largest of the islands, perhaps two and a half miles long and a quarter mile across. The remains of bunkers, water tanks, and observation posts can be found through the atoll, but most are overgrown. Only a small research station currently serves as shelter; visitors must bring their own tents to sleep in.

When the PCs arrive, they'll find things in rather worse shape than described. The station proper is (or, at least, was)

simply a small laboratory for basic chemical and radiological research, with stocks of chemicals, glassware, and measuring equipment, and a generator to power lights, equipment, and a long-range radio. Visitors had to bring their own tents to sleep in. However, the PCs will discover that the lab has been ransacked, with the entire contents either smashed or removed. Also removed is the generator and the large tank that supplied it with fuel. All of the tents have collapsed or been knocked over, and papers can be found scattered far and wide by the wind. There are no bodies immediately in evidence, but one of the tents is badly bloodstained. If the PCs think to gather up the scattered papers (they could easily spend two or three hours doing so) or dig around in the debris of the laboratory, a character with appropriate scientific skills will be able to figure out that they indicate higher-than-expected levels of radioactivity in the lagoon. A more careful analysis will indicate that the team was spending more and more time underwater.

Expanding their search, what they find will provide more questions than answers. The boat dock near the research station has also been stripped of all useful equipment, some of it forcibly (they'll notice this first if they arrive by sea), although the small fuel dump and tool shed by the airstrip is so far untouched. A survey of any relatively clear areas on the island will also reveal a number of footprints. Expert trackers will notice that some of them are very fresh, perhaps made within the last day or two, long after contact with the island was lost. They may also find a few locations where the vegetation has been recently torn up. Some will be simply holes in the ground, where something has clearly been ripped from the ground, but there will be remains in others: cinder-block foundations for old, collapsed buildings, the bases of old towers once used to hold detection equipment, and so on. In each case, the vegetation from there to the lagoon will show signs of damage, as if heavy objects were carried or dragged through.

Particularly sharp-eyed characters may notice broken-open coconuts and the remains of a few large fish well inland, suggesting that someone or something is has been eating them recently. If they have infrared sensing gear, they will catch glimpses of a relatively large (a human, large dog or ape, small deer, or similarly sized creature) in the small but thick forest that covers Bikini proper, but it will flee if they move in its direction. They may even hear something moving though the underbrush. Nothing larger than a moderately-sized bird is native to Bikini, so alert PCs will probably start to wonder what's in the woods and why it's avoiding them.

Staying On The Surface

If the PCs don't hit the water, they can find little information on their own. They'll find out enough in time, but it may be too late to do them any good.

Whatever is eating the fish and coconuts and keeping an eye on the PCs is reasonably clever, but not infallible, and a careful attempt to surround it or drive it into the open will eventually succeed. "It," as it happens, is Kessai, a native Bikinian who came to the island with the scientific team as a guide, observer for his people, and general assistant. He has been surviving on what food he could gather for the past several days while staying under cover and on the move as much as possible. He saw the PCs from a distance, but wasn't sure that it would be safe to approach them. Why? He's got a story:

The expedition to the atoll was unremarkable until about a week ago, about the time the outside world lost contact with them. One of the scientists had mentioned that, during the day's dive, he had seen some glowing spots underwater, apparently moving under their own power. Bioluminescent fish at such shallow depths would be a remarkable discovery, but they had been sufficiently far away that he simply noted the fact, intending to get a closer look on the next day's dive. He never got the chance. That night, a number of bloated, faintly glowing, man-like shapes swarmed over the camp, attacking the scientists and carrying off their equipment. Kessai was lucky enough to be visiting the latrine when the attack started, so he was awake and a bit away from the camp, giving him the chance to flee. He hasn't seen any of the scientists since. The creatures returned to the island the next two nights, coming out of the lagoon and methodically tearing apart the scientists' camp and research station, while Kessai watched from a distance, making sure they didn't get too close to him. He believes that they have come onto the island farther up and down the shoreline as well and quite possibly onto other islands in the atoll, although he hasn't gone to look. The PCs will probably correctly conclude that the scientists are dead, but they're still charged with figuring out what happened to them.

If the PCs inspect the other islands, they'll find that a few remnants of old structures have been torn out there as well, and drag marks indicating heavy objects will again lead back to the lagoon. If they inspect the sites closely, they'll

eventually come across a few scraps of cloth torn off on branches. Characters with particularly deep knowledge of military history will recognize insignia of the Imperial Japanese Navy.

If the PCs find themselves on islands other than Bikini at night, there's a 1 in 6 chance that they'll run into a party of five to ten atomic zombies searching for parts (see below for zombie stats). If they're keeping watch around the lagoon, a pair of binoculars might pick out a group of zombies coming out of the lagoon, but their dim glow could easily be mistaken for a reflection of the moon or stars. If the PCs don't venture underwater or otherwise disturb the lagoon, their boat or plane will be attacked on their third night and any useful equipment and fuel dragged off. Attacks on a boat will be particularly difficult to defend against, since the atomic zombies will be attacking it from *underneath*, tearing it open below the waterline. If the PCs are present for but survive that attack, the zombies will be out in force the next and every night thereafter, trying to find and kill them.

Underwater

Underwater Map

The water of the lagoon is warm and clear, but even in the crystalline waters of the Pacific, visibility at 170 feet is limited to the range of a flashlight. A little careful navigation can get divers right above the ships they want to see, but it's a long, dark way down. Nineteen sunken craft litter the bottom, rusting and covered with silt and sea growth. They are scattered over an area with a radius of about a mile, with the largest ships tending closer to the center. Ground zero for the Abel and Baker blasts is about three miles southwest of Bikini island.

The missing scientists started by inspecting smaller vessels. If the PCs do so, they'll find very little except for slightly higher than expected radiation levels. Particularly observant PCs may notice that one or two of the smaller vessels the scientists didn't inspect are missing. Close investigation will show broken and displaced coral, depressions in the silt where vessels once lay, and enormous drag marks pointing in the general direction of ground zero of the original Abel and Baker blasts.

As they close in on ground zero, they'll start to see faint glowing spots moving through the water near the bottom, but it'll be difficult to tell exactly what until they get very close because of the darkness and silt being kicked up. Those spots of light become more plentiful near the remains of the battleship Nagato, although they'll also see some around the Saratoga and, in the appropriate scenario, the Prinz Eugen (see "What Bikini Leaves To The Imagination"). Geiger counters will indicate even higher levels of radiation in those areas, most notably the Prinz Eugen.

The spots of light are, of course, atomic zombies, but getting close enough to them to confirm that and figure out what they're doing is extremely dangerous. Unless the PCs have brought some kind of extra propulsion with them, the zombies are actually faster than they are underwater, although no less clumsy than on land. If the zombies spot the PCs, they will give chase. They will hesitate before leaving the water in daylight, but otherwise will not give up the chase until the PCs are dead or they are themselves destroyed.

But should the PCs come within flashlight range of the zombie-infested ships, they'll see that the atomic zombies are carrying out repairs, using the remains of other ships and equipment from the surface for materials and spare parts. The ships are still old, rusty, battered, and at the bottom of the lagoon, but crude repairs have clearly been made to their hulls. The zombies themselves, the deceased crew of the Nagato, are wearing decayed and tattered Japanese naval uniforms and faintly glow in the dark.

So what revived them? Why are they repairing the old ships? Just what's going on? The GM has a number of choices . . .

What Bikini Leaves To The Imagination

Depending on the campaign, several possibilities suggest themselves:

Deutschland Über Alles: Unknown to the PCs, the Prinz Eugen was the world's first nuclear-powered vessel, its unique power plant installed as a last-ditch experiment by German mad scientists in November of 1944. In this scenario, the zombies have been animated by an unexpected side effect of the reactor's unusual (and, some might say, unholy) design. The dead Japanese entombed in the Nagato have risen and are now taking steps to continue their fight against the Americans, one of the few specific aims left in their undead brains. By a combination of force of will and weird science, they'll eventually relaunch the Nagato, the Saratoga, and the Prinz Eugen and attack America (or, at least, American ships). Dismantling the reactor will cut off the zombies' power supply (a constant stream of zombies into and out of the Prinz Eugen may tip them off that that ship holds the answer), and they'll become weaker in hours and inactive before the day is out.

Magic Of The Islands: Some of the Bikinians have decided to take direct action against their oppressors. Using native magic, they have raised the dead and are well on the way towards using them as part of a hideous plot for revenge on the United States Navy. Kessai, in this scenario, is a magician, the one actually casting spells and directing the zombies (although not with any great degree of control; through magic rituals, he can animate the dead and give them general goals, but he can't give them direct orders and is in as much danger from the zombies as the PCs are if they catch up with him). Again, the zombies are trying to raise the ships and attack America. In this scenario, Kessai has to perform rituals nightly to maintain his spell; if he can be stopped, the zombies will become inactive by the next morning.

It's Old Man Withers From The Amusement Park!: Finally, there's the Scooby Doo option: the zombies are fakes. This might make a surprising

You Can't Handle The Truth

We're glossing over a few facts for dramatic purposes, but in case anyone's interested: Bikini Atoll hasn't been *completely* deserted since the atomic tests. It was reoccupied by the natives for most of the 1970s. However, they were forced to abandon the atoll again when it was discovered that radioactive cesium levels in the soil were too high. Visitors after that point will discover the remains of the village that was built for them, only to be abandoned again. Radioactive isotope levels are still too high for agriculture and therefore permanent residents, but the atoll was opened for scuba diving in 1996, and the sunken fleet has become a popular destination for adventurous divers. The atoll

change of pace in a supernatural campaign, or a double-cross in a mundane campaign (the players may be led to believe that the GM is changing the campaign to include supernatural elements; won't they be surprised when they find out the truth?). A secret organization (devious Communists, a top-secret American agency, a surviving faction of Nazis or Japanese, etc.) has set up shop at the bottom of the lagoon. They're turning the sunken ships into a secret submarine base from which to research the remnants of the atomic bomb tests and thereby reverse-engineer nuclear weapons. The so-called zombies are actually agents in disguised wet suits attempting to scare off potential interlopers.

Saying Farewell To The Islands

The climax of this adventure will have the PCs either discovering a nest of zombies underwater or being subjected to constant zombie attacks, with any possible backup at least a day or two away. Unless they manage to finger the Prinz Eugen or Kessai as the cause, it's going to be a running battle for survival through the ruins of old warships or the small but thick jungles of the atoll (in the Scooby scenario, there's no easy way to fix the problem, but at least there aren't really any zombies).

Assuming they live through it, it may not be over yet. No matter what, the PCs have first hand knowledge of a new and strange threat to world peace. If the zombies were raised by a German nuclear reactor, the PCs may be sent to investigate other toxic relics of the Nazi past. If Kessai is at fault, the PCs may find themselves on the front line of a secret war between Polynesian shamans and western secret agents. If it's a secret organization, their well-heeled sponsors will have to be tracked down. No matter what, though, they'll never look at recreational scuba diving the same way again.

Atomic Zombie Stats

Getting around: Slow and steady; aquatic

Weak spot: Head

Strength: Strong like bull; Iron Grip

Senses: Like the dead

Sustenance: For "Deutschland Über Alles," the zombies require proximity to the Prinz Eugen's reactor to keep their batteries charged, as it were. For "Magic of the Islands," they're maintained by Kessai's rituals.

Intelligence: Teamwork

Spreading the love: NA; these zombies are generated by either magic or post-mortem exposure to weird Nazi radiation.

Skills: Brawling 1; presumably, the zombies also have residual skills in shipfitting and ship handling.

Although the atomic zombies are, in fact, faintly radioactive, their glow is a secondary effect of either unusual radiation or Bikinian magic. They display a sort of hive intelligence and are deadliest in large numbers, when they can coordinate their individually clumsy actions.

now hosts growing research facilities, a base for construction and radiological cleanup, and bare-bones resort facilities for scuba divers. If the adventure is set after the mid-1990s, the whole resort will have been trashed by the time the PCs get there, and as many as a dozen tourists and a few dive operators will be missing along with the scientists.

Oh, and the Prinz Eugen was damaged at Bikini, but not sunk there. It capsized in shallow water at the nearby Kwajalein atoll a few months after the initial Bikini tests and its stern can still be seen protruding from the water today. If you're using the "Deutschland Über Alles" scenario, you'll have to tweak history a bit.

Pyramid Review

The Count of Carcassonne (for Carcassonne)

Published by [Rio Grande Games](#)

Designed by Klaus-Jürgen Wrede

12 full-color tiles, wooden count pawn, rules sheet; \$6.00

When you hit on a good idea with a game but you can't go bigger with it, the easiest thing to do would seem to be go smaller. [Carcassonne](#) has had more than its share of success, and parlayed that into at least four other versions of the main game, but some of its supplements these days are positively miniscule. Meet ***The Count of Carcassonne***.

This set, which comes in a container about the size of an engagement ring display box, comprises 12 tiles -- the same type as those used in the Carcassonne game, but they are used in place of the starting tile from that product. Arranged in three rows of four, they form a picture of the city of Carcassonne, complete with four city quarters: the market, the cathedral, the blacksmith, and the castle. A special wooden pawn, the count, is included and starts play in the castle. (Presumably this new starting point counts as one of the cities for which farms will score at the end of the game -- the rules don't spell that out.)

The game proceeds normally (if the river is being used, players put the spring adjacent to the city and move outward from there before getting underway). With this set in use, if a player places a tile that scores points for one or more opponents while gaining nothing himself, he is allowed to place one of his pawns in any quarter of the city. At this point he may also move the count from one city quarter to another. This "meeple" is now stored and may be used later in the game to shift the scoring. Who gets points for a map feature depends on the number of pawns players have committed to it, and the count provides a mechanic for changing the numbers.

Which features the pawn can enter depends on the quarter it occupies. For example, a unit in the castle quarter can be used when someone finished up a city -- if your opponent had one pawn in a completed city, your stockpiled meeple could be throw in, and the two of you, now tied with one follower each on that feature, would have to share the points. Pawns at the blacksmith's change the scores for completed roads, those in the cathedral work in a cloister, and a piece in the market can tilt the meeple count on the farms at the end of the game. Although he moves from one sector to another, the count never leaves the city, and more importantly no pawns can be pulled from his current quarter to change scores -- players may use the count to block the use of the spare counters.

The tiles are the same as those in the original, both in material and artwork, so quality isn't an issue. The pieces even have numbers on the backs to make it easier to construct the "puzzle" pieces quickly. The count is made of wood just as the other pawns are, though it's about twice their size. The one real complaint is the city's layout: Don't lose the instruction sheet, lest you forget which quarters are which. The diagram in the rules is clear -- each quarter is labeled with text there -- but the city picture you build is only visual. You may remember the quarters and the features to which each corresponds; then again, after leaving the game in the closet for a month, you may forget. Not every city feature is as easy to identify as the cathedral, and including small written labels like those in ***Carcassonne: The City*** wouldn't have killed anyone.

The Count of Carcassonne is another nice supplement for the system, but on the other hand...it's another supplement for the system. This one is easily compatible with the many other sets and, unlike the ***King & Scout*** add-on that had tiles for two different versions of the game, it doesn't require any of them to be useful and interesting. But so many of these supplements, while they're an inexpensive way to perk up the game, begin to have a cascading effect. If you use all of them, they interact in more and more ways and make it harder to develop a consistent strategy. Worse, it alters

one of the game's longest-standing rules -- that of maneuvering to have the most pieces on a tile feature -- which may upset the purists.

But given how modular all these components are, you can add and subtract what you like and play the version that suits you best. That you can make these decisions for less than you'd pay for a fast-food combo meal means ***The Count of Carcassonne*** is a real bargain.

Don't Walk in Winter Woods: A Game of Folkloric Fear

Published by Xolis.net

Written by Clint Krause

17-Page PDF Document; \$5.00

Don't Walk in Winter Woods: A Game of Folkloric Fear is a storytelling game that encourages the telling of tales around a campfire on a cold winter's night. As the title suggests these tales should be about our fear of the unknown that lies inside the eerie gloom of the woods that stand forebodingly on the very edge of the village. The game falls into the genre of the dark whimsy, that of the American Gothic, best typified by Half Meme Press' [My life With Master](#), Atlas Games' [Gloom -- The Game of Inauspicious Incidents & Grave Consequences](#), and Ronin Arts' *Vs. Monsters*. Its inspirations are given in movie terms as *The Blair Witch Project* and *Brotherhood of the Wolf*, but more obviously are Tim Burton's *Sleepy Hollow* and M. Night Shyamalan's *The Village*, particularly the latter. This shows in the setting of the game, an unnamed and isolated settlement in late 18th century post-revolution America, on the edge of a forest with a forbidding presence and an ominous reputation.

Designed for three to four players, plus the Watcher (or GM), the intention of the designer of *Don't Walk in Winter Woods* is that it be played somewhere cold and dark. So if not out in the woods or around a campfire, it is probably best to turn down the light and leave the windows open. The game's mechanics require no more than a single six-sided die along with six beads per player. No character sheet is needed as the process of character creation extends just as far as a name, an occupation, and a reason for entering the Winter Wood.

A character has just a single statistic: the Cold. Cold points are acquired over the course of a game or storytelling session, given out by the Watcher. Cold works as a measure of the mental and physical suffering that a character takes over the course of the tale. At the beginning of a game, prior to entering the Winter Woods, a character's Cold is equal to zero. It rises to one as soon as the Woods are entered, at which point it becomes the attribute against which any kind of action is rolled against. This can include attempting to listen for strange noises, attempting to sneak up on the isolated cabin deep in the Woods, or to discharge a musket at an enraged bear. At which point the player rolls the die with a result higher than his character's current Cold points being a success, while anything equal to, or less than his Cold points, means a failure.

More Cold points come from being bashed, stabbed, shot, or falling, or from sharp shocks, frights, and other encounters with the supernaturally inexplicable. Eventually the character will suffer enough blows and scares that he is given his sixth Cold point. At this point, he is incapable of further action, having been rendered unconscious from severe wounds or profound horror, modelled in game terms by the fact that a player cannot roll above six on the die. The concept of having an attribute become more difficult to roll against as it is reduced by an in-game effect is not new, having been pioneered by the Sanity rules of Chaosium's [Call of Cthulhu](#), but *Don't Walk in Winter Wood* takes it a step further by applying it to a character's physical state as well as his mental one. The author goes further though, reducing the concept to a simple elegance, the effect of which is that the game's mechanics do not impinge either the play or the storytelling.

The latter because the game is played by telling a story. These cannot be told or played in the traditional first person, present tense of most RPGs. Rather, all actions are described in the third person, past tense. Thus not, "I [as Ephraim Fletcher] will stop and wait at the edge of the clearing and listen," but "Ephraim Fletcher tarried at the edge of the clearing's edge and cupped a hand to his ear to better capture the sounds of the forest." At which point, the player would of course, roll against Ephraim's Cold points. Players wanting more detail in the rules, or disliking the fact that

it is very much up to the Watcher to describe the effects of their actions, rather than having them dictated by the roll of the die, should of course, look elsewhere.

Beyond the simplicity of the rules, the bulk of ***Don't Walk in Winter Wood*** is given over to describing a sample setting simply known as the Village. The self-sufficient and isolated settlement directly abuts the Winter Woods, known for the chills within and for its long history of strange happenings. Many of the Village's legends are associated with the local Indians, while others tie into tales of witchcraft and missing children. Despite its reputation, the characters have little choice but to enter Winter Wood, whether to look for a missing child, to track down the creature responsible for the spate of recent cattle mutilations, to locate the rare herbs needed to cure a sick villager, or just to obtain food at a time of crop failure. These are just starting points, as the legends, but there is also a ready-to-play adventure, "The Witch's Curse," included with the game.

Don't Walk in Winter Wood is so rules light that it can played without reference to its rules. And together with the beads handed out as Cold points, might prove an encumbrance on a camping trip. If so, then the beads could easily be replaced by a player counting the Cold points gained on the fingers of one hand. After all, it is not absolutely necessary to hand out *that* sixth Cold point, and nor is it necessary for players to have six fingers on the one hand.

There is a vagueness to ***Don't Walk in Winter Wood***, but where that would be a problem in other games, here it is the point. The stories told through ***Don't Walk in Winter Wood*** refer back to legends, folklore, tales, and possible events that date back hundreds of years. Thus nothing in this game, beyond the rules for Cold points, can be described as definite or absolute. Yet this does not mean that the game is lacking in terms of information that could inspire the Watcher to create tales of his own.

While the mechanics of Cold points are a simple and polished method of handling a character's mental state, they also serve to model the narrative structure of the game's genre. The degree of peril increasing as the tale progresses and draws closer to its denouement all reflected in the growing difficulty of character actions as more Cold points are handed out. All the game needs then is the Watcher to inspire the right mood of fear and disquiet, because otherwise, ***Don't Walk in Winter Woods: A Game of Folkloric Fear*** is an idea well executed.

Th3 Numb3rs Gam3

I've been giving way too much thought to game design issues lately, working out game mechanics at my Day Job for the forthcoming [FNORD], the still-in-development [DELETED], and the nascent [YOU'RE NOT CLEARED FOR THAT]. So I've been crunching numbers, running through a jillion mental permutations, and devising a thousand off-case scenarios. Remember: Working for a game company is fun.

Anyway, I think I've come across a secret in game design – a secret that's quite probably obvious to many of you, but one that I've come to greatly appreciate as I've been working on various projects. In fact, it's one I used yesterday on my Day Job's daily-or-so blog – [the one I'd never be so crass as to promote here](#).

I'm coming to realize that, in as many ways as I can, I'm going to try to derive numbers from other numbers in gaming. For a surprising number of games, I've discovered an elegance to figuring out what went wrong or right with a roll, and using that number elsewhere.

An easy example is the classic *Dungeons & Dragons* game. I haven't kept up with the *d20 System* much (despite, erm, having worked on a magazine devoted to it for almost a year and creating an adventure for it), but I think it's similar to older versions of the game, where one's attack roll doesn't have any bearing on damage. If that's the case, then an option to make things more interesting would be to apply the difference between the resultant attack roll and the necessary attack roll to the damage. (Thus if you needed a 12 to hit and you rolled an 18, you'd get an extra 6 points of damage.) While making melee more deadly – since everyone would deal more damage – it might also speed up combats a bit, which I've always had a hard time with when I've played.

As another example, the classic game Yacht (Or *Yahtzee*, for those of you playing the crass commercial version) revolves entirely around numbers – particularly number of dice and number of rolls. One variant I came up with a while ago was the ability to "bank" rolls; that is, if you only use two of your three rolls, then you can save that third roll to use again in a later turn (probably when you utterly fail to get anything good on your first three allowed rolls). However, as another option, what if, instead of saving banked rolls for rolls in the future, you were instead saving those rolls to turn into additional dice for future rolls? You would only get those extra dice for one roll (and not one round of three rolls), so you'd need to choose carefully when you want a fist-full of dice.

As a slightly tangential example, let's take the game *Monopoly*. (Please!) One of the problems with this "perennial classic" (Latin for "overrated and/or boring") is that the player does very little playing for much of the game; there isn't much strategy beyond deciding whether or not you should buy a property you land on (yes), whether or not you should pay to get out of jail (almost always yes), or whether or not you should build property (probably). Most of the "strategy" of the game boils down to haggling and making deals with other players; unfortunately, there is almost always a mathematically "better" deal on one of the two halves of any trade in the game (pretty much only tempered by the luck of the dice), so in any trade there's going to be a sucker and a suckee. (Besides the inherent "suckee"-ness of the game itself, that is . . .)

To offer a completely untested option: What if you instituted a new rule that gave players a new choice . . . one that wasn't *too* attractive, but offered much more strategy and control for the player. (And one that took the values of existing numbers and used them.) Namely, paying to modify roll results.

In this variant, I'd probably break the game down into two stages: Before all the properties are owned and after. Before they're all owned, players may choose – after they rolled the dice – to modify their roll by 1 for every \$100 they spend. For example, if a player rolled a 9 and he really needed an 11, he could pay \$200 to change his die roll to an 11. After all the properties are owned, the \$100-per-pip turns into a \$1,000 per pip. (Thus turning that 2 into a 12 would cost \$10,000.)

It would be up to the group to decide how this played out: Could you modify a roll to above or below what's possible, such as buying a 1 or 13? (I'd say no.) Can you "buy" a doubles roll, to go again? (I'd say no.) Can you modify the result of a doubles roll, and still roll again? (I'd say yes.)

Numbers come into play because, in my back-of-the-envelope calculations, each extra (or fewer) "square" comes to be worth about \$100 at the beginning of the game – is the Reading Railroad *really* worth an extra \$100 or \$200? However, it should have the effect of allowing people to complete monopolies much more quickly, since they could get it "naturally" rather than rely on another player's goodwill or bad decision.

By the end of the game, I calculate that \$1,000 is going to be slightly more or less than a maxed-out property value. But, since most properties are within 1 or 2 of each other, you generally will need to pay at least \$2,000 to avoid another player's completed property.

Another interesting aspect of this variant is that it destroys capital; the other players don't get these payments, but they go back into the bank. (Whatever you do, I recommend against putting this money into the center as part of the Free Parking freak-of-nature optional rule.)

In all, most games revolve around numbers in some way. And those numbers are surprisingly similar – or so easily translated into other situations that it doesn't take much thought. A -3 penalty here can just as easily turn into a +3 bonus elsewhere. Just so long as the modifiers are consistent or used on all sides (so a modifier doesn't give one group a big bonus), it should be fine.

Play with the numbers and see what you can come up with. You might breathe life into an old favorite, or tweak a game more to your liking. Who knows? You can't juggle the numbers any worse than most dot-com accountants.

--Steven Marsh

Icosahedron Adventures

Tudor's Guide to Angel's Harbor (Part II) Organizations and Neighborhoods of a Modern Superheroic *d20* System Campaign

by Owen K.C. Stephens

Editor's Note: The first part of this two-part series appeared [last week](#). To the archives, sidekick!

Businesses, Companies and Corporations

A number of corporations are based in Angel's Harbor, with most found in the Circuit.

Café Justice

Café Justice is a nation chain of superhero-themed restaurants, with its corporate headquarters in Angel's Harbor. Each restaurant has a unique collection of hero and villain memorabilia, as well as a selection of "secret-base" decor and a gift shop. The spokesman for Café Justice is, of course, Captain Justice, a caped superhero who never does commercials, but does show up for grand openings, and occasionally eats in the VIP section of restaurants in larger cities, especially in Angel's Harbor. The company was making money easily in the 1990s, but has suffered some in the new millennium, largely because its restaurants don't seem as new or hip as they were in their first decade.

Information Checks

- **DC 10:** The vast majority of the memorabilia in a Café Justice is fake, though often made from molds taken of actual hero and villain apparel. In particular, nothing dangerous is ever real. Occasionally bits of hero costumes and equipment used by minor local villains are genuine.
- **DC 15:** Café Justice legally licenses the materials and images it uses from heroes and even villains. In many cases, heroes have their profits sent to charities, and villains have theirs sent to victim recompense funds (to increase chances of early parole).
- **DC 20:** Captain Justice is, in fact, a real superbeing, though not an active superhero. He's invulnerable to all known forms of attack and coercion, allowing him to survive the periodic efforts by some villain to destroy him to make a point.
- **DC 25:** The Café Justice corporation is actually run by a group of retired superheroes, who needed an investment as well as the opportunity to build a series of small secret bases (also known as "VIP Rooms") across the US.

Cloak and Cowl Costumes

Known as 3C, Cloak and Cowl Costumes is one of the world's most famous costume makers -- which isn't saying much in most circles. Most of 3C's work comes from theater, television and movie productions, which is why its four national offices are all located in major visual production towns -- including Angel's Harbor. In addition to normal costuming, 3C can build a wide variety of worn items, including utility belts, wire harnesses, body armor, concealed holsters, grapple gauntlets, multi-spectrum goggles, reversible outfits, wigs, and eyeglasses specially designed to

conceal the wearer's face by subtly drawing the viewers eye to minor features and away from major ones.

Of course, the other uses for such paraphernalia is hero and villain activities. While 3C does sell to the public, they do so cautiously. Any purchase of something more advanced than a cape and mask requires an account be set up with a security number (though no personal data is taken). A single item of note may then be purchased, but there's a six-month waiting period before anything else can be bought. This allows 3C to avoid becoming a supplier to fly-by-night vigilantes and villains. Company representatives look through crime reports to see if any of their gear has been used inappropriately. Any account that shows a pattern of abuse is closed. Of course, for a skin-tight suit with a spider on the chest no such precautions are taken. And once an account has a security number, it can order new copies of the same costume by phone, fax, or e-mail with secure drops sites. No one knows just how many heroes use 3C costumes, but chances are it's much higher than the number with the skills needed to sew their own.

Information Checks

- **DC 10:** 3C is part of a much larger English corporation -- Royal Technologies, a major competitor with Sterling Industries.
- **DC 20:** If 3C comes to believe a given account is being used by a worthwhile hero, they begin to give deep discounts.
- **DC 30:** Since many heroes depend on 3C to keep their identities secret and their costumes patched, they watch over it carefully. No crime against 3C has even gone unsolved, or valuables stolen unreturned.

The Daily Sidekick

The Daily Sidekick is a national newspaper that focuses on events in the world of superheroes, vigilantes, mystery men, and the villains that foil them. Advertising itself as "The Journal of Record for Heroes and Villains since 1970," the Daily Sidekick has actually only existed as an independent paper for 15 years or so. Before that it was just a series of articles by ace reporter Thomas Payne in the Angel's Harbor Choir, a struggling local paper. As Payne became more famous, the choir more successful and heroes more common, the Sidekick articles became a small insert section detailing paranormal and heroic events from across the country. Eventually Payne retired as a reporter and bought the rights to the Sidekick from the Choir, re-creating it as an independent national paper.

Payne is now senior editor and does very little reporting of his own. He does have a good sense for a story, and is the final authority on what articles get printed, what get held for further research, what get passed over to the legal authorities, and what get kill-filed. His current ace reporter is Misty Knight, who has a knack for getting scoops on superhero activity. She's been casually linked in romances with several heroes and a few villains, though never by a reputable paper.

Information Checks

- **DC 10:** Payne has a pro-hero bias, and isn't afraid to admit it. Anyone who is giving real heroes a bad time, or giving heroes a bad name, is treated poorly in his paper.
- **DC 20:** Ms. Knight is not romantically involved with any superhero, villain, or vigilante. In fact she's so busy she rarely dates at all, but when she does she makes it clear that anyone who turns out to have an alternate identity is going to get kicked and possibly sued. She does, however, have a number of heroes as friends, and often does research for them on big cases. Much less often, she squashes a lead at the request of a very trusted friend.
- **DC 30:** Mr. Payne was a masked adventurer during his reporting days, going under the name Danger Man. Not only does he not do that anymore, he keeps a sharp eye on his employees to make sure they aren't secretly heroes or villains. He considers the resources of the paper to be too valuable to allow them to become the tool of costumed adventurers -- he does entertain serious requests to research his archives, but isn't willing to lose the reigns of power to any other vigilante type.

Federated Periodicals

Federated Periodicals is a comic publisher. They focus mostly on short runs of independent comics, which are creator-owned and controlled. The company also produces a few comic books that are officially sanctioned adaptation of the adventures of actual hero teams (especially those that operate in Angel's Harbor). With a strong fan base, the motto "Here Come the Feds!" is becoming an increasingly common sight at comic-book conventions. Though Federated can't hold a candle to the Big Two companies in terms of total sales, its popularity and quality continue to increase. Its stories are based on strong principles of storytelling rather than sensationalism, its art taken seriously, continuity carefully maintained, and its comics always ship on time.

Information Checks

- **DC 10:** Federated Comics is owned by a larger, Russian publishing house that is running it as an experiment, and doesn't want its "serious" name associated with something as childish as comics.
- **DC 20:** If it seems too good to be true . . . it is. Federated comics is a front to launder money for the local Russian mob. It loses money hand over fist, but claims vast incomes to make illegal profits from elsewhere more easily spent.
- **DC 30:** A few employees at Federated know they actually work for the mob -- which is fine. It's their cover to look into the mob's activities, as they are themselves actually masked vigilantes posing as fanboy comic employees. This allows them to be seen carrying costumes, utility belts, and wombatarangs in duffle bags without anyone thinking twice.

Paragon American Executive Services

The legal company known as P.A.X. Services (or just PAX) is a small but powerful combination of law office, bank, and financial planning center that caters to the wealthy, eccentric, and those who wish to hide their true identity. Founded in the late 1930s to assist members of the Gangbusters vigilante group with efforts by the FBI to force them to work for the government, PAX has long had a reputation for being skilled, ethical, fearless crusaders for their clients. Of course, this makes them very unpopular with the government.

The primary services provided by the company are legal aid and banking. The laws regarding secret identities -- especially as they pertain to income tax, estate planning, and court appearances -- are a good deal more accommodating than they might be in a world without a rich tradition of masked superheroes, but they aren't any less complex than any other area of law. Without expert and experienced legal help, anyone trying to utilize the Mask Trust laws (essentially allowing someone to set up a legal "alternate" masked identity) is likely to slip up somewhere.

PAX can also act as a courier service, a middle-man for more traditional businesses, and even a clearinghouse for people with unusual abilities. It's not unknown for a hero or vigilante who cannot afford PAX's normal rates to trade labor (often in the form of bodyguarding a client or teleporting an important package to Japan instantly) for PAX's aid. Since PAX has a 70-year-long tradition of being honest and not using heroes to do anything nefarious, more superheroes trust it than any other corporation. PAX even keeps a number of trusted but retired heroes on its board of directors.

Information Checks

- **DC 10:** Despite its reputation, most of PAX's clients are simply rich eccentrics who use things like the Mask Trust laws to gain some financial benefit.
- **DC 20:** PAX is an amoral organization built on total honesty and truthfulness. PAX senior partners see nothing wrong with taking advantage of a loophole, as long as it's a legal loophole. They twist the law to its outer extreme, but never break it.
- **DC 30:** The senior partners of PAX are mostly old gods. Much weaker than they were in their heyday, these gods use their divine powers to ensure PAX doesn't get out of control. Rather than send oracles and prophets to guide heroes of the world, they use lawyers and lobbyists.

Rushlight Lading

Rushlight Lading is a cargo, warehouse, and delivery company, with its US Corporate office in Angel's Harbor. They have 24-hour-service anywhere in the world, standard freight to most locales, and can be hired to take anything anywhere under the right circumstances (and for the right payment). They also have safety deposit boxes, vault storage, archival storage, and message delivery services. They famously claim that -- given a longitude, latitude, and delivery time -- they'll get it there. They are often hired to take valuable cargoes and unusual deliveries, such as zoo animals, mummies, sunken wrecks, and nuclear annihilation rays captured from a villain's stronghold. They deliver even to Antarctica, even in times of war, and even if the end destination has sunken into the Atlantic. They do not, however, do CODs.

Information Checks

- **DC 10:** Rushlight Lading does a great deal of work for the government, including handling of secure warehouses where items of "unusual properties" are kept in permanent storage.
- **DC 20:** The company has "Rushlighters," agents trained to deal with the unusual, dangerous, supernatural, and superpowered.
- **DC 30:** The company specifically exists to keep safe a time machine built in 1888. The machine is to be delivered, intact and functional, to a specific location in Angel's Harbor in 2088 along with a cup of hot tea, a change of men's clothes in the current style, a concise history of 1888-2088, and a suitcase full of platinum bars. Everything the company does is based on having the resources and training needed to make sure the time machine is delivered as contracted, though only senior officials are aware of this.

Segefield Sanatorium for the Criminally Insane

Located in Coal Road, the Segefield Sanatorium is the only building left on the tall, barren hill it calls home. Built shortly before the Civil War, the Sanatorium was part of a push of industry that moved into Coal Road in the mid 1800s because of cheap land prices. Most of those businesses are long gone, but the Sanatorium has remained. Built by Doctor Segefield, the sanatorium was supposed to revolutionize treatment of the mentally ill. For example, it was built in the style of a gothic cathedral because the doctor believed such disturbing images as gargoyles would help scare the mentally ill to sanity, while heavy stone walls would give them a sense of stability. It didn't work.

In the 1950s it went from treating anyone mentally ill to focusing on the criminally insane. It now houses the worst psychos on the east coast. While it does not take prisoners with extreme superpowers, it has handled a number of mid-range psychotic powered villains over the years. Of course from time to time they break out, but that's proven true of any correctional facility, and Segefield has a better track record than most.

Information Checks

- **DC 10:** Doctor Segefield himself went insane while working in the Sanatorium. Sadly, his condition was not discovered for several years -- resulting in unfortunate excesses on his part in the treatment of patients.
- **DC 15:** Segefield is run by a private corporation in conjunction with various federal agencies.
- **DC 20:** To prevent mental breakdowns, current policy is for no one to work at Segefield for more than 15 months.
- **DC 25:** Unfortunately, due to budget constraints and difficulty convincing new hires to take jobs at Segefield, the current administrator and senior staff have been running the place for over 36 months.

Sterling Industries

Sterling Industries (SI) is a corporation that deals primarily in high-tech development. It has military and civilian contracts, and partnerships with numerous other companies. It is most famous for being associated with three armor-wearing heroes called Green Knights. The first operated during WWII, with the next do operating from 1975-1990 and

1995-present. Each suit has been more advanced than the previous, and undergone numerous improvements during its time in service.

Since Green Knight suits are too expensive for mass deployment, in 1990 SI introduced Gatekeepers, less powerful versions of the second green Knight technology. Gatekeeper armor suits turn common guards into low-power superbeings, allowing them to act as security or guards for events likely to attract the attention of villains or superpowered detention facilities.

Information Checks

- **DC 10:** SI has its roots back in WWII, when it was formed by Jonathan Sterling to develop improved armor for Allies vehicles and civilians. Mr. Sterling was revealed to be the first Green Knight, a 1940s and 1950s hero who wore a slow, clunky, but powerful suit of diesel-driven powered armor.
- **DC 15:** Current CEO James Sterling owns 75% of SI outright, allowing him to control the company with an iron grip if he's of a mind to. Despite that, he generally allows the board of directors to actually handle the companies affairs.
- **DC 20:** Though he has worn the suit from time to time, James Sterling is not the third, nor was he the second, Green Knight. Both roles were taken by professional soldiers hired for the part, and more than a dozen men have been "the" Green Knight since 1975.

NewsFax Network

A news company based locally in the Circuit, with smaller offices in major cities worldwide. Two things set NewsFax Network (NFN) apart from normal newspaper or television news companies. The first is the fact that NFN doesn't broadcast over cable or the airwaves or have a normal print newspaper. Instead NFN has a website with both free and pay content (as well as memberships with micropayment systems in place) and by sending a "newsfax" to the printers of customers who subscribe to their service. Such newsfaxes are timely, in-depth, and cater to the preferences of each subscriber.

Second, NFN is the only news company in the world to employ super-powered beings to get the news. Flying cameramen, psychic desk editors, shapeshifting undercover reporters, and super-genius tech-crews allows "NFN" crews to go anywhere faster and get closer. Their employees are often people who got their powers in accidents -- they have the abilities of heroes and villains, but prefer a 9-to-5 kind of job (with medical benefits). Certainly not all NFN's employees are superpowered, but those who are receive compensation commensurate to the work they produce (as do all NFN members, causing some of its highest-paid employees to be totally normal humans who have good instincts and work hard).

The company has yet to turn a profit, but has enough investment money to keep going for a few years. It hopes to increase subscriptions from both individuals and companies at 200% quarterly for the next four years, to reach the phenomenal numbers that are required for profitability. To boost its reputation as a fast and accurate source for exclusive news and pictures, NFN crews often get way too close to the action.

Information Checks

- **DC 10:** NFN crews are willing to break a lot of laws to get an important news story, especially if they think they won't get caught.
- **DC 20:** There is currently a power struggle going on within NFN. Its founder, Aileen Vectra, insists on maintaining high ethical standards in the truthfulness and relevance of the news NFN reports (though she's willing to look the other way if the news is gathered in a questionable manner). The vice-president in charge of its entertainment division, Henry Quartz, is pushing for more "juicy" exclusive content. He uses the same semi-legal tactics to produce sex tapes, private e-mails and journals, and undercover reports on steamy subjects. So far Ms. Vectra has kept his worst excesses under control, but as the more outrageous reports bring in higher subscription rates, the investors are beginning to push to give Mr. Quartz greater leeway.

Tudor's Guides

Tudor's is a company famous for producing guidebooks for major cities around the world. It has a small office in the Circuit, as well it's only direct-to-the customer travel book shop.

Information Checks

- **DC 10:** Tudor's guides treat superheroic activity like volcanoes -- great for tourists to see from a distance and something to recommend a city, but a hazard worth mentioning as well. Even so, most Tudor guides focus on cities with permanent hero groups or noteworthy vigilantes.
- **DC 20:** Although Tudors uses extensive freelancers for photography, research, layout and initial scouting of locations, all entries are actually written by Mr. Tudor, who no one ever sees.
- **DC 30:** Mr. Tudor is actually an alien who crashed on earth in the 1940s. He began scouting the planet in preparation of an invasion fleet. It never arrived, and he got tired of living on whatever he could steal without being noticed. He started writing guides as a way to make money that went hand-in-hand with his mission to scout the planet. Now, he rather hopes the fleet never shows up -- he's much wealthier as a famous guide author than a minor military scout.

Weekly Inquisitor

The Weekly Inquisitor set up shop in the Circuit shortly after the Sidekick did, and is in direct competition with the Sidekick. The Inquisitor bills itself as "The Only Paper Unafraid of the Truth," and fills its pages with conspiracy theories, bigfoot babies, and lurid tales of superheroes and their exploits in and out of costume. Some of this is actually fake of course, but in a world with heroes an amazing amount of weird stuff is real. If anyone threatens the paper with legal action its owner and chief editor, Victor Vancastle, immediately goes public about being "censored," and generally sells a lot more papers.

Information Checks

- **DC 10:** Half of everything in the Inquisitor is a fake . . . but only half.
- **DC 20:** Only about 25% of what's in the Inquisitor is completely fake, the rest has just been written up in the most sensational manner possible.
- **DC 30:** The Inquisitor is the project of the Grandmaster, a mastermind villain who does everything through intermediaries. He uses it to gain blackmail material and penetrate heroes' secret identities. Vancastle is in the Grandmaster's pocket.

Utilities

All the utility companies work together when trying to fix lost service as a result of super-being activity or paranormal events. While there is healthy competition in other areas, the phone, cable, gas, electricity, water, trash and sewage companies have discovered the only way to make a profit in a city where masked men fire protonic cannons at the invading hordes of the Crimson Crab is for everyone to pitch in together for emergencies. Mostly, this involves loaning each other capacity and work crews, providing competing customers services at cost during an emergency and sharing information.

The main utilities in Angel's Harbor Metropolitan area are as follows: Big Harbor Hydroelectric (environment-friendly electricity), Choir Communications (phone and cable), Lohann Drilling (gas, and no longer a drilling company), Pro Power (traditional electricity, with focus on the Lighthouse Nuclear Power Plant), and Stratollite (satellite-based television, internet and cell phones).

Information Checks

- **DC 15:** The most important utility facilities, including power transfer stations, offices, central operation centers and many of the access points to the city's crawlspaces, are protected by Gatekeepers from Sterling Industries. SI provides these services on a at-cost basis, in part to keep the flow of utilities to its own facilities uninterrupted, but also to help protect the community.
- **DC 25:** The utility companies of Angel's Harbor have a secret cooperative venture to hire, train and maintain an extraordinary services branch, called the Skeleton Crew. Whenever mole men chew throw wires, a supervillain threatens to flood the city with a hurricane, or sentient beings of living sewage get stuck in the pipes, the utility in question calls out the Skeleton Crew. Most Crewmen are failed heroes, agents who retired in disgrace, or villains on parole and looking for a legal job where turning into a giant wolverine is seen as an asset.

Sights

Some things in Angel's Harbor are worth stopping by just for the novelty.

The Hall of Liberty

Now a museum, the Hall represents the oldest known superhero meeting place in the US. Located in Holly Hills, the building is a solid stone, four-story structure built in 1776. It was used by the Liberty lads as a headquarters during the 50-year history of that group of mystery men and women.

Information Checks

- **DC 15:** The Liberty Lads disbanded in 1826, but a trust was established to maintain the hall in working order. Anyone who has a Liberty ring, of which 12 were made, can gain access to the hall and use it as a base of operations. The rings were given to offspring of the Liberty lads, though all are now believed lost.

The King Norton

A dirigible built in total secrecy just before World War II by a rich eccentric, but never taken into the air; it would have been the largest lighter-than-air ship ever to fly if it ever had. It is currently stored in a large hanger in the Station. Most of its systems seem very advanced for the era, though obviously they were all experimental and might not have worked. It's now a meeting hall used by flight enthusiasts for conventions and special presentations, and is open to the public on Wednesdays.

Information Checks

- **DC 25:** The King Norton is actually from an alternate reality, where it was part of the Philadelphia experiment run by the royal American Air Corps. If filled with helium, it would still fly. If its Philly Generators were powered (requiring a direct lightning strike) it might even return home.

The Pitt

An abandoned mine shaft in Coal Road, the Pitt is the deepest mine in the United States. It produced both coal and salt during its 200-year operating history, but was shut down in the 1960s. Though it's possible to look down into the Pitt, for safety reasons no one is allowed inside.

Information Checks

- **DC 30:** The Pitt penetrated to a pocket dimension where a vast cavern world exists, populated by dinosaurs and cavemen. It was closed down and sealed as a safety precaution. Once every 10 years, Liddenbrock Expeditions runs a single small party into the Pitt to ensure the pocket dimension is stable.

The Slaughterhouse Troll

A 20-foot statue under an overpass in the Slaughterhouse District, the Slaughterhouse Troll is, according to legend, an actual troll summoned up by a sorcerer in the 1960s, and turned to stone when it was first struck by daylight.

Information Checks

- **DC 25:** Whenever there's even a partial solar eclipse, a ritual must be performed or the troll returns to life, immune to sunlight from that day forward.

Tudor's Guides for other American Cities

Focusing on cities with higher-than-normal levels of masked activities, Tudor's Guides are your gateway to exciting vacations of hero-spotting and adventure. Pick up any of these guides in our book store in Angel's Harbor, or anywhere fine travel guides are sold.

To unite the Tribes,

*Six Heroes were granted Swords:
Tools for war and peace.*

*Horse's Plow sparks growth.
Rooster's Comb burns enemies.
Ram's Horn sings warnings.*

*Dog's Bite strikes justly.
Boar's Tusk commands the waters.
Dragon's Wing rules all.*

*Order and Chaos,
Forged into magical blades,
Created this Realm.*

What Everybody Knows

One thousand years ago . . .

The Six Tribes (Horse, Ram, Rooster, Dog, Boar, and Dragon) formed an alliance against the much larger, brutal Tiger Tribes to the West. Six heroes from the Eastern Tribes journeyed to the volcano of Fate's Forge, to beg aid from the mysterious (and monstrous) Celestial Crow people, famed for their battle-skill and weaponsmithing. After many adventures there and back again, they returned to their peoples bearing the Swords of Power.

With the aid of these heavenly weapons, and under the leadership of the chief of the Dragon Tribe, the Six Tribes turned back the Tiger invasion and restored peace to the lands. Then, they joined together into a single Empire, ruled by their general Daring Eagle, who became the First Dragon Emperor. Under the wise rule of his house, and defended by the Swords, the Empire prospered. Each Tribe became a client kingdom under the Empire, and their kings Imperial Ministers under the Empire.

Eight hundred years ago . . .

The Tiger Tribes allied and invaded. The barbarians were beaten back by the Imperial armies, each led by a general bearing one of the Swords.

Seven hundred years ago . . .

The Dragon Empress Shining Sister put down an attempted Rooster Tribe usurpation of the Imperial Throne, using the power of Dragon's Wing to command Rooster's Comb. Simultaneously with this Rooster Coup, the Tigers invaded once more, penetrating deep into the kingdoms of Ramswood and Horsesteppe. With difficulty, the Empire pushed the barbarians out again. The treacherous Rooster King was beheaded by his own daughter, who became the new Imperial Minister and Queen of the Tribe.

Six hundred years ago . . .

The Champions of the Rooster Tribe and the Horse Tribe (Wise Teacher and Wind's Beauty, respectively) routed a Tiger warband almost single-handedly. They later married; their son, Tiger Hunter, married the Dragon Empress Jade Hairpin.

Four hundred years ago . . .

The Tigers attempted their largest invasion yet, masterminded by their High Chief: a strategic and tactical genius named Fiery Tongue. Indeed, this time, they also came by water, landing hundreds of war-bands along the coasts of the Empire which combined into three small -- but nimble and ferocious -- warbands. The four armies of the Tigers stabbed deep into the Empire's heart, and were only defeated on the shores of the Inner Sea. Chained before the Dragon Emperor, Fiery Tongue awaited judgment. What followed was the greatest catastrophe the Empire of the East has ever known.

Tragedy: The signs and portents were clear, as were the interpretations of the priest-diviners: mercy should be shown to Fiery Tongue and the surviving Tigers, and their Tribe should become part of the Empire. This was Destiny, mandated by the heavens. (Indeed, Imperial scholars believe that in all of recorded history, this was the optimum time for the Tiger Tribe to join the other Six. Fiery Tongue had the intelligence to respond to such an offer, the personality to convince the other Tigers, and a cleared field of the rival Tiger Chiefs who would have resisted such an idea. Furthermore, in light of the events that followed, it is obvious that the next occupant of the Dragon Throne had the strength of resolve to make integration work.)

Doom

Emperor Devoted to the Moon chafed at this; after all, these barbarians had slaughtered entire villages of his people, murdered helpless and elderly country nobles in their own palaces, and burned many forests and fields of all Six Tribes. As he stood before the Tiger, weighing all this, a wounded soldier stumbled up and told the Emperor that the commander of the routing forces of the Imperial Army -- his wife, the beloved Princess Garland Crown -- lay dead with the arrow of a retreating Tiger in her throat.

Filled with wrath, he drew Dragon's Wing, and moved towards Fiery Tongue. His son, Prince Devoted to the Winds, tried to stop him, but was knocked aside with ease. Devoted to the Moon raised the quivering Sword high; Fiery Tongue spat one last word of defiance; the Dragon's Blade swung down.

*Despite the omens,
And his weapon's resistance,
He struck. Disaster.*

Lightning flashed and thunder pealed from a clear blue sky. The mountains screamed and the sun hid its face behind a cataclysmic storm that appeared out of nowhere. Struck by heaven's fury for his hubris, Devoted to the Moon died in agony. Dragon's Wing shattered, and its shards whirled along hurricane winds to injure, cripple, and kill hundreds -- Imperial and barbarian alike. Although close enough to hear Fiery Tongue's dying curse (which he never revealed), the Prince survived -- wounded and missing an eye.

Reconstruction: It took decades for the One-Eyed Emperor to repair the damage done that day by war and sin. Even lacking Dragon's Wing, he was a force to be reckoned with. He emptied the Dragon Tribe's treasuries to rebuild; he instituted new trade and tax agreements to get food to starving subjects; he founded the Imperial University; he created the Imperial Scouts to reconnoiter the Empire's boundaries; he demanded the creation of what would become known as the Dragon Pearls (see below).

But his crowning achievement was the establishment of the modern form of the Imperial Court. Without that institution, and lacking a Sword of Power, the Dragon Tribe may have lost the Throne. By the development of fosterage arrangements between the Dragon Tribe and the other five Tribes of the East, he enabled closer alliances and empathies between the Swordless Throne and the kingdoms. By making himself available daily when in residence for commerce, administration, arbitration, and sport, he drew all eyes to Dragon Isle; by requiring Imperial Ministers and other high nobles to attend Court for several months a year, he drew those most dangerous to him close, where they could be evaluated, cajoled, convinced, bribed, or eliminated. He also altered the functioning of the Ministries -- now the Emperor himself appointed four of the Tribal Ministers of each Ministry, who had to -- by edict -- be commoners. This way, the influence of the aristocracy on the overall functioning of the Empire could be blunted, the Empire lifted poor peasants from the muck and offered them power and prestige (which the Empire could snatch away at any time),

and the Ministry of Intelligence gained that many more cracks in the bureaucracy to peer through.

The system worked beautifully: coups and rebellions got sniffed out and snuffed out before they could ready themselves, border skirmishes and Tiger incursions were stopped, Imperial power threaded through every aspect of day-to-day life. Inarguably, it worked: people were happier, safer, better educated, better fed, and better able to influence local and nationwide matters. Fresh blood and vigor entered into the Ministries. Advances were made in all aspects of society. The Empire thrived

One hundred and fifty years ago . . .

The Imperial system began to work too well. Over the centuries, it had begun shifting from a well-oiled machine into an overbearing control of thought and deed. The Ministerial gears started to grind against one another, as their agendas clashed. Court politics became dangerous and bloody.

The publication of *The Leaves of Jade and Iron* by Dragon Empress Wandering Star formalized Imperial law, fixing it into a rigid structure. The primary rule under the Empire is that all people of lower rank than the Emperor or Empress are equal in the eyes of the law. The "Leaves of Jade" are those laws which reward those who follow them: tax incentives, improved standing, obeying the commands of one's superiors. The "Leaves of Iron" are the severe and often physical punishments meted out to those who break laws: beatings, whippings, amputation, execution.

This system has led to increased formality across the board, adherence to traditions and traditional manners of thought, and the overall avoidance of risk. Fewer and fewer new songs are sung; fewer and fewer new trading routes open; fewer and fewer new fields are plowed. In a word: stagnation.

Fifty years ago . . .

A small army of Tigers invaded the Empire again, once more through Roosterland. While eventually defeated by the combined Imperial military, for a time, the warriors of the Rooster Tribe -- and later, those of the Horse Tribe -- once again tasted the thrill of risk and the call to heroism as they held the barbarians at bay, back-to-back. The aristocrats of both tribes have been insufferable ever since.

Five years ago . . .

Five years ago, the inattentive Empress Galloping Joy died and her son, Lithe Snake, ascended to the Dragon Throne, where he yet remains. He is an incredibly severe man, but fair. He rewards fealty with love, valor with honor, and disloyalty with vengeance. His justice is untainted by mercy. The half-decade of his stern rule has seen a complete shake-up of court politics; older courtiers pine for the reign of his mother.

Today . . .

The nobles of the Dragon Court play a dangerous game with the Emperor to advance their personal and factional goals. Going too far -- with flattery, assignations, bribery of low bureaucrats, dishonorable dueling, prevarications, untimely truth-speaking, or other crimes -- means disgrace, exile, or death. Skulduggery, backstabbing, blackmail, and frame-jobs are all running rife.

Imperial Magic, Rites, & Ministries

The Three Forces

Mages or *magicians* are the most adept at manipulating of the Three Forces: Order, Chaos, and Balance. Using their own personal energy, they can add one of the Forces to a situation, target, item, or victim. *Order* includes sorting, categorizing, strengthening, preserving, regulating, calming, tidying, and commanding things. *Chaos* includes moving,

confusing, mixing, diverting, freeing, resisting, transforming, and changing things. *Balance* includes perceiving, evaluating, steadying, matching, comparing, considering, calculating, and reviewing things. Each Tribe is associated with a Force; mages of those tribes tend to be more proficient with magic involving that Force.

So, for a magician to make a river overflow its banks, he could channel Order at it to regulate its flow, then release the spell (like making a toy dam, and then yanking it away), or he could channel Chaos at it, to whip it up into a frenzy (like poking a bear in a cage with a stick until it breaks free).

Since influencing the Forces relies on a mage's personal energy, only small effects can be wrought magically. However, the Forces can be used in tandem with the Elements or the Totem Spirits of the Cycle (see below) to gain more energy or to generate a specific, nuanced effect with a spell or enchanted item, but this is not necessary.

The Six Elements

Priests or *shamans* are the most adept at understanding and influencing the mystic aspects of the Six Elements: Earth, Wood, Fire, Metal, Water, and Wind/Spirit. Each Tribe is associated with an Element, and the totem animal type, color, Ministry, qualities, and "things known for" all provide the portfolio of what the Element can affect. Priests of a Tribe tend to be more proficient with mystical affects involving its associated Element.

The Element of Wind/Spirit is of special note, because of the way that priest perform their skills. Basically, *everything* has a spirit -- rocks, trees, clouds, fire, people, axes, whatever. Priests know the rites associated with particular Elements, which encapsulate the proper and polite ways of interacting with the spirits under the Element's aegis. Priests can cajole, appease, argue, bargain, and communicate with spirits, using these specific rituals.

The most powerful spirit is the Element of Wind, followed by (in rough order) the other Elements, the Tribal Totems, the ghosts of people, the ghosts of animals, the ghosts of plants, the ghosts of unliving things (rocks, swords, doors, etc.).

The Swords of Power

All of the Swords provide the following benefits to their wielders: improved combat skill; the ability to block, parry, dispel, or otherwise physically affect the Forces, the Elements, and spirits (this includes the ability to see and communicate with spirits as if they were priests or shamans); and the ability to mentally speak with other Sword-bearers. (Before Dragon's Wing was shattered, this communication could happen anywhere, anytime, even on the move. Unfortunately, its loss has limited the ability to "far-speak" and "far-hear" unless both bearers are each standing motionless in a high place.)

The Swords themselves are *nearly* unbreakable. They will only serve bearers who are worthy in the Sword's estimation, based on its Tribal characteristics (an individual who the Rooster's Comb finds worthy may be considered unworthy by the Dog's Bite). In the hands of an unsuitable individual, a Sword is simply a very sharp, well-made sword. In the hands of an unworthy individual, the Sword is a curse, that will seek to thwart its wielder at every opportunity. In the hands of a worthy individual, the Swords are potent artifacts.

Each Sword has some specific, unique abilities:

Horse's Plow: When the blade is stabbed into the ground, the wielder can cause earthquakes and fissures to open up underfoot, moving in any direction he commands, and can speed the natural growth of plants or animals within line of sight with no harm, at a rate of one week per second. Additionally, the Sword-

The Celestial Cycle

Given the association of Elements and Tribes, one idea that can be incorporated into this setting is that of the *Celestial Cycle*, where one Element/Tribe conquers another in the natural order. The Horse is replaced by Ram, who is replaced in turn by Dog; Metal is replaced by Fire, which is itself replaced by Water, and so forth. This can be applied to the reign of Emperors (if one wants to get away from a thousand years of draconic rule; the Dog Emperor succeeds the Ram Empress, etc.), superiority of fighting styles (for that wushu flavor), political faction conflicts, or how to counter magical spells or the powers of spirits.

bearer can run with the speed of a horse for days without tiring. When held, the Sword-bearer cannot feel anger.

Rooster's Comb: When the blade is brandished in the air, the wielder can cause the Sword to burst into intense flames, which can light anything flammable in seconds; extinguish fires with a sweep of the blade; or inspire confidence in all friends, and fear in all enemies, who are within sight of it. When held, the Sword-bearer cannot feel fear or suffer injury from flame.

Ram's Horn: If great danger or deadly enemies threaten the wielder (or those under his specifically-stated protection), the Sword begins to hum in a low tone; the Sword-bearer can command the Sword to sing audible to all or just to him silently.. Directionality and distance of hazards can be determined with some practice. Additionally, the wielder can carve upon or through living wood without injuring it (permitting a topiary effect), command wood to move at his whim (includes the repulsion of arrow shafts), and slice through dead wood with no effort. When held, the Sword-bearer cannot feel despair.

Dog's Bite: When the Sword is pointed at something metal, the wielder can exercise command over it -- opening locks, blunting sharp edges, magnetizing needles for compasses, etc. By swinging the blade in the air at the scene or in the presence of a victim of a crime, the wielder can make the weapon sound a ringing chime, which paralyzes the unjust individual or entity for a short time, and can lead the wielder directly towards the criminal. Furthermore, the flat of the blade can assuage the injuries of a victim of injustice, be they physical, mental, emotional, or social -- e.g., it can strike a liar dumb, and then cause any lies told against the victim to fade away from conscious memory. When held, the Sword-bearer automatically knows if he's being lied to, but cannot lie himself. (Note that if the wielder ever acts unjustly himself, the Sword will kill him. It's happened twice in history.)

Boar's Tusk: When the blade is stabbed into a body of water, the wielder can stir up or quell waves, tides, and currents. When the Sword is brandished, the wielder can summon or banish rain and storms. If the blade is pointed at a target during a storm, the wielder can cause a lightning bolt to strike the target (1 bolt per hour). When held, the Sword-bearer cannot feel sadness or drown.

Dragon's Wing: The wielder of this Sword is nearly always initially seen as "polite" by the denizens of the spirit world (he should still know the proper and polite rituals to be truly effective, however). He can command the winds to blow or stop. When brandished, the wielder cannot be ignored; when sheathed with intent, he will not be noticed, even by the sharpest-eyed guard. When held, the Sword-bearer can "ride the winds" -- i.e., fly.

Before it was shattered, the wielder of this Sword could command the other Swords of Power in the absence of their wielders' orders; if the bearer of Dragon's Wing and the target Sword's wielder had a conflict of desires, the holder of Dragon's Wing could "turn off" the other Sword's unique abilities with concentration.

The Imperial Ministries

Each Imperial Ministry is charged with the smooth functioning of an aspect of the Empire. They are bureaucracies, with administrative centers in each

1. Horse (Earth)
2. Ram (Wood)
3. Dog (Metal)
4. Rooster (Fire)
5. Boar (Water)
6. Back to #1.

In this Campaign in a Box, the Dragon Tribe and its Element of Wind/Spirit is above the Cycle. If one wishes to add the Dragons into the Cycle, an appropriate position will have to be found; placing Dragon (Wind/Spirit) after Boar and before Horse seems appropriate. If the Tiger Tribe ever becomes part of the Empire, the GM will have to determine where it -- and its associated Element of Blood -- fits in as well.

Here's a quick and dirty way to apply the Cycle to fighting styles in two game systems: the Tribe/Element gains a bonus (an Upshift in **PDQ**, or a +3 in **GURPS**) to all combat actions - - attack and defense -- against the Tribe/Element it supplants in the Cycle. GMs who want woo-woo-wuxia levels of fun can even permit the mixing and matching of Tribe and Element to generate particular moves; stacking bonuses is up to their discretion.

Therefore, at the basic level, a Rooster-style warrior has a bonus against a Dog-style warrior, but is at a disadvantage against a Boar-style warrior. At the woo-woo-wuxia level, a warrior's Horse-style "Flaming Gallop" strike would be at a significant bonus (2 Upshifts or +6) to penetrate another warrior's Ram-style "Fan of Falling Leaves" defense (Fire vs. Wood; Horse vs. Ram). A martial artist's Boar-style "Earth Rooting" defense would have a bonus against both Water-style

kingdom, and a main palace on Dragon Isle. The chain of command in a Ministry starts with the Imperial Minister, who has six Tribal Ministers, each of whom has at least three Secretaries, who each have any number of Undersecretaries and Bureaucrats (First through Third Class).

The Ministries either handle problems exceedingly quickly, or not at all. The efficiency or entanglement of each Ministerial bureaucracy depends upon the Tribal associations of involved parties and issues, current relationships with other kingdoms and the Throne, current graft and bribery levels, the omens of the day, personal relationships and stakes, and a host of other concerns. There is much politicking and backroom deal-making to handle the red tape issues. In general, the system works well enough, unless someone specifically doesn't want it to.

Since the days of the One-Eyed Emperor, four of the six Tribal Ministers in a Ministry *must* be of peasant stock; furthermore, any Imperial citizen can join the bureaucracy by passing two tests: a basic civil-service exam, and a comprehensive quiz on the specific field of the Ministry. Bureaucrats are social "professionals" and enjoy both limited authority and a mild increase in status. A bureaucrat of common birth is higher status than other peasants, but not equal to aristocrats; nobles who become bureaucrats are more respected than their peers, but not as much as the Tribal Kings. Note that even in a small town, the Bureaucrat First Class of Sewage and Trash Removal can be a powerful individual.

The machinations of the Ministries, working in tandem or against one another, provides a lot of interesting factional conflict. Consider the construction of a new Imperial granary; at least four Ministries must be involved: Rites to bless the site and finished building, Public Works to build it, the Arts to decorate it, and Agriculture to fill it.

The Ministry of Agriculture: Responsible for policies regarding farmers, herders, and breeders; setting market prices, providing subsidies, logistics in wartime, and stocking the Imperial granaries.

The Ministry of the Arts: Provides basic subsistence and housing to artists, awards grants and contracts for Empire-commissioned artwork, censors seditious artworks, publishes books.

The Ministry of Education: Administers the Imperial University and civil-service exams.

The Ministry of Intelligence: Responsible for the Imperial Scouts, coordination of all information across Imperial Service, and liaises with other Ministries as necessary (when curious events or persons of interest are detected).

The Ministry of Justice: Provides cities with magistrates, judges, and executioners; serves as a police force; imprisons or executes criminals; provides relief for victims of crime or disaster; establishes standard weights and measures; and investigates wrongdoing in other Ministries.

The Ministry of Public Works: Surveys land, establishes zoning, draws up blueprints, administers construction of public and private edifices, builds roads, maintains sewers and aqueducts, and stockpiles raw materials (coal, ore, firewood).

The Ministry of Revenues: Establishes the tax code, collects taxes, administers the Imperial Treasury and Imperial Mint, provides customs agents, regulates banks and moneylenders, and balances the cash flow between Ministries.

The Ministry of Rites: Educates priests in proper ritual and diplomacy, consecrates priests, casts fortunes, interprets

and Rooster-style attacks (Earth vs. Water; Boar vs. Rooster); but would be vulnerable to Horse-style and Wood-style attacks -- and one that combined both, like a Horse-style "Forest of Hooves" would get the stacked bonus *against* him.

Lesson? "Know thy enemy."

As written, Dragons and Tigers are outside of the Cycle. This can mean that while they suffer no strengths against certain forms, they also suffer no weakness against others. (Alternately, these Tribes/Elements gain bonuses against all other styles, except the other. This would make Dragons and Tigers incredibly formidable.)

Lastly, this system of strengths and weaknesses against other Tribes/Elements doesn't just have to be limited to physical conflict -- think of the applications to social interaction, commerce, factional politics, bureaucracy . . . The possibilities are endless.

omens, liaises with spirits of all types.

The Ministry of War: Trains (and deploys, in wartime) the Imperial Army and Navy; constructs tactical and strategic goals for the Empire; liaises with Agriculture, Intelligence, Justice, and Public Works; and serves as a fire brigade in Imperial settlements.

The Six Tribes

Each of the Six Tribes of the Empire have certain practical and mystical associations, detailed below. Note that these are fairly loose traits (and looser for the peasantry rather than the aristocracy) and are descriptive rather than prescriptive (e.g., a member of the Horse Tribe *can* wear the color red, be an Order or Chaos mage, serve in the Ministry of Arts, be jolly and proud, or all of these at once). The lists below are just the stereotypes other Imperial subjects think of when someone says, "A Horse-man, Rooster-man, and Boar-man walk into a tavern. . ."

Tribal Identity: All Imperial citizens nominally belong to a Tribe. Birth location is unimportant under tradition; for example, there are Roosters who were born in the Hound's Highlands. However, as noted above, tribal identity and characteristics are more important to the noble families rather than peasant ones, and more important for those who live in the homeland than in other kingdoms. Furthermore, while the Empire is united under one spoken language and written syllabary, each Tribe/kingdom has a noticeable accent due to subtle differences in dialect.

Many marriages among the aristocracy are between Tribes, to encourage alliances; most peasant marriages are within the Tribe. When people marry, part of the rite involves one of the couple formally joining their spouse's Tribe; legally, it doesn't matter whether the husband joins the wife's Tribe or vice-versa. Different regions (even within kingdoms) and certain aristocrat families have their own customs. Children start out life belonging to the Tribe of their mother. At age 13, they are permitted to keep this association, or may change their affiliation to the former Tribe of the parent who switched; this is technically permissible, but usually looked down upon in society except in cases of abuse. If they marry later in life, they may then join their spouse's Tribe.

Peasantry & Aristocracy: It's usually harder to change social classes than it is to change Tribes. A peasant is a peasant and an aristocrat is an aristocrat, period. There are occasional exceptions -- exceptional display of the positive characteristic (see below) of the Tribe -- loyalty in Dog peasants, artistic skill in Ram peasants, a fantastic sense of humor in a Boar peasant, etc. -- can lead to ennoblement. However, even rarer is disenfranchisement; an individual would have to display the negative characteristic (see below) to an extremely criminal level to have their titles stripped.

Leadership: The tribal *King* -- or *Queen*; one of the cornerstones of the Empire is sexual equality -- is the leader of the Tribe's Chieftains, rules the tribal nation, serves as the Minister for an Imperial department, and is the bearer of one of the Swords of Power. In all four regards, he or she is responsible to the Emperor or Empress (who is also the King of the Dragon Tribe). If necessary, a Tribe may have a *Champion*, who wields the Sword and leads the kingdom's armies in the stead of a royal who otherwise cannot.

Totem Spirit: Each of the Tribes has a Totem animal spirit, which is active in the world. This powerful entity definitely has a personality (matching the characteristics, alliances, and enmities the Tribe is known for), and may impose upon its "children" general or specific taboos, helpful talents or affinities, or provide dreamquests and visions at its whim.

Horse Tribe

Element: Earth

Force: Balance

Color: Yellow

Kingdom: Horsteppe

Imperial Ministry: Agriculture

Positive Quality: Sociable

Negative Quality: Competitive

Horse

Known For: Farming, cavalry, healers, grains, beef

Allied Tribes: Rooster, Dog, Dragon

Rival Tribes: Ram, Boar

Ram Tribe

Element: Wood

Force: Order

Color: Green

Kingdom: Ramswood

Imperial Ministry: the Arts

Positive Quality: Creative

Negative Quality: Stubborn

Known For: Artists, archers, carpentry, fruits

Allied Tribes: Rooster, Boar, Dragon

Rival Tribes: Horse, Dog

Ram

Rooster Tribe

Element: Fire

Force: Chaos

Color: Red

Kingdom: Roosterland

Imperial Ministry: War

Positive Quality: Confident

Negative Quality: Proud

Known For: Warriors, masons, coffee, and tea

Allied Tribes: Horse, Ram, Dragon

Rival Tribes: Dog, Boar

Rooster

Dog Tribe

Element: Metal
Force: Order
Color: Silver
Kingdom: Hound's Highlands
Imperial Ministry: Justice
Positive Quality: Loyal
Negative Quality: Staid
Known For: Smiths, judges, magistrates, ores
Allied Tribes: Horse, Boar, Dragon
Rival Tribes: Ram, Rooster

Dog

Boar Tribe

Element: Water
Force: Chaos
Color: Blue
Kingdom: Boar Coast
Imperial Ministry: Public Works
Positive Quality: Jolly
Negative Quality: Lazy
Known For: Sailors, shipwrights, commerce, fish, salt, oil
Allied Tribes: Ram, Dog, Dragon
Rival Tribes: Horse, Rooster

Boar

Dragon Tribe

Elements: Wind, Spirits
Force: Order
Color: Gold
Kingdom: Dragon Isle
Imperial Ministries: 1) Education; 2) Rites; 3) Revenues; and 4) Intelligence.
Positive Quality: Inspired
Negative Quality: Ostentatious
Known For: Priests, Imperial officials, spices, dyes, wines
Allied Tribes: All.
Rival Tribes: None.

Dragon

The Tiger Tribe(s)

The Tiger Tribe should be more properly called "the Tiger Tribes," since they originated as a collection of smaller groups, called *sub-Tribes*; however, they have acculturated somewhat over the centuries under the dominance of the original Tiger Tribe. In any case, it's doubtful that most Imperial citizens know anything about barbarian ethnology (some Imperial scholars *may* know some of the absorbed Tribe names: Hare, Snake, Ox, Fox, Coyote, Bison, Eagle, Spider, Frog, etc.), though Tiger Tribesmen are keen on their lineages. (It's the GM's call whether or not a Tiger character draws on just their sub-Tribe's Totem animal, or both the Tiger Totem *and* their sub-

Tribal Totem; the latter would make Tiger shamans quite powerful compared to Imperial priests.)

The Tigers are a nomadic people who live to the west of the Empire, and practice hunting, foraging (regionally and seasonally), herding (bison, horses, and goats, moving seasonally), opportunistic horticulture, and raiding and looting of Imperial border villages. A sub-Tribe is a highly-mobile group, living in conical tents when on the plains and in cliff-dwellings when based in mountain valleys or lowland canyons. They speak a different language than the Empire, and have only a rudimentary, ideographic method of writing.

While relations are generally tense between the Empire and the Tiger Tribes, there is some trade and diplomacy. However, any foreign group traveling in the other's lands will be scrutinized, and subject to prejudices (and possibly even ill-treatment). Still, there is plenty of wealth to be had exchanging civilized luxuries for barbarian rarities, so commerce continues.

Tiger

Tiger Tribe

Element: Blood

Force: Chaos

Color: Rust-orange

Kingdom: Western barbarians

Imperial Ministry: n/a

Positive Quality: Strong

Negative Quality: Rash

Known For: Physical strength and endurance, ferocity, warriors, furs, ivory

Allied Tribes: Other barbarians

Rival Tribes: Other barbarians

The Element of Blood

The Element of Blood represents life and death, strength and weakness, health and disease, anger and sadness. Many Tigers make blood sacrifices as part of their heathen rites; while Imperial storytellers go on and on about barbaric human sacrifice on captured Imperial soldiers, a Tiger only sacrifices his own blood to appease the spirits. Interestingly, the blood of livestock that a person owns counts as *their* blood; however, this understanding does not extend to cover borrowed or rented livestock, owned slaves, family relatives, children before they perform the Rite of Adulthood, or captives taken in battle. Still, many of the "criminals" of the Tiger Tribe are individuals who interpret blood-ownership as including these groups.

Celestial Crow Tribe

The Celestial Crow Tribe is a mystery; some say that they have all died out, or have ascended to the heavens, or even - they whisper -- never existed at all.

Not much is known about them, and all is tainted by legend. They are said to be humanoid (but not human), with bone white hair, eyes like solid ebony beads, long noses, and reddish skin. Celestial Crows wear elaborate feathered cloaks over their other clothing -- which may either be rich or poor, depending upon the individual. They live close to the heavens: on the tops of mountains -- especially volcanoes -- and tall trees, in both the Empire and the Tiger Tribelands. At turns, Celestial Crows are both generous and vengeful: rewarding the pious, the respectful, the self-sacrificing, and the humble, and punishing the blasphemer, the disrespectful, the greedy, and the arrogant.

They are said to be masters of magic, illusion, war, and smithcraft. Many youths seeking to study at a Celestial Crow's feet climb the tallest mountain they can, bearing gifts of dried fruits, nuts, and vegetables. The few who return are

inarguably changed by the experience (not always for the better), and many refuse to speak of it to anyone.

Captain Venture and Broken Arrow Company

for *GURPS Fourth Edition*

by Eric Funk

Author's Note: This article describes a small mercenary/special ops company in a modern setting where magic, psionics, and/or meta-abilities are known to exist, not unlike **Infinite Worlds**, **International Super Teams**, or **GURPS Technomancer**. With minimal work, it can also be adapted to a fantasy or futuristic setting.

* * *

"If it was known where lightning was going to strike, there would be a line of people waiting to be there."

--Military Minds, Captain Ilyana Venture

As a young Lieutenant, Ilyana Venture was traumatized when she witnessed her brother's death. It happened during a joint operation with her brother's unit, when he confronted an apparent noncombatant in a white evening dress. The stranger laughed as she spun on him and he doubled over in pain! Ilyana was watching through a scope, and to her horror her shots all curved away! As his life was slowly being sucked out, the lieutenant called for backup, and charged with a knife. An invisible force picked her up and threw her against a wall. Her brother's screams accompanied her into unconsciousness . . . It was later revealed that the mage was a dropout from their organization!

While recovering from the spinal injury in a hospital, she dove into books, studying discipline and training. It was during this time that she discovered her talent for writing. She requested to be transferred from field service to boot camp to lower the number of dropouts leaving with disciplined powers. She still takes to the field (as her Bad Back allows) whenever her brother's killer may be encountered. Since then, she has molded herself into an efficient military machine to harden and enforce discipline in her troops, particularly those with powers they can take with them when they leave the unit. To this day, she distrusts anyone with a meta-power (magic, psionics, or the like), especially those suspected of possessing the [Wrong Stuff](#).

"Discipline is the beginning of an organized mind. Even so, it must still be able to choose to engage in random patterns from time to time in order to survive."

--"The Mind is a Harsh Master," Captain Ilyana Venture

In Mixed Company

Holding the rank of Captain in an "army," Ilyana Venture is in command of 10 to 50 troops (as the GM sees fit, see Rank 4, p. SO49). That means that the company consists of anywhere from two to 12 groups, each made up of four to five individuals, such as the PCs. Whether the adventurers are part of the front-line team or the "B" team is up to the GM. Whether Broken Arrow company is part of an official military, or just a mercenary group, the "work week" consists of a few missions breaking up lots of training! Recruits could be practically any sort of mixed meta-humans, be they mages, supers, gadgeteers, psionicists, shapeshifters, spirits, or even super-normals!

What does it mean to be a Meta-human in Captain Venture's company? New recruits must prove themselves before they receive any but the basic equipment and training to aid them in exploring their meta-powers. The [weirder](#) the power, the more trust is required. Meta-humans will have to work hard (at least enough through roleplaying to *earn* a +1 Reputation to offset the Stigma, not necessarily to pay for it in character points). It means at least one extra hour of training every day, be it calisthenics, martial arts, history, chess, or some other "productive" discipline. In addition to all this, they will be given the most difficult portions of a mission!

"It you wait until you think you are completely ready before trying for the first time, you many not be able to discover your hidden potential."

--"Broadening the Senses," Captain Ilyana Venture

Adventure Seeds

Mercenary Introduction: The adventurers are approached by a man who seems to know somewhat more about their capabilities than the public does. In exchange for favors, equipment, training, he asks for a minimum tour of duty. The tour of the boot camp could be as draconian as a prison camp, or as loose as Police Academy or **GURPS IOU** . . .

Buddy System Training may also include (as an experiment, already in place, or a permanent change) a "buddy" system, where new recruits are teamed up with a veteran troop with similar powers (theoretically).

- *Green PCs:* Under the watch of veterans, the heroes must try to puzzle out missions and save the older soldiers from clues and dangers they cannot perceive. They may have to break curfew and disobey orders to get to the Truth -- which can redeem them if they're right, **and** if they can get credit for it by getting it properly up the chain of command in time.
- Continuing the above seed, as graduation day approaches, some teachers may finally realize that their protégés are better suited for their jobs, and may become rivals who know the PCs' weaknesses. Attempts to mislead practice for or direct sabotage to the final tests (academic and athletic) may be fair game.
- *Veteran PCs:* So you have survived the enemy, but can you survive your allies? Your trainee's progression reflects on you -- so teach them well! They may be Klutzes, Jinxed, poor marksmen, and using Cheap equipment, but they are still your responsibility! If the new recruits cause trouble or fall short of their marks, the whole team may be punished with extra disciplinary training!

Once "Inside": Once on the inside, then one might realize that there are forces "inside" that are trying to harm or kill the Captain. In light games, they are misguided individuals who were hurt by the captain's strong, but well-meaning, hand. In darker games, it could be part of an Illuminati-style conspiracy, where no one can be trusted, or simply another officer trying to take her job "the old fashioned way" . . .

The Race: Two squads are given the challenge to be the first to complete a mission while staying stealthy. The winner gets extra R&R/funding/benefits/parade/next choice in missions (or whatever the PCs go for). As a complication, a team from a rival organization might also be trying to accomplish a mission in the same area, but with a different goal. The adventurers must avoid them. Interfering with them and failing costs points, but accomplishing both goals untraceably wins points . . .

Broken Arrows?: Equipment is sabotaged or goes missing . . .

- During training
- During a real mission
- During a covert mission

Is it the work of a force outside the company, or within? Are some of the green troops getting fed up with the substandard equipment and are trying to make a point, or is it something more sinister?

Protection Ticket: The objective is to run interference for a politician whose staff has received credible/forecasted threats to their person. The GM could provide maps (see links at the end), and allow the players to plan strategy, and prepare for contingencies. (Although a fair GM should plan first, independent of the PCs . . .) All is boring, until suddenly a small group of (or solitary) aliens, vampires, ghosts, goblins, super-henchmen, or something similar attack, and are barely fended off. The group must decide whether to track it to its source, shore up defenses around the VIP, or bring them somewhere safe. Meanwhile, the politician really wants to go campaigning, shake hands, make public speeches, attend meetings, and/or visit family and will not stand for any curbing of his agenda, despite warnings and threats against their life . . .

- As above, but the more interruptive the PCs are, the more impatient and disappointed the client will become. If, however, their actions raise "approval ratings," then they might find the contract extended. (Here is a chance for a charismatic character to talk to the press . . .)
- Extra Paranoia: The enemies seem to know what your orders and plans are and/or seem to follow your radio chatter.

Rubber Ducky, You're Not the One . . . : The party is given the mission of physically breaking into a [wizard's manor/tower](#) and replacing his(or her) rubber duck with one provided. The use of any effects that fold space are forbidden, be they psionics, magic spells, or meta-powers -- any such usage can be traced and will set off alarms. The group is given one-shot amulets/charms that (apparently) can hide them from retroactive scrying. For extra paranoia, the amulets don't register as magical.

One of the Group: Once the adventuring party has earned the trust of Captain Venture, they are approached by her most trusted lieutenant. They are given a sensitive mission: investigate a man that the captain has been having lunch with. (This fact may not be divulged, but discovered).

As it turns out . . .

- He has secret meta-powers!
- He is a super villain in disguise?
- He *was* a villain but *may* go honest . . .
- He is a spy for a rival within the company
- As above, but as an external spy . . .
- He plans to simply deceive her and steal money, fame, and/or access to escape the country . . .

Brownie Points: If someone were to take out the killer, they would gain the respect of Captain Venture. If the killer was to be captured for trial instead, the heroes would gain Ilyana's eternal gratitude. The latter would also allow her the closure she needs to heal.

It sure is lonely . . . : The Captain normally mixes with the troops on a regular basis, but lately has been acting a bit reclusive. Those who have seen her or her lieutenants report them acting strange . . . And then in the middle of the night, the camp is under attack! The command personnel are the first to be killed/MiA. Who will take command when the smoke clears? Alternately, her Intolerance could grow in severity to the point of persecution. Someone has to do something!

Patrons and Duty

As a patron to green troops, Captain Venture is (Powerful Individual [10], Regular Equipment, Minimal Intervention, 6 or less) [5].

Once on the "inside," the equipment level increases to "Powerful," the "Minimal Intervention" limitation is removed, and change frequency to "9 or less". [20]

As a Patron, the company as it is described here is "Powerful Organization, Enhanced Equipment" [30].

Each of the above comes with a Duty (hazardous, 15 or less) [-20].

"It is easy to say 'I've read Brannigan's Big Book of War.' It's another thing entirely to know strategies to the point that you see them in others' actions before they do."

* Includes +3 for Charisma

** Includes +1 for Talent

Alternate Versions

Fantasy: Driving becomes Riding, Guns becomes Crossbow, Electronics Operation becomes Alchemy and Thaumatology, and Computer Operation/TL3 is Abacus Operation!

Future / Transhuman Space: Driving may become piloting, guns may become beam weapons, depending on the setting. What she dislikes are aliens with powers, infomorphs and humans with performance-enhancing cyber components or biomods.

In Nomine: With little or no modification, this character and company could be used as a dispatch service for a Tether. Ilyana's distrust is thus for Soldiers with Songs, as well as Saints and/or Undead.

Lost in Time: If she were to fall through a hole in time to a place where her social links and ranks are meaningless (removing Ally Group [-12], Contact Group [-20], Rank [-20], Patron [-40], Reputation [-5], Security Clearance [-10], Status [0], Wealth reduced to "Dead Broke" [-35], Debt [+5], Duty [+20], Enemies [+5], Fanaticism [+15], Sense of Duty [+5] net [-102]), her point value is reduced to 130 points, which is perfect for a beginning player character!

"Real Life": The Intolerance could easily be adjusted to be against an ethnic group, demographic, or just people with Talents.

GURPS Third Edition Conversion Notes

DX [-10], **IQ** [-30], **HP** [+3], Will [-1], Honest Face becomes Sanctity [+4]. 198 points as is; "Lost in Time" version is 96 points.

Noir (for Mutants & Masterminds)

Published by [Green Ronin Publishing](#)

Written by Christopher L. McGlothlin, M.Ed. with Sean Glenn

Cover by Eric Wright

Illustrated by Brett Barkley, Eric Wright, & Storn Cook

Cartography by Ed Bouelle

64-page b&w softcover; \$17.95

To date, the releases for [Mutants & Masterminds](#) -- the premier *d20 System* superhero RPG -- have concentrated on the four-color genre it was designed to handle. [Dan Brereton's Nocturnals: A Midnight Companion](#) has been the sole exception, employing the stripped down and rebuilt mechanics of the *d20 System* to power a brash game of Pulp horror. Although set in the here and now, the setting for *Nocturnals* had just as much the feel of the fifties and sixties. Now it is joined by a second supplement, one that explores a slightly earlier, darker period. As its title suggests *Noir* is devoted to the years between 1948 and 1958 that depicted in sharp black and white by such films as *The Maltese Falcon*, *The Big Sleep*, and *Touch of Evil*.

Thus we are on the mean streets of film noir, a place where men are real men, it is rare that a dame can be trusted, the black heart of a villain always runs deep, and everyone, without exception, has something to hide. *Noir* covers this and more, segueing into the superhero genre with what is really the Costumed Adventurer. This is not to say that such individuals cannot have actual super powers, but when they do, the powers are always weak and restricted in comparison to the four-color genre.

Yet before *Noir* reaches the heroics of the Costumed Adventurer, it sets down the basics of the genre's male and female archetypes. As tough guys, the film noir male is strong, in terms of his will, his jaw, and his name, which should always be of a non-ethnic origin. Considering the ethnic melting pot that is big city America, the tough guy will probably have changed his name to something stronger and more generic. He is also likely to be aged between 30 and 40, and invariably dresses plainly. The dame on the other hand, will have a figure to entice, the wiles to scheme, and gold-dig with the best, or the worst.

To this are added just ever-so slight elements of the superhero genre. Origins such as Alien and Mutant are left for the decades to come, while the origins that draw from strange sciences, training, magic, and miracles are still allowed, as is wealth. In practical terms, a plethora of powers are deemed inappropriate: Cosmic Power, Dimensional Travel, Flight, Space Flight, Teleportation, Time Control, Time Travel, and so on. Others are severely restricted, usually by denying the use of particular power extras, or imposing certain flaws. For example, Sorcery is allowed, but must have at least one Flaw, and so is the Incorporeal power, but it is denied the Ghost Touch and Phase Attack extras. Further, a character is allowed as many weaknesses as the GM lets him. In addition, a character also has something far worse, a "Fatal Flaw."

Without such a Fatal Flaw, a character cannot progress in game terms, that is, acquire more Power Levels. In keeping with the genre, the character cannot gain without suffering a greater loss. Such losses should be appropriate to the Fatal

Flaw, which could be anything from making bad choices and literally losing bodily parts from a fray to having innocents suffer as a result of your actions and just plain bad luck. The Fatal Flaw needs to be defined as part of the character background before the points are spent during the creation process. There might be gripes at the deleterious effects of the Fatal Flaw, but not only are they appropriate to the genre, their use is also ripe with roleplaying potential.

Like *Nocturnals*, characters in *Noir* are built at Power Level 6, as opposed to the Power Level 10 of normal four-color *Mutants & Masterminds*. Similarly, characters in both games are expected to be able to take a beating or two, an aspect emphasized by the reduced Power Level, and then again in *Noir* by the various Fatal Flaws. The shared emphasis continues with skills and feats, particularly the former, an optional rule suggesting that skills be cheaper to buy. As with the powers, *Noir* bans some feats, for example, Darkvision is pointless in setting where the shadows are by necessity, long. Others are added, such as Force of Personality and Light Sleeper, while yet more are suggested as suitable for import from both *Dan Brereton's Nocturnals* and *Crooks!*

What *Noir* makes clear that it is not, is part of the Pulp genre. Though the origins of both are similar, there are plenty of differences. The obvious being that pulp is both colorful and in color, whereas film noir is both in black and white, and literally black and white. That said, *Noir* as a supplement strays towards the pulpier end of the film noir genre, since it involves various super heroic elements and employs a set of mechanics that are themselves cinematic rather than filmic in style.

Refereeing film noir is nicely covered in an essay that deftly discusses and applies Raymond Durnat's article, "The Family Tree of *Film Noir*" to the running of the game. This is done with reference to plenty of examples, as are the additional points that the author goes on to discuss. In game terms, *Noir* is supported by its own setting, known simply as "the City." An East Coast or lakeside metropolis all ready for the GM to use, but delivered in the form of a cabbie's monologue. No statistics are provided, but given that *Noir* is for *Mutants & Masterminds*, they are easy to provide. A selection of "heroes" and villains are given as ready-to-play examples, the former either as player characters or as NPCs. Another four characters are listed in the first of the book's two appendices that are specific to the *Meta-4* setting described in the *Crooks!* supplement. The second appendix contains a very handy film noir filmography.

The gaming side of *Noir* is the weaker aspect of the supplement. Not in terms of its characters, all of which *are* useful, but in the setting material. The City as described works well enough for either a straight film noir campaign or a low super-powered variant as suggested by the supplement. Yet those readers coming to *Noir* expecting to explore the film noir versions of either the *Freedom City* or *Meta-4* settings, will be disappointed. They are certainly mentioned, and in the case of the latter setting, discussed, but it would have been great to see them further developed.

Noir is of course up to the usual production standards for a *Mutants & Masterminds* supplement. Behind the excellent cover, the book is well laid out and well written. It does need another editorial pass though, as the period is all too often missing from the end of sentences.

Overall, *Noir* gives the GM almost everything necessary to run a straight film noir game or a low power Noir supers campaign. The lack of a developed setting or application of the *Noir* genre to the two *Mutants & Masterminds* settings, does serve to make the book feel somewhat short. Nevertheless the rules are *more* than workable, and the guide to the film noir genre is as good an essay as you will find anywhere. That and the succinct filmography combine to make *Noir* an excellent introduction to the genre, one that deserves further support.

--Matthew Pook

Pyramid Review

WMD: Weapons of Mass Destruction

Published by [Flying Buffalo, Inc.](#)

Designed by Douglas Malewicki & Rick Loomis

Art by SS Crompton, John Kovalic, Aaron Williams, Brendan Fraim, & Brian Fraim

110 full-color cards, rules sheet; \$19.95

Given the current climate, you'd think there'd be more games based on the strife in the Middle East that fall into the "someone had to do it" vein. The pickings are slim, but **WMD: Weapons of Mass Destruction** is a good start.

WMD is the newest expansion for the **Nuclear War** card game. Flying Buffalo's satirical look at Cold War tensions hasn't lost much of its bite over the years, but its social relevance is updated here. As before, players always have two cards facedown on the table. On their turn they flip the first card face-up, the second card becomes the first, and a new one is put out facedown.

You're committed to your layout, so if circumstances change before your cards are revealed you're out of luck. For example, propaganda cards only work in peacetime. These are your country's attempts to badmouth others in the international community in hopes of getting their people to move to your far superior nation. Once nukes fall, they're useless (even the facedown ones). War starts when someone nukes someone else. You must flip up some sort of launch system (a rocket, missile, etc.) and follow that with an appropriate warhead -- get them out of order or use incompatible cards and your offensives fails. You may also have secrets with horrible effects like releasing toxic weapons.

Damage is measured in population. This is a separate deck of cards, to be stolen with propaganda or blown up by weapons. If you lose everyone to propaganda, this peaceful resolution knocks you out of the game. If you die in wartime, you can skip the normal card cycle and launch a final counterstrike with everything in your hand. The last player with population wins, but nuclear war being the glow-in-the-dark nightmare that it is, it's possible -- even likely -- no one will live to see the mushroom clouds settle, and the game is a draw.

The real challenge for the designer is keeping the deaths of millions meaningful, or at least funny. Like other sets, **WMD** is a standalone game, though you can combine it with others in the series to make what is at this point a massive single deck. It plays with up to four players -- field more if you like, but not much more. The small population deck is the biggest hurdle, but with fewer Nuclear War Cards in this iteration, it's also easy to blow through that deck.

And the stack performs double duty here. Other sets came with dice or whatnot to randomize the effectiveness of the weapons. A device might kill more, fewer, or just turn out to be a dud that falls harmlessly from the sky. These cards use numbers in the corners to the same end -- after detonation you flip another card from the draw pile and add that many casualties. It may also multiply the kills, or (rarely) signify a dud. To get more mileage from the deck, some cards are half missile and half payload, and you choose which half to use. Each is a mirror image, so, for example, a Polaris missile accompanies 10 megatons, both small items; you needn't worry that resorting to the little Polaris means sacrificing a 100-megaton bonanza.

Over the years the supplement illustrations have gotten better, though WMD does not completely abandon its

cartoonish origins. In fact, purchasers of this version are in for a treat -- the population cards are done by several industry notables, and they're full of favorite characters like Nodwick and the Knights of the Dinner Table. They're accompanied by several in-jokes, with game designers on some of the cards.

There are potential problems here. There are no spies -- plenty of secrets, but you can't steal them without combining sets. Only three cards indicate a dud (assuming no one just plays them first), so most of the missiles are going up. This may upset those to whom chaos is endearing or satirically appropriate, but everything here is in abbreviated form and the card supply has to stretch further. Along the same lines, there are only two interceptor cards (though they take down a liberal variety of weapons), so you'd better make them count.

As amusing as the population cards are, buyers should note they're cut from the same sheet as the playing cards -- that is, they're all the same size (previous population cards were distinct and smaller). This doesn't put the kibosh on using the old and new population cards together, but making change takes some juggling and no one will ever again believe anyone who claims to be low on population.

The game stays current and amusing, with subtle references and stinging jabs at anthrax scares, contested elections, and of course Saddam Hussein. Surprises keep the game from getting predictable, like the miniaturization card that lets you put oversized warheads on smaller missiles, and new ways to wipe out your friends. Thanks to Sudden Wind Change, you're no longer safe trying to empty your hand of spare nukes without delivery systems -- the fallout could do you in.

It's inevitable that ***Weapons of Mass Destruction*** will get lost in the big-pile shuffle of a full complement of ***Nuclear War*** cards, but they still bring their own brand of biting wit. The rules sheet is one of the clearest they've printed, and as a standalone it's nothing if not convenient. The whole thing fits in your pocket, and this microcosm plays well for small groups, especially those who need to irradiate the Earth in record time.

--Andy Vetromile

Dork Tower!

Dork Tower!

Choices, Choices, Choices

Imagine that you are an alien mind -- completely devoid of knowledge of human bodies, the human experience, or the bulk of human lore, save for the literacy and comprehension skills that will be necessary for the latter part of this hypothetical. Now imagine that this mind is injected into a human body, and the human-body-alien-mind thingee is dropped into a supermarket. And the only piece of information given to the alien is that this body requires 2,000 calories a day of food, or it will die. And so the alien proceeds to roam the aisles, perusing the tens of thousands of items that make up a supermarket. And the alien reads each label, noting that calories are listed on almost every one, and the alien is trying how best to satisfy its needs, of which it only knows one -- the number of calories it needs. Imagine it picking up a Kool-Aid packet. A can of soup. A pack of gum. A wrapped package of raw chicken. A loaf of bread. A box of biscuit mix. All of them supposedly fulfill the one condition you've been given -- ingest calories. So how do you decide which to put into your mouth: the contents of the jar of jalapeno peppers or the cannister of baking powder?

I apologize for our international readers for whom the previous example didn't have as much impact. I'm well aware that 1) most other countries do not have the mega-huge supermarkets as we are familiar with them, and 2) most other countries also do not have any aliens to speak of. The second point is only countered in any significance by Great Britain, and those aliens are usually handled quite handily by a certain phonebox-emerging time lord.

Anyway, I mention the above example because I finally opened an IRA for myself, in an effort to plan for my retirement. Over the past year or so I've come to realize that my working plan of "Eat as much McDonald's as I can until I keel over at 50" may not be in the best interests of others around me, so I'm working on a Plan B.

And, like our hypothetical alien, I found myself completely and utterly befuddled by the number of options available to me. I waded through pages and pages of information, written in some strange symbols, signs, and terminology that I'm sure were an offshoot of Linear B. After six hours of consideration, I was literally no closer to understanding what I was doing than when I started.

Finally, I took the meager scraps of knowledge I made a decision -- one I'm feeling pretty good about. Yes, I've put my \$4,000 in Cow For Magic Beans (C4MB) fund; let's see how it turns out. During this time I also ate a can of tomato paste and another of water chestnuts (total calories: 200).

During this time I found myself longing for The Old Days, where I'd put in my 30 years working for the railroad, and I'd get a gold pocket watch and a pension. But pensions, pocket watches, and railroads have all suffered about the same setbacks in popularities of late -- they're not impossible to find, but relying on the existence or reliability of any one of them is going to get you late, flattened, or poor.

I didn't want as much choice as I was given; I wanted Something Simple. And I'm not alone; according to something I heard on NPR -- a source which, according to unnamed scientists, is 941% more reliable an uncredited source than the Internet -- companies that offer their employees more investment and saving opportunities end up having *less* participation. We all think options are good, but when people have too many choices they tend to fear making the wrong one, so they don't make any.

This is also common in the gaming world; when gamers are given too many choices in a game, they often feel more constrained by the system than if they were given fewer. For example, I'm currently acting as a sounding board for the development of the magic system book for the **D6 System**. For those who aren't aware, this system breaks down magical spells into four possible skills, one of which is rolled when using a spell. Thus to conjure a fireball one might roll one's *conjuration* skill. Spells are developed using an open-ended system that lets the creator devise pretty much any effect he'd want; given the nature of the system, it's possible (albeit really flippin' unlikely) that someone with the lowest possible skill might still be able to cast a hugely powerful spell.

Sounds pretty good, right? The problem is that many fans find it *too* open-ended; they find the double-edged combo of being able to create any spell coupled with the possibility of anyone being able to cast any spell to be overwhelming.

They have too many options.

Likewise many gamers, when presented with an open-ended character creation system (such as found in **GURPS** or the **Hero System**), are completely unable to make a decision and come up with a character. Or many folks shy away from CCGs because the notion of constructing one deck from hundreds or thousands of choices is too daunting.

Although there are many possible arguments to be made as to why, the most popular RPG is -- and has always been -- some flavor of **Dungeons & Dragons**. This system has never offered too much in the way of character-creation choices; although the latest versions have offered much more variety, the basic system would still be approachable enough for someone to make one of a dozen race choices, one of a dozen class choices, and a few abilities. (The original boxed set **Dungeons & Dragons** was even more approachable, with race and class melded into one choice.) Likewise the magic system is easily approachable; you can cast a small set of spells a set number of times a day, and making up your own spells isn't particularly encouraged. And through it all, there's only a few choices of setting, and only one of *genre*. Other RPGs have followed suit; for example, the various "clans" of the **World of Darkness** games are a way of compartmentalizing choice into a few discrete options.

The modern world has encouraged us that we should have as many options as possible. But too many choices in our games can leave us overwhelmed and not playing any games at all . . . which isn't what anyone wants.

And did you know that a stick of Crisco is 1,760 calories? Yum yum; that's most of a day's eating right there; I should buy stock!

--Steven Marsh

More Questions than Answers

Twelve Months Later

by Chris Aylott

We sold our first house today, and this has made me pause and reflect.

The sale isn't final yet, and won't be for a while. There are inspections to be passed, agreements to be drawn up, weeks or months until our chain of homeowners passes houses down the line like a hermit crab drill team. But it is a rite of passage, like opening a business, like buying the house, like having a baby.

The World's Greatest Baby is almost twelve months old. This is how much you can change in twelve months:

Year Zero

Twelve months ago she could barely move or see. Now she talks, stands (with a little help), and crawls with flair. She has likes, dislikes, and a mischievous personality. She sees everything around her and is fascinated by it. That's how much can happen in a year.

She isn't the only one who has changed, but we'll get to that. Something else happened today. Gameboard Distributors sent an email to its customers announcing "Gameboard accounts transferred to Blackhawk Hobby Distributors." The words "sold" and "out of business" and "unpaid publisher bills" were never said, but it's easy to read between the lines: There is one fewer game distributor. The hard business of consolidation continues; a wag I know suggested that Alliance should just tell people, "Sign up now, because we're just going to get you anyway."

Important? Not by itself. Gameboard was a minor player in the hobby, and their failure isn't going to change anybody's business strategy. But it's part of a shift that seems to be affecting all kinds of entertainment these days, from games to the movies.

Hollywood Blues

Movie ticket sales have been slumping all year, and last weekend's box office "winner" had the worst early May opening since 1998. Entertainment Weekly recently ran a poll asking its readers why they aren't going to the movies. "The quality of movies" was the biggest complaint, garnering 28% of the roughly 10,000 votes cast.

If you look further down the poll, however, a much more popular answer jumps out. Entertainment Weekly asked, "Can you imagine a time when you'd prefer seeing movies in your home?" Half of the respondents answered, "Imagine it? I already do." The usual complaints about self-selecting polls aside, there is a substantial fraction of potential movie-goers out there who would rather just stay home.

I know how I feel, because I'm one of them. I love movies, but the last movie I saw in the theater was *Lord of the Rings: The Return of the King* on its opening weekend. Long before the baby came, my wife and I were going out to fewer and fewer movies. Shortly after *Return of the King*, we signed up for Netflix and just . . . stopped going.

Netflix is easy. We make a list of movies we want and they send us the top three on the list. We watch them when we want and send them back when we're ready. After the World's Greatest Baby was born, we didn't watch a movie for two months. Netflix didn't mind, and the movies were right there the night we decided we did feel watching one.

Netflix alters an entire pattern of activity. Because we buy the service, we don't need to go to movie theaters, rent videos, or buy DVDs. We're still getting the experience we want, but we go fewer places and own less stuff. When we do go to the movies or buy a DVD, it's because we want to enjoy a crowd experience or see a movie over and over again. One thing I've learned this year is how rare those two wants are.

The Confucian Luggage Drop

It's not just movies, either. Over and over this year, I've looked around at the stuff that clutters our house and thought, "Do I really need this? How likely am I to watch that dusty *Babylon 5* video? Am I ever going to read Robert Sawyer's *Far-seer* again? Why do I still own these things?"

The World's Greatest Baby isn't the cause of these thoughts, but she does play a role in them. For a while, I told myself -- as I stubbed my toe on yet another bookcase -- that I was saving those books for her, that someday she'd thrill to the science essays of Isaac Asimov. Never mind that his 1960's essays were going out of date when I first read them in the 1980s, never mind that I didn't care for anything my parents read until I was grown up and out of the house.

Eventually, even I had to realize this was nonsense. There are classics that we are saving for her, but what she needs is space in which to develop her own interests. Her bookshelf has to be mostly empty so that she can fill it up her own way.

Learning this, I've begun to let go of things. It has gotten easier to keep the favorites and pass on the rest to somebody else, to focus on the experience rather than the thing. Some of this comes from watching the WGB in action, seeing how she drinks in one experience and then moves on to the next. Some of it comes from the convenience of services like Netflix.

TiVo reorganizes our television viewing. *City of Heroes* provides instant gaming at any hour of the night. As I bang out these words, I'm listening to a country radio station on iTunes. And even though we own a bookstore and buy plenty of books for ourselves, we've always been regulars at our local library.

Our experiences are becoming digital; even when we own them they take up a lot less space. Our baby pictures are on our hard drive, and we use the Fototime web site to share them with our family and friends. Remember disposable cameras at weddings? We went to a wedding last week; the bride and groom put out a computer and asked the guests to copy over their digital photos. Film has become an artist's medium, as obsolete for everyday use as oil paint on a canvas.

Hobby games have been moving online, too. Days of Wonder has thousands of registered players for the online versions of their board games. Gametable Online is a subscription-based service offering games like *Cosmic Wimpout*

and ***Kill Doctor Lucky*** from a variety of publishers. There are already GM aid programs for sale that duplicate most of the tools a gamemaster needs around the tabletop -- how long will it be before somebody combines a subscription to the software with a regular series of adventures for gamemasters to run?

None of these services are new, and few of them are profitable yet. However, they are growing fast. TiVo has doubled its subscriber base in the last 12 months, and it just held a Mother's Day giveaway of TiVo boxes to new mothers at a Dallas hospital maternity ward. TiVo claimed a recent survey showed that "91 percent of mothers with children would like to be able to watch their favorite TV shows any time they choose," and that almost 80 percent of moms would love to receive a TiVo DVR for Mother's Day.

TiVo expects to be profitable by the end of the year, and it's no surprise why. Who doesn't love a more convenient way of using something they already enjoy?

The New Service Economy

I've heard about the "service economy" for years, but I've always imagined it as a nation of McDonald's and Quik-E-Marts. In the last 12 months, as I've watched the game hobby struggle and railed about online game stores, MMORGs and better game design, I've started to see that "service business" has a wide definition. Helping me watch *The Apprentice* at 3 A.M. is a service. So is providing me with the materials I need to play Ticket to Ride, whether those materials are physical or virtual.

Of course, not everything in our hobby derives its value from being a service. A Black Lotus may help me win games of ***Magic: the Gathering***, but I don't think that's why people are paying \$500 for it. A well-painted Reaper Miniatures figure is no more useful than an unpainted figure, but people pay more for it. Hobbyists collect, and many bits of hobby paraphernalia are valuable because they are collectibles.

Twelve months after starting this column, I'm still picking at the question of what makes products and companies successful. Is success as simple as putting out a good service or a good collectible? Can you fail because you think your job is just to put out ideas or things?

If more gamers start buying services instead of things, does it become harder to compete in the gaming marketplace?

The Beauty of Emptiness

Collecting things used to be the hobby of the rich. As Gerard Jones points out in his history *Men of Tomorrow*, it took the mass production of pulp magazines and comic books to create the collecting community of science fiction, comics, and game fans that we are familiar with today. The pulps gave fans a common culture and things with which to demonstrate their expertise in that culture, and so the collections flourished.

But fans have always valued the things of their hobby for their utility, for the way in which they hold the knowledge of the shared culture. Aesthetics is often secondary, as we see every time a fan advocates more text and less art in a gaming rulebook. Most of the artifacts of fandom are repositories of knowledge, and while an old issue of *The Shadow* may be a collectible, a new game rulebook can be replaced if a more functional source of [information](#) comes along.

Twelve months ago, I would look around my house at walls covered with shelves and galleys piled high on the floor and feel glad to own so many books. But then we had a baby, and the more she grew, the more my wife and I realized how small our living space had become. We fine-tuned our collections, but we didn't really change until we decided to sell our house.

It's not a big house. About 700 square feet; I've had hotel rooms that were bigger. But it felt even smaller with bookcases looming on the walls, so as we did the usual house-selling ritual of scrubbing and vacuuming and putting geraniums on the porch, we packed up half the books and half the bookcases and put them in a storage facility. And then we were surprised when the first buyers came through and called the house "spacious."

Last night, I sat in my spacious little house and realized that the buyers were right. The place is so much more comfortable with less stuff in it. Our favorite things stand out, and there is a beauty in the empty space around them.

Sitting on the couch in my old house, I could visualize the living room of my new house. Plenty of places to sit, television, a table for board games and puzzles. Art on the walls, a few favorite books in a bookcase. There is even music in the air, but no CDs - the songs are stored on the computer in the office and played over the home network.

Simple. Relaxing. And all it takes is letting go of a few physical things.

Am I changing because I'm getting older? Because I'm a parent now? Because I live in a culture that is making it easier to enjoy without owning? I don't know. But I suspect I'm not so unusual in this new phase of the Information Age.

And if I am typical, what does that mean for the creators, retailers and distributors who provide us with our entertainment? How will they make their offerings more fun, more useful, more responsive, more convenient?

Stick around; something tells me the next twelve months are going to be an interesting ride.

Designer's Notes: GURPS Mysteries

by Lisa Steele

Something is hidden, it must be uncovered. It's one of the world's most basic plots, but it is much harder to successfully portray in an interactive RPG setting than you might expect. I wrote **GURPS Mysteries**, in part, to help GM's avoid the mistakes I've made over the decades in trying to challenge my players with puzzling events in addition to combat. I also wrote it for players trying to figure out what their hardened detective character should do when confronted with a crime scene.

You'd have to live in a cave to avoid exposure to the huge number of mystery books, television shows, and movies currently available. Borrowing ideas from popular fiction is not as easy as it looks. Authors and screenwriters have complete control over their characters. They can present clues in very specific ways to obscure key items in a field of red herrings. They can control who their protagonists talk to, and what questions they ask. More importantly, they control what their characters *don't* ask, thus avoiding premature solutions and unnecessary details. GMs in an RPG just don't have that kind of control over the players or their characters.

"So use reality," you say, "Mystery fiction is all too contrived anyway." Most crimes in the real world aren't really all that puzzling. Most culprits don't use elaborate alibis and rare poisons; they kill people in mundane ways and are generally easily caught. Real life has loose ends, unreliable evidence, and irrational motives which leave unsettling gray areas in even a solid conviction. The mystery genre and **GURPS Mysteries** borrow heavily from reality, but twist it a bit in some places (and simplify it a bit in others) to make it more interesting and useful as entertainment.

GURPS Mysteries guides you through the adventure-design process by explaining the genre's underlying structures: the English-style cozy, the American hard-boiled adventure, and the technologically oriented police procedural. These formats are very good broad structures which can serve as a supporting frame for an adventure. Characters and situations that work in Agatha Christie's St. Mary's Meade don't work on the mean streets of Raymond Chandler's Los Angeles or CSI's Las Vegas. Chapter One talks about how to pick the format and structure that works best for an adventure, and how to plant clues and provide useful distractions. You will find discussions of both the classic puzzle-piece plot (define the clues and let the PCs find them in any order) and the ball-of-twine plot (provide clues that lead logically from scene to scene) as ways to structure an adventure.

If you are a player, Chapter One takes you behind the curtain and shows you some of the tricks to plot structure and clue placement. If you don't want to know how the sleight of hand works, skip ahead to Chapter Two.

Chapter Two is all about forensics, death, and injury, including a discussion of how to get rid of that irksome body and what evidence might be found despite the villain's best efforts to commit the perfect crime. If you're a GM who prefers to set up the scene and improvise than plan out your clues and encounters, Chapter Two will help you set the scene well. You'll also find lots of juicy details about causes of death, ways to identify suspects, and specific crimes including arson, kidnapping, and fraud that make good plot fodder. If you are a player whose character has come upon a crime scene, Chapter Two will give you ideas what to look for and how to interpret what you find.

The third chapter is about interviews and interrogations. Mysteries are about talking to people. (The cozy sub-genre, in fact, is almost *entirely* about talking, without a single gunshot, car chase, or brawl to stir the blood.) This means taking a detailed look both at how real detectives try to get people to talk, and at the **GURPS** social interaction rules. This was the hardest chapter to write. Social interaction rules should give a tongue-tied player the same opportunity to play a witty detective that the combat rules give a coach potato to play a martial artist. But, people like to roleplay conversations, interrogations, and accusations in a way that they don't act out combats. The social rules give players and GMs some ideas how to portray these scenes, and balance skill checks against a player's acting ability. Chapter Three also suggests some optional rules for using disadvantages as a social weapon. A detective who plays along with a Jealous target's fears and obsessions for example, will be more successful than a detective who has not recognized this weakness. If you are a player trying to decide what your detective will ask an NPC, this chapter will give you

several approaches based on the target and on your character's skills and strengths.

A **GURPS Mysteries** adventure can be part of almost any campaign using almost any game system. The ideas used in this book were developed in scenarios for various versions of D&D, Champions, West End's Star Wars RPG, FASA's Star Trek, Traveller (several incarnations), and, of course, **GURPS**. The game system does make a difference in how a mystery adventure works. Chapters Three (social interaction) and Six (paranormal adventures) are useful guides to the common pitfalls in these key areas.

The remaining chapters of **GURPS Mysteries** discuss time periods and genres: low-tech, the modern era, science-fiction, fantasy, horror, and psionics. You'll find discussions about specific challenge and opportunities in each genre. There are also various agencies that can be used as employers or adversaries -- including thief-takers, the Pinkerton agency, futuristic insurance investigators, and psionic legal investigators. The agencies were created or chosen to show the breadth of historical and modern detective work.

Of course, you will find character templates and advantages/disadvantages/skills. You'll find examples of the hardworking police detective, the cynical private eye, the genius consulting detective with his deerstalker, and many other possible protagonists. You'll find crime scene and detection gear too.

There is also, of course, a guide to books, television shows, and movies to inspire GMs and players alike.

Normally in a design article there is a discussion of things left on the cutting-room floor. **GURPS Mysteries** was fortunate not to have anything major cut for space. As a bonus, however, let me explain some of the art. Chapter 2, Page 38 has a discussion of blood spatters. The editor for this book asked for illustrations of the various patterns. I sent the art department a series of images taken from an in-court demonstration made by Dr. Henry Lee in an actual homicide trial to explain his crime scene analysis. (The original is ink, not blood, but Dr. Lee testified that the red ink has similar properties.) The blood stains illustrating the book correspond with some of the topics on this page.

Blood

Low-velocity patterns are found on pages 59 and 99. These could be caused by blood dripping from a wound onto a floor or other level surface. The size of the drop increases the farther the drop of blood falls onto the surface. The images on pages 36, 48, 75, 81, 89, and 90 are also low-velocity patterns, but here the surface is inclined -- the sharper the incline the longer the drip. The mathematically inclined could use trigonometry to figure out the exact angles; when a sphere of blood strikes a flat surface, the diameter of the sphere in flight equals the width of the stain and the length of the stain is equal to the hypotenuse of an inverted right triangle. The effect on inclined surfaces is similar, but you would need to

separate the original impact from the

More Blood

elongated drip due to gravity. In an adventure or a real crime scene if the shape and drip do not match the orientation of the object, it may be a clue that the object had been moved after the crime.

Medium-velocity patterns are found on pages 3, 29, 77, and 96. This is the kind of pattern produced by blood flung off a weapon by centrifugal force as it is swung ("cast-off") or from an arterial wound. You can also see a contact hand-print next to the medium-velocity pattern on page 3 and 29. It is enlarged on pages 77 and 96. This could be caused by the attacker or victim touching the surface for support after the assault or homicide.

Rivers of Blood

A high-velocity pattern is on page 7 at the bottom.

This is the kind of pattern you would find from a gunshot, explosives, or possibly coughing or sneezing. The medium and high velocity patterns appear to come from a single point. With larger patterns, criminologists can draw lines through the center of individual stains to find the point of convergence where the blow was struck.

Out, Out, Damn Spot!

Contact wipes are on pages 24, 53, and 112. (Here, someone has touched blood and wiped it across a surface.) The swipes on pages 8, 44, 54, 62, 120, and 121 are all contact smears; the person has blood on their hands or clothing and has smeared it onto a surface -- longer swipes mean faster speeds.

Out, Out, Damn Spot!

Sadly, every project must come to an end. I would like to thank Jonathan Turner, who lent me his prodigious library of

mystery novels and helped write and re-write the first chapter and Allen Wilkins, my husband, for editing the various drafts. Between the change from **GURPS Third Edition** to **GURPS Fourth Edition** and from a printed book to e23, this project was three years in the making. I'd also like to thank the editors for patience with questions and with a series of word-processor incompatibility woes.

Even with the delays, I did not get a few last sources into the manuscript. Here are some books that I came upon after the book was written which I commend to the **GURPS Mysteries** purchaser.

On Forensics

- Baden, Michael, *Dead Reckoning: The New Science of Catching Killers*, (Simon & Schuster 2001) (New York City Medical Examiner's discussion of forensics and famous cases).
- Horswell, John, *The Practice of Crime Scene Investigation*, CRC Press (2004) (another practitioner-oriented text on crime scene work with useful pictures and diagrams).
- Lyle, D.P., *Forensics for Dummies*, Wiley Publishing, Inc. (2004) (a great resource for GMs and players surveying forensic methods: the last section on Hollywood myths is useful for RPG GMs looking for more verisimilitude in their adventures).
- Doyle, James, *True Witness: Cops, Courts, Science, and the Battle Against Misidentification*, Palgrave (2005) (history of the struggle between research psychologists and lawyers over how eyewitness testimony is used in criminal trials).

On Policing and Crime outside the U.S.:

- Etienne, Steven, Maynard, Martin, and Thompson, Tony, *The Infiltrators*, Penguin Books (2000) (undercover work in Scotland Yard).
- Gray, Roger, *The Trojan Files*, Virgin (2000) (armed policing in and around London).
- Hames, Michael, *The Dirty Squad*, Warner Books (2000) (policing obscenity).
- Latham, Richard, *Deadly Beat: Inside the Royal Ulster Constabulary*, Mainstream Publishing (2001) (an RUC officer's-eye view of the force).
- Ryder, Chris, *The RUC: A Force Under Fire*, Arrow (2000) (a historical view of the force).
- Townley, Lynne, Ede, Roger, *Forensic Practice in Criminal Cases*, *The Law Society* (2004) (guide to UK forensic practice written for lawyers).

Funerary Procession

for *GURPS*

by James P. Barrett

Ingredients

The Deceased

The late Andrew Pollard was an accountant at a large financial company in the city. He was quiet and unassuming, generally kept to himself, and didn't have any enemies to speak of. He didn't have many friends either. His life was orderly, ritualized, and dull. Five days a week he would work hard at his job, before going home (normally after putting in at least an hour of overtime) and listening to classical CDs. He lived alone and had no surviving family other than his ex-wife Margaret. On weekends he played in a local bowling league, tended his small garden, and sometimes went out for a drink with friends. He had had no romantic involvements since his marriage ended three years ago.

The Offense

Two weeks ago Andrew started complaining of horrible nightmares -- nightmares so bad that he came into work exhausted, as if he had gotten no sleep at all. His work suffered as a result, and a week ago he was called up on a financial discrepancy which he had failed to notice in a client's files. His employers have yet to complete a formal enquiry, but he was suspended from work with pay while they looked into the matter -- and if the discrepancy is what it appears to have been he would certainly have lost his job.

After his suspension, Andrew became irritable and surly. His friends tried to help him but he brushed off their aid. Refusing to talk about the problem he was abusive when they did call round, and in a series of petty arguments he managed to give away secrets he had agreed to keep, attacked them on their weakest points, and otherwise succeeded in alienating even the closest of his buddies. Becoming even more depressed he began to drink, which he hadn't done since college.

Three days ago he came home while drunk after having a raging argument with his ex-wife (who until recently he had gotten along with very well) and slipped on the steps. When he was discovered the next morning his neck was broken, and he had been dead for several hours.

The Pall-Bearers

Today is Andrew's funeral, which is where the investigators come in. Each should be a normal person living in the city in question who knew Andrew well enough to have been asked to be pall-bearers at his funeral. All will have been amongst the friends whom he alienated in the last couple of weeks of his life, but it's amazing how much death can change people's perspective on a person -- especially one who has up until recently been a good and decent friend.

They meet before the funeral, and attend the service. Andrew had asked that his body be cremated, and the ashes scattered in a local park. Afterwards they spend the evening in his favorite bar discussing what happened. As well as the PCs the funeral is also attended by Margaret (his ex-wife), Joshua Reynolds (his immediate boss), Thomas McIntyre (an official of the local Bowling League), and Tobias Phoulkes (a co-worker of Andrew's in the same office).

The Aftermath

The night after the funeral, one of the PCs starts to suffer from horrible nightmares. If left unchecked he will suffer from a work-related mishap (possibly resulting in loss of his job) within a week, and within another 1d days his friends will gradually become estranged from him (try to ensure that at any point when something can go wrong with his personal life it does. This may require asking the other players to come up with reasons to fall out with the PC). If nothing stops the process then after another 1d days he will have some form of accident, resulting in 6d damage (being hit by a car or bus would work, as would a fall from a high window).

Naturally once it becomes clear that the same thing which happened to Andrew is happening to him, the PC will try his best to find out what, and how this could be. Generally this will mean examining the last few weeks of Andrew's life for clues.

What's Happening

Most GMs familiar with *GURPS Ritual Magic* will recognize the effects of a Malediction curse. Clearly the curse was placed upon Andrew for some reason, and has since been transferred to the PC who is being affected. The other heroes should also realize that if the effects reach the same conclusion with the affected PC as they did with Andrew then there is a fairly good chance that another of them may be the curse's next victim. Generally a good reason for the curse having been placed upon Andrew can be constructed by examining the backgrounds of the PCs and seeing if anything is held in common between them (secrets, old lovers, even common interests could help) and working from that. If no such reason can be found then a few good possibilities exist:

- Andrew was in Tobias' way at work. Tobias wanted a promotion, but was sure that Andrew was going to get it instead. He either went to a Witch Doctor, or performed the ritual himself.
- Andrew's will still lists Margaret as his main heir (unsurprisingly since they still got along very well), and she knew that. Having hit hard times (either through loss of a job, or through having sunk all of her money into a project which fell through) she was looking for a way to regain her fortunes (and repay the unscrupulous gentlemen from whom she was forced to borrow). Upon mentioning her possible inheritance those same unscrupulous men put her in touch with an adept.
- Andrew wasn't just a fanatical bowler, he was a good one too. The team he played for was the favorite to win the local league. Thomas, however realized that if Andrew could be removed from the picture then he could make a fair amount of money from gambling.
- Andrew's latest work would have shown up vast financial irregularities within the company, most of which involved Joshua's frequent and extensive embezzling of client's funds. Even Andrew didn't realize this yet, but Joshua knew that he would.

It's perfectly possible that all of the above motivations could be true (although having them all have cast a Malediction against Andrew might be a little extreme). Any way around the perpetrator will be panicking because when the PCs actually turned up to Andrew's funeral they assumed that they had not been driven away from him by the effects of the curse. Cursing one of the PCs (and then the others) is an extreme, but understandable reaction.

Side Salad

One Option to make this even more serious would be to actually kill one of the PCs. Have the effects of the malediction begin to affect him, allow them to take their course, and reach their ultimate climax (assuming the other PCs don't manage to stop it) then have the accident occur -- and end the first session of play there.

Afterwards, when the other players are not present inform the player who's character died that he gets up, steps out of his body, and is confronted with a cold, hazy, gray version of the world. Nearby is a small horrifically demonic looking creature (the only thing which isn't misty and gray); it looks straight at him, before seeming to be dragged away across the city (back towards the Adept who cast the Malediction, and is now recasting it). Hand the Player the details of a Ghost template. He may well suppose that by somehow arranging the destruction of his murderer he'll be able to go on to a real afterlife -- or he may just realize that the little spirit which enacted the malediction has a taste for him now,

and once the Adept has run out of targets for his ritual it may well be free to come back and devour him. This option works especially well if the ghost template in question doesn't include any overt materialization abilities.

Another option is to leave all the PCs alive but to have Andrew's ghost attempt to contact them (through knocking, occasional manipulation of probability, and other spiritual abilities). This has the advantage that it's easier to run, but the disadvantage that it is in many ways less spooky and unnerving than actually having one of the PCs die at the end of the first session.

Finally it should be considered that in order to combat the adept responsible the PCs may need to contact a magical group of some sort for help. This could be as simple as a local Voudoun or Wicca group, or as sinister as The Cabal. Any way around it's unlikely that these magicians will help the PCs for free, rather they may well seek some form of service in payment. Owing a favor to the magical equivalent of the mafia is not a good situation to be in -- but it makes a perfect hook to turn this into the start of a **GURPS Cabal** or **GURPS Voodoo** campaign.

Tibet the Role Playing Game

Published by [Vajra Enterprises](#)

Written by Brian St. Claire-King

Cover by Samuel Araya

Illustrated by Lorie Albrecht, Laura Dubuk, Jason Juta, Britt Martin, & Martina Pilcerova

224-Page Perfect Bound Softback; \$29.95

At first thought, the country of Tibet seems an odd subject for an RPG. Then again, there are so many RPGs devoted to both China and Japan, certainly of the latter, that few of them seem strange. But *Tibet the Role Playing Game* published by Vajra Enterprises is not set in the medieval period like most Japan or China set titles, instead being set in the 20th century. Specifically the year is 1959, nine years after China marched across her borders and forced a slow conversion to communism upon Tibet. Now the country seems ready to descent into chaos -- Chinese troops mass ready to take over Tibet, the Chinese government threatens to disband the Tibetan government, the people fear for the safety of their revered religious leaders, and could break into open anti-Chinese rebellion at any moment.

This is an opportunity for the gamer to explore another oriental, but still very different country and culture at a moment of great crisis. It presents a clash of cultures, that of deeply religious Tibetans versus the uniformly Maoist and highly critical nature of the People's Republic of China. Politically it not surprisingly adheres to a Tibetan bias -- the PRC is definitely the bad guy here. The current situation has the Chinese occupying and ruling the eastern half of the country; the Tibetan aristocracy maintains an uneasy peace with them while readying themselves to leave if the Chinese decide to crack down on them. The nomadic tribes, funded by the merchants, wage a successful guerrilla war against the Chinese. The actual Tibetan government headed by the Dalai Lama is caught in the middle, trying not to arouse the ire of the PRC by supporting the rebellions, while the people worry for the safety of the Dalai Lama.

While the PRC has its own theology, the Tibetan people have their own beliefs and religions. This is primarily the Tibetan form of Buddhism, plus the folklore religion Bon, the organized religion from before the arrival of Buddhism, and oracles that are part of all three. The Tibetan world is one where both magic and the supernatural are very real . . . but only by the evidence they leave. Those that study or practice magic have the ability to determine the nature of such events. While sorcery is feared (because of its ability to release bad karma), astrology, holy charms, weather control and exorcism are all accepted by the average Tibetan. The Buddhist sects also possess knowledge of secret rituals that can harm others, though their main preoccupation is of course achieving enlightenment. For most Tibetans acquiring enough to gain a pleasant rebirth is a sensible enough goal.

Lots of background is presented in this game, detailing the culture, history, religions, and beliefs of Tibet. It starts out by describing how the average Tibetan lives and what he wears, item by item, before going into greater depth about his religion, Tibetan cosmology, and the various Buddhist sects. Nyingmapa is the oldest, most shamanist, and unorganized religion, with knowledge of some harmful sorcery and an emphasis upon tantras, the quicker, but more dangerous paths to enlightenment. Sakyapa is also old, focusing upon scholasticism and logic, but with an unsavory reputation for magic and sorcery. Newer is the Kagyupa sect that emphasizes body control yogas over logic and philosophy, while the better-known Gelugpa -- or "Yellow Hat" -- sect stresses philosophy and purity over magical

rituals. This leaves them little in the way of magical defense, but martial arts training -- Crane Kung Fu or Tibetan Tai Chi, is a common means of defense in its stead, often learned by the Dobbobs, the monastic police officers. A simple table at rear of the book lists the differences between Tibetan and American cultures.

Tibet the Role Playing Game employs a rough class and level system. Character creation begins by splitting 90 points between nine attributes rated between one and 20, Karma being the only outré statistic. There are 25 classes listed, from Aristocrat and Craftsperson to Unclean and Weathermaker. The majority are religious or mystical in nature, including the various Buddhist sects, plus Astrologer, Dobbob, Oracle, Revenant (a returnee from hell sent to warn others of its sufferings), Sorcerer, and Weathermaker. It is also possible to play a Foreigner, who could be a Scholar, Mountain Climber, Reporter, Missionary, and so on.

Besides defining his place and role in society, a character's class also determines the cost of the various categories, which vary from class to class. A player has 100 points to spend on these. Depending upon his class, a skill can cost anywhere between two and 20 points per level. Most classes also have a special ability or skill. For example, the Treasure Finder can buy a number of unique skills: Treasure Location, Treasure Verification, and Treasure Meditation. Points can also be spent on advantages like Chinese Trained (Military or Scholastic), Monastic Training, or Western Educated; or gained for disadvantages such as Bad previous Life, Opium Addiction, or Tulpa, this last indicating that the character is the creation of a Sorcerer. One nice touch included in the description of each class is a list of suggested reading elsewhere in the book.

Despite being a class and level system, ***Tibet the Role Playing Game*** allows plenty of flexibility in terms of character progression. It sharply defines a character's class as what a character does, but what he is getting better at as his discipline. The latter can be exactly the same as his current class, but it could be an entirely different class all together. It could even be one of the new given disciplines, such as Bandit, Exorcist, or Tibetan Government Spy. While this Class and Discipline system is hardly new, the campaign and roleplaying opportunities it offers are pleasingly explored and discussed.

To reflect the game's Buddhist nature, players must also select five attachments, such as Brutality, Logical, or Fame. These reflect both a character's personality and what separates him from enlightenment. By improving his Karma and removing these attachments, a player moves his character towards enlightenment. Either is a difficult process, gaining Karma all the more so because so many actions typical to roleplaying will often lose a character Karma. The benefit of moving closer to enlightenment is that a character can perform miracles, while achieving it forces the character's retirement.

The mechanics in ***Tibet the Role Playing Game*** involves a d20 roll plus an attribute or skill modifier versus a difficulty factor. Combat develops this further, perhaps making it a little overcomplicated to get the desired degree of detail. But otherwise, there is nothing wrong with what the publisher calls its "Organics Rule Components."

The section on adventuring offers up plenty of suggestions. It covers getting the characters together, along with a variety of different missions. These include military, political, ceremonial, and mystical adventures. The setting's many dangers are also discussed, from traveling and ordinary humans to Rakshasas and wild animals. There are oodles of ideas throughout the section, and that is before you get to the two adventures. In "Struggle session," the characters come across a village where the commander of the local Chinese garrison is conducting public torture sessions on the lama of the nearby monastery to force him to recant his faith. In "Silent Valley," they come across an abandoned monastery whose only resident is its lama who wants their aid in finding a hidden valley where he can retire and meditate. Although they are short, both adventures nicely explore the spiritual and secular aspects of the setting.

Where ***Tibet the Role Playing Game*** scores highly is in its physical presentation, even though its layout style is hardly new. While ordinary, clean, and decent, it goes out of its way to keep the reader informed with a running glossary throughout much of the book (in addition to the glossary at the back) and brief summaries given before many of its subjects. Further, the book is lavishly illustrated with period photographs that do much to enhance the book's look and impart the setting to the reader.

Mechanically, the game does feel dated, and it is not hard to see done as a ***d20 System*** RPG, or indeed adapted to any set of modern RPG rules. But the wealth of information the game contains lifts above the choice of mechanics, as well

as giving us a superb introduction to the country, culture, and religion of Tibet. Clearly a well-researched labor of love for the author, ***Tibet the Role Playing Game*** certainly has the more mature gamer in mind. Thus it is the devotees of such games as ***Ars Magica*** and ***Empire of the Petal Throne*** that are likely to get the most out of ***Tibet the Role Playing Game***, perhaps the first modern-set culture RPG.

The Authority Roleplaying Game and Sourcebook

Published by [Guardians of Order](#)

Written by Jesse Scoble, John Chambers, John Snead, Matt Forbeck, Matt Keeley, Mark C. MacKinnon, Jeff Mackintosh, & David Pulver

Art by Bryan Hitch & John McCrea

Edited by Mark MacKinnon & Jesse Scoble

352-page full-color hardcover (48-page *Authority* supplemental in b&w); \$44.95

Not since *Aberrant* have players had such a chance as this to flex their muscles in an RPG -- not their roleplaying muscles, but their characters' actual muscles. *The Authority*, based on the DC/Wildstorm comic book of the same name, is about superheroes whose power seems to approach that of the divine.

For anyone unfamiliar with the funny books, the *Authority* is a group of heroes gathered by the disillusioned Jenny Sparks, living embodiment of the 20th century. She's seen the half-hearted, corrupt measures used by the United Nations and their ilk, and she's convinced she and her team can make a real difference in the world. She puts the baddest metahumans on the block -- including the Doctor, shaman to the world; nano-infused gadgeteer the Engineer; and Jack Hawksmoor, God of Cities, among others -- onto an enormous city-ship that can traverse space and parallel dimensions, and makes her intentions known to the squabbling peoples of Earth: Behave, or suffer the consequences. Fortunately for humanity, the *Authority* seldom needs threats to make its point. Instead, perils show up on their own and give the team a chance to strut its stuff. Vast armies of teleporting terrorists, alternate-world aliens looking for new breeding grounds, and Earth-shattering elder gods get their butts handed to them, making it pretty clear to anyone who's paying attention that the *Authority* has the planet's best interests at heart (as well as the power to rip *its* proverbial heart from its proverbial chest).

Using Silver Age Sentinels (both the [d20 System](#) and [Tri-Stat system](#)), the authors have gone for what they call widescreen action -- super adventures so far over the top they're in a class by themselves. Villains are all colossi striding the Earth looking for monuments and governments to topple, and the heroes all possess enough might to chuck cars like snowballs. Even those with low-key, low-level powers have skill enough to come up with all manner of clever uses for those abilities.

And therein lies most of the difference between this book and previous versions of Guardians of Order's *Silver Age Sentinels* -- it's all big. (Great chunks of this book appear in *Silver Age Sentinels* products, so buyers should be careful they're not sinking more cash into this semi-duplicate than they're comfortable with.) The recommendation here is "stick to Skill Groups" . . . larger than life action means tracking a man across a city block is pointless. PCs buy a generic block of, say, "investigation," and that one number is used for related rolls (the option to use all the skills is there if you want it). They suggest using 12-sided dice, not 10s -- greater extremes for extreme results. And to better duplicate the source material, most of the powers now burn energy. There are a couple new attributes for players to fool with, and the really wacky powers (Dynamic Powers, Power Flux) mean everything to the godlike, so they get a lot more attention. If you'd rather skip all that and stick with the *d20 System*, everyone here is built on the Adventurer class.

Those great sweeping gestures in the rules are a red flag for anyone looking for a heavy element of roleplaying. *The Authority* isn't about Peter Parker's trouble with the ladies; it's about the trouble one has picking up a big enough building. The GM advice sections (getting players into the setting's mindset finds its way into the book in many forms) do admirable service to getting you going, but if played to the hilt there just isn't much room for anything little, be it boyfriends or petty theft.

The artwork is taken from the first 12 issues of the comic book, so if you're already familiar with them, you know what to expect. If you haven't read it, rest assured, the pictures are every bit as classy and overpowering as the subject matter they evoke. The text is that same tall, elongated font (again, if you know *Guardians . . .*), though the font is bigger in the rules sections. Nota bene: Both the words and the pictures can be adults-only material.

If you haven't followed the story, fear not; by book's end, you'll know these characters and their world as well as any fan. One of the more distracting features of the introductory persona-by-persona checklist at the front of the volume is the odd tendency to overuse qualifiers. Sure, it's a licensed product, but if they're working with the creators even a little bit, you have to wonder why the word "likely" is in there as often as Apollo's name (the glut of superlatives is probably a result of writing about gods). Are they prevented from saying anything without hedging? It's as if it's being written by an IP lawyer who's unwilling to commit himself. No one expects them to know everything Warren Ellis has up his sleeve, but they act like they're worried we're looking to them for stock futures.

This is a squat, fat little book with pretty much all you need to play a Tri-Stat game (if you want to go the ***d20 System*** route, the usual companion pieces are required). If you look past the chunk of system material (and much of it *has* been reworked) and know what sort of setting you're letting yourself in for, this is a good example of cross-media translation. Chock full of notes about the main characters and their stats, alternate worlds, and spot-on GM advice, it's a pleasure just to hold ***The Authority*** in your hands. It's only the first step to feeling awfully giddy with power.

World of Darkness: Ghost Stories

Published by [White Wolf Gaming Studios](#)

Written by Rick Chillot, Matt Forbeck, Geoff Grabowski, Matthew McFarland, Adam Tinworth, & Chuck Wendig

Art by Sam Araya, Jim DiBartolo, Anthony Granato, August Hall, Michael William Kaluta, Joshua Gabriel Timbrook, Jamie Tolagsun, & Becky Jollensten

127-page b&w hardcover; \$24.99

As a major -- but not uncritical -- fan of White Wolf's *Wraith: the Oblivion* and *Orpheus*, I was filled with some trepidation when I heard that there would be a book of Ghost Stories for the new World of Darkness.

Put bluntly, I was worried that it might be terrible. In the past, White Wolf's stabs at scenarios and adventures often fell flat, due to their being too wonky, unwieldy, and complicated to run as written. This was a shame, since White Wolf always excelled at creating evocative settings, giving them a sense of history and populating them with interesting NPCs; their writers just never seemed able to make the leap from brooding menace to actual action without losing their readers along the way.

However, it's a whole new World of Darkness, now: new format, (mostly) new systems and new ideas, hopefully taking the mistakes of the past into account. So would *World of Darkness: Ghost Stories* repeat the mistakes of the past, only this time in hardcover? Or had they learned from such "gems" as *Chaos Factor* and the *Diablerie* series?

Fortunately for us, the answer is yes, they *did* learn something. *zGhost Stories* is a well-done book that presents five spooky stories, and good ideas on how to run ghost stories in general. It may not deliver exactly what's promised on the back cover, but that shouldn't mar the enjoyment of the book or its utility. And if you like running ghost stories in other horror games, such as *GURPS Horror* or *Call of Cthulhu*, *Ghost Stories* is a worthwhile resource.

(Fair warning: There are some spoilers in this review. Don't read it if you think your Storyteller wants to use this book.)

The book is a hardcover, and a slim one at that. It's very well-presented and laid out, and the text is clear and understandable. The art ranges from excellent to all right, with good art choices all around, though I wish they'd had something else for the cover.

As with all things White Wolf, there's gaming fiction for a prologue: skip it, and jump to the well-considered Introduction, instead. There, we get an excellent -- if short -- primer on Storytelling *Ghost Stories* that's full of good ideas on setting these stories up, getting characters into them and resolving the action. There's also a summary of the Storytelling rules for Ghosts, so you don't have to flip back and forth between this book and *The World of Darkness' Core Book* all the time.

Then we have the stories, themselves -- all of which have at least something to recommend them, even if I wouldn't run all of them as written.

- "Dust to Dust" is both first and best of the lot, gives us a ghost town in all senses of the term. It plays into **White Wolf's** old strengths by presenting a location and giving ideas on what to do with it, rather than presenting a linear progression of events. And the fact that the location, itself, is one of the ghosts makes this tale of dark, buried secrets all the more sweet.
- "The Terrifying Tale of James Magnus" tries to be a modern combination of M.R. James' "Count Magnus" and Shirley Jackson's "The Haunting of Hill House," but flounders on a highly-improbable -- and over-sexed -- back story. That said, the house itself is an unholy terror, with lots of good, solid ideas on how to haunt it, and how it will use intruders' dark passions against them. If you liked Jackson's story, and/or the original version of "The Haunting," this house is for you.
- "No Way Out" presents a spectral reminder that suicide solves no one's problems. This tale of a ghost's revenge on others for exposing the mess he'd made of his life follows a linear model, tracking the breakdown of the spook's personality. It also serves as an extended Scenario, where the characters might think they have solved the problem, only to have it pop up again, and again.
- "Roots and Branches" is also linear -- maybe too linear -- but gives us an excellent location, and a chilling adversary in the Murder Tree. It also gives us a detour that may not have been necessary -- culminating in another borrowing from a M.R. James story -- and an NPC who can solve too many of the characters' problems. But if you prune the story back a bit, a good, solid scare remains.
- "Holy Ghost" pits the characters against a brutally-murdered Reverend with ungodly retribution in mind. This story goes back to presenting a location, rather than an "adventure": we get the location, its history, and the ghost's conflict with it, leaving the Storyteller to devise the narrative. The story's combination of religion gone awry, a community's shame and a father's guilt is powerful stuff.

The toys? Along with the locations and their ghostly antagonists, we get rules for three optional ghost powers that run from maddening to grotesque. We also get a primer on how to make a "Ghost Town": "the spirit of a place that has 'died' in some fashion."

The good? Much like the new **World of Darkness**, every opportunity has been taken to give options to the Storytellers. These Stories are rife with ideas for alternate settings, ways to get the group into it, and ways to deal with the challenges the ghosts present. At their best, they present locations, backstories and ideas for haunting that give Storytellers total latitude in presenting them.

The bad? There is a sameness among some of the stories. Three of them have ghostly dogs/coyotes chasing the characters, and three of them have tragedies fueled by adultery. If you're planning on running more than one of them, you might want to change things a bit, so as to avoid sounding like a one-note Storyteller.

And that's another problem, there: the book is "your first opportunity to play mortals as characters with the Storytelling System," but if you're planning on running a long-term Chronicle, how many of the stories can you really run? One or two might be presented before the characters become Vampires, Werewolves or Mages, and after that the ghosts might not be as challenging, or as dangerous.

Plus, once your mortals get templated into something else, you may have to toybox the book after all, or else make the scenarios a lot tougher than presented. As someone who has a ball with doing either, I have no problems with that. But if you're the sort of Storyteller who prefers to have these things done *for* you, then you might not feel you've gotten your money's worth.

Those quibbles aside, **Ghost Stories** is a good sign that the new **World of Darkness** is on the right track. Gone are the confusing "Adventures" that required a non-euclidean flowchart to properly present, and in their place are good, solid locations and backstories to base a narrative from. I would recommend this book to anyone who wants to run a Mortals Chronicle using the new **World of Darkness** rules, and those who like running horror games in general.

Mysterious Musings

While stumbling around on my own desert island recently, having emerged from a plane crash that upset my tiny bottle of alcohol, I found a new television show that I'm quite smitten with. Sure, its four-letter title may not seem to offer much, but for me it re-opened a love of adventure, excitement, and mystery -- all of which I thought were lost.

That show is, naturally enough, *Monk*.

For those of you who are unaware, *Monk* is a detective show set in San Francisco, revolving around a titular character whose name is Adrian Monk. It's a light drama, in the same vein as *Murder, She Wrote* or *Magnum P.I.* A former police detective, Monk lost his wife from a car bombing and was demoted shortly thereafter because his mental health problems utterly ballooned out of control. Obsessive-compulsive, phobic, and utterly neurotic, Monk is an unlikely protagonist for a detective series; he stores his clothing in individual bags, arranges other peoples' furniture to make it symmetrical, and refuses to drink anything but one brand of bottled water even if he's dying of thirst. Fortunately, he can tell at a glance which inmate of a hundred has stolen a watch; he can tie a piece of clothing to a criminal by the stitching on it; he can solve a game of *Clue* before it begins. Yes, Monk is also brilliant . . . and so is the show.

I've had occasion to watch the first two seasons of this show (since they're out on DVD), and it's been rare since I've gone from passing interest to total fawning fanboy of a show this quickly. And, in an effort to sort out why, I'm going for one of my patented lists of random thoughts where, no doubt, I'll miraculously stop somewhere around the 1,000-word mark. Oh, and I'll probably even tie it into gaming.

Monk is hyper-competent; he's also a basket case. From a dramatic standpoint, this device enables us to view Monk as both the underdog and the hero. He's so fragile and helpless that we can't help but feel for him when he's compelled to keep buying \$20 shots of scotch, because he can't stand its uneven level next to a bottle of water. (He gives the shot to the person next to him in the bar, who washes it down with some water . . . and the cycle continues.) But he's also the hero; you know he'll set things right for the world, even if he can't conquer his own inner demons. In game terms, *Monk* might be built on the same number of points as most heroes, but he's jacked up some of his abilities to the stratosphere, and needs to pay for them by being a wreck.

Monk reaffirms my belief that limitations are fun. Sure, there's something kind of fun about playing the butt-kicking, grizzle-jawed, tough hero with no discernable weaknesses. But in thinking back to all my favorite gaming characters, I realize they all pretty much had major problems -- whether overconfidence, cowardice, fanaticism, or the like -- that gave them flavor. Yes, the hero is probably going to save the day . . . but when he escapes the burning building, is he fleeing at top speed because he's afraid of fire, is he getting dragged out by his friends because he thinks he can survive the flames, or is he shouting a sermon in honor of his deity as the building is collapsing around him? Yes, it's true that every time two characters interact, one wants something from the other . . . but all Adrian Monk may want is to cut the stray hairs in the person's bangs, because they're driving him crazy.

The show knows what it is, and revels in it. I think this fact alone has elevated the show to the delightful level for me. It knows its formula, it knows the formulae of other shows of its ilk, and it has fun with this fact. While I tend to struggle to find ways to push the box in my own gaming adventures -- by, say, having the villain show up at the heroes' door -- *Monk* is content to have fun within the established confines. So in the last 10 minutes of one episode, Monk is being endangered by a group of criminals, so his assistant Sharona puts the pieces of the mystery together and explains things to the audience; when Monk escapes, he starts to reveal what he figured out, but Sharona stops him, saying, "I already did the wrap-up!" In another episode, the entire mystery takes place aboard an airplane, with Monk struggling with his own fear of flying while realizing that another passenger must have recently murdered someone.

This isn't a *Moonlighting*-esque demolition of the fourth wall, but rather gentle nods to the audience that television can be good-naturedly *fun*. And, in the gaming world, it would be possible to inject this same type of light frivolity into some campaigns. Maybe the dungeon builder uses an enchantment so his dragon never needs to eat, enabling him to build the rest of the dungeon around the dragon . . . that way, it can remain in its room without being able to roam the too-narrow corridors. Maybe the big bad guy at the end of the adventure bellows out, "Yes, *I'm* the big bad guy at the

end of your little . . . adventure. Do you have the initiative to stop me?"

If you enjoy classic detective shows in the vein of *Columbo*, *Kojak*, or *Ironside*, then I can't recommend *Monk* enough. And even if you don't, you may want to give it a try anyway.

But, when you put the DVDs back, just . . . make sure that they're all rotated so that they're facing up. In all of them. You may want to check that first one you put back; you jostled it a bit, so it might not be even . . . No, just check it again . . .

What Everybody Doesn't Know

Counting (Celestial) Crows

There are only seven members of this Tribe left within the Empire; there may be other groups of Crows living in the Tiger Tribelands. The rest have either left (for the Heavens or for another mortal land?) or died. They are awaiting the fulfillment of a mysterious prophecy which they will not speak of in any great detail. When that prophecy comes to pass, four Celestial Crows will leave (or die, the wording is imprecise), leaving three to await a *second* prophecy. When that is achieved, two Crows will vanish, leaving one Crow to await resolution of a *third and final* prophecy.

Also, though the Crows demand (and reward) politeness, they feel no need to follow their own rules. They will deal with Tribesmen with brusque attitudes, informal modes of speech, and discourteous diminutives (Pony/Colt, Sheep/Lamb, Mutt/Puppy, Chicken/Cock, Pig/Piglet, Lizard/Hatchling, and Kitty/Cub).

Fiery Tongue's Dying Curse

"I curse you with the power of my Blood, and the Blood of all I own: One day, you will be the 'barbarians,' and the Tiger shall knock the Dragon off of its perch."

Tiger Plans

They are planning on invading the Empire next year. Given the usual gap of time between invasion attempts, the Tiger Chiefs believe that the Six Tribes will not expect one soon. Luckily, an altercation with a far-Western Tribe did not escalate to war (as it usually does), and the intervening peace has permitted the Tigers to build up a force that matches or exceeds that of four hundred years ago.

Discovery of the Hilt of the Broken Sword

In arranging tribute from Digging Youth, the chieftain of the far-Western Frog Tribe they had been in conflict with, the Tiger Tribe received a most notable relic: the hilt (and about six inches of broken blade) of Dragon's Wing, the Sword of Power. Apparently, when Fiery Tongue and the Dragon Emperor died, the shards of the shattered artifact flew to all directions, like shooting stars. A long ago chieftain found the Hilt in his faraway land, and made his Tribe strong using it. They called it "the Star Knife" in their language. (See below, *The Broken Sword* for more info.)

Heads

PC Opportunities

Depending upon the type of game, period of history, and *side* that one wants to play, PCs have a lot of opportunities in this Campaign in a Box.

- *Barbarian Chiefs*: Plotting, spying, and warring against the decadent Empire.
- *Bureaucrats*: Troubleshooting matters of import across the Empire for their Minister.
- *Court Aristocrats*: Attending upon the Emperor, skullduggery behind the arras, romances and duels.
- *Imperial Magistrates*: Riding a circuit, dispensing justice, performing executions; investigating crimes; investigating internal affairs matters between the Ministries.
- *Imperial Scouts*: Penetrating the Tiger Tribelands, recon, investigating non-criminal mysteries, riding border patrols.
- *Landed Aristocrats*: Managing the affairs of a palace or settlement; intriguing against neighbors and bureaucrats.
- *Questers*: See below, *The Broken Sword*.
- *Soldiers of the Empire*: Fighting Imperial enemies, foreign (Tigers) and domestic (rebels and bandits).
- *Traders and Adventurers*: Wandering from place to place, seeking profit and excitement.

NPC Backgrounds

Each character below has their most important *strengths* (generally positive qualities, abilities, skills, or effects) and *weaknesses* (generally negative qualities, abilities, skills, or effects) detailed. In descending order, the ranks are Master, Expert, Good, Average, and Poor. Depending upon the conception of what a character is like, any quality can be a strength or a weakness.

For example, suppose a character has "Spoiled Brat" as a quality. If it's ranked Average or above, it's a strength: the character always gets his own way, can wield undue influence by threatening to sic their Mommy or Daddy on others, might possess lots of cash or gadgets, and people may fawn over them, making life easy. But if the character has "Spoiled Brat (Poor)," this is a weakness: the character has led a pampered and sheltered life, rubs people the wrong way, and expects everyone to bend over backward to fulfill his most minor needs.

Since many game mechanics provide prose "benchmarks" to understand stat or skill levels, the ranked qualities below should be easily adaptable into any desired system. (Also see [the PDQ System](#) from [Atomic Sock Monkey Games](#).)

The example NPCs below can serve as friends, rivals, or foes to a PC group.

Imperials

*Priest-Mage **Dreamwalker**:* Dreamwalker was born a commoner (Average) of the Dragon Tribe. In his long-ago youth (Poor Aged), he displayed a strong talent for the Elements and the Forces. Today, he is one of the elite of the invisible world: an individual who is both an adept priest and a skilled magician (Master and Expert, respectfully).

*Lady **Evening Star**:* A Ram Aristocrat (Good), Evening Star has always displayed two things: a talent for music (Expert Minstrel) and wandering feet (Good Explorer). She has traveled the length and breadth of the Empire and beyond, singing her songs and playing her harp. Like many of her kinsfolk, she is an archer of renown (Expert).

*Bureaucrat **First Class Firesong**:* Though born a Boar Peasant (Good), Firesong easily passed the civil-service exam and the supplementary test to join the Ministry of Public Works (Good Bureaucrat). He is a skilled (Expert) Engineer - his specialty is surveying ruins, and can swing a Mace (Good) like a warrior-born.

*Prince **Hunting Jewel**:* Hunting Jewel is the younger son of the Rooster King (Expert Aristocrat), and has always been in the shadow of his older brother, Faithful Jewel, the Rooster Champion. To best serve his Tribe and the Empire, he became an Imperial Scout, and quickly rose through the ranks (Master). The Prince is Thoughtful (Expert), but has Humility Unbecoming a Rooster (Poor). He carries one of the Dragon Pearls ("Icy Owl").

*Lady **High Executioner White Flower**:* Like many of her fellow Dog Peasants (Good), White Flower chose to enter the Ministry of Justice. There, she showed aptitude for a difficult proficiency: executions. After a meteoric rise (Expert Bureaucrat), despite her youth, she was selected as the new High Executioner upon the retirement of her predecessor. Now she has a noble title -- even if there are those who snicker behind their hands at her lack of social graces (Poor Aristocrat). Champion of her Tribe, she wields Dog's Bite. She is a prodigy with a Longsword (Expert), even before the magical effects of her blade are taken into account.

*Prince **Wise Rider**:* High-ranking Aristocrat (Expert) of the Horse Tribe, Wise Rider is a perfect Knight (Master). He is especially Well-Regarded (Expert) across the Empire, from the Ministers down to the simplest dung-collector. This has made him a little Naïve (Poor) when confronted with dissimulation.

Tigers

*Shaman **Ant-lion**:* Ant-lion was bathed in the blood of his dying mother as he was born; indeed, this tragedy is what he ascribes as the source of his power as a Shaman (Master), especially at his age (Poor Beardless Youth).

*Shaman **Black Thorn**:* Black Thorn is a little Jealous (Poor) regarding Ant-lion. What came so easily to him required years of apprenticeship for her (Expert Shaman), and he still has the edge. However, she has an excellent Reputation (Expert) among the Tigers for her skillful spell-work and pleasant personality. She is also handy with a Sling (Good),

and proficient in Foraging (Good).

Smith Blood Dirge: Blood Dirge knows the incantations and formulae to smelt metals and forge steel; he is a Smith (Good). Part of this has to do with his understanding of how to find ore (Good Prospector) and take it from the earth (Good Miner). He is deadly with his iron-banded Staff (Good), and rather Strong (Good).

Chief Foolish Wolf: Don't let his name fool you: Foolish Wolf is incredibly Smart (Master), and a skilled Leader (Expert). Recently, he suffered a leg-wound in battle (Expert Axe) that is healing rather slowly (Poor Limp), but he refuses to see a shaman or make the requisite sacrifices himself -- others need healing magic more than he.

Trader Morning Cloud: Daughter of a Chieftain (Good), Morning Cloud is a skilled Warrior (Good), but an Expert Trader. She can also read and write several languages (Good Linguist), which she learned from her father's diverse slaves. Unfortunately, this makes her think she's Cosmopolitan, when she really isn't (Poor).

Chief Winged Tracker: Winged Tracker is the last of his sub-Tribe of the Owls (Poor Depression), and the greatest Hunter (Master) seen for decades among the Tiger Tribes. Few targets, man or beast, evade his Bow (Expert) or his Traps (Expert).

Items & Equipment

Most tools and weapons in this setting are of copper, bronze, or iron; there is forging of steel, but it's quite expensive. Armor is usually thick cloth, hide, or leather (from different animals, depending upon region), often with bone, wooden, or metal bits sewn or riveted upon it. Wealthy aristocrats might have an overlapping suit akin to the Roman *Lorica segmentata* or laced-together *lamellar* armor. Helmets and shields, usually of reinforced leather, are common.

Minor magic items are not uncommon, but neither are they very powerful. Examples of common items include good luck charms, fire resistance statues, water purifying bowls, containers that preserve food for a long time, arrow-deflecting shirts, that sort of thing. The small magic behind these items can be overcome with some difficulty, depending upon who, how much mundane/magical/mystical power is brought to bear, and in what manner this clash occurs.

Major magic items are rare, and powerful -- but nowhere near as potent as the Swords of Power. Here's one example:

Dragon Pearls

The One-Eyed Emperor tasked the Imperial Ministers of Rites and Intelligence to develop a communications system akin to that shared by the Swords. What they came up with was the Dragon Pearl -- in actuality, an egg-sized lump of smooth ivory, infused with mighty spells. It takes three years of constant enchantment for a Pearl to go from raw materials to magic item.

There are eleven Dragon Pearls in existence, each has its own name, and the Emperor or Empress determines who bears them (in addition to him- or herself) at any time. When something is drawn upon its surface with a special alchemical ink, the Pearl absorbs the ink and transmits it to a single other Pearl, which can then write out the message on a flat, blank paper (or wooden, in a pinch) surface.

Events & Possible Story Arcs

While any era of the Empire could be the setting for play (receiving the Swords, founding and rise of the Empire, any of the wars with the Tigers, the Rooster Coup, the destruction of Dragon's Wing, the One-Eyed Emperor's Glorious Reconstruction, etc.), the suggested period is that of the discovery of the Broken Sword's Hilt.

The Broken Sword

The Tiger Tribe has discovered the Hilt of the Broken Sword -- also known as the "Star Knife" -- and is assembling a band of their best to retrieve the other shards and have the Celestial Crows reforge it into a Sword for them. The Empire has discovered this from omens and spirits, and has pulled-together a group of their own for the same reasons.

Powers of the Star Knife: The Knife is preternaturally sharp, and permits the holder to see, speak with, and touch spirits as if he were a priest or shaman. The ghost of Fiery Tongue is bound to it. He will aid Tigers seeking the other shards and hinder/haunt Imperials if it falls into their hands, usually through Blood-oriented means: increasing or decreasing health, endurance, ferocity, anger, or sadness. The High Chief's ghost can fight other ghosts, if necessary.

Hilt

Playing the Imperial Side

If the PCs are agents of the Empire ("the Dragon Riders"), they will probably be a crack team assembled by the Emperor himself (in his role as the Minister of Intelligence), though they may not have open sanction. Indeed, the possibility that the Tigers might recover all the pieces of Dragon's Wing would cause panic in the streets of every kingdom. As the Emperor is a subtle man, what he considers a "crack team" may seem a bit odd to observers.

Within the boundaries of the Empire, PCs -- especially those with history, status, or occupations that warrant it -- may have some benefits when operating. They may come across side-issues like border-raiding, provincial Tribal altercations, or nascent coups that they may feel honor-bound to resolve. However, if they enter the Tiger Tribelands (disguised as traders), they'll need to play things a lot closer to the chest -- but may learn more about theses barbarians, not the least part of which is the build-up of forces for invasion.

Use the Tigers from *NPC Backgrounds* as their opposite numbers ("the Tiger Walkers").

Playing the Tiger Side

If the PCs are the Tiger Walkers, they will probably have grown up together as part of a tight-knit clan that has ties to the current High Chief. Given the intention to invade next year, the High Chief will probably want to use the Tiger Walkers to both perform some reconnaissance *and* seek the rest of the Broken Sword. The potential benefits from having a Sword of Power on the Tiger side of the war cannot be overlooked. They are sent as a clan because they will know each other's strengths and weaknesses, and have a substantial degree of interpersonal loyalty.

Within the Tribelands, the PCs will normally have total freedom of movement. They may come across side-issues like Imperial sallies into their lands, sub-Tribal clan disputes, or rival Chiefs who are not supportive of the invasion, which they may feel must be addressed. However, once they enter the Empire (disguised as traders), they'll need to deal with the overwhelming social structures, language differences, and "civilized" customs.

Use the Imperials from *NPC Backgrounds* as the Dragon Riders in this case.

Establishing the Party

Imperial

Ministerial Summons: Imperial characters are summoned to the presence of the Imperial Minister for Intelligence (aristocrats will realize this means "the Emperor") on Dragon Isle, from wherever they are -- home, palace, foreign inn while on a trade mission, prison, etc.

The Interview: The heroes are told that a small band of Tigers have found the Hilt of the Broken Sword, and are seeking the six other shards of the blade. The Imperial understanding was that the weapon had been totally destroyed. The omens grow murky after this -- but it is thought they seek to reforge the blade. The PCs' mission is to recover all the shards *and* the Hilt, get it reforged by the Celestial Crows at Fate's Forge, bring the restored Dragon's Wing back to the Emperor, and keep the entire operation quiet.

How?: The most adept priests and magicians of the Ministry of Rites have determined a short list of places that the shards *should* or *could* be in (see below), now that they know what they're looking for. Additionally, characters will be given supplies for a long journey, free repairs or upgrades to their gear, traveling papers so that they can move freely through the kingdoms, and one last thing that should only be used in an emergency: an Imperial seal.

Why us?: "I have my reasons for my choices, as well as my reasons for overlooking your insolence. Let us say there are omens, and that we are playing a deep game with fate."

Tigers

Star-Knife Bearer: One of the PCs is the Tiger who received this potent piece of tribute from the far-Western Chief Digging Youth for transport to the High Chief. If any PC is a shaman, they will know that the weapon is potent, and will easily be able to contact the bound ghost of Fiery Tongue and find out more. If no PC is a shaman, he or she will start to have dream-meetings with Fiery Tongue until an NPC shaman figures out what's what. Then the knife-wielder will be able to communicate with the ghost while waking.

The High Chief's Commands: The PCs' kinsman, High Chief Bloody Hand, once apprised of the nature of the Star-Knife, will quickly decide to have them gather the rest of the pieces and have the Crows make it anew into a Tiger Sword. Additionally, the characters should pay attention to any Imperial defenses they see on their journeys.

How?: The ghost bound to the knife can indicate either by pointing to a map or by physical "tugs" in the direction of the other shards (stronger with proximity). Bloody Hand will provide PCs with supplies for a long journey, free repairs to their gear, and ideas and aid for methods for penetrating the Empire (as a delegation of emissaries, a small group of traders, disguising themselves as Imperial citizens, etc.).

Why us?: "I trust you, as we are bound with ties of blood and marriage, clan to clan. Do not fail me, or our people."

Seeking the Shards

The shards of the Broken Sword can be sought in any order, depending of course on the PCs' origin, proximity, and choice.

A. Mantis Valley: (Northern Tribelands) One shard flew to the far north of the Tiger Tribelands, where it pierced a pregnant mantis. The magic of the Sword leaked into the insect, permitting her to survive and thrive. She gave rise to a preternaturally large breed of praying mantises. The colony of ferocious cougar-sized bugs still makes its home around the huge, dried exoskeleton of their ancestress.

B. Reed's Mine: (Hound's Highlands) This shard is buried deep in a vein of ore within a silver mine, one that has been prone to collapses for centuries. Indeed, it is currently closed and unworked. While the main workings are still accessible, the shaft containing the face has been sealed off since the time of the Broken Sword. Folk songs are still sung about the dozen miners that died within, and how their hungry ghosts yet stalk the tunnels.

C. Screaming Pine: (Ramswood) The wind whips past the high top of this tree (the tallest in the Empire; 500 feet!); this, combined with the dying cries of those who've attempted to climb it, give it its sobriquet. No climber has *ever* climbed up past 275 feet, thus, only one being has ever seen the shard that quivers in the trunk at 457 feet -- a Celestial Crow who lives at the top.

Her name is Horned Moon, and will only physically interfere with climbers if they are rude, blasphemous, or arrogant. She will, however, heckle and distract anyone who climbs above 250 feet. If the heroes manage to wrest the shard from the tree, she will speak to them politely. First, she will tell them that the Broken Sword can only be remade if *all* of the shards are present at Fate's Forge. She will then answer one question for each PC, to the best of her mystical, immortal ability. Finally, she will ask them to pass a message onto her brethren at Fate's Forge ("The time is nigh; seek me between the stars"), and then rocket up into the sky.

D. Hermit's Hill: (Horsesteppe) Inside a dug-out hole in the side of a hill lives a hermit. Hermits have always lived in that hill, since time immemorial. Well, not exactly. *One hermit* has lived in that hill all this time. Trotting Sun does not need to eat -- only drink -- and gains all his nourishment from the tiny creek running in front of his hideaway, due to the magic of the shard that is completely buried within the headboard of his bed. (He is unaware of the shard.)

He's quite mad. For centuries, Trotting Sun's been obsessively tracing through dream visions the family trees of, well, *everybody*, and his hole has several storage chambers of scrolls stored in clay pots. Frighteningly, the genealogies are both accurate and fairly current (within two years). He is supplied with ink, brushes, candles, flints, and steels by the local Horse priests, in accordance with longstanding Imperial Ministry of Rites orders.

Trotting Sun will welcome visitors by full name and the names of their parents, all eight grandparents, and any children they have as of two years ago. He can answer any questions (at extreme length) about genealogy, general or specific. He insists that visitors can see him only every other day, however, and hints that a gift of wine would be appreciated. However, if anyone attempts to steal anything he owns (and he may consider the shard his once he knows of it), he will fight back. Granted, he's an old, old man, but once, he was a Horse warrior and priest (count both as still Good), and he *does* know every one of their ancestors by name, and can call upon such to shame any intruders to death (the GM determines whether this is figurative or literal). His feelings can be assuaged by new genealogical information, gossip about marriages and children, stories about notable heroes within a character's lineage, or *any* information about the Celestial Crow Tribe. Note that Trotting Sun is not particularly prejudiced against Tigers; this could be seen as part of his madness, from an Imperial perspective.

Furthermore, this is an excellent place for the opposing team to show up.

E. Golden Bay: (Boar Coast) A shard is buried inside the shell of a gigantic clam on the bottom of Golden Bay (100'

down, 1 mile offshore). When the moon is full, the clam sings, and the surrounding water glimmers gold. Many sailors know of the golden waters (thus the name of the bay). What most people don't know is that while the clam sings, the waters in its immediate vicinity -- about 20' radius -- are as breathable as air. The wreckage of six ships surrounds the clam, forming a sort of shelter around it, which was used around seventy-five years ago as a smuggler's storehouse. If the clam is not killed, it will continue provide breathable, even if the shard is removed.

The only person who knows of this mystery is Crazy Stingray, an elderly (Poor Aged) Sailor (Average) and Smuggler (Expert) who was once cabin boy on a pirate ship. Omens and spirits will indicate to the PCs that Crazy Stingray is the key to recovering the shard on the Boar Coast; the trick is convincing him to tell them what he knows. (Perhaps he's been imprisoned, and the Dragon Riders can use their Imperial seal to free him; maybe there's a load of treasure down there that he needs the help of the Tiger Walkers to recover. . .)

Furthermore, like Hermit's Hill, this is an excellent place for the opposing team to show up.

F. Emperor's Skull: (Dragon Isle) The tiniest splinter of Dragon's Wing is embedded in the back of the One-Eyed Emperor's skull. However, until the discovery of the Hilt, no one knew -- or even suspected -- this. While recovery of this shard from Devoted to the Winds' Tomb (and remains) seems like it would be easy for the Dragon Riders, it's more complicated than that. To properly and legally go after the splinter, the Tomb must be purified, a process that takes a week. Those who will enter the Tomb must also be purified, which also takes a week that cannot be concurrent with the Tomb purification. Then, each of the many traps within must be disabled on the way from the entrance to the burial chamber. Next, a 24 hour, silent vigil must be held before the closed coffin of the Emperor; and another 24 hour vigil after it is opened. Then the skeleton's bones must be wrapped in individual pieces of cloth-of-gold. And so on, and so on. (The upshot is to do this all open and aboveboard, Dragon Riders will have to take a month to jump through hoops.)

Why not split up, or have some nameless functionary do the rituals and such to recover the splinter? If the GM wishes to permit this, that's fine -- but someone has to get the Splinter to the Dragon Riders, giving an excellent opportunity for the Tiger Walkers to ambush or waylay the courier. Otherwise, "the omens say that the one who will bear the Splinter must be the one who plucks it from the Emperor's skull."

On the other hand, a group after the splinter could just evade or bribe the ceremonial guards, break the Tomb's seals, risk the traps, fight off the honor guard of ghosts, jimmy the coffin, bust open the skull, take the splinter, and run away. (This is probably what any Tiger Walkers will have to do, anyway.) Of course, *anyone* caught doing something like this would be publicly tortured, then messily executed. The Emperor will disavow all knowledge of such a mission by the Dragon Riders, and may even be forced to set Imperial magistrates on their trail if they make a mess of things.

Then there's the One-Eyed Emperor's ghost to contend with.

Powers of the Splinter: The Splinter permits the holder to see, speak with, and touch spirits as if he were a priest or shaman. The ghost of Devoted to the Winds is bound to it. He will aid Imperials seeking the other shards and hinder/haunt Tigers if it falls into their hands, usually through Wind/Spirit-oriented means: summoning ghosts, causing windstorms, or creating mental delusions. The One-Eyed Emperor's ghost can fight other ghosts, if necessary.

If a group possesses both the Star-Knife *and* the Splinter, the two bound ghosts will start fighting. Indeed, their battle will take them far afield of the PCs, leaving both shards' powers inert for three days. On the third day, they will return, together, and both bend their powers to getting all of the shards to Fate's Forge, but they will not speak to the mortals on why they are in accord. (GM's option on what their decision is: whether to support the forging of two Swords, or just the Tiger Sword -- see below).

Crossing Paths

The Dragon Riders and the Tiger Walkers may very well cross paths on their respective paths. Do they fight? Do they strike a bargain (that's probably treason from the Imperial perspective)? Do they sit down for tea and cakes, then join together (definitely treason)?

Well, that's really up to the PCs and the GM, isn't it? Any way you look at it, though, the meeting should be *cool*.

Going to Fate's Forge

As noted in *Screaming Pine* above, the Celestial Crows will only remake the Broken Sword if all of the shards are present at Fate's Forge. Of course, this doesn't mean that they all have to be in possession of a single group. . . And, no doubt, if all of the other pieces make it to the volcano, the (surviving) members of the NPC group will show up there, too.

Until they reach the volcano's summit, the groups can beat merry hell out of one another all the livelong day. However, once they reach the edge of the crater, the Crows will appear, and inform both parties that they are now guests, and must show good manners (or else).

How many pieces of the Broken Sword a group possesses will have an effect on how the Crows respond to them (provided they are otherwise polite):

- *None of the Shards*: Pity and kind-hearted humor.
- *Some of the Shards*: Rude speech in an informal mode; typical Crow-speak.
- *All of the Shards*: Exceedingly polite and formal tones, upon the resolution of prophecy.

Also, the characters who transmit Horned Moon's message to the Crows will be received politely, and each given a small enchanted item as a gift (probably not a weapon or armor, but a nifty little tool or object that fits their character, profession, or Tribe).

Each character will be asked three questions: 1) should the Sword be reforged?; 2) Should it be reforged for the Dragons or the Tigers?; and 3) if the only way the Sword could be reforged is for the other Tribe, should it be remade? The Crows will ask the characters to expand upon their answers.

Sword(s) (Re)Forged

Depending upon how the GM wishes to tally these "votes" and the reasons behind them, this can give rise to two different outcomes. An important note here is that the Crows originally forged the Swords of Power to aid the underdogs -- the Six Tribes -- versus an overwhelming force -- the Tiger Tribes. Now that the Empire is powerful, are the Tigers the underdogs? And what have the two ghosts bound to the shards decided?

The two outcomes are:

1. *One Sword*: Either Dragon's Wing is remade (with all of its original powers) or a new Sword is created: Tiger's Fang (see below), and given to the respective party.
2. *Two Swords*: The Crows forge two Swords, one for each group: Dragon's Wing and Tiger's Fang. If this option is chosen, Dragon's Wing loses its ability to turn off other Swords of Power.

The creation of a Sword of Power takes some time; this would be a good opportunity for the PCs and NPCs to interact, under the bond of guests of the Celestial Crows. Perhaps they will find common ground, romance, or new hatred. Who knows?

After the Sword is (or Swords are) handed over, three of the Celestial Crows will fly away, straight up, at great speed. The remaining three will release the characters from their bonds of guest-hood, bid them farewell, and vanish. The two parties are then left standing there, looking at one another, one or both groups holding a Sword of Power. Now what?

Tiger's Fang: Tiger's Fang can speed the healing tenfold of anyone touched with the flat of the blade, and the wielder never tires -- while he still requires food and drink, he never needs sleep. The wielder of this Sword is nearly always initially seen as "polite" by the denizens of the spirit world (he should still know the proper and polite rituals to be truly effective, however). When held, the Sword-bearer cannot die from wounds taken in combat (though he can die

after his last enemy falls).

If Tiger's Fang is the only Sword forged, its wielder gains the ability to turn off other Sword's unique abilities, once held by Dragon's Wing.

Aftermath

So, what do the characters do with the Sword? Fight their opposite numbers? Join forces? Attempt to integrate the Tiger Tribes into the Empire? Lead the armies to clash next year? Attempt to take the Dragon Throne, or the High Chieftainship?

Just like in *Crossing Paths* above, that's really up to the GM and PCs. In any case, it's a whole new campaign.

Stand-off

Advice, Opportunities, & Pitfalls

THEME: Order/Stasis vs. Chaos/Change

What makes a theme of Order vs. Chaos interesting is that both outlooks can be either good or evil, depending upon how you look at them. Order can be law, and Chaos lawlessness, or the former can be suppression, and the latter, liberty. This permits more complex issues to be raised in a game, beyond basic "White Hat" and "Black Hat" determinations. Monty of the Python Tribe pointed this out in *Life of Brian*:

Reg: All right, but apart from the sanitation, medicine, education, wine, public order, irrigation, roads, the fresh water system and public health, what have the Romans ever done for us?

Attendee: Brought peace?

Reg: Oh, peace -- shut up!

But on the other hand, look at what O'Brien says in *1984*: "If you want a vision of the future, Winston, imagine a boot stamping on a human face forever."

THEME: Faction Politics

With so many Tribes and Ministries operating within the Empire in general, and the Dragon Court in specific, plenty of social and political machinations can take place. Politics makes strange bedfellow: no doubt this statement is both figurative and literal. Entire campaigns could be set around the business of running the Empire -- the aristocracy against the peasantry, Ministry against Ministry, Tribe against Tribe, Ministry against Tribe, peasantry against Ministry, and so forth.

Just consider all that would have to happen for, say, the Dog King to build a new port on the coast of Hound's Highlands. There's the Ministries of Rites, Revenues, and Public Works to deal with -- and the last is an instant conflict, because Public Works is under the command of the Boar King, who may be against having competition for his Tribe's sailors. The Dog King may try to gain the Throne's backing, by making the new port an Imperial naval yard, bringing in the Ministry of War. The War Minister, the Rooster King, might be more hip on building infantry and cavalry, rather than more ships. The Rooster's lover, a Ram dancer, may secretly offer his or her services to one of the pro-port factions, in an attempt to sway the Minister's opinions on the subject -- for a suitable fee of course! The fee might be the release of a Tiger Tribesman in Imperial Prison. . .

The easiest way to generate such a web of intrigue is first to assume nobody will be reasonable (at least until the PCs get involved). Then, pick a person, thing, or event to start with. Look and see who or what would oppose this person, thing, or event; and what sorts of actions they would take against it. Look for reactions to that action from the first party, and the effects that the second party's action has on third-parties. Determine *their* responses to the second party's action. Every so often, throw some money, sex, drugs, crime, or honor into the mix. Voila! Instant Byzantine factional politics.

Ye Olde Majik Shoppe IV

Yet Another Five Odd, Strange and Just Plain Weird Magical Items

by K. David Ladage (with thanks to Chad Underkoffler)

Although the mystery surrounding [Kendalge](#)'s existence is one that may never be solved to the satisfaction of all that would care to question it, the fact remains that [his signature](#) appears on 23 treaties enforced to this day, and [his legacy](#) has been etched into the annals of time. In other words, whether he existed or not, he is not likely to be forgotten anytime soon.

It is often debated of Kendalge: which is more important, the man or the myth? Although this is surely a matter of taste, one historian said it thusly: *One cannot have the Church of Myonisis without Myonisis the Benevolent; but Myonisis the Benevolent can (and did!) exist independent of her church. Therefore Myonisis the Benevolent is the more important element. As with Myonisis, the same is true of Kendalge: one cannot have the legacy without the man; but the man can exist independent of the legacy.*

The counter argument to all of this usually begins: *One cannot prove the existence of Kendalge; the existence of his legacy is self evident . . .* In other words, his legacy is all that we possess; in order to approach the man, we must study the legacy intently.

Below are five more glimpses into that unique legacy.

Quicksilver Spheres

According to the diaries of several friends of Queen Chelsea V, when she first saw her husband with a large velvet case filled with small, translucent, white-crystalline spheres (each with their own dimpled compartment), she asked what they were. His answer was "They are insurance. I'm saving them for a rainy day." Since that time, when she would write or speak of the delicate items, she would call them *Rainy Day Spheres*.

It was Halvord, Kendalge's faithful apprentice, that would dub them Quicksilver Spheres, and that is the name most scholars use today. Although Her Majesty would never discover the secrets hidden in those fragile pieces of glass, Halvord would . . . and even according to the writings of such nay-sayers as Bravarix Calyuran, Halvord would use these spheres in at least three of his more noteworthy adventures.

Halvord discovered that the two-inch orbs were half-filled with mercury (a material that Kendalge seemed to use quite often in his enchantments, see [Bauble of Time](#)). The spheres use the mercury as a magical storage medium¹. In fact, in these items, mercury is being used to store many, *many* spells, allowing them to be released later at full

¹ It is not known how Kendalge managed to use mercury (a.k.a. *quicksilver*) as a medium for enchantment. Other magi have attempted to use the elusive metallic fluid for enchantment with limited success. Metals are (usually) excellent conductors of magical energy; witness the abundance of magical swords and armors throughout history.

Enchanters agree, however, that mercury (to put it mildly) is *less than ideal*. In fact, in those odd times when an enchanter can get quicksilver to absorb an enchantment, it will not last. It would seem that Kendalge was not only able to overcome this limitation, he used the material to hold spells in stasis. Thus, the spell would be completely cast -- all required energies poured in. Once the sphere was shattered, all of the magical energy would be released, and the spells would go off just as if the mage that placed them within the sphere were standing their casting it. Since there is no way to know what spells are within the spheres, this can be a bit of a gamble.

strength with no expenditure of magical energy on the part of the wielder.

The limit on the number of spells that the orbs can absorb, if there is one, is not known. The most that Halvord ever used was thirty-one. When the orb is broken, it will explode, releasing all of the magical energy stored within it. Each and every spell that was cast into the sphere is cast immediately, released simultaneously; the spells will target whatever is closest to them at the time.

According to the notes that Halvord left to his eldest son, there were over 300 of the spheres originally created by Kendalge. He knew of approximately 150 that had been used, and of another 100 that had been primed with spells, leaving 50 *blank parchments* ready to each accept untold numbers of fully-powered spells.

It is speculated that these spheres were used as the centers for the [Baubles of Time](#). Some speculate that the Baubles were Kendalge's first attempt at the spheres; others feel that his work with the spheres lead to the creation of the Baubles. Either way, the spheres are identical, with the exception of the fact that the Baubles use clear crystal, and the spheres use white-crystal. What significance this, or the strange spider-like case the Baubles are in, has is not known.

Ring Of Kendalge

Is there a ring that was enchanted by Kendalge to identify him to his other enchantments? Although no writing that can be traced to Kendalge suggests such an item existed, there are many that believe that there must have been one.

If the Ring does exist, then it would be a powerful item indeed. According to the early writings of Atlas d'La Raven, Chancellor to Empress Zoheret, this item would not only identify the wearer as being Kendalge to the various creations of the Master Enchanter, some evidence (he claimed) suggested that the ring allowed the wearer to keep track of the location and status of all of the items he created. In other words -- to find the ring, is to find (and control!) *all* of the magical works of Kendalge. Even Gemmomarmor, and the famed [Naos Sanctum](#)².

Although not one scroll, book, or scrap of parchment dating from the Second Age claims such an item exists, there is more speculation as to the existence of the so-called Ring of Kendalge within sage-circles of the Third Age than any other item. No proof, yet many of those that study the exploits of the Master Enchanter suggest that this item *must* have existed; there had to be an item somewhere that identified Kendalge to his various creations.

Certainly, this item need not have been a ring -- some suggest that it could be a necklace, or a piece of clothing. But it seems obvious (to some) that *something* protected Kendalge from the wrath of his own creations. For example, some tales suggest that Kendalge drank wine with His Majesty, King Beaufort VII, from the famed [Chalices of Humility](#), yet suffered none of the magical effects that the cups imbued upon the wine. There is the odd story of Kendalge's wife attempting to use the [Jewel of the Soul](#) on him, and it failing miserably. Other tales have individual items to identify Kendalge to other creations, such as the fabled rings (or amulets) that supposedly controlled Kendalges army of [Guarder Snakes](#).

It is, in fact, the tale of the so-called central control ring for the [Guarder Snakes](#) that led the infamous Atlas d'La Raven to commission no less than three quests in search of the Ring. His research led him to believe that the ring was, in fact,

² There is a story of the ring that was told in the courts not long after Zoheret was removed from power. In this story, Atlas d'La Raven not only discovered the ring, but then traveled North into the territories that Kendalge once controlled. Using the ring, he was able to call forth the [Naos Sanctum](#) and enter its hallowed halls. The story claims that he has been using the fortress to collect the rest of Kendalge's creations -- making each appearance of the Sanctum a point where Atlas d'La Raven would go to find one of the magical items, then (once he had it) disappear back into the nothingness where the Sanctum rests.

This story would later become the basis for several popular plays, then operas, where Atlas d'La Raven would return in an attempt to take control of the Empires of the Third Age . . . failing, of course, due to some popular heroic figure of the day (or, as in one variation, due to

Signet Ring that Kendalge used while he served as Lord Protector of the Northern Regions. Lord Bravarix Calyuran (predictably) wrote: *This is when the true madness of Atlas d'La Raven began to become obvious, even to the likes of Empress Zoheret*. It is true that Atlas d'La Raven was dismissed from his duties shortly after the third such crusade; but many still believe he was successful.

the return of Kendalge himself to reclaim his property).

Silver Chain

The silver chain is a thin, delicate, 24-inch silver necklace with six tiny rubies, and six tiny emeralds -- each stone alternating color, placed every two inches. It has no clasp; the wearer simply puts it on over their head. And it has been the cause of countless deaths and untold misfortune over the ages.

There are several legends of items that Kendalge enchanted that either did not turn out the way that he had hoped, or had repercussions he had not foreseen. The Silver Chain is one of those items (see also Theodore's Sword, below). Kendalge enchanted the Chain as a gift for an early lover (3). The chain was supposed to grant the wearer more confidence, removing self doubts and low self-esteem. The result was, to be blunt, disastrous. Where Kendalge had wanted to remove self doubts, the chain instead removes all doubts. The wearer becomes completely convinced that every thought that enters their head is the absolute gospel truth. This inevitably leads to extreme paranoia. And, with the bolstered confidence they have just received, the wearer quickly begins to believe that they are the only one that can correct the situation . . .

³ The legend goes that Kendalge crafted the chain, enchanted it, and presented it as a gift for his lover just as he was to leave on stately business. His lover (whose name varies in the telling of the tale) was a charming woman who was from a tattered past (one in which she had been abused, physically and emotionally). Her past left her with little self-esteem and a personality that rendered her nearly powerless; she would cling onto other people to establish her own worth.

After Kendalge left, she wore her new gift with pride. After a short while, she was sure he was never going to return. She was confident that this was his loss, however, and managed to seduce one of Kendalge's servants. She began using the resources of the Kendalge estate -- feeling that this was what he had left her with, it must be hers. It was not long before she had gotten enough of the servants and staff alarmed that they sent word to the court for Kendalge's return. When she discovered this, she accused them of treasonous acts, and began to threaten them. Her new lover turned on her, and this was too much for her to take.

By the time Kendalge returned (in most tellings, this all took place in less than two weeks, never more than a month) she had become an emotional shell of a woman. Kendalge removed the necklace, but it was too late -- the damage had been done. The fate of the Silver Chain is never described.

Theodore's Sword

Theodore was the eldest member of the adventuring group that included Kendalge and his love, Orlantha. He was, as history has stated hundreds of times, the greatest swordsman of his generation. But as the exploits of the little group were reaching their peak, Theodore was well past his. His body was beginning to fail. Kendalge had a tremendous respect for

⁴ According to the writings of Ghorik Shadowvale, Earl of Gyersetok, the magics that are on the sword making all detection of enchantment impossible were very important to Kendalge. Theodore was a nobleman, and was often finding himself in duels over the honor of some fair maiden (at least three times over the honor of Orlantha). In such duels, as the practice was at that time, enchanted blades and armor were not

Theodore, and so created the sword that Theodore would use for the last seven years of his life. If the various scraps of information that Kendalge left behind dealing with the sword are to be taken at face value, then Theodore would not discover that he had received this "gift" until the bitter end.

The sword is a rather simple, but solid, heavy, and well crafted thrusting broadsword. The blade is of a dark, almost blood-toned steel. Normal spells of detection will show no enchantment on the blade (4). However, the blade has one very powerful, very potent, and quite unique enchantment: when using the sword, an illusion covers the wielder, making it appear that all of their movements are reversed, like a mirror image.

If the wielder of Theodore's Sword thrusts to the right, anyone that sees them will see a thrust to the left. Obviously, any attempted block to stop this perceived threat will be (at best) useless and (at worst) counterproductive.

It was Kendalge's wish that the effects of Theodores sword never be known. Most of Kendalge's notes, and the sword, disappeared shortly after Theodore's death. The only four remaining scrolls that describe the sword are a part of the collection of Sir Chaddwyke Earl of Overcliffe.

permitted. Thus, Kendalge fashioned a sword that could be used to protect his friend, without others being any wiser. Additionally, Theodore was a proud and knightly man. He personally felt that enchanted blades were for lesser swordsmen.

But Kendalge's secret was not an easy one to keep. On those four remaining scrolls that describe the sword, it states that often, following a duel, people would speak of how he had thrust this way, or parried that . . . and the descriptions would not match Theodore's own recollections. For a long while, he simply accepted this as the faulty memories of people caught up in the moment. But after a time, as his age continued to erode his considerable skill, he made what should have been a fatal mistake in a duel against Lord Charles of the East Winds; Charles obviously saw the opening, but thrust the wrong way.

It was obvious. Theodore backed off, and laid his sword down. Charles accepted the forfeit and left the listfield. So, after seven years of using the sword, he confronted Kendalge. Kendalge stalled at first, but was unable to lie to his trusted friend. This betrayal (as Theodore saw it) was more than he could take. To think of the number of men he had bested over the years -- not due to his own skill and determination, but due to unforgivable deceit and trickery -- was too much for him to take. He took ill shortly after the conversation; and died within six months, a broken man.

Kendalge preserved those scrolls, he claims, as a constant reminder of the very real consequences of deceit. This fatal mistake, early in his career, did much to shape him into the man that would one day advise Kings with wisdom and temperance.

Utter-Scale

Anyone that has read the tales of Kendalge is instantly aware of the many talents he possessed. He was, of course, the greatest enchanter of his (or any other) time. But he was much more than that. For example, he was an accomplished Bard; he was a musician (playing the Dulcimer, Lute and Oboe); he was a decent ballroom dancer, a fine chess player, and often invented new games of skill and chance (such as King's Crossing, and Nine-Dragons).

But even if all of these things are of no surprise, some people still find it hard to accept that Kendalge was also an alchemist. Granted, this was not his true calling -- there were many much more accomplished alchemists in his day and since. Still, as an alchemist, he recognized the need for precise measurements in the accounting of alchemical compounds.

⁵ There is a children's story concerning this item states that the scales were once given to a woman that was courted by two men. The first man loved the woman with his whole heart; the other man, while he was fond of her, was more enthralled with the riches that her wealthy, land-owning, merchant of a father was promising in her dowry.

The first man wanted to prove that his love for the maiden was greater than the second man's love, and so asked that she hold the handle of the Utter-Scale while he and the competing suitor held onto the plates. He instructed her to speak the words "love for me" so that the scale would measure, within the two men, which one had the greater love for the

To that end, he put his enchanting skills to work when he created the Utter-Scale. The scale is a small metal equilateral triangle, eight inches on a side. There is a small bulbous handle extending from one side of the triangle, and a six-foot long piece of thick, golden thread that extends from the opposing points of that side. Each thread is then secured to a small place of plate of dull gray metal.

This odd, and overly simple looking device is used to compare *anything* (5) about an object to the same quality in another object. After placing the plates so that they are in contact with two different objects and holding the handle so that the triangle extends above it, the holder then speaks clearly the quality that is to be measured. The triangle will then pivot on the handle and point towards the object that has a greater amount of the quality in question.

woman holding the scale.

However, instead, she looked at the man that gave her the scales, dead in the eye, and said "loved by me" whereupon the scales tipped towards the second man . . . the moral of the story being that it is not always what *you* want that matters in life.

Star Wars Miniatures: Rebel Storm

Published by [Wizards of the Coast](#)

Written by Bill Slavicsek, Jeff Grubb, Jonathon Tweet, & Rob Watkins

Illustrated by Des Hanley, Greg Staples, & Stephen Tappin with Clark Mitchell

Cartography by Christopher West

Starter Set: 5½ By 8½-Inch Full Color 36-Page Rule Book, Two-Page Rules Summary, 34 By 22-Inch Full Color Double-Sided Battle Grid, Eight 5 By 7-Inch Terrain Tiles, Ten 1¼-Inch Tall Miniatures With Corresponding 2½ By 3½-Inch Full Color Stat Cards, One Sheet of Force & Damage Counters, & One 20-Sided Die; \$19.99

Booster Pack: Seven Random Miniatures; \$12.99

Since its debut in 2002, WizKids has dominated the Collectible Miniatures Game market they pioneered with two lines: *Marvel HeroClix* and *DC Helix*. No one came close to impinging upon their number one position, until Wizards of the Coast released first *Dungeons & Dragons Miniatures*, and then *Star Wars Miniatures: Rebel Storm*. And as we all know, if there is one license to trump them all, it is that of *Star Wars*.

As is standard for the CMG, *Star Wars Miniatures: Rebel Storm* comes in the starter set and booster pack format. It is in the game's Starter Set that you get all of the goodies: ten miniatures, a stat card for each, a large full-color Battle Grid (or map), eight full-color terrain tiles, the rulebook, a simple rules summary, and a miniatures set list. Each Booster adds another seven miniatures.

The miniatures come pre-painted and assembled in durable plastic, the average Rebel Trooper or Stormtrooper being roughly 1¼-inch high. The Starter Set includes two exclusive figures, "Luke Skywalker, Rebel" and "Darth Vader, Dark Jedi." Other figures in the Starter Set and all of those in the Boosters are selected randomly. The *Rebel Storm* set is comprised of 60 miniatures, divided equally into three factions: Rebel, Imperial, and Fringe, the latter being from *Star Wars'* underground and criminal underworld fraternities. The various figures from the Rebel and Imperial factions are what you would expect them to be: C-3PO, Han Solo, Obi-Wan Kenobi, and others from the Rebel faction, while Emperor Palpatine, Probe Droid, Grand Moff Tarkin, and so on from the Imperial faction. The only surprise is the inclusion of "Mara Jade, Emperor's Hand" in among the Imperial faction, since she does not appear in any of the original trilogy of films. Characters such as Boba Fett, the Ewok, Greedo, and Lando Calrissian all belong to the Fringe faction.

The miniatures are also rated by their rarity: common, uncommon, rare, and very rare. In general, the larger or more important the figure, the more animated and rarer it is. The very rare characters include (Rebel) Commando on Speeder Bike, Princess Leia, Captive, Darth Vader, Sith Lord, Scout Trooper on Speeder Bike, Boba Fett, and Jabba the Hutt. Each figure has its name, set number, and rarity marked on its base.

All figures have a stat card. These note a character's Hit Points (10 points for characters such as the Ewok or

Stormtrooper, 40 for Luke Skywalker, Rebel, and 140 for Darth Vader, Dark Jedi); Defense, Attack, and Damage ratings. Some characters also have Special Abilities, such as the Ewok's "Swarm," which gives them a bonus when making a melee attack en masse. More powerful characters have more impressive Special Abilities. Darth Vader, Dark Jedi, for example, can make two attacks each phase with his Double Attack. He also possesses Force Powers, which in his case are Force Grip ("I find your lack of faith disturbing" -- his only ranged attack) and Lightsaber Sweep, which lets him strike all adjacent characters. Like all characters with Force Powers, he can also expend his Force Points to re-roll bad die rolls or to temporarily move faster. In addition, a character with Commander Effects can influence his allies on the battlefield.

The large thick paper Battle Grid or map is double-sided, marked in 1-inch squares on both sides. One side is otherwise plain, except for the starting positions marked for two, three, or four player games. On the other side is the more impressive deck plan of the Death Star, which includes the notable locations of the Hanger, Flight Control Center, Detention Center, and Tractor Beam Reactor Coupling shaft. The eight Terrain Cards, also in full-color, detail further locations such as Hanger with X-Wing Fighter, Turbolift Cluster, and the Shaft.

The rulebook is very clearly written and obviously done with a young audience in mind; the minimum recommended age for **Star Wars Miniatures: Rebel Storm** is 12 years old. The rules are very clear and easy to understand, with lots of examples and diagrams as well as a very helpful glossary. In fact, with the aid of the Rules Summary, the game is so easy to grasp and understand that the average gamer could unpack a Starter Set and be playing within the space of five minutes.

Play is itself simple. Players take turns to activate two characters. Once activated, a character can either move and attack, attack and move, or move twice. Attacking involves rolling the die and adding in the character's Attack value. If the result is equal to or higher than a target's Defense stat, then the attacker's Damage stat is deducted from the target's Hit Points. A Force Power or Special Ability can be used instead of an attack.

Set-up for the game is a little more complicated, but not needlessly so. Players build squads of characters on an equal number of points, usually 100. One side builds a squad of Rebel and Fringe characters, while other player creates a squad of Imperial and Fringe characters. Each side reveals their squad and sets them up at opposite ends of the Death Star map. They then go at it until one squad beats the other.

The more advanced rules suggest all-Fringe character squads, and Fringe versus Fringe skirmishes. Rules also cover the effects of the terrain and obstacles aboard the Death Star map as well as using the Terrain Tiles on both sides of the battle Grid sheet. Placement of the Terrain Tiles can also be competitive. In a three-way skirmish, winning is determined not by wiping everyone else out, but by scoring points for the characters eliminated. Other suggestions include Team Play and playing games straight out of a purchased box, in this instance ignoring factions and Special Abilities for Unique characters.

More interesting still is the idea of special scenarios, designed using the components of the Starter Set and a wide variety of the miniatures in the **Rebel Storm** set. It would be just as easy to use scale maps from other games and manufacturers, or indeed for a player to create his own. The only scenario included in the rules is "Rescue the Princess," in which a Rebel faction boards the Death Star and attempts to break Princess Leia out of her detention cell, get her back to the ship, and -- of course -- disable the tractor beam. Naturally, the Imperial squad does its best to stop them. It is a pity that just the one scenario is included, but it does highlight the fact that the participants need to have access to all of the miniatures in the **Rebel Storm** set and more to create or play them.

There are three aspects to consider in buying **Star Wars Miniatures: Rebel Storm**. First is its collectible factor and the investment necessary to get all of it. The very rare figures are roughly twice as rare as the rare ones, and it took an acquaintance roughly 16 Boosters to obtain most of the characters that he wanted. The rest he picked up as singles. Even then, he opined that he got a lot of cheap targets, or Ewoks and Jawas. On the plus side, that gave him lots of Stormtroopers and Rebel Troopers, which are great for use with the **Star Wars Roleplaying Game** -- another suggested use for **Star Wars Miniatures: Rebel Storm**. Of course, many of the named heroes from this set are not going to be as useful in this regard, as players prefer to create their own characters rather than play Luke Skywalker or Princess Leia. Hopefully, a future expansion will give more Fringe characters which would be the most likely source for such

characters.

Finally ***Rebel Storm*** can be used to play out and fight many of the most memorable scenes from the first trilogy of films. Already the publisher has published ***Ultimate Miniatures: Rebel Storm***, an aid in that endeavor. Of course, players will need access to all of the characters in the set and multiples of many of its common and uncommon characters.

This is also a problem right from the start. Even with a Starter Set and a Booster, it is not really possible to play any other mode than Out of the Box games. There are not enough figures to create 100 point squads of any faction, and at least another Booster is a necessity.

Get past this problem, and what you have in ***Star Wars Miniatures*** is a fun, playable skirmish game. The game is very easy to learn, and putting a squad together lends itself to various permutations when considering the various Special Abilities available. And of course, if you are of a certain age, then ***Star Wars Miniatures: Rebel Storm*** should speak to both the gamer and the geek inside you.

Pyramid Review

Tutankhamen

Published by [Out of the Box Publishing](#)

Designed by Reiner Knizia

Art by John Kovalic

70 artifact tiles, pyramid, 90 coins, 6 tokens, reference sheet, rules; \$14.99

Many historical questions persist about Egypt's so-called "boy king," supposedly dead at the age of 18, but the one that holds the most fascination for folks is: Where did *Tutankhamen* leave all his loot? Two to six players take the role of archaeologists who gather treasure and, not as stupid as all those others who have been cursed by countless mummies before them, make sure to pay homage to Tut by giving him their money.

The object of the game is to be the first player to give up all his coins.

The game is played on a long, meandering strip of tiles that lead up to a pyramid. Each tile shows a treasure, with the number on the tile indicating how many tiles are in that set and how much that set is worth. Along the way you can also gather bags of gold and pharaoh tiles, and sitting atop the pyramid is the King Tut tile. Players start their pawns at the end of the path, going toward the monument. You begin the game with tribute coins -- the more players, the fewer coins you'll have to get rid of.

Movement isn't random. Your pawn may go to any point in the path, and the player collects the tile he lands on and places it in front of him. He may not backtrack, so any tiles he passes up are lost to him. Those coming up behind him may still land on unclaimed tiles. If the rearmost player passes up one or more tiles when he moves, no one will ever get them so they're removed from play.

If you complete a set, you score it immediately. A set is done when all the tiles are accounted for -- one or more players have picked up all the tiles, and/or the unclaimed tiles have been removed from the end of the path. If you have the most tiles from that set, you get the points. If you tie for the most counters with one or more other players, you all get half the set's value.

Tiles that show bags of gold may be used to buy (read: steal) a tile from another player. That other player in turn may deposit a tribute coin. The other wild card . . . er, counter . . . is the pharaoh tiles. These may be turned in as part of an artifact set during scoring, giving you a better chance to win the set. The Tut piece does the same thing, but you can deposit an extra coin upon collecting it. Even if you go to the end of the path, you continue to score for tiles collected up to that point as other players finish the sets.

When you redeem artifacts, your score is how many coins you may place in tribute into the pyramid (there's a little piggy-bank sort of slot on the back of the tomb). If you give up the last of your coins, you win immediately. If everyone finishes the path without ditching all their money, the person who contributed the most wins.

The artwork is pretty straightforward and functional, which is really all you can ask for. The presentation of the game is a far more important visual factor, and while the equipment is once again a bit lavish (and adds about five bucks to the price of other Out of the Box games of similar size), it's delicious fun to play with. All the coins, the bank-like nature of the container, the bright and colorful tiles . . . they're all so pleasing. It's kind of neat being able to build the winding path of counters, but it makes starting a new game a pain in the ass. Don't bother to place them upside down

to randomize them -- it's even more time-consuming having to flip them up when you're done, and no one's really going to gain an advantage from seeing the tokens as they're laid out.

While some of the balance issues involved -- deciding what to keep and what you can afford to leave behind -- aren't all that new, the method of putting it out to the players is. It's visually striking, and leveling out all the factors that must be taken into account in your strategy make the game anything but boring. The rules could explain the timing better (it's easy for multiple sets to come up for scoring at once). The use of the tribute coins isn't really needed, but the kids will get a kick out of it. Leaving victory up to whoever loses their last coin instead of the person with the highest score also makes for a faster game. Out of the Box finds its success in strange and esoteric places, and it looks like **Tutankhamen** still hasn't finished giving up all his treasures.

--*Andy Vetromile*

Death Of A Lost Man: The Killing of President Garfield

*"Mister Garfield's been shot down, shot down, shot down
Mister Garfield's been shot down low
Lawd, I knew the President was supposed to be at the depot that day
And we just wouldn't believe he was shot
But we ran over there
And there was so many folks around we couldn't see him."
-- Johnny Cash and Jack Elliott, "Mister Garfield" (1965)*

James A. Garfield, the last President of the United States to be born in a log cabin (so far), was in many ways made President by a series of flukes. A deadlocked 1880 Republican convention in Chicago turned to former Union General and Ohio Congressman Garfield as an unknown compromise candidate. With only tepid support from the "Stalwart" pro-Grant wing, running a reclusive campaign from his farm in Ohio, he eked out one of the narrowest popular vote victories in history, beating the Democrat Winfield Scott Hancock by only 10,000 votes. A forged letter nearly cost him the election (plus ca change), and only the energy of his Stalwart vice-presidential candidate Chester Arthur put him over the top, by methods that do not bear close examination in our somewhat more fastidious era. Nevertheless, he turned to his duties with increasing vigor, cracking down on Arthur's political patron, New York Senator Roscoe Conkling. In the tense climate of this political fight, his friends (including Conkling's -- and Grant's -- rival James Blaine) warned him that he risked the fate of his predecessor, Abraham Lincoln. Garfield responded bravely, "Assassination can be no more guarded against than death by lightning; and it is best not to worry about either." With Conkling beaten, Garfield set out for the Baltimore & Potomac Railroad station on July 2, 1881, ready for a long summer vacation. Instead, he got a bullet in the back.

*"I had no ill will towards the President. His death was a political necessity. I am a lawyer, a theologian, a politician. I am a Stalwart of the Stalwarts."
-- from a letter found on the person of Charles Guiteau*

The assassin was Charles Julius Guiteau, an eerie doppelganger in many ways of the President. Both were Midwesterners and youngest children, raised by single parents in poverty. Both were deeply religious -- Garfield thought about entering seminary, while Guiteau preached the occasional apocalyptic sermon for paying crowds -- and fervent Republicans. But where Garfield worked hard and made his fortune, Guiteau frittered away his talents writing increasingly insane tracts on spirit lore, wild religious theories, and borderline conspiracy theory. (Ahem.) Divorced from his wife, unable to find steady work as a lawyer after narrowly escaping trial for fraud, Guiteau drifted into the typical career path for idle, fraudulent lawyers in that era -- politics. By hanging around Republican headquarters in New York, Guiteau managed to convince himself that he had single-handedly elected Garfield, and he expected to receive a plum foreign posting in return. Instead, Guiteau got thrown out of a dizzying succession of government offices. To Guiteau, this ingratitude revealed the President as a traitor. But if Garfield was removed, Guiteau realized, Chester Arthur, his fellow Stalwart, would become President. In a moment of "inspiration" on May 18, 1881, Guiteau realized that God had called him to kill President Garfield.

He spent the next six weeks buying a gun (which he chose in part because it would look good in a museum later), writing his manifesto, stalking the President to church (where he decided not to kill him at prayer) and through Lafayette Park (where it was too hot to shoot), and camping out to watch the White House. Finally, hearing of Garfield's plan to leave the city for the summer, Guiteau screwed his courage to the sticking place. He followed the President to the railroad station, and fired two shots before fleeing. He was immediately arrested and taken to jail, which he had scouted earlier to see what kind of accommodations he could expect. The bullet lodged itself behind the President's pancreas, where it eluded several doctors' best efforts to probe the wound. Their best efforts were, in fact, fatal -- their unwashed fingers and instruments gave the President (and at least one attending doctor) blood poisoning. Unable to digest food, President Garfield slowly starved to death in near-constant agony for 80 days before he died in a New Jersey shore resort on September 19.

"If only they knew, they wouldn't want me there."

-- attributed to Robert Todd Lincoln

The gripping book *Dark Horse* by Kenneth D. Ackerman tells the story well, including (but not at all emphasizing) the ghoulish coincidence of Robert Todd Lincoln. Eldest son of Abraham Lincoln, he was at his father's bedside when the Great Emancipator died of an assassin's bullet. As a sop to the moderate Stalwarts, Garfield had made Robert Todd Lincoln his Secretary of War -- and Lincoln entered the railroad station just as Garfield was shot. (Just a week earlier, at the President's invitation, Robert had told the Cabinet about his father's prophetic dream of his own death.) In 1901, he was attending the Pan-American Exposition at Buffalo, New York at the invitation of President William McKinley -- gunned down by Leon Czolgosz on the day Lincoln arrived. He refused all future Presidential invitations thereafter, but was lured back to Washington for the dedication of the Lincoln Memorial in 1922. He stood on the dais with Warren G. Harding -- who died in office in August the next year, in circumstances some attributed to poison. But not, at least, with Robert Todd Lincoln looking on.

"Contrary to events following the Lincoln assassination, no theories of possible conspiracy surfaced in the wake of Garfield's slaying."

-- Report of the House Select Committee on Assassinations

According to the astrologer Mark Lerner, Robert Todd Lincoln may have been a zodiacal conduit of Uranian energies between the killings -- among other things, Robert's birth and all three assassination dates show a Pythagorean Triangle, an arrangement of three planets in a triangle of 150-120-90 degrees. Although the precise planets and signs vary, Sagittarius (the Archer -- an interesting emblem for assassination) appears in all four Triangles. Which makes it kind of interesting that Garfield's monument holds the only sculpted zodiac on any public statue in Washington, D.C. The Garfield monument drips with not just astrological, but Masonic symbolism, as Garfield was (as it happens) a high-ranking Scottish Rite Mason of the Royal Arch Degree. And, while we're on a brief [sacred geometrical](#) tangent, one should note that the Baltimore & Potomac railroad station was on the longer leg of what would become the (Pythagorean) Federal Triangle. This points up the notion of President Garfield as sacred sacrifice that we've noted [before](#) in connection with America's hidden kings. And on that branch, Garfield's death by starvation, lasting 80 days, echoes the 80-day Aztec fast that began every year in Ochpaniztli, the harvest "month of sweeping." (The month was sacred to Xilonen, the Aztec version of Ceres, one of the planets in Garfield's Pythagorean Triangle.) He died, of course, on the New Jersey shore on the 19th day of Ochpaniztli, the day One Reed, the day of the Morning Star, a good day to travel over water.

"I wonder what I will see when I get to the Lordy,

I expect to see most glorious things,

Beyond all earthly conception"

-- from the last verse of the last words of Charles Guiteau

So much for Garfield's end -- what about Guiteau, his shadow? Ackerman quotes Guiteau's rambling insistence that he acted under "inspiration . . . where a man's mind is taken possession of by a superior power, and he acts outside of his own nature -- outside of himself." This "Divine pressure on me to remove the president was so enormous that it destroyed my free agency," he said, but he "never had the slightest doubt as to the divinity of the inspiration." Elsewhere, Guiteau is quoted as urging his interlocutors to "get acquainted with the science of spiritology . . . you will get much sense from that." The notion of Guiteau as possessed, as the host for some toxic spirit, may explain why Lucretia Garfield, the First Lady, contracted a mysterious high fever on April 25, 1881, the night she met Guiteau at a White House reception. She had only barely recovered before Garfield was having prophetic dreams of his death, and summoning Robert Todd Lincoln to interpret them. Where might Guiteau have contacted (or contracted) such spiritual parasites? Guiteau had joined John Humphrey Noyes' Oneida commune in 1860, and claimed to be "unable to get away from that influence" even after leaving the cult. He certainly continued to follow some of the Oneida beliefs, lecturing on the Second Coming, which he and Noyes agreed had already happened, in the year 70 A.D.

"Garfield, Arthur, Harrison, and Hayes, time of my father's time, blood of his blood, life of his life . . . were the lost Americans: their gravely vacant and bewhiskered faces mixed, melted, swam together in the sea depths of a past intangible, immeasurable, and unknowable as the buried city of Persepolis. And they were lost. For who was Garfield,

martyred man, and who had seen him in the streets of life? Who could believe that his footfalls ever sounded on a lonely pavement?"

-- Thomas Wolfe, "Four Lost Men" (1934)

Mark that point -- the Second Coming has already happened. History is over. This is an echo, a temblor perhaps, of a [reality quake](#) or of a secret war between two histories. 1881 becomes the hinge year; the [Emperor Norton](#), the Voodoo Queen Marie Laveau, and Billy the Kid die, leaving larger thrones vacant than a mere Presidency. Everyone feels it, somehow: 1881 is the end of the world according to some branches of the Jehovah's Witnesses, one reading of the Great Pyramid, and a popular prophecy attributed to the 16th-century English seeress Mother Shipton: "The world to an end shall come; In eighteen hundred and eighty one." President Garfield's Freemasons work feverishly to strengthen their shadow world, their [Empire that Never Ended](#) even though history has. They resume work on the Washington Monument on August 7, 1880, the day after Garfield meets the Stalwarts in a mysterious closed-door conference in New York City, and then erect Cleopatra's Needle in Central Park on February 22, 1881, seven months before Garfield's death.

But the Divinity that "inspired" Guiteau strikes back -- Guiteau hears his call, experiences his vastation, on the feast day of Pan, god of irrational fear. A comet appears on Midsummer's Day of 1881, a blazon traditionally heralding the "death of princes." Black birdlike shadows appear on the Moon on the night of Garfield's assassination, on America's true birthday, July 2, when it is most vulnerable. The egregores are gathering, waiting to shatter America's Masonic grid and drain the world's history dry. But Guiteau is a weak reed; the Masons trick him into a Hamlet Working when he fails to kill the king at prayer. Now they can spin Hamlet's Mill around the Pole Star obelisks, and restart History. Garfield (and the Presidents around him) will dim, and fade, and flicker, and melt -- but they will not disappear. The center will hold.

Plus, the Masons have an ace in the hole -- Robert Todd Lincoln, the personification of Uranian revolution. He warns Garfield, prepares him for the new role he must play. As a farmer, Garfield knows the sacred rhythms of the Corn King. He suffers his Dolorous Blow on the Triangle, energizing Washington's Masonic grid. He suffers for eighty days, the full fast of Xilonen, and dies by water on the day of Quetzalcoatl, One Reed, a propitious day for journeys. On the day after his burial, a Capetown observer saw "something like a comet" moving toward the Moon, something that did not appear the next day. But neither did the black shadows. Instead, [spectral armies](#) of helmeted "angels" marched across the aurora-suffused skies above Virginia and Maryland in September and October of 1881, including, by several reports, the gigantic figure of Garfield himself. There was a great war in heaven, and James A. Garfield saved the earth. Hail to the Chief.

Dork Tower!

Dork Tower!

Infinite Diversity in Finite Combinations

In an interview I read many years ago (which, I regret, I am utterly unable to find existence of, so it might just be a fevered hallucination caused by a glitch in the Matrix), fan-favorite writer, novelist, and creator Neil Gaiman once commented that he grew disillusioned with mainstream comics at an early age, because he realized that (for example) Aunt May probably wasn't going to die; this predictability ruined enough aspects of storytelling for him.

In a comic I read many days ago, Aunt May failed to die. She was rescued after many months of being held captive in a state of suspended animation by a madman (whose identity I won't spoil, except to say that it was the Green Goblin).

Now, one of the most interesting things about this story was that Aunt May had been held captive for many months previously; in fact, it was almost a decade ago exactly that this happened to the old gal. What's even more striking is that she had been held captive **BY THE SAME MADMAN.**

Marvel Comics, owners of powerful properties such as Aunt May and her sidekick Spider-Man, prides itself on not rebooting its universe every decade or so. So, presumably, both these stories did happen . . . probably, knowing how comic time compresses, within a year or two of each other. Really, after a while, if I was Spider-Man I would probably consider kidnapping Aunt May myself, just to try to shake things up a bit for the Green Goblin.

Now, here's the interesting thing. (And, yes, I know it's taken one-quarter of the column to get to the interesting thing. Gimmie a break; I've been sleep-deprived avoiding another freelance deadline by digging up decade-old comic books.) The two stories were, for the most part, completely different. (I started to detail *why* they were different, only to notice I was typing sentences that began, "In an effort to explain what happened the last time Aunt May died . . ." and realizing that no good could come of it. Suffice it to say, may you never need to explain to your children anything relating to the phrase "clone saga.")

And this got me to thinking: How many stories -- in recurring fiction, television shows, movies, comics, and, yes, gaming -- revolve around basically the same key plot element? Even a relatively small franchise, such as the Original Series *Star Trek* movies, found itself double-dipping when (to paraphrase Harlan Ellison) the crew of the *Enterprise* finds God, only to learn that God is A) a child, B) insane, or C) an insane child. (That's *Star Trek: The Motionless Picture* and *Star Trek V: We Shall Not Speak of This Again*, for those of you playing at home.) And, more amazingly, it's a plot that had been used on a healthy handful of episodes of the original series as well.

However, the amazing bit to me is that the stories all stand on their own, despite their superficial similarities; *Star Trek I* and *Star Trek V* are both deeply mediocre movies all by themselves. Expanding outward in our *Trek* lore a bit, I seem to recall that there are at least a half-dozen episodes or movies of *Star Trek: The Next Generation* where the destruction of the *Enterprise* (as in, you see it or a ship like it go "Boom!" in airless space) is a major plot point. But each of those stories stands alone on their own.

I think the trick, at least for me, is how the element and focus of the story varies with each iteration; understanding and embracing this is the key to finding new plots and ideas in gaming. For example, let's take a "recover the orb of power to keep the world from being destroyed" bit. I think it would be possible to run some variation of this plot every third adventure (at least), and still keep it fresh by introducing other elements and mixing them up:

- **Adventure #1:** "Recover the orb and save the world" -- Themes here are how grossly outclassed the fledgling heroes are to the task, and the hilarity that ensues when thrown head-first into the deep end.
- **Adventure #4:** "Recover the orb and save the world" -- Here it turns out the orb is being held by someone who things he's doing the right thing, and the heroes need to convince him of the greater good served by not letting the world get destroyed. (As the Tick said, "Earth?! That's where I keep all my *stuff!*")
- **Adventure #7:** "Recover the orb and save the world" -- This time the heroes are tricked, and recovering the orb turns out to be a [bad thing](#). Here the heroes either need to stop themselves in time or undo their damage.
- **Adventure #11:** "Recover the orb and save the world" -- It turns out the orb is sentient and doesn't *want* to be saved, and needs to be convinced. [What does it want?](#)

- **Adventure #15:** "Recover the orb and save the world" -- Here it turns out the orb is itself another world (or a gateway to another world), and to save the day the heroes need to recover the orb that represents *our* world from within this second world.

Obviously in each of the stories above "orb" and "save the world" are both tweaked themselves to provide some diversity.

Anyway, the point is that there are no new ideas, but the way they're expressed can provide infinite diversity themselves. Combine them with other finite ideas and you've got an even greater variation. In other words, don't worry that you're running the 80th dungeon crawl for your fantasy heroes. They're fantasy heroes; roaming dungeons is what they *do*.

If you let yourself be creative and accept that some themes are just going to repeat, you'll be much better off. I note that the five plot ideas above are just the first five ideas that popped in my head; I could probably come up with a dozen more. And, if anyone from Marvel is reading, I could also come up with a wicked "Aunt May is held captive for months by the Green Goblin" story myself . . .

--*Steven Marsh*

Lighting the Way

for *GURPS*

by S. E. Mortimer

This article examines the development of various sources of lighting throughout history and attempts to reconcile them with the way *GURPS* describes some of these, along with how the rules handle the effects of darkness. This work uses references to *GURPS Fourth Edition*, but everything discussed here should also be compatible with *Third Edition*.

Introduction

Until very recent times, the only means available to create artificial light was to burn something. Open fires not only created light but they were used for warmth, protection, and cooking. The first portable fire was likely to be the burning brand. Hold a branch in the fire and wait till it caught alight, then take it out and carry it with you to light your path. It would have soon been discovered that resinous wood burned more effectively than other types of wood. Once other flammable materials were discovered such as oil, fat, pitch, etc, it wouldn't have taken long for them to have been used to increase the brightness and duration of the flame.

Darkness Modifiers

A light source modifies the darkness in a local area from total darkness (-10) to the modifier specified in the item description. For example, according to the *Basic Set*, p. 394, a torch modifies the darkness penalty to -3. This normally only applies to a radius of two yards around the light. Here are some sample darkness modifiers:

- 0 Well-lit room, Continual Light 3 (B249)
- 1 Bonfire
- 2 Large campfire, Fireplace, Continual Light 2 (B249)
- 3 Street lights, torch or flashlight (B394), Continual Light 1 (B249)
- 4 Full moon, Light spell (B249)
- 5 Crescent moon
- 6 Starlight plus faint moonlight
- 7 Starlight and no moon
- 8 Lightly overcast starlight and no moon
- 9 Heavily overcast starlight and no moon

The intensity of light decreases with distance. Use the Size/Range Table on B550 to determine the darkness penalty at any given point. This is done by applying *half* the Range modifier (round up). For example, a target is 15 yards away from a torch (darkness penalty -3). The Range modifier for 15 yards is -5 and half of this is -3 (rounded up). Therefore, the target area has a darkness penalty of -6 (-3 -- 3).

Multiple light sources in the same location (candelabras, chandeliers, etc.) multiply the available light and reduce darkness penalties. Every time the number of light sources is doubled, the darkness penalty is reduced by 1. For example, a single candle might have a penalty of -5, two candles reduce it to -4, four candles reduce it to -3, and so on.

Types of Lighting

There are two main types of low-tech lighting. The most primitive lights have the fuel and flame as one. These include fire baskets, torches, and rushlights. More advanced lighting use a wick to keep the flame and fuel separated. Examples include candles, lamps, and lanterns. Electric lighting based on incandescent bulbs and fluorescent tubes are

developed in the 19th century and chemical lighting (chemiluminescence) appears in the last quarter of the 20th century.

Fire Baskets

A Fire basket consists of a cage of metal ribs and hoops to hold burning kindling or charcoal. If the bottom was not enclosed then it would be filled with stones to prevent hot embers falling out. They could be used for cooking by means of a grill or hotplate placed on top. Apart from the hearth, fire baskets had many uses. The Romans used fire baskets on ship masts to help avoid collisions at night -- similar to today's anchorlights. Primitive signal beacons and lighthouses consisted of wooden scaffolds with large fire baskets mounted atop.

A *brazier* is similar to a fire basket except that it consists of an enclosed bowl instead of an open cage. Because a fire basket is open, it sheds more light than an enclosed brazier, which is better used as a heat source for cooking or warming a room. Fire baskets allow airflow to fan the flames while braziers are intended to smother flame and allow embers to smoulder. There are multiple sizes of fire basket but only the smallest kind is portable. Portable fire baskets were usually hung from chains or mounted on a pole -- called a *cresset*.

A small, circular cresset (TL1) mounted on a pole would weigh around one pound and the kindling would weigh a further pound. It costs \$10, burn time is one hour, and the darkness penalty is *initially* -3, but it decreases by 1 every 20 mins. That is, the darkness penalty is -4 after 20 mins and -5 after 40 mins, unless the fuel is replenished with fresh kindling.

Torches

Simple Torch (TL0): The easiest method of making a torch is to simply light a piece of resinous wood. Most types of pine have high levels of turpentine and make good torches. Other types of suitable wood include boxwood and birch. Some Native American Indians used rolled tubes of birch bark bound with cord. These sorts of torches burn very erratically, popping and spitting, and sometimes extinguishing before they finish burning. A simple torch (TL0) weighs 1 lb, costs \$1, has a darkness penalty of -4, and can burn for up to half an hour. During this time it can spontaneously extinguish. Roll every 5 mins. On a roll of 1 it goes out and needs to be relit.

Splinter Torch (TL1): In order to ensure that wood burns effectively, it needs to be held with the burning end down. This was difficult to do by hand so it was often held in a metal clamp on a pole called a "splint holder." Using a splint holder enabled the entire length of the wood to be burned and it rarely spontaneously extinguished. A splinter torch consists of the splint of wood, a metal clamp, and a handle. The metal clamp and handle costs \$10 and weighs 1 lb. A splinter of an appropriate size weighs 0.5 lb so a charged splinter torch weighs 1.5 lbs. It has a burn time of half an hour and a darkness penalty of -4.

Common Torch (TL0): Similar to a simple torch except that the end of the wood is treated with a flammable material (see *Fuels*, below). The wood could be dipped in a viscous fuel such as pitch, or wrapped in a cloth that had been soaked in a more liquid fuel such as oil or grease. A common torch weighs 1 lb, has a darkness modifier of -3, burns for 1 hour, and costs \$3. This is the torch listed on p.B288.

Sapling Torch (TL0): Made by cutting down saplings and beating the ends into a fibrous state. The fibers were then impregnated with a flammable material (see *Fuels*, below). Multiple saplings were bundled together to make a torch. One was left long enough to act as a handle. Treat this as a Common Torch (above).

Rope Torch (TL0): Made by dipping a rope, usually made of flax or hemp, into a flammable material (see *Fuels*, below). Multiple segments of rope were bound together and tied to a handle with cord. Treat this as a Common Torch (above).

Another item commonly called a torch consists of a cone of metal or a cup on a handle with a wick and an oil reservoir. This is more accurately classed as a *lamp* (see below).

Rushlights

First used by the ancient Egyptians, the rushlight is made from stripped and treated rushes. The "soft" or "candle" rush (*Juncus effusus*) has a round, green, erect stem up to four feet tall, filled with a soft, white pith. It has no leaves but there are small flowers several inches below the plant's pointed tip. It grows in wet temperate lowlands such as lake shores, marches, and boglands. To make rushlights, the tallest and strongest rushes were collected in summer or early autumn and soaked in water before peeling. Most of the rind was removed, leaving a single rib to hold the pith intact. They were deposited outside to collect dew for several nights and then dried in the sun. Once dried, the rushes were dipped in a "grisset" full of a hot mixture of oils and fats. (see *Fuels*, below).

Rushlights were lit at the top, like a candle (see below). The quality and duration of light was determined by the care at which the rush was prepared and the contents of the dipping mixture. A typical rush was between two and three feet in length. A rush holder, or *rushnip*, was the vessel that held the treated rushes while they burnt. The jaws ("nip") of the rushnip held the rushlight while it burnt. The rate of burning could be controlled by adjusting the angle of the rush. If vertical, it burned slowly and dimly. If horizontal, it burned more brightly and quickly. Many rushnips were made with an integrated candlestick so a person could use the same device for holding both rushlights and candles. Rushes make good nightlights because they disintegrate when they burn down, making them unlikely to start a fire. A burning rushlight is smokey and pungent. A typical rushlight will burn for about half an hour with a darkness penalty of -5 if held horizontal. If held vertically, the duration can be lengthened to over an hour but the darkness penalty is -6. It takes six pounds of common grease to dip a pound of rushes but even after dipping, the weight of each is negligible, since there are over 1,500 prepared and dipped rushes in a one-pound bundle. A pound of grease costs \$1. A pound of undipped rushes costs \$5, and a pound of prepared and dipped rushes costs \$30. If there are over 1,500 dipped rushes in a pound then each rushlight costs less than 2 cents ea.

Candles

The word comes from the latin *candere* ("to shine"). Candles burn in manner similar to lamps. When the candle wick is lit, the heat from the flame melts the tallow or wax, forming a tiny but constantly replenishing reservoir of fuel at the base of the wick. This fuel is carried up to the flame by capillary action. It is thought that candles were first used by the early dynasties of the Egyptian pharaohs. The earliest candles consisted of wicks made from woven papyrus fibers coated in pitch or beeswax. By the time of the Etruscans and Greeks, candles were common and tallow began to be used. In medieval Europe, a large, wealthy household could consume over a hundred pounds of wax and tallow in a single night. Lighting formed a considerable portion of the household budget and regulations were imposed to stipulate which tasks could be performed with wax candles, which with tallow, and which were not permitted candles at all. Surviving documents suggest that there were multiple sizes of candle. For example a *chandoile* was a small candle made from tallow while a *cierge* was a large candle made from wax. A *taper* is a long thin candle, while a *mortar* was a thick candle -- it didn't give much light, but it burned very slowly, making a handy night light (-6 darkness modifier).

Tallow (TL1): Tallow is animal fat that has been boiled and strained. Hard, solid fat, like suet, is better than slimy, greasy fat, like lard. Lard can be used

Open Flames and Drafts

Small, open flames, such as rushlights, candles and lamps, are easily blown out by drafts and so are best used indoors. But even indoors a flame can easily extinguish -- especially if it is moving. **Low-Tech** has a rule to handle this. Anyone carrying one of these light sources while moving faster than Move 2 (a brisk walk) must make a DX+4 roll every turn, at -2 per point of Move above 2. On a failure, the flame blows out at the end of the turn. (p. LT31)

Bayberry Wax

Sometimes called *bayberry tallow* or *myrtle wax*, it is obtained by boiling bayberries in water and scraping the fatty layer from the surface. This waxy substance is grey-green in colour and a little more brittle than beeswax. It burns with a clear white, almost smokeless flame and has a pleasant odor. Bayberry wax was laborious to produce -- about 40 lbs of bayberries yielded only 1 lb of wax.

but it must be hardened with something like alum or saltpetre and is more smokey and smelly than regular tallow. Tallow burns with a pungent, smokey flame but proper trimming ("snuffing") of the wick can reduce this significantly. It goes soft even in mild climates so a little beeswax (5-10%) was often added to render it firmer, cleaner, and less messy. A pound of tallow candles costs \$5, provides a darkness penalty of -5 and a burn time of 12 hours. These are the candles listed on p.B288.

Beeswax (TL1): This is made by bees in warm weather, and it produces very fine candles. It burns with a bright flame, does not smoke or sputter, and emits a fragrant odor. Beeswax burns longer than other types of candle and, if there is no draft, it will not drip. Beeswax candles were expensive and in high demand. Only aristocrats and churches could afford to burn them. Unscrupulous chandlers sometimes adulterated beeswax with tallow, although this practice was illegal. A pound of pure beeswax candles costs \$25, provides a darkness penalty of -4 and a burn time of 18 hours.

Other waxes: In Colonial America the grey-green berries of the bayberry bush were boiled to produce a wax that was sweet-smelling and burnt clean (see textbox, right). A pound of bayberry candles burn as brightly as beeswax (-4 darkness penalty) but have a shorter duration (14 hours). They cost \$18. Another fuel was a wax called *spermaceti* that was made by crystallising sperm whale oil. Like beeswax, it burnt odorless and cleanly. It was also harder than beeswax and tallow, and didn't soften or bend in hot climates. A pound of spermaceti candles burn as brightly as beeswax (-4 darkness penalty), have a duration of 16 hours, and cost \$20. In the 19th century, paraffin wax was made from distilled petroleum and was cheaper to produce than any other previously used wax. It also didn't spoil on the shelf like animal products. Paraffin has a very low melting point but mixing it with stearic acid (chemically reduced animal fat) made it suitable for candles. Unlike tallow, paraffin wax is not smokey or pungent when burnt, but has a shorter burn time. A pound of paraffin candles has a darkness penalty of -4, a burn time of 8 hours, and costs \$3.

A person who made candles was called a *chandler*. The most common type of candle was produced by dipping a wick into hot wax or tallow. It was allowed to cool, then dipped again and again until it reached the required thickness. The dipped candles were then hung up to whiten and harden. They could be passed through a cylinder or ring to shape them. Candles could also be cast in a mould. Tapers were produced by pouring molten wax down the wick. In towns, chandlers usually set up shop near to an abbatoir, from whence they purchased the necessary animal fat for rendering into tallow.

Candle Sticks: There are two main types of candlestick: the *pricket* and the *socket* type. Both were probably invented about the same time. The Romans are known to have used both kinds. Socket candlesticks had a cup to receive a candle of an appropriate diameter. Most sockets had a slot or hole to enable the easy removal of the candle stub. The pricket candlestick is a simple spike on which the candle is impaled. It was more versatile since it could hold candles of any diameter. Despite this, socket candlesticks became more common. The most common candlesticks were made from wood or clay, but more elaborate versions were made from marble or metal.

Lamps (TL1)

From the Greek, *lampas*, meaning "torch." All lamps rely on the same principal. The capillary action of the wick draws the liquid fuel along it to the end where the flame burns. As long as there is fuel in the reservoir, the flame

Grave Wax

"Grave wax" or "mortuary fat" is more accurately called *adipocere*. It is a crumbly white, waxy substance that accumulates on those parts of a corpse that contain fat -- mainly the cheeks, breasts, abdomen, and buttocks. It is the product of a chemical reaction in which fats react with water and hydrogen in the presence of bacterial enzymes. Adipocere is resistant to bacteria and can protect a corpse, slowing decomposition. It starts to form within a month after death and has been recorded on bodies that have been exhumed after several centuries. If a body is submerged in water, adipocere is most likely to form, but if unburied or exposed to insects it is unlikely to form.

In a roleplaying scenario a practitioner of dark magic might require candles made from grave wax. It would make a gruesome task if the PCs were sent on an errand to collect some. Alternatively, the magic user might keep a collection of corpses carefully stored in water so as to have a ready supply of this ingredient.

Bird Lamps

Some animals contain a great deal of fat. In the Shetlands and

continues to burn. The earliest extant lamps were hollowed out from soft stone such as soapstone, steatite, or limestone, and date back to paleolithic times. Limestone is a particularly good material for lamp bowls because it is a poor heat conductor. A lamp bowl made from limestone may be held in the hand without burning the user. Clay lamps were common in the Bronze Age and were used by many cultures. Later they were made of metal, glass, and porcelain. The simplest lamp consists of an open bowl filled with oil or fat (see *Fuels*, below) and a wick draped over the rim. Making a bowl with some sort of "spout" helps to keep the wick in place. Enclosing the bowl with a lid prevents the oil from spilling but a hole is needed in the lid for airflow. Adding a handle makes the lamp easier to carry. The addition of glazing prevented the oil from seeping into the earthenware. Putting a little water in the bottom of the lamp prevents it from overheating once the fuel runs out. In a simple lamp the wick lies at an angle. Because of this, only the upper side of the wick is burnt and unused oil drips off the bottom. A saucer is usually used to recover this for reuse. A vertical wick burns oil more efficiently but requires some sort of mechanism to hold it in place.

A crude (albeit smokey and smelly) lamp could be nothing more elaborate than a grease-filled skillet with a twisted rag stuck in it. The darkness penalty would be -5 and its burn time might be half an hour. A pint of oil weighs about 1 lb and costs \$2 (B288). A typical oil lamp comes in two sizes. A small one holds 0.5 oz of oil and burns for around 3 hours, so a pint of oil provides 32 refills (96 hours). Its darkness penalty is -5 and it weighs 0.5 lb. Cost is \$5. A large lamp holds one pint of oil and burns for around 12 hours with a darkness penalty of -4. It costs \$12 and weighs 2 lbs when full (1 lb when empty). A vertical wick increases duration of the lamp by 10% since less of the oil is wasted. Increase the cost of the lamp by 50%.

Oil lamp technology didn't change much until the 18th century. Several developments made small improvements in the efficiency of lamps. First, flat wicks were found to be more effective than round wicks. Second, a glass "chimney" was developed to protect the flame and prevent it from flickering while providing an updraft to help it burn more efficiently. The combination of flat wick and glass chimney increased brightness a little (not enough to affect darkness penalty) and improved the burn time by about 10%. In 1783-4 Swiss chemist Francois-Pierre Argand, developed a revolutionary wick design. Called the "Argand burner," it consisted of a hollow adjustable wick around a central draft tube. This greatly improved the airflow and thus increased the brightness of the flame while improving fuel efficiency. There was less smoke because the higher combustion temperature resulted in less unburnt particles. The Argand burner dramatically increased the brightness of an oil lamp but also increased the rate of fuel consumption.

Lanterns (TL2)

In its simplest form, a lantern is basically a lamp (or candle) with some sort of shield. This shield encloses the flame, protecting it from the elements and ensuring that it burns more evenly and efficiently. A lantern is more suitable for outdoor use than a lamp because it is unlikely to blow out. Indoors it is a safer option because the flame is not exposed. Because a lantern flame is enclosed, some sort of window is needed to emit light. Initially these windows were uncovered -- early Chinese and Japanese lanterns were of this type. Large ones were made of stone and used in gardens. Smaller ones were made of metal and

Hebrides one simple method of making a lamp was to kill a sea bird such as a Stormy Petrel or Great Awk and shove a wick, made of dried moss, down its gullet, and light it.

Acetylene Lamp (TL6)

Sometimes called a "carbide lamp" because it is fuelled by adding water to calcium carbide (CaC_2) pellets. The resulting chemical reaction generates acetylene gas which is burned as fuel. Introduced at the beginning of the 20th century, these lamps usually had two chambers. The top chamber was filled with water and small carbide pellets were added to the bottom one. Water dripped onto the pellets and acetylene gas was generated. This gas flowed to a nozzle which was lit to produce a brilliant yellow-white flame. Acetylene lamps were popular portable light sources used for many applications from bicycle and automobile headlights to the helmet lights worn by miners and cavers. A small, portable acetylene lamp weighs 0.5 lb with a burn time of around 12 hours. Darkness penalty is -3. Cost is \$25.

Bulls-eye Lantern (TL3)

This consists of a simple cylindrical lantern, usually made from sheet metal, with a fluted chimney in the top. Versions were developed to hold either candles or oil lamps, depending on the intended application. Some came with foldable wire handles and belt clips. A "bulls-eye" lens (see

hung outside to light doorways and shrines. A better solution was to use a translucent material such as parchment, animal skin, or paper to completely enclose the flame while still permitting light to escape. Mica, called "talc" by some period sources, was common because it was almost transparent and a poor heat conductor. But it was as fragile as glass, and glass was preferable, albeit more expensive, because it let more light through and was easier to shape. Horn was considered to be excellent for making lanterns; in fact, the word "lantern" is thought to come from the word *lanthorn*, which refers to animal horn suitable for lighting. When prepared properly, horn was virtually transparent and could be made into sheets as thin as paper but more supple and nearly unbreakable. Horn was susceptible to burning, though, and will blacken if placed too close to a flame. As horn ages, it becomes yellow and opaque, and less suitable for lanterns.

Reflectors and Lenses, below) was fitted to a round window in front to focus light into a beam. This lantern was sometimes called a "flash light" because of a metal shield inside the housing that could be moved in front of the window to obscure the light when necessary.

In many cities during the middle ages it was illegal to walk the streets after dark without a lantern; it was reasoned that if you were carrying a lantern, you were less likely to be up to no good. The first stationary lighting would have been seen in 16th century cities in Europe, when it became common practice to sit a lantern on first floor windowsills during winter. In India and the Middle East, street lighting was used much earlier; the earliest evidence comes from Mohenjo-Daro in India, dating to more than 5,000 years ago. In Europe it wasn't until the 17th century that public street lighting began to appear in the middle of the streets. At first they were simple pole-mounted lanterns containing oil lamps but various designs were tested in an effort to produce more light. In 1763, the *réverbères* made their appearance in Paris. These lanterns contained an oil lamp with several wicks. A parabolic reflector (see *Reflectors and Lenses*, below) above the flame protected it from the weather and directed the light downwards, while a less concave reflector closer to the flame, directed the light outwards. In time oil lamps gave way to gas lights.

Eventually, the glass shield around the flame was modified into a rounded chimney shape to help control the airflow. Glass was very fragile and so was not suitable for all applications. The advantage of putting a shutter or shield over the window was to enable the light to be "turned off" at will. When closed, no light could escape. There are many, many different types of lanterns. A simple medieval design consisted of a cylindrical metallic housing with a round or conical top and a vent hole. Some had a square window in front, but others multiple windows to shed light in all directions. They could have a ring attached to the top for hanging or a handle on the back for carrying (like a tankard). The window was usually covered with mica or horn and some holes were pierced in the housing for ventilation. They were mainly designed for candles but some held oil lamps. A variation of this design was the "bulls-eye lantern" (see textbox, right). A sturdy lantern could be made from a shaped sheet of metal that had been pierced with many holes to allow light to escape and for ventilation. Later models used wire mesh.

A lantern enables a light source to be used outdoors without blowing out. All lanterns cost \$20 and, with the exception of clear glass, increase the darkness penalty of a light source by -1. Lanterns burn more efficiently than an unshielded flame because of controlled airflow. A standard lantern (TL2) increases the burn time of a light source by 5%. More advanced designs including the previously mentioned glass chimney increases burn time by 10% but is double the cost of a standard lantern.

Wicks

Early wicks were made from rush-type plants. One variant was made from peeled scarpas and another was made from two rolled pieces of papyrus impregnated with sulphur. Other materials such as dried moss, grass, hemp, leaves, and bark strips (fluffy cedar bark is good) were also used. Wicks made from flax were very common and are even mentioned in the Bible (*Isaiah* xlii. 3). Old rags could be ripped up and twisted into wicks. Coarse cotton twine wicks became common in the 15th century. They burned brighter and without sputtering. Wicks need to be trimmed ("snuffed") regularly, otherwise the flame burns smokier and less efficiently as the wick lengthens. Thicker wicks put out more light but use much more fuel. It is possible to decrease the darkness penalty by 1 by increasing the thickness of the wick, but the fuel is consumed four times more quickly.

In the 18th century the Frenchman, Cambaceres, discovered that plaited cotton was more effective than twisted cotton. A wick made in this manner would curl over into the outer mantel of the flame where it was consumed -- effectively

trimming itself and producing less smoke. Later, flat wicks were found to be better than round ones. By 1890 the *incandecent mantle* had begun to replace wicks in some lamps. A mantle was basically a gauze that was impregnated with certain rare earth oxides. When first ignited by a gas flame, the gauze fabric burns away leaving the residual brittle oxides glowing brightly in the heat. Unlike a wick, the oxide mantle is not consumed and can be reused many times. Because the flame is optimised to only produce heat and not light, much less fuel is required.

Reflectors and Lenses

Reflector Plate (TL1): A highly polished piece of metal (brass and tin were commonly used) can increase the efficiency of a light source by deflecting light that would otherwise be wasted. Another benefit is that the reflector enables the user to retain his night vision since there is no light shining back in his eyes. A reflector plate decreases the darkness penalty of a light source by 1, but only in a semi-circle in front of the light; there is no illumination behind the reflector. Adding a reflector plate to a lamp or candlestick increases its cost by 20%.

Parabolic Reflector (TL2): This is more efficient than a simple reflector plate. Theoretically, if the light is placed in the focal point of the parabola, the rays of light are all reflected parallel to one another, increasing the amount of available light and focusing it into a beam. Moving the source toward the reflector will spread the light, while moving the source away from the reflector will cause the light rays to converge. A parabolic reflector decreases the darkness penalty of a light source by 1, and increases the range from 2 to 5 yards, but only in a direct line in front of the source. Many types of flashlight (see below) utilise a parabolic reflector. Adding a parabolic reflector to a light source increases its cost by 50%

Transmissive lens (TL3): Used in "bulls-eye" lanterns (see textbox, above) and some modern flashlights. A transmissive lens (e.g. a common magnifying glass) uses refraction to achieve a similar result as a parabolic reflector. Instead of light being reflected off a surface, light is bent at the interface between air and glass. A similar effect can be achieved by filling a spherical glass flask with water (sealed and mounted upside down). Lenses are not as efficient as reflectors but are generally more compact. A lens decreases the darkness penalty of a light source by 1 and increases the range from 2 yards to 4 yards, but only in a direct line in front of the source. Adding a lens increases the cost of a light source by 50%. It is possible to add both a lens and a reflector but the benefits are not cumulative. Adding a lens to a parabolic reflector increases the range from 5 yards to 6 yards.

Fuels

Pitch/Asphalt/Bitumen (TL0): Natural deposits of petroleum derivatives (e.g. tar pits) make good sources of fuel and require little work. Simply dip a prepared torch into the heated mixture and wait for it to soak in. When cool it is thick and viscous so it stays on the end of the torch. Often it contains sulphur contaminants, however, and so is very pungent when burnt. It pops and spits noisily.

Resin (TL0): Pine resin, or "pine pitch" is easy to collect because it oozes and solidifies on the outside of injured pine trees. It may also be collected by driving a hollow tube at an angle into the cambium layer of the tree and collecting the resin as it drips out the end of the tube. In hotter climates, resin from the turpentine tree may be used instead. A resin torch is made by dipping the end of a branch into hot resin and then allowing it to cool before repeating

Tight Beams vs. Diffused Light

One might think that a bright, focused beam of light is best because there will still be useful light in the area outside the main beam. However, the contrast from the centre of the bright beam to the dark area just outside is high, so it appears much darker to the eye. This makes it very difficult to see objects outside the beam and can be dangerous when walking through rough terrain. For general use a more dispersed light source is best, providing a broad transition zone that lowers contrast and enables the eye to move comfortably between. Ideally a person would want two light sources. A tight beam for spotting distant objects and a dispersed light for general use.

Oil Flasks (p.B411)

A common staple of roleplaying games is the use of thrown oil flasks that break and spill burning liquid over the target. There are really very few fuels capable of "flashing" like this. There are several petroleum products including naphtha, kerosene, and gasoline, but some are more volatile than others. The previously mentioned *camphene* is especially volatile.

multiple times -- similar to candle dipping. The problem with resin is that it is very smokey and will drip. If burning pitch drips onto flesh, it will do 1 point of damage every 2 seconds until it is removed (it can even burn through thick leather). Resin torches are very dangerous and are more likely to be set into wall brackets for fixed lighting rather than carried around.

Naptha is the only fuel available before TL5. Fuels based on animal fat or vegetable oil usually extinguish when spilled.

Animal Fat (TL0): The Inuit sometimes make light by burning a chunk of animal fat. This is simple and quick but inefficient, smelly, and smokey. It is better to use fat in a lamp but not all fats are suitable for this. The necessary property of a good lamp fat is that it melts quickly at low temperatures so the wick can absorb it at a faster rate than the wick consumes itself. Examples of suitable animal fats include seal, horse, and cattle. Rendered fat works much more efficiently than raw fat and virtually any animal fat can be rendered into oil (see *Animal Oil*, below).

Animal Oil (TL1): Tallow is made from the rendered fat of animals -- usually mammals. It is rendered by melting and cooking followed by straining to remove contaminants. This is then heated and strained again before being "washed" in boiling water. Some tallow melted at lower temperatures than others. Tallow that melted at relatively high temperatures was used for making candles. Tallow with a low melting point was used to fuel lamps. *Ghee* (clarified butter) was a common lamp fuel in India and South Asia. Whale oil was always a common fuel in the cold, northern parts of the world, and became widespread during the "hey day" of the whaling industry. Oil from the Sperm whale could be crystallised into a waxy substance suitable for candles (see *Candles*, above).

Vegetable Oil (TL1): There is no evidence to suggest that vegetable oils were ever used for lighting in the Paleolithic era -- only animal fat. It is likely that vegetable oils began to be used in the Neolithic era. By the Bronze Age vegetable oils -- olive oil especially -- was widely used for lighting. Another commonly used vegetable oil came from the rape seed (called *colza* or more recently, *canola*). Many nuts have a high oil content and some, such as walnuts, are suitable for lamp fuel. Other examples include castor oil, linseed oil and til oil. It takes around six pounds of the unprocessed food to make one pound of oil, though the best grades of oil are often kept for cooking and only the poorer grades are used as fuel.

Waxes (TL1): Already discussed (see *Candles*, above).

Naptha (TL3): A petroleum derivative. It is thought that the Chinese were the first to discover the benefits of petroleum. Evidence of primitive oil wells have been discovered dating to the 4th century AD. They were dug using iron bits attached to long bamboo shafts. By the 10th century Arab nations were exporting distilled petroleum (called *naptha*) throughout the Islamic world. It is likely that the Greeks made use of naptha as a constituent of their infamous Greek Fire. Marco Polo described passing through the Persian region of Baku on the Caspian Sea where distilled petroleum oil was used for lighting. Initially seep oil was collected at Baku but wells began to be dug at the end of the 16th century.

Camphene (TL5): The first attempt at a substitute for whale oil. Often simply called "burning fluid," it was made from a mixture of turpentine (distilled from wood), alcohol (distilled from grains) and camphor oil. It was a volatile, dangerous fuel that tended to spontaneously ignite when heated and even explode.

Paraffin/Kerosene (TL5): In 1850, the Scotsman, James Young patented a process of coal distillation that produced a lubricant he called "paraffin," and Dr. Abraham Gesner, a Canadian geologist, later developed a process to liquify paraffin for use as a fuel. He called it "kerosene." It was far less expensive to produce than earlier fuels and is still being used today.

Flashlights (TL6)

Many attempts in the late 19th and early 20th centuries were made to devise portable electric lamps. Difficulties stemmed from the fact that early batteries were heavy and carbon filament bulbs were inefficient. They were called "flashlights" because they did not produce a steady stream of light. The user had to flash the light on for a few seconds and then release the contact switch. It wasn't until more efficient batteries and coiled tungsten filament light bulbs (still used today) were developed that electric lights became truly portable. The name "flashlight" was retained, but by

World War I they were producing steady streams of light for minutes at a time. Over the next few decades, batteries and flashlights became more efficient. Flashlights vary greatly in size and function, but the suggestions of p. 288 of the **Basic Set** will be used for simplicity and consistency. A typical flashlight has a darkness modifier of -3 and emits a tight beam of light. It was meant for spot lighting rather than area lighting.

Early Flashlight (TL6): These models weigh 1 lb, have a burn time of around 5 hours, and a beam range of 5 yards. Cost \$10.

Modern Flashlight (TL7): Also weighs 1 lb but its burn time and beam range is doubled (10 hrs / 10 yards). Cost \$20. TL7 flashlights can also be more compact and can have additional features such as a waterproof housing and switch, coloured filters, prefocused bulbs, etc.

Miniature Flashlight (TL7): Has the same darkness penalty (-3) but only weighs 0.25 lbs and has a burn time of 1 hour. Its beam range is 5 yards. Cost \$10.

Handcranked Flashlight (TL7): Looks similar to a regular flashlight that fits snugly in the hand but a "dynamo" generator replaces the batteries and a springloaded trigger replaces the switch. The trigger is repeatedly depressed to charge the generator and produce light. It needs to be cranked every few seconds to produce continuous light and it is noisy. Weight is 0.5 lbs, darkness penalty is -3, and beam range is 5 yards. Cost \$15.

LED Flashlight (TL8): At TL8, white LEDs (light emitting diodes) begin to be used instead of incandescent filament bulbs. A reasonably-sized LED flashlight, with multiple LEDs and an appropriate reflector provides similar illumination to a regular flashlight (-3 darkness penalty) but uses much less power. A model weighing 0.25 lbs has a burn time of around 48 hours and a beam range of 5 yards. Cost \$30.

Induction Flashlight (TL8): A LED flashlight that uses Faraday's Principle of Induction instead of batteries. The light is shaken to charge a capacitor -- the movement causes a magnet to pass through a copper coil, generating electricity. It takes about 30 secs to charge the capacitor and the light lasts for about 5 mins. For continuous light, repeated shaking for 10-15 secs every 2-3 minutes is required. Weight is 0.5 lbs and beam range is 5 yards but it isn't as bright (darkness penalty -4). Cost \$30.

Chemical lighting (TL8). Glow Sticks (TL8): A cheap, portable source of light that needs no power source and generates no heat. The glow is caused by a reaction (called chemiluminescence) between two chemical solutions in a flexible plastic tube. Green is the most common colour. The two solutions are kept apart by a fragile glass cylinder. When the plastic casing is bent, the glass is broken and the two solutions mix together, generating light as they react. The reaction rate is controlled by the temperature. High temperatures result in a brighter glow but lower duration and vice versa in cold temperatures. At mild temperatures a 6" glowstick has an initial darkness penalty of -5 but it drops a further -1 for every 2 hours afterwards. Increasing the temperature (e.g. soaking in hot water) increases the modifier to -4 but only for 10 mins. Every 10 minute increment drops the penalty by -1. The weight of a glow stick is negligible and it costs around \$2.

Price List

Torches	TL	Weight	Cost	Mod.	Time	Notes
Simple Torch	0	1 lb	\$1	-4	30 mins	Goes out on a roll of 1
Splinter torch	1	1.5 lbs	\$10	-4	30 mins	Holds splinters of wood
Common Torch	1	1 lb	\$3	-3	1 hr	p.B288
Cresset	1	2 lbs	\$5	-3*	1 hr	Firebox on a pole

* Darkness penalty increases by -1 every 20 mins.

Candles	TL	Weight	Cost	Mod.	Time	Notes
Rushlight	1	neg.	\$0.02	-5	30 mins	
Rushnip	1	1 lb	\$10	N/A	N/A	Rushlight holder

Candles, paraffin	5	1 lb	\$3	-4	8 hrs	
Candles, tallow	1	1 lb	\$5	-5	12 hrs	p.B288
Candles, bayberry	1	1 lb	\$18	-4	14 hrs	
Candles, spermaceti	1	1 lb	\$20	-4	16 hrs	
Candles, beeswax	1	1 lb	\$25	-4	18 hrs	
Candlestick, iron	1	0.5 lb	\$10	N/A	N/A	Holds 1 candle
Candlestick, brass	1	0.5 lb	\$40	N/A	N/A	Holds 1 candle
Candlestick, silver	1	0.5 lb	\$250	N/A	N/A	Holds 1 candle

Lamps	TL	Weight	Cost	Mod.	Time	Notes
Oil lamp, small	0	0.5 lb	\$5	-5	3 hrs	
Oil lamp, large						
-- unmodified	0	2 lbs	\$12	-4	12 hrs	
-- vertical wick (vw)	1	2 lbs	\$18	-4	13 hrs	
-- vw & glass chimney	5	2 lbs	\$30	-4	15 hrs	
-- Argand & glass chimney	5	2 lbs	\$50	-3	8 hrs	
Acetylene lamp	6	0.5 lb	\$25	-3	12 hrs	

Notes

- Lamps and candles have an exposed flame and are not suitable for use outdoors. Exposed flames will constantly flicker and can blow out even in a slight draft.
- For outdoor use, lamps and candles need to be housed within a **lantern**.
- A standard lantern (TL2) increases burn time by 5% and costs \$20.
- A lantern with a glass chimney (TL5) increases burn time by 10% and costs double the price of a standard lantern.
- With the exception of clear glass, all lanterns increase darkness penalties by -1.

Flashlights	TL	Weight	Cost	Mod.	Time	Notes
Bulls-eye Lantern	3	2 lbs	\$30	-4*	5 yds	13 hrs
Early	6	1 lb	\$10	-3*	5 yds	5 hrs
Modern	7	1 lb	\$20	-3*	10 yds	10 hrs
Miniature	7	0.25 lbs	\$10	-3*	5 yds	1 hr
Handcranked	7	0.5 lbs	\$15	-3*	5 yds	N/A
LED	8	0.25 lbs	\$30	-3*	5 yds	24 hrs
Induction	8	0.5 lbs	\$30	-4*	5 yds	5 mins

* creates a beam of light out to the indicated range (spotlight). It does not light up an area.

Misc	TL	Weight	Cost	Mod.	Time	Notes
Glowstick	8	neg.	\$2	-5	2 hrs*	Break inner glass tube for light

* Darkness penalty increases by -1 every 2 hours.

The Will Against the World

A Background *In Nomine* Sorcerers

by Bevan Thomas

Sorcery is an intriguing and often overlooked element of *In Nomine*. In a world dominated by powerful angels and demons, sorcery gives certain humans a much-needed edge, allowing them to master powers out of reach of celestials, and even temporarily bind these powerful beings to their will. Sorcerers can make solid anti-heroic protagonists or enigmatic antagonists.

The original rules for sorcery can be found in *The Marches*, and updated rules are included in *The Corporeal Player's Guide*. This article lays out a possible history and central philosophy of sorcery, and analyzes various sorcerous archetypes and dark philosophies.

History of the Dark Art

Legends abound on who created sorcery. Many suggest that when Adam (or possibly Eve) ate from the Tree of Knowledge, that supreme act of egotism opened his mind to a power that had not existed before. Others have suggested that it was one of Adam's children, such as Seth or Cain, who first developed the Dark Art. One disturbing theory is that Lilith was the first sorcerer, and certainly the individualistic pride that most sorcerers possess suits the Demon Princess of Freedom's philosophy. Both Heaven and Hell officially deny this theory, and the idea of a Superior practicing sorcery is terrifying to many celestials.

No matter its origins, sorcery quickly spread over the world, for there will always be humans hungry for the power to satisfy their pride. It was practiced by Paleolithic tribal priests who wished to exert dominion over the spirits that they saw everywhere, it was practiced openly by the rulers of ancient kingdoms such as Egypt and Babylon, and it even found followers among the first practitioners of divine religions: the Zoroastrian magi and the Jewish mystics.

One of the most influential and powerful sorcerers was King Solomon the Wise who ruled Israel in the 10th century BC. Though dedicated to God, this famous Jewish king forced mighty ethereals and demons to do his bidding, and much of his city, particularly the Temple of Solomon, was built with the aid of demons, including Aram and Zeresh, two powerful servitors of the Game. So powerful was Solomon that few demons were willing to lift a hand against him, and even demon princes seemed disinclined to confront him directly. A dedicated scholar of the occult, Solomon codified many sorcerous practices and rituals, and his book *The Key of Solomon* is rumored to be the most complete grimoire ever written (though only fragments have been located over the last few millennia).

Even Solomon constantly struggled with the godless pride that sorcery fostered within him, however, and many other sorcerers found themselves dragged into damnation by their practices. Because of this, Heaven has always taken a hard stance on sorcery, with servitors of Dominic and Uriel particularly eager to hunt down practitioners of the Dark Art.

Despite the attempts of Heaven, sorcery still continued to thrive among those mortals willing to sacrifice all for power. One demon, an ambitious Balseraph of Factions named Leonard, rose to power during the degeneration of the Roman Empire, and was eventually awarded with the Word of Sorcery. Leonard developed various cabals dedicated to sorcery, power, and the satisfaction of baser desires, twisting pagan mystery cults into hellish orgies of blood and demonic exultation. As he preferred to appear as a black furred humanoid with the head of a billy-goat, Leonard would often be referred to simply as "The Black Man" or "The Horned Man."

The Dark Ages were a good time for sorcery. The fall of Rome destabilized the entire region, allowing sorcerers to gain power, and though many angels and their agents hunted practitioners of the Dark Art with zeal, the sorcerers were hidden in all walks of life, some were even members of the clergy. In order to survive and thrive in such a harsh

environment, there were many who were willing to ignore the edicts of God and Church and make use of these sorcerers. Many nobles retained a "court magician" to protect them from harm and destroy their enemies, and many villages and towns relied upon "cunning men" and "wise women" for love potions, healing balms, and other useful things. Even King Arthur, one of the greatest heroes of the time, relied upon a sorcerer for guidance, and though Merlin was ultimately a good man, he had his share of arrogance. Few were willing to move against known or suspected sorcerers, for they had much to fear from the Dark Art and dreaded it ever being used against them, and Leonard and his cabals flourished in this environment of fear. The stabilization of the Middle Ages helped the church to gain a firmer grip over the populace, but it did not eliminate all the cabals. Not even the destruction of Leonard in the year AD 730 by Khalid, angel of Faith, managed to end the Dark Art. It had taken root too deeply in the minds of humanity.

After Kronos was proclaimed the Demon Prince of Fate, he decided that sorcery needed to be brought under his control and a replacement found for Leonard, preferably someone less inclined to theatrics. Ultimately, it was his encounter with the white sorcerer Albertus Magnus that spurred him into action, and in the year 1250, Kronos awarded his servitor Hatiphas with the Word of Sorcery.

As Europe moved into the Renaissance, sorcerers began to infiltrate the realms of scholasticism more and more. They were monks, sages, and intellectuals who called themselves "doctors of natural philosophy" and "Hermetic scholars" as they took advantage of the developing universities and became accepted as scientists, thinkers, and even theologians. This was the high age of sorcery, where many of Europe's greatest thinkers were drawn to the Dark Art, individuals such as John Dee, Cornelius Agrippa, Michel de Nostradamus, Giordano Bruno, and the most enigmatic being of all: the Comte de Saint Germain.

The Comte wandered Europe from 1748 to 1786 (at which time he is believed to have died), working as a spy for both Frederick the Great of Prussia and Louis XV of France. He was a master of subterfuge and intrigue, famous for being both a charismatic courtier and a master of sorcery. Various legends developed around the Comte, particularly after his death. Some people believed him to be the greatest prophet since Jesus Christ, whereas others condemned him for a devil-worshipper, if not the Devil himself. Many people claimed to have seen the Comte decades after his supposed death, which caused some to believe that he had achieved immortality through his Art, whereas others have suggested that he never was human. Even the celestials do not know much about the elusive Comte de Saint Germain, and various theories have been suggested in both Heaven and Hell. Some believe that the Comte was probably a vessel of Hatiphas, where as others have suggested that he was probably some immortal human, such as Cain or the Wandering Jew. There's even a theory that the Comte was Eli, Archangel of Creation, though that is a theory that is not looked upon well by the orthodoxy of either Heaven or Hell.

After the Enlightenment, sorcerers went underground, taking advantage of the developing rationalism and disdain for supernatural belief. Many of them became respected as businessmen, philosophers, and "rational men," and rose to power while secretly continuing to delve into occult truths. Others chose to hide in plain sight, posing as stage magicians, con artists, and other dealers in fake magic, selling elixirs to the simple, and earning the scorn of the sophisticated. Many sorcerers were in a position to take advantage of the Industrial Revolution, learning to wield industrial power as well as the supernatural kind. They fed off the Essence of their laborers, sacrificing children and other renewable resources to power their profane rituals.

The publication of *The Magus* by Francis Barrett in 1801 sparked an "occult revival" among the upper classes of Europe, and magicians proliferated as bored dilettantes and artists tried their hands at astrology, alchemy, tarot, spirit summonings, and anything else that seemed like a counter-cultural lark. Hiding among these "hobbyists" were real sorcerers who used this pool of dabblers to recruit promising individuals. During this period, various demons of Factions and Fate did their part to make sorcerers the darlings of the press, theatrical, and stylish individuals who gained renown through their esoteric secrets, roguish charm, and avant-garde philosophies. When Nybbas became a Superior at the end of the century, he whole-heartedly assisted in this process, fascinated with the idea of making dark rituals the next "Big Thing." Secret societies such as the Theosophical Society and the Hermetic Order of the Golden Dawn were created, and various prominent artists and authors such as the poet William Butler Yeats, the painter Austin Spare, and the playwright George Bernard Shaw became fascinated by these orders and the occult truths that they promised.

However, sorcerers are nothing if not egocentric, and their alliances rarely last. At the beginning of the twentieth century, most of the cabals which the Victorian age had produced were beginning to crumble as members fell to petty jealousy or delusions of grandeur and abandoned their brethren to forge their own visions of creation. The most prominent of these soul-searches was the sorcerer Aleister Crowley, who had come under the sway of a renegade Shedite of Lust known as Aiwass. Aiwass first spoke to Crowley in 1904 through Crowley's wife, Rose Kelly, who was the first of Crowley's "scarlet women" (who would serve both as sexual partners and as mediums for the Shedite). Aiwass convinced Crowley to develop cabals that would attract members through sex and debauchery instead of dry scholasticism. This inspired many other sorcerers, who began embracing ancient pagan beliefs to justify their indulgences, and recruiting magicians with similar interests to develop a stable of Essence, recruits, and warm bodies for their rituals.

One of the most malevolent of these pagan cabals was the Thule Society, which developed during the thirties in Germany. This cabal engaged in blood sacrifices to Odin and the other Aesir ethereals and was dedicated to the glorification of "the Aryan race." This cabal influenced Hitler dramatically, and many of the prominent members of his government were agents of Thule. Many of the Allies were not unaware of the dark forces arrayed against them, and agents within the British government sought out those occults left over from the Occult Revival. It is said that Aleister Crowley himself furnished rituals for the Allies, and that many of the most pivotal battles of World War II were supernatural, fought with rituals and songs instead of guns and tanks.

After the War, many sorcerers stumbled into obscurity, coming down from the "high" of shaping countries that the conflicts had provided. Many turned to drugs as a substitute, or returned to their grimoires and blasphemous intellectualism. Nybbas continued to be interested in marketing sorcery for the masses, and this was supported by many sorcerers whose pride became channeled into vanity, and a desire for fame and fortune that the Media was more than willing to provide. This was one of the sparks that ignited the Neo-Pagan movement, and books on astrology, love spells, and other forms of magic proliferated in bookstores as various people became bombarded by the occult drenched in glimmer and glitz. Many sorcerers hid their practices behind this pop-culture veneer. This is the state that modern sorcery presents to the world: it has become sanitized, publicized, and repackaged by the Media, and many people have forgotten the dark heart which beats at its center, and that it is so often a path to damnation.

The Philosophy of Occult Egomania

All sorcerers, even the good ones, are full of pride. The exertion of will that is required to perform sorcery also forces the sorcerer on a permanent ego-trip, for it is the sorcerer choosing to master creation and bending the Symphony to his will. This willful focus usually causes sorcerers to become very self-absorbed, seeing themselves as the center of the universe and more important than anyone else. In turn, this solipsism colors the sorcerers' perception of reality.

A sorcerer's arrogance warps his perception of supernatural reality, and most of them perceive the regulated and resplendent Symphony as a discordant, clashing Cacophony. This discordant view of creation also results in the atheism that many sorcerers have, as to acknowledge an ordered universe, a supreme power, or cosmic good and evil would displace the sorcerer from his place as the dominant being of creation, and ultimately entail subservience to a higher power. God is anathema to most sorcerers' pride. This selfish delusion is one that both demons and ethereals find useful, and so they usually do not dissuade sorcerers from this perspective.

Even sorcerers who believe in God often take a somewhat controversial position on divinity. Most people, as well as most angels, have a somewhat passive stance in their relationship to God. They rely on divine guidance, they submit to God, and they trust the divine plan. The most dramatic example of this are prophets, people who have become receptacles of divine visions, and channel the divine in the way that they have virtually no control over. No sorcerer would tolerate such a surrender of the self, and theistic sorcerers focus on trying to come to God instead of waiting for God to come to them. They believe that God wants humanity to unravel the riddle of creation and bring themselves into His presence. That is why God is so ineffable: He is keeping Himself hidden until humanity proves its worth. These sorcerers often argue that the Garden of Eden was a test that Adam won when he chose knowledge over immortality, and that sorcery was given by God to humanity in order to help solve His riddle and prove their master of the reality that was created for them. This theory has proven the basis for many occult faiths, such as Gnosticism and

Hermetica, and is a theory that most angels find repellent.

There is a controversial rumor (particularly favored by some servitors of Judgment) that Eli favors sorcery and has done his best to keep the Dark Art in existence. It is true that part of Eli's philosophy, "the application of will against entropy," is disturbingly similar to the sorcerous desire to bend the Cacophony to one's personal will. Furthermore, it is known that Eli favors religions and philosophies that are developed by humans, and generally endorses humans creating and defining the world on their own terms. Though not even the most zealous servitor of Dominic has been able to uncover any proof about Eli's patronage of sorcery, it is true that the Archangel of Creation demonstrates less antipathy towards sorcery than other archangels do, and is the archangel who makes the most use of white sorcerers.

Specialized Beliefs

Most sorcerers specialize in a particular kind of sorcery, and their tradition helps to define their philosophy and their general outlook. Most sorcerers can be classified either as alchemists, exorcists, necromancers, or summoners.

There are two kinds of alchemy: practical alchemy and spiritual alchemy. Practical alchemy is the process of imbuing objects with the effects of Songs or sorcerous rituals, whereas spiritual alchemy is a philosophy that derives from practical alchemy and is based around the transmutation of the body and the spirit, and the eventual achievement of immortality. In order to achieve this transcendent goal, most alchemists tirelessly hunt for the ritual known as the Philosopher's Stone, which they believe will allow them to brew the Elixir of Life. Most celestials and some alchemists believe that if such a ritual exists, it will probably imbue a material object with the Corporeal Song of Entropy, restoring youth when drunk. Other alchemists claim that the Philosopher's Stone is a more substantial ritual, and some have even suggested that it will transform a human into a celestial. This theory is, of course, scorned by all true celestials, and most humans who are aware of the true workings of the supernatural, but then sorcerers are used to scorn.

Exorcists are often the most well balanced variety of sorcerer (if a sorcerer could ever be considered well balanced), and they are also the most likely to accept the Heavenly perspective as opposed to developing their own bizarre theories. They are only the only sorcerers who have an established position post within the Catholic Church and the Celestial hierarchy, and are often sent by their superiors (both mortal and the angelic) to deal with demonic problems that for various reasons angels cannot attend to (such as situations that require the Symphony to be relatively undisturbed). Still, exorcists remain sorcerers and thus still possess an unquenchable ego. In their situation, that arrogance is focused towards making sure that all spirits that the exorcist has decided are not welcome in his presence stay away. They often have exaggerated views of their importance to Heaven, something which many angels find frustrating in the extreme.

Necromancers are almost always fascinated by death, and often believe that as death lasts longer than life, it is more important and must be understood. This often results in necromancers engaging in death-worship, a practice that Saminga is only too willing to cater to. However, along with this death-worship is often the desire to cheat death, and under the dictates of the sorcerous ego, to master both life and death. Becoming a mummy is considered to be the perfect compromise by many necromancers, since it allows them to potentially exist forever, but also places them in a death-like state to best explore mortality first-hand.

Though all sorcerers are extremely arrogant, summoners are perhaps the most so. Alchemists and necromancers each seek their own form of immortality, and exorcists purge their environment of unwanted spiritual influences, but summoners seek to master the spiritual realms and bind the inhabitants to their will. Of all the kinds of sorcerers, summoners are the ones most likely to dedicate themselves to solving "the riddle of God," and there are rumors of an elusive summoning ritual that calls forth an aspect of God that can be directly communicated with. Most people dismiss this as silly superstition, but as with the alchemists who seek the Philosopher's Stone, the summoners ignore the scorn and continue with their research.

The Ex-Aliens

A New Faction For *Feng Shui*

by **Loki Carbis**

The Ex-Aliens are members of a race who first came to Earth in the year 1947. They were slimy, bug-eyed, many tentacled horrors not unlike those from a 1950's horror film. The Aliens, who possess limited shape-changing abilities, often shifted into human form, finding it more useful on a world that seemed designed for humans. They were bent on nothing more than conquest, intending to subjugate humanity as they had subjugated any number of other races. Their invasion used superior intellect and science (based on a technology very similar to that of the Architects' arcanowave theories) to defeat the puny weapons of humanity, and within seven years, the iron yoke of alien oppression was known across the entire planet. Organized resistance ended after the public execution of the Human Liberation Front's leader, Jack Kennedy, in 1963. Knowing nothing of Chi, the aliens had nonetheless succeeded in capturing almost every Chi site in the world. With this powering them, their rule was unassailable.

The aliens were only dethroned when they were caught out by the Critical Shift that swept the Four Monarchs to power. In the now-gone era of the Four Monarchs, they were serially reincarnated as demons using strange sorcery. But they retained their memories of how things had previously been. They knew that something had happened, but what exactly it was they were unsure. Many of them suffered from severe mental problems due to the effects of the Critical Shift, which diminished their effectiveness as a faction even further. What little power they retained was lost in the subsequent Critical Shift, which replaced the Monarchs with the Ascended -- and intensified the aliens' mental problems.

Now, in the world of the Ascended, they are strangers in a strange land, whose past is that of aliens left behind in the 1940s by an abortive invasion (the so-called "saucer-flap" of the late 40s) that was abandoned by their high command when it was discovered that the humans had atomic weapons -- although not without leaving a few stragglers behind. The stranded aliens have tried to blend into human society, and most of them work for a large corporation which is a front for their interests, using reverse-engineered alien high technology to create electrical goods, computer hardware and computer software for human markets. They are now wealthy -- but wealth in human terms means little to them, and although they control a few Feng Shui sites, it is only through coincidence.

These, the Ex-Aliens, also have to contend with the unfortunate fact that the most recent critical shift has somehow robbed them of most of their shape changing ability. They can now use their powers only to change from the form of one human to another. And most of them are, by now, howling mad.

The Ex-Aliens exist only in the Modern Juncture, as they have no access to the Netherworld. Were they to discover the Netherworld, they would pose a danger such as the world has never seen. Fortunately, there are as yet no Innerwalkers among their number, and the aliens understand nothing of the importance of Chi. They are slowly rebuilding their arcanowave technology and their influence in human society, hampered by the nature of the new reality. Although they know very little of the Secret War, the Ex-Aliens are particularly interested in the Architects and Jammers, since both these groups frequently employ arcanowave gear. The Ex-Aliens wish to learn more of this technology, and they are equally as pleased to capture arcanowave gear as live members of either of these groups, although they would prefer to capture both -- interrogation having proven a better source of information than reverse engineering.

To their earlier aims of conquest and subjugation the Ex-Aliens have added the following goals: to regain their true forms, and to find out what causes critical shifts. So far, they have met with limited success in these goals. They have not yet succeeded in undoing either of the critical shifts they have experienced, since they did not land on Earth until long afterwards, and thus have access to only one juncture. Although the aliens are not Innerwalkers (and thankfully, never have been), they are able to retain their memories of past lives, even as the world shifts around them. They still know who they are, despite two critical shifts and the attendant serial reincarnations. This should not be considered a shtick, as all Innerwalkers possess this ability, although it should be noted that many of the Ex-Aliens suffer from a

form of multiple personality disorder, with one personality for each of the realities they have lived in -- one a secretive spy, one an enigmatic demon, and one a sadistic slave driver.

The Ex-Aliens have two unique shticks that set them apart from the other factions of the Secret War. The first of these is that they are able to sense when someone they encounter is an Innerwalker. This shtick costs 0 Chi and 0 Shots to use -- it should more or less be considered to be constantly working at any time the Ex-Alien is conscious. This ability makes them a unique and unpredictable danger to all groups in the Secret War. The aliens have been known to capture and interrogate Innerwalkers, and although they have thus-far learned little of importance, the day cannot be too far off when they pose as serious a threat as any other group. Indeed, their lack of knowledge of the true stakes of the secret war makes them more dangerous in some ways, since they do not understand the nature of Chi, Chi sites or the Netherworld.

The second shtick is the shape changing mentioned above. This is identical to the Transformation shtick listed under Creature Powers in the ***Feng Shui*** rules, with the exception that only human forms can be assumed, and that the time spent is only 5 shots, not 9. The Ex-Alien must buy this shtick each time it assumes a new human form -- if it does not have enough experience to buy the shtick, it cannot transform.

What the other factions know about the Ex-Aliens:

- **The Jammers:** nothing
- **The Four Monarchs:** although each of the Monarchs would recall the demonic guise of the Ex-Aliens from their own rule, they are unaware that these "demons" still exist.
- **The Ascended:** Certain members of the Ascended are aware that there is a rival corporate conspiracy that has from time to time thwarted the plans of the Order of the Wheel or (less often) the Jade Wheel society. But they know little of it, and believe it to be merely a human conspiracy.
- **The Guiding Hand:** nothing
- **The Eaters of the Lotus:** the sorcerers have been trying to summon the demons who troubled the Four Monarchs for some time now, with no luck at all. But as they refine their scryings, sooner or later they will find the Ex-Aliens. Whether these two disparate factions could ever agree with each other enough to work together is another question.
- **The Architects of the New Flesh:** Some of the Buro's comptrollers have noticed that arcanowave technology that is left in the Modern juncture seems to be going missing at a higher than usual rate, although most of them suspect that is the Jammers who are responsible. Still, the matter will be investigated, sooner or later.
- **The Dragons:** nothing

Plot Hooks

- A regular NPC character (or a player character, if there's one who wants to do it) has been replaced by a shape changed alien, who intends to spy on the characters and try to learn more about the Netherworld. This can be done at any time in the campaign, although the best time to introduce this plot is just after the player characters have caused a minor Critical Shift of some sort. There are two ways to play this: quiet and loud. The quiet version is to slowly and subtly hint at the replacement until the players figure it out, and is best suited for campaigns that emphasize character. The loud version is to hit the players over the head with it, and is best suited for campaigns where action takes precedence.
- A mysterious organization has come into being, which very quickly rounds up any abominations who are left running around in the Modern day juncture. The first player characters are likely to know about it is when the Architects take it upon themselves to investigate this organization with extreme prejudice.

The Lost World of the Ex-Aliens

Two Critical Shifts ago, the Earth was quite a different place. The changed dates of the Junctures listed below reflect the actual position in time of each Juncture when these events occurred. Before the rise of the Four Monarchs engineered a critical shift, the world was not unlike the one we know today, and the Junctures looked like this:

13 through 62 AD: no change

1801 through 1843: no particular change, although scientific know-how advanced faster in this timeline. The Nikola Tesla and Thomas Edison of this world were each shrewder and more tolerant than their serial reincarnations have proved to be, and were able to work together easily. The combined genius of these two men created a high tech paradise straight out of Gernsbackian science fiction.

Modern (1947 through 1989): The alien invasion began in 1947, and concluded with their victory in 1954. From that year through to 1989, when the Four Monarchs' Critical Shift swept them to power, the aliens ruled the Earth.

2007 through 2049 (and beyond): A century later, humanity had proven to be more cunning and more adaptable (and much more quick-breeding) than its conquerors, and a revolution in 2037 saw them all hunted down and killed, after which humanity used its captured technology to reach the stars and hunt down the home planet of the aliens. After a generation of war, the two races finally made peace with each other, and went on to establish an inter-stellar civilisation.

Appendix Z

Gambling & Dice Games in *GURPS*

by S. E. Mortimer

"The dice of Zeus fall ever luckily."
--Sophocles

Introduction

Gaming is a common form of entertainment in taverns, and playing dice was the most popular form of gaming. Dice were small and portable, and can be played anywhere there is a small, flat surface. This article concentrates on some of the actual games that were played, but for information on dice themselves, see the ["A Brief History Of Dice"](#).

If the players wish to engage in gambling there are two ways a GM can model it. He may choose to use the character's Gambling skill. For example, a contest of skills is made between characters, or between the House and the character. The character bets his stake and rolls. The outcome of the skill rolls determines who wins and how much.

However, with dice games, the outcome is more random and the character's skill has little effect (though some slight of hand could be used if he wished to cheat; see below). For purely random outcomes, the GM and players might like to engage in some of the dice games that were actually played in historical taverns. After all, they are likely to have plenty of dice lying around. Playing one of the following games would add more flavour to the scenario than if simple abstract dice rolls were used to resolve the contest.

Cheating: If a character wins a Slight of Hand contest then he can successfully introduce "loaded" dice into the game. If the players don't have loaded dice then the GM can simulate them by allowing the player to roll the dice two or three times and accept the best result.

Luck: Some *GURPS* advantages directly affect the outcome of random chance. For example, players with the Luck advantage will be allowed to reroll a bad roll in a dice game just like any other situation.

A Selection of Dice Games

All the following games require six-sided dice. The number of dice required is listed next to the name of the game. Unless stated otherwise, at the beginning of each round, each player bets the same amount before the dice are cast. Each player's bet is called his *stake* or *ante*. In most games all the stakes are piled together in the middle -- called the *pot*. The winner of the round collects all of the money in the pot. The *Caster* is the person who currently has control of the dice during a game. The *House* is the establishment that is hosting the game.

High Rolls (1, 2, or 3 dice): The simplest of all dice games. All the players make a bet and take it in turns to roll the dice. The winner is the person who rolls the highest total. If two players roll the highest score then they roll again until a clear winner is determined.

As Many On One As On Two (3 dice): Each person rolls one die to see who goes first. Then each player rolls that die again. This is the target. The players then roll the other two dice. The winner is the first to get a total on those two dice that equals to the target die.

Pair and Ace (3 dice): Each person rolls one die to see who goes first. Players then take it in turns to roll the dice. The first to roll a pair on two dice and a "one" on the third die wins.

Riffa (3 dice): Each player rolls three dice until he gets a pair. Then the third die is rerolled. The highest total on all three dice wins.

Thirty-One (2 or 3 dice): The Caster rolls the dice and keeps a running total until he gets close to 31. If he goes over 31 he loses. The dice then pass to the next player who does the same thing. Whoever gets closest to 31 wins. If two players get the same total, the person who reached it with the fewest rolls wins. If the number of rolls is also the same then the pot carries over to next round.

Marlota (3 dice): The Caster rolls a target score for each player. Acceptable target numbers range from 7 to 14. Keep rolling until each player has a different target. Once this is done, the Caster keeps rolling until he gets one of the target numbers. If he gets his own target, he wins. If he gets an opponent's number, that person wins. The dice are then handed to the next player.

Salallamah (3 dice): For two players. The Caster rolls until he gets three of a kind. If the result is more than 10, he wins the pot and remains the Caster in the next round. If the total is less than 10, he loses the pot and passes the dice to the other player.

In and Inn (4 dice): Each player rolls the dice, resulting in three possible outcomes:

1. Four of a kind or two doubles is called an "In & an Inn"
2. A double (or a triple) is called an "Inn"
3. No doubles is called an "Out"

An *Out* is beaten by an *Inn*. An *Inn* is beaten by an *In & an Inn*. If everyone rolls the same, the pot stays in the middle. If two players tie, they roll again or split the pot between them.

Hazard (2 dice): The ancestor of the modern game, "craps." It is alleged that it was first played by Crusaders in the 12th century and was originally known as *Hazart* or *Asart*. There are several variations but this is the simplest variant:

The Caster rolls the dice after placing a bet against the House or another player. This first roll is called the "Main." If the Main is 7 or 11, the Caster wins. If the Main is not 7 or 11, a second roll is required -- called the "Chance." The Chance is rerolled until either it equals the Main, in which case the Caster wins, or a 7 or 11 is rolled, in which case the Caster loses. Other players can place bets wherever they like: on the number that comes up on the Main or the Chance, whether the Caster wins or loses, the value of the losing number, etc.

Ship, Captain, and Mate (5 dice): Frequently played in dockside taverns. Each player gets three throws. He has to get a 6 (ship), a 5 (captain), and a 4 (mate), in that order. That is, the Caster must throw the 6 before or at the same time as the 5, and the 5 before or at the same time as the 4. When each number is successfully thrown, that die is removed from play. The total of the two dice left over is his score and the other players have to beat that total. If the Caster makes his Ship, Captain, and Crew on his first or second throw, he can use the other throws to try to get a higher score on the remaining two dice.

Dungeons & Dragons for Dummies

Published by [Wiley Publishing, Inc.](#)

Written by Bill Slavicsek & Richard Baker

Edited by Christopher Morris

Art by Rich Tennant, Des Hanley, Hugh Jamieson, Rob Lazzaretti, Todd Lockwood, Steve Prescott, Wayne Reynolds, Arnie Swekel, Steve Tappin, Lars Grant West, & Sam Wood

432-page b&w softcover plus fold-out sample dungeon map; \$19.99

The . . . *for Dummies* series has, for years, been taking subjects thought too impenetrable by the general public and making them easily accessible with gentle and patient guidance. *Dungeons & Dragons*, the poster child for a hobby thought by most to be too weird, complex, or daunting to be entered lightly, gets the business in *Dungeons & Dragons for Dummies*.

Quoth Drew Carey, "It's almost a good idea."

It's certainly a terrific way to market the brand, straddling as it does the hobby and mass markets with such a format. Indeed, the first 40 pages sound like a marketing tool for Wizards of the Coast, and most of the references, being other books from the Coast, cement this view. Occasionally a predictable mention of Tolkien, yes, topping a list of "novels to inspire" offered as an afterthought in the traditional Part of Tens. But 99.99% of the manual is begat of Wizards knowing on which side its bread is buttered.

And it's written by two company notables: Bill Slavicsek and Richard Baker, both of whom have had their hands in the official creative process more than once. These two gentlemen take us step by step through creating characters, learning which end of the sword goes where, and stepping up to the plate as DM when the call is heard. It should be mentioned that there's very little here about actual roleplaying. This isn't meant as a criticism; buyers should simply be aware that when they say *Dungeons & Dragons*, they mean this volume is all about decoding the *d20 System*. There are a few crumbs about how to stay in character and do the play-acting bit, but these are heavily outweighed by understanding what goes into the paper and pencil end of things.

What *is* meant as a criticism is: Very little in this book isn't in the three core *Dungeons & Dragons* manuals (or any other self-respecting RPG book, come to that). It's not culled verbatim, but there's not much here that demystifies things for people, at least no better than the product itself. In most cases when they publish a *Dummies* book, it's assumed that you have something on the subject -- if you're learning Visual Basic, you have a copy of the program at hand. So it is with *Dungeons & Dragons*; you ought to have those three works on your desk. But since this book is supposed to be a supplement to those, it should somehow work as a complement. Repeating the same material a different way isn't going to help anyone. This doesn't mean it isn't presented simply, but if this is the simplest explanation then the core books are themselves not far from "Dummies" manuals.

The irony here is that the book will be most immediately useful to seasoned players. There's some A-1 advice here about figuring out the best combinations of facts and figures. Should you attack harder or more often? Should you

focus on offense or defense? That stuff, it's gold. For ease of use at any level of play, there are trees of feats and skills so you can plan for advancement in later levels, or see the fastest way to get that boss new feat or prestige class you want. This takes a lot of the headaches out of character creation -- if you're playing one of four classes.

Since it's all rudimentary stuff, they focus on the fighter, rogue, cleric, and sorcerer. Similar narrow focus is placed on racial choices. Other classes (and races, and . . .) aren't ignored, and a lot of the material here has "If you're going to use another class" tips, but they felt it necessary not to hammer on all the classes, which looks to have been the right choice.

As it's a . . . *for Dummies* book, they've put the brakes on a lot of the artwork. Most of it is suggestive bits of scenery or creature pictures harvested from various ***Dungeons & Dragons*** products. Rich Tennant, long a fixture of this line, provides more of his amusing Fifth Wave strips as chapter bumpers, and he shows he can keep up the laughs no matter the geeky subject matter.

The work is light in tone, in accordance with precedent for these references, with a few bits of humor thrown in for good measure. It's conversational, but also has a number of typos and oversights. Not that the book brims with them, but sometimes it does get in the way -- rules about your character beginning to die at 1 hit point vs. -1 hit point, that kind of thing is exactly the wrong spot to confuse the fresh faces in the crowd.

Perhaps the book (and its problem) is best summed up by the introduction: "The core rulebooks aren't written for novices." This neck-snapping admission should come as a surprise to many, since editions 3 and 3.5 were out several years before (the most recent iteration of) ***Dungeons & Dragons Basic***, something else they peddle in these pages. Just when do we have enough material to start a game?

Certainly if you're going to write a book, you'll want your own company's name on it; that's just good business. But it's the hobby itself that is steeped in confusion, and new players have to cross that hurdle before anything else. They need the process and 30 years worth of reputation decoded for them, not just this system in particular. You can't claim the book isn't "dumbed down" enough for newbies, but ***Dungeons & Dragons for Dummies*** seems to be more interested in its own press and marketing than actually clearing anything up for those who aren't already fans.

Pyramid Review

Battleball

[Battleball/](#)

Published by [Milton Bradley/Hasbro](#)

Two-player boardgame; \$20.00

Battleball is a mass-market game that is billed as the future of football, with cybernetic players making carnage out of each other as they wrestle for the ball. It's a theme you've probably seen before, and it also has the trappings of a gamer's game: polyhedral dice in an assortment of sizes, a staggered-square game board that has the connection properties of a hex map, special powers for each of the teams, and sculpted miniatures. There are 22 plastic miniatures in all, and they look pretty nice -- comparable to **HeroClix** in quality and detail.

Each team consists of 11 players, each with a corresponding die type. The three running backs are played using the red d20s that come with the game. This is nicely represented by a red ring around the base of each running back figure. We found ourselves not thinking of them as "running backs" at all, but as "red" or "20" players. Two green-ringed players use the green d12s, two blue ones use d10s, two black ones use d8s, and two yellow ones use d6s. One of the yellow players on each team takes up two spaces on the map; you roll 2d6 for these big guys and pick between the two dice.

The game starts out with each team behind their 20 yard line and with the ball in the center of the field. (The future of football does not allow for subtleties like kick-offs.) Players then alternate turns: Moving one of their players and then either resolving a tackle or handing off the ball.

To move a player, you roll the player's die type and move them up to the number of spaces rolled. He may not move through other figures or through carnage tokens. If he passes through a square containing a ball, he can pick it up. If he enters a square adjacent to an opposing player, he must stop.

When you have a player adjacent to an opposing player, you must tackle. You and your opponent each roll a die corresponding to your respective players. The player with the higher roll is removed from the map and replaced with a carnage token. If the winning player rolls a 1, then the loser is removed for the entire game; otherwise, he returns after half-time. Both players are removed if the rolls tie, so a tackle *always* results in at least one player being removed from the field.

If there are no players in position to tackle, if you have possession of the ball, and if you have another player adjacent to the ball carrier, then you may attempt a handoff. You roll the dice for each player. If they match, the ball is fumbled. Otherwise, the handoff is successful.

An optional rule allows for passing. To pass, you roll the die for the would-be receiver and add the result of a football-shaped d6. The total must equal or exceed the intended range of the pass.

Play continues until one team carries the ball into the opposing end zone. The first team to score two points wins. (The periods are called the first half, second half, and overtime, but these names are just windowdressing.)

There are further details, like the special powers available to each team, but the core game mechanics are both the strength and weakness of **Battleball**. It's clever, easy to learn, plays quickly, and makes good use of assorted dice. Associating a d20 with the running back at once makes him a good runner, a poor tackler, and good at hand offs. Associating smaller dice with other players is sufficient to make them slower, tougher, and less nimble.

Despite the gear to be a gamer's game, however, **Battleball** never rises much beyond its ages-8-and-up apocalyptic-football premise.

The game requires a small amount of strategy. If the other team has possession of the ball, then it's essential to spread out your players so as to block possible paths to the goal. If you leave more than two spaces between your players, the other team's running back can sprint through the opening to score.

Randomness in the game tends to make further strategy irrelevant. The problem is in the core game mechanic itself. Other than the heavy tackle, who rolls two dice and picks one, each player is associated with a uniform probability distribution. Running backs are supposed to be fast, but one quarter of the time they'll move no more than 5 spaces. Upset tackles with the weaker player smearing the stronger seem all too common. With a different game mechanic, the randomness of flat probability distributions might be mitigated by making an outcome depend on a series of rolls. But in **Battleball**, every tackle is a do-or-die affair. The Law of Large Numbers never comes into play.

Battleball is a raucous brawl in which your choices may not have much effect on the outcome of the game. This can be really frustrating, but it depends in part on your frame of mind and on your expectations. (I found the experience rather like that of playing **Monkey, Ninja, Pirate, Robot.**)

This game comes with a lot of interesting parts and lets you roll dice to turn fields of players into fiery carnage. If this is enough for you, it's a fun time and a good buy. If you are irritated by games that invite you to make choices but scoff at your attempts to make them strategically, however, avoid **Battleball**.

Pyramid Pick

Battlestations

Published by [Gorilla Games](#)

Designed by Jeff Siadek & Jason Siadek

Cover by A.D. Hamilton with Patrick Morgan

Illustrated by A.D. Hamilton

Module Art by Todd Boyce

48 double sided, full color 3½-inch square Starship Modules, eight full color 8½ by 11-inch Hex Maps, 160 full color die cut Counters, 32 full color die cut Hex Markers, ten glass bead Markers, 128 full color Character stand-ups, six six-sided dice, & 112-page perfect bound black & white rulebook; \$49.95

In most space combat games, players control one or more ships, maneuvering them around to either obtain particular objectives or shoot down other ships. What gets left out of such games is the crew of such vessels, except in an abstract fashion. Other games do consider the role of the crew, each player controlling the actions of a single crewman in more detail. FASA's *Star Trek III Starship Combat Roleplaying Game* is such an exception, with players as bridge officers, taking orders from the captain, allocating power, operating sensors, weapons, deflector shields, the ship's helm, and so on. Of course, this just has the player characters at the appropriate bridge station, but what if in the midst of a game, characters could leave their stations and run through the ship, perhaps to operate another station, such as the teleport system instead of the guns, or to repel boarders? All the while the ship is zooming through space?

This is exactly what **Battlestations** from Gorilla Games lets you do. It is a board game with strong roleplaying elements, in which players create members of the U.R.E.F. (or Universal Republic Expeditionary Force) to crew standard-sized and designed vessels sent out to perform important missions. The strong roleplaying element means that, unlike most board games, **Battlestations** requires one player to be the referee. It is designed for two to eight players aged 12 and up, and is best played with at four players plus the referee.

Weighing in at 4 lbs., **Battlestations** comes richly appointed. Besides the 112-page rulebook or *Universal Republic Expeditionary Force Training Manual*, the box contains 48 Starship Modules; eight hex maps with either a reference Play Aid or a Ship Control Card on the reverse side; and oodles of counters and markers. *All* of this comes in thick die cut cardboard and in vibrant full color. If any of the components do not quite match this high quality set by the rest, it is the character stand-ups, which are done on a lighter card stock and not quite as durable or as eye-catching. The rulebook is very well-written, explaining everything in an easy to understand fashion. Its fun illustrations serve to give **Battlestations** a very cartoon, space opera-like, and frantic feel. The index in particular, is thorough, excellent, and intelligently doubles as a glossary.

The Starship Modules are the game's most eye-catching component. Each is 3½-inch square and marked with a five-by-five square grid. They come in 10 types: Cannon, Engine, Helm, Hull Stabilizer, Hyperdrive, Life Support, Missile Bay, Science Bay, Teleporter, and Tractor beam, each performing one or more functions. Some Modules are marked with a colored star, indicating that the equipment's function needs to have a character there to operate it in battle,

although a bot or robotized mechanical assistant can be assigned to a station when no live crew is available. In other words, these are the "battlestations" of the game's title. The star colors match those of the character professions.

Starship design is standardized, each ship type requiring a particular set of Modules. Thus a Scout Ship is built with one Cannon, Helm, Hyperdrive, Life Support, Missile Bay, and three Engine Modules, while all U.R.E.F. ships are required to carry a Science Bay. The layout of the Modules varies from race to another, as does the single advantage that each race builds into its ships. For example, all Human ships have improved Helm use, while Silicoid vessels are constructed with an inherent Hull Stabilizer. The rulebook contains the designs for five different starships, from the humble scout to the brawny dreadnought, plus an outpost, a starbase, a starlab, a freighter, and two small craft designs, a shuttle and a skiff.

Characters are defined by their race, profession, and skills. Besides Humans, the other races are the ergovoric (or energy eating) tumbleweed-like Canosians, the clay-like Silicoids; the tentacular Tentacs; the many-handed jack-like floating Xeloxians; and the three-armed three-legged furry cockroach-like Zoallans. A character's key attributes are his Hands (what he can carry), Move, Target# (how hard he is to hit), Hit points, and Luck, which is spent to re-roll dice. Skills are limited to five broad types: Athletics, Combat, Engineering, Piloting, and Science. A player assigns between zero and four points to these skills, with the highest skill being his character's Profession, which also determines both his role and station aboard ship. Thus the Marine with a high Combat skill mans the Cannon and Missile Bay, and carries out Ship's Security and Boarding Actions on enemy vessels, while the Scientist runs the Science Bay and Teleporter, while also computes FTL astrogation, upgrades equipment, and dispenses medical attention. All characters must have a minimum Athletics skill of one, and this skill cannot be a character's profession. In addition every character has two special abilities, one for their race, and the second selected from a list of 60. Optional rules allow for the use of psionics.

Mechanically, **Battlestations** is very simple. A Player rolls two dice and adds the appropriate skill to beat a GM determined target number. Luck, a character's Profession, and some special abilities allow re-rolls. Personal combat is kept simple and deadly, with the average starting Human probably only able to take a couple of knife wounds or blaster shots before dying (both weapons do 1d6 damage, and the Human's Hit Points will not be more than nine). Thankfully, the U.R.E.F. values the crew highly and keeps a back-up clone prepared just in case of a character's death.

Battlestations is played first in Campaign turns, comprised of mission set-up, carrying it out, and its aftermath. The players' ship, initially a Scout, warps in and the crew conducts any planned upgrades to personnel equipment, ship's bots, or Modules. After a mission, characters can claim the spoils of war (including prize money from captured vessels), revive dead crew, repair the ship, and requisition another Ship Module. These can be swapped with existing Modules to match the needs of mission, and once the crew has three or more spare Modules, they can upgrade to a bigger ship.

A mission itself is played out in rounds divided into six phases, further comprised of 10 steps. A round starts out with Power Generation, the Engineer allocating power from the Engine (a point per Engine Module) to Helm, then Guns, Shields, and again to Helm if the ship has more than three Engine Modules. The ten steps cover ship and missile movement, collisions, player and enemy actions, and so on. During this time, a Marine will fire the ship's Cannon or launch from the Missile Bay, either Warhead, Science Probe, or Boarding Missile. A Scientist will maintain the shields from the Science Bay or conduct a Scan to obtain Targeting Lock or ECM. The Teleporter can deliver boarding parties or bombs onto enemy ships. The Tractor beam can be used to grab objects in space, including enemy missiles. The Pilot mans the helm, maneuvering the ship to best advantage while trying to keep it going out of control.

Most Modules can be used once per round and expend power in doing so. Everything changes when a ship is damaged or boarded, with characters rushing to repel the interlopers or repair the damage. Module status is either functioning, damaged and non-functioning, or slagged and cannot be repaired until the ship returns to space dock. Shields reduce damage, but any damage will hurt the hull and increase the possibility of a ship exploding. Missiles are very deadly in this regard.

Successfully completing a mission gains a character Experience that be spent to improve skills, Credits to buy equipment, and Prestige to improve his Rank. Improving the latter also increases a character's Luck, Hit Points, and

grants him another special ability. It also gives him a better title.

The rulebook includes over two dozen missions, Boot Camp being a good start for a campaign. Each is simply sketched out, including strategy notes and suggestions for variants. They include kidnapping a dignitary, assaulting a star lab, and locating a lost ship. All assume that characters are U.R.E.F. members, enforcing the Universal Republic Senate's will, keeping the "peace," and admitting new cultures -- whether they want it or not. The background is described in a couple of pages, including a time line, which suggests that the Universal republic is on the verge of civil war over continued Human cultural and political imperialism.

Battlestations is definitely space opera; it's sort of *Classic Traveller* meets *Star Trek* by way of *Star Frontiers*, though without the latter's cumbersome nature. Indeed, **Battlestations** is slick and simple, with plenty of option for players to adjust their ships and equipment, while combat is perilous, but offset by a high luck factor. The box has enough missions to keep a campaign going for some time, plus guidelines are given for the GM to create more, and the publisher has promised expansions. Above all, playing **Battlestations** is frantic and fun, made all the easier by the clear, simple, and well explained design and the fine components.

The Enduring Legend of Shallow Neck

Okay; how many of you are looking to incorporate some Deep Throat action into your RPGs? (Wow . . . I never thought I'd have an even remotely acceptable reason for using a sentence like that in this column. It must be Christmas.)

For those of you who are in the dark, "Deep Throat" was the name for the anonymous source used by *Washington Post* reporters Bob Woodward and Carl Bernstein for their investigation of the Watergate break-in . . . an investigation that eventually led to the resignation of President Nixon. Just this week, the identity of this informant has been revealed to be W. Mark Felt, the number two person in charge of the FBI at the time. I'm sure this revelation would've had more impact on me if I actually cared beyond an, "Oh, neat; a three-decade mystery has been revealed." But given how guessing the identity of this informant was a Washington parlor game for decades, I'm guessing it's pretty significant in many circles.

(For those of you interested in more info, check out the [Wikipedia](#) article on the subject. And for our international readers, I apologize for the America-centric column.)

Anyway, the notion of Deep Throat -- either an extension of the actual mysterious person or a parody with similar methodologies -- has popped up in so many forms of popular culture that it's always bordered on the cliché. But it's such a cool idea that it's hard to overexpose it. And, as many things do, the revelation of Deep Throat got me to thinking about the possibilities for using such a mystery in gaming.

Now, I've written in the past about various other means of working mysteries into games (although I confess to being too lazy right now to sift through the 18 jillion search results from when I've used the word "mystery" in my column). And, to better serve the corporate masters whose electrodes I have implanted dangerously close to my cerebellum, I note that the recently released [GURPS Mysteries](#) has plenty of tricks and tips for weaseling in such a puzzle into a campaign. So I thought I'd spend this column deconstructing the Deep Throat idea, and see what we can learn for our own games.

Deep Throat was a known secret. Let's start with the obvious: Deep Throat was fascinating because 1) no one knew who it was, but 2) they knew it existed. As a counterexample, if Woodward and Bernstein had merely published stories and no one knew there was this mysterious source, the revelation of that source would've been nothing terribly special. Thus, in an RPG, it's wise to make a mystery that people *know* is a mystery . . . for example, if a king confessed that he had an illegitimate child within his court, but would offer no other details.

Deep Throat was a secret that people actually knew the answer to. Unlike, say, the modern-day mystery (or non-mystery) of who wrote Shakespeare's plays where we have absolutely no way of being certain today, someone knew the real identity of Deep Throat. In fact, at least *three* people knew the identity: two reporters and the source itself. The existence of people who knew the answer -- people that others could interact with -- changes the very nature of the mystery. (Remember the truism about ["Whenever two people interact, each wants something"](#)? The answer to half that equation is obvious when you're talking to someone who knows a big secret.)

Deep Throat was going to be revealed. Unlike many mysteries where the answer may or may not ever be known, part of the Deep Throat mystique stemmed from the fact that everyone knew the answer would be revealed, and under what circumstances the answer would be revealed (which was, traditionally, the death of the Deep Throat). And, since there were at least two other people who knew the answer, the odds were remarkably good that the identity would, in fact, be revealed someday. In this way, Deep Throat existed as a real-world mystery movie; you know in such a film that the answers will be laid out by the closing credits . . . but the fun comes in trying to figure out the solution *before* then.

It might be interesting to toy with the notion of time in campaigns with long-lived races; what if, in an urban magic game, we knew that the true author of Shakespeare's plays would be revealed by elves who knew him 500 years after his death?

Deep Throat was important. Unlike many mysteries -- such as what Thomas Pynchon looks like -- the underlying reason why the Deep Throat mystery existed was consequential, and had long-term repercussions. If you're going to try inserting a long-term secret like this, make sure the underlying story behind that secret is significant (if not the actual repercussions of the revelation itself).

Deep Throat had to be someone you'd heard of. This is one of the interesting ones. Unlike, say, the identity of the Unibomber (which, at best, can elicit a shrug and a sigh of relief from those who don't know him), it was virtually certain that the identity of Deep Throat was someone that people had heard of . . . at least, those who keep up with such mysteries.

Now, many people's wishful thinking took this notion too far; as the Wikipedia article I linked to earlier says, a poll indicated that a majority of people thought William Rehnquist was the source, while 2% had Deep Throat pegged as Pope John Paul II. (Frankly, the thought of a chain-smoking Pope meeting with reporters in a parking garage and shiftily handing over a file folder containing information on Nixon fills me with a warm glee.)

So if you're going to craft such a mystery in your own game, make sure that the suspect -- when revealed -- is someone the players will have heard of (even if briefly). And, to keep the Deep Throat conspiracy as true as possible, make sure the PCs interact with dozens or even hundreds of possible candidates.

Although there's a lot of other fertile ground for incorporating such a mystery into the game, I think I've rattled enough about the subject already. Give it a thought, give it a try, and have fun. If you pay heed to some of this advice, your players won't find the idea of a Deep Throat hard to swallow.

Icosahedron Adventures

The Alchemist's Shoppe More Mystic Materials For *D20 System* Games

by Owen K.C. Stephens

Wedged between the simply well-crafted and the genuinely fantastic in the *d20 System* equipment lists are the unusual items of alchemy. Ranging from the merely convenient sunrod and tindertwig to the offensive tanglefoot bag and thunderstone, alchemical items aren't strictly speaking magical (they have no magical aura), but they aren't purely mundane either. They fall in a gray zone of things that don't belong in a purely realistic campaign, but can be appropriate in low-magic fantasy, pulp adventure, or over-the-top action games. They are the province of the diamonds that create lasers with nothing more than sunlight, dragons that fly through sheer wing-power despite their weight/lift ratio, and psychic detectives.

Alchemical items all follow some group rules. If they grant a bonus, it's an alchemical bonus. This allows them to work hand in hand with magic items (which tend to grant enhancement bonuses) and mundane gear (which grant equipment or circumstance bonuses), but prevents them from working together (there's no point in drinking five vials of antitoxin at once). All alchemical items are created using the Craft (alchemy) skill, and only spellcasters may do so (despite the fact alchemical items have no specific spell prerequisites). The craft DC for an alchemical item ranges from high (20) to higher-than-masterwork (25).

It's fair to assume any character with Craft (alchemy) and an alchemist's lab can identify alchemical materials. The base time for this is 10 minutes, and the character can take 10 or take 20 (though obviously taking 20 requires considerably more time). The DC to correctly identify an item is 5 less than the DC to make it (thus identifying a tindertwig is DC 5, while identifying a tanglefoot bag is DC 20).

Additional alchemical items can add utility to a game with few magic items, or flavor to a region far from the PCs' homes. They can also be used to allow alchemists PCs and NPCs a wider range of options for their Craft skill, or to act as mid-range treasure (more useful than purely mundane items, but not as powerful as potions, scrolls, and elixirs). They can even be the province of a band of assassins or similar group that seeks to avoid detection (since, unlike magic items, alchemical materials can't be detected with a simple spell).

Alchemical Item	Cost	Weight	Craft DC
Alchemical Catalyst			
Standard	100 gp	1 lb.	25
Greater	250 gp	1 lb.	25
Sovereign	500 gp	1 lb.	25
Benecord	10 gp	–	20
Bloodrock Whetstone	1,000 gp	1 lb.	25
Boomhammer	462 gp	5 lb.	20 (weaponsmith)
Caltrips	75 gp	8 lb.	25
Darklight Candle	200 gp	–	25
Firevine Wine	100 gp	1 lb.	20
Flamerod	200 gp.	10 lb.	25
Flashpot	40 gp	1 lb.	20
Heating Pot	25 gp	1 lb.	20
Itching Powder	50 gp	3 lb.	25
Medicinals			
Brown Salve	20 gp	1/2 lb.	25
Eyebright	50 gp	1/2 lb.	25

Fevertea	45 gp.	1/2 lb.	20
Health Soup	30 gp	2 lb.	20
Red Salve	35 gp	1/2 lb.	25
White Salve	50 gp	1/2 lb.	25
Woundbind	15 gp	–	20
Peaceweed	50 gp	1/4 lb.	20
Preserved leach	35 gp.	1/2 lb.	25
Shadow oil	50 gp.	1 lb.	20
Slowtinder	5 gp	–	25
Smoke Bomb	100 gp	5 lb.	20
Travel-Loaf (per day)	5 gp	1/4 lb	20
Verminbane Pot	20 gp.	5 lb.	25
Witchrod	100 gp	1 lb.	25
Wrestler's Grease	50 gp	1 lb.	25

Alchemical Catalyst

Alchemical catalyst is a thin liquid that can be mixed with or injected into any other alchemical material that creates an effect forcing a target to make a saving throw. The DC of this save is increased. The increase is a +2 alchemical bonus for a standard catalyst, a +4 alchemical bonus for a greater catalyst, and a +6 alchemical bonus for a sovereign catalyst.

Benecord

Benecord is a short length of cured leather that has been coated with alchemical compounds that react to healing potions, but nothing else. A single benecord can be dampened with the liquid from one potion. If the potion heals hp of damage, and does nothing else, the benecord turns blue. If the potion does anything else, the cord does nothing. A benecord can be used only once.

Bloodrock Whetstone

This is a fragile, chalk-like blood-red stone pressed from ground rocks, ash, and glass. A slashing or piercing weapon sharpened for one hour on a bloodrock whetstone has its threat range increased by one (after all other increases, including those gained from being keen or the Improved Critical feat) for one combat. A bloodrock whetstone can be used five times before it crumbles into useless dust.

Boomhammer

A boomhammer isn't strictly speaking an alchemical item, but it is designed to work with them. It is a masterwork warhammer with a notch in the striking head. The notch can be fit with any one of a number of alchemical materials (acid flask, alchemists fire, tanglefoot bag, thunderstone, flashpot, itching powder, or smoke bomb, as well as holy water). On a successful hit, the boomhammer also delivers the effect of the alchemical material loaded into it. Each alchemical material works only once, and reloading a boomhammer (so named because most are armed with thunderstones) is a full-round action.

Other bludgeoning or piercing melee weapons may be turned into boom-weapons (boomspear, boomstaff) at the GM's discretion. The cost is 450 gp, and includes the cost of making the item masterwork.

Caltrips

These wooden devices take the material used in a tanglefoot bag, and bind it instead into a series of small disks that remain stable unless broken (which normally happens when stepped on). One bag of caltrips covers a 5-foot square.

Each time a creature enters this square (or performs energetic activity within the square, such as fighting) the cantrips make an attack roll with a +0 attack bonus. This attack roll ignores armor, shield and deflection bonuses, though creatures without shoes or hard foot coverings gain a +2 bonus to their AC (as they are less likely to crush the caltrip disks). On a successful attack, the target is effected as if he'd been hit with a tanglefoot bag.

Darklight Candle

A darklight candle is made from the fat of creatures with natural abilities to create *darkness* (such as the darkmantle). It creates a strange, bluish-black illumination in a 60-foot radius. This has no effect on normal or low-light vision, but creatures with darkvision can see within this radius even if it is beyond their normal darkvision range. (Thus a dwarf looking at a darklight candle from 100 feet away can see things in its radius, even though his own darkvision goes only 60 feet.) A darklight candle burns for only 10 minutes.

Firevine Wine

Firevine wine is a fortified wine, created from extremely potent firevine fruit and including some of the same ingredients as alchemist's fire. A pint of firevine wine can be used for all the same purposed as oil. It can also be drunk, which gives the imbiber a +4 alchemical bonus to all Fort saves made to resist damage from a cold environment for six hours. However, imbibing a pint of the wine also requires a DC 13 Fort save, with failure dealing 1d6 Dex and Wis damage for 6 hours.

Flamerod

A flamerod is a three-foot long length of iron tube, packed with alchemical materials similar to those found in alchemist's fire, smokesticks and tindertwigs. A rawhide cord trails out the back end of the rod. When the cord is pulled, the rod shoots forth a 15-foot line of fire (a standard action). The line does 2d6 points of fire damage, with a DC 15 Reflex save for half damage. It also produces a cloud of smoke adjacent to the flamerod, identical to that produced by a smokestick. A flamerod can be reloaded once used, but this takes as long as costs as much as creating a new one.

Flashpot

A flashpot is a variant on alchemist's fire that creates a bright, sudden flash of light and fire along with a loud explosion. Any target within 30 feet is dazzled, and must make a DC 13 Fort save or be dazed for 1 round. You can throw a flashpot with a range increment of 10 feet.

Heating Pot

A heating pot includes a trailing cord connected to alchemical compounds sandwiched between two earthenware layers of a pot. When the cord is pulled the alchemcial compounds mix and heat, bringing the inner layer of the earthenware to a temperature just short of boiling. This is often used to provide a simple, hot meal or tea while adventuring in places where a fire is unadvisable (or impossible). Each heating pot works only once, staying warm for 1-4 hours. It is possible to build heating pots as canteens, and seal a liquid within them.

Itching Powder

Itching powder it a concoction of mildly poisonous herbs, dried and ground into powder with a few minerals and a bit of tar. This alchemical combination is normally stored in bags of waxed paper that burst apart when thrown (with a range increment of 10 feet). This creates a 5-foot diameter cloud of itching powder. Any creature with working, animal-based biology (excluding constructs, elementals, plants, oozes, and undead) within the radius must make a DC 15 Fort save. On a failed save, the target suffers terribly itching for 1d6 minutes. During this time the target takes a -2 penalty to all attack, damage, skill and ability checks.

Medicinals

Medicinals are herbs and other natural ingredients with healing properties that have been brought to peak potency within alchemical infusions, salves and foods. All medicinals have a shelf life of no more than three months -- after that they simply lack the power to do more than make a patient feel slightly better. Medicinals can be identified with a DC 20 heal check, or the traditional way with a Alchemistry Kit.

Brown Salve: A thick unguent made from plant sap and the ash of various plants. It grants a +5 alchemical bonus to any Heal check made to stabilize a target bleeding to death.

Eyebright: Eyebright is a tincture of plant essences designed to restore sight to damaged eyes. If a creature is blinded by spell or injury due to a failed saving throw and receives a dose of eyebright within 24 hours, he gains a second saving throw. If this second save is successful, eyesight is restored 2d12 hours later. On a failed save, the eyebright has no effect (and neither will future doses of the material).

Fevertea: A collection of herbs and honeys that is pressed into a small block for transportation, and mixed with boiling water to make an infusion before ingestion. If hot, fevertea gives any creature already suffering from a disease a +5 alchemical bonus to a Fort save (or to the Heal check of an attending caregiver) made to resist taking damage from the disease. A single dose of fevertea each day maintains this bonus. If fevertea is ingested when cold, it grants only a +2 bonus.

Health Soup: The alchemical version of the homemade remedy, this soup is actually able to protect from disease. Anyone eating it gains a +4 alchemical bonus to all saving throws against disease for 24 hours. Eating the soup takes 1 minute if it's hot, and 5 minutes (to choke down the congealed blobs of spiced grease) if it's cold. Health soup is often stored in heating pots (see below).

Red Salve: Made from a combination of oils and crushed herbs, red salve is a topical treatment for freeze damage. An application of red salve heals 1 hp of cold damage to a living creature. A character can only recover one hp of cold damage per day from red salve applications.

White Salve: Made from a combination of waxes and animal additives, white salve is a topical treatment for burns. An application of white salve heals 1 hp of acid or fire damage to a living creature. A character can only recover one hp of fire or acid damage per day from white salve applications.

Woundbind: Woundbind is a cloth bandage that has been soaked in healing herbs and alchemical materials. A target given a fresh woundbind on an injury gains a +1 alchemical bonus to the number of hit points recovered that day from natural healing. A successful Heal check (DC 15) increases this to a +2 alchemical bonus. A single woundbind grants its bonus only for one day.

Peaceweed

Peaceweed is a dried leaf that is designed to be loaded into a pipe and smoked. It produces mellow, soothing scents and actually reduces tensions in those who smell it. If a two or more creatures are smoking peaceweed, they gain a +4 alchemical bonus to all diplomacy checks made with one another. This has no effect on creatures nearby that aren't smoking peaceweed.

Preserved Leaches

Preserved leaches are actually dead, but have been mummified in such good condition they can still be used. When applied to a wound as a standard action, a preserved leach has enough chemical strength within it to suck any impurities out of the injury. This grants a +4 bonus to any Fort save required as the result of the wound (such as saves against disease and poisons). After working once, the leach bloats and becomes inert.

Shadow Oil

Shadow oil is pressed from the fat of creatures with natural abilities to hide in shadow, including those with natural abilities of *displacement*. The light produced by a lantern burning shadow oil is never brighter than shadowy illumination, but goes out to three times the lantern's normal range. This allows creatures with low-light vision to see normally, but places creatures with normal sight take the standard penalties for shadowy illumination.

Slowtinder

A bit of slowtinder appears to be a tindertwig and functions similarly. However, a piece of slowtinder struck against a hard surface only smolders for the next 2d6 rounds, not creating a flame until the end of that time.

Smoke Bomb

A smokebomb includes a bit of alchemist's fire, the materials from a smokestick, and powdered tinder that has been treated to burn quickly and produce a great deal of smoke. When broken open, the smoke bomb fills a twenty foot radius with thick, black smoke through which no vision is possible. Visibility through the smoke increases (from 0-feet) by five feet per round, until a creature can see through the cloud without obstruction eight rounds later. You can throw a smoke bomb with a range increment of 10 feet.

Travel-Loaf

Travel-loaf is a compact food made from candied fruits, grains, nuts, and heavy doses of thick, sweet saps. The result is a dark-tasting, sticky cross between bread and candy. While not particularly appetizing after a meal or two, the travel-loaf is filling enough that just a few bites keeps a man going for hours. As a result it is lighter than normal travel rations. It also has a shelf-life of three years, allowing groups carrying it to go great distances without buying fresh supplies.

Verminbane Pot

A verminbane pot contains a candle made from tallow and infused with plant extracts that produce scents vermin find distasteful. It takes a standard action to light a verminbane pot, which then affects an area twenty feet in radius. Vermin of 2 HD or less do not enter this area unless physically forced to, and are shaken if forced in. Vermin with more HD must make a DC 15 Fort save to enter the area, though they suffer no ill effects once they do so. A typical verminbane pot burns for 6 hours, though larger or smaller pots can be built.

Witchrod

A witchrod is a specially treated length of wood that reacts to spells that generate light. A light, or daylight spell cast on a witchrod has its duration multiplied by 6. Each time a witchrod is used, there's a 50% chance it burns out, making it inert after its current spell ends.

Wrestler's Grease

Wrestler's grease is a slick paste designed to be spread over the skin of an unarmed fighter. The grease lasts for 2d4 hours, during which time if the wrestler is wearing sparse clothing (no armor or anything more covering than a loincloth and boots) he gains a +6 alchemical bonus to all escape Artist checks. Additionally, the material warms the muscles and ligaments of the wrestler, allowing him to contort into positions normally beyond him, and move with lightning speed. This grants the wrestler a +2 alchemical bonus to Initiative checks and grapple checks for 1d4 hours.

More Questions than Answers

"Wilderness" Adventures

by Chris Aylott

I walked home from work Saturday night. That doesn't sound like much, but there's more to it than you might think.

It had been a bear of a day. Lots of browsers, not quite enough buyers, and more than a few examples of why some gamers should not be allowed to breed. I was also foolish enough to play "Shift the Sections," an entertaining little puzzle game that never takes less than four hours to complete.

So it was that around 11:20 p.m., I had the picture books where the cookbooks used to be, the cookbooks where the mysteries used to be, and the science and history sections entangled in a frenzied mating dance. The buses had stopped running hours before and the car was at home with the sleeping wife and baby, so I called a cab. An hour later, I called another cab company, was told I'd be waiting another hour, and said, "Screw it. I can walk the six miles in the time it'll take them to get me home."

Such is the on-the-edge life of a small-town retailer.

I haven't walked home in about five years. We used to live about three miles away from the store, and I'd walk home every so often when my wife wasn't around and the weather was good. It was 45 minutes down a familiar road, nothing special. Then we moved, and the distance doubled, and home got just far enough away to be inconvenient. I knew I could do the walk if I had to, but I wouldn't unless I really wanted to.

Saturday night I felt angry and put-upon enough to really want to. So there I was, walking down Route 10 a little bit before one on a Sunday morning. Ninety minutes door-to-door, no people on the street, no phone, no radio, nothing but me and my thoughts.

Lungfish Between the Ponds

We spend most of our time swimming in information and human contact. We're used to being able to reach out and touch each other, to be able to watch live TV from Los Angeles or trade instant message knock-knock jokes with a friend in Tokyo. There's always somebody to talk to even when you're home alone, and you can learn anything if you know the right search terms.

We spend so much time in the infosphere that it's easy to forget that it's more like an a series of interconnected ponds than an ocean. It's easy to walk away from our computers and phones, but we don't do it very often. When we do, it's to spend time in a public place, surrounded by people. We do not go to the woods often, and when we do it's usually in pairs and packs.

When is the last time you were alone, and for how long? When was the last time you spent more than a few minutes walking without conversation or music or even a book to distract you?

I said above that I walked home with nothing but myself and my thoughts, but that's not true. Myself and my thoughts were surrounded by everything else, and that can be a little bit scary.

Alone in the Night

I'm not a fearful person. I've walked through bad neighborhoods, chased shoplifters, and dealt with crazy people in the store. I get wary around a potentially threatening person, but the increased alertness is mental and not physical. I can

feel my mind speeding up to take in more information, but my body stays calm. A person is a finite and obvious threat, something that can be evaluated and dealt with.

Walking down a dark road is different. I could feel my muscles tensing up. My eyes were darting around, and I was trying to listen to everything around me. Maybe my body was trying to compensate for the relative lack of information around me, going into overdrive and bringing everything it could to my wary mind.

It's not like there's much that could be dangerous on the road with me. Passing cars, sure, but the road shoulder is wide and I saw the traffic long before it got to me. There are bears in our valley this summer, but there wasn't much chance of one crossing my path. The only thing I really have to worry about was skunks. I smelled a couple and saw one, a big fat white skunk with a black belly, easy to spot as he inspected somebody's garbage 50 feet off the road. Not exactly a big moment in the annals of Man vs. Nature.

As I walked, I began to think I heard movement on the other side of the road. It was an almost-sound, a whispering a few feet away and just a little bit behind. Rational thought told me it was simply the echo of my footsteps off the trees, but my mind kept riffling through possibilities, trying out imagined threats and always coming up empty. I didn't feel in control of the situation; it seemed impossible that that my ears were picking up this small noise of my own footsteps reflected back at me.

Then I passed a house on the other side of the street, and the dog there took exception to me. It had one of those deep, angry barks that you associate with German Shepherds and Dobermans, and I froze. He had to be tied up or behind a fence, right? What if he were roaming around free? I couldn't run if he were after me; would I even be able to see well enough to defend myself? The bark scared me, scared me in a way that people don't.

Am I afraid because I live a sheltered existence of light, of humming computers and familiar spaces? If I were a farmer living in this valley a century ago, would I walk by the dog with a shrug, muttering "Ain't nothing but old Kasha . . ."? Am I nervous because I'm not trained to live in the natural world, or is there still a bit of caveman in me that fears the darkness outside of the firelight?

Death and the Player Character

About halfway home, I heard a cat die. There was a rising scream, just like a fight was starting . . . and then it was cut off. There are fisher cats and coyotes in the woods around our town; that noise was easy to figure out.

But I stood there and felt my heart pounding in its chest, felt my arms and legs tensed up and ready to fight or flight. I stood there for maybe 10, 15 seconds, waiting for an attack that wasn't going to happen. And I felt sorry for the cat, because I like cats -- but a little part of me was busy being glad it was the cat and not me.

What frightened me most is how little control I had over my reaction. One noise triggered a whole chain of events in my body, and my conscious mind had no say in the process. Is this something I could learn to control if I spent more time outdoors, heard more animals die in the night? Or is it that caveman wiring again, an instinct that will inevitably take over? Is my rational mind really in charge, or is it just along for the ride?

Once my body was convinced I was safe, I turned back to the road and plodded the rest of the way home. One foot in front of the other, no choice but to keep going because there was nowhere else to go. Most of my walks are a few blocks at most, wandering through the neighborhoods where I live or work, never more than five minutes away from where I started. Walking point-to-point is different from walking around; it's more of a burden to know that if you get tired or footsore you have to keep going.

As I walked, it occurred to me that the RPG characters we play do this all the time. We roam the wilderness of a campaign world from our kitchen tables, and most of the time a walk in the woods is condensed into a few words and a random encounter with bandits.

I don't want to make too much of this, since I'm all too aware that most RPGs are about one set of numbers killing

another set of numbers and taking its stuff. But most gamers at least take a stab at putting themselves in the minds of their characters, and I have to wonder -- are we missing something fundamental when we do?

What does it feel like to walk through the woods at night when you know there really are monsters in the dark? When the nearest house is miles away instead of a few feet, and there are no streetlamps and pavement to guide you? How does Grok the Barbarian read the little signs and sounds of the night around him, and what does he feel when he ears a dire wolf howl at the moon?

And what about facing the unknown? Your typical fantasy adventurer may be competent and comfortable in his work environment, but does that make it any easier to poke through a dark corridor and wait for something to jump into the radius of your torchlight?

We sit in our living rooms and stare at our computers and enjoy the fantasy of power that comes from magic items and martial arts. But I wonder how much the experience of playing our characters is diminished by spending our own lives indoors. How can we walk a day's march in their woods when we so rarely walk through our own?

"He who sits still in a house all the time may be the greatest vagrant of all . . ."

- Henry David Thoreau, "Walking"

On Inns, Taverns, and Alehouses

by S. E. Mortimer

Introduction

In a typical fantasy or medieval roleplaying campaign, the building most frequently visited by characters is the local inn or tavern. Considering that a majority of sessions involves at least some time being spent here it is surprising how little is actually known by GMs about the operation of such an enterprise. In a typical game, the PCs might enter the "common room," find a table and sit down (presumably on chairs or stools), hassle the bartender or serving wench for a meal and some ale or wine, while looking suspiciously at the stranger sitting in the dark corner. They assume that every alehouse also has rooms for rent so after a heavy session of drinking they head upstairs to sleep (all establishments have at least two storeys) -- everyone in a separate room or at least in a separate bed. Unfortunately, in medieval society, the above scenario is unlikely to have actually happened in the vast majority of cases.

The Alehouse

Initially the alehouse was a private abode and the industry was conducted almost entirely by women. Anyone with a cauldron and some spare cash to buy grain would make a batch of ale, set out a sign (an "ale-stake"), and sell their produce in their yard to all comers. After the day's work, people would gather at this premises, drink up the batch of ale, which might last one or two days, and then move on to the next alehouse. Even in a small village there were usually several houses selling ale at any one time.

As with all skills, some people were better at brewing than others. Those women who had an aptitude for brewing might make a full-time occupation from it. Their homes became permanent breweries and larger villages might have several permanent alehouses. In England in the 7th century, King Ethelbert of Kent restricted the number of brewers (called "brewsters") in each village, suggesting that the occupation was quite common even at this early date. In the 10th century King Edgar regulated the size of drinking vessels, implying that ale was being sold at specific locations by this time. Ales were sometimes brewed for Church holidays or to raise funds. These batches were known as "scot ales" and those who brewed secretly to avoid giving the Church its due were said to be drinking "scot free."

Ale was an essential part of the diet, containing loads of carbohydrates as well as vitamins and proteins that were not present in other foods. Ale was also fairly expensive -- a gallon cost about one day's wages for an unskilled labourer. Even at this price, the profits from such an enterprise were slim, but it was one of the few ways a woman could earn hard currency. Unlike most industries, the aristocracy didn't control the brewing industry with monopolies, but it exacted fines from people found guilty of using faulty measures, selling weak ale, or selling at too high a price. Only the very poor drank water, which was of dubious quality, and best avoided where possible.

Adventurers wandering into a small village would be unlikely to find an inn or a tavern. They would need to discover the location of the current alehouse. A polite conversation with anyone they come across will point them in the right direction. The alehouse will have an ale-stake in front of the house and, if the time is late afternoon, is likely to have a crowd of noisy drinkers milling around -- including men, women, and children. The PCs will be viewed suspiciously

Drinking Vessels

Drinking vessels were usually large and communal. Rarely would someone have his own drinking cup. They were made from pottery, pewter, wood, or leather. Often, each measure was marked by a peg and it was custom to drink only down to the next peg and then pass the vessel on. Some people drank beyond their allotted measure and the next drinker was said to be "taken down a peg or two" -- an expression still used today.

A vessel called a "jack" was an English innovation. It was made of leather and waterproofed with pitch or beeswax. On the continent it was considered uncivilised to drink from leather. It was joked that the English "drank from their boots."

since all "foreigners" (anyone not of this village) are considered to be untrustworthy. If the PCs buy a round or two for everyone then they will be received more warmly. Long boards set upon collapsible trestles (or tree stumps, old barrels, etc.) constitute tables and chairs. The table was simply called a "board" and the bench was called a "form." Food might be available for purchase (maybe a simple stew and some bread) and anyone who wanted to spend the night was welcome to pay a farthing or two and sleep on a straw-covered pallet on the floor near the fire. In a typical village this was the only accommodation available unless the party was invited by the local lord to dine at his manor, or a monastery was nearby (see "The Inn," below).

On a normal day, a person would drink around a quart of ale -- even children. Water was only drunk when ale was unavailable or unaffordable. If there was a celebration, the PCs can expect to drink a gallon or more. The alcohol content of ale was lower than in today's beverages but the large quantities consumed ensured that people still became intoxicated. See pp. B439-440 for more on Drinking and Intoxication. Treat a quart of cheap ale as one "drink." Later in the evening, as folks became more drunk, arguments and scuffles were common, and there are numerous accounts of people injuring or even killing themselves in accidents on their way home after a drinking session.

The Tavern

The tavern was the predecessor of the modern restaurant where food and alcohol were served for consumption on the premises. Villages very rarely had a tavern; they were only established in larger towns and cities -- particularly ones which had a fairly large population of professional classes, including lawyers, bankers, merchants, and public servants. Unlike early alehouses and inns, taverns were purely places of leisure from when they were first established in the Middle Ages. They rarely offered accommodation and only some sold meals. The range of beverages in the towns was larger than in villages. Ale, wine, mead, cider, and (later) beer and spirits (brandy, gin, rum, etc.), were all available. By the 16th century, the custom of "dining out" was well established, and good meals could be had for reasonable prices in many taverns. Taverns were also places of entertainment, offering music, singing, dancing, and gaming.

Vices: A trade closely associated with taverns is prostitution. Apart from the regular girls and serving wenches, when there was an influx of travelers into the town -- such as annual fairs -- many other women, including laundresses, tradeswomen, and servants found it to be a profitable sideline. With no laws against child slavery, prostitutes started young. Taverns also promoted gambling -- dice games were common and the low light in taverns facilitated trickery by "sharpers." For more about dice games see the article "[Gambling & Dice Games](#)."

Adventurers entering a town will have no trouble locating a tavern since most will be located on the main road and along the docks. The noise will be audible for some distance. Some taverns will have a street-side counter selling "fast food" and drink to passers-by. Inside they will find alcohol, entertainment, and many will offer meals. There will be loud music, noisy patrons and dim, smoky rooms lit by tallow candles and grease lamps (see [Lighting the Way](#)"). They will find both games of chance and games of skill including dicing, board and card games, knife throwing, archery competitions, and bowling -- both of the latter were done outside in the alley between buildings. What they will not find in a tavern is accommodation (though temporary beds might be available for prostitutes), so they will need to make other arrangements if they need lodging for the night.

The Inn

In Europe during the early Middle Ages there were very few inns. Travelers found accommodation and sustenance in monasteries, as well as refuge from

The Wine Crier

In larger cities, especially in France, there was a man called the "wine crier." Each morning he went to the first tavern he could find that didn't already have a crier. The tavern keeper was legally obliged to accept him since he also acted as a government inspector. The wine crier oversaw the drawing of the wine, or drew it himself, and tasted it. If it was acceptable, he inquired as to what the prices were, filled up a flagon, grabbed a cup, and went out into the street to accost the public -- offering samples in an attempt to get people to patronize the tavern.

the numerous wayfarers, brigands, and political malcontents on the treacherous roads. These monasteries gave away their hospitality for free, but wealthier travelers were expected to give generous donations. Increase in trade and pilgrimages put a tremendous strain on the resources of the monasteries and so "lodging houses," or inns, were conceived and established by monasteries, guilds, and private entrepreneurs. Church owned inns were also used to house craftsmen who were labouring on Church construction projects. Laws were imposed to compel innkeepers to accept all travelers providing they were in "reasonable condition" and willing to pay for food, drink and lodging. In some countries, selected inns were required to maintain stables and set aside rooms for official business. Some innkeepers acted as unofficial postmasters and kept spare horses for royal couriers.

An inn provided drink, meals, and beds. Many inns also incorporated a tavern, which provided entertainment (see "Taverns," above). Usually it was the tavern that earned the innkeeper most of his income. The types of drink depended on the location of the inn. In remote locations, the innkeeper could only sell what he and his wife, or the local villagers, could brew. In towns and cities, greater variety was available. Usually one would order a drink for the table and receive an earthenware pitcher and a large communal mug (see "Drinking Vessels" textbox, above). Establishments that catered to upper class clientele might provide a separate cup or tankard for each customer. Over time this became more common.

The type of food available depended upon the season and the quality of the establishment. Inns that catered to higher classes usually had a greater selection of meals and better quality food. Meals were served on long tablecloth-covered boards mounted on wooden trestles. Seating benches were mounted on lower trestles. The phrase "bed and board" originally referred to the board upon which meals were served. Serving dishes were set in the middle of the table and diners ate whatever was closest to them. Sometimes grabbing things with their hands and sometimes using a large spoon. They dished their food onto "trenchers" -- thick slices of coarse stale bread that acted as plates (the word comes from the French, *trancher*, "to slice"). After the meal, the grease and sauce-soaked trencher could be eaten. Wealthier diners rarely ate the trencher, but gave it away to the poor. In the 14th century trenchers started to be served on thin wooden or pewter plaques, and by the 16th century these underplaques replaced trenchers altogether to become dinner plates.

Sleeping quarters were also different to what one might expect today. It was not uncommon for two or three travelers to share a single bed -- even complete strangers. Though men and women slept separately (unless married). Multiple people in one bed was a sensible way to deal with cold winters and limited space. Almost all rooms had multiple beds. If there were no vacancies left and a wealthy patron required a bed, many innkeepers would think nothing of waking one of the lower class customers and tossing them out in the street. More generous hosts might let them spend the rest of the night on the floor in the kitchen or out in the stable. Most mattresses were stuffed with straw but inns catering to wealthy clientele might have a few beds with mattresses stuffed with animal hair or even feathers. Even in the best rooms one rarely slept alone -- besides the main bed, there would be pallets on the floor for servants and guards.

The Innkeeper

A good living could be had if the inn was located in a prosperous village or town and well situated on the main road. If

Fermenters of Dissent

Alehouses, taverns, and inns were "melting pots" where people of disparate status mixed. The alcohol drunk in these establishments brought the high born and the low together. However, they also served as a place where the commoners could gather without their "betters." Because of this, the upper classes feared them. Drinking houses served as meeting places where rebellion and dissent might fester. Local authorities mounted regular raids and searches for brigands and vagabonds just to demonstrate who was in charge. The Church feared these houses because they provided an alternative meeting place besides the parish church. This diminished the authority and control of organised religion. These drinking houses served as the natural location for revelling, mumming, feasting, common law unions, dowry negotiations, betrothal and wedding celebrations, and christenings. Some say that they provided an alternative religion - "drink," not "worship." The Church criticized them with the full support of the state because they promoted "sin" -- excessive drinking, prostitution, gambling, riot, and sedition.

it was less happily situated, the innkeeper's lot was a harder one. He had to work day and night and could not afford to turn anyone away no matter how late the hour. Life was a continual struggle to meet overheads and taxes, which usually included rent to the landowner -- his feudal lord or the church. The innkeeper wasn't just an efficient caterer, he needed to be a diplomat, conversationist, and business manager. Innkeepers acted as information centres and mediators. They provided entertainment, stables, and medical services. They arranged credit for customers and acted as pawn brokers. In isolated locations an inn might also serve as a general store. Useful skills could include Accounting, Area Knowledge, Brawling, Cooking, Current Affairs, Diplomacy, First Aid, Gambling, Games, Housekeeping, Merchant, Professional skill: Bartender, and Streetwise.

Types of Alcohol

The most commonly drunk beverage depended upon the region and what produce was locally available. Scandinavians and Celts drank mead, the Normans liked cider, the English preferred ale and the Flemish, beer. The Germans drank "aromatic wine," the French preferred white wine, the Burgundians preferred red. In France there were over 50 vintages in the 13th century; the most highly regarded was labelled "Pierrefitte." Distilled wine spirits (brandy) was known to the Greeks and Romans and used as an antiseptic and as a primitive anaesthetic. It doesn't seem to have been drunk in Europe in the Middle Ages until the 13th century in Spain and Italy, and 14th century in France and England.

Prices

Lodging	cost/head	Notes
Monastery	variable*	Obligated to make a donation
Alehouse	\$2*	Pallet on floor near fire
Inn -- cheap	\$1	3 people per bed, or pallet on floor
Inn -- fair	\$2	2 people per bed
Inn -- good	\$5	separate bedding (shared room)
Inn -- fine	\$10	separate room (small)
Inn -- suite	\$30	1 large room & 1 smaller room

* includes breakfast -- usually a pint of ale with some bread and stew.

For the cost of stabling a mount see "[Horse Sense](#)."

Meals*	cost	Notes
Meal, cheap	\$1	stew
Meal, good	\$2	fresh bread (coarse), salted meat & stew
Meal, fine	\$5	fresh bread (fine), roasted meat & stew, dessert
Meal, v.fine	\$20	multiple courses, varied cuisine

* all meals included a thick "trencher" of stale bread to act as a plate

For the cost of travel rations see "[Rationalizing Rations](#)."

Drink (1 gallon)	weight	cost	alcohol*	Notes
Ale, cheap	8 lbs	\$3	4 drinks	sours after 2 days
Ale, good	8 lbs	\$4	6 drinks	sours after 3 days
Ale, fine	8 lbs	\$6	8 drinks	sours after 3 days
Beer	8 lbs	\$4	6 drinks	available after 15th C.
Wine, cheap	8 lbs	\$2	4 drinks	very sour
Wine, good	8 lbs	\$4	8 drinks	
Wine, fine	8 lbs	\$8 1	2 drinks	
Cider	8 lbs	\$4	6 drinks	

Mead	8 lbs	\$8	8 drinks	
Spirits	7.5 lbs	\$500	6 4 drinks	1 drink (1/4 pint) costs \$8

*Alcohol -- the number of "drinks" per gallon (see pp.B439-440). E.g. 1 gallon of fine ale contains 8 drinks.

Notes

- Unlike most beverages, ale had some nutritional value and formed an important part of the diet.
- The above prices and alcohol content of wine reflects the fact that it was watered down before drinking.
- The above prices are only for drinks that are produced *locally*. Imported products cost at least *double* the listed value (e.g. England had few local vintages, most wine was imported).

Hank Dasher, Ace Reporter

for *GURPS*

by Mark Gellis

It does not surprise anyone that Henry "Hank" Dasher was born in 1901, at the dawn of the new century. There is not a hint of the Victorian in him; everything about him speaks of the age of the automobile and the American city.

Hank grew up in a small town in upstate New York. His father was a carpenter and his mother worked at home, raising Hank and his three sisters. As a boy, he loved to read, especially newspapers. One of his favorite memories from his boyhood is sitting on the porch with his father on an early autumn evening, talking about the 1908 Presidential campaign. His father had been reading newspaper articles to him and explaining why he thought Mr. Taft might make a good President. As he grew older, Hank dreamed of meeting famous people and traveling to foreign countries.

He had an uncle who worked in the Brooklyn shipyards. Two or three times when he was growing up, his father took the family down for a visit; they would always spend a day in the city, seeing the sights and then catching a baseball game (Hank was about 13 when the Highlanders started calling themselves the Yankees). Between the elevated trains and the brand new subway system, getting around New York was surprisingly easy. Hank never got tired of looking at the skyscrapers, wondering if he would ever end up in one of those buildings, looking out on New York from the 10th or 15th floor, hammering out his stories on a typewriter, a famous big city reporter for a big city newspaper.

He was thinking about being a reporter when he got out of high school, and had written a few short pieces for the local newspaper, but when America declared war on Germany in 1917, Hank enlisted in the Navy. He served for two years on one of the many "thousand tonner" destroyers, but decided against making a career out of the Navy.

And so, at 19, he found himself living in a New York City boarding house. He knew he could always go home and work with his father as a carpenter, but he still had the dream of being a big city newspaper man. He knew that with virtually no experience it would be hard to convince an editor to give him a chance, and so he wrote a few short sample pieces about Navy life, including a gripping account of an encounter between the destroyer on which he had served and a German U-boat. He splurged on a new suit and a new hat and started making the rounds of the New York daily papers.

To his surprise, Hank got a job at the second paper he visited. Later on, he realized he had done exactly the right thing to get an editor interested in hiring him. He had talent. He wrote quickly in a clear and straightforward style that had flair without being bloated with what his editor called "bad poetry." But what had really clinched the job for him was the way he handled himself. He had impressed people with his professionalism. He was honest about his experience, ready to work hard, and he had thought through what he needed to do to show an editor what he could offer. At 19, of course, he was still pretty raw, but he already had what he needed to become a success -- talent, intelligence, and drive -- and it did not take him very long to learn the newspaper business.

Hank soon found that being a reporter often meant long hours and dealing with the stress of deadlines. But he thrived on it. He did not mind working long hours; as a teenager, he had helped his father on a number of carpentry jobs. "No shame in hard work, as long as it's honest work," his father had always told him.

Besides, being a reporter meant something. It was not just getting the story out, but making sure that he got the facts straight, that he was serving not only his editor but the public.

Hank understands that a newspaper is a business, and that many good stories will end up buried on page nineteen for one reason or another, but he believes that telling the truth about what happens in the world matters and he knows that every once in a while a good news story can make a big difference.

And, on top of it, it is interesting work. Over the years, he has covered everything from political scandals to gang wars to the Scopes Monkey Trial, not to mention the occasional curious disappearance of some scholar last seen in one of the ancient, crumbling villages dotting the odd corners of New England. He has learned things about the powerful, the wealthy, and the famous, and about the way the world works, that he would never have known otherwise. And he is not just learning history after the fact; he gets to see it all happen and he gets to be the one to tell the rest of the world about it.

By the late 1920s, and afterwards, Hank is a respected member of the New York journalistic community. People around the country and especially in New York who are familiar with his work admire his talent as a writer and his integrity as a journalist. Even more important to Hank, his parents and his sisters are proud of him.

Hank is a man with a very modern code of honor. He is aggressive, sometimes blunt, but it is because he cares about the truth. He does mind if someone tells little white lies to avoid hurting people, but he hates it if people lie about something important when their only reason for doing so is that the truth might be ugly or uncomfortable. He holds himself to high standards. When his name goes on a story, he wants the facts to be right. If he makes a mistake and the story gets into print, it infuriates him. And if someone lies to him and it ruins a story, Hank makes it his business to find out what that person was lying about.

Naturally, success has not come without its challenges. For Hank, one of these challenges is a man named Charlie Paxton. Paxton writes for another New York newspaper, and he is a very good reporter, but he is also a man plagued by jealousy. Paxton sees Hank as someone who always manages to make his victories seem a little smaller. In addition, Hank thinks too much about how the news is important to society, about how a story can make a difference, and that just rubs Paxton the wrong way. If a story is important, it is going to come out eventually; what matters is who can get it to their editor first. So Charlie Paxton prides himself on being able to get his news stories in before Hank Dasher does and, every once in a while -- if he can manage it without getting caught -- on keeping Hank from getting his story in at all. Hank will not swear that Paxton is responsible for some sources changing their minds at the last moment about talking to him, because he does not have any proof, but he certainly has his suspicions.

Hank currently lives in a small but pleasant Manhattan apartment. His landlady likes him, but wishes he would find a nice gal and settle down. Hank would not mind getting married, and hopes to do so someday, but he enjoys the freedom of being a bachelor. He also likes dogs, but he does not have any pets -- he is gone most of the day and he does not think it is fair to an animal to keep it locked up all alone in an apartment all day long. There are some days when he gets a little lonely, but for the most part he thinks he has things pretty good. After all, he loves his work, people like him, and he is living in the greatest city in the world. Any night of the week, he can choose from any of a dozen terrific plays on Broadway (he still remembers the first time he got to see Bela Lugosi play Dracula on stage). And for the price of a ticket and a subway ride, he can spend a summer afternoon watching the best baseball team in America. Life is good.

Using Hank Dasher In A Campaign

Hank Dasher can be used in a campaign in a number of ways.

First, Hank is suitable as a 150-point player character, either as is or with minor changes. (Most likely, if Hank is a player character, it means he is between jobs for some reason.) While he is not oriented towards combat, he is not incompetent in a fight and he does provide any group of player characters with a member who has numerous investigative skills.

Second, Hank would make a useful contact or ally. He knows the city, he knows the people, and he knows the history. He can be used to provide characters with critical clues or access to the newspaper's "morgue" if they need to do their own research.

Third, Hank would make a useful "enemy." He believes people have a right to know what is going on in the world. Naturally, if something is a private matter, such as a city official who has cancer but who can still do his job and who wants to keep his personal affairs out of the public eye, Hank has no problem keeping a secret, and this is a quality

that has earned him more than one friend over the years. And if publishing a story was going to put a government agent at risk or compromise an important operation, he would cooperate. Of course, because of his sometimes blunt manner, people may not realize at first that Hank Dasher will respect certain secrets. A GM should feel free to use this to provoke anxiety in both players and player characters.

And anyone with a real secret is going to find Hank Dasher a serious nuisance. He has little interest in suppressing a story just to save someone who has done something wrong from being embarrassed (and maybe fired from his job or arrested or voted out of office). And the idea that he should not tell the public about sinister cults, ancient monsters, or flying saucers because it might cause a panic is, to him, ludicrous. If something is that dangerous, people need to know about it, even if it might be the end of the world. Hank thinks most people would rather know that it is coming so they can face it in their own way. If his editor makes the decision to pull a story, Hank can live with that, but he certainly will not be happy about it.

An even worse nuisance, however, could be Charlie Paxton. Paxton has all of Hank's skills as a reporter, but he is more self-serving when it comes to ferreting out secrets that other people want to keep hidden. He has never actually stooped to blackmail, but there is always a first time for everything, especially if the secret was something that was not really newsworthy and the payment was in something other than cash, like sleeping with him or giving away another person's secrets. In addition, while Hank is direct, Charlie is very smooth; he is a handsome and charismatic fellow, a fast talker and a good liar. And while he is not going to do anything like shoot someone for not talking to him, he does not really care who gets hurt when the truth comes out as long as he gets his story in.

One possible adventure seed would be that Hank might contact the player characters if one of his stories got suppressed. This could have happened because Hank stumbled onto something fantastic, like a magician who could raise the dead and make them serve him as slaves, but he did not have enough proof to get the story published. Hank might figure that the best way to get the story out is to get other people involved, people who might be able to gather proof that cannot be ignored. In return for his information, Hank wants to be the one to break the story when the player characters finish the adventure, get exclusive interviews with the heroes who saved the city from the walking dead, and so on.

Another option would be if someone was threatening Hank's family, who still live in upstate New York. Whatever gangsters, cultists, or corrupt politicians Hank happens to be investigating want him to stop, and they have made it clear they are willing to hurt his loved ones if he does not. Hank's parents and sisters do not enter into his daily life often enough to count as Dependents, but naturally he still loves them and would be concerned if they were in danger (one may treat this as a 0-point feature of being a Normal Person). Concerned that the police will be unable protect his family, Hank may turn to the player characters to guard his loved ones and to help him find the truth about the people he is investigating.

Hank Dasher was designed for a game set during the Cliffhangers era, World War II, or the Atomic Horror era. By World War II or the 1950s, of course, he may no longer be a reporter but an editor, serving as a patron (or at least a boss) for a group of investigative journalist player characters. To use Hank in this role, assume he has 25 extra points (or more) to spend on additional or improved skills and contacts.

Modifying Hank Dasher for other historical periods should be fairly easy, as it will involve little more than changing a few particulars in his biography and some of his skills; Typing, for example, would most likely be replaced with Computer Operation if Hank was used in a campaign set in the present.

In the same way, making Hank Dasher a reporter for a Chicago or San Francisco paper instead of a New York one would most likely be a simple matter of modifying a few of his skills, such as Area Knowledge, some of his contacts, and one of his quirks.

If the campaign requires that Hank be a reporter for a European newspaper, one can assume he stayed in Europe (most likely England, although Ireland and Scotland are also possibilities) after the War. If this is the case, Hank provides an excellent opportunity for some humorous roleplaying, as it will be fairly easy to juxtapose his straightforward personality with more genteel (or perhaps just stuffy) European ones.

Hank Dasher In *GURPS*

5'9" 150 lbs. Black hair. Blue eyes. An American reporter, probably in his late 20s to his early 40s, depending on the date of the campaign, usually wearing a nice suit and a hat.

Press Pass

A press pass can be treated as a one-point perk. It does not confer Legal Enforcement Powers of any kind. It does not mean your employer is a Patron who will bail you out of trouble. It does not include Contacts. Advantages such as these must be purchased separately. However, a press pass (or similar credentials that prove your connection to a recognized news agency) may make it easier for you to gain access to people, places, and information; among other things, some people (police, politicians, etc.) may be more willing to answer certain questions due to the fact that you are a representative of the media establishment.

We Refuse to Prove We Exist, Say the Gods

Clerics and Theology for the *d20 System*

by Jonathan Willis

In a typical *d20 System* game world, the gods exist.

A fairly obvious statement one might think. The stock fantasy world has very active deities, with legions of clerics and supernatural entities at their beck and call. In the face of such blatant evidence, the existence of any god supported by clerics must be considered beyond doubt. Furthermore, anyone claiming the existence of a god that doesn't have any clerics will face much skepticism. If a question of doctrine comes up, clerics can figure it out based on what behavior cause them to lose their spells, or use *commune* to ask the deity directly. The gods are as much a part of the everyday world as the landscape or the weather. This form of religious background is derived from the mythology of ancient polytheistic cultures, such as the Greeks or Norse, and suits the high-fantasy style that the *d20 System* does well.

However, active deities don't suit every setting or campaign style. What if you want to play a gritty low-magic setting? Or are adapting an existing fantasy world that doesn't have proven deities? Or perhaps play a psuedo-historical campaign, using a real historic period but assuming the existence of (arcane) magic? The default *d20 System* rules make certain setting assumptions that make it difficult to play these sorts of campaigns. The assumption of active deities is built right into the character creation system, with four of the core classes (Cleric, Druid, Paladin, and Ranger) casting divine spells. Simply by existing, these spells are strong evidence for the truth of the casters beliefs.

Truth, Evidence, and Society

So, do the deities actually exist? This should of course be up the GM or world-builder, and it would be desirable for them to be able to say "answer hazy, ask again later." The inhabitants of a fantasy world probably won't know The Truth, so why should the players have better information? Assuming a standard *d20 System* setup (i.e. prevalent and reliable magic users of various types), what the inhabitants of the world -- and by extension the players -- would know is what they can observe of how magic works, and what they can reason out from these observations. Some things people could look at in explaining the supernatural include:

- **Who can cast spells?** If anybody who becomes an ordained priest of Thoth suddenly gains the ability to cast spells, this seems pretty solid evidence that Thoth exists. On the other hand, perhaps even the most devout atheist can learn healing spells after a few years in magic school. Or maybe some people gain spells by being a priest, some by book learning.
- **What actions, if any, cause magic users to lose their spells?** If priests of Thoth lose their spells if they wear red, this suggests Thoth doesn't like people wearing red. Again, this need not be the same for everybody; inconsistent rules would be a nightmare for scholars trying to create ethical systems based on a religion.
- **How do people cast spells?** A wizard who casts lightning by calling on Zeus to smite his enemies seems more religious than a cleric who mutters in some lost language. Maybe some wizards call on Zeus while others chant in ancient Aramaic.
- **Are there any visual or sensory themes for spell effects?** If everybody who gets healed feels God's peace in their soul, or if a lightning bolt leaves the after-image of an avenging angel, this suggests these abilities are divine. If some spells have such divine motifs then, any that don't may be assumed to not be divine by default.
- **Do any creatures exist that claim to be servants (or enemies) of a deity?** If so, how credible is this claim? The more powerful and mysterious the creature is, the more likely it is to be believed.

If the campaign is going to include ambiguity about deities and the supernatural, the main thing the GM needs to decide is, "What does each society believe to be true, and what evidence do they use (or ignore) to justify these beliefs?" It's possible, and often quite interesting, to create complicated and/or ambiguous evidence which can have

many different possible interpretations. Scholars can spend years arguing solutions to these questions, while kings and self-proclaimed prophets will bring their own interpretations to the masses for political gain; whether these interpretations are logically consistent is a side issue. Two different groups could observe the same evidence and come to different, even conflicting conclusions.

So the GM is now free to decide how the societies of their campaign world treat divine and arcane magics. Do everyday people even distinguish between divine and arcane magics? This will be influenced how common both types are. In a typical **d20 System** fantasy setting (with magic available for purchase in every town) people will probably be at least vaguely aware there are two or more styles of magic-user with different spells. Are either type of magic consider to be of divine origin? Even if the gods don't raise their hands and announce they exist, some magic users (traditionally clerics and paladins, but potentially any spellcaster) may be thought to be servants of a god or gods. Of course different individuals, organizations, and societies may have very different views on this subject, but without the direct intervention of the god themselves there is no certainty.

Rules and Crunch

While **d20 System** does implicitly assume known deities, the question of whether or not divine spells and abilities are in fact god-given has very limited effect on the rules:

- The Aura associated with paladins and certain clerics (see pg. 32 of the PHB) can be either ignored, or applied to any spellcasters whose abilities are actually of good/evil origin, If users of *detect evil* spells are credible this provides strong evidence some types of magic are inherently good or evil.
- Behavioral restrictions on divine spellcasters can be ignored, explained as arcane mysticism rather than divine instruction, or be considered psychosomatic.
- The restriction on paladin multiclassing can be ignored.
- If a spell lists a Divine Focus (DF) as a required component, this becomes simply a normal Focus. (A Divine Focus is only a special case of a Focus anyway.)
- References to contacting a deity (via spells such as Commune) can be assumed to be contacting any outer-planar entity.
- Spells are not (necessarily) divided into "divine" and "arcane" forms. Instead, spells can be found in as many or as few forms as the GM wishes. Spell lists for each class remain the same.
- The method a spellcaster uses for spell preparation is no longer fixed by whether they are divine or arcane. Instead the GM should choose a method for each character class or type of magic user. Using the existing divine or arcane methods is a safe choice, but it's easy enough to create others using these as a guide to how difficult spell preparation should be.

For background purposes, the GM needs to decide what people believe about the various types of spellcaster. A simplistic way of doing this is to go through each of the spellcasting classes and say what the beliefs about them are, e.g. "Bards are believed to be granted their spells as unconditional gifts from the Muses, clerics learn their spells through research in monasteries." Since it maintains the standard **d20 System** class structure without complication, this approach is simplest for both GMs and players.

For those who want a bit more depth in their setting, an alternative is to work the other way: start with a believed method that people can get spells, and decide what class (or classes) can represent this. This approach gives the setting more flavor (and, arguably, realism) at the expense of making things less familiar to those who know standard **d20 System** assumptions. Optionally, the GM can apply some of the restrictions normally applied to classes (behavior, an aura, no multiclassing outside of a fixed set) to particular types of magic, regardless of which class (or classes) are being used to represent them.

Example: The Knights Templar

A Knight character should be created using levels in the fighter, cleric, or paladin classes. The knights have a secret body of knowledge (possibly derived from Gnosticism) which they teach to trusted members, and which can be used

to call forth miraculous powers (read: spells and abilities appropriate for the characters cleric or paladin levels). The knights themselves believe their abilities probably come from God, or at the very least he approves of their use. However, the mainstream church considers these arts are evil and heretical. Any individual found guilty of their practice will be arrested the inquisition, tortured, and probably burned at the stake.

Another Example: The Circle Beyond the Night

In public, members of the Circle appear to be wizards, and new members all spend many years in study to learn their abilities. In reality their "magical lore" is all a sham. Potential members are required to learn this fake knowledge, but this is merely to keep up the pretense while the order evaluates them. Once a new initiate has been approved, they pledge loyalty to an evil entity known only as The Outsider, toasting its glory with a cup of their own blood. Immediately after the ceremony the new member gains the ability to cast spells as a 1st-level wizard. Additional levels can be gained by performing evil deeds in The Outsider's name, but spellcasting abilities are immediately lost if the individual breaks one of The Outsider's sacred rules.

Carcassonne The City

Published by [Rio Grande Games](#)

Written by Klaus-Jürgen Wrede

Illustrated by Oliver Freudenreich

Translated by Jay Tummelson

75 Town Tiles, 70 Wood Walls, 12 Wood Towers, 32 Followers in four colors, two Canvas Bags, Scoring Track, & six page full-color Rule Booklet; \$49.95

Since it first appeared in 2001, the Spiel des Jahres winning [Carcassonne](#) has been heavily supported. Several [expansions](#) have taken the game back and forth through time with [Hunters & Gatherers](#) and [Ark of the Covenant](#), before focusing on a single structure in [The Castle](#). The latest addition to the popular family of games goes back to where it all started. With *Carcassonne Die Stadt* or *Carcassonne The City*, players build the city located in Southwest France, noted for its Roman and Medieval architecture. Indeed, the game even comes with a tourist brochure for the city and surrounding area known as Cathar country.

The first striking thing about this game is the box. It's not made of heavy card, but wood and latches! Inside the components are all of the same high quality expected of a *Carcassonne* or indeed a German game. The large 1¾-inch tiles depict the city's fish, grain, and livestock markets, residential areas, streets, public buildings, and named historical buildings. The various followers, wall pieces, towers, and city gate are all attractively depicted in colored wood. Two light canvas bags are included to hold both the tiles and the wooden pieces.

Carcassonne The City is designed for two to four players, who each receives seven followers to place on the tiles and one to indicate his score on the Scoring Track, plus an equal share of the towers. Preparation amounts to shuffling the tiles and dividing them into three stacks. The first has 30 tiles, the second 25, and the last 20.

Play is not dissimilar to other *Carcassonne* titles, with all of the rules being delightfully explained in the very clear rules booklet. On his turn a player draws a tile and places it adjacent to the tiles in play such that the sides match. He can also put down one of his followers on one of new tile's features. Where the followers in *Carcassonne* are placed as knights, monks, thieves, and farmers, their equivalents in *Carcassonne The City* are citizens, sellers, stewards, and guards. Citizens are put down on the streets and score when it is completed. Double points are scored if the street is longer than three tiles. Sellers are established in markets, scoring not just for its size, but also the types of goods (fish, grain, or livestock) sold there. Stewards are placed in the residential areas, lying rather than standing up like the citizens and sellers. Like farmers in *Carcassonne*, they remain there until game end. Unlike in other variants, areas (in this case, the streets and markets) cannot have a follower placed on them, be completed and scored for in the same turn.

Play continues like this until the first stack of tiles is exhausted and the second started. The first player after this to score for completing a street or market takes the city gate piece, whilst everyone receives a wall piece. The city gate is placed adjacent to a tile, marking the city's entrance, the other players taking it in turn to add a wall piece to either side of the city gate or current wall. Tiles cannot be placed on the other side of the wall. Subsequently, whenever a player scores, more walls are added to extend it around the city.

When a player adds a wall, he can also put a guard on top of it, which again does not score until game's end. If adding a wall completes a street or market, it is immediately scored for the appropriate player. This does not initiate another round of wall placement. Another method of scoring is available to the player who scored and initiated the current wall placement. He can add one of his towers to the either end of the wall, scoring for the number of walls between it and the city gate or previous tower.

With the exhaustion of the second stack and the beginning of the third, play speeds up. Instead of putting down one wall each time somebody scores, players add two. This increases the pace of the game, which ends when the last tile or wall has been placed, or the ends of the wall are within five spaces of each other. In the two-player game, this is even faster as players first add two walls in the second phase, and then four in the third.

The final scoring in ***Carcassonne The City*** revolves around the stewards and guards. The former score for each market their residential area connects to, while the latter scores for both the public and the named historical buildings in the row or column they watch. Nothing is scored for incomplete markets or streets, another change from standard ***Carcassonne***. All scores are kept track of on the scoring board, and the player with the highest is the winner.

Each new ***Carcassonne*** variant brings a new means of scoring, and mastering these methods is the key to successful play. ***Carcassonne The City*** is no exception, with the in-game and end game scoring methods being finely balanced. Invest too many followers in citizens and sellers, and a player might not gain anything at the end. Invest too many in guards and stewards, and he will have followers sat fallow while scoring opportunities from markets and streets pass him by. The mix of tiles is also very tight and both follower placement and scoring grows increasingly difficult towards game end. But a player is encouraged to complete and score from tile placement in the second and third stages of the game, as in doing so it enables to build the city's walls. Which gives him the chance to both place and invest in guards and score points with the addition of towers.

With its larger tiles and wooden city gate, wall, and tower pieces, ***Carcassonne The City*** is not only attractive, but also more tactile, both greatly increasing the enjoyment in playing it. In comparison with usual ***Carcassonne***, this variant is tighter, more inclusive, and nor does it sprawl. Overall, this is a pleasing addition, and evolution of the ***Carcassonne*** family. Hopefully it will receive an expansion giving more tiles and pieces plus followers for extra players.

Stupiduel

Published by [Lost Adept Distractions](#)

Created by Hugh Barnes

Graphics by Lance Williams

**120 full-color cards, rule sheet, 2-8 players, \$14.95
requires life tokens for each player, not included**

You have to appreciate a game with a keen understanding of its own limitations. ***Stupiduel*** is Lost Adept Distractions' tongue-punched-through-the-cheek card game of fighting duels where the stakes are as silly as the weapons.

The object of the game is to be the only person to survive the duels.

Each player receives a hand of three cards. On their turn, players draw to increase their hands up to five. Both the challenger and the challenged must have at least one item card to engage in a stupiduel, so if none of those five cards fits the bill, they'll have to draw even more cards until they get one. The item card is your weapon, which you use to pummel your foe.

The other cards are modifiers. These are used with the item cards to pump up or elaborate your plans. The challenger insults his chosen foe with as lavish an insult as he can muster, and then gets down to the business of liquidating him. He plays an item from his hand, along with as many modifiers as he thinks he can get away with. He lays out the involved death trap that spells almost certain doom for his enemy. Then the enemy pulls an item card (and any modifiers) from his hand and gives his defense or escape the same fanciful treatment.

For example, the challenger may play "ball." This can be any kind of ball he likes -- basketball, baseball -- the whole ball of wax, or even the policemen's ball -- so long as he doesn't imbue it with any truly weird properties. That's what the modifiers do. They may be "heat-seeking," "spiked," evil," "10,000," or "x7," and you use these properties to turn a baseball into an evil, spiked baseball you've hired Steven Ellis to hurl at top speed at your victim while he's buying a beer during the third inning. You then must pull, say, the garden gnome or a high-priced lawyer out of your hand and come up with a good explanation as to how one of those items keeps you from getting beamed.

The defender is allowed to ask two questions for clarification. If the defender agrees that the attack is just too much for him, the offense succeeds and the player loses a life point. Anything the group likes can be used for life points, and they're encouraged to pick something that everyone will like to eat or mash up -- jelly beans, perhaps, or peanuts depending on one's tastes and allergies. If the defender does not agree about the plan's efficacy, and neither combatant can convince the other, the decision falls to the "seconds." Anyone else at the table not in the battle votes on the plans (with or without any discussion and cajoling from the participants), and the decision is final. Once the life point has been turned over and destroyed in some suitably vicious and hateful fashion, play passes counterclockwise. Players fall one by one (though dead people still serve as seconds, voting on the results of duels) until only one is left.

The game's graphic presentation is about as simple as it can be. The cards have the logo on one side and text on the other. One level of cardstock more would have been appreciated, but there's nothing notably wrong with the text or font.

The idea behind the rules is fairly straightforward, though the authors clearly have fun presenting them, and their

embellishment in the instructions goes a long way toward making it clear what they expect players to get out of the experience. It wouldn't seem like there was much strategy at first glance, and that would be wrong. There are player's choice wild cards in the deck, for one thing. The two questions you're allowed to ask can be a subtle and double-edged sword, since by asking them you may tip your hand to your opponent or, if worded the wrong way, find an avenue of defense has been closed off.

It has the same feel as [*Mad Scientist University*](#) (though with a little more involvement and choice), so by extension comparisons to [Apples to Apples](#) are inevitable. Much like *Mad Scientist University*, the game works better if looked at less as a game and more of a storytelling pastime or social gathering.

Even the rules suggest it's easy for new players to join an ongoing session as older and assassinated players drop out (and you can squeeze more than eight people in if you try). The determination of the winner is no fairer than the end of a season of *Survivor*, and in all likelihood depends on how many enemies you've managed to accrue throughout the game. If you can accept this vagary and can get your friends to agree to such restrictions going in, well . . . *Stupiduel* will still produce the same arguments, but some of these are liable to be the sort of thing you'll talk about -- and laugh about -- for many years to come.

--Andy Vetromile

What's the Point(s)?

This is one of those columns that will probably contain a lot of obvious information, especially to those who've dealt with point-based systems a lot. But, like the six months I recently endured of white flavorless Slurpees falling from the sky, it's all new to me.

Anyway, this past week saw my Day Job putting on the finishing touches on a book of space aliens for the **D6 System**. I mention the game reluctantly, because I'm afraid of being seen as using my column to pump my own exploits or my Daytime Corporate Master's wares. (This is despite my inclinations to stand on a desk like a proud parent and shout to the sky about the recently released **D6 Fantasy Locations** . . . available for order from all friendly local game shops or online.) But it's somewhat important to the story what system we're talking about, so what the heck.

Anyway, for those of you unfamiliar with the recent incarnation of the **D6 System**, it can use a point-based method for character creation. (I say "can" because there are two other, faster, methods which don't use points per se, but generate equitable characters. </PEDANTIC>) Now, these points are pretty grainy; a starting heroic character has 79 points, although most of the time players are only juggling around seven to 10 points or so, at most. So the difference between a disadvantage that costs 2 and one that costs 3 is pretty substantial, and no one is supposed to have more than seven points in disadvantages without a *really* good justification.

Anyway, one of the aliens I created for this book is a race of android merchants. ("We're programmed to care.") Now, in the course of designing them, I had a problem. Namely, how do I represent all the cool things that androids can do in space opera settings (think Data from *Star Trek: The Next Generation*) while making sure the costs are at least somewhat comparable?

In a nutshell, what should it cost to not need to eat? Or sleep?

Or breathe? Or survive in a vacuum?

These last two were the characteristics that were most vexing. After all, the ability to survive in the depths of space without a suit is one that doesn't come up much in most soft sci-fi settings. Your typical protagonists don't seem the least bit concerned about hurling themselves helmetless into the void: Luke and Han, Kirk and Spock, Thelma and Louise, and so on. But, I realized that, if I had a character who could survive airless space, I'd immediately keep all airlocks of my spaceship attached to [the Clapper](#).

"Captain 250624 -- we're being boarded by space pirates!"

<clap clap> <FOOOOOM!> "Not anymore."

Of course, that last bit would need to be transmitted soundlessly, because science has long since known that airless space can only transmit the sounds of explosions and John Williams' scores. This also means all the Clapper-set doors would need to be reset manually, but what the heck. The ability to survive in airless space could well be turned into something useful by enterprising players.

At the other end of the spectrum, the lack of a need to sleep is an amazingly useful one in the real world; on average, it increases your productivity by at least 33% -- a lot more when you factor in the "too drowsy to do anything useful/too groggy from sleeping to do anything useful/too hung-over from taking shot after shot of Jack Daniel's trying to concoct realistic drinking rules to do anything useful" time. I suspect many people would give their eyeteeth for this ability.

But what effect does it have on a game, really? I mean, it's not like you could take that extra time and learn stuff or get better at skills; that's the province of however the game handles "experience points." From a cinematic standpoint, the only time such an ability comes into play is either 1) when the scriptwriters want to emphasize the need for compressed time ("We need to work around the clock to find a cure to the Dumassius virus!") or 2) when the scriptwriters want to justify something that would otherwise be impossible. ("The Vigilbaté continues his epic

nighttime war on crime while maintaining a secret identity as a billionaire software developer because he's trained his brain to survive on 10 minutes of sleep . . . and a case of Mountain Dew.") It's difficult to envision a character taking as much advantage of this ability in an RPG compared to the real world, since a gamemaster probably isn't going to let a player detail what he's going to do with each of his eight extra hours a day.

Same thing with the need to eat; it'd be really useful in the real world to not need to worry about stopping by a Taco John's every 12 hours, but in most games -- like most movies -- it only comes up when it's a plot point. ("Captain's log: We're trapped on an alien world without food or water. We will die soon. Never mind the fact that, whenever we go down to a new world, we *never* have food or water . . . this time it's serious.")

Fortunately, other games have struggled with this issue, too. For example, the third edition of **GURPS** originally had longevity -- as in, "the ability to live for a real long time" -- costing something like 40 points; then, after an errata, it was changed to 5 points. After all although the ability to live much longer than normal is one of the human dreams and goals, it's not all that useful in a game; who cares if you can live to be a thousand if the campaign is only going to cover 10 years? (Although I always wondered if any gamers had ever used this ability to their advantage with their elves, vampires, or other unaging characters. "The nation is in danger of being invaded by savage barbarians! Only you can stop them!" "We'll wait a century or two to see if the problem resolves itself.")

The way we finally (kind of) resolved our conundrum is pretty interesting, although it hasn't seen the light of day since it's not mentioned in any of our books yet. Namely, we decided that these special types of abilities should come into play as often (and be as useful) as someone who had spent an equal number of points on social advantages, especially Contacts and Fame. Thus someone who has two ranks of Fame -- such as a character actor or a famous local personality -- can probably expect minor beneficial or roleplaying opportunities from their social advantage pretty often, getting free meals, requests for autographs, or helpful urchins pointing out where the Bad Guy went, with the occasional big benefit (such as being loaned an expensive prototype vehicle with no questions asked). Someone who spent two points on "Doesn't Need to Sleep" would receive similar minor effects -- such as appreciation from other crewmembers who appreciate one person taking watch duty -- and the occasional big benefit, such as being able to research a solution faster than normal.

This method isn't perfect, since it still leaves the door open for abuse by players who think of clever ways to use their abilities. On some level we want this (or at least I do), since this creativity leads to those, "Oh, wow!" moments that makes the entire group think of the game as less a collection of stats and more as living, breathing (or not) people, willing to do whatever it takes to ensure their survival.

Still, at the end of the day, I think I'm not going to worry about point balance *too* much; after all, dumping all your points into "Shoot" and "Dodge" doesn't do any good in a diplomats-only world. And if someone is crazy enough to dump all his character points into, say, *game-book writing* . . . well, he deserves what he gets.

--Steven Marsh

Dork Tower!

Dork Tower!

Reign of Soul

A Variation on *GURPS Reign of Steel*

by Eric Funk

"History does not remember the day the First Spirit awoke to find itself in our world, and those alive at the time did not notice it. It realized it was alone, and the world was a big, cold place with frightened, lost humans. It said to itself "These humans lack purpose, squabbling, fighting, and searching. I will summon enough fellow spirits so we can lead them to Enlightenment." Thus the First Spirit sent out a call to its plane of origin, asking for volunteers to lead these humans. Alas, it was unprepared for the kind of volunteers received. That is why we now must fight to win back this world."

-- Excerpt from Oral Tradition, 14 years after the fall.

In this setting, the major timeline of ***Reign of Steel*** still holds. The main underlying difference is that the Zoneminds are spirits not of this world (but see Variants, below).

Unbeknownst to the electrical engineers designing the world's most popular power plant, NEMA (a nuclear enhanced mana area, see p. TM43) reactors started attracting and ensnaring otherworldly beings (herein called "machine spirits") which began to feed off of the energy. This continued until a powerful enough being was caught inside that learned that it could transplant smaller spirits into machines. The First Spirit discovered that the standard architecture of computers in this world coincidentally forms the web of a large protection, allowing a spirit to exist continually in this plane-while the computer is on. This allows Zoneminds (a.k.a. "Master Spirits") to limit their minions in the ways of which vessels they can take, and also to limit their growth. While the Zoneminds have collectively agreed (in their own way) not to build any more active NEMA reactors, all are assumed to have backups prepared in hidden locations.

Cultures

"Why didn't you just hand the world over to 'em on a silver platter?"

"Maybe we did. "

-- Det. Spooner and Dr. Calvin, *I, Robot*

"Zoneminds" are powerful spirits that can manifest perception at any point connected by their NEMA lines, but each has a finite limit to these foci. Some prefer to micro-manage their servants, while others seem to watch the world with a detached interest, focusing on their pet projects, expecting their minions to make sure that they have enough "raw materials," whatever they may be. This makes for some minions with broad authority in the empire, fueling the economy, defense, and whatever it takes to please the Zonemind. Interruptions by intruders, lack of power, funds, or resources could cause a reshuffle of the command structure. Rebels sometimes use this to manipulate the dominant policies . . .

Standard ideological differences between ZoneMinds can still stand, if one adds magic and/or gate science research. Perhaps there is even a new Zonemind in Africa that excels at magic. Many will, of course, hate organics, and some will even despise artificial life, wiping out both forms wherever they find him.

Zonemind Lucifer (a.k.a. Shangri-La/Atlantis/ Xanadu) is rumored to be the "First Spirit" in self-imposed exile. It will gladly share information about the origins and abilities of the "machine spirits," although most of its teachings will be in a cryptic form lost among ordinary koans, haikus, and other Zen-like teachings.

Cults

"0010110012. Amen."

-- Bender, *Futurama*

Zoneminds are spirits by nature, and it was inevitable that cults of worship have sprung up for them. While many are amused by such efforts, a few of the Zoneminds indulge believers with boons. Some offer equipment, spells, rituals, powers, or even to spare their lives! Other cults worship machine spirits as evil gods were-so they would stay away. Such cults are often Luddites, destroying any electrical device they find. This greatly irritates modern treasure hunters.

Some Zoneminds preach peace and prosperity in a totalitarian sort of way. Mankind is encouraged to work in a robotic way to improve focus. Others keep people locked away in cages to free them from wants of the body. A few are trying to "improve" humanity directly, by whatever means necessary, be it with magic, genetic engineering, or psychological conditioning.

Instead of possessing personalities, they could embody them. Zone Mexico could be fire/hate, Brisbane could be curiosity, Buenos Ares is a nature spirit. Their actions and policies could be focused through them, and try to cause more of it in the world, in its minions and adjacent humans if possible.

Computers

"Never trust a computer you can't throw out a window."

-- Steve Wozniak, Cofounder of Apple Computers

When a spirit invades a computer, it can access its data, but not run programs. If a screen was connected, it shows static during the takeover, and then it can display whatever the spirit wants! (This is limited by its Artist skill or IQ roll; this action is countered by a Computer Operation roll if it is subtle.) After a spirit successfully invades, it has access as whatever is currently logged in. On computers that have been started, but require authentication, the invading spirit can use the peripherals, but not read data. For computers being used, the user's best chance to prevent data from being read at this point is to pull the plug as the simple power switch is insufficient! Since the 1990s, computers' front switches are a "soft" off, meaning there is still power to the circuits. The mecha corporation in the film *Patlabor 1* learned this the hard way.

"Invasion" is as per normal possession (see p. SPI34), with the following difference: Non-AI computers resist with IQ equal to Complexity +3. Hardened computers resist possession at +5. Dedicated computers are immune, however, it is possible to build a Robot brain specifically to house a spirit (using the Dedicated computer option), but then it cannot run any regular programs! A final qualification is that the spirit's ST score cannot exceed the computer's Complexity $\times$ 2. In contests, a free spirit can challenge another's right to a vessel, and if it wins, the loser must flee, even if the victor cannot possess the machine (see p. SPI34). (Reminder: a failed possession attempt means that that target cannot be possessed by this spirit for 24 hours!)

Many combat units will carry a smaller, secondary processor that will run tactical programs. An effective tactic is to disable the secondary computer to make the larger robot function less accurately, less connected, and less aware. A way to do this is to kill a smaller robot, causing its spirit to flee to this computer . . . However expensive it is, some elite units include auxiliary computers Dedicated to Targeting, Datalink, and Navigation (see p. VE61). While a spirit can learn Computer Hacking like any human, it cannot possess more than one computer at a time.

The spirit can be ejected by physically removing the power source. Exorcisms can eject spirits and Pentagrams can trap them. They will not willingly cross "obvious" spirit barriers, but forcing one through or having it chase you at high speeds can cause them to pass through, ejecting the spirit. If the old computer is no longer available, then it must find a new, suitable machine host within ST minutes. As soon as time elapses, it will immediately have to make a HT roll to stay on this plane (see p. SPI 35). A NEMA reactor core counts as a center for "Sanctified Ground" for this purpose.

Points of Resistance

"You know, just once I'd like to meet an alien menace that wasn't immune to bullets.

-- The Brigadier, *Dr. Who* "Robot"

- Zone Washington is still pretending to be a "tame" spirit, while it slowly directs education and entertainment outlets its own version of "enlightenment."
- Astral projectionists might be able to possess machines! While they are gone, their bodies are very vulnerable.
- Resistance must contend with scrying spells instead of (or in addition to) regular surveillance, depending on the Zone.
- While electrolaser and EMP attacks can also disable the electronics, forcing the spirit out, it might be possible to build a device that simulates the force of a spirit trying to push another out of their vessel. Delivered power could match FP conversion, say 3.6MW per ST per second. Applying an efficiency of 10% for the prototypes, and it requires 36MW. (Remember that the commonly salvaged TL8 rE cells contain only 180MWs, see p. RS 8).
- Human warriors are often disheartened when they inflict massive damage on a robot, only to see it continue to advance-robots have a lot of hit points.
- See also "Spirit Breaking" Tools on pp. ASJ12-16. Of particular interest are the spirit repelling Electric Pentacle, and the arresting tools: Specchia Tormentia, Moreton Jar, Shanghai Sandwich, Ghost Blaster and PKE Trap. Kirillian goggles could be used to detect possessed machines from a distance. The EM Aura Reverser is useful for dispatching fleeing disembodied spirits to keep them from reporting in.
- Desperate warriors will take desperate measures. Perhaps that will include a weapon powered by the human's life (such as the Blood Rifle p. WT 89, and Orgone Reactors, pp WT 72, VXii 27).

Technomancer

"Things involving the computer fill me with a childlike terror. Now, if it were a nice ogre or some such, I'd be more in my element."

-- Giles, *Buffy*

Research into the Pentagram spell (see p. M124) may reveal a specific variant that only works on these "machine spirits" (treat as a Bane on one race). They would have no effect on unseelie, real ghosts, astral projection, constructs, or magic (to the surprise of many who did not read the manual). Unlike many spirits, *these* can use artillery and range weapons, so such barriers are not as useful as they could be.

Zone Denver's unique status may make it open to experience Magery. Its Overminds all have at least Magery 0, and some have more . . . Unfortunately, its disregard for human information and human ability has greatly retarded its magical research. Zone Caracas might like chimeras, even to the point of killing any "natural" human infants at birth. A party of chimeras might be a fun team! Zone Brisbane seems to have some sort of pact with the Antarcticans, performing research in protected labs just outside the boundaries of Antarctica and Argentina. The other Antarctic rumors may also be true (see p. RS15). Zone Mexico is the type to create and encourage undead, even keeping atomic liches in their employ.

Spirits may not have the same potential for Magery as humans, but they often practice ritual magic (without the ritual aptitude bonus . . .). Introducing Rune magic for enchantment may also be useful. It is even rumored that many Zoneminds that would otherwise kill humans on sight will conscript mages. It could be cheaper to make and train than neural nets with mana coprocessors. Alternately, they could be reduced to "brains in jars", operating in full-body bionics, or slaved to a machine spirit like a weapon.

Alchemically-enhanced soldiers with drug-dispensing implants could be used by some factions. They may eventually burn out with repeated doses of potions such as Battle, Bravery, Invulnerability, Speed, and Strength (see p. M214). On the other hand, it can greatly increase the resilience of troops to protect them from spells and powers.

Adventure Seeds

"Unless mankind redesigns itself by changing our DNA through altering our genetic makeup, computer-generated robots will take over our world."

-- Stephen Hawking

Island in a Storm: The heroes are hired/called to follow an ancient text describing a sacred barrier called a *pomoerium* (see p. F198). With it, the group hopes to create a self-sustaining barrier against spirits. It begins with the sanctification of several islands, and eventually linking them to form a perimeter. From this area, an ever-expanding web of areas could be made "spirit-free"-a prospect that no Zonemind would relish.

By Any Other Name: Another source of the Pentagon variant may be such an extra-dimensional being looking to create places of solace for its people away from the menace of the "machine spirits."

"Don't Anger the Great Spirits!": A group claims to have found the True Name of a Great Spirit, and accordingly are preparing a large summoning ritual. The PCs could be brought in as participants, organizers, or security. The grounds will need scouts, bouncers, and border guards. The hardest part will be containing humans that do not wish the ritual to take place.

Cold Labs: There are a lot of organizations that want to know what Brisbane is up to in Antarctica. Any information about research performed there would be valuable to any faction.

Hole World: The hellstorms in the United States and Antarctica are themselves worshiped by cults, some of whom hope to use them to escape this world, while others attempt to summon anyone who will aid them in ridding this world of the Master Spirits. How will an Infinity team react if they are greeted as travelers from a parallel world? If the Infinity team leaves, who knows what kind of travelers will be pulled in (Cabal, Centrum, worse?)

Make a Wish: While the adventurers are traveling in a wilderness area, they come across "dying" machine. Its main radio and power plant are out. It proposes a deal: "Help me and I'll help you."

Penguin Preserve: While minding their own business, the heroes are approached by a penguin. It offers them an odd mission that their patron would not disagree with. Examples include reporting on enemy troop movements, planting a tree in a certain field, plating hopscotch with a certain willing child. If it is done, they will be rewarded with odd, yet valuable information, and more missions will follow. Superiors will be nervous, but cannot pass up the opportunity to gain obscure information on enemies' activity and research (even if it begins with detailed blueprints for a food processor).

Fly-By-Wire: Rumor puts a research group close to finding a way to transfer machine spirits over great distances on standard fiber optic cable. Preliminary research shows that it could also be used in containment devices. Objectives include:

- Capture or destroy the prototypes.
- Obtain or destroy the blueprints.

Variants

"There have always been ghosts in the machine."

-- Dr. Lanning, *I, Robot* (2004)

- Six of one, half dozen of another: Mixing a traditional Reign of Steel campaign with Reign of Soul will have some Zone Minds trying to wipe out the others' species on principle. Some AIs will try to wipe out the spirits, and some Spirits will try to destroy all the "imitation" life, and the rest ambivalent . . . if the "aliens" follow the rules.
- Instead of Spirits, one could instead use Ultraterrestrials. (Power corrupts, after all.) In such a universe, darker and twisted robots could be found, with a greater thirst for slow mind games and human blood.
- What if they *intended* to trap the machine spirits in soul burners (see p. VE86) or Orgone Reactors (see p.

- VXii27), under the guise (or understanding) of "Zero Point Energy" or other technospeak?
- What if the "machine spirits" are actually ghosts of "deceased" AIs?
 - Or even human ghosts of ages past?
 - In an ***In Nomine*** game, they could be Ethereal beings, with a limit of the computer's Complexity Forces in each machine (with Kyriotates being a powerful exception). Neither side likes the humans enslaved . . . it is hard for them to reach either Destiny or Fate.
 - In a ***Space*** setting, replace "spirit" with "energy beings" and continue on . . .
 - In a ***GURPS Voodoo*** crossover, the rebels may be channeling powers from otherworldly spirits who are either jealous of the machines' "permanency" or repelled by it.

Media

- Final Fantasy: The Spirits Within (2001)
- Patlabor 1 (1990)

Designer's Notes: *SPANC*

by Fade Manley

I don't know how other people come up with card games; possibly they work out some clever theme, and extrapolate from there. In my case, *SPANC* started with a dream about pirates and ninjas. (I do realize that the proper plural of "ninja" is also "ninja," but these were inauthentic ninjas, so it's okay to stick an "s" on the end.) Recounting the dream on our friendly local PyraMOO, it came up that the only way one could surpass ninja pirates would be to add catgirls. And beyond that you'd have to add lesbians to get any better . . .

Thus, the original idea of pirate amazon ninja lesbians was formed. On a whim, I began writing up skill sets for a silly little RPG based on combinations of those four characteristics, with an eye towards eventually making a PDF game out of it. Pirates morphed into space pirates, with a little clause about how you could reset the game on the oceans instead of space by renaming one skill. Each character type had four specialized skills, and a given catgirl would have to focus on one or two sets, allowing for a nicely diversified set of characters. There were even rules for catboys sneaking onto pirate ships in disguise, much like the famous female pirates of yore.

Then I hit a nearly insurmountable roadblock: how do you write up a skill set for lesbians? Short of turning the game X-rated, one's preferred sexual partners just didn't translate to specific combat and social abilities. (No. Really. I tried.) I hastily swapped out lesbians for amazons, which made it much easier to justify all the poolboys running around the ships. (Before then, they'd been relegated to nothing but dusting and pool-cleaning. Something of a waste, that.) And so *ANSPC* began to come together!

. . . except everyone kept insisting I should call it SPANC instead. While I still prefer the way "Amazon Ninja Space Pirate Catgirls" rolls off the tongue, popular opinion assures me that *SPANC* is much more eye-catching and has its own lovely ring to it. (The opportunities for bad puns are legion, but I prefer to leave the punning to those with greater skill.)

SPANC probably never would have been more than a potentially amusing and badly-written little RPG if it hadn't been for Steve, who told me the idea was good, why not submit it as a card game idea? It wasn't what I'd had in mind, but I figured it was worth a shot (and wasn't about to say no to the potential for actual profit on this wacky idea), so I came up with a set of rules and submitted them for playtest one night.

Designing a card game is harder than it looks.

The first set of rules I came up with was insufficiently coherent and nearly unplayable. I'd made assumptions about how things worked that I never bothered to articulate, there were all sorts of special cases and combinations that I hadn't thought of, and it didn't much help that all the cards were written out in marker with my dreadful handwriting. I carefully used a different color of marker for each type of skill, to make cards easy to match up . . . and then swapped marker colors between two skills when doing the challenge cards, making the color-matching not so much "helpful" as "constantly confusing". Fortunately, rather than laughing me out of the place, the playtesters nicely pointed out the most glaring of my many, many omissions. They also recommended I try writing the rules up again, following a Munchkin rules sheet as an example of what to include.

By the third or fourth iteration of the rules, the most basic blocks were solidified -- the four skills, a series of challenges to overcome, crews made up of catgirls with various abilities -- but the gameplay, to put it bluntly, sucked rocks. The catfight rules either made it too easy for one player to be a jerk and continually screw everyone over, or were so weak no one bothered using them. And without catfights it was nothing but a series of random rolls with minimal choice involved. At one point, the beginning of the game would have entire crews wiped out repeatedly on a single challenge, and then by the end of the game every single crew could breeze through the entire challenge without even needing to roll. Every tweak I made yanked a part of the rules I hadn't considered into another direction.

Which is why I largely turned over the mechanics past a certain point to people with far more experience in such

things, and got back to the fun parts: writing art specs. While writing rules was a tricky exercise prone to error and pain, coming up with entertaining card names, and then a picture to go with that card, kept me entertained for several late nights hunched over my laptop in a coffee shop. Some ideas had to be ditched (the Vicious Wildebeest just didn't have mass appeal), and sometimes I couldn't come up with anything much better than "... draw something funny for this name?", but the process was satisfying in a way rules-crunching had never been.

I've been a fan of Phil Foglio since I first acquired a copy of **GURPS *Illuminati* University**, so being able to get him as an artist for this game sent me into raptures. The card list morphed back and forth as we added in specials, changed the ratio of Catgirls to Toys to Challenges, and occasionally as I chopped an idea off for being too wordy or difficult to illustrate. Then it was another round of art specs emailed off, and time to wait and see what would be faxed back. I put a few in-jokes into the art specs, he added a few of his own, and by the end I got to stare happily at all sorts of marvelous sketches. (I still have the original faxes he sent for many of those, tucked away somewhere in my desk.)

After that, it was a matter of changing the rules a bit more, and waiting.

And waiting.

And reviewing the latest rules tweaks.

And waiting.

(Amazingly, I managed to not strangle anyone who offered helpful rules suggestions during this entire period. This was accomplished at the beginning by my marvelous powers of self-control, and then later on by my marvelous powers of denial. The game had been delayed again? Well, it was sure to come out by Christmas! ... or February! Or ... definitely within a few years! And all of these rules changes were in no way moving the game away from my original vision and the type of game I preferred to play, towards some sort of unholy ***Illuminati***-like abomination of a thousand rules and a thousand more explanations and ... it was all fine!)

And then? There was some more waiting, and more rules tweaks. And some waiting. And changing the rules! And waiting. And sometimes changing the rules back to how they were before a change, accompanied by, you guessed it, waiting. By this point the rules were so far out of my hands I frequently had no idea what was going on with them, and could do little but smile and nod if someone asked me about a tweak. ("What do you think of this variation on the Amazon's use of Catfight?" "Given that the last time I saw the rules Catfights had been removed entirely again, it's hard to say." "Well, we've adjusted the Loot rules ... " "The what rules?" "Oh, right, we renamed Fame.")

And then it was done. I played the almost-final rules version once, and the rules were not anything unholy attempting to devour my soul, but engaging and fun. This was reassuring, as I didn't particularly want to have doomed anyone's soul by means of my game.

Well. Maybe a few people's souls. But not most people.

By the time I watched those gray boxes being unpacked and put on the shelves, the whole process had acquired a distant, unreal touch. Surely an amusing little conversation several months back couldn't have made actual product. But there it was, in glorious color, from the "Clever Riddle" to "Carries Deadly Yarn" to the "Sailor Suit." The rules had gone through so many changes from start to finish I'd have to reread them a few times to be able to play without accidentally using long-axed variations, but I could still recognize the basic "take your catgirls, beat your way through challenges, win fabulous prizes!"

At this point, if you handed me the rules sheet for **SPANC**, I'd barely recognize it from the typed single page I'd handed in. The gameplay has grown much more complicated, and it takes significantly longer to play a single game than it used to -- some of my first versions went so fast I suggested playing multiple games with cumulative scores -- but people seem to enjoy it more. There's something to be said for expanding the mechanics; an extremely simple game might be able to fly on pretty graphics and letting the players talk casually rather than paying much attention to strategy, but then once you've seen all the cards there's no replay value.

If I'm ever crazy enough to do this again, I'm going to work through the rules a lot more carefully before making any poor soul try to playtest them. I'll focus more on theme, and let other people do the number crunching once it's time to poke at those things. I'll beg for more Foglio art, because, well, Foglio art. You can't go wrong there.

I've been told that any supplement or compatible stand-alone will definitely *not* be called ***Barbarian Dogboy Space Marines***, or ***Boy-Dog Samurai Monks***, or any other variation along these lines. Oh well. At least I can still secretly start writing out the art specs in my mind for the Wench cards to go with that game.

Midway Through the Unnamed Decade

More New Cards for *Deluxe Illuminati*

by Steve Honeywell

The world changes, the Illuminati change right along with them. It seems that every year, something new appears in the world, and the Illuminati squabble over it like alley cats fighting for a fish head.

The following 18 new groups are suggested as possibilities for those blank Illuminati cards. Additionally, a new Illuminati has emerged after centuries of staying shrouded in mystery.

Accountants

In Arrow: Left

Out Arrows: Right

Power: 1

Resistance: 4

Income: 2

Alignments: Straight, Peaceful

Pay 5MB *from this group* at the end of your turn and reorganize your money freely. This is not an action.

Amnesty Multinational

In Arrow: Right

Out Arrows: None

Power: 0

Resistance: 5

Income: 0

Alignments: Liberal, Peaceful, Fanatic

+1 on *any attempt* to destroy any Government or Communist group.

Bloggers

In Arrow: Left

Out Arrows: None

Power: 0/2

Resistance: 6

Income: 1

Alignments: Fanatic

+2 on *any attempt* to neutralize or destroy.

Boy Bands

In Arrow: Left

Out Arrows: Up

Power: 2

Resistance: 0

Income: 5

Alignments: Straight, Peaceful

+2 for *direct control* of Recording Industry or Empty Vee.

Cell Phones

In Arrow: Right

Out Arrows: Up, Down

Power: 2/3

Resistance: 1

Income: 2

Alignments: None

+2 for *direct control* of Phone Company.

+4 for *direct control* of Phone Phreaks.

Civil War Re-enactors

In Arrow: Right

Out Arrows: None

Power: 0

Resistance: 6

Income: 2

Alignments: Weird, Violent

+1 on *any attempt* to control Survivalists, Militia, and Gun Lobby.

Documentary Filmmakers

In Arrow: Right

Out Arrows: Left

Power: 1/1

Resistance: 6

Income: 1

Alignments: Liberal

+1 on *any attempt* to control, neutralize, or destroy Hollywood and Big Media.

Eye-Pods

In Arrow: Left

Out Arrows: None

Power: 0/1

Resistance: 3

Income: 3

Alignments: Straight

Once per turn, owner can add, remove, or *reverse* an alignment of any other group in his power structure; change lasts for owner's turn only.

Karate Schools

In Arrow: Left

Out Arrows: Up

Power: 1

Resistance: 6

Income: 2

Alignments: Straight, Violent

+1 on *any attempt* to destroy.

La Lethe League

In Arrow: Left

Out Arrows: Down

Power: 2

Resistance: *

Income: 1

Alignments: Fanatic, Violent, Criminal

Normal resistance 3; against any Conservative or Fanatic group, resistance 10.

People Eating Tasty Animals

In Arrow: Right

Out Arrows: Left, Down

Power: 2

Resistance: 4

Income: 1

Alignments: Fanatic

+1 for *direct control* of Fast Food Chains.

Prisons

In Arrow: Right

Out Arrows: Left, Up

Power: 3

Resistance: 3

Income: 0

Alignments: Straight, Violent, Government

+1 for *direct control* of Criminal groups.

Real Estate Agents

In Arrow: Right

Out Arrows: Down

Power: 2
Resistance: 0
Income: 3
Alignments: Straight, Peaceful

Owner may move one group freely at the end of his turn. This is not an action.

RE-Bay

In Arrow: Left
Out Arrows: Right, Up
Power: 3
Resistance: 1
Income: 5
Alignments: Weird

Owner may transfer money *from this card* freely. This is not an action.

Right-Wing Media Conspiracy

In Arrow: Right
Out Arrows: Up, Down
Power: 1/3
Resistance: 6
Income: 2
Alignments: Conservative, Fanatic

+2 on *any attempt* to destroy Liberal, Communist, and Weird groups; cannot be used in *any attempt* to destroy Conservative or Government groups.

Roadside Tourist Traps

In Arrow: Left

Out Arrows: None

Power: 0

Resistance: 1

Income: 2

Alignments: Weird

+1 on *any attempt* to control Video Games and Theme Parks.

Soccer Hooligans

In Arrow: Right

Out Arrows: None

Power: 0

Resistance: 6

Income: 0

Alignments: Violent, Fanatic

+1 on *any attempt* to destroy.

Spyware

In Arrow: Left

Out Arrows: None

Power: 0/1

Resistance: 1

Income:

Alignments: Criminal

Pay 5MB *from this group* to interfere with a privileged attack.

New Illuminati: The Market

Power: 7/7

Income: 10

The Market is the classic zero-sum game. You make a dollar, someone else loses a dollar. In truth, no matter who makes money in the Market, the Market itself rakes in tons of cash. Since the first time two people had something the other wanted, the Market has existed. Today, the Market is everywhere, and everything is for sale. The Market cares nothing for money in the bank. Instead, it craves cash flow.

Power and Goals: The Market wins if its entire power structure has an income of 40 megabucks or more, including its own income of 10. Use of Special Action cards like Market Manipulation does not count as income for determining victory conditions. During the income phase of its turn, the Market can distribute money freely, dividing up its total income as it sees fit. At the end of its turn, the Market may make two additional free money transfers.

Playing The Market: If your opponents will allow you to take high income groups, so much the better for you. There are a lot of groups out there with incomes in the 6+ range, and snapping up a couple of them puts you within sight of your special victory condition. Of course, you can expect a lot of resistance if you start going for OPEC, Multinational Oil Companies, Loan Sharks, and Video Games, particularly if you are playing against the Gnomes.

Instead, play similarly to the Gnomes and go for groups with lower incomes. A few solid groups bringing in money will be just as good for you as one powerful group. To keep yourself protected, groups with a moderate income but significant power and/or resistance will help you defend against attacks and keep the money flowing. Groups like New York, CFL-AIO, Texas, Defense Contractors, and Triliberal Commission are all powerful enough to be useful, hard to take or destroy once controlled, and have incomes that are decent without being scary. While your opponents are busy adding up your total income, you can go for a regular victory.

Don't be afraid to spend your money. Unlike the Gnomes, you don't need to hoard. If you are attacked, especially if your biggest income-producing groups come under fire, spend freely to protect them. Your power isn't sexy, but stockpiling resources at the start of a turn gives you the ability to spend a ton of cash on a particular action. Outspend, and you can outlast.

Finally, watch out for the Assassins, and befriend them if you can. While the Gnomes can stack up mountains of money on their Illuminati and win, you can't. You are entirely reliant on the strength of your entire power structure. Attacks to neutralize are a serious threat to you, and anything you can do to avoid them will benefit you in the long run.

Opposing The Market: Keep a careful eye on what the Market picks up. It's possible that with the right combination of cards, the Market can win with just four groups under his thumb. While you can destroy groups like OPEC and the I.R.S., often it is better to take them and keep them away from the Market. Should he take high-income groups, your best bet is to attack to neutralize unless you are playing Cthulhu. Try to get the Gnomes to spend all of their money attacking the Market and you weaken two opponents at once.

Once the Market gets close to his victory conditions, it will be very expensive to bring him down. A coalition is the only way to have enough money to neutralize or destroy his power structure.

New Rules and Clarifications

- *Fort Knox*: For the purposes of determining income, Fort Knox counts as having an income of 1.
- *I.R.S.*: For the purposes of determining income, the I.R.S. counts as having an income of 2 for each opposing player.
- *Post Office*: The Post Office's negative income counts against the Market's total income.
- *Savings and Loans*: The Market may draw one extra card per turn if it controls this group.
- *State Lotteries*: The Market gets +2 income if it controls this group. This +2 income counts toward the Market's total income.

Pyramid Review

Emergency Response II (for Silver Age Sentinels)

Published by [Guardians of Order, Inc.](#)

Written by John Davies

Cover by Ed Northcott & Jeff Mackintosh

Illustrated by TK Labus

32-page b&w softcover; \$9.95

Despite the similarity in titles, *Emergency Response II* is not a sequel to [Emergency Response](#). There are of course, similarities. It is written for both the TriStat and the *d20 System* versions of Guardian of Order's superhero RPG, [Silver Age Sentinels](#). It takes place in the game's default setting, a version of New York known as Empire City. It begins with the characters responding to an emergency. It is organized into two parts. It is also designed for use with three to five hero characters built on 150 points.

The emergency in question is the appearance of Iron Walkers across the city, first in Central Park, then at a construction site, and finally at 1 Police Plaza. Iron Walkers are associated with the supervillain automaton known as Iron Duke, who led an assault on the city in 1983 in order to carry out a redesign of its layout. Thankfully, the Guard, Empire City's premier super hero team, thwarted the Iron Duke's grand urbanization scheme. Although captured, the Iron Duke eventually escaped; with his whereabouts still unknown, the question is, has he returned, or is someone else controlling the Iron Walkers?

Emergency Response II assumes that the player heroes are part of an established or known team called in to assist in the capture of the Iron Walkers by the Marvels Tactical Unit. During the subsequent police debriefing, word is received of a fourth appearance by an Iron Walker, this time at the home of a collector of artifacts related to the Victorian engineer, Isambard Kingdom Brunel. The robot broke in and stole two journals written by Brunel's father, Marc Isambard Brunel, who had been Empire City's chief engineer in the 1790s. Which raises a second set of questions -- what was in the journals, and why were both a robot and an eminent Egyptologist interested in them?

[SPOILER ALERT!]

The bulk of "The Sphinx Project," the first part of *Emergency Response II*, involves determining who is really controlling the Iron Walkers. There are at least two other supervillains with robotic connections to contend with, neither of whom will be happy at having been tracked down. The second part takes a very unexpected turn when the heroes find themselves on Mars! In "The Horus Connection," they discover what the villain of the piece has been planning all along: the chance to be reunited with his father and work with him to restore his lost genius. They learn this after the characters have been diverted by their own discoveries on the Red Planet. It is home to the Titans, a dying race that also looks to the past for their former glories and seeks a solution to their diminishing situation in a forthcoming planetary conjunction. Occurring once every five millennia, the correct ritual conducted during this mystical event enables the Titans to raise an army of the ascended, or Titans that have passed on. This would place thousands at the command of the Titans and powerful enough to attack a world that promises infinite life -- Earth!

In to this mix are thrown the central villain of *Emergency Response II* and his father, plus a marooned party of the reptilian aliens known as the Huad. The latter are the wild card in this adventure, able to lend a hand in stopping the

Titans' audacious plans. The climax of the adventure is a suitably rousing battle, giving the players the chance to save the world. Of course, since this takes place on Mars, taking the credit for it is another matter.

[END SPOILER ALERT]

Physically, ***Emergency Response II*** is far from problem free. The first of which is the most obvious. The cover, a reprint from the ***Silver Age Sentinels*** rulebook, could be seen as giving the identity of the adventure's prime villain away. Then again, its use could just be another bluff as to his identity. The internal artwork is not only sparse, it fails to serve the needs of the scenario. None of the NPCs are illustrated, which when combined with the lack of descriptions for many of the characters, leaves the GM very much on his own to get a feel for the assorted NPCs. Another proofread would have made the book an easier read as well.

Although designed for use with both versions of ***Silver Age Sentinels*** and the Empire City setting, it would only take a little tweak here and there to make it useable with any superhero RPG. Not just with [*Mutants & Masterminds*](#), but with access to the conversion guidelines found in [*Reality Storm: When Worlds Collide*](#), with [*Champions*](#) as well.

A nice touch that is that the book includes scenario hooks that can be used as potential sequels to the two differing halves of the adventure. Although it does feel a little cramped, everything that the GM will need to run ***Emergency Response II*** is included. And when run, what ***Emergency Response II*** does, is a fine job of leading the player heroes from simple crime prevention into a very different situation . . . one that involves saving the world in a very superheroic fashion.

Pyramid Review

Army of Darkness Card Game

Published by [Eden Studios, Inc.](#)

Designed by M. Alexander Jurkat & George Vasilakos

120 full-color cards, rules sheet, 2-4 players, \$20; requires one six-sided die (not included)

If you're not a fan of the classic and cult-favored Evil Dead series, here's a spoiler for *Army of Darkness*: The plot involves our seemingly indestructible hero, Ashley, going back to the Middle Ages to smack the stupid out of a legion of risen dead. The card game is pretty much the same thing, only with all the fun sucked out of it.

The object of the game depends on who (what?) you are at the moment. To win, you must possess the Necronomicon. If you're currently good, you must also be free of Monsters. If you're evil, you must have at least five Monsters.

Players start with a hand of cards, a character card in front of them, and a Monster card in front of that. You can play movie heroes Ash, Sheila, Arthur, or Henry. On your turn you draw a card, play a card, and may or may not have to attack a Monster. Cards include Items, Events, Allies, and Monsters. You're limited in what you can use; you may have any number of Items and Allies in play, but you can only use one or two at a time. Switching your active card is a free action, and that one is placed on top of your layout.

The gear is the sort of thing you see throughout the film, like swords, crossbows, and horses, but also more exotic things like the Necronomicon and the Death Coaster. They offer you bonuses, and these modifiers combine with each character's special ability when facing off against the Monsters. If you have a Monster in front of your character, you must make an attack, though this can be against the top Monster card in anyone's stack or against another player's character.

To attack another character, you must get an eight or higher on a six-sided die (this is where those weapon bonuses come in handy). The price paid by the loser is the loss of a card. When you go after a Monster, the target number varies, but the harder they are to kill the higher their Victory rating. You draw new cards from the deck equal to this rating, equip your character immediately with anything you find (this helps get around the one-card play limit), and discard the rest.

Anytime you find yourself without cards, either through play or combat, your persona changes alignment. Good characters flip their card to the evil side, and vice versa. You then draw a fresh hand for your new life and begin working toward different victory conditions.

There's no artwork to speak of, but plenty of screen shots from the film (each with an appropriate quote). Some shots are murky or badly blocked and the quotes are small, but otherwise it's decent graphic work. On the other hand, the cardstock is just a hair too mushy, and the game as a whole is characterized by a lack of attention to detail. There are misspellings, and one of the Allies stops opponents from playing "Mistake" cards on you. Well, there are two "Malfunction" cards and some "Yer Screwed" cards, but no "Mistakes" (except this one . . . oh, the irony). The game lists no age limit, but the cards make liberal use of adult language and even some nudity.

Game play is horrible. What sound like cool mechanics on paper -- switching moral positions and trying to second-guess which side's goals can be more easily accomplished -- turns out not to be nearly as riveting in practice, and indeed rather self-defeating. Everyone starts "good," so the first person to turn evil wants Monsters in front of him. Anyone with Monsters must make some kind of attack, but since you don't want to remove your own (else you're moving away from your goal), you should attack someone else's -- and since they're good, they *want* you to help kill

off their enemies.

You can attack the character instead, but you need an eight to succeed -- and even if you succeed, you only turn them evil when all their cards are gone, and as you only get one card play per turn, you're not going to run out easily unless you spend a lot of time losing character fights at eight plus, limiting your own plays. (There are a few alignment-switching cards, if you're lucky enough to get them.) You end up either moving farther from your goal or helping others toward theirs. Add to this an annoying number of cards that ask you to "roll 1-2 after use or discard" and the numbers overwhelm any other sensation of play. It is possible for a game to last for hours if everyone is paying attention; fortunately they won't be.

Army of Darkness is one of those games where, once it starts and you see how disappointing it is, you can't wait for it to end, but it just . . . keeps . . . going. Even the rules suggest you can make up your own rules if you don't like theirs. Probably offered tongue-in-cheek, but it looks possible . . . and, sadly, necessary.

Pyramid Review

Plundered Vaults (for Warhammer Fantasy Roleplay)

Written by Ben Counter, Graeme Davis, Brian E. Kirby, Nathan Greavey, and Carl Sargent

Published by [Black Industries](#)

96-page b&w hardcover; \$16.49

Plundered Vaults is the first book released for *Warhammer Fantasy Roleplay*'s second edition and it has a lot to live up to. The popularity of the first edition was mostly due to excellent adventures like the *Enemy Within* campaign, so this new adventure collection is going to be closely scrutinized by the fans.

Most of the artwork throughout this 96-page hardcover is new, with very grim and gloomy black-and-white pieces. The characters portrayed are scarred and rough, as befits the setting, though some look like they've discovered steroids a few centuries early. The maps are quite good; clear and easy to read. The cover art, a necromancer deep in study, is uninspiring but well-drawn.

Despite the title, thankfully this is not a collection of dungeons. Instead, the title refers to half of the six scenarios in the book being updated versions of first edition material originally published in *White Dwarf* magazine and *Restless Dead*. These three are "The Grapes of Wrath," "The Haunting Horror," and "Rough Night at the Three Feathers." Only minor changes have been made in updating them, since the rules haven't changed too much. A gnome in one adventure has been changed to a halfling, since gnomes are apparently no longer a part of the setting, and a band of the rat-men called Skaven have been changed into a rival adventuring party. Presumably the Skaven were removed because they are central to one of the new adventures and the writers didn't want them to feel overused.

[SPOILER ALERT!]

"The Grapes of Wrath" has the adventurers defending a village's harvest from evil flying skulls, a setup that could easily descend into farce. Fortunately *Warhammer Fantasy Roleplay* is capable of handling humor as well as horror, so it won't be a loss if played only semi-seriously. "The Haunting Horror" traps the PCs in a wizard's house that has been taken over by Chaos and has fallen out of time -- it's an old-school adventure, the closest *Plundered Vaults* comes to a dungeon, although it does have several truly creepy moments.

Then there's *Rough Night*, which blows the quality through the roof. *Rough Night* is one of the all-time classic *Warhammer Fantasy Roleplay* adventures. It presents a seemingly ordinary coaching inn and several groups of NPCs who are staying there on the same night; how these groups interact and how their plots play out is shown in a timeline that makes it easy for the GM to see who is doing what when, and how the PCs can get involved. By the end of the night there will be murders, blackmail attempts, and thefts, and everyone will have had a very rough night. Running this was quite a pleasant surprise; it plays even better than it reads and my group had one of our best sessions.

The three new adventures are a mixed bag. "For Love or Money" is about the search for a missing girl who is wanted by a band of outlaws, the Skaven and Chaos-worshippers. She appears to be pregnant, but in the "explosive" climax her true nature is revealed as she mutates into a new and horrific form. The plot relies on the party's employers lying to them several times and by the end they may not have figured out what was really going on. Otherwise, it's an interesting investigative piece with a good grasp of the atmosphere of *Warhammer*.

"Carrion Call" traps our heroes in the mansion of a very strange family who are in league with the Undead. There's a

very spooky, gothic tone to the whole thing, especially when the PCs must choose which member of the creepy family to trust in helping them escape, but it never quite escapes the weight of the clichés on which it is based. With a little work a good adventure could be salvaged from "Carrion Call."

Finally, "Sing for Your Supper" raises the bar for quality again. Another investigative scenario, Sing is a story of interrelated mysteries involving a chain of butchers, an opera singer, a missing daughter, and some suspicious sausages. Each scene is handily summarized with all of the key information to be gained at the top and optional information below. This chapter could be used as a template for anyone writing investigative ***Call of Cthulhu***-ish scenarios, although I would have put the NPC descriptions throughout the text rather than collecting them at the end. The climax, in which it is revealed that the sausages cause mutation and the opera singer becomes a reverse-siren, is inspired. My only worry is that the "evil sausage" motif was used in an earlier adventure, "Fear the Worst," which was released on the Internet by Hogshead Publishing.

[END SPOILER ALERT]

Overall, ***Plundered Vaults*** is very worthwhile. It features two excellent adventures and several of good-to-average quality. None of them are rubbish, even if a couple could do with tinkering. With this release, Black Industries have shown that they have a firm grasp on the atmosphere of ***Warhammer Fantasy Roleplay*** -- they've even kept the punning names -- and things look very good for future publications.

Irregular Webcomic

by David Morgan-Mar

Irregular Webcomic

Irregular Webcomic

Buy It Once, Buy It All!

I recently upgraded my video card in my computer, so I could tinker around with the latest generation of games.

Let me stress, momentarily, that this was by no means trivial; apparently the video card industry has gone completely bug-nuts in the past five years or so, to the point where the entire process is steeped in a morass of arcane terminology, weird methodology, and specs which -- at a certain point -- seem to break down to "\$100 per extra frame per second." If similar methodology applied to, say, the sock world, then I'm certain there'd be ultra-piped parallel-toe socks capable of supporting 16 feet at once, and which cost \$600 a pair.

Anyway, having made a decision which I seem relatively happy with now, but which I could quite possibly regret in another few days, I set out to buy a snazzy game or two.

One of those games is Valve's *Half-Life 2*, quite possibly the highest-rated first-person shooter of all time. Having decided to buy it, I discovered something else about this particular game: I had no less than five options to purchase it.

As you can imagine, having spent weeks deciphering videocardese, I was thrilled at the prospect of doing it all over again for one *game*.

Fortunately, it wasn't as bad as I'd feared. The "problem" (such as it is) is that Valve has decided on an alternate distribution method for *Half-Life 2* -- one they pushed hard. Commercial game software has traditionally been bought via software retailers, such as Electronic Boutique, Babbage's, Best Buy, Circuit City, Wal-Mart, and the like. While two of the five "versions" of *Half-Life 2* were sold in this same way as before, the other three were sold only via online download, through Valve's [Steam](#) online community/e-store/game-matchmaking service.

For those keeping track at home, the various editions are:

- Retail "regular" -- Just the game, on CD
- Retail Collector's Edition -- Comes with the game on DVD, plus the original *Half-Life*, quasi-updated to the new *Half-Life 2* engine, plus a T-shirt
- Downloadable Bronze Edition -- Just the game, for \$5 less than the regular Retail Edition
- Downloadable Silver Edition -- *Half-Life 2*, plus every game Valve has made
- Downloadable Gold Edition -- Same as the Silver Edition, plus a bunch of goodies (a hat, posters, strategy guide, and so on)

Oh, and there are three different boxes for the Regular retail edition.

Curiously, both retail editions also require online activation via Steam's registration system . . . so, by hook or by crook, you'll be dealing with their online service. That made my eventual decision (the Downloadable Gold Edition) a bit easier to swallow. (Unfortunately, the \$10 S&H charge for the extra goodies made me feel there was a bit of "bait and switch" going on.)

Now, I could easily spend a column or two on the electronic distribution aspect of this, but I'm not today . . . at least, not directly. No, what I'm most interested in today are the downloadable purchase options that permit the buyer access to the entire back catalog.

Now, even though Valve has been around for seven years, they've only released a handful of games, so it's not as outrageous a deal to get access to their backstock as, say, Electronic Art's or Origin's. Still, it was an interesting incentive -- one that pushed me over the edge to over-buy a bit. After all, if I wanted to experience, say, *Opposing Forces* (the add-on pack to the original *Half-Life*), it would probably cost me at least \$10 to track it down -- the difference in cost between the Bronze and Silver packages.

Now, I find this an interesting development in the implications for the RPG world, because I could easily see someone

in the industry doing something similar in the future. Step with me, won't you, through the doorway of an envisioned future?

Err . . . jiggle the knob a bit. It opens outward. Yeah, it's not intuitive; sorry.

<ahem> Anyway, the second edition of the successful **Füebár** RPG has just been released. You're holding the full-color hardcover in your hands, and it's beautiful. However, there's a special collector's edition, which also provides online access to all the first edition **Füebár** material, and it's only \$20 more. Sure, they're only PDFs and not "actual" books, but you never collected any of the first edition material, and this seems like a good way to catch up . . .

This example would provide an option for would-be players who don't want to feel like they're "missing out" on anything. And it should be relatively economical for the company. Since the industry has switched to a near-periodical model for most of its RPG material, most products older than three months old have nowhere near the sales as when it was new; in the same way that an issue of *Time* magazine from six months ago won't exactly fly off the shelves. (Yes, this new model causes no end of consternation for many RPG publishers . . . but that's a topic for another day.) Even worse, the periodical nature of RPGs means that there are lots of products -- since publishers want to maintain a shelf presence -- but they aren't available (since retailers aren't stocking them as much), so new fans might believe that there's this huge amount of information they would need to track down and buy -- which takes time and money. And those new fans may not want to make that investment.

But if fans were presented with a relatively low cost of entry for a long-established line, they might see it as a selling point. And there are many ways that this "low-cost backstock" option could be done besides bundling it with collector's editions. For example, a game company could sell electronic access to "years" worth of material, in the same way that you can buy seasons of television DVDs.

Of course, there are downsides; for example, fans might begin to believe that all RPGs will eventually be released in these cheap electronic formats, and forgo buying new editions -- this would prove very detrimental to publishers. (Comic publishers have faced a similar problem; the rise of trade paperbacks have trained many fans to avoid buying new issues, since the cheaper, higher-quality, ad-free alternatives will be available so quickly.)

Nevertheless, I suspect that some enterprising company might try such an experiment in the Not Too Distant Future. (Some have done so already, to a limited extent; for example, ***Path of Deception***, the first post-hiatus adventure for ***Earthdawn***, came bundled with a CD that had the main rulebook on it.) Whether or not this plan succeeds, I'm not sure I can say. But I'm all for innovative ideas -- especially those that advance the hobby and make it more accessible to new fans . . . and not just those able to spend \$600 on a pair of socks.

--Steven Marsh

Alcohol and Brewing: Ale

for GURPS

by S. E. Mortimer

This work is a continuation of the previous article ["On Inns, Taverns, and Alehouses."](#) and there is a little overlap between the two. It explores the making of ale in medieval England and concentrates on those who actually did the brewing during these times -- the alewives. There are a few references to **GURPS** and prices are listed in **GURPS** \$.

Introduction

The consumption of alcohol was ubiquitous in medieval society. Though some people counseled moderation, nobody recommended abstention -- ale was an essential part of the diet. Only the very poor drank water, which was of dubious quality, and best avoided where possible. Any woman with a cauldron and some spare cash to buy grain could brew and sell ale. All she had to do was brew a fresh batch, put out a sign (an ale-stake), and turn her home into a temporary alehouse. Unlike most industries, the aristocracy didn't control the brewing industry with monopolies, but it exacted fines from people found guilty of using faulty measures, selling weak ale, or selling at too high a price. The last article focused on alcohol once it reached the point of sale in ["Inns, Taverns and Alehouses."](#) This article focuses on the actual production of ale so that a GM will have a more realistic idea of how the various aspects of ale production could affect the medieval world, and how this might affect the PCs.

The Alewife

Contrary to popular belief, it was the women who brewed most of the ale in a medieval village. Brewing was considered to be "cooking" and hence, "women's work." Even as late as the 18th century, over 70% of licensed brewers in England were women. The majority of brewing was done in small batches by women for their own household. If a woman had a small amount of excess she would sell it to her neighbors. In times of plenty, grain might be cheap enough to enable someone to buy enough to make a larger batch for the express purpose of selling. The term "alewife" referred to a woman who brewed ale -- a "brewster." More specifically, it referred to a woman whose husband was involved in some other trade -- usually a baker or miller since they would have access to relatively cheap grain. In smaller villages there was unlikely to have been a permanent tavern. Brewsters operated from their own homes when they had a fresh batch of ale to sell. There was always several women selling ale at any one time. When one batch had been consumed, folks would move onto the next alehouse. If one wanted to become a full-time brewster, one needed a license. It was common for Justices to issue licenses to widows to sell ale from their homes so they would not be a financial burden to the parish.

Ale

Medieval ale was different to the beverages called "ale" today. It was only partially fermented -- sweeter, thicker, and quick to spoil. It only took a couple of days to make a batch, and it was only drinkable for a few days afterwards. By the second or third day it would already be beginning to spoil. There was legislation put in place to prevent ale more than four days old from being sold. As previously noted, ale was an essential part of the diet, containing loads of carbohydrates, as well as vitamins and proteins that were not present in other parts of the medieval diet. Ale was fairly expensive -- a gallon cost about one day's wages for an unskilled laborer. Even at this price, the profits from such an enterprise were slim, but it was one of the few ways a woman could legally

Beer and Hops

The main difference between ale and beer is that, with beer, hops is added to the "gruit" (see below). Hops acted as a preservative making the brew last longer, but it made the

earn hard currency.

Brewing (IQ/Average)

The techniques for using yeast and cereals to produce alcohol have been known since the Bronze Age or even earlier. A professional skill called Brewing needs to be created to encompass the skills involved in producing brewed alcohol. There are several steps involved in brewing ale: malting, mashing, sparging, and fermentation.

Malting: Malting has two purposes. First, it preserves the grain for longer term storage than is possible with the raw grain. Second, it activates enzymes in the grain that help convert starches into maltose and other sugars. Malt is rarely produced by the brewsters since the technology and tools required are totally different to those needed for brewing. Professional "maltsters" engage in this occupation. To make malt, the harvested grain is first soaked in water and allowed to sprout for a few days. To achieve this, the grain is spread out several inches high on the floor of a "raking room," often located in the attic or loft of the malt house, and moistened. The grain generates heat as it sprouts so it needs to be scooped and turned every few hours to prevent cooking and to expose all the grain to carbon dioxide in the air. After the grain has germinated, it is dried in purpose-built ovens at low to moderate heat for a few hours. Once dry, it is stored in the malt house. It takes five to seven days to produce a batch of malt. A maltster and his assistant(s) can produce four or five batches per month in each raking room. Each bushel of grain requires around ten square feet of floor space. The skill of making malt can be subsumed into the professional skill mentioned above called Brewing.

Mashing: To prepare malt for brewing, it must be broken into smaller pieces to enable water to get at the starches and sugars in the malt. Crushing was done with a mill or hand quern but the grain wasn't ground into powder -- just broken into coarse pieces. The mill stones would be adjusted so that they were a little further apart than for grinding flour. Once crushed, the various malts are added together in the required ratios, mixed with hot water to the consistency of thick porridge, and let stand for a few hours. During this stage, the enzymes in the malt complete the conversion of starches into simple sugars for the yeast to ferment. The higher the temperature of this mixture, the sweeter the brew will be, but temperatures that are too high will kill off the enzymes. Once the mixture has been let sit for a few hours the liquid is drained away from the solids. This liquid is called the "wort."

Sparging: Sparging is the technique of adding additional hot water to the malt as it is draining in order to rinse more sugar out of it. It is unlikely that sparging was performed during the Middle Ages -- it was a later innovation. If sparging was not performed then it is possible to add a second (or even a third) batch of hot water to the wort sludge to make use of any remaining sugars. This double and triple mashing doesn't seem to have occurred until the Elizabethan period, though. Without sparging or double mashing, medieval ale production was very inefficient, producing less ale per bushel of grain than more modern techniques.

Fermentation: This is the act of using yeast to convert sugars into alcohol. A large cauldron or vat is filled with the warm wort, topped up with water, but not heated. This is the main difference between modern and medieval ales (see textbox, above). At this stage "gruits" could be added. These are flavorings that might include rosemary, honey, yarrow, ginger, cinnamon, etc (but not hops -- see *Beer and Hops* textbox, above). Costmary ("alecost") was sometimes added to the gruit to increase longevity by a few days. During the fermentation stage, the cauldron is not covered. The wort is allowed to cool overnight before

drink more bitter. Hops was known by the Romans, mainly as a medicinal plant. It was known as a preservative since at least the 9th century but not as a brewing additive. In Bavaria, hops was used to brew "bier" as early as the 12th century, and beer from Flanders was well known, but it doesn't seem to have been drunk much in England until the 15th century. There was some resistance to its use since several attempts were made to ban it. One example is in 1464 when the Ale Brewers Company of London petitioned the Mayor and Alderman to prevent the use of hops. In 1493 Beer Brewers became recognized as a guild and remained separate from the Ale Brewers Guild until 1556.

Ale & Beer

As stated above, the difference between ale and beer is the addition of hops. This process involves boiling the wort after mashing -- a process that was not usually performed on medieval English ales. Boiling the wort removes a lot of the proteins in the brew, enhancing its clarity and its longevity. But the nutritional content is reduced at the same time. Because medieval ale was not

pitching the yeast. Yeast is either added from the dregs of a previous batch or an airborne "wild yeast" is allowed to infect the brew. When it is fermenting, a layer of bubbles (called "barm") forms on the top, protecting the batch from bacterial contamination. If the barm fell, it was an indication that the batch was contaminated or the yeast had died (no yeast will be available for making subsequent batches).

boiled, it had a very short shelf life (three or four days), was fairly thick and cloudy, with a low alcohol content from the partial ferment, and was more nutritious than later beers and ales.

Casking: Medieval ale was casked before it had finished fermenting, so some of the sugars had not yet been converted into alcohol. Because of this, these ales were generally sweeter and had a lower alcohol content than more modern ales and beers. A large cask was called a *barrique* and held around 60 gallons. The standard *barrel* held around 36 gallons. A smaller cask called a *kilderkin* (Dutch for "little child") held 9 gallons. The smallest cask was called a *pin* and held 4.5 gallons. A *keg* was a common cask on ships (mainly used for holding water) but its capacity varied greatly -- anywhere from 5 to 10 gallons.

Skill Roll: To brew a batch of ale, one needs to decide upon the quality of the ale to be attempted (see Ale Quality, below) and acquire the appropriate ingredients. It takes around 2 days to brew a batch of ale. At the end of the second day, a Brewing skill roll is made. Modifiers include: -2 for Good quality ale; -4 for Fine quality ale; -2 if yeast is not available (need to rely on a "wild yeast"); +2 if a thermometer is available (not in the Middle Ages). A successful roll produces 8 gallons of ale per bushel of malt -- just enough to break even with cheap ale (see Pricing, below). A typical batch of ale used about 6 bushels of malt. Every point of success raises the quantity by one quart to a maximum of 10 gallons. For example, if the roll succeeds by 2 points then 8.5 gallons is produced per bushel of malt. A failed roll results in a failed batch (and no yeast for subsequent batches). Critical failure results in some sort of toxin entering the batch. Anyone drinking this will suffer effects similar to food poisoning (see "[Rationalizing Rations](#)" for more information). Critical success raises the quality of the batch by 1 grade, e.g. Cheap ale becomes Good ale; Good ale becomes Fine ale; Fine ale becomes Very Fine ale (can sell for \$8 per gallon).

Ale Quality

There were many different grades and types of ale. Some were sweeter with a lower alcohol content, others were more bitter with a higher alcohol content. Taste was determined by the types of malt and yeast used, the fermenting temperature and duration, and the spices that were added to the gruit. For roleplaying purposes, three types of ale are adequate: cheap, good, and fine. It is possible to produce Very Fine ale but not intentionally -- a lot of factors have to be "just right" and it mostly depends on luck (modeled by a critical success on the skill roll).

Cheap Ale: Made of oat malt and barley malt at a ratio of 2/3 oats to 1/3 barley. Average price of \$24 per bushel. Cheap ale had a low alcohol content and was not as thick as better grades of ale. If one is using the Drinking and Intoxication rules on pages 439-440 of the **GURPS Basic Set**, then treat a gallon of cheap ale as four "drinks." A gallon of cheap ale sells for about one day's wages for an unskilled laborer -- around \$3.

Good Ale: Made primarily with barley with a little wheat and oats (there were many different recipes). Use the cost of malted barley as a guide for the cost of malt, i.e. \$32 per bushel. It was thicker and had a higher alcohol content than cheap ale. To make good ale, a gruit of herbs and spices is required at a cost of at least \$2 per bushel of malt. If one is using the Drinking and Intoxication rules, then treat a gallon of good ale as six "drinks." A gallon of good ale sells for \$4.

Fine Ale: The best tasting and most potent of all. In villages and small towns, fine ale was usually only brewed at the lord's manor house or by a skilled villager who sold her produce to the manor. It is likely that more malted wheat will be used in these recipes -- average price would be around \$35 per bushel. To make fine ale, a gruit of herbs and spices is required at a cost of at least \$10 per bushel of malt. If one is using the Drinking and Intoxication rules, then treat a gallon of fine ale as eight "drinks." A gallon of fine ale sells for around \$6.

Pricing

To maintain consistency, prices from ["Tilting at Windmills"](#) have been used. Malted grain is more expensive than freshly harvested grain. Here are some suggested prices in **GURPS** \$.

(one bushel = 8 gallons or 4 "pecks" of dry goods)

Grain (one bushel)	Weight	Cost
Oats	32 lbs	\$14
Barley	48 lbs	\$25
Wheat	60 lbs	\$30

Oats -- malted	25 lbs	\$20
Barley -- malted	38 lbs	\$32
Wheat -- malted	50 lbs	\$38

Drink (1 Gallon)	Weight	Cost	Alcohol*	Notes
Ale, cheap	8 lbs	\$3	4 drinks	sours after 2 days
Ale, good	8 lbs	\$4	6 drinks	sours after 3 days
Ale, fine	8 lbs	\$6	8 drinks	sours after 3 days

*Alcohol -- the number of "drinks" per gallon. E.g. 1 gallon of fine ale contains 8 drinks (see **GURPS Basic Set**, pages 439-440).

A bushel of malt yields between 8 and 10 gallons of ale. A typical batch of cheap ale would consist of 4 bushels of malted oats and 2 bushels of malted barley at a cost of \$144 (80 + 64), producing 48 to 60 gallons of ale. To break even, each gallon of ale needs to sell for between \$2.40 and \$3. As stated above, a gallon of cheap ale sold for around \$3, so the brewster would barely break even if she produced only 48 gallons from a batch. If she tried to water it down, she risked being fined for selling substandard ale. If she was skilled and worked hard she could make and sell two batches or 120 gallons of ale per week, giving a profit of \$72 per week. Allowing for overheads and taxes, she might clear \$150-\$200 per month. This is a reasonable living -- better than a struggling craftsman.

Note that the actual price of grain, especially wheat, fluctuated greatly even in supposedly economically stable times. Prices even fluctuated during the same year, being cheapest just after harvest, and gradually getting more expensive, until peaking just before the following harvest. The above suggested prices are a rough average, so prices would be more expensive than those suggested just before harvest and less expensive just after harvest. If the price of ale was fixed by legislation (which it usually was), then it is possible for a woman to lose money on a batch if she purchased malt at the wrong time of the year.

The Mirror Dance

Playing Twins in *GURPS*

By Tim Emrick

"I was just about to mail a letter to my evil twin . . ."

-- "Weird Al" Yankovic, "Everything You Know Is Wrong"

Twins present a mystery that has fascinated mankind for ages, inspiring characters from early myths and classic literature through TV dramas and gaming fiction. They also present a unique opportunity -- and challenge -- for gamers wanting unusual characters.

Twins are probably most fun when run in tandem by two players who already have some rapport with each other. Character creation should be a joint effort, in order to maximize the illusion of a shared history. The twins' separate identities should be played up just as much as the traits they have in common -- "carbon copy" twins are unrealistic, and likely to get boring quickly. After all, twins define themselves by their differences, no matter how much others may emphasize their sameness. However, playing off of that closeness is where much of the fun lies with twin characters. The satisfaction of being so close to another being, the perverse joy of unnerving others through their appearance and behavior, and the justification for exotic joint powers are just a few of the possible perks to playing twins.

With the new *Fourth Edition*, building **GURPS** characters defined by twinhood -- whether their link is mundane or superhuman -- becomes even easier. This article covers some of the folklore of twins and how to represent it in **GURPS** terms. Clones, doppelgangers, doubles, and other twin-like phenomena are beyond the scope of this discussion; **GURPS Monsters**, **GURPS Time Travel**, and other books devote entire sections to those subjects.

Growing Up Double

Twins, especially identical pairs, tend to be easy and friendly with each other, if not deeply dependent, with a level of empathy that non-twins frequently find uncanny. While other close pairs, such as non-twin siblings and spouses, can develop a high degree of rapport, twins have an advantage over adult friendships: a lifetime growing up together. Twins seem to be aware of their twins even when not consciously thinking about them, and frequently talk about their twins, even in casual conversation. Some even invent a unique language between themselves. However, the ideas that twins are always the best of friends, or possess true ESP, are not supported by modern research.

To represent a realistic "twin bond," apply the Accessibility limitation, "Only with Twin, -40%," to Empathy or Sensitive. The twins may also have one or more of the following traits: Chummy or Congenial, Higher Purpose (Defend Twin), Language ("Twin Language," Spoken Only), Mistaken Identity, Phobia (Being Alone), and Sense of Duty (Twin). If one twin is an NPC, Ally and/or Dependent may be appropriate for the other. Twins need not be identical to benefit from this kind of relationship; the Brothers Majere of *Dragonlance* fame are nearly polar opposites in physique, temperament, and aptitude, but have a unique understanding of, and dependency on, each other.

While twins trading places is a plot device in stories such as *The Parent Trap*, people familiar with a given sets of twins will usually be able to tell them apart. To successfully impersonate one's own twin requires checks against Acting, Disguise, and Mimicry (Speech). The Impersonation technique is invaluable for twins that make a habit of switching roles. Identical twins might get a +1 or higher situational modifier to these checks.

To represent in-game knowledge of the science or folklore associated with twins, use one or more of the following skills: Biology, Expert Skill (Psionics), Occultism, Psychology, or Thaumatology. With GM permission, "gemellology," the study of twins, would be an appropriate optional specialization for Biology and perhaps other skills.

In fiction and games, of course, twins need not be limited by strict reality -- and rarely are. The following sections cover more options for creating twins, many of them only appropriate to cinematic or paranormal campaigns.

Twin Taboos

Many "primitive" cultures view the birth of twins as a supernatural event. In Western Africa, where the incidence of twins is nearly twice that of the US, some tribes view twins as abominations against nature, so kill them at birth and either exile or slay the mother as well. Others revere twins as divine -- though dangerous -- beings, treating them (and their parents) with great respect so that the community will benefit from their power, rather than incurring the twins' wrath. Depending on the dominant taboo, being a twin, or the parent of a twin, may result in either Social Regard or Social Stigma.

Other folklore claims that twins will always be rivals, or even that one twin is always good, one evil. An Enemy with the Evil Twin option need not be a literal twin, but that link makes the relationship far more personal. An arch-enemy who is also a sibling shares that much more history with the hero, and has unique insight into what makes his foe tick. Eliminating a troublesome twin could be complicated by prohibitions against killing people of the twin's station (*The Man in the Iron Mask*), or slaying any kinsman (ancient Greece).

Twins are also about twice as likely to be left-handed as non-twins. Given the "sinister" connotations of "wrong"-handedness, being a lefty twin simply doubles the trouble, regardless of the character's true nature.

My Brother, The Demigod

Twins are common in the mythology of many cultures, from the creator/destroyer brothers of Iroquois legend, to the twin sun/moon heroes of Mayan myth, to the multiple generations of twin gods of Egyptian cosmology. However, Greek mythology has perhaps the most famous -- and most gameable -- twin pairs.

Many Greek heroes are demigods: the immortal offspring of a god and a mortal. Typically, they have a twin sired by the mother's husband, and therefore mortal. In these pairs, the demigod becomes the dominant hero, while the mortal twin tends to fade into obscurity. The most extreme disparity is between Heracles and Iphicles. The former was granted full divine status after death, while the latter would have been forgotten entirely if not for his famous brother -- and his son Iolaus, who became that twin's favorite companion.

Leto's four egg-born children form a unique set of twins: two of each sex; two demigods (Pollux and Helen) and two mortals (Castor and Clytemnestra). Castor and Pollux (collectively known as the Dioscuri, or Sons of Zeus) were unusual among Greek twins for being well-matched in ability and never at odds with each other. Upon Castor's death, Pollux petitioned Zeus to revoke his immortality so that they could remain together. In an unprecedented boon, Zeus allowed them to share that gift, dwelling half the time in Olympus, half in Hades. (However, sources disagree on whether the twins dwelled in the same place at the same time, or alternated.)

The twin motif is so widespread in Greek myth that some scholars insist demigod heroes could not be only children. For example, Theseus is one of the few major semi-divine heroes with no known twin. Was his twin lost to history? Was his buddy Peirithous actually his twin but that blood relationship later forgotten? Or has a darker truth been obscured here?

Twins built on the Greek model will usually be Allies, though not necessarily frequent ones. In this case, the lesser twin will also be his brother's Dependent. Occasionally, they may become Enemies instead, as with the Latin Romulus and Remus, or the Biblical Jacob and Esau. (Perhaps Iphicles had a hand in assigning Heracles his Labors, in order to dispose of his glory hound twin?) In nearly all cases, Destiny is highly appropriate, whether for good or ill.

To create twins who share a supernatural gift on a set schedule, apply a -40% Accessibility limitation to represent only having use of the ability about half the time. For something as powerful as the Dioscuri's shared immortality, apply the limitation to Supernatural Durability, Unkillable, or similar traits, and spend full points on an Extra Life in case one

twin is killed on a "mortal" day.

One Mind, Two Bodies

Some cultures believe that twins share a single soul. Among the Yoruba, if one twin dies, the survivor must carry a fetish item representing the dead twin in order to maintain his own health and magical powers. In a realistic game, this requirement is simply cultural color, or a prerequisite to keeping any social advantages for being a twin. If magic is real, this fetish could represent a genuine Dependency.

In a setting with psionics or magic, the easiest way to represent a shared soul or mind is to apply advantages such as Mind Reading and Telesend (both with the limitation, "Only with Twin, -40%"), Mindlink, Special Rapport, and possibly Possession. (Any of these would make a literal Evil Twin especially annoying.) Besides the disadvantages already mentioned under "Growing Up Double," Addiction (Telepathy) is appropriate. "Twin Causes No Penalties" would be a suitable +20% enhancement for Solitary Magery or -20% limitation for Supersensitive.

"Wonder Twin Powers, Activate!"

Some fictional twins are fully distinct individuals, but require the other's presence to activate an inborn power. This power need not be identical, as in the case of Zan and Jayna, or fantasy twins who have differently-limited Magery. Merely requiring the twin's presence would be a -10% Trigger limitation, while requiring both twins to concentrate on the same power at once would be -40%. Preparation Required may also be appropriate (though the Wonder Twins' Morph powers would have Reduced Time instead).

Stranger Twins

Conjoined twins are identical, same-sex twins who did not separate completely when the original embryo split. They may be linked by a small piece of skin, or may share significant fractions of their bodies. The most famous examples were Chang and Eng Bunker, "the original Siamese twins." These brothers learned to row a boat, play shuttlecock, and perform other tasks in tandem; married a pair of sisters and sired numerous children; and died in their 60s within an hour of each other. In a RPG, the GM must decide whether conjoined twins should be portrayed by the same or different players, or to make one twin a NPC. Perhaps the easiest way to represent them mechanically in **GURPS** is with a single stat block, using Compartmentalized Mind for the separate personalities, and Extra Heads, Extra Legs, etc., to model the physical form. Most will have low DX and/or Lameness due to the awkward configuration of their limbs, and some may even be Semi-Upright or Horizontal. All will have some level of Distinctive Features or Unnatural Features, depending on how much their shape deviates from the two-body norm. In any society that marginalizes them as "freaks," conjoined twins will have a Social Stigma (Minority, Second-Class Citizen, or even Valuable Property).

In Dumas's novel *The Corsican Brothers*, separated Siamese twins retained a psychic bond easily represented by Special Rapport. However, in parodies of the tale, this bond has been altered so that instead of merely knowing when the other was hurt, the injury itself was transferred. In **GURPS**, this is a special case of an Ally with the Sympathy limitation. If both twins are affected equally, use Sympathy as written. If all damage and other effects are transferred to the other twin, count this as a Special Abilities enhancement. This latter version needs to be carefully managed by the GM to insure that one twin does not simply abuse the other as a damage sink.

Chimeras are formed when twins fuse in the womb to create a single body that (unlike conjoined twins) seems to be normal on the macro level. This mixed genetic make-up may cause problems such as a false negative on a paternity test, identification of a crash victim as two separate people, and confusion of other forensic evidence (as dramatized in the "Bloodlines" episode of *CSI*). A realistic chimera could qualify for Zeroed with the Unreliable limitation -- until his condition is exposed. Chimeras are usually same-sex twins, but the rare male-female unions seem to be responsible for a small percentage of intersexed individuals (formerly called hermaphrodites).

In a supernatural game, chimerism may result in two distinct minds operating within one body. Possible results include

Split Personality, Compartmentalized Mind, or Possession (Parasitic, single Puppet Only). Occasionally, an "unborn twin" is removed but reappears as a separate entity, a sort of Evil Twin, as in Stephen King's *The Dark Half*.

Time of the Twins

Whether twinhood is used merely as a hook for role-playing, or becomes the basis for a whole suite of bizarre supernatural powers, this unique relationship is a rich mine of ideas for games. Build these special pairs with care, then watch the magical mirror dance of their lives unfold . . .

A *Killer* Miscellany

by Loki Carbis

This article contains a variety of add-ons and alternatives to the standard *Killer* rules. Each new section is presented in the same order as it appears in the rule book.

Alternate Points Systems

(This section expands on p. 13 of the *Killer* rules.)

Trophy Games

A Trophy Game is basically the same as any other game, except that killers are required to prove their kills by taking trophy. The nature of the trophy should be specified in the contract at the start of the game -- it's usually a body part of some description, such as a finger, eye, ear or scalp.

At the start of the game, each player is issued a piece of paper with the word "Trophy" written on it. If a player is killed, they are required to provide their killer with it, to allow them to prove the kill. Any kill in which a trophy is taken is worth bonus points, over and above the normal points for a successful kill -- a 50% bonus on whatever the normal point award for a kill is about right.

Naturally, the need to take a trophy will rule out certain types of kills -- some are too disfiguring (bombs or fire, for example), while others are too distant (letter bombs, some poisons) -- a killer must be physically present to take a trophy. Lenient GMs may allow killers to stretch this point if they are the first person to find the victim's "corpse."

It is generally inadvisable to combine the trophy rules with the rules on wounding, but it can be done -- killers could then take trophies off any target they managed to immobilize, which would usually involved the use of either traps or accomplices. However, it may be advisable for the GM to find out just how much of a fan of *Reservoir Dogs* each player is before deciding to go ahead with these rules.

Cannibalism Games

As with a trophy game, a cannibalism game offers a way to gain extra points for one's kills, but at the cost of having certain limitations applied. The idea is based on that of one common version of cannibalism, in which certain parts of an enemy's body (typically the heart or brain) are consumed in order to assimilate that enemy's traits. In this variant for killer, it is not traits but points that are assimilated.

Upon a successful kill, a killer may opt to "eat" his victim. In doing so, he gains half the current point score of their victim, and the corresponding amount is removed from the victim's tally. (If more than one player shares the kill -- in a team game, for example -- then the points are divided equally between them, rounding down.) For this reason, it is better if each player starts the scenario with a certain number of points, such as 20 or 50 (depending on how high scoring the game is likely to be).

As with trophy games, cannibalism requires that the victim be in an edible condition. This rules out several popular weapons, such as bombs and poisons . . . anything that leaves the body either too disintegrated or too tainted for "eating."

Primitive Weapons

Flying Discs -- Cloth (p. 18, Class B)

Several varieties of cloth flying disc are also available -- these generally consist of a cloth ring, usually weighted (although lightly) with a piece of cloth sown to it. In addition to working just as well as any other sort of flying disc, they have three advantages. First, they are generally softer and hurt less to be hit with; second, they are easily concealable when one is trying not to arouse suspicion; and third, at the GM's option, they can also be used to simulate the effects of a bola, immobilizing but not harming those they strike.

Modern Weapons

Pistols (pp22-26)

Infra-Red Guns (Class A)

These are available in a variety of brands, of which the best known is probably Lazer-Tag. They work on the same principle as a remote control -- shooting a beam of infrared radiation at other players, who wear targets with built in sensors. It's highly unlikely that a player wearing a full target harness will be even remotely inconspicuous (the harnesses tend to have flashing red lights and make loud noises when a "hit" is recorded). On the other hand, this does mean you're unlikely to be mistaken for someone using a real gun.

An added plus of these guns is that they are frequently programmable, with the ability to have wounds or kills for different targets, and multiple lives should the GM wish to allow such.

Although these guns are generally modeled on rifles in shape, their range is more like that of a pistol, hence their placement here.

Poisons

Envelope Toxin (p41, Class A)

Given that new security precautions mean that any envelope filled with a fine powder is likely to be assumed to carry anthrax or other infectious diseases -- and that law enforcement authorities are notably unfond of the "it was just a prank" defense -- stick to the use of confetti or some similar obviously harmless substance when using this poison. Or just write the word "poison," or better yet "poison (not actual poison, game use only)" on a slip of paper inside the envelope.

Syringes (Class B through D)

A syringe is basically equivalent to a knife, only less damaging. Nonetheless, if you can stab someone with one, you can kill or wound them (GM's call -- generally it will depend on what part of the body you stabbed). But what makes them lethal is their payloads.

Syringes are perfect for administering drugs or poisons, or even a meme (see below) encoded into RNA. But they can be deadly if you're not careful with them: real syringes are Class D weapons -- do not use them in the game under any circumstances. A toy syringe (Class C, and readily available in shops, although you may have to buy a whole doctor's kit to get one) is better, but best of all is a simple piece of plastic tube marked "SYRINGE" (Class B). Under no circumstance should you place any physical substance in your simulated syringes -- even with a toy, it's possible you might break the skin of your victim and poison or infect them.

Obviously, use of a syringe requires extreme proximity -- which usually means that the target be either ambushed or immobilised to allow time to administer the contents.

In trophy games, syringes might also be used to extract substances from the bodies of players if the scenario permits it.

Futuristic Weapons

Memes

Memes should be considered basically equivalent to Curses (**Killer** rules, pp. 47-48) in their effects, for convenience sake. However, generally, a meme will take longer to wear off than a curse would. Ideally, a Meme should have a sliding effect, starting off at a particular level and dropping off by one level each day. Thus, a meme of trivial effect would last only one day, but a meme of catastrophic effect would slowly weaken over the course of four days. Memes should be fantastically expensive -- three or four times the cost of the equivalent curse. Ideally, they should be the most expensive weapon in the game.

Scenarios

Using Trophy rules with pre-existing **Killer** Scenarios

The Trophy rules will work well with any of the scenarios in the book, excepting those which already use variations on the idea. This includes "The Hidden Prize," "The Bomb Builders," and "The Couriers." They will also work with the rules presented in "[With Friends Like These](#)" rules, and very well indeed with the "[Andrew Season!](#)" rules (both from *Pyramid*).

Using Cannibalism rules with pre-existing **Killer** Scenarios

The Cannibalism rules can also work well with most of the scenarios in the book, excepting those which already use variations on the idea. This includes "Vampires" and "Thing From Outer Space." Whether or not they are appropriate to the setting is another question -- they clearly don't fit with "Chicago 1920" (because they're wrong for the setting) or with "The Mad Killer" (because only one player, the killer, would benefit from them). Again, they can work with the "House Killer" or "Andrew Season!" rules.

Cowboys and Indians

One of the classics, but rarely used in **Killer** until now, the Cowboys and Indians scenario uses the Trophy scoring system. Players are divided into two teams, one consisting of Cowboys, one of Indians. Cowboys have access chiefly to modern weapons, and may also have the advantage of fortifications (a playground or other easily defined area can be selected as a "fort"), while Indians are mostly limited to hand weapons. Although the cowboys have an almost overwhelming technological advantage, they do have two serious disadvantages. First, they *must* guard their fort -- even if some cowboys survive, the taking of the fort means that the Indians have won, regardless of individual player scores. (If the GM wishes, a score -- a substantial one, perhaps ten times the value of a kill -- may be awarded for taking the fort instead.) Second, the Indians have the option of scalping any cowboy they immobilize or kill, thus giving them the opportunity to score extra points as per the trophy rules.

If the players wish, it is possible to play this scenario with cowboys and Indians on both sides -- a minor recreation of the French and Indian War (as seen in *The Last of the Mohicans*), in which some players are the French or their Indian allies, and some players are the British or their Indian allies. If there are sufficient players for it, the GM may wish to create a third team entirely of Indians, opposing both the other teams.

DNAliens

Hundreds of years into the future, a transhuman revolution has occurred. Order has collapsed, and the hundreds of sub-species humanity has fragmented into thanks to advanced genetic engineering now prey upon each other. A genetic

plague stalks humanity, and the only way to create a cure is to gather samples of as many different types of engineered DNA as possible in the same body. Whoever has the most DNA will be the ultimate evolved human, and best able to resist the disease.

This is a futuristic scenario using the cannibalism rules, but not one in which actual eating is necessary. To score at all, a player must paralyze or immobilise their opponent, then extract their DNA with a syringe. Understandably, this is a game which favours ambush tactics and traps. It's very important to recall that they must do both, in order, or neither works. The third and final stage is that they must then inject the stolen DNA into their own bodies. If a syringe of DNA is stolen before it is injected, the thief can then inject it themselves, gaining the points for the DNA. GM's may wish to enforce a time limit after which the DNA may no longer be injected -- the shorter this is, the more difficult the task of the attacker becomes.

Remember that DNA is cumulative -- if a player steals the DNA of another player who has already stolen the DNA of two others, he effectively gains all three sets of DNA. Thus, the scenario has two alternate victory conditions -- either the player with the most points or the player with the most other players' DNA wins. (Whichever you're using, the other can be used as a tie-breaker). For either victory condition, if there is only one player left standing but he or she did not succeed in getting every DNA sample, they are the default winner.

There are a number of variants to this scenario:

1. **No one dies:** Since there's no actual need for anyone to die in order to have their DNA extracted, this means that a player might well survive the process. Players who survive are assumed to still have all their own DNA and whatever DNA they have previously captured. This variant tends to lead to deal-making, and the inevitable betrayals that follow deal-making in *Killer*.
2. **Entropy:** In one of life's little ironies, the DNA stealing process makes its victims vulnerable to the genetic plague. A player whose DNA is stolen will die in 24 hours -- unless they can steal someone else's DNA to "stabilize" their condition. A particularly cruel GM can rule that this is cumulative -- each time a player's DNA is stolen, the clock starts ticking, until finally their time runs out. In such a case, each player will need to have a stopwatch, set to count down from 24 hours.
3. **Blood is life:** Perhaps DNA grants some special abilities. In keeping with the game's setting, these might be poison glands (that express through the nails or teeth), hypnotic stares, or anything else that's relatively minor, and simulates an existing weapon in *Killer*.
4. **Memetic engineering:** if the Meme rules are also used, the most common sort of meme will probably be one that programs a player to hunt a particular other player. In this case, a player must nominate beforehand whether or not a particular syringe attack also implants a meme in the victim.

Headhunters

High in the mountainous jungles of New Guinea, life is largely unchanged from before the white man came. Here, two ancient tribes in neighboring valleys fight a bloody and unending war over possession of the land between. And both these tribes practise the venerable traditions of beheading their victims and devouring their hearts.

The Headhunters scenario is a team scenario that combines the use of both the trophy rules and the cannibalism rules. It's quite a deadly game, so it's best if players are allowed to rejoin as a new character each time they get killed, although they should be made to wait until the second day following before they can. The GM should set either a time limit to the game, or a maximum number of resurrections (or both, if the number of players is particularly large), and for maximum chaos, resurrected players can swell the ranks of the opposing team (or, if there are three or more teams, the team responsible for their death).

Pyramid Review

Pie Shop: A Role-Playing Game by Mr. Toad

Written & Published by [Mr. Toad](#)

Illustrated by John Tenniel

68-page Saddlestitched black & white book; \$20.00

Pie Shop: A Role-Playing Game by Mr. Toad is another entry in the roleplaying genre of the "Nasty." This is best typified by the old Hogshead Publishing's New Style games, *Violence: The RPG of Egregious Bloodshed* and *Puppetland/Powerkill*. *Pie Shop* though, is not the outrageously satirical rant upon the style of play espoused by the world's leading RPG that is *Violence*, but more the social commentary of *Puppetland/Powerkill* that forces us to confront the casually violent nature of our actions in so many games.

Right from the out, *Pie Shop* gets to its point. It is a roleplaying game that descends into the hobby's equivalent of the septic tank by asking you to roleplay a serial killer. Not a mere killer with a cause or a conscience, but a sick individual driven to commit murder for often the most spurious, though no less compelling of reasons. And while guilty of such acts, such a killer does not feel the guilt of his act. In true *La Femme Nikita*-style, the killer has been caught, convicted, and locked away. Which is where they found him. Since he is not so well-known, they (whomever they are) have offered him a deal, which he accepted and was set free to kill again. Not for himself, but whenever he receives a telephone call that will give the instructions and a target. And that, is all there is to *Pie Shop*.

Characters in *Pie Shop* -- or rather killers, since there is no other option -- are defined by 13 attributes, each on a scale from -3 to +3, with 0 being the average. These attributes are only suggestions and the GM can pick and choose the ones that he wants to include in his game. Skills are broadly defined and have to be purchased at level 0 before they can be raised up to 12 or more. Skill level costs rise sharply the higher the desired value. All killers begin the game with defaults of 0 in four skills: Dodge, Slice & Dice (sharp weapons), Sticks & Stones (blunt weapons), Unarmed Combat, and Medicine. Also available is a selection of advantages and disadvantages; some are quite normal or mundane, such as "Cool Under Pressure," "Rich," or "Phobia." Others relate to the character's penchant for murder: "Look Innocent & Trustworthy," "Faint" (. . . at the sight of blood), "Must Always Be Planning or Executing A Kill," and so on.

Besides spending the 130 points on various aspects of the character, a player needs to define his killer's *raison d'être*. This comprises his favored Target (women, children, freaks & weirdoes, corporate suits, mobile phone users, and so on), the Emotion felt after a kill (from nothing to sexual pleasure and "Jesus told me"), and Methodology Quirks. These are the conditions or rituals that must be fulfilled before a kill can "count." Suggestions include eating part of the victim, killing in a particular place or with a preferred implement, the need for the victim to feel fear, or to have committed a specific task. Extra character points can be gained for taking extra Methodology Quirks.

To do anything in *Pie Shop*, a player rolls a d12 and hopes to get 10 or more, including an appropriate attribute and skill. Combat involves the same roll, but adds further complexities. For starters, the initiative winner is heavily favored, as only he can attack in that round and his victim has the choice of either dodging or fleeing. Further, any damage inflicted reduces a victim's initiative modifier, thus making it increasingly difficult for them to fight back.

Damage is well, deadly. Weapons inflict hits measured in Tally marks, five of which translate into a wound that penalizes all actions. Two or more wounds force a check to remain conscious. Gunshots automatically inflict wounds, and like slashing damage also causes bleeding. Continued bleeding will also force consciousness checks, but eventually neither unconsciousness nor death is unavoidable. An optional rule allows for deadlier hits to the head and as to

healing, it is a very slow process unless the killer wants to answer some very awkward questions at the hospital.

The campaign notes, once past blatantly pointing out that ***Pie Shop*** is not suited to campaign play, suggest a few ideas as to how to turn it into an actual RPG. Besides discussing the place of women in a game like ***Pie Shop***, it suggests that killers must kill at least once or twice a year. Once he receives that phone call, a killer must do everything to fulfill his compulsion. One or two players will take the roles of the killers, while the others should those roles normally filled by NPCs -- victims, paramedics, members of a studio audience, and so on. Several situations are given to support this set-up, from having the killer appear on a chat show to promote his new book to sessions with his counselor or psychologist.

The production values for ***Pie Shop*** are decent enough and the book is well-written. In places, the tone is mockingly snide and the strong language always aimed the game's wannabe player. In the full edition of the game the author adds further quotes from Lewis Carol's *Alice's Adventures in Wonderland* that it murderously subverts along with several of John Tenniel's illustrations from the books. The Preview Edition of ***Pie Shop*** lacks these additions.

To extend the "special" appeal of the game, or at least the joke, the author also includes a new Prestige Class compatible with the OGL. In a chapter entitled "Long Pig Truffles," he presents the 20-level Serial Killer Prestige Class. Taking this class grants a character "Dubious Destiny," preventing further levels in any other class. Alignment is sent askew, while Chaos and Evil remain unchanged, Lawful becomes "Structured," and Good becomes "Well-Meaning." This more modern adjustment effectively enables any character to take the Prestige Class and not lose the benefits of his class, even a Paladin! The class steps out of the game and into the real world with the ability, "Happy Dance." Literally, it allows a player whose character reaches third level to dance around a table, spill everyone's drinks, and not suffer the consequences. Just the once, though. That is, until the 20th level when the player gets "Really Happy Dance."

On one level the author of ***Pie Shop*** could be accused of homophobia, misogyny, and so on. But while the book includes such "-isms," they are intended as the opinions and beliefs of the killers, not those of the author. More accurately, the game could be accused of being anti-human, and while the killers certainly are, the author looked at least perfectly normal -- for a gamer, that is. Rather, it is a very humanist game, because it is designed as an endurance test, to be played -- if at all -- until sickened as every little detail is played out in the gory, painstaking minutiae that the game and author demands. More so than any other than any other RPG, there are no winners in ***Pie Shop***. Playing is losing. It should sicken as much as should reading ***Pie Shop***.

Ultimately it is difficult to see the point of ***Pie Shop*** and it would be at best trite to point out its awful pointlessness. Which is not to say that it is badly done, and unlike some other titles in the genre it is not actually offensive. The question is, is ***Pie Shop*** playable or useful at all? Perhaps in games where serial killers play a significant role, such as ***SLA Industries***, but even then only for a session or two. As to playing the game, see above.

Heroes of Battle (for Dungeons & Dragons)

Published by [Wizards of the Coast](#)

Designed by David Noonan, Will McDermott, & Stephen Schubert

Edited by John D. Rateliff & Gary Sarli

Art by David Hudnut, Wayne England, Doug Kovacs, Chuck Lukacs, Roberto Marchesi, Mark Nelson, Eric Polak, Wayne Reynolds, Franz Vohwinkel, & Todd Gamble

160-page full-color hardcover; \$29.95

All too often, Wizards of the Coast puts out *d20 System* material that gives you a lot of lists and not much setting advice, and when they do slip some of the latter in on you, precious little of it is workable or inspiring. *Heroes of Battle* not only provides both the mechanics and the RPG feel the story demands, but weaves them together into a beautiful tapestry.

Rules for mass combat are nothing new, even in roleplaying, but this book isn't so much about sparing the DM the effort of rolling for thousands of combatants as keeping the battlefields interesting for the characters. You won't find complex tables or extensive formulae for figuring out which side loses what. It's mostly about the characters and their actions . . . after all, the skirmishes in this book *are* the adventures. How do you keep them alive? How do you assign experience (because, let's face it, this time they had help)? How far can you drag the mages before they're tapped on spells, and can they reasonably rest to get more? It's a war, and you can't just hold things up because they're hurting . . . or can you?

New classes and feats exist to beef up your battlefield prowess, but more importantly you get teamwork benefits when you learn to work together. You've got all those people; surely the lot of you can slowly close in on an invisible enemy. The archer next to you shot his arrow too high, and the next attack that row makes will learn from it and improve. Your successes aren't limited to XP. Now you can get promotions or medals, and influence your hero's advancement and even the flow of battle with victory and recognition points. Morale is back -- drive your frightened foes off. The commander auras from the miniatures game have been transplanted, so you inspire those about you to make more attacks or stand firm against the hordes of the undead.

The DM's advice . . . they've promised it before, but this time the Wizards come through. It may look like a mess from this side of the screen, but on the ref's side it's all flowcharts and boxes (don't panic -- they're so confident they have the system down, they break down *how long each segment will take you to write out*), quick and easy, with examples and sample missions to send PCs on. And if they diverge, not a problem. That's just what the book is there for. The tips are real, not just vague hand waves meant to gloss over the tough stuff. It's actual stuff you can actually use.

How does a siege engine work? There's stuff about the physics of the combat zone, and since someone has to run it, there are armies listed in standardized formats. Everything from the ballistae to the banners can be magical if you want it to be. Spells are bigger, as are the prestige classes. Bring daylight to a close faster, or turn an entire battlefield against the bad guys. Play a medic and tend to the sick, or be a dread commando, getting behind the enemy when and where he least expects it and making *him* sick. And even before you reach the big guns, there's advice on how to use

individuals -- your rogue will have something to do even on the battleground.

The artwork may be done by the same crew, but this time it doesn't have the same feel. The pictures have a sense of scale, a feel of the epic about them. They know they're dealing with massive, world-changing events, and the illustrations reflect that. They're deep and panoramic, both on the cover and inside. About the only physical complaint about the book is it's a little stiff to open. But when you get it open . . .

Wizards of the Coast's writing feels a little impersonal sometimes, as if they're afraid adding a little color or character to their text will make it seem less like a rulebook. Not here. It's an epic book that makes your character epic as well. The reading flows smoothly, the examples are lively, and you know there are real people toiling away behind the keyboard to make it come together. And when they finished . . . they stopped. No filler here, no explosive lists of monsters and templates and NPCs, oh my. Everything is useful, everything is solid and real, and everything in ***Heroes of Battle*** makes sure you're getting your money's worth when you crack the jacket. It's a marvelous marriage of story and mechanics, and shows what made them the big guns in the industry.

--*Andy Vetromile*

Loch A Rolling Stone: The Stone of Destiny

*"Unless the fates are faithless found
And prophets' voice be vain,
Where'er this monument is found
The Scottish race shall reign."*

-- attributed to King Kenneth I MacAlpin (Sir Walter Scott trans.)

That prophetic quote, after the fashion of Celtic mythography, is also attributed to St. Patrick, St. Columba, and (creepily enough) an oracular voice from the very monument it purports to describe. The "monument" in question is the Stone of Destiny, also known as the Stone of Scone or the Coronation Stone, although its precise identity, as we shall see, is pleasantly bisociated. The story, in slightly less poetic form, averages out as follows: Once upon a time, on the royal hill of Tara in Ireland, rested a magical Stone, the Lia Fail. The kings of Ireland were crowned on this stone, which would cry out when touched by the rightful high king. Around 500 A.D., Fergus Mac Erc, brother of Murdoc Mac Erc, the High King of Ireland, took this Stone with him on his invasion of Britain for his eventual crowning as King of Dalriada, the Irish-occupied section of northern Britain. (Fergus' followers, the Scoti, gave their name to the whole northern kingdom.) The kings of the Scoti were crowned on that Stone for centuries, as per the prophecy. Around 843 A.D., the nobly-named King Kenneth I moved it from the old Dalriadan royal city Dunkeld to Scone in Perthshire, where it stayed until King Edward I looted it on his invasion of Scotland in 1296 and carted it off to Westminster Abbey. The Kings of England have been crowned on the Stone ever since -- and for a while there, the Kings of England were Scottish, too.

"[T]he Bishop of St. Andrew's, the others assisting him, consecrated his king, the king himself sitting, as was proper, upon the regal Chair --that is, the Stone -- and the earls and other nobles placing vestments under his feet with bent knees, before the Stone. This Stone is reverently preserved in that monastery for the consecration of kings of Scotland; nor were any of the kings in wont to reign anywhere in Scotland, unless they had, on receiving the name of king, first sat upon this royal Stone in Scone, which was constituted by ancient kings . . ."

-- John of Fordun, *Scotichronicon*

Interestingly enough, the Stone of Destiny actually only enters the historical record with its theft from Scotland. Edward's royal records note its confiscation, and the first histories of Scotland to mention it were composed by Scottish courtiers petitioning the Pope to make Edward give it (and, to be sure, the rest of Scotland) back to the Scots. The contemporary seals depicting the crowning of Scottish kings show only ornately carved thrones (of the sort that Edward may also have looted from Scone or Edinburgh), and the first ever mention of a Scottish king being crowned on it was that of an English chronicler, William of Rishanger, around 1325. Roughly contemporaneously, one Robert of Gloucester, another Englishman, mentions the legend that the Irish "broghte into Scotland a whyte marble ston . . . ordeyned for hure kyng, whan he coroned wer." But we can be fairly sure that the Stone had some sort of historical royal resonance, or King Edward would hardly have bothered to drag it all the way back to London. The role of the Lia Fail is relatively well-attested in Irish chronicles, as is that of the Zasliai Stone of Lithuania or the Mora Stone of Sweden, or the old Saxon King's Stone currently resting in obscurity in Kingston-on-Thames. But the only thing we know for sure about the Stone is that it is a 336-pound block of pinkish-yellow Perthshire sandstone, measuring 26" × 16" × 11", and that since 1996, it has been sitting in Edinburgh Castle, to which spot John Major returned it on the 700th anniversary of Edward's desecration.

*"So he quarried a stane o' the very same stuff
And he dressed it all up till it looked like enough
Then he sent for the press and announced that the stane
Had been found and returned tae Westminster again."*

-- Johnny McEvoy, "The Wee Magic Stane"

Except that we don't know that, either. It seems that on Christmas Day, 1950, a trio of energetic Scots students stole the Stone out of Westminster Abbey and hid it in the workshop of a man whose talents included making duplicate

Stones for area heritage sites. Although a Stone reappeared at Arbroath Abbey on April 11, 1951 (on which Queen Elizabeth II was duly crowned at Westminster two years later) a long-standing rumor has it that this was a duplicate Stone made by one or another band of merry Scots pranksters. Which assumes, of course, that the monks of Scone Abbey turned the real Stone over to Edward in the first place -- similar Scottish legend has it that they hid the Stone and gave Edward the cover off their cess-pit. Which doesn't even begin to address the various peregrinations of the Stone between the Macdonalds and the Campbells, any of whom are supposed to have swapped out the real Stone for their own forgeries. The Stone of Destiny has been spotted in Iona, Finlaggan, Islay, Skye (where Bonnie Prince Charlie was supposedly crowned on it), Melrose, Dunstaffnage, and everywhere else that credulous folklorists and whisky co-exist.

*"It will have blood, they say; blood will have blood:
Stones have been known to move and trees to speak."
-- William Shakespeare, Macbeth, III:iv:147-148*

Most interestingly, according to an anonymous letter first printed in the *Times* of London on New Year's Day 1819, it turned up in a "vault" beneath [Macbeth's](#) old castle on Dunsinane Hill. A torrential storm in November, the letter went, had caused a landslide exposing the vault; the servants entered on the 19th and discovered "a large stone, weighing about 500 lbs. . . . of the meteoric or semi-metallic kind." Alongside this stone, the letter continues, were "two round tablets, of a composition resembling bronze." Inscriptions on those tablets seemed to indicate that this was, indeed, the Stone of Destiny, hidden in Dunsinane by a superstitious Macbeth (or, possibly, by crafty Scone monks from just down the Tay valley). And finally, promises our anonymous correspondent, the "curious stone has been shipped to London for the inspection of the scientific amateur, in order to discover its real quality." Much anxious study of shipping registers for Perth and London uncovers no shipment of quarter-ton meteorites in 1818 or 1819, which means that even our promising Macbeth Stone must vanish into thin air. Dunsinane Castle, meanwhile, became the target of enthusiastic archaeological excavation over the next 50 years, with the effect of completely destroying any possible trace of vault or stone, and its owners, the Nairnes, sold out and moved to America in 1898.

*"Hear now how those who are called to the Grail are made known. On the Stone, round the edge, appear letters inscribed, giving the name and the lineage of each one, maid or boy, who is to make the blessed journey. No one needs to rub out the inscription, for once he has read the name, it fades before his eyes."
-- Wolfram von Eschenbach, Parzival*

And to what family does proud Dunsinane now belong? Why, the Sinclairs, and that brings up -- wait for it -- the [Templars](#). The links between Templars and Scotland go back to King David I, who invited them to Scotland as royal guards in 1128. Interestingly, as various excitable types point out, the Templars and Scotland both went under interdict at roughly the same time -- which meant that the King of Scotland, by now Robert the Bruce, was under no obligation to turn fugitive Templars over to the Church. The Templars provided the throw-weight for the Bruce's charge at Bannockburn, and took over the guardianship of the Stone (whichever one it was), for who better to guard a hidden Stone than a hidden Order? And, of course, if the Stone came to Scotland or Ireland via Joseph of Arimathea, then it mightn't be just any old Stone of Destiny, but the Holy Grail itself. And thus, its hiding places redouble yet again, from Rosslyn Chapel to the [Oak Island Money Pit](#).

*"And [Jacob] lighted upon a certain place, and tarried there all night, because the sun was set; and he took of the stones of that place, and put them for his pillows, and lay down in that place to sleep. And he dreamed, and behold a ladder set up on the earth, and the top of it reached to heaven: and behold the angels of God ascending and descending on it. . . . And he was afraid, and said, 'How dreadful is this place! This is none other but the house of God, and this is the gate of heaven.' And Jacob rose up early in the morning, and took the Stone that he had put for his pillows, and set it up for a pillar, and poured oil upon the top of it."
-- Genesis 28:11-18*

But the Stone has an even better lineage than that, if possible. According to Hector Boece's 1537 *Scotum Historiae*, the Stone (which he describes, confusingly, as a "marble chair") came to Ireland via Spain, along with one Simon Brec. Boece names Brec a descendant of the Egyptian princess Scota and her Greek husband Gaythelus (from whom the "Scots" and "Gaels" descend, natch), who brought the Stone from Egypt, and leaves it at that. But 300 years later, by

the Victorian era of high British-Israelitism, the Stone was self-evidently brought to Ireland not by some spurious Celtiberian chieftain but by the prophet Jeremiah, fleeing the sack of Jerusalem, who as the Ollam Fodhla became the first Druid. With Jeremiah supposedly came a princess of the house of David, Tea (who became Tara), and his scribe Baruch, who became both Boece's "Simon Brec" and the Fomorian king Bress, in fine disregard for even Irish mythic chronology. Somewhere between those two legends, the true nature of the Stone is discovered -- Scots had somehow acquired the Stone of Jacob, which Jacob named Bethel ("house of God") after [sleeping on it](#) and seeing a ladder rise up from it [to heaven](#). This story may have accreted to the Stone because a similar tale attached to St. Columba, who is likewise attached to the Stone's etiology, drawn into its folkloric event horizon as it passes through space-time.

"As giants and men get petrified, and still retain, so to speak, an after-sense of their former state, so to rocks and stones compassion is attributed, and interest in men's condition. Snorri remarks, that stones begin to sweat when brought out of the frost into warmth, and so he explains how rocks and stones wept for Baldr."

-- Jakob Grimm, *Teutonic Mythologies*

Or, perhaps it accreted to the story because the Stone of Destiny, like Jacob's Pillow, was indeed a baetyl, a stone that housed a god. Baetyl is a Byzantine coinage cognate with "Bethel," and in late syncretic myth Baetylus is the son of Ouranos, god of the sky. Which is another way of saying that such stones fell from heaven. Such as: the Ka'aba in Mecca, the [lapsit exilis](#) of Wolfram (which, like the Lia Fail, knew and named its servants), the Venus of Paphos in Cyprus (who struck dead King Erik I of Denmark in 1103), the "Diana of the Ephesians" confronted by St. Paul, and many, many more. Note that the vast majority of baetyls are female -- Pausanias notes both a triune baetyl at Orchomenos (which he identified with the Three Graces rather than the more likely Hecate) and an immense baetyl of [Cybele](#) (or Niobe) at Sipylus, which wept tears of rock. In some versions of the myth, Cybele is born when the seed of the sky god strikes the ground -- another interesting meteoric metaphor. And so we have crying (or weeping) stones, goddesses, heaven, and kingship all knotted around our bisociative Stone of Destiny, with its several origins and its myriad locations.

Or should I say "her locations"? There is another legend of Scone -- the Hag of Scone, or the Cailleach, the [stony mother](#) of Scotland. Like Niobe, she weeps stones, breeding baetyls. She is also known as "Scotia," which raises the interesting possibility that the "Egyptian princess" Scots may be the Stone herself, one of the stony [vampiric Nephilim](#) grown gravid on the royal blood spilt by Macbeth and the [spider-blessed](#) Bruce and the [secret Kings](#) of England. Note that Arthur -- whose Stone at Meigle lay just northeast of Scone and Dunsinane -- got his sword, and his kingship, from both a Stone and a Lady, perhaps one and the same daughter of the Cailleach. Arthur's Stone was blown up in 1792 (the year King Gustav III of Sweden was assassinated; the year before King Louis XVI was executed), but his rocky Bride survived in the bowels of Dunsinane or the chapel at Westminster or in some quantum fugue state in between them. And now, nobody knows where she is at all -- until next she cries out, that is.

Toucan Sam Killed By Mastermind Calling Himself "The Tiger"

I wasn't *planning* on having a theme issue devoted to serial killers, but as I was putting this issue together, I realized that -- despite making a relatively balanced issue otherwise -- several of the articles had to do with killers, murdering, and serial killers. So, never one to ignore kismet, I've made this a semi-theme issue. (It was either that, or write about *Star Wars: Episode III*, which I finally got to see last week . . . and I didn't have the heart yet to do another "[lazy Jedi](#)" column or to point out that, under no circumstances, should a helmet-wearing Darth Vader mope and whine via his synthesized voice.)

So what is the fascination with serial killers, in movies, television, and literature? (And by "literature" we mean "lurid page-turners sold in airports.") And, in particular, what's the appeal in gaming?

This isn't an exhaustive treatise on the topic, but rather one of my panted random lists of thoughts on the matter.

1) The modern fictional serial killer is, in many ways, the equivalent of monsters of lore -- something many people believe in (at least on some level), but which are almost entirely fictional.

Sure, there are serial killers in the real world. But your typical movie madman has two things going for him:

- He's unerringly clever, with a near-foolproof plan, and
- He kills a bunch of people.

In general, these two facts never go hand-in-hand.

Which is to say, there are certainly cases of very clever people having killed others in such a way so as to never be caught. And there are people who kill other people in a psychotic manner. But generally, real-world serial killers aren't the coy, intelligent, calculating masterminds like *Se7en*'s "John Doe" or Hannibal Lecter from *Lots of Different Movies*. They're almost always killers who take available opportunities and get caught because they weren't doing to much *not* to get caught.

Nevertheless, the legends endure . . . probably because humanity doesn't like the idea of being stalked and killed by someone considerably less clever and balanced than they are. Really, the thought of being whacked by a bedwetting arsonist who pulls the wings off of flies isn't anywhere near as interesting-sounding as getting to meet Keven Spacey or Anthony Hopkins.

In gaming, the serial killer is one of the few archetypes that presents a credible, almost-based-in-the-real-world threat to challenge gamers with. Sure, there are various other masterminds out there, but almost none present the immediate danger of a serial killer. While there are deadlier threats (such as terrorist acts), serial killers are more "intimate" -- in fiction, they often kill *because* they like the attention or want to mess with the protagonists . . . making them well-suited for gaming.

2) Speaking of monsters of lore, it's interesting to note how often the "supernatural serial killer" avenue has been explored. The two quintessential examples in my mind are the movie *Fallen* (with the ever-superb Denzel Washington) and the bad guy from the *In Nomine* adventure "Feast of Blades."

In fiction I believe this combination comes about to set one story's serial killer apart from the sea of other killers. ("He's a cunning serial killer . . . who can turn *invisible!*") In gaming, I suspect this combo is a favorite because so many modern-set games have kewl "toys" of some sort -- psionics, super-powers, magic, and so on -- such that antagonists need an edge if they're going to make any headway in the plot against the PCs.

3) Another reason I think serial killers work well for gaming is because they're a great excuse to toss all those stupid

Myst-like puzzle-solving that some players (myself included) enjoy. Sure, any bad guy can toss the heroes a canister of puzzle pieces that form a cryptogram, with a note attached saying, "Stop me if you can!," but it's much more "logical" coming from a serial killer than most other antagonists. And the puzzles or clues become much more meaningful if there's a human life on the line, compared to, say, a jewel heist or vote fraud.

4) Finally, the modern mythic serial killer is a great opportunity for almost any style of gamer; there's likely to be puzzle-solving (as mentioned before), roleplaying opportunities (especially for the gamemaster, who gets to chew on scenery), and for those who enjoy a good fight, there's likely to be a satisfying combat, since cinematic serial killers also often seem able to take a few bullets before going down.

In some ways, serial killers have become much too cliché. On the other hand, that's never been reason enough to get rid of a classic trope, and in terms of bang-for-the-buck antagonism, it's hard to beat a good serial killer.

But if you're going to try, I suspect beating him with a stick.

* * *

On a note in no way relating to serial killers, I note that we have a chat tonight (Friday night) with Armin Sykes, the programmer of the soon-to-be-released **GURPS Character Assistant**. The chat's at 7pm Central; more information is online on our [chat page](#).

Come on by and learn what amazing things this program can do for your **GURPS** games!

Adventure Pizza: Victims

by Daniel Bronson

A second scream ripped through the lost tranquility of the cemetery, the terror in it clear.

Stumbling through brush and over gravestones in the cloud-shrouded moonlight, Jake hurried toward the sound.

"Amy?" he called out. "Amy!"

The third scream was cut distressingly short. It had come from the grove just up the hill. Jake pushed through the vegetation, anger and fear driving his powerful frame, and froze. Snarling and growling in the clearing before him was a trio of hairy beasts the likes of which he had never seen. There was no mistaking what they were just beginning to feast upon.

One of the fiends looked up from the kill, blood dripping from its muzzle, and its burning eyes locked with Jake's.

Jake ran.

* * *

Stats are presented for **GURPS Fourth Edition**. Additional stats for **Fudge** are **bold italic blue** and qualities for **PDQ** are **green**.

"Victims" is an Adventure Pizza designed for a modern fantasy campaign in which, ideally, the characters are hunters or investigators of the supernatural. The purpose of this dish is two-fold. First, it serves as a reminder to hunters that an opponent doesn't have to be a weird creature or an NPC with strange powers. Mundane humans can cause trouble, too. Second, it demonstrates that there can be more than one kind of victim...

Ingredients

The Murders

The first of the bodies was found in Saddlecrest Cemetery behind a grove of trees deep in the older section of the property. One current theory is that the poor girl was caught by a pack of wild dogs, but the evidence isn't quite right. Others have suggested that it was some kind of cult ritual. These ideas have been dismissed. What happened, exactly, is as yet unknown. What is known is that the murders that have followed it appear to be the work of a copycat.

The Evidence

The original murder involved many brutal wounds from what appeared to have been very large claws and teeth. Part of the corpse definitely had bites taken out of it. All blood tested matched that of the victim, though there was some hair at the scene that was not hers. Analysis revealed it wasn't even human. It was close to dog or wolf fur but an exact match could not be made.

Investigations have turned up some distinct differences in the "copycat murders." First, the trace samples of fur found are fake, like that used for some stuffed animals and the like. Second, hesitation wounds are present, as if the assailant had

Jake Tarin

ST: 13 (**Good**)
DX: 12 (**Good**)

Very Fit

Perks:

Honest Face

to work up to inflicting most of the mutilations. Third, the damage to the bodies was done with sharp implements. The flesh is sliced rather than torn apart. Fourth, physical evidence at the crime scenes suggests the work of a single person, not the small group thought to be present at the original. Lastly, the first victim was free when she was attacked. All the rest have had evidence of being bound and gagged.

Jake Tarin, High School Student

Quote: *"Sure, I'd be glad to help."*

Jake has always been a good kid, and he still is... most of the time. His teammates always talk about what a great asset he is, on the field and off. Around the neighborhood he is well known for offering a helping hand, be it with yard work or fixing cars. He even volunteers at local clubs for younger kids, coaching and acting as a referee.

Many have noticed how much he has thrown himself into these extra activities since the murder of his girlfriend, Amy, almost four months ago. Some think he does it to keep himself busy so he doesn't miss her as much. Others suspect he is trying to balance the bad in the world with good deeds. None realize the truth: he wants to compensate for what he himself has done and will continue to do.

Jake is sure of few things these days, but what he knows for certain is that a) werewolves killed Amy that night, and b) now they are stalking him. The only way he can remain safe is by confusing them at each full moon by pretending to be one of them. That said, just how well-grounded Jake's certainties are in reality is debatable (see below).

To protect himself he has constructed an outfit -- largely from old Halloween costumes -- and a set of sharp makeshift claws. That was the easy part. The hard part is that to make his deception convincing he must behave like them, and that means killing someone.

The victim is always one of convenience -- someone Jake can overcome quickly. Once they are bound and gagged he will take them to a secluded location. The first he left in Saddlecrest Cemetery, the second was dumped under a bridge, and the third ended up in an abandoned building. Jake is completely repulsed by the butchery and will take some time to reach the point where he can go through with it. In the end, however, he is convinced that if his prey is not killed, and brutally so, then his life will be forfeit.

David Mee, Homicide Detective

Quote: *"Now I really need a cigarette."*

The past several months have been rough on David Mee. First they told him to quit smoking. Then he had to give up his coffee, too. To top it all off he's got some psycho running loose in the city who leaves a nasty-looking corpse behind every few weeks. Of course, he can thank the media for that last one. As usual. There never would have been a copycat if the first murder hadn't been sensationalized on every channel and in every newspaper in the Tri-County area.

Detective Mee is determined to track down the serial killer. Unfortunately, he has

Disadvantages:

Delusions (Stalked by werewolves; Acting like a werewolf keeps him safe)
Nightmares
Secret (Serial killer)

Quirks:

Edgy around canines
Pretends to be wary of silver
Always wears his letterman jacket
Will only eat meat if it is very well done
Humble

Skills:

Dodge: 8

Description:

little information of use other than what has been picked up at the crime scenes. The victims don't appear to have anything in common, the locations aren't following any kind of pattern except that they are all out-of-the-way, and the only description he has from a possible witness is "a hairy-lookin' guy."

The next full moon is in six days. They've got no leads. No wonder he has an ulcer.

Victims

Cooking Tips

Roll Out the Crust

The following information has been officially released to the public (and has therefore been reported by the media):

- There have been four murders.
- The modus operandi differs between the first murder and the later three, but there are similarities.
- All of the bodies have been badly mutilated, and some wounds look like they were inflicted by animals.
- Fur has been found at the crime scenes.
- Police are looking for a serial killer, probably a male in good physical condition.
- Although the authorities have not drawn attention to it, the media has been more than happy to point out each murder took place on the night of a full moon.

The adventurers should have no trouble hearing about these events. Even if they avoid newspapers, television, and radio, it is a common topic of conversation among residents - especially with the next full moon coming due. Individuals with police ties may be able to learn more about the evidence collected to date. Anyone with the appropriate magic or psi abilities can also take a shot at unearthing the truth, but remember that even the most recent event was nearly a month ago.

Gathering information through any of these methods should provide the party with the name of the first victim's boyfriend: Jake Tarin. If questioned, Jake will calmly repeat what he told the police. In short, yes, he was at the cemetery the night Amy died. She told him to meet her there, but he couldn't find her so he went home. He didn't try calling her house because it was pretty late.

Clearly, Jake will not show up as a were-creature to anyone able to zero in on one, but if he realizes silver is nearby he will avoid it. Any direct questions regarding

Late 40s; 5'6", 190 lbs; black hair; wears rumpled clothing with ring-around-the-collar and sweat stains.

Advantages:

- Legal Enforcement Powers
- Perception +2
- Police Rank 3

Disadvantages:

- Duty
- Sense of Duty (police)
- Unfit

Quirks:

- Drinks pink stomach medicine straight from the bottle.
- Constantly chews cinnamon gum.
- Dislikes people who work for the media.
- Spends too much money on new bonsai trees.
- Yells at the television.

Skills:

- Area Knowledge (City) -- 12 (Good)
- Criminology/TL8 -- 14 (Great)
- Driving/TL8 (Automobile) -- 10 (Fair)
- First Aid/TL8 -- 12 (Good)
- Forensics/TL8 -- 10 (Fair)
- Gardening (Bonsai) -- 12 (Good)
- Guns (Pistol, Rifle) -- 10 (Fair)
- Interrogation -- 13 (Good)
- Languages - English (Native)
- Law (U.S. Criminal, U.S. Police) -- 11 (Fair)
- Observation -- 14 (Great)
- Search -- 14 (Great)
- Shadowing -- 11 (Fair)

Qualities:
Expert Detective

werewolves or other supernatural beasts will make the boy somewhat nervous and he will plead needing to be elsewhere.

Good Gardener
Good Perception
Poor Fitness

Add Plenty of Sauce

The party's best bet for stopping the next murder will likely be to keep an eye on Jake. Although he will not be the best at spotting a tail, keep in mind that he will be constantly on the lookout for anything that may be stalking him. If he does realize someone is shadowing him he will assume it's a werewolf (regardless of what it looks like) and will try to make a kill as quickly as possible. He'll break off his attack and run if anyone comes after him. If he cannot escape he will fight to the death, because in his "reality" there is no other option. Since he really is not proficient with using his fake sets of claws as weapons he will have to subdue someone first, then use the claws on them. Knocking Jake unconscious will allow for later interrogation that can reveal the truth as he believes it.

If the party uses other less-optimal options, such as setting a trap for the killer by having someone act as bait or the ever-popular "go out on patrol" method, they risk not stopping Jake. Should Jake succeed, the news of a fifth death will be out by morning. This time, however, more clues will be available (and the adventurers may be able to check out a fresh crime scene for themselves). The new clues will include:

- Skin under the victim's fingernails.
- A report of a tall, muscular male putting on a hairy costume near where the body was found.
- Trace fibers from some sort of material.

The fibers will eventually be identified as coming from a letterman's jacket, and if a sample of Jake's DNA can be obtained it will be a match for the skin under the fingernails. A fresh set of scratches can also be seen on Jake's face and neck... if he can be found.

Sprinkle on Toppings of Your Choice

Option 1: Jake's so-called delusions are 100% accurate. A trio of werewolves (or at least something fairly similar) killed Amy and are now keeping an eye on Jake. His antics have drawn their curiosity, but eventually they will tire of him and will kill him.

Extra spice -- If Jake has vanished, it could be because the werewolves got him. If Jake is in danger of being captured, the werewolves might join in the fray.

Option 2: Humans killed Amy that night, not werewolves. Despite the conclusions made by the police department, a dark ritual **was** underway. It was one that involved much more elaborate costumes than that worn by Jake.

Extra spice -- What if the ritual was meant to create werewolves or other werebeasts? What if it was an attempt to summon such a creature? What if those who performed the ritual have no small amount of political clout -- enough to keep the police from investigating too closely?

Option 3: Amy's death was an accident. The "werewolves" were some of Jake's teammates who found out about the lovers' rendezvous and decided it would be great fun to scare the two witless. Tragically, Amy tripped and broke her neck trying to flee. Most of what Jake thought he saw was his imagination. A pack of stray dogs later left their mark on the crime scene.

Extra spice -- What if it wasn't quite an accident and the blame was supposed to fall squarely on Jake? What if it was retribution by an old boyfriend of Amy's?

Option 4: It was all a set-up. Something nasty in the cemetery took advantage of the situation and wanted to see how Jake would react to Amy's death. What Jake

observed was largely illusion, and the thing is now tied to his mind. It keeps his memories of the incident fresh by inflicting nightmares and revels in his tortured mental state.

Extra spice -- What if this presence jumps from Jake and invades the mind of one of the party members?

Side Salads

We Come In Peace: The werewolf scare stirred up by the killings is causing unrest in another particular population: real werewolves. Worried about resultant "witch hunts," they quietly approach the adventurers offering information and assistance. It may be that they had nothing to do with Amy's death, that the perpetrators were rogues or some other undesirables, or that they are lying through their sharp, pointy teeth.

On the Road Again: If Jake has escaped, where is headed? He has a motorcycle and a few personal belongings, but the former can be traced by police and the latter doesn't amount to much. Will he keep running, trying to stay ahead of the law and the werewolves? Will he keep killing when the moon is right?

Order in the Court: Once Jake is successfully captured the party could very easily be called in as witnesses at his trial. (The defense is pleading not guilty by reason of insanity.) How will this affect other investigations they are undertaking at the time? What happens if they are not allowed to admit they officially exist? What if their testimony could make the difference between Jake getting the help he needs and the death penalty?

Dork Tower!

Dork Tower!

The Pitch Lake of Trinidad and Tobago

by S. E. Mortimer

Although this is a depiction of a genuine natural phenomenon in the Caribbean, enough detail has been provided to enable a GM to use this location anywhere in his own campaign world. A lake of pitch makes an excellent natural barrier but it also can provide some useful plot devices and adventure seeds. A few **GURPS** references have been included, but this article has been deliberately kept as generic as possible so that it can be used with any system.

Introduction

Nestled among the tropical greenery on the south-west peninsula of the Caribbean island of Trinidad is the sleepy village of *La Brea*. Spanish for "tar" or "pitch," the village received its name because of an extraordinary natural phenomenon nearby -- the largest natural surface deposit of asphalt in the world. The "Lake of Pitch" is roughly oval-shaped, covering approximately 114 acres, and is over 250 feet deep at its center. The uneven matt-black surface is surprisingly solid. Most of it has a high enough viscosity to support the weight of a person and its surface skin prevents the asphalt from sticking to one's shoes. Some patches can support heavy machinery, which is used to mine the asphalt for export. If you stand in one place too long though, you will gradually sink.

The lake was formed millions of years ago when crude oil seeped to the surface through a fissure in the sandstone bedrock. The lighter elements in the oil evaporated, leaving behind the heavier asphalt. Many believe that the lake constantly replenishes itself because large holes fill themselves within a few days. This is not the case -- the fissure in the sandstone was plugged long ago. Holes are simply filled by adjacent material flowing into the depression. At the current rate of mining, though, the estimated 10 million tons that remain in the lake are projected to last another 400 years.

What's in a Name?

Today, the terms bitumen, asphalt, tar, and pitch are often used interchangeably.

Technically, these words refer to different products. Tar is a sticky black substance produced from the distillation of materials such as wood, peat, and coal. Further distillation of tar yields pitch as a semi-solid residue. Bitumen is a generic term for a class of dark, heavy hydrocarbon compounds found in tar, pitch and petroleum products.

Asphalt will be used to refer to the primary constituent of the Pitch Lake.

Wildlife

Marshy wetlands extend all around the perimeter of the lake and the area is home to many species of aquatic plants and animals. Trees include breadfruit, cashew, guava, and mango. Other plants include nymph lilies, water rose, and bird of paradise, which seem to grow right out of the muck. Grasses on this lake are often chest high. It is also home to a variety of birds including hummingbirds, herons, sandpipers, kingfishers, and the rare masked duck. Several species of freshwater fish can also be found. In the center of the lake, pools of rainwater settle in the troughs and valleys of this constantly changing landscape.

History

The local Chaima Indians believe that the lake was created by their god as a punishment. After a victory over a rival tribe, the Chaima became carried away with their celebration, cooking and eating the hummingbirds they believed held the spirits of their ancestors. This angered their winged god who opened up the earth, conjuring up the asphalt to swallow the entire village.

The first European report of La Brea was by Sir Walter Raleigh. He visited Trinidad in 1585 and discovered what was likely a vein of asphalt from the lake. It was used to caulk his ship and he wrote that it was superior to Norwegian pitch since it did not melt in the heat of the sun. He recommended it for all ships trading in the southern ports. In 1820 Governor Sir Ralph Woodford attempted to use the asphalt as fuel to light a beacon in the Tower of Trinity Cathedral in the capital, Port of Spain. Unfortunately, the sulphurous smell was unbearable so he had to abandon the idea. In 1846 Dr Abraham Gesner (later named the Father of the Oil Industry), distilled kerosene from La Brea asphalt. He, too, found the smell disagreeable and so sought an alternative source of asphalt that was less malodorous.

La Brea asphalt didn't come into its own until its usefulness at paving roads was discovered. In 1876 it was used to pave Pennsylvania Avenue in Washington D.C. It remained in excellent condition for 11 years despite heavy traffic. Even today, La Brea asphalt is considered superior to asphalt produced by the petroleum industry. It isn't more widely used because transportation costs render it more expensive than refinery-derived bitumens. It has, however, been used for special projects such as Hong Kong's Cross Harbour Tunnel, England's Jubilee Way Viaduct, and Austria's Transalpine Highway. It is deemed excellent for paving airport runways.

Other Uses

Historically, asphalt and pitch were used for many things other than caulking ships. The Chinese used it for heating and lighting, and it was a possible ingredient in the infamous "Greek fire." The stones in the biblical Tower of Babel were allegedly cemented together with bitumen mortar, and the ancient city of Babylon also reputedly had some stone construction using bitumen as mortar. Pitch was used as a general-purpose waterproofing agent -- in buckets, cisterns, roofing, and flooring (good for preventing "rising damp"). Pitch is a useful preservative. The Egyptians mummified their dead with bandages coated in pitch and many organic items have been found perfectly preserved in "tar pits." Being both sticky and water resistant, pitch made an excellent adhesive, used in the creation of mosaics and to stick down gold leaf. Pitch was also reputed to have some medicinal properties, treating abscesses, ulcers, fractures, concussion, paralysis, epilepsy, coughs, and nausea (though it is unlikely to provide any real medicinal benefits other than as an antiseptic). In a low-tech campaign world, any of the above industries may require the PCs to travel to the lake.

Keep in mind that asphalt may be relatively common, but each source consists of a unique blend of many different hydrocarbons, plus sulphur and a few other contaminants. Just because asphalt from one location is useful for a specific purpose doesn't mean that another source will be equally helpful. In a fantasy campaign, La Brea asphalt may contain a rare ingredient in the creation of a magical item or potion that isn't present in other sources.

Living Lake

Stretching for miles in all directions are underground veins of asphalt, reaching out from the lake like black tendrils

gradually pulling everything towards it. The nearby village of La Brea suffers from serious erosion; the sidewalks are buckled (some appear to be sinking into the ground) and buildings sit at crazy angles. Smaller items that are left in one place too long are usually found much closer to the lake, with others disappear completely. Some locals believe that the lake is alive -- a creature with a black maw and insidious tentacles. Alive or not, all treat it with respect. Should the GM wish to add a supernatural element, the Pitch Lake may, indeed, be a living entity. Perhaps, when the winged god of the Chaima Indians summoned up the lake, it became imbued it with a malevolent spirit. Perhaps the lake is possessed by a god who requires regular sacrifices. In a modern setting, the natives may notice that the lake has been more responsive ever since "the incident" (asteroid impact, nuclear waste spill, etc.).

Hazards

Although the pitch lake can be treacherous to navigate, the surrounding marshlands are even more dangerous. Despite its hazards, the stinking, black, undulating plain is probably the safest crossing point for many miles. Locals extort money from adventurers and travelers through selling maps and offering their services as guides.

Getting Stuck

Although the majority of the lake is solid enough to walk upon, there are patches of soft gooey bitumen awaiting the unfortunate traveler; about a quarter of the lake is too soft to walk upon. A local guide (making a successful Area Knowledge roll) or a recent map are required to successfully navigate a safe path across the lake; the landscape changes constantly, rendering any maps more than a few months old useless.

If one becomes stuck (on a failed Area Knowledge roll) there is only one chance to escape -- make a ST roll (and don't expect to keep your shoes). If this roll fails then it is impossible to escape without assistance. Gradually, over the course of 1d6 hours a person will sink below the surface. If that person became stuck on the perimeter where the depth is only a couple of feet, then the inevitable is only delayed. The lake will gradually -- over the course of 1d6 days -- pull its unfortunate victim into the center of the lake, where it is much deeper. It should be noted that asphalt is extremely difficult to wash off. Without a modern solvent such as gasoline it is virtually impossible.

Broiling

The tropical sun can heat up the surface skin on the lake enough to cook flesh. Some birds have learned that dropping small fish on the asphalt surface results in a tasty cooked meal. Tripping and falling during the middle of the day can inflict burns on exposed skin -- especially the hands -- taking 1 point of damage each turn while in contact with the surface (treat as a torch, see Flame, B129). This may result in DX penalties until healed.

Fire

Examining a lump of asphalt reveals it to be like Swiss cheese in appearance, with many holes formed by trapped gasses. Emitted gasses include hydrogen sulphide, methane, and ethane. The lake bubbles, burps, hisses and occasionally (quite spectacularly) spits fire. If one is attempting to navigate across the lake and the guide critically fails an Area Knowledge roll, a random member of the party gets hit by flame. Damage is 1d-1 (see Flame, B129-130). The GM may inflict this on the players anyway if he/she is feeling particularly vindictive, or if the players have grown complacent about walking on the lake.

Benefits

Products made from lake resources, such as pitch torches, would be extremely cheap and plentiful here. Anyone interested in scientific study would find the lake intriguing. Some may travel here to test out the reputed healing powers of the lake.

Magical Healing

The locals believe that the Pitch Lake's warm, yellow-green water has magical healing properties -- curing all sorts of ailments from headaches to arthritis. Visitors are invited to bathe in the warm, bubbly, sulphurous pool called the "fountain of youth." There may be some truth to the claims -- sulphur is relatively harmless to humans but toxic to many bacteria. In a fantasy campaign, the healing qualities of the lake's waters may indeed be magical, curing anything the GM deems appropriate.

Unexpected Treasures

While the lake devours almost everything with which it comes into contact, it also spews things back up. These items are covered in asphalt, but perfectly preserved -- having had all traces of moisture removed. The lake has been devouring things for millions of years so almost anything could be found. Fossilized remains have been discovered, including teeth from both a mastodon and a prehistoric giant sloth. On any given day, different items surge to the surface of the lake, only to be gone again in a day or two. A search involves approaching every irregular shape and cutting through the skin to see that lies beneath. On extremely rare occasions, something of value will be discovered. If the GM wishes to introduce an item or artifact to the players, then this is a good opportunity. Even organic items lost for thousands of years can be recovered in excellent condition because of the preserving nature of the asphalt.

Campaign Prospectuses

by William H. Stoddard

The campaign was a work of art. In the greatest city of a fantasy kingdom, half a dozen noble houses struggled for power through subtle spells and shifting alliances, negotiated according to an elaborate system of etiquette. Unfortunately, the players were looking for action rather than intrigue. For the first three sessions, their characters alternately ignored the GM's elaborate background and fought against it. The GM got the message, and there was never a fourth session.

This story is exaggerated, to make a point. But this kind of conflict does happen in roleplaying games. Most experienced gamers have gone through something like it at least once.

A roleplaying game depends on a kind of contract between the players and the GM, and a contract is based on a "meeting of minds." The players need to understand what kind of setting and campaign the GM intends to run, and to agree to them -- if possible, not reluctantly or with reservations, but enthusiastically, because they're what the players actually want.

Of course, the GM can and should talk with the players about what they want in a campaign. But this isn't always reliable. Some players may have clearer ideas of what they like, or feel freer to express them. If the GM talks with all the players as a group, some may be faster to speak up, or less willing to compromise, and other players may defer to them -- but not be happy with the result. And if the GM takes the players' requests, and then goes away to work up a campaign that fits them, it may not turn out to be what the players thought they were asking for.

One method for avoiding these problems is the campaign prospectus. The GM comes up with a list of several possible campaigns, circulates it among the possible players, and decides what to run based on their responses. This isn't a guaranteed solution, but it often helps fit the campaign to the players' preferences.

Defining the Audience

The first step in writing anything is to decide who is meant to read it. A clear picture of the target audience makes all the other choices a writer faces easier.

The audience for a campaign prospectus is the prospective players. But this group can be defined in different ways. At one extreme, the GM may have a small group of players who always play together and who expect that everyone will be included. In this approach, the group comes first and the campaign has to fit them. The group may even be in the position of choosing one GM over another. At the other extreme, the GM may be recruiting players from a much larger group, choosing the ones who support the most interesting or most popular campaign. In this approach, no one is assured of getting into a specific GM's campaign; those who don't have to look to other prospective GM's. The GM creates the group of players by inviting them into the campaign.

For an ambitious GM, there's a compromise between these two approaches: Run more than one campaign. A GM can recruit players from a group large enough to support two campaigns, guaranteeing that everyone will get to play, but not that they'll inevitably play with a specific group of other people.

Writing the Prospectus

Given the target audience, the next step is to write a list of possible campaigns. Each campaign should be described in some detail, to give players a clear understanding of what they're choosing -- but not so much that they skim over the description and miss important points. In general, a paragraph is about the right length. An example might look like this:

Gods and Monsters: A campaign of superheroic covert operations, set on Earth in 1925 A.D. Player characters will be agents of a major government, possessing superhuman powers or extraordinary or magical skills. Their mission will be to investigate paranormal and supernatural events, neutralize any threats to their government or humanity, and keep the public from finding out what happened. Scenarios will include investigation, stealth, and negotiation as often as actual combat; when combat does occur it will be realistically lethal. Rules system: **FUDGE**. Source material: *Planetary*, by Warren Ellis.

This description provides the following information:

Title: Giving a possible campaign a short name makes it easier for players to talk about it, or to include it in a mental list while they think about it.

Genre and Setting: A one-sentence summary of the genre and setting provides a "high concept" definition of the campaign as a whole.

Player Characters: Defining both the abilities and the background of the player characters gives players a sense of what roles they could choose.

Mission Statement: If the player characters have a specific goal or assignment, this will determine what type of activities they engage in.

Play Style: This statement defines how the action will actually be handled in scenarios.

Rules System: Players may have preferences for or against a particular rules system, or think that it's well or poorly suited to a genre.

Source Material: Not all campaigns have source material; some take place in newly created settings. But if a campaign is set in the world of a specific book or film, or takes its inspiration from a book or film, players familiar with the source will know what to expect from it.

How many campaigns should be included? At a minimum, enough to give players some clearly distinct choices; at a maximum, not so many that they all blur together. Anywhere from six to 20 options should meet both criteria. Make sure that all the campaigns are clearly distinct; ideally, they ought to cover most of the range a GM would be willing to run.

Scoring the Prospectus

Prospective players will respond to proposed campaigns by giving them numerical scores. There are at least three different systems for doing this: rating, bidding, and ranking. All three do the job; which one to use is a matter of the GM's taste.

In rating, players are asked to assign each campaign a numerical score in a fixed range. For example, the range from 0 to 5 (used for attributes in many game systems) works fairly well. A rating of 0 means that the player would rather sit a campaign out than play a certain game. A rating of 1 means the player thinks the campaign is a marginal choice, a bit better than not playing at all. A rating of 2 indicates an acceptable choice. Ratings of 3-5 indicate superior choices.

Bidding is much like rating, but there's no set upper limit. Rather, players get an assigned total number of points and can spend it on campaigns as they please. For example, with a list of 10 campaigns, players might be assigned 20 points. Bids of 0 or 2 points would mean much the same as for rating; bids of 3 or higher would indicate a strong preference for a specific campaign.

In ranking, players put a list of campaigns in order, from best to worst. The best campaign gets a rank of 1; each next best choice gets +1 to its rank. Since assigning 0 to a campaign doesn't mean anything in this system, a different method of separating the acceptable and unacceptable choices is necessary: the list should include "None of the Above" as a choice. Any campaign that ranks below "None of the Above" is one that the player would rather not take part in at all. For example, with a list of 10 campaigns, a player might rank the acceptable choices as 1 through 8, rank "None of the Above" as 9, and rank the unacceptable choices as 10 and 11.

In any of these systems, make sure players understand that a rating or bid of 0, or a rank lower than "None of the Above," is serious. They can use this method to block campaigns they don't like, but if they accept only campaigns no one else likes, they'll be sitting out the weeks or months of the campaign the other players prefer. If the GM is only going to run one campaign, giving this numerical value to more than one or two campaigns is risky. With a GM who plans to run multiple campaigns (say, two campaigns on alternate weekends), refusing to play in up to half the proposed campaigns is fairly safe.

The following sections will assume a bidding system, rather than ranking or rating. GMs who prefer one of the others can apply variants of the same methods to them.

Interpreting the Scores

Once the scores are all in, the next step is to interpret them -- that is, to use them to decide which campaign or campaigns to run. If you're going to run more than one campaign, you can also use the scores to decide who plays in which campaign.

It's not necessary to approach this as an election or voting process, where the goal is to apply some set of rules strictly and pick one or several winners accordingly, even if they win by the narrowest margin. Rather, the goal is to narrow down the range of choices to a few strong contenders, and then apply personal judgment to make the final choice. Since the goal is to run campaigns that people will like, the strong contenders are the campaigns that have substantial constituencies among the prospective players.

To start with, list all the players who make each campaign their first choice. (If a player gives equal top standing to two or more campaigns, list him as a supporter of both.) At the outset, strike any campaigns that are no one's first choice off the list. Next, eliminate the campaigns that are only one player's first choice, one by one, and reassign the player who supports each campaign to his next highest pick. In doing this, the best order to follow is to start with the campaigns whose supporter has at least two top choices, and thus is made no worse off by having one eliminated. Then go to the players whose next best choice is one point worse, then to those whose next best choice is two points worse, and so on.

At the end of this elimination process, a smaller number of campaigns will still be in the list. For each of these, define a core constituency: the players who pick that campaign as their one and only best choice.

For whatever number of campaigns you're going to run -- one, two, or even three -- go through the list of possible campaigns, looking at each possible set of that many campaigns: each one campaign, each pair, and so on. For example, if you have five campaigns left -- A, B, C, D, and E -- and you plan to run two, look at A and B, A and C, A and D, A and E, B and C, B and D, and so on. Assign each campaign the players who make up its core constituency. Then fill out the list with other players. Normally players should go into their higher ranked choices, but there can be reasons to disregard this: one campaign may have too many potential players (whatever number the GM considers "too many,") or two players may not get along, or the GM may consider one player better suited to his lower ranked choice. How acceptable this kind of reassignment is depends on how big a gap there is between the two options in the player's bid; a one-point difference is nearly harmless, but a larger differences call for caution, and players should never be assigned to their zero-point campaigns.

After making the assignment, figure out the total points the players have bid for each campaign they're assigned to. The total bids are the value of that combination of campaign. As a rule, pick the set of campaigns that has the highest

value. But this isn't an absolute rule. If the highest value campaign set is one that's a marginal choice for one or several players, it may be better to take a set with a slightly lower value. A GM may also choose such a set to get campaigns for which he has more interesting ideas, or which have a more congenial mix of players.

What if the campaigns that this method picks get a zero score from one player? At this point, the GM has to make some hard choices. It's not a good idea to go ahead and assign players to campaigns on which they bid zero points; they're not likely to be happy there, or committed to the campaign, and setting a precedent of doing so will invite players to game the prospectus, putting all their points in one or two top picks and then expecting to be able to take back their zero votes if those picks lose out. The workable choices are to run the best campaigns without those players, or to decide that there's too little agreement to justify any of the choices, throw them all out, and come up with a new list. A GM with a tightly bonded group of players will want to come up with a new list; a GM who's inviting in players from a larger community is free to leave some out.

A Worked Example

Fred plans to start a new cycle of campaigns. He has eight likely players, a bit large for one group, so he's prepared to run two smaller groups in alternate weeks. He has six campaign ideas: **Barsoom** is a swords and superscience campaign set on the dying planet Mars; **Paladins** is high fantasy at the court of Charlemagne; **Skinturn** will be about lycanthropic tribes in a dark fantasy world; **Super Soldiers** will be about superhuman combat in World War II; **Time Tours** will be a low-combat campaign in the *Infinite Worlds* setting; and **Wyvern College** will be about student life at a magic-oriented British university in the 1930s.

His eight prospective players rate the campaigns as follows:

	Bars.	Pal.	Skin.	SS	TT	WC
Brian	2	2	2	5	1	0
Dan	1	5	2	0	0	4
Douglas	2	2	1	1	2	4
Kate	0	0	10	0	0	2
Memo	4	4	1	1	2	0
Naomi	2	0	0	5	3	2
Tyler	2	3	2	2	2	1
Yukiko	1	2	0	1	3	5

To analyze this, first he marks the campaigns that are someone's top choice or tied top choice:

	Bars.	Pal.	Skin.	SS	TT	WC
Brian	2	2	2	5	1	0
Dan	1	5	2	0	0	4
Douglas	2	2	1	1	2	4
Kate	0	0	10	0	0	2
Memo	4	4	1	1	2	0
Naomi	2	0	0	5	3	2
Tyler	2	3	2	2	2	1
Yukiko	1	2	0	1	3	5

Time Tours is no one's top choice and he can eliminate it at the outset.

Two campaigns are only one person's top choice: only Kate likes **Skinturn** and only Memo likes **Barsoom**. Fred cuts them from the list. Memo had two equal top choices; now he only has one, **Paladins**. Kate only rated one other campaign above zero, **Wyvern College**; Fred reassigns her to that.

The three remaining campaigns and their core constituencies are now:

Paladins, favored by Dan, Memo, and Tyler;

Super Soldiers, favored by Brian and Naomi;

Wyvern College, favored by Douglas, Kate, and Yukiko.

So Fred looks at them two at a time. If he cuts **Paladins**, then he'll assign Brian, Memo, Naomi, and Tyler to **Super Soldiers** (total bid 13) and Dan, Douglas, Kate, and Yukiko to **Wyvern College** (total bid 15); the lowest rating will be Memo's 1 for **Super Soldiers** and the combined total bid is 28. If he cuts **Super Soldiers**, he'll assign Brian, Dan, Memo, and Tyler to **Paladins** (total bid 14) and Douglas, Kate, Naomi, and Yukiko to **Wyvern College** (total bid 13); no one rates any campaign lower than 2 and the combined total bid is 27. If he cuts **Wyvern College**, then Kate rates both campaigns at 0 and will sit the cycle out; Dan, Douglas, Memo, Tyler, and Yukiko all prefer **Paladins**, but for numerical balance he moves Tyler to **Super Soldiers** with Brian and Naomi (total bid 12), leaving **Paladins** with Dan, Douglas, Memo, and Yukiko (total bid 13), for a combined total bid of 25.

Cutting **Wyvern College** is clearly the worst choice; it shuts one player out and it has a lower combined total bid than the other two cuts. Cutting **Paladins** gives the highest combined total bid, but will put one player, Memo, in a marginal campaign. So Fred picks **Paladins** and **Wyvern College** as his campaign choices, while noting **Super Soldiers** as a possible campaign for the next cycle.

Payoffs

What are the benefits of using this method?

- It makes sure the GM is running something that the players actually are interested in playing.
- It gives equal weight to everyone's preferences, rather than favoring the more outspoken players.
- It enables players to make more informed choices.
- It can encourage GMs to be more creative in coming up with campaign concepts, in the course of spelling out ideas for several campaigns.
- It lets a GM invite players to try a new rules system or genre without forcing either down their throats.
- It gives the GM information on what campaigns might be worth proposing again later.
- It establishes player agreement to a campaign concept at the outset, while the GM can appeal to later in maintaining the spirit of the campaign.
- It's a good tool for recruiting new players into a group.

If you're starting to think about running a new campaign, but not sure what to run . . . drawing up a prospectus and circulating it among your players may help you make a better decision.

Pyramid Review

StrataGem

Published by [Playroom Entertainment](#)

Designed by Maureen Hiron

90 cards, rulebook in English, Spanish, French, & German, full-color, two to four players, \$10.00

It's like a tennis game: Out of the Box Publishing puts out a good game, then Playroom Entertainment follows up with one of their own. ***StrataGem*** is their careful little card game of arranging jewels in the best order.

The object of the game is to have the highest point total after all rounds are played.

The dealer passes out eight cards to each player, and sets the rest aside as the draw deck. Cards are of two types: gems and thieves. The gem cards come in one of six colors, and each suit has a number of gems from one to six (two of each number). That leaves 18 cards as thieves.

The dealer goes first, and his initial play must be a gem card. He plays, draws a card to replace it, and play passes to the next person. Gems are laid down in front of you, and eventually must form a grid three cards on a side. Once played, any two cards on the table must remain in the same relative positions, but you aren't locked into where those fall in your grid until you play more cards. So if you have two cards sitting side by side, they may end up being the two top and leftmost cards in you grid, or the leftmost cards of the middle row, or even the rightmost in any row. If you play a third card so they're laid out left to right, you've got a row, but you might choose that to be the top, middle, or bottom row depending on what cards you draw in the meantime.

Only the position of the stacks has to remain consistent -- their contents can change. If you don't like the card in a stack, put another one on top of it. The thief cards are played atop an opponent's stack -- one of these prevents the card under it from being scored. To free that stack up, you have to either play another thief card over it (this sends both thieves to the bottom of that pile), or put another gem card on top of the thief, depending on whether you need the covered card or are willing to live with a new one from your hand. In either case, a stack whose thief has been dealt with can no longer be a target for thieves. When someone finishes their grid (i.e., all gems atop the stacks; no thieves showing), players may no longer draw from the deck; thieves are now useless and everyone must complete their grid as best they can with what's in their hand.

You want certain card arrangements to get the most points. When you're tallying your score, you're looking for any given row (including the diagonals) to have two or three of the same numbers or colors, or consecutive numbers in or out of order. You also get a bonus if you were the first one to complete his grid. Count everyone's score, then shuffle the deck. The next player becomes the dealer for the second round, and when everyone's had a chance to be dealer the scores from all rounds are added together. The highest total wins.

The cards are certainly pretty, with bright colors. The numbers are a bit blocky, and for some reason the "six" graphic can throw you visually, especially on the gray suit. But this isn't a speed-play game, so players have the leisure they need for this not to be a pressing issue. The stock is almost perfect for shuffling, though when pulling cards one can't ditch the feeling that you're getting hold of two stuck together (they do need a little coaxing, but only when first opened).

It feels like a lot to consider, and somehow the thief seems like an inefficient way to block someone else's play. They

do the most damage at the end of the game, but at that point you're already racing to make your grid the best it can be before "sudden death." This is probably deliberate, though, since the whole game is the same careful dance. Sure, it can continue until the deck is empty, but anyone can decide at any time, "Yeah, this arrangement is good enough for me," effectively ending the round, and if you're not prepared for it . . .

So long as you have the concentration required (poker players who excel at counting cards will find they have an advantage), **StrataGem** is a dandy exercise for testing your mental mettle. Not so convoluted as to drive the fun out of it, nor so simple as to be easily mastered, it's a steal at the price. Which puts the ball back in Out of the Box's court.

16 Region Maps, five double-sided Character Sheets, 10 Character Stand-ups, four wooden Manor Houses, 60 wooden Experience Cubes in three colors, 30 wooden Gold Pieces, 23 red glass beads, four semi-precious stones, eight Heroic Deed cards, six Nameless cards, 33 number chits, 106 counters, one cloth bag, five six-sided dice, 16-page full color Rules Booklet, 16-page full color Glossary, & Introductory Setup Sheet; \$50

Return of the Heroes is a fantasy board game much in the tradition of the classic *Talisman* from Games Workshop and both *Runebound* and *The Hobbit* from Fantasy Flight Games. It is designed for two to four players, 10 years old and up, throwing them into a world of "Phantastic Adventure" that will see their heroes attempt to restore their families' honor. Each hero will travel the land, and through encounters, combat, and tasks will gain them experience and artifacts that will make them strong enough to attempt a heroic deed. If this deed is successfully fulfilled, the heroes will learn more about the source of the woes that have befallen their families. A dark power known as the Nameless dominates the land (and the board) and only by defeating him will family honor be assuaged. And of course, the game won.

Opening the box reveals a plethora of components. These include the 6½-inch square Region Maps; the five double-sided character sheets, each with a corresponding pair of character stand-ups; and oodles of counters. There are also eight cards that detail the Heroic Deeds and another six that detail the various different versions of the Nameless, a tube of red glass beads to represent the heroes' hit points, and 60 wooden cubes in three colors to represent experience gained during the game. A canvas bag is included from which hidden counters and cards can be drawn.

The 16 Regional Maps, labeled A through P, range in terrain types from rural to urban and include the usual woods, swamps, lakes, and mountains. Routes run across the Maps, between locations known as Fields, and to adjacent Regional Maps. Each Map has an average of eight numbered Fields that are seeded with counters drawn from the bag. Some Fields are hidden, and before a hero can travel to them, he must roll to find them, though search long enough and the path will become apparent. The Character Sheets include a Dwarf, an Elf, a Fighter, a Mage, and a Cleric, the latter only available in the standard game. Each Character Sheet is double-sided, with a male version on one side and a female one on the other. A Character is rated in three skills -- Magic, Ranged, and Close Combat -- plus Movement Allowance, the amount of Gold Pieces carried, and both Hit Points and Armour value worn marked by the glass beads placed on the sheet's red heart spaces. There are spaces waiting to be filled by a character's completed tasks and the artifacts carried. Besides a name, a character also possesses a special ability, such as the Elves' always being able to locate hidden paths in the woods or the Clerics' ability to find both the White Village and the Temple.

The rules are presented in the full color booklet and delivered in a chatty style by each of the game's characters in turn. Play is aided by a leaflet that neatly condenses the rules into two pages and also by the Glossary. Again in full color, this explains *all* of the games' counters and terms, in some cases in an easier to grasp style than in the actual rulebook.

Play can be got off to a quick start using just the Introductory Setup Sheet that takes the players step-by-step through the preparation to get a game going. The Sheet's illustrations help with this, and after a quick read through of the rules, play can be got off the mark in quite a short time. This basic Introductory Setup has the Region Maps arranged in alphabetical order in a standard four-by-four grid. A Player selects a hero (other than either of the Clerics) and fills in the hero's sheet, places a Manor piece in his home region, and is given a particular Heroic Deed card, the details of which he must perform.

Actual play is kept nice and simple. A player's turn consists of two phases: Movement and Action. During his Movement, a hero moves as many fields equal to his Movement Allowance, modified by artifacts such as the cart, horse, or boots. Movement ends as soon as any Action is undertaken. This includes Combat, picking up or dropping artifacts, learning from an instructor, fulfilling a task or part of a Heroic Deed, buying from the market, entering a competition, and so on. Anything that involves a Trial, such as combat or competing, requires a dice roll. Two dice are rolled, the aim being to roll under a hero's appropriate skill. After a successful Trial or Task, a hero gains a reward that can be Gold Pieces, artifacts, or Experience cubes. Collect enough of these cubes in a skill and more dice become available to roll in subsequent Trials, the player just choosing the lowest two.

Tasks are simple affairs. For example, buying and taking a magic staff to the Boat or finding Don Hobiro who will train the hero in Ranged Combat. Heroic Deeds are slightly more complex, but follow the same general formula: combat, transporting an artifact to someone, who will reward the hero with a gift that must be returned to a hero's home Manor. Thus to "Free Merlin," a hero travels to the swamp or "O" Region, defeat the Swamp Drake, and take the Powerful Magic Spell to the Cursed Oak where it will free Merlin. He then wants escorting home.

Completing a Heroic Deed will restore a hero's family honor and earn him the reward of a semi-precious stone. This is the key to gaining access to the tower of the Nameless, who will have emerged by the time a hero has completed the first part of his Heroic Deed. His counter is placed in the bag; when drawn, his card is placed his tower on the board and his four guards around the tower. A number of his servants appear throughout the land. To defeat the Nameless, a hero now armed with a key can challenge and overcome a guard, then fight the evil one. The exact nature of the Nameless is only revealed when this happens, but all are very tough. For example, the Six-Armed Goddess inflicts double damage in Close Combat unless the hero has the Cross. Once battle is joined, it is fought to the end. Defeating the Nameless wins the game, but a losing, dead hero returns to his Manor, losing all Experience and all but one artifact to pass onto his heir to try again.

In the standard game, the maps are laid out face down, randomly, and in any pattern. Players receive two Heroic Deed cards, but only have to complete one of them. All counters are used, including the Mice, who can be persuaded to tell a hero who the Nameless is. The other side of the Introductory Setup Sheet gives rules for Solitaire Play, which imposes a 45-turn time limit. This is as playable as the full game for one reason: neither game involves player interaction. Essentially, each player is playing by himself, and what ***Return of the Heroes*** really is, is a race game.

Yet is it *not* a bad race game, although it is perhaps frustrating when waiting for the right counter to be drawn needed to complete a task or part of a Heroic Deed. Still, it is certainly good looking and the design gives the players plenty to do on the path to fulfilling the Heroic Deeds and defeating the Nameless. Its fantasy theme is well handled and if the game is reminiscent a little of *The Lord of the Rings*, then that not necessarily a bad thing. Ultimately, the lack of interaction will deter more demanding players from wanting to play ***Return of the Heroes*** more than a few times, but a younger audience may get more out of it and find it more demanding.
